INDEX TO VOLUME II FOR 1875

A.
Abdominal organs, malformation of, 279; presentation, Mr. Coffin on, 362
Abercrombie, Dr. John, 137
Abortifacients, sentences on, 75
Accident, a curious, 143; Dr. Smart on deaths by in army and navy, 270, 357
Accidents from frost in London, 743
Acemite, action of in fever, 532
Acoustics, physiological, 275
Acton, Mr. W., treatment of constitutional syphilis, 258; death of, 740; inquest on, *ib.*
Adams, Mr. W., operation for depressed cicatrices, 260; treatment of broken nose, 421
Adamson, Dr., proposed memorial of, 741
Addison's disease, cases of, 541, 614
Adolescence, mortality of, 271
Adulteration of milk, 140, 715, 741
Adulteration Act, new, 511; old, last action in Scotland under, 535
Advertising of medical books in newspapers, *see* Medical books, advertising of
Advice, immoral and pernicious, 91
Africa, East, medical mission in, 711
Air, compressed, action of, 207
Air-passages, Mr. Spence on surgery of, 193
Aitken, Dr. J., Syme's operation modified, 459; poisoning by laburnum seeds, 555
— Dr. L., the sanitary state of Rome, 271; night medical service, 637
Alcohol, discussion on in International Medical Congress, 466; dangers of abuse of, 506; medicinal use of, 763; detection of in urine, Mr. F. C. Hewett on, 750; physiological action of, 800
Alder, Dr., trial of, 180
Aldershot, hospital arrangements at, 659; losses of stores at, 630, 719, 802
Alford, Mr. Samuel, treatment of whooping-cough by carbolic acid, 480
Algiers, winter quarters in, 592
Allbutt, Dr. T. C., auscultation of the œsophagus, 228, 420
Almond river, pollution of the, 144
Aloes, crystalline constituents of, 304
Alopecia areata, Mr. J. H. Stowers on, 226
Althaus, Dr. J., electrolytic dispersion of tumours, 263, 606
Ambrose, Dr. J., concealment of venereal disease in the army, 93
Amenities, unusual, 713
America, medical practice in, 121, 157, 319, 479, 691; proposed international medical congress in, 796
Amputation of thigh for rupture of popliteal artery and vein, 259; Syme's, improved method of performing, 420, 459, 672; by combined cutaneous and musculo-cutaneous flaps, 675; skin-grafting on stump after, 719; at elbow-joint, 734
Amputations, medical officers' fees for, 106
Amyl, nitrite of, traumatic tetanus treated by, 523; action of, 527
Angemia, idiopathic or progressive pernicious, Dr. B. Bramwell on, 758
Anæsthesia, the discoverer of, 25
Anæsthetics, mortality from, 109; deaths from, 113; choice of, 159, 148; Committee of Association on, 214; in extraction of teeth, Mr. A. Stewart on, 733; Mr. H. Sewill on, *ib.*; chloroform and ether as, in hospitals, 781. *See* Chloroform and Ether
Anatomical science, Dr. Cleland on present state of, 289
Anatomy, text-books on, 349; human, at Cambridge, 793
Anderson, Mrs. Garrett, on dysmenorrhœa, 233
— Dr. McCall, treatment of aneurism of arch of aorta by galvano-puncture, 228, 517
— Mr. W., the will as a therapeutic means, 692
**Aneurism of thoracic aorta, Dr. Smith-Shand on, 12; Dr. McCall Anderson on treatment of by galvano-puncture, 228, 517; treated by distal ligature, Mr. Annandale on, 594; cases of, 558, 746, 755, 769; involving recurrent laryngeal nerve, 615; of abdominal aorta, 558; of aorta in the army, 684; traumatic varicose of femoral artery, 194; arterio-venous in thigh, 246; of arteries treated by wire-compress, Mr. J. Dix on, 258, 551; intracranial, 542; iliac, *see* Intrathoracic, large, 641; popliteal, ligat. — al artery with carbolised catgut for, 656, *670*
Angina Ludovici, F. Murchison on, 778**

Anglo-Saxon skeletons, 741
Ankle, disease of treated by carbolic acid injection, 248
Ankylosis, straight, of hip-joint, Adams's operation for, 258; fibrous, of knee, subcutaneous operation for, 262, 553, 703; of hip, treated by fracture of neck of femur, 430
Annandale, Mr. T., aneurism of aorta treated by distal ligature, 550
Anthropology, new school of in Paris, 505
Antiseptic, salicylic acid as an, 510; treatment of wounds, discussion on, 510, 657; ligatures, Mr. O. Pemberton on, 551; treatment, Mr. Lister on influence of on salubrity of hospitals, 769
Antivaccinators, in Dresden, 26; statements of, 283; in Montreal, 307; at Keighley, 713; in Berlin, 762
Antivivisectionists and the late Dr. John Reid, 374. *See* Vivisection
Aorta, thoracic, aneurism of, Dr. Smith-Shand on, 12; Dr. McCall Anderson on treatment of by galvano-puncture, 228, 517; treated by distal ligature, Mr. Annandale on, 590; cases of, 558, 746, 755, 769; involving recurrent laryngeal nerve, 615; in the army, 684; abdominal, aneurism of, 558
Aortic valves, congenital disease of, 511
Aphasia, emotional, 275
Apjohn, Dr., testimonial to, 795
Apoplexy, meningeal, Mr. Hodgson on, 88, 361
Apothecaries' Society, prizes in Botany, 51; regulations of, 326; the Chelsea gardens of, 619, 616; pass lists, *see* Medical News in each number
Apothecaries' Hall in Ireland, regulations of, 331
Appeals, 187, 479, 539
Appointments, medical, 546
Apprenticeships, medical, 602, 603
Araroba powder, 419
Armstrong, Mr. H. E., introductory lecture at University of Durham College of Medicine, 180
**Army, British, changes among medical officers at Malta, 61; Dr. J. Ambrose on concealment of venereal disease in, 98, 110; medical regulations, 107; Dr. Lush's advocacy of claims of medical department, 109, 119; promotions, appointments, etc., of medical officers, 115, 243, 653, 690, 803; number of vacancies at examinations, 151, 571; good service pensions, 187; successful candidates for medical appointments, 216, 285; regimental system *versus* unification, 216; Dr. Smart on deaths from accident in, 221; Dr. Smart on deaths from accident in, 270, 357; regulations for admission to medical service, 405; hospital corps, 461; departmental officers of, 495; retirement of Dr. Loege, 571, 589, 627; military hospitals, 572; Knights, bridge barracks, 598; letter on medical reform, 627; promotion in, 659; assistant-professors at Netley, 659; half-pay without half-pay, 659; hospital arrangements at Aldershot, 659; beads, 660; the unification system, 677; losses of stores at Aldershot, 690, 719, 803; remarks on medical department, 769; the case of Surgeon Spurway, 721; fringe allowances, 749; married soldiers' quarters, 752
— French, medical description in, 511
— Indian, successful candidates at examinations, 285; mortality of children of soldiers, 370, 511; regulations for admission to medical service, 465; remarks on medical department, 413; dress of medical officers, 571; question regarding medical service, 601
Arnica in orchitis, Mr. H. G. Knaggs on, 71; eczema from tincture of, 731
Arnold and Sons', Messrs., flexible stethoscope, 546; hypodermic syringe, 751
Arnott, Sir John, donation to charitable institutions in Cork, 375
Arrest of development of forearms, 709
Arsenic, chlorea treated by, 397; eaters of in Styria, 437; in casks, poisoning by, 467; poisoning by from a green lamp-shade, 590; Mr. Kerr on chlorine poisoning by, 610; in India, 618, 618
Arteries, internal carotid, thrombosis of, 541; aneurism of treated by wire-compress, Mr. J. Dix on, 258, 551
Artery, femoral, Mr. Spence on traumatic varicose aneurism of, 194; popliteal, rupture of, 259; common femoral, Mr. O. Pemberton on ligature of, 259, 551; anterior communicating, aneurism of, 512; anterior cerebral, tumour of, *ib.*; external iliac, aneurism of, 614; femoral, ligature of with carbolised catgut, 656; external iliac, Mr. Myers**

on ligature of with carbolised catgut, 670; pulmonary, embolism of, 685; rupture of in thigh, 748

Arthritis, tubercular, 430
Artisans' Dwellings Act in Liverpool, 598
Ascleps cured by resin of copaiba, Dr. Wilks on, 780
Assistants, unqualified, 63, 154, 287
**ASSOCIATION, BRITISH MEDICAL, Dr. G. M. Humphry on aims of, 35; Mr. D. Kent Jones on, 36; Dr. Orsborn on, 37; programme of annual meeting, 58, 81, 116, 144; Dr. Davies-Colley on rise and progress of, 66; vote of Edinburgh University Court towards expenses of meeting, 77; by-laws of, 79; proceedings of Committee of Council, 115, 366; remarks on annual meeting, 139, 178, 200; Sir Robert Christison's address, 155, 182; Dr. DeBerg's address in Medicine, 164, 212; Dr. Matthew Duncan's address in Section of Obstetric Medicine, 171; Riegt II. u. Lyon Hayfair's address in Section of Public Medicine, 173; Dr. Lewis's address in Section of Psychology, 176; forty-third annual meeting, 181, 219; address of retiring president, 181; vote of thanks to the retiring president, *ib.*; a address of welcome from the Edinburgh Municipal Council, *ib.*; report of Council, 182; vote of thanks to Mr. Samuel Wood, 184; vote of thanks to Dr. Stewart, *ib.*; the army medical department and civil surgeons, *ib.*; by-laws of the Association, *ib.*; re-election of Vice-presidents, *ib.*; re-election of Treasurer, 185; election of General Secretary, *ib.*; Mr. Spence's address in Surgery, 189, 212; Dr. Rutherford's address in Physiology, 198, 213; Dr. Gardner's address in Section of Medicine, 200; report of Parliamentary Bills Committee, 201, 214; report of Scientific Grants Committee, 202, 212; report of Joint Committee on State Medicine, 202, 212; place of meeting for 1876, 210; President of Council, *ib.*; vote of thanks to Mr. S. Graham, *ib.*; vote of thanks to Dr. Falconer, *ib.*; election of Treasurer, 211; Committee of Council, *ib.*; honorary members, 211, 215; the admission of lady members, 211, 254, 654, 724; report of the Committee on Qualifications in State Medicine, 212, 214; habitual drunkards, 214; medical relief of the poor in Scotland, *see* anaesthetic agents, *ib.*; vote of thanks, 215; dinner, 215; president's reception, 258; *congratulations, ib.*; garden party, *ib.*; *Edinburgh Medical Journal* on annual meeting, 305; remarks of a contemporary on, *ib.*; members present at annual meeting, 311; remarks on scientific reports of, 528; notice regarding scientific grants, 568; numerical strength of, 646; new Branches of, 748, 796; notice of motion regarding, 715; progress of in 1875, 787; foreign critics of, 794; annual meeting, etc., in 1876, 807
**— Section of Medicine: Dr. Gardner's address at opening of, 201; types of continued fever, 228; treatment of aneurism of arch of aorta by galvano-puncture, 228, 517; auscultation of the œsophagus, 228, 420; appearance of the tongue in health and disease, 228; treatment of acute rheumatism by tincture of perchloride of iron, 229, 417; rheumatic fever and its treatment, 229; the pneumonias of childhood, *ib.*; tetany, 229, 456; experiment relating to the pathological anatomy of myelitis, 229; hooping-cough and its treatment with carbolic acid vapour, 229, 455; paralysis of the serratus magnus muscle, 229, 455; abnormal disposition to sleep alternated with choreic movements, 229, 547; cases of rubeola notha, 230; pulmonary and tricuspid valvular disease, *ib.*; the sphincter stomachi, 230, 455
— Section of Surgery: treatment of club-foot, 257; peculiar variety of hydrocele of the cord, *ib.*; excision of the thyroid gland, 257, 306; subcutaneous division of the neck of the thigh-bone on both sides for a straight ankylosis, 258; cases of aneurism treated by the wire-compress, 258, 551; modern treatment of constitutional syphilis, 258; tracheotomy in croup, 258, 292, 258, 292; partial rupture of the popliteal artery, 259; structure of the urethra, 259; conjunctiva, 259; a child's view from a child's eye, 259; ligature by an autogenous vessel, 259, 262; new operation for the obliteration of depressed cicatrices, 260; new rhinoplasty operation, 260, 304; treatment of strum or enlargement of the glands by hypodermic injections, 260; punctured fracture of the frontal bone treated by trephining, 260, 300; conservative anal surgery, 261; provincial surgery in Scotland, *ib.*; new operation****

- for ununited fractures, *ib.*; section of cornea in certain diseases of the eye, 262; subcutaneous operation for fibrous ankylosis of the knee, *ib.*; Egyptian ophthalmia and cataract complications, *ib.*; the varieties of wry-neck, *ib.*; modern methods of extracting cataract, *ib.*; treatment of spina bifida, 263; electrolytic dispersion of tumours, 263, 606; tertiary sore-throat, 263; treatment of lymphatic tumours of the neck, 264; severe cerebro-spinal symptoms from a fall at football, *ib.*; extirpation of the tongue, *ib.*; nourishment of the head of the femur after intracapsular fracture, *ib.*; fibrous tumours of the auricle, *ib.*; Mr. Lister's address, 769
- Association, Section of Obstetric Medicine: Dr. Matthews Duncan's address at opening of, 171; embryotomy, 231; accidental hemorrhage alternating with watery discharge, *ib.*; new midwifery forceps, *ib.*; obstetric thumble, *ib.*; ovarian dropsy, *ib.*; prevention and management of miscarriages, 231, 665; placenta prævia, 231; inversion of the uterus, 231, 296; memoir of the life of Smellie, 231; examination of the female bladder, 232; intemperance in women, *ib.*; obstetrical statistics, 232, 635; uterine flexions and displacements, 232; nitric acid as a caustic in uterine practice, 232, 609; management of the lying-in woman, 233; transfusion by Aveling's apparatus, *ib.*; triplets complicated by double uterms, 233, 359; dysmenorrhœa, 233; syphilitic placenta, 234; points in the management of the third stage of labour, *ib.*; vomiting in pregnancy, *ib.*; neuralgic dysmenorrhœa, 235; rupture of the umbilical cord during delivery, *ib.*
- Section of Public Medicine: Right Hon. Lyon Playfair's address, 173; life-history of contagium, 265; nature of contagium, *ib.*; scarlet fever, how to prevent its spread, *ib.*; is enteric fever spontaneously generated? 266; typhoid fever in Skye, *ib.*; enteric fever traceable to a specifically polluted water-supply, *ib.*; enteric fever in Killmarnock, 267; ages at death from small-pox, measles, and scarlatina, 267, 520; points connected with cottage hospitals, 267; legislation for the control and treatment of insane drinkers, 263, 255, 267; State Medicine in relation to education, 268; parochial medical relief in Scotland, 269; relations between weather and mortality in London, 270; the influence of weather on the death-rate from different diseases and at different ages, *ib.*; deaths by accident in the army and navy, 270, 357; numerical ratio of diseases in the adult male community, 270; mortality of adolescence, 271; tobacco and its effects on health, *ib.*; evils of medical men undertaking the duties of nurses, *ib.*; sanitary state of Rome, *ib.*; sanitation of houses, 272, 388; mortality in relation to dwellings, *ib.*; sanitary remarks on trap and soil-pipes, 273; comparative merits of the water-carriage and dry systems of sewage, *ib.*; sanitary conditions of rural districts, *ib.*; drinking and table waters, 274; mineral constituents of drinking waters, *ib.*; vote of thanks to President, *ib.*
- Section of Psychology: Dr. Low's address, 176; unilateral phenomenon of mental and nervous disorders, 274; unusual case of epilepsy, 275, 709; emotional aphasia, 275; statistics of lunacy in town and country, *ib.*; unilateral convulsions and hemiplegia from circumscribed lesion, *ib.*; microcephalic idiocy, 276, 454; bulbar paralysis, 276; effect of diseases on weight of encephalon, *ib.*; psychology of muscle, 277; hypodermic injection of morphia in insanity, *ib.*; experiments on brain of monkeys, *ib.*
- Section of Physiology: transference of long tendon of biceps muscle from scapula to humerus in chronic disease of the shoulder, 278; electric currents of brain, *ib.*; digestive principles of insectivorous plants, *ib.*; effect of drugs in intracranial circulation, *ib.*; case of death in a diver, *ib.*; physiological acoustics, *ib.*; effect of division of cervical sympathetic, *ib.*; anatomy and physiology of semicircular canals, *ib.*; process for staining tissues, *ib.*; action of stimulants and narcotics, 279; magnetic effects of arterial and venous blood, *ib.*
- Aberdeen, Banff, and Kincardine Branch, spontaneous origin of typhoid fever, 720
- Bath and Bristol Branch, president's address, 68, 85; annual meeting, 85; Report of Council, *ib.*; president-elect, *ib.*; vote of thanks to retiring president, *ib.*; proposal regarding discussions, *ib.*; secretaries, *ib.*; representatives in General Council, *ib.*; ordinary meetings, 655, 798; new members, 655, 795; discussions at meetings, 655; advertising medical books in public newspapers, *ib.*; papers, *ib.*
- Birmingham and Midland Counties Branch, annual meeting, 83; the president elect, *ib.*; new members, *ib.*; vote of thanks to retiring president, *ib.*; report of Council, *ib.*; financial statement, 81; votes of thanks, *ib.*; election of officers, *ib.*; dinner, *ib.*; president's address, 481, 655; ordinary meetings, 654; new members, *ib.*; dilated stomach, *ib.*; recurrent tumour of the eyeball, *ib.*; exophthalmos, 655. Pathological and Clinical Section: lupus vulgaris, 655; lamellar cataract and defective teeth, *ib.*; amputation of the foot, *ib.*; retro-uterine hæmorrhage, *ib.*; femoral aneurism, *ib.*
- Association, Border Counties Branch, annual meeting, 284; report of Council, *ib.*; Medical Benevolent Fund, *ib.*; president's address, *ib.*; new members, *ib.*; election of office-bearers, *ib.*; medical fees, *ib.*; dinner, *ib.*; autumnal meeting, 717
- Cambridge and Huntingdon, East Anglian, and South Midland Branches, combined annual meeting, 60; president's address, 35, 60; new members, 60; place of next meeting, *ib.*; representatives in General Council, *ib.*; legislation for habitual drunkards, *ib.*; medical advertising, *ib.*; papers, *ib.*; dinner, *ib.*
- East York and North Lincoln Branch, conjoint meeting with Yorkshire Branch, 568
- Gloucestershire Branch, annual meeting, 717; president for 1876, *ib.*; insular sclerosis, *ib.*; medical education of women, *ib.*; diseases of the fauces and larynx, 718.
- Lancashire and Cheshire Branch, president's address, 66, 117; annual meeting, 117; report of Council, *ib.*; medical advertising, *ib.*; officers and Council, *ib.*; communications, *ib.*; dinner, *ib.*
- Metropolitan Counties Branch, president's address, 23, 119; annual meeting, 118; new members, *ib.*; report of Council, *ib.*; treasurer's report, *ib.*; election of officers and Council, *ib.*; votes of thanks, *ib.*; habitual drunkards, 119; dinner, *ib.*
- Midland Branch, annual meeting, 84; president's address, *ib.*; new members, 85; officers and Council, *ib.*; election of members of the Association, *ib.*; advertisements of medical books, *ib.*; dinner, 85, 445; quarterly meeting, 445; papers, *ib.*
- North of England Branch annual meeting, 117; votes of thanks, *ib.*; report of Council, *ib.*; officers for 1876-76, *ib.*; representatives in General Council, *ib.*; representatives in Parliamentary Committees, *ib.*; dinner, 118, 445; autumnal meeting, 445; papers, *ib.*
- North Wales Branch, president's address, 36; annual meeting, 60; vote of thanks, *ib.*; report of Council, *ib.*; next annual meeting, officers and Council, *ib.*; mitral constrictions, *ib.*; morbid specimens, *ib.*; bead enclosed in a nerve, *ib.*; epiphrosids eruenta, 61; lupus exedens, *ib.*; injuries of head, *ib.*; bone-setters, *ib.*; dinner, *ib.*
- Northern Counties of Scotland Branch, annual meeting, 506; paper, *ib.*; abnormal births, *ib.*; office-bearers, 507; dinner, *ib.*
- Shropshire Ethical Branch, annual meeting, 651; vote of thanks, *ib.*; election of officers, etc., *ib.*; medical advertising, *ib.*; hospital charity abuse, and gratuitous operations, *ib.*; Dr. Inglis and the executive committee of the Worcester Infirmary, *ib.*; quick advertisements, *ib.*; thanks to the president, *ib.*; communications, etc., *ib.*; dinner, *ib.*

REPORTS TO THE SCIENTIFIC GRANTS COMMITTEE OF THE
BRITISH MEDICAL ASSOCIATION.

The Report of Dr. Rutherford and M. Vignal on Experiments on the Biliary Secretion of the Dog, and the Commencement of the Report on the Life-History of Contagium, by Dr. Braidwood and Mr. Vacher, were published in the JOURNALS for October 23rd and 30th, November 6th and 13th, and December 11th.

BRITISH MEDICAL JOURNAL:

BEING THE JOURNAL OF THE BRITISH MEDICAL ASSOCIATION.

EDITED BY ERNEST HART.

LONDON: SATURDAY, JULY 3, 1875.

THE HARVEIAN ORATION

DELIVERED BEFORE

THE ROYAL COLLEGE OF PHYSICIANS,

On Friday, June 25th, 1875.

By WILLIAM A. GUY, M.B., F.R.S.,

Fellow of the Royal College of Physicians.

PRESIDENT AND FELLOWS.—More than two centuries ago (it was some time in the month of July, 1656, nine years, therefore, before the great Plague, and ten before the great Fire of London), the old College of Physicians, at Amen Corner, was the scene of a most touching ceremony. In the library of the "noble building" which he had erected at his own cost, furnished, supplied with books, objects of curiosity, and surgical instruments, and three years previously presented to the College, William Harvey met the Fellows, his colleagues, friends, and pupils, for the last time. Bent beneath the weight of nearly fourscore years, worn by repeated attacks of a painful malady, "not only far stricken in years", but "afflicted with more and more indifferent health", conscious that his life must be drawing to a close (he died in less than a year afterwards), Harvey formally resigned the chair he had held for upwards of forty years; and, as the crowning act of many a deed of princely munificence, made over to the College his paternal estate.

Harvey's object in so doing was to incite other Fellows and members of the College to like deeds of liberality, "to search and study out the secrets of nature by way of experiment", and to cultivate mutual love and affection among themselves: his means to these ends, an oration to be delivered annually within the College.

Such, in brief, is the origin of this day's ceremony; a ceremony which, for upwards of two centuries, has been the occasion of gathering together, year by year, the *élite* of the medical profession, with many a worthy representative of every department of learning and literature, art and science.

The appointment of the Harveian orator rests, as is well known, with the President of our College. Were it not so—if I were a volunteer, self chosen for the duty I have this day to perform—I should begin my address by words of self depreciation; but these, under the circumstances, would be obviously out of place. Assuming, then, a certain undefined and wholly undefinable degree of competence, I address myself earnestly to the task of justifying the President's choice, fulfilling your reasonable expectations, and approaching, as near as my powers permit, to my own ideal of what is due to the dignity of this College and the memory of its brightest ornament and greatest benefactor.

The lapse of time and altered circumstances have, as you are aware, brought about deviations from the original design of the Harveian oration. In lieu of the Latin tongue, once the written and spoken language of the learned, we now use our own native English, which promises some day to be to the whole world what Latin was to the educated section of a small part of it; and, by a sort of general understanding and consent, we meet on this occasion to do honour to Harvey himself, as the man who, above and beyond all others, has "approved" himself "a benefactor to the College", and our greatest contributor "to the sum of medical science".

In saying this, I think that I rightly represent your feelings and expectations; but, on referring to the published orations of my predecessors, I find them grouping themselves into two equal classes, the one devoted to Harvey and his labours, the other to some topic connected with modern discovery and research.

Among those who have chosen to discourse of Harvey, some (like my immediate predecessor Dr. West) have set him before us in "his

habit as he lived"; others (among whom Dr. Rolleston deserves special mention, as having made an important discovery bearing on the question of Harvey's originality) have maintained Harvey's claim to be considered the real discoverer of the circulation; and one (I speak of my friend and former colleague Dr. Arthur Farre), handling a subject of which he is an acknowledged master, showed us how Harvey, in his *Treatise on Generation*, displayed the same ability as in that great discovery with which his name is more generally associated.

It is with this class of Harveian orators that I elect to associate myself; and the more willingly, as certain physiological questions connected with the circulation were the first of a strictly scientific character which attracted my own attention.

Harvey entered on his work of discovery with some considerable advantages. He came of a wealthy family, and had independent means of his own, so that he could command the very best education England or Italy could give, and either purchase, or secure through royal favour, whatever he needed for purposes of experiment and illustration. And thus his easy circumstances took from him all motive and temptation to a hasty or premature announcement of his views; and though, as his writings attest, he had good opportunities of experience as physician, surgeon, and accoucheur (for in Harvey's day the three faculties were united), and turned them to excellent account, he was not overwhelmed by the cares and incessant demands of practice, and was even withdrawn more than once by command of the Court from the usual duties of his profession.

Harvey, in being spared the drawbacks of poverty, must have lost with them the proverbial stimulus of necessity. But happily he found, in the stirring circumstances of his times, and the example of great thinkers and discoverers (his contemporaries or immediate predecessors), that spur to exertion to which generous minds yield so ready a response. For Harvey lived in an age of excitement, political and theological, breathing an atmosphere of civil strife, a witness of, and a sufferer by, one of the fiercest struggles between throne and people, between power and prescription, on the one side, and aggressive liberty on the other, that the world has ever seen. And this state of excitement, be it recollected, was but the carrying forward of the agitation of men's minds that had arisen out of the events of the Renaissance and the Reformation.

Harvey, as I have said, had for contemporaries many great thinkers and discoverers. He might have known both Shakespeare and Milton; for he was thirty-eight years old when Shakespeare died, and thirty when Milton was born. He was well acquainted with Lord Bacon, who died when Harvey was forty-eight years of age; Lord Napier, the inventor of Logarithms; Hobbes of Malmesbury, author of the *Leviathan*; Robert Boyle, Dryden, Cowley, and rare Ben Jonson, were among his contemporaries; the Marquis of Worcester was busy with his water-compelling engine and *Century of Inventions*; Sir Hugh Middleton was at work with the New River; John Woodall, author of *The Surgeon's Mate*, was commending lemon-juice as preventive and cure of scurvy; and Sydenham (thirty-three years of age when Harvey died) was collecting materials for his immortal works, when Harvey was demonstrating the circulation of the blood. It is worthy of note that the *Novum Organon* and Harvey's great work *De Motu Cordis et Sanguinis* appeared within a few years of each other. Need I add that Harvey, surviving the execution of his royal master and patron, died in the same year with Oliver Cromwell?

As to foreign contemporaries, Harvey was only by seven years the junior of Kepler, and by fourteen of Galileo, and the senior by several years both of Descartes and of Spinoza. So that Harvey was of an age to have shared that Italian journey of Milton's, during which, as Milton tells us in his *Areopagitica*, "he found and visited the famous Galileo, grown old, a prisoner to the Inquisition, for thinking in astronomy otherwise than the Franciscan and Dominican licensers thought". And here I am reminded of another advantage Harvey had in dealing with his great discovery. The views he might form and promulgate were not likely to clash with the preconceived notions of those who drew their science equally with their theology from the same source—from that Bible, of which the authorised version was first published when Harvey was thirty-three years of age; and which, laying hold of the

minds of men by the sustained dignity of its language, its lofty poetry, its vivid and life-like narratives, and stirring them to their very depths by awful threats and precious promises, must have greatly added to the excitement and exaltation of the popular mind.

Harvey, then, as I have just stated, took in hand the work of discovery, with some obvious advantages. And, on the other hand, he had only to contend with the obstacles which beset all such paths as he was about to tread. He would arouse that spirit of opposition and detraction which springs up quite naturally in the minds of those who, having imbibed certain views, at the cost of much study, and from the lips of men whom they hold in respect, are asked to abandon not only the views themselves, but all that, in course of time, has grown up and clustered round them. To root up these weeds and keep them under, to select and sow the better seeds, to reap and gather in the harvest, is a work demanding both industry and patience.

Such a work Harvey took in hand when he set himself to discover the circulation of the blood; and such industry and patience he continued to display to the end of his long life. For it should be well understood, and constantly borne in mind, that the discovery of the circulation was not a something that lay on the surface, and which any man of common discernment might pick up and appropriate. It was not like a new remedy which, having come into repute among the common people, waited only for some patient and intelligent collector of facts to affix to it the stamp of authority. It was not such a discovery as John Woodall made, when he inferred the efficacy of lemon-juice, as others since his day have done of oranges, or fruits, or vegetables, or even of a mixed diet, from the happy accident of two ships' crews, one smitten with scurvy, the other free from it, differing in the possession of the one article of diet, and in nothing else. Nor was it a mere simple and natural inference from occurrences numerous and uniform, as was the severity of the natural small-pox, and the mildness of the inoculated form of it, as all the world of Constantinople saw them, when Lady Montague made herself the organ and interpreter of an universal belief. It was not even so simple a matter as Jenner had to deal with when he (more observant, more logical, more persevering than his neighbours, and with the precedent of inoculation to help him), converted the neglected gossip of the dairy into a life-preserving principle; or (to give but one other example), the discovery of the circulation was not such a simple correction of ancient and authoritative error as Ambrose Paré made when, with a mind prepared by a wholesome scepticism, he found the soldiers wounded by gunshot, and treated by the orthodox method of boiling oil, suffering pain and inflammation, from which those he had been forced, by lack of material, to dress with a cold slimy mixture, were comparatively free.

Harvey's work was of a different order. It demanded observations and experiments of a novel kind, and a keen, penetrating, refined logic to bring it to perfection. As we think of what it was, we are forcibly reminded of the modern researches of Sir Charles Bell, and at the same time of that famous *Essay on Dew*, by Dr. Wells, to which logicians accord such high praise, or that other not less remarkable inquiry by which Sir George Baker, a former President of this College, compassed the discovery of the true cause of the colic of Devonshire.

To put the matter somewhat differently—between discoveries of a more simple and obvious kind, and that of Harvey, there is the same sort of difference as between the merit of discerning the use of a tool never seen before, and that of a man who, having the parts of a complex machine, such as a watch, a clock, or a steam engine placed before him, should find out their uses, discover its motive force, and (being a work of human minds) succeed in putting it together, and setting it in motion.

You will observe that I take it for granted that Harvey did really discover the circulation of the blood; that neither he himself, nor his contemporaries who, whether they opposed or supported him, at least took him at his word, were mistaken about the matter. Harvey, who had come from Padua laden with university honours, bearing with him all the learning of the ancients, and the best fruits of modern teaching; intelligent, well-informed, candid, honest: doubtless spoke the simple truth when he said to the President of the Royal College of Physicians, other learned physicians, and his esteemed colleagues, concerning the great work he dedicated to them, "*This book alone declares the blood to arise and revolve by a new route*"; and equally when, in his old age, he says with allowable self-complacency, "The admirable circulation of the blood originally discovered by me, I have lived to see admitted by almost all." Harvey, fancying himself a discoverer, and all the great anatomists and physiologists of Europe sharing his belief, would be a delusion for which, with all our experience of human credulity, we are scarcely prepared.

To understand Harvey and his work aright, to appreciate thoroughly what he did, to form a just estimate of the ability with which he exposed fallacious arguments, his acuteness of observation and corre-

sponding clearness of description, the ingenuity with which he devised experiments, and his skill in performing them, we must study not only his great work, the *Exercitatio Anatomica de Motu Cordis et Sanguinis*, but also his anatomical disquisitions addressed to Riolan of Paris, and his letters to Hofmann, Slegel, Nardi, and others. Having, as in duty bound, and in accordance with the plan I had sketched out for myself, read these productions with care and attention, I venture to submit to you a brief analytical sketch of the circulation of the blood as Harvey understood it.

I may premise that nowhere, unless I am greatly mistaken, does Harvey tell us when and where (whether while a student at the University of Padua, or while studying for his degree at Cambridge, or after settling here in London) those doubts and misgivings entered his mind, without which, in his case as in others, there could have been neither motive nor stimulus to inquiry. The first glimpse we get of him is when, seeking to discover the motions and uses of the heart by actual inspection of the living animal, and not from the writing of others, he stands perplexed and bewildered by the rapid alternation of dilatation and contraction, coming and going in the twinkling of an eye like a flash of lightning; not surprised that Andreas Laurentius found these motions as perplexing as did Aristotle the flux and reflux of Euripus (that narrow sea between Bœotia and Eubœa, which ebbed and flowed seven times a day or oftener), and almost tempted with Fracastorius to think, "that the motion of the heart was only to be comprehended by God". He is, as it were, in a labyrinth from which he can only extricate himself by using greater and daily diligence, by performing frequent vivisections of a variety of animals, and by the collation of numerous observations. Having by these means discovered "both the motion and use of the heart and arteries", he proceeds to enlighten not only his friends, but the public also, in his anatomical lectures, after the manner of the Academy of old.

But Harvey, though he does not tell us when he first began to suspect the true state of things, lets us into the secret of the process of thought by which he attained to his grand inference. He surveys his mass of evidence drawn from vivisections, and his reflections on them; on the structure of the heart and of its ventricles; on the symmetry and size of the conduits which enter into and issue from them; on the arrangement and intimate structure of the valves, with many things besides; and then, frequently and seriously revolving in his mind what might be the quantity of blood transmitted, in what time, and the like, and deeming it impossible that this quantity could be supplied by the juices of the ingested aliment, without draining the veins on the one hand, or rupturing the arteries on the other, unless the blood should somehow find its way from the arteries into the veins, and so return to the right side of the heart, "I began", he says, "to think whether there might not be a motion as it were in a circle. Now this I afterwards found to be true."

I proceed with my analysis. Harvey begins by telling us what he saw on exposing to view the heart of a living animal, especially such "colder animals" as frogs, serpents, small fishes, snails, and the like; or such warm-blooded animals as dogs and hogs, when the heart begins to flag. There is a time when the heart moves, and a time when it is motionless; and when it moves, it grows hard and tense; when it does not move, it is soft and flaccid. This difference may be both seen and felt in the heart of an eel taken out of the body; and, in all colder-blooded animals, the heart which grows pale as it moves, takes a deep red colour when it becomes quiescent; pale in the one case, because this motion is a muscular contraction which squeezes out the blood; red in the other, because the muscular walls relax, and the blood flows into the cavity. That this is so, is plain from the fact that, if the ventricle be pierced, the blood spurts out each time the heart moves, and grows tense; and, when the heart as a whole has ceased to beat; but the auricles still contract, if the finger be placed on the ventricles, each contraction is felt as a pulse, and, if the point of the heart be cut off with a pair of scissors, blood flows with each beat.

Putting together all his many observations and experiments on this division of his subject, Harvey concluded that the heart moves in two times and four places; that the auricles first contract together, then the ventricles; and that (speaking of the ventricles alone as the heart) these things happen in our bodies at the same instant: the tension of the heart, the pulse at its apex, felt striking against its ribs; the thickening of its walls; and the forcible expulsion of the blood it contains by the contraction of the ventricles.

Harvey has completely mastered the heart's motions. He knows all about them as well as we do now; and, in discovering the truth, sweeps away these errors: that the heart dilating, draws blood into its ventricles; that when it strikes the breast, its ventricles are distended with blood; that its fibres contract (as Vesalius thought they did) like a bundle of twigs bulging in the centre, whereas the fibres

acting together, constrict the heart and make it tense; and that (as Bauhin and Riolan asserted) it has four motions distinct in time and place: two proper to the auricles, two to the ventricles.

I must not stop to notice the multitude of curious facts by which Harvey illustrates this division of his subject; nor what use he makes of the magnifying glass to watch the heart's beat in such creatures as slugs and snails, crabs, wasps, and flies, and that convenient transparent shrimp taken in the Thames and in the sea, in which the heart is seen as through a window; nor, again, those observations, so minute and exact, relating to the first appearance in the embryo of the "pulsating drop of blood", and gradual development of the heart.

From the motions of the heart, Harvey leads us on to those of the arteries, as seen in living animals. He tells us that, at the moment the heart contracts and strikes the breast (the heart's systole), the arteries are dilated and yield a pulse (their diastole); and that this happens with the right ventricle and pulmonary artery equally with the left ventricle and aorta; also that the contraction of the left ventricle and the pulse in the arteries are cause and effect. If the one cease, the other stops; as the one is strong or weak, so is the other. The pulse is small and weak in aneurism, of which Harvey gives a case; for then the blood is diverted into the tumour, and so intercepted. Again, when the artery is punctured or divided, the blood is seen to spout forth with violence the instant the ventricle contracts. This is true of all arteries: of the pulmonary artery; of the vessel which leads from the heart of a fish to its gills.

Here again Harvey finds an error to correct. It was the commonly received opinion, that the arteries are filled by expanding like bellows. He illustrates the true state of the case by the analogy of blowing into a glove. At the same time, he takes occasion to give Aristotle his due, who says that "the blood of all animals palpitates within their veins (meaning the arteries), and by the pulse is sent everywhere simultaneously"; that these vessels "all depend upon the heart", and move with it.

Passing now from the motions of the heart to the large vessels that enter and leave it, Harvey takes in hand the circulation through the lungs, and finds himself freed from the doubts and difficulties which perplexed other men, by enlisting on his side that comparative anatomy and those vivisections which they had neglected; for he tells them that they do amiss when they (as most anatomists do) limit their researches to the human body, and that when it is dead.

First, then, he tells us that in fishes, which have no lungs to embarrass the inquiry, but a sac like an auricle, a single ventricle, and a vessel analogous to an artery, the blood may be seen to be driven into the vessel at each beat of the heart, and, if the vessel be divided, to issue in jets. Again, in toads, frogs, serpents, and lizards, which have lungs in a certain sense, and a voice, the blood is transferred, as in the higher animals, from veins to arteries by the action of the heart; their case being, to all intents and purposes, that of a man in whom the septum of the heart should be perforated or removed, or one ventricle made out of two: a state of things which really does exist in the embryos of those animals that have lungs, as Harvey proceeds to prove in the course of a luminous description of the fetal heart and large vessels, both in man and in animals.

And here, again, Harvey has to correct the errors of others—of those who alleged that the large fetal vessels which are closed after birth, when the lungs take on their proper function, exist only for the nutrition of the lungs; and of others who asserted that the heart of the embryo does not pulsate. This last assertion is plainly false; for he, and Aristotle before him, saw the reverse in the incubated egg, and in embryos just removed from the womb.

In most animals, then, and in all up to the period of their birth, the blood passes from veins to arteries by the action of the heart, and it is obvious that, in creatures which have no lungs, one ventricle (the left) would suffice to distribute the blood over the body; but (and here Harvey, as is his wont, personifies Nature), when she ordained that the same blood should percolate the lungs, she saw herself compelled to add another ventricle (the right), which should force the blood from the vena cava through the lungs into the left ventricle. The right ventricle, therefore, may be said to be made for the sake of the lungs, and for the transmission of the blood through them, not for their nutrition; for it were unreasonable to suppose that the lungs require more blood for this purpose, and that blood more pure and spirituous (as coming direct from the heart), than the brain, or the eye, or the heart itself.

Some there were in Harvey's days who denied that the whole mass of the blood could pass through the substance of the lungs; and to these he opposes admitted facts relating to the skin, kidneys, and liver, especially the kidneys and liver, which have so dense a texture when compared with the light spongy lungs. Drink swallowed by the gallow

will pass off from the body in an hour or two, and yet it must first traverse the liver and the kidneys to reach the bladder. The liver is a special case in point, for there is no propelling power; while in the lungs there is the force of the right ventricle and the movements of respiration to help the onward course of the blood. Columbus, then, was right when he inferred from the size and structure of the pulmonary vessels, and their constant state of repletion, that there was a passage for the blood through the lungs; and Galen might be quoted to the same purport, and especially as insisting on the function of the valves of the heart and great arteries, permitting an onward course of the blood, but preventing all regurgitation.

Having satisfied himself respecting the lesser circulation through the lungs, and taken note also of that other circuit by which the heart itself is nourished, Harvey proceeds to the greater circulation throughout the body, and has something so novel and unheard-of to say about the quantity and source of the blood which passes from the veins into the arteries, that he fears to give it expression, lest he should stir up the envy of a few, and excite the enmity of mankind at large, in whom custom has become a second nature, doctrines once sown have struck deep root, and antiquity inspired respect. Still the die is cast; and Harvey, placing his trust in his own love of truth and the candour inherent in cultivated minds, proceeds to pass in review his stores of knowledge in terms I have already quoted; and, laying special stress on his subtle and profound argument, based on the obvious impossibility of the circulating system—heart, veins, and arteries—holding together, unless there were "A MOTION AS IT WERE IN A CIRCLE", indulges in a lofty flight of poetic expressions. He compares the blood forced by the left ventricle into the arteries, and so distributed to every part of the body, then finding its way through the veins and vena cava round to the right ventricle, which, in its turn, sends it through the pulmonary artery to the lungs, to return by the pulmonary veins to the left side of the heart, to what Aristotle says of the air and rain emulating the circular motion of the superior bodies. As the vapours drawn upwards from the moist earth warmed by the sun, descend as rain to moisten the earth again, so it is with the blood. Cooled, coagulated, and rendered effete by contact with the various parts of the body, it is brought back again to its sovereign, the heart, as to its source or inmost home, there to recover its excellent and perfect state, to resume its due fluidity and natural heat (powerful, fervid, a kind of treasury of life), to be impregnated with spirits, as it were with balsam, and so sent back on the old errand of nourishing, cherishing, and quickening every part of the frame. The heart consequently is the beginning of life, the sun of the microcosm, even as the sun might be called the heart of the world; for by the virtue and pulse of the heart the blood is moved, perfected, made apt to nourish, and preserved from corruption and coagulation. It is the household divinity which nourishes, cherishes, quickens the whole body—the foundation of life, the source of all action.

I stop for a moment to remark that, at the time Harvey wrote, nearly a century and a half was yet to elapse ere the chemical discoveries of Priestley superseded poetry by fact, and transferred to the laboratory of the lungs those life-giving changes which Harvey and his contemporaries thought they saw carried on in the workshop of the heart.

The consideration that inspired this poetic outburst of Harvey's was this: that the quantity of blood circling through the body in some given short space of time is far too large to be supplied by the ingesta, or used up in the process of nutrition. Harvey had gauged the left ventricle of the heart, and found it to hold upwards of two ounces of blood; and, reducing his estimate of the quantity sent out at each contraction, and prevented from returning by the action of the valves, to the absurdly low figure of one drachm (and all the world, he says, allows that with every systole something is projected), he calculates thus: In half an hour, the heart beats more than two thousand times, and so sends forth in that short space of time more blood than the whole body contains. Say that, in the sheep or dog, a single scruple of blood passes with each stroke of the heart; then, in one half-hour about three-and-a-half pounds of blood would be injected into the aorta. This approaches the whole quantity which their bodies contain, for Harvey ascertained that in the sheep this does not amount to more than four pounds.

But, if any one should object that the nutritive fluid derived from the food might quickly pass through the body in the guise of some abundant secretion, such as the milk, Harvey meets the objection by first naming the quantity of milk which an animal will yield in twenty-four hours, and then affirming that the heart by computation sends forth as much or more blood in an hour or two.

Passing over certain details relating to the quantity of blood in the body, and also to the causes which determine the frequency of the

pulse, we come upon certain corroborative facts drawn from the phenomena of hæmorrhage. Divide but a small artery, and the whole blood of the body will drain away in some half-hour or less; and the same thing occurs very rapidly in amputations and the removal of tumours. When a butcher, again, cuts the throat of an ox, the whole mass of blood will escape in less than a quarter of an hour; and when an artery only is divided, the same thing happens, the blood spurting forth abundantly, impetuously, as if propelled by a syringe. But, if the butcher did not cut the ox's throat, after he had stunned it, till the heart had ceased to beat, he could not bleed the carcass effectually.

That the arteries receive blood from the veins no otherwise than by transmission through the heart, is proved by the simple experiment of tying the aorta at the base of the heart, when, if the carotid, or any other artery, be opened, it will be found empty, while the veins are full. And now we see why, after death, the veins contain so much, and the arteries so little, blood; the right ventricle so much, the left so little; facts which probably led the ancients to believe that the arteries (as their name implies) contained, during life, nothing but spirits. Harvey surmises that this is due to the fact, that the action of the heart outlives the movements of respiration, so that blood is sent to the body, while none is received from the lungs. At this point Harvey makes a direct appeal to the evidence of the senses. He says: "If a live snake be laid open, the heart will be seen beating quietly and distinctly for more than an hour, propelling its contents, becoming pale during systole, of a deeper tint during diastole. Now seize the vein with a forceps, or pinch it between finger and thumb, and the part between the point of pressure and the heart immediately becomes empty, while the heart itself grows paler and smaller, beats more slowly, and at length seems about to die; but remove the impediment, and the heart resumes both colour and size. Now compress or tie the artery instead of the vein, and the part between the obstacle and the heart, and the heart itself, become inordinately distended, take on a deep purple colour, and at length are oppressed, and even choked, with blood; but remove the obstacle, and all things at once resume their pristine state—the heart regains its colour, size, and stroke." All this "may be observed more clearly than the noon-day sun"; and we have before us illustrations of "two kinds of death—extinction from deficiency, and suffocation from excess". The last of these forms of death Harvey recognised several times within two hours of death, and before the colour had left the face, in the bodies of men who had been hanged; and he had shown to many witnesses the right auricle and lungs distended with blood, and the auricle in particular as large as a man's fist, and so full that it looked as if it would burst.

Referring to this vivisection of a snake in his second dissertation addressed to Kiolan, Harvey describes the vivisection of a fallow deer, at which many of the nobility, and his most serene Majesty the King, his master, were present. The internal jugular vein was exposed and divided, when only a few drops of blood were observed to escape from the lower orifice, while "a round torrent of blood" gushed forth from the upper orifice, coming down from the head.

And here, as lending an incidental interest to the life of Harvey, I may remind you of the many occasions on which our great anatomist and physiologist bears testimony to the personal interest the King, Queen, and Court took in his inquiries. Harvey, as is well known, was allowed to make what use he pleased of the royal herds of deer in his studies both of the circulation and generation; and he tells us how he often showed the King the uterus of the doe in the early stages of conception, and the *punctum saliens* beating "beautifully distinct" in the sun's light; and once also to the King and Queen what he describes as "a most agreeable natural spectacle" derived from the same source. When he comes across a most curious specimen of a perfect egg within a perfect egg, he forthwith makes the King partaker of his delight. And when people tell his serene Majesty King Charles of a certain young nobleman who, in consequence of a fracture of the ribs of the left side, had come to have a large opening there, and a sort of sac, within which, as had been supposed, the lung protruded, Harvey is sent on an errand of inspection: and having discovered that it was not the lung but the heart that had been thus strangely exposed to sight and touch, Harvey, instead of taking to the King a verbal answer, takes the young man himself, "that his Majesty might with his own eyes behold this wonderful case"—this "man alive and well", in whom he might, "without detriment to the individual, observe the movement of the heart, and with his proper hand even touch the ventricles as they contracted". Having done so, "his most Excellent Majesty, as well as myself, acknowledged that the heart was without the sense of touch, for the youth never knew when we touched his heart, except by the sight, or the sensation he had through the external integument". Thus did royalty in the least fortunate of its representatives, and science in one of the worthiest of her sons, mutually do honour to each other,

leaving behind them an example which, let us hope, will never fail to influence our kings and philosophers in days to come. Whatever the faults of Charles the First, neglect of science is certainly not to be numbered among them.

The circulation of the blood in parts remote from the heart Harvey demonstrates by the twofold process of describing the exact forms and positions of the valves of the veins, and making a series of simple experiments on the veins of the forearm, swollen by the ligature of the upper arm applied as in bleeding.

As to the valves of the veins, neither Silvius, their discoverer, nor succeeding anatomists, rightly understood their use. But Harvey, by careful dissection, and passing a probe either way, arrives at the conclusion that "the valves are solely made and instituted lest the blood should pass from the greater into the lesser veins", thus favouring its motion from the lesser to the larger branches, and furnishing a conclusive argument for a circulation.

By applying a bandage above the elbow, as in bleeding from the arm, Harvey shows the site of the valves, and by the pressure of the finger, and "streaking" the blood in one direction and the other, demonstrates their action, and the movement of the blood from smaller veins to larger, always in the direction that leads to the heart. And here, reverting to his favourite argument, based on figures, Harvey bids us select some length of vein, assume it to be able to hold some given quantity of blood, empty it by "streaking"; suppose this process repeated for, say, a thousand times, and then judge for ourselves what quantity of blood must be always passing towards the heart, and what sure evidence its passage affords of a circulation.

We who come to the study of the circulation with minds prepared to accept the evidence of facts and the force of arguments, can scarcely appreciate the difficulty Harvey had in convincing some of his contemporaries, whose minds were preoccupied by certain prevailing errors. I will mention four of them.

The first consisted in imagining a passage for the blood from the right to the left ventricle of the heart through the septum; the second in assuming an equally unreal anastomosis somewhere between the large arteries and veins; the third, that the arteries dilate after the manner of bellows, and so occasion the pulse; and the fourth, that the arteries do not contain and carry blood, but air.

Harvey meets the first of these errors by denying the state of things which they allege, as well as by statements which prove the extent and precision of his anatomical knowledge. As to communications between the two sides of the heart, he does not see them; and as to these anastomoses, he searches for them in vain in all the principal viscera, even when he resorts to the artifice of rendering them so friable by boiling, that he could shake their tissue-like dust from even the capillary filaments.

The third fallacy, which attributed the pulse to "a power communicated from the heart through the coats of the arteries, and not to the shock of the blood contained within them", thus making "the coats of the vessel the cause of the pulse", rested on the experiment of tying the artery upon a tube inserted within it—an experiment which Vesalius and Galen prescribed, but Harvey really performed. They assumed that the part beyond the tube would not pulsate, but he finds that it does; and, by way of confirmation, adduces the case of a nobleman, his "very particular friend", whose "most attentive physician" he was. From the body of this nobleman Harvey removed part of the descending aorta, about a span long, with the two crural trunks. They had been converted into bone, and yet he had often noted the pulse in the legs and feet of this patient while he lived. Here was an experiment of Nature's own making; the bony artery was the exact counterpart of the rigid tube, and yet the facts of the case distinctly contradicted the hypothesis of which Harvey was exposing the unsoundness.

The fourth error Harvey had to combat, instead of being an unfounded assertion, was an inference based upon a fact. I will show you how Harvey refutes this fallacy, and so give you a good illustration of his method of procedure, and bring this, my analysis, to a close.

When Harvey's predecessors opened a dead body, they found the arteries nearly or quite empty, and the veins full; and accordingly they inferred, with Erasistratus, that the arteries contained only "aerial spirits". Harvey begins his work of correction by observing that this empty state of the arterial system occurs only in that kind of death which begins in the lungs, not when the heart ceases to beat and the lungs to act at the same moment of time, as happens in more than one form of sudden death. An universal truth had therefore been assumed from a common, but still only an occasional, occurrence. And these "aerial spirits", with which the imagination had peopled the arterial system, what were they? What their consistency? Are they separate and distinct from the blood and the solids, or mingled with them? Harvey had never been able to find any of them—neither *natural*

spirits in the veins, nor *vital spirits* in the arteries, nor *animal spirits* in the brain or nerves. The ancients, need I say? never found an empty space in brain, heart, or arteries, but, convinced of nature's horror of a vacuum, they filled it with spirits. Indeed, they fancied as many spirits as there are faculties or organs. But Harvey saw in these creations of the fancy "the common subterfuge of ignorance", alleging that "persons of limited information" used them, as indifferent poets do the gods, whenever they have a plot to unravel or a catastrophe to bring about; or as the vulgar and unlettered refer the causes of events they do not understand to the immediate interposition of the Deity. If these spirits of which people speak so confidently are of the nature of the air that issues from the breathing organs of animals, then, if an artery or vein from which blood is flowing be plunged under water or oil, the spirits will show themselves by "a succession of visible bubbles". But this does not happen with the blood, though it does with all drowning creatures without exception.

I have entered thus far into detail, at the risk of being deemed tedious, that I may create in your minds the impression which the study of Harvey's works has left upon my own, that the discovery of the circulation was a discovery in the best and fullest sense of the word. It was no mere hypothesis, suggested by analogy, and supported by a fact or two, destined some day to be cited by some learned man as an anticipation of a discovery rightly so called, but a demonstration complete and perfect up to the extreme limits of our then existing knowledge—a demonstration the more remarkable for as much as the composition of the "fuliginous vapour" discharged from the lungs was then unknown, and the chemical necessity of a pulmonary circulation unexplained; and the magnifying-glass through which Harvey had seen the movements of the heart in the transparent shrimp taken from the Thames had yet to be developed into the powerful compound microscope through which we now see the unbroken capillary circulation in the frog's foot.

The circulation of the blood, then, was not a discovery merely, but a demonstration; and this demonstration was in part a refutation of ancient and prevalent errors, but also a revelation of new truths wrought out by as felicitous a combination of original talent, acquired learning, and unwearied industry as ever met in one man.

Fresh as I am from the study of Harvey's works, I confess myself at a loss which most to admire: his rare endowments, or the use he had made of them. If his natural gifts were great, they were not greater than the resources his industry created. The objects of his study at one time shine in the clear pure light of an unclouded intellect, at another they glow with all the rich tints of a poetic fancy. He is as ingenious in devising experiments, as skilful in performing them. He displays all the logical acumen of an Aristotle, all the industry of a Hunter. He brings to bear on his subject a large and exact knowledge of anatomy, human and comparative, healthy and morbid, and of intra-uterine life, and he makes, for the time in which he lived, an unwonted use of vivisection. And here I may remark that no thought of cruelty, no misgiving as to the lawfulness of the proceeding, ever seems to have crossed his mind.

But what has impressed me most strongly in studying Harvey's works, is the fine logical faculty which, so to speak, pervades and permeates the whole mass, and struggling for distinct and independent expression, breaks forth into clear enunciations of the principles of that philosophy which the great Italian genius Leonardo da Vinci first announced, and Harvey's contemporary Lord Bacon recommended to the world with all the force and eloquence of a practised advocate. Harvey, indeed, seems to have carried on together the demonstration of a great truth, and the vindication of the methods by which all truths must be explored and established. So that we have only to search out, extract, and arrange these abstract utterances of his, in order to construct a complete system of scientific logic; just as we might, if we pleased, bring forth from one part or other of his masterpieces perfect illustrations of all the logical methods which John Stuart Mill arranges in order in his great work on logic.

That Harvey did really claim to be not a discoverer only, but also a teacher of new logic, may be inferred from the very title of the second section of the introduction to his work on Animal Generation:—"Of the Manner and Order of acquiring Knowledge." Indeed he tells us in express terms that, in treating on animal generation, he is anxious not merely to set forth "the sure and obvious truth", but also to exhibit "the method of investigation" which he followed, in order to "propose to the studious" "a new" and "safer way to the attainment of knowledge". And here let it be well understood, that Harvey seeks rather to revive than to overturn the method of the ancients, whose "unwearied labour and variety of experiments, and especially the industry of ancient Greece", he warmly commends. Nor does he ignore or despise the logical teachings of Aristotle; for after giving us his own

views respecting "the manner and order of acquiring knowledge" in one chapter, he presents us in another with a dissertation on "the same matters, according to Aristotle", whom "foremost of all among the ancients" he follows as his leader.

Harvey, preeminently a practical man; the accurate observer; ingenious in devising, skilful in performing experiments, the practised logician and acute critic of the views of others about matters which he himself studies and understands, can appreciate the great Greek philosopher whom Bacon, the man of the closet and study, industriously depreciates. This being so, what, you may ask, is it that Harvey complains of in the scientific habits and methods of his contemporaries? what does he find to reform and amend? Aristotle was in the right. Harvey in the main approves his method and his logic. How, then, have Harvey's contemporaries exposed themselves to rebuke and correction? Simply by lacking the industry for which he gives the ancients credit. For Harvey tells us that it was "the custom, or vice rather, of the age" he lived in, that men preferred going idly "wrong with the many" to become industriously "wise with the few". Hence a method of investigating truth "erroneous and almost foolish", content with asking what others had said, instead of inquiring whether things were so or not; substituting verisimilitudes, and "knotty, and captious, and petty disputations", for truths; passing off other men's discoveries as their own; their ideas, "false fancies and empty visions", their knowledge but "a waking dream, or such a delirium as the sick fancy engenders". From this sickly state, this idleness and indolence, this lazy satisfaction with existing knowledge, this quenching of the spirit of scientific adventure, Harvey would rouse his contemporaries to exertion. He tells them how they may arrive at the "citadel of truth" by following the traces of nature, with open eyes, "through devious but most assured ways", rising from inferior to superior levels, till at length they penetrate into "the heart of her mystery". In this pursuit of truth "it is sweet", he says, "not merely to toil, but even to grow weary", for "the pains of discovering are amply compensated by the pleasures of discovery".

Harvey, then, would fain convert men from idleness to industry. But how is this industry to display itself? Not in inventing words, but in observing things. For as there is nothing in the understanding which was not first in the sense (the well known *dictum* of Aristotle), or, as Harvey puts it, "no certain and definite idea which has not derived its origin from the senses", it is to the senses we must have recourse; first inquiring whether a "thing be or not, before asking wherefore it is", bringing all assertions "to the proof of sense" and admitting or rejecting them according to its decisions. This is the tribunal to which Harvey refers all that he has said respecting the circulation—to the "senses" not to the "reason", to "ocular inspection", not to any "process of the mind"; for "the facts cognisable by the senses wait upon no opinions", "the works of nature bow to no antiquity, for, indeed, there is nothing either more ancient or of higher authority than nature"—nature, as Harvey is never tired of calling her, nature "ever perfect and divine", ever in harmony with herself, never doing anything amiss or in vain, ever acting with admirable skill and foresight.

And here I am again reminded of Harvey's habit of personification—"a habit born and bred of that fine frenzy" which the discoverer shares with the poet, inspiring him with thoughts of the possible, and so setting him on the track of the actual. For the philosopher, with his "scientific insight", is as truly a poet as if he wrote verses—a poet and something more. Hence we hear without surprise that Harvey, the discoverer, who is found studying mathematics, and working geometric problems within a short period of his death, finds in the pages of Virgil a perpetual spring of rapturous delight. And as the sailor personifies his ship and the engineer his locomotive, and all men everywhere the sun, moon, and stars, so Harvey puts not life only, but thought, will, power into the heart and blood. Of this his tendency to personification I have already given one example from his treatise on the circulation. I will add two others from his work on generation. Speaking of the heart, about which he has thought so often and so much, he says: "The vesicle and pulsating point construct the rest of the body as their future dwelling place; "developed into" the heart, it enters and conceals itself within its habitation, which it vivifies and governs, and applying the ribs and sternum as a defence, it walls itself about. And there it abides, the household divinity, first seat of the soul, prime receptacle of the innate heat, perennial centre of animal action; source and origin of all the faculties, only solace in adversity!" Of the blood, which Harvey saw coming into existence in the embryo before the heart itself, he says, there is "a spirit or certain force" inherent in it, superior to "the power of the elements, very conspicuously displayed in the nutrition and preservation of the several parts of the animal body; and the nature, yea, the soul in this spirit and blood, is identical

with the essence of the stars". The blood is "spirit", a something "celestial", "analogous to heaven, vicarious of heaven"!

Here, and not here only, but sometimes when treating of the circulation, often when discoursing on generation, we lose sight of Harvey the discoverer, with his foot firmly planted on the earth, to see in his place Harvey the mystic, floating indistinctly in the clouds, in company with Democritus, Leucippus, and their atoms; Eudoxus and his pupil Epicurus, with their theory of pleasure as the chief good, Empedocles and Hippocrates misleading Aristotle by their doctrine of the four elements; Pythagoras and Plato, interpreters of the fantastic notions of the ancient Thebans. But Harvey is not at home in cloud-land. His fine faculties fail him there. He is not only obscure but inconsistent, reproving in others what he allows in himself; over and over again speaking of occult forces as being of the essence of the stars, and yet objecting to other men that "they bring gods upon the scene", that they "encumber philosophy with fanciful conceits", and derive from the stars what is produced at home. Sometimes too, but, it must be confessed not often, Harvey seems to promote to the place of a personal God, whose existence and attributes as creator and preserver he humbly recognises, some mysterious impersonal force. Harvey has also been accused of credulity in accepting the evidence of an eye witness (an intimate friend) respecting the existence in Borneo of a race of human beings with tails; and in attributing the dispersion of certain tumours to the application of a dead man's hand. Our authority for this last statement is Robert Boyle, who says that Harvey told him he had sometimes tried this strange remedy "fruitlessly, but often good success". It is to Boyle, too, that we are indebted for the information, derived, as he tells us, from Harvey himself, that his dissection of the valves of the veins led him to the discovery of the circulation. For my part, I think the account I have extracted from Harvey's works the more feasible.

Need I tell you that Harvey does not stand alone among great discoverers in thus displaying an easy belief in matters that lie beyond the sphere of their own special inquiries; or that in this case, as in theirs, to take no note of such matters would be to substitute an impossible hero for a truly great man. The portrait of the discoverer of the circulation will not be the worse for a few shadows. They will but make it the more real.

What now remains to be said of Harvey must be said in as few words as possible. Let us first weigh his great discovery in his own scales. This is what Harvey himself says of it: "Reflecting on every part of medicine, physiology, pathology, semeiotics, therapeutics, when I see how many questions can be answered, how many doubts resolved, how much obscurity illustrated, by the truth we have declared, the light we have made to shine, I see a field of such vast extent in which I might proceed so far, and expatiate so widely, that this my tractate would not only swell into a volume, but my whole life, perchance, would not suffice for its completion"; and again, after noting some of the leading changes in the circulation brought about by causes bodily and mental, he says:—"Such a flood of light and truth breaks in upon me here; occasion offers of explaining so many problems, of resolving so many doubts, of discovering the causes of so many slighter and more serious diseases, and for suggesting remedies for their cure, that the subject seems almost to demand a separate treatise." These were no idle words; for in his work on generation, where we should scarcely expect to meet with such statements, Harvey says, "I have occasionally, and against all expectation, completely cured enormous sarcoceles, by the simple means of dividing or tying the little artery that supplied them, and so preventing all access of nourishment . . . to the part affected; by which it came to pass that the tumour on the verge of mortification was afterwards easily extirpated with the knife or the searing-iron." And then Harvey gives us a case of a fatty tumour of the serotum, larger than a man's head, and hanging as low as the knees, which he succeeded in removing without sacrificing the important organs involved in it. This case was but one of many "accomplished in opposition to vulgar opinion, and by unusual procedures";—a statement fully borne out by a perusal of Harvey's works. But even had it not been so, I should have given Harvey credit for being as good a judge of the originality of his methods of treatment as of the justice of his claim to have discovered the circulation. Certain it is that Harvey himself looked upon that discovery as on a very fruitful field, and that his own experience justified him in so doing. And we may take it that he either had written, or was preparing to write, several works on physiology, pathology, and therapeutics, of which the titles only are to be found scattered through his works; but which, had they seen the light, would have proved him to be no idle boaster. His treatise on the circulation would have been enlarged and supplemented by a *Physiology and particular treatise on the Blood*, by *Disquisitions on the Respiration of Animals*, by an essay on *The Causes, Uses, and Organs of Respiration*,

and by a work on *Physiology*; and we should have had the results of his experience as a practitioner set forth in his *Medical Observations*, his *Medical Observations and Pathology*, and his *Medical Anatomy, or Anatomy in its application to Medicine*. Add to this evidence, if not of views committed to writing, at least of ample material collected, the preparations and writings which a puritan mob destroyed, and the books, objects of curiosity, and surgical instruments which the great fire of London consumed, to the irreparable injury of this College, and we have before us proofs of an unwearied industry guided by rare intelligence and practical tact, which it is no injustice to the greatest men who have preceded and followed him to characterise as unrivalled.

If we would judge of the spirit and temper in which Harvey worked, we must listen to the language of his old age, as he takes a mournful retrospect of his first great trouble and heavy loss. "Let gentle minds forgive me, if, recalling the irreparable injuries I have suffered, I here give vent to a sigh. This is the cause of my sorrow:—whilst in attendance on his majesty the King during our late troubles and more than civil wars, not only with the permission but by command of the Parliament, certain rapacious bands stripped not only my house of all its furniture, but what is subject of far greater regret with me, my enemies abstracted from my museum the fruits of many years of toil. Whence it has come to pass that many observations, particularly on the generation of insects, have perished, with detriment, I venture to say, to the republic of letters." This language, so self-restrained, so gently sorrowful, reminds one irresistibly of the plaint of Priestley, who suffered a like injury at the hands of a mob, and of the touching apostrophe of Newton to the little pet that had set his papers on fire. Such has ever been the spirit of those who have done and suffered most in the service of mankind; and I may add that I have been irresistibly struck with the curious coincidence between the words of Harvey and Priestley, and in the expressions used by Harvey when he reluctantly gave over his manuscript on Generation to Sir George Ent, and by Jenner when he resisted the first efforts made to transfer him from the modest retirement of Berkeley to the busy turmoil of London life. Nor is the coincidence less complete between the will of Harvey and that of Howard, in which, after making their humble profession of faith, they prove to their friends and poor dependents that not one of them had been forgotten. But I must hasten to a close, leaving unsaid many things which I had noted as worthy of record.

I began this lecture by presenting to you Harvey, the aged philosopher, endowing the College with his paternal estate, and providing for the annual delivery of the oration that bears his name. It is Harvey, the old man, whose words I shall finish by quoting, and it is Sir George Ent, on the errand that secured for us Harvey's Work on Generation, who speaks:—"I found him," he says, "Democritus like, busy with the study of natural things, his countenance cheerful, his mind serene, embracing all within its sphere." In answer to his salutation, Harvey, referring to the miserable distractions of the time, says:—"Did I not find solace in my studies, and a balm for my spirit in the memory of my observations of former years, I should feel little desire for longer life. But so it has been, that this life of obscurity, this vacation from public business, which causes tedium and disgust to so many, has proved a sovereign remedy to me." Again, in one of his letters to Nardi of Florence, in which he treats of some obscure matters connected with generation, he says: "I myself, though verging on my eightieth year, and sorely failing in bodily strength, nevertheless, feel my mind still vigorous, so that I continue to give myself up with the greatest pleasure to studies of this kind."

To incite the fellows and members of this College "to search and study out the secrets of nature by way of experiment" was, you may remember, a duty imposed on the Harveian orator. What better course, I ask myself and you, is open to him to promote this object, than to present Harvey, the discoverer, in his old age, still finding "the greatest pleasure" in his studies, and a solace and balm to his spirit in the memory of his observations of former years; realising to the full the truth of his own words, that the "pains of discovering are amply compensated by the pleasure of discovery".

There sits the aged philosopher, the toil and weariness of the past transformed into tranquil satisfaction, as his mind's eye rests on some spot once dark and barren, now bright and fruitful, bathed in the "flood of light and truth," which he has shed upon it; or peering into the unrevealed future, "dark with excess of light", feeling even then what we know now, that in the sense in which "a thing of beauty is a joy for ever", a truth discovered and established is an everlasting gain, conferring on generations yet to come, in the life that now is, priceless benefits, some by direct application, some through indirect and unexpected developments.

Even in the obscure future, Harvey might have discerned thus much, that through the long stride he had taken among the many steps that

lead from ignorance to perfect knowledge, minds that might have continued to be busied and puzzled with the unsettled problem of the circulation, would be set free to engage in other and more profitable inquiries; that no one could henceforth devote himself to the study of any matter relating to the physiology of the human frame, but must own himself in some degree his debtor; that every physician every time he felt a pulse, would have a more intelligent appreciation of its indications, every surgeon who should staunch a hæmorrhage, or tie an artery, or perform an operation, would do it with a firmer hand, in consequence of his discovery of the circulation.

And these annual orations!—may we not venture to hope that in as far as, year by year, they faithfully pourtray Harvey, in his studious youth, busy manhood, and serene old age, they promote the objects he had in view, supplying with motive, example and encouragement, all who are now striving to render the life that now is longer, healthier, pleasanter, happier, by manifold methods of cure, palliation and prevention; in full assurance that true knowledge is real power; and that, if we make the discovery of truth our motive, and use intelligent industry as our means, we shall not miss some portion of that rich reward which fell in unwonted measure to the lot of him whose “immortal memory” we honour this day, for this among other reasons, that he conferred upon us, in the full practical sense of the words, the *Discovery of the Circulation of the Blood*.

POSTSCRIPT.—It will be seen that, throughout my Harveian Oration, as now published, I have abstained from the use of notes; for I was anxious to present to the reader a continuous unbroken text. But it is the more necessary that I should acknowledge the obligations I have incurred to the elegant and scholarly translation of the works of Harvey made for the Sydenham Society by Dr. Robert Willis. It is his English version that I quote throughout.

For facts and dates relating to the life of Harvey, I am indebted partly to the same source, and partly to the *Roll of the Royal College of Physicians*, compiled by our learned librarian Dr. Munk.

What I have said on the subject of Harvey's belief in the efficacy of the hand of a corpse, and on the origin of the inquiries which led to his discovery of the circulation of the blood, will be found borne out by reference to *The Works of the Honourable Robert Boyle*, published in six volumes quarto in 1772. The passages to which I have referred occur in vol. ii, p. 167 and vol. v, p. 427.

This handsome and complete edition of the Works of the Christian Philosopher will be found in the Library of the College.

CASE OF STERILITY FROM ANTEFLEXION OF THE UTERUS, AND CONSTRICTION OF THE INTERNAL OS UTERI, CURED.

By HEYWOOD SMITH, M.A., M.D.,

Physician to the Hospital for Women and the British Lying-in Hospital.

OF all the causes of sterility depending on malposition of the uterus, that of anteflexion is the most frequent. Other malpositions of the uterus, except marked retroversion, leave the cervix uteri depending into the posterior original *cul-de-sac* in the dorsal decubitus; but in acute (I here use the word acute with regard to the angle, not time) anteflexion, the os uteri is lifted out of the posterior *cul-de-sac*, and placed in a position unfavourable for the imbibition of the semen. Anteflexion, dysmenorrhœa, and sterility, are three conditions so frequently associated, that, when a patient comes complaining of dysmenorrhœa, and is also barren, a vaginal examination more often reveals anteflexion than any other condition. And here it may be noticed that it is the dysmenorrhœa that causes the patient to seek for advice. Among the applicants for relief at hospitals, pain is that for which medical advice is generally sought, seldom barrenness. The latter is either considered a blessing, or women give themselves up to their fate, never for a moment supposing that such a condition is remediable; whereas among the upper classes, when property or name are at stake, medical men are more frequently consulted for relief from barrenness; and in such cases, pain not necessarily being an element of complaint, the sterility may be found to depend on many causes other than flexion. It is therefore, perhaps, more among the poorer classes that favourable results, as far as sterility is concerned, may be looked for from operation and treatment for the cure of anteflexion, and for the relief of obstructive dysmenorrhœa.

E. S., aged 29, married six years, became an out-patient at the Hospital for Women, February 20th, 1871. The catamenia commenced at the age of 18; they were regular, with some pain generally before the flow. The passage of a thick sound before the period lessened the

pain. She was admitted into the hospital on July 3rd, 1871. The uterus was normal in size; a thick sound could be passed after some gradual pressure, and the constriction held the sound rather firmly. On July 13th, Dr. Protheroe Smith's uterine dilator was used to half an inch. On the 17th, the dilator was used to three-fourths of an inch, and the constriction at the internal os divided bilaterally with a straight knife, as well as the external os slightly, and a spring metallic (Greenhalgh's) stem introduced. On the 19th, the stem was extended half its length, with some forcing pains, and was replaced. On the 23rd, the patient was free from pain. A slight blood-stained discharge continued. On the 26th, the stem was removed; and on July 31st, the patient was discharged.

In April of the following year (1872), she was seen again. The external os was divided a little more freely, and the spring stem again introduced. It remained in altogether nearly three weeks. The patient continued under observation from that time, the thick sound being occasionally passed until conception took place, after the catamenia of November 13th, 1873; and she was delivered of a living female child on August 31st, 1874.

The above case is given in order to encourage practitioners not to lose sight of a case after operation for dilatation of stricture of the internal os, because pregnancy does not immediately follow, but to persevere, by the occasional passage of the thick sound, to maintain the cervical canal in a state of sufficient patency.

Moreover, it often happens that, for some time after forcible dilatation, there may exist some chronic irritation of the cervical mucous membrane with or without granular inflammation of the labia uteri, which, giving rise to leucorrhœa of some form or other, may hinder impregnation. And here it may be well to insist on the necessity of not trusting to dilatation alone, whether by tents or by the introduction of graduated sounds, to enlarge the cervical canal. For if dilatation alone be had recourse to, its action is only temporary, for the uterine fibres are thereby merely stretched, as India-rubber might be, and, on the stretching force being intermitted, the cervix returns to its usual condition.

The dilatation must be associated with, and made subsequent to, incision of the canal. After incision of the cervical canal from within, which need not be extensive, dilatation then continues the incision with a slight rupture, and, this being kept from closing, the dilatation remains permanent. Many failures of this treatment are due to the external os being too freely divided, and being thereby rendered too patent; the act of imbibition is greatly interfered with, if not altogether prevented. The object to be gained is slightly to enlarge the cervical canal, and, at the same time, not to destroy the orifice of the uterus.

TREATMENT OF HABITUAL DRUNKARDS.*

By J. W. EASTWOOD, M.D.Ed., M.R.C.P.Lond., Darlington.

THE subject of Intemperance, and the diseases specially produced by the free use of alcohol in its various forms, has occupied my attention, more or less, during the last twenty years. The different forms of insanity, or some morbid conditions of the brain, which have been produced by drinking habits, have especially come under my care. At the annual meeting of the British Medical Association, held at Newcastle in 1870, I read a paper before the Public Medicine Section, on “Intemperance in its Medical and Social Aspects”, when I strongly urged the appointment of a committee to examine the whole question. The difficulty which was found in obtaining men from different parts of the country to meet together sufficiently often to go into this subject seemed a serious objection, although there were not wanting those who by their special knowledge and devotion to the profession, were quite willing to form members of such a committee. I may here particularly mention Dr. Rumsey of Cheltenham, and Dr. Morgan of Manchester. Again, at the Birmingham meeting in 1872, I read another paper on “The Use of Alcohol in Health and Disease”. To those who have paid any attention to this subject, it will be obvious that during the last three or four years the great question of intemperance, and the proper use of alcohol, as well as the treatment proper for some of the individuals who suffer from its excessive use, have made rapid strides both with the public and the profession. It is not, however, this large question which I wish to bring before you now, but a portion of it which has recently been taken up by a committee of the Birmingham and Midland Counties Branch. This has reference to the treatment of habitual drunkards, and the committee recommend the different Branches to consider the subject for themselves. Before I saw this report, I intended to bring this matter before this meeting.

* Read before the North of England Branch.

Those gentlemen who are in any way engaged in the special treatment of insanity, and many others in general practice, will readily bear me out when I state how difficult it is to know what to do with certain cases which come before us, where it is manifest that a morbid desire for intoxicants exists. The essential disease itself, whatever may be its exact pathological cause, is dipsomania. This may produce different results: acute mania, delirium tremens, and chronic alcoholism. The treatment of the first is clear enough; for if the patient cannot be kept at home, as the mania is generally of a noisy and destructive kind, he is sent to a public asylum or private retreat. The second form is likewise very clearly understood; and if the patient cannot be managed at home, he is also sent away for treatment. So far there is suitable provision already existing for the treatment of these cases; for it is of no consequence what the cause is, if the patient have mental symptoms which warrant medical certificates being signed, he can be placed under suitable care and treatment, as an insane person. The cases of chronic alcoholism are the production of the long continued habits of the dipsomaniac. It is most difficult to know what to do with those persons who appear not fit to be placed under care as lunatics. I am frequently appealed to by medical men, who write me letters containing a heart-rending account of some amiable young man, or gifted lady, who would sometimes do anything or submit to anything in order to be cured of their malady. It is with great reluctance that I admit such patients into my house, for they are more trouble than they are worth, and one cannot help feeling that they are not in their proper place amongst lunatics. If I admitted them, I should have more than I could accommodate. Sometimes the good effects of confinement continue for a considerable time, but it is always too brief to be of permanent good to them. The patients can only be kept during the period when they are mentally unsound, and obviously so. Two cases have recently been under my care, but only for a month each. One of them has learned a lesson, and at present keeps sober, but the other relapsed in a very short time. In the case of females, the result of any treatment is very unpromising.

There is another class of drunkards which do not come under my care and notice: the drunken criminals. These are to be found chiefly in a lower stratum of society than the patients to which I have referred, who are often educated and refined, at least at the commencement of their malady. They are more frequently dealt with by the magistrate than the physician, and they belong to that border-land between crime and insanity which it is so difficult to deal with.

What then is to be done with these unfortunate people, who are undoubtedly the victims of either mental or moral deficiency, or actual disease? The cases being properly selected, I think there can be no doubt about their being treated in suitable places or establishments for the purpose, under legal control. They are not fit for asylums generally—at least in the early stages, and they will not, as a rule, go voluntarily to an establishment for dipsomaniacs.

At the time that Mr. Dalrymple's Bill for Habitual Drunkards was brought forward, I advocated its adoption, with some amendments, and I was in correspondence with the late author of the Bill at the time that it came before the House of Commons. I think, however, that the Bill may now be taken as the basis on which to act, and that we should be justified in recommending it to the members of the British Medical Association to support by petitions to Parliament. The chief clause to which I have objections to make is the fifteenth, as the one most likely to be abused, and I should therefore desire some modification of this clause, so that its strictness shall be lessened.

I beg, therefore, to propose that the Bill for the Management of Habitual Drunkards, brought before the House of Commons by the late Mr. Dalrymple, be the basis for any future action on this subject, with a modification of the fifteenth clause, and that the members of this Branch be requested to sign a petition in favour of this Bill, to be presented to the Houses of Parliament.

That a copy of this resolution be forwarded to the Birmingham and Midland Counties Branch.

OBSTETRIC MEMORANDA.

A CASE OF FOOT AND HEAD PRESENTATION.

THE presentation of a foot along with the head is, I believe, of sufficiently rare occurrence in obstetrical practice as to call for a short notice from me of the following case. On June 12th, 1875, at 6.40 P.M., I was asked to attend Mrs. S. in her sixth confinement, six weeks earlier than she expected it. On examination, I found the right foot presenting, and the membranes entire. About an inch above the foot, and entering the brim, a large substance was to be felt, which I was

unable to reach sufficiently easily to decide what it was. Because of this doubt, and as the patient required to change her position, I was anxious not to rupture the membranes immediately. With the change of position and the advent of the next pain, the membranes ruptured just before I again made an examination; but, even after the rupture of the membranes, I could not determine with certainty what was presenting above the foot; I, therefore, immediately introduced my hand into the vagina, when I found that a small head was entering the pelvis with the foot. The presenting foot was immediately returned well above the head; this caused another pain, which sent the head much lower, and converted the labour into a natural one. A small premature child was born at 8.15 P.M., which only survived its birth seven hours. The right foot had evidently occupied the position in which I found it for some time; for, when the child was born, that foot was still very dark in colour, from pressure above the ankle. JAMES SEDGWICK, M.D.

CASE OF PLACENTA PREVIA: TURNING: SUDDEN DEATH ON THE EIGHTH DAY AFTER DELIVERY.

A. B., AGED 35, a somewhat stout but well built woman, at the eighth month of gestation with her sixth child, commenced flooding at 8 P.M. on May 6th. Her husband applied to me the same evening, about 11 o'clock, for some medicine for her. He stated that his wife had suddenly commenced to lose blood *per vaginam* without any apparent cause, and that up to this time she had always enjoyed good health. I accordingly sent her a mixture containing ten grains of gallic acid and five minims of tincture of opium, a dose to be given every three hours; and gave the husband instructions to send for me at once should she be any worse. At 4.30 the following morning, I was summoned to the patient, who, it was stated, had been taken much worse about an hour previously. I went at once, and found the woman somewhat blanched. I ascertained that she had lost a considerable amount of blood, and that it was still coming away in "large clots". Her pulse was small and rapid, 120 in the minute. She complained of slight pains in the lumbar region, coming on about every quarter of an hour, and at each recurrence of pain the loss of blood was increased. On examination, I found the os considerably dilated, the membranes still intact, through which could be felt the head and a hand presenting; but posteriorly a portion of the placenta was protruding. Whilst I was making this preliminary examination, a slight pain came on, which caused a considerable gush of blood. I now felt convinced that, unless I used prompt measures, my patient would soon sink from loss of blood. I therefore determined to rupture the membranes and turn the child, which I did with little difficulty; and, having got the breech of the child, filling up the cavity of the pelvis, I waited for more decided uterine action, which up to the present had been both slow and feeble. I therefore gave thirty minims of tincture of ergot in half an ounce of brandy, with some water. The pains soon became stronger and more frequent, and a living child was born about twenty minutes after administering the ergot and brandy. I removed the placenta immediately, and applied pressure over the uterus, which contracted firmly; consequently there was very little more loss of blood. The patient fainted about a quarter of an hour after the birth of the child, but soon revived. Still the pulse was extremely small, and also rapid (120). I now gave her another half-ounce of brandy, and also fifteen minims of tincture of opium. On the following day, I found my patient much better, she having had a good night's rest. Each day now she gained strength up to the seventh day after delivery, when I found her very cheerful, and to all appearance doing well. I gave special directions that she must not sit up at all until I saw her again; which, however, unfortunately, I had not the opportunity of doing, for on the following day (the eighth after delivery), about 4.30 A.M., I was summoned again to see her, as she had been taken suddenly worse. I accordingly went immediately, but before my arrival she had expired. Her husband informed me that she had a light supper the previous evening, and went to sleep apparently well about 11 P.M., but that about 2.30 the next morning she awoke suddenly with a feeling of constriction at her chest and great difficulty of breathing, which became rapidly worse until she died at 4.30 A.M., two hours after the commencement of the attack. Such was the sad end of a case which appeared to be progressing favourably. There had been no *post partum* hemorrhage. I could not obtain a *post mortem* examination; but I think, in all probability, this was a case of embolism of a branch of a pulmonary artery, due to a clot being carried from the uterus, and so giving rise to the asphyxia. The child, I should have stated, was very weak at birth, and gradually sank; it died the third day after delivery.

J. ASPINALL HUNT, M.R.C.S.Eng., Ockbrook.

GENERAL COUNCIL

OF

MEDICAL EDUCATION AND REGISTRATION.

SESSION, 1875.

DISCUSSION ON THE ADMISSION OF WOMEN TO THE
MEDICAL PROFESSION.

THE Medical Council, having received from Mr. Simon, writing by instruction of the Lord President of Her Majesty's Privy Council, a letter asking their opinion concerning Mr. Cowper-Temple's Bill for legalising the registration of foreign degrees by women, and also asking their observations on the general question on the admission of women to the medical profession, appointed a Committee, consisting of Mr. Turner, Sir William Gull, Sir Dominic Corrigan, Mr. Quain, Dr. Humphry, Dr. Andrew Wood, and Dr. Rolleston, to consider and report on the subject. The letter was as follows.

"Medical Department, Privy Council Office, June 8th, 1875.

"Sir,—I am directed by the Lord President to request that, at the meeting now shortly to be held of the General Medical Council, you will have the goodness to bring under the consideration of that body the bill which has been introduced in the House of Commons by Mr. Cowper-Temple 'to amend the Medical Act, 1858, so far as relates to the registration of women who have taken the degree of Doctor of Medicine in a foreign university', and that you will move the Medical Council to favour his Grace with their observations upon it. It appears to the Lord President that Mr. Cowper-Temple's bill, though very limited in its direct scope, can hardly fail to raise in Parliament the general question whether women ought to be able to look to medical practice, or certain branches of it, as open to them equally with men as a profession and means of livelihood. And I am to say that, as Government may have to express an opinion on this general question, with regard, on the one hand, to women who desire to obtain legal status as medical practitioners in this country, and, on the other hand, to the examination rules, or other conditions, which prevent them from accomplishing their wish, his Grace would be glad that the observations with which the Medical Council may favour him should not be restricted to the particular proposal of Mr. Cowper-Temple's bill, but should discuss, as fully as the Medical Council may see fit, the object to which that proposal would contribute.—I am, sir, your obedient servant,

(Signed) JOHN SIMON."

On Thursday, June 24th, the discussion of the Report of the Committee was commenced. It was printed at page 855 of last week's JOURNAL; and nearly the whole of it is quoted in Mr. Turner's speech.

Mr. TURNER moved, "That the report be received and entered on the minutes." He said: It is not a motion for the adoption or the approval of the report; but I think this may be the right stage for me, acting as Chairman of the Committee, to explain the report. I may say that the Committee has arrived at the conclusions stated in the report, with a due sense of the responsibility of the task imposed upon them by the Council, and that the conclusions arrived at have not been arrived at hastily. We have had four meetings, and we have spent several hours in the discussion of the various points raised. All the members of the Council, I have no doubt, have read Mr. Simon's letter written by direction of the Lord President, and all are aware that there are two important questions raised in that letter. The first is with reference to the Bill introduced by Mr. Cowper-Temple to amend the Medical Act of 1858, so far as relates to the registration of women who have taken the degree of doctor of medicine in a foreign university, and the opinion of the Medical Council is requested on the subject. Now, I think there can be no doubt at all that the consideration of this Bill falls within the legitimate province of this Council. We are a Council of medical education and registration. The registration of foreign degrees is specially referred to in one of the clauses of the Act under which we are constituted, so that clearly any emendation of that Act or of that clause comes naturally before us. The Committee, therefore, had no difficulty in taking into consideration this part of Mr. Simon's letter; and I think I am right in saying that the Committee came to an unanimous conclusion as to the kind of answer which should be given to the Lord President. "In regard to Mr. Cowper-Temple's Bill, the Council cannot approve of a measure intended to confer on women the privilege of registering certain foreign degrees, from which, under clause 46 of the Medical Act,

men are debarred, and over the education and examination for which the Medical Council have no means of exercising that supervision and control to which all licensing bodies of this country, whether universities or medical corporations, are subjected." With reference to the more general question raised in Mr. Simon's letter, there was naturally room for a much greater difference of opinion. The opinion was expressed at the Committee; and I should observe that it is the opinion, also, of another member of the Council not a member of the Committee (Dr. Storrar) that this is a subject which does not legitimately fall within the province of the Medical Council; that we are a Council of medical education and registration; and that we have nothing whatever to do with the consideration of so wide and general a question as that which has been brought before us. Now, I have no doubt that Dr. Storrar is technically correct in the view which he has taken up, and which he has embodied in his motion. But the question that the Committee had to consider was whether we should avoid, by a mere technicality, the expression of our opinion; whether, when the question is directly submitted to us by an important department of the Government, we should not express some opinion on the question; whether, for example, it would not be a breach of courtesy on our part if we declined to enter into consideration of this matter which has been submitted to us. And I may mention that I have heard complaints expressed that the Government did not sufficiently consult the Medical Council on various questions connected with the medical profession, on which this Council might fairly be asked to express an opinion. Certainly, if we were to refuse to enter into this matter, it is not likely that we should ever be again appealed to by the Government. On this ground, therefore, if on no other, I think it very important that we should, as far as we can, endeavour to give some opinion, whether it be favourable or not, as to the question which has been submitted by the Lord President. The Committee, then, taking this view of the case, considered that we were bound to say something on the general question. But another preliminary question was raised in the Committee before we felt ourselves prepared to go into the consideration of the general matter, and this question has been embodied in a motion, notice of which has been given by Sir Dominic Corrigan. Sir Dominic's idea is this, and he submitted it to the Committee for consideration, "that the members of the Council do not feel authorised in expressing a decided opinion without first submitting the matter to the consideration of the several licensing bodies, whose representatives they are; and, if it seem fit to the Lord President that the members of the Medical Council should obtain the views of the licensing bodies whom they represent, they will, as soon as possible, obtain the information for the Lord President." The Committee considered this proposition, and they decided that if they adopted this proposal of Sir D. Corrigan it would be practically shelving the question for an entire year. The Government do not ask for the opinion of the various licensing bodies, but they ask for the opinion of this Council; and therefore we ought not to hesitate to express our opinion in the matter. We therefore decided on the following paragraphs in our report, which paragraphs, with your permission, I shall read. "The Committee having taken Mr. Simon's letter into consideration, recommend the General Medical Council to adopt the following as the reply to be sent to the Lord President of the Privy Council. *a.* In reply to the communication addressed to them by the Lord President of the Privy Council, the Medical Council have to state that, being thus directly appealed to by the Lord President, they have felt bound to consider the question of the admission of women to the medical profession." Then having decided that we should take up this question, the next point for our consideration was what answer we should give; and this was a much more intricate matter; what answer should be given to the question propounded by Mr. Simon's letter; whether women ought to be able to look to medical practice, or certain branches of it, as open to them equally with men as a profession and means of livelihood. This naturally excited very considerable discussion in the Committee; but after framing several paragraphs in reply, and after much consideration, we at last decided upon recommending the two following paragraphs, which I shall, with your permission, sir, now read. *b.* "After due deliberation, the Medical Council have to express their opinion that the study and practice of medicine and surgery, instead of offering a field of exertion well fitted for women, do, on the contrary, present special difficulties which cannot be safely ignored, and some of which cannot be obviated. *c.* Instead of medicine offering more facilities and less difficulties for women than other professions, the Medical Council believe that, as the whole question is looked into, there will be found peculiar hindrances, moral and physical, to the successful pursuit of medicine by women. Moreover, they desire to add that if it be admitted that women should enter the medical profession, the existence of an equal fitness for other professions must be assumed." Now, sir, perhaps it may not be considered out of place if I should give one or

two reasons why I agree to the statements made in these two paragraphs; and in giving these reasons I do not wish to commit any other member of the Committee to the reasons which I may advance. These are my own personal and individual reasons. Doubtless other members of the Committee will be quite prepared to state why they agree to the admission of paragraphs expressing these very decided sentiments. In giving my reasons, I can assure you that there is no wish on my part to say anything that might hurt the feelings of any one, either man or woman, on this matter. It would ill become me who, throughout all my life, have had domestic relations with the opposite sex, which are all that could be desired, to say one word which might be regarded as depreciating the sex which we all value and esteem so highly. Still, however, there are certain general facts which, I think, ought not to be ignored in discussing this question; and facts which, I am sorry to say, have been too much ignored in looking at the important bearings of this question. I have heard it argued that men and women are alike in capacity; that what is open to the man to do, ought to be open to the woman to do; that woman has no distinctive sphere. I have heard that point broadly stated; and I have heard great ridicule thrown upon those who have asserted that woman has a distinctive sphere. Now, sir, to my mind, all such statements as these are mere idle talk. No amount of special pleading or ingenious argument can break down the physiological barrier which separates the two sexes from each other. Woman is not man, any more than man is woman. The sexes are not on a footing of equality. They ought not to be rival claimants for the same object. Each has its own excellences, and one is the complement of the other. I believe, sir, that it is a perfectly sound physiological doctrine when I state that the physical framework of a woman is inferior in its capacity and power to the physical framework of a man. Her muscular apparatus is less powerful, her bones are more slender, her skull is smaller, and, if I might say so, exhibits a smaller amount of departure from the infantile condition than is to be found in a man. Her brain, also, is smaller and lighter. Now, clearly, sir, these important anatomical differences find some physiological expression. The difference between the weight of the brain in a man and in a woman is, on an average—and I am referring only to averages, because there are exceptions, of course, in both cases—the difference between the weight of the brain in a man and in a woman is as much as ten per cent., and that difference is in favour of the male. Now this, I think, is a fact of great physiological significance. If we regard, as we all do, the brain as the centre of the intellectual faculties, and as the centre of the sensori-motor activity, it is clear, I think, that this lower brain-weight implies a smaller capacity for concentration of thought, for intellectual capacity, and for prolonged exertion, either mental or bodily. But, sir, it is not merely in connection with the physical attributes that the two sexes differ. In woman, the emotional qualities greatly preponderate over the logical. Now this is one of the most valuable characteristics of women—the preponderance of the emotional qualities. It gives them all those characteristics which we value so much in a wife and a mother, and which are also of the greatest importance in connection with the functions of a nurse, which she is often called upon to perform. These qualities, therefore, are those which make her truly a helpmeet for man. But the preponderance of the emotional qualities in woman's nature, I submit, ill adapts her for the performance of those duties which are entailed upon those who enter into the profession of medicine. In the profession of medicine, what is so much desired is the clear exercise of the logical faculty. If medicine is to be advanced as a science, it can only be by the application of scientific principles to the study of disease. Now, while the pages of history bristle with the names of men who have added to our scientific knowledge, I am not aware that the name of a woman occurs in connection with the discovery of any leading scientific fact or scientific theory. Hence I think that the whole history of our race shows that, in this matter of the possession of logical or scientific faculty, women have not yet shown that they possess any power of coming to the front. I put forward these considerations as arguments in support of one of the statements contained in one paragraph that I have read: that there are peculiar hindrances, moral and physical, to the successful pursuit of medicine by women. It may be said that all men do not possess the logical faculty. It may be said that there are many members of the medical profession who have not this faculty; who have not power of eliminating, in the consideration of a case, all sources of error, and of limiting themselves merely to the consideration of those facts which are based upon a correct consideration of the case in question. Undoubtedly this is true. But I doubt very much with the introduction of a new element into our profession—an element as to which, I think, experience has shown us that the logical or scientific faculty has not yet exhibited itself—I doubt very much whether this would tend to improve the standard of medical practice in this country. I would especially direct attention to that part of the

paragraph which states that "if it be permitted that women should enter the medical profession, the existence of an equal fitness in women for other professions must be assumed." This was carefully considered by the Committee before it was introduced into our report; and I think I may say that it was felt that the medical profession had been made a sort of battle-field, upon which was to be fought out this question, which has come prominently forward of late years, as to the equality of the two sexes; and many of us felt that it was not right or fair to our profession that it should be made the battle-ground on which this great question was to be fought out. Those, then, were my reasons for agreeing to the introduction of the two paragraphs to which I have referred. It will be seen, therefore, that we had many weighty objections to bring to the consideration of the Lord President against the introduction of women into the medical profession. Still, we felt that, if the Government and the legislature should in their wisdom see fit to give facilities and offer encouragement for the introduction of women to the profession of medicine, it would be seemly for us to indicate how this might be done, and to lay down certain propositions or conditions that we thought ought to be carried out, if possible, in connection with this matter. Accordingly, you will find in the report certain recommendations of the Committee. The first of these recommendations is to the effect "That, in the interests of public order, the education and examinations of female students of medicine should be conducted entirely apart from those of males." All of us who are sitting round this board know exactly what a medical education is. We know what medical students have to go through in their endeavours to obtain such an education; and we know that circumstances are constantly arising which render anything like a mixture of the two sexes extremely improper; so that I do not apprehend that there should be any difficulty at all in the Council agreeing to a condition of this kind. Then, in the second paragraph, we say: "With regard to the 'examination-rules or other conditions', which prevent women from obtaining a legal status as medical practitioners in this country, it would be sufficient if an Act of Parliament were passed which should enable the Medical Council to recognise the examinations of the licensing bodies under schedule (A) of the Medical Act separately or conjointly, or such other examination or examinations as the Medical Council may from time to time deem sufficient for the purpose of granting admission of women to the *Medical Register*, under the title of 'Licensed Practitioners of Medicine'." Well, now, we had considerable difficulty indeed in coming to the conclusion as to how women should be admitted to the *Medical Register*. That was obviously a matter of great difficulty, and, also, one of great importance: whether women should be allowed to present themselves for the usual examinations for licenses and memberships and degrees of universities, and so on; or whether there should be some special license created for the purpose of granting admission to the *Register*. You will observe that we have recommended that a special license should be created for their special behoof. It seemed to us that, if they were allowed to obtain the ordinary licenses and degrees, not only should we be giving them power to be inserted on the *Register*, but we should also be giving them certain rights and powers in connection with the corporations or universities from which these degrees were obtained. Now, it seemed to us that we had no right to recommend any such course to the Medical Council, but that that was a matter that went beyond the remit that had been made to us; and we thought the proposal we have made was the best mode of meeting the difficulty. Then there is the paragraph numbered 3: "That the examinations of female candidates for a license entitling their names to be placed on the *Register* should be of the same character as those of males." As to the inclusion of this clause, there was some difference of opinion. One member, if not more, of the Committee thought that there was no need for it; but it was felt by the majority that it was advisable to put forward a public declaration of this kind, so that it might be seen that we did not wish imperfectly educated persons to be put on the *Register*; that is to say, persons who had received a lower standard of education than the men. We considered that the standard of education for the two sexes should be the same. Then we have the fourth paragraph: "That the education and examination for these licenses should be under the supervision of the Medical Council in the same way as is required for the other licenses of this country." We were all agreed as to that. I do not think that there was any difference of opinion in the Committee, and I should apprehend that there ought to be no difference of opinion in the Council, because the clause merely recommends what is provided by the Medical Act for the supervision of the licenses at present granted. The next paragraph (c) is one which includes one or two principles of importance. I will read the first sentence. "As to other than mere legal difficulties which prevent women from accomplishing their wish to engage in the practice of medicine and surgery, the Council are of opinion that such difficulties must be overcome by private exer-

tions, and that no special legislation is called for, except, perhaps, in the case of midwifery." We found that all those questions connected with the providing for the education of women, and providing schools and teachers for them, should be left, as in the case of male medical students, to private exertions. I understand, for example, that in London all the hospital schools are organised and kept up by the private exertions of those that are particularly interested in them; and we felt that the women and their friends might fairly be asked to undertake all this part of the necessary work for themselves. The last clause of this same paragraph is one of very considerable importance. "Moreover, the Council are of opinion that any course of legislation which would interfere with the free action of the universities and corporations mentioned in schedule (A) in respect of the medical education of women, is undesirable." I think that, if this clause be adopted, I should suggest a little addition to it. I would suggest the addition of the words "examination and licensing" after the words "medical education"; so that it would read, "In respect of the medical education, examination, and licensing of women". We felt that there should be nothing done by the legislature to interfere with the free action of corporations in this particular. Then the last part of our report is one which bears upon the question of a special register, especially in connection with recognising the competency of women to practise midwifery. It is as follows. "It is understood that there are women who would prefer to have a special qualification, and to be entered on a special register, recognising their competency to practise midwifery. The Council believe that the education and examination of persons with such views will not be found to differ greatly, upon the whole, from those required of candidates for ordinary licenses to practise. Nevertheless, women might be fit for registration on a special register, without passing examination, in various parts of surgery and, indeed, of medicine. The decision of this question of a special register does not affect the question of admission of women to the general register, but would require an alteration in schedule (D) of the Medical Act." I think I am right in saying that this last paragraph embodies very much the spirit of the report of the Committee presented to the Medical Council in the year 1873, of which you, sir, were the chairman; and it was with special reference to the report of this Committee that the last paragraph was inserted by us in our report. It was the intention of one member at least of the Committee that we should have a clause authorising a copy of this report to be sent to the Lord President, along with the communication from the General Medical Council, to be made in reply to Mr. Simon's letter; and, perhaps, if the Council should decide upon adopting this report, which I am now submitting to you, we may add to it a clause authorising the report of the Committee to be forwarded.

Mr. QUAIN: I have great pleasure in seconding the reception of that report.

The motion was carried unanimously.

Mr. TURNER moved: "That the Council resolve itself into a committee to consider the report on Mr. Simon's letter, paragraph by paragraph."

The motion was seconded by Sir WILLIAM GULL.

Dr. STORRAR moved as an amendment: "That the duties to which the General Medical Council are appointed are defined by the Medical Acts, and the Council consider that their appointments do not empower them to represent to the Government any authorised opinion on the large social question of the expediency or otherwise of admitting women to practise medicine." He said: My opposition to this report does not arise from any essential difference of opinion from Mr. Turner as to the proper function of women, but from a difference of opinion as to the expediency of the Council taking up this question at all. My view of the matter is that this Medical Council is a corporate body acting under a common seal for definite purposes. What are those definite purposes? They are defined by the Medical Acts before us. Certain persons are appointed by the Queen, and by the various medical bodies, to administer these Acts; and what we are to administer is contained in the body of the Act. What are these points? They are very few. There is the registration of medical practitioners, with the power of omitting names from the *Register*; then there is the power of supervising the education of medical practitioners; and, thirdly, there is the authority to make a *British Pharmacopœia*. In these three, with very small exceptions, are comprised all the duties of this Council; and I apprehend that we have no capacity whatever to discuss any question outside the area of these matters. The medical bodies that sent us here reserve to themselves the duty of deciding, if they choose, upon questions that are not within the scope of these Acts, and we have no right to enter upon their province. Take my own case. I speak of it because it is the one with which I am most familiar. I represent the University of London, and I am the representative to administer what is contained in these Acts.

But we have had this women's question before the University of London, and the popular house (Convocation) passed a resolution in favour of admitting women to the degrees; but the Senate, which is the administrative body of the University, has decided that they will not take any steps to enable them to confer degrees upon women. The question, therefore, is so far decided as regards the University of London; and the members of the Senate of the University of London may fairly turn round upon me, and say: "What right have you to take up this, or to take a share in the settlement of a question possibly in an opposite direction from the settlement which we had made, when we, in fact, so far as we are concerned, have settled this question already?" It is on that ground that I propose this amendment. I feel that we as a Council are not here as a promiscuous body, thrown together to fire at every object that happens to be thrown up in the air; but we are here for a definite object, and nothing can be more distinct than the duties assigned to us. But it seems that some members of this Council are impressed with the honour of the distinction that has been conferred upon them by the reference of this question by the President of Her Majesty's Privy Council to us. I cannot say that I entertain so strong an impression of the distinction conferred upon us by the reference. I cannot help recollecting all that has transpired in past years between us and the Privy Council office. It would be a long story to go back to all the transactions that have occurred between us in successive Governments; but I will only go back to the time when we were discussing a Medical Bill which the Privy Council undertook to carry through Parliament. They did carry it through the House of Lords, and they withdrew it in the House of Commons. And they have shown a disposition to push us aside on any occasion when we happened to appeal to them on this particular subject. Two or three years ago, we waited upon the Marquis of Ripon to ascertain whether he, as the head of that department, was prepared on the part of the Government to introduce a Medical Bill. We were kept with him for the better part of an hour, and I think that you will agree with me that, when we were outside the room on the pavement, we knew just as much of the intentions of the Government as we did when we entered the room. We found it utterly impossible to ascertain from the Government what the intentions of the Government were; and all these difficulties have spread over a series of years. Governments have changed. At one time it was the Duke of Marlborough in office; at another time it was the Marquis of Ripon; and now it is the Duke of Richmond. But, whatever Government may be in office, and whatever the source of authority, whatever has been communicated to us has passed through the same channel. The letters have always been signed "John Simon", and whatever may be the sources, it is impossible not to see that the views of the Government had received peculiar expression in passing through the channel of communication. In whatever hand the department has been, we can see that, though the hand is Esau's hand, the voice is Jacob's voice. I must say I am not one of those who are impressed with the sense of the honour which has been conferred upon us by reference of this question to the Council. I look upon it in quite another light. I look upon it as a "Trojan horse". It contains the elements of disputation in this Council; and I can very well conceive the members of the Privy Council saying among themselves: "What are we to do with this Bill of Mr. Cowper-Temple? The House of Commons is not very clear about it. The country is not very clear about it. Nobody seems to have very definite ideas about it. It will be a very nice bone of contention to send down to the Medical Council. Let them worry over it for a few days." We have worried over it, and we have got no less than three reports out of a small Committee, and Mr. Turner speaks of the difficulty that he had in the preparation of the report. In these difficulties I sympathise with him heartily. Now what I feel is, that, if we once get into the entanglement of a discussion on this great social question, with which in my opinion we have nothing to do, we shall find ourselves probably at loggerheads with the bodies we represent here—the universities and medical corporations. They will ask us what right we have to supersede them. What authority, for instance, have we to step in and exercise a function which is no function assigned to us under the Medical Acts? And they will think that they have a right to an independent opinion upon it. I confess I could not defend myself against a charge of this kind. Then, as regards the point itself; if we decide in favour of the admission of women, the chances are that we shall have a very considerable number of persons finding fault with us, laughing at us, discussing the matter with us, and as I say, telling us that we are interfering with matters with which we have no concern. On the other hand, if we decide against the women, it will be said of us as has been said already, "Of course, you decide against the women because you are a trades union". That is the remark that has been made, and, I suppose, will be made again. But from the commencement—from the year 1858 to the present year—we have kept clear from

these subjects. We have never questioned the right of women to be registered if they will produce the certificate of any of the bodies that we are authorised to recognise. There are Mrs. Garrett-Anderson on the *Register*, and Miss Blackwell, and there may be many others. Let me make my position clear in another respect. I do not call in question the very great propriety of the Privy Council appealing to us as to what is to be done with regard to the registration of foreign degrees. That is another thing. Apart altogether from the admission of women under these degrees, the question of registering foreign degrees is one regarding which there is a good deal to be said; but I am anxious, as far as my own views are concerned, to condense them as much as possible. I dare say there are many points into which I might diverge; but I am exceedingly anxious to take my ground upon principle, and simply to state, in the narrowest possible terms, what that principle is. I beg, therefore, to propose this amendment.

Dr. PARKES: I do not think it is fair to the Marquis of Ripon that a statement such as that made by Dr. Storrar should remain without my saying one word. Perhaps it is hardly a matter that should occupy the time of the Council; only I think it is a little unfair to a nobleman who has taken the greatest possible trouble with regard to medical Acts. What took place was shortly before the medical bill which was introduced by the Marquis of Ripon had been dropped by the House of Commons.

Dr. STORRAR (reading from the minutes of Council): "The deputation appointed on March 28th to ascertain from the Government whether they are willing to aid the Council in the removal of any legal difficulties that may exist in carrying out the objects of Clause 19 of the Medical Act, reported that they had waited, by appointment, on the Marquis of Ripon, Lord President of Her Majesty's Council, and that two other cabinet ministers, Earl Granville and Mr. Bruce, Secretary of State for the Home Department, were present at the interview, and took part in the conference. That the conference lasted an hour and a quarter; that there was no difference of opinion as to the desirability of the medical authorities in each division of the kingdom combining their examinations, so as to reduce the number of entrances into the profession; but the Lord President was not disposed to introduce into Parliament for this purpose a measure which would be limited to conferring on the medical authorities a merely permissive power to combine."

Dr. ANDREW WOOD: Go on.

Dr. BENNETT (reading): "His lordship was favourable to the introduction of a measure of this limited kind by some private member of Parliament, but with the understanding that it would not preclude his consideration of a larger measure, if, on further thought, he should find it expedient."

Dr. STORRAR: Precisely so. He simply said, "Take what course you please, and I shall reserve to myself the right of opposing or supporting"; so that it amounted to absolutely nothing.

Dr. PARKES: I submit that that is very inconsistent indeed with the statement that Dr. Storrar just made about the Marquis of Ripon.

Dr. THOMSON: In seconding Dr. Storrar's amendment, it is not my intention to offer any observations upon the wide question that threatens to come before the Council, but merely to explain the grounds upon which I rise to second the amendment. He has so clearly explained those grounds, that I may say, in the first place, that I thoroughly agree with him in the reasons he has given, showing the propriety of such a motion being introduced at this stage of our proceedings. I do not think it comes within the province of the Council to give any general declaration upon the subject which has been proposed. I think it is altogether beyond the province of the Council to express, either for themselves or, as it might appear, for the profession at large, any opinion on this subject. The admission of women to the rights of practitioners is a question that can only be settled by the licensing bodies or by the Government. If it cannot be settled by the licensing bodies, then it is a large question that must be settled by the legislature; I do not pretend to say by which. I have no hesitation in seconding the amendment, because I think this is a stage at which it should be brought forward. At the same time, I should like to say that, in any answer which is given to the letter of the Lord President, the utmost courtesy should be shown to the Lord President and to Mr. Simon. I quite feel that the amendment, in its present state, does not meet all that is required. I am aware that an answer must be given to that part of the letter which refers to the registration of foreign degrees; and I hope that, in the course of our proceedings, such a motion may be framed as will combine the sense of Dr. Storrar's amendment with that amount of courtesy which I am sure we all desire to show to the letter from the Privy Council.

Dr. ROLLESTON: I have listened with pleasure to what Dr. Thomson has said. He has taken a large view of this matter. If it is to be

settled by the legislature, it cannot be settled by the licensing bodies. Now, since 1858, the licensing bodies have taken no step whatever. Between that time and 1875, public opinion has been declaring itself not only by means of clever and able writers, who (following the method adopted in this country) do not sign their names, but by others who have forced their names upon the public, and through the public upon the legislature. We have had, for example, Mr. Mill's book on the *Subjection of Women*, one of the wisest and best books that he has written; and that is the sort of reasoning that we have to deal with; that is the sort of reasoning that influences the legislature at the present moment. And what is the legislature going to do? Is it going to act without advice? Will it take the advice of these clever writers, or, as Sir William Gull suggested to me, is it coming for counsel to the Council? It wishes to act upon the best advice; it is acting with more wisdom in the matter than some other governments have done; it wishes to get advice from the very best source. I feel very strongly that the Council should not run away from what is its duty. I care comparatively little whether it says yes or no upon this question whether a couple of dozen females shall have what some think justice done to them; but I do say that it would be a slur upon the Council if it failed to consider the question, and give its opinion respecting it. With reference to what Dr. Storrar has said, I used to think that the older universities had practised the art of how not to do it. We have rather dropped that art during the last ten or twelve years. Let me remind the members of the University of London that they owe their *raison d'être* to the way in which we practised that art. We refused to do justice to one-half the males of this country—the dissenters—and the result was, that the London University was established. Now, some persons are refusing to do justice to one-half of the human species.

Dr. STORRAR: It is assumed that we are doing them justice.

Dr. ROLLESTON: That is an assumption of which I shall speak presently. With reference to this matter, let me say that, if the London University send here its representative, whom, by the way, it can scarcely call a representative, but rather a delegate—

Dr. STORRAR: I am elected, in the highest sense of the word, to exercise my judgment on matters that form the proper function of this Council; but I have no right, by delegation or election, to deal with any other matters.

Dr. ROLLESTON: I am sorry I cannot entirely agree with Dr. Storrar in that matter either. If you will look at the report of the Committee, you will see it says: "Moreover, the Council are of opinion that any course of legislation which would interfere with the free action of the universities and corporations mentioned in Schedule A, in respect of the medical education of women, is undesirable." Now, whether the London University choose to do what we did a generation ago—that is, not do it—or do what I believe the older ones will do now—that is, do it—it will make no difference one way or the other; but it is a serious matter entering upon this line of not doing things unless they have something absolutely wrong about them. Holding your tongue when you are asked to speak is one of the very worst things you can possibly do. If we older bodies had not studied that art, I am sure we should not have had a representative of the London University present at this Board, for there would have been no London University but for our refusing to do justice to one-half of the Queen's subjects; that is, the dissenters. Now, let me say what I have to say. "Strike, but hear", should be our motto. We know that this proposed admission of women has been tried elsewhere. Again, we know that we had such a person as Queen Elizabeth; we know that we had such a person as Queen Caroline (the first, not the second); and we know that we have at this time Queen Victoria on the throne of this country. Nevertheless, women are totally unfit; their brains are smaller. Mr. Turner omitted to add, their bodies also; and we know that there is a good deal of relation between the size of the brain and the size of the body. Let us say all this, if we like, but do not let us run away from our duty. Let us take for our motto that of the fine classical novel of Ivanhoe, *Adsum; Cave*. Do not let us run away, but let us do the duty that lies before us.

Dr. THOMSON: In consequence of what has fallen from Dr. Rolleston, I wish to say that, in seconding Dr. Storrar's motion, I did not express any opinion one way or the other. That will be for the future.

Sir WILLIAM GULL: I think the whole of Dr. Storrar's argument falls to the ground when I ask myself, why am I here? Why is Dr. Stokes here? Why is Dr. Sharpey here? Why is Dr. Parkes here? Why is Dr. Quain here? Whom do we represent? Where do we get our authority? If we have none, why has Dr. Storrar any? If he have none, neither have we. It seems to me that that consideration cuts away all the ground from him. I cannot take the position of a delegate, for I have nobody to delegate me but the whole country. I

have to consider what are my duties to this country at this board. Dr. Storrar says our duties are alike. What defines my duty equally defines Dr. Storrar's. We are not delegates at all; we come here to give counsel on the great affairs of this country, with respect to medicine and medical practice. That is the view I chose to take. I am not sent here merely to act the part of a policeman, which I daresay any tolerably respectable man, at £3 a week, could do as well as I could, and perhaps a great deal better. The Government have taken me from my important duties to do what? Not to do next to nothing. They have sent me here to consider the whole question. I read in the first line of the Medical Act: "Whereas it is expedient that persons requiring medical advice should be enabled to distinguish qualified from unqualified persons." The *Register* is only subordinate to that. It is for us to consider what the *Register* shall include. Dr. Storrar seems to think that the *Register* can only be of a certain character; but I think that the Council is here to determine what the *Register* shall be, what shall be its extent, and what the conditions under which people shall be put upon it. That takes in the whole question whether it is expedient for women to look to medical practice as a means of livelihood; and, if they may so look, then we shall consider the conditions upon which they shall be put upon the *Register*. The Government has sent representatives here having equal power with other members; and, therefore, our duty is to the country above all things, and not to the corporations: our duty is to help the public to determine who are fit persons to consult; and, if the public say, "We wish to consult women", we are bound to consider under what conditions they may consult them safely. If that be not consecutive and logical, I am inconsecutive and illogical. If that be the fact, we cannot escape from our duty. What is the meaning of the word Council? I ask the President if he can tell me the scope of it. If this be a Council, surely it has some function beyond looking after the registration of medical practitioners. Dr. Storrar says that Government has not treated us well. Then let us give them good for evil; let us be ready to offer them the best of our services in the best way we can, and they will treat us better in future. I cannot see that that is any argument. Then he says that the letter has come from Mr. Simon. Well, let it be taken *quantum valet*. I have an intense personal respect for Mr. Simon. I do not know why his name should have been introduced. We are bound to consider the letter as coming from the Privy Council. The Lord President said to me to-day (I am at liberty to use his name): "I am much interested in the matter" (he knew we should be discussing it), "and I shall be happy to confer with the Medical Council at any time they may desire." So you see the Government is interested in this question. This is not a corporate question at all. The report states that the corporations should be left free to do as they like. It is said that we ought to inquire what the profession has to say. Does any man pretend that he does not know what the profession will say? It has been discussed again and again. I should like to know how you will get at the voice of the profession. How can it be got at better than it is at present? We have the public journals, and the whole thing has been discussed there. We have talked of it on all occasions. Does this Council represent the profession or not? If it be a representative Council of the medical profession, let us act for ourselves, and not adopt the policy which was referred to yesterday: the policy of waiting, putting off, and going back to the corporations. I say, if I am here for any purpose, I am sent by the Government to fulfil a large and important duty; to give the advice to the Government that they may ask for in the best way I can, and to take as large and constitutional views of the whole question as I can. We are not sent here for the mere limited purpose of keeping the *Register* as it now stands. We ought to help the public in every way we can to know whether they are consulting qualified or unqualified persons.

Dr. QUAIN: There are two questions before us: one a question of law, and the other a question of expediency. No one can doubt that Dr. Storrar is perfectly right in saying that, by law, we have no right to express any opinion such as is asked of us. Our duty is to carry out the Act of Parliament. Then there is the question of expediency as to whether we should send a suitable answer to the question that is put to us. I agree with every word Dr. Storrar has said, but I shall be obliged to vote against him, because I think it is expedient that we should give an answer to the question. There is only one other word I wish to say. I cannot understand why the question of delegates or universities should be introduced. Dr. Storrar merely asked what right we had to express an opinion about the functions of those bodies. Considering the expediency of answering the President's letter, I shall vote against Dr. Storrar's amendment. I do it with regret, because I think that he is right.

Dr. WOOD: I shall vote against Dr. Storrar's motion for a different reason, and that is because I disagree with every word he has said. I

consider that we are not sent here as delegates by any body. I would not sit here as a delegate. When my College appoint me to come to the Council, they leave me at perfect liberty to deliberate upon all matters coming before the Council; and if they be not pleased with the way in which I do that, they can act upon their own judgment and turn me out, and put in somebody else. Therefore, I do not consider myself a delegate; I consider myself a representative, and I believe this Council to be a representative Council. If it is a representative Council, what does it represent? It must represent the medical profession. We are all medical men here. We are all sent in the interests of the public, in order that the public may get the best medical aid that can be got. I am astonished that a slur should be thrown upon the Government; because they come with courtesy and kindness, and a deference which I am glad to see, and ask us for our advice. There have been occasions when they have not treated this Council with the deference they deserve, "but many things have happened since". When the Duke of Richmond, who is most anxious to do what is right, asks our opinion, why should we not give him an answer? He may ask the opinion of any one. He may go to ask the opinion of Miss Jex-Blake if he likes. He may ask the opinion of the Royal Society as of any other body whom he wishes to consult. But he says, "Whom shall I consult with the greatest hope of getting good advice? Shall I not consult the men who are assembled in London at this time, and who represent the medical profession?" And shall we say to the Duke of Richmond, "Oh, your Grace, we are much obliged to you for communicating with us, but really decline to give you an answer upon the subject, because, forsooth, it is not within the clauses of the Medical Act that we are to give advice to the Privy Council upon the education of women"? I say when a great revolution is threatening our medical profession—for I consider the introduction of women into it would be a great revolution—and when it is pressed upon the Government to take up this question, and when the Government are anxious to have the best advice before taking any steps one way or the other, shall the Council say, "Your Grace, you have asked our opinion; we will give you no opinion; we are a mere Council for registering practitioners, and, therefore, we do not consider ourselves a Council to whom you should refer"? I am thankful to the Duke of Richmond. He has treated us with the utmost courtesy—he and the other ministers, the Marquis of Ripon among the rest—and we ought to give them the best advice we can. We are not to be considered the infallible advisers of the Government; but the Government will consider the arguments we lay before them, and if they approve of them they will adopt them; if not, they will reject them. I hope the Council will not adopt Dr. Storrar's amendment, because, if it do, it will lose an amount of influence which can never be restored.

Sir D. CORRIGAN: With a very slight alteration in Dr. Storrar's resolution, I should feel bound to vote for it, although I consider the motion of which I have given notice is very much better. I quite agree that we are not authorised to take up this question. Dr. Storrar says that we never could take it up; but I do not go so far as that. For myself, I feel that I am not justified in coming here to decide upon so important a question without going back to my constituents and consulting them as to what are their opinions. What I, therefore, propose is, that the answer should be deferred until we have had time to consult our constituents. Dr. Wood has said that we ought not to delay, and the same doctrine has been preached by Mr. Turner. It amounts to this: the Government has treated us badly for a series of years. It has snubbed us; there is no question about it. They would not tell us what they were going to do, and now that they evince a desire to throw themselves into our arms, forthwith we are to accept their repentance and suddenly answer the question that is sent to us. I cannot assent to the proposition that we are to answer the question suddenly without consulting our constituents. Dr. Wood has said that we are representatives of the profession. Technically speaking, we are not. We are representatives of nineteen licensing bodies, and there is a wide difference between representing the profession and representing those bodies. You know that there has been a struggle going on for many years between the British Medical Association and this Council with regard to getting admission to this body. I do not want to take one side or the other, but I say that technically we are not representatives of the profession. The question is a very important one, and it has been decided on by a committee which, I must observe, was not at all unanimous. We differed on nearly every proposition, and we are called upon now suddenly to bring forward those propositions, every second one of which is inconsistent with the one before it. I regret that I must vote against Dr. Storrar's amendment, although, to a certain extent, I agree with him.

Mr. MACNAMARA: Clause 18th of the Medical Act enables us to take into consideration generally the requisites for obtaining qualifica-

tions. It seems to me that that entitles us at the present moment to take into consideration whether the male or the female sex is requisite for the license.

Dr. SHARPEY: I must vote against Dr. Storrar's amendment. I heard, with some pain, the introduction of the word "delegates" as applied to members of this body. I have had the pleasure of sitting on this Council many years now with Dr. Storrar, and I must say that the whole tenor of his conduct and proceedings in this Council has been anything but that of a mere delegate. But let that pass. My reason for rising is to point out to Dr. Storrar that he is mistaken in supposing that our function is restricted to the carrying into effect the provisions of the Medical Act; because we are frequently called upon to propose amendments of the Medical Act, and we have again and again proposed amendments of it to Government. That is quite a different thing from merely carrying into effect existing provisions. I beg to remark further, that in the report which was read and commented on by Mr. Turner, there are proposals which would involve amendments in the Medical Act. The report proposes that certain additional powers should be granted to the Council—powers which they have not now under the Medical Act. I think, therefore, that the technical objection of Dr. Storrar is not sufficient. Independently of the question of expediency, I think it quite competent to give an answer to the Government on the question which they have submitted to us. Sir William Gull has very properly pointed out that some of us are not directly commissioned by any medical body in the kingdom, but are understood to represent here the public interest. No doubt it is understood that we all do that more or less directly, and I think we should be shrinking from an important duty to the country if we declined to aid the Government in this matter.

The amendment was then put and lost.

On the motion for the adoption of the report,

SIR DOMINIC CORRIGAN said: With regard to the question now being put from the Chair, I beg to propose the following amendment:—"That the following letter be forwarded to Mr. Simon in reply to his of the 8th June." [The letter referred to was printed at page 856 of last week's JOURNAL.] In taking up Mr. Simon's letter, it is necessary to start with a very short analysis of the questions he asks. As to the questions which he asks concerning Mr. Cowper-Temple's Bill, I think there is not a second opinion on the Council. I know that on the Committee we were unanimous in the opinion that the Bill would admit on the Register the names of women with foreign degrees, given by universities over whose course of education and examination we have no control whatever. While men are denied the privilege of having those degrees recognised, women are to have that privilege. That part of Mr. Simon's question I consider to be decided; and I may state that that part of my proposal answer which conveys our views with regard to his letter coincides with the reply in the Report of the Committee which Mr. Turner has read. With regard to Mr. Cowper-Temple's Bill, I believe the sentiment here is in accordance with the views of the Council. Now, the next question which is in Mr. Simon's letter is that of general practice; that is, whether women are to be entitled to look to general practice as a means of livelihood, and, of course, to be registered. And then he puts a question which, I think, has been ignored in the report of the Committee. He puts the question whether they are to be admitted to general practice, and then the question as to whether they are to be admitted to certain branches of it. I do not think this last branch of the question is sufficiently and distinctly dwelt on in the report. The last part of the letter to which I will direct your attention is this. He goes on to inquire what are the conditions with regard to women who desire to obtain legal status as medical practitioners in this country; and, on the other hand (I will ask your attention to this), to the "examination rules or other conditions which prevent them from accomplishing their wish". Now, there is not a single word in the answer with regard to that. He simply asks for information as to the conditions or circumstances which prevent them from accomplishing their wish, and what is our answer? Why, the report of the Committee passes that by, and it says, "In order to accomplish their wish, such and such regulations ought to be passed". That is not an answer to the question of the Lord President. The Lord President, or Mr. Simon for him, asks what are the conditions which prevent women from accomplishing their wish, leaving to the Lord President and the House of Commons to devise what are to be the means by which those objections are to be removed, or what course the House of Commons might follow. But instead of informing the Lord President as to the conditions which prevent women from accomplishing their wish, the report of the Committee passes that by totally, and simply lays down a plan for the government by which they may be enabled to gain admission. The Lord President asks one question: we have answered another question which has not been put. He never asks us in that

letter what are to be the means by which those objections or obstacles are to be removed. He simply asks the question, "What are the examination-rules or other conditions which prevent them from accomplishing their wish?" That is what he asks for, and that we have passed over completely; for we have not acquainted him with what are the conditions which prevent them from accomplishing their wish. Now this forms, in my mind, a very serious objection to this answer from the Committee; for I think it is a very good rule that you should answer, as fairly and as fully as you can, the questions asked; but I do not think that it is a proper course to evade a question asked and give an answer to a question that is not asked. The Lord President has not asked us what is the Parliamentary measure that he ought to introduce, or what is the Parliamentary measure that we should recommend. He has asked us no such question, and yet we have gone into the question of what it ought to be, and what the House of Commons ought to do. Now this, I think, is the most serious objection to the whole answer, and the whole course proposed by the Committee. The letter of the Committee says, "In reply to the communication addressed to them by the Lord President of the Privy Council, the Medical Council have to state that, being thus directly appealed to by the Lord President, they have felt bound to consider the question of the admission of women to the medical profession." I feel myself bound to consider it, and in that I differ from Dr. Storrar; but I am not bound to consider it on so short a notice as four-and-twenty hours, and without consulting the university which I have the honour to represent. In my answer I do not propose at all that we should evade the question. I simply propose that we should have an opportunity of going back to our constituents to put the letter of the Lord President before them; and then, armed with their opinions and their views, give an answer. It is said by Dr. Wood that we ought to give an answer immediately. Well, how long have we had a conjoint scheme before us? Three years; and we have not felt ourselves bound to give an answer up to the present moment. There comes before us from the Lord President, and very properly, a most important question: first, as to Mr. Cowper-Temple's Bill, on which we have given an answer, because we know distinctly the opinion of the whole profession on that point; and next, with regard to the other bodies admitting women; and next, with regard to their entering certain branches of the profession. I cannot think that the Lord President, who knows of what consequence it is to have due deliberation even upon the most minor considerations that come before the House of Commons, would hurry us or should be imagined to hurry us, into a decision upon that very important question. Now we come to an opinion expressed, and it may be right or wrong; but I do say that we have come too suddenly to it. It is in paragraph 6 of the Report of the Committee. It says, "After deliberation, the Medical Council have to express their opinion that the study and practice of medicine and surgery, instead of affording a field of exertion well fitted for women, do, on the contrary, present special difficulties which cannot be safely ignored, and some of which cannot be obviated." Well, I think, that, after the many avocations which we have had to go through in London in relation to professional questions, and the hospitality which has been exercised towards us, we have been unable to give the matter due attention. Now I come to the next paragraph, which I think the most objectionable. "Instead of medicine offering more facilities and less difficulties for women than other professions, the Medical Council believe, that as the whole question is looked into, there will be found peculiar hindrances, moral and physical, to the successful pursuit of medicine by women. Moreover, they desire to add, that if it be admitted that women should enter the medical profession, the existence of an equal fitness in women for other professions must be assumed." I do not think that is common logic. Are we to assent to such a ridiculous proposition as that, if we admit women into the medical profession to study medicine and practise it, therefore, forsooth, a little girl of thirteen or fourteen may be sent as a "midshipman" upon a ship of war? That paragraph appears to me to be utter nonsense. Then it says, "If notwithstanding such objections, it should appear expedient that women should not be debarred from obtaining that status". We have in the paragraph a few lines before this, a statement that there are special difficulties which cannot be obviated. "If, notwithstanding such objections, it should appear to the Government and the Legislature expedient that women who desire to obtain the legal status as medical practitioners in this country should not be debarred from obtaining that status, the Council recommend that it should be under some such conditions as the following." I think that, instead of favouring the progress of a measure which we have distinctly stated objectionable on moral, professional, and social grounds, and as to which there are difficulties which, we have said, cannot be obviated, the more straightforward, independent, and proper course is this: that, instead of the paragraphs which I have

read, we should say that, having expressed our opinion so strongly upon women pretending to go into the profession of medicine, and considering that there are special difficulties which cannot be safely ignored, and some of which cannot be obviated, it is our duty, as men who are advocates of social order and propriety, to say to the Lord President that we are obliged to decline being a party to any compromise, or to any measure that would admit women into the practice of the profession. That appears to me to be our proper course. There are, to my mind, two objections which cannot be got over with regard to paragraph *d*. In the first place, we take up a question which has not been asked at all, and we give the Government advice as to what they are to do. The Government does not ask us for it. The Government has simply asked us to state for their information what are the conditions which at present impede the way of women who desire to obtain legal status as medical practitioners in this country. That is the only question that they have asked on the point; and we have evaded that question, and advised them to pass an Act of Parliament. Now let us come to this wonderful Act of Parliament. We have been for years working on a conjoint scheme. Well, I think that all our exertions in that way have not hitherto been successful; but what are we now proposing? It is to pass an Act of Parliament which, to say the least of it, will make three or four examining bodies in addition to those already existing. So that we are blowing hot and cold. We are saying, on the one hand, that the licensing bodies ought to be diminished in number, and here is a proposal that the Government should give this Medical Council, on certain conditions, power to grant admission to women. (I am quoting from condition 2.) It proposes to grant admission to the *Medical Register*; and the examination is to be "such examination or examinations as the Medical Council may from time to time deem sufficient". Do you think that, if that were admitted, three months would pass over in London, or Dublin, or Edinburgh, or Glasgow, or any such places, without the women coming forward and having a meeting in St. James's Hall or somewhere else, and saying that they were not fairly treated; that they did not get proper examinations? Now we come to condition 3: "That the examinations of female candidates for a license entitling their names to be placed on the *Register* should be of the same character as those of males". If that mean anything at all, it means that it should be the same examination; it cannot mean anything else. But in paragraph *f* we find an observation that is utterly inconsistent with it. It is, that "the Council believe that the education and examination of persons with such views" (that is, with a view to practise midwifery) "will not be found to differ greatly, upon the whole, from those required of candidates for ordinary licenses to practise". Well, so far it is in accordance with the paragraph which I have just read, namely, that the examination should be of the same character; but it goes on: "Nevertheless, women might be fit for registration on a special Register without passing an examination in various parts of surgery, and, indeed, of medicine". Now, it is impossible that those two things should stand. One says that the examinations ought to be of the same character as those of men; and the other says that women might be fit for registration on a special Register without passing an examination in various parts of surgery, and, indeed, of medicine. I now go back to a paragraph (*e*) that I do not understand at all. "As to other than mere legal difficulties which prevent women from accomplishing their wish to engage in the practice of medicine and surgery, the Council are of opinion that such difficulties must be overcome by private exertions, and that no special legislation is called for except, perhaps, in the case of midwifery." But you have not stated what those difficulties are. You say "other than legal difficulties". I do not know any other than legal difficulties. I do not recognise anything but legal difficulties; nor does this paragraph point out in what direction the special exertions of women are to be directed to attain the end in view. Now, I have shown, I hope, sufficient reason for the course I have taken in taking this report paragraph by paragraph. I do not think that it is a report worthy of this Council. I do not think that it is a report worthy to go before the Lord President of the Privy Council. I do not believe that it is a report that can be amended so as to make it, as I have said, worthy of us. I believe that, if my amendment be thrown out, the proper course will be to withdraw the report. My letter goes, in the first place, to answer the first question which relates to Mr. Cowper-Temple's Bill. Then I say: "The second part of your letter resolves itself into two questions: firstly, whether women ought to be able to look to medical practice, or certain branches of it, as open to them, equally with men, as a profession and means of livelihood? The branches are not enumerated, but the question as to women looking to certain branches of medical practice as open to them equally with men, may be considered, the Council suppose, as specially referring to midwifery." Well, I do

not know any other branch that may be considered to come under that view. "On this the Council have to observe that, by established usage, women from the earliest times have practised midwifery." The practice of midwifery at all times, as far as we know, has been pursued by women. In Ireland, at the present moment, midwives are licensed by private individuals, and on those licenses salaries are awarded to them. I think that this is a very improper course; and, if the system of midwives attached to Poor-law medical appointments be continued, for the sake of the public, the licenses ought to be issued by bodies who have no pecuniary interest in selling their certificates. I will tell you what has occurred within my own knowledge. A man who had never attended a case of midwifery bought his license: I will not say where. He went to the country to practise as a dispensary doctor; and, when the first case presented itself, he did not know what to do. It was a foot presentation; and, when he found that the head was in the vagina and the feet outside, he twisted it round and round till he left the head in the vagina and had the body in his hand. Similar instances might be multiplied in England, Ireland, and Scotland. That is a thing that has occurred, and it ought to be put a stop to; and we ought to prevent midwifery licenses from being granted except by the legitimate corporations. Dr. Storrar says that the Medical Council was appointed under the Act of 1858 to carry out the provisions of that Act. Now, I have said, and I say again, that the question of the education of women as midwives has not come before this Council; and yet we are asked in twenty-four hours to give an answer to it. In 1873, there was a Committee appointed to draw up a report on the special education of women, and I think our respected President was the Chairman of that Committee. They drew up a report, which never came before the Council. Two years have passed away, and yet it is said that we ought at once to give an answer to that important question, while the report of the Committee on the same subject has been published and handed about, but the Council have never had the courage to take it up. Therefore, I hold that we ought not to be asked to decide in a great hurry upon such an important question. My letter continues: "The Council may, in the meantime, append these observations: First, they are aware that there exists a diversity of opinion in the profession, and among the licensing universities and corporations, as to the admissibility of women to general medical practice." I know that that diversity exists, for the subject came before the Queen's University, and, as a preliminary step, we had the opinions of the law officers of the Crown. I cannot say what the decision might have been; but the discussion was stopped in consequence of the law officers of the Crown declaring that we had not the power to give a license to women. There was a diversity of opinion in the senate of the university, and there is a diversity of opinion in the corporations; and, where that exists, I think that we ought to go back to those corporations and get an authorised statement of their opinions. The next observation I have appended is this: "There appear to exist very great difficulties with regard to the details of education and examination of women desirous of entering the medical profession, on social, moral, and professional grounds; and it does not appear that the Council can at present do more than bring the whole subject under the consideration of the licensing bodies of the United Kingdom, and obtain their views as to the admission of women 'who may desire to obtain legal status as medical practitioners', or to practise certain branches; and also the information desired by the Lord President as to 'the examination rules or conditions which prevent them from accomplishing their wish'." That is the pith of the whole letter from Mr. Simon, and that we have not answered at all; "and then forward the communications to the Lord President with such observations as the Council may deem it necessary to add". Now, does anyone believe or think that there is any very great necessity for any any extraordinary hurry at this present moment? Does anybody think that either Mr. Disraeli, or anybody else, will take up this question. Now, when we are almost in the month of July, and after the Government have declined to take up measures of great consequence, such as, for instance, the holiday question and the Brighton Aquarium, is it likely that they will take up the consideration of this matter? I do not believe that the delay will do any harm if we simply pass a resolution that the members of this Council be directed to obtain the views of the corporations on Mr. Simon's letter, and bring those views forward at the next session of the Council. There can be no real delay by postponing it; and, if that course were adopted, I should have no objection to withdraw my amendment. If the report be persevered in, I shall take the opinion of the Council upon it.

THE PRESIDENT: I think it is my duty to the Council, as having been formerly the Chairman of the Committee to which Sir Dominic referred, to state that I feel I owe an apology to the Council for not having prosecuted the matter; but it hardly represents the exact state of the case to say that this report never was before the Council. On

the contrary, I find that, on April 2nd, 1873, a motion was carried re-appointing the Committee, and empowering it to proceed with the subject. It would hardly be desirable that the Council should suppose that nothing had been done, and that this report had not been received. If there were a motion on the subject, I could explain why nothing was done.

SIR DOMINIC CORRIGAN: It remains as I have said; namely, that the Committee was appointed in 1873; but the Council never gave an opinion upon that report. They never had it before them.

DR. AQUILLA SMITH: I rise to second the amendment of Sir Dominic Corrigan; and one reason for my doing so is, that it differs very materially from Dr. Storrar's amendment, which has been discussed. Sir Dominic Corrigan's amendment does not ignore the question, and does not take the power from the Council of considering it in future. I concur that it is the bounden duty of this Council, when we have been honoured by a communication from the Privy Council, to entertain the question and, at any rate, to return a becoming and courteous answer to the head of the Government on any question that could be discussed by the Council. But I also support this amendment because I take it that Sir Dominic's object in proposing it is, that it should supersede the report that has been received from the Committee. I shall not go over the matters to which Sir Dominic has so fully drawn the attention of the Council; but I shall just state very briefly my reasons for objecting to that report, and objecting to the motion which is now before the chair. I was very much struck this morning by the very remarkable contradictions in the report: contradictions as flat as can be. In the latter part of the report, the Committee suggest that an Act of Parliament should be passed to introduce women into the profession, after expressing in very clear language that they believe that women are utterly incompetent to compete with men as medical practitioners. In paragraph *e* we find: "Moreover, the Council are of opinion that any course of legislation which would interfere with the free action of any of the universities and corporations mentioned in Schedule A, in respect of the medical education of women, is undesirable." Those appear to me to be such contradictions in the report, that I cannot give my sanction to it. To recommendation No. 3 also I have a very great objection. "That the examinations of female candidates for a license entitling their names to be placed on the Register should be of the same character as those of males." Now, I will ask those who are teachers, would they feel themselves warranted in going into the very important and wide subject of syphilis and all its consequences? Would the ladies be instructed in that? I have reason to know, from a document which by accident has come into my possession since I arrived in London, that there is one lady who aspires to medical honours who would not shrink from the inquiry into syphilis in its most revolting forms. I have great pleasure in seconding Sir Dominic's motion, because it is a most important matter. I take the view of Sir Dominic, that this subject has certainly never been brought under the consideration of the body whom I have the honour to represent, and I should not feel myself warranted to state an opinion that females should be admitted according to the suggestions of the report.

DR. ANDREW WOOD: I beg to recall the attention of the Council to the actual subject under debate on this motion. We have had a long discussion on the report of the Committee; but the great question involved in Sir Dominic Corrigan's amendment is, that we should tell the Privy Council that we are not ready to give answers to this question that they put to us, and that we must send the matter down to the licensing bodies. That is the whole question; and I say that a great many of the statements that have been made are quite outside the question; therefore, I hope that we shall now go to the vote and say whether we shall go on to consider this question in Committee, or whether we shall agree that we are not ready to take up the question. On that subject there may be difference of opinion, though the question is certainly not new to us. It is not new to me, certainly, in Edinburgh; and all through the country there has been nothing going on for a great many years that has excited so much attention as this subject of female doctors. I therefore hold that, to go to the Government and say that we have not had time to consider the question when we have been considering it for years, would be a great stultification; therefore, I hope that we shall throw out Sir Dominic Corrigan's amendment and come to the question, whether woman ought to be doctors or not, for that is the question at issue. I hope we shall vote without further delay.

SIR WILLIAM GULL: If we are stopped here, we are stopped altogether. This is not in the least a question of corporations or universities; they have nothing whatever to do with it; it is a question for the public, the Medical Council, and the Government. We particularly say in the report, that the medical corporations and universities

shall be left free, and that we deprecate any interference with their system. Women are outside these bodies. The Government wants to know whether women are to have this freedom that they desire, and what will you do? Go and ask people who have nothing at all to do with the question. The London University has nothing to do with it unless it likes to take it up. Sir Dominic Corrigan thinks that he and others who represent corporations have as much power as we have who do not. Then they have power outside their corporations; but to send this question back to the corporations, is to admit that there are in this Council members who are nothing but nominees and representatives of different bodies.

The amendment was then put and negatived.

DR. WOOD: I shall not intervene between the Council and the Committee by proposing what I have put upon the programme, because a large part of it is actually in Mr. Turner's report, and I shall have an opportunity, in the course of the discussion upon the different clauses, of moving any parts of my report that seem to be different from it, and also of discussing the general question which has not yet been touched on.

MR. TURNER: I should like to ask in what position we are placed with reference to Dr. Bennett's motion? If we agree to certain propositions in this report, it then becomes the report of the Council.

DR. BENNETT: I see the difficulty. My proposed report is in the hands of the printers; but if it be desired, I can read it, so that the Council may know what is to come before it. I assume that our answer will come in the form of a letter from yourself, sir, to the Lord-President; and the letter I propose is this.

"Sir,—*a*. In accordance with the request of the Lord President, as conveyed in your letter of the 8th instant, I have the honour to inform you that I have brought under the consideration of the General Medical Council the Bill which has been introduced in the House of Commons by Mr. Cowper-Temple, 'to amend the Medical Act (1858) so far as relates to the registration of women who have taken the degree of Doctor of Medicine in a foreign university'.

b. "To this Bill of Mr. Cowper-Temple, as well as to the collateral and wider questions to which your letter refers, the Council have given full and careful consideration.

"*c*. With regard to Mr. Cowper-Temple's Bill, considered by itself, and apart from its bearings on the 'general question whether women ought to be able to look to medical practice, or certain branches of it, as open to them equally with men, as a profession and means of livelihood', the Council have found no difficulty in forming an opinion. By the Medical Act (1858), the Council are precluded from granting admission to the *Medical Register* to persons holding foreign degrees, and, consequently, have been compelled repeatedly to refuse to register foreign degrees held by men.

"*d*. The reason for this is obvious—viz., that the Council have no means of exercising that supervision and control over the education and examination required for foreign degrees to which the licensing bodies of this country, whether universities or corporations, are, by the Act of 1858, subjected. But this privilege, which the Medical Act refuses (and, the Council believe, very properly refuses) to men, Mr. Cowper-Temple's Bill proposes to grant to women. To such a proposal the Council feel bound to offer a respectful but decided protest, as being subversive of the main principle of the Medical Act, and, though in appearance of very limited scope, calculated to be productive of serious evils.

"*e*. With regard to the general questions referred to, and on which the Lord President desires to have the observations of the Medical Council, they would in the first place remark, that it is a very wide subject, and one that appears to them to involve the discussion of very grave questions—moral, social, and political—which appertain to the Legislature, rather than to a council of medical education and registration. If the Legislature should determine that the learned professions, and, therefore, that of medicine among them, should be thrown open to women as well as men, and that a legal status should be given to women as medical practitioners in this country, it would be the duty of this Council to offer every assistance in their power to the Government in framing rules for the education and examination of women, and in suggesting conditions for giving them admission to the *Medical Register*. The Council, however, cannot conceal from themselves the serious difficulties that would attend the framing of such rules and conditions, involving, as they would, the peculiar, and, in the opinion of many, almost insuperable hindrances, moral as well as physical, to the efficient education and successful pursuit of medicine by women, and demanding, in the interests of public order, that both the education and examination of female students of medicine should be conducted entirely apart from those of males.

"*f*. The Council have already had their attention drawn to the im-

portance of securing more efficient instruction for women who engage in the practice of midwifery, and whose services are largely employed, especially by the poor of this country. The Council feel very strongly that it is desirable that some means should be adopted for securing a better education, and granting certificates of competency to women who act as midwives. For, whilst fully admitting that for the safe and efficient practice of midwifery as a branch of medical science, a full and complete education both in medicine and surgery is required, the Council believe that a much more limited and less expensive education might be afforded to women, who, after due examination, might, as midwives, render valuable service to the community, and supply a deficiency long felt and expressed. For women thus educated and certificated, it might be desirable that a special Register should be provided, which the Council think might be secured by an alteration in Schedule (D) of the Medical Act.—I have the honour to be, etc.”

After a brief discussion as to the mode of proceeding,

The Council went into committee on the report.

Mr. TURNER moved the adoption of the first three paragraphs (*a*, *b*, and *c*) of the proposed reply to Mr. Simon's letter.

Sir W. GULL seconded the motion.

Dr. PARKES moved the omission of the paragraphs. He thought that they expressed a great deal too much, and yet too little. They gave no real answer to Mr. Simon's question, and were likely to land the Government in great perplexity. It was stated that there were special difficulties in the way of women which could not be safely ignored, and some of which could not be obviated, and yet it was well known that there were women practising in various countries. No answer was given as to what the "special difficulties" really were. No doubt there were certain portions of medical practice in which women would never be able to compete with men, but there were other portions in which, on the whole, he believed they had a superiority over men, especially with regard to diseases of women and children. The paragraph as to the "peculiar hindrances, moral and physical", to the successful pursuit of medicine by women was extremely objectionable, and he should feel it his duty to vote against it. He also objected to the statement of the report that, if women entered the medical profession, it must be assumed that they were equally competent to enter other professions: a most illogical conclusion to arrive at.

Dr. BENNETT seconded Dr. Parkes's amendment, and suggested that the different points in Mr. Simon's letter should be taken up in the order in which they were there stated, instead of being dealt with as in the report of the Committee.

A long discussion then took place as to the form in which the question should be brought before the Council.

Mr. QUAIN said he accepted the paragraphs proposed by Mr. Turner as a kind of compromise, there being a strong opposition in the Committee to the recommendations being carried, unless they were prefixed with some such statements as those contained in the opening paragraphs of the proposed letter.

Dr. ROLLESTON opposed the amendment, and urged that the paragraphs in question should be retained for the purpose of securing something like unanimity in the Council.

The amendment was then put and carried by a considerable majority.

On the motion that the amendment be carried as a substantive resolution, an amendment was moved by Dr. ROLLESTON, and seconded by Mr. TURNER, that the report be remitted to the Committee, and brought up next day, and that Dr. Bennett be added to the Committee. After some discussion, this amendment was carried, and it was also agreed to as a substantive motion.

The Council then adjourned.

On Friday, June 25th, the discussion of the subject was resumed. It was agreed, on the motion of Dr. ANDREW WOOD, seconded by Dr. QUAIN, "that the Council resolve itself into a Committee for the consideration of the report."

An amended report was presented by Mr. Turner, the Chairman of the Committee; and the Council agreed to consider the report, paragraph by paragraph. The report was as follows.

The Committee, having taken this (Mr. Simon's) letter into consideration, recommend the General Medical Council to adopt the following as the reply to be sent to the Lord President of the Privy Council.

a. In reply to the communication addressed to them by the Lord President of the Privy Council, the Medical Council have to state that they have felt bound to consider the whole question of the admission of women to the medical profession.

b. The Medical Council are of opinion that the study and practice of medicine and surgery, instead of affording a field of exertion well fitted

for women, do, on the contrary, present special difficulties which cannot be safely disregarded.*

c. With regard to Mr. Cowper-Temple's Bill, considered by itself, and apart from its bearings on the "general question whether women ought to be able to look to medical practice, or certain branches of it, as open to them equally with men as a profession and means of livelihood", the Council have found no difficulty in forming an opinion. By the Medical Act, 1858, the Council are precluded from granting admission to the *Medical Register* to persons holding foreign degrees, and consequently have been compelled repeatedly to refuse to register foreign degrees held by men.

d. The reason for this is obvious; viz., that the Council have no means of exercising that supervision and control over the education and examination required for foreign degrees to which the licensing bodies of this country, whether Universities or Corporations, are, by the Act of 1858, subjected. But this privilege, which the Medical Act refuses (and, the Council believes, very properly refuses) to men, Mr. Cowper-Temple's Bill proposes to grant to women. To such a proposal the Council feel bound to offer a respectful but decided protest, as being subversive of the main principle of the Medical Act.

e. If it should appear to the Government and the Legislature expedient that women, who desire to obtain a legal status as medical practitioners in this country, should not be debarred from obtaining that status, the Council are of opinion that it should be under some such arrangements as the following.

1. That, in the interests of public order, the education and examinations of female students of medicine should be conducted entirely apart from those of male students.

2. That, with reference to the "examination rules or other conditions" which prevent women from accomplishing their wish, the Medical Council have to state that, under the provisions of the Medical Act, those persons only can be placed upon the *Medical Register* who have been admitted to Medical Degrees in the Universities, or who have been admitted Fellows, Members, or Licentiates of one of the Medical Corporations of the United Kingdom. It appears that most or all of the Universities and Corporations are unable or unwilling to admit women to their degrees, or to admit them as members of the respective corporations. The Council are of opinion that sufficient provision would be made to enable women to obtain a "legal status as medical practitioners in this country", if an Act of Parliament were passed which should enable the Medical Council to recognise such examination or examinations as the Medical Council may from time to time deem sufficient for the purpose of granting admission of women to the *Medical Register* under the title of "licensed practitioners of medicine". But the Council are of opinion that any course of legislation which would interfere with the free action of the Universities and Corporations mentioned in Schedule (A), in respect of the medical education, examination, and licensing of women, is undesirable.*

3. That the education and examinations for these licenses should be under the supervision of the Medical Council, in the same way as those required for the other licenses of this country.*

4. That the examinations of female candidates for a license entitling their names to be placed on the *Register* should be equivalent to those of males.

5. That the education and examinations for these licenses should be under the supervision of the Medical Council, in the same way as is required for the other licenses of this country.

f. The Council have already had their attention drawn to the importance of securing more efficient instruction for women who engage in the practice of midwifery, and whose services are largely employed, especially by the poor of this country. The Council feel very strongly that it is desirable that some means should be adopted for securing a better education, and granting certificates of competency to women who act as midwives; for, whilst fully admitting that, for the safe and efficient practice of midwifery as a branch of medical science, a full and complete education both in medicine and surgery is required, the Council believe that a much more limited and less expensive education might be afforded to women, who after due examination might, as midwives, render valuable service to the community, and supply a deficiency long felt and expressed. For women thus educated and certificated, it might be desirable that a special Register should be provided, which the Council think might be secured by an alteration in Schedule (D) of the Medical Act.

g. It is right to observe that the Committee were not unanimous on some of the propositions in this report.†

WM. TURNER, *Chairman*.

Mr. TURNER moved the adoption of paragraph *a*.

* These paragraphs were altered in the course of the discussion.

† This paragraph was withdrawn.

The motion was seconded by Dr. QUAIN.

Dr. BENNETT moved as an amendment, "That instead of paragraph *a*, as now read to us, the following be adopted :

"Sir,—In accordance with the request of the Lord President, as conveyed in your letter of the 8th instant, I have the honour to inform you that I have brought under the consideration of the General Medical Council the Bill which has been introduced in the House of Commons by Mr. Cowper-Temple, 'to amend the Medical Act, 1858, so far as relates to the registration of women who have taken the degree of Doctor of Medicine in a foreign university'."

The amendment was seconded by Mr. MACNAMARA.

Dr. ROLLESTON : If the Council accept Dr. Bennett's amendment, it will cause a very large amount of rearrangement in the report, without any real advantage whatever. A very great deal of what Dr. Bennett has given, as I said yesterday, was an improvement in many particulars. The whole of the paragraph *f* is in Dr. Bennett's words.

Dr. BENNETT : My objection was to the words "feel bound to consider the education of women". It is not a rearrangement ; but I object to the main sentiment which underlies the first paragraph.

Mr. TURNER : Dr. Bennett suggests that this letter be addressed to Mr. Simon. The Committee propose that the reply should be addressed to the Lord President, and I submit that he is the proper person to whom it should be addressed.

Sir WILLIAM GULL : I agree with Dr. Bennett that this is not a mere matter of rearrangement, and that we know quite well. Mr. Cowper-Temple's Bill lies at the very bottom of the whole question. Mr. Cowper-Temple will come before the House of Commons, and say, "In England, a woman can obtain no education in medicine, and no recognition of her knowledge. Therefore, you must enable women to register foreign degrees"; and he has good ground for that. I think there can be only two courses open : to admit Mr. Cowper-Temple's Bill, and shelve the whole question as regards England ; or to take up the whole question, and take the pith out of Mr. Cowper-Temple's Bill. That Bill comes in to remove a hardship upon the public, as they think. The public say, "We wish to have women to practise medicine, and we wish to know whether they are fitted to practise medicine"; and the medical corporations and schools all say that they cannot take any part in this matter. Some women go abroad and get a degree, and they come back and say, "Now, we want to be put on the Register." It is a very hard thing for us to say, "You shall not have your request granted". Dr. Bennett's proposition takes up Mr. Cowper-Temple's Bill first. The Committee have raised the whole question ; and they say that we ought not to debar women from getting a medical education in this country to fit them for the Register. We do not say how it is to be done ; but we say that we ought to take away the hindrances that exist at the present time.

Mr. MACNAMARA : Where do you say that ?

Sir WILLIAM GULL : We imply it all through, and we state actually that they ought not to be debarred. I will only offer one consideration. Either adopt the principle of Mr. Cowper-Temple's Bill, which is reasonable, and say, "England shall register women"; or, on the other hand, get rid of Mr. Cowper-Temple's Bill, and say, "They shall neither come in from England nor from anywhere else." That seems to be a strange conclusion, and unfair to the public.

Dr. QUAIN : I do not quite go with Sir William Gull in his observations. There is an opening paragraph in Mr. Simon's letter, in which he makes a reference to Mr. Cowper-Temple's Bill, and asks that the President will move the Medical Council to favour his Grace with their observations upon it. Surely we can do that alone without moving a step beyond it. He asks us definitely and distinctly in a separate paragraph for our opinion on Mr. Cowper-Temple's Bill ; then, he says, that will open the whole question. We are quite prepared to go into the whole question ; but it would be simply more systematic to answer his question, and then take up the whole thing afterwards. It is perfectly competent to anybody to employ women with foreign degrees. All that they can gain by being placed on the Register is that they can recover fees.

Dr. ANDREW WOOD : The Council have not *proprio motu* originated a discussion of the question of the admission of women to the profession, but they have been consulted by the Government, who have asked them to give an opinion, not only upon the Bill, but upon the whole question of the admission of women. I think that there cannot be a better opening to this report than this paragraph. I therefore hope that the Council will, by a large majority, adopt it.

Sir D. CORRIGAN : Dr. Bennett proposes that the reference to Mr. Cowper-Temple's Bill shall stand in place of paragraph *a*. The reference to Mr. Cowper-Temple's Bill was agreed to in paragraph *c* ; and I think it matters exceedingly little whether it is put under *a* or under *c* ; but I do agree with Dr. Rolleston that, if we begin to overturn the order of

the paragraphs, we shall not know where to stop in the way of amendments. For this reason, I hope we shall follow the paragraphs as they are inserted.

Mr. MACNAMARA : I seconded the amendment of Dr. Risdon Bennett, because I think that it is most important that this Council should send forward a document that would be worthy of them. I ask you, if any of us received a letter on any matter of business, and if it were an important letter, and required a serious answer, whether we should not go to the first paragraph of the letter and answer it, and then go to the second paragraph and answer it, and so on. We should apply ourselves at once to discuss the letter of Mr. Simon.

Dr. THOMSON : I feel that the paragraph suggested by the Committee is not in accordance with the usual form of business. As far as I know of business, it is usual, in referring to any letter which a public body has received, to recite—perhaps shortly, but to recite clearly—the points upon which the answer is required. There are clearly two points which are suggested by Mr. Simon's letter. One is with reference to the foreign degrees, and the other is with reference to the more weighty question. Those two points are not referred to in the first paragraph of the answer. I think it is an unbusinesslike mode of proceeding to omit to recite them.

After a little further conversation, the amendment was put to the vote and lost. The original motion for the adoption of paragraph *a* of the report was then carried.

Mr. TURNER moved the adoption of paragraph *b*.

Sir WILLIAM GULL seconded the motion.

Dr. PARKES : I move as an amendment to leave out the words "which cannot be safely disregarded", and insert the following : "But the Council are not prepared to say that women ought to be excluded from the profession."

Dr. PYLE seconded the amendment.

Sir WILLIAM GULL : I see no objection to the admission of those words.

Mr. TURNER : I cannot accept those words.

Mr. QUAIN : I may state that words of that kind were used originally, and that it was to conciliate support that they were afterwards altered as they now stand.

Mr. TURNER : There is no statement in the report that women ought to be excluded from the profession. The amendment moved by Dr. Parkes does not add anything to the strength of the position that he takes up.

Dr. PARKES : The sentence as it stands speaks of "special difficulties which cannot be safely disregarded". That may be taken as, practically, an exclusion.

Dr. SHARPEY : I feel bound to vote with the amendment. I should not recommend women to enter the medical profession. I should dissuade them from doing so ; but I am not prepared to say that they ought not to do so. Persuasion is one thing ; denial is another ; and I am not prepared to stand in the way of women entering a career which they think they can safely and properly enter.

Dr. ANDREW WOOD : If the amendment be carried and put as a substantive motion, or if it be thrown out, I shall be prepared to propose an amendment carrying out my own views ; but, in the meantime, I will speak on the question whether women should be admitted to the medical profession or not. We have a specific question put : whether women ought to be able to look to medical practice, or certain branches of it, as open to them equally with men as a profession and means of livelihood ; and it is expected that we should discuss, not only Mr. Cowper-Temple's Bill and any collateral questions, but the whole question as to whether women are fit. From the beginning of this agitation with regard to women, I have always taken up one, and a consistent and honest course. I have always held that women are not adapted to the medical profession, and that the medical profession is not adapted to women ; and I have had to stand considerable volleys of abuse from that faction which carries on the agitation for the advancement of women's rights, because I have sturdily stated my opinion on the subject. I have given them and their supporters all the credit of honesty and good motives ; and I think it hard that they will not, in return, give us the same credit. If we were to judge from the noise and the dust which have been made in regard to the question, it might be imagined that the whole country, or a large majority of it, was in favour of the admission of women to the medical profession. I cannot admit that. I believe that if the population, and especially if the women of the country, were polled, it would be found that there is an immense majority against it. When we venture to advocate these opinions we are told, "You are putting yourselves in opposition to public opinion". I deny that public opinion is in favour of it. Many of those who advocate the admission of women into the medical profession do not know anything about either the profession, or what its practice involves. They

do not know what toils and dangers and perplexities and constant anxieties there are in the medical profession. They do not know all the repulsiveness of the dissecting-room. They do not know the bloody scenes of the operation-room. They do not know a great many of those things which are even so repulsive to men, that they refrain from entering the medical profession. I do not know whether it is the case here; but in Edinburgh we have ventured, in our ignorance, to talk of women having a particular sphere. I had always thought this was an axiom; but when we venture to talk about it we are sneered at. "Woman's sphere!" they say, "woman has no sphere which is less than that of man." I say that that is utter nonsense. God never meant woman for the sphere of man, and never meant man for the sphere of woman. If a woman be pushed into a man's occupation, she is as much out of place as a man when he is pushed into the occupation of a woman. Woman has a sphere—a very important sphere. She has the sphere of her own home. She has the bearing and suckling of children. She has the training up of the young, and she has a great many feminine occupations with which she ought to be as largely employed as possible. "But," it is said, "she is now at this time of day to begin to enter upon a profession into which she never entered before." Why does she go to the medical profession? The medical profession, of all others, is one that places most difficulties in the way of a woman. Why does she not go to the law or to the church? Why does she not go to a great many other occupations that would be far more congenial to her? She will have no dissecting-room to go into there. She will have no blood to encounter there. She will not have to exercise brute strength, such as a woman very seldom has, and which is required in many important operations. Fancy a woman called to reduce the dislocation of a hip-joint! Could a woman do that? And there are a great many other things that she might be called upon to do, on an emergency, that I really think it would be painful for her to attempt, and not only painful as regards herself, but painful as regards her poor patients. It has been said, "You are a trades-union. You are like the silversmiths at Ephesus. You are afraid that your craft is in danger, and you cry, 'Great is Diana of the Ephesians!'" I repudiate with scorn these insinuations. I have been a member of the medical profession for forty years, and I believe it to be an honourable and unselfish profession—a profession which lavishes its skill and its labours gratuitously in a greater degree than any other profession in England; and I say, therefore, to call us a trades-union and all that sort of thing is not the way to force us into adopting any scheme that may be laid before us. There is another set of people with whom I wish to deal: those who think that it is the very worst profession that women could take to; and who would rather, if possible, keep them out of it. But they say, "Although we think all that, if it be inevitable we must bow before the inevitable; and, since it must come, is it not far better to take measures to make it easy?" Is that consistent? Then other people say, "Do not make such a noise about it. It is a mere farce. It is only a few women who will enter into the profession. Nobody will care much about it, and in the course of a few years it will die out. They will not succeed. They will be miserable. They will be quite uncomfortable in their new position. We would strongly advise you to say nothing about it. The more you say against it, the more they will want to be allowed to enter." What! are you going to tempt these women to their ruin? I contend that I am the most honest friend of these women, when I say to them: "Do not enter a profession which I know is not suited to you." I say that honestly; and I add to that: "I cannot give you any help in getting into it." How can I logically and consistently do so? I think we have had a little experience in Edinburgh as to the evil of leading women into a wrong position. Some of our professors in our University of Edinburgh led these women upon the ice. I will appeal to any who know about the case of Edinburgh whether there was not constant turmoil. The women's question was brought into everything. If it were a meeting of the Infirmary or of the University, there cropped up this ladies' question. Such was the rioting, that we were very thankful that a court of law put an end to it, and that the women took flight to London, where they found a more congenial atmosphere; and I congratulate the London members on having them, if they like them. Then it is said: "If women like to enter the profession, why not let them do so?" Dr. Sharpey does not think that they are very fit for the profession. He says that they will find out their mistake before they go much further. Why not tell them clearly that they had far better not enter a profession for which they are not adapted? We have been told over and over again that women demand women-doctors. I deny that women call for female doctors; and I believe that, in opposing the admission of female doctors, I am, in fact, the champion of nine-tenths of the women of this country. I have taken the opinions of a great many women in all classes of the community, and of all

ages, and, with one exception only, I was never told by a woman that she would employ a female doctor, "as long," they say, "as we can get an accomplished, skilful, and proper medical man". Women are themselves, therefore, the most inveterate and sturdy antagonists of this movement, and are we to disregard the women? The age of chivalry has not gone yet. Let us chivalrously stand up for the women, and keep them from having their sex discredited by women becoming doctors of medicine. Another argument is, that women shrink from telling their ailments to men. I have never found this. I believe that there are some women who would not tell their ailments to anyone, either male or female; and I have had frequent conversations with some of our most accomplished and most largely employed accoucheurs, and they have all told me that they never found any difficulty in having from women a full detail of what was the matter with them. When you find a considerable difficulty in getting a knowledge of the ailment, you do not find that it is always the most delicate woman that gives that difficulty. I come to another point. It is said: "Well, perhaps women may not be up to all the different departments of medicine and surgery; but surely you will allow that the natural thing would be, that they should practise in midwifery": just the department of practice for which they are least fitted. That may appear an anomaly; but just look at it as it is. Would you like to entrust your wife to a female midwife if there were a case of embryulcia? Would you like to see a woman with the crotchet in her hand, or with the long forceps, pulling with all her might, and with the sweat running down her face? Would you like to see a woman in charge of a case where blood was gushing out in torrents from the womb, and do you think that she would have the readiness and nerve which would save the patient from being lost? I say that these cases of midwifery are just the very cases which are least adapted for female doctors; and it is a very curious fact, and an undeniable fact, that, whereas in the last century, and in the beginning of this century, very few women were delivered by any but women in Edinburgh, even the very poorest woman in the poorest close of Edinburgh would now infinitely prefer a man to attend her, and always does employ a man. The next argument is an appeal of political economy. We are told that there is a great excess of females, and that there is a lack of employment for them; that they cannot earn their bread properly; that you should open up to them every field of exertion that you can. I agree with it; but then, in opening it up, you must see that you open up that for which they are adapted. There are very many things for which they are far better adapted; such as the teaching of young children and of grown-up girls. The public offices have been gradually opened up to females, such as the post-office and other offices, where they can sit quietly at their desks, and not be called to encounter any of those dreadful things that they must encounter if they become doctors. They are also employed in the telegraph-office. Many women write for the press, and others become compositors; others are artists, and I do not know why there should not be many more. These are feminine occupations; but, as to practising medicine, I say that it is by no means so. Then I will just make this *argumentum ad hominem*: I would ask any member of this Council whether he would like to see his sister or daughter embracing the practice of medicine. He would not like to go into the dissecting-room, as I have gone, and see five or six ladies dissecting a body, and five or six male students dissecting another body two or three yards from them. He would not like to see them liable to be called out at all hours of the day and night. He would not like to see the noise, discomfort, and disquietude to which they would be subjected. Why should we encourage the sisters and daughters of others to enter into a profession that we would not like our own daughters and sisters to take up? If there be not anything in the arguments I have brought forward, and if the Government come to us and say, "What do you think about it?"—if they put the question directly in this form, whether women ought to be able to look to the medical profession, or to certain branches of it, as open to them equally with men as a profession and means of livelihood, say "Aye". But, if you believe that women ought not to be doctors, then, come what may, you are bound to tell the Government so. I do not think that, in this question, there can be any compromise. Supposing you send any uncertain reply to the Privy Council, and supposing, even by inference, you give the Government to understand that you think that women might be employed as female doctors, you are not uttering the sentiments of your profession. I am quite sure that your opinion which is given and your action which is maintained will meet with the disapproval of nine-tenths of our profession; and I think that there must be some truth in the objection, when you find that nine-tenths of an honourable profession are so much agreed in this. From a knowledge of their profession, and from a knowledge of all that is to be undergone in the practice of it, they are not inclined to think that the public would be safe with female doctors,

or that the female doctors would be a comfort to themselves, if they embraced the profession. I say, then, in conclusion, leave the female sex to be what God made them, and what Nature intended them for. Leave them to command our esteem, our deference, and our love, and do not put them in a position in which you would not like to see them; for we, on our part, all feel what we owe to the female sex. When I say that they are not fit for female doctors, I do not wish to disparage them; I love the female sex, and it is because I love them that I wish to keep them from this "mockery, delusion, and snare". Let us continue to regard them as women, who, in the language of our immortal Scotch poet, are to us in our hours of perplexity and sickness and sorrow nothing less than "ministering angels".

Dr. HUMPHRY: After the remarkable and most honest and admirable speech of Dr. Wood, I think it is necessary to call the attention of the Council to the fact that the question before us is not whether women are to be encouraged to enter the profession, but whether they are to be excluded from it. I have always felt regret that that question ever came before us. I have always felt that the profession of medicine was the one of all the professions least adapted for women; but I do not feel that they ought to be absolutely excluded from it. I apprehend that there is no man at this table, and perhaps no man in the whole profession, who has felt more than I have done, the difficulties and the annoyances of the medical profession. There is, perhaps, no one present who can feel more strongly than I do the disadvantages that women will incur who enter the profession of medicine, and far would I be from encouraging or advising any woman to enter it. Far would it be from me to encourage any daughter or sister of mine to enter the profession; but it would also be with much hesitation that I should encourage a son to enter it, and, indeed, I have never done so. The disagreeables which met me were so great that I would not encourage anyone else to enter. I quite admit that there are vast counterbalancing advantages. The enormous opportunities of doing good to our fellow men in the greatest difficulties and the most trying circumstances, are advantages which ought to have compensated myself long ago to a greater extent than they have, and they are advantages which fortunately have compensated others more than they have done myself. I should be unwilling to preclude any class of society, or any sex, from the opportunity of doing great good to their fellow men. Dr. Wood has alluded to the bloody scenes of the operating-room. I have never witnessed an important operation without a woman being present. I have often observed them, and I have often observed, too, men not of my own profession present; but I confess that I have thought none of the women who were present had so much feeling of dislike for the thing as I had myself. If women of one class are regularly admitted into our operating-rooms, I do not see that there is anything in the thing itself to preclude other women from being present there. It appears to me that their line on this occasion must be determined by the consideration, whether there is anything in women distinctly rendering them unfit for the practice of the medical profession. If we feel that there are mental and physical disqualifications on the part of women to prevent their entering the profession and their being useful in it, I think our bounden duty at once is to negative the amendment of Dr. Parkes; but, unless we do think that they are distinctly and physically disqualified, and unless we do feel that a distinct and serious evil to the community would be incurred, I think we have no right to declare for the exclusion of that sex. Dr. Wood has alluded to the reduction of dislocation; and I think that Dr. Wood will admit that in the present day reduction is not a matter of force, but pre-eminently a matter of skill. Is there anything in woman to preclude her from exercising skill as great as that of a man? If there be, then I admit we ought at once to forbid her entering the profession. If there be not, I do not think it is our duty to exclude her. Is there any mental disqualification? Mr. Turner has alluded to the smaller size of the woman's brain; but, relatively to the size of the man, there is very little difference in that respect, and I think that we all of us have sufficient knowledge of woman to feel that her mental power is very little below our own. Doubtless, in some respects it is; and I think that the examinations which have taken place at Cambridge indicate in a remarkably clear manner the difference of woman's faculty from man's. They indicate that, perhaps, in some of the most serious and harder branches of education, the woman does fall a little inferior to the man, and the girl falls a little inferior to the boy; but in many other points—in facility of attention, in tenacity of memory, in readiness of application of herself, not unfrequently in accuracy and precision of statement—the girl is considerably superior to the boy; nay, in looking over, as I have often done, the reports of the examinations, I have found it rather difficult to avoid the conclusion that the girl is mentally rather superior to the boy, and I believe in these earlier periods of life it is so; but, at any rate, the boy does overtake her and advances somewhat in front, but I do

not believe that there is really any disqualification on the part of woman. Then, looking at the question morally and socially, I think it is not easy to say that the practice of medicine by women upon men is a greater moral evil than the practice by men upon women. Indeed, I am sure that it is not altogether unattended by its great moral evils. Although Dr. Wood has said that women do not desire the assistance of women, I think, nevertheless, it is certain that some do. Dr. Wood has mentioned that we tempt women to their evil; that is not the purpose directly or indirectly of this resolution. Its object is simply not to preclude women from the opportunity of entering upon a certain course which she and her friends think it advisable she should take. Dr. Wood has asked whether we would like to see women enter upon the more severe cases of midwifery. He has alluded to embryulcia. Happily, the cases are rare; and the men who are fitted for that work are very few. I am not prepared to say that women in great emergencies are much worse than men. The woman has remarkable readiness. I may say that personally I have often been surprised, I may say put to shame, by the readiness of resource and the courage of woman in some of the greater emergencies and some of the more serious positions of life. I have always said—"Oh, enter not that profession, and think not of it; it is one of the most unsuited to you"; but, nevertheless, with all that feeling, I do say that, as a matter of public justice, and forming one of this Board, which is a public body who have not to be influenced by a majority of any kind, either the majority of our own profession, or the majority of women, or the majority of the country, but to state seriously, and in a responsible manner, our own feelings upon this great question—I come to the conclusion that we ought not, as representatives of the medical profession, to say that women should be excluded from it.

Sir DOMINIC CORRIGAN: The question before us is, as Dr. Humphry has explained it, simply that women ought not to be excluded from the profession. He does not say one word of their fitness, or their being fit for it; he says simply that we ought not to exercise the powers that we have in order to exclude women from the medical profession. In the senate of the Queen's University, the question was discussed, until an opinion was obtained from the law officers of the Crown that we had not the power of granting degrees to women; and on this discussion I was the advocate of women's admission into the profession, but I also distinctly stated that, supposing women obtained their medical degrees, no consideration should induce me to meet them in practice. Those two things may seem inconsistent; but, while I advocated the principle that there should be free admission for women in competition for whatever honours or distinctions were open to them, I could not conceal from myself that I could not go into consultation with a woman and discuss with her the particulars of cases that must occur in hundreds every week, without losing totally that respect for her sex which I have no wish to lose; and, if I were asked as regards the members of my own family whether I would advise either one or the other to go into the medical profession, my answer would be that I would rather see them buried. Suppose we pass the original resolution. Women will say, "You have passed such a resolution; but what are you, or who are you? You are all men, and it is your personal motives that have induced you to pass that resolution and to exclude us from a profession for which we are fitted." In my mind, there is nothing that keeps up agitation so much as permitting a grievance to continue. I well remember, many years ago, attending a Board in Ireland, and there was some grievance, and the person who was concerned in the agitation lost all command over himself. He rose at the table and dashed all the papers over it, and said, "Will you give me nothing to fight about?" Now, supposing we come out decided oppositioists. Suppose we say, "You shall not be admitted to our profession." We generously help them in hoisting the flag of grievance, and they will apply to us the remark of the lion to the sculptor. The sculptor, to show that man was superior to the lion, showed the lion in a prone condition and the man standing over him. The observation of the lion was, "Let the sculptor be the lion, and see what position both would be placed in." I would remove their grievance. I would say, "You shall have the degrees if you can earn them." I do not believe that one out of 10,000 women would look for the degrees, and I know that the opinion of the women themselves is in accordance with what Dr. Wood has stated, namely, "That those who are most opposed to them are the women themselves." It has been stated in one of the works which have been issued from the press in favour of the movement, and in the most pathetic language, that there are thousands of women's lives lost in Ireland from their disinclination to employ male doctors; and it is said that in the nunneries hundreds of women sink annually on that account. I have a very fair share of opportunity of knowing what the opinions of the women in convents are. I have asked hundreds of them whether they would like to have women-doctors, and

the invariable answer has been, "We would not have one of them near us." Now that is the opinion of the most modest women possible in any community. Supposing there was a resolution brought forward to prevent their going into other professions. Does anyone think that if the office of trombone player or big drum player in a regiment were open to women, they would offer themselves for it? Perhaps some would do so, but I am sure they would soon find that they were unfitted for the office. I remember a scene in one of our Dublin hospitals, where a woman was admitted as a student. As soon as this female student made her appearance in the ward, the women pulled the sheets over their heads so that they might not be detected, and they gave one continued hiss until the female student left the ward. With regard to the question of midwives, I think that is not before us at present. The question simply before us is Dr. Parkes's amendment whether we should express an opinion that women ought to be excluded from the profession. I will simply repeat what I said: While I stand up as the advocate of admitting women to degrees, I would never meet one in the practice of my profession; and, as regards their fitness, I would see the dearest member of my family in her coffin rather than following the medical profession. But, taking those principles as those which are guiding me now, I would say "Give them a fair field, they will soon find that they are out of their place, and the agitation will disappear."

Mr. MACNAMARA: I think it is exceedingly to be regretted that the question of women's rights has been thrown upon this Council, as it were, for solution. If we decide here in favour of admitting ladies to the medical examinations and to the *Medical Register*, we are but introducing the thin edge of the wedge into the solution of a most difficult problem. If women be admitted to the medical ranks, why should they not be admitted to the franchise? and if admitted to the franchise, why not to the House of Commons? But, much as I think a great deal may be said against our doing anything which would attempt to solve such a question as that, still I feel coerced to vote for the amendment, which strikes me as being one of the most guarded that I have ever seen since I became a member of the Council. It guards us in the most marked manner from expressing any opinion. I have heard a good deal said upon the question of the physical disabilities of women. I was rather astonished to hear that the physical disabilities of women would prevent their entering our profession. We have not, in this report before us, added one word as to the special difficulties which are alluded to; not one of them is enumerated: there is only a general mention of "special difficulties". I hear from one gentleman something about brain; from another, something about muscle. I suppose that it is meant that physically women are not strong enough to discharge the duties required of them. If necessary, I think I could produce 20,000 women who would try that conclusion with one half of the medical profession, and the question would be decided in favour of the women. It is merely begging the question to speak of physical force. There is not much physical force required to handle the stethoscope or the urinometer, or the thermometer, so far as medicine is concerned; and as to surgery, I do not know that in that case either very much physical force is required. As to the mental question, it has been said that women have not done much towards the advancement of scientific problems. "Well", they answer at once, "we have not had the opportunity. Our studies have not been directed to that quarter"; but I would like to know how many of our profession have done much for the advancement of scientific problems. If I were very ill, I would prefer the practical physician who had devoted himself to his profession, and not to the solution of scientific problems. It has been said that the study would have a lowering effect on the nature of women. The most delicate-minded women that I know of are at this moment employed as nurses in the hospitals: I refer to the sisters of charity in the city of Dublin. It would be a calumny to say that the finer feelings of these ladies have been blunted because they have attended in the most serious and critical cases of surgery. They are found discharging their duties well, and ably, and modestly; and I cannot believe that a lady could not discharge the duties if she received a larger honorarium than is accorded to the sisters of charity. I think that it is most unfair to use the *argumentum ad hominem*, and to ask whether we would like our own sisters and daughters to engage in the profession. There are many pursuits that are exceedingly noble, but to which probably we should not like to put our own sons or our own daughters. I think that it is a great mistake that we should decide the question upon such a small argument as that. The Government have asked us a most important question: whether women ought to be able to look to medical practice. We are asked now to state that there are special difficulties which cannot be safely disregarded. Of course, the inference is that women ought not to look to general practice. Then we are asked as to their fitness for certain branches of it. I think that there are certain branches as to

which there could not be a word of cavil, in which women might be well employed, and as to which we find great difficulty at the present moment. I think that they might be well employed in pharmacy; they might earn an honourable income in dispensing and compounding physicians' prescriptions. That has not been alluded to at all. It is well known that there are about ten or twelve thousand women in this division of the kingdom employed in attending women in their confinements. What we would propose would be to improve their education. That is one question, I think, to which we might apply ourselves. Let them be well educated on that point. But in this report the Committee say, "The Council are of opinion that sufficient provision would be made to enable women to obtain a 'legal status as medical practitioners in this country', if an Act of Parliament were passed which should enable the Medical Council to recognise such examination or examinations as the Medical Council may from time to time deem sufficient for the purpose of granting admission of women to the *Medical Register*, under the title of 'licensed practitioners of medicine'." On one side, the report goes absolutely to assist in doing it, and, on the other side, it goes to say that there are special difficulties. I feel bound to support Dr. Parkes's amendment, because I think that it will relieve us of a very great difficulty.

Dr. STOKES: We are asked to advise the Government upon this matter. The question is one of extreme difficulty. There are questions raised as to the physical powers of women, and as to the moral view of the case. Is the unsexing of women, which certainly would be threatened by a large surgical or medical education, a desirable thing? That is the question which the Government in any future communication with us will in all probability ask. Then, to go back to the question of the physical incapability of women to perform every operation in surgery. I remember the case of a lady who was attacked with peritonitis, she before having suffered from a large abdominal tumour. She recovered from the peritonitis, and in the course of a year afterwards, she was seized again with the disease with great severity. She came to London, where a large ovarian tumour was diagnosed, and an operation was performed by one of the most eminent operators in such cases. That gentleman told me that, owing to the two attacks of peritonitis, strong adhesions had formed. I must tell you that the disease was double. It was found that both ovaries were affected, the adhesions were so strong that it took the entire force of the operator's body to tear them out, and so much force had to be used that after the operation he was obliged to sit down, and remained in a fainting condition for some time. That patient recovered, and for years was a very beautiful woman. Well, I doubt very much whether we can anticipate that women will be able to meet such an emergency as that. In obstetrics, there are conditions in which the full force of the most muscular men is absolutely necessary. Then comes the moral question. Is it not very much better that a certain number of women should not make the profession of medicine and surgery a source of employment to them, or that the moral condition of the female should, more or less, be damaged by having to attend to matters which are in fact antagonistic to the delicacy of a woman? Is it not contrary to nature that such things should be? The feelings of women are opposed altogether to these pursuits. I think that I can confirm in every respect what Dr. Wood has said upon that point. I have made it my business ever since the agitation began, to inquire of every intellectual woman with whom I happened to come into contact, what were her views upon the subject; and they have uniformly treated the attempt to transfer any portion of operative surgery or medicine to women as a grand mistake. I think that, as we have been consulted by the Government, it might be well that we should lay before them the difficulties of the subject in the first instance.

Dr. BENNETT: I think it desirable that I should say why I cannot accept Dr. Parkes's amendment. It is not really sufficiently cognate with what precedes in the same paragraph. The paragraph consists mainly of a statement that medicine and surgery would afford a field more fitted for women; and then it properly ends by saying that there are special difficulties which cannot be safely disregarded. Dr. Parkes would introduce a specific statement, having no absolute and necessary connection with either of these, and would affirm that women ought not to be debarred from entering the medical profession. Secondly, I object to it because it goes a step further in giving our views to the Government in favour of breaking down the barrier that at present exists and favouring the introduction of women to the medical profession. We have not excluded women from the practice of medicine. In corporations and universities, which by their regulations exclude them, the question is, whether the barriers should be thrown down, and whether we and others should give them assistance in entering on a legal status into the profession. I am not prepared to say that it is our duty as a profession or as a council of medical men to assist in breaking down those barriers, and permitting the entrance of women upon a

legal position into the medical profession. I think, quite apart from the physical and mental incapacity of women, about which much has been said with which I do not heartily agree, there are other serious objections to justify us in coming to a conclusion that their admission is undesirable in the interests of the community at large, in the interests of women themselves, and in the interests of this profession as a scientific profession. I will assume their physical capacity for it, and that there is no insuperable mental and moral objection to it, but I should still feel that there were many considerations that would make it exceedingly desirable for the maintenance of woman's high, rightful, and honourable position in the community, that she should not enter into such a profession as ours. I think we are going considerably beyond what we are called upon to state, if we specifically set before the Government modes by means of which these barriers should be broken down, and reasons why they should be broken down.

Mr. TURNER: I do not see my way to accept Dr. Parkes's amendment, so as not to divide the Council, because he cuts out certain words which I think it is important that we should put before the Lord President, and he adds certain other words which I think unnecessary.

Dr. QUAIN: We are asked to pronounce upon the admission of women to the medical profession, because we are supposed to know their constitution and their fitness for great mental and physical labour, and also because we know the amount of physical and mental labour required for the medical profession. We come forward and say that we believe that the medical profession is one of the most arduous to learn, one of the most difficult to follow; and if we state that a woman by her mental constitution and physical powers is fit to enter upon this profession, the women who lead the present agitation will say, "Is there any position in social or professional life from which she should be excluded?" and that may lead to the withdrawal of a large number of women from the position in which they have been placed since creation. It is not necessary for me to state in this Council what that position is—it is the comfort of the household, the bearing and the education of children. This is a question which bears on the relation of the sexes; it is a wide and important question; and I think it would be a wiser thing for the legislature to seek to determine it; and then, if they resolve that women shall enter the medical profession, this Council can be asked how best they shall be adapted to the change.

Dr. ANDREW WOOD moved the adjournment of the debate.

The motion was seconded by Dr. BENNETT, and carried.

On Saturday, June 26th, the Council again went into Committee, and proceeded with the adjourned debate on Mr. Simon's letter.

Dr. ROLLESTON: I should have been glad to have voted yesterday on this question; for there was, as it seemed to me, very little to be said after the speeches of Dr. Wood and Dr. Humphry, which, for straightforwardness and sincerity, left nothing to be desired. But, apart from that, I think that every member of the Council must have thoroughly possessed himself of the bearings of this question; at any rate, they ought to have done so, for the question has been before us since 1858, and we are now in 1875, and we really ought to have made up our minds upon it. With regard to the speech of Dr. Andrew Wood, there was no need for him to vindicate his honesty or defend himself against public opinion. But, if there were no need for Dr. Wood to vindicate his honesty, there is some need for me to vindicate the credit of anatomy. Why should anatomy be repulsive? Why should the dissecting-room be repulsive? It need not be so. If the thing be done properly, it need not be repulsive or loathsome. Dissections, like all operations in surgery, can be done badly. Even such a thing as the administration of an enema can be done in a vulgar disgusting way, or in a way quite the reverse. There is nothing that cannot be done in two different ways: a coarse way and a refined way. If students dissect in an untidy fashion, it reacts on all their work from beginning to end. Then there is the *argumentum ad hominem* which I would apply in another way. Dr. Wood is too good a scholar not to know that the sentiment, "Homo sum, nihil humanum a me alienum puto", applies to women as well as to men. Now, what are the arguments in the matter? The first great argument, against which all opposition seems to me to count for nothing, is, that a large number of persons do wish for this thing. Some women wish to be doctors; others wish to have women-doctors. Now, if you have a large number of the community who desire this, I say that is itself a reason. This feeling of people who wish to be doctors and of people who wish to have doctors of their own sex to attend them is a growing one, and has been growing from those savage times when woman was treated as a mere instrument of lust or a beast of burden. It is said that the very refined and delicate people are really quite content with men. I have not only had the advantage of coming on the Medical Council and meeting with a large number of refined and cultivated men, but I

have had even the greater advantage of meeting with a fair share of cultivated and delicately minded women. I am happy to think that there is one person here who is acquainted with some of the same women, and who will rise and speak on the same side. I know many most refined women, the aspect of whose refinement has taken first the form of a desire to give the largest and freest scope to the energies of all, and, secondly, a feeling of sensitiveness which, in the course of ages, has developed itself as to the two sexes being kept apart in those matters which are peculiar to women, such as midwifery. The women of the greatest cultivation, women of at least as great cultivation as many of the cultivated men around this table, have had just that positive feeling in favour of this enactment. As it happens, I am not in relation with any female doctor; I do not know one personally; but a great number of highly refined women are strongly in favour of this great movement. It is either a great thing or a small thing. If it be a great thing, you should not oppose it, if it have a root of goodness in it and concerns the happiness and development of the species. If it be a small thing, why make all this fuss about it? I believe that, of the few women who will attempt this, if you throw open the gates, many will succeed. It will not be, as in many other professions, that many will attempt and few succeed, but of the few who attempt it many will succeed. There is one point which has not been touched upon at all. We here in this United Kingdom are responsible for the good government of a very large part of the world; and the great want of India, for example, is to have female doctors, who may bring civilisation into the zenanas and other places of that sort where men are not admitted. Would it not, then, be better that such women should be thoroughly educated, and have a trade-mark put upon them, so that the Indian Government can trust them, than to have them going about without examination? Then comes the question, Are women equal to these things? Louis XI said: "Let the women try; there is nothing like trying;" but I should say: "Let them try, because many of them will succeed." I do not believe a large number will try, but a proportionately large number of them will succeed. Just see what some women have done. Look at Queen Christina of Sweden, who used to watch Descartes's experiments, physiological and otherwise; or look at women of our own time—Mary Somerville, Harriet Martineau, Dr. Garret-Anderson. Those are persons who possess intelligence of which I should be glad to have a small fraction. I do not mention other distinguished women, such as our present Queen or Queen Elizabeth, but such as in our own age have been fitted for this particular work. We should not be "the first to have new things tried"; but, on the other hand, I hope we shall not be the last "to lay the old aside". Let me close what I have to say with a sort of parable or apologue, which has often been used by people who have had, as I have now, to oppose an argument of this kind. It was used about the removal of the Jewish disabilities and the disabilities of dissenters. Dr. Andrew Wood made me feel young again, because I heard, twenty years ago, *mutatis mutandis*, precisely the same argument about the Jews and the dissenters. This is a good instance of it. You are told by persons like Dr. Andrew Wood just as you were told about the removal of the disabilities of Jews and dissenters, "This is a great change, a great revolution, an enormous *bouleversement*." I will tell you this story. A man was taken by his enemies. He was blindfolded, a rope was put into his hands, and then he was swung into the air, and told to hang on to the rope, because there was a precipice beneath him, and, if he did not hold on, down he would go, and there would be revolution, smash, and utter destruction of him and of public morality and public order. So he held on for many hours, till his muscles were cramped and his ligaments were all stretched, and, in one word, he tasted the bitterness of death. Then they removed the bandage; he opened his eyes, and found his feet within two inches of the ground.

Dr. THOMSON: Allow me, as a teacher as well as a member of this Council, to express my opinion in regard to this matter. It is an opinion which, as will be felt by all, I have been required to consider for a long time, and therefore, as I believe is the case with all the members of Council, I do not by any means approach this question for the first time; for I have long had it before me. I would speak first upon the wider question with which we have to deal. I think it is obvious that, among the points suggested by the letter sent to us are, first of all, the suitability of women for the medical profession; next, whether they are more suited to one branch of the profession than another; and, in the third place, the more formal question, What are the circumstances connected with examination-rules, and so forth, which prevent those who wish it from accomplishing that wish? It is quite obvious that our answer should embrace the whole of these three topics in connection with the general question. On the suitability of women to the profession, and what should be the answer referring to that point, I must say that I agree entirely with the observations which first of all

fell from Dr. Sharpey, expressed with all that wisdom and simplicity and clearness which we know to belong to all he says. I cannot allow myself to speak without also referring with similar pleasure to that which Dr. Rolleston has expressed, to what fell from Dr. Humphry. I think we are obliged to Dr. Parkes for presenting to us in the most temperate form the opportunity of correcting the too strong expression which is contained in that report of the Committee. That, I think, is the sole point now before the Council. In conceding, as I do most fully, the right of women to enter the medical profession, and in saying at the same time that I do not think them altogether suited for it, I do not shut my eyes to the difficulties that present themselves in connection with it, nor even to the objections that may be made to it. I am not influenced in this by any consideration of what has been called the question of the rights of women, or by any of the moral considerations that have been put before us; but simply by a sense of justice, of what is right and proper under the circumstances. It seems to be incontrovertible that attendance on females by females is, upon the whole, more decent and appropriate than attendance of men upon women; and I am quite sure that I am right in following Dr. Rolleston's assertion with mine, that there are a great number of refined and delicate and cultivated women in this country, who would prefer to be attended by women rather than by men. But when I say this, I must recall to the attention of the Council that they have scarcely ever hitherto had the opportunity of being so in this country. The time has not come when women will be so educated that all others will be able to derive benefit from their services; but when it does come, I am quite sure it will be found that the most superior women in this country, the most delicate and refined and best-informed, will be most glad to avail themselves of the services of those females who enter the profession. I do not in the least share in the somewhat exaggerated fears expressed by Dr. Wood. I do not, any more than Dr. Rolleston, think that a large number of females will rush into the profession after entrance is conceded to them; and I have still less fear that those who do so will attend principally upon men. My belief is, that they will devote themselves more especially to childbirth and attendance upon women and children; and can anyone doubt that, with their knowledge of the expressions and the habits of infants and children, with all their care and gentleness, if they be properly educated they will be better attendants upon children in illness than men can be? At the same time, I think it is quite right that we should face the difficulties that undoubtedly exist, and of course it is with these that I, as a teacher, would have principally to contend; but I apprehend that they are not so much of a moral or general as of an administrative kind. I have no special liking for this measure; I have no desire to see any of those connected with myself entering the medical profession; I do not look upon it in that light with great satisfaction; but I do not see why we should deny the right to any person who may feel it to be her mission, and that she has it in her power to carry it out. With reference to teaching, I may say that such is my feeling, that I would object very strongly to teaching males and females together in any subject of anatomy; but, on the other hand, if the legislature should pass the measure that is suggested, and if the body to which I belong should, after full consideration, think right to confer their license upon females, I should regard it as my duty to make the best of it, and to take measures to instruct those females in the manner that might be best for their advantage and for that of the public. If the general question be conceded, I think it is quite obvious that females may practise in any branch of the profession; but it will be very readily admitted that there is one branch which is more immediately suitable for them, as I have already said, the care of childbirth and the diseases of women and children. We have already considered what has taken place in regard to nursing in recent times, and what improvements have been introduced in that direction. Is there anything connected with the profession that nurses do not do for men; and has impropriety arisen from that or any difficulty? Certainly not. With regard to the improvement of nursing, we know what we owe to Miss Nightingale in the way of advancement of our knowledge and views upon that subject; and everyone who has come into contact with these skilled nurses who have been trained according to her suggestions, knows what a prodigious advantage it is in a hospital, or in practice of any kind, to have to do with cultivated gentlewomen who have been properly trained to their duties as nurses. If that be true of nurses, is it not still more strongly true with regard to women who choose to enter the profession? Can anyone doubt that if delicate, well-informed, well-educated, and accomplished women shall also acquire, under proper regulations, that skill and knowledge which is necessary for the practice of the profession, their entrance into the profession will not only be a great benefit in the individual instances in which they have been employed, but, I must take leave to say, will be a means of introducing more delicacy into the medical profession and

their relations to the public than often belongs to it? As to the question of examination-rules or other conditions at present preventing women from entering the profession, I think it is scarcely necessary to offer any observation, because I dare say the Council will see the propriety of the suggestion made by the Committee, that, supposing the general suitability of women to enter the profession is conceded, or measures are taken to make it possible for them to be entered upon the *Register*, there should be a full reservation of the rights of all universities and licensing bodies with respect to their powers to grant such licenses. About the special question also, which is contained in the letter, as to foreign degrees, I presume we are all as one, and there will be no difficulty there. Before I sit down, I may be excused for referring again to the point of form. Notwithstanding the decision of the Council with regard to the first paragraph, I do still feel that the report of the Committee is not exactly the answer which ought to be given to the letter from Mr. Simon. I said before, and I repeat it, that I think the custom in such cases is to answer the letter in the same form as that in which it is sent. I quite understand the objections which might be made to Dr. Bennett's proposal, because it, too, did not entirely meet my views with respect to the form of the answer; at the same time, I thought it the most suitable. While I consider the whole of this discussion as most useful, in fact necessary, to the formation of the opinions of the Council, I do hope that the President will be allowed to write this answer to the letter which he has received, embodying in any way which may be proper the opinions which have been expressed.

Sir W. GULL: I am exceedingly glad to find that the question is raised beyond the circle of corporations and universities. We have admitted that we have entire power here to consider the question on its full merits. Then comes another thing. I think we have also raised the question, at least I hope we shall be able to raise it, out of the sex relation, which seems to me to have already occupied too much consideration. Dr. Andrew Wood's admirable address had reference chiefly, I think, to the difficulties and inconveniences, and doubts, and disgusts, which beset this question as a sex question. I do not think that is a matter for us to consider. We are not recommending to Government a conscription of women; if Dr. Andrew Wood will bear that in mind, I think the whole of his argument went against the conscription of women for the medical profession. As I understand, there is to be no conscription of women; they are not to be taken *volens volens*, and made to attend some horrible results. I think, if that be considered, it is entirely for the persons about whom we are talking to consider themselves whether they are fit to do it, or whether they have a mind to do it. That is a personal question with which we have nothing to do. I think, therefore, we might leave that sexual part out of consideration, except so far as Dr. Humphry put it; for he has all the tenderness of woman, and yet has all the distinction of a most admirable surgeon; and I think he answers the question in his own person, as far as that goes. It seems to me, if we wanted an answer at all, there is an answer. But I think women must determine that for themselves. Let us consider that we are not now passing a vote, or any opinion, as to whether women shall enter the profession. If so, I must confess I should go dead against it; and I think I express the opinion of every man at this board when I say that we rather think it undesirable; and that if they could occupy themselves in some other way, we could occupy the field equally well. Still, I do not think that is a full answer; for I consider there are some parts of the medical profession that a highly trained woman could do better than a man. There are certain sex relations which might be avoided in that way with great advantage to the public. I need not say that there is a quiet scandal in certain parts of our profession about women's diseases, which probably will be got rid of by introducing high-minded, well-trained women into the practice of medicine. That is rather an important point; and the question then becomes narrowed to a very simple issue: whether we shall advise the Government that permission may be given; but I think we must give that permissive opinion with a slight *caveat*, that the entrance of women is rather dangerous. If you will look over the history of this woman's question in London, where things spring up and produce their fruits very quickly, you will see that considerable social mischief has sprung up from women of a low tone of mind entering the profession. I remember there was a letter in the *Lancet* about six years ago, giving the social history of about 150 or 160 women who had entered the profession; and I must say I think it was anything but a creditable history; and it is right to state that there are physical as well as social dangers besetting the question. I therefore do hope that we may vote for the first clause as it now stands. I do not think there is much in Dr. Parkes's addition, for it is not an amendment, but an addition. I think it is a fair concession to the strong views that are entertained by some members of this board, that we should enter a slight *caveat* in the first sentence.

Mr. QUAIN: The words "That women should not be debarred from the study and practice of medicine and surgery" were in the draft of the report to which we agreed, but we found that others differed so much from us that we thought it better to omit them; and though I agree with Dr. Parkes's addition, I think it would not be judicious, and I cannot vote for it. I think it is better to consult, in some degree, the variations of opinion in the Council, and not to include those words, for their introduction certainly created very great opposition in the Committee. I myself would not advise any female member of my family to enter the medical profession; but I confess also I agree entirely with Dr. Humphry in what he said about men. I would dissuade any male of my family from entering the profession by every means that I could. Yet I would not hinder a male from entering, nor would I hinder a female from entering; but when they had once made up their minds to do it, I would assist them by every means in my power.

Mr. TURNER: I wish to point out that Dr. Parkes's amendment on paragraph *b* in the report, the adoption of which I had proposed, contains both a subtraction and an addition. The words which he proposes to cut out are not many in number; but I think it is the opinion of many members of this Council that it is right that we should put before the Government that the special difficulties which surround this question (for it is surrounded by them), cannot safely be disregarded. I feel, therefore, very strongly indeed that it would not be right to consent to the deletion of those words. Then with regard to the addition recommended by Dr. Parkes, "But the Council are not prepared to say that women ought to be excluded from the profession", I should like to know not merely what the interpretation the members of this Council may put on these words, but what the interpretation of the public outside may be. The interpretation that will be put upon them will be that this Council are prepared to say that women ought to be allowed to enter the profession, and many arguments will be founded upon them in the light of the interpretation. I, therefore, hold that these words ought not to be inserted.

Dr. PARKES: With regard to this amendment, I shall not occupy the time of the Council very long. Its object and its purport have been most fully explained in the speeches we have heard, and especially in the admirable address of Dr. Humphry. That speech has laid down the exact reason why these words have been introduced. The fact is, as the clause now stands, it gives a direct negative to women entering the profession. I do really think it can be taken in no other light than that the Council are opposed to the introduction of women into the profession. The object of the amendment is to state that the Council will not oppose the admission of women under such regulations as may be thought proper. I think it is unnecessary to say anything more. The case is in a nutshell, and is perfectly clear. I believe that no wider question has been raised or can be raised in the Council at any time, and it is of the very greatest importance that the Council should raise itself above all party and petty considerations, and judge this on the broad principles of right and justice; and on those principles I believe from my heart that the Council cannot do otherwise than support the amendment which I now offer.

Dr. PARKES then asked permission to alter his amendment so that it might stand as follows:

"That, after the words 'which cannot be disregarded' in paragraph (*b*), the following words be inserted, 'but the Council are not prepared to say that women ought to be excluded from the profession'."

This permission was granted, and, on being put to the vote, the amendment was carried by 14 votes to 7.

Dr. ANDREW WOOD required that the names and numbers of those who voted for and against the amendment, and of those who did not vote, should be taken down. Majority, 14: Mr. Quain; Dr. Rolleston; Dr. Humphry; Dr. Pyle; Dr. Thomson; Dr. A. Smith; Mr. Macnamara; Dr. Leet; Dr. Apjohn; Dr. Sharpey; Dr. Parkes; Sir W. Gull; Dr. Begbie; Dr. Stokes. Minority, 7: Dr. Bennett; Mr. Bradford; Dr. Haldane; Dr. Andrew Wood; Dr. Fleming; Mr. Turner; Dr. Quain. Declined to vote: The President; Dr. Storrar; Sir D. Corrigan.

The amendment was then put as a substantive motion.

Dr. ANDREW WOOD: If this motion goes forth to the country, it will state that there are difficulties in the question, that in the interests of the public cannot be disregarded; and, after saying that the profession is not fitted for women, you go on to say that they should be admitted—that you are not prepared to exclude them, that is to say, that you are prepared to admit them. It amounts to that, and will be so read out of doors, and by the women doctors. I move as an amendment that paragraph *b* read thus:

"One of the questions submitted to the Medical Council by Mr. Simon is, 'Whether women ought to be able to look to medical prac-

tice, or certain branches of it, as open to them equally with men as a profession and means of livelihood?'

"With regard to this question of the admission of women to the medical profession, the Council, after mature deliberation, have to express their opinion that, considering the nature of the studies requisite to be gone through in order to attain that knowledge of the various branches of medicine and surgery necessary to constitute a safe and efficient practitioner; and, considering that the practice of the medical profession infers, even in men, peculiar moral and physical qualities, as—bodily strength, nerve, and endurance to face much toil, anxiety, responsibility, perplexity, and danger, and that by nature women have not been so constituted as to fit them for such a profession, it is inexpedient to encourage and give facilities to women for entering the medical profession. The Medical Council, therefore, do not recommend legislation with the view of removing the difficulties in the way of women entering the medical profession."

Dr. QUAIN: I have very great pleasure in seconding Dr. Wood's amendment, and, if I wanted any reasons for doing so, I would appeal to the arguments of those who voted for Dr. Parkes's amendment. Better or stronger reasons for not allowing women to enter the profession I never heard than those offered by some members around this table. But I go a little beyond that, to the report of the Committee which was produced to us. To my mind, no objections that can be raised to the admission of women to the medical profession can be more convincing than those given in the report which Dr. Parkes most cleverly got us to rescind. I confess, when I voted for rescinding the first paragraph of the report, it was with the hope that something much stronger would be inserted; and I believe it was the opinion of all those who voted the same way, or certainly of a very considerable number. I shall vote for Dr. Wood's amendment.

Dr. A. SMITH could not support Dr. Wood's amendment, because it ignored the whole question.

Dr. FLEMING regretted that Dr. Wood should bring forward such an amendment, when it was evident that it had no chance of passing.

Dr. Wood's amendment was put to the meeting and lost, 4 voting in its favour, and 12 against it.

Dr. Parkes's motion was then put and carried, the numbers being—For, 14; against, 7.

Mr. TURNER proposed the adoption of paragraphs *c* and *d* together.

Mr. QUAIN seconded the motion, which was carried *nem. con.*

Mr. TURNER proposed the adoption of the first clause of paragraph *e*.

Mr. QUAIN seconded the motion.

Dr. BENNETT objected to laying down regulations for what might never take place; and therefore moved: "That the whole of paragraph *e* of the report be omitted."

Sir D. CORRIGAN seconded the amendment.

Dr. ROLLESTON supported the motion.

Dr. A. SMITH expressed his intention to vote for the amendment.

Dr. HUMPHRY was in favour of the paragraph being retained.

Dr. Bennett's amendment was put to the meeting and lost, and the original motion for the adoption of paragraph *e* was carried.

Mr. TURNER moved the adoption of Section I of paragraph *e*.

Mr. QUAIN seconded the motion.

Sir D. CORRIGAN moved the omission of the words "in the interests of public order".

Mr. MACNAMARA seconded the amendment, which was put and negatived; and the paragraph as proposed was adopted.

Mr. TURNER moved the adoption of the next section, but after a short discussion it was resolved to incorporate section 3 with it, and after some verbal alterations, they were passed as follows:—"That with reference to the 'Examination-rules or other conditions' which prevent women from accomplishing their wish, the Medical Council have to state that under the provisions of the Medical Act, those persons only can be placed upon the *Medical Register* who have been admitted to medical degrees in the Universities, or who have been admitted Fellows, Members, or Licentiates of one of the Medical Corporations of the United Kingdom. Should the Universities and Corporations be unable or unwilling to admit women to their degrees, or to admit them as licentiates or members of the respective corporations, the Council are of opinion that sufficient provision would be made to enable women to obtain a 'legal status as medical practitioners in this country', if an Act of Parliament were passed which should enable the Medical Council to recognise such examination or examinations as the Medical Council may from time to time deem sufficient, for the purpose of granting admission of women to the *Medical Register* under the title of 'Licensed Practitioner of Medicine'. The education and examinations for these licenses should be under the supervision of the Medical Council in the same way as is required for the other licenses

of this country. The Council are of opinion that any course of legislation which would interfere with the free action of the universities and corporations mentioned in schedule (A), in respect of the medical education, examination, and licensing of women, is undesirable."

Mr. TURNER proposed the adoption of Clause 4.

Mr. QUAIN seconded the motion.

Dr. BENNETT opposed it as being unnecessary, and as binding the Council to a particular kind of examination.

Sir WM. GULL supported the clause, and maintained that the ladies themselves and the profession ought to know that the examination of female candidates was equivalent to that of males.

The clause was adopted.

Mr. TURNER moved the next clause relating to midwifery, which (with the omission of a few words at the end) was also adopted.

It was unanimously agreed to omit the last paragraph of the report, stating that on some points the Committee were not unanimous.

The Council then resumed.

Mr. TURNER moved, Sir WM. GULL seconded, and it was agreed :

"That the report, as amended by the Council in Committee of the whole Council, be received, entered on the minutes, and adopted."

It was moved by Dr. ANDREW WOOD, seconded by Dr. ROLLESTON, and resolved : "That the President of the Medical Council be directed to transmit to the Lord President of the Privy Council a copy of the report on Mr. Simon's letter, adopted by the Medical Council."

Sir DOMINIC CORRIGAN moved, and Dr. STORRAR seconded : "That the Minutes of the Council, and of the Committee of the Council, relating to Mr. Simon's letter, be forwarded to Mr. Simon, for the information of the Lord President."

Sir WILLIAM GULL moved as an amendment, and Mr. QUAIN seconded, "That the president be requested to send the report of the Council to Mr. Simon to be transmitted to the Lord President without further remarks."

The amendment was negatived. The original motion was then put to the vote and carried.

It was moved by Dr. ROLLESTON, seconded by Mr. BRADFORD, and agreed, "That Dr. Bennett's letter of June 24th (see page 16) be placed upon the minutes of this day, and be forwarded together with the other minutes already ordered to be sent to Mr. Simon."

COLUMN FOR THE CURIOUS.

WATER OF WORMWOOD.—A correspondent of the *Chemist and Druggist* gives the following account of water of wormwood :—"This is mentioned in 'The vertuose boke of Distyllacyon of the waters of all manner of Herbes with the figures of the stylatoryes Fyrst made and compyled by the thyrte yerres study and labour of the most conyng and famous master of phisyke Master Jherombrynswyd, now newly translated into English, etc. Imprinted at London in Southwark by me, Peter Treveris, dwelling in the sign of the wodows. In the yere of our lord god MDXXVI the xxvii day of July.'"

"chapter cclxxv.

"Water of wormewode.

"Absinthium in latyn. . . . The same water hath the right merue- louse great vertues, for it is sayde of dyvers persones that the iuce or water of the same herbe hath he geuen for a token in maner of incantacyon unto gret captaynes or conductours of an hoste ovarney beleivynge that thrugh suche a token they sholde haue victorye against their enemyes.' Also recommended for 33 other complaints and purposes."

SNAKE-HEADS STEEPED IN SPIRITS A CURE FOR EPILEPSY.—A correspondent of the *Melbourne Record* states that he is acquainted with a person who has been cured of epilepsy by taking three tea-spoonsful of rum in which the heads and necks of black snakes had been infused for ten days. The influence of imagination is so great, that the remedy might be worthy of a trial in nervous epilepsy, and many other nervous affections. The proportions were a pint of strong rum—any other spirit would do as well—to the heads of three full-grown snakes. In all countries where poisonous snakes exist, infusing the head or heads, according to the size of the snake, in spirits, and taking some of it daily, is considered of service in many diseases. This man was told to try it by a negro from Jamaica. There is a notice of its being used in that island in some of the early English medical journals.

BRITISH MEDICAL ASSOCIATION: SUBSCRIPTIONS FOR 1875.

SUBSCRIPTIONS to the Association for 1875 became due on January 1st. Members of Branches are requested to pay the same to their respective Secretaries. Members of the Association not belonging to Branches, are requested to forward their remittances to Mr. FRANCIS FOWKE, General Secretary, 36, Great Queen Street, London, W.C.

BRITISH MEDICAL JOURNAL.

SATURDAY, JULY 3RD, 1875.

THE PRACTICE OF MEDICINE BY WOMEN.

THE debate in the Medical Council on the admission of women to a legal status as medical practitioners in this country, is one of the most important which has been held since the formation of the Council. We have reported it, therefore, at length; and we feel no doubt that it will be read with very great interest. The general conclusions of the report adopted, with Dr. Parkes's amendment, are such as we have expressed more than once as those which seem to us most fairly to accord with the general balance of opinion, with the conflicting rights of the public and of the existing corporations. There are many who think that women are unfitted for practice in any department of medicine; there are others who think them peculiarly fitted for some departments of practice; there are others again who, irrespective of either opinion, consider that it is unjust to prevent those women who can fulfil the required tests from entering on this means of honourable and remunerative exertion; and there is a large section of the public which claims the right of employing qualified women as medical attendants, and desires to be enabled to distinguish the qualified from the unqualified persons, as in the case of men. In view of these varied opinions and requirements, we think the Council have adopted a very moderate and prudent course. As we present the report at length, we may abstain from further comment.

THE ROYAL COMMISSION ON VIVISECTION.

THE recent appointment of a Royal Commission "to inquire into the practice of subjecting live animals to experiments for scientific purposes, and to consider and report what measures, if any, it may be desirable to take in respect of any such practice", will probably be welcomed by those who are engaged in the performance of such experiments, as well as by those who consider them unlawful and detestable; for, while the latter hope that the inquiry now beginning may lead to the total abolition of vivisection, the former feel confident that, whatever else it may or may not do, it will at least clear English physiologists from the grievous charges brought against them. As an example of these charges, we may fairly take the following extract from an advertisement daily inserted in the *Times* by the Society for the Abolition of Vivisection, and accompanied by the offer of a reward of twenty pounds for information leading to the detection and conviction before a magistrate of any one engaged in the practice.

"The hideous cruelty of dissecting living animals, or inflicting on them, though innocent and defenceless, multitudinous deaths of excruciating and protracted agony, has secretly grown up in this nation—a nation which for ages past has been nobly distinguished by the courageous and unsanguinary character of its people. This moral ulcer has spread widely, and (whether it be or not a dreadful form of insanity) become dangerous and demoralising to society—a blot on civilisation—a stigma on Christianity. The public has little idea what the horrors of vivisection are; its crimes in studied, ingenious, refined, and appalling torture, in wantonness, uselessness, and wickedness,

cannot be surpassed in the annals of the world. It therefore calls for extirpation by the legislature, cruelty being not only the worst of vices in itself, but the most retributive to mankind, more especially when perpetrated by the refined and educated."

Now, it is exceedingly unpleasant for any one, however thoroughly he may be convinced that his experiments are productive of the utmost good to mankind, and prevent a thousandfold more pain than he inflicts, and however conscious he may be of the purity of his motives in making these experiments, to see his doings thus stigmatised in the daily papers; to see a reward offered for his conviction; and, worse still, to know that many good men and women, for whom he has the greatest regard, and for whose opinion he has the greatest respect, misled by such erroneous statements as the preceding, look upon his actions with horror, and class him in their own minds with the vilest of criminals. Such notions as these will, no doubt, be removed by the Report of the Royal Commission; but still differences enough will remain between the opponents and supporters of vivisection to render a reconciliation very difficult. It is quite impossible that the proceedings of the Royal Commission should prove quite satisfactory to both parties; it is by no means improbable that they will satisfy neither; but, at any rate, the names of the members composing it afford a guarantee that a fair hearing will be given to both, and such measures recommended as are likely to be approved by the British public. The antivivisectionists will be represented by Mr. Hutton, the interests of medical teaching by Mr. Erichsen, and those of science by Professor Huxley. The experimental physiologists have no representative; but we have no doubt that they will willingly trust their cause to the sound common sense of Lords Cardwell and Winmarleigh and Mr. Forster, when once these gentlemen become acquainted with the facts of the case, which Sir John Karslake will assist them in obtaining. Their first feeling, on commencing their inquiry, will probably be one of astonishment to find how few men are engaged in performing experiments on animals in this country, and to see how little pain is, thanks to anaesthetics, actually inflicted. In comparatively few of the medical schools are experiments on animals shown to students for purposes of demonstration; and those which are shown are performed, we believe, invariably under the influence of anaesthetics. The feeling is, we believe, universal amongst British physiologists, that it is unjustifiable to put an animal to pain for the purpose of demonstrating some fact already ascertained; but it will be one of the duties of the Commission to decide whether or not an experiment may be performed on an animal under the influence of anaesthetics, and a perfectly painless death inflicted, for the purpose of impressing some important physiological fact upon the memories of medical students; for it must be borne in mind that knowledge is a thing of degrees, and many a fact which the student knows sufficiently well to describe in an examination-paper has not made that impression upon his mind which will enable him properly to utilise it as he stands, perhaps years afterwards, in unfamiliar circumstances by the bedside of a patient, and when a thorough grasp of it in all its bearings may enable him to decide on a proper course of treatment. Knowledge of the former kind is readily acquired by lectures and diagrams; but few will deny that knowledge of the latter kind is more readily imparted by demonstrations.

The main question, however, with which the Royal Commission will have to deal, is the infliction of pain on the lower animals by physiologists in their attempts to discover new facts regarding life and the various functions which constitute it. The Commission will have to determine how far the infliction of pain for such purposes is justifiable, and where and by whom experiments involving it may be performed. Dr. Playfair, in the address which appeared in our columns, pointed out what is well known to men of science. It is only series of experiments which lead to beneficial results, while a single experiment for the determination of some doubtful point must commonly be useless as a link in a chain. The truth of this statement is undeniable; but his argument has been adopted and overstrained by a recent writer,

and the value of isolated experiments as links has, we think, been underrated. Onlookers often see most of the game; and a third person is not unfrequently able to detect the reason of the discrepancy between the opposite conclusions drawn by two observers from researches of the same kind, and, by making one experiment more, to reconcile the conflicting statements. Occasionally, too, a physiologist proves a fact to his own satisfaction by a series of experiments, while his very interest in the question prevents him from seeing the possible fallacy which may entirely vitiate his conclusions. Here again an outsider has the advantage, and, after noting the weak point, may by a single experiment overturn the conclusions, although the facts remain; or may confirm them beyond the possibility of doubt, by supplying the missing link, and rendering the chain of evidence complete.

An example of this may be found in the researches of Schiff and Heidenhain on the secretion of bile. Schiff discovered that, when he injected bile into the duodenum, the secretion of bile from the liver was increased, and he therefore concluded that the bile had been absorbed from the bowel, and was again passing out unchanged through the liver. This occurred so quickly, that Heidenhain could not believe there had been time for the bile to pass round in this way; and he was therefore inclined to suppose that its presence in the bowel stimulated the liver to increased action, and the formation of more new bile. A single experiment, in which he injected rhubarb into the duodenum, and found it reappear in the bile from the liver in less than a minute, was sufficient to resolve his doubts (although he might repeat it, to avoid any risk of error), and to establish on a firm basis the doctrine of the reabsorption of bile, so important in practical medicine. So intimately entwined are the processes of life, that it is impossible at any time to say of what importance the knowledge of an apparently trivial and isolated fact may afterwards be, any more than the immense potentialities involved in the rattle of a kettle-lid caused by the escaping steam could have been foretold at the moment when it was first observed by James Watt. But so long as facts, whether isolated or connected, remain simply scientific curiosities, they have comparatively little attraction to the English mind, which is unusually practical, and, as a rule, delights more in applying knowledge to the wants of daily life, than in acquiring it simply for its own sake. It is in this practical nature of the English character, that we must seek for an explanation of the recently awakened thirst for physiological knowledge, and the consequently increased number of experiments upon animals. As long as physiology appeared to be only an interesting study, having but a remote bearing on practice, we were content to leave it in the hands of the French and Germans; but now that it has progressed far enough for us to see how all-important it is becoming in the advance of the kind of exact knowledge to which we must look for progress, the prevention, recognition, or treatment of disease, we have begun to pursue it with an eagerness that may in a few years again place Englishmen, as in the days of Harvey, Hales, and Lower, in the foremost rank of the students of life and the benefactors of humanity.

Absolutely dependent on experimentation as physiology is, the question so often asked by the opponents of such experimentation, "Of what good is it?" might well be answered by Faraday's "Of what good is a baby?" for physiology is undoubtedly still in its infancy, although it is rapidly growing and beginning to be useful. The services it has already rendered to medicine are too numerous to be catalogued here. What further services it may yet render it is impossible at present to say; but, whether its future development will go on in England, or will be confined to continental countries where laboratories are built, professorships endowed, and the expenses of experiments defrayed by the governments, will in no small degree be determined by the proceedings of the Royal Commission just about to begin its work.

An antivaccination society exists in Dresden. It has recently published a programme in which it announces its intention of resisting, by all lawful means, the law on vaccination issued last year.

THE DUCHESS OF TECK has laid the foundation stone of a children's infirmary at the Princess Mary's Village Home at Addeleston.

THE specimens added to the Museum of the Royal College of Surgeons during the past twelvemonths are now exhibited in the theatre of the College, where they will remain until Thursday, July 8th.

IN a recent published list of Waterloo survivors, the name of Dr. G. S. Jenks, who served as assistant-surgeon in the 10th Hussars, was omitted. Dr. Jenks is now living at Bath. He is the senior Vice-President of the British Medical Association.

WITH her usual thoughtful kindness, Her Majesty the Queen has commanded that a considerable quantity of cast off linen for surgical purposes should be sent from Buckingham Palace to the London Hospital for the use of the patients.

DRS. KAPOSÍ, Auspitz, and Neumann, have been appointed extraordinary professors of Dermatology and Syphilis in the University of Vienna. They have hitherto held the position of *privat-docent*. Dr. Carl Störk, *privat-docent*, has been appointed extraordinary professor of Laryngoscopy in the same University.

A MOVEMENT is on foot for the purpose of teaching swimming systematically to the pupils of elementary schools in the metropolis. An organised system of teaching this useful art has long been wanted, and, if carried out effectually, will be the means of saving many valuable lives annually.

A SOCIETY, under the name of *Società di soccorso agli Asfissiatì*—having, as its names indicates, the same objects as our Royal Humane Society—has just been founded at Florence. Among the promoters are Sir James Hudson, Professor Pacini, and other professors in the University, and a number of the principal inhabitants, medical and non-medical.

A NEW hotel, under the name of the Hôtel du Lac, was opened at St. Moritz on June 15th. It is described as being in a beautiful situation, with a commanding view, in the neighbourhood of the baths and opposite the lake. It is provided with every modern comfort; it contains 25 rooms and 240 beds, a ladies' saloon, a reading-room, a conversation-room, with coffee, billiard, luncheon, and dining-rooms. There are douche-baths in the hotel.

THE LATE DR. DEMARQUAY.

OUR Paris correspondent writes, under date June 27th. It is with unfeigned regret I have to announce the death of M. Demarquay, which took place somewhat suddenly on Monday, the 21st instant, at Longueval, his birthplace, a small village in the department of the Somme, in the sixty-first year of his age, from cancer of the stomach. The name of Demarquay is familiar to the medical world, as he not only distinguished himself by his writings, which proved him to be a *savant* in the true sense of the word, but was also one of the ablest and most practical surgeons of the day. M. Demarquay was surgeon to the "Maison Municipale de Santé", more familiarly known as the Maison Dubois, where he had made himself very popular. He was far above political influences, which is a rare thing for a man of his position in France, so that he had none but friends in the ranks of all parties. This he showed during the siege of Paris, and subsequently during the Commune, when, as surgeon and one of the founders of the "Ambulance de la Presse", he rendered the most unreserved and signal service. M. Demarquay was a member of the Academy of Medicine, and, had he lived, would doubtless have one day taken his seat at the Institute. His professional services were rewarded by the State by promotion to the dignity of Commandant of the Legion of Honour. His funeral took place at Longueval, and, among the mourners, was observed a man with a pair of wooden legs, his own having been removed by M. Demarquay, as they were shat-

tered by a Prussian shell during the war. Born of poor parents, M. Demarquay died a millionaire. He was never married, and, consequently, bequeathed a portion of his large fortune to his poorer relations, and the remainder was distributed as follows: £4,000 to the Paris School of Medicine for the foundation of an annual prize; £400 was reserved and made over to one of his friends and disciples for the purpose of putting together and publishing his loose manuscripts. A man of literary pursuits, M. Demarquay possessed a very extensive library, which is to be distributed among his friends, who will also inherit the various articles of curiosity with which his apartments in the Rue Taitbout teemed.

THE COUNCIL OF THE ROYAL COLLEGE OF SURGEONS.

THE numbers polled at the College on Thursday last for the candidates for the Council were as follows:

Mr. Prescott Hewett . . .	127	Mr. Spencer Smith . . .	97
Mr. Cooper Forster . . .	110	Mr. Alfred Smee . . .	30
Mr. John Birkett . . .	109	Mr. E. L. Hussey . . .	29

The first three gentlemen were thereupon declared duly elected members of the Council. Many Fellows of the College who put in an appearance late in the afternoon, were unable to vote; since, no vote having been tendered for ten minutes, the President, in accordance with the bye-law of the College, soon after 4 P.M. declared the voting ended. It will be seen that the strong combination in favour of Mr. Birkett and Mr. Forster was successful. Mr. Spencer Smith, however, polled a very large number of votes, and we cannot but regret that his just and high claim to a continuance of his career at the College should fortuitously have been cut short, when he was within grasp of those high honours which he would most worthily have borne.

DISCUSSION ON PUERPERAL FEVER.

THIS discussion will be brought to a close on Wednesday next, when Dr. Fordyce Barker of New York, who is at present in London, will make some remarks in favour of the specific nature of the disease. Mr. Spencer Wells will reply upon the whole debate. Dr. Newman of Stamford is expected to show the uterus of a woman on whom he successfully performed Cæsarean section some years ago.

SCARLATINA IN SOUTH KENSINGTON.

WE publish in another column a note from "the medical attendant" concerning the mysterious outbreak of scarlatina among the guests at the recent entertainment in South Kensington. This outbreak, to which he refers as "unparalleled in suddenness, variety of age, numbers, and rapidity", caused no small excitement, since nearly half of the guests at a large dinner are understood to have been subsequently attacked with scarlatina proper, and others with the less defined symptoms of abortive scarlatina-poisoning. The hosts and the members of their family were entirely free from any source of infection. Circumstances at present point to a mode of infection such as that which has more than once been traced in these columns, viz., the conveyance of fever-poison by milk; but the investigation, which is being carried on by the highest sanitary authorities, with the assistance of the parties concerned, is not yet completed. When concluded, it will probably form a very instructive episode in sanitary history.—Dr. T. O. Dudfield, the able and active Medical Officer of Health of Kensington, writes on this subject: "I am acquainted with several cases of illness from this disease in South Kensington, some of which have arisen under peculiar circumstances that are now undergoing rigorous investigation. So far, no death has occurred, and, although nearly three weeks have elapsed, I believe the disease has not spread from any of the persons originally attacked to any other persons. This subject will continue to receive the most attentive treatment in my department; but I need hardly remind your vestry that I have no power to compel disclosure of the occurrence of cases of infectious disease, and that it is often only when death has taken place, and the cause of death has been registered, that information reaches me. Although in the special outbreak to which I have referred these remarks do not apply, there is usually considerable difficulty in obtain-

ing information in these cases among the wealthier classes; and this would be a source of greater regret, and a greater evil than it is, were it not that medical men are fully alive to the importance of measures for isolating the sick, and preventing the spread of the disease. As an illustration of the exaggerated statements abroad, with reference to scarlet fever, I may mention that, not many days since, I was gravely informed that a number of persons, variously stated at from two to seven, were lying dead in one house in which I ascertained, by personal inquiry, that there had not been a single case of the disease! Nevertheless, it behoves us to be alive to the probability of a sharp epidemic. In my Report, dated October 21st, 1874, I informed you that an epidemic was due. We had a foretaste of it last year. The disease abated in the usual manner after a time. The greatest severity of the epidemic may be expected this year, after which the disease will probably relapse into a state of quiescence for a few years."

THE DEATH-RATE FROM ZYMOTIC DISEASES.

THE weekly return of the Registrar-General states that not a single death from either of the seven principal zymotic diseases was registered last week in Portsmouth, whereas more than 25 per cent. of the deaths in Salford were referred to them. The high zymotic death-rate in Hull (S.2) was caused by whooping-cough and diarrhoea. In London, the 1,413 deaths registered during the week, included 2 from small-pox, 25 from measles, 62 from scarlet fever, 12 from diphtheria, 62 from whooping-cough, 27 from different forms of fever, and 77 from diarrhoea; thus to these diseases 267 deaths were referred, against 224 and 221 in the two preceding weeks. These deaths exceeded the average by 2, and were equal to an annual rate of 4 per 1,000. The fatality of diarrhoea begins to show more than its accustomed increase at this period of the year, notwithstanding the recent low temperature. The deaths referred to this cause, which had been 31 and 54 in the two previous weeks, further rose to 77 last week, and exceeded by 17 the corrected average number in the corresponding week of the last ten years; 56 were of infants under one year of age. The deaths of three adults and of two infants were referred to simple cholera or to choleraic diarrhoea. There were 13 deaths in London during the week "in childbirth", which much exceeded the average number. The Registrar-General observes that the greatest precautions are required on the part of both medical men and nurses during the prevailing epidemic of scarlet fever.

ROYAL COMMISSION ON VIVISECTION.

THE following are the names of the gentlemen appointed to act as her Majesty's Commissioners to inquire into the practice of subjecting live animals to experiments for scientific purposes, and to consider and report what measures, if any, it may be desirable to take in respect of any such practice:—Viscount Cardwell, Lord Winmarleigh, the Right Hon. W. E. Forster, M.P.; Sir J. B. Karlake, M.P.; Mr. T. H. Huxley, Professor of Natural History in the Royal School of Mines; Mr. John Eric Erichsen; and Mr. Richard Holt Hutton.

A NEW LUNATIC ASYLUM FOR SURREY.

AT a meeting of the Surrey magistrates on June 29th, it was decided, in consequence of the inadequate accommodation for lunatics which at present existed, to erect an additional asylum for 1,000 patients. A committee was appointed to purchase a site, and carry out the plan at a cost not exceeding £120,000.

THE DISCOVERER OF ANÆSTHESIA.

THE Americans have erected a colossal bronze statue in honour of Horace Wells, the discoverer of anæsthesia. The legislatures of Connecticut and the City of Hartford having each voted a sum of 5,000 dollars some years ago for that purpose. Funds are being now collected for the purpose of providing a bronze pedestal for the statue.

A NEW METROPOLITAN SICK ASYLUM.

ON June 24th, the president of the Local Government Board was present at the opening of a new asylum for the sick poor, which has

recently been erected by the managers of the Central London Sick Asylum District, on the site of the old Strand Union workhouse, in Cleveland Street, Fitzroy Square. The managers of the same asylum district already possess a similar institution at Highgate, both having been erected under the provisions of the Metropolitan Poor Act of 1867, for the purpose of receiving from the workhouses of the co-operating unions of the district cases of acute sickness. The new asylum has accommodation for 281 patients, exclusive of the necessary staff. The total cost of the asylum, including its site and the furniture, amounts to £32,458, equal to £115 10s. per bed; the necessary provision for the staff is included in these amounts. The president of the Local Government Board having expressed his entire satisfaction with the institution, its arrangement, and fittings, the hospital was formally declared to be open by Sir Sydney Waterlow, the chairman of the board of managers of the Central London Sick Asylum District.

SCOTLAND.

ON Saturday last, the old lunatic asylum at Montrose was struck by lightning and damaged considerably.

THE death of Dr. Paterson of Rothesay is announced. He was the first to introduce the system of hydropathy into Scotland, and his establishment, opened in 1843, was one of the largest of the kind in this country.

ON Wednesday the 23rd ult., Mr. Annandale ligatured the external iliac artery, in the Edinburgh Royal Infirmary, for a large femoral aneurism. The patient is so far reported as doing well.

PROPOSED ENLARGEMENT OF THE EDINBURGH MEDICAL SCHOOL.

THE extramural lecturers in Edinburgh, feeling themselves cramped in their present incommensurable class-rooms, have been considering for some time what steps should be taken in order to obtain accommodation more suitable to the size and number of the classes. Nothing definite has as yet been agreed upon, but an architect has been consulted as to the best means of providing what is wanted. One difficulty is the large outlay required for a suitable building, and the matter at present stands adjourned for future decision.

GLASGOW ROYAL INFIRMARY: PROPOSED MEDICAL SCHOOL.

THE proposal, frequently advocated in these pages, to have a school of medicine in connection with Glasgow Royal Infirmary, has at length taken practical shape. The Royal Infirmary is about to apply to the Crown for a new charter or a modification of their original one; and, among the things embodied in this charter, is the power to form a medical school in connection with the hospital. At a meeting of the subscribers, at which the draft of the charter was approved, some discussion took place as to the form which this school ought to take. Professor Gairdner strongly deprecated the idea that the infirmary should attempt to endow, in any form, lectureships on the various subjects of medical education. The draft charter presented to the meeting distinctly sought powers "to institute, and aid by pecuniary assistance and otherwise" the proposed medical school. Apart altogether from other considerations, it is very doubtful whether an hospital depending on the yearly contributions of the charitable would be warranted in giving any direct pecuniary assistance to a medical school. But there is this further objection. The University has always refused to recognise the Andersonian University; in great part, no doubt, because of its objectionable name, but also because it presumes to be a rival institution. If the infirmary also propose to set up and endow a medical school, to make as it were a third medical college, then it is exceedingly doubtful whether the University will recognise its teachers. It seems that no such direct endowment is contemplated. The secretary of the infirmary writes that the phrase, "by pecuniary assistance or otherwise", should have been struck out of the draft before it was presented. But this hardly alters the matter. They may still con-

template having a set of teachers, one for each branch, who, if not endowed, will be favoured with the use of class-rooms, etc. Now, this would be very much like the Andersonian over again. Dr. Gairdner's proposal, that the matter should be arranged on an entirely open basis, seems a much better way. Let the teaching of the several subjects be open to any young man who thinks he can attract an audience, instead of appointing some one specially for the subject, and, if that be the case, then the University can hardly refuse to acknowledge the individual teachers. If the infirmary directors venture to arrogate to themselves the power of appointing lecturers, whom they may call even professors, they can hardly expect the University to homologate their appointment by recognising their nominees. It would be an assumption of powers for which they have no kind of qualification, and introduce into the directorate a patronage which they will be much better without. In the meantime, it may be noted that two gentlemen who have received permission to give courses of lectures in the infirmary, have applied to the University for recognition. We understand that there is every likelihood of this recognition being granted. It is rumoured that two others contemplate taking a similar step.

ACCIDENT TO THE SIMPSON STATUE.

MR. BRODIE, R.S.A., has now finished his design for the Simpson statue, and on Saturday the model was to have been sent to London to be reproduced in bronze. The figure, which is eight feet high, is represented in a sitting posture; this, with the pedestal, making a height of about twenty feet from the ground. Sir James is represented in academic robes, as if in the act of lecturing to his students. It was expected that in six months at the latest we should have seen the statue in its place in the East Princes Street Gardens, but, unfortunately, while being raised in a crane at Leith docks, for the purpose of packing it on board ship for transference to London, the crane broke, and the box containing the statue fell a distance of about six feet. The amount of damage done is not yet known, as it was at once taken back to the artist's studio. The head and hands are safe from injury, as they were, as usual, packed separately from the rest of the figure.

THE NEW UNIVERSITY BUILDINGS.

A DEPUTATION of the University Extension Committee waited upon the City Road Trust of Edinburgh, last week, in support of an application for leave to extend their building operations so as to include the footway on one side and a part of the carriage-way of Park Place, to the extent of thirty-five feet. They propose to give up to the Road Trust, in return, a piece of ground at the south-east end of the proposed buildings, and point out that the present foot and roadway in Park Place will be of no use to the public when the present houses are removed. The question was remitted to the justices who have to be consulted.

DRAINAGE OF CRIEFF.

A SPECIAL meeting of the burgh commissioners at Crieff was held lately, to consider the charges made by the architect, the majority of the commission considering them too high. A partial system of drainage was suggested as involving less outlay; but it was eventually determined to request the engineer to modify his charges, before any further move be made.

DEATH OF DR. TROTTER OF DALRY.

WE regret to announce the death, last week, of Dr. Trotter of Dalry, one of the last of a phalanx of authors produced by Galloway in the early part of the present century. After enjoying for many years a large practice, Dr. Trotter retired some years ago, and devoted the remainder of his life to literary and antiquarian pursuits. He published several tales, and was a frequent contributor to general periodicals. His collection of antiquities was one of the most valuable in the south of Scotland, while he possessed a fine library of rare works on his favourite subjects. Dr. Trotter's family was eminently a medical one;

his grandfather, father, brother, and five sons being all members of our profession. He has left behind him an autobiography and a large collection of letters from some of the most eminent men of his time.

THE ANDERSONIAN UNIVERSITY, GLASGOW.

THE annual meeting of the trustees of the Andersonian University, Glasgow, was held on June 23rd. After detailing the changes that had taken place in professorships during the past year, the report announced the receipt of £6,000, under the will of the late Mr. Ewing, for general purposes, with £1,000 to build a suitable fireproof room for his collection of musical instruments, and other smaller sums. The late Sir Malcolm Kerr had bequeathed the University £1,000, to found three bursaries in philosophy, anatomy, and botany. Professor Bischoff had resigned the chair of technical chemistry.

WASTE OF WATER IN GLASGOW.

A SPECIAL meeting of the Water Committee was held on June 23rd, to consider the enormous waste of water going on throughout the city. The mover of the first resolution stated that the waste of water going on in Glasgow for domestic purposes amounted to about fifteen gallons per head daily. Thirty-six million of gallons of water passed through the city daily, and, taking public works into account, it might be fairly estimated that fifteen million gallons were daily wasted. The meeting being too small to dispose of the question as to the best method of remedying this abuse, the matter was adjourned.

DEATH OF PROFESSOR OSWALD BELL OF ST. ANDREW'S.

THE town and University of St. Andrew's have just suffered a severe loss in the premature death of Dr. Oswald Bell, professor of medicine in the University; and the loss will be widely felt among the inhabitants of the district, and the numerous visitors who crowd from all parts of Scotland to the little seaside town during the summer, and who looked upon Dr. Bell as a personal friend as well as a kind and skilful physician. Appointed twelve years ago as successor to Dr. Day in the chair of medicine and physiology, he discharged admirably his duties as a lecturer, and managed, with no less success, the business devolving upon him as head of the medical faculty. The arrangements for the medical graduations were almost entirely in his hands, and the unvarying courtesy and care with which he conducted the arrangements, are familiar to all with whom he came into contact. Dr. Bell was only thirty-eight years of age, but leaves behind him a larger and more sincere band of mourners than many an older man.

IRELAND.

SMALL-POX AT ATHENRY.

AS the prevalence of small-pox in Galway has been denied, the following is a correct list of the number of cases at Athenry from March 1st to June 27th. Cases of small-pox, 153; treated in hospital, 53; discharged cured from hospital, 11; died in hospital, 10; died out of hospital, 28. The number of cases is diminishing, and very shortly we may expect to hear that the disease has died out.

THE WHISKEY FIRE IN DUBLIN; ITS MEDICAL AND SANITARY ASPECTS.

THE great whiskey fire which occurred in Dublin on the night of June 18th has many interests from a professional point of view. The district in which the fire took place is one of the oldest and poorest of Dublin. A large number of tenement houses were completely destroyed, and many others injured. The destruction of these wretched houses is, to a great extent, a blessing, as all those destroyed, with one or two exceptions, were the haunts of epidemic disease, and furnished annually large supplies of patients to the Cork Street Fever Hospital, which stands within a few hundred yards of the scene of the disaster. Whatever the remote benefits may be, the present state of the displaced poor people is not only sad, but very alarming. They have been reduced to absolute poverty, and merely saved from starva-

tion by the liberality of their wealthier neighbours. They have obtained house-accommodation for the present in the already overcrowded houses of their neighbours, and it is manifest that a very short duration of the present state of overcrowding and insufficient food and clothing supply will promote an epidemic outbreak. During the progress of the fire, a considerable but not very large number of dissipated wretches drank large quantities of the spirit, which was flowing about the streets in veins of fire. Some thirty of these persons were brought to the hospitals in a state of coma, and several deaths occurred in consequence. The whiskey was of unusual strength, and a good deal of it new. The scene on the morning after the fire, exhibited by the ruins, with their late occupants seeking for some remains of their lost property; the powerful odour of the spirit as it streamed from the ruins and lay in pools the streets; tottering walls, scattered bricks, broken-up sewers, and raving drunkards, mixed up with famine, policemen, hogsheads of whiskey, crying women and frightened children,—baffle all description. Although no loss of life occurred directly from the fire, yet we are afraid that many deaths and much disease will follow from the exposure and privation to which the poor people have been subjected. The mayor immediately summoned a meeting of citizens to take measures for the relief of the sufferers. The meeting was well attended, and a sufficient amount of money subscribed on the spot to meet present needs. A considerable sum, however, will be necessary to compensate the poor for the loss of their "little all". The occurrence of this fire has drawn attention to the very dangerous practice of storing large quantities of whiskey in populous neighbourhoods. We think the storing of spirits should be as carefully guarded as that of gunpowder or petroleum.

UNIVERSITY OF DUBLIN.

ON Saturday last, at a meeting of the Senate, resolutions in Latin were read to the effect that the degree of Master in Surgery *honoris causâ* had been conferred on Mr. William Colles, for the pre-eminent diligence with which he had cultivated the art of surgery, by reason of which, as well as for the great advantage to the sick and afflicted, and other deserts, the Senate received him as Regius Professor into the bosom of the University. A resolution was also unanimously adopted, on the recommendation of the Provost and senior Fellows, prolonging to the end of this year the permission given to the senior Proctor in 1872, of using the old formula in conferring the degree of Master in Surgery.

DR. FLEETWOOD CHURCHILL.

WE regret to announce the retirement of this distinguished obstetrician from the active practice of his profession. Dr. Churchill, in consequence of failing health, has found it necessary to withdraw from our profession, which he has long adorned, and from which he retires with well-earned laurels to enjoy the *otium cum dignitate* which he richly deserves. Although we must regret that Dr. Churchill will not any longer be able to serve the profession and the public with the energy and zeal which he has hitherto displayed, yet we are glad to know that he is still in full mental vigour, and that from his pleasant country house at Ardrea, near Stewartstown, in the county of Tyrone, we may still hope that he will further enrich medical literature by selections from his vast stores of practical experience. Dr. Churchill has presented his valuable obstetrical library to the King and Queen's College of Physicians, and has thus, by his own liberality and the unselfish kindness of his son Dr. Fleetwood Churchill, jun., established a lasting token of his love for the profession in which he so long laboured. The College of Physicians has presented Dr. Churchill with an address expressive of its thanks not only for his liberality in bestowing his library upon the College, but also for the great and valuable services which he has rendered that body as its President and as Professor of Midwifery in the School of Physic. The College has also directed that a portrait of Dr. Churchill shall be placed in the College hall, in company with the other distinguished ex-Presidents of the College.

CORRESPONDENCE.

SCARLATINA IN SOUTH KENSINGTON.

SIR,—As an erroneous impression is gaining ground with reference to predisposing causes in the house where "the fashionable dinner" and "at home" occurred on June 9th, will you kindly allow me through your columns to state that there was and had been no illness of any kind in the family; that "every guest" was not affected by scarlatina or the characteristic sore-throat; that the sanitary arrangements of the house in question are complete; and that no illness has ever occurred on the premises to raise a doubt concerning the drainage or water-supply? The outbreak, however, is so unparalleled in suddenness, variety of age, numbers, and rapidity, that it is receiving the fullest investigation in the highest quarters, and all concerned are aiding in every possible manner to elucidate the mystery.—I am, sir, your obedient servant,
THE MEDICAL ATTENDANT.

ASSOCIATION INTELLIGENCE.

COMMITTEE OF COUNCIL:
NOTICE OF MEETING.

A MEETING of the Committee of Council will be held at the Queen's Hotel, Birmingham, on Tuesday, the 13th day of July next, at Three o'clock in the afternoon.

FRANCIS FOWKE,
General Secretary.

36, Great Queen Street, London, W.C., June 19th, 1875.

NORTH OF ENGLAND BRANCH.

THE annual meeting of this Branch will be held in the Town Hall, Darlington, on Thursday, July 8th, at 3 P.M. President, 1874-75, ANDREW LEGAT, M.D.; President-elect, 1875-76, S. E. PIPER, Esq., F.R.C.S.

The annual dinner will take place at the King's Head Hotel, Darlington, at 4.45 P.M. precisely.

G. H. PHILLIPSON, M.D., *Honorary Secretary*.
Newcastle-upon-Tyne, May 29th, 1875.

SOUTH WALES AND MONMOUTHSHIRE BRANCH.

THE annual meeting of this Branch will be held at Abergavenny, on Friday, July 16th.

Nomination-papers and the titles of communications, etc., must be sent to one of the undersigned by June 26th at the latest, in order that they may appear in the circulars.

Further particulars in the circulars as usual.

ANDREW DAVIES, Swansea. } *Hon. Secs.*
ALFRED SHEEN, M.D., Cardiff. }

Swansea, June 14th, 1875.

ABERDEEN, BANFF, AND KINCARDINE BRANCH.

THE annual meeting of the above Branch will be held at Aberdeen, on Saturday, July 17th, at 1.30 o'clock P.M.

Further particulars will be intimated by circular.

ALEXANDER OGSTON, *Honorary Secretary*.
Aberdeen, June 1875.

WEST SOMERSET BRANCH.

THE annual meeting of this Branch will be held at the Railway Hotel, Taunton, on Thursday, July 22nd, at 2.30 P.M.

The President-elect, Dr. Cordwint, will read a short paper on "Vital Conservancy in Disease".

Members wishing to communicate papers or cases are requested to send notice to the Secretary.

The dinner will take place at 5 o'clock.

W. M. KELLY, M.D., *Honorary Secretary*.
Taunton, June 29th, 1875.

BORDER COUNTIES BRANCH.

THE annual meeting of the Border Counties Branch will be held at Dumfries, on Friday, July 23rd, 1875: *President*, Dr. GREEN, Kendal; *President-elect*, Dr. W. A. F. BROWNE, Dumfries.

Gentlemen intending to be present are requested to communicate their intention to the undersigned.

HENRY BARNES, M.D. } *Hon.*
Carlisle, June 28th, 1875. J. SMITH, M.D. } *Secs.*

MEDICO-PARLIAMENTARY.

HOUSE OF LORDS.—Thursday, June 24th.

Pollution of Rivers Bill.—Lord SALISBURY, in moving that the House resolve itself into Committee on the Pollution of Rivers Bill, said that having regard to the progress of business in the House of Commons, he feared there would be no chance of passing this measure as it stood during the present Session. He nevertheless hoped that some of the provisions might even yet be placed on the Statute Book. He proposed, therefore, to proceed with those parts of the measure relating to the pollution of rivers by solid matter or by sewage, and he did not intend to press on the attention of Parliament at present that part of the measure which dealt with pollution caused by mining or manufacturing operations.—Lord ABERDARE suggested that Lord Salisbury should, during the recess, re-consider the subject, and bring forward a complete measure next Session.—After a short conversation, the House went into Committee *pro forma*, and immediately resumed, after the adoption of some amendments proposed by Lord Salisbury.

HOUSE OF COMMONS.—Tuesday, June 29th.

Public Health (Scotland) Acts.—In reply to Mr. W. Holms, the LORD ADVOCATE stated that he had the authority of the Chancellor of the Exchequer to say that he would consent to the introduction of a Bill with a single clause, enabling money to be borrowed at as low a rate for sanitary purposes by the local authorities in Scotland as had been conceded in regard to loans to local authorities in England.

MEDICAL NEWS.

ROYAL COLLEGE OF SURGEONS: DENTAL SURGEONS.—The following gentlemen, having undergone the necessary examinations, were admitted Licentiates in Dental Surgery of the Royal College of Surgeons at a meeting of the Board on June 29th.

Messrs. Frederick Canton, M.R.C.S., Marlborough Street; E. J. M. Phillips, M.R.C.S., Liverpool; J. L. Robertson, Cheltenham; J. J. F. Corbett, Cork; J. M. Lipscombe, Alresford; G. H. Harding, Acton, near Stafford; J. H. Whatford, Brighton; W. H. Fox, Gloucester; G. B. Pearman, Chelsea; H. H. Clifford-Eskell, Dublin; Augustus Cook, Upper Norwood; A. A. Hart, Newington Green; Francis Youngman, Thornton Heath; Alfred Foss, Stockton-on-Tees; T. A. Bodecker, Newark-on-Trent; G. A. Williams, Cavendish Place; C. E. White, Belgrave Road; W. G. Morris, Winchester Street; John Carteighe, Stratford Place; Thomas Gaddes, Barkham Terrace; T. E. King, York; James Stocken, Euston Square; R. H. Woodhouse, M.R.C.S., Hanover Square; H. C. S. Bennett, George Street; Alfred Allworth, Lyndhurst Road; James Williams, Walsall; and Thomas Rowney, Hull.

Only three candidates out of the thirty examined were rejected.

APOTHECARIES' HALL.—The following gentleman passed his examination in the science and practice of medicine, and received a certificate to practise, on Thursday, June 24th, 1875.

Martin, John Michael Harding, St. Helen's, Lancashire

The following gentlemen also on the same day passed their primary professional examination.

Dobbie, Robert John Algernon, London Hospital
Haines, William John, St. Bartholomew's Hospital

UNIVERSITY OF DUBLIN: SCHOOL OF PHYSIC IN IRELAND.—Trinity Term, 1875.—At the examination for the Degree of Bachelor of Medicine, held on Monday, Tuesday, and Wednesday, June 7th, 8th, and 9th, the candidates passed in the following order of merit.

Cochrane, Robert S.	West, John Russell
Franks, Kendal M. St. John (Sch.)	Daoe, Arthur H. C.
Fisher, Thomas Carson	Burne, Edward H. }
Halpin, Nicholas John	Smith, William E. } equal
Power, John J.	Cibborn, William
Laue, John G.	Montfort, Archibald H.
Hart, William R.	Goodman, Francis G.
Baker, Arthur W. W.	O'Carroll, Martin

At the examination for the Degree of Master of Surgery, held on Monday and Tuesday, June 14th and 15th, the following were the successful candidates.

Fisher, Thomas Carson	Bleakley, Alexander S. }
Hunter, William Lovell	Power, John J. } equal
Halpin, Nicholas John	Baker, Arthur W. W. }
Hart, William H.	Banks, Alfred
Griffith, De Burgh	Moran, James J.
	Nixon, George M. }
	Burne, Edward H. } equal

Medical Travelling Prize.

Cochrane, Robert S.

Surgical Travelling Prize.

Fisher, Thomas Carson

Senior Medical Exhibitions.

Cochrane, Robert S.

Fisher, Thomas Carson

KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.—At the monthly examinations of the College, held on Tuesday, Wednesday, and Thursday, June 5th, 9th, and 10th, the following candidates passed.—For the License to Practise Medicine.

Cutler, Peter Aloysius	Lee, William Alexander
Johnston, Arthur Alma	Masters, Sidney Herbert

For the License to Practise Midwifery.

Cutler, Peter Aloysius	Masters, Sidney Herbert
Johnston, Arthur Alma	Ryan, William
Lee, William Alexander	

MEDICAL VACANCIES.

The following vacancies are announced:—

AMERSHAM UNION—Medical Officer and Public Vaccinator for the Workhouse and the Amersham District. Salary, £50 and £63 respectively. Applications on or before 10th instant.

ARMY MEDICAL DEPARTMENT—Surgeons. Examination on August 9th and following days.

BEDWELTY UNION—Medical Officer for the Ebbw Vale District. Salary, £15 per annum.

BOOTH BOROUGH HOSPITAL, Liverpool—House-Surgeon. Salary, £80 per annum, with board, lodging, and washing. Applications on or before July 3rd.

BOSTON UNION—Medical Officer for the Boston District and the Workhouse. **CARNARVONSHIRE and ANGLESEY INFIRMARY**—House-Surgeon. Salary, £80 per annum, with board and lodging. Applications on or before the 20th instant.

CHORLTON UNION—Assistant Medical Officer at the Workhouse. **DENTAL HOSPITAL OF LONDON, Leicester Square**—Assistant Dental Surgeon. Applications on or before the 12th instant.

EAST LONDON HOSPITAL FOR CHILDREN and DISPENSARY FOR WOMEN, Ratcliff Cross—Resident Medical Officer. Salary, £60 per annum, with board, lodging, and washing. Applications on or before the 15th instant.

HAY UNION—Medical Officer for the Workhouse. Salary, £55 per annum.

HULME DISPENSARY—Resident Medical Officer. Salary, £130 per annum, with furnished apartments, coals, gas, and attendance. Applications on or before the 6th instant.

INDIAN MEDICAL SERVICE—Ten Surgeons. Examination on August 9th and following days.

KENSINGTON DISPENSARY—Resident Medical Officer. Salary, £150 per annum, and furnished apartments. Applications on or before July 5th.

KILBURN DISPENSARY—Assistant Resident Medical Officer. Salary, £80 per annum, with apartments, coals, gas, and attendance. Applications on or before the 10th instant.

LEIGHTON BUZZARD UNION—Medical Officer for the Upper District. **LIVERPOOL NORTHERN HOSPITAL**—House-Surgeon, House-Physician, and Assistant House-Surgeon. Salaries, £100, £80, and £50 respectively, with board and residence. Applications on or before July 10th.

LIVERPOOL ROYAL INFIRMARY SCHOOL OF MEDICINE—Demonstrator of Anatomy. Salary, £100 per annum, and other emoluments. Applications on or before the 31st instant.

LONDON TEMPERANCE HOSPITAL—Visiting Hospital Surgeon. Applications to the Rev. Dawson Burns, Honorary Secretary, 112, Gower Street.

MARLBOROUGH UNION—Medical Officer for the Second District. Salary, £80 per annum, and fees. Applications on or before July 31st.

METROPOLITAN ASYLUM DISTRICT—Second Assistant Medical Officer at the Asylum for Imbeciles, Caterham, Surrey. Salary to commence at £120 per annum, increasing £10 yearly to £150, with board and furnished apartments. Applications on or before the 8th instant.

METROPOLITAN FREE HOSPITAL, Devonshire Square—Assistant House-Surgeon.

NEWCASTLE EMLYN UNION—Medical Officer for the Penbryn District. Salary, £50 per annum.—Medical Officer for the Llandyssul District. Salary, £50 per annum.

NORWICH DISPENSARY—Resident Medical Officer. Salary, £120 per annum, and residence.

POPULAR UNION—Medical Officer for the Western District.

PORTSEA ISLAND UNION—Medical Officer for the Workhouse. Salary, £250 per annum. Applications on or before July 7th.

RAINHILL (Lancashire) COUNTY ASYLUM—Assistant Medical Officer. Salary, £100 per annum, with apartments and board.

ROYAL SURREY COUNTY HOSPITAL—House-Surgeon. Salary, £75 per annum, with board, residence, and washing. Applications on or before July 31st.

SAFFRON WALDEN UNION—Medical Officer for the Fifth District. Salary, £15 per annum.

ST. BARTHOLOMEW'S HOSPITAL—Assistant Physician-Accoucheur. Applications on or before July 7th.

STOURBRIDGE UNION—Medical Officer for the First Kingswinford District. Salary, £56 per annum.

SWANSEA HOSPITAL—Assistant Resident Medical Officer. Salary, £70 per annum, with board, lodging, and washing. Applications on or before the 6th instant.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths, is 3s. 6d., which should be forwarded in stamps with the communication.

BIRTH.

PARSONS.—On June 26th, at Sunnyside, Wimbledon, the wife of T. E. Parsons, Esq., Surgeon, of a daughter.

OPERATION DAYS AT THE HOSPITALS.

MONDAY	Metropolitan Free, 2 P.M.—St. Mark's, 9 A.M. and 2 P.M.—Royal London Ophthalmic, 11 A.M.—Royal Westminster Ophthalmic, 1.30 P.M.
TUESDAY	Guy's, 1.30 P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.—Royal Westminster Ophthalmic, 1.30 P.M.—West London, 3 P.M.—National Orthopaedic, 2 P.M.
WEDNESDAY	..	St. Bartholomew's, 1.30 P.M.—St. Mary's, 1.30 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—St. Thomas's, 1.30 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—Great Northern, 2 P.M.—Samaritan Free Hospital for Women and Children, 2.30 P.M.—Cancer Hospital, Brompton, 3 P.M.—King's College, 2 P.M.—Royal Westminster Ophthalmic, 1.30 P.M.
THURSDAY	St. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Royal Orthopaedic, 2 P.M.—Royal London Ophthalmic, 11 A.M.—Hospital for Diseases of the Throat, 2 P.M.—Royal Westminster Ophthalmic, 1.30 P.M.—Hospital for Women, 2 P.M.
FRIDAY	Royal Westminster Ophthalmic, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.—Central London Ophthalmic, 2 P.M.—Royal South London Ophthalmic, 2 P.M.
SATURDAY	St. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Royal London Ophthalmic, 11 A.M.—East London Hospital for Children, 2 P.M.—Royal Westminster Ophthalmic, 1.30 P.M.—St. Thomas's, 9.30 A.M.—Royal Free, 9 A.M. and 2 P.M.

MEETINGS OF SOCIETIES DURING THE NEXT WEEK.

WEDNESDAY.—Obstetrical Society of London, 8 P.M. Some interesting Specimens will be exhibited at the beginning of the meeting. The Discussion on Puerperal Fever will be resumed.

NOTICES TO CORRESPONDENTS.

CORRESPONDENTS not answered, are requested to look to the Notices to Correspondents of the following week.

PUBLIC HEALTH DEPARTMENT.—We shall be much obliged to Medical Officers of Health if they will, in forwarding their Annual and other Reports, favour us with Duplicate Copies.

AUTHORS desiring reprints of their articles published in the JOURNAL, are requested to communicate beforehand with the printer, Mr. T. Richards, 37, Great Queen Street, W.C.

CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.

WE CANNOT UNDERTAKE TO RETURN MANUSCRIPTS NOT USED.

COMMUNICATIONS respecting editorial matters, should be addressed to the Editor: those concerning business matters, non-delivery of the JOURNAL, etc., should be addressed to the General Manager, at the Office, 36, Great Queen Street, W.C.

IN consequence of the length of the report of the discussion on the Admission of Women to the Medical Profession, we are obliged to defer to next week our account of the remaining proceedings of the session of the Medical Council.

SALICYLIC ACID LOZENGES.

MESSRS. MOTTERSHEAD and Co. of Manchester have forwarded to us samples of salicylic acid lozenges, which they are about to introduce to the profession. We believe that the lozenge form will be found a good one for the administration of this substance, especially when it is desirable to bring the acid into frequent contact with the mouth and throat.

RUMSEY TESTIMONIAL FUND.

IN addition to the amounts previously acknowledged (£573 6s. 6d.), the following subscriptions have been received.

	£	s.	d.		£	s.	d.
J. Heywood, Esq.	5	0	0	H. Jephson, M.D., J.P., Lea- mington	20	0	0
W. Rendle, F.R.C.S.	2	0	0	James Wyatt, Esq.	1	1	0
J. W. Tripe, M.D.	1	0	0	W. Cadge, F.R.C.S., Norwich	2	2	0
S. W. Duckworth Williams, M.D.	1	1	0	Walker Fergus, M.D., Marl- borough	2	2	0
John Beddoe, M.D., Clifton	1	0	0	Capt. R. P. Beamish	5	0	0
W. Martin, F.R.C.S.	1	0	0	M. W. Taylor, M.D., Penrith	2	0	0
A. J. Beresford Hope, Esq., M.P.	10	0	0	H. Bullock, Esq.	5	0	0
E. L. Fox, M.D., Clifton	1	0	0	W. Beamish, M.D., Cork	2	0	0
J. G. Swayne, M.D., Clifton	1	0	0	H. Camps, Esq.	5	0	0
G. Elder, M.B., C.M., Not- tingham	2	0	0	Prescott G. Hewett, F.R.C.S.	10	10	0
C. Godwin, F.R.S.	3	3	0	E. Ballard, M.D.	3	3	0
Rev. F. T. Bayly, B.A.	5	0	0	W. J. Harris, Esq., Worthing	2	2	0
Leonard Armstrong, Esq., New- ton Abbott	3	3	0	R. B. Grantham, Esq., M.I.C.E.	2	2	0
J. B. Sanderson, M.D., F.R.S.	5	5	0	Peter Eade, M.D., Norwich	1	1	0
C. B. Skinner, Esq., Ipswich	10	10	0	West Sussex District, South Eastern Branch of British Medical Association	2	0	0

Subscriptions may be forwarded to Dr. Buchanan, New Government Offices, Whitehall; to the Honorary Secretary; or to Messrs. Roberts, Lubbock, and Co., Bankers, 15, Lombard Street, E.C. Cheques should be made payable to the "Rumsey Testimonial Fund" or bearer, and crossed "Roberts, Lubbock, and Co." Post Office orders should be drawn on the Curzon Street Post Office, and forwarded to the Honorary Secretary, W. H. Corfield, M.A., M.D., 10, Bolton Row, Mayfair, W.

NOTICES of Births, Deaths, Marriages, and Appointments, intended for insertion in the BRITISH MEDICAL JOURNAL, should arrive at the Office not later than 10 A.M. on Thursday.

THE DEGREE OF M.D. AT THE UNIVERSITY OF BRUSSELS.

DURING the present discussion concerning medical titles, it will doubtless interest many of your readers to ascertain how the M.D. Brussels may be obtained, and to read an account of an examination I have recently passed at that University. British and other medical practitioners, provided with medical and surgical qualifications, and appearing in person and producing their diplomas, can have their names inscribed in the books of the University, and may then proceed to the examination. The examination is precisely that prescribed by law for the students of the University, and is divided into first, second, and third Doctorate. I passed the examination in French; but, if necessary, the services of an interpreter may be employed. The examination lasts from four to six days, according to circumstances—the practical tests sometimes protracting the period. The examiners are ten in number, and have to be faced separately, two or three of the professors being usually present as auditors.

The first Doctorate consists of materia medica and general therapeutics; special pathology, and therapeutics of internal diseases; general pathology; and pathological anatomy, consisting chiefly of descriptions of morbid microscopical changes.

The second Doctorate includes surgery and surgical pathology; theory of midwifery and diseases of women; public and private hygiene; medical jurisprudence and toxicology.

The third Doctorate includes examination at the bedside of medical and surgical cases, with general clinical examinations; midwifery, with operations on the mannequin; operative surgery on the dead body, and surgical anatomy.

The cases given were pneumonia, second stage; phthisis, lungs in different stages; and rheumatic fever, with endocarditis; hemorrhoids, combined with rectal abscess; and a case of gunshot wound in the head. The operations were—ligature of the brachial artery at the bend of the elbow, excision of the breast, and amputation of the thumb at the carpus.

From what I could learn, the most usual stumbling blocks are the first Doctorate and the operative surgery. The clinical examinations are conducted in a most practical and admirable manner; and in hygiene and jurisprudence the candidate is allowed to explain the state of the law in England.

The secretary of the University will forward particulars on application, or I shall be willing to furnish all the information in my power to any gentleman desirous of proceeding to Brussels, which, by the way, is a most charming town.

44, Weymouth Street, W., June 1875.

LLEWELYN THOMAS.

DR. HUGHLINGS JACKSON'S "Note on Hemikinesis" shall appear next week.

FLATULENT DYSPESPIA.

SIR,—Will any of your readers kindly advise me what to do for myself? I have for nearly two years been the unhappy victim of flatulent dyspepsia. Immediately after breakfast, my symptoms begin: I feel a kind of "kick" at my heart; my pulse intermits; a strange sensation, more or less approaching giddiness, in the head; and a burst of tasteless gas from the stomach. All this is repeated many times a minute, and goes on hour after hour throughout the day. Incredible volumes of gas are thrown off the stomach every day. The supply of blood to my brain is so irregular, that I am becoming quite unfit to do my professional work; or, indeed, to make any mental effort whatever. I have taken the advice of several eminent men in town, and have tried every device, dietetic and medicinal, that I or my friends can suggest. In despair, I appeal to any professional friends who will kindly volunteer to assist me through the medium of the JOURNAL.

I am, sir, your obedient servant,

A MEMBER.

London, June 23rd, 1875.

WE are indebted to correspondents for the following periodicals, containing news, reports, and other matters of medical interest:—The Bristol Daily Post; The Daily Bristol Times and Mirror; The Derby and Chesterfield Reporter; The Lincolnshire Herald; The Glasgow Herald; The Sunderland Daily Echo; The Carnarvon and Denbigh Herald; The Manchester Guardian; The European Review; The Hackney and Kingsland Gazette; The Worcestershire Chronicle; The Birmingham Daily Post; The Brighton Daily News; The Sussex Daily News; The Glasgow Herald; The Cork Examiner; The Scotsman; The Cork Daily Herald; etc.

COMMUNICATIONS, LETTERS, etc., have been received from:—

Mr. Henry Lee, London; Mr. T. Annandale, Edinburgh; Dr. A. P. Stewart, London; Mr. T. H. Bartlett, Birmingham; Mr. W. Fairlie Clarke, London; Dr. R. Farquharson, London; Dr. A. B. Steele, Liverpool; Dr. J. Hughlings Jackson, London; Messrs. Baillière and Co., London; Mr. R. Clement Lucas, London; Mr. W. D. Mann, London; Dr. Sergeant, Camberwell; Mr. H. Carden, Landport; Mr. A. Wanklyn, Leek; Mr. T. J. Dyke, Merihyr Tydfil; Dr. B. E. Cotting, Boston; Dr. Chadde, London; Mr. Eastes, London; Our Edinburgh Correspondent; Dr. T. J. Denton, Bridlington; Dr. H. G. Knaggs, London; Mr. John W. Teale, Scarborough; Dr. W. Sneddon, Beith; Dr. J. Milner Fothergill, London; The Secretary of the West Bromwich Hospital; An Associate; Mr. F. W. Lowndes, Liverpool; Dr. Balthazar W. Foster, Birmingham; Mr. Joseph Farrar, Bradford; Mr. E. F. Fussell, Brighton; Dr. Pavy, London; Mr. John Salmon, London; Dr. J. J. Merriman, London; Mr. J. Howell Thomas, Shirehampton; Dr. Joseph Coats, Glasgow; Mr. T. Copplestone, Crewe; Mr. Thomas Godfrey, Herne Bay; Dr. David Page, Kendal; A Member; Our Dublin Correspondent; Mr. P. H. Holland, London; Dr. C. W. Philpot, Croydon; Dr. T. O. Dudfield, London; Dr. Heary Barnes, Carlisle; Dr. W. M. Kelly, Taunton; Mr. W. Paget, Liverpool; Dr. W. H. Corfield, London; Dr. Wiltshire, London; Dr. Finlayson, Glasgow; Dr. G. A. Molesworth, London; Mr. W. E. C. Norton, Brighton; Mr. Humphrey, Romney Marsh; Mr. Wm. H. Rothery, Cheltenham; Mr. S. M. Bradley, Manchester; Mr. Edwin Chartier, Birmingham; Mr. T. M. Stone, London; Dr. M. Charteris, Glasgow; Mr. Roland D. Smith, London; The Secretary of the Charity Voting Reform Association; Dr. Daldy, London; Mr. A. W. Stocks, Salford; The Secretary of St. Thomas's Hospital; Mr. Arthur C. Sandberg, Hilt; Dr. Smart, Haslar; Dr. A. Inglis, Worcester; Mr. J. Greasley, Canterbury; Dr. Augustus Brown, London.

AN ADDRESS

ON

OBSTETRIC MEDICINE AND ITS POSITION
IN MEDICAL EDUCATION.*Delivered at the Annual Meeting of the Metropolitan Counties Branch,
June 28th, 1875.*

By ROBERT BARNES, M.D., F.R.C.P.,

Obstetric Physician to St. George's Hospital; President of the Branch.

THE honourable office to which your kindness has called me involves a duty which, I fear, I shall very inadequately discharge. It is no light task worthily to address so distinguished a body as the Metropolitan Counties Branch of the British Medical Association. It is not, indeed, difficult to find a theme deserving your attention; for that is dictated by the fact of your having chosen me as your President. I understand that your choice has fallen upon me, because you wished to recognise the claim that Obstetric Medicine has to a share in the representation and in the work of our great Association. I am grateful for that recognition. It is an omen, I trust, of fuller and more equal participation in the honours and in the government of our profession.

The actual position of obstetrics in relation to medicine and surgery is a scandal to the profession, and a grievous injury to the public. I offer no apology for asking, In what respect is obstetric medicine intrinsically less worthy than so-called pure medicine and pure surgery? Is not its object at least as important to mankind? Does its exercise demand less scientific knowledge, less trained skill, less devotion to duty? Are those who teach and who practise it inferior in education, in attainments, and in capacity to those who teach and practise medicine and surgery? Flattery was never my forte or weakness; and I should be guilty of flattery most gross, were I to affirm that all the physicians and surgeons of our hospitals were men superior in merit or in usefulness to the teachers and practitioners of obstetrics. Many, I presume, would not themselves lay that flattering unction to their souls. In the name of justice, then, how can they reconcile it to their conscience to usurp almost exclusive possession of the clinical opportunities, honours, and emoluments of the hospitals, and to the government, honours, and other benefices of the colleges? In the name of common sense and in the public interest, why is it that obstetric medicine is all but absolutely unrepresented in the General Medical Council, in the Senate of the University of London, in the College of Surgeons?

Is the answer to be, that medicine and surgery confer upon their votaries the miraculous gift of capacity to legislate for that department of our profession of which they are practically, if not also theoretically, ignorant? It can hardly be contended that medicine and surgery, in the special sense in which they are cultivated by our hospital physicians and surgeons, include a knowledge of obstetrics and gynecology sufficient for the purposes of government. If there be one department of the healing art which can show a better founded pretension to universality than another, it is surely obstetrics, to understand and to practise which we must combine a liberal knowledge of medicine and surgery.

The best argument in favour of the actual state of things that occurs to me, is the great advance that obstetric medicine has made in spite of every discouragement and the studied indignity to which it has been subjected. But success so achieved is not evidence of the wisdom of those who inflict that discouragement and indignity. It is evidence of the inherent scientific and practical importance of the subject that can enlist able men in its service, and find fitting material for the exercise of their faculties.

It is worth while to take a rapid survey of the actual position occupied by obstetrics and gynecology in relation to medicine and surgery in our London hospitals, schools, and governing bodies. At this moment the eleven hospitals to which schools are attached have each one obstetric physician, and not all have an assistant obstetric physician. One of the largest has but just been roused to a perception of the fact that a second officer was wanted. Now, in all these hospitals, I need not say, there is a large staff of physicians and surgeons and assistants in training and in full occupation; for not only is there an enormous preponderance of medical and surgical *personnel*, but the distribution of material is so arranged that each physician and each surgeon has a very much larger share than has the solitary obstetric officer. A few beds at most are allotted to him. In all the eleven hospitals there are

4,118 beds. Of these, 141 only are devoted to gynecology. Does this beggarly proportion fairly represent the relative importance of the three departments? Does it adequately meet the public need? Does it supply sufficient opportunity for clinical instruction? I will not venture to assert that no one will be found bold enough to answer these three questions in the affirmative; but I may confidently assert that no one will be able to make good the affirmative in a single point. Any one who may make the attempt will have to answer a few more questions. Is disease in women a rare thing? Are the sexual organs and functions in women in themselves unimportant? Is their influence upon the economy and upon other organs insignificant? Is it possible to understand aright disease in women, without taking into account its interaction with the physiology and pathology of the generative system?

I will not now attempt to pursue these questions throughout all their bearings. It is enough to point out how painfully inadequate is the provision in our hospitals and schools for the investigation and teaching of subjects so extensive in themselves, and capable of throwing so much light upon many problems regarded as simply medical or surgical. It is inconceivable that the provision for this purpose could be so unworthy, so niggardly, were it not dictated by sheer ignorance; for I will not suppose that it is the result of culpable indifference. This scanty provision, then, must be taken as the measure of the estimation in which the pathology of women is held by those who govern our hospitals, who frame our educational curricula and examinations for diplomas, and who generally legislate for the profession.

The same spirit that is seen in this scanty allotment of beds is manifest in the relative position awarded to the teachers. I believe it is still true that in most of our London hospitals the obstetric physicians hold the position of supernumeraries rather than of recognised members of the staff. They are not in all cases elected in the same manner as the ordinary physicians and surgeons; and these last are especially careful not to admit their obstetric colleagues to share in the fees.

It is not wise for any community to brand a section of its members with the stamp of inferiority, or to inflict upon them the injury of representative and administrative disability. But this we might bear with more or less patient acquiescence, if it could be shown that the actual system worked well for the public interest. *A priori*, it might be safely inferred that injustice cannot work well for the public interest; but it is a matter of easy demonstration that the actual system does not work well. I may appeal to every young man leaving our schools, armed with a diploma, therefore conventionally and legally qualified to practise, for testimony in support of my argument. He must needs admit that he enters upon practice very imperfectly prepared to encounter the difficulties and responsibilities of obstetric work. Those who out of their own mere motion and imperfect knowledge rule these matters, have declared that to have attended twenty cases of labour is clinical experience enough wherewith to enter upon obstetric practice; whilst as for gynecology, the clinical instruction he has had is not less absurdly insufficient. I know that many of the best and ablest of our young men keenly feel their deficiency in this respect. They find that they must by slow and painful steps, under innumerable difficulties, pick up the knowledge which they ought to have acquired during their career as students. Nor are they to blame for this. Students notoriously concentrate their attention upon that which "pays" at the examination-tables. And there, excepting for the license of the Royal College of Physicians and the degrees of the University, obstetrics and gynecology are of no use; indeed, even certificates of practical study, that dangerous substitute for the examination-test, are hardly required. If proof of practical study and a sufficient examination-test were instituted, then it would follow as a logical consequence that the opportunities for clinical study would be extended, and that students would "get up" this subject.

It is a painful fact, that the greater number of charges of malaproxia brought against medical men relate to obstetric practice. In many cases it could be shown that the fault imputed was the result of ignorance—that is, of imperfect teaching and experience. Unhappily, the law is too apt to declare that ignorance is criminal; and thus an honest man is sent to gaol as a felon for not possessing that knowledge and skill which our governing bodies have denied him the opportunity of acquiring.

It may be said that the great scheme for a joint examination-board will remedy some of the evils to which I have referred. I hope it may be so; but I have little faith in protracted gestation. There is generally something doubtful in the legitimacy of the conception; and the progeny seldom comes to good. It is true that after many false throes, such as climacteric women big with wind are apt to feel, actual parturition seems near at hand. The University, the Apothecaries' So-

ciety, and the College of Surgeons, having called in the aid of Parliament, some of the causes obstructing labour have been removed; but still the progress is slow. I am afraid anaesthesia is carried a little too far, and that further operative measures may still be necessary. And when the long-promised birth is accomplished, shall we be happy? Will our expectations be realised? This is a question which, of course, time and experience only can answer. It is at any rate premature, if not fatuous, to dote upon that which at best has only a potential existence.

Amongst the burning questions of the day is the propriety or the right of admitting women into the professions. I say the right or the propriety, because even if the right were made good, the propriety would not follow. Why it is that the women have selected medicine as the special point of attack, is not quite clear. They are far better fitted by organisation, by natural aptitude, to shine in the pulpit and at the bar. And in the career of arms, if we may trust legendary or mythic history, they have earned no mean distinction. But medicine, whilst demanding physical power not less than the other professions, is essentially based upon science.

Now, the women who have been distinguished for scientific power might be counted on the fingers of one hand. There seems to be a natural incompatibility between science and the female brain. There is, indeed, no such inherent incompatibility between science and religion or law. Theology and law that are not in harmony with true science must rest upon a very insecure foundation. But the clergy of all denominations, and lawyers as a rule, assume a direct antagonism to science. They set themselves above it; they would trample it down as something in chronic rebellion against their authority. In this antagonism they resemble the women; in these they find their most useful allies. The church and the law, then, are the professions most congenial to the somewhat arbitrary character of the female intellect. Now this question a committee of the Medical Council have handled in its broad aspect in a recent report submitted to the Council, with a view to transmission to the Privy Council, in a masculine and sensible manner.* But there is a subordinate question, which, from an organic defect in their constitution, they are not likely to handle satisfactorily—I mean the education, qualification, and registration of midwives.

It is not for want of information, or advice entitled to respect, that the Medical Council and the governing bodies have so long maintained this deplorable state of things. In July 1868, a Committee of the General Medical Council, of which the late Mr. Syme was chairman, addressed inquiries to the teachers in the various schools, asking for their opinions on the following points: 1. The topics which might most advantageously be included under the subject they taught; 2. The period in a four years' course, when that subject could be most profitably studied, and the length of time which should be devoted to it; and 3. The manner in which it could best be taught—that is, by lectures, practical instruction, or otherwise. Upon this invitation all the obstetric teachers in London met in deliberation, and agreed to the following proposition. "The lecturers, considering the great extension which has been made in recent years in the knowledge of obstetrics and the diseases of women and children, the deep interest of the public in possessing practitioners duly skilled in this department, and that it is of paramount importance to the comfort and success of the young practitioner to possess sound theoretical and clinical training in it, are unanimously of opinion that the actual means of study, and the share devoted to it in the present curriculum, are insufficient." Mr. Syme's Committee frankly acknowledged the necessity of extending the instruction in midwifery. "We are decidedly of opinion," they say, "that the present space allotted to midwifery in the regulations of some of the licensing bodies is too short, and that it should, as was formerly the case, extend over one winter session, and that instruction in practical midwifery should also be extended." But nothing has come of this "decided opinion". A body of men, each of whom is a representative of the governing bodies which have affirmed that attendance on twenty cases of midwifery is basis enough to qualify for obstetric practice, can hardly possess the requisite knowledge to legislate upon this question.

* I am sorry to be obliged to qualify this statement. I had not taken into account the probability that the Council would stultify its Committee. The Committee reported as follows: "After due deliberation, the Medical Council have to express their opinion that the study and practice of medicine and surgery, instead of offering a field of exertion well fitted for women, do, on the contrary, present special difficulties which cannot be safely ignored, and some of which cannot be obviated. Instead of medicine offering more facilities and less difficulties for women than other professions, the Medical Council believe that, as the whole question is looked into, there will be found peculiar hindrances, moral and physical, to the successful pursuit of medicine by women. Moreover, they desire to add, that if it be admitted that women should enter the medical profession, the existence of an equal fitness for other professions must be assumed." This report, after long discussion by the Council, was effectually emasculated.

The practical question, of course, surges up: But how will you find more time for the study of obstetrics? The answer is not difficult. Time may be gained by the simple and common-sense process of striking out of the curriculum teaching that oppresses and bewilders the student, that distracts his attention from the real object of his study, that loads his memory without training his intellect. Without hesitation or misgiving, I would abolish the lectures on Forensic Medicine. This course seems to have been designed chiefly in order to train the lecturer in the great art of teaching what he does not know, without exposing his ignorance. I speak from experience, having gone through the ordeal as a very young man. I am afraid I did not succeed in concealing my ignorance from my class. And just when, by dint of teaching, I had begun to learn a little of the subject, I turned it over to a junior to go through the same experience. I could not help thinking how, when *delirant magistri, plectuntur alumni*. I hope the alumni have forgiven me, reflecting that I, not less themselves, was the victim of an absurd and arbitrary regulation.

The course is usually committed to the youngest lecturer in the school. His "prentice hand" is exercised in teaching the last and most difficult applications of medical knowledge. To do this effectually demands the most matured experience that long practice in medicine, surgery, and obstetrics can supply. No young man can possibly teach efficiently any one of these subjects. It is beyond the power of mortal man efficiently to teach all three. And, practically, this is acted upon by the public. In any case coming before the law-courts, in which a question of medicine, surgery, or obstetrics is involved, do we ever see a simple lecturer on forensic medicine summoned? Is it not the invariable practice to summon those who have had special experience in the subject? So again, where a chemical question is involved, is not the professional chemist appealed to? Society has no longer faith in medical admirables Crichtons: your only admirable Crichton nowadays is the lawyer. He, indeed, is privileged to decide in the last appeal upon every question of medicine, surgery, obstetrics, chemistry, and every other science; and the less he happens to know of the science, the more ready is he to cut the knot with the sword of blind justice. The public naturally invoke the aid of those who have had the largest special experience bearing upon the question in dispute. It seems a logical necessity, then, that the physician, the surgeon, the obstetrician, the chemist proper, should each work out his teaching to its applications to the law—that is, to the limited extent which it is possible to attain in a course of lectures.

I could not cite higher authority in support of this view than that of Sir Thomas Watson. In his reply to the Committee he says: "I doubt whether forensic medicine should find a place in a course prescribed for all medical students in common. Its singular interest and its vast importance are unquestionable. But not one in a hundred of those engaged in the practice of medicine in this country can ever become safe guides, or capable of the more difficult and abstract experimental investigations which from time to time are required in judicial proceedings incidental to our social life. These inquiries should be committed to recognised professional experts, who ought not to be regarded as mere witnesses in any case, but as medical assessors to the appointed authorities."

As to the more strictly legal part of forensic medicine, that which teaches the forms and practice of the law-courts in dealing with ordinary and skilled evidence, the relations between true science and that which lawyers construct out of their inner consciousness, and what constitutes malapraxis and other offences in the eye of the law, all this can be better studied in books, and in the courts themselves. This part of forensic medicine should, in short, be studied as medicine proper is best studied—that is, where it can be seen in practice. It is an essential part of the education of every man to learn how the law is administered. In this country most of us may be called upon to take part in its administration. Observation in the law-courts is the best training for this duty. I have often doubted whether the exemption we enjoy from serving on juries is an unalloyed advantage to ourselves. I am sure it is a disadvantage to the public. The jealousy of the law will hardly bear the presence of scientific men as assessors to the court; but a skilled juryman would virtually exercise a similar function: and thus the public would sometimes enjoy the benefit of law enlightened by science, which is now carefully excluded.

It is impossible to resist the opinion of Mr. Simon, "that a good deal of time is wasted in our medical schools, and also much confusion caused, by lecturers on surgery and lecturers on medicine both considering themselves required to teach such general parts of pathology and practice as are common to both branches". A good deal of needless overlapping also occurs between the courses of anatomy, physiology, and surgery; and almost all the most practised teachers concur in the opinion, that clinical instruction is so incomparably superior to formal

lectures in the class-room, that the systematic courses on medicine and surgery might be usefully curtailed.

Applying these principles to the teaching of obstetrics and gynecology, I think I may say that we do not indulge in overlapping. Our time and opportunities are so restricted, and our subject so extensive, that we are often compelled to omit altogether special topics of urgent practical importance which rightly belong to us, and which no one else cares to touch. We can barely indicate the special relations of the anatomy and physiology of the female organs to pregnancy and labour. We must needs assume that the lecturers on medicine and surgery have, out of their greater store of time, instructed our class in the general doctrines of pathology. But still, doing the best we can in the three months' summer course of about forty lectures at our disposal, we find it simply impossible to trace satisfactorily the history of pregnancy, parturition, and childbed, including that of the embryo and the newborn child. It must be remembered that the lectures on obstetrics eminently admit of and require illustration by specimens, drawings, practical demonstration, and practice in operations. If the class be ever so small, this practice takes considerable time. And after all, the extensive and growing subject of the diseases of the non-pregnant woman is untouched. This is relegated to the winter, when it is taken up in the clinical lectures, which, again, are too few by far to treat it effectively. This would offer less reason for regret if we had adequate clinical material at our command; if we could supplement at the bedside the defects of our systematic lectures, as the teachers of medicine and surgery can and do. But we find ourselves hampered at every turn; told, like the Israelites of old, to make bricks without straw; the difference being that nobody cares whether the bricks be made or not.

ABSTRACT OF AN ADDRESS

ON

THE BRITISH MEDICAL ASSOCIATION AND ITS AIMS.

Delivered at the Combined Meeting of the Cambridge and Huntingdon, East Anglian, and South Midland Branches, July 2nd, 1875.

By GEORGE M. HUMPHRY, M.D., F.R.S.,

Professor of Anatomy in the University of Cambridge; President of the Branches.

PROFESSOR HUMPHRY, on taking the Chair, observed that it was usual for the person who occupied the honourable position in which he was then placed to say a few words in opening the meeting. The axiom "Let your words be few" could never be more applicable than in a meeting composed, as that was, of men respecting whom it might be said more truly, perhaps, than with regard to any other men, that the work was long and the time was short. The meeting in that ancient seat of learning was a reminder of the close bond which had at all times united medicine with the various branches of literature and science represented by the University. It might, perhaps, be said that the connection between literature and the medical profession was less close now, than it was in those times when the foremost men of letters were to be found in the medical profession, and when the classic languages were the media of communication of medical facts and medical thoughts throughout the various parts of Europe. Still, even at the present time, when it was so hard to excel in more than one subject, there were among them those who were no unworthy successors to Celsus, to Sydenham, and to Sir Thomas Browne. With regard to science, there never was a time when it could be more truly said that every discovery and advance in science had a direct or an indirect bearing upon medicine; and there never was a time when the effort was more determinedly made to lay the foundations of medical study deep in the ground of general science. More especially was this the case with regard to that branch of medicine which had for its object the prevention of disease. He meant sanitary or preventive medicine. Of this, which was daily increasing in importance and public estimation, medical men had always been the most active promoters. It might be urged that, in so doing, they were cutting the very ground from under their feet; for, if disease were prevented, there would be no need of medicine or of medical men. It might be added that there was, perhaps, no other profession or calling the members of which were so actively and disinterestedly engaged in promoting the public welfare in that which would seem to involve the destruction of themselves. They, however, knew well that diseases were for the most part the pro-

duce of civilisation, and that it behoved civilisation to employ the best weapons from its armoury to repress and destroy these its noxious children. It was no small satisfaction to be able to add that the most active promoters of sanitary medicine had been the members of the Association; and that the University of Cambridge had been foremost in England in lending a helping hand to it by instituting an examination, so that the public might be certified respecting those who possessed a competent knowledge of it. There could be no doubt that the importance of this subject increased every year, and that the town or district which neglected it would sooner or later pay the penalty in the shortened lives of its inhabitants.

The British Medical Association was an Association of medical men for the purpose of promoting their mutual welfare; the welfare, that is, of the whole body of the profession, not especially of the magnates whom smiling fortune had enabled to take care of themselves, but rather of the general practitioners, of those who bore the burden and heat of the day, of those who did the hard work, and too commonly received only the hard wages. In some respects, the Association bore resemblance to the guilds of olden times. Those guilds were societies of men belonging to particular trades and avocations, formed for mutual advantage, as is the British Medical Association; but there were certain wide points of difference between them. The guilds for the most part had an eye to the material advantage of their own members, and the furtherance of their own trade, which was often attended with disadvantage to others. Not so the British Medical Association. It had an eye rather to the social and scientific than to the material improvement of each individual member; it had an eye less to the pocket and more to the head and heart. Moreover, those ancient guilds were accompanied with numerous restrictions to prevent persons from entering the trade which they represented, and their laws were enforced sometimes with serious and even savage penalties. He would give an illustration, happily a rare one, and the scene of which was laid in a distant land. There was in China an association of persons engaged in gold-work—a gold-workers' guild—one of the laws of which was, that no member should take more than one apprentice, whereby the number of those entering the trade was limited. One member of the guild, more liberal-minded than the rest, protested loudly against this restriction, and thereby excited the furious animosity of his fellow-craftsmen. Time wore on, and he thought the offence had been forgotten or condoned, when one day a banquet of the members was held. All passed well till, on retiring into an apartment after the banquet, the members suddenly fell upon the unfortunate offender, bound him hand and foot, and then proceeded to bite at him each in turn till they had killed him. The reason of their selecting this mode of inflicting summary punishment is, that the laws there are not against killing, but against particular modes of killing. There is law against shooting a man, or hanging, or drowning, or strangling; but none against biting him to death. He need not say in the British Medical Association there was nothing of this sort. There were no punishments, no limitations, no desire to narrow the area of the profession, or to bar the entrance against those who desire to be enrolled in it. There was, however, one other feature in common with the guilds; viz., that they had a dinner. He hoped all would come to it, and see that there was no biting but of good food, and none of that worst of all biting, viz., back-biting.

The British Medical Association aimed at improving its members scientifically and socially. He well remembered the energy with which the noble founder of the Association, Sir Charles Hastings, used to proclaim that science was graven on the banner of the Association. Well might it be so, for nothing tended more to promote continued happiness than the continued acquisition of well grounded scientific knowledge. Something of this kind was needed to compensate the medical man for his many anxieties and vexations and cares, to beguile and enlighten him in the often weary routine of daily life, and assist him in his many perplexities and difficulties; and certainly no scientific knowledge could do this more effectually than the knowledge connected with his own profession.

Nothing added so much to his happiness as a deeper, more earnest, more continued acquaintance with the science of his profession, which, after all, was a noble science—he said advisedly, the noblest and highest of all sciences. They had to deal with the noblest work of God: to deal with the most complicated machinery in the natural world; and not only had they to deal with it, but they had to deal with it in its aberrations, and to endeavour to prevent and correct those aberrations; and as an incentive to it was added the assurance that it was associated with the prolongation of human life and the diminution of human suffering.

To induce medical men to cull the vast amount of facts which fell under their observation, was one of the objects of the Association. There was one direction especially in which there was a vast, an incalculable

waste of knowledge—namely, in connection with *post mortem* examinations. Medical men followed up a case, sometimes in dim uncertainty, not infrequently in most mistaken certainty, up to the point when death offered an opportunity of unravelling the mystery, and of turning his own weapons against himself. How very large an amount of knowledge was here lost for want of some better means of gathering it in. If the Association could take measures to prevent this waste, it would be doing a vast amount of good. It had occurred to him that the way in which this could be done would be to have in each centre, e.g., in Cambridge, some well qualified person who would be able to go into the surrounding district and assist medical men in conducting *post mortem* examinations. Medical men had not the time, and they would pardon him for saying that many of them had not the skill, to carry out an investigation of this kind in accordance with the modern requirements of science. Two things were needed to give practical effect to this suggestion: first, the men—a difficulty which might probably be met; and, secondly, the money, for certain funds would be required to pay men who should be thus occupied; and this was not easily provided.

The Association also endeavoured to improve its members socially. A great alteration for the better had taken place in this respect within his own observation. Medical men now looked upon one another less as antagonists and more as fellow-labourers in the great cause of humanity. He would venture to throw out the hint, by way of making a practical suggestion, that they should never take offence at that which came through a third person. The most friendly feelings might be misrepresented by a simple gesture; the softest, kindest words might be marred and poisoned by an altered tone, and a meaningless and utterly inoffensive expression might be turned into gall and wormwood by a slight alteration or a trifling exaggeration. This ought not to be so. As members of a professional brotherhood, still more as members of a Christian brotherhood, they ought each to be clothed with such a mantle of good feeling as should ward off many of the arrows which were aimed at them, and certainly should allow none of those which were not intended for them to enter and leave a wound. There should be a confidence in one another's uprightness which hinders the imputation of an ill motive—some of that best feature of charity which thinketh no evil. He had said that there had been a decided improvement in this respect among the medical profession in his time, and that was not a little due to the Association and its meetings. One of the greatest privileges in life was that of coming into contact with men better than themselves. At these meetings they came face to face and hand to hand, and by those unerring pulses tested the qualities of one another's hearts; and there were very few who did not feel that they had met others better than themselves. There was, therefore, a responsibility in attending these meetings, as well as a pleasure—the responsibility of self-improvement, the responsibility of going away better than they came: and if any individual member were raised at the meeting a single step on the ladder of good thought and high motive, their gathering together would not have been in vain.

REMINISCENCES OF A BRANCH SECRETARY.

Being the Address delivered at the Twenty-sixth Annual Meeting of the North Wales Branch.

By D. KENT JONES, M.R.C.S.Eng., President.

I CAN assure you I highly appreciate the honour bestowed upon me by electing me to the position of President of this Branch of the British Medical Association. To me, who have always taken the liveliest interest in everything that concerned the affairs of our Branch, it must, you may well imagine, be a source of the highest gratification to find myself again in close official connection with you. When I resigned the post of honorary secretary, which I had held since the establishment of this Branch, and removed to a distant and new sphere of professional labour, I did not anticipate I should return so soon to the scenes of so many happy and pleasant meetings of this Association. There are many friendly faces and genial voices which I miss—some voices, alas! hushed for ever; there are others, again, who, I am sure, would gladly have been here to-day but for urgent professional engagements. A holiday from our heavy and anxious duties, even for one day, to meet men of whom we have probably heard only by fame, is an enjoyable matter, and cannot be said to have been altogether thrown away.

I intended to say a few words on some subjects of medical practice, making, as it were, a running commentary on some points of therapeutics. It occurred to me, however, that a retrospect, though necessarily a condensed one, of the transactions of this Branch, extending

over a period of twenty-six years, might be acceptable. It was in the spring of 1849, that I took upon myself the initiation of calling a meeting of Poor-law medical officers and others, who I thought might be favourably disposed, at the Liverpool Arms Hotel, Bangor, for the purpose of forming a medical society for North Wales. Of the several gentlemen who attended that little meeting, two or three only are now living, whilst others emigrated to the colonies, and have there ended their career. My old friend, Dr. Lloyd of Llangeini, who was a member of the Provincial Medical and Surgical Association at the time, recommended that we should try to form a Branch of that Society for North Wales, and wrote to the late Sir Charles Hastings of Worcester for advice. Mr. T. T. Griffith of Wrexham took a lively and important part in the movement; and attended the second meeting, at which it was decided to convene a meeting at Rhyl of all the qualified members of the profession, with the view of inaugurating the North Wales Branch. This was held in May, 1849, and was numerously and influentially attended. And from that meeting the Branch may be said to have fairly started upon its career of usefulness, with Mr. Griffith of Wrexham as its first president, and Dr. Edward Williams of Wrexham and myself as honorary secretaries. To their persevering and valuable exertions, I attribute the successful establishment of this Branch. We were fortunate in having presidents annually who were men of high professional attainments; and, what is also of considerable importance, they were gentlemen whose social position and private worth were recognised by the public, not only of their respective localities, but throughout North Wales. Men of such mark could not fail to attract notice, and they upheld the honour and dignity of the profession. Medical men were gathered together to exchange kindly sentiments; they became better acquainted with each other; and helped to remove those narrow prejudices and jealousies, which so much mar that mutual respect and good feeling which should ever characterise the members of such a profession as ours. The isolated practitioner no longer could complain of the want of a society within easy reach, but for which he might continue to live on unknown to his brethren in more distant parts of the Principality. The benefits of such an institution surely cannot be over-estimated, especially when we are oftentimes beset with difficult cases, and need the advice and assistance of abler and more experienced counsellors.

The locality for holding these meetings should, I think, be always carefully decided upon. We should not forget that much of the success of these gatherings depends upon the place selected for holding the meeting, so that we may attend, and return home on the same day. But it is not always possible to confine ourselves to this scheme. For instance, it is very desirable to break new ground, and go where we have never been before, as was lately done at Bala, where a most successful meeting, largely attended, crowned our efforts. It was here, at Rhyl, that Mr. Theed proposed we should hold what are now familiarly known as intermediate meetings. Although at first these were not so well supported, they have for several years past, I may say upon the whole, been well attended, and have afforded more time for reading papers and discussing cases, leaving to the annual meetings the work of electing officers and auditing treasurer's accounts, and so on. Here, too, from its central position, the majority of our gatherings have been held. I must not forget to record how hospitably we have been entertained by some of our kind fellow-associates to dinners and elegant luncheons, on the occasions of these reunions occurring in towns where they resided.

The British Medical Benevolent Fund was established a few years after the formation of the British Medical Association, with which it has always been in connection. This excellent institution has from time to time afforded a vast amount of good; relieving the poor and distressed medical men, their widows and orphans, in a quiet unostentatious manner. The operations of the Committee are not confined to members only of the British Medical Association; but its benefits are extended to others also. Several members of this Branch are annual subscribers to its funds; and at one of our annual meetings, the sum of £5 was unanimously voted towards the same out of the annual subscriptions. I earnestly commend it to your favourable notice; and would suggest that at every annual meeting some voluntary donation, however small, be made at our festive board to show that, whilst Providence smiles upon us, we do not forget that at that moment there are many unfortunate brethren, and the widows and orphans of deceased brethren, struggling for very existence!

We have as our property that first class weekly paper the BRITISH MEDICAL JOURNAL. It reflects the opinions of the members upon all great professional and social questions. In it we have every subject thoroughly ventilated, and it is conducted with unwearied industry, zeal, and talent.

To the parent Association, and her dutiful children the Branches,

credit must be accorded for the success of the great measures affecting our profession which have passed through Parliament and become law, after being for twenty years or more before the public creating considerable agitation. Substantial as have been some of these, there are many remaining to excite our vigilance and to call for

time, I am confident, must soon arrive when decisive steps must be taken. The Charity Organisation Society of London has done a great deal of good; and were the British Medical and Social Science Associations to co-operate with them, I have no doubt the public would soon be interested in the matter. The Public Health and the Adulteration of Food and Drugs Acts are measures of importance, and have imposed great responsibilities upon the medical men who have been appointed to discharge such heavy and multifarious duties.

Looking back to some of the transactions of this Branch, I am particularly struck with one interesting feature which brings out vividly the character and worth of one of our oldest and most esteemed fellow-associates, viz., Mr. Thomas Taylor Griffith of Wrexham, who has on two different occasions been elected our president. To mark the great regard and friendship entertained towards him, the members, at the annual meeting held here on July 8th, 1873, presented Mrs. Griffiths with his photographic likeness, in a speech full of pathos and kindly sentiments by Dr. Hughes of Colwyn, formerly of Mold, who had also the able assistance of Dr. Llewelyn Williams of Wrexham, as honorary secretary of the presentation committee.

The medical profession ranks deservedly high in the estimation of the public; and its sayings and doings are eagerly scanned. But many members of it, I am sorry to think, have not that proper and exalted idea of the true ethical bearing which characterises not only the doctor, but the gentleman. Too much of the trade and underselling spirit pervades the minds of some, a great deal of charlatanism is practised by others. The really earnest lovers of the art delight only in securing to their patients the fruit of their skill and knowledge without the tares of sophistry and empiricism. These cannot, naturally, connect themselves with irregular practice; and whenever they are confronted with unqualified men, it will behove us all to rally round them, and tender our support and warmest sympathy. Some years ago, I recollect, at one of the annual meetings of this Branch, a strong resolution was unanimously carried against all recognition of quackery, whether in the shape of homœopathy or any other name. I invite notice to be taken of what has recently occurred at Llanberis and Bethesda. I have been acquainted with Mr. Hamilton A. Roberts for upwards of thirty years, and I have known Mr. Hugh Rees also for a considerable period. Both are members of this Branch; the former having filled with distinction the post of President. They have, as you know, voluntarily relinquished lucrative offices, rather than countenance bone-setters. We ought to convey to them our opinion of the unfair and most ungenerous treatment they have received at the hands of men who ought to have required them better. A letter on the subject was placed in my hand, as I came into the room to-day. It is as follows.

“11, Victoria Place, Bethesda, 15th June, 1875.

“Sir,—Most of the members of the medical profession in North Wales are no doubt aware of the appointment of an unqualified bone-setter to act in conjunction with a professional gentleman at the Penrhyn Quarry Hospital. In consequence of this, Dr. H. A. Roberts, who has held the appointment of surgeon to the quarry for a period of about forty-three years, has thought it incumbent upon him to resign that post. I need not inform you that the resignation of Dr. Roberts is a matter of deep regret to all who have had the benefit of his skill and experience in this neighbourhood; and it has been resolved to present him with a testimonial as a slight token of their esteem and respect, and also as a mark of their sympathy, under the circumstances that have compelled him to resign. Subscriptions will be received by the undersigned, or by Mr. R. O. Morris, the Bank, Bethesda. (Signed, etc.) E. PHILIP WILLIAMS, Hon. Sec.”

It is time I should draw this to a close; I am anxious to say a few words more before I do so. In conducting the affairs of this Society, I was for several years ably assisted by our old friend Mr. George

Turner Jones of Denbigh, who was lately obliged to resign the treasurer-ship, owing to bad health. You will join me, I am sure, in expressing our sincere regret at this circumstance, and hope that rest and genial climate may restore him to good health. I bear in grateful remembrance the substantial tokens of your good wishes towards me expressed on two different occasions. I am glad to say that Dr. Eytton Jones of Wrexham has consented to fill the office of honorary secretary of the Branch, and that Dr. Lloyd Roberts of Denbigh holds the treasurer-ship. I am rejoiced to say that nearly all the respectable and talented members of the profession in the United Kingdom and Colonies are now members of the British Medical Association. To those resident in the district of the North Wales Branch who have not yet joined our ranks, I would earnestly appeal, and ask them to become members. The advantages of membership are well defined in the mutual regard and friendship it establishes. I look back to the many years I have been connected with it with singularly felicitous reminiscences. I cannot recall an instance in which I regretted absenting myself for a few hours from the anxious duties of country practice to meet my fellow-associates at meetings like this. The objects of this Society are not those for the gratification of the moment; they point the attention of the profession to the attainment of those medical and scientific purposes for which principally it was established. Bringing so many together naturally conduces to the better cultivation of friendship and knowledge of each other, but for which this happy consummation would never have been attained. I thank you sincerely for listening to a somewhat prolix address, and fear I have occupied too much of your time.

ON THE VALUE OF ASSOCIATED WORK IN INVESTIGATING THE PREVENTABLE CAUSES OF DISEASE.

Abstract of an Address delivered at the Annual Meeting of the Southern Branch, July 1st, 1875.

BY GEORGE GEORGE, M.D., Vice-President.

of medical science would be willing to admit that it might proudly take its position amongst the most highly cultivated branches of human knowledge; and, recognising the treasures which had been bequeathed to them by their predecessors, it was incumbent upon the members of the Branch to strive to aid in the completion of that edifice whose foundations had been laid by the great, the noble, and the good of their race. It appeared to him, further, that it was the special province of medical societies, more especially an Association so extensive and influential as that of which they constituted a Branch, which numbered not its hundreds only, but its thousands of members, to regard this rich inheritance with peculiar reverence, to foster it with the tenderest care, and to endeavour, by collective and individual efforts, so to use it that it should suffer no deterioration at their hands, and so to guard it that its prestige be preserved, its usefulness extended, and its boundaries enlarged, so that as an inheritance it might pass to their successors richer than it came to them. Although much might and had been done by individual effort, it seemed to him much more might be accomplished if the executive and members of the Association were to undertake the duty of organising some system whereby the smaller rivulets of knowledge that now in a large measure ran to waste could be guided, as it were, into one general current, so that they might become assimilated. This was not the time to consider the details of such a scheme, but he believed its adoption to be both possible and practical. For instance, what a high degree of interest would attach to a carefully arranged geography of diseases, acquired through the combined efforts of the members of the Association, contributing, as it might be made to do, to a medical topography of the several districts of the kingdom. No one could tell how far it might tend towards the elucidation of much that was now mysterious in the genesis of disease, or to the explanation of variations in their character. By its aid, some definite conclusions might be arrived at as to the effects of altitude, geological formation, direction of winds, proximity to the sea, the “lay” of the land, the dryness or humidity of the air, and other influences which in their totality constituted climate, upon diseases generally, and on epidemics specially. There was, without doubt, a certain range of variability

compatible with the preservation of health, but the accommodating powers of the system were limited, and it would be a great gain if by united efforts something like definite knowledge of such limits could be approached, so as to be able to predicate of a given locality that it would be favourable or inimical to health—that it would mitigate or intensify certain forms of disease. Geological formation had also its influence, by no means inconsiderable, on health and disease, not merely in so far as it might facilitate drainage, etc.; its more immediate effects would depend upon the character of the strata of any given locality, and on the water-supply thence derived. The full importance of water as a modifying element of climatic influences, and as a powerful agent ever present and participating in all physiological action and in every pathological change, was not by any means yet appreciated. He was speaking of water in its natural state, and free from those pollutions which were unhappily common. The members were familiar with some of the effects due to water *per se*, such as the prevalence of stone in certain districts and of goitre in others; but there were many other not so strongly pronounced manifestations of which they were entirely ignorant, or possessed but a vague and uncertain knowledge.

He next spoke of another matter requiring investigation, viz., the facility with which certain water not charged with lime-salts acted upon metals, acquiring thereby highly deleterious properties through passing through lead pipes: a danger not yet fully recognised as a source of disease, but which, either slowly and insidiously, or more rapidly, effected its poisonous work. Inquiry in regard to this matter was still more necessary in the present day from the circumstance, that from some cause, probably from a difference in the mode of manufacture, the action of the water on the lead was far more energetic than in former periods. Then, there was the prevalent use of copper vessels for culinary purposes, the baneful effects of which had been witnessed by himself in not a few instances. Other metals had their own peculiar dangers, and a new element in the genesis and modification of disease had been recently introduced with the extensive use of galvanised iron for the conveyance and storage of water in certain districts, a train of evil-marked symptoms ensuing upon the daily use of water thus contaminated.

Having at length dwelt upon the great gain which would come to medical science if minute and remote causes of disease were traced out by the machinery he had indicated, he referred to the action of stimulants as a subject deserving of consideration, with a view to the acquisition of more definite knowledge upon it. The diversity of opinion that obtained in reference to the medicinal and dietetic use of these, and the discrepancy of practice that prevailed, were greatly to be deplored, inasmuch as they imparted to the medical art a gratuitous measure of uncertainty, and detracted from its scientific pretensions. A wide latitude of opinion might be expected to prevail, but it ought not to be so wide as to embrace views so conflicting and irreconcilable that their existence would seem to indicate that a blind empiricism rather than a rational method was the guide of their practice. He referred to the investigations of Professor Parkes and others, as adding much to the elucidation of this subject.

In conclusion, he said if the collective efforts of the Association could be from time to time concentrated on subjects of inquiry similar to those he had mentioned, under some well devised methods of observation, they might well hope for the elucidation of much that was now vague and uncertain. The supplementary reports of the Privy Council and Local Government Board just issued demanded the careful perusal of every member of their profession, as well as of every thoughtful and humane citizen, for they revealed facts at which humanity stood aghast and decency was put to open shame. Their chief burden was the production of diseases by filth, and Mr. Simon said that the deaths in each year registered in this country (now about half a million a year) were fully 125,000 more numerous than they would be if existing knowledge of the chief causes of diseases affecting masses of population were reasonably well applied throughout England, this being the conviction of persons who had studied the subject. And with such terrible power did these preventable causes of disease in certain districts impress their fatal influence on infant life, that Mr. Simon had felt it to be consistent with truth to apply to such districts the epithet "Herodian"—a term expressive of the sacrifice of the weak, the helpless, and the innocent. "Put not your trust in princes", sang David in olden times, and to this

injunction, as regarded sanitary measures, they might now add, and still less in Governments, struck with apathy and palsied with indifference, who stood feebly tottering in the presence of "vested interests", and the "liberty of the subject", piously ejaculating, with averted eyes and uplifted hands, "Sanitas sanitatum, omnia sanitas."

ON THE PRODUCTION OF GLYCOSURIA BY THE EFFECT OF OXYGENATED BLOOD ON THE LIVER.*

By F. W. PAVY, M.D., F.R.S.,

Physician to and Lecturer on Physiology at Guy's Hospital.

THE author referred to a former communication to the Royal Society on "Lesions of the Nervous System producing Diabetes" (*Proceedings of the Royal Society*, vol. x, 1859-60), in which he made known that division of certain parts of the sympathetic system occasioned the presence of sugar in the urine. The results given in that paper showed that there were other means besides Bernard's celebrated experiment of puncturing the floor of the fourth ventricle, by which artificial diabetes could be induced, but they did not explain the reason of the appearance of the sugar, and the author still sought to discover something upon this point. The inquiry was pushed in various directions, but always with a fruitless issue until the summer of 1874. The author for some time past has been led to look to an altered condition of the blood flowing to the liver as likely to prove the most probable cause of the transformation of amyloid substance into sugar, which evidently constitutes the foundation of the artificial diabetes following operations on the nervous system. Schiff is of this view, and (*Journal de l'Anatomie et de la Physiologie*, Paris, 1866) has referred the escape of sugar from the liver, and thence the production of glycosuria, to the development of a ferment in the blood as a result of the hyperemia (not necessarily of the liver) which follows the operations on the nervous system which occasion artificial diabetes; but, although the author has carefully examined this opinion, he cannot obtain evidence of the development of a ferment in the manner asserted. He has further tried the effect of introducing a secretion, viz., saliva, into the circulatory system, which is known to act as an energetic ferment upon the amyloid substance of the liver, and on one occasion he found, from some cause or other, that the urine became, to a moderate extent, saccharine, but in a large number of other experiments the operation was attended with a negative result.

Having so far proceeded without success, it occurred to the author to try the effect of introducing defibrinated arterial blood into the portal system. He was led to experiment in this way from having some time previously observed that when arterial blood only was allowed to flow through the liver, as, for instance, when the portal vein was tied and the hepatic artery left free, sugar escaped from the organ to such an extent as to render the contents of the circulatory system strongly saccharine. This result he had commented upon as being somewhat surprising, and as furnishing evidence standing in opposition to Bernard's glycogenic theory. He had not succeeded by the operation in producing glycosuria, because, as it appeared to him, no urine was secreted, owing to the ligation of the portal vein leading to such a diversion of blood from the general circulation by the accumulation occurring in the portal system, that the flow through the kidney was too slight to allow of it. He had endeavoured to overcome this obstacle by connecting, through the medium of a cannula, the portal with the right renal vein after ligaturing the corresponding renal artery. If the experiment had succeeded, the liver would have been left with its arterial supply, but the portal stream would have been diverted and made to reach the inferior cava without traversing the hepatic vessels.

As regards the operation, this the author found he could accomplish, but each time he performed the experiment the object he had in view was frustrated by the cannula becoming quickly filled with a plug of

* Abstract of a paper read at the Royal Society, June 17th, 1875.

blood-clot. It was whilst under this difficulty that the thought of collecting blood from an artery, defibrinating it, and then introducing it into the portal system, occurred to him. He had considered it possible that some slight effect might be perceptible, but had not anticipated the strongly marked result which is producible. The amount of blood used has been from ten to eighteen fluid ounces. After the production of anæsthesia by chloroform, the blood was collected from the carotid artery, stirred in order to defibrinate it, strained, and then very slowly injected into a branch of the mesenteric vein. In one experiment, where half an hour had been employed in making the injection, the urine at the completion of the operation contained a notable amount of sugar, and half an hour later showed by analysis the presence of fifteen grains to the fluid ounce. In a second, the urine contained ten, and in a third fourteen grains to the fluid ounce when collected three quarters of an hour after the operation. The experiments were performed upon dogs, and in each case it had been ascertained that the urine was devoid of sugar before the operation.

Having noticed the effect which have been described from the injection of oxygenated blood into the portal system, it became necessary to ascertain positively that it was attributable to the oxygenated condition of the blood, and not to any other cause. To decide this point, an appeal to the counterpart experiment was made. Defibrinated venous instead of arterial blood was injected into a branch of the mesenteric vein, and upon each occasion where such an operation has been performed a negative result has been obtained.

With the evidence thus furnished, the conclusion may be warrantably drawn, that oxygenated blood in some manner influences the liver so as to lead to the production of glycosuria. It may be inferred that, contrary to the effect of venous blood, it promotes the transformation of amyloid substance into sugar. The suggestion naturally occurs, that what has been stated above affords an explanation of the glycosuria occurring after Bernard's puncture of the fourth ventricle and the various lesions of the sympathetic. Without any new agent being called in, sufficient is presented in the state of the blood to account for the production of sugar that occurs. By a vaso-motor paralysis affecting the vessels of the chylipoietic viscera, the blood will reach the portal system without having become dearterialised in its natural way, and in this state it has been shown by the experiments narrated to possess the property of acting within the liver in such a manner as to determine the production of glycosuria.

STATISTICS OF FEVER, ENDING IN RECOVERY AND IN DEATH, OCCURRING IN TWO THOUSAND CONSECUTIVE CASES OF LABOUR.*

By I. HARRINSON, F.R.C.S.,
Fellow of the Obstetrical Society of London.

In making my contribution to the now all-discussed subject of puerperal fever, I propose to do so from, as far as possible, a practical point of view; to follow the example so admirably set on the introduction of the subject at our last meeting. By practical, I mean as the cases occurred in practice, with all their, it may be, obscurity of origin, irregularity of progress, and, in some cases, unlooked for terminations. I shall not attempt to make things fit where there was no fitness; much less shall I draw a line, hard and fast, in their causes, symptoms, pathology or treatment. I shall give the cases as they were written at the time of their occurrence, with the remarks, if any, appended at the time, and draw inferences from them fairly apparent to you and to me. It cannot be expected that the earlier cases would be examined as closely and with the same light as the latter ones, but, as far as they go, they may be taken as truthful representations.

I need not insist in this place on the normal abnormality of a puerperal woman, specially on her system teeming with the effete products of an involuting uterus and the waste of parturient muscular effort, oppressed with the diverted stream of foetal nutrition, and charged with the detritus of an obsolete circulation, to which kidney implication may be added; nor will I insist on her susceptibilities, increased as they must ever be by the accidents of hæmorrhage, unhealthy surroundings, and mental conditions. It is a state *sui generis*, and only has a parallel, as Dr. Ord remarked to me a few days ago, in a system saturated with the material of gout. It is a state which renders her specially vulnerable to toxæmic impressions.

A good illustration of toxic susceptibility, on a grand scale, is afforded

* Read before the Pathological Society of Reading.

at the present time by our new Pacific acquisition. There, the virgin blood of the Fijians, unacclimatised to zymotic influences, unprotected by previous attacks, and unprepared for any, is at once disordered by the invasion of the weakest of European foes—that of measles—which revels in its freedom from antagonism, and now is numbering its victims by the thousand.

I will take it for granted that puerperal fever is admitted to be a toxæmia, the septinous matter being introduced by contagion (contact) or by infection (any and every other mode of introduction). It is possible that this septinous material may be inoculated before labour; and it is pretty certain that infection, as of scarlatina or erysipelas, may be received at an indefinite time during pregnancy, and only develop itself after delivery.

I will not attempt to draw a line between the access, progress, terminations, lesions, etc., of the specific poisons, as scarlatina, erysipelas, and those induced by animal matter, fresh as after a *post mortem* examination, or more or less putrid, as from a dissecting-room, though I believe it is generally admitted that the fresher the subject greater the danger; or those arising from a bit of retained placenta, or a non-expelled clot; between differences in kind and differences in degree.

Undoubtedly there are differences, and each cause produces a different series of effects, which only require to be carefully classified to establish a differential diagnosis. This is the work yet to be done. It is possible, also, that a practitioner, having met with a number of similar cases dependent on the same cause or causes, as in one hospital or locality, might be led to believe that there was one special puerperal fever.

It is proved by the experiments of Dr. Richardson that septinous poisons may be diluted with water to a given extent, and yet remain active up to an extreme of dilution. This fact warns us how the smallest quantity of morbid matter may inoculate a puerperal woman. He proves, also, that the intensity of the poisonous matter is increased in the most marked degree, and in a manner that seems to defy computation, with the transmission of the poison through fresh series of animals. This fact explains why, when a practitioner has a succession of unfortunate cases, particularly if he redouble his attentions to each, the last cases may be and are the worst.

It is reasonable to suppose that the risk both of contagion and of infection will be greater in some cases than in others, in the specific than in the non-specific; for example, in those arising from the inoculation of erysipelas than in that produced by the mere non-expulsion of a clot.

"It appears to us", says the *Lancet*, "that the history of puerperal fever proves that the disease can be communicated without contact in some cases, and by contact in all. It is not essential that the disease should be taken from one patient to the other; the original contamination of the fingers may give rise to the disease in a series of consecutive cases. I cannot decide how, when a septinous material is inoculated, the effects ensue; whether directly or whether by first inducing inflammation, from the product of which the virus is derived."

I may here state that to the more immediate effects of the introduction of septinous matter, either by contagion or infection, I limit the term septicæmia. Pyæmia is a secondary, or rather a tertiary, state, the product of phlebitis—one of the sequelæ of septicæmia. Blocking of the arteries—pulmonary, cerebral—by clots, local and migratory, must also be included among the dependencies of poisoned blood.

It is not easy to determine whether the dire effects of septinous poisons, seen in some instances, be dependent on the intensity of the poison, on the quantity introduced, or on the susceptibility of the individual to poison or to shock. Mr. Davis related, a few weeks ago, the case of a woman who died in half an hour from the sting of a hornet. It is well known what a very small amount of hæmorrhage from the uterus proves fatal in some cases. The greater protective power of four vaccine vesicles over one, demonstrates that quantity has some influence; some people catch everything; others take nothing. Practically, identity of cause does not produce uniformity of effect. Bear in mind Mr. Jeston's cases. A young woman nursed her father with erysipelas. She was seven months advanced in pregnancy. Two of her children had erysipelas, and, lastly, she was seized. Premature labour came on; puerperal fever supervened, and death occurred in seven days. The nurse who attended this woman was immediately afterwards seized with acute rheumatism and pericarditis, and died in seven days.

Among the things to be remembered in cases of puerperal fever are, that, though the origin may be erysipelas or scarlatina, it does not follow there should be the ordinary expression of either on the patient, nor does it follow that either the practitioner or the nurse introduced it. The patient may have been exposed unconsciously or recklessly to the poison of either, which, during her pregnancy, may have remained in a state of quiescence. A curious question arises, whether a woman in this state may not poison the fingers of the medical attendant at

her confinement, so that he unwittingly may convey the contagion to another woman. I shall have to enumerate cases affording some ground for such a supposition.

It will, I think, be admitted that the nurse must, if previously unclean, have the opportunity of conveying contagion more frequently than the medical attendant. Let it be remembered that the examinations of the medical man may be few, that his fingers will be smeared with some unctuous sheathing, that the secretions of the woman are copious and protective, and that the process of labour rouses her to a pitch of excitement opposed to the imbibition of septinous contamination. After delivery, the state is altered; the frequent ablutions, although with antiseptic fluids, give ample means for its introduction. For the future, the antecedents of the nurse must in every case of fresh engagement in her duties be rigidly supervised. It is evident that lacerations, ulcerations, etc., of the woman's structures may favour the inoculation, and that bruising may even furnish a supply of septinous material.

The statistics will include cases of extreme irritation, originating in the undue retention of a small portion of placenta. Clots may produce the same effects. In ordinary cases, such occurrences should rarely happen. I have no instance of septicæmia in cases of abortion, in some of which the expelled ovum smells. I am aware of the lesser development theory, but I have much faith in the ability of Nature to accomplish her own processes without disaster.

What, then, is puerperal fever? I reply, fever occurring in a woman recently confined. I say simply fever; neither a fever, nor the fever. The causes are numerous, the effects various; all are referable, however, to one condition—that of poisoned blood. The first impression, it is true, may be on the nervous system, as from fright, etc.; but the consequences are disturbance of function and vitiation of product. We shall see this more clearly when we come to compare puerperal fever with the effects of cold. In asking what puerperal fever is, I exclude, of course, the state of reaction from the labour, the physiological condition, the tumult of the novel situation, the secretion of milk, and the troubles of lactation.

The fever in mammary abscess sometimes runs high in the earlier periods after labour, being generally, I believe, a local pyæmia, extending from a cracked nipple; in the later, a deposition from a more general affection. The same rule applies to pelvic complications.

It must next be asked, What are the symptoms of puerperal fever? I will answer this practical question in the words of an able article in the *Lancet* of January 30th, 1875.

"We are not going to be drawn into any fine definitions of puerperal fever. The state we have in view is that of a woman recently confined, who, after a shivering, or something that represents a shivering, has a quick pulse. Temperature 101—105 deg.; more or less pain in the uterine region, suppression of milk, distention of abdomen. Lochia deficient or absent; more or less wandering"; and, I would add, an expression of distress.

One state must be here noticed, which has been most unaccountably ignored by—as far as I have seen—all speakers in the recent discussion. I refer to "intestinal irritation", as delineated by Dr. Marshall Hall. In it we get all the symptoms above named, with one important exception: the expression is not altered; it is good.

I cannot now discuss that important point how loaded bowels block the chief avenue of that eliminative process, so imperatively needful in the puerperal woman, and in what a rapid ratio, if neglected, mischief would accumulate. On many grounds, I must here do homage to that traditional dose, on the third day, of castor-oil, or something of the kind. Intestinal irritation is by far the most frequent after-illness of puerperal women.

"The truest and safest view we can take of such symptoms is to regard them as indications of septicæmia, arising from the introduction into the blood of materials more or less putrid, or capable of giving rise to changes in the direction of putrescence and to low forms of inflammation."

Before we say anything about the treatment of these symptoms, I propose to show how frequently they have occurred, their causation (as far as ascertainable), and whether ending in recovery or in death, in two thousand consecutive cases of labour attended by myself.

After-illness, of the poisoned class, in the first 100 cases. Intestinal irritation, 14 cases; uterine phlebitis, 1; phlegmasia dolens, 3; irritation from morbid infection, 1; mania, 1; variola, 1; rheumatic fever, 1. This class includes only the graver manifestations of mischief.

Some of the cases of intestinal irritation were very severe; often, doubtless, confounded with, and not readily distinguished from, cases of puerperal fever. The morbid infection arose in this way. While making a *post mortem* examination, I was called to a labour. Intense irritation followed, and she narrowly escaped with her life. Only one case of uterine cellulitis is reported.

Death occurred in six cases. 1. Abdominal inflammation (epidemic); died in four days. 2. Phlebitis from scarlatina. I was attending several cases of malignant scarlatina, and had opened an abscess in a fatal case immediately before seeing the patient, and she required the catheter till her death. She died in six days. 3. Puerperal inflammation; premature labour; dead child; died in eight days. 4. Erysipelas, by contagion. Before and during the time of my attendance on this case, I was frequently visiting a lady residing close by, who had erysipelas and retention of urine, requiring the frequent use of the catheter. Died in six days. 5. Scarlatina, or the rash of septicæmia. Died in six days. This case will be named again presently. 6. Fright and exposure to cold, followed by fever. The nurse fell down drunk, and was reported dead. Died in eleven days.

These are copied from statistics of 1,000 cases read before this Society sixteen years ago.

After-illness in second 1,000 cases. 1. On the tenth day, the patient had a rigor, followed by fever; and, on the fourteenth day, a bit of placenta came away, with immediate relief. 2. The patient had diarrhoea three weeks before delivery. For three days before labour, the pulse was more than 100. Fever followed. No probable cause. After a few days, the nurse was seized with erysipelas. This was case No. 70 in 1857. 3. No. 75. Slight phlegmasia dolens. 4. No. 76. Pulse above 100, without any discoverable cause. These three cases were the only ones of sequence and seeming consequence, and will be mentioned again. 5. Forceps. At the end of three weeks, had rigors, followed by slight pleurisy and phlegmasia dolens. 6. Severe intestinal irritation. The outcome of *ante partum* neglect. 7. Rigor; fever; herpes oris. In thirty days, a piece of placenta came away. 8. Swelling of calf of left leg during the third week. 9. Pain in calves of both legs during the third week. 10. Craniotomy; rigors; herpes oris; intestinal irritation. 11. Forceps; mental distress; rigors; intense fever for a little while.

I must give a little detail of this last case.

A lady, aged 28; first child; powerless labour. The forceps was used. She was a stranger, and begged I would not ask her name, nor make any inquiries about her. On the evening of the fourth day, she had a rigor, followed by high fever. On the fifth day, every symptom was so intensely aggravated, that the case seemed hopeless. As a last resource, late at night, I placed a box containing iodine under her nose, and requested her to breathe it during the whole night. She followed the direction with desperate obedience; and, next morning, I had the satisfaction to find every symptom marvellously ameliorated. She rapidly recovered. The note appended (1867) is, "to the iodine, I think, is to be given the credit of being the chief means of cure". I think so still. The effects of iodine in these and kindred cases are not yet all told.

Deaths in second 1,000 cases. 1. Mrs. S., aged 29, in labour with her third child, went on well to the end of the third week, when she was exposed to cold, followed by rigor and so-called acute rheumatism. At the end of a fortnight, she was quite free from pain, and up and about; when, one morning, she was found dead in her bed. This case was clearly arterial, from poisoned blood. 2. Mrs. C., aged 35, was confined with her first child. All was well for three weeks. During the fourth week, she had diarrhoea. On the day month from her delivery, after exposure to cold, she had rigors, fever, pleuropneumonia, and died in five days. This case was clearly venous: a pyæmia not to be distinguished from that arising from, e.g., a case of otitis. 3. Mrs. A., aged 30, was confined with her fourth child. She had diarrhoea during her whole pregnancy; slight fever; phlegmasia dolens. She died from diarrhoea—probably through ulceration of the bowels—at the end of two months. 4. Mrs. S., aged 28; first child. Craniotomy; hydrocephalus; rigors; fever. She had pleasant delirium, and died on the tenth day. This case was unfortunate in all its surroundings, nursing, etc. 5. Mrs. T., aged 22; third child; had phlegmasia of one leg, and died in five weeks. In this case, there was no rigor, little fever, some nausea, occasional vomiting, but no prominent symptom, except increasing weakness. The tenderness and swelling of one leg told, however, of phlebitis and pyæmia. Another woman died after confinement, in the same street, the week before.

What do these cases show? A variety of causes and a variety of effects. Where the history is clear, they show that the main means of propagation was by contact, and not by infection. I have no unequivocal case of infection. I have no cases of sequence and consequence, except after-illnesses, marked No. 70, 75, and 76. No. 70 had fever without any ascertainable cause. She had diarrhoea for three weeks, and a pulse above 100 for three days before delivery. Presently the nurse was seized with erysipelas. No. 75 had slight phlegmasia; and No. 76 a pulse above 100, without any discoverable mischief. My suspicion is—it can only be a suspicion—that No. 70 at, and for some

time before, delivery, was charged with the material of erysipelas; that though there was no external expression of the disease, she by contagion, and probably by infection, gave it to the nurse, and that she poisoned my finger at the time of her labour, and that I communicated it—in a slight degree, it is true—to Nos. 75 and 76. The catheter was a ready method of communicating mischief in two cases.

The poisons of scarlatina and erysipelas did not produce those diseases as such, but virulent septicæmia. I have no case of the specific rash of scarlatina, doubtfully excepting one—that of a lady who, during pregnancy, had been visiting cases of scarlatina, and who had a rash like scarlatina on the third day after delivery, and who died on the sixth day. I was not then acquainted with the efflorescence seen in some cases of septicæmia, and I now hesitate to which class to refer it.

The cases show that septicæmia sometimes follows forceps deliveries. This is no more than we might fairly expect on surgical grounds. The contingency applies to all obstetric operations. It is satisfactory, however, to find only one death from fever after instrumental interference: that of craniotomy for hydrocephalus.

It will be observed that there is a marked difference in the duration of the cases fatal by septicæmia and pyæmia. In the former, a few days; in the latter, all died in five weeks from the time of delivery.

After thus briefly telling what the cases show, the next important lesson is, What do they teach? They teach this: that, in some instances, mischief, even unto death, arose from preventable causes, viz., intestinal irritation, in default of previous attention, from the hand tainted with the virus of a *post mortem* examination, from the fingers poisoned with the matter of a scarlatinous abscess, or reeking with the venom of malignant erysipelas. These lethiferous causes, and all such like, may and must be avoided, if we are for the future to practise our profession in peace, quietness, and safety. Endemic influences must be counteracted as well as may be, operative measures avoided when practicable; and the whole physiology of labour and the pathology of its sequences must be carefully observed and ministered to with patience, with a definite aim, and with clean fingers.

I have used all the preventive means I knew—habilitary, detergent, and antiseptic. When scarlatina has broken out in a family where the lady was pregnant, I have recommended her to go away to be confined, as we all know with what pertinacity the poison of scarlatina sticks to a house or to a room. I have avoided, as far as possible, attending cases containing the elements of septinous contamination, and I have never been obliged to cease from practice, even for a limited period.

Before just running over the principles of treatment, it may be useful to compare puerperal fever, the unity of its cause (some septinous material) and the non-uniformity of its results, with some other common agent, and the diversity of its effects. Let us take one with which we are just now familiar: that of the cold of last winter.

We have nothing to do now with the annihilation of function produced by extreme cold, as of a flock of sheep being found dead in the morning after premature shearing, or of a rabbit denuded of its fur. A coat of varnish has nothing to do with the event; they are frozen to death. What I refer to are those lesser perturbations of the system, spoiled functions, with all their noxious entail, not consequent on a cold, but dependent on the cold.

What were they? Affections of every region of the body, from the head to the feet; convulsions, coma, inflammation of tonsils, pharynx, larynx, trachea, bronchi (rarely of smaller tubes), lungs, pleura, stomach, rheumatic fever (so-called), and neuralgias everywhere; as usual, extremes of exposure and extremes of susceptibility must be taken into account.

Observing these every day occurrences, how can the effects of poison introduced into, or generated in, a puerperal woman, be expected to be uniform?

I should like to know how members treated all these various affections during last winter. If a remedy were sought for each organ affected, your therapeutic resources must have been pretty well exercised. For my part, I treated them all alike, on general principles.

So in puerperal fever, turpentine, internally and externally; breathing an iodised atmosphere; opium and quinine, with, of course, proper food, air, and stimulants, etc., do best what can be done, on the same general principles; modified, of course, by the cause.

Quinine, according to Dr. Richardson, counteracts the different poisons in their power of liberating oxygen, his theory of their bane.

Salicine is allied to quinine, and is given as its substitute. Salicine is obtained (analytically) from the willow tribe, the meadow sweet, and winter green.

Salicylic acid is found to be the most effectual disinfectant. It can be made, also, and commercially it is so made—synthetically—by the action of carbonic acid on carbolic acid.

This alliance between quinine, salicine, salicylic acid, and carbolic acid, strikes me as at least curious, and possibly may have a more intimate relation with the success of these substances in the treatment of puerperal fever and such like diseases, than we are at present aware of.

INTRATHORACIC TUMOURS.*

By J. W. F. SMITH-SHAND, M.D.,
Physician to the Aberdeen Royal Infirmary, etc.

I.—PRIMARY CANCER OF THE LUNGS. (Concluded from page 845 of last volume.)

CASE II.—In the next case I shall bring before you, I have no positive proof to adduce in support of my diagnosis of primary cancer of the lung, although I think I have strong presumptive evidence in its favour. George McKenzie, aged 28, a coachman, was admitted into the Royal Infirmary on July 1st, 1872. The patient stated that he enjoyed good health till last winter, when he was exposed to cold and wet, but he was not confined to the house in consequence. He noticed after this, however, that his breathing was short after any exertion, and that he had a short dry cough. He never had any pain in the chest, and he could lie on either side in bed. About a fortnight ago, his cough became much more troublesome, and he had a white frothy expectoration. There was no hæmoptysis.

Condition on Admission.—The patient had a puffy bloated appearance, with lividity of lips and cheeks, and lay in bed with his head and shoulders raised. There was slight fulness of the jugular veins. There was deficient movement of the left chest, with dullness on percussion in the lower half, and absence of breath-sound and fremitus. A subtympic note was heard in the left infraclavicular region. There was puerile breathing on the right side. The heart-sounds were best heard to the right of the sternum. Pulse irregular, 125 per minute. Bowels costive. The urine was scanty, of specific gravity 1030; contained no albumen. Temperature 103 deg.—July 6th. There was dullness over the whole left chest, with absence of breath-sounds, except on deep inspiration, when distant feeble breathing was heard. The left hand and arm were œdematous.—July 8th. The nurse stated that he had been confused and delirious the previous night. The œdema of the arm had increased, and there was marked swelling of the left side of the face and neck. On inspection, the left side of the chest was smaller than the right, and the infraclavicular region was flattened. The heart-sounds were heard more to the right of the sternum. There was no change in the other physical signs. He expressed himself as feeling easier. The left pupil was slightly more dilated than the right. His voice was rather husky. He said that of late his voice had altered in character, and had not been so clear as formerly. About 3 P.M., he fell into a heavy sleep, from which he could with difficulty be roused. The stupor gradually became more profound, and he died at 6 P.M. The last two days, his urine was copious, as he passed three pints in twenty-four hours.

Strong efforts were made to obtain a *post mortem* examination, but they failed. All that I could venture to do was to insert a trocar into the chest in the axilla. Considerable resistance was offered to the passage of the trocar, as if it were passing through some dense firm substance, and when the trocar was withdrawn, nothing followed, except two or three drops of bloody serum.

REMARKS.—The existence during life of well marked inward pressure signs on the left innominate vein in this case, and the result of the exploratory examination after death, conclusively prove that the dullness on percussion was due to a solid tumour, and not to fluid. It is a clinical law laid down by Walshe, that evidences of pressure on internal parts, as the aorta, arteries, veins, nerves, trachea, bronchi, œsophagus, or thoracic duct, are solely due to tumour, whatever its nature may be, and that neither hydrothorax, pneumothorax, or empyema can produce them. There can be little doubt also that the obstruction to the venous circulation was the cause of death, by inducing stupor and cerebral congestion. The only point to decide is, whether the tumour was aneurismal or cancerous. My reasons for fixing on the latter were the absence of pain and impulse, and the evidence of slight displacement of the heart to the right side.

In this case, the left chest was flattened and smaller than the right, while in Mackie it was enlarged, as judged by the eye. Dr. Walshe, in his last (fourth) edition of *Diseases of the Lungs*, states that, when there is simple cancerous infiltration associated with limited tuberous formation, the affected side is either retracted or depressed, but that, when the cancer of the lung is mainly tuberous, the diseased side is generally

* Read before the Aberdeen, Banff, and Kincardine Branch.

but not uniformly enlarged. In Mackie's case, I unfortunately did not measure the two sides of the chest; but my decided impression was, that the left was considerably larger than the right. I, therefore, wrote to Dr. Walshe, asking him whether he did not think it likely that an infiltrated pulmonary cancer weighing close upon five pounds would produce enlargement of the affected side. In the reply with which he kindly favoured me, Dr. Walshe said that he had never seen a case of primary infiltrated cancer where the pleura was demonstrably free from the disease, in which the effect was not a contracting one, if the dimensions of the side were affected at all. But he said he could *a priori* conceive that, in a case of rapid quasi-general infiltration with encephaloid disease, enlargement of the lung and slight expansion or bulging of the side might take place. He shows, in his work, that, in acute pneumonia during the stage of red hepatisation, enlargement of the side may occur; and I have little doubt that, in rapid cancerous infiltration going on to any extent, the same result would ensue. From Dr. Walshe's extensive experience and opportunities of observation, great weight must be attached to any statement of his on the subject, and it may doubtless be the case, as he says, that, in simple cancerous infiltration, the general effect is a contracting one; still it will be well to bear in mind that it is quite possible that, in certain stages of the disease, or in cases of rapid growth, an enlargement of the side may be produced. And Aviator, as quoted by Coekle, is of opinion that, in the early stage of cancer, there is a slight though decided augmentation in size of one side of the chest.

Cancer of the lungs is a disease of adult life, and is said to occur much more frequently in the right than in the left lung, and amongst males than females. Out of 39 cases collected by Dr. Risdon Bennett, however, 19 were females and 20 males; the left lung was involved in 14, and the right in 9, both lungs being affected in the remainder, or the disease was confined chiefly to the mediastinum.

Of the two forms, the medullary and scirrhous, the first is by far the most common. It may be met with in the form of small granular masses, like miliary tubercles, or, which is more common, in larger masses isolated from each other, with healthy lung-tissue intervening. It was formerly supposed that cancer may be infiltrated into the air-cells, the lung-tissue being entirely converted into cancerous matter. This form, Rokitsky says, is rare, and when it occurs, it is the result of a pneumonic process. This view, however, of the conversion of an infiltration into cancer, says Niemeyer, has been abandoned; and it is now believed that, in the origin of infiltrated cancer, after the transformation into cancer-cells of a few of the connective tissue-cells of the matrix of the lung, this conversion is propagated into the neighbouring connective tissue and into the connective tissue-cells of the adjacent alveoli. The air-cells may be filled, but this is not as the result of a true exudation.

No more need be said at the present time on the histology of cancer while the controversy rages between Virchow, Forster, and others, who believe that the connective-tissue corpuscles form the matrix from which cancer springs; and Thiersch and his supporters, who hold that cancer can only originate from epithelial structures. And, as Rindfleisch remarks, the histology of cancer of the lung, more especially from the great rarity of the disease, is still in its infancy.

II.—ANEURISM.

The second portion of my paper will be mainly devoted to the consideration of some of the physical signs and symptoms produced by this aneurism, which I now show you. The notes of the case are as follows. John Jaffray, aged 43, seaman, and a native of Aberdeen, was admitted into the Royal Infirmary on July 22nd, 1871.

Previous History.—The patient had been in the way of coming to hospital for the last four years to be treated for secondary syphilis (chiefly periostitis), which was always speedily cured by five-grain doses of iodide of potassium, and he had been able to follow his employment till March of the present year. He stated that he had been subject to a cough for a good many years; that for nearly a year he had had difficulty in swallowing, especially liquids; and that, in January 1871, his cough being then bad, he became affected with hoarseness and loss of voice. In March of the same year, he was a month in hospital with periostitis of the right tibia, which was cured by treatment; but, after this, he was not able to work, owing to shortness of breathing and pain in the breast. The pain in the breast becoming worse was the cause of his again entering the hospital at the present time.

Present Condition.—July 23rd. The patient, who was a dark-haired, brown complexioned man, had lost flesh considerably since he was in hospital in spring. He complained severely of a dragging pain in the left hypochondriac region, and of shortness of breathing, and he lay habitually on his right side. On inspection, the chest was well formed, and

nothing abnormal could be detected in the heart or lungs by auscultation and percussion. The sputum was frothy, slightly mucopurulent. The right pulse was weaker than the left. The urine was natural. His digestion was bad; the bowels costive. There were no inequalities of the pupils. The sight was dim, except for distant objects. He was ordered iodide of potassium, steak diet, and stimulants.—August 25th. The patient had not been examined particularly for some time till today, when the following points were ascertained. On inspection, there were flattening and diminished chest-movement in the left infraclavicular region, and slight bulging in the left hypochondriac region. The heart's apex beat in the fourth intercostal space, immediately below and to the inner side of the left nipple. The impulse was visible in the left mammary and infraclavicular regions, and there was slight pulsation at the sternal notch. On percussion, there was dulness over the left clavicle and infraclavicular region anteriorly. The percussion-note was clear, almost tympanic, in the left hypochondriac region. There was dulness over the left back. The area of hepatic dulness was diminished. On auscultation, the breathing on the right side was harsh generally; on the left side anteriorly, it was faint, with slight blowing expiration in the left infraclavicular, mammary, and axillary regions. There was absence of breath-sounds in the hypochondriac region. Posteriorly, the breathing was faint on the left side with blowing expiration in the supraspinous region. The heart-sounds were weak but normal.—August 31st. The patient coughed up two or three mouthful of dark blood. The pain in the chest and the dysphagia had gradually gone. Slight hæmoptysis occurred now and again, and the sputum was on one occasion examined microscopically, but no other cells were seen than the normal blood-corpuscles.—After September 1st, no notes of the case were kept, as I was absent from home for a few weeks; but there was little change in the patient, except that he became gradually weaker, and that the flattening of the left side of the chest became more marked.—On October 4th, profuse hæmoptysis occurred, and he died suddenly that day.

Post Mortem Examination.—October 5th. (Reported by Dr. Rodger, pathologist.) The heart was adherent to the pericardium. Its valves and cavities were healthy. It was much congested on the right side, as were also the veins leading to it. The right lung was congested and œdematous; the left lung was closely adherent to the chest-wall, and compressed. At the root of the neck, the whole of the arch of the aorta was aneurismal from in front of the innominate artery to its posterior termination—the left bronchus and the left recurrent laryngeal nerve being considerably compressed by the enlargement. The thoracic aorta was more or less dilated throughout its whole extent; and, immediately above the diaphragm, there was another smaller aneurism projecting to the left side, but there was no excavation of the bodies of the vertebrae from the aneurism, and neither of them had ruptured—the immediate cause of death being hæmoptysis from congestion of the lung, and suffocation. The liver externally was covered with patches and bands of tough lymph from previous perihepatitis, and the liver itself was very much distorted and deformed in its lobulation; the gall-bladder being placed at the extreme right margin of the organ, the right lobe being almost wanting, and the quadrate, Spiegelian, and left lobes very irregularly and enormously enlarged. The spleen was normal. The kidneys had the tubules of the cortical substance much loaded with inflammatory desquamative deposit, but not much degenerated.

REMARKS.—I must admit that this case puzzled me a good deal, and that, although I was divided in opinion as to its being a case of aneurism or of phthisis, my impression latterly was strongly in favour of its being cirrhosis or syphiloma of the lung, with a syphilitic affection of the larynx. Doubtless the severe pain and dyspnoea, the loss of voice and dysphagia, together with the impulse and pulsation in the left mammary and infraclavicular regions and at the sternal notch—slight though they were—the hæmoptysis and the inequality of the two radial pulses, seemed to point very clearly to aneurism. At the same time, it has to be remembered, that there was a history of syphilis and of long-standing cough; that the patient soon afterwards, being unable to work, began to lose flesh; and that shortly after this there was evidence of flattening and diminished chest-movement on the left side, with dulness on percussion.

It has also to be noted, that the apex-beat was higher than normal, and that this fact, as also the impulse in the upper portion of the left chest, and the tympanic note in the left hypochondrium, was explained by the contraction of the lung, and displacement of the heart and stomach, which are seen in cases of phthisis, and notably in cirrhosis. There was no heaving character about the impulse, and the seat of the pain referred to the left hypochondrium was unusual for aneurism, and may have been produced by periostitis, or by the second aneurism above the diaphragm. It was most probably produced by

the latter cause, and the disappearance of the pain and dysphagia may have depended upon a change in the direction of the protruding forces. As there is said to be a connection both between syphilis and aneurism, and syphilis and cirrhosis, the previous history in this case could be of no decided value in the diagnosis. Hæmoptysis as a symptom is common to phthisis, cancer, aneurism, and cirrhosis; but, in the latter disease, it appears to be more rare than in the other examples.

It may be briefly stated in conclusion, that, in the differential diagnosis of intrathoracic tumours, the most valuable of all the symptoms seems to me to be *pain*, and that, in doubtful cases, when severe pain is complained of, it is much more likely to be dependent on aneurism than on cancer.

DENTIGEROUS CYST IN THE UPPER JAW.

By A. W. STOCKS, M.R.C.S.,
Surgeon to the Salford Royal Hospital.

R. D., AGED 18, a healthy-looking girl, residing at Morecambe, came under my care for the treatment of a tumour occupying the right cheek, forming a projection into the nose, filling up the canine fossa, projecting outwards under the malar eminence, and encroaching on the mouth. In the latter position, it was found to occupy the space of the right lateral incisor, canine, and first bicuspid teeth, which were wanting. The alveoli corresponding to the former two were found to be dilated (for, although three teeth were absent, yet there were to be found only two alveoli), and the edges of the alveolar plates could be distinctly traced, having projecting through them a soft semifluctuating tumour, on the surface of which ramified numerous large veins. The movement of the upper lip was considerably interfered with. The tumour had existed for about three years. The appearance of the girl's face was peculiarly that produced by a dilatation of the antrum of Highmore. There was not much pain, and the voice was rather nasal. An exploratory puncture through the dilated alveolus by means of a cannula and trocar let out a small quantity of bloody serum. No distinct fluctuation could be made out between the most prominent parts of the swelling and the projection into the mouth.

On November 12th, 1874, the cheek having been raised from the front of the upper maxilla (under chloroform) without any wound of the external skin, the tumour was easily perforated by a gouge, and the opening enlarged by a pair of nibbling forceps sufficiently to admit the finger into the antrum, which was found to contain a clot of blood and some serum, the former being the result, no doubt, of the late exploratory puncture. On passing the finger into the cavity, a hard pointed substance was found projecting from the roof of the antrum, about a quarter of an inch from its posterior wall, and, after a few forcible but vain attempts, a fully developed canine tooth was removed by the forceps. The cavity was filled with lint and the patient sent to bed. Her progress towards recovery was uninterrupted, and, on January 16th, there was only a slightly fistulous orifice at the junction of the lip with the upper jaw. The distortion, which continued as great as before the operation, has been much reduced by pressure obtained by wearing a small India-rubber ball firmly bandaged on the cheek during the night; and the projection into the mouth has shrunk very much; indeed, now there is scarcely any distortion left.

The tooth which was removed from its abnormal position is in all respects a well developed canine (permanent) tooth measuring barely four-fifths of an inch, the crown being exactly three-tenths of an inch long. The fang, however, instead of having a smooth surface similar to that found in most teeth, is surrounded by a firm deposit of bone, giving one the idea that it was not implanted in an ordinary alveolus or socket, but rather ankylous to the bone in which it was found. It appears that, some time ago (how long she could not say), according to the girl's statement, she had her "eye-tooth" on that side removed; that it was a "sucking tooth"; and that the corresponding tooth in her permanent set never appeared. The lateral incisor and first bicuspid teeth were extracted at a much later period, with a view to the cure of the tumour. How the tooth got into the position in which it was found, is very difficult satisfactorily to explain; but it would appear not improbable that, in the extraction of the primary tooth, some damage had been done to the pulp of the secondary tooth, and that the germ had been lifted out of its normal position and carried, so to speak, on the top of a cyst formed by a morbid secretion in the dental sac, through the antrum, and so taken root in the orbital plate of the superior maxilla, where it was found.

The case mentioned in Bryant's *Surgery*, page 279, is somewhat similar to the above, save that in it the tumour was formed by a solid instead of a fluid growth. The engraving on the same page gives very fairly the peculiar external appearances of the above case.

CLINICAL MEMORANDA.

HEMIKINESIS.

IN reply to Dr. Clay Shaw's remarks, I would say that I have not introduced the term hemikinesis for any *one* mobile disorder. In the report from my hospital practice to which Dr. Shaw refers, it is stated that the term is applied to "over-movements of one side of the body, as, for example, hemichorea, hemispasm, etc." I coin this word to facilitate the comparative study of one-sided mobile disorders, and their study in relation to hemiplegia. There are several mobile disorders which are alike, in so far that each of them affects first and most the same muscular region as is paralysed in hemiplegia; they are unlike, in that in each case the muscles suffer differently. There are many varieties of one-sided movements; athetosis is one variety. I did not think the case of my patient was one of athetosis. It is a variety of over-movement which I have been in the habit of calling hemicontracture. Before I publish the case, however, I shall re-read Hammond's description of athetosis, as well as study the papers of Gairdner and Clay Shaw.

I have many times written on the comparative study of one-sided mobile affections in relation to hemiplegia. That this method of investigation is useful, I will adduce Dr. Radcliffe's testimony. In his article on Chorea in the second (not in the first) edition of the second volume of Reynolds's *System of Medicine*, after stating the reasons I have advanced for the localisation of the changes producing chorea in convolutions near to the corpus striatum, he writes: "For most assuredly the difficulties which beset any attempt to localise the choreic lesion in the nerve-centres are not a little simplified by thus insisting upon the clinical relations between hemichorea and hemiplegia as a ground for believing that the region of the corpus striatum is the part affected in both disorders." J. HUGHLINGS JACKSON, M.D.

THE CAUSE OF DEATH AFTER THE INJECTION OF A NÆVUS.

IN Dr. Buchanan's interesting lecture, published in the *BRITISH MEDICAL JOURNAL* of June 26th, mention is made of a case of nævus of the eyelid treated by the injection of perchloride of iron, and ending fatally.

"A drop of perchloride of iron was introduced, and in two minutes it was dead, just as if shot through the head with a pistol. A particle or portion of the coagulated blood had entered into the ophthalmic vein, and had gone back and got plugged in some part of the venous circulation at the base of the brain or orbit. Congestion or stagnation of the blood had taken place, and the result was fatal."

It would be interesting to know whether the cause of death in this case was determined by *post mortem* examination, as the explanation offered by Dr. Buchanan would otherwise appear somewhat improbable; for, as the calibre of a vein increases with the distance from the capillaries, it is difficult to understand how the plug would become obstructed in its course towards the heart. Supposing, however, that the plugging took place in the orbit, I am still at a loss to conceive how an obstruction of the ophthalmic vein would occasion sudden death. If, on the other hand, the clot became lodged in the cavernous sinus of one side, owing to the free communications existing between the sinuses of the two sides, and the special provisions present in children for the escape of blood from the cranium, it may be doubted whether a fatal result would immediately follow. I have seen cases in which the lateral sinus and internal jugular vein of one side were plugged from extension of inflammation from the ear without causing any brain-symptoms.

It once happened that I was present when a child died suddenly after the injection of a nævus of its scalp, and the explanation then offered was, that the plug had passed through the right side of the heart and become impacted in some large branch of the pulmonary artery. I should be inclined to think that a similar accident had occurred in the case related by Dr. Buchanan, unless some other cause of death were discovered by *post mortem* examination.

R. CLEMENT LUCAS, B.S., St. Thomas's Street.

TESTIMONIAL.—A complimentary dinner and testimonial were on Friday, June 18th, given by the members of the Bradford Medical Aid Association to Joseph Farrar, Esq., L.R.C.P.Ed., in token of the highly satisfactory manner in which he has for the past two years discharged his duties as medical officer to the Association. Great regret was expressed by several of the speakers at Mr. Farrar's resignation.

GENERAL COUNCIL
OF
MEDICAL EDUCATION AND REGISTRATION.
SESSION, 1875.

Wednesday, June 23rd.

DR. ACLAND, President, took the Chair at 2 P.M.

Visitation of Examinations.—The Council resolved itself into Committee for the consideration of the reports of the visitors of examinations.

University of Dublin.—The medical examinations of this body were visited and reported on by Dr. Haldane and Mr. Busk.

Dr. PYLE moved, and Dr. ANDREW WOOD seconded:

“That a copy of the report of the visitors of the examinations of the University of Dublin be forwarded to that University, for their consideration and remarks.”

Dr. APJOHN, while expressing his general satisfaction with the report, commented on some portions of the report. The visitors had stated that, by a resolution of the Council of the College founded on the recommendation of the professors, the written answers could not be removed from the custody of the Medical Registrar, nor could extracts be taken from them for publication. It was a mistake to state that this was in consequence of a recommendation of the professors.

Dr. STOKES said that he shared with Dr. Apjohn his pleasure at reading the reports of the visitors. The care, patience, and skill which the visitors showed in the performance of their duty were beyond all praise. There were, however, one or two points in the reports which were not quite accurate. It was stated that the second examination for M.B. might be “regarded as the final one for the highest medical degree granted by the University”. Candidates for the degree of M.D., which was not allowed to be taken till three years after that of M.B., were required to present a thesis or theses, which they were always encouraged to base on original observations; and were liable to be examined on the subjects of the theses. The visitors suggested that the same plan should be followed as in the previous examination, of having as coadjutors examiners who were not teachers in the school. The Regius Professor of Physic, who was associated with the King’s Professor of Medicine in the examinations, was not a teacher. It had been suggested that the time occupied in the *vivâ voce* clinical examinations was too short. His opinion, and he believed that of his colleagues, was that the judgment as to the *mens medica* of the candidates was arrived at by the study of the clearness of the written descriptions of the cases put before the candidates, more than by any number of questions. With regard to the question whether the professorial element should be represented in the examinations, he did not think that the Council would advise that the professors should be confined to teaching alone. Several of the professors in the Examining Board at Trinity College were not teachers of Medicine, or only teachers of collateral sciences; e.g., Dr. Galbraith and Mr. Leslie in Physics, and Dr. David Moore and Mr. Wright in Botany. Mr. Macnamara, who was an examiner in *Materia Medica*, was not a teacher in the school. The total exclusion of the teaching element had been recommended; but this proposal implied want of confidence in the impartiality of the examiners. Great advantage both to medical science, to students and to the teaching bodies, arose from teachers in other schools being called on to assist in the examinations. He was ignorant of any recommendation of the professors regarding the written answers. Permission to inspect these was always liberally granted. At the same time, it was right to exercise restriction as to their publication, which might be injurious to the interests of candidates.

Dr. STORRAR, referring to the statement in the report that, at the previous examination, a candidate might come up in all the five subjects, Physics, Botany, *Materia Medica*, Chemistry, and Descriptive Anatomy, but that few did so, asked if candidates were allowed to present themselves for examination in one subject at each of five separate examinations.

Dr. APJOHN replied that this was the case.

Dr. STORRAR thought the practice very much in favour of superficial knowledge. The advantage of grouping several subjects in one examination was, that a more thorough knowledge of them was secured.

Dr. HALDANE said he had sent a telegram to Dr. Haughton, the Medical Registrar, asking whether the professors had made the recommendation referred to respecting the written papers; and that Dr. Haughton had replied that they had done so. There was probably a misconception, but no inaccuracy, as to the fact. He could speak in

the highest terms of the manner in which the clinical examination was conducted; but he thought the time rather too short. No doubt a good idea of the comparative merits of candidates could be formed from an examination of the written papers; but the case was quite different when the object was to determine whether the candidate was qualified to practise.

Dr. APJOHN was glad to hear that there was authority for the statement as to the recommendation by the professors; but he was quite ignorant of it.

Dr. AQUILLA SMITH had no recollection of it. With regard to the alleged shortness of the time allowed, a competent candidate ought to be able to answer the questions within the time. In one case, a candidate, instead of occupying the whole hour, sent in his answers—which were the best of the series—in thirty-five minutes.

Sir DOMINIC CORRIGAN said that there was no similarity in the plan of the reports; and that, if the visitations were continued, it would be necessary to give instructions to the visitors as to the method to be followed.

After some further discussion, in which Sir D. Corrigan, Mr. Macnamara, Mr. Quain, Dr. Storrar, Dr. Humphry, Dr. Apjohn, Dr. Rolleston, Mr. Turner, Sir William Gull, and Dr. Bennett took part, the motion was carried.

University of Durham.—The examinations at this University were reported on by Dr. Storrar and Dr. John Struthers. It was moved by Dr. BENNETT, and seconded by Mr. QUAIN:

“That a copy of the report of the visitors of the examinations of the University of Durham be forwarded to that University, for their consideration and remarks.”

Dr. PYLE said that the University of Durham was one of the first bodies to recognise the importance of examining candidates in practical anatomy, and it had carried out this system for fifteen years. Referring to a case mentioned in the report, in which a candidate deficient in practical chemistry had been allowed to again present himself within a short time for examination in this subject, he said that his answers in anatomy and physiology were good, and those in chemistry fair, and that it would have been a hardship to put him off for a year, as he would have been prevented from offering himself for examination at other boards. The visitors had referred to the conduct of the examinations by the teachers in the school alone. This was quite an exception. This year, Dr. King Chambers was appointed an examiner; and the President of the Council, among others, had in past years performed the duty. The report would receive attention from the authorities of the University.

Dr. ANDREW WOOD referred to remarks made by Dr. Struthers on the deficiency in English education shown by one of the candidates. It was not creditable that there should be deficiency in spelling. Dr. Parkes had last year drawn attention to imperfect spelling on the part of candidates for the diploma of the Royal College of Surgeons of Edinburgh; but it had been found that they had passed their preliminary examinations elsewhere. He thought that the examiners for a medical diploma or degree ought to have the power of rejecting a man who showed himself to be illiterate; and that they should report on the matter to the Council.

Mr. TURNER thought that the candidate referred to as having been allowed to present himself in practical chemistry ought not to have had another chance. From the report, it appeared that he bungled frightfully in his dissection.

Dr. HUMPHRY said that the report showed the necessity of dissection. The candidate was reported to have answered the questions in anatomy readily and correctly, and yet to have made a most extraordinary hash of his dissection.

The PRESIDENT, before putting the motion to the vote, said that the subject of preliminary examination had come under his notice when he was an examiner at Durham nine years ago. He was sure that sooner or later the Council would have to consider whether the examinations in the subjects of general education were what should be required.

The motion was then carried; and the Council adjourned for an hour to allow several Committees to complete their business.

Adoption of the Proceedings of the Council in Committee.—The Council having resumed, Dr. ANDREW WOOD moved, and Sir WILLIAM GULL seconded:

“That the resolutions of the Council in Committee be adopted by the Council.”

Dr. ALLEN THOMSON moved as an amendment:

“That the resolutions of the Council in Committee be adopted, with the exception of the words in resolution 5 of the 19th June, viz., ‘and that special consideration be requested to be given to such part as refers to the clinical examination for the licentiate, and to the deficiencies in the department of medical jurisprudence.’”

The College of Physicians was the only body regarding which a resolution of the kind had been adopted. He thought that the reports on other bodies contained remarks which called for quite as strong expressions of opinion. The reports should be simply sent to the several bodies, so that all the points in them might be considered.

Mr. QUAIN seconded the amendment, which was opposed by Sir WILLIAM GULL; and, on being put to the vote, was lost, 3 voting for, and 10 against it.

The motion for the adoption of the proceedings of the Committee was then carried.

Thursday, June 24th.

The Council were occupied during the whole of this day in discussing the report of the Committee on Mr. Simon's letter. An account of the debate was given at pp. 9-25 of last week's JOURNAL.

Friday, June 25th.

Dr. ACLAND, President, took the chair at 2 P.M.

Medical Education of Women.—Letters on this subject from Miss Jex Blake and Mr. A. T. Norton were read; and on the motion of Dr. ANDREW WOOD, seconded by Dr. RISDON BENNETT, it was resolved:

"That the letters from Miss Jex Blake and Mr. Arthur Norton on the Medical Education of Women be acknowledged, with a statement that they have been considered by the Council."

Registration of Foreign Degrees.—The following letter was read.

"Royal Albert Asylum for Idiots and Imbeciles of the Northern Counties.

"Lancaster, June 21st, 1875.

"SIR,—Having, on behalf of myself and several other registered practitioners, who are graduates in medicine of foreign Universities, been in communication with Mr. Cowper-Temple on the subject of the Bill which I find is now referred to the consideration of the Medical Council, I beg leave to bring to your notice, as President of the Council, the following facts and suggestions:

"1. That there is a considerable number of registered British practitioners, some occupying important public positions, who, for various reasons, have, since 1858, obtained degrees in medicine at foreign Universities of repute.

"2. That such degrees, though possessing no *legal* value, have been generally recognised, not only by the courtesy of the profession, but by many of the examining boards in this country as possessing *examinational* value.

"3. That were it lawful for the Council to register, as *additional qualification*, well-attested foreign degrees in the case of persons previously admitted to registration as qualified by British diplomas to practise medicine, no objection could be urged on the ground of public policy. The registration, under such conditions, of *bonis fide* foreign degrees, would moreover clear the way for the stringent suppression by law of the use by unqualified persons of medical titles based upon worthless (so-called) degrees.

"The concession suggested in the last paragraph, though not reaching the extent contemplated in Mr. Cowper-Temple's Bill, would probably be received with satisfaction by the promoters of that Bill, as recognising the medical qualifications already held by women, contingently upon their being hereafter admitted to examinations under the control of the Council. At the same time it would satisfy the just aspirations of those who, like myself, possess a foreign degree, the examinational value of which is confessedly superior to that of the 'minimum' British qualifying diplomas, but who, in the present state of the law, can require only the lower and not the higher class of qualification.—

"I have the honour to be, Sir, your obedient servant,

(Signed) "G. E. SHUTTLEWORTH, B.A. Lond.; M.D., Heidelberg; M.R.C.S. Eng.; L.S.A. (Regd.); Med. Supt. Royal Albert Asylum.

"H. W. ACLAND, Esq., M.D., F.R.S., Pres. Med. Council."

A postscript to the letter stated that the writer believed his views to be shared in by Dr. Balthazar Foster, Dr. G. F. Bodington, Dr. Grange, Dr. W. Hoffmeister, and other gentlemen holding foreign degrees with whom he had been in communication.

Dr. SHARPEY moved, Dr. ROLLESTON seconded, and after a brief discussion it was resolved:

"That it is desirable that the Council should take into consideration, at a future meeting, whether, with a view of furthering the desire of extended accomplishment in medicine and science among the members of the medical profession, it may be advantageous to make it lawful for the Council to insert in the *Medical Register*, after the name of a person registered on qualifications in medicine and surgery obtained in

the United Kingdom, the appropriate title indicative of a medical degree obtained, after study and examination, in a foreign or colonial University approved for this purpose by Her Majesty's Privy Council on the recommendation of the Medical Council."

Dr. SHARPEY moved, Dr. ANDREW WOOD seconded, and it was resolved:

"That the receipt of Mr. Shuttleworth's letter be acknowledged, and that he be informed that the Council have reserved the consideration of the subject of his letter."

Proposed Repeal of Portions of the Medical Acts.—The following report from the committee on this subject was presented.

"The committee appointed to consider the proposed repeals of parts of the Medical Acts, submitted for the consideration of the Medical Council by E. K. Rickards, Esq., the Speaker's counsel (as contained in the appended schedule), after consulting the solicitor to the Council, is of opinion that the repeals proposed are merely formal, and do not alter the principle or effect of the several Acts.

"The only doubt the committee has had is whether the whole of Section 46 of the Medical Act, 1858, should be repealed, or only that portion of it which relates to students who had commenced their studies before the passing of the Act. On the whole, however, the committee is of opinion that no part of the section is now required, and that the whole may be repealed. "JOHN STORRAR, *Chairman.*"

To the report was appended a schedule of the alterations proposed.

Dr. STORRAR moved, and Dr. HALDANE seconded:

"That the report of the Committee on Mr. Rickards's letter be adopted."

The adoption of the second paragraph of the report was opposed by Mr. TURNER, Dr. ALLEN THOMSON, Dr. ROLLESTON, and other members of Council, on the ground that there might still be students and practitioners who might come under the operation of that section, which enables the Council to dispense with the provisions of the Act in certain cases.

Mr. TURNER moved as an amendment, Mr. MACNAMARA seconded, and it was resolved:

"That the report of the Committee on Mr. Rickards' letter be adopted, with the exception of the proposed repeal of Section 46."

Executive Committee.—The Council having ballotted for the Executive Committee, the following members were found to be elected: Dr. Bennett; Dr. Humphry; Dr. Andrew Wood; Dr. A. Smith; Dr. Sharpey; Dr. Quain.

Qualifications in State Medicine.—Dr. PARKES moved:

"That in reference to the communication from the University of Oxford, relative to 'qualifications in State Medicine, the Council considers that, in the interests both of the public and of the advancement of medical science, the principle embodied in the conjoint examination scheme for licenses to practise medicine and surgery, should be extended to any licenses or certificates in State Medicine or public health."

Mr. QUAIN seconded the motion; which, after a discussion in which Mr. TURNER, Dr. STORRAR, Dr. ROLLESTON, Dr. HUMPHRY, Dr. A. SMITH, Dr. A. WOOD, Sir WILLIAM GULL, Sir DOMINIC CORRIGAN, and Dr. PARKES took part, was carried.

Admission of Women to the Medical Profession.—The debate on this subject was resumed. [See page 17 of last week's JOURNAL.]

Report of the Pharmacopœia Committee.—Dr. QUAIN moved, Mr. BRADFORD seconded, and it was resolved:

"That the report of the Pharmacopœia Committee be received and entered on the minutes."

The report was as follows.

The Pharmacopœia Committee have to report that 2,097 copies of the reprint of the *Pharmacopœia* have been disposed of since its publication; that 10,000 copies of the *Additions*, which was the entire number of the original issue, have been sold; and that it has been found necessary to reprint 5,000 copies. The whole outlay and return are exhibited in the annexed table of expenditure and receipts, together with a statement of the stock in hand.

The Committee have had under consideration the important question of issuing a new edition of the *Pharmacopœia*, inasmuch as it would be necessary, if this step were decided on, to take immediate steps for the preparation of the work. The Committee, however, after much consideration, and after conference with the editor of the existing edition of the *Pharmacopœia*, have come to the conclusion that there is no necessity, and that it would not be desirable, to issue a new edition for some time to come. In this conclusion the Committee are strengthened by the consideration that the publication of the *Additions* last year has been sufficient to meet the requirements of the profession, by the introduction of all the more important new remedies and preparations.

The Committee further report that there are no outstanding liabilities

on account of the *Pharmacopœia*, and that there is at present no outlay required.

The Committee recommend that a Pharmacopœia Committee be reappointed.

June 23rd, 1875.

RICHARD QUAIN, M.D.

Statement of "*Pharmacopœia Account*" (1867) with Additions (1874).

It was moved by Dr. A. SMITH, seconded by Mr. BRADFORD, and agreed to :

"That the report of the Pharmacopœia Committee be adopted."

Dr. ROLLESTON moved, Sir WILLIAM GULL seconded, and it was resolved :

"That the Pharmacopœia Committee be reappointed." The Committee to consist of—Dr. Quain, Chairman; Dr. Bennett; Dr. Begbie; Dr. Aquilla Smith; Dr. Sharpey.

Report of Committee on Visitations.—Dr. PARKES moved, Dr. HUMPHRY seconded; and it was resolved :

"That the Report of the Committee on the visitations of examinations in 1873-74, and on the remarks of the licensing bodies on the reports of the visitors, be received, and entered on the minutes."

The Committee commented in detail on the remarks offered by the several licensing bodies on the reports of the visitors, and concluded with the following summary.

The Committee have now brought before the Council the chief points in the reports of the visitations, and in the remarks of the licensing bodies, which appear to call for comment. But there are certain general points adverted to in several of the reports which can be best considered in this place.

The Committee must, however, first remark that it has been a source of gratification to them to observe in how good a spirit the licensing bodies have received the suggestions of the visitors, how almost uniformly they have given their suggestions full attention, and in how many cases they have adopted them. The Committee have also observed with pleasure not only the thoroughness with which the visitors have inspected the examinations, but the freedom of their reports from anything like captiousness or unnecessary criticisms.

The Committee beg to recommend that in future visitations the visitors should be instructed to make themselves acquainted both with the reports previously made of the examinations they are about to inspect, and also of the remarks of the licensing bodies on these reports.

The Committee will now proceed to the general questions raised in the reports.

1. It appears that there are still examinations conferring licenses to practise which are only partial, *i.e.*, which do not include all the ten subjects* which the Medical Council has recommended shall be tested before a qualification is granted. The Committee think that, when all the visitations are completed, it may be desirable to consider how to deal with such cases, if they then exist.

2. The old question of teachers examining their own pupils has been raised in some of the reports. But, as the custom of appointing non-professional examiners, and of giving them a large share in the exa-

mination, is now generally adopted in all the cases where professors are also examiners of their students, the point seems to the Committee of less importance than formerly. An entirely different practice is followed by one licensing body, the Royal College of Surgeons of Ireland; in which, either by charter or by-law, it has been arranged that no teacher can be an examiner; and thus the Dublin College, by going to the other extreme, deprives itself of the very best examining power. Teachers, and especially those who use examination in the instruction of their classes, must be the best examiners; but, when teachers have to examine their own pupils, non-professional aid must be introduced. But surely it is a great mistake to convert this necessary adaptation into a principle, and to refuse to make the best examining talent available, as is done in this instance. The Committee think it would be well if independent corporations, in arrangements for the composition of their respective examining boards, had regard to some plan for securing an interchange of *personnel*. By such a course, the advantages undoubtedly secured by having practised teachers to act as examiners would be obtained without the drawbacks sometimes found to attach to the working of boards in which teachers examine their own pupils.

3. The question whether actual dissection should always be required in the anatomical examination is raised in some of the reports; but this point is now settled by a late resolution of the Council, which has decided that candidates may be called on to dissect, and, therefore, they will necessarily always prepare for the contingency.

4. Several of the visitors have objected to so many subjects being taken too closely together; in one case six, and in another five great subjects are examined upon in writing in one day. The Committee agree with the visitors that this is putting too much pressure on the candidates, and that better answers would be obtained if these examinations were extended over two days. The point will probably recur next year, and can be then dealt with.

5. The method of conducting the clinical medical examinations is extremely diverse. In some instances, the candidate is taken to the bedside; is left there for a definite time, and then writes out the case, on which he is then questioned. In another instance, the candidate examines the case for himself, but does not write it; the examiner then goes to the bedside, and hears his diagnosis and the reasons. In another examination, the examiner and candidate go together to the bedside, and the latter then examines the case under the eye of the former for any time deemed necessary by the examiner. Some licensing bodies do not take the candidates to the bedside at all, but bring the patients to the room where the candidates are. In some cases, the visitors have made remarks and recommendations to which the licensing bodies do not give their assent, and the Committee believe that, in the present state of things, it will be well for the Council to make no suggestion on this point; but it would be desirable that the Council should request the licensing bodies to direct their attention to these diversities of practice, in order that each body may review its own practice, and improve it if it see cause. The Committee, however, entertain no doubt on one point; *viz.*, that the candidates should be taken to a hospital to be examined, and that the medical patients should not simply be brought to the Examining Hall.

6. The methods of conducting the Surgical Clinical Examination are also different, but the Committee recommend that this matter should be discussed at the next Council session, when the reports of all the bodies will have been made and commented on.

7. The Committee has had under consideration the custom of allowing a candidate to pass only one portion of an examination, and of permitting him to be examined on a future occasion, only in a subject he has failed in before. This custom takes several forms; in one case, a candidate who passes in surgery but fails in medicine, is allowed to present himself in medicine only at a future occasion; or a candidate who passes in *materia medica* but fails in chemistry, is subsequently only examined in chemistry; but, in some cases, this plan is carried farther, and a candidate who fails in the written and oral parts of the examination in medicine, but passes in the clinical examination, is not required to undergo the clinical examination a second time. These several plans of residues or remnants appear to the Committee to require some consideration from the Council; but probably, as in two or three other cases, this matter had better be discussed next year, when all the reports of visitations are before the Council.

8. A question has been raised in the Committee with regard to candidates, who have been rejected by one licensing body, presenting themselves (without additional study) before another examining board. This question has often been before the Council, but without any satisfactory plan being suggested by which a licensing body could know that they had a candidate before them who had shortly before been rejected by another board. A member of the Committee has proposed that, in all cases, every candidate's schedules should be stamped by the licensing

* The ten subjects are—Anatomy, General Anatomy, Physiology, Chemistry, Materia Medica, Practical Pharmacy, Medicine, Surgery, Midwifery, and Forensic Medicine.

body admitting him to examination, and that the date should be inserted. A rejected candidate would receive back his papers, but these would inform any other examining board that he had been rejected at a certain date. In this way, without any record of rejection, and without any invidious distinction between candidates, the fact of previous rejection would be known.

9. Another question has been raised in Committee which does not fall within its power to consider, but which it thinks of importance enough to be reported to the Council. It has been asked whether the Council should not directly, or by means of the licensing bodies, inspect the schools of medicine, and see whether the appliances for teaching are sufficient? The Committee conceive they have discharged their duty in passing over this question to the Council for consideration, if it deem fit.

E. A. PARKES, *Chairman*.

Saturday, June 26th.

Dr. ACLAND, President, took the Chair at 12 noon.

Admission of Women to the Medical Profession.—The debate on this subject was resumed. (See page 22 of last week's JOURNAL.)

Visitation of Examinations.—On the motion of Dr. PARKES, seconded by Dr. BEGGIE, it was resolved:

"That the report of the Committee on the Visitations of Examinations, and on the remarks on such visitations, be considered next session, in connection with the reports which have now been sent down for the consideration of the licensing bodies."

The Conjoint Scheme for England.—Dr. BENNETT moved:

"That the President be asked to inform the Council whether he is able to state in what position the joint scheme for England now is, and whether there is reason to believe that there is any foundation for the report that the Royal College of Surgeons of England have virtually seceded from the conjoint scheme agreed on by the English licensing bodies, as reported to this Council, inasmuch as it is currently reported that certain resolutions have been come to by the Council of that College respecting the appointment of examiners under the conjoint scheme in question, which resolutions are in direct contravention of certain principles of the scheme as approved by this Council."

The motion having been passed, the PRESIDENT made the following reply.

"In answer to Dr. Bennett's question, I must observe that no full information can be officially given without communication with the Committee of Reference of which Sir James Paget is chairman, and with the bodies who have sent representatives to that committee. The scheme cannot be completed till Sir John Lubbock's Bill is law. As to the College of Surgeons having withdrawn from the scheme, that is a report as to the truth of which I have no evidence, nor have I any reason for believing it. There seems to be no ground for supposing that the College of Surgeons, which has taken much pains with a Bill that has already passed the third reading in the House of Commons, will do other than act in the same spirit as that which induced them to obtain the Bill. The College of Surgeons had, I believe, always maintained or implied their right to secure the nomination of a certain proportion of the examiners in surgery and in anatomy. If this right be now insisted on, the consent of the co-operating bodies and of the Medical Council to the arrangements proposed by the College of Surgeons is obviously necessary. These circumstances show that the negotiation is one which, in its very nature, requires time, but they do not indicate that the scheme will come to an end."

The Conjoint Scheme for Ireland.—Dr. ATJOHN moved, and Dr. STOKES seconded:

"That the President be requested to ask the representative of the Royal College of Surgeons in Ireland whether the Council of the Royal College still adheres to the scheme of conjoint examinations as adopted by the King and Queen's College of Physicians, and agreed to by the other licensing bodies in Ireland, with the exception of the Queen's University, and sanctioned by the Medical Council (March 31st, 1873)."

The resolution having been adopted, Mr. MACNAMARA gave the following answer.

"The Council of the Royal College of Surgeons of Ireland have not withdrawn from the conjoint scheme of examination for Ireland. The Fellows, the year before last, by a large majority, decided that they could not approve of the scheme then submitted for their consideration, but did not express themselves as being hostile to the principle of a conjoint examination. The Council, nevertheless, remained pledged to the scheme approved of by this Council; but, during the past year, the question has fallen into abeyance. The present feeling in Ireland would seem to be, that we should be very much influenced

by the steps which may be taken in England and Scotland in this direction."

Instruction in Materia Medica and Therapeutics.—The following letter, addressed to the President of the General Medical Council, was read.

"Sir,—We, the undersigned lecturers on materia medica and therapeutics in the medical schools of London, desire to call the attention of the Medical Council to the unsatisfactory conditions under which, owing to certain existing regulations, we are compelled to teach the above-named subjects. We are of opinion that the two branches of pharmacy and therapeutics should be taught at different periods of the medical curriculum, the former being naturally connected with the courses of chemistry and botany, which the student attends during his first year, whilst the latter absolutely requires some more advanced acquaintance with pathology and medicine. We find that this question has already occupied the attention of the Council, inasmuch as, in 1871, the following resolution was proposed by Professor PARKES, seconded by Sir R. CHRISTISON, and carried by a majority of 15:

"That it is desirable that the instruction in pharmacy should be separated from that in therapeutics, and that the former should be obtained at an early, and the latter at a later, period of the course."

"This encourages us to hope that the Council may see fit again to consider this matter, with a view to deciding in how far, or in what way, these suggestions may be carried into effect.—(Signed) Frederick J. Farre, Lecturer on Materia Medica, St. Bartholomew's Hospital; W. Moxon, Lecturer on Materia Medica, etc., at Guy's Hospital; T. Lauder Brunton, Lecturer on Materia Medica, St. Bartholomew's Hospital; John C. Thorowgood, Lecturer on Materia Medica at Middlesex Hospital; Octavius Sturges, Lecturer on Materia Medica, Westminster Hospital; E. Buchanan Baxter, Professor of Materia Medica in King's College; R. Douglas Powell, Lecturer on Materia Medica, Charing Cross Hospital; Robert Farquharson, Lecturer on Materia Medica, St. Mary's Hospital; Sydney Ringer, Professor of Materia Medica in University College."

It was moved by Dr. PARKES, seconded by Dr. A. SMITH, and resolved:

"That the foregoing letter be received and entered on the minutes."

Dr. PARKES moved, Dr. A. SMITH seconded, and it was resolved:

"That the recommendation of the Committee on Professional Education, that the teaching of pharmacy should be an early, and the teaching of therapeutics a late course in the curriculum, which recommendation was adopted by the Council, be included in the 'recommendations and opinions of the General Medical Council which are sent to the licensing bodies, and that a copy of the above letter be forwarded to each of the bodies enumerated in Schedule (A) of the Medical Act."

Memorial from Practitioners in Durham.—A memorial was then read by Dr. PYLE from certain practitioners in Durham, calling attention to a charge made against an unqualified practitioner under the Medical Act, in which the magistrates refused to convict, and also declined to grant a case.

It was moved by Dr. STORRAR, seconded by Sir DOMINIC CORRIGAN, and agreed:

"That the memorial of certain medical practitioners in the county of Durham be read, acknowledged, and entered on the minutes."

Recommendations of the Council.—It was moved by Dr. ANDREW WOOD, seconded by Dr. STORRAR, and resolved:

"That the Committee on the Recommendations of the Council be continued, and that they be directed to bring up their report to the next session of the Council."

Executive Committee.—Dr. A. SMITH moved, Dr. BEGGIE seconded, and it was resolved:

"That the powers and duties heretofore delegated to the Executive Committee shall be vested in the said Committee until the next meeting of the General Medical Council."

Votes of Thanks.—It was moved by Dr. A. SMITH, seconded by Dr. BEGGIE, and agreed:

"That the cordial thanks of this Council are due, and are hereby tendered to Dr. Andrew Wood for his services as chairman of the Business Committee, during the present session of the Council."

"That the thanks of the Council are due, and are hereby tendered to the treasurers, Dr. Quain and Dr. Bennett, for their important services."

It was then moved and carried by acclamation:

"That the thanks of the Council are hereby cordially tendered to Dr. Acland, the President, for his efficient services during the present session of the Medical Council."

BRITISH MEDICAL ASSOCIATION:
SUBSCRIPTIONS FOR 1875.

SUBSCRIPTIONS to the Association for 1875 became due on January 1st, Members of Branches are requested to pay the same to their respective Secretaries. Members of the Association not belonging to Branches, are requested to forward their remittances to Mr. FRANCIS FOWKE, General Secretary, 36, Great Queen Street, London, W.C.

BRITISH MEDICAL JOURNAL.

SATURDAY, JULY 10TH, 1875.

PROVIDENT INSTITUTIONS AND OUT-PATIENT
DEPARTMENTS.

V.—PATIENTS' PAYMENTS.

WE now come to a branch of the subject which has never before occupied the share of public attention which it deserves. We allude to the system adopted at several provincial and some London medical institutions, of obtaining payment from each case applying for relief as an out-patient, and in some cases from in-patients also. This system is at present confined exclusively, we believe, to hospitals for women and children in the provinces, and to some of the special hospitals in London. The difference in the mode of treating the patients who apply for relief at these institutions is, that in London they admit free cases in addition to those out-patients who make some payment, but in the provinces no persons are allowed to receive the benefits of the institution without the payment of at least an entrance-fee of sixpence on their first visit. It appears that this particular system was originated by a surgeon of Bristol, who opened a dispensary for women and children in February 1857, and fixed the following scale of fees: For women, 1s. 6d. the first visit, 2d. each subsequent visit; for children, 6d. the first visit, 1d. per visit afterwards. His work proved so successful that, six months afterwards, a committee of gentlemen interested in the experiment was formed, and the institution was thus firmly established as one of the charities of Bristol. This dispensary grew in public favour; and in the year 1866, owing to the exertions of Mr. Mark Whitwell, the Treasurer, an in-patient department was added for children, with forty beds, admission to which has been on the free principle from the first. The institution was at the same time called the Bristol Hospital for Sick Children and for the Out-door Treatment of Women. Although the in-patient department is quite free, great care is taken to exclude all improper cases, and the chief responsibility for all admissions rests with the medical officer himself. At the end of 1872, the Committee raised the original fees for all visits after the first from 2d. to 3d. for women, and from 1d. to 1½d. for children, with the object of making the out-patient department self-supporting. This they will, we believe, succeed in doing; for we find from the last published report that 963 women who paid 9,523 visits, and 2,449 children who made 14,418 visits, to the out-patient department in 1873, contributed by their payments £315:19:2 towards the cost of their treatment, which actually amounted to £487:9:4. The system pursued at Bristol commended itself to the managers of the Children's Hospital, Birmingham, as a remedy for an abuse which caused them much anxiety a few years ago; viz., the large number of trivial cases who applied for treatment at the out-patient department, to the exclusion or detriment of more severe and deserving cases. It was accordingly adopted by them in principle—a payment of 6d. for each child on the first visit: and has been quite a success, financially at any rate, as the sum received from these payments in 1874 was £310:14. We say *financially*, because it appears to have had but a temporary influence on the number of out-patients, who were 1,345 fewer in the six months after its adoption, as compared with the numbers for the corresponding period of the previous year (1871).* In the next twelve months, the number of out-

patients was increased by 1,389, as compared with that of the preceding year (1872). Nevertheless, the Committee, in their last published statement, speaking of this system, say: "Your Committee continue to think this regulation an excellent one. The fee is always paid cheerfully, and the sum raised enables the charity to carry out its good work more thoroughly"; although the number of out-patients had again increased by 1,178.

Another Birmingham Hospital—the Hospital for Women—the patients at which amounted to 1,750 (in, 71; out, 1,679, in 1873), has also adopted the system of small payments. Here the rule is: "Out-patients are required to pay one shilling as a registration-fee on entering, and a further fee of one shilling at the expiration of each two months during which they may remain under treatment." The amount received from patients in this way in 1873 was £95:9:8, and the total expenditure was £1,059:16. At this hospital, out of seventy-nine in-patients, thirty paid £79:14 for their treatment, making the total receipts of £175:3:8 for the year from this source. The Women and Children's Hospital at Sheffield has also adopted the registration-fee; and we are informed, on reliable authority, that this system "is commending itself more and more to the managers of provincial hospitals, and is likely to be very generally adopted". Whatever objections may be raised against this system—and they are summed up briefly in the statement that under it "cases may be, and sometimes are, admitted which are not proper subjects for charitable relief, and which could, in all probability, afford to pay for the necessary treatment in their own homes"—it cannot be denied that it has many advantages over the old ticket system, and on this ground alone it should, in our opinion, commend itself to the thoughtful consideration of all hospital managers. Every hospital that we have mentioned reports favourably on its working, and we quote the following brief extracts from the last published Reports of the Committees for the year 1873.

Children's Hospital, Birmingham.—The Committee wish to record their conviction that the system works most satisfactorily. It has had the good effect of weeding out many unsuitable cases, such as those belonging to the pauper classes, and other cases too trivial to need hospital treatment. A portion of the sum raised by these fees also gives the Committee the means of increasing the medical staff by the appointment of two *paid* extra acting physicians. Thus, the patients receive even more attention than they did formerly; the income of the charity is considerably increased; and the Committee have never heard of any objection being raised to the payment of the small fee required.

The Women's Hospital, Birmingham.—The Committee report that the shilling fee has fully answered the expectations they formed of it. It keeps from the already overcrowded waiting-rooms trivial and pauper cases, and affords a very appreciable addition to the hospital funds. The fee is so small, that there are very few women above the pauper class who are unable to pay it, and yet it is sufficient to keep away those who would otherwise come from mere curiosity. Whenever, from long illness or shortness of work, patients of the working class are unable to pay, then the fee is remitted. Thus, your Committee consider that they have avoided the evils attendant upon the ticket system and the absolutely free or unchecked system.

At the Bristol Children's Hospital, as already stated, it makes the out-patient department nearly self-supporting.

Surely, the abuse to which we have alluded may be almost left to cure itself, especially when it is borne in mind that the vigilance of the committees of management at the above institutions and their anxiety to guard against abuse of all kinds has led them to adopt this system, which, to say the least, is a step in the right direction, and may be regarded as one more nail in the coffin of hospital abuse.

We now come to the special hospitals, which are increasing in number, if not in influence, every year. The mania for these institutions has produced a sort of graduated scale of ingenuity of invention in the fertile brain of the originators, which may be briefly summarised thus: Positive, "Throat Hospital"; comparative, "Heart Hospital"; superlative (wonderful invention this), "Infirmary for *Diseases of the Legs*". Whether the mania may still increase, and result eventually in a Hos-

* Medical Report for the year 1872 of the Children's Hospital, Birmingham.

pital for "Corns, Bunions, and Diseases of the Nails", with an in-patient department, time alone will show.

At the Hospital for Diseases of the Throat, Golden Square, the annual report of which, by-the-by, is one of the cleverest pieces of "appeal literature" we have ever seen, most of the patients pay something. These payments are weekly, fortnightly, or monthly; they vary from 1s. to 5s. per month, and are written at the head of the prescription-papers for the guidance of the medical officer, but not in plain figures. The sum received from patients during the year 1873 at this hospital was £733:1:6, being rather less than a third of the expenditure. It may be well, bearing in mind the scenes enacted at the meeting of the Metropolitan Hospital Sunday Fund in January and March last, and the statements then made by the representatives of special hospitals, to examine closely the accounts of the Hospital for Diseases of the Throat. The statement of receipts and expenditure for the year ending December 31st, 1873, shows that the ordinary income derived from subscriptions and donations (£2,632:8:4), contributions from patients (£733:1:6), dividend (£91:18:10), and donation boxes (£44:10:3), amounted to £3,501:18:11; and the ordinary expenditure (if such items as telegraph to medical superintendent's house, and printing and binding second edition of the *Hospital Pharmacopœia*, may be included under ordinary expenditure) amounted to £2,625:11:2, leaving a balance of ordinary income over expenditure of £876:7:9 for the year. In addition to this balance in hand of £876, this hospital received from the Hospital Sunday Fund £191:13:4, and yet its supporters say that the award of the Hospital Sunday Committee "has not been fair or impartial" so far as the special hospitals are concerned. We quite agree with these grumblers, though we arrive at our own conclusions from a different point of view. In what have the Hospital Sunday Committee "not been fair and impartial" in their dealings with these special hospitals? We answer; in having, even on one occasion, granted £191 to the Hospital for Diseases of the Throat when it had a balance of £876 in hand from other ordinary sources. Nor is this all; for, in the same year, 1873, this very special hospital received £1,000 from the proceeds of a bazaar; £1,000 from an anonymous donor, "H. D. T."; £19:19 from legacies; having besides a balance in hand from the previous year of £253:4:3. To summarise:

The actual income for the year 1873, was ...	£ 5,966:15:6
The actual expenditure of the year 1873, was	2,625:11:2

Balance of income over expenditure ...	£3,341:4:4
--	------------

Yet the supporters of this hospital appeal to the general public for additional funds on the ground that "subscriptions and donations are much needed to meet the heavy expenses".

There is another special hospital, the Central Throat and Ear Hospital, which may be fairly regarded as in opposition to the one we have just been describing. It has only been in existence since March 1874, and, up to January 19th, 1875, 2,329 patients had been treated, and £137 13s. had been received from patients' payments. It is expected that these payments will pay the salaries of dispenser, matron and servants, and perhaps the current expenses of dispensary and house-keeping. Patients are seen at this hospital, in addition to the usual days and hours, on Tuesday and Friday evenings at 7.30, and the clergy are allowed to send cases gratuitously. The following is reported to us as the result of a visit to this hospital one Tuesday evening.

There were about sixty people waiting to be seen when we arrived at 7.30. The cases were:

1. Workwoman, shopwoman, milliner, earning from seven shillings to thirteen shillings per week each, and living at home, agreed to pay, in each case, one shilling per week for attendance at hospital.

2. Wife of a carpenter, not in regular work, agreed to pay two shillings and sixpence every fourteen days.

3. Labourer's wife, pays nothing. Husband ill, and receiving twelve shillings per week from club.

4. Carpenter's child, one of twelve children, ten living at home. Weekly earnings of family fifty-two shillings, pays one shilling a fortnight.

5. A carpenter not always in full work, earns thirty-eight shillings

per week. Wife and daughter have been to hospital before. Pays two shillings and sixpence every fourteen days.

6. Law-writer, living at home with parents, earns fourteen shillings per week, pays one shilling per week to hospital for attendance.

These are the cases just as they presented themselves, and we are bound in fairness to say that, if special hospitals be needed by the poor, this hospital is certainly doing good amongst that class of patients who ought alone to receive medical advice for a nominal sum. Seeing, however, that most of our great hospitals have now well administered special departments, we incline to the opinion that special hospitals are not needed at all, and are open to many objections.

We must not conclude this paper without commending the work done by that useful and unobtrusive institution, the Establishment for Gentlewomen during temporary illness, in Harley Street. No hospital in London does probably greater good with the funds entrusted to its managers than this excellent Hospital. Its object is declared to be "to afford a home in illness, with medical and surgical treatment, to gentlewomen of moderate means, the wives, daughters, and relatives of clergymen, naval, military, and professional men, and to governesses and artists". Patients are placed under the charge of one of the medical staff of the institution, and any other medical attendance is prohibited, except at their discretion and when they think it desirable. Neither infectious cases nor cases of insanity are received. Applicants must produce: 1. A certificate from medical attendant as to fitness for admission; 2. Two letters of introduction, with particulars of social position and income; 3. A guarantee as to weekly charges and expenses.

The weekly charge is (including board, lodging, medical attendance, and medicine), for single women, twenty-three shillings; for a room occupied by two ladies, nineteen shillings; for accommodation in the divided room, fifteen shillings. Children are admitted in special cases on the same terms. The income from all sources in the year 1873 was £4,510:0:6, and the patients' payments amounted to £839:16:0. The expenditure was £3,110:13:3. If we exclude legacies, which amounted to £2,061:19:0, it will be seen that the ordinary expenditure exceeded the ordinary income by £904:6:9. This valuable institution only received £38:6:8 from the Hospital Sunday fund.

HOSPITAL REFORM.

THE Westminster Hospital deserves credit for the painstaking manner in which, during the last two years, it has been investigating the whole question of out-patient administration. No less than four committees have been appointed during that period. To the reports of the earlier committees, we have from time to time alluded. That of the fourth is now before us. In it the whole subject is reconsidered, and, in conclusion, the Committee make the following recommendations, which are well worthy the attention of all hospital managers.

1. That the entrance for out-patients be at the side gate, instead of at the front door of the hospital; that the registration of the patients take place within that entrance, instead of in the front hall; that a competent porter be placed in charge of the out-patients; and that the hours of admission, 12.30 to 1.30, be strictly enforced, the gate being closed punctually at the latter hour.

2. That the present limitation and selection of the patients by the assistant house-surgeon be discontinued. He might, if found necessary, still distribute the patients to the different physicians and surgeons.

3. That the medical officers be instructed that they have full power to dismiss any applicants, with or without governors' letters, whom they consider not proper objects of charity, or not likely to benefit by treatment as out-patients; but, in case of a patient bringing a governor's letter, they shall endorse their reason upon the letter, which shall be filed and laid upon the Board-room table on the following Board day, in order that the same may be communicated to the governor, if the House-Committee shall so order.

4. That each medical officer shall exercise this power at his own discretion, either by attending half an hour earlier and selecting the proper cases for further investigation and sending the rest away, or by seeing all the cases in the ordinary course, and, after investigation, referring

such as shall not be retained to the Poor-law, the General, or the Provident Dispensary, or sending them into the wards, or elsewhere, as the case may be, writing such reference across the patient's paper. There is nothing to prevent the medical officer from prescribing once for such patients, if he think it desirable.

5. That any case of evident and gross abuse should be immediately reported to the House Committee, in order that full investigation may be made.

6. That friendly relations should be entered into between the out-patients' department of the hospital and the dispensaries; that notices of the latter be put up in the out-patients' rooms of the hospital, and papers distributed to such patients as would be more properly treated at such institutions; and that, on the other hand, the medical officers of the dispensaries should be invited to bring their unusual and interesting cases to the hospital out-patients' rooms, not necessarily for treatment at the hospital, but for consultation.

7. That the present limitation of the out-patients' prescription papers to two months be abolished. It is useless as a check, the majority of the patients ceasing to attend before the expiration of that time, and the rest receiving a fresh paper as soon as it is required. It also entails additional and avoidable labour on the medical officers, as, by the confiscation of the expired letter by the dispenser, they are deprived of the assistance of previous notes and prescriptions. It occasionally happens that a patient has to attend once or twice a month for a long period, and great confusion is produced by the constant renewal of the prescription paper, a periodical re-registration being all that is required.

8. A further recommendation of the Committee would be the offer of assistance to the assistant-physicians, whose patients unavoidably continue in excess, either by the election of one or more additional assistant-physicians, or by the appointment of one or more casualty physicians, as has been adopted at St. Bartholomew's Hospital.

With some of these recommendations we heartily concur; others appear to us wanting in decision; but they only serve to show the difficulties which surround an individual institution when it attempts to move in this matter, and how much it is to be desired that some general plan could be agreed upon, and form the rule for all hospitals and dispensaries. The weakest point in this scheme is, that it throws the task of discrimination upon the medical staff. We have always maintained that this duty forms no proper part of their work, and that the additional burden ought not to be put upon them. It places them in an invidious position with regard to their patients, and it is an unwarrantable demand upon time and energies which are already taxed to their full extent. There is something like satire in the suggestion, contained in another part of the report, that the out-patient officers might attend half an hour earlier, in order to sift their cases, while it is recommended to appoint additional assistant-physicians, in consequence of the present excess of work.

The question of out-patient relief has also been under consideration lately at the Children's Hospital, Great Ormond Street; and it appears to us that the managers of that institution have adopted a plan which is at once simpler and more satisfactory. It has been determined that no patient can be prescribed for a second time, unless his hospital letter has been stamped by the Committee of the Charity Organisation Society for the district in which he lives.

Letters have been issued which bear on their face, in addition to this new rule, a list of the local offices of the Charity Organisation Society, and the hours at which application may be made to them, in order to furnish the necessary particulars and obtain the requisite stamp. This plan appears to us very promising, and we shall watch with interest to see how it succeeds.

SALARIES OF MEDICAL OFFICERS OF HEALTH.

AMONG the many anomalies that exist in our present disjointed system of sanitary organisation, not the least striking is the absence of proportional uniformity which marks the salaries that have been allotted by the various authorities of combined urban and rural sanitary districts to their medical officers of health. The most cursory glance down any list of medical officers of health which shows the amount of their salaries, is sufficient to prove that neither the population, nor the area of the district, nor the probable amount of work to be performed, has

had much weight in fixing the amounts of these salaries. The inspection of such a list, moreover, leads to the inevitable conclusion that many of the appointments have been made only in deference to the pressure of public opinion, or of the Local Government Board, and that the real intention, in fixing upon nominal salaries, was to secure the amount of sanitary work done being also nominal. In order to check, as far as possible, this pretence at sanitation, we are naturally, as in all other branches of sanitary organisation, brought face to face with the necessity for a Central Health Authority, with power to act as a control department in health matters. It is important to our sanitary progress not only that medical officers of health should be adequately remunerated for sanitary duties efficiently performed, but that, in the matter of salary, they should not be without appeal entirely at the mercy of their sanitary authorities, who, in many cases, would be best pleased by inaction.

As an example of the necessity for the Central Health Authority to have some power of control in the matter of salaries of health officers, the case of Keighley may be cited. The Local Board District of Keighley has a population exceeding 20,000 persons, and has recently become notorious for its antivaccination board of guardians, and the inaction of its sanitary authority, although for months the town has suffered from epidemics of small-pox, scarlatina, typhoid fever, and other forms of zymotic disease. A medical officer of health was appointed by this local board at £50 a year, but, during the past six months, the duties have necessarily been of such an arduous character as to engross the whole time of the medical officer, and recently an application was made to the local board for an increase of salary, or at any rate for some remuneration for the extra duties which have been entailed by the prevalence of small-pox. This application was referred to the sanitary committee, who recommended that the "application for extra remuneration be considered when the present epidemic is stamped out". At the last monthly meeting of the local board this recommendation was adopted, and it was voted that the committee had exercised a wise discretion in the matter. A member of the board was of opinion that, if the medical officer knew that an increased remuneration would be given to him when the town was clear of the epidemic, it would stimulate him to greater exertion. Only those who have read the history of the small-pox epidemic in Keighley, and of the present sanitary condition of the town, and who know how the zeal and energy of the medical officer have been thwarted and neutralised by the neglect of their sanitary duties by the board of guardians and the local board, can thoroughly appreciate the full import of this treatment of the medical officer's application for an increase of salary. In such cases as Keighley, the medical officer of health should have an appeal to the Central Health Authority to fix his salary at such a sum as would afford reasonable remuneration for his duties.

At a meeting of the General Committee of Management of the Royal Free Hospital on the 8th instant, Mr. William Rose, of Old Cavendish Street, was elected Surgeon of the hospital in the vacancy occasioned by the decease of Mr. J. D. Hill.

We publish in another column a letter from Mr. Smece advocating strongly the formation of a special committee to take proceedings which shall lead to the establishment of voting by proxy in the College of Surgeons on the occasion of the election of Fellows. We have before now set forth in full the arguments in favour of that reform. But more than argument is necessary; action is required, and the action must come from those who are really interested. The country Fellows are virtually largely disfranchised by the present arrangements, and the power of election is vested in the hands of small cliques. When now and then some vigorous action has been taken by extra-metropolitan Fellows to make their voice and their choice respected, it has struck the wire-pullers with dismay, and terrible notes of warning have been sounded. As a matter of fact, what is desirable in the interests of the College is, that the whole body of the Fellows should be equally repre-

sented. We are very far from thinking, however, that this will be effected without vigorous resistance and prolonged effort. Mr. Smee must prepare for a vigorous campaign, if he wish his manifesto to be more than *brutum fulmen*; and then the doubt will remain, whether the result is worth the trouble. It is curious how greatly the importance of a rather limited body and a very insignificant election has been magnified by newspaper-writing and paper-wars. It might be supposed that the Council of the College of Surgeons was the parliament of the profession, and its members the conscript fathers who decide the fate of medicine. The Council is a venerable and respectable teacup, in which so many storms have raged, that it is apt to be looked upon by a few enthusiasts as quite the biggest bowl in the universe.

AT the election of Fellows into the Council of the College which took place last week, and which resulted, as already stated, in the re-election of Mr. Prescott Hewett and Mr. John Birkett, and the replacement of Mr. Spencer Smith by Mr. J. Cooper Foster, 222 Fellows attended to record their votes. Of this number, 55 were from provincial towns, some at a great distance from London. Of the 59 plumpers given at this election, 32 fell to the lot of Mr. Smith; Mr. Smee received 13, Messrs. Hewett and Forster 5 each, and Mr. Hussey 3. The following analysis of the voting on this occasion may perhaps be interesting. The combinations were: Hewett, Smith, and Birkett, 20; Hewett and Smith, 9; Hewett, Smith, and Forster, 10; Hewett, Smith, and Hussey, 2; Hewett, Smith, and Smee, 2; Hewett and Birkett, 1; Hewett, Birkett, and Forster, 58; Hewett, Birkett, and Hussey, 2; Hewett, Birkett, and Smee, 3; Hewett and Forster, 3; Hewett, Forster, and Hussey, 7; Hewett, Forster, and Smee, 1; Hewett and Hussey, 2; Hewett and Smee, 2; Smith and Birkett, 1; Smith, Birkett, and Forster, 9; Smith, Birkett, and Hussey, 2; Smith, Forster, and Hussey, 1; Smith, Forster, and Smee, 1; Smith and Hussey, 4; Birkett, Forster, and Hussey 1; Birkett, Forster, and Smee, 2; Forster and Hussey, 2; Forster, Hussey, and Smee, 1.

THE festival of the Fellows of the Royal College of Surgeons of England took place after the election, when a much larger number than usual attended, owing, no doubt, to the well deserved popularity of the excellent chairman, Surgeon-General T. Longmore, C.B. Many gentlemen attended from long distances. Among the country Fellows were Mr. Ambler, Hemel Hempstead; Mr. J. Archer, Birmingham; Mr. W. Barker, Wantage; Mr. Barrow, Ryde; Mr. Benfield, Leicester; Mr. Boxall, Horsham; Mr. W. A. N. Cattlin, Brighton; Mr. T. W. Crosse, Norwich; Dr. Green, Bristol; Mr. C. J. Hawkins, Cheltenham; Mr. Hodson, Bishop's Stortford; Dr. Humphry, Cambridge; Mr. Horsfall, Leeds; Mr. Hussey, Oxford; Mr. F. F. Lee, Salisbury; Mr. E. Lund, Manchester; Dr. W. J. V. Lush, Weymouth; Mr. Manby, Wolverhampton; Mr. D. P. Maurice, Marlborough; Dr. J. B. Maurice, Marlborough; Mr. G. May, Reading; Mr. A. W. Nankivell, Chatham; Dr. Orsborn, Bitterne; Mr. E. K. Owen, Oxford; Mr. Penhall, St. Leonards; Mr. Symonds, Oxford; Mr. C. E. Thomson, Ross; Mr. Treves, Margate; Mr. J. Webb, Cobham; Mr. White, Oxford; Mr. Wilkin, Southampton; Mr. S. Wood, Shrewsbury; Mr. S. Woodman, Ramsgate; etc. Mr. T. B. Curling, F.R.S., late President of the College, has consented to take the chair next year.

AT a quarterly meeting of the Council of the Royal College of Surgeons on Thursday, July 8th, Sir James Paget, Bart., F.R.S., was elected President, and Messrs. Prescott Hewett, F.R.S., and John Birkett, Vice-Presidents, of the College. At the same meeting of the Council, Mr. R. Brudenell Carter was elected Professor of Surgery and Pathology; Mr. W. H. Flower, F.R.S., and Mr. W. K. Parker, F.R.S., Joint Professors of Comparative Anatomy and Physiology; Mr. Erasmus Wilson, F.R.S., Professor of Dermatology; and Mr. William Turner, F.R.S.E., Lecturer on Anatomy and Physiology. Dr. T. B. Peacock and Dr. Wilks, F.R.S., were appointed Examiners in Medicine; and Dr. Arthur Farre, F.R.S., Dr. Barnes, and Dr. Priestley Examiners in Midwifery.

THE President of the College, in resigning office, delivered (for the first time) an address, relating the progress of events during the year. We shall refer to it again next week. Pressure of matter prevents us from referring to other matters interesting to the members and fellows.

AT the dinner, Sir William Muir was understood to confirm in a positive manner the promise held out by Mr. Hardy lately, when he stated that ever since receiving the statements of the deputation from the Parliamentary Bills Committee of our Association last year, he had been more or less engaged in endeavouring to settle the grievances of the Army Medical Department on an equitable footing, and that an improved warrant might shortly be expected.

THE correspondence which has taken place between the Lord Chancellor and Dr. Hardwicke, in reference to the inquest held on the body of the late Sir Charles Lyell, has been published. The correspondence opens with a communication from the Lord Chancellor recapitulating the facts of the case, which our readers are acquainted with, and calling for an explanation. To this Dr. Hardwicke replied that, having received information that Sir Charles Lyell's death had been hastened or caused by a fall, he deemed it his duty to investigate the circumstances, as the relatives declined to furnish him with particulars, but referred him to Dr. Andrew Clark, whose certificate was, "Meningitis, ten weeks; effusion, six days". In reply to this, the Lord Chancellor says that he cannot but think that, if an official application had been made to Dr. Clark, he would have given such explanation as would have rendered a coroner's inquiry unnecessary. The very brief memorandum of Dr. Clark appear to have been taken without any explanation having been asked for, and the inquiry has caused much pain and uneasy feeling in the public mind. The letter winds up by observing that "the Lord Chancellor is ready to believe that Dr. Hardwicke acted in this matter under a scrupulous sense of what he considered to be his duty; but he feels obliged to point out the considerations which lead him to the conclusion that a more sound and careful exercise of discretion would have led to a different course, and expresses a hope that in future more accurate and reliable information will be obtained, before proceeding to public investigations of death, which must be so harrowing to the feelings of relatives and households".

THE coroner has a short way of his own for dealing with difficulties. Addressing a Marylebone jury this week on the subject of the confinement of dipsomaniacs, he observed: "If people liked to go on paying taxes for the support of thirty or forty thousand lunatics, it could not be helped; but, if he had his own way, he would soon make short work of it, although the Home Secretary, Mr. Cross, had told a deputation the other day the subject was one of great difficulty." Now, we confess to sharing the difficulties of the inferior person who is for the moment Home Secretary; and, if the great mind of the present coroner for Central Middlesex could really give us "a short way" to the settlement of the matter, it would greatly abridge some very intricate discussions which are likely to be carried on at the Edinburgh meeting of the Association, much facilitate the work of legislation, and lay the whole nation under the same debt of gratitude as the acquiescent jury. Is it not "atrocious" that Dr. Hardwicke should see so much labour and anxiety wasted over a difficult problem, when he has in hand a solution not only satisfactory, but short, which, however, he omits to state?

DEAN STANLEY ON THE PROFESSION OF MEDICINE.

DEAN STANLEY, in the course of an admirable address to the students at St. Thomas's Hospital, described the hospital as the "palace of the poor and suffering; founded by one of our kings, whose name was among the best beloved of the long series of English sovereigns, and who was himself an eager student cut off before he passed the age of studentship. It was, he thought, exceedingly interesting in finding oneself in a great hospital to remember how it served, more perhaps than any other institution, to check the revolutions of time. This institution, with the exception of its change of locality, had pre-

served its objects and its purpose absolutely unchanged. He remembered seeing in the town of Angers a hospital, still continued, which was founded by Henry the Second, and which alone of all the institutions in Angers, had remained unchanged in that most changeable of all countries. And this brought him to the profession to which they were called. Nothing could be more delightful to contemplate than a number of young men who were growing up to devote themselves to a career which had for its object nothing less than to do good to the human race. All the great professions, no doubt, had this for their object indirectly, but their profession and his own profession were the only two which had this direct beneficence for their object. The clergyman and physician must be inseparable allies. Looking over all the professions, if they took the best of all the various classes of students, the best specimen of all was the best kind of medical student. There were three reasons why a good medical student ought to be better than the student of any other profession. First of all, he had to deal with human suffering—the alleviation of human suffering, and doing good to mankind in the most direct form. There was a very striking passage in *Scenes in Clerical Life*, by George Eliot, in which was described how all the various doubts and difficulties, speculations and despair of a man shrunk away to nothing when he entered an hospital. In an hospital there was no intervening obstacle between themselves and doing good. There they met with every sort of creed and opinion that could be presented to them, and yet always in a form that demanded nothing but their sympathy, nothing but their endeavour to perform their duty towards the suffering, nothing to rouse theological or scientific or any other sort of odium—only the one single purpose of enabling their patients to recover their health, or be what they were intended by their Creator to be in their passage through life. There was another reason. Some might think that familiarity with the sight of human suffering might cause them to lose sympathy with it, but, judging from what he had seen of medical men outside hospitals, he had invariably found that their interest in and sympathy for their poor suffering patients was as great as if they never met with any other cases of sickness and suffering in the world, so that it would seem that, instead of having their minds deadened by witnessing suffering, they were quickened. That he trusted would be the case with all medical students who had anything whatever in them that was worth living and worth dying for. Then, again, some people thought that having their attention so much fixed on the external frame, it might lead them to disparage and to put on one side the spiritual and the moral part of human nature, but, in point of fact, and again judging from the most distinguished surgeons and physicians he had known—he thought he might say they all had known—this was not the case; but it was the case that physicians and surgeons of any eminence at all, so far from having their minds fixed or their hearts corrupted by having their attention fixed on the outward physical frame, were perhaps even more than other persons led to feel the difference, the everlasting difference, between what was merely external and what was inward and spiritual.”

THE WORCESTER INFIRMARY.

THE public are apt to be very unreasonable in the demands which they make upon the gratuitous services of those who hold honorary appointments at hospitals. The governors seem to forget that, if they do much for a young man by placing him upon the staff of such an institution, he does far more for them by the valuable services which he is constantly rendering, it may be throughout a long term of years; and it should be remembered that, whereas the value to him of his connection with the hospital is considerably lessened after a few years, the value of his services to the institution is, on the contrary, yearly augmenting with his increased skill and experience. In order to take a right view of this matter, and to secure just treatment for our profession in those questions which will from time to time arise, it is very desirable that the medical staff should have a larger share in the management of hospitals than they now possess. This subject has been brought prominently before us by an incident which has recently

occurred at the Worcester Infirmary. In February last, Dr. Inglis received on one of his out-patient days a sudden and urgent call to attend a private patient in the country. The 59th rule of the institution requires that when a medical officer is prevented from attending in person, he shall obtain a substitute from among his honorary colleagues; but, on the occasion in question, Dr. Inglis had not time to do this. He, therefore, wrote to the house-surgeon, a fully qualified man, asking him to see his out-patients; which was accordingly done. On this particular morning, two labourers, who had previously been attended by a local practitioner, had walked eight miles to the hospital in order to obtain farther advice, and were disappointed at only seeing the house-surgeon. This apparent hardship was reported to the committee; and, after various deliberations and much discussion, a vote of censure was passed upon Dr. Inglis “for neglect of duty by absents himself from the out-patients of the infirmary on February 13th without providing a substitute according to the rules, to the disappointment of two patients in a humble class of life”. As Dr. Inglis has been for fourteen years on the honorary medical staff of the institution, we cannot wonder that such a vote as this should have led him to tender his resignation at the next monthly committee, which was held on the 19th ult. It is hardly possible that this matter should be passed over in silence at the annual general meeting of the governors, and it remains to be seen whether the vote of censure will be sustained. There can be no doubt that the letter of the law is against Dr. Inglis, but the manner in which it has been pressed appears to us both harsh and unjustifiable. It was said that a similar incident had occurred four years ago, and that, therefore, the present case could not be passed over. We can only say that if, during fourteen years’ service, there has been no greater cause of complaint against Dr. Inglis than that which is afforded by two such cases, he deserves praise rather than blame. It appears to us that the rule under which he has been censured was drawn up without a due consideration of the exigencies of the medical profession. Cases must frequently arise in which medical men in active practice can neither see their hospital patients themselves, nor be able in the emergency to communicate with their colleagues. The house-surgeon, on the contrary, is always on the spot; he is a duly qualified medical man, and he is acquainted with the previous treatment of those who are attending the hospital regularly. As Mr. Budd well pointed out, the medical staff of the Worcester Infirmary would most effectually carry out the spirit of the rule by referring to him in any such sudden and unavoidable absence. We trust the general body of governors will see the injustice that has been done to Dr. Inglis, and that the vote of censure will not only be rescinded, but that the wording of rule 59 will be so altered as to leave greater latitude to the medical officers in providing a substitute. As we pointed out before in alluding to this matter, those who find the money and those who find the skill are alike necessary to the well-being of a hospital; and the former, who are often men of leisure and free from all pecuniary anxieties, should treat with consideration those who, while perfectly willing to give a large portion of their time to the gratuitous service of the poor, must not be expected to neglect the private practice upon which they are dependent for their livelihood.

THE STUDY OF INSANITY.

THE following petition, signed by the Lecturers on Insanity at the Medical Schools of the United Kingdom, has been presented to the medical examining boards, praying that students of medicine may, if they so desire, substitute a three months’ course of clinical instruction in the wards of a lunatic asylum for the same period of attendance in the medical wards of a general hospital. The petitioners state that not fewer than four hundred gentlemen are engaged in the treatment of the insane; and, when we reflect that at present the assistant medical officers of asylums have to learn their duties after they are appointed, and that students of medicine in general enter upon the practice of their profession without having seen a single case of insanity, we think the permission asked for a reasonable one. There are large asylums

near all the schools of medicine. There are several in and near London, besides St. Luke's and Bethlem Hospitals. Asylums might be qualified, like provincial hospitals, according to the number of beds; and in no way could a greater impetus be given to the scientific study and treatment of insanity than by the presence of a clinical class within the wards of an asylum.

1. That your petitioners are lecturers on insanity or psychological medicine in the schools of medicine to which their names are attached, as below.

2. That their courses of lectures are not (by the regulations of any qualifying board) imperative on students of medicine as a part of their curriculum of professional study.

3. That your petitioners are aware of the grave objections to adding to the already large number of subjects which students of medicine have to master during their period of study, but they venture respectfully to suggest that the entire absence of any provision for the clinical study of so important a branch of medicine as insanity and its kindred diseases cannot but be prejudicial to the interests of a large majority of students in their future careers.

4. That insanity is not (like diseases of the eye, teeth, etc.) to be met with in the wards of a general hospital, and that consequently students have no opportunity for observing it without attending at a lunatic asylum.

5. That, of the great number of asylums and hospitals for the insane which there are in the country, there is at least one contiguous to every medical school in the kingdom.

6. That your petitioners not only lecture on insanity, but also have the means of affording clinical instruction in asylums for the insane of easy access to the students, and that their lectures and *cliniques* include both insanity and many other important nervous diseases of a class which are not usually seen in general hospitals, such as epilepsy, paralysis, softening and tumours of the brain, chorea, hysteria, hypochondriasis, and others.

7. That there are, on the narrowest computation, four hundred medical men now engaged in the speciality of mental disease, either as officers or as medical attendants at the asylums and other receptacles for the insane in the United Kingdom of Great Britain and Ireland, this number having greatly increased of late years, and there being an increasing difficulty in procuring qualified assistants for asylums; and that it is of the highest importance that those entering this department in future should have some practical and scientific knowledge of this most difficult branch of medicine, not only for their own comfort and satisfaction, but also in order to the proper treatment of the insane and the advancement of science.

8. That the University of London has the following regulation and note thereon: "Attendance during three months in the wards of a lunatic asylum recognised by the University, with clinical instruction, may be substituted for a like period of attendance on medical hospital practice." "The senate regard it as highly desirable that candidates for the degree of M.B. should practically acquaint themselves with the different forms of insanity by attendance in a lunatic asylum."

9. That your petitioners are of opinion that, if the regulations laid down by the University of London were adopted by all examining boards, a great boon would be conferred on many students who might then, without sacrifice of time, which they can hardly afford, avail themselves of the opportunities for studying a class of diseases with which at present they have little or no practical acquaintance, but which are of all others liable to entail on medical practitioners heavy losses both of prestige and of fortune. Indeed, so undoubtedly is this the case, that it is within the knowledge of your petitioners that many medical men of skill and repute have declined to give an opinion and certify in cases of insanity, in consequence of the disastrous results into which a faulty certificate may lead them; thereby, in the opinion of your petitioners, shirking responsibilities, which, as fully trained medical men, they are bound to accept.

Wherefore, your petitioners humbly pray that you will be pleased to take into favourable consideration their petition, that it shall be permitted to students of medicine who wish to qualify to appear before you for examination, to substitute, if they so desire, a three months' course of clinical instruction in the wards of a lunatic asylum for the same period of attendance in the medical wards of a general hospital.

It is signed by G. Fielding Blandford, M.D., F.R.C.P.L., St. George's Hospital, London; J. Crichton Browne, M.D., F.R.S.E., Leeds Medical School; T. S. Clouston, M.D., F.R.C.P.E., Royal Edinburgh Asylum; W. J. Hunt, M.D., F.R.C.P.E., Charing Cross Hospital, London; Robert Jamieson, M.D., University of Aberdeen; T. Laycock, M.D., F.R.C.P.E., University of Edinburgh; Henry Rayner, M.D., Middlesex Hospital, London; Alexander Robertson,

M.D., F.F.P.S.G., Town's Hospital and Asylum, Glasgow; W. H. O. Sankey, M.D., F.R.C.P.L., University College, London; George H. Savage, M.D. Lond., Guy's Hospital, London; T. Clave Shaw, M.D., M.R.C.P.L., St. Bartholomew's Hospital, London; Edgar Sheppard, M.D., D.C.L., King's College, London; H. Sutherland, M.D., M.R.C.P.L., Westminster Hospital, London; John Batty Tuke, M.D., F.R.C.P.E., F.R.S.E., Extra Academical School, Edinburgh; R. H. B. Wickham, F.R.C.S.E., University of Durham; W. Rhys Williams, M.D., St. Thomas's Hospital, London; and D. Yellowlees, M.D., F.F.P.S.G., Royal Glasgow Asylum.

THE LATE OUTBREAK OF FEVER IN SHEFFIELD.

AT a recent meeting of the Sheffield Board Guardians, it was stated that the workhouse contained thirty cases of fever, of which five had been admitted from one house. Although the general zymotic death-rate in Sheffield has recently been satisfactorily low, the fatal cases of fever have shown an excess for some weeks. Sheffield appears to be suffering from its neglect to provide suitable hospital accommodation for the isolation and treatment of infectious diseases. It is one of the few large towns without a fever-hospital. The admission of fever-cases into a workhouse, or even a workhouse infirmary, is a necessity which should now never arise in large towns.

SANITARY AND EDUCATIONAL EXHIBITION.

AN exhibition of sanitary, educational, and domestic appliances will be held from October 6th to the 16th, in the Corn Exchange, adjoining the Pavilion, Brighton, in connection with the Social Science Congress to be held contemporaneously in that town. The object of the exhibition is to bring under the notice of the public generally, and particularly those who are interested in social, sanitary, educational, and economical questions, the latest scientific appliances for improving the public health, promoting education, and advancing social economy. These will be classified under the following heads: 1. Warming, ventilation, and lighting; 2. Domestic appliances and apparatus; 3. Sanitary architecture and appliances; 4. Sanitary engineering and methods for disinfecting; 5. Food and clothing; 6. School furniture and school apparatus. The exhibition will be opened with an address to be delivered in the Dome. Lectures on the various classes of exhibits will be given during the period of exhibition.

THE ROYAL MEDICAL BENEVOLENT COLLEGE.

WE have just received the annual report of the Epsom Medical College, and are pleased to learn that the school is full, and that its finances are prosperous. We are not, however, equally satisfied with the manner in which the Council refers to the petition lately presented by a deputation of subscribers who are in favour of a reform in the present mode of electing scholars and pensioners. The report says that "the Council have received a memorial *purporting to have been* signed by 1,342 subscribers"—an expression which would certainly convey to most readers an idea that some of the signatures were not obtained in the usual straightforward manner. The report itself contains the strongest evidence of the necessity for the changes petitioned for. At the last election, there were forty-one candidates for four scholarships, and nine candidates for two pensions. Every one of these fifty candidates had been declared by the Council to be a deserving case, yet not one of them could possibly be successful without the expenditure of a considerable sum of money in canvassing, etc., whilst a large proportion, and these not necessarily the least deserving, must, in spite of this expenditure, inevitably be unsuccessful. The Council still hold to their idea of placing the names of those subscribers who object to being canvassed in a separate list; but this, as we have before explained, does not go to the root of the evil. The object of the petitioners is not to save themselves a little annoyance—it is but little trouble to drop the canvassing letters and cards into the waste-paper basket; they wish that the needy applicants may be spared all this unnecessary trouble and expense. At present, the members of the Council, with the help of their immediate friends and adherents, have practically the control of the elections; they thus enjoy a large amount of patronage without the

smallest responsibility as to the way in which it is exercised; those who signed the memorial desire that the Council shall still enjoy their patronage, but that they shall be openly responsible to the general body of governors for the way in which it is used. At present, fifty candidates and an army of friends fight and struggle for months in order that six of them may obtain the advantages of a *charity*. The petitioners think that these claims would be far more satisfactorily settled by a Committee of the Council, and they trust that the day is not far off when a charity election will no longer be an expensive scramble. The Council may be right in calling this a "sweeping" change; but, if so, the change is only the more necessary.

APOTHECARIES' HALL: PRIZES IN BOTANY.

AT the recent competitive examination for the Prizes in Botany, given annually by the Society of Apothecaries to medical students, the successful candidates were:—1. Neville Scott Whiting, of University College, a Gold Medal; 2. William Rushton Parker, of University College, a Silver Medal and a Book.

THE NECK OF THE FEMUR.

IN the current number of the *Art Journal* is a paper by Mr. Edward Owen, Demonstrator of Anatomy at St. Mary's Hospital, describing the arrangement of the cancellated tissue in the upper end of the femur. Mr. Owen's explanation differs very considerably from that which is to be found in Mr. Ward's work on *Osteology*. He argues that the weight received upon the head of the bone is transmitted to the shaft in two distinct courses. The first is by means of rays of bones which pass almost vertically from the interior of the head, to be lost in the inner wall of compact tissue in the shaft of the bone. These rays lie to the inner side of a plumb-line let fall from the upper and outer margin of the head to the compact tissue on the inner side of the shaft. The compact tissue on the outer side, as it approaches the base of the great trochanter, dissolves itself into arched spicules of cancellated tissue, which pass into the interior of the head of the bone, where they interlace with the vertical rays. These arched spicules afford the second course for the transmission of weight and shock, and are materially strengthened by fine arches which, springing from the inner compact pier, intersect them at regular intervals. Mr. Owen has shown the plan of this arrangement in vertical section, and has instituted a close comparison between it and the first iron bridge, of which he also gives an illustration. In that part of the neck where neither vertical nor arched rays are to be made out, the cancellated tissue takes no definite arrangement. This part is compared with the "spandrel" in the bridge.

SCOTLAND.

A MEETING of managers of the Royal Infirmary and Asylum, Aberdeen, was held a few days ago to consider the contracts for building a new west wing to the asylum, at an estimate of £5,000. It was resolved to delay proceedings for the present, in consequence of the unexpectedly large amount of the tenders.

THE funeral of the late Professor Oswald Bell of St. Andrew's took place on June 30th, and was attended by the Senatus Academicus, the Town Council, and a large number of private friends. Business was suspended in the town for some hours while the mournful ceremony was taking place.

THE inhabitants of the mining village of Moringside, near Wishaw, are at present suffering severely from the great scarcity of water. Hitherto the village has been supplied with water from an adjoining coal-pit belonging to the Shotts Iron Company, but this source having failed, the only supply that can now be obtained is from the Stone Craig's pit, a distance of fully a mile from the village.

GLASGOW ROYAL INFIRMARY: PROJECTED SCHOOL OF MEDICINE.

THIS matter seems about to be taken up in earnest by the directors of the Royal Infirmary. They are about to apply to the Crown for a new charter or a modification of their original one, to enable them to hold heritable property to the amount of £5,000, and some other powers. They also seek in the new charter to obtain powers to establish a school of medicine at the infirmary. This seems to us the most important of the matters sought for. In the course of the meeting in which the matter was brought before the subscribers, Dr. Gairdner impressed on the managers the desirableness of not appointing individual lecturers to teach the several subjects, but making it open to any one who thought he could attract students to give courses of lectures on the various departments. The advantages of such an arrangement are obvious, as it offers facilities to any energetic young man to work his way up as a teacher. In whatever form it is finally established, the Royal Infirmary ought to form a very attractive extramural school.

HEALTH OF CUPAR ANGUS.

THIS town has been of late remarkably free from any epidemic disease, and it is believed that the plentiful supply of pure spring water, which was introduced into the town about a year ago, has had much to do with the preservation of the health of the inhabitants. The quality of the water cannot be surpassed. It may be mentioned, as illustrating the health which the community has enjoyed for the last six months, that during that period only twenty deaths have occurred in the parish. The population is 3,055, and thus the death-rate has been a little over thirteen per thousand *per annum*.

ABERDEEN UNIVERSITY COURT.

AT a meeting of the University Court, Aberdeen, held on July 2nd, a letter was read from Dr. Macrobain, professor of medicine in the University, petitioning to be allowed to retire from his professorship, the duties of which he has discharged with great ability and success for the past forty-three years. Advancing age and a failing voice made this step necessary. The court unanimously resolved to report to the Queen in Council their opinion that he ought to be allowed to retire under the provisions of ordinance 9. The court also altered ordinance No. 16, to the effect that in future there will be six non-professorial examiners in medicine, each receiving £30 *per annum*, in place of three, each receiving £60. This alteration, however, will not come into force until it has received the approval of the Queen in Council. An order was read signifying the approval of the Council of alterations made at the last meeting in the ordinance regulation of the Fullerton, Moir, and Gray scholarships.

CLOSING OF AN ENDOWED HOSPITAL.

LAST week, workmen were engaged in barricading the windows of the Asylum for Incurables, Leith. This institution was built and endowed in 1840, by John Gladstone of Fasque, a native of Leith, and was intended to provide a refuge for incurables. For the past few years, the inmates have been few in number, and have received no accessions, and those who still remain have been boarded out. The building was offered by Sir T. Gladstone, the acting trustee, to the School Board, but not accepted, and will now, it is said, be disposed of privately.

THE SIMPSON STATUE.

THE case containing the statue was removed after the accident to the studio of Mr. Brodie, and, on examination, it was found that the damage occasioned by the fall was very considerable. But the artist expects that a fortnight's hard work will restore the model to a perfectly satisfactory condition.

SMALL-POX IN ABERDEENSHIRE.

WE are glad to be able to state that the last patient suffering from this disease has been discharged from the Small-pox Hospital in the town of Aberdeen, and it has now been closed. Since January 7th, 1875, seventy-six patients have been admitted, of whom sixty-four recovered

and twelve died. In Woodside, a village in the neighbourhood of Aberdeen, however, the disease has again showed itself in the persons of three girls employed in a large factory there.

NORTH OF SCOTLAND MEDICAL ASSOCIATION.

THE annual meeting of this Association was held on Saturday, June 26th, in the Medico-Chirurgical Hall, Aberdeen. Dr. Jamieson, Aberdeen, the retiring president, delivered an admirable address on Insanity considered from the historical and physical point of view. Dr. Mackie of Inch was elected president for next year, and after further business was concluded, there was a long private discussion on medical ethics. The members dined together in the evening.

THE WHITADDER POLLUTION CASE.

WE learn that the defenders in the action brought by the riparian proprietors of the river Whitadder have caused intimation to be made to the proprietors' law agents that it will be unnecessary to go on with the trial, which was to have taken place this month in Edinburgh, as the pollution of the river to the extent of creating a nuisance will now be admitted by them, and that the court will be asked to give the defenders time to execute remedial measures for preventing any noxious matters flowing from these works into the river for the future.

PROSECUTION UNDER THE VACCINATION ACT.

AT the Sheriff Summary Court, last week, a druggist in Edinburgh was charged, at the instance of the inspector of the poor of St. Cuthbert's parish, with contravening the eighteenth section of the Vaccination (Scotland) Act, in failing to have his child vaccinated. The accused pleaded guilty, stating that he abstained from having the operation performed on principle. The sheriff imposed a fine of five shillings, with two guineas of expenses, with the alternative of ten days' imprisonment.

IRELAND.

SIR WILLIAM WILDE, M.D., has been elected an honorary member of the Royal Academy of Science at Upsala, and a corresponding member of the Geographical Society of Berlin.

THE DUBLIN MAYORALTY FOR 1876.

AT a meeting of the Municipal Council, held on last Monday, it was proposed by the Hon. J. P. Vereker, seconded by Sir J. W. Mackey, and carried unanimously, that Dr. Owens, J.P., should be Lord Mayor of Dublin for 1876. Dr. Owens has had considerable experience in sanitary matters.

DUBLIN MAIN DRAINAGE.

HER Majesty's Treasury have objected to increase the loan of £350,000 to £500,000 for main drainage purposes, without further security than the corporation has already offered. Their lordships also recommend that should any money be lent, that the Government should be represented on any committee appointed to superintend the execution of the scheme. This latter suggestion is a most reasonable one, and is the only way to give confidence to the citizens, should the intercepting sewerage system be ultimately adopted.

THE LATE FIRE IN DUBLIN.

THE recent fire has not proved so disastrous as some statements published would lead one to believe, and it is now thought that the fire will have done considerable service in a sanitary point of view, by removing a large number of houses let in tenements, in a bad state of repair, overcrowded with families of the poorest class, and hot-beds of epidemic disease. The total number of houses destroyed has been seventeen, and two have since been taken down, making a total of nineteen, which contained about fifty-six families, the average value of

whose effects may be placed at £10, though this may be considered rather a high estimate, which would make a total of £560 amount of damage to those inhabiting the tenements; but, as about £2,000 has been collected, several of these poor families so suddenly removed from their homes will soon be in a more prosperous condition than before the calamity.

HEALTH OF IRELAND: QUARTERLY REPORT.

DURING the first quarter of the year, the births registered amounted to 36,444, being equal to an annual birth-rate of 27.5 per 1,000; and the deaths to 30,589, or an annual mortality of 23.1 in every 1,000; the birth-rate being under, and the death-rate beyond, the average. Small-pox caused a good many deaths; and, in reference to this subject, a registrar of the Ballinrobe Union states that a few cases of small-pox of a most virulent form occurred, and in several instances it attacked persons who previously had the disease from inoculation, though, curiously enough, it spared parties who had been vaccinated. Abuse of all sanitary arrangements is spoken of very strongly by various registrars, and a considerable number of the deaths clearly traceable to the unwholesome conditions under which so many of the poorer classes in Ireland exist. Among the deaths registered was one at Mallow of a man stated to be 107 years of age. Small-pox caused 239 deaths; measles produced 195; to scarlet fever, 1,107 were ascribed; diphtheria, 128; diarrhoea, 450; and to fever and whooping-cough, 769 and 322 respectively were referred.

SANITARY INQUIRY IN A DUBLIN SUBURB.

A SANITARY inquiry was held on June 25th at the Town Commissions Hall, Pembroke Township, Dublin, into a complaint made by the inhabitants that a portion of the district had not been provided with a "sufficient sewer", and that a nuisance existed arising from an open ditch which received the sewage of a populous and fashionable neighbourhood. The petitioners allege that "the nuisance is dangerous to human life". It is not long since the unsanitary condition of Beggar's Bush Barracks, situated not very far from the site of the present inquiry, attracted attention to many unhealthy points about this district. The inquiry was held by Captain Robinson, the Local Government Board Inspector for the Dublin District. The inquiry presented some curious features as to the manner in which it was conducted. The person presiding was an ex-cavalry officer; the case for the petitioners was conducted by a clergyman (the Rev. E. W. Maunsel); and the case for the local authority by their Chairman (Mr. Vinnon, the agent to the Earl of Pembroke, an eminent Dublin business man). It will be observed, that not one of those concerned knew anything of either law, medicine, or engineering, and therefore had to trust altogether to the statements of the witnesses. Several witnesses deposed to illness in the neighbourhood, and to the great prevalence of zymotic diseases in the vicinity of the nuisance. Dr. Murdock, the medical sanitary officer of the district, considered the nuisance to be dangerous to health. Dr. Grimshaw was specially employed by the petitioners, and described a state of things well calculated to produce all kinds of zymotic disease. We cannot enter upon details here; but suffice it to say that a wide ditch about a mile long runs through one of the most fashionable portions of the most fashionable suburb of Dublin, and receives the sewage from hundreds of houses. The ditch has only about a fall of a foot and a half through its whole length. This mile of cesspool contains about eighteen inches of fetid mud. This horrible nuisance has been repeatedly complained of, and nothing has been done towards remedying it; hence the inquiry. The only defence put up by the Town Commissioners amounted to this: that it was a difficult thing to drain a place without a natural fall; that it would cost a good deal to make an artificial fall; and, lastly, the usual and good defence that the ditch belonged to the railway company, and that a neighbouring sanitary authority *must* sometime to construct a system of main sewers which *ought* to take in the Pembroke district.

THE EDINBURGH MEETING.

ON the page facing Dr. Barnes's address, will be found a blank form intended to be filled up by those members proposing to attend the next annual meeting of the Association in Edinburgh. For the convenience of all concerned, it is desirable that every one who expects to attend this meeting should fill up the form and post it prepaid.

NEW MEMBERS.

DURING the last fortnight, nearly two hundred members of the profession have intimated at this office their desire to become members of the British Medical Association, and have received the required forms of nomination for signature. Our associates can be furnished with forms for proposing new members on application to the Honorary Local Secretaries of Branches, or the General Secretary, Mr. Francis Fowke, 36, Great Queen Street, London, W.C. Nomination papers intended to qualify new members for election in time to attend the next annual meeting in Edinburgh, should be duly signed and forwarded to the General Secretary without any delay.

MEDICAL ADVERTISING.

AT the recent annual meeting of the Lancashire and Cheshire Branch of the British Medical Association, the following preamble and resolution were adopted, endorsing the views expressed recently by the BRITISH MEDICAL JOURNAL on a subject interesting alike to the profession and to the public.

That this Branch, having considered the prevalence of the existing practice of advertising in the daily and other newspapers, medical works avowedly addressed only to medical readers, and not calculated to enlighten (or intended for the perusal of) the public generally, is of opinion that, in the majority of instances, this practice can in no way tend to public edification; that it is largely used as a means of indirectly advertising the names and departments of practice of the authors of such books: that it tends to confuse and mislead the public by confounding the distinction between medical men of real eminence and laborious work with others who find in such advertisement means of notoriety, and a costly but still lucrative mode of commercially pushing their professional fortunes.

Resolved, therefore, That this Committee is of opinion that medical works intended for medical readers should not be advertised in any other than medical journals.

Resolutions to the same effect were also passed at the recent combined annual meeting of the Cambridge and Huntingdon, East Anglian, and South Midland Branches, and at the annual meeting of the Midland Branch, of the British Medical Association.

TREATMENT OF HABITUAL DRUNKARDS: DEPUTATION TO THE HOME SECRETARY.

A DEPUTATION, principally representative of the medical profession, waited on July 1st upon Mr. Cross, the Secretary of State for the Home Department, to urge upon the Government the desirability of introducing in the next session of Parliament a measure, founded on the recommendation of the Select Committee of the House of Commons, for the control and management of the class of persons known as habitual drunkards, or dipsomaniacs. There were upon the deputation: the Earl of Shaftesbury; Lord Houghton; Lord Henry Scott, M.P.; Sir H. Fergusson-Davie, M.P.; Dr. Lush, M.P.; Mr. Mc'Carthy Downing, M.P.; Sir Wm. Fergusson, Bart.; Sir Thomas Watson, M.D., Bart.; Canon Conway; Dr. C. J. B. Williams, F.R.S., Physician Extraordinary to the Queen; Mr. W. C. Garman, ex-President, and Dr. Bodington, President-Elect, of the Birmingham and Midland Counties Branch of the British Medical Association; Dr. Pigott, D.C.L.; the Rev. Dr. Cox, Vicar of St. Helen's; Dr. H. Monro; Dr. Farquharson; Mr. Holthouse; Mr. Curling, F.R.S.; Dr. Murchison, F.R.S.; Mr. J. Wood; Dr. Sibson, F.R.S., and others.

The Earl of SHAFTESBURY, in introducing the deputation, said he could not do better than read the memorial of members of the medical profession and others, which he begged to hand to the right honourable gentleman. The noble lord then handed to the Home Secretary the document, which was signed by, amongst others, the Dean of West-

minster; Sir George Burrows, M.D., Bart.; Sir Thomas Watson, M.D., Bart.; Sir William Fergusson, Bart.; Sir James Paget, Bart.; Sir William Gull, M.D., Bart.; Sir Henry Thompson; C. J. B. Williams, M.D., F.R.S.; Edward H. Sieveking, M.D.; and Caesar Hawkins, F.R.S.

Sir THOMAS WATSON observed that, during his very long professional life, he had been incredulous respecting the reclamation of habitual drunkards, but his late experience had made him sanguine as to their cure, with a very considerable number of whom excessive drinking, indulged in as a vice, developed itself into a most formidable bodily and mental disease, resulting from alcoholic poisoning of the system. The introduction in excess continually, from time to time, of intoxicating drinks—particularly of alcoholic drinks—led to an accumulation in the system of their specific poisons. The tissues of the body and the nervous system—which included the brain—became at length so impregnated, so charged with the poison, as to produce in the unhappy victim of this condition a craving for the accustomed stimulant which became absolutely irresistible. Such people as those were "dipsomaniacs"; and for those victims there could be no doubt there was but one remedy: absolute restraint from all access to spirituous or alcoholic drink for a sufficient length of time, so that they should gradually recover from the mania. When men were inclined to renew the vice, there should be "institutions" or "retreats" for their reception, where they might be placed by their friends or well-wishers, by their own personal desire, or by the authority of the magistrates, for periods of three to twelve months.

Dr. MONRO remarked he would rather treat fifty lunatics than one "dipsomaniac".

Mr. CROSS replied to the deputation in the following terms. Lord Shaftesbury and Gentlemen,—I am very glad I have seen you here to-day. This matter was brought before the attention of Parliament by the late Mr. Dalrymple, who certainly was most energetic in advocating repressive measures. I am not now going to give you—nor do you ask me to give you—any expression of opinion on the matter. You must all know that there are great practical difficulties in the way. We are enabled to treat criminals and lunatics, but in this matter we should have to deal with a class which are not quite criminals nor quite lunatics, although they nearly approach both classes in many cases. As an old visitor of asylums, I have seen many of these cases treated as cases of lunacy with very beneficial effects. I remember a case in which one poor man stayed in an asylum for years by the advice of his friends, because he felt that if he were freed from restraint he would lapse into his former habits. But you have not to-day gone into the question of numbers or expense. I take it that you might find a great many dipsomaniacs in London.

Mr. GARMAN: I believe so; but we think that the class of cases would be so readily distinguished that the number, where forced seclusion would be necessary, would not be so numerous as might be supposed.

Mr. CROSS: However, there are great practical difficulties in the way. There are numbers of a class of cases where the dipsomaniacs would have to be given into custody, and there would be great difficulty in getting persons of that kind into safe keeping. All I can say on the present occasion is, that your memorial shall receive that consideration which its importance deserves.

The deputation then withdrew.

CORRESPONDENCE.

VOTING BY PROXY AT THE ROYAL COLLEGE OF SURGEONS.

SIR,—The last election at the Royal College of Surgeons has revealed a wide-spread discontent amongst the Fellows. It is assumed that the members of Council are elected by the Fellows at large; but the election takes place at the College in London, whilst the majority of the electors reside in the country, hundreds of miles distant, so that it is not possible that any election can represent the opinions of the general body.

It is a mere mockery of justice to bestow a franchise on Fellows which in many cases they cannot possibly use, because they are unable to leave their duties, and incur the cost, the loss of time, and fatigue of the journey, simply to enable them to drop a voting paper into a ballot-box. Every man entrusted with a vote is bound to have a *bona fide* opportunity of recording it; for if he have not, he is virtually disenfranchised. For this reason, Parliament has wisely decreed that the members of universities, who are in a similar position with respect to

residence to the Fellows of the Royal College of Surgeons, can vote by papers without the necessity of a journey.

By the Act 24 and 25 Vic., cap. 53, the members of the Universities of Oxford, Cambridge, and Dublin, are empowered to employ voting papers. This privilege was extended to members of the London University by 30 and 31 Vic., cap. 102; and the details of election were further simplified by 31 and 32 Vic., cap. 65. The College of Surgeons having been shown the way, has only to take advantage of the precedent by procuring an Act, of a few lines in length, rehearsing the University Election Acts, and applying their provisions to the particular case of the College of Surgeons before the next election takes place. The question has only to be raised for its propriety to be admitted; for where is the surgeon who would not rather watch a serious case when life or death may depend, than neglect his patient, that he may formally hand over a printed paper to the recognised official of the College of Surgeons? To obtain the desired end, proper means must be taken. The body of country Fellows must ask before their request can be granted; and I shall be glad to receive the names of every Fellow desirous of voting by papers, that we may at once take steps to obtain the Act of Parliament necessary to obtain our just due.

I remain, sir, your obedient servant, ALFRED SMEE.
7, Finsbury Circus, July 6th, 1875.

P.S.—Only fifty-seven country Fellows voted at the last election.

MR. TEALE'S CASE OF EXCESSIVELY HIGH TEMPERATURE.

SIR,—On February 28th, I brought before the members of the Clinical Society, and through them of the profession in general, some notes of a case of excessive and long maintained high temperature after special injuries, with recovery, in which a temperature ranging from 108 to 122 deg. and upwards, had been maintained for a period of nearly nine weeks.

It is not, I think, surprising that the relation of such a case, which, if it be faithfully recorded, tends to upset all the ideas previously entertained as to vital resistance to heat, should have provoked some criticism, and even, in the minds of some, a certain amount of scepticism. From various quarters, I have received suggestions and questions on points of difficulty in the case; and to these I propose, with your permission, to reply *seriatim* in the JOURNAL.

I have been asked, "Was the temperature ever taken in the mouth?" I was more than once desirous to do so, whilst my patient was very ill. The attempt, however, always caused retching, and was not persevered in. After the paper was read, as Miss G. was then suffering from the relapse brought on by her journey home, I wrote and asked her brother to call in her medical attendant, to ascertain the temperature in her mouth. The brother, in reply, says: "On Sunday, March 7th, my sister's temperature was taken under the tongue, between the thighs, and under the arm (simultaneously), and was from 108 to 108½ deg."

Mr. Henry Hind, partner of the Messrs. Trotter of Stockton, writes on the same date:

"I was asked to see your patient, Miss G., on Sunday, March 7th, and I then found her with a quiet pulse, and apparently in a good state of health, but in bed; and upon taking her temperature, I found the thermometer in use by her to register 108 deg. This I verified by using my own, which registered the same within one-eighth part of a degree. I have now in my possession a thermometer lent by me to Mr. G., which is indexed to mark 110 deg.; and after use, the register was driven into the little bulb at the end."

"Was the temperature ever taken in the rectum, groin, and axilla simultaneously?"

On December 10th, 1874, it was so taken (as was stated in my paper, an abstract of which only appeared in the JOURNAL). The result was: temperature in both axillæ, 110.4 deg.; in rectum, 111 deg. It was repeatedly taken in both axillæ, and between the thighs simultaneously, when, as a rule, the three thermometers were within half a degree of one another."

"Have you ever kept your hand and eye on the instrument whilst any of the high temperatures were recorded?"

I have repeatedly steadied the thermometer in the axillæ myself, and have watched them rise simultaneously to heights ranging from 112 to 118 deg. and upwards. The thermometers have then been carefully removed by me into the adjoining room, to avoid drawing our patient's attention unduly to our observations; and I have then frequently given them to the nurses and friends to grasp. The sensation to the hand of

a glass tube heated to 118 deg. is one that, when once it has been felt, is not easily forgotten.

"Had you a trained nurse during the period of the high temperature?"

For most of the time; at first, one from the York Institution, and afterwards one from Lincoln. They were both somewhat sceptical about the high temperature at first, having been accustomed to take readings in hospitals; and I put them on their guard against mistakes. They were repeatedly present when observations were taken.

"Had the patient frequently bot bottles in bed with her, or hot flannels?"

To her feet, an India-rubber hot-water bottle was occasionally applied, but nowhere else. To her head and spine, she had very frequently ice-bags, which were grateful to her. I was early made acquainted with the "hot-water-bottle theory", and mentioned it to her nurses and attendants. On this point, I would ask, if a patient could endure in contact with her skin *one* bottle so hot that it would raise a thermometer to 118 or 120 deg., still less two or three in various parts of the body. On removing the instrument, I have repeatedly placed my hand in the axilla, and have found the impression of heat given there as great as that given by the thermometer, the patient's hands being at the same time icy cold.

Observations were taken at all sorts of times, sometimes in the night when the patient was dozing.

During the nine weeks of my patient's severe illness, a variety of instruments (most of which have since received the Kew certificate) registered temperatures which never once fell *below* 108 deg., and which sometimes reached 122 deg. and upwards. For five weeks afterwards, the patient being convalescent, the same instruments never once registered a temperature above 100 deg. After the patient's return home, when she was suffering from a partial relapse of her old symptoms, another set of instruments, in the hands of another medical man, again registered as high as 110 deg. and upwards (the temperature in the mouth tallying with that in the axilla). Since that time, convalescence having again been gradually approached, frequent observations have never on any occasion given a high rate of temperature.

I have now laid before the profession every point that occurs to me as likely to be of interest in this case. I have carefully looked round to see if there can have been any possibility of error, and have failed to find any. I now leave it, with the conviction that, if it has been accurately observed and faithfully recorded, as I believe it has been, other facts must sooner or later crop up, which will tend to throw light on that which is at present obscure.

In the discussion which followed the reading of the paper at the Clinical Society, Mr. Jonathan Hutchinson pointed out that there was an essential difference between the cases of abnormal temperature following lesion of nerve-centres, and those which formed part of the course of a specific fever; and Dr. Farquharson drew attention to a case of excessive lowering of temperature after spinal injury to 81 deg. Again, in the BRITISH MEDICAL JOURNAL of April 3rd, 1875, under the heading "Drunkenness in Germany", an account is given of thermometric observations carefully taken both in rectum and axilla, in two cases of alcohol poisoning, in one of which a temperature of 76 deg. was recorded, and in the other of 75.5 deg., with recovery in both cases. That is to say, a depression of 23 deg.; whilst in my case it was raised to about the same amount.

In pursuance of the same idea, that the greatest variations of temperature may be looked for in injuries to the nervous centres, Mr. Pridgin Teale, on the same occasion, related a case he had recently seen of fracture of the skull, where, in a few hours after the injury, the temperature had risen to 109 deg., when death ensued. Can any one say how high it might not have risen, had not the injuries caused death? For I contend that there is no proof in such cases that the temperature, *per se*, is the cause of death.

Dr. Lionel Beale, in the Linnæian Lectures on Life and on Vital Action in Health and Disease (see BRITISH MEDICAL JOURNAL, May 8th, 1875), in further illustration of the same idea, speaking of bioplasm-particles, says:

"Another important change to which these bioplasm-particles, in connection with the peripheral expansion of nerves, probably takes part, is the development of heat. Is it not possible that, under certain circumstances, the mode of force developed in the matter of the nerve-bioplasm may be changed, heat being rapidly produced instead of nerve-force? The suggestion at once occurs, whether the explanation of such exceptional cases of high temperature as that brought by Mr. John Teale before the Clinical Society a short time since, will not probably be found to have something to do with the phenomena of nerve-bioplasm." I am, sir, faithfully yours,
JOHN W. TEALE.

Scarborough, June 20th, 1875.

ASSOCIATION INTELLIGENCE.

COMMITTEE OF COUNCIL: NOTICE OF MEETING.

A MEETING of the Committee of Council will be held at the Queen's Hotel, Birmingham, on Tuesday, the 13th day of July next, at Three o'clock in the afternoon.

FRANCIS FOWKE,
General Secretary.

36, Great Queen Street, London, W.C., June 19th, 1875.

BRITISH MEDICAL ASSOCIATION: FORTY-THIRD ANNUAL MEETING.

THE Forty-third Annual Meeting of the British Medical Association will be held at Edinburgh, on Tuesday, Wednesday, Thursday, and Friday, August 3rd, 4th, 5th, and 6th, 1875.

President.—E. COPEMAN, M.D., Senior Physician to the Norfolk and Norwich Hospital.

President-elect.—SIR ROBERT CHRISTISON, Bart., M.D., D.C.L., LL.D., F.R.S.Ed.

An Address in Medicine will be given by JAMES WARBURTON BEEBIE, M.D., F.R.C.P.Ed.

An Address in Surgery will be given by JAMES SPENCE, F.R.C.S.Ed., F.R.S.E., Professor of Surgery in the University of Edinburgh.

An Address in Physiology will be given by WILLIAM RUTHIERFORD, M.D., F.R.S.E., Professor of the Institutes of Medicine in the University of Edinburgh.

The business of the Association will be transacted in Six Sections, viz.:

SECTION D. PUBLIC MEDICINE.—*President:* Right Hon. Lyon Playfair, M.P., C.B., F.R.S. *Vice-Presidents:* Inspector-General Smart, M.D., C.B.; Dr. Arthur Mitchell. *Secretaries:* Dr. Andrew Smart, 24, Melville Street, Edinburgh; Dr. Fraser, Knutsford.

SECTION A. MEDICINE.—*President:* Dr. Quain, F.R.S., London. *Vice-Presidents:* Professor W. T. Gairdner, Glasgow; Dr. Grainger Stewart, Edinburgh. *Secretaries:* Dr. Claud Muirhead, 7, Heriot Row, Edinburgh; Dr. Stephenson, 33, Buccleuch Street, Edinburgh.

SECTION B. SURGERY.—*President:* Professor Lister, F.R.S. Edinburgh. *Vice-Presidents:* Professor Pirrie, Aberdeen; Professor Macleod, Glasgow. *Secretaries:* Thomas Annandale, Esq., Charlotte Square, Edinburgh; Dr. John Duncan, 8, Ainslie Place, Edinburgh.

SECTION C. OBSTETRIC MEDICINE.—*President:* Dr. Matthews Duncan. *Vice-Presidents:* Dr. Keiller; Professor Simpson. *Secretaries:* Dr. Peel Ritchie, 16, Hill Street, Edinburgh; C. J. Cullingworth, Esq., 260, Oxford Street, Manchester.

SECTION E. PSYCHOLOGY.—*President:* Dr. Lowe, F.R.S., Edinburgh; *Vice-Presidents:* Dr. Sibbald; Dr. Clouston. *Secretaries:* Dr. Brown, Royal Asylum, Edinburgh; Dr. Saundby, Saughton Hall, Edinburgh.

SECTION F. PHYSIOLOGY.—*President:* Professor Burdon Sanderson, F.R.S., London. *Vice-Presidents:* Dr. McKendrick; Professor J. Dewar. *Secretaries:* Dr. Lander Brunton, F.R.S., 23, Somerset Street, Portman Square, London; Dr. Caton, 18, Abercrombie Square, Liverpool.

Honorary Local Secretaries.

Dr. John Batty Tuke, Edinburgh.

John Chiene, Esq., Edinburgh.

Dr. J. G. McKendrick, Edinburgh.

Dr. J. Bishop, Edinburgh.

Tuesday, August 3rd.

11 A.M.—SERVICE IN ST. GILES'S CHURCH. Sermon by Rev. Dr. Alexander.

1 P.M.—MEETING OF COMMITTEE OF COUNCIL.

3 P.M.—MEETING OF THE COUNCIL, 1874-75.

3.30 P.M.—GENERAL MEETING.—*President's* Address; Annual Report of Council; and other business.

9 P.M.—*PRESIDENT'S* RECEPTION IN ASSEMBLY ROOMS, MUSIC HALL.

Wednesday, August 4th.

9.30 A.M.—MEETING OF COUNCIL, 1875-76.

11.30 A.M.—SECOND GENERAL MEETING.

11.30 A.M.—ADDRESS IN MEDICINE.

2 P.M.—SECTIONAL MEETINGS.

9 P.M.—CONVERSAZIONE GIVEN BY THE ROYAL COLLEGE OF PHYSICIANS IN THE INDUSTRIAL MUSEUM.

Thursday, August 5th.

9 A.M.—MEETING OF THE COMMITTEE OF COUNCIL.

10 A.M.—THIRD GENERAL MEETING.—Reports of Committees.

11 A.M.—ADDRESS IN SURGERY.

2 P.M.—SECTIONAL MEETINGS.

6.30 P.M.—PUBLIC DINNER IN MUSIC HALL.

Friday, August 6th.

10 A.M.—ADDRESS IN PHYSIOLOGY.

11 A.M.—SECTIONAL MEETINGS.

1.30 P.M.—CONCLUDING GENERAL MEETING.

4 P.M.—PARTY IN THE ROYAL BOTANIC GARDENS, GIVEN BY THE UNIVERSITY OF EDINBURGH.

Saturday, August 7th.

EXCURSIONS.—Bass Rock, Melrose, Trossachs, Roslin.

Gentlemen desirous of reading papers, cases, or other communications, are requested to forward the titles to the General Secretary, or to one of the Secretaries of the Section in which the paper is to be read. All papers should be forwarded to one of the above named officers at as early a date as possible.

No paper must exceed twenty minutes in reading, and no subsequent speech must exceed ten minutes; all speeches at the General Meeting must not exceed ten minutes each.

ANNUAL MUSEUM.

The Eighth Annual Museum of the British Medical Association will be held in the Practical Chemistry Class-room in the University on the 3rd, 4th, 5th, and 6th of August, 1875, and will be open from 10 A.M. to 6 P.M. The Committee appointed to take charge of the arrangements for this museum will be glad to receive for exhibition:

1. Latest Inventions in Medical, Surgical, and Obstetrical Instruments and appliances of all kinds.

2. New Drugs and their Preparations, and New Articles of Diet for Invalids.

3. General Pathological Specimens, with photographs, models, casts, drawings, etc., illustrating Disease.

4. Specimens and Preparations in connection with Injuries and Diseases of Bones and Joints. [It is desired to make this a special feature in the Exhibition.]

5. New Physiological Apparatus.

6. Microscopes and Microscopic Specimens, Pathological and General; New Chemicals and other Appliances used in Histological Research.

The following is a list of the Museum Committee. All communications to be addressed to the Hon. Secretaries:—Professor Turner, Dr. Angus Macdonald, Dr. Argyll Robertson, Dr. John Wyllie, Dr. W. Gordon, Mr. Thomas Annandale, and Mr. A. B. Stirling. Dr. Charles E. Underhill, 8, Coates Crescent, and Dr. John Playfair, 25, Rutland Street, *Hon. Secretaries.*

NOTICE TO EXHIBITORS.—Application for space should be made as soon as possible, and the amount required mentioned. A written or printed description of all objects intended for exhibition must be forwarded for insertion in the Catalogue; and the Committee earnestly request all intending Exhibitors to bear in mind that it is impossible for their descriptions to be inserted unless sent in early—viz., not later than July 17th. All objects intended for exhibition must be delivered on or before July 27th. They must be addressed "Curator of Museum of British Medical Association, the University, Edinburgh."

N.B.—The Name of the Exhibitor should be written on the outside of each parcel, and a card bearing his name and address should be enclosed, to facilitate the return of the articles.

FRANCIS FOWKE, *General Secretary.*

36, Great Queen Street, June 26th, 1875.

ABERDEEN, BANFF, AND KINCARDINE BRANCH.

THE annual meeting of the above Branch will be held at Aberdeen, on Saturday, July 17th, at 1.30 o'clock P.M.

Further particulars will be intimated by circular.

ALEXANDER OGSTON, *Honorary Secretary.*

Aberdeen, June 1875.

WEST SOMERSET BRANCH.

THE annual meeting of this Branch will be held at the Railway Hotel, Taunton, on Thursday, July 22nd, at 2.30 P.M.

The President-elect, Dr. Cordwent, will read a short paper on "Vital Conservancy in Disease".

Members wishing to communicate papers or cases are requested to send notice to the Secretary.

The dinner will take place at 5 o'clock.

W. M. KELLY, M.D., *Honorary Secretary*.

Taunton, June 29th, 1875.

SOUTH WALES AND MONMOUTHSHIRE BRANCH.

THE annual meeting of this Branch will be held at Abergavenny, on Friday, July 16th.

Nomination-papers and the titles of communications, etc., must be sent to one of the undersigned by June 26th at the latest, in order that they may appear in the circulars.

Further particulars in the circulars as usual.

ANDREW DAVIES, Swansea. } *Hon. Secs.*
ALFRED SHEEN, M.D., Cardiff. }

Swansea, June 14th, 1875.

BORDER COUNTIES BRANCH.

THE annual meeting of the Border Counties Branch will be held at Dumfries, on Friday, July 23rd, 1875: *President*, Dr. GREEN, Kendal; *President-elect*, Dr. W. A. F. BROWNE, Dumfries.

Gentlemen intending to be present are requested to communicate their intention to the undersigned.

HENRY BARNES, M.D. } *Hon.*
J. SMITH, M.D. } *Secs.*

Carlisle, June 28th, 1875.

YORKSHIRE BRANCH: ANNUAL MEETING.

THE annual meeting of this Branch was held at the Medical School, Leeds, on Wednesday, June 9th. Dr. MARTIN DE BARTOLOMÉ having resigned the chair to the new president, Mr. TEALE, he, after a few remarks, called upon the secretary to read the report of the Council.

Report of Council.—The report stated that there had been a steady increase in the prosperity of the Branch. Twenty-five new members had been admitted during the year; eight had been lost by deaths and resignations, making the present number 230, and showing an absolute increase of seventeen members. Reference was then made to the business done at the two ordinary meetings held at Scarborough and Huddersfield, and to the value and number of the communications which had been brought forward. The report then went on to speak of the progress of the Parent Association, and the valuable work which it had effected since the foundation in 1832. With this growth had improved the financial position of the Association, by which it was enabled to afford considerable assistance to the advancement of medicine and allied sciences, by devoting grants of money for the promotion of original research. Regret was expressed at the death of their venerable associate Mr. W. Hey; and the report concluded, after thanking the President and Council for their services, by calling upon each member to use his endeavours for the furtherance of the objects of the Association and the Branch, and for the increasing their numbers, and showing that each individual might, if he chose, become an important unit in this extensive and powerful professional brotherhood.

Election of Officers and Council for 1875-6.—The following were elected—*President*: T. P. Teale, Esq. *President-Elect*: Wm. Burnie, M.D., Bradford. *Honorary Secretary and Treasurer*: William Procter, M.D., York. *Branch Council*: B. Dodsworth, Esq.; W. D. Husband, Esq.; W. Matterson, M.D.; S. W. North, Esq.; G. Shann, M.D.; I. M. Williams, Esq.; York: T. C. Allbutt, M.D.; C. Chadwick, M.D.; J. D. Heaton, M.D.; S. Hey, Esq.; T. R. Jessop, Esq.; T. P. Teale, Esq.; T. Scattergood, Esq.; C. G. Wheelhouse, Esq.; Leeds: M. Martin de Bartolomé, M.D.; J. Benson, Esq.; W. F. Favell, Esq.; J. C. Hall, M.D.; A. Jackson, Esq.; J. H. Keeling, M.D.; Sheffield: R. H. Meade, Esq., Bradford: R. T. E. B. Cooke, Esq., Scarborough: S. Holdsworth, M.D., Wakefield: S. Knaggs, Esq., Huddersfield. *Representatives in the General Council*: T. C. Allbutt, M.D.; W. F. Favell, Esq.; J. C. Hall, M.D.; J. D. Heaton, M.D.; S. Holdsworth, M.D.; A. Jackson, Esq.; W. Matterson, M.D.; R. H. Meade, Esq.; G. Shann, M.D.; T. P. Teale, Esq.; C. G. Wheelhouse, Esq.

Clinical Cases.—The PRESIDENT then said that, rather than deliver a formal address, he had chosen to exhibit and make remarks on a number of interesting clinical cases. The first were a series of cases of disease of the trochanteric bursa, simulating hip-joint disease. The disease, he said, consisted in suppurative of the bursa which intervenes between the trochanter major and the flat tendon of the gluteus maximus which is inserted into the fascia lata. In all there was absence of hip-joint disease, although the simulation had been such

that the point could not be decided until the muscles became relaxed under chloroform. The treatment consisted in the free opening of the diseased cavity, and relieving the bursa from pressure by division of the gluteal tendon. Mr. Teale also exhibited a series of successful rhinoplasty cases.

Simulated Hip-Disease.—Mr. MCGILL read a paper on two cases simulating hip-joint disease, cured by division of the fascial attachment of the gluteus maximus. In one case the disease had existed for two years; for eighteen months of this time, the patient, a boy aged 8, had been kept in bed. The disease, which was external to the joint, was cured by division of the gluteal tendon. The other patient was a girl, aged 9; her symptoms were neither so severe nor of such long standing. She was cured by the same treatment. Mr. McGill thought it was doubtful in these cases of inflammation external to the hip-joint, whether the lesion commenced in the bursa over the great trochanter or in the cellular tissue round the joint; in either case division of the tendon of the gluteus maximus, either directly or subcutaneously, was indicated.

Necrosis of Cranial Bones.—Mr. IKIN exhibited a case of extensive necrosis of the temporal and parietal bones in a staff-sergeant, aged 46. About two years ago, a small tumour appeared on the upper part of the head. It was opened, and little or no pus escaped; and, after a short time, the bone could be felt three or four inches in each direction round the wound. Thinking that the dead bone might eventually be detached, it had not been thought desirable to interfere. His general health was good, and he stated that he had not had syphilis.

Temporary Paralysis.—Mr. IKIN exhibited a case of temporary loss of vision, partial paralysis, etc., from lightning, in a staff-sergeant, aged 48. During a storm of thunder and lightning in January, he was in a room, and, immediately after a vivid flash, he felt "dazed", with violent pain down the left side of his head and arm, and said that he was blind of his left eye; during the night he became delirious, and had all the symptoms of an apoplectic seizure. Under treatment, he was better in a week or ten days, but was ailing for two months. The sight of his left eye was now as good as ever, but he had not entirely recovered the nervous shock.

Origin of Typhoid Fever.—Dr. BURNIE related two cases, the circumstances of which, he thought, tended to show the possibility of the origin of typhoid fever *de novo*.

Gall-stone.—Dr. MATTERSON related a case of gall-stone.

Dinner.—After the meeting, thirty-five members dined at the Great Northern Hotel.

SOUTH-WESTERN BRANCH: ANNUAL MEETING.

THE annual meeting of this Branch was held at the Royal Albert Hospital, Devonport, on Thursday, June 17th, at 1 P.M. About sixty members were present.

Dr. SPENCER THOMSON, the retiring president, in opening the business, thanked the members for the honour done him in electing him last year the president of so large and important a Branch of the British Medical Association. His duties had been very easy. His hope was to have held some meetings during the year, but he was informed that the members were too widely scattered over the two counties to permit of this being done. In such a town as Devonport, with Plymouth and Stonehouse near, he thought this desirable plan might be carried out. He concluded by introducing his successor, P. W. Swain, Esq., whose choice as president he regarded as an honour to the Branch.

President's Address.—Mr. SWAIN having taken the chair, delivered an address, which will be published in the JOURNAL.

On the motion of Mr. KERSWILL, seconded by Dr. THOMSON, the president was thanked for his able address.

Next Annual Meeting: Officers and Council.—It was agreed that the place of meeting next year be Exeter; and the following officers and Council were elected. *President-elect*: C. H. Roper, Esq. *Members of Council of Branch* (in place of those retiring): J. Bankart, M.B. (Exeter), A. Baker, M.D. (Dawlish), S. Budd, M.D. (Exeter), H. J. Edwards, Esq. (Teignmouth), E. M. Puddicombe, Esq. (Silverton), T. M. Ward, Esq. (Exmouth). *Representatives in the General Council*: W. Brown, Esq.; H. Harris, M.D.; R. W. P. Kerswill, Esq.; W. W. Macright, M.D.; T. Owen, Esq.; P. W. Swain, Esq.; Spencer Thomson, M.D. *Secretary*: J. Woodman, Esq.

Votes of Thanks.—The President, for his conduct in the chair, and the ex-President, for his year's services, were thanked.

Communications.—Mr. W. P. SWAIN exhibited five cases of excision of the hip, knee, and elbow joints, which had been performed in the Royal Albert Hospital by himself, Mr. C. Bulteel, and Mr. R. J. Laity.

2. Dr. SPENCER THOMSON read notes on the Rapid Relief of Neuralgic Pain.

3. Mr. C. BULTEEL related a case of Renal Calculus, causing Suppuration in the Right Lumbar Region, its Removal by Operation: Death from Pneumonia and Erysipelas.

4. Mr. E. H. EDLIN read a paper on the Slings of Stumps after Amputation.

In the room was exhibited anatomical preparations; Mr. W. Heath showed microscopes and spectroscopes, and Mr. F. Codd a spectroscope with subjects showing the difference in the spectral analyses of blood and colouring matters.

After the meeting several members inspected the hospital, in one of the rooms of which was a large display of Millikin's surgical instruments. Later on, a large party went on board H.M.S. *Cambridge*, inspected the fine museum of modern ordnance, and witnessed the explosion of sea-torpedoes.

Dinner.—In the evening the members, to the number of sixty-five, dined together at the Royal Hotel, where an excellent dinner was served. The president, Mr. P. W. Swain, in the chair, had the support of the mayors of Devonport (Mr. A. Norman), and of Plymouth (Mr. W. F. Moore), Mr. C. Bates, F.R.S., Mr. Risk (Port Admiral's secretary), Captain Carbell, R.N., Dr. Minter, R.N., and the Rev. R. Dunning.

CAMBRIDGESHIRE AND HUNTINGDONSHIRE, EAST ANGLIAN, AND SOUTH MIDLAND BRANCHES: ANNUAL MEETING.

THE annual meeting of the above Branches was held in the Anatomical Museum, Cambridge, on Friday, July 2nd, under the presidency of G. M. HUMPHRY, M.D., F.R.S. There was a large attendance of members of the three Branches.

Previously to the meeting, the members were entertained at luncheon by the President.

President's Address.—THE PRESIDENT, having been briefly introduced by the ex-President (J. C. Smith, Esq., of Yarmouth), gave an address, an abstract of which is published at page 35.

New Members.—The following new members were elected: J. Deighton, Esq., Cambridge; E. W. Parkinson, L.R.C.P., Melbourn; G. M. Sinclair, L.R.C.P., Ely; and George Roger Parker, Esq., Littleport. The above were elected members of the Association and of the Cambridgeshire and Huntingdonshire Branch; and J. B. Bromley, Esq., Castle Hedingham; Robert Lucas, Esq., Bottisham; and W. Armistead, M.B., Cambridge, were elected members of the Cambridge and Huntingdon Branch.

Next Place of Meeting.—Dr. DURRANT proposed, and Mr. SMITH seconded, that the place of meeting next year be at Lowestoft, under the presidency of Mr. Worthington.

Dr. BATEMAN proposed, and Mr. WILSON seconded, that the meeting next year be at Peterborough, in conjunction with the South Midland Branch.

Dr. BRADBURY proposed, and Dr. MEAD seconded, the following amendment: "That the next meeting be at Peterborough, if the South Midland members be agreeable; but, if they prefer to meet alone, the meeting of the Cambridge and Huntingdon and East Anglian Branches be held at Lowestoft."

The amendment was carried.

It was also resolved that the selection of President be left to the South Midland Branch, if Peterborough be the place of meeting.

Representatives in the General Council.—The following were re-elected for the Cambridge and Huntingdon Branch: D. B. Balding, Esq.; W. R. Grove, M.D.; G. M. Humphry, M.D., F.R.S.; J. B. Bradbury, M.D., Honorary Secretary, *ex officio*.

Legislation for Habitual Drunkards.—Mr. CADGE and Dr. PAGET brought before the meeting the subject of legislation for habitual drunkards, and petitions to the Home Secretary and both Houses of Parliament in favour of such legislation were numerous signed at the meeting.

Medical Advertising.—On the proposition of Mr. BALDING, seconded by Mr. WATSON, the following resolution was carried unanimously: "That, in the opinion of this meeting, the custom hitherto practised by some members of the profession, of continuously advertising medical works in the non-medical newspapers, is inconsistent with the dignity and honour of the profession, and should be at once discontinued."

Papers.—The following papers were read.

1. By W. Cadge, Esq.: On Sacculations of, and Stone in, the Bladder. The President took part in the discussion.

2. By W. Newman, M.D.: Three Cases of Operation for Cicatrix after Burn, mainly with reference to the Value of Antiseptic Dressings. Dr. Elliston took part in the discussion.

3. By H. F. Banham, M.A., M.B.: Case of Exophthalmic Goitre: with Remarks. There was a discussion on this paper by Mr. Foster, Dr. Bradbury, Dr. Eade, Dr. Paget, and Dr. Bateman.

4. By G. E. Paget, M.D., F.R.S.: Case of (Edema of the Glottis). Dr. Chevallier made some observations on the case.

5. By Peter Eade, M.D., Norwich: On the Treatment of Boils and Carbuncles. This paper was discussed by Mr. Read.

For want of time, a paper by Dr. Bateman was not read.

A. Mackay, M.B., of Stony Stratford, exhibited an interesting specimen of Fracture of the Skull of nineteen years' duration.

Dinner.—The dinner took place in the hall of St. Peter's College; the President in the Chair, and Dr. Bradbury acting as Vice-Chairman. Forty-three sat down to dinner, the Master of St. Peter's College and the Mayor of Cambridge being among the visitors.

NORTH WALES BRANCH: ANNUAL MEETING.

THE twenty-sixth annual meeting of this Branch was held at Rhyl, on Tuesday, June 15th. The retiring President, J. E. JONES, Esq., briefly introduced his successor, D. KENT JONES, Esq., who delivered an address, which is published at page 36.

Vote of Thanks to the President.—Dr. WILLIAMS (Wrexham) proposed a vote of thanks to the President for his interesting address. Dr. Kent Jones had nursed the North Wales Branch from its cradle, had watched over it, and had now launched it into a state of manhood; and while they all regretted that he had gone to reside in South Wales, they were greatly rejoiced to have him with them that day, as nobody could have been so appropriate a President under the circumstances, and by none could the annual address upon the history of the rise and progress of their Branch have been better delivered.—Dr. EVANS seconded the motion, which was unanimously passed, and acknowledged by the President.

Report of Council.—Dr. EYTON JONES, Honorary Secretary, read the annual report of the Council, who, whilst congratulating the members upon the increased efficiency of the Association, regretted that it did not yet embrace even one-half of the profession in the five counties of North Wales over which its operations and influence are supposed to extend, there being seventy members, and over one hundred who had not yet joined its ranks. In the course of the report, the Council called attention to the case of Dr. Rumsey, cordially recommending his case to the professional sympathy of the members.

The report was adopted, on the motion of Dr. HUGHES of Denbigh.

Next Annual Meeting: Officers and Council.—Bangor was fixed on as the place for holding the annual meeting in 1876. The following officers and Council were elected. *President-elect*: John Richards, L.K.Q.C.P., Bangor. *Secretary*: T. EYTON JONES, M.D., Wrexham. *Treasurer*: J. Lloyd Roberts, M.B., Denbigh. *Representatives in the General Council*: John Richards, L.K.Q.C.P., Bangor; L. Lodge, L.R.C.P.Ed., St. Asaph; W. Williams, M.D., Mold. *Representative on the Parliamentary Committee*: C. Williams, Esq., Northwich.

Papers, Cases, and Communications.—There was an interesting exhibition of new and improved microscopes and pathological specimens.

Mitral Constriction.—Dr. E. J. LLOYD of Denbigh showed a specimen of mitral constriction, and gave a history of the case. It was that of E. J., a youth aged 18, admitted to the Denbighshire Infirmary last autumn. He said that a fortnight before he was working in the garden with a spade, when he felt something give way in the region of his heart, and he fell on his head upon the ground. On examination, a loud mitral regurgitant murmur was heard at the apex. There were extreme anasarca of the whole body, and great difficulty of breathing, death ensuing in a fortnight afterwards. The peculiarity of the case was the extreme constriction in so short a time, and it was a question whether some mechanical lesion of the valve was the cause.

Morbid Specimens.—Dr. E. J. LLOYD showed on behalf of Dr. Turnour a head of a femur excised by him at the Children's Hospital, Rhyl; a specimen of colloid cancer of the foot, amputated by Dr. Turnour; the parts removed in the amputation first of the forearm, and next at the shoulder-joint, of a girl suffering from strumous and syphilitic disease of the hand and arm.

A Bead enclosed in a Worm.—Dr. J. WOLSTENHOLME of Rhyl described a case of a large intestinal worm in which was enclosed a cornelian bead. The patient was a child, who had, it was believed, swallowed some of the beads a year previously. It was supposed that the worm, when very small, had half crept through the bead, become fixed,

and continued to grow to its full size, when it was removed by medicine.

Ephidrosis Cruenta.—Dr. ROBERTS of Chester read a paper upon two cases (two brothers) of ephidrosis cruenta, or bloody sweat, treated successfully.

Lupus Exedens.—Dr. R. W. J. EVANS of Wrexham described a case of lupus exedens in a girl, the disease being hereditary.

Injury of the Head.—Mr. HAMILTON ROBERTS showed a piece of bone cut out of a quarryman's head by the fall of a piece of rock. The bone was found lying by his side. The man is alive, and works at the quarries.

Cases were also described by Dr. Davies of Cerrigydruidion, Dr. Llwllyn Lodge, and Dr. Wm. Jones of Ruabon.

Bone-setters.—Dr. EYTON JONES called attention to the case of two of the associates, Mr. Hamilton Roberts and Mr. Rees, who had been placed in a position so abhorrent to professional men, that they had resigned the appointments held by them at the Bethesda and Llanberis quarries. He instanced two cases in which amputation had been necessary owing to the treatment of a bone-setter, and urged that the thirty-sixth section of the Medical Act should be put in force by a Committee to be specially appointed for that purpose.

Mr. HAMILTON ROBERTS stated that it had been his intention to prosecute the bone-setter; but the Committee had promised that no bone-setter should come near his hospital during the time he was in charge.

On the motion of Dr. WILLIAMS (Wrexham), seconded by the PRESIDENT, a special Committee was appointed to take proceedings under the Act against bone-setters and quacks; the Committee to consist of Mr. Kent Jones; Dr. Eyton Jones; Dr. Griffith, Portmadoc; Dr. Lloyd Roberts, and Dr. John R. Hughes, Denbigh; and Mr. Williams, Mold.

On the motion of Dr. HUGHES of Denbigh, seconded by Dr. ROBT. DAVIES of Llanfairtalhaiarn, a resolution was passed expressing unqualified disapproval of the conduct of any medical practitioner in accepting the appointment of surgeon to a friendly society or hospital in conjunction with an unqualified person appointed as assistant bone-setter. The spirit of the meeting was greatly roused on this subject, it appearing that in Mr. Rees's case the appointment of his successor had actually been made; and in Mr. Hamilton Roberts's case, applications were advertised for his appointment.

The Dinner was held in the evening at the Belvoir Arms Hotel; the President, D. Kent Jones, Esq., in the Chair.

PUBLIC HEALTH AND POOR-LAW MEDICAL SERVICES.

ENTERIC FEVER AND MILK-SUPPLY.

DR. E. DUNCAN has prepared a careful report on the recent epidemic of enteric fever in Crosshill and Eaglesham. He commences by explaining, in terms which can be generally understood and appreciated by the non-professional portion of the public, how this disease may be spread; one of his main objects being to remove the general ignorance prevailing on this subject, in the hope that, by so doing, the public may exhibit more interest in sanitary questions. Dr. Duncan at the onset expresses the conviction that enteric fever does not arise *de novo*, and that the cases in which the disease does appear to originate simply from the inhalation of decomposing animal matter, are really instances in which the poison has been communicated by some article of food: a method of infection illustrated by his report. The outbreak in question commenced in the month of January last, in Crosshill, near Glasgow. It appeared to die out after the middle of February, but recurred with renewed violence after that date, about 280 cases occurring up to the end of March, in a population not exceeding 14,000. The inquiry into the means by which the disease was spread appears to have been conducted by a process of exclusion, the various conditions favouring such spread being considered separately. The nature of the soil is first dealt with, reference being made to Professor von Pettenkofer's views on this subject; but consideration of this subject led the writer to conclude that the soil had no connection either with the origin or the spread of the fever. The prevailing atmospheric conditions are next briefly adverted to, and also set aside. The various conditions of sewerage and drainage are dealt with at some length; and, although defects were found, as might have been expected, yet, in many of the houses where the disease appeared, some of those defects which are so much associated with the spread of this dis-

ease were absent, and in other houses, which were not affected, grave defects were discovered. In short, it is evident from Dr. Duncan's description, that the epidemic was not caused by defects of sewerage, although it was probably to some extent propagated by them. With regard to the water-supply, it does not appear to have been at fault; and it is specially pointed out by Dr. Duncan that, although the water-supply is an intermittent one, yet, since the water-closets are in every case supplied by means of a cistern, such pollution of water as arose at Caius College and at Lewes cannot have taken place. The pollution to which water may be subjected in the mains is, however, by no means limited to suction of foul matters from closet-pans in the manner in which it occurred at the two places named. Foul and even excrementitious matters can be drawn into the mains from the soil which they traverse, wherever there is a cracked or faulty pipe, and the supply is an intermittent one; the filth being taken up by the water, or deposited in the house-cistern; and we have but little doubt that some of the deposit in our London cisterns reaches the mains in that way. It does not, however, appear that any such mishap caused the epidemic under discussion, there being an absence of any evidence implicating the water-supply. Finally, Dr. Duncan considers the question of the milk-supply. This subject is examined at considerable length, and the result of the investigation tends in the strongest manner to show that the disease was spread through the agency of this article of diet. Enteric fever had prevailed for some time in a certain district whence a considerable portion of the milk-supply was derived, and it had attacked the families of farmers whose milk was conveyed to the affected locality. Indeed, out of a total of 262 families receiving milk from what we may now term the suspected dairies, 94 were attacked with enteric fever; whereas, out of 242 families receiving other milk-supplies, only 18 were affected, and of these 18 families it was ascertained, on subsequent inquiry, that 10 got occasional supplies from the suspected dairies. With regard to the remainder of these exceptional cases, it is only a matter of surprise that the number was so small, in view of the large area over which the epidemic was spread.

With regard to the method in which the milk of the various farmers became infected, we cannot now follow Dr. Duncan throughout the many details with which he deals; but one example is well worth recording. In November last, enteric fever attacked the family of a dairyman at Eaglesham. On his premises was a dung-stead which partly drained towards and into two wells, the contents of which were used for the dairy and farm purposes, and which were also drunk by persons residing in a back row. In December, the residents of this row were attacked with enteric fever, the stools of as many as twenty patients being thrown into adjoining privies. Constant soakage must have taken place from the privies towards and into a streamlet close by; but just at this date the privy-contents were frozen up, and the soakage was thus stayed for five weeks, at the end of which time a thaw ensued, rain came on, and the accumulated contents of the now specifically diseased privies soaked and drained towards the stream. This water-course, which also receives some of the drainage from the dung-stead above referred to, formed the principal source of water for another dairy-farm; and, following on this thaw, both the farmer's family and the persons residing within the area of the distribution of his milk became affected with enteric fever. This indicates very clearly the wisdom and propriety of a sanitary survey of farms from which a town milk-supply is drawn: such, for instance, as is regularly instituted by the Aylesbury Dairy Company for all its farms.

The whole history of this epidemic has been carefully worked out by Dr. Duncan, and a perusal of his report will repay those who are interested in such investigations. His views concerning the spread of this outbreak are also confirmed by the opinion of Dr. Littlejohn, who promises a further report on the subject, but who has already, as the result of an inquiry made on behalf of the Board of Supervision, expressed his conviction that the importation of the disease into the affected district had been conclusively traced to the use of an infected milk-supply.

MILITARY AND NAVAL MEDICAL SERVICES.

MALTA.—Several changes have recently taken place among the medical officers of this station. Surgeon Dunstan has been transferred home on completion of five years' foreign service. Surgeon G. W. L'Estrange has resigned his commission rather than continue to serve in the "military hothouse of the Mediterranean". Surgeons Lyons and Wood have been invalided; and, as the duties of all these officers are performed by those still remaining, a reinforcement of the staff is expected, else it will be a case of "all work and no play" more than ever, if possible. Surgeon-Major Crerar is head of the department

in the absence on leave of Surgeon-General Ker James, C.B. After an unusually cold winter, the hot season is entering in with great rapidity, and the leave roster is in great request.

FLEET-SURGEON S. S. D. WELLS has received the appointment of Deputy Inspector-General of Hospitals and Fleets. The delay in filling up the appointment is said to have been caused by the anxiety of the authorities to decide fairly claims and services of the various officers who were qualified for the appointment.

UNDERMANNED.—We take the following from our contemporary, the *Army and Navy Gazette*. "Dr. Nelson is sick and unable to serve, and Dr. Mackay is engaged at the Admiralty; so, if a casualty should occur at any of the foreign or home hospitals, there would not be a single deputy inspector (excepting Dr. Wells, who is still doing duty at Haubowline Hospital) available, as all the others are employed. Surely Mr. Ward Hunt has not taken this matter into consideration, or can he have been baffled by the Treasury? It would seem that the medical, like all the other lists of the navy, is in an unsatisfactory condition."

MEDICO-PARLIAMENTARY.

HOUSE OF LORDS.—Friday, July 2nd.

The Rivers Pollution Bill passed through committee.

Monday, July 5th.

Sale of Food and Drugs Bill.—The report of amendments on this Bill was received on the question that the report be adopted.—Lord EGERTON of TATTON moved the omission of the word "knowingly" in the 3rd and 4th clauses.—Lord ABERDARE supported the amendment, and said that, as the retailer and his wife could give evidence as to the state in which they had received the goods, no hardship would be done to the retailer by the omission of the word.—The Duke of RICHMOND said that since the Bill passed through committee he had received a vast number of communications, urging upon him the objections which had been raised by the noble lords. He should, on the motion for the third reading of the Bill, move the omission of the word "knowingly" and the insertion of such other words as might be necessary to meet the objections which had been urged.—Lord PENZANCE moved the omission from clause 5 of words which excepted from punishment for adulteration persons who sold articles containing harmless foreign matter, mixed with them for the purpose of making them portable or palatable, of preserving them, or of improving their appearance, provided such matter was not used for the purpose of concealing the inferior quality of the article.—The Duke of RICHMOND observed that an article might be "portable" without requiring a handle—as, for instance, ether. Then, as to the mixing of articles, he did not suppose it would be possible to get lard without salt. However, he would endeavour before the third reading to give effect to the noble lord's views.—Earl GRANVILLE thought the words might be omitted now and the amendment introduced afterwards.—The LORD CHANCELLOR said that it was particularly important that an amendment should not be lightly made, because, if he mistook not, the words in question were introduced into the Bill in the other House of Parliament.—Earl FORTESCUE called attention to the danger which might arise from the dilution of drugs even with harmless ingredients, and urged the advantage of having drugs of identical strength throughout the United Kingdom.—Lord PENZANCE consented to withdraw his amendment.—The Marquis of SALISBURY remarked that if the clause were made too stringent it would be unworkable.—Lord PENZANCE said absolute chemical purity was not required. A number of articles of food were commonly prepared in a particular way, and, if the purchaser obtained them of the nature, substance, and quality he demanded, he had no reason to complain.—The amendment was then withdrawn.—An amendment, proposed by Lord REDESDALE, to the effect that it should be stated on each article sold what was mixed with it, if anything, and in what quantity, was negatived, after some conversation, and the report was agreed to.

Public Health Bill.—The House went into committee on this Bill.—On the 110th clause, relating to various trades, the Duke of NORTHUMBERLAND moved to include in it "manufacturing, smelting, or burning of ore, or minerals giving off sulphuretted hydrogen, sulphurous acids, or ammoniacal gases".—The Duke of RICHMOND opposed the amendment, which was rejected by 54 against 33.—The remainder of the clauses passed through the committee with verbal amendments, and, the schedules having been agreed to, the Bill, with amendments, was reported to the House.

HOUSE OF COMMONS.—Friday, July 2nd.

Physical Training for the Young.—Mr. BUTLER-JOHNSTONE called attention to the advisability of introducing physical training into our public elementary schools. He quoted statistics and scientific authorities to prove the advantageous effect of such training in improving the physique and health of the people.

MEDICAL NEWS.

APOTHECARIES' HALL.—The following gentlemen passed their examination in the science and practice of medicine, and received certificates to practise, on Thursday, July 1st, 1875.

Collins, Henry Abdy, Bayswater
O'Callaghan, Kenneth Macdonald, Blackrock, co. Cork
Rees, Alfred, Maesteg, Glamorganshire
Saunders, Edward Argent, Haverfordwest, South Wales

The following gentlemen also on the same day passed their primary professional examination.

Jakins, Percy Septimus, St. Mary's Hospital
Skerman, Sidney, King's College

MEDICAL VACANCIES.

The following vacancies are announced:—

ADDERBURY, Oxon.—Medical Officer for the Districts of Adderbury East, Adderbury West, and Milton. Salary, £60 per annum. Applications on or before the 20th instant.

AMERSHAM UNION.—Medical Officer and Public Vaccinator for the Workhouse and the Amersham District. Salary, £50 and £63 respectively. Applications on or before 19th instant.

ARMY MEDICAL DEPARTMENT.—Surgeons. Examination on August 9th and following days.

BOSTON UNION.—Medical Officer for the Boston District and the Workhouse.

BURY UNION.—Medical Officer for the Radcliffe District.

CARNARVONSHIRE and ANGLESEY INFIRMARY.—House-Surgeon. Salary, £80 per annum, with board and lodging. Applications on or before the 20th instant.

CHORLTON UNION.—Assistant Medical Officer at the Workhouse.

DENTAL HOSPITAL OF LONDON, Leicester Square.—Assistant Dental Surgeon. Applications on or before the 12th instant.

EAST LONDON HOSPITAL FOR CHILDREN and DISPENSARY FOR WOMEN, Ratcliff Cross.—Resident Medical Officer. Salary, £60 per annum, with board, lodging, and washing. Applications on or before the 15th instant.

HAY UNION.—Medical Officer for the Workhouse. Salary, £55 per annum.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street.—Surgeon-Dentist. Applications on or before the 15th instant.

INDIAN MEDICAL SERVICE.—Ten Surgeons. Examination on August 9th and following days.

KILBURN DISPENSARY.—Assistant Resident Medical Officer. Salary, £80 per annum, with apartments, coals, gas, and attendance. Applications on or before the 10th instant.

LEIGHTON BUZZARD UNION.—Medical Officer for the Upper District.

LIVERPOOL NORTHERN HOSPITAL.—House-Surgeon, House-Physician, and Assistant House-Surgeon. Salaries, £100, £80, and £50 respectively, with board and residence. Applications on or before July 10th.

LIVERPOOL ROYAL INFIRMARY SCHOOL OF MEDICINE.—Demonstrator of Anatomy. Salary, £100 per annum, and other emoluments. Applications on or before the 31st instant.

MARLBOROUGH UNION.—Medical Officer for the Second District. Salary, £80 per annum, and fees. Applications on or before July 31st.

METROPOLITAN FREE HOSPITAL, Devonshire Square.—Assistant House-Surgeon.

POPLAR UNION.—Medical Officer for the Western District.

ROYAL CORNWALL INFIRMARY.—House-Surgeon, Secretary, and Dispenser. Salary to commence at £120 per annum. Applications on or before the 31st instant.

ROYAL SURREY COUNTY HOSPITAL.—House-Surgeon. Salary, £75 per annum, with board, residence, and washing. Applications on or before July 31st.

VICTORIA HOSPITAL FOR SICK CHILDREN, Chelsea.—Assistant Physician. Applications on or before the 13th instant.

WORKSOP DISPENSARY.—Resident Surgeon. Salary, £100 per annum, with furnished apartments, coals, gas, and attendance. Applications on or before the 30th instant.

MEDICAL APPOINTMENTS.

Names marked with an asterisk are those of Members of the Association.

COONOLD, Charles S. W., M.D., appointed Assistant Medical Officer to the Metropolitan Asylum, Leavesden, Herts.

*WILSON, John S., M.R.C.S., L.R.C.P. Ed., appointed Medical Superintendent to the Greenock Amalgamated Friendly Society Medical Association.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths, is 3s. 6d., which should be forwarded in stamps with the communication.

BIRTH.

KERR.—At 42, Grove Road, Regent's Park, on July 2nd, the wife of *Norman S. Kerr, M.D., F.L.S., of a daughter.

DEATH.

CLARKE, James Fernandez, M.R.C.S. Eng., in his 63rd year, at 23, Gerrard Street, Soho, on July 6th.

OPERATION DAYS AT THE HOSPITALS.

MONDAY Metropolitan Free, 2 P.M.—St. Mark's, 9 A.M. and 2 P.M.—Royal London Ophthalmic, 11 A.M.—Royal Westminster Ophthalmic, 1.30 P.M.

TUESDAY Guy's, 1.30 P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.—Royal Westminster Ophthalmic, 1.30 P.M.—West London, 3 P.M.—National Orthopaedic, 2 P.M.

WEDNESDAY .. St. Bartholomew's, 1.30 P.M.—St. Mary's, 1.30 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—St. Thomas's, 1.30 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—Great Northern, 2 P.M.—Samaritan Free Hospital for Women and Children, 2.30 P.M.—Cancer Hospital, Brompton, 3 P.M.—King's College, 2 P.M.—Royal Westminster Ophthalmic, 1.30 P.M.

THURSDAY St. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Royal Orthopaedic, 2 P.M.—Royal London Ophthalmic, 11 A.M.—Hospital for Diseases of the Throat, 2 P.M.—Royal Westminster Ophthalmic, 1.30 P.M.—Hospital for Women, 2 P.M.

FRIDAY Royal Westminster Ophthalmic, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.—Central London Ophthalmic, 2 P.M.—Royal South London Ophthalmic, 2 P.M.

SATURDAY St. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Royal London Ophthalmic, 11 A.M.—East London Hospital for Children, 2 P.M.—Royal Westminster Ophthalmic, 1.30 P.M.—St. Thomas's, 9.30 A.M.—Royal Free, 9 A.M. and 2 P.M.

NOTICES TO CORRESPONDENTS.

CORRESPONDENTS not answered, are requested to look to the Notices to Correspondents of the following week.

PUBLIC HEALTH DEPARTMENT.—We shall be much obliged to Medical Officers of Health if they will, in forwarding their Annual and other Reports, favour us with *Duplicate Copies*.

AUTHORS desiring reprints of their articles published in the JOURNAL, are requested to communicate beforehand with the printer, Mr. T. Richards, 37, Great Queen Street, W.C.

CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.

WE CANNOT UNDERTAKE TO RETURN MANUSCRIPTS NOT USED.

COMMUNICATIONS respecting editorial matters, should be addressed to the Editor; those concerning business matters, non-delivery of the JOURNAL, etc., should be addressed to the General Manager, at the Office, 36, Great Queen Street, W.C.

RAILWAY FARES TO EOINBURGH.

IN reply to several correspondents, we may state that every effort has been made to induce the railway companies to issue return tickets at reduced fares; but after full and courteous consideration of the reasons urged, the companies have (as heretofore) declined to make any reduction; deciding that, "with every desire to deal liberally with the medical profession, there is, in face of the recent reduction in fares and extension of time for return-tickets, no case for granting the special facilities sought".

C. W.—Dr. William Squire's book on the *Period of Infection in Epidemic Disease* is published by Messrs. Churchill, New Burlington Street. Price Half-a-crown.

SNAKE-POISONING IN AUSTRALIA.

IN a letter to the *Standard*, an old resident in Australia makes a vigorous defence of Professor Halford's treatment of snake-bites, by the intravenous injection of ammonia, against the attack made upon it by the commission appointed by the Government to test it experimentally. The members of the commission reported that the result of their investigation was, that the intravenous injection of ammonia, instead of being of the slightest benefit, actually accelerated death; and their report is naturally looked upon with great surprise and complete incredulity by many Australians, the writer in the *Standard* included. As an old resident, he is considerably fascinated by the subject of snakes, as he may any day tread on one, and require the treatment, in which he still puts implicit confidence, notwithstanding the Calcutta gentlemen and their dogs; but his faith in this treatment is no stronger, and the reasons for believing it no better, than those of the Hindoos for their trust in the antidotal power of certain plants, snake-stones, and snakes' gall. Although residents in Australia may disbelieve in these remedies, yet they are as confidently trusted elsewhere as even the ammonia treatment has been, until, like it, they are carefully put to the test, and shown by exact experiments to be valueless.

VACCINATION.—During the small-pox epidemic of 1870, I vaccinated two children, of one family, and on the eighth day following, the scars had disappeared; but three weeks later there was a full crop of vesicles in each child. Five weeks ago, I vaccinated a child in the right arm, without apparent effect; a week later, I vaccinated the child in the left arm with the same result; but I have just seen the child with a well developed vesicle, the result of the first operation.—T. G.

SALE OF DEGREES.

A CORRESPONDENT writes to us:—In the *Saturday Review* for June 19th, there is an advertisement, which states that gentlemen requiring degrees, etc., can obtain them by writing to the advertiser. Curious to know what it was about, I wrote for particulars, and received the enclosed letter. Cannot such a thing be put a stop to?

"Jersey, England, 23rd June, 1875.

"Dear Sir,—I shall be happy to procure you the M.D. degree from the American University of Philadelphia. The total cost of a promotion *in absentia* is £20, inclusive of a handsome diploma, with certificate of registration.

"Awaiting your reply.

"I remain, dear sir, yours faithfully,

"P. F. A. VAN DER VYVER."

CORRESPONDENTS are particularly requested by the Editor to observe that communications relating to Advertisements, changes of address, and other business matters, should be addressed to Mr. Francis Fowke, General Secretary and Manager, at the Journal Office, 36, Great Queen Street, W.C., and not to the Editor.

UNQUALIFIED ASSISTANTS.

SIR,—Will you kindly allow me, through your valuable JOURNAL, to make a few remarks on the subject at present occupying the attention of the Medical Defence Association in regard to unqualified practice? A letter appeared in the JOURNAL of the 29th ultimo from the pen of an unqualified assistant, now allowed to practise in Wales; and as it is rather invidious, and couched in sophistical phraseology, with an attempt at a display of erudition, it calls for a few remarks from one of the impeached party. If such be the individuals who uphold the much-to-be deplored practice of employing unqualified assistants, and if such are to speak for the general body of educated English gentlemen without diplomas, who must necessarily visit and prescribe, at best, under a fictitious garb, I must say they are weakly represented in the person of your correspondent. Unqualified assistants, as a rule, are those medical students who have spent three or four years at a recognised place of medical education, have had experience in hospital practice, by acting as dressers, clinical clerks, or resident pupils; not those who have never entered college, never attended classes nor hospital practice, merely acquiring an acquaintance with drugs by acting in a menial capacity with practitioners who keep a drug-store and open surgery. The former class may in some cases be useful to their employers; but the profession must be seriously degenerating if the uneducated, coarcted apprentice in the drug-store of a medical man, entrusted with a few cases occasionally, and in time furnished with a testimonial and reference, eventually becomes more successful in practice than the educated gentleman who has learned the science by progressive gradation, and is possessed of a license or degree. Medicine being a science, and undoubtedly technical in its acquisition, its professors are responsible for its open practice. If medical qualifications are so easily obtained, surely there ought not to be such a class of assistants as "gentlemen who have had the advantage of a training under the eye of a general practitioner with extensive practice, and a few lessons at hospital and collegiate studies"; but with these very necessary adjuncts, they ought to be able to conjoin a knowledge of human anatomy, physiology, and pathology, necessarily implied in the possession of a medical qualification. The uneducated unqualified man must inevitably descend to "mean subterfuges, contemptible quackery, and a system of pandering to the ignorant", which bring discredit on his principal, and often fatal results to the poorer class of patients entrusted to his care. I have known many fatal deeds accruing from the unskillful manipulation of an unqualified assistant, who passed in society—at least among the poorer classes—as if qualified. With a daring presumption, and without the slightest acquaintance with the principles of obstetrical or simple anatomy, he undertook the management of critical obstetrical cases, told his principal he had achieved wonders, who praised his deeds of "fearlessness"; but very often this contemptible quackery and pandering to his ignorance brought about disastrous events. So long as this class of practitioners are allowed to wield instruments and drugs—attended with some degree of danger even in the hands of the more educated—not confining themselves to minor operations and simple cases, but with daring presumption and unblushing audacity usurping the place of those in the position to which most of them aspire, legislation must be denominated lax; the medical profession will present various shades in quackery; appropriate means will not be taken for the alleviation of the ailments of the poorer classes; and medical men will be thought mercenary who employ quacks and ignoramuses for the sake of the difference in salary, instead of those who are on a footing with themselves by being in the professional ranks and recognised as competent to deal with critical emergencies.—I am, sir, your obedient servant,

South Wales, June 3rd, 1875.

VIGILANS.

ESPRIT DE CORPS.—Dr. Ricord, a short time ago, had a corn extracted, and gave the operator twenty francs, which was declined, on the ground that "between professionals" no fees were taken.

ROYAL COLLEGE OF SURGEONS.

THE largest batch of students who have complied with the full educational curriculum required of candidates for the license in dental surgery of the College, underwent the written portion of their examination on Tuesday, June 2nd, when thirty gentlemen presented themselves, to whom the following questions were submitted.

Dental Anatomy and Physiology.—1. State the different stages of growth in the development of a canine tooth and a molar tooth, from the commencement of the calcification of the cusp or cusps, to the completion of the fang or fangs. 2. From which of the embryonic oral structures is the enamel developed? What is the form of the enamel prisms? Describe their arrangement on the crown of a molar tooth; and explain the advantages of such an arrangement. 3. What are the soft structures connected with the permanent teeth after their complete development? Enumerate the histological elements which enter into their composition; and state how they are arranged.

Dental Pathology and Surgery.—1. Give examples of reflex disturbance in relation to irritation connected with the teeth during their eruption; and explain fully the pathology of reflex nervous action. 2. Enumerate and briefly describe the several casualties that may arise in tooth-extraction. 3. Describe the different modes of treating inflamed and exposed tooth-pulp.

Candidates were required to answer at least two out of the three questions, both on dental anatomy and physiology, and on dental surgery. The examiners were Messrs. Cartwright, G. A. Ibbetson, and S. J. Salter.

The following questions were also put.

Anatomy and Physiology.—1. Give the dissection necessary to display the pterygoid muscles. Describe their attachments and action; and state whence they receive their vascular and nervous supply. 2. Describe the structure, relations, and functions of the soft palate.

Pathology and Surgery.—1. Describe the different methods of excising a portion of the tonsil; and state under what circumstances this operation may be required. 2. Mention the several causes, and describe the symptoms and treatment, of abscess of the antrum.

Candidates were required to answer at least one of the two questions both on anatomy and physiology, and on pathology and surgery. The examiners were—Mr. H. S. Hancock, Chairman; Mr. Le Gros Clark, President of the College; and Mr. W. Savory.

The oral examinations took place on Tuesday, June 20th.

NOTICES of Births, Deaths, Marriages, and Appointments, intended for insertion in the BRITISH MEDICAL JOURNAL, should arrive at the Office not later than 10 A.M. on Thursday.

FLATULENT DYSPEPSIA.

SIR.—I presume A Member is not at present using either tea or coffee, nor tobacco or alcohol, in any form. I venture to recommend him to try a diet somewhat as follows:—Breakfast: Two or three slices of dry stale bread, with about six ounces of fresh milk, thoroughly well iced. Lunch: The same, or six ounces of beef-tea (made from fresh beef, or Brand's essence), instead of the milk—the beef-tea to be well iced. Dinner: A slice or two of underdone roast or broiled meat, or else a moderate allowance of fish, with bread only, and half a tumblerful of water, also well iced. Evening meal, a repetition of the morning; and, if hungry at bed-time, a few biscuits, with iced water or milk. If thirsty through the day, a wineglassful of iced water. I have known a month's strict adherence to a diet of this class signal benefit cases resembling that of A Member, and I can assure our friend that he will not starve upon it. Has his urine been thoroughly examined by a competent hand?—I am, etc.,
LIVERPOOL, July 4th, 1875. THOS. CARSON.

SIR.—In reply to your correspondent, who seeks advice with reference to the above mentioned ailment, allow me to suggest that he should give a fair trial to the following method of treatment. In addition to strict attention to obvious hygienic rules, such as regularity of meals and daily exercise, amounting to actual perspiration, in the open air, let him take from time to time a dose of the following mixture. R. Magnesie ponderos. ℥j; sodie bicarb. ℥vj; antimoni tartarici ℥v; antimoni tartarati gr. iiss. Misce; fiat pulvis, cujus sumatur, pro re nata, ℥j ex aqua hora somni. By acting upon both the offending organs simultaneously, this draught is frequently productive of the most beneficial effects.—I am, sir, your obedient servant,
C. O.

SIR.—If A Member, who suffers from flatulent dyspepsia, have not already attended to the following suggestions, I can assure him they are of considerable practical value. In the first place, it is necessary to maintain for some time a lax condition of the bowels. In order to get rid of the tendency to the accumulation of gas in the upper part of the intestinal canal, it is absolutely necessary that not even a temporary block should be allowed to exist in the lower regions; hence the value in such cases of a mild Carlsbad course, which secures two or three loose evacuations before any food is taken. Even in cases of organic constriction it often proves of the greatest service. I have known some patients with whom no aperient produced so much relief as castor-oil—the comfort of each day depending on a desertspoonful of this medicine, taken in the early morning. The Hunyadi water also answers well, and is often efficient in small quantities. No breakfast should be taken until the bowels have been freely relieved.

With regard to food and drink—tea, coffee, cocoa, and all hot and sweet beverages must be entirely banished from the dietary. In such conditions, tea or coffee will almost immediately disturb the heart's action. Malt and sherry are also under the ban. Sound claret and water, milk mixed with some alkaline effervescent water, and cold whisky and water, are the safest beverages; but much fluid of any kind is hurtful. Oatmeal porridge is still better; the Revalenta Arabica is an excellent food. Animal food should be restricted to roast or boiled mutton, the lighter kinds of fish, and a little broiled fat bacon. Fruit, jellies, and marmalade, should take the place of butter.

Of drugs, I have found great use in a pill of creasote, carbonate of magnesia, and extract of hop, taken immediately after every meal; and when this has failed, I have seen excellent results from a few grains of ox-gall made into a pill with powdered rhubarb, and taken after breakfast and dinner.

If, however, A Member wish for something more than temporary relief, and desire to avoid the necessity of constant dosing, he must, if he can, cast off all anxiety of mind, and walk from ten to twenty miles a day, for three weeks, or a month, in the finest air accessible. If he cannot get to the glaciers of Switzerland or the moors of Scotland, there are the Surrey hills within an hour of London.—I am, sir, your obedient servant,
HERTFORD STREET, MAY FAIR, July 5th, 1875. I. BURNEY YEO.

SIR.—A Member and Sufferer solicits advice (*vide* BRITISH MEDICAL JOURNAL, July 3rd, 1875). He should take for breakfast half a pint of hot milk, flavoured with tea, one or two scalded eggs, bread and butter, with from three to five grains of Boudault's pepsin. Dinner, at two o'clock, mutton chiefly, and nothing absolutely to drink with it, (but better avoided) a tablespoonful of brandy in hot water; no vegetables. Drink—pure water between meals. Supper—brown bread, as little as possible; a tablespoonful of whisky or brandy in hot water; no malt liquor; no wine of any kind.—I am, etc.,
P.S.—Please report progress. A FELLOW SUFFERER.

SIR.—If A Member have not tried nitrate of silver for his gastric trouble, I would recommend him to do so. I have found great benefit in more than one chronic case similar to his. Let it be used in the form of a weak watery solution (about one grain to the ounce), and a few drops be taken before meals. It has a woody-ferrous tonic action on the disordered gastric and intestinal nerves.—I am, etc., N.

SIR.—Having formerly been much troubled with this affection, I gladly respond to the appeal of A Member, and offer a few suggestions, in the hope that he may find them of some service. Much that I would venture to recommend might be briefly expressed in the words—diet and quiet. It is an axiom, that organs whose functions are deranged should have rest; and the quieter a dyspeptic is, within certain limits, the less demand will there be for the assimilation of nutriment; and the more digestible the food, the easier will be the work for the digestive organs. A well defined plan of diet is therefore strictly necessary. I would say, let the breakfast be as light as possible, consisting of nothing but bread, toasted or not, and a little butter; an early dinner of mutton or beef, with bread and potatoes; tea as breakfast; and supper of meat and bread. Coffee and tea should not be taken strong; and I would recommend a cup of Cadbury's extract, or some similar preparation of cocoa, without milk or sugar, as a beverage for dinner or supper. When properly prepared, the flavour is very delicate, but, like claret, may require a few days to become used to it. A moderate amount of exercise is of course necessary, and the best is that obtained by quiet walking; the jarring of riding is objectionable. Should there be excess of urates, or of uric acid, a little nitrate of potash should be taken early in the morning, and an occasional compound rhubarb and blue pill at night. Tepid bathing is useful in the evening, but I am not so sure about the use of cold baths in the morning.

Lastly, avoid all excitement and harass, and do not be in a hurry to change the treatment as the symptoms improve, should they fortunately do so.
July 6th, 1875. I am yours truly, W. L.

NOTICE TO ADVERTISERS.—Advertisements for insertion in the BRITISH MEDICAL JOURNAL, should be forwarded direct to the Publishing Office, 36, Great Queen Street, W.C., addressed to Mr. FOWKE, not later than Thursday, twelve o'clock.

POCKET TEMPERATURE CHARTS.—We have received a specimen of Pocket Temperature Charts, prepared for the Practitioners' Visiting List, and published by Messrs. Salt and Son of Birmingham, which will, we think, be found very useful. The charts give both the Centigrade and the Fahrenheit scales, and have a novel feature in dotted lines shewing the limits of variation in temperature compatible with health. The charts also give space for notes on urine, pulse, and respiration; and on the back of each is a form for short notes of the case. These charts have been prepared at the suggestion of Dr. Foster of Birmingham. They are published in books of fifty; and are perforated, so as to be easily removed for use.

MULTIPLE TUMOURS.

JUDGING from Dr. Cross's description of the case named under the above heading, it is an instance of true leprosy—the tubercular form in its first stage. If this be so, the patient has probably been resident in a foreign country at some time in her life; cases of true leprosy in persons who have never left England being rare; possibly supposed to be the result of not being always recognised. Brighton, June 1875. W. E. C. NORRIS, F.R.C.S.

CHEMISTRY (Reading) can, no doubt, obtain a copy of the analysis on writing to the office of the importers.

L.R.C.P.—The observations of Dr. Theodore Williams on the Temperature in Phthisis were read to the Royal Medical and Chirurgical Society, January 26th, 1875, and will appear in the next volume of the *Transactions*. An abstract of the paper and of the discussion on it appeared in the BRITISH MEDICAL JOURNAL for February 6th of this year.

We are indebted to correspondents for the following periodicals, containing news, reports, and other matters of medical interest:—The Bristol Daily Post; The Daily Bristol Times and Mirror; The Derby and Chesterfield Reporter; The Lincolnshire Herald; The Glasgow Herald; The Sunderland Daily Echo; The Carnarvon and Denbigh Herald; The Manchester Guardian; The European Review; The Hackney and Kingsland Gazette; The Worcestershire Chronicle; The Birmingham Daily Post; The Brighton Daily News; The Sussex Daily News; The Glasgow Herald; The Cork Examiner; The Scotsman; The Cork Daily Herald; The Southampton Times and Hampshire Express; The Hampshire Advertiser; The Birmingham Morning News; and etc.

COMMUNICATIONS, LETTERS, &c., have been received from:—

Dr. Robert Barnes, London; Dr. G. M. Humphry, Cambridge; Mr. H. Lee, London; Mr. I. Harrinson, Reading; Dr. George Johnson, London; Mr. P. W. Swain, Devonport; Mr. G. F. Hodgson, Brighton; Dr. Edis, London; An Old Member; Mr. W. Fairlie Clarke, London; M.D.; Dr. Finlayson, Glasgow; Mr. Gordon, Edinburgh; Dr. A. Smart, Edinburgh; Dr. Anderson, Selkirk; Dr. Harris, Redruth; Dr. Constable, Leuchars; Dr. A. Fraser, Aberdeen; Mr. W. Brown, Edinburgh; Mr. A. Lyall, Leven; Dr. J. Watson, Manchester; Mr. H. Thompson, Sevenoaks; Dr. J. Sawyer, Birmingham; Mr. J. Westmorland, Manchester; Mr. R. S. Fowler, Bath; Mr. E. Bevan, London; Mr. Sandham, Cork; Dr. D. Stewart, Liss; Mr. J. Woodman, Exeter; Mr. Jackson, Wolverhampton; Dr. W. A. Finlay, Edinburgh; Mr. J. W. Orton, Aldershot; Dr. Braddury, Cambridge; Mr. C. A. Bush, Chippenham; Dr. Caton, Liverpool; Mr. R. C. Gardner, Painswick; Mr. Berkeley Hill, London; Mr. H. Moore, Milnthorpe; Dr. Althaus, London; Dr. J. B. Tulke, Edinburgh; Mr. Griffiths, Hincley; Dr. J. W. Cousins, Southsea; Mr. H. Brown, Northallerton; Mr. A. Wood, Kirby-Moorside; Dr. Lambart, Liverpool; Mr. Cuffe, Horncastle; Dr. W. J. Fleetwood, Chester; Mr. J. Farrar, Bradford; Dr. W. Taylor, Edinburgh; Mr. G. R. coveries to which I have alluded, and all their bearings on the relief of human suffering, been but for the frog? Now we have recourse to the merciful anaesthetics; and I trust none of our researches will be made but under their influence, and even then no vivisection should be done except for the establishment of facts, and not for the mere curiosity of ourselves in verifying what others have well established.

Few subjects have undergone greater modification than the treatment of stone. The late Mr. Cornelius Tripe, to whom I was bound, was singularly successful, and I saw him operate several times. When I look at the small, handy, exquisitely made lithotrite of the present time, I smile to think of the apparatus of Baron Heurteloup, who came to exhibit it to us at Guy's Hospital. A heavy table, with all sorts of traps, kept the patient immovable. Some sort of instrument was passed into the bladder to secure the stone, and then screwed into a vice; lastly, the stone was attacked with a hammer and steel rod. I cannot remember how successful the operation was, nor did I see more than one performance.

Certainly wonderful progress has been made in the general treatment of women. In my early recollections there occur to me a very large number of cases in which young women were consigned to the supine position for indefinite periods, sometimes extending over years, under the impression that they had spine-disease. You seldom find the spinal column of a young girl absolutely perpendicular; and the practice was, if the slightest curvature were observed, or if any tenderness were produced by passing the finger over her spinous processes, down she went on her back, or an inclined plane. No doubt most of these cases were uterine or hysterical, or both. The effects of uterine displacement in unmarried young women are fully recognised now. We ourselves have known most serious loss of power in the lower extremities result from this cause, which disappeared entirely when the uterus was rectified. But I am inclined to suspect the existence of a *nimia diligentia medicandi* in these displacement cases. This, perhaps, applies more especially to the specialists of the metropolis than to us provincial surgeons. Of course, devoting their whole attention to these cases, they obtain a singular facility in discovering them. I wish I could congratulate them and ourselves on greater success in curing them. I find a large number of patients returning little the better for their sojourn in the metropolis.

I was for a short time clinical clerk to Dr. Bright while he was investigating that class of diseases which bears his name. I have no doubt that subsequently he became aware of the microscopic anatomy of the kidney, as demonstrated by Todd and Bowman; but at the time of which I speak of, the search was for *fat*. We used to soak the specimen in alcohol or ether, and fry it, to estimate as nearly as possible the amount of oily matter. It was reserved for my friend Dr. G. Johnson to point out definitely the relations existing between the tubular structure of the kidney, the functions of the Malpighian bodies, and the various forms of cast which we find in the urine of those suffering from any form of albuminuria. I regard his work unrivalled as a monograph, and a fine specimen of inductive conclusions.

Mr. Swain then briefly referred to the plan of enucleating a fibroid from the substance of the uterus, the great success of ovariotomy, and the value of the speculum vaginae. He said that, when in Italy last year, he saw in the National Museum at Naples, among the Pompeian relics, a three-valve speculum vaginae, which was made to expand by a rack and pinion movement.

The battle of the microscope was now being hotly waged over the bacteria, and no doubt the majority of the members present had read the discussion on the germ-theory at the Pathological Society. The presumed spontaneous generation was a very different matter now from what it was in Virgil's time, when bees were said to be produced from carcasses. Nor did it approach to the comparatively recent announcements of Mr. Crosse, that he had obtained fully developed acari from gelatinous siles, under the influence of electricity. The organisms under discussion were the most minute and simple beings in creation. He quite entertained the opinion that inorganic matter might be converted into protoplasm by the direct combined influences of the forces of nature.

In concluding, he said: When one turns from the known to the unknown, we enter into a transcendental region, where speculation is all we can indulge in, and where imagination imparts a somewhat poetic glamour to these atomic beings which are assembled together, and, under the reign of law, combine to make up ourselves. Their very smallness astonishes us; and it would seem the less they are in bulk the more remarkable is the power they exercise. Contemplate the protoplasm of the brain; the exquisite cells which Beale describes, with their delicate offshoots interlacing with one another, and which make up the grey matter of the cerebrum. What is their condition, when they despatch their behests along the nervous lines of communication too deli-

cate to be even compared with an electric wire? Still more subtle is the speculation as to their conduct when the will is at rest, but thought and imagination busy. Does every emotion wear away its parent? and is thought the result of some chemico-vital process? I fear no microscope can solve this problem. Again, think on the curious effects produced on the protoplasm by those diseases which leave behind them an immunity from future attacks. Nearly fifty years ago I had scarlatina; not one cell or particle of protoplasm which made me up then now remains; nothing but my identity, yet I am protected. All my life long each cell has been bequeathing my safety to its successor. Still more extraordinary are the circumstances connected with the reproduction of the species. Lionel Beale tells us that a single spermatozoon weighs as much only as the one-hundredth part of a red blood-corpuscle, and yet think of the force with which it is endowed. Within its infinitesimal limits it contains a power which can determine the external lineaments of the future man; cause him to be tall or short, black or white; confer beauty or deformity; nay, endue him with the highest intellect or make him a fool; determine whether he shall be a Borgia or a Howard. Queen Eleanor says to her youngest son, King John, speaking of the Bastard Faulconbridge:

"He hath a trick of Cœur de Lion's face;
The accent of his tongue affects him.
Do you not read some tokens of my son
In the large composition of this man?"

Considerations such as these, as Hamlet says, "must give us pause". They strike forcibly at the roots of our materialism; they refer to forces moved by such tiny agents that we hesitate to call them functions. No intellectual microscope can reach them; and we peer beyond in the realm of some ministering spiritual essence which plays upon them, possesses an independent existence, and will survive when all its tiny minions become "motes in the sunbeam".

THE RISE AND PROGRESS OF THE BRITISH MEDICAL ASSOCIATION.

Extract from an Address delivered at the Annual Meeting of the Lancashire and Cheshire Branch.

By T. DAVIES-COLLEY, M.D.,

Senior Physician to the Chester General Infirmary; President of the Branch.

IN taking the chair as your President, I feel bound to offer you my sincere thanks for the honour you have conferred upon me. It is no light task to preside over the deliberations of so large a number of my medical brethren as are included in the Lancashire and Cheshire Branch of the British Medical Association. I only hope that by your assistance I may be able to discharge the duties appertaining to my office satisfactorily.

When I became a member of the Association in 1840, at the annual meeting held in Liverpool, under the presidency of the late Dr. Jeffreys, a relative of mine, the Society had then been established a comparatively short time by Sir Charles Hastings. Of those who then attended from all parts of the country, and whose names have become a part of its medical history, I fear most have passed away, and I know of two only in Chester, besides myself, who survive. Previously to 1840, the Society had held several meetings at Worcester, Bath, Birmingham, Oxford, Cheltenham, and Manchester. It had secured to itself a very large amount of support, and had corresponding members connected with almost all the medical societies on the Continent. The name of the Provincial Medical and Surgical Association was given to it at first, and its members at the time named amounted to 1,180. It confined itself to the publication of an annual volume of *Transactions*, in which, among other papers, were to be found the results of inquiries specially instituted into the hygiene of different large districts of the country, the occurrences and causes of epidemics, the prevalence and practice of vaccination, and its success in warding off small-pox, and reports on efforts to reform abuses in the profession, whether arising in the corporate bodies granting degrees, or in the regulations affecting medical men in the army and navy, or in administering relief under the Poor-law. Who that has watched the gradual progress of this Association has not seen cause to admire the far-seeing sagacity of its founders and early friends, and also to value the important work it has accomplished?

It was early found necessary to substitute a weekly journal for the annual volume. This added greatly to the influence of the Society, forming as it did a bond of union for the increasing number of members, a means of circulating information on professional subjects, and an opportunity for advocating the interests of the profession, which was

greatly needed. For more than twenty-five years, this JOURNAL has continued the organ of our Association, and it has increased in value year by year, until, under the able management of its present editor, it has arrived at such a state of efficiency as may enable it to compare advantageously with the best medical journal of the day.

It became necessary, as the members of the Association increased in numbers and its area of operations extended, to substitute the name of British Medical Association for that of Provincial. Scotland and Ireland were included in its sphere of operations. Several of the annual meetings of the Association have taken place in distant parts of the country, and, as you are aware, the annual meeting of the Association this year will take place in Scotland. Recently, the Association has been incorporated, in compliance with the requirements of an Act of the legislature.

The influence for good that the British Medical Association is capable of effecting is very great, and it only remains for its constituents to act with unanimity, bringing their legitimate influence to bear upon the eradication of such abuses as are capable of being removed by the legislature, and advocating the cultivation of scientific medical inquiry for the good of the community and the credit of our noble profession.

For the third time, gentlemen, this Branch meets within the walls of this remarkable city. I need hardly say, on the part of the resident members, we welcome you heartily, and, were there time, we would gladly take you round and show you some of the many objects of interest to be found in the neighbourhood, and especially our hospital, founded in 1755, and to which has recently been added a supplementary building for the treatment of small-pox and other infectious diseases. But the long list of papers laid before the meeting will, I fear, prevent our having the pleasure indicated.

Dr. Davies-Colley then proceeded to give an historical sketch of Chester, principally with regard to medicine.

ON THE HISTORY OF BLEEDING, AND ITS DISUSE IN MODERN PRACTICE.

Extracts from an Address delivered at the Annual Meeting of the Bath and Bristol Branch.

By W. MICHELL CLARKE, M.R.C.S. Eng.,
Consulting Surgeon to the Bristol General Hospital; President of the Branch.

AFTER describing his experience of the mode of practice followed when he commenced the study of the medical profession as an apprentice, Mr. Clarke said: Since that time, the management of disease by the antiphlogistic treatment has been gradually and completely given up; and this, I think, is the greatest change that has been made. There have been many others; but this abandonment of the old heroic plans, and the substitution of a more careful following of natural processes, stands preeminent, and is so great that, as I said before, the whole condition of things is altogether so altered that it appears to be entirely new.

We are not likely to see so great a transformation again, and more particularly as to the complete way in which the principal item of the antiphlogistic class, viz., bleeding, has been given up. It would be difficult to overestimate the influence that bleeding has had upon medical practice, from a period almost beyond the beginning of the history of medicine, or how in a vast number of cases the chief point considered was whether the patient should be bled or not. No doubt, there have been great variations in the amount of bleeding done, and there have been opponents of the practice asserting that it was never necessary from the earliest times; but, on the whole, it has been the most important part of medical treatment from very early times.

It is not easy to trace the exact beginning, but it was in free use in the time of Hippocrates, from which it may be fairly inferred that it was introduced long before by the schools of the Asclepiadæ. The discovery of the probe and the employment of bandages for wounds is attributed to one of the three individuals who were distinguished by the name of Æsculapius; but there is no mention of the lancet at so early a period.

The practice of purging, too, is recorded of a time long before we have any mention of bleeding. Thus Melampus is said, long before the times of any of the Æsculapii, to have cured the daughters of Prætus king of Argos, by the free use of hellebore; and we have retained until modern times the name Melampodium. But no mention of bleeding is made so early, nor, indeed, until we find it used as an ordinary remedy by Hippocrates and his school. Homer makes no note of bleeding in either the *Iliad* or the *Odyssey*, although it has always been a matter of wonder how ingenious he was in inventing various kinds of wounds and

injuries. We know from this author that two surgeons, at least, accompanied the Trojan army to the siege of Troy, Podalirius and Machaon, reputed sons of the Æsculapius who is said to have first used the probe and bandages. They do not appear to have practised bleeding. Perhaps, if Homer had known what we do, they would have been esteemed still more for that omission.

Podalirius, it is said, was cast, on his return, by a tempest on the shore of Caria. A shepherd rescued him; and, learning that he was a physician, says Renouard (a surgeon would have been more correct, as Celsus says they only treated wounds, "sed vulneribus tantummodo, ferro et medicamentis, mederi solitos esse"), he conducted him to Dametus, the king of the country, whose daughter had lately accidentally fallen from the top of the house. She was insensible and motionless, and the attendants already supposed her dead; but this skillful surgeon bled her from both arms, and had the happiness of restoring her life.

Here is the first example of bleeding practised for the purpose of a cure; unhappily, it is not very authentic.

There is, in truth, no certain notice of phlebotomy until it stands but clearly as a common practice in the time of Hippocrates; and a search after the precise time, or the particular operator who first was bold enough to plunge in the lancet and abstract blood, will only lead to disappointment.

The Greeks derived their earliest medical knowledge from the Egyptians; but there is no evidence that they learned from them the art of bleeding, or that it was ever employed by them.

The Chinese claim even a greater antiquity than the Egyptians; but there is no evidence of the practice having been employed by them, or by any other of the ancient Eastern nations. (Bancroft.)

Although, however, we cannot ascertain the exact period during which bleeding has been in vogue, we know that it was in use for nearly 2,500 years; and I have often thought that the remarkable and abrupt cessation from its use in our own times has not surprised us so much as, when we consider the subject, it ought to have done. Whether we consider the antiquity and duration of the practice, and the universality of its employment, or the completeness of its abandonment now, it is equally astounding—nothing less than a complete revolution in the practice of medicine.

Experience must, indeed, as Hippocrates says in his first aphorism, be fallacious if we decide that a means of treatment, sanctioned by the use of between two and three thousand years, and upheld by the authority of the ablest men of past times, is finally and for ever given up. This seems to me to be the most interesting and important question in connection with this subject. Is the relinquishment of bleeding final? or shall we see by and bye, or will our successors see, a resumption of the practice? This, I take it, is a very difficult question to answer; and he would be a very bold man who, after looking carefully through the history of the past, would venture to assert that bleeding will not be profitably employed any more.

There have been opponents of the practice from the earliest times; and this is one of the strongest arguments against those who have held, or hold now, that bleeding has gone out because of a change in the type of disease, or because of a deterioration in the strength of the present race of patients. There have been, also, periods when it has been scantily, and others when it has been profusely, employed; and some of the facts connected with this point seem to show that, although the change of type theory cannot afford the whole explanation, yet there have been times when bleeding has been better borne, or more beneficial than at others.

Nearly as early as the time of Hippocrates, who "sometimes carried bleeding to a great extent, even in chronic diseases" (Hamilton), we find that Chrysippus, a pupil of Eudoxus of Cnidos, had an insuperable objection both to purgatives and venesection. (Hamilton, p. 71.)

Again, Erasistratus, who is supposed to have been a contemporary with Herophilus, and to have flourished in the reign of Seleucus, about three hundred years before our era, and is admitted by all but Galen, whose inordinate veneration for Hippocrates too often leads him to be unjust to the merits of others, to have been an anatomist of the first skill, and a practitioner of the first reputation, according to Galen, wholly banished the use of the lancet; but we are informed by others that, without absolutely interdicting it, he was much more sparing of bleeding than other practitioners. (Hamilton, pp. 85 and 89.)

There is no difficulty in finding evidence of the free use of bleeding in most periods of medical history; and, although not so distinct, there may yet be traced with sufficient clearness marks of the varying frequency with which it was employed. I have alluded to two instances of abstinence from bleeding at very early periods; my next illustration belongs to another time and another school.

Galen, in his work addressed to the Roman followers of Erasistratus,

details how, when he first came to Rome, he saw patient after patient die, suffocated with pneumonia and angina, because the physicians refused to bleed; by way of contrast, he triumphantly records how he had been called to see the steward of a rich man in the suburbs of Rome, who had been suffering under ophthalmia for twenty days, and had been treated without benefit by the family physician, who was of the Erasistratean sect. "I found the patient," says Galeo, "a plethoric young man, with intense inflammation, swelling, and pain and discharge. Knowing what the treatment had been, I said that it was impossible I could take charge of such a patient in the suburbs, and that I ought to see him very frequently for at least three days. Let me take him home, I said, for three days. They assented gladly. I at once drew three pounds of blood; and, at three o'clock, one more." He was wonderfully relieved next day; and, with other treatment, much as we should employ it now, the patient recovered. We learn, also, that the master of the steward, on hearing what had made so admirable a cure, nicknamed his Erasistratean physician *Αιμαφθορος*, Anglicè Blood-funker. (Cooper's *Surgical Dict.*, p. 54.)

For the practice of bleeding largely in pleurisy and pneumonia, which Hippocrates and Galen had enjoined, the Arabs substituted one entirely opposite; they prescribed pricking slightly the vein of the foot, to let the blood flow drop by drop. Their method prevailed throughout Europe until the commencement of the sixteenth century; then, a pleuritic epidemic having appeared several times in the capital of France, a physician of Paris, named Pierre Brisset, distressed to see the most of his patients perish, and encouraged, also, by reading the Greek authors, dared to revive their practice. The success he obtained filled him with enthusiasm; he hastened to publish it, and proclaimed boldly the superiority of the method of Hippocrates to that of Avicenna. (Renouard. *Trans.*, p. 323.)

It has generally been, I believe, during the occurrence of some epidemic in which the treatment at the time in fashion has been found to be unsuccessful, that bleeding has been resorted to at one time, and abandoned at another; and this, I think, speaks plainly in favour of the landmarks by which both modern and ancient physicians profess to have been guided.

I cannot find time to cite the numerous instances in which bleeding was avoided. Abernethy appears to have had a wholesome dread of it, whilst yet he bled freely. He says: "I have seen a patient bled and bled; and, two or three days after, the medical man has been glad to throw in the bark, and try every means when it was too late." Again: "I have lived in London all my life, and am very chary of taking blood; but still, if some were to see how I would bleed a patient in inflammation of a vital organ, they would wonder." (Cooper's *Dict.*, p. 56.)

But it is not only with regard to very long periods of history that this change with regard to the practice of bleeding has occurred. Dr. Adams, the learned translator of Hippocrates for the old Sydenham Society, says: "Then there is given a general rule for bleeding in disease which certainly is well deserving of attention at the present time, when professional opinions on this point are very much unsettled. Now-a-days we have abandoned all general rules of practice, and profess to be guided solely by experience; but how variable and uncertain are its results in the present case. I myself—albeit but verging towards the decline of life—can well remember the time when a physician would have run the risk of being indicted for culpable homicide if he had ventured to bleed a patient in common fever; about twenty-five years ago, venesection in fever, and in almost every disease, was the established order of the day; and now what shall I state as the general practice that has been sanctioned by the experience of the present generation? I can scarcely say, so variable has the practice become in fever and in many other diseases of later years." (Sydenham Society's Translation of Hippocrates, vol. i, p. 307.)

We certainly cannot say now that the practice is variable, for we are most decidedly living in one of the periods when the lancet is carried idly in its silver case; no one bleeds; and yet from the way in which I find that my friends retain their lancets, and keep them from rusting, I cannot help thinking that they look forward to a time when they will employ them again. And there certainly may come a period when a recurrence of similar conditions may lead to a revival of the practice; we can only hope that this will not be, except upon the most substantial evidence, not upon the apparent success of some popular practitioner.

There can be no doubt that, at some periods, bleeding was used in frightful excess, and such seems to have been the case at the time just preceding that of which I am writing. We cannot read the accounts that have been given by Stokes and others without seeing how the practice was abused; and most of the older of us will have met with instances in which permanent injury had been done to the individual

by it. It appears in this place to have been carried to as great, if not to a greater, excess than anywhere; and I have heard many stories of the way in which the patients at the infirmary and other places used to be bled all round by the students, and that in the most lavish manner. When we come to inquire as to what immediately led to the giving up of bleeding, I think we shall be inclined to say that it was the excess of the last generation that caused the utter collapse of the practice.

Dr. Bennett alleges that it has paled before the brighter light of modern pathology; and, no doubt, the more correct discrimination of disease that we make now, the better diagnosis that we attain, has had much to do with confirming and endorsing the relinquishment of the practice; but the proof of the advantage, so far as it has been derived from statistics and advanced pathological science, seems to me rather to have followed than to have preceded it.

The statistics which prove pneumonia, apoplexy, etc., to have a better rate of recovery without than with bleeding, certainly were produced after the use of it was given up, and when it was being sought to account for this change; but, no doubt, they settled and established the issue.

The consideration of the subject of apoplexy will show how much our advanced and increased knowledge of its causes must influence us when we deliberate upon the advantage or disadvantage of employing bleeding as a means of treatment of it. Thirty years ago, everyone falling into a fit, or even threatening to do so, would inevitably have been bled, and that profusely; but, from what we know now, we may, I think, say that many were fatally bled. At that time, most of the cases of sudden hemiplegia, with or without coma, were attributed to apoplexy, which was divided in the works on medicine into sanguineous and serous; and to the latter class were assigned all the cases in which very slight morbid appearances, or none at all, were found after death; if the serum were but visible, why then it had undergone *post mortem* absorption or transudation, or, at all events, it had been there, but had disappeared.

At this time, we know that many of these cases must have depended upon defective circulation, some upon embolism, some upon minute vegetations detached from one of the valves of the heart, and washed along in the blood until arrested by a cerebral artery, and other conditions in which bleeding is, and must have been, absolutely injurious.

Of these cases, large numbers must have been of the pseudo-apoplectic character, which Stokes has so well described, and which, he says, "differ from ordinary sanguineous apoplexy in three particulars, namely, the frequent repetition of the seizures, the rarity of consequent paralysis, and the fact that there is not only danger from an antiphlogistic treatment, but benefit, both remedial and preventive, from the use of stimulants." (Stokes on *Diseases of Heart and Aorta*, p. 322.)

I do not think that this condition is even yet sufficiently apprehended; but it is fortunate, because it is not always easy to say with which condition we are dealing, that statistics are forthcoming to show that bleeding must have been injurious even in sanguineous apoplexy.

Again, our whole knowledge of the conditions that we now class under the names of septicæmia, pyæmia, embolism, etc., has been acquired in the last twenty or thirty years; and what a difference our recognition of these, imperfect and crude as it is, has made in our estimate of the propriety of bleeding. In a pleurisy, or a pneumonia, a pericarditis, or arachnitis that proceeds from septic conditions, no one would dream of bleeding; and yet these acute affections—most acute and intense, indeed, when produced by blood-contamination—are the ones for which bleeding would have been most severely practised.

No one can imagine that the cases we are writing of have resulted from any change in type or character of constitution, although there can be no doubt that they are much more rife at some times than others, nor can we doubt that they must have occurred through all time. At present, they are the most common conditions, especially in connection with surgery and midwifery; but they occur much more frequently than is yet generally recognised without obvious cause, and in connection with diseases that we are accustomed to call medical.

That they occurred in early times as well as now may, I think, be easily shown. No one can question that the following case, taken from Hippocrates, *On Epidemic Diseases*, was one of pyæmia. "He, whose tibia was cut, had a blackness come upon the part. The ulcer was large on the outside, and the discharge from the hinder part. When it was cleansed, he was seized with a pain of the side and left breast, opposite to it, grew feverish, and died of his fever." (Clifton's Hippocrates, p. 127.)

The hurt bone, in connection with which pyæmia so constantly occurs, the sharp pleuritic pain, the fever, and the fatality, bear the closest resemblance to the disease as we have it now, and we cannot but admire the clear and graphic way in which the case is recorded.

Nothing is said about bleeding in the record; but it shows that sep-

ticæmic conditions played their part at the very beginning of the history of medicine as they do now at the latest period of the same; and that it is almost certain that all through the intermediate time they have done the same; and equally certain that the insight that we now have into the nature and character of these has had an immense influence over medical treatment. That bleeding was formerly and in most times resorted to in such cases might, I think, be abundantly proved.

Sydenham says: "I think pleurisy is a fever originating in a proper and peculiar inflammation of the blood—an inflammation by means of which nature deposits the peccant matters in the pleura." (We might think he was writing of septicæmic pleurisy only.) "Sometimes she lays it in the lung itself, and then there comes a peripneumony. This differs from pleurisy only in degree. In my treatment, I have the following aim in view: to repress the inflammation of the blood, and to divert those inflamed particles, which have made an onset on the lining membrane of the ribs (and have there lit up so much mischief) into their proper outlets. For this reason, my sheet anchor is venesection." "Such", says Bennett, "was the pathology and practice of Sydenham, the latter following consistently enough on the former; and the essential idea of diminishing the morbid matters in the blood has not only descended from Hippocrates to the days of Sydenham, but has come down from his to our own times." (*Principles of Medicine*, p. 267.)

What a far-reaching influence Bright's researches must have had on the treatment of inflammation! We should hesitate to bleed for the serous inflammations, the pneumonias, the apoplexies that occur in the course of diseases of the kidneys, although there is one condition—that of puerperal convulsions—in which our colleague Dr. Swayne still advocates venesection.

It is difficult to conceive a time when disease was not the same in most respects as it is now. There may be, and there undoubtedly is, as the result of civilisation and the artificial and enervating modes of living begotten of it, a great deterioration of vital power and degradation, and gradual degeneration of the race; and, amongst other causes, this is, no doubt, promoted by the medical skill which saves weakly and unhealthy children, to live to procreate an unhealthy offspring. But, after all allowance has been made for this, we cannot imagine but that the conditions that I have referred to must have existed through all time. Injuries must have been made fatal by blood-poisoning, and the parturient woman must have encountered the same dangers that she does now; and the various other causes which our advancing knowledge has made clear to us must in old time, as now, have existed, and influenced and modified disease. The amount of influence that the advancing progress of pathological knowledge has had in the last thirty years it is difficult to calculate, and certainly it is not even yet adequately acknowledged or appreciated in many of the books which profess to teach medicine and surgery. In the text-books that I used as a student, there is no mention of pyæmia, or septicæmia, or any hint of their influence; and directions were given to bleed for almost everything. In all inflammations of lung or pleura, free bleeding, repeated again and again, was directed; and in those of the peritoneum, the abdomen, after bleeding, was to be covered with leeches. But even then, as I have said, I was startled to find that the writers who laid down those rules had ceased to practise them. It is strange that even now the best text-books give the same directions as to bleeding, although it has become so utterly a thing of the past; and it certainly is time that the teaching should be brought into accord with the practice.

Although something may be said for the varying character of epidemic influence, and for the deteriorating effect of large aggregations of people in cities, I think we may fairly congratulate ourselves that the altered practice we have been considering is not only the greatest change, but also the greatest advance, in our time; and that it is due to the real progress that we have made in our knowledge of the nature of disease.

Mr. Clarke then referred to the abandonment of two other members of the antiphlogistic group—antimony and mercury; expressing the opinion that their disuse had been too universal. He did not think mercury necessary for the subduing of acute inflammation, but believed that it was useful in removing the products of inflammation.

It is a great misfortune, as I think Sir William Jenner has somewhere said, that it so often happens that, because a remedy does not do all that it has been said to do, and because its action is not in the way that previous theory had indicated, it should be entirely given up. The patient may be the better for a medicine, although some other explanation of its action than the one generally received may be the true one, and even though we may not be able to explain its action at all. As in the days of Celsus, so now, there are to be found theorists and empirics; and I am afraid that, as then, so now, unless for the one class the stamp of experience, or for the other of a perfect explanation,

can be obtained, they will not adopt the practice. But even experience itself teaches that neither empiricism nor theoretics is an infallible guide. The experience of ages may mislead; very plausible theories may be false; but we must still hold that the guiding of experience is the perfect pilot; whilst, on the other hand, we cannot discard reasoning because its conclusions are often untrue. Happily, we may say, as it has been said before, that men whose opinions have been directly opposite to one another have, notwithstanding, equally restored their patients to health.

Celsus has wisely said that "medicine ought to be rational, but to draw its methods from the evident causes; all the obscure being removed, not from the attention of the artist, but from the practice of the art". It is not to be wondered at that, during such a remarkable transition as we have been considering, when plans of treatment that had endured the test of ages of experience were almost completely set aside, and even men of education and intelligence, should have made shipwreck of their medical faith, and thought that they had found in infinitesimal doses better results than had been obtained from the former heroic treatment, or that others should have passed over to the very opposite extreme, and endeavoured, by an inordinate use of stimulants and cramming, to make up in our generation for the depletory treatment of the ages. But, fortunately, most men took a more reasonable view of the change, and accepted the more promising practice of the present time, the main guiding principle of which is to support and aid the natural tendency to recovery.

There can be no question, I think, that the change has been greatly due to a more scientific investigation of the natural history of disease than has ever been made before; the symptoms and phenomena during life carefully followed up and compared with what was to be found after death, greatly aided by the discovery of numerous instruments of precision—discoveries which have been excelled in no department of science, and which afford a subject of the greatest congratulation and encouragement.

Mr. Clarke then proceeded to give a notice of the discoveries to which he alluded, mentioning the aid which medical science and practice derived from the stethoscope, the microscope, the laryngoscope, the ophthalmoscope, the thermometer, the uterine sound, the various specula, the sphygmograph and endoscope, etc. He expressed the opinion that medicine and surgery had made more progress within the last century than in the preceding 3,000 or 4,000 years; and, among their achievements, spoke specially of the discovery of vaccination and of the use of anaesthetics, giving an interesting historical sketch of each. He next referred to the progress of surgery, dissenting from the opinion that it had become an exact science, but admitting that the improvements in it had been very striking. Among them, he referred especially to the substitution of excision for amputation—holding, however, that excision itself might often be avoided by proper management. He also noticed ovariotomy, Esmarch's method, skin-grafting, the compression-treatment of aneurism, pneumatic aspiration, the operations for the remedy of defects and deformities, subcutaneous injection, etc.; and concluded his address as follows.

Whilst medicine, and surgery, and obstetrics have made enormous advances in our times, we must still freely admit that much ground remains unreclaimed. We seem as far off as ever from any perfect theory on which diseases may be treated; and, although we derive great aid from physiology and chemistry, and other allied sciences, we are still compelled, in our treatment of cases at the bedside, to fall back upon a refined experience. We rely upon the stored-up wisdom of the past, guided and directed by what we ourselves have learned from observation.

We cannot yet say, in many cases, here is such and such a group of symptoms; they indicate a definite derangement, which can be met with mathematical precision by such and such remedies; in some cases, we do almost attain to this accuracy, and it is highly desirable that the number should be increased; but, in the meantime, in the majority, we take a safer course in following the path that the stored-up information that has been gathered in the past leads us.

We must admit, too, that many of the most painful and terrible diseases to which "flesh is heir" remain inexorable to any remedies that we at present possess, and bid defiance to every effort made for their cure. It is only the charlatan who promises to cure everything. For us, the grandest aim is to be true, and all the great in our art have been men who have tried to see clearly and to tell fairly what is likely to be the issue of the storm that they often cannot quell; and nothing, in my opinion, shows more clearly the secure foundation on which our knowledge rests, than the certainty with which we can foresee and foretell the course that a disease will take, thereby often affording most valuable guidance to those we cannot cure. Too much, no doubt, is often expected of us in these days; every one

seeks to be healed of his disease, and wonders why, in his case, we fail, not recognising that, in this world, we are not to reach the land where there shall be no sickness nor any more deaths.

MEDICAL TOPICS OF THE YEAR.

Being the Address delivered at the Annual Meeting of the South-Eastern Branch.

By JAMES R. STEDMAN, M.D.,

Consulting-Surgeon to the Royal Surrey County Hospital; President of the Branch.

IF I feel very great pleasure and, at the same time, but little confidence in my power efficiently to carry out the honourable position as your President, in which my too partial friends have placed me, it is from an honest feeling of self-blame, which tells me I have not sufficiently attended to, I fear, for many years the duties incident to the position of a member of our Association so well as to make myself so fully conversant with the duties of your President as I ought to be. I, therefore, crave your indulgence, and promise to do better for the future. I this day, on behalf of myself, our Vice-President, and the local committee who have acted so kindly and indefatigably with me, bid you most hearty welcome, and trust this present meeting may recall the two former Guildford meetings; the first under the presidency of my father twenty years since, quite in the youthful days of the Association; the second, which, doubtless, many may remember in this room, a few years since, most successfully carried out by my old friend Mr. Napper.

Owing to the warm and most kind wish of Dr. Brushfield of Brookwood Mount, one of our vice-presidents, to show the great County Lunatic Asylum at Brookwood to the members of our Branch who may meet here to-day, I have ventured to depart from the usual order of our meeting in making but a very short address to you; but, in the few minutes we may have to spare, may I presume to call your attention, however briefly, to subjects which at the present time are of importance and interest to the profession? I do this not so much for the purpose of imparting information, as of eliciting discussion at such meetings as may be held during the coming year.

I think we must admit that, although the private position of the medical practitioner, as far as affects his relations to those who seek his advice, remains much as it has been for nearly half a century, the public demands made on him have much increased, requiring a greatly additional and varied amount of information, especially on subjects on which the public will look to him as a skilled opinion.

Among the public duties of the profession, we class sanitary legislation, as affecting the position of medical officers of health; and we should endeavour to determine if the sanitary condition of the country be best forwarded and ensured by the appointment of a single medical sanitary officer acting over a wide district, or by those parochial medical officers whose care extends over a much more limited sphere.

The much increased duties and strict attention to analysis required of those acting as medical analysts requires notice.

The very important question of how our rivers are to be freed from pollution demands instant attention, and the advice of the medical profession of the country should be sought in aid of the engineers whose special duty it must be to carry out the great work of preserving in its purity the water which is bestowed on us, and of restoring the results of our sewage to an innocuous state.

The newly raised question of burial, brought before the public with much ability and spirit by a distinguished member of the profession, Mr. Seymour Haden, will not, I hope, be allowed to fall out of the sphere of public opinion and public observation from want of support from the medical profession, especially from those of our members who may have the opportunity afforded them of watching either the result of cremation, as practised in the case of Lady Dilke, or the, in my opinion, preferable plan proposed by Mr. Haden, which is more agreeable to the feelings of the living and highly practical, as regards the speedy passing away of the dead; indeed, by the means suggested by him, the injunction of "earth to earth" will be best carried out. I may here notice that, in Spain, arrangements are always made for the purchase of graves for a certain number of years. The interest of the holder of the ground then ceases; it is sold again after a limited period of disuse, no remains of the former tenants, save a few bones, being found; but it must be said this takes place in a very dry soil. I regret I am not fully informed what kind of coffins are used under these circumstances.

I also think it would be right to urge by every means in our power, due regard being given to the special requirements of the several districts in which we practise, the providing of small hospitals for the treatment of infectious diseases. I am perfectly satisfied of the necessity of a

rigid system of isolation, which may require legislative aid, empowering medical men, under urgent conditions, and where, at the same time, there may be great overcrowding in the house or room where the malady exists, to order the removal of the patient to a hospital; which would, indeed, be but returning to the prudent customs of our ancestors, who kept up in many places what they termed pest-houses, but which might require from modern feeling some more elegant name, such as sanatorium.

I will next draw your attention to the fact that a Bill will be brought forward for the better regulation of the election of coroners, and also for providing retiring pensions for them; in which it will be proposed that the power of electing coroners be vested in the magistracy; no provision, as far as I know, being made (but, doubtless, it will be) for smaller districts, such as our boroughs. On this subject, I do not agree with those who think that the election for coroner had better remain, as heretofore, in the hands of the county freeholders, doing away with voting for graves and other most trifling claims, which have hitherto been admitted as valid in votes recorded for coroners; giving as the reason for such an opinion that, if the appointment were vested in the magistrates, it would most possibly be filled by a legal, not a medical candidate, the lawyers having, in the editor's view of the question, the most influence, and being most accustomed to organise and carry out elections. I do not agree with this opinion, fearing that but little good will be effected by the proposed bill, if left to the county freeholders, as sufficient interest will not be excited by a contested election for coroners, differing as it does in public interest from an election for a county member, to induce the freeholders to travel far or put themselves to any expense to vote, unless the candidates, be they either legal or medical, be put to large and not altogether legitimate outlay to secure their election. I do not know if the election would be by ballot; but, not many years since, I saw electors at the railway station in this town, and in large numbers, very unfit to carry out any function requiring the exercise of intelligence or sober judgment. For my part, I would rather trust to the knowledge that the extended education of medical men in those subjects in which a coroner requires to be well informed, jurisprudence, sanitary legislation, etc., may become so generally known as to make its own legitimate impression on public opinion; so that the medical candidate may possess as strong or stronger claim on the support of the county magistrates as his legal brother; but, to secure this much to be desired end, the medical men of the contested county must be prepared to use all the interest they possess. My experience as a coroner is but limited; but I am very strongly of opinion that the office of coroner is carried out with more benefit to the community by a medical than by a legal authority.

I must take up your time for a few minutes on the subject of abuse of hospitals, of which there has been frequent mention in our JOURNAL during the past year. On this matter, we must feel it our duty, let it affect us personally or not, to do our best to diminish and check a misappropriation of charity, which should be looked on as degrading to those receiving it, who are capable of paying for medical attendance. I have been astonished to hear the plea urged in defence, that at hospitals the patient gets the most skilled opinion. This argument, however, is readily met by the reply, that the same opinion may be had by making the ordinary payment for it.

The President of the Royal College of Physicians, in his recent annual address to the Fellows of the College, deemed it needful, owing to the greatly increased expenditure of members of the medical profession, commencing with their early professional education, extending over a much longer time before they are prepared for the start in medical life, to bring before his colleagues this subject, that they might consider by what means the physician's fee of a guinea should be sufficiently increased to make it a fair equivalent to the guinea as paid one hundred and twenty years since; adding that the physician practising in London at the present day, unless in large consultation or home practice, cannot maintain himself. For this reason, I think the time has fully come that other branches of the profession should also consider how far the great increase of house-rent, stable requirements, price of horses, servants' wages, should justify us to increase our professional charges to such an extent as to place us under such conditions as might compare not unfavourably with our position in the past. At the meeting held two years since in London, I was present at a sectional meeting, when this subject of great increase of price, or rather, lessened value of money, was discussed in rather an irregular manner; and I joined with those who held the opinion that it was more dignified to wait until the occasion for determined action on the part of the profession was more decidedly forced on them by the continuance of increased and necessary expenditure.

I would here allude to the Contagious Diseases Acts, and express my

warm wish that, in voting on this most important subject, as regards any alteration of Act, the members of the House would consult their medical men, and duly weigh the advice received. I am not so much influenced by the greater or less amount of disease in protected stations, but think far more of the mass of disease from which people will be saved, especially as regards the transmission of syphilis to virtuous and healthy women, who pass it on to their children. We all of us can bear sad witness to this fact in what is frequently brought before us.

It is worthy of consideration how far a just and evident claim for increased remuneration may be advanced by medical men holding appointments under the Poor-Law Board, taking into consideration the basis on which payment was calculated in the past.

The great question of temperance, now happily prominent, is one in which we must be deeply interested, and the importance of which we cannot too highly estimate, although I must enter my protest at the manner in which, from time to time, our total abstinence friends gibbet those maintaining temperance views, and medical men especially, before an abstaining and sympathising audience, as being by our, in their view, loose method in ordering stimulants, giving a helping hand in the formation of the future drunkard. This charge cannot, however, be maintained, as I feel confident we are all precise in the quantity of wine or other stimulant directed; doubtless, we are often quoted as directing stimulants when we are not doing so.

I should have wished to call your attention to other subjects of interest: the education of midwives, the addition of female practitioners—all subjects on which I should with great pleasure hear the opinions of the members of the Branch; but time forbids me to dilate on them.

CLINICAL MEMORANDA.

RAPID PULSE.

I WAS much interested in reading Dr. Farquharson's paper on Excessive Rapidity of the Pulse, in the JOURNAL of June 12th, as I myself saw a patient similarly affected a few days later. The patient, a lady 66 years of age, has habitually enjoyed very good health, with the exception of occasional stomach derangement. Recently, however, during a visit to Buxton, she almost fainted in church after an indigestible meal. For the next few days, she did not feel well, and overtaxed her strength, in addition, by too much walking. She then returned home, and I saw her a week later. During this week, she had been suffering from palpitation, giddiness, weakness, and sleeplessness. On placing my finger on the pulse, I was surprised to find that I could not satisfactorily count it, by reason of its frequency, smallness, and irregularity. On examining with the stethoscope, however, I found the heart beating 150 per minute, with no *bruit* of any kind. There were no other symptoms of any moment. I prescribed tincture of digitalis and the perchloride of iron, of each fifteen minims. After five doses of this had been taken, I was pleased to find a wonderful improvement: the pulse had fallen to 74, perfectly regular, and of fair volume, the other unpleasant symptoms being also removed. In this case, I cannot help regarding the dyspeptic symptoms, combined with overexertion, as giving rise to a partial suspension of the inhibitory action of the vagus upon the heart, as Dr. Handfield Jones explains. At any rate, the action of digitalis is wonderfully prompt and decided in such cases.

WILLIAM S. PAGET, M.B.Lond., Great Crosby, Liverpool.

SURGICAL MEMORANDA.

ON THE USE OF ARNICA IN ORCHITIS.

I SHOULD be glad if I could have a corner in the JOURNAL to say a few words respecting a method of treating orchitis which I have for many years found very effective. It consists in the more or less constant application (of course, while the patient is resting) of a lotion of tincture of arnica and water (one part of the former to six of the latter) to the affected organ; secondly, in rubbing in an embrocation composed of one-third or even one-half tincture of arnica and soap-liniment two or three times a day along the course of the spermatic cord; and thirdly, in the internal administration of seven-drop doses of tincture of arnica, combined (when there is febrile disturbance) with two-and-a-half-drop doses of Fleming's tincture of aconite and acetate of ammonia. This simple treatment, so far as my experience goes, generally cures the patient in a fortnight or less. In using our remedial agents of the above-named strength, there is little danger of causing cutaneous irritation; but it must be admitted that, while some skins

will bear the constant application of even pure tincture of arnica for a considerable time, there are others which are inconceivably sensitive to the action of the drug. We must, therefore, be on the watch for any show of erysipeloid inflammation, in case such should occur.

I cannot well, for obvious reasons, give cases; but I dare say I have said sufficient to induce some of the readers of the JOURNAL to try the arnica treatment of orchitis. Should they do so, I feel confident that they will not be disappointed in the results. H. G. KNAGGS.

REPORTS OF SOCIETIES.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, JUNE 2ND, 1875.

W. O. PRIESTLEY, M.D., F.R.C.P., President, in the Chair.

Specimens of Hindoo Pelves and Fetal Heads were shown and presented to the Society by Dr. SHORTT of Madras.

Suppurating Tumour of Left Ovary.—Dr. J. W. J. OSWALD related the particulars of a case, where, from the rapidity of its growth, the emaciation of the patient, and lung-complication, tubercular peritonitis was supposed to exist. The patient had been under Dr. ROUTH's care in the Samaritan Hospital, and died suddenly about a week after her return home.—Dr. ROUTH remarked, that the chief point of interest was the rapidity of the growth of the tumour, which led to the supposition of its being a cancerous growth; there was amphoric breathing over the right chest.—Dr. WILLIAMS asked, if any microscopic examination had been made. He had witnessed a similar case.—Dr. OSWALD replied, that the microscope proved it to be tuberculous.

Specimen of Extrauterine Fœtation, in which a communication existed between the Cyst and the Uterus.—Dr. GALABIN exhibited an interesting specimen of this nature. In February, when the patient—a multipara—considered herself eight months pregnant, severe abdominal pain and hæmorrhage from the vagina occurred; the fetal movements ceasing from this date. The breasts also enlarged. She was admitted into Guy's Hospital in May, and attempts were made to deliver the fœtus, but the patient died collapsed. At the *post mortem* examination, a greenish semisloping membrane was exposed, which formed an entire cyst, enclosing the fœtus. There was a round opening from the cyst into the uterus.—The PRESIDENT referred the specimen to Dr. Playfair and Dr. Williams, in conjunction with Dr. Galabin, for further investigation.

Intramural Calcareous Tumour impeding Labour.—Dr. A. WYNN WILLIAMS exhibited a specimen, and related the history of the case. Dr. Kirby having called him in consultation to a primipara, aged 45, craniotomy was performed; and, delivery being still impossible, cephalotripsy was about to be resorted to, when the hard mass was discovered to be movable within the uterus. The cephalotribe was applied, and a portion of the mass broken off. Delivery of the body of the fœtus was then effected, and subsequently the tumour, which proved to be an intramural calcareous tumour, was extracted. The patient made a good recovery.

Case of Extreme Dropsy: Fatty Degeneration, and Friability of the Placenta.—Dr. JOHN BRUNTON exhibited what had been an enormous placenta, but had unfortunately become much shrivelled up by being kept in spirits of wine. The patient, a primipara, was very stout, labour was premature, about the sixth month. The right hand and left foot presented. The child died immediately after birth. A very large placenta was first expelled, and subsequently three other separate portions. The patient was in an advanced state of dropsy. The urine was slightly albuminous. She recovered perfectly.

Case of Monstrosity.—Dr. FREDERICK WALLACE exhibited a fœtus, attached to the head of which was a large fluid tumour, supposed during labour to be hydrocephalous. One eye was wanting, and the other only rudimentary, and there was no tongue.

Large Uterus.—Dr. WALLACE also exhibited an enormous uterus removed *post mortem* from a patient, aged 55, who had been tapped over a dozen times for supposed ovarian tumour.—Dr. HAYES thought the case worthy of further examination.—The PRESIDENT requested Drs. Aveling, Hayes, and Wallace, to examine and report upon both specimens.

Placental Polyypus.—Dr. T. C. HAYES exhibited a specimen removed from a patient on the eighth day after delivery, whose labour had been natural and easy, though followed by a smart hæmorrhage. Symptoms of septicæmia ensued, and a portion of placenta was extracted; the lochia being horribly offensive, injections of Condy's fluid were employed, and the patient made an excellent recovery.

BRITISH MEDICAL ASSOCIATION:
SUBSCRIPTIONS FOR 1875.

SUBSCRIPTIONS to the Association for 1875 became due on January 1st. Members of Branches are requested to pay the same to their respective Secretaries. Members of the Association not belonging to Branches, are requested to forward their remittances to Mr. FRANCIS FOWKE, General Secretary, 36, Great Queen Street, London, W.C.

BRITISH MEDICAL JOURNAL.

SATURDAY, JULY 17TH, 1875.

THE APPLICATION OF MATHEMATICAL FORMULÆ TO
MEDICAL STATISTICS.

THE "Calculus of Probabilities", developed by Pascal, Fermat and Parisot, Laplace, Lacroix, and other eminent mathematicians, has, within the present century, been applied to popular and medical statistics. The original papers of Sir John Herschel do not appear to have attracted much attention in this country; and, although recently reprinted by Quetelet in French, are ignored by Professor Radicke of Bonn, and his critics—at least, in the papers translated by Dr. Bond in the *Selected Monographs* of the New Sydenham Society (1861). It is now some years since these latter were published, and it may therefore not be uninteresting to quote Professor Rosenthal's review of J. Hirschberg's recent work, *Die Mathematischen Grundlagen der Medicinischen Statistik elementär dargestellt*, 8vo, pp. 95, Leipzig, Veit and Co. 1874. This review appears in No. 6 of the *Centralblatt für die Medicinischen Wissenschaften* for 1875.

The article begins by saying that medical statistics differ from ordinary statistics (demology), because the latter draws conclusions from observations or numbers the series of which are terminated or fully ended; whilst the former, or the medical, series can only be carried out partially. For example, we cannot absolutely say what is the percentage of mortality from pneumonia at the present moment. This distinction is, we think, somewhat artificial; since no census-returns can give the absolute numbers alive at a given age in any given moment. The real distinction would rather seem to be in the magnitude of the numbers [of observations], and in the machinery employed for their collection; those for a census, for instance, being far more simultaneous than any series of medical observations can be. From such difficulties, the reviewer remarks, the calculus of probabilities will do much to extricate us. 1. It will show how far, in medical matters, we need extend our observations or experiments so that the general results may be fairly accurate. 2. It will show us what degree of accuracy belongs to the observations and reports of medical cases which are published from time to time. The theory, of course, presupposes the accuracy of each separate observation or experiment in the series. On this account, it is only applicable in cases where there is no doubt about the diagnosis—such as cataract and cataract-operations, for instance—when we wish to determine, on physical principles, the laws regulating the occurrence of a disease, and the mode in which it is affected by various therapeutic agencies. Gavarret, who used Poisson's formulæ, and even A. Fick, have treated the subject dogmatically, *i. e.*, without proofs, whilst our author endeavours to furnish a complete, systematic, and progressive elementary treatise on these topics.

The first part of his pamphlet gives an abstract of the calculus of probabilities adapted for medical readers. The mathematical probability of any event is the relation borne by cases favourable to it to all possible cases. Thus, in a die or cube with six faces, marked with dots progressing from one to six, the probability of the face with six dots being uppermost in a given throw may be regarded as one in six, and expressed thus: $P = \frac{1}{6}$; or the formula may be made more general, thus: $P = \frac{n}{N}$ where $n < N$. It is

very often not possible to determine the *absolute* probability of any disease occurring at a given age, for example, for the several decades of life; but we may very often discover the relation borne by the different probabilities to each other. Thus, the probabilities of cataract occurring in the first seven decades of human life are to one another as 1:1.5:2:2.5:8.3:24.5:66.3. Suppose the probability of an event $A = \frac{n}{m}$, that of a second event $B = \frac{p}{q}$; then the probability of A and B occurring together, or concurring, where both events are independent of each other; in other words, the chance $c = \frac{np}{mq}$. [The chance of throwing double sixes, in other words, of both dice exhibiting six dots on the uppermost faces, will therefore be (in a single throw) $\frac{1 \times 1}{6 \times 6} = \frac{1}{36}$]. If the number obtained by observation, C of the relative frequency of the concurrence of A and B , approximates closely to c , we have no ground for the opinion that there is any etiological connection between them, etc. The probabilities (P_1, P_2, P_3, \dots) of different primary causes (*ursachen*) to which an event may be ascribed are exactly similar to the probabilities or chances (C_1, C_2, C_3, \dots) according to which any one of the primary causes, if in action, might have brought about the event in question. From $P_1, P_2, P_3, \dots = C_1, C_2, C_3, \dots$ it follows, if all the possible primary causes (hypotheses) be investigated, that if $P_1, P_2, P_3 + \dots = 1$, then

$$C_1 = \frac{P_1}{P_1 + P_2 + P_3 + \dots}, \text{ and so on.}$$

The ordinary way of "making a diagnosis" is based upon this. A single symptom (such as the rash in scarlatina) is taken, and the primary cause assumed with more or less of probability. [It is, however, very rash to do so in the majority of cases.] It must be admitted, however, that we have yet to discover correct numbers expressing the frequency of given symptoms; and, on this account, instead of definite numbers, the indefinite expressions "frequent", "rare", and the like, are obliged to be used. The mathematical expectation [*lit.* "hope"] is the sum or product of the desired gain or advantage in the probability of obtaining it; that is, the sum of all those possible products in which losses are estimated as negative gains. Medical men have to practise their profession in such a manner that the sum of the benefits their patients may expect to derive from their practice may be greater than the sum of the possible injuries, or negative gains. If two kinds or degrees of cure or success be possible (as, for example, in syphilis and in cataract operations), we must strive to discover for which of these the mathematical expectation is the greater. In certain cases, the *moral* probability must be substituted. [As in ovariotomy?]

The second part of the work is devoted to the elements of medical statistics.

1. Bernoulli's "law of large numbers" (one of the most remarkable and most comprehensive truths which have ever been recognised by human reason) asserts that if only two events, A and *not-A*, be possible (as life and death, for instance), the actual chance of A may be discovered within certain limits (if we repeat our observations or experiments sufficiently often) with a probability closely approaching to certainty. The proof is simple, and rests on the binomial theorem.

2. If we have determined, by statistics in large numbers or long series of *comparable* cases, how often a definite event occurs (as, for example, a fatal termination in a given disease) once (1) in q cases, we can obtain from these same numbers the possible error (τ) of the results of the observations $\frac{p}{q}$; with the probability $P = 0.9953$, we get

$$\tau = \pm \sqrt{\frac{Sp(q-p)}{q^2}}. \text{ Thus the range or boundary of the true value of}$$

the chance of the event lies between $\frac{p}{q} + \tau$ and $\frac{p}{q} - \tau$. (The proofs of this proposition, and the tables founded upon it, which spare the practitioner the trouble of calculating τ in concrete cases, may be seen in the original.) No importance is to be attributed to slight fluctuations in the relative proportions of statistics. The possible error τ is not

merely theoretical, but actually occurs. Mooren had 3 per cent. of failures at first in 102 operations on cataract by Von Gräfe's method. Taking the probability as 0.916, the error v amounts to 0.03; so that the true value of his "number of failures" might amount to 6 per cent. He has lately found in 1,500 such operations, that the average percentage of failures actually amounted to between 6 and 6½ per cent. Small numbers or short series only tell us what we *may* do in analogous cases; large numbers or long series tell us what one *ought* to do or obtain. In order to be able properly to fix the mortality of a disease at 20 per cent. from the results of statistics, the number of cases observed ought to be about 10,000.

3. If we have two long series of numbers $\left(\frac{p}{q} \text{ and } \frac{p_1}{q_1}\right)$ for the fatal termination of a disease (say pneumonia), and two different methods of cure, and we want to reckon the probabilities of each, the result, if the maximal or higher limits of the chance in the second method of cure are less than the minimal or lower limits of the chance in the first method of cure, is incontestably in favour of the former. But most of our remedies are less successful: the range or excursus of the chances in the first method of cure $\frac{p}{q} \pm v$ interferes with that of the second method of cure $\frac{p_1}{q_1} \pm v_1$. If the actual chance in both series be the same, *i. e.*, if the sum of the acting causes (*Ursachen*) be constant, then the differences between the two sets of "numbers of frequency" observed cannot exceed a certain limit, which may be estimated by means of the numbers themselves.

$$\pm \left(\frac{p}{q} - \frac{p_1}{q_1}\right) \leq v; v = \pm \sqrt{\frac{8p(q-p)}{q^3} + \frac{8p_1(q_1-p_1)}{q_1^3}}$$

The probability $P=0.9953$. If we thus discover the difference $\Delta < v$, we must admit a strong probability that the real or true chance of the events was the same in both series; as, for example, that it was immaterial in the given disease to which of two methods of treatment we might resort. If we find that $\Delta > v$, the chance of the event in the two series must have been different. If the outward circumstances and the treatment were alike in both series, *i. e.*, expectant, we have reason to believe that the character of the disease in the two series of observations was not identical. If the variation in the determining cause of the event A be of our own introduction, *e.g.*, by a change in the medication, we have fair ground to attribute the altered chances of A to the altered medication or treatment, provided we can demonstrate that, apart from the treatment, the sum of the determining causes of A in the two series was actually identical.

The remainder of the pamphlet is devoted to a comparison, on these principles, of Von Gräfe's method of extracting grey cataracts with the old flap operation.

We believe that the advantages of *statistics*, in other words, of long tables of cases, or their results crystallised into a formula, have been greatly overrated in medicine. At the same time, the advantages of the statistical method, and the clearness and definition given to our diagnosis and practice, and to its records, by the habit of mind engendered by mathematical studies can scarcely be overvalued. In a future paper, we hope to give a practical turn to some of these theoretical remarks. One thing is quite evident, that such methods would give the death-blow to most of our modern systems of quackery.

HOSPITAL REFORM.

THE Queen's Hospital, Birmingham, deserves great credit for the manner in which it has persevered in its efforts to stem the current of abuse, and to introduce a sounder system into hospital administration. It is now several years since it instituted an inquiry into the social condition and circumstances of its out-patients, which resulted in the unsatisfactory discovery that considerably more than one-fourth of the applicants were unsuitable upon one ground or another. No doubt, this has led the committee to give their attentive consideration to the whole subject of hospital admissions; and we are not surprised to hear

that they have now laid before the governors a scheme of reform. The main features are as follows: The abolition of subscribers' letters, the establishment of a registration-fee of one shilling, and the institution of an inquiry into the circumstances of the applicant. It is only to be expected that such sweeping alterations as these should excite considerable opposition. Accordingly, we find that a public meeting has been held, presided over by Mr. Sampson Gamgee, in order to protest against their adoption. The opposition seems to have originated principally with the promoters of the "Hospital Saturday", and they claim that the contributors to that fund, as well as all the subscribers of small sums, should be consulted, no less than the two guinea governors, before such changes are introduced. Mr. Gamgee is so well known as a reformer, that the fact of his presiding at the meeting shows that the opposition does not arise from a dislike to all change, but from a belief that the proposed alterations are ill-advised. And, indeed, it does seem that they are of rather too sweeping a character. The abolition of governors' letters, and the institution of a regular system of inquiry, appear to us admirable measures. They lie at the very root of all sound reform. The one is the complement of the other. First let the indiscriminate nominations be abolished, and then substitute, in their place, a system of admission according to the real necessity or urgency of the case. It was objected that an inquiry was degrading, and that the working classes had an aversion to "prying officialism". But surely such inquiry as is proposed is less degrading than the present system of begging for letters of recommendation. As regards the registration fee, however, we think the scheme requires amendment. The majority of hospital patients could, no doubt, easily afford the proposed payment of one shilling for a month's attendance. But surely there are others, whom even a stringent inquiry would adjudge to be suitable applicants, upon whom the registration fee would fall very heavily. We are most desirous that plans should be adopted which would require the working classes to contribute according to their means; but, on the other hand, we should much regret if our hospitals lost their philanthropic character, and ceased to be the means of offering charitable assistance to the really needy and deserving poor. The opposition to these reforms at the Queen's Hospital springs, as we have said, chiefly from the promoters of "Hospital Saturday". But we have never looked with much favour upon "Hospital Saturday" either in the metropolis or elsewhere. It appears to us a very questionable means of bringing the working classes into relation with the hospitals. As at present arranged, it gives to a large and very ill-defined class a kind of right to hospital treatment, though, perhaps, while abundantly well able to pay their own medical man, they may individually have contributed little or nothing to the fund. As a system, it lacks individuality. What is needed at our hospitals is, that working people should be required to contribute according to their means; that for their contributions they should receive ample relief; while those who cannot reasonably be expected to pay anything for themselves, but who are nevertheless above the pauper class, should continue to receive gratuitous assistance.

A SPECIAL general meeting of the Chester General Infirmary took place on the 9th instant. The meeting was well attended, and an important discussion took place on the duties of physicians in relation to general practice, to which we shall allude in a future number.

A NEW convalescent home for metropolitan children was opened on Monday by the Prince of Wales, at Kingston Hill. The home is built to accommodate 180 children, at a cost of £10,000, of which £6,400 is still owing.

MR. HAMILTON A. ROBERTS has been granted a pension of £300 *per annum* upon resigning as medical officer to the Penrhyn Quarry Benefit Club and Infirmary, Bangor, after upwards of forty years' service; *viz.*, £150 from the men, and £150 from Lord Penrhyn, the proprietor.

ON Tuesday last, Dr. Clement Godson was elected Assistant Obstetric Physician to St. Bartholomew's Hospital. There were four other candidates in the field.

A RELATIVE of the late Mr. Thomas Turner of Manchester has just published a memoir of that distinguished surgeon. The book is inscribed to the principal and professors of Owens College.

DR. GILBERT SMITH and Dr. Greenfield have been elected physicians to the Royal Hospital for Diseases of the Chest, City Road, *vice* Dr. Dobell, elected consulting-physician, and Dr. Donkin, resigned.

A CASE of hydrophobia occurred at Wigan recently. A woman was bitten on the nose by a dog while she was beating it. The wound healed gradually; but symptoms of hydrophobia appeared, and rapidly proved fatal.

UP to the present time, the amount handed over from the various congregations to the Hospital Sunday Fund amounts to £27,300. This sum is about £800 less than that of last year, and exceeds by £1,200 the sum realised by the first year's collection.

A BUTCHER named Lerch, residing at Linden, near Hanover, has been condemned to two years' imprisonment for gross negligence. His offence was the selling of a quantity of trichinised meat, which caused the illness of about four hundred persons, and the deaths of more than fifty.

MR. LE GROS CLARK'S Annual Report on the affairs of the Royal College of Surgeons is a clear summary of the progress of events in Lincoln's Inn Fields, which has, however, been pretty completely anticipated by the notices which have appeared in our columns from time to time. A copy of it will be sent to every Fellow, and Members will be furnished with it on application.

A VERY awkward excuse is made for the very tardy discovery of "a misapprehension in relation to the appointment of examiners", on which the shipwreck of the conjoint examination scheme is threatened. If the College of Surgeons intended from the first to maintain an exclusive right to the nomination of the surgical examiners, as is here stated, we should very much like to see the passage in the reports and scheme, which they approved, in which that right is expressed.

THE Managers of the Metropolitan Asylums Board made their annual inspection of the Caterham Asylum on the 10th instant. The asylum contains nearly 2,000 patients, of whom 1,900 are imbeciles. The plan adopted there of reclaiming and cultivating what at one time was almost waste ground has been productive of great benefit to the patients by curing many who were looked upon as chronic cases, and also in an economical point of view by greatly reducing the cost of each inmate.

WE publish in another column a communication from Mr. Hamilton Cartwright, with reference to a brief note which we published lately on the subject of the two classes in the dental profession. The letter expresses, apparently, the opinions of some others besides the writer. Mr. Hamilton Cartwright bears worthily the honourable name which he inherits, and he probably speaks accurately the sentiments of the higher class of dentists with whom he is socially familiar. We are well acquainted with his sentiments, and we respect and to some extent share them; but we do not see that he shakes the main propositions which we suggested rather than urged. Briefly, our proposition is, that dentistry is a "mixed" occupation, partly a profession and partly a business. The professional part of dentistry consists in the surgical care of the diseases of the teeth. The business or trade part of dentistry consists in the manufacture of sets or portions of teeth. The dentist who is a Member of the College of Surgeons partakes of the double character, first, of the surgeon, and second, of the surgical instrument-maker; and the larger part of his business commonly con-

sists of the latter. If the surgeon-dentist aspire to be purely professional, he might, perhaps, entrust to other hands the second part of the avocations which are at present combined. We do not know how far this would really ultimately be desirable or possible, but the suggestion serves to explain more fully our meaning. We are, of course, well aware of the claims to social and professional respect of many of the best known members of the dental profession; but that does not touch the argument. The practical bearing of the matter is, that the attempt to force a professional character upon trade proceedings only vitiates and gilds the facts. Beneath the veneer, as beneath all veneer, there is apt to be a good deal of unsoundness. The professional part of dentistry would possibly be more wholly and generally conducted with the required professional safeguards, and more easily regulated on a purely professional basis, if it were separated from the trade element; and the trade part of the business would possibly be more soundly, cheaply, and efficiently done, if it were released from its quasi-professional fetters, done on a large scale, superintended and conducted with a view to rigid economy and soundness, and made more universally accessible in a reliable form. Good and cheap mechanical is as much a desideratum as highly professionally skilled dental surgery. We should be glad to have the views of Mr. Cartwright and his colleagues on that aspect of the question. We trust that it may not be thought that there is here anything which can be offensive to the many highly cultivated gentlemen to whom the professional aspect of dentistry is that for which they most highly value it, and that to which they would always cling.

THE ROYAL COMMISSION ON VIVISECTION.

OUR attention is called to the fact that the "Royal Commission to inquire into the Practice of Subjecting Live Animals to Experiments for Scientific Purposes" is proceeding very rapidly with its inquiry, and has held four or five meetings, at which a great many witnesses have been examined, but at none of which has Professor Huxley been present. As Mr. Huxley was placed on the Commission to supply the element of high physiological scientific acquirement essential in such a Commission, but otherwise wanting (except collaterally to some extent through Mr. Erichsen), Mr. Huxley's absence, and the continued meetings of the Commission thus imperfectly constituted, are the subject of dissatisfied comment. No one objected to the constitution of a highly informed and competent tribunal to investigate this question; but, in the absence of the only physiologist appointed to assist the Commission in its appreciation of the full bearings of the evidence, such a tribunal can hardly be considered competent. The only one member of this Commission who is known to have devoted much previous energy and interest to the subject is publicly committed to the statement that it were better that mankind should suffer for generations from curable disease and removable pain, than that animals should suffer in order that the means of curing disease and relieving pain should be discovered. These are, at least, the convictions of an enthusiast; and it is unfortunate that the counterbalancing knowledge and judgment of Mr. Huxley fail the Commission at the time when, in the great public interests of the healing art, they are most needed.

THE CHOLERA IN SYRIA: QUARANTINE.

A CORRESPONDENT writes:—You have by this time probably received advices relative to the recent outbreak of cholera in Syria. It seems to have first shown itself in Hama, a town of considerable size, five days distant from Damascus. The Turkish officials appear to have acted with unusual promptitude, immediately taking steps to localise and stamp out the epidemic, drawing a *cordon sanitaire* round the infected town; but as it was found, from a variety of adverse circumstances, to be impossible to maintain the same efficiently, it was withdrawn. On June 21st, seven deaths were returned. It seems that the disease is unfortunately spreading itself to the neighbouring and outlying villages. A few isolated cases, it is reported, have occurred in Antioch, Aleppo, and Damascus. Quarantine has been rigidly enforced upon all vessels

from Syria entering the ports of Syra and Trieste, their bills of health being endorsed "Cholera exists at Hama". A medical commission is to be at once despatched from Constantinople to the cholera districts, the principal members being Drs. Millingen and Littour. We have to deplore the loss of a very able physician, Dr. Willon, late resident sanitary medical officer at Mussul, who died at Hama from the effects of cholera.

HOSPITAL OUT-PATIENTS.

WE lately mentioned that an excellent plan had been adopted at the Children's Hospital, Great Ormond Street, and that no patient would be prescribed for a second time unless his hospital letter had been stamped at the Charity Organisation Society's office of the district in which he lives. The following case, extracted from the *Reporter* of June 30th, shows how impossible it is to accept the off-hand statements of the patients themselves.

"The Islington Committee has had to inquire into the circumstances of an applicant for the Children's Hospital, Great Ormond Street. She stated at the hospital that her husband's earnings were 20s. weekly. On inquiry, it was found that his wages were 36s. weekly. They have nine children; the eldest (19) was earning 12s.; the four next younger were apprentices, receiving a few shillings, say 10s., between them; their several ages 17, 15, 14, and 11. They rent a six-roomed house, where they have lived fourteen years, the rent being £28. They let off two rooms at 6s. 6d. per week, and the husband is a member of two clubs."

From the same source we learn that a person, about whom the Kensington Committee had been requested to make inquiries, declined to allow the Committee to verify her statements, and added that she preferred subscribing to a provident dispensary.

A GOOD LESSON.

THE governors of the Cheltenham General Hospital and Dispensary have been advertising for an honorary medical officer to the Branch Dispensary for the last three months; but, not having succeeded, they have at length advertised for a paid officer, to receive a salary of £50 *per annum*, for attending four days a week. We rejoice at this; for, although the amount is not large, an useful principle is vindicated.

ABORTIONISTS.

THE sentence of death which was recently carried out does not appear to have been the means of causing a discontinuance of the crime. The sentence of twenty years' penal servitude which was awarded to Mary Ann Billington by Mr. Justice Field, on Tuesday, may perhaps have a wholesome effect. It was stated that the prisoner had been in the habit of carrying on the trade for many years. It is, however, satisfactory to know that she will not be able to do so again for many years hence.

EXPERIMENTAL PHYSIOLOGY: ITS RECENT SERVICES TO THE STUDY OF NERVOUS DISEASE.

WHEN the works of Charles Bell, Magendie, Longet, Bernard, etc., had taught the knowledge of the functions of the nervous system, when the normal anatomy of the brain, medulla, and nerves was known in a more precise way, it was possible to study with profit the changes in these portions of the nervous system. Thus the labours of the physiologists opened the way to the discoveries of the clinical teachers; but at the present time, by a curious exchange, clinical research, basing itself on pathological facts which are veritable experiments, has been able to determine the properties of some parts of the nervous system of which the physiologists had not been able to ascertain the function. It is to clinical observation that we owe the knowledge of the function of several parts of the encephalon, regarding which our physiological information is not yet sufficiently precise nor extensive to enable us to found on them a classification of the diseases of the nervous system. Thus M. Dieulafoy has not felt himself capable, in his new work *On the Progress realised by Experimental Physiology in the Knowledge of the Nervous System*, of considering the part played by physiology in the knowledge

of the diseases of the nervous system from a general point of view; but he has studied it successively with regard to each part of the nervous system: medulla, mesocephalon, encephalon, cerebellum, and nerves. Physiology, by establishing the fact of the influence of the medulla on sensibility and motility, the reflex actions, respiration, circulation, calorification, the modifications of the pupil, has indicated the phenomena which should be sought for by the clinical teacher in the diseases of the medulla, and has given facilities for the more precise definition of the affections of the nerve-axis, and even for the determination of the precise situation of the lesions in the medulla, whether in the grey or white substance, the anterior or posterior funiculi. Physiology has indicated that glycosuria, albuminuria, and polyuria, may be accidents of bulbar origin: it has also explained the production of sudden death as a consequence of lesions of the medulla oblongata. The trophic troubles, eschars, arthropathies, pulmonary or renal lesions observed after experimental lesions of the encephalon, have been found again in clinical practice. The conjugate deviation of the eyes, and the rotation of the head, produced by softening of the brain, have been explained. Finally, attention has been latterly called to the existence of excito-motor centres on the surface of the brain. M. Vulpian has shown that disturbances of motion observed after lesions of the cerebellum were due either to excitement or compression of the neighbouring parts. The trophic disturbances supervening on section of the nerves, the degeneration and regeneration of the nerve-fibres, have been studied by the physiologists. It is, indeed, to them that we owe the knowledge of the real action of the facial and trigeminal nerves, the influence of the changes of the great sympathetic and the pneumogastric on the movements of the heart, the laryngeal troubles consecutive on lesions of the recurrent nerve, and the production of glaucoma after lesions of the trigeminal nerve.

THE CANVASSING SYSTEM.

IT is stated that not fewer than 2,101 subscribers to the Royal Medical Benevolent College have signed a memorial with the object of abolishing the canvassing system; whilst, as nearly as can be ascertained at present, 255 only are in favour of continuing the present system. A memorial with a similar object has been sent to the Board of Management of the Governesses' Benevolent Institution, and supported with the same relative number of subscribers.

SOCIAL SCIENCE ASSOCIATION.

THE following are the special questions, in addition to other voluntary subjects, for discussion in the Health Department of the Social Science Association during the forthcoming meeting at Brighton:—
1. To what causes are to be attributed the ill-construction and want of sanitary provisions which exist in the dwellings of the upper and middle classes; and what is the best method which should be adopted to remedy and rectify the same? 2. What are the advantages or disadvantages of water-supply being lodged in the hands of local authorities? 3. What are the advantages of English, as compared with foreign, watering-places and health-resorts? What are the best means for rendering the English watering-places more efficient, for obviating the dangers arising from the occasional introduction of infectious diseases, and for determining the annual rate of mortality in each district?

DEATH FROM CHLOROFORM.

AN account of another of these lamentable occurrences reaches us from the Antipodes, where the first death due to chloroform at the Adelaide Hospital occurred on the 25th February last. According to the report published in the *Australian Medical Journal*, a healthy muscular-looking man, suffering from necrosis of the last two phalanges of the little finger, was placed on the operating table for the purpose of having the finger removed. He had been kept without his dinner, and exhibited no fear or nervousness whatever, either while on the table or previously; his clothes were loosened; the heart was examined, and considered typically healthy. The administration of chloroform was then proceeded with

n the following manner. A towel, folded twice, on which was poured about a drachm, as nearly as could be guessed, was held over the face at about two inches from the nose and mouth. The respiration was regular, neither too quick nor slow; the pulse good; and the patient quiet. The administrator, finding, on smelling the towel, that the chloroform had all evaporated, renewed it. The patient from the commencement had inhaled the vapour for about two minutes, perhaps a little more, when suddenly great muscular excitement took place; every muscle was rigid; the man struggled violently, and nearly got off the table; the face and body were deeply congested, and of a dark purple colour. The use of the chloroform was immediately desisted from; the man was pulled further on to the table, and, as this was done, it was found that respiration had ceased, and that he was pulseless. All this took place in a few seconds; death seemed to have been instantaneous. The pulse, up to the time of the struggling, was firm, strong, and full. Immediately every door and window was opened; the tongue was pulled forward; cold water dashed on the face and abdomen; and artificial respiration resorted to systematically and regularly; galvanism, too, was used along the course of the phrenic nerves, and over the heart. Nélaton's method, based on the supposed anæmia of the brain in chloroform-poisoning, was followed, viz.: the head and body were inverted, the legs thrown over the shoulders of one of the house-surgeons, while the other continued the artificial respiration. This was persevered with for three-quarters of an hour, all to no purpose, and without once getting a symptom of returning animation. At the necropsy, held twenty-one hours after death, rigor mortis was not well marked; there was hypostatic congestion; on opening the thorax, both lungs were found fairly expanded, and quite healthy, but congested; the pericardium was healthy; the heart and blood-vessels contained a quantity of black fluid blood, which escaped as the heart was being removed. The right side of the heart contained black fluid blood, and in the left auricle was a clot of black blood; the left ventricle was contracted and empty; all the valves were perfect, but were stained of a dark blue colour, as was also the heart itself. The liver was rather enlarged, and weighed 6 lbs. 5 oz.; in this, in both kidneys, and in the spleen, congestion was very marked; but other than this, nothing could be found not compatible with perfect health. The brain was firm and of normal appearance, but it was very anæmic; the right and left cerebral ventricles contained but a small quantity of fluid.

FINANCES OF THE ROYAL COLLEGE OF SURGEONS.

FROM the annual report of the receipts and expenditure of the Royal College of Surgeons of England, which was submitted to the Council on the 5th instant, it appears that the former amounted to £16,057 12s. 4d., and the latter to £14,052 8s. 2d., showing the good balance of £2,005 4s. 2d. The income is derived principally from fees paid on examinations for the diplomas of fellow and member, and of dental and obstetric licentiate, which produced £11,156 7s. The rents from chambers adjoining the College, and dividends on stock, amounted to £2,587 2s. 2d. There appears a great falling off in the amount received for elections into the Fellowship against former years, and, doubtless, this will continue to be the case, seeing that only those gentlemen who were members of the College prior to 1843 are eligible for election. On the present occasion, the receipts for elections to the Fellowship, Council, and Court of Examiners amounted to £136 10s. The trust funds yielded £251 9s., the largest sum accruing from the Erasmus Wilson Endowment of £5,000, which is put down at £148 15s. Of the expenditure, amounting to £14,052 8s. 2d., the largest sum is in fees paid to members of the Courts and Boards of Examiners, including the College of Preceptors; to Council, auditors, etc., amounting to £5,312 12s. 10d. Salaries and wages for the three departments of college, library, and museum are put down at £3,915 6s. 7d.; taxes, rates, insurance, diploma stamps, £1,217 8s. 7d., exclusive of postage; alterations, repairs, and painting, £904 11s. 10d. Pensions are gradually decreasing, owing to the coming of age of the Tuckett family, and now amount to £316 2s.

THE OUTBREAK OF SCARLATINA IN KENSINGTON.

THE suggestion of a contemporary that the outbreak of scarlatina amongst the guests at a fashionable party might have been caused either from the table linen, or by new dresses, has been satisfactorily disposed of. The table linen had not been in use since November last, and no new clothing had been made for the occasion. These facts, of course, neutralise the theory that the outbreak was due either to an infected laundry or dressmaking establishment. A searching inquiry is being instituted with a view to trace the cause of the outbreak.

THE EAST LONDON HOSPITAL FOR CHILDREN.

THERE are few institutions of more real value in crowded town populations than hospitals for children; their importance, whether regarded from a charitable or sanitary point of view, can scarcely be overrated. On the last day of June, the Duke of Westminster laid the foundation stone of a new and enlarged building for the East London Hospital for Children and Dispensary for Women. The site, which adjoins the well-known Peabody dwellings in Shadwell, has been purchased for £1,900; the building and furnishing of the new hospital will entail a further expenditure of £15,000, of which it is said that £7,000 has got to be raised. This charitable institution was founded on a small scale in January 1868, but the demands upon the resources of the hospital have rapidly increased of late, and the new building is designed to provide accommodation for a hundred and thirty-six in-patients. The new East London Hospital for Children, when completed, will be one of the largest hospitals of the kind in the metropolis, and in no part of London is such an institution so certain to be fully appreciated as in the crowded and poor population of the East-end.

PIG-KEEPING IN TOWNS.

THERE are few questions connected with the health of towns that appear more difficult to deal with in some places than that of keeping pigs. At a recent meeting of the Dudley Town Council, during a discussion following the reading of a report of the Sanitary Committee, a member rose and stated that he had promised his constituents to ask the Mayor officially whether a *poor man could keep a pig*. The natural answer of the Mayor was, that pigs might be kept unless they became a nuisance. He added, however, that no particular distance from a dwelling was sufficient for the maintenance of a pigsty, if, in the inspector's judgment, or in consequence of the complaints of neighbours, the pig or pigs constituted a nuisance. A reference to Dr. Ballard's suggestion, that no pigs should be allowed to be kept within the borough, was received with laughter. There is evidently a good deal of strong feeling about pig-keeping in Dudley, which is likely to give the Town Council some trouble, unless they face the matter boldly.

A PHILADELPHIA DOCTOR IN A GERMAN COURT OF LAW.

A PERSON named Carl Christoph Müller has lately come under the notice of the Bavarian law-courts for infringement of the laws relative to the practice of medicine. In February last, he was found guilty by the court at Hamburg in Upper Franconia, as having announced himself in five newspapers as a "Doctor of Medicine, specialist for Hernia, Prolapsus Uteri, and Chronic Diseases"; thereby declaring himself to be a qualified person, although he had not been approved as such by any recognised authority. Against this judgment he appealed to the supreme court at Munich, stating that he was entitled to call himself "Doctor", in consequence of having received a diploma from the University of Philadelphia, and that he had never announced himself to the public as a physician or by any similar title. The appeal was rejected by the court at Munich on the following grounds. Apart from the question whether Müller had really obtained the academical degree of Doctor of Medicine from the University of Philadelphia, after such an examination as to his scientific competency as might serve as the foundation of a claim for the recognition of the degree according to the academic requirements in Germany, the use of the title in conjunction with the announcement that he undertook the

treatment of certain diseases implied the assumption of the title of physician (Arzt); for which a degree is not necessary, but as to which he had not received the necessary authorisation.

IRELAND.

SCARLATINA still continues its ravages in Belfast, nine deaths being registered during the past week from this disease, and a similar number the week preceding.

FEVER-CABS.

Two cabs are supposed to be supplied by the Corporation of Dublin for the conveyance of fever-patients to hospital from their homes; but, at a late meeting of the Dublin Sanitary Association, it was stated that an application had been made at the Corporation dépôt, Marrowbone Lane, for a cab to carry a patient to the Meath Hospital, but no cab being there, the Cork Street fever-cab had to be used instead. On inquiry at Bass Place, no cab was available, the horse being kept there and the cab elsewhere, so that for all available purposes it was as if it did not exist. The executive committee of the Dublin Sanitary Association have requested the Public Health Committee of the corporation, who have the management of these vehicles, to inform them how many conveyances are at present available for removing fever cases to hospital, where situated, and how they are to be obtained. The plan of placing a vehicle in one place, and the horse to draw it at a distance from it, is so absurd that it would be laughable if it were not dangerous to health.

BELFAST HOSPITAL FOR DISEASES OF THE SKIN.

THE tenth annual meeting of the friends of this institution was held in Belfast on the 8th instant; the occasion being taken advantage of for the formal opening of the new hospital and baths, which have been erected, at a cost of nearly £4,000, by the generosity of the late Mr. Benn. The hospital is fitted up with all kinds of baths requisite for the cure of cutaneous diseases, and will provide internal accommodation for thirty patients. The number of patients attended to during the past year was 1,090, being 247 in excess of the previous twelve-months, of which 150 were received for intern treatment; and the number of visits paid by patients at the hospital has been 17,531. The committee sincerely hope that the efficiency of the institution may be maintained by increased subscriptions from the public, the hospital not only providing medical treatment, medicine, and relief for the poor individually, but also providing a valuable and sure means of checking the spread of contagious cutaneous diseases in Belfast and its neighbourhood. Several resolutions having been passed, including a vote of condolence with the family of the late Mr. Benn, and thanks to the medical officers, Drs. H. S. Purdon and Scott, who gave their services gratuitously, the meeting separated.

THE LORD MAYORALTY OF DUBLIN FOR 1876.

DR. G. B. OWENS, Licentiate of the Apothecaries' Hall of Ireland, and member of the governing body of the latter institution, has been nominated as Lord Mayor of Dublin for 1876. In proposing Dr. Owens as Lord Mayor, a Dublin town-councillor stated that "Dr. Owens had for twenty years been Chairman of the South City Dispensary Committee, and he had great experience in seeing the sanitary laws of the city carried out". Now, we have no doubt that Dr. Owens is much more enlightened and liberal-minded than the boards on which he has sat; but this would be rather detrimental than otherwise to his qualifications to fill the post of Lord Mayor. Dr. Owens is member of the Public Health Committee of the Dublin Corporation, which offers the inadequate salary of £10 a year each to members of our profession for discharging the important duties confided to them under the Public Health Act. Dr. Owens is a member of the governing body of the Apothecaries' Hall of Ireland, a body which has so performed its public duties that a Government Bill is now passing

through Parliament to constitute a new corporation to discharge those duties. He is a member of the South Dublin Board of Guardians, which has also insulted our profession by offering nominal salaries for important sanitary services. He is Chairman of the South City Dispensary Committee, a body recently frustrated in the attempt to browbeat a member of our profession. If Dr. Owens have much zeal or love for his profession, he has now an opportunity of showing in a practical manner his disapproval of the sanitary and medical doings of the various local boards of which he is a member.

SCOTLAND.

A CASE of triplets occurred in Edinburgh last week. The three children, all girls, were born alive.

THE French Government has made a valuable present of books to the library of the Scottish Museum of Science and Art. They consist of ninety-one octavo volumes of the patent specifications of France since 1850, with thirty-seven volumes of indices. Besides, there are twelve most valuable works in twenty-two volumes relating to the art and archæology of Paris. It is expected that they will shortly be opened to the public.

ON Tuesday, July 6th, a man named Martin, a pilot, died suddenly in a police-cell at Alloa. He was taken up the previous night for disorderly conduct and resisting the police. In the scuffle, he fell on the pavement, and was much cut about the head and face. He was sixty-five years of age.

AT a meeting of the Edinburgh University court, last week, it was resolved that a sum not exceeding £200 should be expended by the University in entertaining the British Medical Association at their meeting in Edinburgh, in August.

THE Simpson memorial statue has been restored by the sculptor, and again sent to the establishment in Chelsea to be cast. This time it has reached its destination without any mishap.

A CLEAN BILL OF HEALTH.

THE annual report of Dr. Archibald Mott for St. Andrew's shows that during 1874 there had not been a single death either from scarlatina or measles, and only one from whooping-cough. The proportion of deaths per 1,000 was only 13.96. The average death-rate in Scotland is 23.6 per 1,000.

THE CHAIR OF MEDICINE AT ST. ANDREW'S.

TWO candidates are already in the field for the chair of Medicine in St. Andrew's, vacant by the death of the late lamented Dr. Oswald Bell. They are Dr. Bell Pettigrew, whose eminent attainments are well known; and Dr. James Russell, at present the senior demonstrator of anatomy in the University of Edinburgh. The chair, though called that of medicine, is chiefly devoted to the teaching of anatomy and physiology.

EDINBURGH BOTANICAL SOCIETY.

AT the last meeting of the Edinburgh Botanical Society, Dr. T. A. G. Balfour contributed a further note on *Dionaea Muscipula*, and detailed some experiments upon this digesting plant. He put some black pepper upon one of the sensitive leaves, and it closed up and had remained closed for nearly a fortnight, secreting what is called its gastric juice. A second leaf behaved in a similar manner, but others, after closing on the pepper, soon opened again. A number of experiments were also given, in which the six hairs, where the sensitiveness is supposed to reside, were cut off with varying effects upon the closure of the leaf. Mr. Etheridge read some statistics regarding the trees of Australia, one of which, an eucalyptus, had reached the astonishing height of four hundred and eighty feet, as measured.

WANT OF WATER IN EDINBURGH.

EDINBURGH has been threatened for some time past with a want of water, and has, in some districts already suffered considerably from this cause. The fortnightly return of the state of the reservoirs shows that, since June 22nd, the total quantity of water in store has fallen from 64,510,000 cubic feet to 58,671,000 cubic feet, being a decrease during the fortnight of little less than six million cubic feet. The quantity in store at corresponding period last year was 65,500,000 cubic feet. The delivery has been continued at the usual rate, namely, 27.84 gallons per head daily to a population of 275,000. The rainfall during the past six months has been, at the Glencorse reservoir, rather higher than that of either last year or 1873, during the same periods.

SANITARY STATISTICS OF GLASGOW.

A PAMPHLET has just been issued by Dr. Russell, medical officer of health for Glasgow, together with the mortality tables of the first quarter of the present year. During the quarter, the average death-rate was 35½ per 1,000, and the birth-rate, 39 per 1,000. This high rate may be due in some way to the very large mortality among children, for it is shown that the deaths under five years of age amounted to 42 per cent. of the total deaths, and that nearly one-half of these, 45 per cent., were under one year. Of the births, 8 per cent. were illegitimate. The report from these shows that the cold weather of the last month of 1874, had not exhausted its influence on the death-rate when the unusually warm weather of January made its appearance, the mortality of the two months being at the rate of 49 and 40 per 1,000 respectively. The deaths from scarlet fever had declined from 809 in the last quarter of 1874, to 189 in the first quarter of the present year.

FORFARSHIRE MEDICAL ASSOCIATION.

THE seventeenth annual meeting of the Forfarshire Medical Association was held at Arbroath on July 8th; Dr. Dewar, President, in the chair. The minutes of last annual meeting and subsequent meetings of Council were read and approved of, as were also the Treasurer's accounts. It was resolved to take no action in the matter of the proposed Scottish Medical Association. On the motion of Dr. S. Lawrence, it was agreed that the Association petition the Home Secretary for the release of Mrs. Marsden, at present undergoing imprisonment on the charge of homicide by infection. The petition alleges "that the indictment was based solely upon the fact of the two women, Ellen Goodier and Ann Mills, having died of so-called puerperal fever while attended by the said Elizabeth Marsden; that throughout the medical profession, as abundantly testified by recent discussions, there exists the greatest discrepancy of opinion in regard to numerous questions connected with so-called puerperal fever—especially as to whether any given case or series of cases has been produced by contagion, or has originated in other causes; that, while we consider that the said Elizabeth Marsden acted at variance with ordinary prudence in not abstaining from further midwifery practice when advised to do so, yet, in the prevailing uncertainty of medical opinion above referred to, the charge of homicide by contagion in regard to one or more fatal puerperal cases occurring in the practice of any medical man or midwife, is a charge not only without precedent in the annals of criminal jurisprudence, but which cannot by any possibility be scientifically proven, inasmuch as the evidence and argument by which it is sought to establish it are notoriously full of doubt and fallacy." Montrose was fixed on as the place of meeting for next year, and the following gentlemen were elected office-bearers: *President*—Dr. S. Lawrence, Montrose; *Vice-Presidents*, Drs. Howden and Nimmo; *Honorary Secretary*—Dr. Duncan; *Honorary Treasurer*—Dr. Campbell; *Council*—Drs. Arrott, Christie, Miller, MacLagan, M'Ewan, and Small, Dundee. The President, Dr. Dewar, then read a paper on Recent Changes in Therapeutics, in which he touched on many of the most important advances in the practice of medicine and surgery introduced within the last fifteen or twenty years. A short discussion ensued; and, on the motion of Dr. Christie, the thanks of the meeting were accorded to Dr. Dewar for his paper. The members afterwards dined together.

THE COLLEGE TEST.

THE following report from the Court of Examiners of the College of Surgeons of England, showing the number of candidates who have passed and have been rejected from each medical school during the collegiate year 1874-75, was presented to the Council on the 8th inst.

Primary Examinations.

Medical School.	Totals.	Number passed.	Number rejected.	Percentage of rejections.
University College	87	61.50	25.50	29.3

INDEX TO VOLUME I FOR 1875.

- A.
Abdomen, obscure tumour of, 60; pulmonary and cardiac complications of tumours of, 588
Abortion, pelvic cellulitis after, 640
Abortifacient, execution of an, 511, 552
Abscess of spine treated by caustics, 57; mammary, prevention of by rest, 125; postpharyngeal, Mr. S. W. Hope on, 213; of cerebellum from disease of temporal bone, 360; of kidney bursting into peritoneum, 361; psoas, communicating with spinal canal, 508; cerebral, 643; laryngeal, from catarrh and pyæmia, Dr. Whipham on, 805
Absinthe, effects of, 346
Abstinence, total, 533
Academy of Medicine in Paris, discussions in, 587, 819; annual meeting, 696
Accoucheurs, responsibility of, 875. *See also* Fever, puerperal, and Puerperal infection
Acland, Dr. H. W., address to General Medical Council, 799
Actions for recovery of fees, 52, 862; for libel, 117
Acton, Mr. W., syphilis among troops in London and Continental stations, 522
Acts of Parliament, the wording of, 316
Adams, Dr. Robert, obituary notice of, 194; resolution of Council of College of Surgeons of Ireland, 319
Addison's disease, Dr. E. H. Greenhow's Croonian lectures on, 301, 335, 369, 406, 437, 467
Adulteration, definition of, 151; Act, working of the, 282, 484, 488; the new Bill on, 283, 315, 552; proceedings in Parliament regarding, 296, 400, 731, 827; of food in Dublin, 455; of milk, 353, 455, 586, 730
Advertising, medical, Mr. J. R. Lane on, 72; remarks on, 181, 220, 247, 582; letters on, 192; the *Gazette Médicale de Paris* on, 392; *Boston Medical and Surgical Journal* on, 680; resolution of Midland Branch on, 868
Agricultural dietary, 616
Albuminuria of cholera, Dr. W. L. Lindsay on, 9; chronic, kidneys in a case of, 179
Alcohol, action on stomach, 20; as a medicine, Mr. W. Berry on, 78; effect of in cold weather, 86; Mr. T. P. Lucas on Action and Physiological Effects of, *rev.*, 211; letter on, 533
Alcoholism, M. Magnan on, *rev.*, 346
Aldershot, notes from, 730
Aldridge, Dr. R., testimonial to, 764
Alford, Dr. H. J., the relation of croup and diphtheria, 381
— Mr. S. S., the proposed hospital at Hampstead, 27, 64; legislation for dipsomaniacs, 699
Allan, Dr. J. W., case of idiosyncrasy, 95
Allarton's operation, Mr. Bishopp on removal of a foreign body by, 747
Allbutt, Dr. Clifford, the clinical thermopile, 309
Alfrey, Dr. C. H., body-force and stimulants, 30
Aloes, resin of, 454
Althaus, Dr. J., French translation of his report on medical electric instruments, 549
Amblyopia, subcutaneous injection of strychnia in, 246
America, sanitary statistics in Far West of, 187
"American Doctor", the, 184
Ammonia, action of on animal organism, 451
Ammonium chloride, therapeutic uses of, 499
Amputation, mortality after in England and Ireland, 219; at hip-joint, 787
Amyl, nitrite of, therapeutic use of, 143; in dysmenorrhœa, 212; action on vessels of brain, 279; Dr. W. Munro on effect of, 811
Anæmia, idiopathic, Mr. R. W. Egan on, 44; artificial, 688
Anesthetics, effect of alcoholic drinks before, Mr. Clover on, 640; use of in vivisection, Dr. Hoggan's remarks on, 749, 829. *See* Chloroform and Ether
Anatomy, discussion in Medical Council on examinations in, 850, 854
Ancient remains in Scotland, 586; remedies, 812
Anderson, Mrs. E. Garrett, contraction of the lower extremities with muscular wasting, 379; pleuritic effusion, and thoracentesis, 545
— Dr. J. W., etiology of hysteria, 838
— Dr. T. McCall, internal administration of tar in psoriasis, 537
— Dr. Thomas, obituary notice of, 65
Andrews, Dr. H. C., inquests and police, 873
Aneurism of thoracic aorta, 14, 146, 259, 276, 293, 326, 360, 826; of popliteal artery, 14, 709; of heart, 61, 257, 325; of mitral valve, 91; treatment by flexion, 511; intracranial, spontaneous cure of, 525; subclavian, treated by temporary compression, 588; of occipital artery treated by ligature of common carotid, Mr. Lane on, 635; of innominate artery, 692; multiple, 694; varicose, of femoral artery, 713; aortic, ligature of carotid for, 726; varicose, of orbit, Mr. F. P. Lansdown on, 736, 846; aortic, Dr. W. Parkes on morphia injections in a case of, 745; aortic, spontaneous cure of, 782
Aneurismal tumours of orbit, Mr. W. Rivington on, 426, 771; Mr. F. P. Lansdown on case of, 736, 845
Angioma, galvano-cautic puncture of, 688
Angus, Mr. J. A., treatment of spina bifida, 508
Aniline die, poisoning by, 817
Animals, experiments on, results of, 56, 90, 512; letters on, 126, 191; researches on diseases of, 653. *See* Vivisection
Ankle-joint, excision of, 693
Annandale, Mr. T., ununited fracture of forearm successfully treated, 33; treatment of varicose veins, 139; fracture through both rami of lower jaw, 170; excision of fibula with cartilaginous tumour, 242; treatment of cancer of the tongue, 834
Antagonism of medicines, report of Committee on, 97; between picrotoxin and chloral-hydrate, Dr. J. C. Browne on, 409, 442, 476, 506, 540
Antiseptic, salicylic acid as an, 252, 316; thymol as an, 630; method, results of, 688
Antivaccination demonstration, 183
Aorta, thoracic, aneurism of, 14, 156, 259, 276, 293, 326, 360, 726, 782, 826; Dr. W. E. Parkes on case of, 745; annular constriction of, 782
Aphasia, report on a case of, 568
Apoplexy, Dr. A. Martin on tumour of brain simulating, 42; diagnosis from drunkenness, 715, 716, 723; of cerebellum, 774
Apothecaries' Hall of Ireland, charge of negligence against, 491, 754; discussion in Medical Council on examinations of, 854
— Society, London, examination in Arts, 529; lectures on State Medicine at, 654; pass lists, *see* Medical News in each number
Appendix vermiformis, Dr. J. Coats on cases of affection of, 3; death from perforation of, 547; peritonitis from foreign body in, 727
Apyretics, 417
Aqua vite, aqua mortis, 415
Arboretum, proposed, in Edinburgh, 454
Arctic expedition, medical officers of, 188, 753
Arm, tumour of, 258; affection of during pregnancy, Mr. J. Cross on, 447
Arm-presentation, double, Mr. J. Henderson on, 141; Mr. A. Milroy on, 275
Army, British, The British Medical Association and the grant of honours to medical officers, 30; movements of medical officers, 30, 93, 193, 226, 264, 362, 461, 529, 594, 795, 827, 873; Dr. E. Hamilton on Medical Service of, *rev.*, 48; Dr. De Chaumont's pamphlet on, 64; deaths, 93, 529; medical service as a life-career for surgeons, 121; promotions and appointments, 161, 363, 697; an obstacle to reform, 182, 461; source of discontent in, 193, 595; successful candidates for medical service, 226, 363; grievances of officers attached to regiments, 226; letters on medical department, 227, 297, 298, 329, 595, 697; remarks on examination, 329; ministerial explanations, 399; Dr. Hamilton's statistics, 462; reorganisation of medical department, 462; opening of summer sessions of medical school, 488; retirements, 529; reduction of number of medical officers, 497; Dr. Fayer's address at medical school of, 504; proposed hospital corps, 512; duties of medical officers, 530; medical officers and the British Medical Association, 551; Ashantee honours to medical officers, 583; Medical Service of the Past and Future, *rev.*, 675; recruits, 676; failure of medical department, 697; notes from Aldershot, 730; position of medical officers attached to regiments, 730; Dr. Lush and medical officers, 827

 Society, Cambridge Philosophical, meeting of, 15
 — Charity Organisation, first annual meeting, 252; treatment of idiots, 865
 — Clinical of London: officers and council, 22; correction of report, 67; annual meeting, 86; subcutaneous urethrotomy, 91; fibrous naso-pharyngeal polypus, 92; hæmoptysis in a syphilitic patient, 10; periostitis relieved by incision, 114; subperiosteal excision of os calcis, 115; optic neuritis with loss of vision, and recovery, 10; president's address, 233, 257; paralysis of *Serratia magnus* muscle, 257, 323; lepra anæsthesia, 257; antiseptic Japanese paper as a dressing for wounds and ulcers, 322; elephantiasis Græcorum, 323; case of exceeding infrequency of pulse, 323; excessive and long maintained high temperature after injury to the spine, 324; hypertrophy of lower parts of face, 394; tinea favosa, 10; fatal pleuropneumonia in a person addicted to excessive use of alcohol, morphia, cannabis Indica, and iodide of potassium, 10; acute necrosis of ulna, 395; disseminated cerebro-spinal sclerosis, 521; unusual case of lead-poisoning, 525; intracranial aneurism with spontaneous cure, 10; cases of pyæmia and of acute general military tuberculosis with ear-disease, 528; fibroma, 589; disordered nerve-function in an infant, 10; scald of glottis with deposit of diphtheritic membrane, 10; cause of some of the eruptions classed as hydron, 724; acute fatty degeneration of heart, 10; absence of pulsation in radial arteries, 10; dilated heart in which right ventricle was tapped, 725
 — Edinburgh Medical Missionary, report of, 89
 — Epidemiological, of London, relations between diphtheria and scarlet fever, 176; arithmetical questions involved in rise and progress of epidemics, 458; sanitary conference in Vienna, 825
 — Harveian, officers and Council, 21; annual meeting, 118; cerebral complication of typhoid fever in children, 222; treatment of primary disease of heart, 292; lectureship, 421; facial neuralgia, 591; tinnitus aurium, 10
 — Harveian, of Edinburgh, annual festival, 551
 — Hunterian, officers and council, 251
 — Leeds and West Riding Medical Surgical, annual meeting, 752
 — Manchester Medical, molluscum fibrosum, 179; chronic albuminuria, 10; diseased liver and ascites, 10; avulsion of scalp, 10; encapsulated scirrhous of breast, 10; officers and council, 217; tumour of brain, 459; multiple sarcoma, 10; abnormal appendix of bowel, 10; melanotic tumour of orbit, 10; tuberculous ulcers of ileum, 10; diseased kidneys, 10; mitral stenosis, 10
 — Medical, of College of Physicians in Ireland, president's address, 17; Cheyne-Stokes' respiration, 10
 — Medical, of London, dislocation of patella, 15; cystic sarcoma of neck, 10; excision of knee-joint, 10; cleft palate, 61, 62; scirrhous tumour of breast, 61; epidemic sore-throat, 10; malignant tumour of leg, 176; least sacrifice of parts as a principle of surgical practice, 177; anniversary dinner, 388; annual *convegazione*, 618
 — Medical Microscopical, officers and council, 151; mounting microscopical specimens, 459; marking specimens, 160; spinal cord in infantile convulsions, 10; urate of soda in heart, 10; myxoma, 10
 — Medical, of Pennsylvania, Transactions of, *rec.*, 384
 — Medico-Chirurgical of Edinburgh, case simulating inguinal hernia, 16; excision of lip, 10; separation of heart, 10; pleuropneumonia in an infant, 10; epithelioma of lower lip, 10; calculus of female bladder, 10; modification of catheter, 10; excision of bones of foot, 10; instruments for internal urethrotomy, 10; ovarian tumour, 10; lodgment of false teeth in œsophagus, 10; cases of suffocation, 10; exhibition of patients, specimens, etc., 178, 294, 493, 726, 782, 872; bloodless surgery, 178; hydronephrosis, 179; jahorandi, 10; cancer of ovary, 291; grouse-disease, 193; cases in

conservative surgery, 10; hæmaturia, 726; treatment of stricture of urethra, 10; operation for intussusception in a child, 10; experimental production of a wound, 782; injury of hand, 10; disease of knee-joint, 10; fluid in pelvis after ovariotomy, 872; pathology of contracted granular kidney, 10
 Society, Medico-Physical of Florence, prize of, 717
 — Newcastle and Gateshead Provident Medical, *voirc* of, 149
 — North London Medical, formation of, 553
 — Obstetrical of Dublin, report of thirty-sixth session, 17; president's address, 10; election of officers, 10; vote of thanks, 10
 — Obstetrical of London, proposed new officers of, 53; annual meeting, 87; hydatidiform mole, 125; ascitic fetus, 10; prevention of mammary abscess by application of principle of rest, 10; labour complicated by pelvic tumour and by convulsions, 126; Dr. Priestley's address, 165; honorary Fellows, 291; adhesion of uterus to intestine, 10; the couch-aid, 10; aborted ovum, 10; speculum-trough, 10; three cases of cephalotripsy, 10; uterus from a case of nearly sudden death, 292; treatment of chlorosis and anæmia by phosphide of zinc, 10; treatment of rigid perinæum, 10; polypus uteri treated by Vullier's pessary, 10; early course of cancer of os uteri, 429; epithelioma of cervix uteri complicated with pregnancy, 429; questions for discussion on puerperal fever, 456; relation of puerperal fever to infective diseases and pyæmia, 195, 301, 517, 617, 642, 752, 775
 — Pathological of Dublin, Bright's disease, 116; creak caused by a tongue of lung-substance, 10; cerebro-spinal meningitis, 10; aneurism of thoracic aorta, 148, 304, 826; pendulous tumour of mamma, 179; cholesterol in eyeball, 10; intracranial hæmorrhage, 10; fatty degeneration of heart, 10; fatal obstruction of intestine, 10; rupture of posterior part of liver by external force, 10; elephantiasis Arabum, 326; disease of knee-joint, 325, 327; death shortly after thoracentesis, 325; giant-celled sarcoma of lower jaw, 10; fractures of cranium, 10; ovarian cyst, 10; excessive hypertrophy and dilatation of heart, 10; central necrosis of shaft of humerus, 327; ulcer of stomach, 10; fracture of os calcis by erosion, 10; intestinal strangulation in a child, 360; dilatation and hypertrophy of heart, 10; pathological changes induced by urethral stricture, 10; abscess of cerebellum from disease of temporal bone, 10; disease of temporal bone with inflammation of orbit, 10; dilatation of clavicle, 10; congenital malformation of clavicle, 10; recurrence of sarcoma with small round cells, 10; functional tricuspid insufficiency, 361; embolism of middle cerebral artery, 10; amyloid disease of liver and kidneys, 10; necrosis of lumbricoides discharged from umbilicus, 10; rupture of renal abscess into peritoneum, 10; abscess of urethra, 10; diagnosis of simple hypertrophy of left ventricle of heart, 10; tertiary lesions of syphilis, 10; mycosis intestinalis with malignant pustule, 10; monstrous fetus, 10; necrosis of shaft of tibia, 362; calcæous pyelitis, 618; cerebral abscess, 10; influence of rest in uniting fractures and vascular membrane in dislocated joints, 10; echinocyst, 10; acute primary military tuberculosis, 727; fatal peritonitis from foreign body in vermiform appendix, 10; coexistence of gout and chronic rheumatic arthritis, 10; mitral stenosis and tricuspid regurgitation, 783; fracture of neck of femur, 783, 826
 — Pathological, of London: chondroma of the lacrymal gland, 11; osteoma of the upper jaw, 10; tumour of the dura mater, 10; polytelic aneurism, 10; excision of hip and elbow, 10; aneurism of arch of aorta, 10; rupture of trachea, 10; ovarian cyst, 15; calculi from female bladder, 10; officers and Council, 23; annual meeting, 58; cancer of omentum, 60; rare form of skin-disease, 10; obscure abdominal tumour, 10; cancer of tongue, 61; intussusception in a dog, 10; aneurism of heart, 61, 257; solid ovarian tumour, 61, 259; cancer of kidney and liver, 61; diseased kidney, 91; aneurism of mitral valve, 10; hypertrophied bursa patellæ, 10; disease of muscular papillares, 10; epithelioma of colon, 10; cancerous occlusion of rectum, 10; ulceration of rectum cured after colotomy, 10; internal stricture with rupture of cæcum, 10; overdistension of bowel from umbilical hernia, 10; corrections of report, 129; president's address, 143; papilloma of tongue, 10; congenital dislocation of femur, 144; lymphangioma secreting chyle, 10; hypertrophy of knee, 10; elongation of bones from disease, 257; leprosy, 258; tumour of arm, 10; sarcomatous tumour of eye, 10; melanoid sarcoma in a cod-fish, 10; sarcomatous growth of omentum, 10; general sarcoma, 10; incomplete direct inguinal hernia, 10; enlarged liver and spleen, 10; hæmorrhage in joints in gout, 10; cancer of breast and liver, 10; invaginated intestine, 10;

congenital defect of clavicles, 259; double thoracic aneurism, 10; fatty degeneration of muscles, 10; contraction of coronary arteries, 260; obstruction of renal arteries, 10; fibroid disease of heart, 10; fatty tumour in groin, 10; molluscum contagiosum, 325; imperfect teeth and zonular cataract, 10; aneurism of heart, 10; case of epithelioma, 326; malignant disease of testis in a child, 10; aneurism of aorta, 10; programme of discussion at, 392; disease of heart, 395; skin-disease in an infant with disease of nervous system, 10; intestinal obstruction, 396, 781; molluscum fibrosum, 396; mixed tumour of wrist, 10; tumour of shoulder, 10; tumour of scapula, 396, 781; fibro-fatty tumour of zygomatic fossa, 396; ovarian cyst with papillomatous growths, 397; secret preparations, 10; discussion on the germ-theory of disease, 402, 558, 621; blood-cyst in sarcoma, 781; nails in a duck's crop, 10; tuberculosis in the pheasant, 10; cancer in fowls, 10; gangrene of both lower limbs, 10; prolapsus lingue, 10; lymphadenoma in the pelvis, 10; softening of cerebellum, 10; pleuropneumonia, 10; pyopericardium, 10; dislocation of astragalus, 10; colloid cancer of rectum, 10; melanotic sarcoma of eyeball, 10; annular contraction of aorta, 782; spontaneous cure of aortic aneurism, 10; hernia testis in an infant, 10; acute military tuberculosis in an infant, 10
 Society, Pathological and Clinical of Glasgow, morbid specimens, etc., 62, 178, 494, 783; mediastinal tumour, 62; colloid tumour of mamma, 10; malignant tumour on chest-wall, 63; cerebral tumours in a horse, 177; improved elastic tourniquet, 178; neuroma, microscopic characters, 10; shred of hyaline (?) or rain-skin (?), 203; recurrent tumour, 10; deficiency of corpus callosum in an idiot, 293, 494; impacted pessary, with vesico-vaginal fistula, 293; gævanism in hyperæsthesia of fingers, 10; brain of an aphasic, 10; crural membrane, 10; aortic aneurism protruding into right auricle, 10; aneurism of aorta perforating right ventricle, 10; pityriasis rubra recurring during seventeen years, 359; cancer of lower curvature of stomach, 10; cancer bladder and kidneys, 10; scirrhus of breast, 10; tumour on outer side of knee, 360; spontaneous extension of upper articular epiphysis of femur, 10; atelectasis and emphysema, 10; large epiphysematous bulla, 10; intraocular tumour, 494; melanotic cancer in liver, etc., with peculiar reaction of urine, 10; fatty tumour of uterus, 495; vesical calculus, 10; urethral calculi, 10; disease of calculus with large tubercles in liver, 691; hernia with double strangulation of bowel, 10; multiple aneurisms, 10; ruptured intestine from injury, 695; fractured spine in cervical and dorsal regions, 10; localized endocarditis, 10; mammary cysts with intracystic growths, 10; vesical calculi with blood-cot nucleus, 10; stricture of urethra, 782; hamatoma auris in insane patients, 783; affection of retina in Bright's disease, 10; calcified tumour of uterus, 10; enteric fever and suppuration of ear, 10
 — Pharmaceutical, annual dinner of, 680
 — for Prevention of Cruelty to Animals, the trial at Norwich, 25, 63; correspondence with Council of Royal Medical and Chirurgial Society, 216, 221
 — Provident Knowledge, tracts published by, 283
 350 — Psychological of Great Britain, proposed, 10
 — for Relief of Widows and Orphans of Medical Men, quarterly court, 152; appeal by, 391; annual meeting, 655
 — Royal, medical, candidates for fellowship, 581
 — Royal Botanical, Professor Bentley's lectures on Botany, 185
 — Royal Dublin, committees of, 391; chair of chemistry, 554
 — Royal, of Edinburgh, Neill prize, 390; Mackdougall-Brinsburn prize, 423
 — Royal Medical and Chirurgial, pathology of lupus erythematosus, 121; malarious yellow fever on board H.M.S. *Doris*, 125; temperature in phthisis pulmonalis, 175; experiments on animals, 221; hypespadias and epispadias, 10; treatment of fistulous opening by dilatation, 10; diagnostic value of ilio-femoral triangle in injuries of the hip, 10; officers and council, 283; laryngeal phthisis, 290; annual meeting, 319; president's address, 329; urinary crystals and calculi, 358; pulsating tumour of orbit, 426; syphilis among troops in London, 522; pulmonary and cardiac complications of abdominal tumours, 588; left subclavian aneurism treated by temporary compression applied directly, 10; histology of so-called nutmeg-liver, 693; excision of ankle-joint, 10; a new form of cardiograph, 694; treatment of nasal lupus by excision, 725; double facial palsy with loss of taste, 726; the so-called partial dislocation of the humerus, 10; congenital deficiency of the peritoneum, 10;

- Society, Royal Medical, of Edinburgh, annual dinner, 423
- Royal Medical Benevolent Fund of Ireland, secretary of, 684; annual meeting, 800

- Z.
- Zanzibar, Seyyid of, visit to St. Thomas's Hospital, 863
- Zygomatic fossa, fibro-fatty tumour of, 396
- Zymotic poison, 313

These figures, in which we take a parental interest, will no doubt prove very instructive to the schools. They must, however, be read subject to many qualifications, as must all figures which represent only relatively small numbers and single members of a series. They show some singular disparities, if the two tables be compared. Thus University College, which has a moderate average of rejections at the primary examination, shows most favourably in respect to the pass-examination. St. Thomas's, which suffered great slaughter at the primary, stands very well in the pass-list. Westminster is exceptionally unfortunate; but, in a small number of pupils, a few unfortunates and incapables soon spoil the percentages. We do not quite understand how it is that Westminster and Charing Cross respectively are made to appear only to have passed four men and a half and three men and a half during the year. In fact, the decimals in the "number passed" and "number rejected" puzzle us mightily; but no doubt the College arithmetic is only symbolical, else how is it possible that half a man should seem to have passed from Vienna, half a man from Galway, and half a man from Heidelberg? Where are the odd halves? Manchester men will delight to see that the highest and best average attained throughout is from Manchester. This may be taken as an excellent vindication of provincial schools generally. Birmingham, we are sorry to see, brings up the rear. That is not the right or usual place for Birmingham men; and, whatever may be the temporary reason, we may be sure that it will not endure. This list may be, as we have hinted, misleading, if too rigid inferences be drawn from it; but beyond doubt it is an excellent and most useful spur; and, though the mirror may be a little distorted, it is an excellent thing sometimes to see one's own features at the worst, if even they be shown a little awry.

SIR THOMAS WATSON ON THE TREATMENT OF HABITUAL DRUNKARDS.

THE reports which have appeared of the short address of Sir Thos. Watson on the occasion of the recent deputation to Mr. Cross, give an imperfect idea of his words and meaning. Short as was his statement, as under the circumstances was needful, it was so pregnant with meaning and will have so much permanent value, that we take an opportunity of presenting the actual words.

Sir,—My humble advocacy of this petition may be expressed in a very few sentences. I must preface them by saying that, although for much the greater part of my long professional life I was profoundly incredulous of the permanent reformation of habitual drunkards, facts have more recently come to my knowledge which have made me an almost sanguine convert to a better hope and belief.

Among habitual drunkards, there are many in whom what was begun as a vice passes into a frightful bodily and mental disease. The frequent use of intoxicating liquors in excess, and especially of alcoholic drinks, leads at length to an accumulation of the specific poison of alcohol within the system, so that the bodily tissues, and chiefly, I suppose, the nervous tissues, which include the brain, become so impregnated, so charged with the poison, or so affected somehow, as to produce a degree of craving which the unhappy dipsomaniac (for so he is rightly called) is utterly unable to resist or control. So imperative is this morbid craving, that in some instances, by his own confession, he could not refrain from swallowing the customary stimulus even if he were certain that death would be the instant result.

Now, of such persons, it is found that, if they can be strictly debarred from all access to alcoholic drinks, they will surely, though slowly, recover from this form of mania; that the incorporated poison will be gradually dislodged and eliminated from the system by the silent and sole efficacy of that beneficent force which we medical men acknowledge so thankfully, the *vis medicatrix nature*; and the wretched man or woman will become once more able, and in no small percentage of cases willing, and even anxious, to abandon the *vice*, which had been the first step towards the induction of the maniacal disease.

Now, if this be so—and from all that I have seen, and heard, and read on the subject, from experience gathered on a large scale in America, from the teachings of some of our own lunatic asylums, and from the testimony of private observers, I am fully persuaded that it is so; I might even appeal on this point to some members of the deputation now present—then I conceive that the sanctioning, by some legislative measure, of retreats or reformatories, wherein, at the instance of his relations or friends, or by his own wish, or by the sentence of a magistrate, such a sufferer could be legally detained for a time (which has been estimated to be between three and twelve months, though in my judgment three months would be far too little; and, of course, ample provision should be made against any possible abuse of such detention), such legislative action, I say, could scarcely be regarded as anything less than a national blessing.

ASSOCIATION INTELLIGENCE.

PROCEEDINGS OF THE MEETING OF COUNCIL.*

At a Meeting of the Committee of Council, held at the Queen's Hotel, Birmingham, July 13th, it was resolved:

"That the By-Laws as amended be approved and placed before the Annual Meeting in August next for adoption, in accordance with the instructions of the last Annual Meeting held at Norwich, August 1874."

PROPOSED BY-LAWS OF THE BRITISH MEDICAL ASSOCIATION.

ELECTION OF MEMBERS.

1. ANY qualified medical practitioner not disqualified by any by-law of the Association who shall be recommended as eligible by any three members may (subject as hereinafter mentioned) be elected a member by the Committee of Council, or by any recognised Branch Council.

2. No person shall be elected a member unless he has the votes of not less than three-fourths of the members present at the meeting of the Committee of Council or Branch Council at which he is proposed for election, and has agreed in writing to become a member, and to pay his subscription for the current year.

3. Any member may be expelled from the Association by a resolution of the Committee of Council, subject to confirmation by the Annual Meeting, provided that he shall have one month's notice of such resolution, and he shall thereupon cease to be a member, and shall not be eligible for re-election.

SUBSCRIPTION.

4. The subscription to the Association shall be one guinea *per annum*, which shall entitle each member to the privileges of membership and to receive the publications of the Association for the current year. The subscription shall date, and be considered due in advance on January 1st in each year, except in the case of a member admitted on or after July 1st, when the subscription for such part of a year shall be half a guinea in advance.

5. Any member whose subscription shall not have been paid on or before December 31st of the current year, shall be suspended from all privileges of membership; and at the end of the succeeding year, if the arrears be still unpaid, he shall cease to be a member, and shall be ineligible for readmission until he shall have paid all arrears due at the period of his suspension. Any member wishing to withdraw from the Association, shall give written notice of his intention to the General Secretary on or before December 1st of the current year.

HONORARY MEMBERS.

6. Any person of professional or scientific eminence, and recommended by the Committee of Council, may be elected an honorary member at the Annual Meeting of the Association.

ANNUAL MEETING.

7. The Annual Meeting shall be held at a period to be fixed by the Committee of Council; the place of meeting being determined prospectively in each year by the vote of the Association.

OFFICERS.

8. The President of the Association shall be elected annually, at the Annual Meeting, and shall enter upon the duties of his office at the next Annual Meeting, and until then shall bear the title of President-elect. Each retiring President shall be eligible for election as a Vice-President for life, provided that he continue to be a member of the Association.

9. The President of the Council shall be elected by the Council. He shall hold office for three years; and, at the first meeting of the Council after the determination of such office, a new President of Council shall be elected for the then ensuing three years; and every member who has served the office of President of the Council shall be eligible for election as a Vice-President of the Association, provided that he continue to be a member of the Association.

10. The Treasurer shall be elected at the Annual Meeting. He shall hold office for three years, and shall be *ex officio* a member of the Council and the Committee of Council; and every member who has served the office of Treasurer shall be eligible for election as a Vice-President of the Association for life, provided that he continue to be a member of the Association.

11. The Treasurer of the Association shall receive all the subscriptions and other moneys payable to, or receivable by, the Association,

* The remainder of the proceedings of the Committee of Council of the 13th inst. will appear in next week's JOURNAL.

and shall discharge all accounts which have been ordered by the Committee of Council to be paid.

12. The Editor of the JOURNAL shall be elected by the Committee of Council, and shall be remunerated in such manner as the Committee of Council shall think fit.

13. The Secretary of the Association shall be elected by the Committee of Council. He shall reside in London, and devote his whole time to the business and affairs of the Association and the office of the JOURNAL.

14. The duties of the Secretary shall include being present at the meetings of the Association, Council, and Committee of Council; the recording their respective minutes; the conducting of the correspondence of the Association; the superintending the collection of subscriptions; the enforcement of the regulations as regards those in arrear, and acting in general obedience to the directions of the Council and Committee of Council.

15. The Secretary shall be remunerated in such manner as the Committee of Council think fit; he shall hold his office during the pleasure of the Committee of Council, subject to receiving or giving (as the case may be) three months' notice to determine his appointment.

16. The offices of Secretary and Editor of the JOURNAL shall not be held by the same person.

COUNCIL.

17. The Council shall consist of the President, the President-elect, the Vice-Presidents, the President of the Council, the Treasurer, and the Readers of addresses and Presidents of Sections at the Annual General Meetings of the Association for the current and last preceding year, together with such other members of the Association as are to be elected annually by the Branches in accordance with the by-law in that behalf.

18. The Council shall hold its meetings at the time and place of the Annual or General Meetings of the Association, and at such other times and places if summoned by the President of the Council, or by the Committee of Council, or by a requisition signed by not less than twenty members of the Council. Twenty-five members shall be a quorum.

19. Each recognised Branch, as hereinafter defined, shall, before each Annual General Meeting, elect members who shall represent that Branch in the Council for the ensuing year, according to the following scheme. For every twenty members of a Branch, one member shall be elected a representative, together with one other member of such Branch, to be called the Honorary Secretary of that Branch, and who shall together represent such Branch in the Council.

20. The members so elected as representatives, or as Honorary Secretaries of Branches (and of whom a complete list shall be sent to the Secretary of the Association at least five weeks before the Annual Meeting), shall continue to be members of the Council until the Annual Meeting of the ensuing year.

21. Notice shall be given forthwith to the Secretary of the Association by a Branch, of a Representative or Honorary Secretary having ceased to belong thereto; but, unless such notice shall have been received by the Council, no resolution or vote shall be, or be deemed, invalid by reason of any member of the same being disqualified.

22. The Council shall annually prepare a report of the general state and proceedings of the Association for the past year, to be presented by them at each Annual Meeting of the Association.

23. The Council shall also, at each Annual Meeting, propose the place of meeting for the next Annual Meeting, and nominate the President-elect.

24. The Council shall also, at or before the time of each Annual Meeting, elect, by voting-papers, twenty members of its own body (as hereinafter described) as members of the Committee of Council for the ensuing year.

THE COMMITTEE OF COUNCIL.

25. The Committee of Council shall consist of the President, the President-elect, the President of Council, the Vice-Presidents of the Association, the Treasurer, and of the Honorary Secretary for the time being of each Branch (who shall all be *ex-officio* members of the Committee of Council); and also of twenty members of the Council to be elected by the Council, as hereafter described.

26. The Committee of Council shall meet not less than four times a year, and shall be presided over by the President of the Council, or in his absence by a chairman to be appointed by the meeting. Its meetings shall be held at such time and place as the Committee of Council shall appoint. Seven members shall be a quorum.

27. The President of Council shall, upon receiving a requisition, signed by not less than ten members of the Committee, and specifying the business for which a special meeting is required, call together a

special meeting thereof; but at such meeting no business shall be transacted other than that for which such special meeting was called.

28. The five members who have attended the fewest meetings of the Committee of Council during the preceding twelve months shall retire at each Annual Meeting of the Association, and shall be ineligible for re-election for the ensuing year. In the event of an equality of attendances, the retiring members or member shall be determined by lot. The mode of election of the twenty elected members of the Committee of Council shall be as follows. The Committee of Council shall, three weeks before each Annual Meeting of the Association, nominate twenty members of the Council other than the five retiring members of the Committee.

29. A list of the members of Council so nominated, together with a list of the new Council, shall be sent to each member of the new Council at least two weeks before each Annual Meeting. Any two members of the Council shall be entitled to nominate any one or more members as members of the Committee of Council on giving notice of such nomination to the Secretary of the Association at least one week before each Annual Meeting.

30. A list of members so nominated shall be sent to each member of the new Council before the Annual Meeting; and the election of the twenty members of the Committee of Council out of all the members so nominated shall take place at the first meeting of the new Council, and by means of voting-papers.

31. The Committee of Council shall manage the general affairs and business of the Association, except as otherwise provided by the Articles or By-laws. They shall also regulate the order of business, and shall nominate the readers of addresses at each Annual Meeting. They shall decide what shall constitute a section, and who shall preside over the same; and shall also arrange the division into sections of the matters to be discussed and considered at such meeting.

32. The Committee of Council shall direct the publications of the Association, and shall take cognisance of any matter which may require immediate decision.

33. The Committee of Council shall, at each meeting next after the Annual Meeting of the Association, appoint a public accountant to audit the accounts of the Association, and prepare a balance-sheet, financial statement, and report, up to the 31st day of December in each year. Such balance-sheet, financial statement, and report, shall be published in the JOURNAL within the first four months of each year.

34. In the event of the incapacity of any officer of the Association during his term of office, the Committee of Council may appoint any member to act for him. In the event of the death or resignation of any officer, the Committee of Council may appoint a successor during the period for which he would have continued in office if he had not died or resigned.

JOURNAL AND FINANCE COMMITTEE.

35. At the Meeting of the Committee of Council held next after the Annual Meeting, a Subcommittee of twelve members shall be elected, who, together with the President of Council and Treasurer, shall constitute the Journal and Finance Committee for the ensuing twelve months. Three members shall be a quorum.

36. The Journal and Finance Committee shall meet not less than four times a year, twice at least at the office of the Association, and shall enter a report of its proceedings in a book which shall be read to the Committee of Council for adoption.

37. The Journal and Finance Committee shall examine the general working of the office and JOURNAL, and certify the quarterly accounts, prior to their being presented to the Committee of Council.

TRUSTEES.

38. The property of the Association shall, when necessary, be vested in three Trustees chosen by the Committee of Council. The Trustees shall be eligible for any other office of the Association.

COMMUNICATIONS.

39. All communications to the Association are the property of the Association, unless the Committee of Council allow the right of property therein to be specially reserved to the contributors.

BRANCHES.

40. Any number of members, not being less than twenty, may form themselves into a Branch of the Association, subject to such Branch being recognised by the Committee of Council.

41. Each Branch shall be free to govern itself as its members shall think fit; but no Branch law shall be valid which, in the opinion of the Committee of Council, shall contravene any fundamental law of the Association.

42. Each Branch shall pay its own expenses; and no Branch shall be deemed for any purpose the agent of the Association, or have power to incur any obligation in its behalf.

ALTERATION OF BY-LAWS.

43. No By-Law shall be made, altered, or repealed, except at an Annual Meeting, and unless a written notice, specifying the nature and object of the proposed amendment, shall have been given to the Committee of Council at least two months previously. Such notice shall be forthwith published in the JOURNAL.

APPENDIX TO BY-LAWS.

I.—Application for Admission and Agreement as to Terms of Membership.

I, _____, residing at _____, am desirous of being elected a member of the British Medical Association; and I agree, if elected, to pay the subscription, and to conform in all respects to the articles of Association, and to the by-laws now existing, or which hereafter may be made under or by virtue of the same.

Name _____ Professional title _____ Address _____

II.—Form of Certificate.

We, the undersigned, hereby certify that _____ of _____ is a fit and proper person to be elected a member of the British Medical Association.

BRITISH MEDICAL ASSOCIATION:
 FORTY-THIRD ANNUAL MEETING.

THE Forty-third Annual Meeting of the British Medical Association will be held at Edinburgh, on Tuesday, Wednesday, Thursday, and Friday, August 3rd, 4th, 5th, and 6th, 1875.

President.—E. COPEMAN, M.D., Senior Physician to the Norfolk and Norwich Hospital.

President-elect.—Sir ROBERT CHRISTISON, Bart., M.D., D.C.L., LL.D., F.R.S.Ed.

An Address in Medicine will be given by JAMES WARBURTON BEGGIE, M.D., F.R.C.P.Ed.

An Address in Surgery will be given by JAMES SPENCE, F.R.C.S.Ed., F.R.S.E., Professor of Surgery in the University of Edinburgh.

An Address in Physiology will be given by WILLIAM RUTHERFORD, M.D., F.R.S.E., Professor of the Institutes of Medicine in the University of Edinburgh.

The business of the Association will be transacted in Six Sections, viz.:

SECTION A. MEDICINE.—*President:* Dr. Quain, F.R.S., London. *Vice-Presidents:* Professor W. T. Gairdner, Glasgow; Dr. Grainger Stewart, Edinburgh. *Secretaries:* Dr. Claud Muirhead, 7, Heriot Row, Edinburgh; Dr. Stephenson, 33, Buccleuch Street, Edinburgh.

SECTION B. SURGERY.—*President:* Professor Lister, F.R.S. Edinburgh. *Vice-Presidents:* Professor Pirrie, Aberdeen; Professor Macleod, Glasgow. *Secretaries:* Thomas Annandale, Esq., Charlotte Square, Edinburgh; Dr. John Duncan, 8, Ainslie Place, Edinburgh.

SECTION C. OBSTETRIC MEDICINE.—*President:* Dr. Matthews Duncan. *Vice-Presidents:* Dr. Keiller; Professor Simpson. *Secretaries:* Dr. Peel Ritchie, 16, Hill Street, Edinburgh; C. J. Cullingworth, Esq., 260, Oxford Street, Manchester.

SECTION D. PUBLIC MEDICINE.—*President:* Right Hon. Lyon Playfair, M.P., C.B., F.R.S. *Vice-Presidents:* Inspector-General Smart, M.D., C.B.; Dr. Arthur Mitchell. *Secretaries:* Dr. Andrew Smart, 24, Melville Street, Edinburgh; Dr. Fraser, Knutsford.

SECTION E. PSYCHOLOGY.—*President:* Dr. Lowe, F.R.S., Edinburgh; *Vice-Presidents:* Dr. Sibbald; Dr. Clouston. *Secretaries:* Dr. Brown, Royal Asylum, Edinburgh; Dr. Saundby, Saughton Hall, Edinburgh.

SECTION F. PHYSIOLOGY.—*President:* Professor Burdon Sanderson, F.R.S., London. *Vice-Presidents:* Dr. McKendrick; Professor J. Dewar. *Secretaries:* Dr. Lauder Brunton, F.R.S., 23, Somerset Street, Portman Square, London. Dr. Caton, 18, Abercrombie Square, Liverpool.

Honorary Local Secretaries.

- Dr. John Batty Tuke, Edinburgh.
- John Chiene, Esq., Edinburgh.
- Dr. J. G. McKendrick, Edinburgh.
- Dr. J. Bishop, Edinburgh.

Tuesday, August 3rd.

11 A.M.—SERVICE IN ST. GILES'S CHURCH. Sermon by Rev. Dr. Alexander.

- 1 P.M.—MEETING OF COMMITTEE OF COUNCIL.
- 3 P.M.—MEETING OF THE COUNCIL, 1874-75.
- 3.30 P.M.—GENERAL MEETING.—President's Address; Annual Report of Council; and other business.
- 9 P.M.—PRESIDENT'S RECEPTION IN ASSEMBLY ROOMS, MUSIC HALL.

Wednesday, August 4th.

- 9.30 A.M.—MEETING OF COUNCIL, 1875-76.
- 11.30 A.M.—SECOND GENERAL MEETING.
- 11.30 A.M.—ADDRESS IN MEDICINE.
- 2 P.M.—SECTIONAL MEETINGS.
- 9 P.M.—CONVERSAZIONE GIVEN BY THE ROYAL COLLEGE OF PHYSICIANS IN THE INDUSTRIAL MUSEUM.

Thursday, August 5th.

- 9 A.M.—MEETING OF THE COMMITTEE OF COUNCIL.
- 10 A.M.—THIRD GENERAL MEETING.—Reports of Committees.
- 11 A.M.—ADDRESS IN SURGERY.
- 2 P.M.—SECTIONAL MEETINGS.
- 6.30 P.M.—PUBLIC DINNER IN MUSIC HALL.

Friday, August 6th.

- 10 A.M.—ADDRESS IN PHYSIOLOGY.
- 11 A.M.—SECTIONAL MEETINGS.
- 1.30 P.M.—CONCLUDING GENERAL MEETING.
- 4 P.M.—PARTY IN THE ROYAL BOTANIC GARDENS, GIVEN BY THE UNIVERSITY OF EDINBURGH.

Saturday, August 7th.

EXCURSIONS.—Bass Rock, Melrose, Trossachs, Roslin.

Papers.—The following papers are offered.

- Adams, William, Esq. On a New Subcutaneous Operation for the Obliteration of Depressed Cicatrices.
- Aitken, Lauchlan, M.D. On the Sanitary State of Rome.
- Althaus, Julius, M.D. Further Observations on the Electrolytic Treatment of Tumours.
- Anderson, Mrs. E. Garrett, M.D. On Dysmenorrhœa.
- Annandale, Thomas, Esq. 1. Excision of the Head of the Femur in Hip-joint Disease; 2. Successful Case of Distal Ligature for Aortic Aneurism.
- Bartlett, H. C., Esq. On Drinking and Table Waters.
- Bell, Joseph, Esq. Notes on some Minor Improvements in Operative Surgery.
- Bennett, J. Hughes, M.D. On the Necessity of Vivisection both for Advancing and Teaching the Science of Physiology.
- Boyd, Robert, M.D. Effect of Various Diseases on the weight of 2050 sane and insane Adults of both sexes.
- Bradley, S. M., Esq. The Surgical Treatment of Lymphatic and Glandular Tumours of the Neck.
- Braidwood, P. Murray, M.D., and Vacher, Francis, Esq. First Contribution to the Life History of Contagion.
- Braithwaite, James, M.D. The Use of Nitric Acid as a Caustic in Uterine Practice, and its superiority as such to Nitrate of Silver.
- Brotherston, Peter, Esq. Provincial Surgery in Scotland, illustrated by Cases treated in the Alloa Hospital.
- Brown, James, Esq. Typhoid Fever in the Isle of Skye.
- Browne, J. Crichton, M.D., F.R.S.E. Rhythmical Neuroses.
- Brunton, T. Lauder, M.D., F.R.S. On the Means of preventing Death from the Extraction of Teeth under Chloroform.
- Buchanan, George, M.D. (Glasgow). Tracheotomy in Croup and Diphtheria.
- Cassells, James P., M.D. On Conservative Aural Surgery.
- Caton, R., M.D. Report on the Electric Currents of the Brain.
- Chiene, John, Esq. 1. Dislocation of the Astragalus; 2. Value of an Antiseptic Catheter.
- Clouston, T. S., M.D. On Disorders of Speech in Insanity.
- Coghill, J. G. S., M.D. On Uterine Flexions and Displacements; and their Mechanical Treatment.
- Craig, William, M.D. 1. Note on Jaborandi. 2. On the External Uses of the Hydrate of Chloral.
- Croom, J. Halliday, M.B. On Melæna in the New-born Child.
- Daldy, Thomas M., M.D. On Functional Cardiac Murrurs.
- Davenport, John A., Esq. On the Drainage and other Sanitary Conditions of Rural Districts.
- Dickson, Walter, M.D. The Numerical Ratio of Disease in the Adult Male Middle-class Population, as deduced from the Sanitary Statistics of Her Majesty's Customs, London, 1857-74.
- Dix, John, Esq. Two Cases of Aneurism, one of the Carotid and one of the Femoral Artery, treated by the Wire Compress.
- Donovan, W., L.R.C.P.Ed. On Placenta Prævia.

- Dowse, Thomas S., M.D. On Bulbar Paralysis.
- Duncan, John, M.D. 1. On the Modes of Administering Mercury in Syphilis; 2. On the Treatment of Nævus.
- Duncanson, J. J. Kirk, M.D. On Fibrous Tumours of the Auricle: with Specimens and Microscopical Sections.
- Eassie, W., Esq. On the Sanitation of Houses.
- Edis, Arthur W., M.D. On the Prevention and Management of Miscarriages.
- Ewart, J. H., Esq. Case of Inversion of the Uterus of Three Months' standing.
- Fergus, Andrew, M.D. Some Sanitary Remarks on Traps and Soil-Pipes.
- Ferrier, David, M.D. The Localisation of Centres of Special Sense.
- Fothergill, J. Milner, M.D. The Action of Drugs upon the Intracranial Circulation.
- Fox, Cornelius, M.D. Is Enteric Fever ever spontaneously Generated?
- Fox, J. M., Esq. Scarlet Fever: its Prevention.
- Haddon, John, M.D., M.A. On Intemperance in Woman, with special reference to its Effects on the Reproductive Organs.
- Haining, William, M.D. On Death of the Child from Shock from Injury caused by Rupture of the Umbilical Cord.
- Hardie, James, M.D. 1. On a Case in which a New Nose was formed by Transplanting a portion of one of the Fingers; 2. On the Treatment of some forms of Ulcer by Incision of the Edges.
- Hill, Charles, M.D. On Placenta Prævia.
- Hill, Matthew, Esq. A New Operation for Ununited Fractures.
- Hime, T. Whiteside, M.D. On the Management of the Lying-in Woman.
- Hirschfeld, John C., M.B. On Extirpation of the Tongue.
- Hoggan, George, M.D. On a Case of Transfusion by Aveling's Apparatus.
- Hoggan, Mrs. Frances E., M.D. On a New Histological Process for Staining Tissues.
- Hovell, D. De Berdt, F.R.C.S.Eng. On Emotional Aphasia.
- Jagielski, V. A., M.D. Some Further Remarks on the Use of Spirometry in Medicine, demonstrated by a new Double Spirometer.
- Johnston, James, M.B. On Rheumatic Fever and its Treatment.
- Jordan, Furneaux, Esq. Note on a Peculiar Variety of Encysted Hydrocele of the Cord.
- Keiller, A., M.D. Embryotomy: its various Modes of Procedure, with Illustrative Cases.
- Kenyon, G. A., M.B. On the Comparative Merits of the Water-carriage and Dry Systems of Sewage-disposal from a Sanitary and Economical Point of View.
- King, Kelburne, M.D. Two Cases of Punctured Fracture of the Frontal Bone, treated by Trephining; and resulting, one in total, the other in partial Loss of Vision.
- Lucas, T. P., L.R.C.P.Ed. On the Action of Stimulants.
- Lund, Edward, Esq. 1. Case in which Adams's Operation for Subcutaneous Division of the Neck of the Thigh-bone was performed on both sides in the same patient for Straight Ankylosis; 2. On the Use of Steel Screws in the Treatment of Ununited Fractures, Resections of Joints, etc.
- McClintock, A. H., M.D. Life of William Smellie, M.D.
- McDiarmid, John, M.B. On the Hypodermic Injection of Morphia in Insanity.
- McDonald, William, L.R.C.P.Ed. The Nature, Cause, Cure, and Prevention of Puerperal Fever.
- Mackenzie, Morell, M.D. On the Treatment of Enlarged Strumous Glands by Hypodermic Injection.
- Mackintosh, Angus, M.D. On the Outbreak of Enteric Fever at Killamarsh, Derbyshire.
- Maclagan, T. J., M.D. On the Nature of Contagion.
- Maclaren, R., M.D. On some Cases of Subperiosteal Excision.
- M'Rae, Alexander E., M.D. Case of Perforation of the Abdomen (*per Vaginam*): with Remarks.
- Madden, T. More, M.D. Turning *versus* the Forceps in cases of Difficult Labour.
- Mapother, E. D., M.D. Treatment of Lupus, Sycosis, and Acne, by early Incisions.
- Maunder, C. F., Esq. A Subcutaneous Operation for the Relief of Fibrous Ankylosis of the Knee-joint.
- Mitchell, Arthur, M.D., and Buchan, Alexander, Esq. Some of the Relations of Weather to Death-rate.
- Morton, James, M.D. The Treatment of Spina Bifida.
- Nairne, John S., Esq. On the Psychology of Muscle.
- Ogston, Francis, jun., M.D. The Nourishment of the Head of the Femur after Intracapsular Fracture.
- Page, David, M.D. On a Village Outbreak of Enteric Fever traceable to a specifically polluted Water-supply.
- Peddie, A., M.D. The Necessity of Legislation for the Control and Treatment of Insane Drinkers.
- Power, Henry, Esq. On the Action of Certain Drugs on Muscular Contraction.
- Rickards, E., M.B. Epitome of Notes of Four Cases of Thoracic Aneurism.
- Roberts, D. Lloyd, M.D. Two Cases of Occlusion of the Os Uteri after Labour.
- Robertson, Alexander, M.D. Observations on the Unilateral Phenomena of Mental and Nervous Disorders.
- Ross, George, M.D. The Relation of Mortality and Dwellings.
- Ross, James, M.D. Comparative Pharmacology.
- Rutherford, William, M.D., F.R.S.E. On the Biliary Secretion.
- Shettle, R. C., M.D. The Magnetic Conditions of Arterial and Venous Blood, considered in relation to the Influence which Arterial Blood exercises in promoting the Functions of Life; and the consequent value of Magnetism as a Therapeutic Agent.
- Shuttleworth, G. E., M.D. 1. Two Cases of Microcephalic Idiocy. 2. Notes of a Series of Cases of Rubeola Notha.
- Sibbald, John, M.D. 1. The Relative Amount of Pauper Lunacy in Town and Country. 2. The Extent to which Medical Knowledge can contribute to the Determination of Criminal Responsibility.
- Smart, William R. E., M.D., C.B. On the Ratios of Deaths by Violence in the Army and Navy relatively to each Service and to Civil Life.
- Smith, H. Fly, M.D. Vomiting connected with Pregnancy.
- Swayne, J. G., M.D. On Obstetrical Statistics.
- Taylor, C. Bell, M.D. On the Modern Methods of Extracting Lenticular Cataract: with Illustrative Cases.
- Thin, George, M.D. Some of the Changes which take place in Connective Tissue in Inflammation.
- Tilt, Edward J., M.D. On Internal Metritis.
- Tripe, John W., M.D. On the Death-rate at Different Ages from Epidemic Diseases.
- Watson, Eben, M.D. A Case of Femoral Aneurism, with Ligature of the External Iliac.
- Watson, P. Heron, M.D. Excision of the Thyroid Gland.
- Wilson, George, M.D. On the Sanitary Improvements of Country Villages.
- Wolfe, J. R., M.D. 1. On Conjunctival Transplantations from the Rabbit to the Human Subject.—2. On Egyptian Ophthalmia and Cataract Complications: with Cases.
- Veld, H. J., M.D. State Medicine in Relation to Education.

Gentlemen desirous of reading papers, cases, or other communications, are requested to forward the titles to the General Secretary, or to one of the Secretaries of the Section in which the paper is to be read. All papers should be forwarded to one of the above named officers at as early a date as possible.

No paper must exceed twenty minutes in reading, and no subsequent speech must exceed ten minutes; all speeches at the General Meeting must not exceed ten minutes each.

ANNUAL MUSEUM.

The Eighth Annual Museum of the British Medical Association will be held in the Practical Chemistry Class-room in the University on the 3rd, 4th, 5th, and 6th of August, 1875, and will be open from 10 A.M. to 6 P.M. The Committee appointed to take charge of the arrangements for this museum will be glad to receive for exhibition:

1. Latest Inventions in Medical, Surgical, and Obstetrical Instruments and appliances of all kinds.
2. New Drugs and their Preparations, and New Articles of Diet for Invalids.
3. General Pathological Specimens, with photographs, models, casts, drawings, etc., illustrating Disease.
4. Specimens and Preparations in connection with Injuries and Diseases of Bones and Joints. [It is desired to make this a special feature in the Exhibition.]
5. New Physiological Apparatus.
6. Microscopes and Microscopic Specimens, Pathological and General; New Chemicals and other Appliances used in Histological Research.

The following is a list of the Museum Committee. All communications to be addressed to the Hon. Secretaries:—Professor Turner, Dr. Angus Macdonald, Dr. Argyll Robertson, Dr. John Wyllie, Dr. W. Gordon, Mr. Thomas Annandale, and Mr. A. B. Stirling. Dr. Charles E. Underhill, 8, Coates Crescent, and Dr. John Playfair, 25, Rutland Street, *Hon. Secretaries*.

NOTICE TO EXHIBITORS.—Application for space should be made as soon as possible, and the amount required mentioned. A written or printed description of all objects intended for exhibition must be forwarded for insertion in the Catalogue; and the Committee earnestly request all intending Exhibitors to bear in mind that it is impossible for their descriptions to be inserted unless sent in early—viz., not later than July 17th. All objects intended for exhibition must be delivered on or before July 27th. They must be addressed “Curator of Museum of British Medical Association, the University, Edinburgh.”

N.B.—The Name of the Exhibitor should be written on the outside of each parcel, and a card bearing his name and address should be enclosed, to facilitate the return of the articles.

FRANCIS FOWKE, *General Secretary.*

36, Great Queen Street, June 26th, 1875.

ABERDEEN, BANFF, AND KINCARDINE BRANCH.

THE annual meeting of the above Branch will be held at Aberdeen, on Saturday, July 17th, at 1.30 o'clock P.M.

Further particulars will be intimated by circular.

ALEXANDER OGSTON, *Honorary Secretary.*

Aberdeen, June 1875.

WEST SOMERSET BRANCH.

THE annual meeting of this Branch will be held at the Railway Hotel, Taunton, on Thursday, July 22nd, at 2.30 P.M.

The President-elect, Dr. Cordwint, will read a short paper on “Vital Conservancy in Disease”.

Members wishing to communicate papers or cases are requested to send notice to the Secretary.

The dinner will take place at 5 o'clock.

W. M. KELLY, M.D., *Honorary Secretary.*

Taunton, June 29th, 1875.

BORDER COUNTIES BRANCH.

THE annual meeting of the Border Counties Branch will be held at Dumfries, on Friday, July 23rd, 1875: *President*, Dr. GREEN, Kendal; *President-elect*, Dr. W. A. F. BROWNE, Dumfries.

Gentlemen intending to be present are requested to communicate their intention to the undersigned.

Carlisle, June 28th, 1875. HENRY BARNES, M.D. } *Hon.*
J. SMITH, M.D. } *Secs.*

BIRMINGHAM AND MIDLAND COUNTIES BRANCH: ANNUAL MEETING.

THE annual meeting of the Branch was held on June 29th, at the Midland Hotel, Birmingham, when there were present W. C. GARMAN, Esq., *President* in the chair, and fifty-two members.

The President-elect.—The CHAIRMAN said that his first business was to introduce his successor to the chair. It was, however, his painful duty to announce that the president for the ensuing year was unable to be present, and they would still more regret his absence when they knew that it was caused by his incomplete convalescence from an attack of fever. This attack had been contracted, he believed, whilst Dr. Wade was pursuing his professional duties. The first part of the business would, therefore, have to be struck out.

Mr. WEST said they all very much regretted that Dr. Wade was unable to attend, and more especially as his absence was due to illness. He would move: “That the Birmingham and Midland Counties Branch of the British Medical Association, hereby expresses its great regret that Dr. Wade’s convalescence from his recent severe illness is not sufficiently advanced to permit his being present at the annual meeting of this Association, and its earnest hope that he may be enabled to deliver his inaugural address at the opening meeting of the ensuing session in October next.”

Mr. MANBY (Wolverhampton) seconded the motion, which was unanimously carried.

New Members.—The following gentlemen, having been elected members of the Association, were duly elected members of the Branch: Mr. G. A. Phillips, Walsall; Mr. James Arthur, Henley-in-Arden; and Mr. Thomas C. Lawson, Lichfield Road.

Vote of Thanks to the Retiring President.—Mr. O. PEMBERTON proposed a vote of thanks to Mr. Garman, the retiring president. He felt sure that the motion would meet with their approbation, because it was impossible for any one to have discharged the duties of president of the Branch with more punctuality, ability, and courtesy, than Mr. Garman

had done. They knew that Mr. Garman filled a chair which had been occupied by many illustrious predecessors, and therefore the task was all the more difficult to fulfil. Therefore, they had abundant reason for thanking Mr. Garman for having on all occasions maintained the repute of that, the greatest association of medical men in the Midland district.

Mr. MANBY seconded the motion, which was carried with acclamation.

Mr. GARMAN appropriately responded, thanking the members of the Branch for the support, and kindness, and consideration, and forbearance they had always accorded him.

Report of Council.—Dr. B. FOSTER read the annual report, which was as follows. “The Council have much pleasure in announcing to the twenty-first annual meeting the steady prosperity of the Birmingham and Midland Counties Branch. This year the Branch has attained a greater numerical strength than at any former period of its history, and now numbers three hundred and thirty-one members. During the year, thirty-two new members have been elected, while thirteen members have been lost—ten by removal to a distance and resignation, and three by death, viz., Mr. F. Turton of Wolverhampton; Dr. Cotterill of West Bromwich; and Mr. W. H. Clarke of Stratford-on-Avon. Mr. Turton’s death was especially felt as a loss by the Branch, as he had for some years been a very active member, and had on several occasions served on the Council. He was a typical specimen of an able and highly esteemed practitioner, untiring in his devotion to his patients, and ever anxious to maintain a high ethical standard among his professional brethren. The early termination of Mr. Turton’s useful life was in no small degree due to his unsparing attention to his professional work. The session 1874-75 has been an unusually active one, seven ordinary and three special meetings of the Branch having been held. The attendance of members has been large, and the papers read have produced debates of more than ordinary interest.” [A list of the papers and communications was here given.] “At the first meeting after the reading of Dr. Russell’s paper, which was a valuable study of chronic alcoholism, and therefore formed an appropriate continuation of the subject of dipsomania, ably treated in the President’s address of last year, the Branch resolved, in accordance with the wish expressed at the last annual meeting, to appoint a committee ‘to consider the best means of furthering legislation for the care and restraint of habitual drunkards’. The committee, with Mr. W. C. Garman as chairman, and Dr. Fowler Bodington as honorary secretary, have held several meetings, and have issued a circular to all the Branches of the Association, calling their attention to the need for legislative action, and asking for their co-operation in obtaining it. The committee have recently drawn up petitions to both Houses of Parliament, praying for early legislation. The petitions are now in course of signature, and will shortly be presented. By the energetic efforts of the committee, other Branches have been induced to consider the subject, and the prospects of Parliamentary action have been materially improved. The committee still continue their work. The Committee on Medical Education, after presenting a report last year, continued their labours during the session which has just closed. After holding several special meetings of the Branch, at which the report was discussed clause by clause, an amended report was presented to the Branch. After a long and careful discussion, it was resolved, ‘That the amended report of the Education Committee be received and entered on the minutes, and that the warmest thanks of the Branch be, and are hereby, tendered to Dr. Fowler Bodington, the chairman, Mr. Arthur Oakes, the secretary, and the other members of the Education Committee, for the deep interest and unsparing exertions with which they have promoted and conducted the discussion of the important question of medical education.’ The Council are glad to state that the arrangements referred to in their last annual report for connecting the two sections of the Branch more intimately in their work have been completed. Somewhat fewer meetings of the sections will be held, and these meetings will be so arranged that special subjects can be conveniently sent for examination from the pathological to the microscopical section. The working expenses of the sections being reduced by the alterations, it has been determined to have a single subscription for both sections. The subscription to the Branch alone will remain as hitherto, two shillings and sixpence *per annum*, while a subscription of five shillings *per annum* will confer the membership of both sections as well as that of the Branch. The Council hope that many members of the Branch who have not as yet joined the sections will now avail themselves of the opportunity of aiding this important department of the work of the Branch. The Council need hardly remind the members that since the last annual meeting the Branch has lost the services of its zealous and able secretary, Mr. T. H. Bartleet. The occasion of Mr. Bartleet’s resignation seemed to many members a fitting opportunity to present him with some slight recog-

tion of the great services he rendered the Branch during his ten years of office. It was, therefore, resolved, at a general meeting of the Branch, to present him with a testimonial, and a committee was appointed for the purpose. The subscriptions were limited to half a guinea, and a hundred and thirty-five members having responded, Mr. Bartleet was presented, on May 4th, by the president of the Branch, acting on behalf of the subscribers, with a silver salver, suitably inscribed. The Council refer to this with much satisfaction, inasmuch as they feel that, however widely members may differ as to the general propriety of giving testimonials to the officials of the Branch, all members must be gratified by any voluntary expression of appreciation given to such exceptionally valuable work as that rendered to this Branch by its late honorary secretary, Mr. Bartleet. To fill the vacancy caused by Mr. Bartleet's resignation, Dr. Sawyer was elected co-secretary with Dr. Foster. The Council would particularly direct the attention of the members to the very important fact that at the last meeting of the Association, at Norwich, a fundamental change was made in the Association by its incorporation under the provisions of the Joint-Stock Companies' Acts of 1862 and 1867. By this incorporation, the financial position of the Association will be greatly improved. The annual meeting passed a resolution recommending all members of the unincorporated body to become members of the corporate body. The Council of this Branch repeat the recommendation, and beg all present to sign the necessary forms which are laid upon the table to-day. The Council are happy to call attention to the increasing prosperity of the British Medical Association, which now consists of nearly 7,000 members, and is the most powerful organisation which any profession has ever possessed. The high objects to which the influence of the Association has been always directed have given it a position and power even greater than its numerical strength. Each year the profession at large acts through the Association in promoting legislation calculated to improve the health and well-being of the people, and to further the best interests of the profession. While developing and using its strength as an organisation for political and social purposes connected with the profession, the Association has not lost sight of its scientific functions, and, now that its resources permit, will make yearly grants in aid of scientific research. The results of the first grants may be expected at the annual meeting at Edinburgh in August next, and there is every prospect that at that meeting a still larger sum may be devoted to encourage researches bearing on physiology, and on the nature, origin, and treatment of disease."

Mr. ALFRED BAKER, in moving the adoption of the report, said it was evident that, while the parent Association was pursuing its course smoothly and unchecked, the Branches were also doing a large amount of valuable work. The President would have rendered the Branch good service if he had done no more than introduce the subject of dipomania to the attention of the members, and he was glad that the question was being dealt with in such a vigorous manner. The wisdom of the founders of the British Medical Association had been proved by the fact that it now embraced about half of the members of the profession.

Mr. BUCK (Worcester) seconded, and Dr. BODINGTON and the CHAIRMAN supported the motion, which was agreed to.

Financial Statement.—Mr. WATKIN WILLIAMS (treasurer) read the financial statement, which showed that during the year the receipts had been £33 5s., and the expenses £29 1s., the balance in hand being £62 1s. 9d. The report was adopted.

Dr. HINDS read the report of the Microscopical Section, which was received.

Votes of Thanks were accorded to the treasurer and secretaries, the chairman and officers of the Pathological and Clinical and Microscopical Sections, the retiring Council and local members of the General Council.

Election of Officers for the Ensuing Year.—The voting papers having been examined by the scrutineers appointed by the meeting (Mr. B. May and Dr. Warner) the following officers and Council were declared to be elected: *President-dat*: G. Fowler Bodington, M.D. *Honorary Secretaries*: Balhazar Foster, M.D.; James Sawyer, M.D. *Treasurer*: T. Watkin Williams, Esq. *Council*: Country Members.—J. C. Garman, Esq., Wednesbury; A. J. B. Harrison, M.B., Walsall; F. Manby, Esq., Wolverhampton; J. Manley, Esq., West Bromwich; C. A. Newnham, Esq., Wolverhampton; James Thompson, M.B., Leamington; E. J. Tibbits, M.D., Warwick; Thomas Underhill, M.D.; West Bromwich. *Town Members.*—Alfred Baker, Esq.; T. H. Bartleet, Esq.; J. S. Gangee, Esq.; J. Johnston, M.B.; E. Malins, M.D.; A. Oakes, Esq.; E. Rickards, M.B.; J. Russell, M.D. *Representatives in the Council of the Association*: T. H. Bartleet, Esq.; G. Fowler Bodington, M.D.; B. W. Foster, M.D.; W. C. Garman, Esq.; A. J. B. Harrison, M.B.; Furneaux Jordan, Esq.; F. Manby, Esq.;

J. Manley, Esq.; C. A. Newnham, Esq.; O. Pemberton, Esq.; V. J. Solomon, Esq.; James Thompson, M.B.; Thomas Underhill, M.D.; W. F. Wade, M.B.; J. F. West, Esq.; T. Watkin Williams, Esq. *Auditors*: J. Russell, M.D.; Arthur Oakes, Esq.—*Pathological and Clinical Section.*—*Chairman*: Vincent Jackson, Esq.; *Honorary Secretary*: E. Rickards, M.B.; Lloyd Owen, Esq.

Dinner: The members afterwards dined together, Dr. F. Bodington, President-elect, occupying the chair, and Dr. E. Foster the vice-chair.

MIDLAND BRANCH: ANNUAL MEETING.

THE annual meeting of this Branch was held at the Derby General Infirmary on Thursday, June 17th, at 2 P.M.; A. H. DOLMAN, Esq., President, in the Chair.

President's Address.—Mr. DOLMAN, on taking the chair, delivered an address. He observed that, as a body numbering six thousand and daily increasing, the organisation of the Association afforded them considerable power of doing good to the public and the profession. Fortunately, they were not divided by political opinions; for, though they held their own, and did not shrink from expressing them when necessary, the reticence and quiet dignity that as a profession they practised rendered them the most peaceable and loyal of subjects; and thus the profession was honoured by all nations, both in peace and in war. They were, it was true, non-combatants; but they faced death in all forms just as fearlessly as the most courageous of warriors, and without the excitement they felt. Looking down their obituary list, he saw name after name of those who had succumbed either to fever or to blood-poisoning after accidental inoculation; and he looked on these victims to their duty as true heroes. The public little knew the great mortality in the profession from fever. There was scarcely one amongst them who did not personally know some one who had only escaped death with a maimed limb or an impaired constitution. Referring to the refusal of the clubs in the town to raise the pay of the medical men, the President spoke of the establishment of the Associated Medical Society, which several of the friendly societies had organised, and observed that they were quite justified in trying the experiment; but he felt sorry for the attendant who had so many to please. He quite approved of one portion of their system, their finding their own medicines; but thought they ought to pay much more for medical advice. There was in the town a large dispensary, which was self-supporting to a great extent. One could not help feeling that it must be a great relief both to the suffering and also to the medical men. With regard to the Infirmary, there was no question as to its very great utility, more particularly to in-patients; but, when one saw the vast number of out-patients, it was a question whether many who attended should not pay a small quota either to the institution or in some other way, so that they should not be quite paupers as to medical relief. Within the last few years there had been great improvements in the arrangements for affording relief to the very poor. Speaking of dispensing, he said that it might not be out of place to bring before the meeting the practicability of general practitioners ceasing to make up their own medicines. He had conversed with some leading practitioners, and they agreed with him as to the difficulty of doing away with it, and all stated that it would entail considerable loss. One instance of loss had occurred to his late partner. A patient of his had been in the habit of taking a particular medicine for some period, and of requesting a visit occasionally. This patient went away for a time, and asked for the prescription. After returning, the patient sent to the chemist, and never troubled his medical attendant again. Moreover, several of his clients had expressed to him their dislike to having their medicines quizzed and conned over by chemists' apprentices. Referring to the way in which students were brought up to the medical profession, he advocated a return to the apprenticeship system. A good training in a well-conducted surgery rendered a youth an adept in dispensing, and gave him a better and more practical knowledge of the action and appearance of drugs than being sent straight from a school to a London hospital. In many cases, the modern pupil passed his examination and returned from London fit only to take an assistant's place to learn the practical part of his profession, which he could easily have mastered as a pupil. The address concluded by alluding to improvements in surgical practice and medical treatment during the last twenty years. Some operations which were regarded as of recent adoption were really old. For instance, the injection of laudanum under the skin was described in his quaint language by Samuel Pepys, as having been performed in his presence on two dogs, one of which died, and the other was stupefied. Again, many supposed modern instruments were engraved in an old book by Dr. William Salmon published in 1681. Mr. Dolman urged the desirability of establishing a medical library in

Derby, and said he would make a start by presenting a couple of hundred volumes. He also impressed on the members in and near Derby the importance of keeping up the quarterly meetings.

New Members.—The following gentlemen, twenty-one in number, were elected members of the Branch: G. O. Siddall, Esq., Alfreton; R. R. Allen, Esq., Belper; John Carnegie, M.D., Chesterfield; R. Wood, Esq., Ilkeston; F. K. Dickson, F.R.C.P.Ed., Buxton; George Lorimer, M.D., Buxton; W. Livesay, M.B., Sudbury; W. Andrews, Esq., Breaston; T. Johnston, Esq., Belper; Charles Cade, Esq., Spondon; C. F. Bryan, Esq., Leicester; — Franklin, Esq., Leicester; J. I. Mackintosh, M.D., Caistor; F. Sutton, Esq., Willingham; W. Millegan, Esq., Wirksworth; Richard Jeffreys, Esq., Chesterfield; James Craig, Esq., Eastwood; J. C. Eaton, Esq., Loughborough; R. Lett, M.B., Waddingham; J. Wright, Esq., Wymberg, Cape Town; J. Willford Marsh, Esq., Lincoln.

The Secretary's Report was read and adopted.

Officers and Council.—The following officers for the ensuing year were elected. *President-elect:* Joseph White, Esq., Nottingham. *Secretaries:* Lincoln—C. Harrison, M.D.; Nottingham—L. W. Marshall, M.D.; Leicester—W. E. Buck, Esq.; Derby—F. W. Wright, Esq. *Representatives in the General Council:* E. Morris, M.D., Spalding; Thomas Sympson, Esq., Lincoln; Joseph White, Esq., Willingham; W. H. Ransom, M.D., F.R.S., Nottingham; J. W. Benfield, Esq., Leicester; H. Lankester, Esq., Leicester; J. W. Baker, Esq., Derby; W. Webb, M.D., Wirksworth.

Election of Members of the Association.—It was proposed by W. E. BUCK, M.B., and seconded by H. LANKESTER, Esq., "That it would be conducive to the interests of the British Medical Association if the election of its members rested primarily with the Branch Association in whose districts the applicants reside, subject to final approval and confirmation by the General Council of the British Medical Association."

Advertisements of Medical Books.—Dr. BEVERLEY MORRIS of Nottingham brought forward the subject of advertising medical books in the ordinary daily non-medical papers, and proposed the following resolution, which was carried: "That this meeting expresses its opinion that the advertising of medical works in the general papers is undesirable."

Papers were then read on various subjects.

Dinner.—An excellent dinner was provided at the St. James's Hotel, to which upwards of fifty members and friends sat down.

BATH AND BRISTOL BRANCH: ANNUAL MEETING.

THE annual meeting of the above Branch was held on Thursday, June 24th, at the Royal Hotel, College Green, Bristol. There were present about thirty-five members; FREDERICK MASON, Esq., President, took the chair.

New Members.—The following gentlemen were proposed as new members of the Association and of this Branch: Reginald Eager, M.D., Northwoods; James Logan, M.D.; and J. J. Mitchell, Esq.

President's Address.—Mr. MASON, after a few remarks, resigned the chair to W. M. CLARKE, Esq., President-elect, who read an address on some of the most remarkable changes in the practice of medicine and surgery during the last thirty years. An abstract is published at p. 67.

Dr. FALCONER proposed, and Dr. SPENDER seconded, "That the thanks of this meeting be offered to W. M. Clarke, Esq., for his very able and interesting address." The motion was carried unanimously.

Report of Council.—Mr. BOARD read the following report of Council. It is with much pleasure that your Council is able to lay before you a most satisfactory report for the past year. Although we have lost several members from various causes, our numbers continue to increase, and we have a fair cash balance after all expenses have been paid. Our losses amount to eleven; of these, six have resigned membership and three have left the neighbourhood, while we have to deplore the deaths of two members, Dr. Maule, and Mr. Pepler of Market Lavington. On the other hand, seventeen gentlemen have joined the Branch, and our numbers now amount to two hundred and five members. Our annual meeting is held some weeks earlier this year, in order that the names of those gentlemen elected to represent the Branch in the Council of the Association, may be sent to the General Secretary before the first week in July. The papers read before the Branch have included some of the most interesting topics of the day, and the attendance has been uniformly good. It is especially satisfactory that many of our country members have been able to be present and to join in the discussions. Your secretaries have, as far as has been possible, alternately attended the meetings of the Committee of Council during the past year; and they are able to report to you that the Association

has been incorporated and registered under the Companies' Acts of 1862 and 1867, with all the privileges allowed to scientific societies. It has now, therefore, a legal standing. The financial report is most encouraging, showing a balance in hand of £22 7s. 10d.; and your Council recommends that the sum of three guineas be given to the Medical Benevolent Fund. The scrutineers appointed to examine the voting papers report that the following gentlemen are elected to fill the vacancies in the local councils: For Bath, Mr. Bartrum, Mr. Bleack, Dr. Hensley, and Dr. Davies; for Bristol, Dr. Davey, Dr. Brittan, Mr. Coë, Dr. Marshall, Mr. Green, and Dr. E. L. Fox.—The report was adopted.

President-elect.—Dr. DAVEY proposed, Mr. STONE seconded, and it was unanimously resolved: "That Dr. Goodridge be President-elect."

Vote of Thanks to the Retiring President.—Dr. MARSHALL proposed, and Mr. F. P. LANSDOWN seconded, "That the best thanks of the Branch are due to Frederick Mason, Esq., for the able manner in which he has discharged the duties of president during the past year." The motion was carried unanimously.

Proposal regarding Discussions.—Dr. BRABAZON proposed, and Dr. E. L. FOX seconded, "That during the ensuing session, two separate evenings be set apart for the discussion of special subjects in medicine and surgery or obstetrics, one subject being allotted to each evening. That such special subjects be selected by the president and secretaries at some meeting antecedent to the commencement of the session, such being selected as shall appear to them to possess most professional interest and most material for scientific and practical inquiry, and that early intimation be given by the Branch secretaries to members of the subjects selected, and of the evenings set apart for special discussion. Also, that the president and secretaries be requested to appoint some one gentleman who, on such special evenings, shall open the discussion by pointing out what, in his opinion, appear to be the salient points for scientific and practical investigation; exponent to be limited to fifteen minutes, and each speaker following to ten minutes, in expressing their views. The discussion on each subject to be limited to the evening appointed."

After several members had spoken on the matter, Dr. MARSHALL proposed, and Dr. FALCONER seconded, "That the resolution proposed by Dr. Brabazon be referred for consideration to the local councils." This was carried.

The Secretaries.—Mr. LEONARD proposed, and Mr. STOCKWELL seconded, "That the thanks of the Branch be offered to Messrs. Fowler and Board for their valuable services as secretaries during the past year, and that they be asked to continue in office." This was carried unanimously.

Representatives in the General Council.—The following were elected by ballot to serve on the general Council of the Association:—W. M. Clarke, Esq.; C. H. Collins, Esq.; C. H. Fox, M.D.; E. L. Fox, M.D.; H. Hensley, M.D.; H. Marshall, M.D.; F. Mason, Esq.; A. Prichard, Esq.; C. Steele, Esq.; J. G. Wayne, M.D.

SOUTHERN BRANCH: ANNUAL MEETING.

THE second annual meeting of the Southern Branch was held at the South-Western Hotel, Southampton, on Tuesday, June 29th. The members assembled at a quarter past two; Inspector-General W. R. E. SMART, M.D., C.B., President, in the chair.

Report of Council.—Dr. J. W. COUSTNS, Honorary Secretary, read the Council's report and financial statement, which congratulated the members on the progress the Branch had made during the past year. Their last annual meeting was held at Southsea, when an excellent address was delivered by Inspector-General Smart. Many meetings had been held during the year; and in Dorset and South-east Hants, the Branch had been especially successful, the total number of members elected exceeding those of last year by 30. The number of those who had joined up to June 1st, 1875, was 142, and the finances were in a satisfactory condition.

Dr. AITKEN, of Netley, moved the adoption of the report, which was seconded by Dr. DYER of Ringwood, who expressed himself highly gratified at the increase in the numbers. The proposal was unanimously agreed to.

President-elect.—Dr. T. W. TREND (Southampton) proposed that Dr. J. P. Aldridge, President of the Dorchester district, should be the President-elect of the Southern Branch for the ensuing year. At a meeting of the Council a short time ago, it was decided that the next annual meeting should be held at Weymouth, and it was considered desirable that the President-elect should be a member of that district.

Dr. D. NICOLSON (Portsmouth) seconded the motion, which was carried with acclamation.

Vice-Presidents.—Mr. MANNING (Salisbury) proposed, and Dr. MANLEY (Knowle, Fareham) seconded, that Dr. Orsborn of Bittern, and Dr. Garrington of Portsmouth, be the Vice-Presidents for the ensuing year. The proposition was unanimously carried.

Inspector-General SMART returned thanks for the honour they had done him in electing him to occupy the chair during the past year of their newly formed Association. He had been present at all the meetings that had been held at Southsea and Fareham, and the papers there read had been treated in a manner which he, as a member of other associations, and accustomed to meetings of a kindred character in different parts of the country, had never seen surpassed in ability. He complimented their honorary secretary and treasurer (Dr. Cousins) for the able and energetic manner in which he had laboured to promote the interests of the Association, for which he believed there was a good future in store. It now became his duty to quit that chair; and he could not but express his regret, in common with them all, that Surgeon-General Maclean, the president-elect, was unable to take his place, on account of the death, he believed, of his only brother; but he was sure they would all unite with him in expressions of condolence on his bereavement. It had been proposed that Dr. Orsborn should be vice-president for the ensuing year; and, in the absence of Dr. Maclean, it would be his duty to request Dr. Orsborn to take the seat which he (the speaker) had now to vacate.

Election of Secretary.—Inspector-General SMART then left the chair, which was occupied by Dr. ORSBORN, who said the next business was to elect a Secretary to the Branch. It was a most important office, and therefore desirable that they should have an able man to fill it. He spoke in terms of high commendation of Dr. Cousins's services, and said he had no doubt that gentleman would be unanimously re-elected. The proposition was seconded, and Dr. Cousins was re-elected amidst applause.

Vote of Thanks to the retiring President.—Dr. GARRINGTON moved a vote of thanks to the late president, Inspector-General Smart, for his services during the past year.

Surgeon-General J. MOUNT, C.B., V.C., seconded the proposition, and it was carried with acclamation.

Inspector-General SMART acknowledged the compliment, and spoke in high terms of Dr. Garrington, who, he said, had at all times shown himself most desirous of promoting the welfare of the Society, which was so calculated to engender and preserve a good feeling among the medical profession, and he felt proud the vote of thanks should have emanated from Dr. Garrington. In forming this Society, he felt they had done that which would be of great benefit here as in every part of the country; for wherever a Branch of the Medical Association had been established, there good had resulted, and this would always be the case. He trusted that, through the influence of such associations, the aphorism that doctors disagree would soon become obsolete, and that their Branch would continue to flourish.

Election of a District Secretary.—Dr. COUSINS (Southsea) returned thanks for his re-election, and said he did not think that the success of the Branch depended upon himself. In every district they had an efficient officer as secretary; and the cordial way in which they had co-operated with him, had made his task a very agreeable one indeed. He need hardly mention Dr. Trend, who had undertaken the meeting of that day, and had done much to enhance its success; Mr. Parkinson of Wimborne, Mr. Langdon of Winchester, Mr. Manning of Salisbury, and Dr. Lush of Weymouth. As to the Branch Council, there would be no general election that day; and the only alteration required was to fill up the vacancy created by Dr. Garrington being elected a vice-president; and he proposed that Dr. Axford (Southsea) should be appointed.

The election was carried *nem. dis.*, and Dr. AXFORD returned thanks.

Progress of the Branch.—Dr. COUSINS enumerated the number of districts in the Branch, with their respective members, from which it appeared that, on the 1st instant, there were sixty-five members in South-East Hants, twenty-three in Southampton, twenty-one in Dorset, twelve in Winchester, eight in the Isle of Wight, five in South Wiltshire, and five in Bournemouth. He mentioned the receipt of a communication in respect to the propriety of advertising medical works in newspapers, in which the opinion of the Branch was invited, but time did not permit of this being done. After this, he touched upon the Rumsey Memorial Fund, inviting subscriptions from all who might be disposed to contribute.

President's Address.—Dr. ORSBORN delivered an address, which was printed at page 37 of last week's JOURNAL.

Dr. PARKES (Netley), in proposing a vote of thanks to Dr. Orsborn for his suggestive and philosophical address, said he thought they must all agree with him that the proper work of a great Association like this

must in part be connected with the investigations which had been indicated, and that the great subject of climatic influences and cognate matters could never be properly investigated until it was undertaken by a great number of men acting together, conscious of the difficulty of the problem, but actuated by a determination to overcome it. He thought, also, Dr. Orsborn had done wisely in directing their attention to the great importance of tracing out the beginnings of disease. They could none of them have listened to the address without feeling how much there was for them to do, and being stimulated by the strong points which Dr. Orsborn had brought forward with so much power.

Dr. DYER (Kingwood) seconded the proposition, observing that, when he entered the room, it was with regret he heard that they were not going to be favoured with an address from Professor Maclean; but this regret was much lessened when he understood Dr. Orsborn was going to deliver one in his place, because he knew they would hear from him something of great eloquence, that was very interesting, and well worth listening to.

The motion was carried unanimously.

Dr. ORSBORN thanked the members for their kind reception of his address, which had been written, he said, under some difficulties; but the emergency was such that he felt it to be a duty to assist Dr. Maclean under the melancholy circumstances of his bereavement. He had been amply repaid for any labour he might have expended on it by the manner in which it had been received.

Excursion to Netley Abbey and Netley Hospital.—After the conclusion of Dr. Orsborn's address, most of the members present joined in an excursion to Netley Abbey and the Royal Victoria Hospital. On reaching the abbey, Dr. Parkes, president of the Southampton Medical Society, which had amalgamated for the occasion with the Southern Branch of the British Medical Association, conducted the party through the ruins, and gave some interesting explanations. The abbey was founded in the reign of Henry III, and was suppressed with the other monasteries in the reign of Henry VIII. It is a splendid specimen of ecclesiastical architecture, though there are not any very special historical events connected with it. Time only admitted of a short stay; and the party proceeded to the Royal Victoria Hospital, where Surgeon-General Fraser, the principal medical officer, Surgeon-General Maclean, C.B., Surgeon-General Longmore, C.B., Surgeon-Major Porter, and Surgeon-Major De Chaumont, F.S.B., were waiting to receive them, and conduct them through the building. The visitors first entered the museum, whither valuable specimens are sent from all parts of the world. The salt water bath-room was next inspected, where is a bath of very large dimensions, into which salt water is brought by a pumping process; and the chapel was next visited. It is neatly fitted up and arranged, and will seat eight hundred or nine hundred persons, and is used by Episcopalians, Presbyterians, and Roman Catholics. The professor of hygiene's private laboratory, hygiene laboratory, the microscope room, and some of the wards, were also visited. After inspecting a portion of the surgical division, including the ophthalmic ward, the party repaired to the lecture-room, wherein is a splendid map of India, constructed of *papier maché* and plaster of Paris, and giving an excellent idea of the configuration of the country—its rivers, boundaries, etc., being most accurately depicted. All the military stations are shown, and a capital idea is given of the Himalaya range of mountains. It was presented to this school by the Secretary of State for India at Dr. Maclean's own request, and many of the Rajahs in India have been furnished with copies of this map. In the pathological museum were shown a number of drawings made by Sir Charles Bell, after the battle of Waterloo, illustrating some of the terrible injuries of war. The drawings were presented by Lady Bell. The model room contains a number of models of appliances for carrying the wounded, etc.; and it was shown how ordinary third-class carriages could be utilised for the conveyance of wounded men. Among the appliances for the removal of sick and wounded, the *dhooley* was mentioned as possibly the best contrivance invented in the world. A model of what may be termed a substitute for the knapsack was shown; and Dr. Maclean stated that for nearly six years the committee with which Dr. Parkes was connected were engaged in contriving something which should please the military eye and satisfy the physiological part of the problem. A number of weapons were exhibited which have a greater or less historical interest attached to them. Before quitting the building, the kitchen was inspected, and it was pointed out that the apparatus therein contained is capable of cooking for 1,200 men. The officers' quarters were finally visited, and here refreshments were supplied in the commodious mess-room.

Dinner.—At half-past six, the members and visitors dined together at the South-Western Hotel; Dr. Orsborn, in the absence of Dr. Maclean, in the chair.

SOUTH-EASTERN BRANCH: ANNUAL MEETING.

THE thirty-first annual meeting of this Branch was held at Guildford, on Thursday, July 1st, in the Board Room of the Royal Surrey County Hospital. The retiring President, Mr. HODGSON of Brighton, having thanked the members for the courtesy and indulgence which he had experienced at their hands during his year of office, introduced his successor, Dr. STEDMAN of Guildford.

Vote of Thanks.—On the motion of Mr. DIXON, seconded by Mr. PURVIS, a vote of thanks was unanimously passed to the President and Vice-Presidents for their services during the past year.

President's Address.—The President delivered an address, which is published at page 70.

The Report of Council was read by the Honorary Secretary, Dr. PARSONS.

In presenting their report for the past year, the Council cannot refrain from congratulating the members of the South-Eastern Branch upon reaching their thirty-first anniversary of the Branch in a state of flourishing vigour. The retrospect of this period from the first establishment of the Branch to the present time affords nothing but un-mixed satisfaction; whether regard be had to the steadily increasing numbers which swell our ranks, or to the measures which this Branch has had the honour either to inaugurate or to support and solidify, for the welfare of the profession generally, and for the benefit of our brethren in the army and navy in particular. Some years have afforded room for greater activity than others: and, on the other hand, some years have been unusually wanting in incident, to the verge even of monotonous dulness. It is to be feared that the year just passed must be referred to the latter category. But still the evidences of steady vitality are not wanting; and the Council would ask attention to the following facts.

At the last annual meeting the number of members was 370, as compared with 338 in 1873. Since July 1st, 1874, 15 have withdrawn from the Branch for various reasons, but chiefly from change of residence, advancing age, or retirement from the ranks of the profession: death has removed 7. And this year the Council have been spared the pain of striking off the name of any defaulter from the books, for the defalcations have been *nil*. On the other hand, 38 new members have been enrolled, so that the total number of members at the present time stands at 386.

Many of these new members belong to the army and navy, and have, doubtless, been attracted by the disinterested efforts in their behalf which have been so persistently made by our Association, both in the JOURNAL and by its Parliamentary Committee.

The Council are not unmindful of the valuable services of the District Secretaries in bringing recruits to the Branch, as well as in the organisation of the various meetings in their respective districts. Much of the success which attends these gatherings depends upon the Secretaries, and the Council have much satisfaction in conveying their cordial thanks to them for their zealous co-operation and assistance.

The efforts of the Association through its Parliamentary Bills Committee to advance the interests of the public services have been continued during the year. Some very important concessions have been made by the Lords of the Admiralty to the naval medical service, and the thanks of a number of the most distinguished medical officers of the navy have since been formally tendered to the Association for the assistance rendered in bringing about this gratifying result. The Secretary of State at War is still considering the representations made on behalf of the army medical officers, and has expressed his intention to make some propositions for meeting the views laid before him at a deputation last season by Mr. Ernest Hart on behalf of the Parliamentary Committee of the Association. Meantime, great dissatisfaction prevails in the army at the present position of the medical officers, which combines all the disadvantages of the staff and regimental systems without the full advantages of either.

The Artisans' Dwellings Bill and the Public Health Bill have both undergone modifications through the influence of our Association, and they will probably be yet further amended before becoming law.

The lamented illness of Dr. Rumsey, F.R.S., of Cheltenham, has to some extent arrested a career of singular public usefulness. Dr. Rumsey had devoted the best energies of a great intellect and a long life to the service of his profession and his country. The Poor-law medical service and the sanitary medical officers owe to him a great debt of gratitude; and to the noble and enduring services which our Association has rendered to the Poor-law administration, and the cause of public health—and these are among its chief titles to honour—Dr. Rumsey has been a guide and a leader. Your Council heartily recommend to you the fund which is being raised, with a view of relieving from anxiety his later years, and doing honour to his services.

The next annual meeting of the Association will take place in August, at Edinburgh, under the presidency of Sir Robert Christison: a brilliant gathering is anticipated. The total numbers of the Association now considerably exceed 6,000; and it affords a gratifying evidence of the hold which, through the popularity of its JOURNAL, it now retains in members who have once joined it, that more than 90 per cent. of the members who joined on the occasion of the London meeting, remain permanently attached to it, and that the percentage of resignations was never so small as it is at present.

The mode of organisation of this Branch and its division into districts, is habitually referred to in the JOURNAL as a model of success and usefulness. It is gratifying to observe, that some of the more recent Branches have been framed upon this type, and are flourishing. The strength of the Association is rooted in its Branches, and the Council trust the members will lose no opportunity of recruiting the strength of the district meetings, and in making each district an animated and united centre of scientific and special activity. So much for the prosperity of the Branch.

Before closing the report, however, the Council desire to say a few words on a subject which has not escaped their observation. For some years past, a feeling has been gaining ground in the Branch, that the time had arrived for the organisation of some machinery within the Branch for the protection, guidance, and support of the members when placed in circumstances of difficulty or anxiety. From time to time this feeling finds expression, notably at the last annual meeting at Brighton; and, at the present moment, the matter is being fully discussed in the East Kent District, with a view to definite action at some future annual meeting.

When the Association was in its infancy, it was felt that subjects of an imperial and public character, in which there was little room for disagreement, and every ground for unanimity, should first receive attention. But now that our Branch is consolidated, and mutual confidence has been established amongst its members for so many years, other matters of more immediate, and, so to speak, domestic concern, might very properly receive attention, without endangering that feeling of good fellowship which is characteristic of us, all as members of the British Medical Association.

The Council desire to point out that their functions are purely *executive*, and it is not within their province, as some have imagined, to initiate any new line of policy. It appears to them, that matters of this kind should be brought forward for discussion at the district meetings, in order to ascertain the feeling of the members generally upon them, and to pass such resolutions as may be deemed necessary. These resolutions would be forwarded to the Council, and, after mature consideration, they would take such action as seemed to them most fit; then, at the annual meeting, the whole would be discussed with a wisdom, clearness, and intelligence, which would not otherwise be possible. The Council, therefore, earnestly commend these brief observations to your careful consideration.

On the motion of Mr. CHALDECOTT, seconded by Mr. THURSTON, the report was received and adopted.

The Financial Report showed the year to commence with a balance of £79:13:8; Branch subscriptions, £71:8; total, £151:1:8. Expenditure, £76:15:7; leaving a balance in hand of £74:6:1.

It was moved by Mr. BOXALL, and seconded by Mr. GREENWOOD, that the very satisfactory report just read be received and adopted. This was carried unanimously.

Representatives in the General Council.—The following were elected: J. Armstrong, M.D.; J. H. Aveling, M.D.; R. L. Bowles, M.D.; R. Branwell, Esq.; Sir J. Cordy Burrows; J. M. Burton, Esq.; A. Carpenter, M.D.; W. Carr, M.D.; E. Clapton, M.D.; E. Garraway, Esq.; A. Hall, M.D.; J. B. Hicks, M.D., F.R.S.; G. F. Hodgson, Esq.; C. Holman, M.D.; W. W. Moore, M.D.; A. Napper, Esq.; T. Heckstall Smith, Esq.; N. Tyacke, M.D.; J. R. Wardell, M.D.

Council of the Branch.—The following were elected: C. O. Baylis, M.D.; J. S. Bostock, Esq.; T. M. Butler, Esq.; T. S. Byass, M.D.; J. N. Cunningham, M.D.; E. F. Fussell, M.B.; G. W. Grabham, M.D.; R. Gravely, Esq.; H. M. Holman, M.D.; J. L. Jardine, Esq.; H. Lanchester, M.D.; B. Marsack, Esq.; S. Monckton, M.D.; M. K. Robinson, Esq.; S. G. Sloman, Esq.; J. R. Stedman, M.D.; S. Woodman, Esq.; S. Turner, Esq.; W. Wallis, Esq.

Secretary.—Dr. HOLMAN supposed that they would all be unanimous in requesting the Honorary Secretary to continue to hold his office, and he would not, therefore, trespass on their time further than to convey their cordial thanks to the Secretary for his past services. This was carried unanimously.

Dr. PARSONS expressed his satisfaction at finding that he was of any service to his professional brethren, and the pleasure it afforded him to place himself at the disposal of the meeting.

Place of Meeting in 1876.—On the motion of Dr. ARMSTRONG, seconded by Mr. NAPPER, it was resolved that the next annual meeting should be held at Maidstone; that Dr. Stephen Monckton of Maidstone be the President-elect; and Mr. W. Hoar of Maidstone, and Dr. W. Sankey of Sutton Valence, be the Vice-Presidents-elect.

Alteration of Law 8.—In the absence of Mr. BURTON, Dr. HOLMAN moved, and Mr. HODGSON seconded, the following alteration in Law 8, after the words "district meetings", insert, "or any other meetings of the Branch". This was carried unanimously.

The Title of Doctor.—Dr. F. J. BROWN had given notice of his intention to move—"That, in the opinion of this meeting, the title of Doctor ought to be accorded to all registered members of the profession, as an act of courtesy, and in agreement with general usage on the part of the public."

Mr. HODGSON said that, in the unavoidable absence of Dr. Brown, he had undertaken to bring forward this motion, not that he approved of it, but solely from a feeling of respect and esteem for Dr. Brown.

Dr. ARMSTRONG, whilst condemning the motion, nevertheless rose to second it, not only from personal regard to Dr. Brown, but also from admiration of his graceful generosity in proposing to concede freely to others what he had himself attained by much labour.

The following amendment, moved by Mr. SLOMAN, jun., and seconded by Mr. CHALDECOTT, was carried unanimously:

"That this Branch of the Association strongly disapproves of any member assuming a title that is not sanctioned by the legally constituted examining bodies."

Midwives.—The following resolution was proposed by Dr. HOLMAN, seconded by Mr. SLOMAN, jun., and carried unanimously:

"That this meeting desires to call the attention of the General Council of the Association to the present unsatisfactory condition of midwives in this country; and to urge the necessity of the British Medical Association petitioning Parliament for a Bill which should ensure the instruction and provide for the examination, registration, and licensing of this large class of women."

New Members.—Twelve new members were elected.

Visit to Brookwood Asylum.—The members having done justice to the excellent luncheon kindly provided by Dr. Stedman, proceeded in carriages to Brookwood Asylum, where Dr. Brushfield, one of the Vice-Presidents, received them, and showed the various means of treating the patients confided to his care, and the arrangements for their comfort and convenience.

Dinner.—A very pleasant day was brought to a close by a dinner at the White Hart Hotel, the Vicar and the Mayor being amongst the guests of the President.

STAFFORDSHIRE BRANCH: ORDINARY MEETING.

THE third ordinary meeting of the Session was held in the Board Room of the Mines Drainage Offices, 22, Darlington Street, Wolverhampton, on Thursday, May 27th. Present: K. GARNER, Esq., President, in the chair, and thirty members and visitors.

New Members.—The following members of the Association were elected members of the Branch: Mr. J. C. Lindop (Newport); Mr. John Green and Mr. B. Moore (Wolverhampton); Mr. G. A. Phillips and Mr. F. W. Willmore (Walsall); Mr. G. H. Hopkins (Stone); Dr. J. Hayes (Trenton); Mr. F. Kendall (Kingsgrove); Mr. J. D. Hewson (Coton Hill, Stafford); Dr. H. W. Monckton (Rugeley); Dr. W. Spackman (Penn Fields, Wolverhampton).

Letters.—The SECRETARY read letters from Mrs. F. Turton (Wolverhampton), and from the Secretaries of the Birmingham and Midland Counties Branch.

Communications.—The following papers were read.

Cystic Tumour of the Thyroid Body.—Mr. SPANTON exhibited a cystic tumour of the thyroid body. The specimen was removed from a man, aged 42, who was admitted into the North Staffordshire Infirmary on April 10th, 1875, on account of a large tumour situated on the front part of the neck, and which was clearly a single-cysted bronchocele of rapid growth, and arising without any traceable cause. All kinds of local treatment had been tried before the admission of the patient, and it was deemed advisable (after tapping had failed) to insert a seton, and one was passed superficially to the tumour. Six days afterwards, considerable hæmorrhage of a dark colour occurred from the seton openings; the threads were removed, and efforts made to arrest the bleeding; but, this being ineffectual, Mr. Spanton, ether having been given, ligatured the left common carotid artery. The patient died two days afterwards from septicæmia. The tumour upon removal was found to be a large single cyst of the thyroid gland, with thick walls, and lined

with decolorised fibrinous layers and soft clots, and filled with soft black clots and black fluid blood. The seton did not penetrate the cyst originally, but through ulceration had extended into it.

Cancer of the Breast.—Mr. VINCENT JACKSON showed two cancerous breasts which he had removed that morning from a female whilst anaesthetised by ether. The patient, aged 45, the wife of a blacksmith, living near Welshpool, Montgomeryshire, was sent to the Wolverhampton and Staffordshire General Hospital for operative purposes. One child was living. Menstruation was healthy. Her general health and aspect were good. The family history was negative as regards cancer or tubercle, and no blow or injury had been received. Two years ago, she noticed a hard lump in the right breast, and shortly afterwards (the precise time could not be remembered) another appeared in the left breast. The situation of each scirrhous mass was on the outer side of the mamma, but below the nipple line; the size of each tumour was small. The nipples were prominent. On the right side, the skin was attached to the tumour, and this latter was connected to the underlying pectoral muscle. On both sides, the axillary and clavicular glands were unaffected. The soft parts between the breasts were healthy.

Dr. TOTHERICK read a paper upon Puerperal Fever. A discussion took place, in which the President, Dr. Millington, Dr. Weaver, Mr. J. T. Hartill, Mr. Lycett, Dr. Arlidge, Dr. H. Day, and Mr. Vincent Jackson took part.

Mr. W. E. CLENDINEN read a paper upon the Provident Dispensary System considered as a Remedy for Hospital Abuses. The discussion was postponed.

SOUTH-EASTERN BRANCH: EAST SUSSEX DISTRICT.

A MEETING of the above district was held at the White Hart Hotel, Lewes, on Friday, May 28th; J. G. BRADEN, Esq., in the chair. Eighteen members and one visitor were present.

Communications.—I. *Malaria.*—Mr. T. F. SANGER of Alfriston read a short paper on malaria, in which he enunciated the following propositions. The malaria of ague is caused by vegetable decomposition, as typhoid and diphtheria are caused by animal decomposition or putrefaction. The poison arising from the former is slower in producing its effects than the latter; often remaining dormant in the system for months before setting up its action. The reason why the vicinity of tidal rivers is aguish, arises from the salt and fresh water mingling, which hastens putrefaction. In malarious districts, whole families are often affected by the ague, even to the child under a year old, which proves that the chill theory is a fallacy.—A discussion followed, which was shared in by Messrs. Wallis, Rix, W. J. Harris, Drs. A. Hall and W. Moore; Messrs. Wallis and Rix particularly noticing the fact of the malarious poison remaining dormant through the winter months, and ague showing itself in the spring in the case of labourers who had been harvesting in malarious districts during the previous autumn.—Dr. W. MOORE drew an analogy between typhoid fever and ague, instancing the treatment of both by quinine in large doses, which, according to the German views, arrests putrefactive processes, and lowers the temperature.

2. *Meningeal Apoplexy.*—Mr. G. F. HODGSON, President of the South-Eastern Branch, read particulars of a case of meningeal apoplexy occurring in a widow, aged 42, a cook in a private family, to whom he was summoned on March 19th. The case began with intense pain in the back of the head and neck, at first supposed to be rheumatic, and treated as such. She gradually became "stupid", reluctant in manner, and intractable as regards taking food and medicine. A systolic aortic bruit was developed. On the fourth day, the temperature rose to 104 deg., and the tongue became dry; "stupidity" continued, but no distinct coma, as she got out of bed of herself to procure a clean night-dress, previously to being removed to the Sussex County Hospital, on the fifth day of her illness, when she passed out of Mr. Hodgson's care. Violent symptoms then ensued, necessitating a resort to a strait-waistcoat. Subsequently, left hemiplegia occurred, the cranial nerves not being involved. She died on March 27th, the eighth day since her seizure. At the *post mortem* examination, the brain was reported to be remarkably congested throughout, the subarachnoid space round the medulla oblongata (especially on the right side) being filled with a recent clot of bright coloured blood, amounting to about an ounce and a half in bulk. The arteries were extensively atheromatous. The heart was much hypertrophied; the valves were healthy; the commencement of the aorta was much dilated and roughened by atheroma.—In the discussion which followed, the question of venesection in such cases was mooted by Dr. A. Hall, but combated by Dr. W. Moore, who argued that death in apoplexy always resulted from depression of the vital powers.

Dr. W. MORRIS's paper on the Pathology of Chorea was deferred for want of time.

Mr. MILLIKIN of St. Thomas's Hospital exhibited a choice collection of Surgical Instruments.

New Members.—Mr. Robert M. Ingle of Brighton, a member of the Lancashire and Cheshire Branch, was nominated for membership of the South-Eastern Branch; and Messrs. Frank Hall, John P. Grover, Walter F. Crosskey, and William L. Hunter, all of Lewes, were nominated for membership of the Association and of this Branch.

Dinner took place at the White Hart, under the Chairmanship of Mr. J. G. Braden, twenty-four being present, including the High Bailiff of Lewes and the Vicar of Newick as visitors.

The Next Meeting will be held at Eastbourne in September, T. F. Sanger, Esq., of Alfriston, in the chair.

CORRESPONDENCE.

MEDICAL ADVERTISING.

SIR,—At the annual meeting of the Midland Branch, held at Derby on the 17th ult., the prevalent system of advertising medical works in the daily general papers was adverted to, and a significant expression of disapproval was then and there recorded. There are many very excellent works on the science and art of healing in all its branches frequently given to the world by the industry of members of our profession, the desirableness of whose publicity cannot be questioned; but the manner in which that publicity is, in the present day, gained for them is, in its bearing on the *morale* of the profession, a question on which, to say the least of it, there is a diversity of opinion. I suppose there can be no doubt in the medical world that technical treatises on medical subjects are written for medical men, and for medical men only.

If this be so, I ask, are there not medical journals in abundance, many of whose pages are always set apart for the purpose of making known the merits of the many books which are, from time to time, being issued? And further, with the great privilege of the British Medical Association within the reach of every respectable member of the profession for the small annual subscription of one guinea, is it not more reasonable to suppose that medical news, of whatever character, will be more likely to meet the medical eye in a medical journal than in the *Times*, *Daily Telegraph*, and *Daily News*? If this be so, I desire to know to what end our daily general papers are daily inundated *ad nauseam* with advertisements of medical works?

If such advertisements are not inserted for the benefit and convenience of medical men—and I think I have shown that such is not the case—then to what end and for what purpose, I ask again, is this perpetual flooding of drawing-room papers with them? Nobody will question the importance it is to many unhappy folk, on personal grounds, to know who is the best authority on the "Urine in Health and Disease", on the "Disorders of the Reproductive Organs", or to be well certified of the man who has the most abiding name and reputation in connection with the "Rectum"; but the public daily journals do not appear to be the place where such information should be found: and I venture to record a doubt, in which I do not stand alone, whether professional morality would not be better served, and public taste less vitiated, if eminent doctors and surgeons would cease to puff their wares, and private drawing-rooms were relieved of a literature which, in some sense, is certainly unclean. I remain, etc.,

Derby, July 7th, 1875.

FREDERICK WILLIAM WRIGHT.

SURGEON-DENTISTS.

SIR,—As a member of the medical profession practising a specialty, which, in its highest bearings, apart from its more purely mechanical point of view, should not acknowledge any inferior position when undertaken by fully qualified practitioners, I feel bound to refer to an article, which has only just come under my notice, which appeared in your *JOURNAL* of the 26th ultimo. It is one calculated to give much pain to those who have really worked for the good name of their profession, though the men of the highest education would be the last to deny the elements of truth which exist in the article in question, inas-

much as they have reference to a class with whom they could not consider themselves connected in any way.

Firstly, as a member of the Royal College of Surgeons and a teacher in one of our best known general hospitals, I would ask whether, if your interpretation of the social status of dental surgery be correct, I have any right to retain my name upon the College roll, or to remain on the staff of a hospital, all the members of which consider themselves professional, not business men.

Secondly, your remarks only seem to apply to men of such an inferior type, that it would be found that, whilst none of them are fully qualified, few of them even hold the special degree of Licentiate in Dental Surgery, which also, by the bye-laws of the College, would prevent them from acting in that way which you seem to think to be inseparable from the practice of dentistry. If you will only recall the names, past and present, of the more worthy members of this specialty, you may find men who, in general and scientific acquirement, can rightly claim a position professionally and socially equal to that of the most respected in any branch of surgery.

No one feels more acutely than myself any blot upon the escutcheon of my calling; but, in the name of all qualified and high-minded men in my profession, I disclaim all connection with such a class as you describe, and shall ever hold that, with equal degrees and equal education, a surgeon, whatever may be the branch to which he devotes his attention, holds the same status as any other member of the profession.

As a lecturer also in a special hospital, I have ever impressed upon my students how inseparable is the subject of their studies from general medicine and surgery; for the teeth are organs no more isolated from the body than is the eye, the stomach, or the ear; whilst I have explained to them that they must not expect to be conceded like privileges with, unless they meet upon a common platform as regards all that which makes, the surgeon.

At the same time I cannot but think that some attention to abnormal conditions of the teeth would repay every practitioner; for very many surgical diseases are intimately connected with such conditions, whilst some of the most persistent cases of neuralgia may be dependent upon morbid conditions of the dental tissues, quite irrespective of caries: the pressure of an osseous excrescence upon the pulp, its ossification or hypertrophied cementum, often being the *fons et origo* of sufferings which have marred the happiness of a lifetime, and baffled the utmost skill exerted in behalf of their alleviation; for in such cases no drugs, but only a correct appreciation of the cause, can effect a cure. In this malady alone, I am confident that there is a vast field of investigation open in its connection with occult abnormalities of the dentinal tissues, whilst I firmly believe, and my opinion is based upon facts observed by myself, that the day is at hand when the necessity of stopping or extracting a tooth will be looked upon, to a certain extent, as a confession of failure in treatment; for, under favourable circumstances, much may be done to arrest the ravages of decay by suitable constitutional means.

The last paragraph of the article which I am criticising is hardly worthy of comment. The poor, if there be a demand for it, can find aid in this specialty, even as the denizen of the lowest parliken can, if he so desire it, obtain medical aid at his own price, and be independent of gratuitous assistance. Had not this paragraph appeared in your *JOURNAL*, to which I have long been a subscriber and a thankful recipient of the valuable information to be obtained from it, I should have thought that it was written by an unqualified specialist who, with no true social or professional feeling, fancied that he saw a greater chance of aggrandising himself by rendering a branch of the noblest of professions a mere "business".—Believe me, sir, yours faithfully,

S. HAMILTON CARTWRIGHT,

Professor of Dental Surgery at King's College.

MEDICO-PARLIAMENTARY.

HOUSE OF LORDS.—Thursday, July 8th.

Medical Acts Amendment (College of Surgeons) Bill.—On the motion of Lord SELBORNE, this Bill was read a second time.

Pollution of Rivers Bill.—The report of amendments on this Bill was considered and agreed to, some additional amendments being made by the Duke of Buccleuch.

Friday, July 9th.

Vivisection.—Earl BEAUCHAMP, on the part of the Earl of Harrowby, moved that an humble address be presented to Her Majesty for copy of the Royal Commission on Vivisection, which was agreed to.

Medical Acts Amendment (College of Surgeons) Bill.—This Bill passed through Committee.

Monday, July 12th.

Pollution of Rivers.—This Bill was read a third time, and passed.
The Medical Acts Amendment (College of Surgeons) Bill was read a third time, and passed.

HOUSE OF COMMONS.—Thursday, July 8th.

Lunatic Asylums in Ireland.—Sir M. H. BEACH, in reply to Mr. O'Shaughnessy, said he proposed to proceed with his Bill with regard to Lunatic Asylums in Ireland at an early day; but he must call on Irish members not to stop the discussion on the measure at a late hour at this end of the Session.

Tuesday, July 13th.

Adulterated Milk.—Dr. CAMERON asked the Home Secretary whether his attention had been called to a report in the *Times* of July 3rd, from which it appeared that Mr. Balguy, the presiding magistrate at Greenwich Police-court, had publicly announced that, after consultation with his brother magistrates, he had resolved not to impose fines in cases of the adulteration of milk with water when such adulteration was not over 10 per cent.; and whether the Adulteration Acts now in force warrant magistrates in allowing the adulteration of milk with water if not practised to a greater extent than 10 per cent. to pass unpunished.—Mr. CROSS: Yes; it is substantially true that the magistrate did say so, after having consulted with some of his brother magistrates; but I cannot think that is a view of the law which will be acquiesced in by my right honourable friend the President of the Local Government Board, either under the Act now in force or under the Bill now passing through the House.

Open Spaces (Metropolis).—Leave was given to Mr. WHALLEY to bring in a Bill for affording facilities to vest in the Metropolitan Board of Works open spaces for exercise and recreation.—The Bill was read a first time.

Militia Medical Officers.—Mr. HARDY, in reply to Dr. L. Playfair, said he hoped to be able to publish at no distant day the new regulations in regard to militia medical officers.

MEDICAL NEWS.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—At the meeting of the Council, on July 8th, the following gentleman was admitted a Fellow of the College.

Atherstone, Wm. Guybon, Cape of Good Hope: diploma of membership dated May 11th, 1838.

The following gentlemen passed their primary examinations in anatomy and physiology at a meeting of the Court of Examiners, on July 12th; and, when eligible, will be admitted to the pass-examination.

Messrs. J. B. Noble and J. H. Callender (of the Newcastle School); L. R. Wilkin and W. F. Jones (of the Dublin School); A. R. McDougall and F. Le M. Grasset (of the Edinburgh School); W. E. Margetson (of the Leeds School); K. F. Owen (of the Liverpool School); and William Rhodes (of the Birmingham School).

The following gentlemen passed on July 13th.

Messrs. J. W. Bond, Kánohá Ranchoddás Kirtikar, J. E. Continho, F. B. Green, and William Gristock (of the University College); J. S. Lambert, F. W. Fagg, Richard Edmunds, W. T. Jackman, and C. S. Bontein (of St. Bartholomew's Hospital); William Huey, E. L. McArdle, and Robert Jones (of the Liverpool School); J. E. Pilkington, James Newton, and F. H. Folkes (of the Manchester School); H. C. Jee, H. J. Liebstein, and L. M. E. Jones (of Guy's Hospital); F. J. Spranger and G. F. A. Harris (of St. George's Hospital); Joseph Peake (of the Glasgow School); C. E. Shelly, B.A. Cantab. (of the Cambridge School); J. A. Irwin (of the Dublin School); G. S. Robertson (of the Westminster School); and William Pratt, M.D. Liege of the Aberdeen School.

Amongst the visitors who attended these examinations were Messrs. Couper, F. Mason, H. T. Butlin, W. J. Walsham, W. H. Cripps, B. T. Lowne, George Lawson, etc.

APOTHECARIES' HALL.—The following gentlemen passed their examination in the science and practice of medicine, and received certificates to practise, on Thursday, July 8th, 1875.

Batterbury, Richard Legg, Haverstock Hill
Blake, Andrew Henry, Castle Street, Berners Street, W.
Blake, Henry, Bedford
Eurton, Harry, Greenhays, Manchester
Cooper, John Neild, Hyde, near Manchester
Jones, Cyril Lloyd, 174, Blackfriars Road

The following gentleman also on the same day passed his primary professional examination.

Inman, Robert Edward, London Hospital

At the recent examination for prizes in Botany, the successful candi-

dates were:—1. Neville Scott Whitney (University College), a Gold Medal; 2. William Rushton Parker (University College), a Silver Medal and a Book.

MEDICAL VACANCIES.

THE following vacancies are announced:—

ADDERBURY, Oxon.—Medical Officer for the Districts of Adderbury East, Adderbury West, and Milton. Salary, £60 per annum. Applications on or before the 20th instant.

AMERSHAM UNION—Medical Officer and Public Vaccinator for the Workhouse and the Amersham District. Salary, £50 and £63 respectively. Applications on or before 19th instant.

ARMY MEDICAL DEPARTMENT—Surgeons. Examination on August 9th and following days.

BURY UNION—Medical Officer for the Radcliffe District.

CARNARVONSHIRE and ANGLESEY INFIRMARY—House-Surgeon. Salary, £80 per annum, with board and lodging. Applications on or before the 20th instant.

CHELTSEY UNION—Medical Officer for the Chobham District.

GREAT NORTHERN HOSPITAL—House-Surgeon. Salary, 60 guineas per annum, with board and lodging. Applications on or before the 30th instant.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton—Resident Clinical Assistants. Applications on or before August 2nd.

INDIAN MEDICAL SERVICE—Ten Surgeons. Examination on August 9th and following days.

LEEK UNION—Medical Officer for the Norton District.

LINGOLN UNITED FRIENDLY SOCIETIES' DISPENSARY—Medical Officer. Salary, £150 per annum, with house, gas, coals, etc. Applications on or before the 20th instant.

LIVERPOOL ROYAL INFIRMARY SCHOOL OF MEDICINE—Demonstrator of Anatomy. Salary, £100 per annum, and other emoluments. Applications on or before the 31st instant.

LYMINGTON UNION—Medical Officer for the Hordle, Lymington, and Milford Parishes.

MARLBOROUGH UNION—Medical Officer for the Second District. Salary, £80 per annum, and fees. Applications on or before July 31st.

ORMSKIRK UNION—Medical Officer for the Second District.

ROYAL CORNWALL INFIRMARY—House-Surgeon, Secretary, and Dispenser. Salary to commence at £120 per annum. Applications on or before the 31st instant.

ROYAL SURREY COUNTY HOSPITAL—House-Surgeon. Salary, £75 per annum, with board, residence, and washing. Applications on or before July 31st.

ST. IVES UNION—Medical Officer for the Warboys District.

UNIVERSITY COLLEGE and HOSPITAL—Teacher of Operative Surgery.—An additional Assistant Surgeon and Assistant Physician. Applications on or before the 21st instant.

WESTMINSTER HOSPITAL—House-Surgeon. Applications on or before the 27th instant.

WORKSOP DISPENSARY—Resident Surgeon. Salary, £100 per annum, with furnished apartments, coals, gas, and attendance. Applications on or before the 30th instant.

MEDICAL APPOINTMENTS.

Names marked with an asterisk are those of Members of the Association.

HICKON, Albert Thomas, A.B., M.B., appointed Assistant Medical Officer to the Lancaster County Asylum at Rainhill, *vice* T. V. de Deane, L.R.C.P.Ed., resigned.

HUGHES, William L., M.R.C.S.Eng., appointed Junior Resident Medical Officer to the London Hospital.

SMITH, Roland D., M.R.C.S.Eng., appointed Extra Junior Resident Medical Officer to the London Hospital.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths, is 3s. 6d., which should be forwarded in stamps with the communication.

MARRIAGE.

BRAMWELL—REYNOLDS.—On July 6th, at St. John's, East Dulwich, John Milne Bramwell, M.B. and C.M. Edin., to Mary Harriet, eldest surviving daughter of the late Captain Charles Sheppard Reynolds, Bengal Native Infantry, and Assistant Commissioner of the Assam Provinces.

VACCINATION.—Mr. E. Stephens of Ilminster has received a bonus from the Local Government Board of £10:12 for the efficient state of the vaccination in this district.

TESTIMONIALS.—Dr. Charles Gowan, Assistant Medical Officer and Deputy Superintendent of the Worcester County and City Lunatic Asylum, Powick, having been appointed Medical Superintendent of the Toronto Lunatic Asylum, Canada, has been presented with a silver goblet bearing his monogram and crest, and a silver salver containing the following inscription: "Presented to Charles Gowan, M.D., by the officers, attendants, and servants of the Worcester County and City Lunatic Asylum, as a mark of their esteem for his professional attainments and integrity of conduct during his service of four years, June 1875." The presentation was made by Dr. Sherlock, the Medical Superintendent, at a special entertainment for the purpose.—Dr. Andrew Armour has been presented with a silver claret jug and revolving tureen at a public meeting at the Mechanics' Institution, Crook—the Rev. J. B. King, Rector, in the Chair—on the occasion of his leaving that town for Stockton.

OPERATION DAYS AT THE HOSPITALS.

MONDAYMetropolitan Free, 2 P.M.—St. Mark's, 9 A.M. and 2 P.M.—Royal London Ophthalmic, 11 A.M.—Royal Westminster Ophthalmic, 1.30 P.M.

NOTICES TO CORRESPONDENTS.

CORRESPONDENTS not answered, are requested to look to the Notices to Correspondents of the following week.

PUBLIC HEALTH DEPARTMENT.—We shall be much obliged to Medical Officers of Health if they will, in forwarding their Annual and other Reports, favour us with *Duplicate Copies*.

AUTHORS desiring reprints of their articles published in the JOURNAL, are requested to communicate beforehand with the printer, Mr. T. Richards, 37, Great Queen Street, W.C.

CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.

WE CANNOT UNDERTAKE TO RETURN MANUSCRIPTS NOT USED.

COMMUNICATIONS respecting editorial matters, should be addressed to the Editor: those concerning business matters, non-delivery of the JOURNAL, etc., should be addressed to the General Manager, at the Office, 36, Great Queen Street, W.C.

IMMORAL AND PERNICIOUS ADVICE.

SIR,—I send you the following case, thinking it sufficiently important to bring under your notice. It is so far of interest in that it teaches us how some medical men treat cases of seminal emissions in young healthy men, and by this means send them either directly or indirectly to ruin—directly through dangerous advice, indirectly by making light of the matter, and so driving them to advertising quacks.

A young man sent for me. I found him in bed, suffering from a severe attack of oedema and gonorrhoea, much down-hearted, etc. On questioning him, I elicited that some weeks ago he was made uneasy by frequent seminal emissions. Going to a medical man for advice, medicine was given him, and he was seriously told to go and gratify his desires, as nature must and would have its course. Acting upon this advice, the patient, at his first attempt, contracted gonorrhoea—might I not add, fortunately.

I would not have troubled you with this detail; but several of these cases have lately come under my notice, and I have from reliable sources learned there are others guilty of such a practice. I believe no advice could be so pernicious. In the first place, it is immoral, and on this account alone ought not to be given by men who have such influence over the minds of their clients; in the second place, it is dangerous. Does the patient not run a great risk of syphilis, and of making himself if he marry) and his family miserable for life. I have not words strong enough to express my indignation and disgust towards those medical men who have so far forgotten their position of confidence and trust as to degrade themselves by such misdeeds.—I am, sir, yours truly,

West Hartlepool, July 1875.

W. J. SIMPSON.

DISCLAIMER.—Mr. J. Wrixon of Sarratt Villa, near Watford (the only person of that name in the *Medical Directory*), writes to disclaim all knowledge of the man John Robert Wrixon, described as "M.D., a surgeon", who was recently charged at Bow Street Police Court with uttering fictitious cheques.

DISEASE OF THE NAILS.

SIR,—Will any of your readers kindly advise me what to do in the following case? A lad aged 12 has been under my care for a peculiar disease of the great toenails (right and left). He and his mother inform me that (as near as possible) every six weeks he suffers a little pain at the roots. Subsequently, the nails become loose, and are in a few days cast off, followed by the growth of a new nail, but which, at the end of the time specified, takes on the same course. There is but very little tenderness around the part, and that only prior to the nail being cast off.—I am, sir, your obedient servant,

D. WILLIAMS MORRIS.

Grosmont, July 14th, 1875.

A FELLOW (Manchester).—The list of stewards of the annual festival of the Fellows of the College of Surgeons contained the names of 111 Fellows, of which number 33 were provincial surgeons. The analysis of the result of the combined voting was prepared specially for the BRITISH MEDICAL JOURNAL last week.

CORRESPONDENTS are particularly requested by the Editor to observe that communications relating to Advertisements, changes of address, and other business matters, should be addressed to Mr. Francis Fowke, General Secretary and Manager, at the Journal Office, 36, Great Queen Street, W.C., and not to the Editor.

A RAILWAY CASE.

SIR,—I shall feel greatly obliged if you will kindly allow me a space in your valuable JOURNAL for the publication of the following case, which deeply concerns both myself and my patient. I hope I am not trespassing upon your columns without a cause, but I feel it my duty to do all in my power to clear myself of the imputations which have been cast upon me. In order that I may do this, I must request you to permit me to give as short and as clear a statement of the matter as I can. On Monday evening, the 27th April, 1874, Mr. William Evans, aged 57, of 97, Offord Road, Barnsbury, an artist (a photographic portrait painter) was returning home by the North Metropolitan Tramway, and met with the following accident at Barnsbury Street, Upper Street, Islington, where the cars stop for passengers to alight. Mr. Evans had descended from the roof of the car, and had given up his ticket to the collector; and, as he was in the act of descending from the iron step to the ground, the car suddenly moved on, and he was precipitated into the roadway with great violence. The conductor had evidently touched the bell for progress too soon; hence the accident. Mr. Evans was picked up in an insensible state, and was carried by some kind bystanders to the nearest chemist. Restoratives having been administered to him, and nearly an hour having elapsed, he became somewhat conscious of what was passing around him, and was led home by two men. On reaching his home, he became sick and vomited violently; and after a time, continuing to feel very ill, and being strongly urged by his wife, who feared that he had sustained serious internal injuries, he managed, with her assistance, to walk to my house. On my return home from my daily visits, I found Mr. Evans in my waiting-room, with Mrs. Evans sitting by his side supporting him. I immediately gave the case my attention, and I soon ascertained that he had received a number of injuries—viz., a cut over the left eyebrow, a bruised and swollen nose, upper lip much swollen, a front upper tooth knocked out; and, as he was quite unable to give me any intelligible account of his accident, I came to the very proper conclusion that he was suffering from concussion of the brain. He presented a most deplorable condition, being pale, cold, and trembling, with a weak pulse, disfigured face, and diminished powers of sight and hearing. As soon as possible, I prescribed for my patient, and gave his wife instructions for the management of the case. I may here state that the task of taking Mr. Evans home was accomplished by Mrs. Evans with the greatest difficulty, the distance being about two hundred yards. It was between the hours of seven and eight o'clock P.M. when I saw Mr. Evans, consequently I did not see him again until the following morning, when I called upon him and found his mind still in a clouded state. I learned from Mrs. Evans that her husband had passed a wretched night, and that he could take nothing, owing to the difficulty of swallowing, and to the excessive pain which he experienced in attempting to do so. Towards the afternoon of this day, the insensibility had passed away, and he could give an account of his accident, and towards evening he felt much better. During the Tuesday, a friend, who had heard of the accident, called upon Mr. Evans, and said he would write to the tramway company. This the friend did, demanding, in rather peremptory language, compensation for Mr. Evans's injuries. As soon as Mr. Evans found that this friend had interfered, he thought, on consideration, that it would look better if he took upon himself this duty; and during the Wednesday following he composed at intervals, and then wrote off, a fairly written letter to the secretary of the tramway company. This letter he signed with his usual artistic flourish. I mention this, as the production of this letter in court produced a very damaging effect upon the claim of the plaintiff. I must now state that when Mr. Evans wrote that letter, with its artistic termination, he thought he would soon recover, although he was suffering from pain in the muscles of the neck and back, and he was desirous to settle the matter, if possible, in a speedy and amicable manner. His letter to the secretary of the company will prove this. On Wednesday night, Mr. Evans had a serious relapse and became very ill again, and I must confess that I was anxious about him. The symptoms did not abate, and on May the 4th I met in consultation the surgeon of the Tramway Company, Mr. Buxton Shillitoe, who, after a careful examination of the case, agreed entirely with my opinion—viz., that Mr. Evans was suffering from the effects of concussion of the brain, and that it would take some weeks for his recovery from the shock. (N.B. Mr. Shillitoe did his duty faithfully to the company, for he carefully examined the case, and took notes of it.) The symptoms then present were, severe persistent headache, weak pulse, coated tongue, obstinate constipation, difficulty in passing urine, diminished powers of vision, taste, smell, and hearing, loss of sleep and strength, nausea, and inability to take any amount of nourishment, through the great difficulty in swallowing, also great pain in the muscles of the back of the neck and lower dorsal region. These distressing symptoms lasted, with more or less severity, for three weeks, and during this period my patient was so prostrated by the accident as to be quite unable to attend to his duties. I ought not to omit the additional fact, that Mr. Evans has now to wear a truss, through a rupture produced by his accident.

As time passed on, Mr. Evans made a very proper claim upon the company for compensation, and, having exhausted all the means in his power to obtain a settlement of his claim, he was compelled to take action against the company. The trial took place on Monday, November 30th, 1874, in the Court of Common Pleas, Westminster, the Hon. Mr. Justice Brett presiding as judge. The plaintiff, owing to his weakness and nervousness, made several mistakes in giving his evidence—such, for instance, as the time occupied by the state of insensibility, which, through defect of hearing, he misunderstood for sensibility. The opposing counsel, Mr. Day, Q.C., made a great point of the letter, with its artistic flourish, and succeeded in seriously confusing the plaintiff. Next, two very intelligent boys gave their evidence in such a truthful and straightforward manner as to leave no doubt upon the fact—viz., that the accident had been caused by the overhaste of the company's conductor. And next, I had to enter the witness-box, and I shall not easily forget the manner in which I was treated both by the judge and counsel when there. I soon perceived that my statement—viz., that the plaintiff had suffered from concussion of the brain, and had passed through some weeks of severe illness—was regarded by the judge with more than doubt; and his lordship, instead of asking me questions as to the plaintiff's illness and sufferings, interrogated me closely about the amount of my bill and how many visits I had paid and the price of each visit. I told his lordship that my bill might be £14 or so, and that I had charged five shillings per visit. I was then joked by Mr. Day that a dose of Epsom salts would speedily have effected a cure. No doubt Mr. Day did his duty to the company, but how he could find it in his heart to joke

away the suffering of my patient, when the surgeon to the company, Mr. B. Shillito, who had advised the company to settle the matter, was sitting in front of him, will ever be, to my mind, more than passing strange. (N.B. Mr. Day exercised a very wise discretion, for he never called Mr. Shillito to contradict my faithful evidence.) Battered and beaten, both by judge and by counsel, I left the box in dismay. But, alas, my troubles and the troubles of my patient did not end here; for on the following morning his lordship, in summing up, ridiculed the idea that anyone falling from so low a position as the iron step of a train-car could sustain such a serious injury as concussion of the brain, and spoke of the old man's loss of a tooth as neither adding to nor detracting from his beauty, and finished this part of his address by telling the jury that the old man, who did not like to be styled a photographer, had probably received a good shaking up and no more. Passing on to my evidence, his lordship remarked that it was his experience of medical men who acted on the side of plaintiffs that they usually gave exaggerated evidence, and that they did so because of their bill, which they knew was not paid by the plaintiff, but by the company. Having spread this preliminary network of remarks, his lordship caught me in it, and presented me to the jury as a man who would enter the witness-box to swear away my oath for the sake of filling my pockets with the money of the company. It would be impossible for me to give word for word the language of his lordship, but no one being present at that trial would leave the court without coming to the conclusion that I had given exaggerated evidence for the very wicked purpose of committing a most contemptible species of robbery upon the company. Several persons of great respectability from my district were present in court and heard his lordship's address. Those who were acquainted with the facts of the case and who knew how faithfully I had performed my duties, expressed their sympathy for me and for my patient; but there were others present, who, not knowing the merits of the case, will, I fear, continue to look upon me with suspicion until this nasty cloud is dispersed. The result of the verdict, even after a splendid speech by Mr. McIntyre, Q.C., was damages £25; deduct the legal and medical expenses from this small amount, and the plaintiff had far better have put up with his injuries. Every company has it in its power to send skilled surgeons to examine cases of accident, and indeed it is quite right that companies should be protected from imposture. When, however, a company has done so, and their skilled medical officer has coincided, as in my case, with the opinion of the general medical attendant who has charge of the accident, then, surely there is no necessity for a judge or a counsel treating a medical man in the manner in which they have treated me. There is no taking action against judge or counsel for defamation of character, for they are shielded by the strong arm of the law. But what is this? In conclusion, I can only add that I have given this case publication in order that it may be, if possible, inquired into, and those who have known me for many years may have it in their power to free me of the charge; viz., that I entered the witness box to swear away my oath for the sake of filling my pockets with the money of the company. My patient is still far from well, and he informs me that he feels very exhausted during the day. He tells me also that he is not possessed of anything like the same amount of energy as he had prior to his accident. Can nothing be done to remove the medical ignorance which degrades our law courts?—ignorance, which causes them frequently to embrace clever imposture, and to reject real injury.—I am, sir, your obedient servant,

AUGUSTUS BROWN, M.D., M.R.C.S.E., L.S.A., L.M.,
Formerly Demonstrator of Anatomy to the Grosvenor
School of Medicine.

29, Belitha Villas,
Barnsbury-park, Islington, N.
June 24th, 1875.

P.S. I lost the better part of three days, during a very busy time, in attending upon the court, and I had the misfortune to take a severe cold. For the loss of this valuable time I received three guineas.

. This rather long but candid and simple narrative must, we think, carry conviction to all, that Mr. Brown has been the victim—not the first—of forensic license and judicial distrust. To those who know his career and character—and we have had opportunities of appreciating his admirable simplicity, purity, and truthfulness of mind, from his student days—no other testimony would ever be necessary than his own word. If, indeed, in this case it have been assumed by the judge that he has been guilty of falsehood for the sake of gain, we cannot doubt that he was cruelly aspersed, and he is amply entitled to such sympathy and reparation as the outspoken testimony of his friends and brethren can afford him.

FLATULENT DYSPEPSIA.

SIR,—Of the six formulæ of advice for the poor sufferer in to-day's JOURNAL, there is only one that I think comes near the mark. My advice would be as follows. 1. Take a good stock of the usual medicines for stomach-disorders, and go down to Southampton. 2. Go on board the first Peninsular and Oriental steamer for Gibraltar, with return ticket. 3. Throw all the medicines overboard. 4. Live like other people as soon as you have got your sea-legs, and smoke when you can. 5. If not perfectly well on your return, go a second trip.

Supposing there be nothing more than the reported flatulent dyspepsia, I would almost guarantee a cure. No. 3 to be especially attended to.

Your obedient servant,
JOHN EARCLAY, M.D.
Leicester, July 10th, 1875.

SIR,—In my letter which appeared in your columns last week, on the subject of flatulent dyspepsia, there was a misprint, to which I beg to call your attention. Instead of "antimonii tartarici", it should have been "acidi tartarici".

I am, sir, your obedient servant,
C. O.

MR. MALINS (Birmingham), Dr. CHARTERS, Dr. MITCHELL WILSON, Dr. M. JONES, will have observed that the pressure on space in the JOURNAL has been such as to preclude earlier issue of papers accepted, but of which the publication has been unavoidably delayed. We have in hand at the present moment a considerable mass of MSS., some of which are of many months' standing, for which we shall do our best to find room.

IODINE VAPOUR AS A PUERPERAL DISINFECTANT.

CAN any of your readers speak with the same amount of confidence as Dr. Wynn Williams, of the efficacy of iodine vapours and ablutions as a disinfectant after attending a case of puerperal fever? and at what time may one safely return to practice? AN INTERESTED MEMBER.

MR. THOMPSON.—It is a mistake on the part of the journal in question. Professor Flower will be, as we stated, associated with Professor Parker as Hunterian Professor of Comparative Anatomy, and not with Mr. Turner of Edinburgh, as stated by our contemporary.

NOTICE TO ADVERTISERS.—Advertisements for insertion in the BRITISH MEDICAL JOURNAL, should be forwarded direct to the Publishing Office, 36, Great Queen Street, W.C., addressed to Mr. FOWKE, not later than Thursday, twelve o'clock.

PUERPERAL FEVER.

SIR,—Like many others, I take a deep interest in the discussion which has been going on in the London Obstetrical Society on the subject of puerperal fever. There was great need for such a discussion, and no doubt much good will arise out of it. In the report which appeared in your issue of the 17th ultimo, we had some very practical remarks from Dr. Wynn Williams and Dr. Tilt. They were specially interesting, in being practical, and as the outcome of, in my humble opinion, a very rational theory; and I think if Dr. Tilt, who spoke most of washing out the uterus, would kindly develop his views on this point in your JOURNAL, and tell us circumstantially how he does it, what instrument he uses, what disinfectant, and of what strength, etc., he would, I have no doubt, confer a very great benefit on the community. I am satisfied many want information and instruction on this point, and he seems well qualified to give both. Most practitioners use vaginal injections only; and I have heard more than one maintain that these find their way into the uterus, but of this I have very great doubt.

In the hope that Dr. Tilt will at an early date comply with this request, I am, sir, your obedient servant,
A LEARNER.
July 5th, 1875.

THE CONTAGIOUS DISEASES ACTS.—We shall be compelled to postpone publication of Inspector-General Lawson's letter for some time. The fallacies of Dr. Nevins's selection of figures have been almost sufficiently exposed, we think, by the clear and candid statements of Dr. Parkes. We have given Dr. Nevins very ample space and scope, so as to avoid even the appearance of injustice. His letters have long since condemned themselves to every one who understands the facts and cares to investigate figures. Mr. Lawson, we think, might usefully send his letter to the *Liverpool Inquirer*, which up to the present time has quoted Dr. Nevins's statements only, without ever daring to put Dr. Parkes's refutations before its readers, although professing, in very blatant language, a monopoly of fairness. As friends of the Acts, which we believe to operate beneficially on health and morals, we are content to omit the publication of any further answer to Dr. Nevins for the present at least. Perhaps we may at a future time be called upon to discuss some new set of figures. So far, we think the case on behalf of the Acts completely proved. The *Inquirer* will, no doubt, be glad to place both sets of figures before its readers, and so may now see well to publish Dr. Parkes's and Mr. Lawson's refutation of Dr. Nevins. It has, we believe, already stated that it has not seen any refutation; perhaps it will allow its readers to see it and judge for themselves.

A TUTOR, H. S., AND OTHERS.—The result of the Midsummer Arts examinations for the diplomas of Fellow and Member of the College of Surgeons has been communicated to all the candidates, whether successful or otherwise.

We are indebted to correspondents for the following periodicals, containing news, reports, and other matters of medical interest.—The Bristol Daily Post; The Daily Bristol Times and Mirror; The Derby and Chesterfield Reporter; The Lincolnshire Herald; The Glasgow Herald; The Sunderland Daily Echo; The Carnarvon and Denbigh Herald; The Manchester Guardian; The European Review; The Hackney and Kingsland Gazette; The Worcestershire Chronicle; The Birmingham Daily Post; The Brighton Daily News; The Sussex Daily News; The Glasgow Herald; The Cork Examiner; The Scotsman; The Cork Daily Herald; The Southampton Times and Hampshire Express; The Hampshire Advertiser; The Birmingham Morning News; etc.

COMMUNICATIONS, LETTERS, ETC., have been received from:—

Dr. George Johnson, London; Dr. R. Barnes, London; Mr. H. Lee, London; Dr. W. M. Campbell, Liverpool; Mr. J. N. Cooper, Manchester; Dr. F. De Haviland Hall, London; Dr. McKendrick, Edinburgh; Dr. H. Beigel, Vienna; Mr. C. Lingen, Hereford; Dr. John Whitmore, London; The Registrar-General of Ireland; Dr. Albert A. Smith, Philadelphia; Dr. J. Batty Tuke, Edinburgh; Dr. C. E. Underhill, Edinburgh; Mr. E. Stephens, Ilminster; Dr. Bradbury, Cambridge; Dr. Cassells, Glasgow; The Secretary of Apothecaries' Hall; The Registrar-General of England; Mr. T. M. Stone, London; Dr. Edis, London; Dr. George Ross, London; Dr. Oxley, Liverpool; Mr. A. E. Carter, Liverpool; Mr. John Stevenson, Edinburgh; Mr. John Ingpen, London; Mr. John Payne, Oldham; Mr. H. A. Brown, London; Dr. William Ketchen, Middlesbrough; Our Dublin Correspondent; Mr. John Job, London; Mr. Campbell Orme, Isleworth; Dr. W. B. Mashet, London; Mr. Robert Glassington, London; An Associate; Mr. E. Garraway, Faversham; Mr. Paul W. Swain, Devonport; Dr. Lawrence, Montrose; Mr. W. M. Baker, London; Dr. Dyce Duckworth, London; Dr. Barclay, Leicester; Mr. A. Shewen, London; Dr. G. E. Shuttleworth, Lancaster; Our Edinburgh Correspondent; Dr. F. J. Brown, Rochester; Mr. J. Greene, Birmingham; Mr. J. W. White, Derby; Dr. Steele, Liverpool; Dr. Shettle, Reading; Mr. W. C. Atkinson, Uckfield; Mr. J. Francis, Southsea; Mr. W. Allard, Tewkesbury; Dr. Ritchie, Pollokshaws; Mr. R. Ryder, Dalston; Dr. Boggs, Paris; Dr. J. J. Bailey, Stockport; Dr. Batten, Gloucester; Mr. F. W. Wright, Derby; Dr. J. J. Lough, Ballyjamesduff; Mr. Baetea, Coleford; Mr. J. Greenslade, Rochester; Mr. S. Kisch, Liverpool; Dr. R. Todd, Dysart; Mr. MacLachlan, Thornhill; Mr. W. Baxter, Kilmarnock; Dr. Batty Tuke, Edinburgh; Mr. J. B. Sanders, Glasgow; Dr. F. R. Dickson, Exeter; Dr. C. H. Groves, Edinburgh; Dr. Finlay, Edinburgh; Mr. W. G. Stevens, Renfrew; Dr. Dow, Dunfermline; Dr. W. Craig, Edinburgh; Dr. Wise, Barnby; Mr. I. Tait, Birmingham; Mr. Rodger, Galston; Dr. W. Frew, Newmills; Mr. W. Adams, London; Dr. Masson, Edinburgh; Dr. Turnbull, Liverpool; Mr. Fawcett, Conway College; Dr. J. H. Thomas, Merthyr Tydfil; Dr. Bradbury, Cambridge; Dr. Johnston, Stirling; Dr. Wolfe, Glasgow; Mr. O. N. Royle, Milnthorpe; Dr. E. Davies, Wrexham; Mr. Kemp, London; Mr. E. Malins, Birmingham; Dr. W. Dobie, Chester; Dr. M. Chatteris, Glasgow; etc.

ABSTRACT OF LECTURES ON SYPHILIS;

AND
ON SOME LOCAL DISEASES AFFECTING PRINCIPALLY
THE ORGANS OF GENERATION.

Delivered at the Royal College of Surgeons of England, 1875.

By HENRY LEE, F.R.C.S.,

Professor of Surgery and Pathology to the College.

LECTURE III.

Inoculation of Syphilitic Patients.—With common Pus.—With the Secretions of Secondary Manifestations in other Patients.—Inoculation as a means of Diagnosis.—Adapted only to one form of Venereal Disease.—Syphilitic Disease of the Mucous Membrane of the Urethra.—Mistaken for Gonorrhœa.—Test by Inoculation fallacious.—Secondary Syphilitic Urethral Discharges.—Recurring after Marriage.—Medico-legal Questions.—Inoculation of Urethral and Vaginal Discharges.—Modified Results in Syphilitic Patients.—Opinions of Sævidianr, Hunter, and Ricord.

THE manifestations of secondary syphilitic disease Hunter regarded as produced by the local action of the poison determined to particular parts, after it had circulated with the blood. The action of the poison can be transmitted in a much more direct manner. It may be inoculated with the point of a lancet upon any part of the skin; and the results of such inoculations are often similar to those produced in the natural course of the disease.

A person may be syphilitic and yet have no manifestation of such a disease at a particular time. It is only at certain periods that such manifestations appear. In chronic cases they may appear only in the spring, or at some more or less irregular periods. There must be some action or excitement in the system before they manifest themselves. In the natural course of the disease, this action is the result of what I have termed the syphilitic fever. When a similar action is produced on one or more spots artificially, I will call it local syphilitic irritation.

The syphilitic poison may lie dormant for a long period. Some change will then take place in the patient's constitution, and the syphilitic manifestations will develop themselves. If a patient live too highly, or if, on the other hand, he be depressed by mental anxiety, or by some other illness, or by bad diet, the syphilitic fever will reappear; or if, in a syphilitic subject, a local irritation be produced, some similar form of disease may occur as would naturally have arisen from a recurrence of the syphilitic fever. I inoculated a syphilitic patient with the pus taken from a wound left in a child after an excision of the knee-joint. The pus was apparently perfectly healthy, but, falling upon a syphilitic soil, it produced, after a time, suppuration and ulceration.

In the very great majority of cases of artificial inoculation on syphilitic subjects, a remarkable difference presents itself in respect to the period at which the results of the inoculation show themselves, as compared with the cases previously given. In the former, there was always a period of incubation of some weeks. The results of the inoculation, when they showed themselves, were of the adhesive character. They were accompanied by corresponding adhesive inflammation of the absorbent glands, and by secondary manifestations, characterised by the adhesive form of inflammation. In these, the patients had not previously been infected. But when the patient is already syphilitic, or under the influence of syphilitic fever, the results of inoculation appeared almost immediately. They are of the ulcerative character, are followed by no corresponding enlargement of the inguinal glands, and no secondary manifestations.

The test of inoculation was only a few years ago almost universally received as the one only sure and certain means of recognising real syphilis, as far as its primary manifestations are concerned. Under the teaching of Ricord, Vidal, and many others, the production of the syphilitic pustule upon inoculation was considered as conclusive. M. Ricord, M. Vidal, and many others, collected and published a large number of cases in which the secretion from the urethra was not inoculable upon the patient himself, and they concluded that these cases were, therefore, none of them syphilitic. To these gentlemen must be accorded the merit of having demonstrated by experiment that the secretion of so-called gonorrhœa differed essentially in its nature from some other secretions which were inoculable upon the patient himself. But this does not prove that they were not syphilitic.

That ordinary gonorrhœa is not in itself syphilitic, and does not produce constitutional syphilis, is abundantly proved without inoculation, by simply observing the natural course of the disease; but to conclude that no urethral discharge, unaccompanied by ulceration, and which cannot be inoculated, is syphilitic, is entirely a different question. I have long noticed a peculiar kind of urethral discharge which differs in its nature and symptoms from that of ordinary gonorrhœa. It occurs not very unfrequently in patients suffering from symptoms of constitutional syphilis who have not exposed themselves to any fresh infection. and it also precedes or accompanies well marked primary disease in those who have. It consists of a viscid greyish secretion, often resembling in appearance thin oatmeal gruel. It is generally unaccompanied by any pain when the urine passes, and attracts little of the patient's attention. When accompanied or followed by a Hunterian chancre, it often does not appear until some days after exposure, and will generally cease as soon as the chancre is developed. Upon the occurrence of this discharge, I have predicted the infection of the general system, and this has been followed by a specific induration in one spot on the prepuce, enlargement of the inguinal glands, and syphilitic eruptions over the whole body.

The syphilitic poison, although applied over a large surface, generally produces the specific induration at one spot only. The remaining surface may be irritated, but does not become indurated. The poison is thrown off with the epithelial scales, or by the natural secretion of the part. It is very rarely that an indurated sore exists within the urethra, although the syphilitic poison must often be conveyed there. On the lips of the urethra it not very unfrequently occurs, but I have never known it to originate farther back than a quarter of an inch from the orifice; and, in the great majority of cases, if it affect the urethra at all, it spreads to it from without. Indurated sores on the glans penis are also rare, yet it is exposed to the contact of the poison more than any other part, and generally an irritation, accompanied by abrasion, or increased secretion, is the only local result. The irritation may persist without induration, and may then be one of the signs of constitutional infection. In the same way, the peculiar discharge from the urethra, which I have mentioned, may persist either in primary or secondary cases, and be a sign of the infecting nature of the poison which produced it. This secretion, like the secretion of a primary chancre, may not be inoculable upon a person already under the influence of the syphilitic fever, but it does not follow that it would not be inoculable upon another person. Ricord inoculated the product of what he called gonorrhœa over and over again upon the same subject, and produced no result. I have done the same with the secretion of an unirritated Hunterian chancre.

It happens every day that a young gentleman, who has never had syphilis, will expose himself to contagion with a woman of the town who has long ceased to have any outward manifestations of disease, and after the lapse of some days, will have a discharge such as I have described; or after a still longer period of incubation, some adhesive form of inflammation will appear on the unabraded skin of the penis, or upon the internal prepuce. The glands in the groin will subsequently become enlarged in a peculiar way, which I have called the amygdaloid condition, and in due course the whole train of secondary symptoms will follow. I have seen a number of patients who fancied that they were safe in having intercourse with women who had recently been examined in "protected districts", and who nevertheless have had the train of symptoms which I have described. And if a woman have no objective signs of syphilis except a vaginal or uterine discharge, and will wash herself before being examined, it would be exceedingly difficult, if not impossible, for a surgeon to say whether she be syphilitic or not. The only reliable symptom, under the circumstances, is the persistence of the amygdaloid glands in the groin. But even this may be fallacious.

The urethral discharge which I have described, instead of being one of the first symptoms of syphilitic affection, will sometimes appear as one of its secondary manifestations. A gentleman, who is, as he believes, free from syphilitic symptoms, but who probably has some remaining induration of the inguinal glands, will marry. Shortly after his marriage, some irritation will appear about the penis, accompanied by an increased mucous discharge from the urethra. After the lapse of a short time, the wife will complain of itching and irritation of the mucous membrane, at the orifice of the vagina. There will be an increased mucous discharge of a greyish colour; and after the next menstrual period, and sometimes before, an abrasion or induration will be discovered, and this will be followed by the appearance of amygdaloid glands in the groin and constitutional syphilis. In many cases, a husband, who found his wife diseased after marriage, has asked his medical attendant whether she could have become so without being exposed to the contact of primary syphilis. The answer of those who

held M. Ricord's opinion, and of M. Ricord himself, would be that she could not. If the husband believed this, he would have no alternative but to consider that his wife had been unfaithful. The most cruel injustice has in this way, through an erroneous pathology, been inflicted. The husband has not only communicated disease to his wife, but has accused her of having contracted the disease elsewhere.

It sometimes, although more rarely, happens that the husband is the party who suffers from these mistakes. I have been engaged in more than one trial where the wife or her friends have sought to obtain a divorce on the ground of the husband having contracted disease after his marriage, and communicated it to his wife. It has been given in evidence that, in order to do so, he must have had some primary disease, but the whole class of cases to which I am now referring show that secondary affections, of the existence of which the husband may have been unconscious at the time of his marriage, may recur, and be the means of imparting constitutional syphilitic disease in the wife. This may happen before impregnation, although it is much more common afterwards.

The observations made by authors with regard to inoculations have had almost exclusive reference to the skin. The effect produced upon mucous membranes when subject to the action of the syphilitic poison, as, indeed, to any irritation, is peculiar. The newly formed matter in them, instead of remaining, for a time at least, part of the living being, is at once thrown off in the shape of mucus or pus-cells. Hence it is only in rare and exceptional cases that we get here any well marked and defined induration in consequence of the application of the syphilitic poison.

Mucous membranes that have been long exposed or long irritated will resemble the skin, not only in appearance, but also in their diseased actions. In both primary and secondary syphilitic disease, portions of mucous membrane which have been long exposed, or have been subject to much irritation, will become infiltrated and indurated, very much in the same way as the skin, and there will not be much difference between the actions then produced, and in those portions of skin with which they are naturally in contact. We have thus produced upon exposed mucous membranes, and upon the thinner parts of the skin, the class of symptoms which have gone by the name of mucous tubercles. On the glans penis, also, if it have been long left uncovered by the prepuce, the syphilitic poison will produce infiltration, induration, and a genuine Hunterian chancre may be the result. Such cases, however, are exceptional. Neither within the vagina, nor on the os uteri, nor in the urethra, nor upon a glans penis that has been kept covered, nor, in fact, on any part of the mucous membrane that is not habitually exposed, do we often find primary indurated sores. With regard to women, this fact was noticed particularly by the late Mr. Babington. He says indurated chancres do occasionally occur within the vagina, being situated either on the vagina or on the os uteri itself. Sores on these internal parts are extremely rare, notwithstanding the degree in which they are exposed to the contact of the venereal virus during coition. It is not that the mucous membranes are not affected by the syphilitic poison, but that the manifestations of its action are there different to what they would be on the skin.

Hunter says that, in all the outlets of the body where the adhesive inflammation would be hurtful, irritation first only produces the suppurative inflammation, but, if it be carried farther, the adhesive inflammation will take place. The product of ordinary inflammation in a mucous membrane has an outlet, and not only thickening of the part, but ulceration, is avoided. As in such cases no parts are destroyed, granulations also are excluded.

The secretions from diseased mucous membranes do not, then, generally tend to produce either the adhesive or the ulcerative inflammation in the parts in which they are generated; neither do they, as a rule, tend to produce those actions in parts to which they are accidentally or artificially applied. The corpuscles thrown off are not of the adhesive nature; they tend to generate other corpuscles similar to themselves, but not of a different nature. And this is probably the reason why so few artificial inoculations on the skin from the secretions of mucous membranes have been successful; and when we consider, in addition, the very great number of causes which may produce a vaginal discharge, a further explanation is given of the comparatively few cases in which that discharge has been inoculated, so as to produce any definite result. The comparative little value of such inoculations in proving the real syphilitic nature of a secretion when inoculated upon the same person, we have fully considered. But evidence, as far as it goes, is not wanting with regard to the occasional inoculability of these discharges.

Mr. Morgan of Dublin has published a very remarkable series of cases, in which he has inoculated the vaginal discharge on syphilitic patients with very positive results. He gives twelve series of inoculations, which, he says, he has selected from many other cases under treatment,

and adds this remarkable observation: It seems to be essential that the system shall be under the influence of the constitutional poison, in order that the vaginal discharge may be capable of producing the characteristic pustule and sore. In all Mr. Morgan's experiments, the result was direct and immediate. But if what I have said with regard to the syphilitic diathesis, or fever wearing itself out or being cured, be correct, we might naturally expect the period of incubation which belongs to real syphilis to manifest itself after inoculation in patients where this has happened. Inoculations from mucous membranes, where patients have not before had syphilis, as I have said, is sufficiently common. Some practical illustrations of this have been forwarded to me by Dr. Marston.

Mr. Pearson's opinion with reference to communicability of urethral discharge may not be uninteresting. He says: "We have seen so many cases of gonorrhœa communicating syphilis, as to leave very little doubt in our mind of this being the case. We have seen several instances of venereal symptoms following gonorrhœa, and where persons having gonorrhœa have communicated venereal symptoms." That the infection in these cases did not depend upon a chancre within the urethra, I think is shown by the extreme rarity with which such chancres exist; and, with regard to the infecting form of chancre, I should say it is almost if not entirely unknown. Hunter opened the urethra in many cases where he supposed persons were suffering from a discharge connected with syphilis, but never found any ulceration.

Swediaur's opinion is also well worth our consideration. He remarks: "That the happiness and tranquillity of many families, not less than the fatal effects arising from the improper treatment of this disease, seem to demand the most careful researches upon the subject." He had convinced himself, from well authenticated experiments, and numerous cases attended with the greatest care, that those who maintained that gonorrhœa and syphilis were always the effect of the same poison, and those who held an opposite opinion, were both wrong in generalising too much, and in speaking so positively and so lightly on a point of so much importance to the physician and the patient. He had, as he believed, proved to demonstration that blennorrhagia of the genitals of the two sexes owed its origin sometimes to the venereal or syphilitic virus properly so called, and sometimes to some other acrimony applied to the urethra or the vagina. Several cases are related which go to prove that a discharge may be syphilitic or produced by the syphilitic virus, and several instances are also given to show that blennorrhagia is very different in its origin and nature from the disease produced by the syphilitic virus. "It will easily be conceived", he says, "of what importance the distinction is in practice, when, on the one hand, we see practitioners treat all gonorrhœas as venereal (syphilitic) with mercurials; and, on the other, when by an ill-founded theory they suffer the syphilitic virus to be communicated, and the disorder propagated through whole families, without giving themselves any trouble as to the unfortunate results."

From what has now been said, I conclude that the product of primary syphilis is inoculable artificially, so as to produce the same effects as when it was naturally acquired; that the results of secondary syphilitic manifestations are inoculable, so as to produce the same results; and that the secretions from mucous membranes in syphilitic patients are very often the means of communicating syphilis, and may sometimes be artificially inoculated.

CASES OF HIGH TEMPERATURE.—Dr. Bacon of Saratoga writes to the editor of the *New York Medical Record* a letter which will be read with interest in connection with Mr. Teale's celebrated case. "Thinking a brief statement of two cases of pneumonia, which I have still under treatment (though now convalescent) might interest your readers, as regards temperature, I submit them. The first case, a girl aged 16 years, strong and full-blooded, had pneumonia of the left lung. Temperature began rising up to fifth day, when it stood, as carefully noted by a self-registering thermometer, 107.5. The sixth day it fell to 104 by evening. The condition of the patient otherwise showed no cause for alarm as far as consultation could decide. She is now about, and free from cough, and gaining her strength fast. The second case was her brother Frank, aged 20 years. He was seen twelve hours after he began to complain. Pulse 165, wiry. Slightly delirious. Examination reveals pneumonia of right lung. Temperature, very carefully taken thirty-four hours after I called, was 110 deg. I could not believe my eyes until I had repeated the experiment several times with the same result. The expectation was nearly pure blood for forty-eight or fifty-hours; cough harassing. Now here is a strange feature (to me) in this case: the temperature was 110 deg. at 5 P.M. and next morning, at 9.30 A.M., it had fallen to 99, or rather 98.68. Treatment: potas. iodid. and tr. aconiti during the night. An intense diaphoresis occurred which continued for twenty hours."

AN ADDRESS

ON

THE RELATION OF PUERPERAL FEVER TO THE INFECTIVE DISEASES AND PYÆMIA.

*Delivered at the Obstetrical Society of London, July 7th, 1875.*By **FORDYCE BARKER, M.D.**, of New York.

I FEEL that I have no right to waste any of your time in personal topics, except briefly to express my grateful appreciation of the honour that I have received at your hands, and to appeal to your courtesy to excuse such deficiencies as may be charitably ascribed to weakness of the vocal organs, or to that embarrassment which a stranger must feel in addressing such a body of obstetrical men on such a topic as puerperal fever. I may be permitted to say that this discussion is now watched with the greatest interest by your brotherhood on the other side of the Atlantic; but, as yet, this discussion does not appear to have led to that happy result spoken of by the Psalmist, that "maketh men to be of one mind in a house".

I shall aim, in the remarks that I am about to make, to confine myself closely to a discussion of the questions proposed to the Society, and to state my opinions, and my reasons for holding such opinions, in the most terse, compact language compatible with clearness. If these opinions seem to be in antagonism with a great majority of those which have been expressed in this discussion, I ask that they may not be regarded as partisan in their tone, but as a presentation of views necessary for a full and comprehensive study of the subject. I ask, for such arguments as may be urged, that candid analytical sifting of evidence which is requisite for sound decision as to what is the true answer to the several questions now before us. I concede to all, and I beg all to concede to me, that it is the truth and not forensic success which is sought for by us all who speak in this discussion.

Of the six questions proposed, the second and third only admit a direct categorical answer of yes or no, and this will be one or the other, depending upon the answer given to the first question. If the first be answered in the affirmative, the second must be answered in the negative, and the third in the affirmative; or the answers may be exactly the reverse.

I suppose the meaning of the first question is clearly defined by the second and third to be, whether there is a disease peculiar to women in childbirth, never met with under any other circumstances, as distinct as typhus or typhoid fever, scarlet fever, measles, or small-pox.

I cannot think that the proposer of these questions regards it as necessary that those who believe that puerperal fever is a *distinct essential* disease must, therefore, accept all the qualifying phrases of the first question. For example, "distinctly caused by a special morbid poison" is one of the qualifying phrases. Is this a necessary characteristic of a distinct disease? Has science yet determined the "special morbid poison which causes typhoid fever"? When a disease is induced by contagion or infection, then it is "distinctly caused by a special morbid poison". If the phrase had been "often caused by a special morbid poison", I should have accepted it as true of puerperal fever, as I believe it to be true of diphtheria and some other diseases. It is just this phrase which seems to have debarred Dr. Farre and Dr. Richardson at the last meeting from answering the first question in the affirmative. And here I wish to remark that it seems to me that the idea involved in this phrase has been a great barrier to a clear conception of the disease, and has greatly contributed to the obscurity and ambiguity of its discussion. It implies that puerperal fever cannot be properly ranked as a distinct disease unless its cause can be proved to be an unit, "a special morbid poison". But this test is not demanded for many other affections which the profession universally accept as distinct diseases. There are many such which originate from multiple causes, so far as science has as yet been able to determine, of which I may instance typhoid fever, diphtheria, erysipelas, and rheumatism.

The distinct character of a disease is determined by the evidence derived from three sources: the causes, the clinical phenomena, and the pathological anatomy. Some diseases give us proof of their distinctness by evidence derived from all three of these sources, others from only two, others from one alone.

Directly in connection and associated with the idea implied in the phrase "distinctly caused by a special morbid poison" is another idea,

which fallaciously colours and obscures much of the reasoning on puerperal fever, and that is, that identity of cause must be followed by identity of result. In other words, a given cause—a special morbid poison if you please—known to develop a special distinct disease, must always produce this particular disease. In a wealthy family belonging to my *département*, a year ago, I saw a lady dangerously ill from pyæmia, in consultation with Dr. Sayre, who was attending her for a traumatic injury. By our suggestion, the house was carefully examined by a plumber, but no defect was then discovered which could explain the source of the blood-poisoning. Very soon, three members of the family were severely ill from a typho-malarial fever. As soon as the condition of the patients would permit their removal, I insisted that the walls of the rooms covering the plumbing should be torn down, when it was found that there was a defect in the leaden waste-pipes sufficient to permit the noxious gases to permeate the house, but not sufficient to cause an escape of fluids to stain the walls of the rooms. During the past winter, I attended a gentleman with severe typho-malarial fever. His residence was in a large house, constructed on the plan of the French apartments, which was entirely occupied by families of refinement and abundant means. During the time of convalescence of this gentleman, diphtheria appeared in another family in this apartment house. I saw the first child attacked, in consultation with Dr. Morris. Subsequently, the father and two other children, one of whom died, were severely ill from diphtheria. It is worthy of mention, that, while these were ill, the wife and mother was removed into another house, and she was confined with her fourth child, under the care of Dr. I. O. Stone, one of our most prominent physicians, and her convalescence was not impeded by any puerperal disturbance from either diphtheria, typho-malarial, or puerperal fever. On examination, it was found that the waste-pipes in this house were in precisely the same condition as that of the house of which I have just spoken.

Who can doubt that the pyæmia, the typho-malarial fever, and the diphtheria were all caused by the same "special morbid poison"? At the last meeting of this Society, Dr. Playfair related some facts which recently occurred at Notting Hill, where puerperal septicæmia in a wife, "from which she barely recovered with her life", and diphtheria in the husband, "from which he nearly died", seem to have been due to the same causes which I have mentioned. I ask you to note the language used by Dr. Playfair, for I shall again have occasion to refer to this. He says "who could rationally disbelieve that those two diseases were produced by the same *septic* poison?" One he names, because of his theory of its cause, septicæmia; the other, produced by the same cause, he names, from its clinical phenomena, diphtheria.

The other qualifying phrase to which I will simply allude, but which time will not permit me to discuss in detail, is the following: "as definite in its progress and the local lesions associated with it" as certain specified diseases. This qualification involves two distinct and different points, the clinical history and the pathological anatomy. I will only say that in my judgment these several diseases mentioned differ in degree as to their definiteness in progress and the definiteness of their local lesions, and consequently puerperal fever cannot be compared or contrasted with them as a group in these particulars.

I will now give my reasons for believing that there is a distinct disease which may be properly called "puerperal fever". I think the definition given in the *Nomenclature of Diseases*, emanating from the College of Physicians, is absolutely perfect: a "continued fever communicable by contagion occurring in connection with childbirth, and often associated with extensive local lesions, especially of the uterine system". It is a disease which presents a group of general symptoms, independent of local inflammations, resulting from the absorption of some poison into the system. It is needless for me to discuss this point here, because it is evident from all that has been said that "localism" or "Broussaïsm" has no *status* in this Society. Those who would call this disease septicæmia or pyæmia are in agreement on this point with those who call it a fever.

We can arrive at truth in medical discussion only by using language accurately. There can be no accuracy of idea without accuracy of language. It is the established usage of standard authorities in medicine to designate as fever all those diseases which result from the absorption of some poison which produce certain morbid blood-changes and give rise to certain general characteristic symptoms, unless the specific poison is known. Under the denomination of fever, are properly and legitimately included not only those diseases which are severally called typhus, typhoid, relapsing, remittent, intermittent, and yellow fever, but all the infectious constitutional diseases which occur either epidemically or endemically.

When the specific poison is known which causes the morbid blood-changes and induces certain general characteristic symptoms, the disease is named from that poison, and so we have the accepted terms in medi-

cine of uræmia, septicæmia, pyæmia, and others of like character. I will here only allude to the fact that none of this latter class are known to be contagious or to occur as epidemics. The point we are trying to settle is not a question of name, except so far as this: I doubt not that we will all agree that the name given to a disease should be significant and appropriate.

The gist of the matter, stripped of its superfluous and obscuring elements, lies in the inquiry whether there be a disease which attacks puerperal women and only puerperal women.

A necessary preliminary is to ascertain from what sources we are to obtain our evidence by which we can settle the question whether there be a distinct disease peculiar to women in childbirth. I think we will agree that this evidence must be derived either—1. From the causes of the disease; 2. From the clinical phenomena; or 3. From the pathological anatomy.

I do not think that we are able, at the present day, to derive much information from studying the causes of this disease in settling this question any more than we can in settling the question whether typhoid fever, relapsing fever, or yellow fever are distinct diseases. In a sanitary point of view, I think a study of the causes of this disease to be of vast importance, and for this reason I esteem the paper which was read by Dr. Braxton Hicks before this Society in 1870 as a most valuable contribution.

If a puerperal woman, not protected by the immunity of a previous attack or by idiosyncrasy, be exposed to the poison of scarlet fever or of any other infective continued fever, I have no doubt that she will have scarlet fever, or whatever specific disease she may absorb the poison of. The puerperal state does not protect her from the influence of such poison. Dr. Hicks, as I understand him, does not claim that puerperal fever is only scarlet fever in the puerperal women, but names this as one of the causes in the same category with erysipelas, diphtheria, mental emotions, etc.

I think the evidence is conclusive to the minds of a great majority of the profession, established by numerous incontestable facts—facts observed not only in sporadic cases, but in very many epidemics, which have occurred not in hospitals or cities alone, but in epidemics which have ravaged large tracts of country in sparsely settled rural districts, that the poison of erysipelas may cause in women after childbirth a distinct disease, which some of us choose to call puerperal fever; and that the poison of puerperal fever, if absorbed into the system of a man or a child, will cause in that man or child erysipelas. But the clinical phenomena and the anatomical lesions which result from this common poison are so diverse as to warrant us in regarding them as two distinct diseases.

Of course it is quite needless for me to refer to the medical history of Great Britain for proofs of this assertion; but I may be permitted to refer to that of my own country for most striking corroborative evidence.

A reprint of Nunneley *On Erysipelas* was published some thirty years since, with notes by Dr. John Bell of Philadelphia, in which he gives most striking facts in regard to several epidemics in the United States, in which erysipelas and puerperal fever have appeared together.

I will also refer to a valuable monograph on *Erysipelas and Childbed Fever*, by Dr. Thomas C. Minor of Cincinnati, published during the last year, and which I had the pleasure of reading on my voyage over. The work is based on a most painstaking and laborious study of the vital statistics of the census of the United States for 1870, and of a puerperal fever epidemic which prevailed in South Western Ohio in the winter of 1872. The work is well worthy of perusal by all who assume to influence medical opinion on the subject of puerperal fever. This careful study of these vital statistics by Dr. Minor does not appear to show any connection of typhus fever, scarlet fever, septicæmia, and pyæmia, with puerperal fever. Epidemic scarlatina was very seldom associated with an outbreak of epidemic puerperal fever; but epidemic erysipelas was "invariably associated with an outbreak of epidemic puerperal fever, or vice versa".

I have but a single remark to add in regard to the question of causes of this disease. The argument of those who deny that puerperal fever is a distinct disease, rests mainly on the ground that the disease so called is the result of septic poisoning. Septic poisoning is a term now used very frequently and somewhat vaguely; but even those who contend that there is, properly speaking, no distinct disease of puerperal fever do not allege that all the resulting disease from septic poisoning is one and the same thing, and that this disease should be called septicæmia. Is there anything improbable or unphilosophical in the hypothesis that septic poison, acting on a system in a peculiar state such as never is found in the human system under any other conditions, the state which has been so graphically described in this discussion by Dr. Richardson and Dr. Farre, results in a distinct disease, which never is found except when the system is in this condition?

Has any proof been offered by anyone, anywhere, that epidemic and endemic influences, nosocomial malaria, contagion or infection, do not develop this poison in such a system, which results in a distinct disease?

We must find the answer in a study of the clinical phenomena and the anatomical lesions of the disease. If septic poisoning never occur as an epidemic, I do not say endemic, among those who are suffering from traumatism, and if it never develop contagion in this class of subjects, and if septic poisoning in puerperal women does occur as an epidemic, and is contagious and infectious, are not these elements sufficient to warrant us in regarding the two diseases as quite distinct?

The advocates of the septicæmia theory of puerperal fever, both on the Continent and in this country, have seen that they must accept this issue, and consequently they are driven to deny that puerperal fever ever occurs as an epidemic, or that it is contagious or infectious. One of your speakers at the last meeting said: "I do not believe that there is any specific condition justifying the name of puerperal fever"; and he logically adds, "nor do I believe that there is any special miasm arising from the puerperal patient capable of being conveyed to another patient; nor do I think that there is any evidence whatever to show that there has been an epidemic of puerperal fever in the strict sense of that word."

The author of the Address in Obstetric Medicine before the British Medical Association last year, said in that address: "I have not been able to find anything worthy of the name of evidence to prove its epidemic prevalence at any time or in any large district." The same author, in his work *On the Mortality of Childbed and Maternity Hospitals*, says: "I feel certain, and I believe I can prove, that an epidemic of puerperal fever never occurred." He also denies, with equal positiveness, that the disease is ever contagious.

Now if, during certain years or seasons, puerperal women in a given territorial district die of a disease, call it either puerperal fever, puerperal pyæmia, or puerperal septicæmia, in numbers fiftyfold or a hundredfold greater in proportion to the births than they have in preceding years, or than they do in following years, I think the profession generally would call this disease an epidemic. When the mortality from puerperal disease, call it puerperal fever or puerperal pyæmia, in that part of New York which is in the best sanitary condition of any part of the city, and in which are the residences of the most wealthy part of the population, in four months of the year 1873 is twenty times as great as it had been for twenty-five years before, and the percentage of deaths in proportion to births is more than double what it is in the parts of the city where the poor women are crowded in tenement houses, and quadruple the proportion of deaths during the same period from the same cause in the lying-in hospitals, I think we are justified in saying that an epidemic exists in this part of this city. If in Cincinnati, Ohio, in 1873, the number of deaths from puerperal fever was 122 while the annual average of deaths from this cause for five previous years was 13½, I think most men would say that the disease was epidemic that year. In view of all the similar facts abounding in medical literature, I will not borrow a phrase from one of the speakers at the last meeting, and say that those who deny that this disease ever occurs as an epidemic, "must have minds which I believe to be not open to conviction"; but I will say that such persons must attach a subtlety of meaning to the word epidemic not consonant with the common sense. Please to observe that I use the article, and say *the common sense*, as otherwise the remark might seem discourteous.

I will not detain you now by a discussion of the question of contagion, for all have undoubtedly fixed opinions on this point. Those who regard puerperal fever as a distinct disease believe it to be "communicable by contagion"; while those who believe it to be only pyæmia or septicæmia in women after childbirth, do not consider the disease contagious.

Can a woman after childbirth be exposed to the danger of receiving the poison which produces typical septicæmia in larger doses than when she has retained within her uterus a portion of decomposed placenta? If puerperal fever be septicæmia, would not the disease under these circumstances appear in its most virulent forms? But we all know that this is far from the fact. One very important idea in this connection was first distinctly enunciated by Dr. Barnes in this Society some years ago; and that is that septicæmia in puerperal women is not actively contagious. "When arising from decomposition of the placenta, it generally began and ended with the patient attacked." During this discussion, Dr. Braxton Hicks has expressed a very similar sentiment; and I feel quite sure that all clinical observers will coincide with this statement.

I will submit for your examination the following propositions.

1. The clinical phenomena of puerperal fever are quite different from those which are met with in surgical septicæmia or pyæmia.

2. These affections do occur in puerperal women, and the result is a disease which does not constitute a continued fever "communicable by contagion".

3. When either of these affections complicate puerperal fever, they modify the clinical phenomena by symptoms which can be distinctly appreciated and described by any close observer.

I will not take up your time by giving the evidence on which these propositions are based, because I think that this has been done in a work *On the Puerperal Diseases*, which it will be indelicate for me to refer to in more definite terms.

I will add only a few words in regard to the pathological anatomy of the disease now under discussion. On the first evening of the discussion, Dr. Richardson argued that there were no local lesions "which would lead us in the dissecting-room in any case to say this was a case of puerperal fever, as we should say this was a case of scarlet fever or of typhoid or of typhus fever". I think it would be impossible to prove by the anatomical lesions that scarlet fever or typhus fever, or relapsing fever, are distinct diseases. A child is put in bed at night apparently well. A few hours afterwards, it is awakened by vomiting, it is very delirious, its pulse is very rapid, and the temperature is six or seven degrees higher than is normal, and the child dies in the early morning without the slightest irruption on the skin. No anatomical lesions can be found to characterise the disease. But scarlet fever is epidemic in the neighbourhood, or another child in the same family is taken ill with well marked scarlet fever within a few hours after the death; and any physician would feel warranted in registering the cause of death as scarlet fever. Such cases are not very rare, and, I dare say, have been met with by several gentlemen now present. Would the most able of the recent authorities on the continued fevers—would Sir William Jenner, or Murchison, or Hoffman, or Lebert—insist that no one would have a right to register a death as resulting from typhus fever or relapsing fever, unless certain characteristic anatomical lesions are found in the dissecting-room? All of these writers declare that these diseases have no pathognomonic lesions.

It was asserted by the author of the Address in Obstetric Medicine, that "pathologists believe that they have torn to tatters the view" that the disease we are now discussing "is an essential fever peculiar to puerperal women, as much a distinct disease as typhus or typhoid".

When? how? where? Show us the proof. Is there evidence that such pathologists have studied the disease anywhere except in hospitals and large cities, where the disease is very probably complicated with septicæmia or pyæmia?

Of what value would be the researches of the ablest pathologists of Germany or England on questions relating to the pathology of yellow fever, if such pathologists had no opportunity of studying this disease, except in Germany and England? Have Spiegelberg, or Schroeder, or Schmiedeburg, or Mayrhofer, or Orth, or Heiberg, or Olshanser, or Fehling, or Cohnstein, or Breisky, or Von Haselberg, ever studied puerperal fever as it is found in epidemics in rural districts, where pyæmia and septicæmia are rarely met with? German is a difficult language to acquire; and it gives an attractive appearance of learning to introduce such names, even if nothing be quoted from them. I am familiar with their writings, and would not undervalue the merit of their researches; but so far as the elucidation of the question now under discussion is concerned, I think it of equal importance that we should carefully study for the clinical phenomena of the disease your English classical writers—Hulme, Leake, Kirkland, Clarke, Gordon, Hey, Armstrong, and Robert Lee. The hint on this point thrown out by Dr. Farre at the last meeting seemed to me most appropriate and timely.

What progress is made in science? Now do "we free ourselves from error", or gain in scientific precision or accuracy of description in giving to this disease a new name—pyæmia, as Dr. Duncan would call it; while he confesses that it has no etymological signification in this disease, and, in fact, has no definite positive meaning?

What propriety is there in giving to an obstetrical disease a name significant and appropriate to a surgical disease, unless it can be demonstrated that the two diseases are identical in their clinical phenomena and their anatomical lesions? The burden of proof to show this identity belongs to those who would call the disease puerperal septicæmia. Some think that the negative has already been established.

I have neither the time nor the voice to discuss the other questions which have been proposed. With my warmest thanks for your courtesy in listening to me so patiently, allow me to close with the suggestion that it may be well for all of us who discuss puerperal fever to remember the exhortation of Oliver Cromwell, when he lost patience with a Scotch Assembly: "I beseech you, brethren, by the mercies of God, conceive it possible that you may be mistaken."

THE RELATION OF PUERPERAL FEVER TO THE INFECTIVE DISEASES AND PYÆMIA.

Address delivered at the Obstetrical Society of London, July 7th.

By CHARLES WEST, M.D., F.R.C.P.,
Physician to the Hospital for Sick Children, etc.

I CAME here to-night because I felt that honour implies duty; and, having now for some years had the honour of being one of your Fellows, I felt that, if on the occasion of so important a discussion as this, I stayed away, it would seem either as if I cared nothing about the exercise of my profession, or about the furtherance of it; or as if some other motive—I know not what—had kept me away from your assembly. What I have to say, I will say in as few words as possible.

And, first of all, I have but one criticism to offer, and that bears on one of the questions which have been suggested with reference to the share which certain microscopic organisms bear, or may be supposed to bear, in the production of the disease called puerperal fever. It appears to me—with all respect to the gentleman who in his able paper proposed that question—that it is somewhat out of time to raise it. We have not as yet a sufficient amount of knowledge on the subject to be able to apply it, or to draw from the observations that have already been made any correct and useful inference. No one can, I think, have read with care the very interesting discussion on the subject of the "Germ-Theory of Disease" without being struck by the way in which men of the greatest talent and the sincerest love of truth differ, not merely with reference to the conclusions that they draw, but also with reference to the very facts that they thought they had observed. I think, if this matter is to be settled, it must be settled in the first place in the case of some disease simpler in its nature than puerperal fever. I pass, then, from that subject in these few words, in which I would still wish to convey the very high respect I feel for a kind of knowledge to which I can make no pretension, and to assure you that what I have said means no disparagement to study carried on by means of the microscope, and no doubt as to the great results that hereafter we may arrive at from it; but I refer to the subject from the conviction that the question so raised is, in the case of puerperal fever at least, premature.

I now approach the other and more practical question. It may be allowed me, perhaps, to remind the Society of what, I doubt not, they have not forgotten: that some thirty years ago a physician, now taken from amongst us, but whose professorial chair it was my high honour for a short period to occupy, wrote a work on the very subject which we are now discussing; and I do not myself see that we have advanced far, if at all, beyond the conclusions which Dr. Ferguson laid down, that the phenomena of puerperal fever depend upon a vitiated state of the fluids, and that, in the case of a woman in the puerperal state, such vitiated state of the fluids is specially apt to arise. I do not think, therefore, that we can in any way assimilate the condition of what is called puerperal fever to typhus, typhoid, or scarlet fever. The disease wants those characteristics which more or less distinctly prevail in the case of the specific fevers. It has not the same regularity of course, the same regularity of incubation, the same regularity of outbirth. It has not the same diagnostic marks which we find in the case of the specific fevers; such, for instance, as the pustules which appear, even though in small number, and characterise even the slightest case of small-pox. Nor is this all. But with reference to these fevers we know, further, that for the most part, at any rate, they produce disease like to themselves; and that, further, though with many exceptions, they have a tendency not to recur where once they have happened. Now, all these characteristics are absent in the case of puerperal fever; while the very circumstance that a far greater proportion of cases of puerperal fever occur in primiparæ than in those who have given birth to many children, shows that there is a marked connection between the liability to an outbreak of the disease and the difficulties attendant on the process of labour. If, further, we expose a man to the contagion of puerperal fever, he does not get any disease as the result of it. If we expose a woman in the puerperal state to the contagion of scarlet fever, measles, or some other disease, she may have that disease, even though its characteristics may be masked and altered in some degree by the puerperal state; but it does not necessarily follow that she will have that same disease. Cases have been related by Dr. Collins of Dublin, with reference to epidemics of puerperal fever, where the introduction of a case of typhus fever into the hospital was followed on each occasion by an outbreak of puerperal fever.

So it would seem that a cause distinct from anything which we can identify as the special poison of puerperal fever may yet, by the influence which it exerts upon the woman in this peculiar condition, produce a disease not distinguishable by any of its phenomena from that assemblage of symptoms which we ordinarily call puerperal fever. It seems as if the puerperal state itself was the condition of the development of this set of symptoms. Moreover, we must remember that there is not any one single solitary cause to which we can refer the symptoms of puerperal fever. It occurs now from one cause and now from another. I remember at this moment the case of a lady in a state of perfect health, who was delivered at a time when puerperal fever was prevalent. She was a person in that position of society in which she was shielded from every possible danger. Soon after her delivery, she was exposed to a current of air, and caught cold. In a short time, the symptoms of puerperal fever developed themselves, of which she died. There was a case in which there was no special morbid poison existing—nothing but what could be derived from her own fluids, or brought about by some impression on the system. Moreover, we know that mental shock will have the effect of producing the symptoms of puerperal fever, leading to a fatal issue. I remember the case of a lady who progressed perfectly well after an easy labour; but, owing to some violent scene of domestic strife with her husband, she was seized almost immediately with symptoms of puerperal fever at a time when no such disease was prevalent, and of that disease she died.

I think, then, we are to look for the cause of puerperal fever rather to the condition present after delivery, than to any special poison. Poisons of various kinds may produce it. We know that, in Vienna, puerperal fever was exceedingly prevalent, owing, as was discovered, in a great measure to the fact that the students left the dissecting-room and went with their hands imperfectly clean to attend the women in their confinements; and when greater care was taken, when careful ablution and disinfectants were insisted upon, puerperal fever diminished in its frequency to a very great extent. We know that local violence may produce it: in short, we know that a great number of causes may give rise to it, and that the only one factor in the production of that class of symptoms consists in the special state of the woman after delivery. That state I need not recall. It is a state in which the fluids are laden with old, effete, and useless materials; laden also with materials out of which the old uterus is removed and a new one is to be built up. They are laden also with those elements out of which eventually the new secretion of milk is to be established. None of us except those few who, like Dr. Richardson, have given great attention to these inquiries, can describe at all wherein the alterations of the blood consists; yet, without indulging in any wild theory, we may say that there is a something. People used to call it a ferment. I do not care what it is called, providing we use the name not as defining the thing exactly, but as a name only to which we attach no other meaning than that of a something by which we are to distinguish this or that from the other, while as yet we know not its real nature. For instance, in the time of the old alchemists, calomel and corrosive sublimate, the chemical composition of which was unknown, were respectively called *Draco magnus* and *Draco mitigatus*; and, if we use names as the old alchemists used theirs, we shall be much more likely to keep from the error of hasty conclusions or rash generalisations, than if we use a name to which we tack a definite scientific meaning, while as yet we have no scientific grounds upon which to rest that meaning.

These were the chief things which it occurred to me might perhaps be worth the saying. Take a woman in the puerperal state checked in any manner, whether by poison from without, by mental shock, by cold, or by injury to the regular performance of those functions that ought then to go on, and you have the condition thereby produced out of which the assemblage of symptoms that we call puerperal fever—and all the world is pretty well agreed to give it that name—arises. The only other word I would utter is to quote a saying of a great wise old physician, who said that the highest aim of our art must be the greatest possible generalisation of diseases and the greatest possible individualisation of our patients; so that we have in each case to look, in the prevention of puerperal fever, not simply to the removing of possibility of contagion, not simply most carefully watching the local condition of the uterus and removing from its inner surface any possible decaying matter, not simply to the taking care that the air that surrounds the patient is good, but we are bound also to consider the patient's mental state, to regard minutely her individuality, and, if we wish to put a stop to the disease, to remove from around or from within our patient anything which can interrupt those important processes, the interruption of which gives rise to these symptoms, which we designate by the name of puerperal fever.

CONCEALMENT OF VENEREAL DISEASE IN THE ARMY.

By JOHN AMBROSE, B.A., M.D., Surgeon A.M.D.,
"Attached", 58th Regiment.

THE discussion which followed the reading of Mr. Acton's paper before the Royal Medical and Chirurgical Society, the recent Parliamentary debate, and numerous other signs and tokens, indicate the avidity with which the opponents of the Contagious Diseases Acts would add to their other objections to these statutes that of failure to compass all the good, in the way of disease-prevention, which might reasonably be expected of them. It, therefore, behoves those who are interested in the efficient working of these Acts to leave no means suggested of ensuring for them as large an amount of success as it is possible to achieve. At present, our efforts to control the propagation of venereal disease consist chiefly—I might almost say solely—in the care taken to bring under examination and, when necessary, hospital treatment, the prostitutes with whom our soldiers consort in certain military stations. This, obviously, is the step best calculated to strike directly at the root of the evil to be overcome, and the one without which any other measures would be likely to be of little avail. But, at the same time, what I may call subsidiary measures should be taken into account, and I should like to draw attention to one or two such, which I venture to think may be profitably considered.

During the past year and a half, a soldier admitted to hospital with primary syphilis or gonorrhœa (relapses excepted) loses the whole of his pay for the time he is under treatment for either of these diseases. Before considering the influence which this deprivation of pay appears to me to exert upon the amount of venereal disease in the army, I shall mention the other point of which I desire to speak, because the two subjects may be, I think, conveniently discussed conjointly. The other point is this: it was formerly the duty of the regimental medical officers to subject the men of the corps to which they belonged to a periodical inspection for the detection of venereal disease; but for some years this duty has been relinquished. If now we glance at our proceedings with reference to our mode of dealing with these contagious complaints for the last ten years or so, we find that, while, with the one hand, we have imposed certain salutary, if irksome and disagreeable, periodical inspections upon prostitutes, we have with the other hand exempted our soldiers from these very inspections to which, be it remembered, these same prostitutes have been subjected purely and solely for the benefit of the army and navy. Further, in the same decade, a measure has been introduced by which a soldier who confesses himself to be the subject of gonorrhœa or syphilis forfeits the whole of his pay while in hospital. There is now no substantial reason why a soldier suffering from a comparatively trivial, though none the less contagious, form of disease should not conceal and impart it to one or more of the women who, on his account, are submitted to a periodical examination. In this way, some of the good effected at the Lock Hospitals is, I fear, undone; and the drawback is not likely to be favourably affected by the fact, that the soldier frequently prefers avoiding the restraint of a residence in hospital, and devoting some of the pay of which he would be deprived in the event of his being admitted there, to remunerating a neighbouring chemist and druggist for the treatment he requires. The soldier, by so acting, no doubt transgresses the regulations, but he retains his liberty and his money. I say nothing here of the after-effects that irregular, and often insufficient, treatment of this kind must exert upon the man's constitution. The following brief narrative of facts will illustrate the remarks I have made, and prove that I have not been conjuring up imaginary difficulties.

The 58th Regiment came home from India in March of last year, and occupied the Anglesea Barracks at Portsmouth—a "protected" station—until April of this year. The amount of venereal disease in the regiment during 1874 was comparatively small, which gratifying circumstance I, in common with others, accepted as an indication of the satisfactory working of the Contagious Diseases Acts at Portsmouth. This explanation was, I believe, to a large extent, correct, and I do not consider that what I am now about to say in any way invalidates the comparison drawn by Dr. Parkes, in the BRITISH MEDICAL JOURNAL of February 20th, between the 58th and 106th Regiments, at Portsmouth and Parkhurst respectively, since the same condition of things which I am now about to describe must have existed in the 106th as in the 58th. When, however, month by month the admissions to hospital, in the 58th, on account of venereal disease, became still fewer and fewer, until, in January and February of this year, they numbered only three; and when, in the last week of February, there was not a case of either gonorrhœa or syphilis under treatment, I could not

help suspecting that some additional cause was in operation. On March 1st, I therefore addressed the principal medical officer officially on the subject, informing him that I suspected disease was being concealed, and requesting that I might be allowed to put my suspicions to the test by means of a "health-inspection". This permission was, with the approval of the lieutenant-general commanding the Southern District, readily vouchsafed, and I accordingly examined 447 lance-corporals and privates. I found that, of this number, 28, or 6.26 per cent., were the subjects of venereal disease, which, two or three of the cases perhaps excepted, was obviously of some considerable standing. The twenty-eight cases comprised eleven of primary syphilis, four of gonorrhoea, eleven of gleet, and two of balanitis. Those of the chancres were cicatrising; and the large amount of gleet discovered bears ample testimony to the fact that gonorrhoea, although concealed, had previously been present on a very considerable scale. It may be as well to mention that the senior medical officer at the Garrison Hospital, to which these twenty-eight men were forwarded for treatment, coincided in my diagnosis of each case. I have served for nearly eleven years with the 5th Regiment, and am consequently, I believe, tolerably well acquainted with the characters, mode of feeling, etc., of many of these twenty-eight men. I, therefore, claim to be in a position to judge, with about as much accuracy as a question of this nature is susceptible of, how far this concealment was attributable to one cause or set of causes, and how far to another. I need not tell any one conversant with the ways and customs of soldiers that it would, as a very general rule, be utterly in vain to expect that they would give a straightforward and satisfactory answer to the question, Why have you concealed your disease? When detected, the soldier is apt to be sulky, uncommunicative, and fully impressed with the idea that the fewer admissions he makes the better for himself. He has (no matter how one may endeavour to convince him to the contrary) a hazy indefinite suspicion that anything he might say would be afterwards used to his disadvantage. Abrupt direct questioning would, therefore, be likely to defeat its object, and I did not attempt it. The men were under my care in the Garrison Hospital, so I had ample opportunities afforded me of ascertaining their sentiments, indirectly and leisurely. This I did, and the result is, that I am perfectly persuaded the great majority were led to conceal their disease altogether for the purpose of avoiding retrenchment of their pay in hospital, while a minority—seven out of the twenty-eight—were actuated, in addition, by other motives, such as dislike of hospital restraint, and, in the case of officers' servants, special orderlies, etc., unwillingness to risk the loss of remunerative and congenial employment. I have also made inquiries of several intelligent and reliable non-commissioned officers, whose opinions unanimously and abundantly corroborate this. I need hardly say that, mixing with the men, and overhearing barrack-room conversation, as they do, these non-commissioned officers are not likely to be mistaken; and being themselves, in most instances, married, they could have no conceivable motive in misrepresenting matters. I accordingly look upon their evidence as absolutely conclusive, even apart from the fact that their opinion commends itself so thoroughly to common sense. The conclusion is forced upon me, that this extraordinary amount of concealment was chiefly due to a dislike on the part of the men to put themselves in the way of having their pay retrenched; and, in a minor degree, to other causes, the result of which could only have been obviated by subjecting the seven men concerned to an efficient system of "health inspection".

If the interests of the Contagious Diseases Acts were alone to be taken into account, my experience would seem to furnish grounds for, at any rate, suggesting the propriety of remitting the retrenchment of pay to which a soldier is now liable, and of again having recourse to a system of health-inspections in the army. But, being fully aware that such interests are not the only ones to be regarded, and as it would appear scarcely probable that retrenchment of the soldier's pay was adopted, or periodical health-inspections relinquished, without deliberation having been bestowed upon all the attendant circumstances apparent at the time of deliberation, it would be unbecoming on my part to recommend a change. I do not for a moment presume to question the desirability of either of these measures, viewed as a whole, but restrict myself to the office of indicating how the Contagious Diseases Acts—which, it should not be forgotten, are even yet on their trial—seem to me to be affected by the presence of retrenchment and the absence of inspection, leaving it to others, who are in a position to take a more comprehensive and able view of the question than I am, to say what should or should not be done.

With regard to the possible reintroduction of health-inspections, I should like to make a few anticipatory remarks. Formerly, and when these inspections were in vogue, each regiment serving at home was provided with two medical officers. Now, a regiment has only one

medical officer attached to it. This one officer, when required to attend the sick of his regiment, as is frequently the case, has his time fully occupied. To inspect five hundred men thoroughly—and, if not performed thoroughly, the examination would be worse than useless, as it would be misleading—would occupy about seven hours of one examiner's time. This would be a very serious addition to the labours of an already sufficiently worked man; nor would the addition be one such as would tend, by agreeable diversification of his task, to invigorate the labourer. On the contrary, a more disagreeable duty could not easily be imposed upon a medical officer. For these and other reasons to which I deem it advisable not to allude here, I would venture to suggest that, in the event of health-inspections being revived in the army, medical officers should be specially appointed to conduct them. A few inspectors, selected on account of energy, intelligence, and aptitude, might be so distributed over the United Kingdom as to bring all the soldiery stationed therein within a really effective system of supervision. Resident in London, Dublin, Edinburgh, and perhaps one or two other military centres, these inspectors might be allowed access to the returns and other sources of information relative to their duties which are, from time to time, received at the offices of the Army Medical Department in these cities. They would, I doubt not, soon learn to interpret these returns, so as to be able to form a pretty accurate opinion as to the corps in which their inspectorial services would be most required, particular attention, of course, being paid to the regiments occupying or about to occupy "protected" stations. Should suspicion be aroused that disease was being concealed in a particular regiment, it should be pounced upon by an inspector; no more warning being given to the regiment than the few hours necessary to get the men together, and to prepare nominal rolls of each company for the inspector's guidance. If soldiers once know that they are liable to be thus examined at uncertain times, and without notice, and if every man detected in the act of concealment be punished to the extent prescribed for this offence in the Queen's Regulations, we should not, I believe, be much more troubled by disease-concealment in the army.

ON THE ACTION OF MEDICINES: OLD AND NEW.*

By JOHN KENT SPENDER, M.D. Lond.,
Surgeon to the Mineral Water Hospital, Bath.

II.

At the conclusion of my last paper, I spoke of the treatment of chronic pulmonary consumption by the application of blisters. I believe it was long ago affirmed that phthisis rarely occurred in any one even but slightly marked with small-pox. Dr. Copland observed that a copious eruption of acute small-pox often cured pulmonary consumption in an early stage, but as often accelerated the progress of the disease in an advanced stage. Other writers have stated that phthisis is hardly ever seen in persons much marked with small-pox, but I cannot confirm this assertion from my own experience. Certainly, however, it has been known from the earliest period of medical history that the development of a purulent eruption has sometimes cured consumption in the chest; and, in the early part of this century, the doctrine was firmly established that pustular eruptions and purulent discharges artificially produced have more or less influence in delaying or arresting the progress of consumption when the disease is not too far advanced. Even the "potential cautery" was not unfrequently used in old times for the same purpose.

The medical antiquarian is apt to consider a practical subject from a different stand-point from the busy practitioner. The latter is necessarily very much governed by current theories, and their acceptance by the literary leaders of the profession; and it is a fact that there has been a considerable change of opinion during the last twenty years on what is called "counterirritation". This change of doctrine is due partly to new physiological views of the influence of nerve-centres on the nutrition of distant organs, and partly to a growing distrust of the efficacy of outward applications. Sharing heartily in this distrust as regards a vast crowd of empirical things, I must yet announce myself a firm believer in the utility of the old-fashioned blister, the *emplastrum cantharidis*. But what a ridiculous caprice it is that fashion has anything to do with our choice of remedies! I have discussed, in my Fothergillian Essay, the scope of blisters in the relief of pain, and it is certain that they are not less useful in the treatment of some constitutional disorders.

It is within the experience of most medical men that enlargement or

* Vide BRITISH MEDICAL JOURNAL, September 27th, 1873.

suppuration of glands in the neck seems to diminish the liability to consumption in so-called scrofulous subjects. Of course, it is difficult to verify this statement, and equally difficult to disprove it; nor is it easy to deal in a scientific spirit with the converse assertion that the suppression of an accustomed evacuation or discharge is sometimes followed by consumption. But no one pretends now that a blister alters a tubercular deposit in a subjacent viscus merely because it causes a drain from the skin. An impression is made upon superficial nerves, transmitted to nerve-centres, and then reflected back on those peripheral processes of nutrition by which a morbid action may be checked and even controlled.* Hence we adopt the views of Dr. Laycock, who says that, by means of counterirritants, we may modify the condition of nerve-centres, and indirectly influence those peripheral nerves which preside over sensation and nutrition. Nor is there anything in this theory at variance with sound pathological doctrine. Sometimes an intestinal flux will seemingly arrest the destructive progress of pulmonary tubercle. Dr. Abercrombie relates an example in which cerebral dissection operated in this way; and Sir B. Brodie used to say dogmatically that, after amputation of a scrofulous limb, phthisical symptoms, little noticed before, may rapidly increase.

Issues and setons were recommended by Portal and Whytt to be inserted in the arm, nape of the neck, or at the edge of the pectoral muscle. These rather severe measures were sanctioned by high authority so recently as twenty years ago; but, as truer ideas of the constitutional nature of consumption began to be received, not only were milder means employed, but the practice of counterirritation seemed likely to be extinguished altogether. A few bold spirits have cried aloud on behalf of the ancient plan, and the therapeutic pendulum appears settling down to the sober medication of blisters and liniments of iodine and turpentine.

The next question is, How and when are blisters to be applied? Almost always as temporary or "flying blisters", renewed at intervals of a week or more, the blistered surface being healed immediately with a soothing ointment. The most suitable part of the chest is obviously in front, just below the collar-bone; and the blister should rarely exceed three inches in length by two inches in breadth. There is a striking unanimity of opinion among authors that the practice is of benefit only in the early stages of disease, or in the chronic forms of consumption; and that it seems particularly serviceable in hæmoptysic and congestive complications. Dr. Tanner recommends blisters when the tubercle is near the surface, with adhesions between the pulmonary and costal pleura.

Thus employed, blisters may be valuable auxiliaries to internal treatment, and, by their physiological action, may stop for a time the local ravages of disease. In my early days of practice, I watched with much interest several cases thus treated by my father: cases in which general and local symptoms were evidently checked by the judicious use of blisters. Equally plain was the deterioration of health when the blisters were discontinued for any length of time. A milder degree of vesication can be kept up by painting over the skin not quite healed from a recent blister with equal parts of glycerine and liniment of iodine: this should be done for a week or two on alternate days. A liniment of croton-oil may suit the less sensitive skin of some male patients, but this remedy is regarded with much less favour than it was a quarter of a century ago. Other counterirritants are simply troublesome without being effective, and, by their transient nature, can hardly be expected to have much influence on a chronic disease.

I turn to the subject of *suppositories*,† which have been by no means generally used until the last few years. They were faintly recognised in the *Pharmacopœia* of 1864, other suppositories were added in the second edition of 1867, and three new ones were published in the *Additions to the British Pharmacopœia* (1874). Possibly a reason why suppositories were not more employed was, that our druggists were unable to provide a good excipient or medium; nor were we more fortunate in possessing an apt and easy instrument for administration. These difficulties have been overcome, and the pharmacist has contrived, by means of curd soap and starch, to give us an acceptable article, which is easily made and keeps very well. It is not pretended that suppositories are of superior efficacy to enemata; but the former may contain valuable medicines in a small bulk, and can be introduced by the patient without extrinsic help.

About the general use of suppositories, Mr. Bransby Cooper gave some sensible directions which will bear repetition. The substance should be properly inserted into the rectum, otherwise it will increase instead of diminishing the sufferings of the patient. If it be only placed within

the anus, under the influence of the sphincter muscle, it will produce an aggravation of all the symptoms; while, if it be passed into the bowel above the sphincter, it will speedily produce the desired soothing effect. A hollow tube should be used, with a movable rod inside; the bolus can thus be introduced high above the sphincter, which cannot be conveniently done with the finger.*

Of the many maladies which are beneficially and decisively treated with suppositories, I may enumerate some forms of diarrhœa, particularly that which may be called "emotional diarrhœa". I know a clergyman who found this "emotional diarrhœa" seriously to interfere with the steadiness and comfort of his Sunday work; and he was always most threatened just before any service when it was his duty to preach. No medicine administered by the mouth did any permanent good; but the introduction of a *suppositorium plumbi compositum* every Saturday night gave calm and comfort all the next day. After a few weeks, the suppository was withheld without any return of the diarrhœa. In this case, the more immediate application of the remedy to the nervously irritable tract of intestine accomplished what the same medicine failed to do when used in a remoter way.

Then there are certain troubles in defæcation which are equally well relieved by the use of the *suppositorium morphiae*. An elderly lady had always two or three evacuations of the bowels in the early morning, the copiousness of which seemed to do no harm, nor was even objected to; but each act was followed by a sense of local uneasiness, which was not lost until after the middle of the day. A complete riddance of all suffering was brought about by the nightly introduction of a morphia suppository with soap. The suppository of tannic acid with soap may be tried whenever opium is from any cause inadmissible. I have heard of the carbolic acid suppository being employed to rectify an unaccountable offensiveness of flatus or of feces.

A suppository of opium often removes some of the painful worries of hæmorrhoids; and chloral has been lately used in the form of a suppository for alleviating the pain of abdominal cancer. Any reflex channels which we can make use of for the alleviation of pain should never be neglected; for local nerves and nerve-centres are often the ready path by which remedies may choose to travel. When substances are slowly dissolved in one of the mucous tracts of the body, it is reasonable to suppose that some of the benefit must be felt proximately in neighbouring organs and tissues. Thus Sir Henry Thompson advises the addition of conium to opium, by enema or suppository, in cases of malignant disease of the prostate gland. Dr. EJis has lately given us an interesting paper on the capacity of the rectum to receive and absorb therapeutic substances.† Ergot may be administered in this way for the control of hæmorrhage. Dysmenorrhœa is relieved by a bolus containing half a grain of morphia and one-twentieth of a grain of atropia; and hardly anything (except hypodermic injection) alleviates the morning sickness of pregnancy better than an opiate suppository introduced the previous night. And motor energies may be similarly quickened, as when constipation is overcome by a suppository containing a grain of extract of belladonna.‡

I trespass on obstetric ground so far as to venture the suggestion that uterine troubles are often far more beneficially affected by anodyne suppositories and enemata than by any remedy put into the vagina. It is familiar to the accoucheur that an ice-water enema arrests *post partum* hæmorrhage when the injection of a frigid stream into the uterine cavity is not unattended with danger.

In treating the exigencies of stomach-disease, it is a moot point how long it is safe to continue the use of *enemata of food*. Dr. B. Foster pushes this practice with boldness and confidence; but a recent critic in the *British and Foreign Medico-Chirurgical Review* delivers some seasonable cautions. It is impossible to discuss just now the general rules which ought to govern the use of food-injections; but it is clear that, in the case of incurable stricture of œsophagus, there is nothing else to be done, and, therefore, we have to consider how we can best promote the feeding of the body in this way. It seems that the ordinary fluid food which is generally used for this purpose is either not retained long enough in the rectum, or cannot be digested there for want of a digestive ferment. Dr. W. O. Leube of Erlangen discovers this digestive ferment in the fresh pancreas of the ox or pig, which, finely minced, he mixes with scraped meat, rubbing them well together with a little warm water, so that the mass may be easily injected. Before this is done, the rectum ought to be washed out with water;

* Quoted in Dr. Waring's *Manual*, p. 874.

† *BRITISH MEDICAL JOURNAL*, December 5th, 1874.

‡ See some remarks by Frouseau (vol. iv, p. 12, New Sydenham Society) on the "Synergy" in the different portions of the muscular apparatus of the digestive canal. He recommends suppositories of hardened honey as very useful in cases of chronic constipation. After surgical operations on any of the pelvic viscera, the benefit of morphia suppositories is often very marked. See a case related by Mr. Bryant in the *Obstetrical Transactions*, vol. xiv, p. 79.

* The application of a blister to stop the "epileptic ama" is a pertinent example of this. (See Dr. Buzzard in the *Practitioner*, October 1863.)

† The word "suppository," as now used, is rather a descent from the high classical level—"Cervicemque polo suppositurus Atlas." (Ovid, *Fasts*, v, 180.)

and the feces resulting when this food has been retained sufficiently long have usually the character of ordinary fecal matter. Further, by a series of experiments, Dr. Leube has proved that this method of feeding *per rectum* enables a considerable quantity of nitrogen to be taken up into the system.

These researches, published by Dr. Leube early in 1872, induced me to try the addition of pancreatic emulsion to enemata of soup and beef-tea. A maiden lady, aged 33, was under my care during the spring and summer of 1872 for an obscure disease of stomach and liver, the principal symptom of which was severe and frequent vomiting. There was also intermittent jaundice, but no gall-stones were found; and neither by myself nor by a medical friend was an absolute diagnosis of the case ever made. However, I had to deal with the symptom of vomiting in a very practical way, as it was clear that, unless something were done, the system would succumb to starvation. For quite two months, the use of food-injections was compulsory, and, during nearly all that time, pancreatic emulsion was added to the injections with the greatest possible benefit. The nutritive material seemed to be easily appropriated; the bulk of the body was fairly kept up, and there was a good fecal evacuation every other day. It is scarcely possible that the practice of feeding by the bowel could have been carried on so long without the admixture of pancreatic emulsion, of which a large dessert-spoonful was used each time. The case ended fatally, from a complication of disorders, while I was abroad for a short holiday; and the medical friend under whose kind care the patient was had no time to make a *post mortem* examination. For cases like gastric ulcer, in which feeding *per rectum* has to be carried on for a limited time, the addition of pancreatic emulsion to the food promises to be of the greatest advantage.

Those who have read Dr. John Harley's paper in a recent volume of the *Medico-Chirurgical Transactions*, on the effects of *coniium* in some extreme forms of tonic and clonic muscular spasm, will be glad to learn any facts which seem to corroborate the necessity of giving the *succus conii* in comparatively large doses. Last summer, a married lady, who had just passed the menopause, was afflicted with a return of an old malady, which I call "hysterical chorea", from want of a more exact definition. The spasms were too tonic for pure chorea, and, in their occasional character of pseudo-opisthotonos, resembled some of the vagaries of hysteria. However, the signal failure of all so-called sedative and antispasmodic medicines (including bromide of potassium and chloral) made me cast about for some new and potent thing, and hemlock seemed just the drug for which I was searching. Two fluid drachms of the *succus conii* were given at first four times a day, the doses being steadily increased until three fluid ounces were consumed in the twenty-four hours. And I am glad to say that nothing could have been more successful. An improvement quickly began, and continued without intermission until the usual health was recovered in less than three weeks' time. The total quantity of hemlock-juice taken amounted to forty-six fluid ounces. Now, here was a patient whose severe and fatiguing convulsions had never been abated by anything short of opium-narcosis; and they always returned when the narcotism passed away. But the hemlock made a dynamic impression on the nerve-centres, so that by degrees the rhythm of muscular movements was restored.*

It is much to be regretted that the *croton-chloral-hydrate* does not appear in the recent *Additions to the British Pharmacopœia*. The power of this medicine over neuralgia seems so unquestionable, that I am confident it will soon occupy a leading place among our antidotes to pain. There are certain cases of what Dr. B. W. Richardson calls "neuralgic fever", *i.e.*, general neuralgia with some pyrexia, which are completely controlled and ultimately cured by a combination of quinine and croton-chloral. In an instance of this sort very lately under my care, a maiden female, aged 49, I gave a grain of quinine in solution with three grains of croton-chloral in a pill, every two hours during the daytime; and, when the desired success was obtained, the medicines were gradually left off. Moreover, there is this good point about croton-chloral, that, even if it fail to produce any benefit, it never seems to do any harm.

I have just alluded to the lately published *Additions to the British Pharmacopœia*, which undoubtedly include some new preparations of considerable value. Reserving for another paper a detailed comment on these, I venture to say a word of commendation here of the tincture of larch and the ammoniated tincture of quinine. The former was introduced by Dr. Greenhow years ago as a remedy for chronic bronchitis, and for some time past I have prescribed it in combination with paregoric and similar drugs. The ammoniated tincture of quinine satisfies a long felt desideratum, and enables us to administer a true and

typical nerve tonic with a medicine (ammonia) which acts more after the fashion of an immediate stimulant. And a medical friend tells me that he has found this preparation more than usually efficacious in those forms of neuralgia for which quinine would usually be prescribed.

(To be continued.)

CASE OF RECURRING HYDATIDIFORM MOLE.*

By ALFRED SHEWEN, M.D.Lond.,
Physician to the Faringdon Dispensary.

I SAW the patient in the first instance on February 4th, 1873. She was then complaining of great debility, loss of appetite, pains in the back and limbs, and depression of spirits. She stated that she had had a discharge more or less constantly since the previous Christmas, and for two or three months previously she had been very irregular in her periods. But her chief complaint was the great prostration, want of appetite, and inability for exertion of any kind.

She gave the following history. She was fifty-three years old, was married at twenty-eight, had had nine children, the last of which was still-born; the others were quite healthy, and all alive. The ninth, the still-born child, was born in the patient's fortieth year, and was but a seven and a half months' child. She described it as looking quite starved to death; it was nothing but skin and bone, although a fairly developed child in other respects. The placenta was said to have been full of lumps of fat. Two years afterwards, she began to suffer with a continual discharge *per vaginam*, accompanied by intense prostration and debility, which continued for about two months, the discharge being sometimes watery and sometimes bloody, and ended by a sudden accession of pain in the stomach and back, and great hæmorrhage from the vagina, with the passage of large lumps of flesh sufficient to fill an ordinary chamber. She described what she passed as a chamberful of bladderly sea-weedy looking stuff hanging in strings together. The bladders varied in size from a pea to a hazel-nut, and were strung together like a string of beads on a fine thread. There was no fetus. She made a good recovery, and the menses returned, but irregularly. Two years afterwards, she had an ordinary miscarriage, and recovered without difficulty. After this, she became very irregular, the menses coming and going in a very erratic fashion. The patient was now in her fifty-third year. For two months previously to my seeing her, she had been continually more or less unwell. She had never had any sudden gushes of water from the vagina, but what she had passed was pale and smelt very badly, and now and then fleshy masses had passed with it. So great were her depression of spirits, loss of appetite, and distaste for everything, that she began to feel quite weary of her existence. She attributed her condition entirely to a change of life.

She recovered sufficiently in the course of a week to dispense with my services, and I saw no more of her for a couple of months.

On April 4th, I found her in extreme agony, completely doubled up with pain in the abdomen, and retching. Inquiring, I found that, since I saw her last in February, the discharge had never entirely stopped; and that, for the last week, it had somewhat increased, but she had felt well enough that morning to go to church, and was in no pain. In church, she felt strange and faint, and when she reached home after the service she was seized with intense pain in the abdomen and retching. Soon afterwards she passed a half a chamberful of clots and fleshy masses with strings of bladders, such as she had passed six years before.

The patient's abdomen was exquisitely tender, and the uterus could be felt as large as the fetal head above the pubes. There was free hæmorrhage from the vagina. The os uteri admitted my hand without difficulty, and, having explored the uterus thoroughly, I brought away all the fleshy masses and clots I could find. Judging from an external examination of the uterus, one might have expected to find many more than was really the case. There was no fetus.

After the operation, the patient had no more retching, and the pains in the abdomen ceased. She made a perfect recovery in about a fortnight.

The masses she had passed proved, on examination, to be a very good specimen of the hydatidiform mole.

* Abstract of paper read before the South-Eastern Branch: West Kent District.

BEQUESTS.—The late Mr. Joseph Fade Duckett, of Kingstown, Dublin, has bequeathed to the following Dublin hospitals the sum of £500 each:—The Adelaide, Mercer's, Stevens's, Meath, and Sir Patrick Dun's.

* The *succus belladonnæ* and the *succus hyoscyami* are among our newest therapeutic resources.

REPORTS OF SOCIETIES.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, JULY 7TH, 1875.

W. O. PRIESTLEY, M.D., F.R.C.P., President, in the Chair.

Donation from Dr. A. Farre.—A letter from Dr. Arthur Farre was read by the president, offering a large collection of casts showing the various conditions of the uterine organs, including the placenta, in health and disease, for the acceptance of the Society. Three casts were shown, merely as specimens of the collection. These were beautifully modelled and painted, representing as naturally as possible the appearance of morbid specimens. After a few words from the PRESIDENT, the offer of Dr. Farre was accepted by the Society by universal acclamation.

Specimen of Blighted Ovary.—Dr. EDIS showed, for Dr. Stothard of Hull, a shrivelled fetus of about the fifth month of utero-gestation, that had been expelled at full term together with another living fetus; the case had been one of twins. Both placentae were attached to the same bag of membranes, the one being considerably smaller than the other.—The PRESIDENT suggested whether the case was one of superfetation.—Dr. EDIS replied that the position of the placenta scarcely warranted such a conclusion.

Uterus after Caesarean Section.—Dr. NEWMAN exhibited a specimen of an uterus removed from a patient *post mortem*, in which Caesarean section had been performed eight years since on account of extensive disease of the os and cervix uteri. The case had been previously reported to the Society in 1872. The woman was delivered with the aid of the long forceps of a living child at full time. In August 1874, the integument of the abdominal wall suddenly gave way, and a large coil of intestine protruded; this was returned by Mr. Kow, but she died within a week. A large dissecting subperitoneal abscess was discovered lying mainly between the under surface of the rectus abdominis and transversalis fascia.—The PRESIDENT observed that it was in reference to this case that Dr. Farre had desired to show one of the casts present.—Dr. PLAYFAIR inquired if anything had been discovered in the condition of the cervix which would explain the difficulty for which Caesarean section had been resorted to.—Dr. NEWMAN replied that he had only made a slight examination of the uterus. When pregnancy occurred in 1871, there were distinct traces of scar tissue, the cervix being deeply indented and changed in structure.

Dermoid Cyst.—Dr. BARNES exhibited a specimen containing hair and several well developed teeth, and a firm jaw-shaped plate of osseous substance. The cyst had been removed by ovariectomy. It was filled with pus at the time of the operation. The patient died on the second day.

Venous Coagulum.—Dr. BARNES also exhibited an uterus, the internal surface of which was covered with dark decomposing mucous debris; the left femoral vein being blacked with coagulum, there having been diffuse cellulitis of left thigh. The patient, aged 45, married, was admitted May 8th, with an abscess under left arm, which had burst before admission. She had been subject to eczema for three years. She was delivered on June 19th, at about the seventh month, and died on July 10th. The case was of interest as throwing some light on the discussion at the present time.

Colloid Tumour.—Dr. BARNES also exhibited a large conglomerate of colloid tumours, weighing 28 lbs., which had grown from the omentum. It was supposed to have been ovarian, and had been removed by gastrotomy twenty-five days previously, the patient doing well. The few large vessels connecting the growth with the omentum had been tied by silk ligatures and left in the abdomen. Mr. Haward had examined the tumour, and pronounced it to be malignant.

Extra-uterine Fibroid removed by Gastrotomy.—Dr. ROUTH exhibited a specimen weighing 17½ lbs. His object was merely to show the tumour in its recent form. On a future occasion, he would give full particulars both as to the history and the treatment.

THE RELATION OF PUERPERAL FEVER TO THE INFECTIVE DISEASES AND TO PYÆMIA. (Concluded from p. 780 of last volume.)

The PRESIDENT: We now proceed to the discussion on puerperal fever, which has been adjourned on two or three occasions. I may remind the Fellows and visitors of the rule which has been laid down, and which has been pretty closely followed, that each speaker should occupy not more than fifteen minutes. It is the general feeling that the discussion should close this evening, and, if necessary, the time can be

prolonged for that purpose. If Mr. Spencer Wells be present, he will have an opportunity of replying. I may add that we are honoured to-night with the presence of two of our distinguished honorary Fellows—Dr. Fordyce Barker (who has come from America especially to take part in the discussion) and Dr. Charles West. Dr. Fordyce Barker has explained to me that he has much to say on this subject that may be somewhat at variance with what has been said by previous speakers, and he fears that he will scarcely be able to conclude within the prescribed limits; he, therefore, throws himself on the indulgence of the Society, if he transgress. Before I call upon Dr. Snow Beck to continue the discussion, I will ask the Secretary to read a short communication from a foreign Fellow—Dr. Cordes of Geneva.

Clinical Observations on the Relation of Scarlatina to the Puerperal State.—In the latter part of 1865, the five children of Mrs. F. (one excepted) were taken with scarlatina. None died. In our country, it is not so dangerous as it is in England. Mrs. F., being pregnant, but quite healthy and very strong, took care of them, and did not look fatigued by it, nor has she the slightest symptom of the disease. On January 1st, 1866, being taken with labour-pain, but having lost no water, she came down to her mother, about two miles away from her other children, whom she left in the country, wishing to be confined in the town, and to avoid the contagion for the one baby to come. On January 2nd, she was confined with a large beautiful girl. After a few hours, the scarlatina began to show itself in the throat of the baby. The physician would not believe it was scarlatina, because there was no case in the neighbourhood. On the 3rd, there was a consultation with another physician, and both agreed that the baby was suffering from scarlatina, which could not come out, and the child died on the 4th of the same month. The eruption came out a few hours before death. Now, is it not a singular thing that the baby could have been infected, being in its mother's womb, without the mother being taken with any kind of eruption, or erysipelas, or puerperal fever, or anything? Everything happened for her in that case as usual, except that she had no baby to nurse.

Dr. FORDYCE BARKER and Dr. WEST then delivered addresses, which will be found printed at length at pp. 95, 97.

Dr. SNOW BECK: I never felt so strongly the feeling that I would have been glad to escape from the position in which I may have been placed as I do this evening, after hearing the very learned and eloquent addresses with which we have been favoured. But I feel emboldened by the sentiment with which Dr. Fordyce Barker concluded, that possibly we may yet all be mistaken, to state the conclusion to which I have been led, chiefly from my own observations, upon the nature of the diseases which at present engage our attention. These observations have led me to a conclusion directly opposed to the opinions expressed by the previous speakers; for I am unable to perceive that there is any special or specific disease connected with childbirth, or to which the term "puerperal fever" can be properly applied. I must be also bold enough to contend that the definition published by the Nomenclature Committee of the Royal College of Physicians cannot be maintained in practice, for I have never yet been able to make out "a continued fever, communicable by contagion, occurring in connection with childbirth, and often associated with extensive local lesions, especially of the uterine system", which is essentially connected or associated with the condition of the system after parturition, or, in other words, which is not met with at any other period of the woman's existence. With reference to this definition, Dr. Arthur Farre informed us that the word "communicable" was only intended to convey that it might be communicated, but that it might also have a spontaneous origin; and the word "often" was only to call attention to the frequency with which these complications arise. Dr. Farre added that the Nomenclature Committee were entirely at a loss where the term puerperal fever ought to come in the catalogue of diseases. It was not placed among the fevers at all, but amongst the general diseases, far away from the fevers, finding a place of refuge at last at the bottom of the list after pyæmia, erysipelas, etc. But why should the Nomenclature Committee be in any such difficulty, if there really existed any continued fever, communicable by contagion, especially connected with childbirth? Whilst admitting this difficulty, however, Dr. Farre said he was not prepared to admit there was no such disease as puerperal fever. He should be sorry to shut out the idea as one that is impracticable and not to be entertained. If we are to look for a puerperal fever at all, one that can be properly so called, a disease which is *sui generis*, we shall probably find it in the interruption to those healthy processes going on in the lying-in woman: first, the milk-process, the milk secretion, and that attendant disturbance of the constitution which we term milk-fever; and, secondly, a much more important one—the change which goes on in the uterus, and which we all know as the involution process. Now, we know, continued Dr. Farre, that, when this process is interrupted,

there is an arrest of all the eliminative action which that involution process implies; and we may fairly conclude that, in consequence of this arrest, there is some accumulation in the body of those effete matters which ought to be expelled from the system, and this, added to the already blood-dyscrasia, must very much aggravate the disease. But may it not be replied that this sounds very like admitting that, up to the present time, no such special or *sui generis* disease has been recognised? If such a disease be developed in the changes which take place after the birth of the child, why has it not been found and described during the years of diligent study which so many of our most able and acute physicians have devoted to the elucidation of these diseases? And why is it that we have got no further than the unsatisfactory statement that, if we were to look for a puerperal fever at all, we may probably find it in some arrest of these healthy processes? What proof, it may be asked, is there that, in the serious and fatal diseases following childbirth, there is any interruption of these healthy processes which go on in the lying-in woman, any arrest of this assumed eliminative action? Supposing, however, for a moment that such an interruption or arrest should take place, what proof is there that this arrestment would create in the system so serious a disease—a disease *sui generis*, and capable of being communicated by contagion? It must not be forgotten that the growth of the uterus is a healthy physiological process; that the tissues which are formed are perfectly healthy tissues. When and where have there been any facts observed which justify, or even countenance, the supposition that the retention in the system of any portion of a healthy tissue will generate such a disease, and that the majority of the women in whom it becomes developed will die? I am not aware of any facts upon which the least reliance can be placed which justify the inference that such a disease-creating action is even probable; and I must add that, instead of speaking of it as being possible or probable that such a *sui generis* disease would be found, if looked for, would it not have been more satisfactory, and certainly more conclusive, if the symptoms which would indicate such a disease during life had been given, or the appearance on the dead body described, by which its previous existence might be affirmed? So far as my knowledge extends, no reliable facts have ever been recorded which show that any such *sui generis* disease has ever been observed in practice; nor can I think that anything is gained by substituting the term *post partum* fevers for that of forms or varieties of puerperal fever; for these terms are evidently intended to denote the same class of morbid phenomena, whatever their nature may be. In further considering these questions, I must contend that the process of child-bearing is a natural function in the female, and that Nature has provided her with all the powers requisite for the complete performance of this function as a part of her natural endowments. Every day's experience appears to exemplify this fact, not only in the human female, but also in the female of all other animals. Yet, on the other hand, no one doubts that the peculiarities of the system after parturition modify, to a certain extent, any disease which may have existed previously to the confinement, or which may have commenced subsequently. But I am not aware of any observations which support the notion that there is anything in these conditions which, in a healthy female, is the source or element of disease, or which in any way can alter, or has altered, the essential nature of any disease with which she may be attacked. All women, however, are not in health when they become pregnant, and consequently are not in health at the birth of the child, and many women are not endowed by Nature with the constitution and formation favourable to the propagation of their species. Women in either of these categories must necessarily suffer from different diseases, and from various causes, after parturition; but the fault is here with the individual, and not with the natural and physiological process of procreation. But, if it be true, as I believe it is, that there is not any disease specially connected with childbirth, it must not be forgotten that the converse is equally true, that there is not any disease from which the lying-in woman is exempt; in other words, that the condition of the system induced by pregnancy, or that which follows after parturition, does not prevent the existence of any other disease which may attack the female at any other period of her existence. Hence we must be prepared to meet with, in the lying-in woman, any of the diseases to which flesh is heir, and the diseases so met with become naturally divided into two classes, one class arising from the general system, and being the result of changes and accidents, to which all women are liable at any period of their existence; the other class arising from the uterine system, and being the consequence of accidents incident to pregnancy or childbirth, yet not comprising any disease specially connected with either of these states. When speaking of these diseases, Dr. Farre observed that he had been in the habit of dividing what he termed *post partum* fevers into three classes: first, those irritative fevers arising from some local irritation, and not implying blood-infection of

any kind, pyrexial states of a fugitive and transient nature resulting from simple mammary irritation, slight injuries to the soft parts, laceration, and the like; secondly, under the name of the milder forms of infective fevers would be classed all those in which the infection is not of a specified nature, in which the process does not undergo a period of evolution, a period of development, and in which the consequences follow no definite order; thirdly, the eruptive fevers, and those which depend upon a blood-infection, the poison following a specific course, having a regular period of incubation, and terminating in those several diseases, eruptive fevers and the like, which occur, of course, in the lying-in woman in common with others. And, in glancing at the different diseases met with after childbirth, it may be well to do so under these heads. First, then, it would appear evident that those pyrexial states of a fugitive or transient nature, which are met with in almost every woman who has been confined, cannot be classed as belonging to the same category as those serious and often fatal diseases which follow parturition or abortion. We might as well include all the diseases in the nomenclature of diseases, for every one of these might by possibility be met with in a woman recently confined. Yet it is singular how often these trifling and transient affections have been considered as the commencement or form of serious disease. Dr. R. Ferguson, in his admirable essay on *Puerperal Fever*, wherein he correctly attributes the most serious diseases to a vitiation of the fluids, though the nature and source of this vitiation is not so clearly stated as perhaps it might have been, remarks (page 101), that a dose of salts and senna so invariably brought on metro-peritonitis, that he forbore the use of this drastic irritant as a routine dose; also (p. 16) that, during a reputed epidemic of the peritoneal form, after two doses of Dover's powder, of ten grains each, the patients did not require any other treatment. Secondly, it is well known that the lying-in woman is often exposed to, and not unfrequently attacked with, the eruptive fevers, or acute specific diseases. I believe that every one of these diseases has been met with at one time or another, and we cannot deny the proofs that they have been communicated by the nurse in attendance, and possibly, though very rarely, by the medical attendant. We all know that these diseases exercise a great influence, though in different degrees, upon the pregnant uterus. The rules under which women are received into the different lying-in hospitals, when the pains of labour have commenced, and often during the night, give great facilities for the introduction of these diseases. Different instances are recorded where typhus and other fevers have been so introduced into lying-in hospitals, and have spread from patient to patient, constituting a so called epidemic. On one of these occasions, it is recorded that, after the introduction of a case of typhus fever into the Dublin Lying-in Hospital, "puerperal fever appeared in forty-eight hours afterwards, although the hospital had been free from it for a year before". But the disease which thus became developed was no doubt typhus fever, for evidence is entirely wanting to show that any of these infective or acute specific diseases have ever been known to change their nature. Some of the symptoms usually characteristic of these diseases may have been masked, or possibly absent in some instances, but their specific nature has in no way been changed. I cannot place any confidence in the statement that all these infective fevers "are excessively prone, if brought near the lying-in woman, to originate puerperal fever"; or that, by some wonderful and potent influence in a woman recently confined, all these different specific diseases are transformed into one and the same disease. Dr. Braxton Hicks appears to draw some subtle, and to me, incomprehensible distinction, between puerperal diseases and puerperal fevers, and has carried this transmutation of diseases even further than those who have preceded him. He imagines that these diseases not only change their nature when they enter the system of a woman recently confined, but when they again leave her system and enter into that of another, to quote his own words, "it becomes reconverted into the zymotic form from whence it had sprung". The experience, however, which has been adduced by the different Fellows during this discussion, appears conclusive that these eruptive fevers do not become changed in any respect when developed in a woman recently confined; and I feel assured Dr. Arthur Farre correctly stated the fact when he said "I do not consider these diseases as in any way taking any part in the puerperal fever". Nor is there any evidence, such as in a scientific point we have a right to require, that the same cause can produce directly different results in different individuals, such, for example, as that mentioned by Dr. Playfair, where the same cause, included under the very vague term of "unhygienic condition" of the house, is said to have produced diphtheria in the husband, and puerperal fever in the wife. I must admit to having a mind "not open to conviction" by such tales, where the effects supposed to have been produced are contrary to everything that has been observed in the course of nature

or in disease, and when the statements rest only on the imagination of the narrator, unsupported by sufficient facts. Thirdly, all these diseases of the general system which have been adverted to, are of minor importance, as only a small minority of them prove fatal. They evidently do not constitute that serious class of diseases which come on so insidiously, continue gradually from bad to worse, and so frequently end in death, that, as Dr. William Hunter said, "treat them in whatever way you will, at least three out of every four will die". These diseases which have invested the term puerperal fever with such fearful significance, arise from the uterine system, and are included in Dr. Farre's second class; though I feel assured he has erred in supposing they are "infective fevers", or can be termed "the milder forms of infective fevers". They really constitute the serious, and too often fatal, diseases which are met with after childbirth. Let me sketch a case as illustrative of the class of diseases referred to. A healthy woman after a natural confinement, with or without hæmorrhage, remains very well for two or three days; then has a rigor, which is followed by a very frequent and feeble pulse, a feeling of great prostration and sinking, some pain across the lower part of the abdomen, with considerable tenderness when pressed; gradual swelling of the abdomen and tympanitic resonance, considerable thirst, some sickness, with loose offensive motions. Gradually the patient becomes weaker and weaker; some shortness of breath, with slight cough and expectoration, is noticed, and she sinks after two or it may be three weeks, without more marked symptoms. After death, the peritoneal cavity contains more or less turbid serum, some soft, friable lymph is deposited on the peritoneal surface, particularly in the pelvis, with more or less injection of the peritoneum or the omentum; the uterus is large; when cut into, the tissues are healthy; the inner surface covered by a mucopurulent, somewhat reddish secretion; more or less pus-like fluid is found in the uterine sinuses, which are pervious throughout to fluid injected into the pelvic veins. What is the origin and nature of an illness such as this? A great variety of names have been applied to this condition, according to the view which authors have taken of its nature. It has been called peritonitis, puerperal peritonitis, peritoneal inflammation, metropéritonitis, etc., under the belief that the effusion of turbid serum in the peritoneal cavity, the deposit of soft friable lymph on the surface, and some injection of or under the peritoneum, were unquestionable signs of previous inflammatory action. But these morbid signs differ much from the appearances of undoubted inflammation of the peritoneum, and are now recognised as exudations which result from the impregnation of the general circulation with some noxious fluid or material. It has been termed phlebitis, uterine phlebitis, suppurative phlebitis, in consequence of the pus-like fluid found in the uterine sinuses, being considered unquestionable evidence of the previous existence of inflammation in these canals. Dr. Robert Lee has recorded several similar cases under the name of uterine phlebitis, and has described the pus-like fluid as suppuration resulting from previous inflammation. But it is extremely doubtful whether inflammation can ever take place in the uterine sinuses. These canals are only channels formed in the contractile tissue itself, and lined by a delicate and apparently non-vascular membrane. It cannot be supposed that inflammation could occur in this delicate membrane; and if it occurred in the adjoining tissue it would be inflammation of the contractile tissue of the uterus itself. There has been considerable difference of opinion expressed as to whether the pus-like fluid found in these canals was the result of inflammatory action, or had been taken up from without through the open orifices of these vessels at the inner surface of the uterus. But this question has been definitely decided by the injection of the perchloride of iron into the gravid uterus to arrest *post partum* hæmorrhage. Where death has followed in these cases, the uterine sinuses have been found gorged with black grumous fluid containing an abundance of iron, and as this iron could not be formed by any secretion from these canals, it follows that it must have been taken up from the inner surface of the uterus, where it had been deposited after injection. I suspect a similar explanation will account for these supposed cases of lymphangitis; the pus-like fluid found in the lymphatics not being formed in consequence of inflammatory action in the delicate walls of these vessels, but the vessels becoming filled by the fluid being taken up from without into their canals. I have not, however, had an opportunity of satisfying myself upon this point from the careful examination of any case. Cases similar to the one sketched have also been described as puerperal fever, typhoid form of puerperal fever, low typhoid pneumonia, typhus, etc., when the symptoms presented during life have alone been taken into consideration. They have also been termed pyæmia, septicæmia, ichoremia, etc., from the symptoms and course of the illness being evidently similar to those which follow the introduction of noxious fluids into the general circulation. It is to be regretted that so much confusion has been introduced respecting the meaning of

these terms; but, so far as the present subject is concerned, it does not appear to be of much consequence which term is employed. Mr. Spencer Wells, in the opening address says: "Supposing that the blood in the uterine veins clots, softens, breaks up, is the seat of chemical and vital changes, is detained in or near the pelvis, or is carried away to distant parts, or alters the composition and properties of all the blood in the body; that we have purulent infection or pyæmia, putrid infection or septicæmia: can all this arise in a healthy woman placed in favourable conditions, if she be not exposed to some morbid poison?" Now, the first thing essential to such changes must be the presence of clots in the uterine veins or sinuses; and, as these clots have never yet been shown to exist, it is difficult to see how they could be the cause of so much that is supposed to follow. I am aware much has been said respecting the formation of clots in the uterine sinuses after parturition, and that these clots mainly contribute in many cases in arresting any escape of blood; but I am also aware that the blood during hæmorrhage does not come from these sinuses, that it is not a venous hæmorrhage by retrogression, and that these clots, about which so much has been said and repeated, have never been shown to be present in the canals themselves. Much, I am also aware, has been echoed from one writer to another as to the influence of hæmorrhage in predisposing the system to those conditions known as pyæmia or septicæmia; but the only relation between uterine hæmorrhage and septicæmia is one of sequence of events. Want of contraction of the uterine tissues allows the blood to escape from the utero-placental arteries; the same want of contraction leaves the canals of the sinuses pervious, allows noxious fluids to be taken up through their open orifices, and to be conveyed into the general circulation. These facts appear to be the answer to Mr. Spencer Wells's question. Can all the consequences which he has depicted arise in a healthy woman placed in favourable conditions, if she be not exposed to some morbid poison? There cannot be a doubt that they can arise, have arisen, and will again arise, under the conditions named. Indeed, it has always appeared to me one of the extraordinary circumstances in relation to this subject, that such questions should ever have been entertained; for every one knows that isolated cases of the most serious affections, ending in the death of the individual, every now and then occur in all parts of the country, as well as in large towns, with ladies in good health, placed in the most favourable conditions, and surrounded by every care and attention that art can devise. If the succession of these cases occurring year after year be not sufficient to answer this question, I know not what evidence can be required. The same succession of cases appears to be an undeniable answer to the supposed influence of a vitiated atmosphere of overcrowding in any institution, or the supposed benefits to be derived from cottage hospital, isolation, etc. All that is required for the production of these serious conditions of the system is a means by which these noxious fluids can be readily conveyed into the general circulation, and this means exists when the uterus remains imperfectly contracted, or afterwards becomes partially relaxed, so that the canals of the uterine sinuses continue pervious, and any fluids formed at the inner surface, or which may have been injected into the uterine cavity, may enter at the open orifices of these canals and be conveyed into the general circulation. This want of contraction or subsequent relaxation, which practically is the same thing, may occur in the most healthy individual, living in the most healthy situation and separated from actual or supposed injurious influences. Whilst the simple means to avoid the whole of these evil consequences consists in procuring and maintaining such an amount of contraction as will render these canals impervious, and prevent the passage of any fluids along them. When the want of contraction or the subsequent relaxation is considerable, a portion of the placenta is often retained or coagula form in the cavity of the body from the blood which has flowed from the pervious arteries. In these cases, the sinuses also remain patent; the usual noxious fluids, rendered more injurious by the decomposition of the retained placenta or coagula, are taken up in larger quantity when the symptoms become more marked and the course more quickly fatal. Whilst dwelling upon this cause of that serious condition of the general system arising from the uterine organs after parturition or abortion, and which I am under the impression has been much overlooked, I do not wish to infer that it is the only cause, or that other causes may not induce similar results. Severe laceration of any of the parts concerned in childbirth, followed by inflammation, inflammation arising from long-continued pressure of the head forced into the pelvis, the formation of abscesses in the cellular tissue outside the vagina or in the pelvis, and other accidents, may any of them produce the condition of septicæmia. But, except in rare and exceptional cases, I cannot think that slight lacerations are followed by such serious consequences as have been attributed to them. Laceration of the perinæum may exist at the same time as want of contraction in the

uterus, but it is the want of contraction in the uterus which admits the septicæmic condition of the system to be induced, not the laceration of the perinaeum. Once the way is open to the system being impregnated with noxious fluids or materials, the effect which is produced greatly depends (1) upon the nature of the fluids introduced, some being followed by no perceptible influence, others by serious and fatal consequences; (2) upon the amount, as in the experiments upon animals; a small amount produced disturbances of the system from which the animal recovered, whilst a large amount always caused death; (3) the state of health of the individual at the time of impregnation, for what to one appears a poisonous dose to another only causes general disturbance; (4) to continual renewal of the infecting matters; as Cruveilhier remarked, the chief cause of the fatal result was, that the purulent infection was incessantly renewed from the original source. Moreover, purulent infections have not the same decided course of action as the poisons, whatever these may be, which originate any of the infective fevers or acute specific diseases; and, when we take into consideration the various factors of disease which have been glanced at, combining together in very varying proportions in women recently confined, it is not difficult to perceive that we may often meet with combinations which puzzle our powers of diagnosis, and render it impossible for us to determine the exact nature of the illness. But, because we are unable to unravel some of these puzzles, or to determine the precise nature of any complicated or obscure illness, is that any reason why we should rush into the regions of romance, or, by concocting some high-sounding word, or imagine we have solved a substantial difficulty or have explained a pathological entity? The question of contagion has been made the standing point from which many have endeavoured to maintain the existence of a special and essential disease occurring in connection with childbirth; but it would be impossible to enter upon this question at present. Some of the acute specific diseases, after being conveyed into the lying-in hospitals, have spread from patient to patient, and have thus been mistaken for an apparent epidemic. But the reliable evidence is not sufficient to show that any other disease than these infective fevers or acute specific diseases has been propagated either epidemically or by contagion. Most, if not all, the recorded histories on this point appear to admit of another explanation, and many to have their foundation in the management of the woman during the period of parturition, or from the circumstance that some minute yet essential particulars in the history of each case have been overlooked in the course of the illness. To quote the words of Dr. Fleetwood Churchill: "I rather think these accounts prove too much; for *post hoc* is not always *propter hoc*." And, so far as bacteria are concerned, these bodies, we are told, are found in the interior of the organs in every dead body, from whatever cause the death may have arisen, their development being only a question of time and temperature.

The discussion was continued by Dr. ROUTH, Dr. GRIFFITHS, Dr. GREENE, and Mr. WALLACE, when Mr. Spencer Wells was called upon to reply on the whole debate.

Mr. SPENCER WELLS: The great difficulty I have in replying tonight in the few minutes that remain before the end of the discussion, consists principally in the great number of speeches that have been made, and the extremely numerous and important topics which have been suggested by different speakers. But I think I may congratulate the Society upon the very great importance of the discussion that has been carried on, and upon the very great ability which has been shown by a great number of gentlemen who have addressed us, and by none more so than by our friend from the other side of the Atlantic, to whom we have all listened with so much pleasure and instruction to-night. I will, with your permission, while what our friend has said is fresh in our minds, refer to two or three topics which he has raised, inasmuch as that will perhaps prevent the necessity of a good deal of repetition in discussing the first three questions which were placed before the Society in the little programme by which I endeavoured to give a direction to the thoughts of gentlemen who were going to speak. There was really nothing in those questions intended in the way that Dr. Farr supposed to lead to any very definite conclusion, or to any kind of suggestion that I myself had formed any decided or positive opinion upon them; it was more with the hope that different gentlemen would take up the different questions according as their opportunities gave them means of information, and would bring before us the results of their own individual experience upon these different questions. Dr. Barker at once started the question by his statement that we must, as he says, from identity of cause, presume identity of result; or, at any rate, that, if we have a specific morbid poison to deal with, that specific morbid poison always produces the same results; or, as I think I understood him to say, that you might, from the same specific morbid poison, get very different results in different women under different condi-

tions. For instance, given a morbid poison, and that morbid poison received by a healthy woman, it would produce in her a very different condition from what it would produce if received by a puerperal woman, and by the puerperal woman, if she be in an unhealthy condition at the time. I do not know that I exactly interpreted his meaning; but, if I did, I should like to say that I would go somewhat beyond that, and assert that, if you have a specific morbid poison, it must, under all conditions, produce identity of results. I do not believe, if you inoculate small-pox in a patient, that you can produce a chancre; I do not believe, if you inoculate a chancre in a patient, you could produce hydrophobia; I believe you as certainly produce identity of result from identity of cause in the animal body as you do in the vegetable. If you sow a grain at the proper season in a fruitful soil, the seed will germinate; if you sow a grain of wheat, you do not get barley or oats. The seed germinates, and you get the same variety of vegetable produce. It is the same, I believe, with animal poisons. If you sow a seed of hydrophobia, or a seed of syphilis, or a seed of small-pox in a patient, you get a crop of small-pox, a crop of syphilis, a crop of vaccine, or a crop of erysipelas, according to the poison you have sown. It is the same with medicine. If you give a dose of castor-oil, you do not send the patient to sleep; if you give a dose of opium, you do not produce purging. All these poisons produce the same result. So with puerperal fever. If you suppose that in puerperal fever you have a specific disease different from any other fever, or from any other condition which we meet with in surgical or medical practice, you must show us some cause which will, under all conditions, produce that disease just as certainly as you produce small-pox by inoculating small-pox or scarlatina by exposing a patient to the poison of scarlatina. That carries me to the question which Dr. West started, as to what share bacteria or some other form of vegetable or animal life in its lowest form may have in producing these diseases, or carrying the poisons that produce them. I agree with Dr. West, that we are only on the threshold of this inquiry, and the question which I put before the Society was simply what relation have bacteria and allied organic forms to the pyæmic process in the puerperal state; in other words, to puerperal fever. I put that question in hopes that Dr. Burdon Sanderson or some other gentlemen, who have lately made important investigations on this subject; who have investigated the subject of splenic fever, sheep-pox, relapsing fever, diphtheria, and erysipelas, would have come here and given us the benefit of their experience. The great use of this discussion has been, that it has brought here not only the ordinary Fellows of the Society, but others from distant parts: a professor from Glasgow, whose candour and ability excited universal admiration amongst us, and a hope that some day he may occupy a still more important position than that which he now fills so creditably; some of our past presidents, and several of our honorary Fellows and gentlemen from the provinces practising obstetrics very largely. It has also brought a distinguished physiologist, who is among us to-night, and who I was in hopes would have spoken, who has done more perhaps to prevent disease in the country than any other man—Dr. William Farr, who, by making known the incidents of diseases, and showing their causes, has done more perhaps to check preventable disease than anyone else. I hope that, at some future time, he will favour the Society with some statistical account of the prevalence of this fever in different localities. We have been favoured by a promise from Dr. Farr of another paper on the subject, so that, at any rate, the discussion has not been fruitless in good to the Society, and I trust that it will be beneficial to the profession at large. We have been favoured by Dr. Farr with an account of a recent epidemic of puerperal fever in the district in the South of London. It is only for the week ending June 19th. In the printed return of deaths, it was stated that the cause of death was given as peritonitis and fever, which were presumably cases of childbed fever. There were three cases in the week and one in the preceding week, which it was found, on investigation, were all attended by one medical man. Between the first case and the other three, he attended two cases without a fatal result, so that the first case was probably the cause. It has not yet been quite ascertained how the first case began, whether it was a case of ordinary peritonitis or not. The investigation is still being carried on. Scarlatina is still prevalent in the district: in the same week, there were nine or ten deaths registered. An interesting question arises, and is being investigated, whether the two women who escaped from childbed fever between the first and third cases by this gentleman were protected by previous attacks of scarlatina. That is a most important matter; it is still being investigated, and I hope Dr. Farr will let us know the results. I have one or two letters here, showing the very close connection of scarlatina with puerperal fever, which it will perhaps be interesting to the Society to read. One is from Dr. Jackson of Notting Hill. He gives the particulars of a case that occurred in September 1864. "The husband,

about 30, had a severe attack of scarlet fever, from which he recovered. The wife, who had, some years previously, had the fever, and who was in the end of her eighth month of pregnancy, waited upon and attended her husband day and night. In about fourteen days from the date of her husband's illness, she began to feel ill, shivering and feverish, but had neither sore-throat nor eruption. Labour suddenly and sharply set in. The child was born alive, well developed and strong, but covered with the distinct and characteristic scarlatina rash. From birth, it was restless and uneasy, and died on the third day. The mother progressed most satisfactorily, and feverish symptoms abated. Milk and lochia were well established. Some slight apparently dyspeptic symptoms were complained of at the end of a fortnight, but these gradually disappeared. The cuticle on both hands desquamated. At the end of the fifth week, she was quite well, and left town for the country." I have several other letters giving instances of the close connection which Dr. Barker has alluded to between erysipelas and puerperal fever. One is a letter from Mr. Freer of Stourbridge. "Some years since, I left home for a few days' holiday, leaving two patients expecting their confinements. The evening before I started, my father was thrown from his horse upon the forearm and right olecranon. The next morning, the arm was red and swollen. Two days afterwards, he attended both my patients, who had very natural labours, not requiring any assistance, and my father was not half an hour with either of them. Upon my return on the fifth day, I found both my patients dying, and my father's arm so much inflamed, that I had to make incisions from the elbow to the wrist. Each case had rigors in twenty-four hours. Two years since, I was engaged to attend the wife of a clergyman in her first confinement—a very fine healthy lady, aged 26. Upon entering the bedroom, I found a nurse in attendance with an erysipelatous blush and swelling upon the side of the face. Upon inquiry, she told me that, two days before, she had been in a Liverpool hospital to have the nasal duct opened. My patient was seized with rigors at the end of thirty hours, and died of puerperal fever on the eighth day. The nurse died of rapid erysipelas of the head and neck on the twelfth day." I have also a letter from Mr. Pemberton of Banbury, which I need not read through. It goes to show that, in a house where there is typhoid fever, a woman being confined may get puerperal fever; but then I do not think at all that it follows from that that the cause was the same. You may from drains get a variety of poisons, a variety of chemical and organic products thrown out, and one patient may get one and another another. You may get sulphuretted hydrogen, phosphoretted hydrogen, and a variety of chemical substances and vegetable or animal organisms of a low form, and one may affect one patient and another another. Showing how this bears upon surgical practice, and somewhat in answer to the question which Dr. Playfair started, I will read a letter from Dr. Keith of Edinburgh, giving me an account of a most remarkable series of cases in which erysipelas, with the puerperal fever and septicæmia after ovariectomy, seem to have been in close association. "On May 19th, my friend, who assists me at my operations, became uneasy for the first time about a puerperal case. The patient died on the 26th. On the 24th, he helped me at an ovariectomy, but did not see his puerperal patient till after the operation. Next morning, my patient was in a typhoid state; had had bed-sores, all sorts of eruptions, and superficial abscesses. He recovered after this pyæmic condition had lasted a month, and had no suppuration in the pelvis. On the 30th, he assisted me at a tedious ovariectomy. The patient was quite well for six days; pulse and temperature were natural. She then suddenly shivered; the pulse rose to 170 and the temperature to 106 within a few hours, and she died five days after. On the same day (the 30th), he opened a small superficial abscess in a lady's neck. She went after this to the country; was quite well for five days, then shivered and died five or six days after of erysipelas of the head. On June 6th, he attended a simple case of natural labour in a healthy woman. She shivered the next day, and died on the 10th of septicæmia. As he went home from this confinement, he himself shivered, and was laid up with erysipelas of the face, from which he recovered. The medical man who attended the last puerperal case during the few days she lived examined for an instant a patient in the first stage of labour, four days after the death of the last case, but declined to attend her. This patient had metritis, and is now recovering, the veins of the left limb being all plugged up." I have seen this kind of thing myself in surgical practice, and it has led me to be extremely careful in getting each gentleman who attends the operations at the Samaritan Hospital to sign a paper before going into the room that he has not attended an infectious case for seven days, and has not attended a *post mortem* examination during that time. I believe that a precaution of this sort would really very much protect puerperal women from many of the infectious diseases to which they are subject, and which, I believe, are, as scarlet fever, or as measles, or as small-pox, or as erysipelas, confounded together under

the name of puerperal fever. I hope the end of this discussion will be to give more accurate names to the different conditions which have been confounded together under that one name. I should like to say a single word as to the great question of what is called homicide by infection, and the attempt that has been made, I think unfortunately, to enlist the sympathies of this Society in the protection of careless and ignorant women, who deserve the punishment they have got. I think, if a woman be cautioned by her medical man, who tells her that she has attended a woman in her confinement who has died of puerperal fever, and that, if she attend other women, she is liable to poison them, and, if she go on in defiance of this caution, to attend other women, and says, "Well, if this one die, I will give up," such a woman is not deserving of the sympathy or help of the Society. I think we should do good service if we rather stimulated the Fellows of the Society and the midwives that they employ not to carelessness, but to additional caution, teaching them not only to wash their hands, but to use disinfectants, and, above all things, to avoid any possibility of doing damage to the patients who employ them. Only this day, I heard of a case which shows that a practitioner would do well to err on the side of overcaution. I was asking about a gentleman, whom I knew some twenty years ago, who had settled down in practice in a large town. He was an able man, a gentleman in every sense of the word, a person of good character and great ability. I was told that he did not get on. I asked why, and it appeared that, in early life in that town, he was introduced to two families. He attended a lady in one of those families, who died of puerperal fever through no fault of his. He attended another lady shortly afterwards, and the people blamed him, and said that, having attended one woman with puerperal fever, he ought not to have attended a second, and he never got over it. I will not say that he deserved his fate; but certainly, if he had shown a little more caution, he would have proved the truth of the old maxim, that "honesty is the best policy". I believe the Fellows of the Society will do great good, not only to themselves, but to all whom they influence, if they inculcate, not carelessness, not protection of ignorant midwives, but instruction to those midwives that they must be over-cautions, and that, if they find themselves in danger of propagating or carrying about disease, they must err on the safe side, and say: "For a time, I will give up practice; I will not run the risk of damaging the patient who has entrusted her life to my care."

THE Sanitary Committee of Birmingham have recommended that the salary of Dr. Hill, as Medical Officer of Health and Public Analyst, shall be increased from £650 to £1000 *per annum*.

MEDICAL OFFICERS' FEES FOR AMPUTATIONS.—The Local Government Board have issued a general order altering the general consolidated order with reference to the payment of fees to district medical officers for amputations. Under the latter order, the prescribed fee for the amputation of a leg, arm, foot, or hand, or for the amputation of a finger or toe, in the case of a pauper, could not be paid to the medical officer, except in cases of sudden accident immediately threatening life, unless the medical officer had obtained, at his own cost, "the advice of some Member of the Royal College of Surgeons of London, or some Fellow or Licentiate of the Royal College of Physicians of London", before performing the operation, and produced to the guardians a certificate from such Member, Fellow, or Licentiate, stating that in his opinion it was right and proper that the amputation should be then performed. The object of the provision is obviously to save the pauper from so serious an operation as amputation, which in after-life may be prejudicial to him, unless a second opinion of some competent person is first obtained as to its necessity. So far, there can be no objection to the provision; but the requirement that the certificate shall be given by some person holding a license or degree of the Royal College of Surgeons of London, or Royal College of Physicians of London, has frequently, for obvious reasons, been the subject of complaint. Under the new regulation, the certificate may be given by any person registered under the Medical Act, 1858, who is qualified by law to practise both medicine and surgery in England and Wales, under a diploma, degree, or license granted by competent legal authority in Great Britain or Ireland. We would express our decided opinion that, having regard to the small stipend paid in too many instances to district medical officers, the department might have gracefully availed themselves of the opportunity of directing that in future a fee (say of one guinea) should be paid to the consultee, and that such outlay should be paid by the guardians, instead of throwing the cost on the medical officer, the latter being empowered to apply to the guardians or to the relieving officer in cases where he should perceive the necessity of obtaining an opinion.

British Medical Association.

FORTY-THIRD ANNUAL MEETING.

EDINBURGH—August 3rd, 4th, 5th, & 6th, 1875.

List of Hotels and Lodgings at which Visitors can be accommodated.

Members intending to be present are requested to apply at once to the addresses given.

ADDRESS.	ACCOMMODATION.	CHARGES.	ADDRESSES.	ACCOMMODATION.	CHARGES.
Princes Street. (Central.) 83. Bedford Hotel	For from 10 to 12 persons	6s. 6d. a day for bed, breakfast, and attendance.	Montgomery Street (North-East.) 16. (Main door) Mrs. Boyd	Dining-room and double bed-room, with 2 single bed-rooms	£2 2s.
99 } Dijay's Family 100 } Hotel 101 }	Bed-rooms Breakfasts Attendance Table d'hôte	from 2s. from 2s. 1s. 6d. 4s. 6d.	West Stanhope Place. (West.) 4. Margaret McNab	Dining-room and 2 bed-rooms	£1 10s.
109 The Palace Hotel & 110.	50 Bed-rooms, a day or two's notice required Sitting-rooms	from 6s. to 2s. 6d. per day, accordg. to floor. from 12s. 6d. to 6s., according to floor. The usual charges of a first-class hotel.	Hanover Street. (Central.) 25. Albert Hotel	Parlours Single bed-rooms Double bed-room Attendance	4s. and 5s. a day. 2s. 6d. per night. 5s. per night. 1s. 6d. per day.
Macgregor's Royal Hotel			Rutland Street. (West.) 26. Mrs. Mitchell	Dining, drawing, and 5 bed-rooms, with dressing-rooms Separately	£6 per week. £2 2s. and £3 3s.
George Street. (Central.) 120 } Veitch's Private 122 } Hotel	Ground floors—Sitting-room, bed-room, and dressing-room Drawing-room floors—Sitting-room, 2 bed-rooms, and dressing-room	£3 3s., or 10s. 6d. per day. £5 5s., or 16s. 6d. per day.	Coates Place. (West.) 3. Mrs. Gray.	2 sitting-rooms and 3 or 4 bed-rooms	£5 5s. altogether.
137. Mrs. Hart	Parlour floors—Same as above Bed-rooms Drawing-room and 2 bed-rooms Breakfast and attendance	£3 3s. or 10s. 6d. per day from 2s. to 5s. per night £4 4s. per week. 2s. 6d. a day for each person.	West Register St. (Central.) Café Royal Hotel	24 bed-rooms	Bed and attendance per night 3s. Breakfasts from 2s. 6d.
Hope Street. (West.) 11. Mrs. Scott 9. Mrs. Anstine 5. Mrs. Bannir 6. Mrs. Stewart 8. Mrs. Watson 14. Forres Street. (West.)			59. Mrs. Drummond	2 sitting and 7 bed-rooms	£5 5s. for the whole.
2. Gunn's Private Hotel	1 large drawing-room and 5 bed-rooms (2 of them double). Can accommodate 9 or 10	£5 per week. 2s. 6d. for breakfasts and attendance.	43. Mr. Fraser	1 sitting and 2 bed-rooms	£3 13s. 6d.
Coates Crescent. (West.)			Shandwick Place. (West.)		
12. Mr. Gall	2 sitting and 4 or 5 bed-rooms	£4 10s.	11.) Royal Alexandra 12.) Hotel 13.)	10 or 12 bed-rooms (to be re- served)	Breakfast, lodging, and attendance, 7s. per day.
Queen Street. (North.)			10. Miss Richardson	1 sitting and 1 bed-room	£1 15s.
42. Mrs. E. R. Con- stable	Drawing-room and 2 bed-rooms Dining-room and 2 bed-rooms	£3 10s. £2 16s.	6. Miss Beck	3 sitting and 7 or 8 bed-rooms	£9 9s.
Duke Street. (North.)			3. Mrs. Gidden	3 sitting and 7 bed-rooms	£7 15s.
23. Mrs. Watson	1 sitting and 1 double bed-room	£1 10s. or £2 for two.	2. Mrs. Hardie	1 sitting and 3 bed-rooms	£3 13s. 6d.
19. Mrs. Taylor	2 sitting and 2 bed-rooms	£3 3s.			
22. Miss Turnbull	1 sitting and 1 bed-room	£1 5s.			

Dr. GILLESPIE, of Edinburgh, has requested us to state that, as he has had numerous applications from Members to procure accommodation for themselves and families, he must decline to undertake such a responsibility; but he has, at very considerable trouble, formed the foregoing list of Hotels and Lodgings, with Addresses of those to whom Members visiting Edinburgh at the ensuing Meeting can apply.

BRITISH MEDICAL ASSOCIATION:
SUBSCRIPTIONS FOR 1875.

SUBSCRIPTIONS to the Association for 1875 became due on January 1st. Members of Branches are requested to pay the same to their respective Secretaries. Members of the Association not belonging to Branches, are requested to forward their remittances to Mr. FRANCIS FOWKE, General Secretary, 36, Great Queen Street, London, W.C.

BRITISH MEDICAL JOURNAL.

SATURDAY, JULY 24TH, 1875.

ARMY MEDICAL REGULATIONS.

THE Code of Regulations for the Medical Department of the Army, drawn up by the Royal Commission, of which Mr. Sydney Herbert was Chairman, and which was published in 1859, has been long out of print. A new edition, embracing the changes introduced into the department, has been for some time anxiously looked for, not only by army medical officers, but by militia and volunteer surgeons, who may at any time be called on to act with regular troops, and who are quiet at sea for want of an authorised guide to direct them in their duties.

The code of 1859 was complete. It defined the duties of administrative, staff, and regimental medical officers; the organisation of general, regimental, and field hospitals; the duties of attendants and nurses; the sanitary measures and precautions for preserving the health of troops. It regulated the duties of sanitary officers attached to armies, and prescribed rules for drawing up sanitary and other reports. To this code was prefixed a lucid letter from Mr. Sydney Herbert, explaining the nature and the principles of the changes introduced by the new code. An appendix was added, containing the dress-regulations of army medical staff-officers. In short, it was what it professed to be, an authoritative exposition of the rank, privileges, pay, and duties of army medical officers of all grades, in all places (India excepted) and under all circumstances, drawn up in a businesslike form in clear language, forming a goodly volume of 249 pages.

As we have said, this code has been out of print for a long time; and a new edition, embodying the recent and impending changes in the organisation of the service, has been anxiously looked for. The expected "code" has at last appeared, in the shape of a flimsy-looking pamphlet of eleven pages, without even a paper cover. Its meagre contents in no way belie its mean exterior. There is nothing on the face of it to enable us to trace its parentage, or even to show what department is responsible for its issue. This much, however, is only too apparent: it is the most unbusinesslike, the most ill-written, confused, and contradictory work, in the shape of an official document, that has ever come under our notice.

Our first care was to look for an authoritative explanation of the present position of medical officers "attached" to regiments, but we looked in vain. There is not a word on the subject from first to last, with the exception of some ill-written and altogether inconsistent and contradictory rules for the way in which the medical officer is to carry on the duties of his present anomalous and unsatisfactory position, to which we shall revert presently. Perhaps, when we consider that the War Minister himself cannot say precisely what the position of an "attached" medical officer is, it is unreasonable to expect a confused and bewildered subordinate to be better informed. The Secretary for War, when asked in the House to say whether a medical officer so placed is not a regimental officer, at one time said he is, at another time that he is not.

Turning to the rules for his guidance, we are told in the second paragraph of the section that the attached officer is to attend the sick of the corps in the station hospital, and to be available for any other professional or departmental duty for which he may be detailed. There is not a word to show how this rule is to be carried out when the "station hospital" is, as it often must be, at a distance from the regi-

ment to which he is "attached". The third paragraph we must quote *in extenso*, as a specimen of the slovenly and unintelligible composition of these regulations.

"3. He will attend parades of his corps when inspected by a general officer, but will not be required to attend any other unless professional assistance is wanted; and on such occasions it will suffice for the medical officer to remain within call, in the event of his services being suddenly required; but, when attached to Royal Artillery, he must be on the ground when firing at target practice is going on."

It will be seen that by this rule he is to attend a parade when professional assistance is wanted, and he need not attend it, for in the next line he is told he need only be within call if his services are needed.

The fifth paragraph directs that all sick soldiers are to be sent to the "station hospital", excepting such as do not require hospital treatment, who are to be dealt with by the "attached" medical officer in the "inspection-room" of the barracks; while in the very next paragraph he is forbidden, without any qualification, to treat any soldier out of hospital.

Paragraph 7 directs him to attend all officers "if unattached to the corps residing within the prescribed radius". What is the prescribed radius? Is it a fixed quantity, or is it to be determined by the officer in command, or how? There is not a word of guidance here. Old officers understand the term well enough, but scores of those who have entered the service of late years are quite ignorant of its meaning. It is added, that he is to attend "such of their (the officers') families as are entitled to medical attendance". But the medical officer is left to find out as best he can who are and who are not entitled to his attendance.

We have seen that the sick are to be treated in the station hospital; yet the medical officer is directed to keep all his medical records, instruments, etc., in the barrack inspection-room already mentioned.

Turning to the regulations relating to station hospitals, we see the same confusion and contradiction arising from a futile attempt to preserve the "regimental system" and yet to carry out the new. In the third paragraph of this section, we are told that the sick in "station hospitals" will be grouped regimentally, and, as far as practicable, treated by the medical officers attached to their respective corps; while in the next sentence it is said that it will be competent for the medical officer in charge of the station hospital "so to appropriate the wards and distribute the patients of the different corps as to facilitate the classification and treatment of cases of disease and injury". Here we have power given to one officer to deal regimentally with the sick, and to another in the same hospital to classify and distribute them as he may see fit.

It will be seen that these regulations fitly reflect the present chaotic state of the department; but surely the medical officers of the army and the auxiliary forces may reasonably complain that the publication of these regulations was not delayed until the scheme of reorganisation which has been so long incubating was completed, and that the task of compiling them was not given to some one capable of drawing them at least in intelligible language.

HOSPITAL GOVERNORS, PHYSICIANS, AND GENERAL PRACTITIONERS.

A SPECIAL general meeting of governors, held at the Chester Infirmary on the 9th current, discussed two questions whose importance is quite as great to the whole profession, and to the supporters of infirmaries in general, as to the parties more immediately concerned. The first of these questions referred to certain privileges which it is customary in the case of many hospitals to attach to the payment of subscriptions to the funds; and the other to the appointment of a physician to the infirmary. As to the former question, it was proposed and carried that a considerable reduction should be made in the number of recommendations of in- and out-patients, which subscribers to a certain amount have hitherto had the power of granting, in order to the receipt of the

benefits of the charity. This was done on the representation to the subscribers, by the board of management, that the greatly increased cost of all the articles required for the cure of the sick, no longer justified the board in accepting so many recommendations as formerly from individual subscribers; and was the local settlement of a matter of detail, to which we should not have referred here, except for the general interest which it excites. Why, it may be asked, is it necessary that subscribers should be granted privileges of recommendation at all? If an infirmary be instituted for the purpose of relieving the sick and hurt of a given district, why should not all proper cases be admitted on the certificate of a medical man, or on application to the infirmary authorities? Surely this plan would work better than the present system, which compels the sick or their friends to undergo the trouble and inconvenience of sending to a subscriber in order to obtain a recommendation for admission. In many provincial infirmaries, we believe, the admission of acute medical cases is a comparatively rare occurrence; and we have been informed that the medical men have attributed this fact to the compulsion laid on the sick to be supplied with a subscriber's recommendation as much as to any other cause. Besides, it seems to us that the system is a very questionable one as regards the subscribers themselves, whose sympathies it ought to be possible to evoke, and whose subscriptions ought to be obtainable, without detracting from the worth of the one or diminishing the value of the other, by the granting of what looks like an equivalent in the power of giving recommendations. We cannot believe that the sympathies of subscribers require that this inducement should be held out to them; nor do we think that withholding it would diminish the liberality with which our infirmaries are at present supported; while the advantages to the sick of immediate admission to a place where they can be well cared for are too great to require specification. Nor would the abrogation of this power of subscribers be without precedent. In some of the largest hospitals in the kingdom, for instance, the mode of procedure which we are now advocating obtains, and works so well that there is no talk of returning to the other plan. Besides which, as everyone who has any acquaintance with the subject well knows, the rule is frequently broken, even where it exists, by medical men, not subscribers, sending in suitable cases, or by the act of the house-surgeon or other official. It does not appear that the entire abrogation of a rule which is of so questionable a character, and which is besides so freely broken, would cause any loss to any one.

The second question was of even more importance, and we heartily congratulate the supporters of the Chester Infirmary on the manner in which it has been settled. Dr. Waters, who has been physician to the hospital for twenty-five years, having resigned, the question of appointing his successor came to be discussed. According to the laws of the institution, as we pointed out on a former occasion in these columns, graduates in medicine of certain universities are eligible to the office of physician. It would appear, however, that, though this is so, the custom in force at Chester for many years past, as seems also to be the case at some other institutions whose laws are as liberally framed, has been more stringent than the rule. Thus it seems that the invariable use and wont at Chester has compelled the holder of the office of physician to the hospital to be not only a graduate in medicine of one of the universities named in the rule, but has also required that he should not be in practice as a general practitioner. We need not go into the cases quoted by some of the speakers at the meeting as authority for maintaining the custom as it is stated to have been; suffice it to say that the names of one or two gentlemen were mentioned, in whose case the fact that they were in general practice either prevented their being elected to the office of physician, or compelled them to restrict their practice to pure physic afterwards. There was not, indeed, perfect unanimity on the subject, the statements of some of the speakers being called in question by other members present. But two things seem certain, and obviate any necessity to discuss the matter any further. The first is, that the rule of the hospital, while it compels the

three physicians to be graduates of certain specified universities, says nothing whatever about their confining their practice to pure medicine. And the second seems to us to be, that there is no sound reason, in the nature of things, why the custom, if it have subsisted up to the present time, should continue. As we remarked some time ago, when a question very similar to this was being discussed in reference to some changes which were proposed to be carried out at the Bradford Infirmary, there appears to be no more reason that medical cases at infirmaries should be treated by pure physicians than that surgical cases should have the services of pure surgeons. This view was strongly advocated at the Chester meeting, not only by many influential lay members of the Board of Management, but also by the medical staff, who were stated by the senior physician to the hospital to concur in it; and with such support there is no wonder that it was all but unanimously adopted. We have formerly expressed our opinion on the general question, and we understand that what we then said has largely influenced the present result. We cannot refrain from congratulating the profession that a custom which dates from a time when the general practitioner was in every respect a much inferior man to the physician proper is gradually dying out, as it comes to be recognised that the distinction no longer exists; and, though we by no means disapprove of, but, on the contrary, highly approve of, some amount of specialisation of medical work, we are glad to find ourselves in harmony with what this Chester decision seems to indicate as becoming the general feeling of the profession, that such specialisation is to be obtained rather by a process of gradual evolution than by any arbitrary line of demarcation, which has sometimes in the past prevented the best men from filling the most important offices.

THE ABUSES OF HOSPITAL SATURDAY.

ON Saturday, the 17th instant, there was a meeting of the Board of Delegates to make final arrangements for Hospital Saturday, which is to be held on the 31st. The meeting was attended by numerous representatives from places of business and working men's clubs. A statement was made by the chairman, Captain Mercier, to the effect that the prospects of this year's collection were satisfactory, that the managers hoped to be able to reduce the expenditure to less than one half of that which was incurred last year, and that they felt confident that the amount received would be at least three times as great as on the first occasion.

The plan of distribution is to be the same as before. "Each institution", it was announced, "would receive to the uttermost that to which its merits entitled it, under the following heads, viz.: amount of relief actually given, economy practised, and efficiency attained". Dispensaries are to be placed on a footing of perfect equality with the hospitals. Collecting boxes have for some time past been placed in post-offices, railway stations, and other public buildings; and we understand that, on the 31st, public collecting tables will be placed in five hundred leading thoroughfares of the metropolis; and it is proposed that each table should be presided over by a lady. Indeed, there appears to be the same intention which was so conspicuous last year, of making a general appeal to the public on behalf of the working men. Instead of the collection being a contribution to the hospitals from the artisans themselves, it is, in a great measure, an appeal from the working men to the general public for pecuniary assistance. If it is to have this character, why should it be separated from Hospital Sunday? One Committee and one organisation might serve for making an appeal to all classes of the community on behalf of the distressed working man. And it certainly appears a misnomer to call a collection which is made by ladies from all the passers by in our great thoroughfares a working man's Hospital Saturday Fund.

We are far from wishing to discourage charity, and are glad to see any manifestation of sympathy which the wealthy show towards their poorer neighbours; but this movement has been spoken of as a great effort on the part of the working classes to assist themselves; whereas it appears to us that there is, on the contrary, a danger of its encouraging

them in the habit of begging for help from others. We cannot say that it appears to us a matter of congratulation that so many large firms and employers of labour are taking part in this movement, and encouraging their men to contribute towards it. We have always maintained that workpeople in the receipt of high and regular wages ought to provide for their own medical necessities: either by paying in the ordinary way the small fee of a general practitioner during illness, or else by subscribing to some provident medical institution. Instead of this, by the general collection which is now being made on behalf of the working class, they are being encouraged in the idea that the well-to-do among them, as well as the really needy, have alike a right to hospital treatment. A great injustice is thus done to the general practitioners, whose patients are drawn away from them; a stress of work is thrown upon the hospitals, which they were never intended to bear; while the consultants, who are willing enough to give their services to the sick poor, are called upon, somewhat imperiously, to prescribe for those who present a Hospital Saturday letter, but who may not have given one farthing to the fund themselves, while they are altogether above the level of gratuitous assistance.

So far as the movement indicates a growing feeling amongst working men that they ought to contribute to their own medical wants, we rejoice at it. But we regret that this wholesome feeling is being misdirected. We believe that, if it succeed, as its promoters anticipate, it will tend to increase the abuse of hospitals, which is now so much complained of; that it will hinder their reform; and that it will injure rather than improve the *morale* of the class for whose benefit it is intended.

DR. LANGDON DOWN, the founder and first president of the new Thames Valley Branch of the British Medical Association, gave, last week, a most hospitable and brilliant reception to some hundreds of the local profession and their wives at his model training institution for imbeciles at Normansfield. This brilliant and generous inauguration of the new Branch can hardly fail favourably to influence its social progress.

DR. LUSH, in a speech of considerable ability, to which the reports do great injustice, has this week advocated the claims of the Army Medical Department in the House of Commons. The debate was mainly a recapitulation of a good deal that has already been said, and we are bound to add that Mr. Hardy did not show to advantage. He is well capable of taking a much broader and more statesmanlike view of the facts, and of saying Yes more gracefully, or No more logically and convincingly. His grand point—that medical officers must like the army well enough, or they would retire from it earlier—is the sort of fallacy which can hardly serve anything else than the momentary purpose of a debate. Even if it were true in any sense, or had any force in deciding the question at issue—and it is neither true nor forcible—it would lose all meaning in the face of the fact, which Mr. Hardy well knows, that part of the complaint is, that retirement-allowances are so poor that men prefer to stay on and half-starve in the army, rather than to retire when the energy and push of the first maturity of manhood are long past, to starve wholly on the Government pittance. The main complaints are, that Promotion is too slow, Retirement too little tempting; and that Forage and other allowances have been harshly, and in some instances by a breach of faith, curtailed. Is it anything more than a bad joke for a minister to say, "Promotion is slow because men don't retire; and they don't retire, I suppose, because they like the service"? Supposition has no place in the argument. They do not retire, as Mr. Hardy knows, because they cannot; and the slowness of promotion makes men unwilling to enter. Hence overwork of those who are in the service, continued grumbling, and increasing discontent. No doubt it is largely a question of money, as well as of position; but that is the case throughout the country. It is, moreover, not wholly a money question.

THE MORTALITY OF ANÆSTHETICS.

AN immense body of evidence, which was collected in these columns in 1870-72, proved, as we think, indisputably, the superiority of ether in point of safety over chloroform or bichloride of methylene for the purposes of anæsthesia. The result of that mass of evidence has been to introduce the inhalation of ether largely into British hospitals, whence for the last twenty-five years it had been almost wholly banished. Among the hospitals where it was thus introduced was St. George's Hospital, where Mr. Pollock, having seen it used, has become lately an enthusiastic advocate of its employment. His enthusiasm is well founded, although a little too exclusive. It has been shown by the tables furnished to us by the Registrar-General, and by our own records, that the deaths from chloroform in this country are nearly one per month. Chloroform, according to the published figures of Mr. Morgan, is eight times as dangerous to life as ether; but the use of ether is not devoid of danger. Of the two deaths published this week, one, which is attributed in the public reports in the papers to chloroform, was really due to the use of bichloride of methylene, an agent which seems to be even more dangerous than chloroform. Ether administered by the American method is nearly as rapid in its action as chloroform, and it is so much the more safe, that the reasons which impede its general substitution for chloroform are not easily to be understood. The statement that ether is absolutely safe is, however, by far too unqualified. It is not physiologically probable that any anæsthetic can ever be introduced which is absolutely safe; certainly none is at present known. Mr. Hutchinson pointed out two years since, in our pages, that ether seems to have dangers peculiar to itself when administered to aged people; and a case which we report to-day further indicates that safety cannot be guaranteed with certainty for ether with patients of any age; but it is certainly less liable to produce death than chloroform. We would refer to an abstract of a series of abstracts in the *London Medical Record* for May 1873 of the mass of evidence on the subject, by which we produced what was called at that time "a chloroform panic", which had the happy effect of largely introducing ether into use in this country. Its use is steadily extending; and, except nitrous oxide, which is preferable and safer for short operations, such as extraction of teeth, ether is at present the anæsthetic which deserves the most general use.

THREATENED DEATH DURING THE ADMINISTRATION OF ETHER.

DR. FREDERICK HAYNES of Leamington writes to us:—Some few months ago, a patient, to whom I was administering ether, nearly died. The ether used was pure sulphuric ether. The patient was a girl, aged 14; and the anæsthetic was administered for an operation for necrosis of the tibia (Mr. Marriott operating). A fluid-ounce was poured on to a sponge, wrung out of hot water, placed in a leather cone, and was given with as little air as possible when first administered. The patient had been under the influence of ether for about ten minutes, when she suddenly became blue in the face, and the jaws closed with a spasm, and the pulse could not be felt at the wrist. I immediately called the attention of the staff to her condition; pulled out her tongue, and turned her quickly on her left side, that being the readiest method for artificial respiration. She gave a few gasps, vomited, and eventually recovered. I report this case, as it shows ether not to be free from danger, even when pure sulphuric. Though I have often administered chloroform, and ether pretty frequently, I never had a case which gave me so much anxiety. The patient was anæsthetised and ready for operation in two minutes.

THE ROYAL COLLEGE OF SURGEONS' TEST.

A CORRESPONDENT writes to us with reference to the "pass and pluck lists" of the Royal College of Surgeons, published in last week's *JOURNAL*: "The following list shows the position occupied by the eleven medical schools of the metropolis. The percentage of rejections at the primary and pass examinations have been added together, so

that the number appended to each school shows the number of rejections from an average of two hundred candidates. It will be seen that one of the largest and one of the smallest schools have run a very close race for the first place. St. Mary's has lost the post of honour by less than half a length, or, to be more precise, by the third-part of one candidate. 1. Guy's, 39; 2. St. Mary's, 39.3; 3. University College, 40.1; 4. St. Bartholomew's, 42; 5. London, 59.2; 6. St. George's, 59.4; 7. Middlesex, 67.2; 8. King's College, 73.7; 9. Charing Cross, 74; 10. St. Thomas's 75.9; 11. Westminster, 108.5."

MEMORIAL TO MR. PRESCOTT HEWETT.

At a meeting held at St. George's Hospital on July 17th—Mr. Cæsar Hawkins in the chair—the following resolutions were passed. 1. Moved by Mr. Charles Hawkins, and seconded by Mr. Henry Lee: That this meeting takes the opportunity of Mr. Prescott Hewett's resigning the office of Surgeon to St. George's Hospital to present him a memorial in recognition of his services in the advancement of medical science, and of the influence his character has had on the profession and the public. 2. Moved by Mr. George Pollock, and seconded by Mr. Brudenell Carter: That a committee be appointed to carry out the above resolution; that subscribers be restricted to members of the medical profession, and the subscription be limited to one guinea from each person. 3. Moved by Sir James Paget, and seconded by Mr. T. Holmes: That the Chairman be requested to forward the resolutions to Mr. Prescott Hewett. 4. Moved by Dr. Blandford, and seconded by Dr. Barnes: That Mr. Charles Hawkins be requested to act as Treasurer, and Mr. James Rouse as Honorary Secretary to the Committee. On the motion of Dr. Pitman, a vote of thanks was carried to the Chairman for presiding. All St. George's Hospital men, and many others who have a personal regard and professional esteem for Mr. Prescott Hewett, will concur, and may well be pleased to take part, in this testimony of respect to the distinguished Senior Surgeon of St. George's, whose career has been marked by solid work, much professional reserve, and a nice sense of propriety in all the affairs of life.

HEALTH AND THE WEATHER IN PARIS.

OUR Paris correspondent writes, under date July 18th:—The continuous rain we have had for some time seems to be telling on the general health of the public; for in the mortuary report for the past week (902), there has been an increase of 90 deaths over the previous week (812). As usual whenever there is the slightest fall of temperature, pulmonary affections furnish the largest number of fatal cases. But, while winter affections are on the increase, those peculiar to summer are on the increase also. These are to be met with in the form of choleraic diarrhoea or cholera, from which there have been 28 deaths, against 16 the week previously. Croup and diphtheria are on the decline.

THE GENEVA CONVENTION.

THE death has just taken place of General Dufour, who presided, in 1864, at the meetings in Switzerland of the European delegates who framed the well known international "Geneva Convention" to secure the neutrality of wounded soldiers in time of war. There can be little doubt that the influence of General Dufour, who was a man of remarkable character in many respects, greatly contributed to the acceptance of the treaty by the great European powers, especially by France. The general, who was born in Constance in 1787, served for many years in the French army under Napoleon the First. He returned to Switzerland when the Empire fell, and eventually became commander-in-chief of the troops of the Swiss Confederation. At one time, Napoleon the Third served under him in Switzerland, and to the last of the Emperor's life he retained his friendship and confidence. General Dufour, who was a highly scientific soldier, as the ordnance maps of Switzerland prepared by him—the best, perhaps, in Europe—sufficiently testify, always maintained that not merely the principles, but that all the particular provisions, of the Geneva Convention for the Care of the Wounded in

Time of War, when rightly interpreted and carried out, were of a thoroughly practical nature, and in no way antagonistic to strategic considerations. The Convention has lost a staunch supporter by the death of General Dufour.

SCARLATINA AT SEVENOAKS.

SERIOUS reports have been current respecting an outbreak of scarlatina at Sevenoaks. They have, we find on investigation, been very much exaggerated. We may state from accurate information that, with the exception of one fatal case, the outbreak has been of the mildest possible character, so much so that members of the same family as those who were attacked were not affected. The sanitary authority have, by the advice of the superintending medical officer of health, successfully taken every precaution to prevent the spread of the disease.

CONCEALMENT OF DISEASE IN THE ARMY.

THE paper by Dr. Ambrose, of the 58th Regiment, which we print in another column, seems to us a very important one, and affords the first direct evidence of the effects of Lord Cardwell's order in October 1873 in tending to the concealment of enthetic disease. We hope its publication may lead the War Office authorities to reconsider an order, which must be acting also in other regiments in the same way. Of course, it is possible that the amount of concealment may be relatively the same in protected and in unprotected stations, and that the result of the statistics may not be actually affected by the concealment; but it may be otherwise, and, at any rate, the fact of so large a concealment of disease must tend both to the injury of the soldier and to the interference, to a large extent, with the successful operation of the Contagious Diseases Acts. The great point, of course, is to get the soldier into hospital as soon as possible, in order to prevent him from propagating the disease. The paper of Dr. Ambrose is in many ways valuable, and probably his experience coincides with that of other medical officers.

RECENT URBAN MORTALITY.

DURING last week, 5,174 births and 3,328 deaths were registered in London and twenty other large towns of the United Kingdom. The average annual rate of mortality was 22; and the rates in the various towns were as follow: Portsmouth and Wolverhampton, 12; Norwich, Bristol, and Bradford, 18; Dublin, Sunderland, and Birmingham, 19; Edinburgh and Liverpool, 21; Leicester and London, 22; Sheffield, 23; Manchester, 24; Glasgow, 25; Leeds and Newcastle-upon-Tyne, 26; Oldham, 27; Nottingham, 30; Hull, 31; and Salford, 36. The average zymotic death-rate in the eighteen English towns was 5.9, and ranged from 0.4 and 1.5 in Portsmouth and Wolverhampton, to 10.5 in Hull, and 11.9 both in Nottingham and in Salford. Scarlet fever showed an increased fatality in London and Hull. No death was referred to diarrhoea in Portsmouth, whereas the annual death-rate from this disease ranged upwards to 6.7 and 7.4 per 1,000 in Leicester and Nottingham. In London, 2,203 births and 1,481 deaths were registered; the births being 40 below, and the deaths 8 above, the average for the week. The 1,481 deaths included 4 from small-pox, 27 from measles, 90 from scarlet fever, 10 from diphtheria, 61 from whooping-cough, 26 from different forms of fever, and 204 from diarrhoea; in all, 422 deaths from these seven diseases, being 41 above the average, and equal to an annual death-rate of 6.4 per 1,000. The 90 fatal cases of scarlet fever exceeded the number in any week since the beginning of December last. The fatality from diarrhoea exceeded the average for the week; and of the 204 deaths referred to that disease 158, or 77 per cent., were of infants under one year of age, and 34 of children aged between one and five years. The annual death-rate from diarrhoea averaged 3.1 per 1,000 in London, and ranged from 1.9 in the west, to 4.6 in the east groups of districts. In greater London, 2,604 births and, 1,696 deaths were registered. In outer London, the general death-rate and the zymotic death-rate were 14.7 and 3.2 per 1,000 respectively, against 22.4 and 6.4 in inner London. At Greenwich, the mean reading of the barometer was 29.69 inches; the mean tem-

perature of the air was 56.2 deg., or 6.4 deg. below the average, and was below the average on each day in the week. The mean degree of humidity of the air was 87. No rain fell on Monday or Tuesday, but the amount measured on the other five days was 3.27 inches, of which 2.39 inches fell during the 44 hours ending at 7 A.M. on Friday. So large an amount of rain has not fallen in London during any week since the last in September, 1871, when 3.34 inches were measured.

THE SEAMAN'S HOSPITAL, GREENWICH.

HIS Royal Highness the Duke of Edinburgh has consented to become President of the Seaman's Hospital, Greenwich, the oldest institution established for the exclusive relief of seamen of all nations. The Committee urgently appeal for funds to carry out fully the objects of the Hospital, the yearly expenses of which amount to £9,500, whilst the permanent income amounts to £4,865 only. The hospital is thoroughly cosmopolitan in its manner of bestowing relief. "Seamen of every nation are admitted without any letters of recommendation; an applicant being a seaman has only to show his need of medical treatment, and he is at once received into the hospital; and, after recovery, he is retained as a convalescent until he is fully capable of resuming his duties on board ship."

A MEDICAL ASTROLOGER IN TROUBLE.

AN inquest was recently held at Marshfield on the body of a young man who died of consumption. During the earlier part of his illness, he was attended by Mr. Bush; but, as he did not improve, he called in a herbalist named Bigwood, who lived at Corsham. This man treated him from May 11th till June 5th; but then, as it was evident that he was much worse, Mr. Bush was again sent for. He pronounced the patient to be in a sinking condition; and the man died the next day. Under these circumstances, Mr. Bush very properly declined to give a certificate of death, and accordingly the case came before the coroner. Bigwood's evidence we give in his own words; for, as we are not ourselves conversant with the mysteries of medical astrology, we cannot pretend to translate it into ordinary language. He said:

"I am a 'licensed botanist', residing at Corsham. I was first requested to visit the deceased on May 11th. He was then down stairs, sitting in a chair. He asked me if I thought I could do him any good. I told him I thought I might, but it would be like raising the dead from the grave; but the deceased wished me to give him a trial. I then asked him if he was under a doctor. He said: 'Yes; but the doctor says he can do no more for me.' I told him I would give him a trial; but I did not think that I should raise him, for he had no blood in him. I told him that his liver did not throw any blood, and that it was very dry. I thought by his countenance that his liver did not throw any blood, as he looked as sallow as death. I sent him a bottle of medicine next day, which contained seven different sorts of herbs. They were herbs governed by the sun. These herbs strengthen the heart, which I wished to do. I work on a botanist scale of astrology. I send medicine all over the country. I consider that my license allows me to do so. When I advertise, I advertise for fits. I do not advertise for consumption, for I know it is no good. I use a hundred different sorts of herbs. I give medicine for every part of the body where it is afflicted. I use the Government stamp on all bottles of medicine sent out, no matter what are the contents. The medicine I gave him was for the chest, heart, lungs, and liver. I sent him four bottles of medicine and a box of twenty pills; the pills to be taken with the medicine. The pills were made with the same herbs as the mixture, ground unto powder with cayenne, hickory-pickry, and rhubarb, which I buy of a chemist in Corsham. I ask for hickory-pickry, for I know no other name for it. I have raised men very near from the grave with that medicine and pills. I have been practising twelve years. I judge all complaints by astronomy. If I have the date of a man's birth, if he lived in London and sent to Corsham to tell me he was bad, I could tell what his complaint was, and what to prescribe for him. This I have done many times, and made many cures. The deceased was born January 6th, 1852 (I do not know the hour and minute). The sun was in opposition sign with the stomach when he was born; that showed that the sun stood in afflicted sign to the body. The moon rules the liver; and that is where his disease was, and that is what he died from. I never had a patient die that had been taking my medicine since I have been in practice. If they fall worse,

I tell them they must get a doctor. By watching the movements of the heavens, I can tell when to call in an experimental medical man, or there would be many such caddles as this, as I would not be responsible for their lives unto the end without further counsel. I would not be responsible, as there would be upsets about it. I do not confine women or do bone-setting."

The jury returned a verdict of death from natural causes—to wit, phthisis; but they requested the coroner to censure the herbalist severely; and to tell him that he had had a very narrow escape of being committed to Gloucester Jail on a charge of manslaughter.

THE FRANCO-GERMAN WAR.

IT is announced that the surplus of the fund subscribed for the relief of the sick and wounded in the Franco-German War has been invested in first class securities in the joint names of His Royal Highness the Duke of Connaught, Lord Shaftesbury, and Colonel Loyd Lindsay, as trustees. The interest accruing from this investment is added to the principal sum from time to time, thus creating a fund which will be applicable to the relief of the sick and wounded in any future international war which may unfortunately arise, similar in its nature and character to that which in the first instance excited the sympathy and elicited the generous contributions of all classes in this country. The Committee, duly regarding the purpose for which the fund was created, have not felt justified in applying any portion of it to the relief of sick and wounded in the protracted civil struggle now going on in Spain. Still less can they, consistently with the trust reposed in them, apply this fund to the relief of distress which, however severe and widely spread, is in no way connected with the operations of war.

BRADFORD MEDICO-CHIRURGICAL SOCIETY.

THE thirteenth annual meeting of this society was held in the Council Chamber, on July 13th. The yearly report, submitted by the secretary, showed that the society had made a great advance during the past session. The members had increased from forty to fifty, and their attendance at the ten meetings of the session had been nearly one-half greater than that of previous years. The communications submitted to the meetings, of which upwards of thirty had been made, had shown more general research and originality than previously. One evening of the society had been devoted to a general discussion upon the subject of Vaccination, its benefits and dangers. The result determined the society to repeat such discussions upon some debated medical subject every succeeding session. A number of important morbid specimens had been added to the pathological department. The society in all respects, financially and otherwise, was pronounced to be in a most prosperous condition. The following gentlemen were elected as office-bearers for the ensuing session. *President*: E. Brommer. *Treasurer*: W. Whalley. *Secretary*: D. Goyder. *Committee*: R. H. Meade, J. Foster, P. E. Miall, J. Dunlop. *Pathologists*: M. Lee, A. Rabagliati. *Auditors*: W. H. G. Buckley and C. H. Taylor.

CONFESSIONS OF A QUACK DOCTOR.

MR. G. A. BRINE, the pauper in Sherborne Workhouse, whose revelations with regard to the tricks of vagrants have attracted some attention, writes this week to the *Charity Organisation Reporter* on the subject of quack doctors and itinerant medicine vendors. He says:

"I commence with the quack doctors. In the first place, I must tell you that I never engaged in the dirty business on my own account. I have been a tool in the hands of others. The first time it was in Yarmouth. A quack, who was lodging in the same 'ken' with me, asked me if I was willing to earn a couple of shillings easily. I replied in the affirmative. This was, to come into the market-place in the afternoon, while he himself was expatiating on the virtues of his infallible medicines, and purchase half-a-dozen boxes of the pills, saying that myself and others had derived immense benefit from their use, and that, for the future, I was resolved never to be without them, the money to pay for them having been given me beforehand by the 'doctor'. Well, I carried out my instructions to the letter, and so well pleased the modern Esculapius, that in the evening he employed me to work

for him at a salary of £1 per week, besides travelling expenses. I was now to be initiated in the sublime mystery of compounding the 'medicines', almost invariably 'pills'. My duty was to collect the ingredients; and I now solemnly declare that I got them ready made from the sheepfold or the rabbit-warren. Those from the sheepfold had to be considerably reduced in size, after which they were coated with finely pulverised sugar and flour, and, after being dried to a proper consistency, were placed in pill-boxes, which are easily obtained, and then held forth to the dolts, who were silly enough to listen to him, as 'American sugar-coated pills', purely vegetable, and warranted not to contain one particle of mercury, colocyth, or other deleterious poison, so extensively used by regular doctors. These pills are a sovereign remedy for bilious disorders, liver complaints, dyspepsia, or indigestion, the symptoms of which are learnedly described by the 'orator' (which was generally myself), learnt by heart from a medical work by Dr. Buchanan.

"When we were travelling in country villages, there was no 'gill which flesh is heir to' but what my master (blatant ignoramus as he was) would not undertake to cure—worms, piles, tusk, or itch, gout, rheumatism, ulcers, fits, etc.; but the naked truth is, that he was a greater fool than I; he could not read a paragraph in a newspaper, and could scarcely write his own name. He knew no more about the maladies he professed to cure than a hog; but he possessed in an eminent degree that grand, indispensable qualification, any amount of cheek, and his takings on an average were £10 a week."

SCOTLAND.

DR. A. P. AITKEN, Demonstrator of Chemistry in the University of Edinburgh, has been elected Professor of Chemistry in the Veterinary College, in the room of Professor Dewar, resigned.

DR. GRANT, the President of the Canada Medical Council, has been paying a visit to Edinburgh, his chief object being to observe the anti-septic method of surgery in Mr. Lister's hands.

WE understand that Dr. Smith-Shand of Aberdeen is candidate for the vacant chair of Medicine in Aberdeen University. Dr. Smith-Shand is undoubtedly one of those who are doing most to advance the science and art of medicine in this important centre of medical education and practice; and his attainments and achievements are such as to place it beyond doubt that he would fill with distinction the office to which he aspires, and would add to the usefulness and lustre of the chair of medicine in the University.

INCURABLE HOSPITAL FOR GLASGOW.

WE hear that the estate of Broomhill, Dumbartonshire, consisting of about eighty acres, has just been purchased, on behalf of the Association for the Relief of Incurables of Glasgow, at the price of £14,000. The estate lies in the neighbourhood of Kirkintilloch. The mansion-house, to which large additions have recently been made, is situated on an elevated ground, commanding an extensive view of the Campsie Hills, and is large and roomy, and can be easily adapted to the requirements of the institution. Entry will be obtained immediately to the mansion, and at Martinmas to the grounds belonging to the estate. In the meantime, the Society is busily engaged in the out-door branch of its operations; that is, in relieving those suffering from incurable disease at their own homes. There are at the present time more than two hundred upon the maintenance fund.

MORTALITY IN THE BRITISH ISLES.

AT the Scottish Meteorological Society, last week, an interesting paper was read by Mr. Buchan on the Rates of Mortality in the British Islands. The author showed that, taking averages from the statistics of ten years in the larger, and five years in some of the smaller towns, the general result of the curves was to the effect that, in England, in the winter months, every one of the large towns showed an excess above the average mortality; that excess, however, being very unequal. In Scotland, Aberdeen showed a steady rise from the beginning of October to the end of the year, while in Greenock the effects of the winter cold were much less perceptible. For the summer season also, from

July to September, all the large towns in England but one showed an excess of mortality; this excess was, however, very unequally distributed in point of time. In London, the mortality was highest at the end of July; in Norwich, not till the end of September. The most remarkable fact that came out was that, in Leicester, there was an excess of 40 per cent in the summer months, being double that of any other place. In Scotland, on the other hand, no town exceeded its average in July and August; in fact, in Aberdeen, the lowest rate of the whole year occurred in these months. Of annual rates of mortality, Glasgow stood highest with 35 per 1,000, Manchester and Liverpool next, with 30. Portsmouth was lowest in England, with 20; Aberdeen in Scotland, with 23. Every one of the English towns showed a tendency to a minimum in October; the Scotch death-rate also was low in that month. It was shown that the high summer rate was due chiefly to diarrhoea, and that in children under one year. In this respect, Leicester was exceptionally high, Edinburgh and Aberdeen exceptionally low. Every Scotch town, in fact, had a lower death-rate from diarrhoea than the English ones, whose temperatures were all higher.

SCARLET FEVER IN LONDON.

AT the last meeting of the Scottish Meteorological Society, Dr. Arthur Mitchell read a paper on Epidemics of Scarlet Fever, the result of an inquiry into the scarlet fever epidemics of London during the last thirty-five years. There had been six epidemics during that time, of which two remained at a maximum for nearly twelve months; in three, the maximum being reached, there was an immediate and steady decline. The curve for the thirty-five years showed the prevalence of the epidemic to be steadily and distinctly below its mean from January to the end of August, and above its mean during the rest of the year; and, with the average thus brought out, the curves for the several periods, and even those of single years, substantially corresponded.

NEW FEVER HOSPITAL FOR THE SUBURBS OF GLASGOW.

THE foundation stone of a combination fever hospital for the burghs of Partick, Hillhead, and Monyhill was laid last week. The site of the building is at Knightswood, in close proximity to each of the burghs. When completed, it will be capable of holding seventy patients, while the ground surrounding and belonging to the institution will admit of its being greatly enlarged, should occasion render it necessary. The cost of the building will be about £10,000.

DINNER TO DR. LOWE.

DR. LOWE, the President of the Edinburgh College of Physicians, was last week entertained to dinner by a large party of his professional and other friends: the occasion for the demonstration being the fact that Dr. Lowe is about to leave Edinburgh. Sir Robert Christison was in the chair; and a number of the leading members of the profession were present. The chairman, in proposing the toast of the evening, assured Dr. Lowe that, wherever he might take up his abode for the future, he would carry with him the warmest wishes for his welfare of the numerous friends he had left behind him in Edinburgh.

NEW WATER-WORKS FOR DUNDEE.

AFTER a long series of local and parliamentary contests, the town of Dundee is about to tap a new reservoir, which is expected to supply all possible wants of the town for a very long time to come. As lately as 1848, this burgh was dependent for its supply of water upon scanty public wells and peripatetic vendors at one halfpenny a picher. A company was formed in 1844, and opened a supply from Monikie, about ten miles from Dundee, in 1848, calculated to supply 70,000. With the rapid growth of the population and manufactures, a larger supply became necessary, and small additional works were opened in 1868. By this time, the population of the town and suburbs, including Broughty Ferry, had increased to 140,000, or just double the number originally provided for. In 1869, the town council took over the waterworks into their own hands, and set about looking for a fresh source of supply. The place fixed upon was the Loch of Lintrathen, which is principally

supplied by the River Melgam, and this was accordingly dammed up and enlarged into an extensive reservoir: its distance is eighteen miles from Dundee. When filled to the level of twenty feet above the ordinary summer level of the loch, the reservoir will contain 250,000,000 cubic feet, or 1,542,000,000 gallons of water. It is situated at the height of 676 feet above the level of the sea. The pipe is twenty-seven inches in diameter, and is calculated to supply a first instalment of 8,000,000 gallons a day. The works are now nearly complete, and will be shortly opened.

DR. YELLOWLEES' LECTURES ON INSANITY IN GLASGOW UNIVERSITY.

OUR Glasgow correspondent writes:—These lectures, whose commencement we noticed a few months ago, were brought to a pleasant termination by the presentation of an address to Dr. Yellowlees on Saturday last. At the beginning of the session, an invitation was issued to the members of the medical profession; and, in the address, those who attended expressed the pleasure they had experienced, and the benefit they had derived from the lectures. They particularly noticed the great advantages from the actual study of cases at the asylum, and commented very favourably on Dr. Yellowlees' skill as a clinical teacher.

IRELAND.

ZYMOTIC DISEASES IN BELFAST.

DURING the second quarter of the year, 114 deaths took place from measles, 88 from scarlatina, 39 from fever, 30 from diarrhoea, 27 from whooping-cough, 10 from small-pox, and 6 from diphtheria; the deaths from the principal zymotic diseases thus amounting to 314, or 23.6 of the total deaths registered. The insanitary condition of Belfast, especially the impurity of the water supplied, and the overcrowding of the poorer classes, sufficiently explain the high death-rate from preventable diseases.

A FILTHY SPOT.

THE sanitary condition of Borisoleigh, in the Thurles union, has lately been brought under the notice of the Local Government Board by a resident, who complains of it as "the most filthy spot in Ireland"; and, referring to the water-supply, states that there is no water for the use of the inhabitants, except what is filtered by passing through three water-closets. This filtration, as it is termed, is rather a peculiar one, and one not very desirable in a sanitary point of view; and the Local Government Board have referred the matter for the consideration of the guardians, who, it is to be hoped, will speedily put an end to such a disgraceful condition of matters.

PAUPER NURSING.

IN a recent charge of manslaughter against a nurse of the Limerick Union for negligence, whereby a fever-patient lost his life, although the charge broke down, some peculiar circumstances in the management of this workhouse were brought to light. It seems that, during the time this fever-patient and thirty others inhabited the ward, the night-nursing was performed by the prisoner, assisted by a pauper girl; the nurse could not read nor write, and yet was supposed to be able to administer the various medicines prescribed by the medical man; there was, also, no clock in the ward or corridor to tell the hours. The judge who tried the case hoped that the trial would have the effect of awakening the guardians to the necessity of making considerable changes in the management of the workhouse, and especially the hospital portion, an opinion in which few will differ from his lordship.

HEALTH OF DUBLIN: QUARTERLY REPORT.

THE births registered in Dublin during the quarter ended 3rd July amounted to 2,194, being equal to an annual ratio of 1 in 36, or 28 in every 1,000; and the deaths to 1,906, affording an annual ratio of 1 in 41, or 24 in every 1,000. There was a considerable decrease as regards the mortality from zymotic diseases, the number being 251, or 72 under

that in the preceding quarter, and 166 less than in the corresponding quarter of last year. Scarlet-fever caused 42 deaths; fever, only 51; small-pox, 2; measles, 6; diphtheria, 11; croup, 20; whooping-cough, 9; erysipelas, 13; influenza, 7; dysentery, 1; and diarrhoea, 26. The deaths of 111 children were ascribed to convulsions; bronchitis caused 253, owing to the inclement weather; pneumonia, 79; phthisis, 261; and other lung affections, 35. Apoplexy proved fatal in 39 instances, paralysis in 41; whilst other brain diseases caused 64 deaths; heart-disease produced 109; liver disease, 26; and kidney affections, 28. The rainfall at Dublin during the quarter measured 5.058 inches.

MEDICAL ADVERTISING.

AT the annual meeting of the South Wales and Monmouthshire Branch, on July 16th, the subject of medical advertisements in non-medical papers was introduced by Mr. Andrew Davies, and discussed. The following resolution was carried unanimously:

"That this Branch desires to express its opinion that the system permitted by many authors of medical works of advertising their works in the non-medical papers is one which, being open to much abuse, ought to be discouraged and condemned."

DEATHS FROM ANÆSTHETICS.

THE following particulars of further deaths from anæsthetics have reached us this week.

A patient died on the 16th instant, under the influence of bichloride of methylene, at the Central London Ophthalmic Hospital, Gray's Inn Road. The case is recorded in the daily papers as having been due to chloroform. The man was a healthy looking sailor, aged 27, who was about to undergo iridectomy. Previously to the operation, he was carefully examined by Dr. Wilkinson, who found his pulse good, and his heart acting quietly and regularly. The man appeared quite calm and free from anxiety respecting the operation. The "machine" spoken of in the daily papers consists of a truncated cone of stiff leather, in the top of which a loose plug of cotton-wool is placed; and to this half a drachm of bichloride was poured, and, after a minute or so, when the symptoms of laryngeal irritation were subsiding, a drachm was added. The patient struggled considerably, though not more than might have been expected from a man of his physique, but at last sank back, breathing quietly. He was now lifted up by the shoulders and placed in position, as during his struggles he had nearly slipped off the table. Dr. Wilkinson now noticed that the man's face was flushed and rather dusky, that his breathing was slow and rather stertorous, and that his pulse was scarcely perceptible. From the commencement of the inhalation to the appearance of these symptoms, between four and five minutes had elapsed. Artificial respiration was at once commenced, and persisted in for about twenty minutes. Galvanism, etc., were also used, but without avail; the respiration became more irregular, the face more livid, and the patient died. The necropsy gave only negative results. The heart appeared healthy; it was neither spasmodically contracted nor unusually relaxed; it contained scarcely any blood. The other organs were also healthy; the blood was, however, everywhere very dark and fluid.—A death occurred under very similar circumstances at the same hospital about fifteen months ago, and the advice of Dr. B. W. Richardson was then obtained, in the hope of preventing a repetition of such an occurrence.

An inquest, reported in the *Times*, was some days ago held at Addenbrooke's Hospital, Cambridge, touching the death of Mrs. Ann Shaw, the wife of an innkeeper of Soham, Cambridgeshire, who was admitted into the hospital last Wednesday, suffering acutely from the effects of an accident to one of her eyes. She was told that nothing would give her relief but the removal of her eye. She asked for chloroform to be used, but died while under its influence. Professor Humphry, who would have performed the operation, stated that the chloroform was administered by Mr. Wherry with great care and caution. Every means was used to restore animation, but in vain. Professor Humphry thought it right that the public should know that persons could not expect to have the benefits of anæsthesia without the risks attending thereon. All agencies for producing unconsciousness were attended with some danger. The jury returned a verdict "That deceased died while under the influence of chloroform, and that the same was carefully and properly administered".

Professor Humphry's remarks are always carefully thought out, and

in this case convey a timely intimation. There is, however, another question of importance in connection with these deaths which we have before raised, and as to which a great deal of evidence has been collected in our columns. Does not the weight of evidence tend to support the belief that ether and nitrous oxide are much less dangerous anaesthetics than chloroform? And if so, is it not desirable that the use of ether should be more generally substituted for that of chloroform? When we agitated this question very freely a couple of years since, ether was hardly at all used as an anaesthetic agent in this country, having been superseded by chloroform. We believe that it is now very largely used, both in hospital and in private practice; operators such as Dr. Keith, and lately Mr. Pollock, and anaesthetisers of such experience as Mr. Clover, have reported most favourably on it. We should be glad that this subject, which we have never ceased now for some years to press upon professional attention, should continue to receive study. It is one of which the importance morally and scientifically is so apparent, that it needs few words to impress it. With a view to hasten its solution, we would suggest that it might with advantage be specially discussed at the approaching meeting in Edinburgh; and that either through the agency of the Scientific Grants Committee, or by the means of a Committee specially appointed by the Surgical Section, steps should be taken for searching investigation and conjoint inquiry into the relative safety of ether and chloroform, and the extent to which ether and nitrous oxide gas can be substituted in the various classes of surgical operations for chloroform.

Since the above was written, Mr. Pollock has addressed the *Times* on the subject. He very broadly indicates a public and judicial censure of practitioners employing chloroform, and suggests that ether is absolutely without risk. The place in which these suggestions are made seems to be ill selected, and the imputations on his professional brethren appear to go further than would be expected from a surgeon of Mr. Pollock's caution and judgment. Mr. Pollock concludes his letter as follows.

Chloroform acts directly on the heart, and with little notice, by stopping its action, destroys life. Ether could be made to kill, just as holding a man's head under the water will do, by producing suffocation; but it is a stimulant to the heart's action. I have no desire, however, to enter into a physiological dissertation on this subject. Suffice it to say that, if the use of one anaesthetic is dangerous and that of the other safe, it behoves us to employ alone that which is safe. Is it not almost criminal to venture on that which is not safe?

I ought perhaps to apologise for intruding a professional question on a non-professional journal; but one must employ a big hammer to drive a large nail through a thick piece of wood. We have some very thick pieces of wood to deal with. The question has been brought forward in the leading medical journals of the day; and yet within one week we read of the loss of two lives, which, I say it with regret, might not have occurred had ether been employed in place of chloroform. I, therefore, seek the aid of your great influence to bring to the mind of the public, as well as the profession generally, the importance of a correct knowledge on this subject.

It is a big subject. It is a question between living or dying. If our judges, coroners, and magistrates, if the members of the bar and the public, were once satisfied of the danger of the one and the safety of the other, I need not pause to inquire what may be the position of that man who is hereafter unfortunate enough to lose a patient under the influence of chloroform.

I have no personal interest in this question. I write purely for the sake of those who may require and those who may be called upon to administer anaesthetics, with the hope that we may see abolished the use of that which is proved to be occasionally fatal for that which is known to be safe and efficacious.

By your inserting this letter, you may do much to carry out this object, and help to put a stop to the records of "Death from misadventure" (see the *Times*) when an anaesthetic has been administered.

He seems here to imply that his professional brethren, including many eminent hospital surgeons, are such "very thick pieces of wood", that nothing short of penal threats in the *Times*, and the fear of magistrates (convinced by Mr. Pollock), can induce them to make up their minds on a scientific question. He cannot really mean this. Such a letter from Mr. Pollock is "like a pistol-shot from a rose-bud"; and

those whom it hurts will hardly know whether they are most pained or astonished. Surely Mr. Pollock must have regretted this letter when he read it next morning in the *Times*.

UNQUALIFIED PRACTITIONERS.

AN inquest, which has excited much interest, was resumed this week at the Court House, Islington, before Dr. Hardwicke, Coroner for Central Middlesex, and his deputy, Mr. Danford Thomas, on the body of Emma Jane Plain, aged nine months, who is alleged to have died from the effects of a medicine administered to her by the owner of a "provident dispensary", a non-qualified medical practitioner. The previous proceedings were reported in the *Times* of Tuesday last. Mr. Brown and Mr. Selater attended on the part of the British Medical Defence Association, and Mr. Merriman, solicitor, represented Mr. Hugh Ker of the Copenhagen Street "Provident Dispensary". The previous evidence went to show that the deceased, usually a remarkably healthy child, was taken ill a fortnight ago. The next morning, the mother took the deceased to the dispensary, and Mr. Ker prescribed medicine. It took three doses, but expired on the following morning. When the child was dying, the father went to the dispensary and asked Mr. Ker to come and see it, but he referred him to Mr. Kane of Offord Road. The latter said the medicine was "queer-looking stuff", and he took it away with him. It was stated that Mr. Ker had previously attended patients in Mr. Plain's house for fever and a woman in confinement, and was supposed to be a qualified medical man. Mr. Derry Jones, who had been directed to make a *post mortem* examination, expressed his conviction that the cause of death was diarrhoea, but in a form amenable to proper treatment. He had examined the medicine, and found it to be "liquor ammonia acetatis", with excess of ammonia. That was not a proper medicine for such a case. Inflammation might have been caused by the excess of ammonia. It would, no doubt, have acted as an irritant; but he could not positively say that death had been accelerated thereby. Mr. Thomas James Kane, of Offord Road, Barnsbury, said he saw the deceased about half-past 10 on the morning of the Wednesday, and it had been dead about an hour and a half. He understood that he had been called at the request of Mr. Ker, of the Copenhagen Street Dispensary. He declined to give a certificate as to the death, as he knew nothing of the case. He had no connection with Mr. Ker or his dispensary, though on one occasion he indiscreetly gave him four or five of his cards. Mr. Ker never acted as his assistant, nor did he ever see any patients at the request of Mr. Ker, except in this case. Mr. Derry Jones, recalled, adhered to his previous statement that the medicine was an improper medicine in the case. To combat this, Mr. Merriman read extracts from Tanner's *Practice of Medicine* and a work by Sir Thomas Watson. Mr. Jones admitted that they were good authorities, but pointed out that the admixtures they referred to were not applicable to children of such tender years, and said it would have been more to the purpose had his interrogator quoted from more modern works, with respect to children specially in such cases. Mr. Hugh Ker said he lived at 110, Copenhagen Street, and kept the provident dispensary. He had no medical qualification. He attended lectures at the Manchester Royal Infirmary, but did not go through the full course. In 1859, he had studied under a properly qualified medical man at Mansfield. In answer to questions put by the coroner and the jury, as to whether he had any qualified assistant at the Copenhagen Street Dispensary, Mr. Ker said that, acting upon the advice of his solicitor, he declined to answer them, as he considered them not relevant to the inquiry. He saw the deceased at the dispensary, and it was suffering from exhaustion. He prescribed for it, and heard that it had died on the following morning. He was not asked to give a certificate, and he was not in the habit of giving certificates. The coroner asked what he did if a person died under his care. Mr. Ker refused to answer the question. In reply to the jury, he admitted he had attended a fever case and a woman in confinement at the same house where the deceased died, but he denied that he represented himself as a qualified medical man. He had some cards of Dr. Kane's, but there was no understanding between them. Over his shop in Copenhagen Street were the words "Provident Dispensary". On a side window was written "Surgical Operations". He attended simple cases; but, when they were serious, he got a qualified man to attend. He admitted that the medicine produced was the same he had prescribed for the deceased. It was a lime mixture, with an excess of ammonia given as a stimulant. The jury returned the following verdict:—"That Emma Jane Plain died from the mortal effects of diarrhoea, and that such death was from natural causes; but the jury desire to draw attention to the fact,

that the deceased received medical treatment at a dispensary in Copenhagen Street, where medicines were administered by an irresponsible unqualified medical practitioner. The jury further wish to add that a dispensary under unqualified medical men, and under the management of irresponsible persons, must be fraught with danger to the community."

IN MEMORIAM.—J. F. CLARKE.

OUR obituary columns recently recorded the death of a medical veteran who was for thirty years known as "Clarke of the *Lancet*", but ended his days as "Clarke of the *Medical Times*". Mr. J. F. Clarke of Gerrard Street was one of the most familiar figures in metropolitan medical gatherings for the last forty years, and there are few of his own generation who will not be ready to do justice to his rare combination of good qualities and pleasant endowments. He had a sprightly wit, and a kindly generous nature. Of a poetic and vivacious turn, his writing was never dull; and in his best days, and under his best inspirations, he often rose to something like eloquence. His grand quality was fidelity, and the star of his faith was the late Mr. Wakley. He had worked for him and fought for him, and shared his hopes, troubles, defeats, and victories. He loved to tell, and often renewed the pleasure, of the early days when nearly everything was wanting to success, when the printers had no copy, when funds were scarce, and when professional wrath was unbounded. But Clarke never wavered in his allegiance; and, during the lifetime of his chief, his purse, his labour, his time, and his whole heart, were always at the command of the man whom he served and the journal with which he identified the work of his life. When times changed and his chief had gone to rest, and he found himself stranded and laid up, he did not acquiesce in the decree, but determined to die, as he had lived, a journalist, though under other colours. The pages of the *Medical Times and Gazette* have during the last few years often owed much to his bright touch. His reminiscences of professional life published there are spirited, lively, and truthful; and they abound in discriminating judgments. He had the rare gift of burying enmities with a kindly jest; his heart was too warm not to respond to advances, to forgive injuries, and to overlook slights. There are many eminent men in the profession who owe him much; there are few who will not remember him as a man who played a manly part through many difficult scenes, who was ever ready to assist any good cause, and whose pen has for forty years helped on the changes which separate the medical institutions of this day from those of his early life as by a century of progress. His later years were clouded by a sense of ingratitude in quarters where he had least expected it; but this did not embitter him, although he often complained of it; and to the last he retained the generous, loving, faithful nature which all who remember him will always identify with the name of James Fernandez Clarke.

MILITARY AND NAVAL MEDICAL SERVICES.

MOVEMENTS OF ARMY MEDICAL OFFICERS.—Surgeon-General J. C. Brown, C.B., Indian Medical Service, Honorary Surgeon to Her Majesty, is allowed leave of absence for six months, from such date as he may avail himself of it, to visit the hills on medical certificate.—Her Majesty has been pleased to appoint Surgeon H. A. C. Gray, M.D., to be a Surgeon in Her Majesty's Indian military forces at the Presidency of Bengal.—The following arrangements have been made in India. Surgeon-Major C. Smith, M.D., to be garrison-surgeon at Bangalore.—Surgeon (local rank Surgeon-Major) F. Prout, from medical charge detachment 43rd Foot, Calicut, to general duty, Madras, when relieved by Surgeon Stewart.—Surgeon A. Brebner, M.D., from A Battery 9th Brigade Royal Artillery, to B Battery C Brigade Royal Horse Artillery, and medical charge of head-quarters 20th Brigade Royal Artillery, *vice* Illingworth.—Surgeon J. Barker, from doing duty 76th Regiment, to A Battery 9th Brigade Royal Artillery, *vice* Brebner.—Surgeon-Major J. A. Illingworth is transferred to the Bengal command. The following orders by the Madras Government have been confirmed. Surgeon H. N. L. James, M.D., from medical charge detachment 89th Regiment, Port Blair, to general duty, Burmah Circle.—Surgeon W. Finlay, from general duty, Burmah Circle, to medical charge detachment 89th Regiment, Port Blair.—Surgeon-Major D. M. Davidson, M.D. (Madras Army) has obtained furlough to England, to appear before a medical board.—Surgeon W. Price, in medical charge 10th N.I., Bombay, has obtained leave of absence, preparatory to furlough to Europe, for thirty days.

ASSOCIATION INTELLIGENCE.

PROCEEDINGS OF THE COMMITTEE OF COUNCIL.

AT a Meeting of the Committee of Council, held at the Queen's Hotel, Birmingham, July 13th, 1875. Present: Dr. Sibson, F.R.S., in the chair; Dr. Falconer (Treasurer); Mr. Alfred Baker, Sir J. Cordy Burrows, Mr. Callender, F.R.S., Dr. Alfred Carpenter, Dr. Charles Chadwick, Dr. R. Farquharson, Dr. B. Foster, Mr. R. S. Fowler, Dr. E. L. Fox, Mr. J. R. Humphreys, Mr. W. D. Husband, Mr. T. V. Jackson, Dr. T. Eyton Jones, Mr. F. E. Manby, Mr. R. H. B. Nicholson, Dr. W. Procter, Dr. J. Sawyer, Dr. Shettle, Mr. T. Heckstall Smith, Dr. A. B. Steele, Dr. T. Underhill, Dr. W. F. Wade, Dr. E. Waters (Chester), Mr. C. G. Wheelhouse, Dr. E. Wilkinson.

The minutes of the last meeting were taken as read.

Read letters of apology for non-attendance from Mr. George Southam and Dr. F. Bateman.

Resolved—That the members of the Committee of Council of the British Medical Association desire to express their deep regret at the serious illness which has befallen Mr. Southam, and their warm sympathy with him on his present disability. They trust that, with improved health, Mr. Southam may again co-operate with them in conducting the business of a Society in which he has displayed deep interest; and they congratulate him on the progress which has been made during his tenure of office as President of Council in the prosperity, numerical and financial, of the Association, and the recognised legal status acquired by its Act of Incorporation.

Resolved—That Dr. Sibson be requested, in the absence of the President of the Council, to take the chair.

Resolved—That, with the exception of one, the whole of the candidates nominated for election be, and they are hereby, elected members of the British Medical Association.

Read resolution from the Metropolitan Counties Branch, of which the following is a copy:

"That the Committee of Council of the British Medical Association be requested to appoint a special Committee to consider the advisability of legislative restrictions for habitual drunkards."

Resolved—That Dr. Stewart, Mr. W. C. Garman, Dr. Farquharson, Dr. Bodington, Mr. Nicholson, Dr. Carpenter, and Dr. Foster, be a Subcommittee, in accordance with the request of the resolution.

Read letter from Dr. Wolfe, Glasgow, upon the formation of a Scotch Medical Association.

Resolved—That where there is no Branch of the Association already formed in Scotland, the Committee of Council will, with great pleasure, assist in the formation of a Branch, and that Dr. Wolfe be informed that any twenty or more members can unite for the purpose of forming a Branch of the British Medical Association.

Read letter from Dr. Stewart, and enclosed abstract, of which the following is a copy:

"75, Grosvenor Street, W., July 12th, 1875.

"Mr. President and Gentlemen,—My connection with the Committee of Council of the British Medical Association being now at an end, I have requested Dr. Sibson, as my old and valued friend and as treasurer of the fund with which my name is connected, to be the bearer of this communication.

"A large sum of money having been contributed, chiefly by members of the British Medical Association, with the view of manifesting their friendly feelings towards myself, they have most kindly permitted me to appropriate £400 of the amount thus realised to the formation of a fund for the recognition and encouragement of important researches into the origin, spread, and prevention of epidemic disease, and have adopted certain rules, in accordance with which it shall be regulated.

"And as we know of no other body to whom we could with more perfect confidence entrust the management of such a fund, the Committee which has called it into existence and myself unite in earnestly requesting the Committee of Council to accept the responsibility of its administration.

"I have the honour to be, Mr. President and Gentlemen,

"Yours very faithfully and gratefully,

"A. P. STEWART.

"To the President and Committee of Council of the British Medical Association."

[Extract from BRITISH MEDICAL JOURNAL, April 3rd, page 456, meeting of Committee *re* "Stewart Grant".]

"Dr. Stewart consents to allow a small part of the amount subscribed to be expended on a personal gift; but he desires that the bulk of the fund be applied in establishing a grant which shall be in the gift of the Committee of Council of the British Medical Association. It was

agreed that this fund should be called the 'Stewart Grant'; and the following scheme for its application, suggested by Dr. Stewart, was submitted to the meeting and approved.

"1. The object of the Stewart Grant shall be to encourage researches into the origin, spread, and prevention of epidemic disease, or such cognate subjects as the Committee of Council of the British Medical Association may from time to time, after due deliberation, determine.

"2. For this end, the funds shall be invested in the names of three trustees, to be appointed by the Committee of Council of the Association.

"3. The accumulated interest shall be given biennially, or less frequently: Firstly, and as a general rule, in recognition of important work already done by such person or persons as the Committee of Council of the British Medical Association, or a Committee appointed by them for such purpose, shall deem most deserving, with a view to the continuance by such person or persons of like researches in the same direction; or, secondly, as an encouragement to such person or persons as the Committee of Council or a Committee by them appointed shall consider exceptionally qualified to undertake the investigation of such question or questions as shall appear likely to lead to further important results."

Resolved—That the thanks of the Committee of Council be given to Dr. Stewart for his disinterested disposal of the large proportion of the sum subscribed for his testimonial and trust, and that his offer be hereby accepted. That Dr. Stewart be further informed that a Committee will be appointed to devise a scheme for carrying out his intentions, which will report to the next meeting of the Committee of Council at Edinburgh, when the Committee of Council will again communicate with Dr. Stewart.

Dr. Sibson, on behalf of Dr. Stewart, then handed a cheque for £400 to the Treasurer of the Association.

Resolved—That Dr. Sibson, Dr. Chadwick, Dr. Wade, Mr. Heckstall Smith, and Dr. Wilkinson, be requested to act as the Subcommittee to consider and report in accordance with the foregoing resolution.

Read Minutes of the Journal and Finance Committee of the 13th July.

Resolved—That the Minutes of the Journal and Finance Committee of this day's date be approved, and the recommendations carried into effect.

Read resolution of the Council of the Metropolitan Counties Branch:

"That in the opinion of this Council it is advisable—

"1. That no person resident in the United Kingdom should be admitted as a member of the British Medical Association unless either registered under the Medical Act, or possessing a qualification entitling to registration.

"2. That the names of persons proposed for admission to the Association through the Committee of Council should be submitted for examination to the Council of the district in which they reside, previously to their election being decided on."

Resolved—That the Committee of Council are unable to see the necessity for alteration of the present mode of election.

The Committee then proceeded to consider the By-Laws proposed.

Resolved—That the by-laws, as amended, be approved, and placed before the Annual Meeting in August next for adoption, in accordance with the instructions of the last Annual Meeting held at Norwich, August 1874.

Report of attendances of the twenty elected members of the Committee of Council was then read, of which the following is a copy, viz.:

List of Attendances for the year 1874-5 of the 20 members elected by the Council.

MEETINGS 6.

Foster, Dr. B., Birmingham ...	5	Wade, Dr. W. F., Birmingham	3
Wilkinson, Dr. Eason, Manchester.....	5	Burrows, Sir J. C., Brighton ...	2
Callender, G. W., Esq., F.R.S.	4	Quain, Dr. R., F.R.S.....	2
Carpenter, Dr. A., Croydon ...	4	Underhill, Dr. T., West Brom-	2
Fox, Dr. E. L., Bristol	4	wich	2
Manby, F. E., Esq., Wolver-	4	Bastian, Dr. H. C., F.R.S. ...	1
hampton	4	Bateman, Dr. F., Norwich.....	1
Smith, T. H., Esq., St. Mary	4	Hill, Berkeley, Esq.....	1
Cray	4	Smart, Insp.-Gen., M.D., Naval	1
Wheelhouse, C. G., Esq., Leeds	4	Hospital, Haslar	1
Harrison, R., Esq., Liverpool..	3	Waters, Dr., Liverpool	1
Humphreys, J. R., Esq., Shrews-	3	Humble, Dr. T., Newcastle-on-	0
bury.....	3	Tyne	0

The name of Dr. Humble, of Newcastle, was taken off in accordance with law; and the attendances of Dr. Waters (Liverpool), Dr. Bastian, Dr. Bateman, Mr. Berkeley Hill, and Inspector-General Smart, being

equal, lots were taken, and the four last-mentioned names were also taken off.

Seven gentlemen having been nominated to succeed the five taken off in accordance with the law, a ballot was taken; and the following having the largest number of votes, it was

Resolved—That they be, and are hereby, nominated to the vacancies, to act on the Committee of Council for the ensuing year, viz.: Dr. Clifford Allbutt, Leeds; Mr. Timothy Holmes, London; Mr. Baker, Derby; Mr. Hodgson, Brighton; Dr. Morris, Spalding.

Resolved—That medical students be admitted to the addresses and the sectional meetings of the Association at its Annual Meeting in Edinburgh, on such regulations as may be adopted by the Reception Committee.

Also that an additional Secretary be appointed to the Physiological Section; and that Dr. Stirling, Edinburgh, be requested to act.

Also that any of the graduates in medicine of the University of Edinburgh who may receive their degrees on Monday, the 1st of August, may, if properly nominated, be admitted members of the Association by the Committee of Council at its meeting on Tuesday, the 2nd of August, without the usual previous list being sent round.

BRITISH MEDICAL ASSOCIATION: FORTY-THIRD ANNUAL MEETING.

THE Forty-third Annual Meeting of the British Medical Association will be held at Edinburgh, on Tuesday, Wednesday, Thursday, and Friday, August 3rd, 4th, 5th, and 6th, 1875.

President.—E. COPEMAN, M.D., Senior Physician to the Norfolk and Norwich Hospital.

President-elect.—Sir ROBERT CHRISTISON, Bart., M.D., D.C.L., LL.D., F.R.S.Ed.

An Address in Medicine will be given by JAMES WARBURTON BEEBE, M.D., F.R.C.P.Ed.

An Address in Surgery will be given by JAMES SPENCE, F.R.C.S.Ed., F.R.S.E., Professor of Surgery in the University of Edinburgh.

An Address in Physiology will be given by WILLIAM RUTHERFORD, M.D., F.R.S.E., Professor of the Institutes of Medicine in the University of Edinburgh.

The business of the Association will be transacted in Six Sections, viz.:

SECTION A. MEDICINE.—*President*: Dr. Quain, F.R.S., London. *Vice-Presidents*: Professor W. T. Gairdner, Glasgow; Dr. Grainger Stewart, Edinburgh. *Secretaries*: Dr. Claud Muirhead, 7, Heriot Row, Edinburgh; Dr. Stephenson, 33, Buccleuch Street, Edinburgh.

SECTION B. SURGERY.—*President*: Professor Lister, F.R.S. Edinburgh. *Vice-Presidents*: Professor Pirrie, Aberdeen; Professor Macleod, Glasgow. *Secretaries*: Thomas Annandale, Esq., Charlotte Square, Edinburgh; Dr. John Duncan, 8, Ainslie Place, Edinburgh.

SECTION C. OBSTETRIC MEDICINE.—*President*: Dr. Matthews Duncan. *Vice-Presidents*: Dr. Keiller; Professor Simpson. *Secretaries*: Dr. Peel Ritchie, 16, Hill Street, Edinburgh; C. J. Cullingworth, Esq., 260, Oxford Street, Manchester.

SECTION D. PUBLIC MEDICINE.—*President*: Right Hon. Lyon Playfair, M.P., C.B., F.R.S. *Vice-Presidents*: Inspector-General Smart, M.D., C.B.; Dr. Arthur Mitchell. *Secretaries*: Dr. Andrew Smart, 24, Melville Street, Edinburgh; Dr. Fraser, Knutsford.

SECTION E. PSYCHOLOGY.—*President*: Dr. Lowe, F.R.S., Edinburgh; *Vice-Presidents*: Dr. Sibbald; Dr. Clouston. *Secretaries*: Dr. Brown, Royal Asylum, Edinburgh; Dr. Saundby, Saughton Hall, Edinburgh.

SECTION F. PHYSIOLOGY.—*President*: Professor Burdon Sanderson, F.R.S., London. *Vice-Presidents*: Dr. McKendrick; Professor J. Dewar. *Secretaries*: Dr. Lauder Brunton, F.R.S., 23, Somerset Street, Portman Square, London; Dr. Caton, 18, Abercrombie Square, Liverpool; and Dr. Wm. Stirling, Physiological Laboratory, University of Edinburgh.

Honorary Local Secretaries.

Dr. John Batty Tuke, 20, Charlotte Square, Edinburgh.
John Chiene, Esq., 21, Ainslie Place, Edinburgh.
Dr. J. G. McKendrick, 2, Chester Street, Edinburgh.
Dr. J. Bishop, 28, Alva Street, Edinburgh.

Tuesday, August 3rd.

11 A.M.—SERVICE IN ST. GILES'S CHURCH. Sermon by Rev. Dr. Alexander.

1 P.M.—MEETING OF COMMITTEE OF COUNCIL.

3 P.M.—MEETING OF THE COUNCIL, 1874-75.

3.30 P.M.—GENERAL MEETING.—President's Address; Annual Report of Council; and other business.

9 P.M.—PRESIDENT'S RECEPTION IN ASSEMBLY ROOMS, MUSIC HALL.

Wednesday, August 4th.

9.30 A.M.—MEETING OF COUNCIL, 1875-76.

11.30 A.M.—SECOND GENERAL MEETING.

11.30 A.M.—ADDRESS IN MEDICINE.

2 P.M.—SECTIONAL MEETINGS.

9 P.M.—CONVERSAZIONE GIVEN BY THE ROYAL COLLEGE OF PHYSICIANS IN THE INDUSTRIAL MUSEUM.

Thursday, August 5th.

9 A.M.—MEETING OF THE COMMITTEE OF COUNCIL.

10 A.M.—THIRD GENERAL MEETING.—Reports of Committees.

11 A.M.—ADDRESS IN SURGERY.

2 P.M.—SECTIONAL MEETINGS.

6.30 P.M.—PUBLIC DINNER IN MUSIC HALL.

Friday, August 6th.

10 A.M.—ADDRESS IN PHYSIOLOGY.

11 A.M.—SECTIONAL MEETINGS.

1.30 P.M.—CONCLUDING GENERAL MEETING.

4 P.M.—PARTY IN THE ROYAL BOTANIC GARDENS, GIVEN BY THE UNIVERSITY OF EDINBURGH.

Saturday, August 7th.

EXCURSIONS.—Bass Rock, Melrose, Trossachs, Roslin, Dalmeny Park, and Hopetown House.

ARRANGEMENTS FOR ADDRESSES, SECTIONS, SOIRÉES, ETC.

President's Address—Tuesday, 3.30 P.M., Queen Street Hall, 6, Queen Street.

Addresses in Medicine, Surgery, and Physiology—Lecture Room in the Industrial Museum.

President's Reception—Assembly Rooms and Music Hall, George Street.

The *conversazione*, given by the Royal College of Physicians, will be held in the Industrial Museum.

University Garden Party—Botanical Gardens, Inverleith Row.

Rooms for Sections:

A. Medicine—Mathematical Class Room.

B. Surgery—Anatomy Class Room.

C. Obstetric Medicine—Materia Medica Class Room.

D. Public Medicine—Chemistry Class Room.

E. Psychology—Hebrew Class Room.

F. Physiology—Physiology Class Room.

Meetings of Council: Latin Class Room. Reception Room; Reading and Writing Room; Lower Library Hall. Editor's and General Secretary's Room; Court Room. Local Secretaries, Treasurer, and Editor of *Daily Journal*; Professors' Reading Room. Annual Museum; Practical Chemistry Class Room.

In the Vestibule of the Library (all in University Buildings)—Post Office and Telegraph Office; Registration Office; Ticket Office; Cab Office; Inquiry Office.

Refreshment Room.—By permission of T. C. Archer, Esq., Director of the Industrial Museum, the Buffet and Refreshment Rooms attached to that institution will be open to members of the Association during the meeting. They can be reached either by the main entrance of the Industrial Museum, or (which will be more convenient for members) by a lobby communicating with the University Quadrangle. A moderate tariff has been arranged for Luncheons, etc. Lavatory, etc., adjoining Refreshment Rooms.

All places will be carefully placarded.

Papers.—The following papers have been promised in addition to those enumerated in last week's JOURNAL.

Anderson, T. McCall, M.D. On the Treatment of Aneurism of the Arch of the Aorta by means of Galvano-puncture.

Black, D. Campbell, M.D. On certain Aspects of Medical Advertising.

Bodington, G. F., M.D. On the Control and Restraint of Habitual Drinkers.

Braidwood, P. M., M.D. Severe Cerebro-spinal Symptoms produced by a fall at Foot-ball.

Browne, Lennox, Esq. On the Treatment of some Diseases affecting simultaneously the Voice, Speech, and Hearing.

Cooper, James, Esq. On some points relating to Cottage Hospitals.

Deas, P. Maury, M.D. Notes on an unusual Case of Epilepsy.

Drysdale, C. R., M.D. Tertiary Sore-throat.

Freer, Alfred, Esq. On the Evils of Medical Men undertaking the Duties of Nurses.

Goldie, George, L.R.C.P.Ed. On Ventilation; with Model and Apparatus.

Lee, R. J., M.D. Remarks on Hooping Cough, and its Treatment by the Inhalation of Carbolic Acid Vapour.

Little, W. J., M.D. 1. Latest Experiences on the Treatment of Congenital Club-foot of Infants. 2. The Varieties of Wry-neck, with some Observations on their Treatment.

Martyn, Samuel, M.D. Hospital Registration.

Nicolson, David, M.D. The Causes of Invaliding among Convicts in the Government Prisons of England.

Pemberton, Oliver, Esq. On Ligature of the Common Femoral Artery, and especially on Ligature by an Antiseptic Material.

Russell, Henry, M.D. The Expense of Ventilation and Warming as Sanitary Requirements.

Smith, Protheroe, M.D. Ovarian Dropsy; some points in its Pathology and Treatment by Ovariectomy.

Tait, Lawson, Esq. On the Existence of Capillaries in the Umbilical Cord.

Thomas, Llewelyn, M.D. The Causes and Results of Otorrhœa.

Torrance, Robert, Esq. On the Appearance of the Tongue in Health and in Disease.

Wanklyn, J. A., Esq. On the Mineral Constituents of Drinking Water.

Woakes, Edward, M.D. On the Existence of Correlated Vasomotor Nerve-Tracts.

Gentlemen desirous of reading papers, cases, or other communications, are requested to forward the titles to the General Secretary, or to one of the Secretaries of the Section in which the paper is to be read. All papers should be forwarded to one of the above named officers at as early a date as possible.

No paper must exceed twenty minutes in reading, and no subsequent speech must exceed ten minutes. Speeches at the General Meeting must not exceed ten minutes each.

ANNUAL MUSEUM.

The Eighth Annual Museum of the British Medical Association will be held in the Practical Chemistry Class-room in the University on the 3rd, 4th, 5th, and 6th of August, 1875, and will be open from 10 A.M. to 6 P.M. The Committee appointed to take charge of the arrangements for this museum will be glad to receive for exhibition:

1. Latest Inventions in Medical, Surgical, and Obstetrical Instruments and appliances of all kinds.

2. New Drugs and their Preparations, and New Articles of Diet for Invalids.

3. General Pathological Specimens, with photographs, models, casts, drawings, etc., illustrating Disease.

4. Specimens and Preparations in connection with Injuries and Diseases of Bones and Joints. [It is desired to make this a special feature in the Exhibition.]

5. New Physiological Apparatus.

6. Microscopes and Microscopic Specimens, Pathological and General; New Chemicals and other Appliances used in Histological Research.

The following is a list of the Museum Committee. All communications to be addressed to the Hon. Secretaries:—Professor Turner, Dr. Angus Macdonald, Dr. Argyll Robertson, Dr. John Wyllie, Dr. W. Gordon, Mr. Thomas Annandale, and Mr. A. B. Stirling. Dr. Charles E. Underhill, 8, Coates Crescent, and Dr. John Playfair, 25, Rutland Street, *Hon. Secretaries*.

NOTICE TO EXHIBITORS.—Application for space should be made as soon as possible, and the amount required mentioned. A written or printed description of all objects intended for exhibition must be forwarded for insertion in the Catalogue; and the Committee earnestly request all intending Exhibitors to bear in mind that it is impossible for their descriptions to be inserted unless sent in early—viz., not later than July 17th. All objects intended for exhibition must be delivered on or before July 27th. They must be addressed "Curator of Museum of British Medical Association, the University, Edinburgh."

N.B.—The Name of the Exhibitor should be written on the outside of each parcel, and a card bearing his name and address should be enclosed, to facilitate the return of the articles.

FRANCIS FOWKE, *General Secretary*.

36, Great Queen Street, June 26th, 1875.

METROPOLITAN COUNTIES BRANCH: ANNUAL MEETING.

THE twenty-third annual meeting of the Metropolitan Counties Branch was held at the Alexandra Palace, on Monday, June 28th; T. B. CURLING, Esq., F.R.S., and afterwards ROBERT BARNES, M.D., in the Chair.

New Members.—Mr. Loraine Weaver, of Clapham Road, was elected a member of the Association and Branch. Mr. J. W. Trotter of the Coldstream Guards; Mr. S. N. Morton, Royal London Ophthalmic Hospital; and Dr. W. Rhys Williams, Bethlem Hospital, were elected members of the Branch.

Report of Council.—Dr. HENRY, one of the Honorary Secretaries, read the following report.

The Council of the Metropolitan Counties Branch have much pleasure in presenting the twenty-third annual report. At the last annual meeting, the number of members on the list was 605. Since that time, 20 new members have joined the Branch, 16 have retired, and 9 have died; leaving the total number at the present time 600.

The members of the Branch who have died since the last annual meeting are; Dr. Francis E. Anstie, Dr. Thomas Ballard, Mr. Joseph Blackstone, Mr. John D. Hill, Mr. Angus Kennedy, Dr. Edwin Lankester, Sir James Ranald Martin, Mr. S. W. Moore, and Mr. Edwin Sercombe.

Your Council feel assured that the Branch fully shares in the feelings of regret which have been expressed at the premature death of Dr. Anstie, at a time when by his high attainments in medicine, his integrity of character, and his persevering energy, he had earned for himself a foremost place not only among the cultivators of medicine, but among those who regard the preservation of the health of the people as the highest function of the medical profession.

Dr. Edwin Lankester, late coroner for Central Middlesex, was, in the early years of this Branch, one of its most active members, and in 1857 was elected President for the year.

Sir James Ranald Martin, though for many years a member of the Branch, never took an active part in its proceedings; but he will be remembered as having honourably spent a long life in the furtherance of the interests of his profession and of the public health.

Dr. Thomas Ballard and Mr. Edwin Sercombe were well known and genial frequenters of our annual gatherings.

Mr. Samuel W. Moore has died at an early age, when he was giving promise of being a valuable contributor to the promotion of the important science of physiological chemistry. Your Council hoped in the course of the session to be able to announce a paper to be read by him at a general meeting of the Branch on the Action of Alcohol. This, however, they have been unable to do.

Three ordinary meetings of the Branch have been held. At one of these, held on February 19th, a paper on a Case of Cerebro-Spinal Paresis accompanied by intense neuralgia, was contributed by Dr. Lockhart Clarke; and at another, held on June 24th, Dr. Barnes read a paper on Some Physiologico-Pathological Phenomena of the Circulation in Pregnant Women.

At a meeting held on April 16th, a discussion on the subject of Legislation for Habitual Drunkards was opened by Mr. Carsten Holt-house, to whom the Branch owes its best thanks for his valuable comments on this important topic. The Branch, at the meeting referred to, passed the following resolutions:

"That the Committee of Council of the British Medical Association be requested to appoint a Special Committee to consider the advisability of legislative restrictions for habitual drunkards."

"That a petition in favour of legislation on this subject be signed by the President on behalf of the Branch."

The subject has also occupied a share of the attention of your Council; who, at a meeting held on May 28th, resolved—

"That a petition to Parliament on the subject of legislation for habitual drunkards be drawn up and circulated for signature among the members of the Branch; also that application be made to the Home Secretary to receive a deputation requesting the Government to consider the subject with a view to the introduction of a measure next session; and that the other Branches be invited to co-operate in this application."

Your Council desire to impress on their successors and on the Branch the importance of giving their most careful consideration to the means of ensuring legislative measures for the protection and curative treatment of the unhappy victims of indulgence in alcoholic liquors; an object the promotion of which is receiving the earnest co-operation of many of the leading members of the profession. The subject is one which is attended with some difficulty, and is not yet comprehended in all its bearings by the legislature or by the public.

Considering the great numerical strength of this Branch, and the number of eminent medical men comprised in it who can speak with authority in the matter, it is not unreasonable to suppose that this Branch may render valuable assistance in facilitating legislation. Your Council would recommend the appointment of a special Committee of members of the Branch, who should be entrusted with the duty of drawing up a report to be submitted to a general meeting of the Branch early next winter, and which should, among other things, deal with and answer the objections which may be urged against the interference of the legislature in the matter under consideration.

The subject of the Contagious Diseases Acts has been brought under the consideration of your Council; and a memorial to the Home Secretary in favour of their continuance has been issued to the members of the Branch, and, having received 305 signatures, has been forwarded to Mr. Cross. The Council are glad to be able to record that the action of Parliament regarding the Acts in question has been in accordance with the opinions of the majority of members of the Branch.

Your Council have had very great pleasure in observing the proof which has been recently afforded of the high esteem in which your late Secretary, Dr. A. P. Stewart, is held by his brethren not only in this Branch but also in the parent Association. It was the pleasing duty of your President, on the 14th instant, to present to Dr. Stewart the testimonial which had been raised, and which amounted in value to upwards of £500. With his characteristic generosity and self denial, Dr. Stewart would allow only a portion of this to be expended in the purchase of a personal testimonial in the form of a handsome dinner and breakfast service; the remainder, amounting to about £400, being placed in the hands of the Committee of Council of the Association for the foundation of a grant, to be named the "Stewart Grant", for the promotion of researches in epidemic diseases—a subject with which his name is intimately connected. The presentation took place, by the kindness of the President, at his private residence, and was attended by a large number of members of the Branch and by several of the leading members of the Association in the provinces. Your Council have cheerfully voted the sum of £20 from the funds of the Branch towards the testimonial; measuring the amount of the contribution much more by the limited resources at their disposal, than by the high sense which they entertain of Dr. Stewart's merits.

Mr. WILLIAM MARTIN proposed, Mr. JAMES HOGG seconded, and it was resolved—

"That the report of Council now read be received, adopted, and entered on the minutes."

Treasurer's Report.—Mr. DUNN, Treasurer, read the financial report. It showed that the receipts for the year amounted to £118:6:1 and the payments to £103:6:0, leaving a balance of £15:0:1. It was proposed by Mr. S. S. ALFORD, seconded by Dr. SAUNDERS, C.B., and resolved—"That the Treasurer's report be received, adopted, and entered on the minutes."

Election of Officers and Council.—A ballot having been taken, the following officers and Council for 1875-6 were found to be elected, *President*: Robert Barnes, M.D. *President-elect*: Jonathan Hutchinson, Esq. *Vice-Presidents*: Richard Quain, M.D., F.R.S.; Thomas B. Curling, Esq., F.R.S. *Treasurer*: Robert Dunn, Esq. *Secretaries*: Alex. Henry, M.D.; Robert Farquharson, M.D. *Ordinary Members of Council*: J. Armstrong, M.D. (Dartford); J. H. Aveling, M.D.; G. F. Blandford, M.D.; A. T. Brett, M.D. (Watford); T. Bridgwater, M.B. (Harrow); J. M. Burton, Esq. (Lee); J. Langdon H. Down, M.D.; J. M. Fothergill, M.D.; Henry Gervis, M.D.; G. A. Ibbetson, Esq.; W. Mac Cormac, Esq.; C. F. Maunder, Esq.; J. H. Paul, M.D.; R. Douglas Powell, M.D.; C. H. Rogers-Harrison, Esq.; C. Shrimpton, M.D.; A. P. Stewart, M.D.; E. H. Vinen, M.D.

Representatives in the General Council.—The following gentlemen were declared elected by a majority of votes as representatives of the Branch in the General Council of the parent Association: William Adams, Esq. (Henrietta Street); J. H. Aveling, M.D.; Robert Barnes, M.D.; H. C. Bastian, M.D., F.R.S.; G. W. Callender, Esq., F.R.S.; W. Fairlie Clarke, Esq.; J. T. Clover, Esq.; T. B. Curling, Esq., F.R.S.; J. Langdon Down, M.D.; Robert Dunn, Esq.; Arthur E. Durham, Esq.; J. M. Fothergill, M.D.; Wilson Fox, M.D., F.R.S.; S. O. Habershon, M.D.; George Harley, M.D., F.R.S.; Ernest Hart, Esq.; Alexander Henry, M.D.; Berkeley Hill, Esq.; T. Holmes, Esq.; Jonathan Hutchinson, Esq.; George Johnson, M.D., F.R.S.; Henry Lee, Esq.; C. F. J. Lord, Esq. (Hampstead); John Marshall, Esq., F.R.S.; H. Maudsley, M.D.; C. F. Maunder, Esq.; A. Meadows, M.D.; W. S. Playfair, M.D.; R. Quain, M.D., F.R.S.; Geo. Webster, M.D. (Dulwich).

Votes of Thanks.—It was proposed by Dr. FELCE, seconded by Mr. ROGERS HARRISON, and carried unanimously—

"That the cordial thanks of the meeting be given to the retiring President, T. B. Curling, Esq., F.R.S., for his able and courteous conduct in the chair and for the interest which he has shown in the welfare of the Branch."

It was proposed by Mr. ROGERS-HARRISON, seconded by Mr. MARTIN, and resolved unanimously—

"That the cordial thanks of this Branch be given to Robert Dunn, Esq., for his valuable services as Treasurer."

Habitual Drunkards.—It was resolved that the following gentlemen be appointed a Committee on the subject of legislation for habitual drunkards, with power to add to their number: The President and Secretaries; Mr. S. S. Alford; Dr. G. F. Blandford; Mr. C. Holt-house; Dr. H. Monro; Dr. A. P. Stewart; Dr. E. H. Vinen.

President's Address.—Dr. BARNES, on taking the chair, delivered an address, which was published at p. 33 of the JOURNAL for July 10th. Dr. AVELING proposed, Dr. ALTHAUS seconded, and it was resolved—

"That the best thanks of the Branch to the President for his able address."

Dinner.—The members, to the number of about forty-five, afterwards dined together; Dr. BARNES in the chair.

MEDICO-PARLIAMENTARY.

HOUSE OF COMMONS.—Thursday, July 15th.

Medical Officers of the Army.—Dr. LUSH, in proceeding to call the attention to the position of the medical officers of the army with respect to honours, pay, and relative rank, expressed confidence of being able to show that the class in question had a real grievance, and that the support of this House was necessary in order that they might obtain redress. The question of pay he regarded as of minor importance, although in this, as in other respects, there was a grievance. In 1793, the pay of a surgeon in the army was precisely the same as at the present time—namely, 10s. a day, and, in consequence also of changes with respect to promotion and to the period of service which must elapse before the superior grades were reached, the position of the medical officers was now materially worse than in 1793. Moreover, the later regulations had had the effect of destroying the social position of the medical officers in their requirements. He greatly regretted that, under the provisions of a Royal Warrant, medical officers should have been severed from their regiments to which they were now only attached instead of actually belonging to them. The question of relative rank had been said to be one of mere superiority of quarters, but he believed that it was one of far more importance as affecting the social rank of the medical officers of the army. Of the 230 combatant officers who formed part of the Ashantee expedition, 78 received honours, promotions, or rewards, and of those a large proportion never left their ships; but only nine of the 81 medical officers attached to that expedition—that was to say, only one of nine—obtained a special recognition of his services. Not long ago, there was a great distribution of honours among military men, but out of 80 or 90 medical officers only one received the honour of K.C.B. With regard to absence on leave, a medical officer of the army was in a most invidious position compared with a combatant officer. Except in time of war, a combatant officer could obtain unlimited leave of absence, but a medical officer could not obtain leave of absence for more than sixty-one days in a year, and he had to provide a substitute. If he had sick-leave beyond six months, he was placed on half-pay, and his position in that respect was entirely different from that of a combatant officer. Again, the management of a great military hospital like Netley ought, he maintained, to be subject to the control of a medical rather than a combatant officer, and the former ought not, at all events, to be exposed to the annoyance there of being unable to order the slightest alterations to be made on his own authority. He might also point out that, while the Royal Warrant of 1873 gave medical officers the rank of field officers, the spirit of it had been so thoroughly turned against them that they were absolutely denied forage for their horses. He hoped, therefore, the Government would take the matter into their consideration, and provide that such prospects should be held out to medical men entering the army that appointments in it would be eagerly sought after by the pride of our medical colleges, thus securing a class of men on whom reliance could be placed in future contingencies. The hon. gentleman concluded by moving that, "in the opinion of this House, the position of the medical officers in the army, with respect to their honour, pay, and relative rank, is not in a satisfactory state, and that the revision thereof is desirable".—Sir W. BARTELOT regarded the question as a most important one, and affecting, as it did, a most de-

serving body of men, who had at all times discharged their duties most admirably. As to their rank, the honourable gentleman would have had a very different tale to tell if he were to speak of it as it stood when he entered the service, for there was no body of men who, in that respect, had been more cared for of late years than the surgeons of the army, seeing that a surgeon-general ranked as major-general. Upon that score, therefore, he did not think that they had much to complain of, while great injury had, he believed, been done them, so far as the position which they held in their regiments was concerned. The aspiration of the medical officers was that they should be considered part and parcel of the regiment, and that the regiment should be their home; but the regiment was their home no longer. Surely, it was a monstrous thing that a man should be called upon to find regiments for a particular regiment, and then be transferred nobody knew when and nobody knew where. That was not so in former times, and he was of opinion that the honourable gentleman had made out that part of his case.—Mr. CAMPBELL-BANNERMAN said that the Warrant which dealt with the subject was not issued without full inquiry. A committee composed of the best officers available sat upon the whole question of medical organisation in the army, and they recommended that there should be a unification of the medical service and a consolidation into a staff service of what had hitherto been a regimental service. It must be borne in mind that, while it was necessary to consider the interests of the Army Medical Department, it was also necessary to consider the interests of the army itself. When a medical man was confined to a particular regiment, his experience must be small, and his acquaintance with the higher branches of his duties must be very limited. One advantage of the unified system was, that it gave medical officers wide experience; and another advantage was, that it enabled us to have the same system in peace that we had in war. The system introduced by the Warrant was, that the medical officer should serve five years in a regiment. It was not intended that they should be subjected to any expense for regiments when transferred from one regiment to another, but that there should be an uniform for all medical officers. It had been said that medical men who had paid large sums for their positions had received no compensation when military men did. But the reason was, because the prices paid by medical officers were quite beyond the cognisance of the War Department. The other great object of the Warrant was, to assist in removing a block to promotion. His noble friend was very averse from fixing, as the medical gentlemen desired, a positive period when promotion should be made, and he thought it would satisfy them if he stated that it was the intention of the Secretary of State that promotion should be made after a certain period, without laying it down in explicit terms that that should in all cases occur. There was every desire on the part of the late Government to meet the wishes of the medical officers, and they were under the impression at the time the Warrant was issued that the general principle of it was agreeable to the medical officers. If they felt themselves aggrieved, he had no doubt the right honourable gentleman would, as far as was in his power, relieve them of any grievance of which they complained.—Mr. WARD had no doubt great discontent was felt upon this subject, and one of the grounds of that discontent was the removal of medical officers from their regiments and placing them on the staff. But the most important of all their grievances was in connection with promotion. In Lord Herbert's time, a medical officer was sure of promotion after serving seven years; now he must serve fifteen years. That was a great hardship, and there was only one remedy for it, by providing a compulsory retirement for the older officers after they reached a certain age. After all, the slowness of promotion was the great grievance; and he strongly urged Mr. Hardy to lessen that evil by fixing the age of retirement at sixty instead of sixty-five.—Mr. HARDY observed that the honourable member for Salisbury and the honourable member who had just spoken had taken up very different positions: the one dealing with the sentimental, and the other with the pecuniary aspect of the question. He (Mr. Hardy) would be the last man to ignore the merits of the medical officers of the army; but he did not think that, on the score of honours, they had much reason to complain. Indeed, he had never before that night heard a word of complaint on that subject. As to the question of rank, the concession asked for could not be granted without in some degree depriving the combatant officers of the position to which they believed themselves entitled. Moreover, it would disturb the sound rule which had always existed, that the military authority should deal with the discipline, and the medical authority with the health of the army. As for the proposal to make retirement at sixty compulsory, he believed it would give rise to so many cases of hardship as really to be productive of more harm than good. All those matters had to be carefully considered, and he could assure the honourable member for Salisbury that he was not losing sight of the subject. It was the fact, he believed,

that promotion was slowest in some of the best regiments in the country, and practically, he might add, medical officers had become now staff officers, would be treated as such, and would have their own uniform. As to relative rank, he could assure the honourable member that, although there were great difficulties in the way of altering the position which they had always held as juniors of their rank, yet that, believing it to be of the greatest importance that they should have suitable quarters, he had directed that such quarters should be assigned them. He hoped, under the circumstances, the honourable gentleman would not deem it to be his duty to press his motion to a division, but would rest satisfied with the assurance that he was looking into the question in the same temperate spirit as that in which it had been brought under his notice. We must have medical officers, and good medical officers, and, if we could not get them without change, that change should be made.—Dr. CAMERON thought the statement of the right honourable gentleman would give considerable satisfaction to those to whom it related. He might add that the death-rate among medical officers was very high—30 per 1,000—while that in the case of the combatant officers was only 15 per 1,000, and should suggest that a thorough alteration should be made in the present system with regard to granting sick-leave.—Dr. LUSH then withdrew his amendment, having expressed a hope that the changes to which the Secretary for War had alluded would speedily be carried into effect.

MEDICAL NEWS.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following gentlemen passed their primary examinations in anatomy and physiology at a meeting of the Court of Examiners on July 14th; and, when eligible, will be admitted to the pass-examination.

Messrs. W. M. Burgess, Richard Lyddon, T. E. Nicoll, A. G. P. Gipps, William Kay, F. A. Teevan, D'Arcy Sugden, A. S. Bradford, F. H. Craddock, A. G. Bernard, and Joshua Rhys (students of St. Bartholomew's Hospital); J. C. Gardner, C. C. Jewell, and C. C. Claremont (of University College); J. A. Masters, A. F. Stevens, and J. F. Dell (of Guy's Hospital); Charles Winterbottom and R. W. Collett (of St. George's Hospital); A. A. Wolff (of St. Thomas's Hospital); R. T. Richardson (of the London Hospital); and C. F. Goode (of St. Mary's Hospital).

The following gentlemen passed on July 15th.

Messrs. C. H. Hough (of Cambridge School); A. P. Cooper, E. Denning, E. C. Bentham, H. D. Cooper, W. T. Askey, and R. R. Norton (of University College); B. B. Fox, E. M. Wilson, and C. W. C. Fletcher (of St. George's Hospital); F. W. W. Goodsall (of St. Bartholomew's Hospital); H. S. Mitchell, F. Wellocks, and Arthur Shipton (of King's College); D. E. Thomas, and R. H. Grimby (of St. Thomas's Hospital); J. Gabe, R. G. White, and Wm. Scott (of the London Hospital); T. F. J. Blaker (of Guy's Hospital); R. C. Revell, and Edward Semple (of the Middlesex Hospital); Wm. Foster (of the Westminster Hospital).

Eighty-three candidates out of the 163 examined, having failed to acquit themselves to the satisfaction of the Court of Examiners, were referred to their anatomical and physiological studies for three months.

The following gentlemen, having undergone the necessary examinations for the diploma, were admitted members of the College at a meeting of the Court of Examiners, on the 20th instant.

Messrs. R. H. A. Hunter, Dalston; H. Skipworth, Brigg, Lincolnshire; T. R. Jones, L.R.C.P.Lond., Walton, near Liverpool; A. C. J. Wilson, Manchester; D. L. Irvine, Newcastle-on-Tyne; G. E. Alford, Weston-super-Mare; J. C. Eames, M.B.Ed., Manchester; N. W. Wright, Ardwick; J. G. Tindle, Middlesborough; F. C. Palmer, Weston-super-Mare; J. McNaught, M.B. Edin., Wall, Northumberland; W. L. Winship, Newcastle; S. D. Clippingdale, Commercial Road; W. T. Hayward, L.K. & Q.C.P.I., Liverpool; A. H. Watkins, M.B.Ed., Nailsworth; C. A. Clinton, L.S.A., Chisclhurst; C. A. Daubeny, Yatton, Somerset.

Eight candidates who passed in Surgery at previous meetings of the Court, having subsequently obtained medical qualifications, were also admitted members of the College.

Messrs. B. Jumeaux, L.R.C.P.Ed., Stafford; W. Sykes, L.R.C.P.Ed., Sheffield; G. H. Peevor, L.R.C.P.Lond., Maida Hill; E. F. Thomas, L.R.C.P.Ed., Weston-super-Mare; A. H. Blake, L.S.A., Castle Street East, W.; G. G. Sparrow, L.R.C.P.Ed., Southsea; W. Vernon, L.R.C.P.Ed., Newcastle-on-Tyne; C. C. Smith, L.S.A., Redditch.

The following gentlemen were admitted members on the 21st instant.

Messrs. C. J. Symonds, St. John's, New Brunswick; J. B. H. Lumby, Birmingham; W. H. Briggs, Stroud, Gloucestershire; E. J. Crouch, L.S.A., Hornon Street, Kensington; A. W. F. Street, Barnet, by Lincolnshire; J. A. Ormerod, B.A.Oxon., Oxford; G. L. Latour, Lambeth; L. J. Hobson, Ainger Terrace, N.W.; J. J. Gawith, London; C. J. C. Mitchell, Bedford; T. Richards, Cardiff.

One candidate passed in Surgery, and, when qualified in Medicine, will be admitted a member of the College.—Seven candidates were referred to their hospital studies for a period of six months.

The following gentlemen having passed in Surgery at previous meetings of the Court, and having since obtained medical qualifications, were also admitted members.

Messrs. T. E. C. Hood, L.R.C.P.Lond., Bletchingly; J. E. Clayton, L.R.C.P.L., Leeds; E. W. Haines, L.R.C.P.L., Tavistock Place.

Twelve candidates were referred to their hospital studies for a period of six months.

APOTHECARIES' HALL.—The following gentlemen passed their examinations in the science and practice of medicine, and received certificates to practise, on Thursday, July 15th, 1875.

Chadwick, Alfred, Heywood, near Manchester
Crowdy, Frederic Hamilton, Newfoundland
Fell, Thomas Kennedy, Ulverstone, Lancashire
Fussell, Ernest, Sherborne, Dorset
Lilley, George Herbert, Ware, Herts
Smith, Charles Callow, York Road, Lambeth

The following gentlemen also on the same day passed their primary professional examination.

Brown, Alexander Stuart, St. Mary's Hospital
De Caux, Frederick, King's College
Goulder, Frank Samuel, University College
Osborne, John Henry, University College
Richardson, Thomas William, London Hospital
Sutton, Thomas Seagrave, Middlesex Hospital
Thompson, Edmund John, University College
Weller, John, London Hospital

MEDICAL VACANCIES.

THE following vacancies are announced:—
ARMY MEDICAL DEPARTMENT—Surgeons. Examination on August 9th and following days.
BOURNEMOUTH GENERAL DISPENSARY—Resident Medical Officer and Secretary.
BURY UNION—Medical Officer for the Radcliffe District.
CHERTSEY UNION—Medical Officer for the Chobham District.
GREAT NORTHERN HOSPITAL—House-Surgeon. Salary, 60 guineas per annum, with board and lodging. Applications on or before the 30th instant.—Ophthalmic Surgeon. Applications on or before August 6th.
HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton—Resident Clinical Assistants. Applications on or before August 2nd.
INDIAN MEDICAL SERVICE—Tea Surgeons. Examination on August 9th and following days.
LEEK UNION—Medical Officer for the Norton District.
LIVERPOOL ROYAL INFIRMARY SCHOOL OF MEDICINE—Demonstrator of Anatomy. Salary, £100 per annum, and other emoluments. Applications on or before the 31st instant.
LYMINGTON UNION—Medical Officer for the Hordle, Lymington, and Milford Parishes.
MARLBOROUGH UNION—Medical Officer for the Second District. Salary, £50 per annum, and fees. Applications on or before July 31st.
MIDLAND COUNTIES HOSPITAL FOR CHRONIC AND INCURABLE DISEASES, Leamington—House-Surgeon. Salary, Fifty Guineas per annum, increasing £20 per annum up to £110. Applications on or before the 30th inst.
NORTHERN LONDON CONSUMPTION HOSPITAL—Two Physicians. Applications on or before August 5th.
NORWICH DISPENSARY—Salary, £120 per annum, with unfurnished residence and apartments.
ORMSKIRK UNION—Medical Officer for the Second District.
OUNDELE UNION—Medical Officer for the Weldon District. Salary, £60 per annum, and fees. Applications on or before August 4th.
ROYAL CORNWALL INFIRMARY—House-Surgeon, Secretary, and Dispenser. Salary to commence at £120 per annum. Applications on or before the 31st instant.
ROYAL SURREY COUNTY HOSPITAL—House-Surgeon. Salary, £75 per annum, with board, residence, and washing. Applications on or before July 31st.
ROYSTON UNION—Medical Officer for No. 5 District. Applications on or before September 6th.
ST. IVES UNION—Medical Officer for the Warboys District.
TIVERTON UNION—Medical Officer and Public Vaccinator for the Western District. Salary, £70 per annum. Applications on or before August 9th.
VICTORIA HOSPITAL FOR SICK CHILDREN, Chelsea. House-Surgeon and Registrar. Salary, £50 per annum, with board and lodging. Applications on or before the 26th instant.
WESTMINSTER HOSPITAL—House-Surgeon. Applications on or before the 27th instant.
WORKSOP DISPENSARY—Resident Surgeon. Salary, £100 per annum, with furnished apartments, coals, gas, and attendance. Applications on or before the 30th instant.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths, is 3s. 6d., which should be forwarded in stamps with the communication.

BIRTHS.

DUCKWORTH.—On July 10th, at 11, Grafton Street, Piccadilly, the wife of *Dyce Duckworth, M.D., of a son.
OVENS.—On July 18th, at Cahir, co. Tipperary, the wife of J. C. Ovens, Esq., F.R.C.S.I., Surgeon-Major 5th Dragoon Guards, of a son.

MARRIAGE.

GAMGEE-CLARK.—On July 22nd, at Stamford Hill Congregational Church, by the Rev. Alexander Raleigh, D.D., Arthur Gamgee, M.D., F.R.S., Brackenbury Professor of Physiology in the Owens College, Manchester, to Mary Louisa, second daughter of James P. Clark, Esq., of London and Montreal. No cards.

OPERATION DAYS AT THE HOSPITALS.

MONDAYMetropolitan Free, 2 P.M.—St. Mark's, 9 A.M. and 2 P.M.—Royal London Ophthalmic, 11 A.M.—Royal Westminster Ophthalmic, 1.30 P.M.
 TUESDAYGuy's, 1.30 P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.—Royal Westminster Ophthalmic, 1.30 P.M.—West London, 3 P.M.—National Orthopaedic, 2 P.M.
 WEDNESDAY ..St. Bartholomew's, 1.30 P.M.—St. Mary's, 1.30 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—St. Thomas's, 1.30 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—Great Northern, 2 P.M.—Samaritan Free Hospital for Women and Children, 2.30 P.M.—Cancer Hospital Brompton, 3 P.M.—King's College, 2 P.M.—Royal Westminster Ophthalmic, 1.30 P.M.
 THURSDAYSt. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Royal Orthopaedic, 2 P.M.—Royal London Ophthalmic, 11 A.M.—Hospital for Diseases of the Throat, 2 P.M.—Royal Westminster Ophthalmic, 1.30 P.M.—Hospital for Women, 2 P.M.
 FRIDAY.....Royal Westminster Ophthalmic, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.—Central London Ophthalmic, 2 P.M.—Royal South London Ophthalmic, 2 P.M.
 SATURDAYSt. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Royal London Ophthalmic, 11 A.M.—East London Hospital for Children, 2 P.M.—Royal Westminster Ophthalmic, 1.30 P.M.—St. Thomas's, 9.30 A.M.—Royal Free, 9 A.M. and 2 P.M.

NOTICES TO CORRESPONDENTS.

CORRESPONDENTS not answered, are requested to look to the Notices to Correspondents of the following week.
 PUBLIC HEALTH DEPARTMENT.—We shall be much obliged to Medical Officers of Health if they will, in forwarding their Annual and other Reports, favour us with Duplicate Copies.
 AUTHORS desiring reprints of their articles published in the JOURNAL, are requested to communicate beforehand with the printer, Mr. T. Richards, 37, Great Queen Street, W.C.
 CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.
 WE CANNOT UNDERTAKE TO RETURN MANUSCRIPTS NOT USED.
 COMMUNICATIONS respecting editorial matters, should be addressed to the Editor: those concerning business matters, non-delivery of the JOURNAL, etc., should be addressed to the General Manager, at the Office, 36, Great Queen Street, W.C.

MEDICAL PRACTICE IN AMERICA.

SIR,—Could any of your readers kindly refer me to any sources of information about general medical practice in the United States of America, particularly on those points respecting which an intending emigrant would naturally be most anxious; such as, for instance—(1) Whether men holding English diplomas are allowed to practise there; and, if so, in what estimation such diplomas are held? (2) The status in society of the general medical practitioner in the States? (3) Whether the profession is overstocked, particularly in the Western States; and whether a man, liking the institutions of the country, desirous of emigrating, not afraid of hard work, and not expecting too much at first, would have a fair chance of advancing himself? Any information on these points would be very thankfully received.—I am, dear sir, yours obediently.
 H. G. D.
 July 13th, 1875.

A FELLOW BY EXAMINATION.—During the past collegiate year, forty-six Fellows of the Royal College of Surgeons died, and only twenty-eight new Fellows have replaced them—viz., eighteen by examination and ten by election.

BOARD FOR IMBECILE PATIENTS.

SIR.—I am induced to write to ask you whether you think any of my brother Associates could or would help me under the following circumstances? I am a member of the British Medical Association, and have been so from nearly the first publication; have had three years of trying illness, and, being 70 years of age, am left in very weakly condition. Of course, you know what long illness does for a medical man; that his practice soon leaves him, and, consequently, that entails every discomfort imaginable. As I am not able to attend midwifery to any extent, I have been trying to obtain an imbecile or two. I have one who has been with me now three years, but could take two more; I therefore ask the members of our Association if they will bear me in mind, should any opening arise, to further my views; and as it has spread so extensively since the little seed began to germinate in the country, I hope there may be some one found who could give a helping hand by recommendation.

Apologising for taking up your valuable space, I remain, sir, yours very truly,
 A. MATTHEWS, Surgeon, etc.
 1, Cliff Road, Dovercourt, Essex, July 20th, 1875.

P.S.—I am now in tolerable health, and able to accomplish what I undertake, having a wife and two daughters. This being a sea-side place (very healthy), I should be pleased to have any one requiring change of air.

OMEGA (Birmingham).—Had you perused our advertising columns, you would have seen the dates of the "primary" and "pass" examinations; you are now too late. Mr. Spencer Smith remains a member of the Court of Examiners; and, as neither Sir James Paget, nor the senior Vice-President, Mr. Hewett, consents to act on the Court, Mr. Birkett, the junior Vice-President, fills the new office of Chairman of it.

FLATULENT DYSPEPSIA.

SIR,—In the letter from me, which appeared in the JOURNAL for the 10th inst., "nitrate of potash" should have been printed "citrate of potash"
 W. L.

M.D. (Royal Navy).—We understand that a representative of your service will be invited to take the chair in succession to Mr. Curling, who has consented to act as chairman next year. Write to the honorary secretary, Mr. W. Allingham, F.R.C.S.

CORRESPONDENTS are particularly requested by the Editor to observe that communications relating to Advertisements, changes of address, and other business matters, should be addressed to Mr. Francis Fowke, General Secretary and Manager, at the Journal Office, 36, Great Queen Street, W.C., and not to the Editor.

ROYAL COMMISSIONERS.

SIR,—In your last number you have very opportunely called attention to the absence of Professor Huxley from the sittings of the Royal Commission on Vivisection, at which (since he was no doubt specially appointed as the representative of scientific physiological inquiry) his attendance is peculiarly important. Judging from a former occasion, this seems to be a way which that gentleman has; for instance, he was a member of the Royal Commission on the Contagious Diseases Acts in 1871, and his signature is appended to its report, although his name is conspicuous by its absence from every one of the forty-five sittings of that Commission for the examination of witnesses. Surely, unless gentlemen, however able, are prepared to devote themselves diligently and conscientiously to the investigation of important public questions such as these, they ought to decline to serve on Royal Commissions, and so make room for others, who take a different view of the responsibility properly attaching to the position.—I am, sir, your obedient servant,
 SCRUTATOR.

H. M. (Guy's).—Yes; Mr. Spencer Smith, of St. Mary's Hospital, retains his seat as a member of the Court of Examiners, of which Mr. J. Birkett, of Guy's, is chairman; the president, Sir J. Paget, declining to be a member of the Court.

MEDICAL TITLES.

SIR,—For the information of those who have written so fully upon the question of "Medical Titles", allow me to inform them that it has been authoritatively decided by our judges, that "if a man be registered he may call himself what he pleases". In support of my statement, I beg leave to subjoin the two following cases, and remain, sir, your obedient servant,
 L.R.C.P. LOND.

"Court of Common Pleas, Westminster, May 28th, 1860.—Sittings in Banco, before Lord Chief Justice Erle, Mr. Justice Williams, and Mr. Justice Byles.—Pedgrift (appellant) v. Chevallier (respondent).—This was an appeal case against a decision of justices on an information. The appellant, Frederick Woodcock Pedgrift, was convicted at the Halesworth (Suffolk) Petty Sessions in the penalty of £10 and costs for falsely pretending to be a surgeon, contrary to the Medical Act 21st and 22nd Vic., cap. 90. Mr. Lush, Q.C. (now Mr. Justice Lush), for appellant, contended that it was no offence to practise as a surgeon; that the law remained as before, that any one could practise as a surgeon; but that now, by the Medical Act, no practitioner could bring an action to recover his fees, or be eligible to certain public appointments, unless registered under the Act. The Act does not compel a surgeon to be registered; it only deprives him of the right of suing for his fees, and of certain privileges if he do not register. The Court said that the statute was of extremely wide importance, but the conviction was upon very scanty facts. There was nothing to show that the appellant was not in practice as a surgeon before the Medical Act passed, or that he had not a diploma or other qualification so as to give him a right to use the title of 'surgeon'. The proposition that every person who calls himself a 'surgeon' without being on the Medical Register was liable, could not be sustained. Conviction quashed."

"Court of Exchequer, November 14th, 1860.—Sittings in Banco, before the Lord Chief Baron, Mr. Baron Bramwell, Mr. Baron Channell, and Mr. Baron Wilde.—Ellis v. Kelly.—This was a case stated under the 20th and 21st Vic., cap. 43. An information was preferred against the defendant, a surgeon at Pinner, for having, on the 2nd November, 1860, pretended to be, and using the title of 'Doctor of Medicine', thereby implying that he was registered under the Act 21 and 22 Vic., cap. 90. It was proved that the defendant had for years past affixed on the outer gate of his residence a brass plate, on which was engraved 'Dr. Kelly'. The defendant was registered in the last Medical Register as a Member of the Royal College of Surgeons and a Licentiate of the Society of Apothecaries. The complainant swore that he had heard him call himself 'Dr. Kelly'. The justices, upon hearing the information, dismissed the case, with costs, against the complainant. The questions stated for the opinion of the Court were—1. Whether the Medical Registration Act, 21 and 22 Vic., cap. 90, prohibits the taking and using the title of 'Doctor of Medicine' by any medical man in England, unless the said title be duly registered according to the provisions of the Act? 2. Whether, if the Court should be of opinion that the Act prohibits the assuming of such title, the defendant, under the circumstances, can be held to have done so 'wilfully and falsely' within the meaning of the 40th section? The Lord Chief Baron: If a man be registered, he may call himself what he pleases.—Their lordships were of opinion that the decision of the justices should be confirmed, and granted the costs of the appeal."

VACCINATION.

D. M. S.—A second application should have been made to the vaccination officer, referring to the applicant's address, as given in the Medical Register, and stating that he was the same person. This would have been followed by the transmission to him of a supply of vaccine lymph. We do not think it desirable that any one except the vaccinator, or some one acting with his consent, should take lymph from the arm of a vaccinated child. Such a course would be liable to be attended with much inconvenience.

AUSTRALIA FOR INVALIDS.

SIR,—Would you kindly permit me, through the columns of your paper, to convey the information to the physicians who favour the scheme of "the tour to Australia for invalids", that the party will be conducted to Melbourne and back by one of the splendid line of steamers which now run from port to port in about forty-four days, and not in a vessel specially chartered for the purpose? The society of others besides that of invalids will therefore be available, and the voyage out and home may be looked forward to as a very enjoyable part of the tour. May I also add that, as the fee for the trip will include every item of expense, the outlay may be calculated up to a pound?—I am, sir, yours obediently,
 THE ORGANISER OF THE EXPEDITION.

50, Lincoln's Inn Fields, W.C., July 19th, 1875.

INVERSION OF THE GREAT TOE.

SIR.—Can yourself or any reader of the JOURNAL kindly inform me where I can obtain an instrument I saw described some time ago (I think in the JOURNAL), for remedying inversion of the great toe and bunion?—I am, etc.,
 TOM HEWITT, M.D.

* Mr. Miller, instrument-maker, Heming's Row.

NOTICE TO ADVERTISERS.—Advertisements for insertion in the **BRITISH MEDICAL JOURNAL**, should be forwarded direct to the Publishing Office, 36, Great Queen Street, W.C., addressed to Mr. FOWKE, not later than *Thursday*, twelve o'clock.

CORONERS AND THEIR JURIES.

SIR,—I think it would be well if not only Dr. Hardwicke, but other coroners, were warned that they incur the risk of action, or indictments for libel, if they make injurious accusations of those not judicially before them; and that the fact of their being coroners, or that the opinions expressed are held sincerely, or even that they are correct, would be no protection to them from the unpleasant and costly consequences. It would not, I think, be wise for Dr. Andrews, for example, to sue Dr. Hardwicke for his libellous imputation, for it might be supposed he thought no sane man could believe so absurd an accusation; but it might be beneficial to teach a coroner that his business is to conduct inquiries as to the cause of death in cases needing such inquiry, and that he has no right, as coroner, to pass judgment upon a practice adopted by those who must know far more of the cases than he does, and that he ought to treat members of his profession, as well as others, with decent civility. It is very proper for him, as for other men, to feel righteous indignation against proved cruelty and wrong; but before giving public expression to such feeling, it is prudent to be sure that it is proved, and that he is the proper judge.

I should be sorry to be hard on Dr. Hardwicke, and have no doubt he will learn by experience to be wiser and less impulsive; moreover, he has done no more than follow a growing and bad custom of coroners and their juries, some of whom seem to think it their duty and their right to censure those who, they fancy, have not been quite free from blame, and often do so for no just reason, or for reasons of which they are neither authorised to decide nor competent to judge; their censure being in every sense of the term highly impertinent—a practice that can hardly be too strongly condemned, especially when it is injurious to the professional reputation of any one who is not present to defend himself. It is to be hoped that the just indignation excited will check the repetition of such wrong; but if not, other and sterner methods must be tried, for checked it must be, if a coroner is not to continue an annoying and injurious nuisance.—I am, etc., H. H. P.

DR. CAMPBELL.—From the last return to Parliament of the receipts and expenditure of the General Medical Council, it appears that the former amounted to £6,349 2s. 6d. for the English branch alone.

WHO CAN SIGN CERTIFICATES?

SIR,—Would you kindly inform me in your next issue if a death certificate, filled up in the usual form thus, "as having attended, and last saw the patient, etc.," by a registered practitioner who did not attend the case (his unqualified assistant having had the sole management of it), is not a false one? and, if so, is there any legal offence committed in signing such a certificate?—Yours truly,

ENQUIRER.

* * The 20th section of the Births and Deaths Registration Act (1874) enacts that: "In case of the death of any person who has been attended during his last illness by a registered medical practitioner, that practitioner shall sign and give the same person," etc. This certificate can only, therefore, be required when the registered practitioner has been in attendance at any time during the last illness of the deceased. The Act, however, does not go on to say that under other circumstances certificates shall not be given, although this may be taken to be the spirit of the Act; and it appears to us that no practitioner, whether qualified, although unregistered, or entirely unqualified, commits a legal offence by giving a certificate of the cause of death. It is clearly undesirable and contrary to the spirit of the Act, although we believe no legal offence, for registered practitioners to give certificates in cases that have been entirely attended by their unqualified assistants; and, so far as their entry in the Death Register is concerned, we see no way to exclude them that would not be open to graver objection than the present system. The following is an extract from a special memorandum issued to registrars by the Registrar-General when the new Act came into operation on the 1st January last, which bears upon Enquirer's question. "A registered practitioner cannot deputise his unregistered assistant to sign on his behalf certificates of the cause of death when he himself has been in attendance; but it will be for him to determine in any particular case attended by his assistant whether or not he can properly take upon himself the responsibility of giving a certificate. On receiving a certificate purporting to be under the hand of a registered practitioner, it is no part of the registrar's duty (except he has reason for believing the signature to be a forgery) to raise the question whether the case was at any time attended by such practitioner. The responsibility for the truth of the statements certified rests exclusively upon the certifying practitioner, who is presumed to be the best judge as to whether he is in a position to give the certificate or not." There is good reason for believing that many unqualified practitioners practise as the nominal assistants only of qualified practitioners, and the custom of granting certificates under the circumstances referred to by Enquirer is a direct encouragement to the objectionable system.

DR. O'ROURKE.—The income of the Irish College of Surgeons amounted, according to the last annual report, to £5,360 0s. 9d., and the expenditure to £4,406 14s. 8d., leaving a balance to the good of £953 6s. 1d. The expenses of the library amounted to £427 17s. 10d., and those of the museum to £46 2s.

MATERNAL IMPRESSIONS.

MRS. M., suffering from the last stage of phthisis, shows upon her upper lip an irregular blue patch, having the size and shape of a piece of pickled cabbage. Her mother states that, when pregnant, she was suddenly frightened by a jar of pickled cabbage falling off a shelf, a piece of the cabbage alighting upon her upper lip. The room being dark at the time, and the pickle cold and wet, the shock was somewhat great. When the daughter was born, the impression showed itself in the manner described. The daughter being recently attended by me in her confinement, desired to know if *her* child was marked by a mouse upon its arm. Upon examining the infant, a patch showed itself, resembling a mouse's back, and covered with fine downy hair. It appears that during the daughter's pregnancy a mouse ran across her bare arm, in the same spot as the mark appeared in the child. The daughter was much alarmed, and the ultimate consequence of the shock evinced itself in the infant, as related. E. J. ADAMS, L.R.C.P.E.

86, Approach Road, Victoria Park, June 1875.

A HOSPITAL SURGEON.—Each member of the Council and Court of Examiners of the College of Surgeons is required to pay a fee of twenty guineas respectively, on admission, to the treasurer.

NOTICES of Births, Deaths, Marriages, and Appointments, intended for insertion in the **BRITISH MEDICAL JOURNAL**, should arrive at the Office not later than 10 A.M. on Thursday.

SUPERSTITION.

A **RESPECTABLE** working man, whose wife I had been attending for some severe burns received in an epileptic fit, called upon me one evening to tell me he had now the means of curing his wife completely of epilepsy. He had gone to some old woman, whose prescription was as follows. "A young frog must be caught before daybreak, on a spring morning, one of its hind legs pulled off while alive, the detached limb to be dried in the sun, and worn suspended round the neck of the patient." He only told me so much after considerable hesitation, and on my promising not to injure the old hag's business by employing it. He carefully carried out the above instruction; but, need I add, his wife is still an epileptic.

A MEMBER.

COLLEGIATE INVESTMENTS.—The Council of the College of Surgeons may well be congratulated on the judicious investment of some of its funds in the acquisition of freehold property, which has hitherto yielded so well. The rents from letting of chambers in the houses adjoining the College have produced during the past year the handsome sum of £1,104 10s. 6d., to which is now to be added, by purchase, the freehold house No. 38, Lincoln's Inn Fields, for about £6,400. The College now has the fine block represented by Nos. 37, 38, 39, 40, 41, 42, and 43, Lincoln's Inn Fields, which is of great increasing value.

DR. MALCOLM.—From the annual report of the Irish College of Surgeons, it appears that from April 1874 to April 1875, the receipts amounted to £5,360 0s. 9d., and the expenditure to £4,406 14s. 8d., leaving a balance at the bankers' of £953 6s. 1d. Of the thirty-seven meetings of the Council, only the Vice-President, Mr. Edward Hamilton, attended all.

We are indebted to correspondents for the following periodicals, containing news, reports, and other matters of medical interest:—The Bristol Daily Post; The Daily Bristol Times and Mirror; The Derby and Chester Reporter; The Lincolnshire Herald; The Glasgow Herald; The Sunderland Daily Echo; The Carnarvon and Denbigh Herald; The Manchester Guardian; The European Review; The Hackney and Kingsland Gazette; The Worcester-shire Chronicle; The Birmingham Daily Post; The Brighton Daily News; The Sussex Daily News; The Glasgow Herald; The Cork Examiner; The Scotsman; The Cork Daily Herald; The Southampton Times and Hampshire Express; The Hampshire Advertiser; The Birmingham Morning News; The Chester Courant; etc.

COMMUNICATIONS, LETTERS, ETC., have been received from:—

EDINBURGH.

THE grey metropolis of the north, which this year has the opportunity of offering the hand of hospitality to the members of the British Medical Association, is beyond question a queen of cities. The attractions of Edinburgh are many, and they are varied. She has something to interest, to entertain, and to instruct students of every phase of history, archæology, and all departments of science; and to the lover of the picturesque and the view-hunter her resources are unlimited. Her citizens might almost be excused if they, conscious of the supreme attractions of their city, should fall into the grievous error of slightly regarding the visit of strangers; just as the reigning beauties of society, sometimes to their own great loss, are haughty, cold, careless, and repellent. Time was, when the city had no good reputation beyond the country for the comfortable and courteous entertainment of such as were not "a drap's blind" to Scotchmen. In the middle of the fourteenth century, the French Embassy, which came to Edinburgh to try to induce David II to join issue against the common English enemy, found the people "envious of the honour and profit of everyone besides themselves, and perpetually jealous of losing the means they had". No accommodation suitable for the luxurious Frenchmen was found or sought, no comfortable houses, no soft beds, and no walls hung with tapestry; and we are told "it required all the prudence of the French commander to restrain their impatience for leaving so miserable a country". But times changed, and the inhabitants of Edinburgh changed with them; and the splendour of the public entertainments given in the Scottish capital in the early part of the sixteenth century is the marvel of people who reflect on the bareness and poverty of the country, while private hospitality grew with the growth of the city, till it became hard to say whether Edinburgh was most attractive for the society it afforded, or for the natural and architectural beauties it possessed.

For centuries the history of Scotland was epitomised in the experiences of Edinburgh; and to the present day, although her western rival, the city of St. Mungo, has far outstripped the capital in population, wealth, and commerce, Edinburgh is still the centre of whatever of the ancient spirit of the red lion lingers in the north. She remains, in fact, the capital of Scotland, though a capital long shorn of its leading glories. Edinburgh is yet the seat of the Supreme Courts of Scotland, short of the House of Lords; and, thanks to her great Tory peer, the Duke of Buccleuch, that ancient and treaty-ratified arrangement is not to be so lightly departed from as the parents of Judicature Acts at first hoped. And then yearly, with the east winds of May, has she not the nearest approach to royal presence and regal state for a full fortnight, in the person of Her Majesty's Lord High Commissioner to the General Assembly of the Kirk of Scotland? The Assemblies themselves—for there are two, each claiming to be the true kirk—are, to nine-tenths of the Scottish people, of vastly greater consequence, and more truly imperial, than the Lords and Commons sitting far away in the Halls of Westminster. If these circumstances are not enough to vindicate the place of Edinburgh as a capital town, her inhabitants can point to the further fact that the modern Athens is at once a city and county combined; that alone among magisterial dignitaries, her Lord Provost is *ex officio* styled Right Honourable; and that he is the Lord Lieutenant of the county of the city of Edinburgh, with the power to appoint deputy lieutenants and justices of the peace within the limits of his jurisdiction. The man who will dare to regard Edinburgh as a provincial town makes a sad mistake.

When Edinburgh first began to be, and why it is, Edinburgh, we may leave to the investigations of those antiquarians who know all about such things. A temerarious jingle is applied to it by a small neighbour burgh, which, if the assertions of the rhyme be true, must be at present down on its luck.

"Musselburgh was a burgh when Edinburgh was nae;
Musselburgh'll be a burgh when Edinburgh's gae."

Without disputing the claims of Musselburgh, Edinburgh has certainly sufficient antiquity to satisfy the pride of any reasonable Scot. Every footstep of the long ridge which creeps upward from the ancient palace of Holyrood, through Canongate and High Street, till it ends in the abrupt castle rock frowning out over the west, is steeped in historical reminiscence, and associated with dark and blood-stained deeds. The most ancient houses which line the way from the palace to the

castle were, not very long ago, the residences of the best families in Edinburgh, and in the middle ages they were the homes of the proud nobility of Scotland. The long narrow closes which run down each shed of the ridge, now smelling of unparalleled squalor, filth, misery, and degradation, were whilom the scenes of the gayest, brightest, and most exalted society of Scotland. Through what vicissitudes of fortune has the ancient Canongate come, when its palaces are now the nightly refuge of the pariahs of Edinburgh, as is the present condition of Queensberry Lodge, in which, according to the guide book, "Lady Catherine Hyde, the sprightly Duchess of Charles the third Duke, patronised the poet Gay".

For long ages Edinburgh was a small town, with its inhabitants huddled closely under the much needed and appreciated shelter of the castle. Visitors from "owre the border" occasionally made their appearance in the neighbourhood of the city, and their visits then were neither invited nor welcomed. On account of this facility of access, Scottish monarchs considered it desirable to keep their court at Perth, and their principal residence at Scone, interposing the Forth between their royal presence and the unwelcome calls of southern intruders. The shelter of the castle was not an unmixed advantage to the rising city. Occasionally, instead of being the protector of the citizens, it behaved as their tyrant; and, as it became more and more the key of domination in Scotland, its possession was equally contended for by rival factions at home, or by the wary and active enemy south of the Tweed. Thus by fair fighting or by foul treason, by intrigue, or by treaty, the castle passed from time to time into almost as many different hands as Erie bonds do at the present day; and with each change of master there was a changed attitude towards the militant citizens of Edinburgh. The persevering townsmen appear to have become well accustomed to this kind of thing; and bit by bit, under the protection or the frowns of the castle rock, the city extended its borders. The castle we know of first as a royal residence by the fact that Queen Margaret, the few days' widow of the slain Malcolm Canmore, died in it in 1093; and thereafter it became more and more a protective residence of those who wore the dangerous and uncertain crown of Scotland. As Edinburgh stretched down the long ridge, another burgh, begun under the shadow and sacred protection of the Abbey of Holyrood, crept upwards to meet it, till, in process of time, the Canongate and Edinburgh coalesced, and actually became one. That "sair sanct for the croon", David the first, of most pious memory, founded—among many other religious houses—the Abbey of Holyrood House; and as the high and mighty prince, James the first of England and sixth of Scotland, knew well, he endowed it and them with a most liberal hand. Among the numerous sources of wealth bestowed by the pious monarch on Holyrood, were "tithes of the whales and sea monsters due to me from the river Avon to Colbrands-path". Can it be that there is any connection between this grant and the fact that, from that time down to the present day, the Firth of Forth remains a recognised calving station by the "whales and sea monsters" of the northern seas? The Abbey of Holyrood House, with its rich endowments, soon grew into the most opulent and magnificent establishment in Scotland; and by degrees it was adopted as a habitual residence of Scottish monarchs. In it, Edward Baliol held a Parliament in 1333, at which it was resolved to surrender the independence of the Scottish crown to Edward III, a proceeding which caused much turmoil of the accustomed description throughout the little but bellicose kingdom.

Next to the Castle and Holyrood, the Cathedral of St. Giles is the most important ancient and historical edifice of Edinburgh. Not that much of the tripartite kirk, now known as St. Giles, can lay claim to any remote antiquity, for nothing of the present building is older than the time of James IV, while externally, in large part, it dates from 1829, and Scottish patriots are at the present moment severely exercised for funds to complete a thorough internal retransformation which they have well begun. Nevertheless, the church of St. Giles has been, and that on its present site, from the earliest days of Edinburgh as a town worth mentioning. The sainted Giles was, we are told, a Greek of the sixth century, who came to Edinburgh, and became abbot and ultimately patron saint of the city. A precious and prized relic of the saint, an arm-bone to wit, was secured with great trouble, and, in 1452, bequeathed to the church, where it was enshrined in silver, and kept as the most precious treasure of the establishment till changed times came. After the Reformation, the relic lost its peculiar value; but, notwithstanding its enormous depreciation in market price, the president and thrifty magistrates sold the idolatrous emblem to the highest bidder; and who knows that the radius of St. Giles may not yet be in the safe keeping of some faithful son of the Church waiting for the coming wave of ritualism and reliquary devotion? In 1519, Gawain Douglas, the translator of *The Æneid* into Scotch verse, became provost of the church. It was against the learn-

ing of this son that his father, the Earl of Angus, rails so bitterly in *Marmion*:

"Thanks to St. Bothan, son of mine,
Save Gawain, ne'er could pen a line."

St. Giles played an important part in the history of Scotland, and in the vicissitudes of the established religion of the country in post-reformation times it occupied the foremost place. In 1558, the reformed religion had obtained so strong a hold on the populace, that the image of St. Giles was taken from the church and pitched into the north loch, and there with arose the commotion which, two years later, led to John Knox—he "who never feared the face of man"—being placed minister in the church of St. Giles. At the back of the cathedral in Parliament square, where formerly was the kirkyard of St. Giles, is a small square block of stone, with the letters I K, marking the resting place of the great reformer, and this is the only monument Edinburgh possesses of Scotland's best benefactor. In the High Kirk of St. Giles, James VI took solemn leave of his Scottish people before setting out on his journey to mount the throne of England. When Charles I made his ill-advised attempt at religious reformation by insisting on liturgical services in the Scottish Church, St. Giles again came to the front, led by Jenny Geddes, her redoubtable stool, and her pithy speech, "Out, out, does the fause loon mean to say his black mass at my lug?" The "stony" Sunday, to which Jenny's speech and stool-throwing were the introduction, was a day long remembered in Edinburgh; and is not the stool, to this day, a prized relic in the museum of Scottish antiquities within two or three hundred yards of the coronal spire of St. Giles?

Among the numerous train that accompanied the Scottish Solomon on his journey southward, to share with him the enlarged sphere of influence to which he went, was a highly respectable and shrewd citizen of Edinburgh, George Heriot. Heriot was a man who transplanted well, and who thrived exceedingly in the new soil and situation of London, but he never forgot the city of his nativity. The educational hospital, for the establishment of which he bequeathed the greater part of his fortune, has grown plethorically wealthy; and on his example an epidemic of hospital foundation and endowment set in with such violence that, at the present day, it has become one of the most difficult local questions to find how these educational endowments may be best administered and disposed of, without demoralising every citizen of Edinburgh who has a son or daughter to feed and educate. The hospital buildings such as Heriot's, Donaldson's, and Fettes's, which have been erected in connection with these endowments, are among the most magnificent architectural ornaments of the city.

The prosperity of Edinburgh was not seriously affected by the removal, first, of the Court from Holyrood, nor, next, by the signature of the treaty of union in the summer bower of Moray House and "the end of the auld sang", which dissolved the Scottish Parliament for ever. The city continued to grow in size and population; but for a long time its increase was vertical, and the houses were piled up into the skies like modern Babels, six, seven, and eight storeys in height. But there is a limit to the piling up of flats even in Edinburgh; and the city began to feel as uncomfortable as a lobster about to cast its shell. Little by little it burst out beyond the old city wall; but the flood came with the throwing out of the huge North Bridge over the North Loch valley more than a century ago. An exodus of the better class of citizens immediately took place, and the new town sprang into shape and substantial solidity with magical rapidity. The change of residence was the beginning of a great social revolution in Edinburgh; a state of society almost unique had grown up in the closely packed courts and closes of the old town of Edinburgh, which deserved almost to be recognised as a distinct phase of civilisation. It is difficult at the present day to conceive how, in the midst of smells which sent their reputation far abroad, and which were actually carried no mean distance on the breeze, and under sanitary conditions at which we now shudder, a social order grew up, and a literature was evolved, to which the Scottish people now point with well justified pride. The change from the pent-up High Street to the spacious squares and airy streets of the new town gradually broke down the old social order, and the habits of the leading citizens came to be modelled on the example of the wider outside world. Among the earliest to move to the new town was David Hume, who left James's Court, near the top of the High Street, and settled in what was subsequently named St. David Street. "They hae ca'd mony a better man than me a saunt", was the sarcasm with which he soothed the perturbed spirit of his Abigail when she announced that the painters at the street-corner were taking, as she thought, unwarrantable liberties with the honoured name of her master.

At no period in the history of Edinburgh was society more brilliant and captivating than about the beginning of this century, as the new

town was in progress of filling up. Late in 1802 appeared the first number of the *Edinburgh Review*, an event which, according to Lord Cockburn, "elevated the public and literary position of Edinburgh to an extent which no one not living intelligently then can be made to comprehend." Francis Jeffrey, Francis Horner, and Henry Brougham were at that time young advocates, and they, in conjunction with Sydney Smith, projected this remarkable periodical. The start which literary enterprise and production obtained at that time in Edinburgh was, in large measure, due to the prudent boldness and skill of Archibald Constable, who was the first publisher of the blue and yellow. About the same time, the *Minstrelsy of the Scottish Border* appeared, without attracting any marked attention; but, three years later, the Wizard of the North revealed himself in his true light by the publication of the *Lay of the Last Minstrel*. What need have we to recall the unparalleled excitement maintained as, in later years, one after another, appeared the series of romances by the mysterious author of *Waverley*? The establishment of *Blackwood's Magazine* and the founding of the great publishing house of Blackwood was another era in the progress of Edinburgh as a great literary centre. Simply to name the men who adorned the literary society of Edinburgh in the early part of the century would be to present a catalogue too formidable for our limits. And how can we allude to the polemical giants who were reared in the Church, and who waxed strong amid the fierce dissensions which finally culminated in wrenching the Kirk of Scotland asunder, and in the birth of the Free Kirk under the parental care of the majestic Chalmers? The great non-intrusionists and their opponents the leading "moderates" now rest quietly from their labours, and a generation has grown up which scarcely knows the meaning of these names.

As a centre of literary activity and enterprise, Edinburgh has continued to hold its own against the all-absorbing maw of London. No publishing firm in the kingdom has a higher or better deserved reputation than belongs to Blackwood; and the shrewdness and business aptitude of the late patriarchal Adam Black secured for his firm and successors the most valuable literary property in the kingdom. Who may compute the quantities in which the *Waverley Novels* have been sent out by the Blacks to every corner of the world where the English language is understood? And, at the present moment, the firm of A. and C. Black is engaged in the issue of a new edition of the *Encyclopædia Britannica*, a work which places them in the foremost rank of British publishers, and on which, it is understood, the best talent, scientific and literary, that the country now possesses is engaged. The British Medical Association wishes continued health and prosperity to the city of Edinburgh.

THE UNIVERSITY OF EDINBURGH.

THE University of Edinburgh, though the youngest of the Scottish universities, is now the largest and the most flourishing, whether we look to the staff of its professors or to the number of its students and graduates. At the present time, its senate consists of thirty-six professors, while that of Glasgow comprises twenty-seven, that of Aberdeen twenty-two, and that of St. Andrew's only thirteen. In the session 1873-4, there attended the University of St. Andrew's 140 students; those of Aberdeen numbered 624; those of Glasgow 1333, and those of Edinburgh 1930. In the present session, the number of matriculated students at Edinburgh has risen to 2,076, of whom 792 are in the Faculty of Arts, 900 in the Faculty of Medicine, 318 in the Faculty of Law, and 66 in the Faculty of Theology. Whether this pre-eminence of the Metropolitan University be due to the fact of its being situated in the metropolis, or to other causes, it were hard to say; but it is important to remember, in this connection, that the origin of the University of Edinburgh was coeval with the Scottish Reformation, and that throughout its career it has been subject to popular influences and to popular management in a way and to an extent unknown till recent times in the other Scottish universities, and still unknown in the universities of England. Its three elder sisters in Scotland were founded, as all the older seats of learning were, by Papal Bull. It was established by Royal Charter, and was carefully nursed by royalty during its infancy. Far more, however, than to royal patronage it owed its steady growth and continued prosperity to its close connection with the municipality of the city. These two facts in combination are probably sufficient to account for the distinctive character and the high position of the Edinburgh University; to wit, its post-Reformation origin and its civic government. No one who is even slightly acquainted with the history of Scotland in the sixteenth century will deem this collocation of causes unnatural. That was the time of the Renaissance in Scotland, when men's minds were wonderfully quickened in the direction of intellectual activity, as well as of ecclesiastical and

political freedom. Scotland owes much to her reformers on the side of thought and learning. Her indebtedness to them for her public school system is a commonplace of history. Her indebtedness to them for what was long her only popular university has not been so generally acknowledged; but, though less direct, it is not on that account the less certain. To trace the gradual growth of an institution which had such an origin, and which has attained such pre-eminence, cannot but be interesting to the friends of learning and science.

It may seem strange, after what has been said, but it is nevertheless true, that the erection of a college in Edinburgh was first suggested and promoted by a zealous churchman, who, had he known the turn matters were to take, would probably not have been so liberal. In 1558, Robert Reid, Bishop of Orkney, bequeathed to the municipality of Edinburgh the sum of 8,000 merks Scots for the establishment of a college. This disposition of the bishop's savings seems to have been little palatable to the Church; for his executor, the Abbot of Kinloss, kept possession of the money as long as he reasonably could. The abbot was so far successful, that twenty-four years elapsed before the municipality obtained possession of the bequest. But the civic authorities were bold enough to discount their expectations; for, in 1563, they purchased for one thousand pounds Scots a portion of the lands in the famous Kirk o'Field, on which the present University buildings stand. In 1566, Queen Mary encouraged their faith and their zeal by bestowing on the projected University certain Church properties—of what amount is not stated—which had been confiscated to the Crown. A sad interest attaches to this disposition; for it was in the following year (1567) that the very site of the future college was made for ever famous as the scene of the murder of her second husband, Henry, Lord Darnley, by James Hepburn, Earl of Bothwell, who ere long became her third. In 1579, the citizens resolved that the work should be begun; but they were prevented by episcopal influence, exercised in behalf of the Universities of St. Andrew's and Aberdeen. Meantime, the power of the bishops was declining; and, two years later, the citizens, encouraged chiefly by the Rev. James Lawson, to whom the completion of the High School in 1579 was mainly due, began the great undertaking.

Their design did not contemplate, in the first instance at least, the rearing of a new and regular pile of buildings. That might come in time. What they were most anxious for was, that the work of teaching should be begun at once in such buildings as they could procure. Beside the Kirk of Field, there stood a fine old house, which had belonged to the Hamiltons. During the iron rule of the regent Morton, the estates of the Hamiltons had been forfeited to the Crown. The young King James had dismissed Morton three years before, and had begun to rule in person. The vacant house of the Hamiltons was, therefore, given to the Town Council and magistrates, to be turned into a college. The middle of the northern side of the present quadrangle marks its site. Near it were the houses on the lands purchased by the town council in 1563. The work of repairing and adapting all these buildings was at once begun, and for the next two centuries, they, with additions made from time to time, formed the home of the University.

While this work was in progress, the interest of the young king was enlisted in behalf of the new institution. In 1582, he granted a charter, authorising the founding of the University by the provost, bailies, and Town Council, who, with the advice of the city ministers, were to appoint the professors. The charter prohibited all persons but those appointed or permitted by the Town Council from teaching within the city. It was ratified by Act of Parliament in 1621.

Early in 1583, Mr. Robert Rollock, who had acquired a great reputation as professor of Humanity at St. Andrew's, was invited to become first regent of the new University; and, in October of that year, he began to teach in the hall of Hamilton House. A single class, with a single teacher, meeting in a confiscated mansion in the suburbs: such was the beginning of the great University of Edinburgh. The number of students in this class is not recorded; but there is reason to believe that it was large. Rollock's biographer mentions that his fame as a teacher was so wide, that multitudes flocked from all parts of the kingdom to attend his lectures. He lectured on Philosophy; but he soon found many of his students so badly grounded in Latin, that they could not profit by his prelections. He, therefore, asked the patrons to appoint an assistant especially to teach those who were backward in the learned tongues. He recommended for the office Mr. Duncan Nairne, who by-and-by became second regent of the college. The curriculum extended over four years, and the custom was for each regent to carry forward his own set of students from the first year to the fourth, teaching them new subjects each year, until he had prepared them for "laureation". As each year brought up a new set of students, a new regent had to be appointed to teach them, until the

staff of four, corresponding with the years in the course, was complete. This point was reached in 1586; but a fifth regent was then appointed, and Rollock was made principal and professor of Theology. The regular staff remained at this number for many years, and the plan of each regent advancing with his own class continued to be followed even after several professors of special subjects had been appointed. This plan characterises the first period in the history of the University.

It is well known that a Scottish University is simply a collection of day classes, and makes no provision for the board or lodging of its students. This was not always the case. The University of Edinburgh, when first opened, and for some time thereafter, lodged and boarded some at least of its students. Those who occupied rooms in college were required to pay rent for them; but it does not appear that fees were charged for tuition. The salaries of the regents were paid by the town. The social character of Scottish university life at this early period is further shown in the fact that the regents and the students went collectively to church, the eastern gallery of the High Church being especially allotted to them by the town council. Judging by the numbers who annually proceeded to graduation, the whole attendance at the University at this time appears to have been from 100 to 140.

The earliest picture which these particulars enable us to call up of the University of Edinburgh is suggestive rather of a college or hall in one of the English universities than of the Scottish universities of the present time. There are quaint solid-looking houses straggling here and there: Hamilton House in the north, the house of the provost of Kirk of Field (the principal's residence) in the south, and that of the prebendaries in the east. There are gardens and shady pleasaunces favourable to meditation; and an air of seclusion is given to the whole by the high wall with which, after the plague of 1585, the careful patrons caused the precincts to be surrounded. As the college grew and prospered, and more accommodation for lecture-rooms was required, the resident students were gradually driven out, and the institution became what it is at present, a collection of class-rooms, used only during the day.

The first addition to the staff was made in the interests of law. In 1590, a chair of Law was endowed jointly by the lords of session, the Faculty of Advocates, the Writers to the signet, and the Town Council. The first professor, however, for some reason unexplained, lectured on Humanity (the Latin language and literature), instead of law. Hence it has come about that, to this day, the Humanity chair is in the gift of these bodies, with the exception that, since 1858, the Court of Curators has taken the place of the town council. At first, the professorship of Humanity seems to have been held as a stepping-stone to a regency, and afterwards the two offices were frequently held joint-y.

The accession of James to the English throne deprived the University of the smiles of royalty. When the king revisited Scotland in 1617, he bestowed special attention on his favourite college. He was gratified to find that, during his absence, a public hall, a divinity school, and other rooms, had been added to the buildings. He was present at, and took part in, a learned disputation, and was pleased afterwards to display his own wit in praising that of the combatants. In token of his favour and good-will, he bestowed on it, by letter from Paisley, before he left the country—not a new endowment—but the name and title of the "College of King James".

A chair of Divinity, endowed by the provost of Edinburgh, was founded in 1620. The chair of Hebrew was added in 1642—the year of the outbreak of the civil war. The University made little progress during the troublous times that followed; but its work continued to be done steadily and calmly by able men. Cromwell endowed the University with £200 sterling *per annum*. William III bestowed on it an annuity of £300, part of which was given in support of a chair of Divinity and Church History, founded in 1662. These three chairs formed the entire equipment of the Faculty of Theology till the establishment of the chair of Biblical Criticism in 1846.

The Faculty of Law next claims attention. We have seen the miscarriage of the endowment designed for a chair of Law in 1590. The first regular law chair—that of Public Law—was founded in 1707, the year of the Treaty of Union. The chair of Civil Law was established jointly by the Faculty of Advocates and the town council in 1710; that of History in the same way in 1719; and that of the law of Scotland by the same parties in 1722. No addition was made to the Faculty till 1807, when the chair of Medical Jurisprudence was founded. The chair of Conveyancing, completing the Faculty as it now exists, was added in 1825.

The second great epoch in the history of the University is marked by the systematic organisation of the Faculty of Arts in 1708. Ever since the foundation of the University, Philosophy, which included physical as well as mental and ethical science, had been taught by the

four regents under the plan of rotation already described. A separate professor of Humanity had been appointed in 1597, and a separate professor of Mathematics in 1674. But, in 1708, the Town Council issued or ratified a new set of regulations for the teaching of Greek and Philosophy. These regulations assigned a special department to each regent or professor. Latin and mathematics were already separate subjects. Now, Greek, logic, and metaphysics, moral philosophy and natural philosophy, were put on the same footing. Instead of each of the four regents teaching all these subjects in succession, one of them was told off to teach each of the subjects exclusively. Thus the Faculty of Arts was thoroughly organised; and, from this application to learning of the principle of the division of labour, the University very soon derived, and has ever since continued to derive, the greatest benefit. From this time, we may date the occupancy of the several chairs by men of eminence, each distinguished in his own department in a higher degree than could have been looked for when one man was expected to teach all subjects equally well. To this arrangement, we owe especially the pre-eminence which the University has ever since held as a school of philosophy under the direction of such men as Adam Ferguson, Dugald Stewart, Thomas Brown, and Sir William Hamilton; and as a school of physics under men like Playfair, Sir John Leslie, and James Forbes. The other chairs in the Faculty of Arts have been added more recently, to meet the growing requirements of modern times. The chair of Rhetoric and English Literature was added in 1762; that of Practical Astronomy in 1786; that of Agriculture in 1790; that of the Theory of Music in 1839; that of Sanskrit in 1862; that of Engineering in 1868; and, finally, those of Geology and Commercial and Political Economy in 1871.

The fame of the Faculty of Medicine, which now forms the most important feature in the character of the University, dates also from the early part of the eighteenth century. Before the time to which we are referring, five chairs now included in the Medical Faculty had already been instituted; those, namely, of Botany, Institutes of Medicine, Practice of Physic, Anatomy,* and Chemistry; but very little use of the training thus available had been made by medical practitioners. The makers were still in Scotland, as in most other countries, the only available surgeons; and the regular practitioners were either empirics, who formed the majority, or men who had been educated abroad, who formed a small and melancholy minority of the craft. The great change began in 1720, when Alexander Monro became professor of Anatomy in the University of Edinburgh. He had effective forerunners in the field of reform in Sir Andrew Balfour, who founded the Royal College of Physicians in 1685, and in his able coadjutors, Dr. Archibald Pitcairne and Sir Robert Sibbald; and he was much indebted to the encouragement he received from his father, John Monro, who, after serving an apprenticeship as surgeon-apothecary with King William in Flanders, had settled in Edinburgh as a medical practitioner in 1697. Perceiving and fostering the admirable parts of his only son, he sent him to complete his education in London, Paris, and Leyden; and he returned to Edinburgh in 1719, so complete a master of his profession that, though only 22 years of age, the whole of the members of the Royal College of Physicians, headed by their president, assembled to hear him lecture. The impetus which he gave to the scientific study of medicine was immense. The medical curriculum was very soon reduced to a system. Additional professorships were instituted in the Faculty in 1724. The movement for founding the Royal Infirmary as a clinical school began in 1725, and the University entered on that career which has made it famous as a medical school over the civilised world. The chair of midwifery was instituted in 1726; and the reputation of the University as a great school of medicine was maintained by the great Cullen, by the Gregories, and by Joseph Black, till the commencement of the present century. The chair of Natural History, of which Edward Forbes is the brightest ornament, dates from 1767; that of *Materia Medica* dates from 1768; that of Clinical Surgery from 1803; those of Surgery and General Pathology from 1831.

It is not wonderful that, long before the last-named date was reached, the old University had burst its bounds. In 1760, the *Senatus Academicus* included eighteen professors; and the old buildings in the Kirk of Field were wholly inadequate to accommodate so thriving an institution. To secure fortune, the town council resolved to take the tide of prosperity at the flood. A scheme was set on foot for erecting a home for the University which should be worthy of its fame and its

name. This movement began in 1763; but the outbreak of the American war caused it to be suspended for several years. With the peace came a revival of prosperity. Public spirit was reawakened, and a subscription was set on foot. Considerable sums having been obtained, part of the old buildings was pulled down, and the foundation-stone of the present magnificent pile was laid by Lord Napier, as Grand Master of Scotland, on November 16th, 1789. The architect was Robert Adam, by whom the Register-house was also designed. The Town Council seems to have been more zealous than discreet in entering on so expensive an undertaking. Probably it overestimated the resources of the country. Before the design was half completed, the work had to be stopped for want of funds. The north side alone was completed. The west side and the east front were little more than begun. The old buildings, including the Kirk of Field House, stood for some years longer on the site of the present library. Thus matters continued—old and new buildings standing side by side—for twenty years longer. In 1815, however, the claims and the needs of the University were pressed on Government by some of the Scottish members, and a grant of £10,000 a year for seven years was voted to complete the buildings. Operations were resumed in the following year, under the direction of W. H. Playfair, who adhered closely to Adam's exterior design, but who altered greatly the interior arrangements. The four sides of the quadrilateral, which formed the original plan, are now complete; but the building still lacks the great dome over the east front, which formed so striking a feature of Adam's design. The buildings, as has been said, form a regular parallelogram with a spacious quadrangle in the inside. The entrance is by three wide gateways in the east front. The gateways are surmounted by a handsome portico, supported by Doric columns twenty-six feet high, each formed of a single stone. The inscription on the entablature records the institution of "the College of King James" in 1582, and the commencement of the new buildings in 1789, during the principality of William Robertson. "The stupendous proportions," says Chambers, "of this magnificent front are seen to great disadvantage, on account of the closeness of the street to the walls; and, the more the edifice is examined, it excites a deeper and deeper regret that it does not occupy the centre of some spacious park." The north side is now finely opened up, a broad and handsome street (Chambers Street) having superseded the narrow and dingy lanes by which till lately it was skirted. One could wish, however, that the architectural features of this side were more worthy of exposure; that, for instance, something like the massive portico in the east broke the dull monotony of the northward wall.

Of the additions begun in 1815, the chief part is occupied by the University library. This library originated in a gift of three hundred volumes to the magistrates, for the use of the citizens of Edinburgh, by Clement Little, advocate and commissary. This gift was made in 1580, before the college was founded; and an apartment was prepared for it in the church-yard of St. Giles (now the Parliament Square). As soon as the college was opened, Little's library was removed thither, and formed the nucleus of one of the finest collections in the United Kingdom. It has been enriched by private munificence and by public liberality. It was one of the libraries which, under an Act of Queen Anne, received a copy of every book entered at Stationers' Hall; but, some years ago, that often inconvenient privilege was compounded for by the acceptance of a money grant. Drummond of Hawthornden, the famous poet, bequeathed his library to the University, and thus enriched it with many rare specimens of early Scottish literature. Drummond's friend Principal Adamson was also a generous donor. The latest accession to the wealth of the library is of great value. It consists of the collection of Shakespearean literature formed at great cost by J. O. Halliwell, and given by him to the University in 1872. The visitor would do well to spend a few minutes over the case in the library hall, in which are displayed a very fine copy of the second folio edition (1632), and many copies of the original editions of the single plays in quarto. In an adjoining case he will find an interesting collection of illuminated manuscripts, among them several missals of the fifteenth century, a French manuscript of *La Sainte Bible* on vellum, written in 1314, and a Greek manuscript of the Four Gospels, written in the twelfth century. The library now contains 137,000 printed volumes, and about 700 volumes of manuscripts, many of them of great interest and value. The library hall, in which most of the books are preserved, is one of the most magnificent rooms in Scotland. It is 198 feet long by 50 feet wide. The bookcases stand at right-angles to the walls, between the windows, and terminate in massive pilasters, which support the arched roof. In front of these pilasters stand busts of famous professors: Alexander Monro and William Cullen, John Leslie and John Playfair, Dugald Stewart and William Hamilton, James Young Simpson and James Syme, and many more. In the library, as well as in the senate hall and the court-room, there are some valuable portraits of

* The anatomical collection of the University began with a skeleton of a Frenchman, brought from Paris by Dr. Michael Young, and presented by him to the University in 1671. So entirely was the University given up to literature at that time, that this skeleton, hung up in the library and covered with a white sheet, was a source of mysterious terror to the whole corporation, professors, students, and all. So much we gather from an old MS. catalogue of the library, of date 1697, in which the skeleton is entered among the *res rariores*.

principals, professors, and benefactors of the university : of Knox, Buchanan, George Heriot, and Napier of Merchiston ; of Principal Robertson, Adam Ferguson, and John Playfair, all by Raeburn ; of Thomas Brown and James Thomson, the poet ; of John Lee and John Wilson ; of Sir David Baxter and Sir Roderick Murchison. A statue of Sir David Brewster stands at the west end of the quadrangle.

The present constitution of the University as a corporation dates only from the year 1858. The causes which led to the passing of the Act, which relates to all the Scottish universities, need not be specified here. It is enough to say that it was the result of an agitation for university reform which had extended over many years, and that it relates not only to the government of the University but also to the regulation of the course of study and of degrees. Its chief effect, as regards the University of Edinburgh, was to deprive the Town Council of the patronage of seventeen chairs, and of their management of the University. The former, the patronage, was transferred to seven curators, four of whom are elected by the town council and three by the University Court. The latter, the management, was transferred to the University, which is now a self-governing body. The corporation consists of the chancellor, the rector, the principal, the professors, and the registered graduates and alumni. Since 1868, when the last Reform Act was passed, the University, jointly with St. Andrew's, has sent a representative to Parliament.

The governing power of the University lies with the University Court, the *Senatus Academicus*, and the General Council. The chancellor is the nominal head of the University, and he is president of the General Council. He is also the fountain of honour, as all degrees are conferred either by him or in his name. But his chief function, like that of a constitutional monarch, consists in his giving his sanction to the laws passed by the University Court. In that court, however, he is represented by his assessor. The University Court is really the supreme power in the administration. It is a representative body of eight members, two of whom, the rector and his assessor, represent the matriculated students ; other two of whom represent the senate ; two the general council or graduates ; and two the town council of Edinburgh. The senate superintends the teaching and discipline of the University, and administers its revenues ; but in all these regards the court superintends the senate. The court makes changes in the internal arrangements ; the court fixes the rate of class-fees and other charges ; the court has power (with the approval of Her Majesty in Council) to censure, suspend, retire, or deprive of office an inefficient principal or professor.

The General Council consists primarily of registered graduates, but the chancellor and the members of the court and senate for the time being are members of it. At the present time it numbers about 3,700 members. Its sole function, besides electing the chancellor, and an assessor to the Court, lies in "making representations" to the Court on matters affecting the wellbeing of the University. The Act, it is true, provides that all improvements proposed by the court should be "submitted to the general council for their consideration" ; but this rule is generally honoured in the breach. The council is the popular element in the university constitution ; but it has no power, except the power of talking, and as most of its members have grown tired of that, its meetings (twice a year) have become a very dull farce. The same is true of the general councils of the other Universities ; and the injustice of the case is felt so keenly, that steps are being taken to endeavour to secure for these bodies some direct and actual influence in university affairs.

The effect of the Act of 1858, as a whole, has been to increase very greatly the efficiency and the prosperity of the University. The increase in the attendance of students is the best indication of this. For many years before 1858, the attendance was much lower than it had been in the early part of the century. In 1819 the number of students on the roll was 2,160, in 1830 it was 2,186, but in 1840 it fell to 1,298, and it did not rise much above that during the next decade and a half. Since 1858 the attendance has been steadily increasing : last year it was 1,930, this year it is 2,076 ; there is, therefore, every reasonable hope that the maximum of 1830 will, ere long, be surpassed. The number of graduates has also increased. This is especially noticeable in the Faculty of Arts, in which, before the passing of the Act, graduation had come to be the rare exception. Sometimes the annual list showed fewer than a dozen ; and the Senate congratulated itself if it presented anything approaching a score. Now, the annual number of graduates averages between 60 and 70. The number of chairs has also increased. Five new chairs (three of which are in operation) have been founded or announced since 1858. The large extent to which assistant-professors have been introduced has further increased the number of working classes.

This has brought up again the question of accommodation. The fact

is, that the University has once more burst its bounds : not only so, but accommodation and appliances that were suitable enough half a century ago, are now wholly inadequate. It was by the free use he made of practical demonstrations and clinical work that Alexander Monro gave its first great impetus to the medical school of Edinburgh. It is the modern practice in all great universities to adopt the same method in teaching such subjects as physics, chemistry, and natural history : to make less use of the lecture-room and more of the laboratory ; to appeal less to the ear, and more to the eye and the hand. But for this kind of work there is no adequate accommodation in the present buildings. A scheme has therefore been started for erecting an entirely new school, with class-rooms, theatres, laboratories, and museums, for the medical Faculty of the University. The site secured is at the Meadows, near the new Royal Infirmary. Of the cost of the new buildings, for which plans have been prepared and approved, the sum of £100,000 is required from the public, and of this sum £77,000 has already been subscribed. When the whole has been obtained, Parliament will be appealed to for aid.

Since 1858, the benefactions to the University have also greatly increased. Since that year, Fellowships and Scholarships of the aggregate annual value of £3,400 have been established. Of these, eight are classical, six are philosophical, twelve are mathematical and physical, and two are theological. There are over one hundred bursaries in the Faculty of Arts, of the annual value of £2,000 ; there are twenty-four bursaries in the Faculty of Divinity, four in that of Medicine, and three in that of Law.

The degrees conferred by the university are Master of Arts (M.A.), Bachelor of Medicine (M.B.), Master in Surgery (C.M.), Doctor of Medicine (M.D.), Bachelor of Laws (LL.B.), Doctor of Laws (LL.D.), Bachelor of Divinity (B.D.), Doctor of Divinity (D.D.), Bachelor of Science (B.Sc.), and Doctor of Science (D.Sc.). The University also grants certificates in arts to women, and local examination certificates to school boys and girls. Of the above, the LL.D. and the D.D. degrees are purely honorary. The others are bestowed after examination. The arts curriculum, without entrance examination, occupies four years. If an entrance examination be passed, it may be completed in three years. In the former case the minimum cost of the curriculum, including fees for degree examinations, is £38 17s. ; in the latter case it is £28 7s. The total minimum cost of attending the medical curriculum (five summer and four winter sessions) and of taking the M.B. degree is £120 13s. For the C.M. diploma there is an additional fee of £5 5s. The minimum for taking the M.D. degree is £141 3s.

THE ROYAL COLLEGES, MEDICAL INSTITUTIONS, DEBATING SOCIETIES, ETC., OF EDINBURGH.

At a short distance from the University, stands the Royal College of Surgeons, one of the most classical buildings in Edinburgh. The first charter granted to the practitioners of the "surreagene craft" is dated July 1st, 1505, eight years prior to the battle of Flodden ; it provided, amongst other things, for the study of anatomy, and established a monopoly for the surgeons of the manufacture of "aquavite". We must refer our readers to the admirable historical sketch by Dr. Gairdner, senior, for a full account of the rise and progress of the Royal College of Surgeons, and for the part this ancient and important body has taken in developing the Medical School of Edinburgh, and promoting the establishment of the Royal Infirmary. This sketch was published in the *Edinburgh Medical Journal* for 1860. The museum of "Surgeons' Hall" is one of the most extensive in the kingdom, and possesses many unique objects of interest. Under the care of the curator, Dr. Bell Pettigrew, it is daily adding to its treasures, and the careful arrangement and order shown in every department reflects the highest credit on this well-known anatomist, and on the liberality of the College. At the rear of the building, stand the anatomical rooms, chemical laboratory, class-rooms, and private museums of most of the teachers of the extra-academical school of medicine and surgery. (The large number of teachers necessitates the juniors lecturing in private class-rooms apart from the main buildings.) This school is not under the control of the College, and, in fact, holds no corporate capacity, being simply an association of private lecturers. The courses of lectures, however, qualify for University degrees and for licenses granted by all other bodies. There is a movement on foot for the procuring of a charter of incorporation.

The Royal College of Physicians of Edinburgh has its Hall in Queen Street, in the New Town. Its first charter of incorporation was obtained from Charles II, and the great seal was appended to it on St. Andrew's Day, 1681. This body has always been foremost in promoting the welfare of the many charitable institutions of the city. Within the last

few years, its donations for medical purposes have been munificent; amongst others, may be mentioned a thousand guineas to the new University buildings. Outwardly, the Physicians' Hall is purely classical in design, and in its internal arrangements sumptuous. Its library is full to overflowing, and the museum of drugs rich and varied. The British Medical Association will have an opportunity of judging how this influential corporation exercises its hospitality at the ensuing meeting, a virtue for which it has been ever famed.

Edinburgh possesses several dispensaries, the Royal, the New Town, two for Diseases of the Eye, one for Diseases of the Ear, and a Dental dispensary, all conducted on the most liberal principles. Nor is it wanting in professional debating societies. The Medico-Chirurgical and Obstetrical Societies meet regularly during nine months of the year, and animated discussions evince the interest taken by the profession in the prosecution of the purely scientific aspects of the subject. By these societies ample provision is made for the expenditure of the scientific energy of the profession in Edinburgh; and for the occasional discussion of such subjects of general social and professional organisation as from time to time have been discussed with advantage in the Metropolitan Counties Branch; it would be well for the Edinburgh members to form a Branch, which should meet once a year, appoint office-bearers and representative members. At such meetings one or more of the leading questions of the day might form the subject of address by the president, and be subsequently discussed. The importance of this step will, we trust, be urged on the profession in Edinburgh and Glasgow at the approaching meeting.

Mention should not be omitted of the Royal Medical Society, instituted in 1737. This Society is composed mainly of students, and forms a most important adjunct to the system of education.

ANATOMICAL SCHOOL OF EDINBURGH.

THIS dates back to the year 1694. In October of that year, Alexander Monteith, a surgeon of high reputation, and the Corporation of Surgeons, independently of each other, sought for and obtained from the Town Council a grant of subjects for dissection. In this way, therefore, two rival classes of anatomy were started in Edinburgh. The contest, however, was unequal, seeing that, in addition to the influence gained by numbers, the corporation had the advantage of a more plentiful supply of subjects; consequently, the efforts of Monteith were not crowned with success, and in three years he gave up his undertaking and retired from the teaching of anatomy.

Until 1705, the Corporation of Surgeons never seem to have appointed any one man whose exclusive duty it was to teach anatomy. They depended entirely on such of their number as were willing to undertake the office. This arrangement, as we might expect, gave rise to many inconveniences; and in that year, therefore, they nominated Robert Elliot as sole teacher, and as such he became entitled to all emoluments proceeding from the class. At the same time, the Town Council appointed him Professor of Anatomy to the University, granting a yearly income of £15. He died in 1714, and in his place Adam Drummond was called to the chair; but, owing to the requirements of the extensive surgical practice in which he was engaged, he was unable to give so much attention to teaching, as the chair required, and consequently MacGill, a young surgeon with a strong inclination towards anatomical research, was appointed joint professor.

We are now approaching a period when the Anatomical School of Edinburgh was placed on a sure and lasting foundation. Hitherto the efforts in this direction had been desultory, and hardly what we could call successful. The real foundation should date from the appointment of Dr. Alexander Monro to the professorship, and it is this man that we should always recognise as the father of the school.

Alexander Monro was the son of John Monro, a surgeon in the army, and afterwards a practitioner in Edinburgh. It was the great desire of his father that an efficient medical school should be established in Edinburgh, and his son early evincing an eagerness to obtain anatomical knowledge, he trained him specially as a teacher of anatomy. Having obtained all the anatomical knowledge he could acquire in Edinburgh, young Monro proceeded to London and studied with great zeal his favourite science under Cheselden. He then went to Paris: but before doing so he sent home to his father certain anatomical preparations, executed by himself, and these were so much admired by Drummond, that he intimated to Mr. Monro that should his son continue as he was doing, he would give up his share of the professorship on his return to Edinburgh. From Paris he went to Leyden and studied under Boerhaave. He returned to Edinburgh in 1720, and both Drummond and MacGill, looking simply to the advantage to be gained by the anatomi-

cal school, resigned the chair of Anatomy in his favour. At this time he was twenty-two years of age.

We must now look to the causes which led to the removal of the anatomical school from the theatre in Surgeons' Hall to the University. This took place five years after the induction of Monro, and the leading cause was an attack made upon the Surgeons' Hall by a mob infuriated by an attempt on the part of some of the students to rob the graveyards, in order to obtain subjects for dissection. It was with difficulty that the anatomical preparations, used by Monro for teaching, were saved from destruction; and this alarmed him so much that he craved and obtained permission to hold his class in a theatre within the walls of the University.

Monro died in 1767. He was a man with a wonderful genius for anatomy, a splendid lecturer, and possessed of great administrative power. Moreover, kind and courteous to the students, and always anxious to help them in after life, he was a great favourite. No wonder, then, that the school prospered under his masterly direction; his course of lectures embraced surgery as well as anatomy, and he generally concluded the session with a few lectures on physiology. Before describing the individual bones, he pointed out their uses and structure, and in demonstrating the various organs of the human body he illustrated his lectures, both by recent dissections and by dissections of the lower animals. He was succeeded by his youngest son, Alexander, who had previously in the year 1757 been appointed joint professor. He had received a very thorough training in anatomy, both at home and abroad, and whilst studying in Berlin under Meckel he had become acquainted with all the newest methods of anatomical research. Profiting by this, and possessing a great faculty of rendering his lectures clear and forcible, he not only maintained the reputation of his father's chair, but soon raised it to be amongst the first in Europe. His method of instruction was similar to that of his father, but, in addition, he used the microscope to demonstrate to his class the minuter structure of the various organs. He also gave lectures on Comparative Anatomy, and it was during his incumbency that the supplementary course of "anatomical demonstrations" was instituted, a method of instruction most popular amongst the students, and still continued in the University, and which has also been adopted by a great number of other anatomical schools.

Alexander Monro *tertius* was appointed joint professor with, and successor to, his father in 1798, but he did not become sole professor until 1808, when his father retired. Following so eminent a professor, Monro *tertius* had no easy task before him in maintaining the honour of the school. Moreover, he had formidable rivals to compete with in the extramural school, and he not being a popular teacher, the numbers attending the class declined. He was a quaint eccentric man, possessed of considerable ability, but evidently with no taste for the subject he professed.

Here it should be mentioned, that up to this time there had been no chair of Surgery apart from that of Anatomy. It was called the Chair of Anatomy and Surgery, and Monro the second had always strenuously resisted all attempts to effect a separation. In 1831 John Wm. Turner was appointed Regius Professor of Surgery, but Monro *tertius* still retained the title of Professor of Anatomy and Surgery, and every Saturday taught an operative class of surgery. It was not until 1845, when he retired, that the complete separation was effected.

John Goodsir obtained the chair after Monro *tertius*, and, he being a man of an entirely different mould, the chair of Anatomy, under his guidance, soon recovered what it had lost during the incumbency of his predecessor. Tall, gaunt, and stern in appearance, he taught anatomy with an earnestness that inspired his students with both awe and admiration. He possessed a great genius for anatomical research, and this, united with a most unflagging industry, soon gained for him a position which was equalled by few anatomists of his day. Moreover, he exercised a wonderful influence upon the minds of his students, the impress of which is to be seen in the various writings of these pupils.

He was succeeded in 1867 by the present professor, Wm. Turner, under whom the School of Anatomy in the University has steadily increased until it is now the largest in Europe. Looking back upon the list of professors who have filled the chair of Anatomy since 1720, it is a curious fact to observe that each acted before his appointment as assistant to his predecessor. This fact suggests the idea that, as each must have received considerable experience from his predecessor, this experience has accumulated, and has in part at least caused the great success which has always attended the teaching of anatomy in the University.

As the prosperity of a school and the efficiency of its teaching can to a certain extent be estimated by the number of students attending, it may be interesting to give a few extracts from the class-rolls. Monro *primus* began with 57 pupils, but gradually his class increased so as to give a yearly average attendance of about 113. His largest class was

somewhere about 190. *Monro secundus* had an average yearly attendance of nearly 300; indeed, his class in 1783 reached 436. During the reign of *Monro tertius* the numbers attending the class fell off, but not so much as might be expected. This was owing to the fact that candidates for graduation were more or less compelled to take out his class at least once, as the extramural classes did not qualify at that time for the University examination. Passing to the incumbency of Goodsir, we find that he began with a class of 275. In 1852-53 the roll shows an attendance of 368. The following winter, his health having broken down, he was compelled to go abroad, and in his absence Dr. Struthers (now professor of Anatomy in Aberdeen) acted as his substitute, and taught in the University not only Professor Goodsir's class but his own; and the classes thus combined amounted to 442. In 1858, a Royal Commission was appointed to inquire into the condition of Scotch Universities. This commission issued new regulations, requiring that each student before being admitted into the Faculty of Medicine should pass a stringent entrance examination. These regulations came into force in 1861, and their immediate effect was to cause a considerable falling off in the attendance upon the medical classes. The anatomical class, which in the year previous, 1860, numbered 354, now participated in the diminution. In 1865-67, the last year of Goodsir's incumbency, the class had diminished to 223. Professor Turner commenced his first winter course with an attendance of 256. The number, however, has steadily increased, until now the Anatomical School of the University of Edinburgh occupies the proud position of being the largest in Europe. Last winter session, viz., 1874-75, the class numbered 470.

We must now retrace our steps and show briefly the history of the EXTRAMURAL Anatomical School. The first lecturer in this school was John Bell. When a student under the second *Monro*, he was much impressed with the fact that the bearings of anatomy upon surgery were not sufficiently recognised in the teaching of that time. Accordingly, having qualified himself for the position and encouraged by the great number of students that yearly repaired to Edinburgh for their medical education, he commenced a course of lectures in 1788 upon Surgical Anatomy. He was assisted in his teaching by his brother Charles (afterwards Sir Charles Bell), the former conducting the surgical, and the latter the anatomical department; and when John gave up the class his brother carried it on himself for four years longer, and then left for London. Before this, however, the well known anatomist Barclay had commenced to lecture, illustrating his course with frequent references to the anatomy of the lower animals. At first, he was not successful, but after the departure of Bell for London and the death of *Monro secundus*, his class was very largely attended. In 1808, Dr. John Gordon appeared on the field, and in his lectures he taught Anatomy and Physiology conjointly. The direct successor of Barclay was the famous Dr. Knox. He was a most fascinating man in private, and, carrying this fascination into the lecture-room, he soon attracted a very large class around him. Into his lectures he introduced much extraneous matter, and he never failed to awake within the student an enthusiasm for the subject which he taught. Besides Knox, however, there were several other lecturers at this time. Amongst these we may mention John Lizars, afterwards succeeded by his brother Alexander, also Sharpey, Handyside, Allen Thomson, the latter taking Lizars' place when he removed to Aberdeen. In a short time, Allen Thomson was called to the Chair of Physiology in Edinburgh; and then, after a time, to the Chair of Anatomy in Glasgow. He has thus occupied a chair in three Scotch schools. Mercer took the place of Handyside, who gave up Anatomy to follow out Surgery. When Knox retired, Dr. Handyside again commenced to teach anatomy, being joined in his undertaking by Dr. Lonsdale and Mr. Spence (before this, Demonstrator of Anatomy with *Monro tertius*, and now Professor of Surgery). Considerable success attended this class; but, after a time, it was broken up by Dr. Handyside resuming practice, Mr. Spence commencing a course of Surgery, and Dr. Lonsdale leaving Edinburgh for the sake of his health. Dr. Struthers took their place; and, on his obtaining the Chair of Anatomy in Aberdeen, Dr. Handyside a second time returned to Anatomy, and he still continues to lecture with success in one of the class-rooms belonging to the Royal College of Surgeons.

Method of Instruction adopted in the Anatomical Department of the Edinburgh University.—During the Winter Session, the teaching staff consists (in addition to the professor) of two graduates, who act as permanent demonstrators, a junior demonstrator, also a graduate, and holding his appointment for the session only, and two undergraduates, generally third- or fourth-year students, who act as assistant-demonstrators. The professor delivers a course of lectures upon Systematic Anatomy, and illustrates these with a large collection of specimens of the osteology, both of the human subject and of the lower animals, by recent dissections, and by numerous preparations and diagrams. A very prominent feature in this course is a certain number of lectures

devoted entirely to the description of the microscopic characters of the various textures of the body, and demonstrations of these under the microscope. In connection with this course of lectures, tutorial demonstrations upon Osteology are given to the junior members of the class four days a week during the earlier part of the session. In the afternoon, an additional course of lectures is delivered upon Regional Anatomy. The Professor and Senior Demonstrator conduct this class conjointly. A recent dissection is placed before the students, and the various structures in their relationships to each other are demonstrated to the class. In the dissecting-rooms, the teaching is carried on by the various demonstrators under the superintendence of the Professor.

During the Summer Session, the staff is reduced to two demonstrators and a junior demonstrator; and the dissecting is carried on as in winter, with this difference, that the number of students attending is very much smaller. In the forenoon, a course of lectures is delivered by the Professor and Senior Demonstrator conjointly; the Professor generally lecturing upon Comparative Anatomy, and laying before the students the results of his own original observations; whilst the Senior Demonstrator demonstrates to the students a recent dissection, laying stress upon the bearings of anatomy to medicine and surgery.

Method adopted in Preparing the Subjects for Dissection.—Every body, on being received, is at once injected with Stirling's Preservative Fluid, the quantity thrown in depending upon the condition of the body. A paint injection may be employed immediately after this; but it is better to allow the body to lie for twelve hours, and then throw into the vessels a coloured lard injection, and this latter is the method adopted in the University. The "preservative fluid" is a most valuable preparation. It has been employed in Edinburgh for more than thirteen years, and the change that it has wrought in the dissecting-room atmosphere is marvellous, and can only be appreciated by entering first the Edinburgh dissecting-room, and then the rooms of some school in which its uses are not known. It apparently has not only the power of preventing, but also to a certain extent of correcting, putrefaction, when not very far advanced. Its action is rapid and almost instantaneous; and on injecting a body green from putrefaction, we can trace the course of the fluid through the minute vessels by the fading away of the green and the restoration of the skin to its natural colour. To any one who frequents the dissecting-room, it is well known that putrid mucus, blood, and fluids of the body, give rise to the most offensive odours. A little of the fluid sprinkled on such immediately removes the odour; and then it is useful not only for the injection of the bodies, but also for sprinkling over any offensive smelling part, or any putrid fluids that may have been spilt on the floor.

THE MUSEUMS IN EDINBURGH.

THE museums in Edinburgh bearing upon medical science are, strictly speaking, only two in number; viz., the Anatomical Museum of the University, and the Museum of the Royal College of Surgeons: but certain others, such as the Museum of Science and Art, the Phrenological Museum, and the Antiquarian Museum, are not without a considerable amount of interest to the profession.

The Museum of the University.—This occupies the ground-flat of the anatomical department. It was founded in the year 1800, by Dr. Alexander *Monro secundus*, who presented to the University his own collection of anatomical preparations, with that of his father. About sixty years later, the museum was further added to by Sir David *Monro*, who presented to it a large number of anatomical preparations which had belonged to his father, Dr. *Monro tertius*. Professor Goodsir, whilst curator, reorganised the collection and created the Museum of Comparative Anatomy; and, on his death, his private collection was purchased by the University. For the last eight years, it has been under the charge of Professor Turner, and rapid strides have been made in its extension. The great drawback to its further increase is the want of space; great numbers of fine specimens being stowed away in corners, and thus overlooked by the visitor; but this will shortly be remedied in the new buildings designed for the University Medical School. On entering the Museum, the first and smallest division is found to contain a small ethnological collection of crania and casts, some of historical interest, such as the skulls of Peppé, the murderer; of Haggart, the burglar; of George Buchanan, the Scotch historian; and of Martin Sobieski; also the skeletons of Burke and "Bowed" Joseph, the leader of the meal-riots in Edinburgh. In the second division we come upon the original nucleus of the Museum—the collection of anatomical preparations presented by *Monro* the second. Amongst these may be seen dissections of the lymphatic vessels of the leg after their injection with mercury—specimens prepared by Allen Burns, and valued greatly by the *Monros*, who obtained them at the

expense of no little money and trouble; also corroded injection of the kidney, and arterial preparations of the head and neck. Here, also, are a number of comparative anatomy specimens added to the museum by Goodsir. The third and main division is occupied by pathological and comparative anatomy specimens; the former being arranged around the walls, whilst the latter are placed on stands arranged in parallel rows along the floor. Here are to be found fine injections of the various organs of birds, reptiles, and fishes, and also dissections of the electrical organs of fishes—all by Goodsir. Very worthy of attention, also, are the series of preparations of the muscular fibres of the heart, and also injected and dissected specimens showing the blood-vessels and nerves of the heart, by Pettigrew. In the preparation of these latter, the great difficulty to overcome was to discover some injecting material which would stand heat, seeing that it was necessary to boil the heart before proceeding with the dissection. At the suggestion of Mr. A. B. Stirling, Dr. Pettigrew employed a mixture of water, flour, and vermilion, which, on the heart being plunged into hot water, immediately formed a solid flour-paste. The success which attended this expedient is at once recognised by an examination of the preparations. Occupying a table by itself, is a very beautiful collection of injections, by Mr. Stirling, of the uterus and placenta of various animals, including the horse, sheep, whale, etc., added to the museum by Professor Turner. Amongst these may be recognised the preparations with which Professor Turner illustrated his lectures to the Royal College of Surgeons in London in June last.

A small private museum belonging to Professor Spence, and very rich in specimens of surgical pathology, must be mentioned. It also contains some very beautiful arterial dissections executed by himself, one showing the arteries of the hand being particularly fine.

Museum of the Royal College of Surgeons.—This is a very handsome building of Grecian architecture, situated in Nicolson Street, a little to the south of the University. It was designed by Mr. W. H. Playfair, and erected in 1833. Behind the Museum are a number of lecture-rooms belonging to the Corporation of Surgeons, and occupied by some of the extramural teachers. This is, perhaps, the most extensive museum of the kind in Scotland, and it contains a very large and valuable collection of anatomical and pathological preparations. For the nucleus of this Museum, the College of Surgeons is indebted to Dr. Barclay and Sir Charles Bell; the former having bequeathed his private collection upon the condition that it should always bear his name; whilst the Bell collection was purchased by the College. In the first apartment, the first object which arrests our attention is the bust of Dr. Barclay, and surrounding this is his collection, which chiefly consists of comparative anatomy specimens, such as the skeletons of the different varieties of horse, of the walrus, seal, and narwhal. Occupying the centre of this room is the very beautiful skeleton of an adult Indian elephant, presented by Sir George Ballingall, and mounted on the neck of this animal is the skeleton of its driver—a Hindoo, who was hanged at Masulipatam for theft. Here also is a very beautiful dissection of the arteries of the leg, showing the anastomoses by which the circulation is carried on after ligation of the femoral artery. In the second room is placed the Bell collection; the specimens of human anatomy in a healthy condition being arranged on the left side, and the specimens of comparative anatomy on the right, whilst suspended from the walls are some fine oil-paintings, by Sir Charles Bell, of gunshot-wounds, etc. At the extremity of this room, is a table, on which we notice two dissections by Sir William Ferguson: one of the arterial system of the foot, very beautifully executed, and the other a modest looking little specimen showing the nerves of the face, and equally fine. On the same table are two specimens of corroded infection of the heart and its great vessels, and of the kidney, well worthy of notice. The galleries, which contain a rich collection of pathological specimens, are divided into compartments, each of which is distinguished by a number. In No. 36 are a series of preparations of the upper and lower maxilla and of the teeth, with their nervous supply. These were chiefly prepared by Professor Goodsir when he acted as assistant to Dr. Nasmyth, and were presented by the latter to the Museum. Both surgical and internal pathology are well represented in these galleries. Last of all, we must mention a room which is devoted to obstetrics, and which is filled with specimens and models bearing upon the subject. The Museum is under the care of Dr. Pettigrew.

The Museum of Science and Art.—This is a very large building, situated in Chambers Street behind the University. Its architecture is essentially Venetian in its type, and the uniformity of the grey-stone with which it is built is very much relieved by columns and pilasters of red stone. It was designed by Captain Fowke, and erected at the expense of the Government. It was opened by the Duke of Edinburgh in 1861. Only one-third part of the building, as indicated in the design, was then completed. Another portion, however, has

been recently added. The only department of this Museum of professional interest is the natural history division; and this, owing to the recent extension of the building, is at present in the process of being rearranged. The greater portion of this collection was formed by the exertions of Professor Jameson. In 1854, it was transferred by the Town Council, at that time patrons of the University, to Government, who removed it to its present quarters. On the ground floor of the hall devoted to natural history, are placed the skeletons and stuffed specimens of mammalia; in the first gallery, is a very extensive collection of birds, numbering nearly 10,000, also shells; in the highest gallery, are the Reptilia, Pisces, and Insectes. The object which obtrudes itself most upon our attention—and deservedly so—is the skeleton of a whale suspended from the roof, seventy-nine feet in length, which was prepared by Dr. Knox and his pupils, and presented to the Museum by the Town Council of Edinburgh. This is a very beautiful specimen, the finest in the country, and it is seen to greatest advantage from the first gallery.

Phrenological Museum.—This Museum is situated in Surgeons' Square, and contains many interesting specimens. A new building for a new museum is in process of being erected in Chambers Street, immediately to the west of the Watt Institution and School of Arts. The museum belongs to and is maintained by the trustees of the late Wm. Ramsay Henderson, who died in the year 1832, leaving the residue of his estate "for the advancement and diffusion of the science of phrenology and the practical application thereof." The accumulated funds amount to about £9,000. The museum contains a large number of human crania and busts, also a large part of the collection of Dr. Spurzheim. The national skulls showing the peculiarities of race are particularly interesting, and many of the specimens are very valuable, rare, and curious.

The Antiquarian Museum, in Princes Street, may simply be mentioned. It contains a great number of Egyptian and other foreign and British antiquities; also, a number of very ancient crania, etc.

THE MEDICAL CHARITIES OF EDINBURGH.

Few cities of its size are so amply supplied with medical charities as is Edinburgh; and, perhaps, in no other city have the charities contributed so much towards the advancement of science and the training of efficient practitioners. Among the multitude of our professional brethren whom Edinburgh hopes to welcome in the early days of August, there must be not a few who look back to the experiences there attained as having constituted the foundations of their professional success. Many will be glad once more to visit the old infirmary before its grand career is terminated; and many will seek for the site of Minto House, where they learnt what surgery could do as practised by the great master.

There will be those whose thoughts will go back to Liston, to Alison, to Simpson, and to Bennett, who will gratefully remember the impetus received, the principles grasped, and the practice witnessed whilst following these eminent teachers. There will be many who will seek the familiar corner where Goodsir ruled, or where Jamieson so long prelected; and where Edward Forbes, for too short a time, delighted his auditory. Many a heart will warm to see the venerable President of the Association, still in fullest vigour, although for more than half a century one of the most popular professors in the University. That garden party beyond the Water of Leith will to many recall the early morning walks and the delightful Saturday excursions with which to generations of Edinburgh students the name of Balfour is associated; to them it will be a sincere pleasure to be welcomed by the Professor, who seems still as fit to breast Ben Ledi, or to penetrate Ben Tilt, as he was in the days of his famous encounter with the old Duke of Atholl, of which his eloquent colleague MacLagan has sung. To many it will give satisfaction to see the Orator in Surgery little changed from what he was when working with John Reid at the vagus; and many will rejoice to see Lister, Begbie, and Matthews Duncan, honoured in the school for which they have done so much.

We purpose to give some sketch of the medical charities: and first amongst them ranks (see fig. 1)

THE ROYAL INFIRMARY.—We cannot better sketch the history of this noble institution than by quoting the words of Dr. E. Willis Way of Adelaide, who, in his inaugural address as President of the Royal Medical Society in 1871, thus spoke:

"The want of some public institution in which the poor might have their ailments attended to, and their sufferings alleviated, must have been strongly felt by persons endowed with charitable and benevolent feelings; but it was not till the year 1721 that an appeal was published, pointing out the need of such a charity, and the benefits that

would accrue from its foundation. Little success, however, attended this benevolent project, and it was laid aside, happily only temporarily, for, in 1725, we find the Royal College of Physicians—be it said to the honour of that body—again bringing the matter before the public. At that time the Scottish Fishery Company was about to be dissolved, and the College of Physicians, obtaining from them a considerable portion of their stock for the purpose of founding an infirmary for the sick, at once started a subscription, heading the list themselves, at the same time engaging to attend the patients without any remuneration. The College of Surgeons joined most heartily in the undertaking. The subscriptions flowed in freely, and, as a further inducement for people to give, it was made a condition that the sum of

you will find this inscription, written by the historian Robertson,—‘George Drummond, to whom this country is indebted for all the benefits which it derives from the Royal Infirmary’.

“George Drummond was particularly energetic in the foundation of the institution; he subscribed largely himself, and laboured unceasingly to induce others to do the same. But this was not all; we find him actively engaged in superintending the building operations. In Bower’s *History of the University of Edinburgh*, I find the following, which I consider worth extracting: ‘Messrs. Drummond and Monro were appointed the “building committee”. The money contributed, and with which the work was begun, was soon expended, but perhaps the alacrity and hearty co-operation with which this laudable enterprise was carried on, is with-

Fig. 1.—THE ROYAL INFIRMARY.

£2,000 should be raised before a certain day; but, owing to the zeal and activity displayed by those engaged in promoting this noble work, that sum was exceeded long before the time. A meeting of the subscribers was now called by the College of Physicians, and the contributors thus assembled nominated twelve of their number to further the object under consideration, and to prepare a plan for the erection of an infirmary. A petition was also laid before the Assembly of the Church of Scotland, asking that subscriptions might be collected in all its churches, and, according to Maitland, in his *History of Edinburgh*, ‘the contribution was earnestly and strenuously recommended by the Assembly in their Act of the 11th May, 1728, and a copy thereof sent to the incumbents of the several parishes throughout Scotland; yet such was the amazing indolence, laziness, and obduracy of the said incumbents, to their eternal reproach, that though this great and pious design was calculated for the relief and benefit of the greatest and most moving objects upon earth, few of them concerned themselves in this truly good and Christian work’.

“Notwithstanding this want of sympathy on the part of the clergy, money was sent from all quarters, and in 1728 another meeting of the contributors was called, at which it was determined to open at once a temporary hospital. Accordingly, a small house was taken and prepared for the reception of patients; and, at the end of one year, I find the total number of patients admitted amounted to 35, of whom 19 were cured, 5 were dismissed in process of cure, 5 discharged as incurable or for irregularities, and 5 remained in the house, there being only one death. Whether a *post mortem* examination was made on this case or not, I have no means of ascertaining; but it is to be hoped that the most was made of this solitary opportunity of acquiring practical pathological information. The working of this temporary hospital seems to have given great satisfaction—the low death-rate in the first year possibly contributing towards it; and the funds in hand went on increasing till, in the year 1738, they amounted to £5,000, when the foundation-stone of the eastern end of the building now known as the Medical House was laid. Two years previously a royal charter was granted, since which time the institution has been known as the ‘Royal Infirmary of Edinburgh’. The first intention of the contributors was to erect only the eastern half of the building; but the encouragement they had received induced them, on the completion of this portion (which was opened to patients in 1741), to proceed at once with the building of the remainder, and accordingly the whole house was completed in 1745. There are two names which are inseparably connected with the birth and infancy of our Infirmary. You must all have noticed, in the vestibule of the Infirmary, a bust, and below it

out a parallel in the history of any charitable foundation. Materials for the building of every description were contributed in small quantities by those who had it not in their power to advance money; and even the common workmen rivalled each other in frequently giving their labour gratis; and, instead of repining, cheerfully submitted to the inconvenience they suffered from their wages being sometimes not regularly paid, such confidence had they, in common with all ranks, in the talent, integrity, and generosity of these two gentlemen. They uniformly paid the workmen themselves, and permitted no avocation whatever to interfere with what they esteemed so imperious a duty; and their presence, combined with their engaging manners to all employed about the work, had the effect of accelerating its progress in the most remarkable manner.’

“Drummond’s great coadjutor was the famous Alexander Monro *primus*. We shall speak afterwards of this illustrious man.

“When the hospital was open for the reception of patients, the managers very wisely—foreseeing the advantages to be derived from the admission of the students to the practice of the hospital, not merely for the purpose of improving their education, but as a substantial means of increasing the revenue of the institution—permitted them free access on the payment of moderate fees; and, it was not very long after, that the system of clinical lectures was introduced. The honour of this advance in medical teaching appears to be due to Dr. John Rutherford (the grandfather, through his daughter Anne Rutherford, of Sir Walter Scott), who was at that time Professor of the Practice of Physic. The history of our Society informs us that, before this, he had encouraged his pupils to bring patients to him on Saturday, when, after inquiring into their complaints, he prescribed for them in the presence of his class. Appreciating the success that resulted from this method of instruction, he suggested to the managers that they should allow him to give clinical lectures in the Infirmary; and they not only approved of the suggestion, but placed two of their wards at his disposal, for such cases as might prove interesting and instructive from a clinical point of view. This was the origin of our ‘clinical wards’ and ‘clinical lectures’, which, therefore, date from 1748. The next year, the managers extended the privilege of giving these lectures to the other medical professors; and it was then that Monro introduced this mode of teaching into the surgical department. Monro laboured most zealously to forward the education of his pupils, and the fame of this University is, in great measure, due to his energy in the cause of science. We have already seen how actively he was engaged in the building of the Infirmary; we now not only find him, as the Professor of Anatomy, teaching with the greatest success, and thus attracting to

this University students from all parts of the world, but we also see him, though engaged as a professor, as a manager, as a surgeon, as a clinical lecturer, yet finding time to unfold to his hearers the treasures of his pathological experience. We are told that 'he personally attended the opening of every body, and not only dictated an accurate report of the dissection, but, with nice discrimination, contrasted the diseased and sound state of every organ'.

"You must pardon me if I introduce to your notice another great man, intimately connected with the Infirmary in the capacity of a clinical professor. I allude to William Cullen. You will remember that, in the year 1748, permission was granted to the medical professors to deliver clinical lectures, but only Monro and Rutherford appear to have availed themselves of the privilege. But, as soon as Cullen was appointed Professor of Chemistry, he began also to deliver a clinical course, and he soon acquired a great reputation in this branch of medical teaching. He also appears to have taken an unusual interest in his pupils, employing every means to become personally acquainted with them, and, in many cases, acting towards them with the greatest kindness. Dr. Aiken, a pupil of Cullen's, remarks: 'He was cordially attentive to their interests, admitted them freely to his house, conversed with them on the most familiar terms, solved their doubts and difficulties, gave them the use of his library, and in every way treated them with the respect of a friend and the regard of a parent.' I must not omit another point, which ought to induce us to respect his memory, and that is,—it was he who introduced the generous principle of refusing to take fees from students for attendance in their illnesses: he would never receive a fee in such a case, and his example has ever since been followed by his successors.

"During the first few years of the existence of the Infirmary, the number of beds occupied amounted to about forty, but, as funds accumulated, this number was increased soon afterwards to sixty, and in 1770 to eighty; besides which, beds were allotted to soldiers, who were paid for by the Government, and to servant-girls, for whom a ward—now known as No. XII—had been furnished by a public subscription in 1755, thus making altogether about a hundred and thirty or a hundred and forty beds. Three or four years later, the other wards were furnished, and the number of beds then occupied was about two hundred. In the earlier days, the resident medical staff consisted of one clerk. Amongst other duties, he had to take reports of the cases. This was done in a journal which used to be moved about the wards on castors during the visit of the physician. The method of case-taking was peculiar, and is well reported in a letter quoted by Maitland. It says: 'Each page of the journal was divided into seventeen columns, containing a diary of the cases of the several patients, and various appearances of their distempers while under cure, the names whereof are placed at the heads of the several columns, as followeth: The 1st contains the dates of the year, month, and day; the 2nd, the number of the bed wherein the patient lies; 3rd, operation of the medicines; 4th, intervening symptoms; 5th, pulse; 6th, thirst; 7th, appetite; 8th, spittle; 9th, tongue; 10th, sweat; 11th, urine; 12th, faeces; 13th, ordinary symptoms; 14th, supervening symptoms; 15th, food; 16th drink; 17th, medicines.'

"There was also a ledger, in which every case had one or more pages allotted to it. In this the clerk had to enter an exact description of the patient's case, dictated to him by the physician, and to this to add the daily reports taken in the journal. The students used to hear and see all the cases examined by the physician; but, in addition to this, 'once a week the whole practice of the hospital is read leisurely by the clerk to the whole of the students in the operating-room, to give them an opportunity of taking notes of every cure they think worth while; and, further, he hath orders to give them full copies of every cure they call for, upon their paying a trifle for writing it out for them'. So that the office of clerk, or what we now dignify by the name of resident-physician, in those days appears to have been no sinecure.

"Here is an old regulation affecting the students. 'Students who attend the physicians during their prescriptions are to study a composed and decent carriage; are not then to stroll about in the wards, converse together, stand upon benches, beds, or do anything that may be disturbing to the physician, clerk, or patients.'

"It appears that the matron, in the absence of the surgeon, was instructed to admit patients; a regulation which, in these days of female doctors, might probably, in the event of a vacancy, cause a medical education to be a recommendation.

"I find that it was in the year 1751 that the first ordinary physicians were appointed; these were Dr. David Clerk and Dr. Colin Drummond, and each of these received a salary of £30 per annum, a sum afterwards increased to £70, for their services. Before this, the Fellows of the Royal College of Physicians in rotation had regularly

visited the medical cases, except those in the clinical wards. About fourteen years later, four ordinary surgeons were similarly appointed to have entire charge of the surgical department, which was confined to the wards on the third floor. The ward now known as No. XVIII was then the operating theatre. The wards on the second and third floors were devoted to medical cases; and, in the attic, was a small one for females, called the 'salivating ward', the use of which is too obvious to demand explanation; and another was used as a maternity hospital."

We cannot resist borrowing from the charming "Hospital Outlines", in the current *Cornhill*, one of the sonnets which so truthfully describe the surgical department of the Infirmary, as it is seen to-day.

A SURGEON.

"His brow spreads large and quiet, and his eye
Is deep and bright, with steady looks that still;
Soft lines of tranquil thought his face fulfill:
His face at once benign, and proud, and shy.

"If envy scout, if ignorance decry,
His faultless patience, his unyielding will,
Beautiful gentleness and splendid skill,
Innumerable gratuities reply.

"His wise, rare smile is sweet with certainties,
And seems in all his patients to compel
A love and faith that failure cannot quell.

"They hold him for another Heracles,
Warring with Custom, Prejudice, Disease,
As once the son of Zeus with Death and Hell."

Other scenes portrayed in the sonnets are descriptive of the old High School where Syme once sat as a schoolboy, and afterwards taught as clinical professor. In "the surgeon", our readers will at once recognise the present not less distinguished occupant of Syme's chair.

The old infirmary contains about 600 beds. In 1874, 4,693 cases were treated in the house, and at least an equal number as out-patients. The daily average of in-patients was 417; and the year's expenditure was £22,072.

Before five years have elapsed, the old infirmary will have been abandoned. Is it too much to hope that the glories of the Edinburgh school in coming generations may as much surpass the glories of the past as the hospital now in course of erection surpasses that we are about to leave?

THE NEW INFIRMARY.—To the eminent architect we are indebted for the following description of the arrangement of the new building, which is to cost about £200,000.

The infirmary buildings are in three divisions or compartments. The section on the north consists of the surgical hospital; that on the south of the medical hospital; and in the centre, between the two, the administrative building is situated.

The surgical hospital consists of a central building and six pavilions.

Pavilions.—The pavilions are situated, four on the north and two on the south side of a connecting corridor, which is twelve feet wide, having at the extreme ends two great staircases for access to the two outer pavilions; the intermediate are approached by similar staircases. The pavilions have three ward floors. Those to the south, owing to the fall of ground, have an additional floor on the basement, used in the east pavilion as dispenser's apartments, etc.; and in the west as a dormitory for women servants.

Wards.—The wards, which are 75 feet long, 28 feet wide, and 15 feet from floor to ceiling, contain each fourteen beds, and have in connection with them a private ward for two beds, doctor's rooms, sister's room, ward-kitchen, bath-room; and convalescent-room, also a hoist for patients, a lift for food, and a dust and dirty linen shoot. At the outer end of each ward are two towers, the one containing water-closets, urinal, and housemaid's closet, and the other bath-room and lavatory. Between the two north pavilions on the east side is a students' hall; and in a similar position on the west is the female accident ward; the male accident ward being in the north end of the eastmost pavilion—first ward floor. The first ward floors of the two south pavilions are set apart for ophthalmic wards, and have operating-rooms, etc., attached.

Nurses.—Over each pavilion are provided dormitories or cubicles for one head nurse, three day nurses, three night nurses, two special nurses, and four nurses' assistants, also nurses' sitting-room, bath-room, water-closet, etc.

Class-rooms.—These are situated on the south side of the corridor behind inner pavilions. The lower storeys of east classroom are occupied by dental department, examination-rooms, and servants' dormitories; the storeys under the west classroom being occupied by engineer's house, steward's bedroom, and servants' dormitories.

The central building contains, on the first ward floor, registrar's room and clerk's offices; on the principal floor, entrance-hall, board-room, and consulting-room, and special wards for cases and a reserved ward for sick students on the upper floor. The back part of the central

building is occupied by the superintendent's and treasurer's rooms and steward's office, and connects the surgical hospital with the administrative buildings.

Administrative Department.—This originally formed part of George Watson's Hospital (an educational establishment), which has been altered and modified to suit the administrative purposes of the new infirmary.

In the centre block is the operating theatre, which is conveniently situated in connection with the corridor of the surgical hospital.

The main kitchen is also contained in this block, with scullery, servants' halls, etc., in connection, which is quite central for the whole building.

The east wing contains, on the ground floor, male and female patients' reception-rooms, examination-rooms, etc.; and, on the principal floor, the dining-room, hall, and apartments of the resident medical gentlemen.

The west wing contains, on the ground floor, the matron's business-room and sitting-room, store-rooms and linen store, nurses' kitchen and dining-room, and superintendent of house's business-room. On the principal floor, are the chapel (entering from the main corridor), the lady superintendent's business-room, sitting-room, and bedroom, etc., and the probationer nurses' sitting-room. The upper floor contains the pro-

Pathological Department.—In the north-west corner of the ground is the pathological department, containing theatre, demonstration room, mortuary, mortuary chapel, etc.

In connection with the same range of buildings, are the mattress store, joiners' shop, etc. To the south are situated the washing-house, laundry, drying-room, boiler, and engine-houses.

Heating.—The boilers at the engine-house supply the steam for heating coils in the staircases and hot-water tanks for extracting vitiated air from the wards. The heating of the wards is entirely from open fire-places.

The style of architecture adopted is the Scotch baronial. The annexed woodcut represents the south façade looking upon Lauriston.

Fig. 2.—THE NEW INFIRMARY.

bationer nurses' sick-room and dormitories in connection with the superintendent of nurses' sitting-room and bedroom.

The south side of the administrative building is taken up by the laboratory and dispensary, with drug-stores, etc., on the basement.

The medical hospital consists of four pavilions running south from a connecting corridor, which is joined to the administrative department by a curved corridor, from which there is direct access to the principal entrance of the infirmary as well as to a side carriage entrance facing east, accessible from Teviot Row and the Meadow Walk.

Pavilions.—The medical wards are 111 feet long, by 28 feet wide, and 15 feet from floor to ceiling; each ward containing 21 beds, having in connection private wards with two beds, towers with water-closets, etc., doctor's-room, etc., arranged similarly to those in the surgical hospital. The arrangement of nurses is also similar to that in the surgical hospital. The pavilions have three ward-floors and a large convalescent room on the basement at the south end of each.

Class-rooms.—There are two class-rooms on the north side of the corridor, with consulting-rooms.

Abstract of Number of Beds in Hospital.
SURGICAL HOSPITAL

Male wards (7 ordinary, 14 beds each; 1 accident, 6 beds; 1 ophthalmic, 10 beds; 7 private, 2 beds each; 1 private ophthalmic, 2 beds)	130
Female wards (same as male, with 1 additional ordinary, 1 additional private, and 1 private ophthalmic with 1 bed)	147
Special wards (4 with 2 beds each; and two students' wards with 5 beds each)	18
Total number of beds in Surgical Hospital	295

THE CONVALESCENT HOUSE is pleasantly situated on rising ground at Corstorphine, about three miles from the city. It was opened in 1867 for patients from the Royal Infirmary, Edinburgh. It has fifty beds, which are under the charge of the junior assistant-surgeon to the infirmary. The house, of which we give a representation (see next page), is strikingly clean and neat, and from its front windows there is a magnificent view of the Pentland Hills.

THE CHALMERS' HOSPITAL.—George Chalmers, an Edinburgh plumber, bequeathed about £30,000 in 1836, for the erection and endowment of an hospital for the sick and hurt. The Dean and Faculty of Advocates are the trustees of the charity. They erected an elegant building in Lauriston Place, which was opened for patients early in 1864. It contains forty beds, sixteen of which have been set apart for patients who can afford to pay a moderate board (3s. per diem). The staff consists of a physician, a surgeon, and a house-surgeon. 283 in-patients and 2,384 out-patients were treated in 1874.

THE EDINBURGH ROYAL MATERNITY HOSPITAL is the somewhat languishing representative of a very old charity. Before there was a regular teacher of midwifery in the medical school, there were beds set apart for lying-in women in the Royal Infirmary. The first Professor of Midwifery in the University, Hamilton, set going a special hospital, which, in accordance with tradition, was called, as even the present place sometimes is, the lying-in ward. While Hamilton survived, the hospital was nominally managed by a committee, but really by himself. The board of managers met in his house, and it was virtually the Professor. Since Hamilton's death, the slow and unsuccessful management has been somewhat more open, but the next and late Professor was also nearly supreme. The institution has been moved about again and again, and, like a rolling stone, it has gathered no moss. At present, it is very inconveniently situated, occupying a small house in St. John Street, and having very little accommodation for its few inmates. Grea-

attempts have been made, and with some success, to improve the management and inspire zeal for the charity in the public mind; but these attempts have, as yet, not had much result. When the Association next meets in the metropolis of Scotland, we hope there will be a becoming building and a prosperous working charity to which visitors may be invited.

with the dispensary, religious services for the benefit of the poor patients are regularly conducted in the Magdalen Chapel, which is a curious relic of the sixteenth century, belonging to the corporation of Hammermen. Along with the adjoining property, it passed from their hands to the directors of the Protestant Institute of Scotland on May

Fig. 3.—THE CONVALESCENT HOUSE.

THE ROYAL EDINBURGH HOSPITAL FOR SICK CHILDREN has had an unsullied career of prosperity during the fifteen years of its existence. It now occupies the house and grounds of Meadowside, at the foot of Lauriston Lane, near the new Royal Infirmary. The institution is in all respects worthy of the visits and attention of the profession. It accommodates from 70 to 80 patients, who are about equally divided between the two sides—medical and fever. The wards are beautifully arranged, carefully kept, and present a spectacle which charms all new comers. Several hundreds of patients are passed through the wards yearly, and several thousands are annually prescribed for in the dispensary of the institution. Two physicians are on duty at a time in the intern department, there being four in all, and there is a resident medical officer. The dispensary is attended to daily by an extra-physician, and of these there are two, who have a paid assistant occupied in visiting patients at their homes. The well deserved success of this charity is owing to the fairness, thoroughness, and zeal of its managers, who have been well supported by the medical staff. Like the other successful medical charities of Edinburgh, it affords evidence that, if the work proposed be carefully and well done, so as to maintain the confidence of the subscribers, money will be given without stint for its continuance; and, like the other medical charities of Edinburgh, it has almost nothing to depend upon but the voluntary subscriptions of the benevolent.

THE HOME FOR CRIPPLE CHILDREN was established a few years ago, at 9, Salisbury Place, for children under the age of twelve years, suffering from hip-joint disease and spinal affections. It contains twenty beds.

THE EDINBURGH HOSPITAL FOR INCURABLES, at 8, Salisbury Place, has recently been enlarged, so that it now contains twenty-four beds.

THE ROYAL DISPENSARY AND VACCINE INSTITUTION, at 21, West Richmond Street, was established in 1776.

THE NEW TOWN DISPENSARY, at 17, Thistle Street, was instituted in 1815.

Each has a large medical staff, and many thousands of patients annually.

THE MEDICAL MISSIONARY TRAINING INSTITUTION AND DISPENSARY belong to the Edinburgh Medical Missionary Society, which was formed in 1841 under the presidency of Dr. John Abercrombie. It has missions in India, Japan, and Nazareth, and has furnished legally qualified medical missionaries to all the different Missionary Societies. Fourteen students are at present connected with the Society, preparing themselves for medical mission work. These young men belong to the various evangelical denominations, and are drawn from all parts of the United Kingdom, the Continent, Africa, and India. They reside in the Miller Memorial Home, 56, George Square, which was purchased to commemorate the late Professor Miller of Edinburgh. The dispensary, 39, Cowgate, was incorporated with the Society in 1859. It has a staff consisting of half a dozen honorary medical officers, a house-surgeon, the students of the institution, and several nurses who labour amongst the poor of the Cowgate and neighbourhood. In connection

with the dispensary, religious services for the benefit of the poor patients are regularly conducted in the Magdalen Chapel, which is a curious relic of the sixteenth century, belonging to the corporation of Hammermen. Along with the adjoining property, it passed from their hands to the directors of the Protestant Institute of Scotland on May 14th, 1858, and is now occupied by the Medical Missionary Society as a training institution and dispensary. The house at the rear is occupied partly by the nurses and partly as consulting and waiting-rooms for the patients, while the rooms in the Cowgate are used as a laboratory and dwelling for the house-surgeon. This portion is under the same roof, and is of the same age as the chapel. Above the gateway are the arms of the Hammermen and the date—1553. The tower, embattled, terminates in a spire, and is visible from George IV Bridge; it contains one of the finest toned bells in the city; its date is 1632. A high-backed chair carved in bold relief, and dated 1708, is now used as a pulpit. At the top of one stained glass window are the arms of Mary of Guise, who was Queen Regent at the time when the chapel was built. In the middle of the chapel still stands the table on which the body of the Earl of Argyll was laid after his execution, June 30th, 1685, to wait till it should be conveyed to the family burial-place at Kilmun. Here, too, were held several General Assemblies of the Church of Scotland. Visitors will be welcome to see the chapel, etc.; but they will find the present establishment quite unequal to the work to be done, and they will not regret to hear that the directors are about to erect, at a cost of £10,000, a handsome and commodious building opposite the Industrial Museum in Chambers Street, to be called the Livingstone Medical Missionary Memorial, in memory of the great African explorer, who was a member of the Society. The Medical Mission Dispensary and Training Institution at 5, St. John Street is carried on with similar objects in view. All these dispensaries do useful work in the homes of the people by means of visits by medical students, who are "taking dispensary practice". The dispensaries also share with the Maternity Hospital in the attendance upon obstetrical cases. The dispensaries are all open daily to the poor.

THE EYE INFIRMARY OF EDINBURGH, at 6, Cambridge Street, was instituted in 1834. It has two surgeons, and it is open daily. An ear dispensary has recently been opened at the same place by a member of the staff. Patients are seen twice a week. The Eye Dispensary of Edinburgh at 54, Cockburn Street, was instituted in 1822. It has three surgeons and a dispenser. It is open three days a week. An ear dispensary was established at the same place in 1857. It is open twice a week, and it has four surgeons. The Edinburgh Dental Dispensary at 38, Cockburn Street has been in active operation from 9 to 10 A.M. daily for some years. The leading dentists of the city attend in rotation.

CRAIGLOCKHART POOR-HOUSE, belonging to the city parish, is about half a mile beyond Morningside, and CRAIGLEITH POOR-HOUSE, belonging to the St. Cuthbert's and Canongate Combination, beyond Fettes College, are both magnificent piles, and have several large and airy infirmary wards for the sick and feeble paupers. There are also PAROCHIAL DISPENSARIES within the city connected with these institutions.

THE ROYAL EDINBURGH ASYLUM FOR THE INSANE at Morningside was founded in 1809, chiefly by the efforts of members of the medical profession; the late Dr. Duncan and the Royal College of Physicians being its most active supporters. Its object was the proper treatment of the insane and the advance of medical science. It has

been enlarged at different times, until it now contains over seven hundred patients. These are of all classes of society, who pay from £400 a year down to £27. The pauper patients from Edinburgh are sent thither by an arrangement with its managers. There are three chief departments: that for the higher classes including two villas and two pavilions situated in their own grounds, and containing about eighty patients; that for the middle classes, containing about one hundred; and that for patients at the lowest rates of board and paupers. There are about fifty acres of ground round the asylum, laid out in ornamental grounds and farm. There is a *clinique* in connection with the Medical School once a week during the winter session, and twice a week in summer.

THE SCOTTISH NATIONAL INSTITUTION FOR THE EDUCATION OF IMBECILE CHILDREN at Larbert, Stirlingshire, is worthy of a visit. It contains one hundred beds, and is under able medical superintendence. It is about twenty miles from Edinburgh, on the way to Stirling.

COLUMBIA LODGE, Liberton, about two miles south of the city, is a small private establishment for imbeciles. It is pleasantly situated, and may be visited by members of the Association.

The psychological physician will find that the district is rich in asylums. Saughton Hall, Roslin, Musselburgh, etc., may be instanced.

THE EDINBURGH TRAINING INSTITUTION FOR SICK NURSES has a home at 125, Princes Street.

THE SCOTTISH NURSING INSTITUTION has a home at 25, Gilmore Place.

LEITH HOSPITAL AND DISPENSARY.—In 1788, a branch of the Humane Society of London was constituted in Leith, under the designation of the Edinburgh and Leith Humane Society. In 1815, a dispensary was established for the poor. These two institutions were united in 1825. A casualty hospital was established in 1837. In 1846, these institutions were combined with the existing one. The old building, as a permanent hospital in Leith, was completed in July 1851, and contained thirty-four beds. New wards, containing thirty-six additional beds, were opened on April 2nd, 1875. They were erected by funds provided by a legacy left by the late Thomas W. Ramsay, Esq. The total number of indoor patients during the year 1875 was 330. The cases prescribed for at the hospital as outdoor patients during 1874 were 5,957. The cases treated at patients' homes during 1874 were 1866.

THE PIONEERS OF MEDICAL SCIENCE IN EDINBURGH.

FOR many years Edinburgh has enjoyed great celebrity as the seat of a school which has produced not a few of the pioneers of medical science. There is no department in the circle of the sciences related to medicine which is not indebted to one or more men who have been teachers in the Edinburgh medical school. Such, however, have not merely been teachers—great as that vocation is—but they have been deep thinkers, who have advanced the bounds of knowledge themselves, and stimulated others to do likewise. Anatomists, physiologists, chemists, physicians, surgeons, have spent their lives in the pursuit of science in Edinburgh, and from it they have given to the world the fruits of their inquiries, many of which have been productive of great results. The names of many of these men are familiar to every student of medical literature, while others are nearly forgotten. Some are still recognised authorities, and are quoted by lecturers and writers; but others, sometimes of greater merit, have not succeeded in so transmitting their fame. In the present age, with its weekly and monthly addition of new papers in the various journals; with its elaborate new monographs appearing in the transactions of the various learned societies; with its text-books, encyclopædias, and registers of scientific discovery—all claiming to be read, the student finds little time to study the past and to inquire what was done for science by the men who worked forty or fifty years ago. A man now-a-days is regarded as ignorant if he be not familiar with the last number of Pflüger's *Archives*, but he is tolerated and even applauded although he knows nothing of the labours of Whytt or Charles Bell. This state of things is no doubt transitional. It favours superficiality and narrowness of view, and therefore it cannot endure. It takes from us veneration for the labours of the past, without which there can be no true work for the future. It may interest, in view of the approaching meeting, to lay before the members of the Association, a few observations regarding some of the medical men of Edinburgh who have left their mark on science. During the first week in August, we shall be on the scene of the labours of such men as Cullen,

Thomson, Black, Monro, and Goodsir; we shall, perhaps, be in the very class-rooms where some of these men lectured; and we shall have pointed out to us the houses in which they lived and spent many laborious hours.

First of all, then, we have as representative *anatomists*, the Monros, John Bell, Robert Knox, and John Goodsir. As early as 1805, provision was made for dissection in Edinburgh. Until 1720, when the first Monro was appointed Professor of Anatomy in the University, dissection was conducted in a desultory manner. At that date, the Town Council gave the title of Professor of Anatomy; and, a few years later, 1726, other professors were added, and a medical faculty was instituted in the University. Monro was a great teacher. We are informed by Struthers (the historian of the Edinburgh Anatomical School), that his lectures were illustrated by dissections of the human body, and also of the bodies of quadrupeds, birds, and fishes. He also treated generally of the diseases of organs, and showed surgical operations on the dead body. In 1726, Monro published his great work on the *Human Bones*, a book which helped to give fame to the Edinburgh School. The second Monro succeeded his father in 1754 at the early age of twenty-one. After studying on the continent for a few years, he returned to Edinburgh in 1758, and commenced his duties as professor. He took a long time in maturing his work, and it was not until he had taught for twenty-five years, and was fifty years of age, that he began to publish the series of papers on which his reputation as an anatomist rests. These were chiefly his work on *The Structure and Functions of the Nervous System*, the *Structure and Physiology of Fishes*, and on *The Brain, the Eye, and the Ear*. He died in 1817, in his eighty-fifth year. Monro *secundus* was a man of great versatility of talent, and was in his day equally eminent as an anatomist, a teacher, a physician, and a man of society.

The next great anatomist who claims our attention is John Bell. He it was who first taught in a systematic way what is now termed surgical anatomy. He was also the first to introduce practical dissection. To quote his own words, "In Dr. Monro's class [*secundus*], unless there be a fortunate succession of bloody murders, not three subjects are dissected in a year. On the remains of a subject fished up from the bottom of a tub of spirits, are demonstrated those delicate nerves which are to be avoided or divided in our operations; and these are demonstrated once at a distance of one hundred feet! nerves and arteries which the surgeon has to dissect, at the perils of his patient's life." John Bell was the leading operating and consulting surgeon of his time in Edinburgh. A bold and dexterous operator, his thorough knowledge of anatomy had led him to undertake and execute operations at that time unknown. His greatest works are, *The Anatomy of the Human Body*, first published between 1793 and 1802, with later editions, in which he was aided by his brother Charles Bell, and *Principles of Surgery*, published between 1800 and 1808. The first of these works is written in a style singularly elegant and attractive, and very different from the dry-as-dust anatomical treatises students are expected to read at the present day.

Robert Knox flourished as an anatomist in the extra-academical school during the incompetence of the third Monro. The brilliancy of his lectures, his wonderful command of felicitous language, his power of apt illustration, so skilfully used as to attract even the most listless student, are in the memory of men still living; and we have heard from one who attended these lectures that, on an occasion, when Knox had been more than usually eloquent, the students rose to their feet *en masse* and cheered him to the echo. Knox, according to Struthers, introduced a new aspect of anatomy. His forte was, not in showing the relation of anatomy to surgery, as had been done by John Bell, but in bringing the facts of comparative anatomy to bear on those of human anatomy. He was really a morphologist; and, had the means at his command been greater, no doubt he would have been a great comparative anatomist. It would be painful to allude to those incidents which caused Knox to leave Edinburgh, or to those peculiarities of character which compelled him in his later years to earn his bread as a general practitioner in a London suburb. Knox was truly a man of genius; no doubt, like many such, somewhat erratic in his path through the world; and his end in obscurity and comparative neglect is a sad commentary on the prospect of worldly success held out to those who may chance to differ from others in their notions of respectability.

The last anatomist we will name is John Goodsir, a man, from some points of view, taller intellectually than any who ever occupied an Edinburgh chair. It will be conceded, at all events, that he was the greatest anatomist Edinburgh has ever produced. His lectures on the Dignity of the Human Body, his contributions to comparative anatomy, the profound views enunciated in his papers on the Morphological Relations of the Nervous System, on the Morphological Con-

stitution of the Skeleton of the Vertebrate Head, and on the Morphological Constitution of Limbs; his well-known writings on pathology, which are the foundation of much of modern pathology; his discovery of the true nature of the function of secretion, and many other papers, all testify to the great mental grasp of the man. No teacher was more revered by his students. Though often obscure in his utterances, still there was an aspect of earnestness about him, which not only repressed carelessness, but commanded respect. Those who never saw the man, should visit his bust in the University Library, the Wall-hall of the great men of the University. They will see a titanic head, indicating high intellectual development; the only head at all like it is that of Thomas Carlyle—in size, outline, and massive ruggedness. A glance at it will indicate to them what it was to listen to that man when the countenance lighted up and the eyes sparkled, often with a quiet humour, as he pointed out the physiological significance of a process, or of fact on a bone, or of any other apparently trifling anatomical arrangement. Some who read these lines may remember, also, how he opened up his stores of knowledge, and discoursed quietly on momentous physiological and psychical questions to those who loved to linger around the lecture table after the others had gone. Few men had a greater power of influencing others to pursue scientific work in the true spirit. To be near him, still more to be associated with him, was impossible, without receiving something of his inspiration.

We have now to consider the chief physiologists: Whytt, Charles Bell, and Fletcher, may be taken as representatives. The Chair of Institutes of Medicine has existed in the University since 1726. The course given from this chair has always been understood to mean physiology, although the exact field traversed has varied according to the predilections of the lecturers. John Allen was the first to give a separate course of lectures on physiology out of the University. This he did from 1794 to 1799. This is John Allen, of whom Lord Cockburn writes as follows: "Allen was the very first of our private lecturers; physiology being his favourite department. I have heard Dr. John Gordon, a judge on such a matter of the highest authority, say that Allen's single lecture on the circulation of the blood contained as much truth and view as could be extracted by an intelligent reader from all the books in Europe on that subject." (Lord Cockburn's *Memorials of his Time*, p. 177.)

Robert Whytt was one of the most distinguished occupants of the physiological chair, and he left a permanent mark on physiology. A complete volume of his works was published in 1768. Early in life, he was dissatisfied with the common theories of respiration and the heart's motion; and he accordingly began an investigation on animal movements, which resulted in his famous essay on the vital and other involuntary motions of animals. This work still merits the attention of all physiologists; the latter part of it, especially, contains an account of many well-devised experiments. Whytt's other works of physiological interest, are *An Inquiry into the Causes which promote the Circulation of the Fluids in the very Small Vessels of Animals*, and *Observations on Sensibility and Irritability*. Whytt was one of the most powerful supporters of the doctrine of a *sensorium commune*, which included brain, spinal cord, and nerves: a view rather in favour at the present day. Whytt held that the "sentient principle" is really nothing but a mode of physiological force united with the nervous centre, susceptible of being excited by impressions brought to the centre by afferent nervous fibres, or of communicating motor force to the efferent nervous fibres which proceed to contractile structures. He denied that this sentient principle involved consciousness; and he speaks of the cord "perceiving without sensation". In the days of Whytt, the idea that the grey matter of the brain or cord was the exclusive origin of force did not prevail, and hence he could not explain why an "impression from an external part to one point of the nervous centre should have its effect reflected into an efferent nerve arising at a distant point of the same centre". There can be no doubt that Whytt prepared the way for a physiological explanation of the phenomena of reflex action. His views were followed up by Unzer, and still more by Prochaska, who stated that reflex action had its seat in the common sensorium or cerebro-spinal axis. It was reserved, however, for the genius of Marshall Hall to prove that each segment of the spinal cord and medulla has a separate power of acting as a reflex centre, possessing a distinct arrangement of afferent and efferent nerves.

Whytt had a great controversy with the illustrious Haller as to the dependence or non-dependence of irritability, now usually called contractility, on nerves. Whytt held the former view, Haller the latter. Time has shown that in this matter Haller was right; and it is now generally taught that contractility may exist independently of any influence derived from nerves. It is a notable fact, also, that Whytt was the first to state that the ultimate fibrils of nerves pass unbranched from

their origin to their termination. A statement of what Whytt did for physiology was given to the Royal Society of Edinburgh on the 7th of April, 1862, by the late learned Dr. William Sellar.

Sir Charles Bell was eminent in his day as an anatomist, a surgeon, an artist, and a physiologist; such a combination of qualities, to his truly lovable character as a man, renders him one of the most attractive in the gallery of our Edinburgh worthies. Trained to anatomy and surgery by his keen and polemical brother John; gifted with great artistic power, a fastidious and yet rapid operator, and a thoughtful and eminently suggestive lecturer; still it is chiefly as a physiologist that Charles Bell's name will descend to posterity. Two works in particular will ever be remembered: first, his researches on the nervous system, published in the *Philosophical Transactions* for 1821, but the first part of which was printed in 1810-11; and second, *The Anatomy of Expression in Painting*, published in 1806, with a second edition in 1841. It is difficult for us at this date to imagine the confusion that existed previous to the time of Bell, not only as to the special functions of the cerebro-spinal nerves, but even as to the meaning of the terms nerves of sensation and nerves of motion. No wonder, then, that he felt himself elated by so grand a conception as a true physiological classification of the nerves. How touching and natural is the following incident narrated by Lady Bell in her *Recollections*. "I must recall one memorable evening. We had a cottage at Hampstead. He drove to Haverstock Hill, and walked on. He came in breathless, and sat down, saying, 'Oh May! I have discovered what will immortalise me'. He placed a sheet of paper on the table, and sketched on it what he afterwards called 'the classification of the nerves'." After an arduous but on the whole successful career in London, the Chair of Surgery in Edinburgh was offered to Bell in 1836. His opinion was, "London is a place to live in, but not to die in"; and he resolved to come to Edinburgh. Here he did not earn the professional success he deserved, but honours came thickly upon him. On the Continent, he was spoken of as greater than Harvey. It is narrated that one day Roux dismissed his class without a lecture, saying, "C'est assez, Messieurs, vous avez vu Charles Bell". He died at Hallow Park, near Worcester, on Thursday, April 28th, 1842, in his 68th year; and he lies under the yew tree in the peaceful churchyard of Hallow. As he began and ended his professional life in Edinburgh, we are proud to include him among our celebrities. (See Biographical Notice by Sir John McNeill, G.C.B., *Transactions of the Royal Society of Edinburgh*, vol. xv, p. 397.)

The next physiologist of note connected with the Edinburgh school is one whose name is now nearly forgotten. John Fletcher was the eldest son of a respectable London merchant. He commenced his medical studies at Edinburgh in 1812, and graduated in 1816. He lectured on physiology in the Argyll Square Medical School in 1828-9, and latterly also on medical jurisprudence. Although one of the best classical scholars of his day, his claim to distinction is founded on his work *Rudiments of Physiology*, in three parts—a work now seldom read, but abounding in profound views regarding life and organisation. Any one who will take the trouble to read his work will find in it the germs of not a few modern speculations which have brought fame to those who have put them forth, perhaps by unconscious cerebration, as their own. The learning and mental grasp displayed in the book are remarkable; and, had not the author been cut down at the early age of forty-five, science would no doubt have been enriched by other productions. An account of many of Fletcher's views will be found in an able work entitled *The Protoplasmic Theory of Life*, by John Drysdale, M.D., London, 1874.

But Edinburgh has produced many other physiologists, such as Allen Thomson, the present distinguished Professor of Anatomy in the University of Glasgow, renowned for his researches on embryology; Martin Barry, also a great writer on embryology; John Reid, one of the most skilful experimentalists and clear thinkers that ever lived, a man whose experimental researches on the physiology of nerves will ever remain as models of how such work ought to be done and recorded; and John Hughes Bennett, who, in addition to a distinguished career as a great teacher of clinical medicine and of physiology, is the author of the molecular theory of organisation, which will sooner or later be recognised as a valuable theory regarding the constitution and development of living organic matter, when the cellular theory, as at present stated, will be found inapplicable to the new facts daily revealed by scientific microscopical research. Such hypotheses are valuable as aids to future inquiry; but, like all such, they serve only for a time.

Chemists.—Turning from physiology to chemistry, we are at once confronted by the names of Black, Hope, and Wm. Gregory. Space will not permit us to do more than merely refer to some of the achievements of the first of these distinguished men. In 1851, Joseph Black wrote as his graduation thesis a paper on the Nature of the Causticity of Lime

and the Alkalies, which he showed to be owing to the absence of the carbonic acid (called by him fixed air) present in limestone, and in what are now called the carbonates of the alkalis. This was his first contribution to chemical science, and may be regarded as a great addition to chemical theory and to the chemistry of gases. Between 1759 and 1763, he gradually worked out the theory of "latent heat", on which his fame chiefly rests, and which was a stepping-stone to the discovery of the work-power of steam by his pupil and class assistant James Watt. William Gregory made many valuable contributions to organic chemistry. He was an eminent teacher, and was remarkable for his power of exposition and of condensation. Towards the end of his life, he became an ardent worker with the microscope, and his habits of laborious and systematic investigation resulted in numerous memoirs on the Diatomacea.

The naturalists next claim our attention. The first of these is Robert Jameson, who filled the chair of natural history from 1804 to 1854. A pupil of the celebrated Werner of Freyberg, he founded the Wernerian Society of Edinburgh; and in 1819, along with Sir David Brewster, he started the *Edinburgh Philosophical Journal*, and in 1826 the *Edinburgh New Philosophical Journal*, which he edited till his death. Great as a mineralogist, he published valuable works on this department of science, and he laid the foundation of the Natural History Museum of the University of Edinburgh, now part of the Industrial Museum. He died at a ripe old age, and full of honour.

His immediate successor was the talented Edward Forbes, who died, however, after delivering only one course of lectures. Forbes, like Sir Chas. Bell, was an artist, and his great delight was to amuse his friends by drawing for them grotesque sketches and caricatures. In a short life, he accomplished an enormous amount of scientific work. His book on the *British Star-Fishes* is still a standard work on the subject; and, even for those who are not naturalists, the little star-fishes dancing on the sands, which form the tail-pieces of the chapters, cannot fail in being objects of humorous interest. He was almost the first also who entertained philosophical views regarding the distribution of marine animals both as regards area of surface and depth. Forbes' memoir, written partly by George Wilson and partly by Archibald Leikie, will show what manner of man he was; and visitors should not forget to look at his bust in the University library, showing a beautiful Grecian profile and finely formed head. His life was in many respects a sad one. After reading it, one puts down the book with a feeling of incompleteness. His career conveys the same idea as the sight of a broken column, and without the deep hope of a something beyond all this, the feeling is sad indeed. He lies in the Dean Cemetery beside his friend John Goodsir. Forbes, in a manner, may be said to have discovered the great anatomist, and encouraged him to pursue science. Friendly in their lives, in death they are not divided. The dust of the anatomist and of the naturalist mix together.

Another distinguished man belonged to the same group, Harry Goodsir, the ill-fated naturalist of the Arctic expedition under Sir John Franklin. Forbes was succeeded by Allman, whose high scientific position as a writer on the morphology of the *hydrozoa* and on other departments of the zoology of the invertebrata is known to all. Some who read this may remember his eloquence as a lecturer, and many have appreciated his estimate of the knowledge of natural history which may be reasonably expected from a candidate for a medical degree. Outside the precincts of the University, Edinburgh has furnished notable naturalists. Sir John Dalzell and Charles Peach have both contributed much to this department of science.

Such is a slight sketch of the leading anatomists, physiologists, chemists, and naturalists who have flourished in Edinburgh. They all belong to that great company who by genius, industry, and experiment have discovered truths in science, and have thus advanced human knowledge. A study of their lives shows that there is no royal road to scientific discovery. Nothing worth preserving is hit upon by chance. True plodding, well directed effort, on the other hand, cannot fail to discover something new to the human mind in the operations of nature.

THE MEDICAL CELEBRITIES OF EDINBURGH.

WITHIN the limits of a short article, it is impossible to notice all the distinguished men connected with Edinburgh who have contributed to the advancement of the theory and practice of the healing art. From the foundation of the University to the present time, one generation of great physicians, surgeons, and obstetricians has succeeded another. When we allow the mind to wander back into the history of the progress of medicine during the last hundred years, the names of Cullen, the two Duncans, Craige, Abercrombie, and James Beggie, as physicians; of Liston, Lizars, James Miller, and Syme, as surgeons; and

of Hamilton and Simpson as obstetricians,—start into view as the great men of the day. Each of these did good work in his time, and has earned a place in the temple of fame. As time rolls on, and the art of healing passes into new stages of development, the marks of their individual work may become effaced; but a consideration of what they accomplished will not be omitted by the historian of the progress of medicine and surgery.

Of all these, the one who probably merits most attention is William Cullen. Born in 1710 at Hamilton, he studied at the Universities of Glasgow and Edinburgh; and, in 1735, he settled in practice in his native town. In 1740, he removed to Glasgow, took the degree of M.D. at the University, and became a practitioner in that city. He early began to lecture, and it appears he gave prelections on the theory and practice of medicine, on botany, on materia medica, and also on chemistry. It is said that Cullen lectured on botany in Latin; but, in the other departments, he spoke the English language, a great innovation at that time. In 1751, he became professor of Medicine in the University of Glasgow, and, four years later (1755), he was elected by the town council of Edinburgh to be joint professor of Chemistry with Professor Plummer. In 1757, he shared the duties of lecturing on clinical medicine with Dr. Rutherford, the professor of Botany and Medicine of the time. His careful training in botany and chemistry—sciences of observation and experiment—no doubt prepared him for the great work of classification and arrangement he had to do. Prior to Cullen's time, diseases were classified in an arbitrary manner, and the works of the older writers were filled with scholastic verbiage, which rendered them almost useless. His clear and systematic mind soon began to reduce this state of things to order. In 1777, he published two works: *First Series of the Practice of Physic*, and *Institutions of Medicine*; in 1785, his *Synopsis Nosologic Methodica*; and, in 1789, a *Treatise of the Materia Medica*. These works are all characterised by clearness of language, strong common sense views of difficult questions, and an impatience of baseless theories and false facts. He showed also the high quality of being able to state the truth, though opposed to his own views, with fairness and impartiality, and he gave credit to the opinions of others. Famous as a writer and a lecturer, he also became the great physician of his time. A few weeks before his death, in his seventy-seventh year, finding himself unable, from age and infirmities, any longer to discharge the duties of the office, he resigned his chair. Immediately honours flowed in upon him, both from home and abroad. He died on February 5th, 1790. The chief features of Cullen's intellect were clearness, accuracy, ability to reason and deduce inferences rightly, originality of thought, and, above all, the power of bringing to a focus on any difficult question of pathology or therapeutics all the knowledge he possessed. He was also one of the first who distinctly recognised the great importance of regarding psychological questions from a physiological point of view. The time in which he lived was one famous for great men. Then David Hume wrote his speculative disquisitions, and announced his practical views of human well-being; Reid brought his patient mind to bear on philosophy, and Adam Smith founded the science of political economy. We learn from his biographer (Dr. Thomson) that "in this circle Cullen lived as professor and scientific physician; and, while he was everywhere known in the latter character, he was not less remarkable as a member of that assemblage of accomplished persons, by whom, during the eighteenth century, the small capital of Scotland became the centre of whatever was ornamental and useful in literature and in science."

The two Duncans and Craige were also distinguished physicians. They were all men of remarkable energy and power of work, and wrote treatises which were the authorities of their day, but are now forgotten. It cannot be said that their names are associated with any special era in the development of medical thought and practice. There is one fact, however, which must be stated, as reflecting honour on the first Duncan; namely, that he was the editor of the first medical journal (so far as we know) ever published in Edinburgh. We have now before us a volume entitled *Medical and Philosophical Commentaries by a Society in Edinburgh*, vol. i, part 1, bearing date 1773, dedicated to Dr. William Robertson, the historian of Scotland and of Charles V. and announcing, at the end of the introduction, that "those who incline to favour us with any materials may transmit them to the booksellers for whom this work is published; or to Dr. Andrew Duncan, physician in Edinburgh, who is secretary to our Society". On referring to this volume, our surprise is not at what the writers of that day did not know, but at how much they appear to have known. If anyone will take the trouble to examine the papers in this volume, they will find statements, both physiological and pathological, which are generally supposed to originate with later times.

We now come to Abercrombie, whose name, apart from the lustre shed on it by his medical writings, will long be remembered in Edin-

burgh as that of one of the best of men. John Abercrombie was born on October 10th, 1781. His father was a clergyman of the Established Church of Scotland, in Aberdeen. He graduated at the University of Edinburgh on June 4th, 1803. After studying for a short time in London, he took a house in Nicholson Street, Edinburgh, and began practice as a general practitioner. For seven years, he devoted much time to the poor, as one of the physicians to the Royal Public Dispensary. He soon gathered around him a band of zealous pupils, to whom he allotted districts in the city, while he superintended all. He thus found for himself a rich field of observation, and accumulated those stores of knowledge which afterwards formed the basis of his future fame, eminence, and skill, as a practical physician. In 1821, on the death of Dr. Gregory, he became a candidate for the chair of Medicine in the University, and failed. Dr. Gregory's death caused numerous changes in the University of Edinburgh: Home, then professor of *Materia Medica*, succeeded him in the chair of Medicine; Duncan, then professor of Medical Jurisprudence, was transferred to *Materia Medica*; while Duncan's place was filled by Robert Christison, now the distinguished president-elect of the Association. About this time, Abercrombie became a consulting physician, a position which he enjoyed until his death, which took place on November 14th, 1844. His famous work on the *Diseases of the Brain and Spinal Cord* appeared in 1828. Immediately thereafter he published another standard work, entitled *A Treatise on the Diseases of the Abdominal Viscera*. Whilst busily engaged in medical practice, Abercrombie found time to write his well known work on the *Intellectual Powers and the Investigation of Truth*, which appeared in 1830; and, in 1833, his *Philosophy of the Moral Feelings*. Of a deeply religious turn of mind, he wrote many valuable tracts, the best known of which perhaps is his *Elements of Sacred Truths for the Young*. The concluding paragraph of the introduction of this little work shows this aspect of Abercrombie's character. "Should the work, on which the author has thus entered, be found useful as a manual, he will esteem it the highest distinction that can be conferred on him. By the favour of the public, his former writings on various subjects have gained a most extensive circulation, and have received the most gratifying marks of approval. The ambition that now remains to him is to have his name associated with those solemn and sacred hours, when the Christian parent calls around him the children of his heart, and—feeling all the uncertainty of life which is passing over them—seeks to raise their minds to a life that is never to end." In 1835, he was elected Lord Rector of Marischal College in Aberdeen, and delivered an inaugural address long remembered, and afterwards published under the name of *Culture and Discipline of the Mind*. He was buried in the West Churchyard amidst universal regrets. "Abercrombie's mind was eminently practical, a trait which shone forth conspicuously on all his writings, alike on medicine, morals, and religion. He scrutinised facts with singular jealousy; and we have heard it well remarked by a physician that 'what Abercrombie recognised as facts must be facts.'" (From an obituary notice initialed J. R. C. [John Rose Cormack?] in the *Edinburgh Monthly Medical Journal* for December 1844.

Space compels us only to allude to James Begbie, author of *Contributions to Practical Medicine*, the father of Dr. Warburton Begbie, who is to deliver the Address on Medicine at the approaching meeting. Dr. James Begbie was a man in many respects comparable to Abercrombie. Though he wrote much less, still what he did write was so good as at once to become part of the literature of the profession worthy of preservation. He was the model of a courteous, skilful, highly cultured physician, the friend alike of his patients and of every member of the profession who called in his assistance. He possessed great quickness in seizing hold of the salient features of the case on which he had to give an opinion, and the rapidity and accuracy of his diagnosis was often remarkable.

When we turn to the *surgeons* who have added to the renown of Edinburgh, we find so many illustrious names as to make it difficult to select one for special remark. After Benjamin Bell, John Bell, and Sir Charles Bell, to whom we have referred in another article, the first name on our list is that of Robert Liston, the most dexterous operator of this country, or, perhaps, of any country. His natural talents fitted him for great distinction in this department of the profession. Not only was his knowledge of anatomy precise, and his manual dexterity and power of co-ordination of movements great, but his mechanical knowledge and readiness of resource, even in the most trying circumstances, showed him to be, in a sense, a born operator. With the exception, however, of his work on the *Surgical Anatomy of Crural Hernia*, and his papers on Lithotomy and Lithotrity, Liston has not added much to the literature of his profession. He was great while he lived, and he will be remembered chiefly as a great operator. The name of Liston naturally suggests that of Lizars, also a distinguished

surgeon in his day, and of William Fergusson, who has in London won for himself so great a name. Associated with the name of Liston, also, we think of James Miller, the immediate predecessor of the present distinguished occupant of the surgical chair in the University, Professor James Spence. Miller was in many respects a remarkable man. Gifted with a natural eloquence which was fitted to command the attention of crowded assemblages, he was an able expounder of the principles of surgery. His power of ready language was a snare, for, trusting to it, his systematic prelections were sometimes deficient in conciseness and accuracy; but no one could listen without being struck with the wealth of illustration and the rich flow of humour which permeated all his lectures. Interesting himself in many of the social questions of his time, his position, natural ability, earnestness and honesty of character, and strongly expressed opinions, made James Miller a great power while he lived.

The surgeon of whom Edinburgh is especially proud is James Syme. His death is so recent, his achievements are still so vividly traced in the records of surgery, and his life is so intimately associated with that of so many still living, as to make it unnecessary to do more than to point him out as one of our greatest men. For an estimate of his character we would refer to the last chapter of *Memorials of Professor Syme*, by Dr. Robert Paterson of Leith. He says: "He found surgery in many respects unworthy of its position, whether as a science or an art; he left it both scientifically and practically corrected and improved. He found it based in many instances on false reasoning, which resulted in erroneous conclusions. He corrected many of these, and thus brought about more satisfactory results. In this course he was sometimes a pioneer, pointing the way, as it were, to what might be accomplished in surgery, as in his description of the treatment of 'callous ulcers' and the theory of the treatment of incised wounds which has now been so generally adopted. He exhibited his conservative tendencies in the saving of limbs and other parts, by adopting methods which had been introduced and recommended by others, but which had fallen into disuse, as was prominently illustrated in his revival of the operation for excision of joints, now so largely practised. The same remarks apply to his adoption of Chopart's operation at the tarsus, which he afterwards modified; but seeing that his own improvement often ended in a defective stump, he was not long in proposing that new operation which bears his name, viz., amputation at the ankle-joint." . . . "His power of conveying knowledge to others, in a concise and practical form, was hardly more conspicuous than the attention and devotion of his students, and the love with which he inspired them. As a clinical teacher of surgery, he stood unrivalled." . . . "His connection with the University of Edinburgh was always to him a matter of pride; and when the history of it in those days comes to be fully written, probably no higher names will be found in its pages than those of Syme and his contemporaries—Alison, Christison, Goodsir, and Simpson. Nevertheless, the monumentum *ere perennius* to our great clinical teacher will be his unrivalled surgical achievements, in the performance of which he displayed all the great elements of character so sententiously expressed by his old and attached friend Dr. John Brown, when inscribing his *Loche and Sydenham* to his old master—*verax, capax, perspicax, sagax, officax, tenax*." James Syme was born at No. 56, Princes Street, Edinburgh, on 7th November, 1799, and died on 26th June, 1870. He is interred in the Burial Ground of St. John's Episcopal Chapel. All who visit Edinburgh who wish to fix on the memory the sagacity, power, and firmness portrayed in the face of Syme, should visit his bust by William Brodie, in the Library Hall of the University.

Edinburgh has produced many distinguished *obstetricians*, notably Hamilton and Simpson. The work done by the latter was more than most men could accomplish in twice the time of his comparatively short life. What he did for obstetrics is well known by those devoted to this department of the profession. Looking at his life and character as a whole, it may be said he was a many-sided man, of restless energy and determination, gifted with that quick perception of the possibilities of certain lines of thought and action characteristic of genius, and especially endowed with the power of personally influencing others, which most men of great mark have shown—a power for which we have seen no adequate physiological explanation. While he lived, Simpson was a great social influence, and he has left a name which will be long associated with the introduction of anaesthetics into obstetrical practice, with accupressure, with certain well known views regarding the construction of hospitals, and with many important improvements in obstetric practice. He was born at Bathgate, in Linlithgowshire, on June 7th, 1811; he died in Edinburgh in his 59th year, on May 6th, 1870; and he is buried in Warriston Cemetery, Inverleith Row. His biography has been written by J. Duns, D.D., Professor of Natural Science, New College, Edinburgh (now out of print). It is a work on the whole well executed, but it falls far short of what a life of Simpson ought to be.

A most discriminative essay, giving the writer's impression of what he was and what he did, lately appeared from the pen of Mr. Sampson Gamgee of Birmingham.

BRITISH MEDICAL ASSOCIATION: SUBSCRIPTIONS FOR 1875.

SUBSCRIPTIONS to the Association for 1875 became due on January 1st, Members of Branches are requested to pay the same to their respective Secretaries. Members of the Association not belonging to Branches, are requested to forward their remittances to Mr. FRANCIS FOWKE, General Secretary, 36, Great Queen Street, London, W.C.

BRITISH MEDICAL JOURNAL.

SATURDAY, JULY 31ST, 1875.

THE APPROACHING ANNUAL MEETING.

IN anticipation of the forty-third annual general meeting of the Association next week, which will take place in Edinburgh, we present to-day a collection of short monographs by competent persons, descriptive of the leading features of medical interest in this important centre of medical science and teaching. Edinburgh has great medical traditions, of which we have endeavoured to condense the spirit; it has a grand medical history, of which we have faintly sketched the outlines; of its recent greatness and modern efficiency, we shall have, next week, the opportunity of supplementing by observation that which is imperfect in our knowledge gathered from other sources. These brief sketches do not, of course, pretend to do justice to the theme; they only constitute a miniature framework to which greater diligence, larger knowledge, more ample opportunities, and higher skill, can give solidity, completeness, and verisimilitude. We aim at furnishing to those who are about to visit Edinburgh the material to assist them in appreciating the Alma Mater of many illustrious sons of medicine, and of the great army of well-educated practitioners, whom it has in the course of years sent forth fitly armed for their life-long battle against disease. Those who are prevented from enjoying the pleasure of attending the meeting, will doubtless thank us, not only for the sketches themselves, but for the local colour which they will give to subsequent reports. Medical Edinburgh, familiar in substance to many, will be henceforth not unfamiliar in spirit to any of our present readers.

The general arrangements for the meeting are fully set forth in the detailed programme. It will be seen that the unremitting labours of the local officers and committees, and the generous goodwill of the University, of the College of Physicians, and of the profession at large in Edinburgh, have prepared an ample programme of scientific work, of oratorical prolixion, and of pleasant relaxation. The days of the meeting will be fully occupied; every hour has its allotted employment for men of varied tastes. The arrangements have been made with much labour and forethought; and the welcome which is so warmly extended to Southern brethren will, beyond doubt, attract a large gathering disposed to be pleased, desirous to be instructed, and anxious to make and to maintain closer acquaintance with their brethren north of the Tweed, and to enter into a compact of professional and social co-operation with them. We are happy to be able to add that, following the example of London and other large towns and cities, the Town Council of Edinburgh unanimously voted at a meeting this week that the British Medical Association be received officially; they also intended an entertainment, but, as no night was open for the purpose, they have voted £100 to the reception fund.

The greatest interests of the medical profession are identical in all parts of the kingdom. The elevation of the professional character, the promotion of science, the fostering of brotherly intercourse and mutual helpfulness, are characteristic aims of this Association which cannot fail to find an increasing response in all parts of the kingdom. The earnestness and success with which they have been pursued by the

British Medical Association have widened year by year its limits and enlarged its numbers. We have already a very large body of members in Scotland, and more than one branch. In order that the voice of the Scottish members shall be fully heard, and their influence adequately felt in the councils of the Association, it is desirable that further branches be organised, and especially that one be formed at an early date in Edinburgh. The need of scientific debate is so fully supplied in Edinburgh by its excellent societies, as our columns have regularly borne witness, that in Edinburgh, as in London, the Branch would rarely, if ever, be called upon to fulfil a scientific purpose; with these societies it would not enter into any sort of rivalry, any more than our Metropolitan Counties Branch does in London. But, by organising a Branch, the due representation of the Edinburgh members of the Association would be obtained in the Council and the Committee of Council of the Association, and in its Parliamentary and other Committees. The Scottish members of our Association have an equal interest with ourselves in many of those socio-medical subjects on which this Association brings to bear the full influence of organised medical opinion; such as the status and remuneration of the medical departments of the army, navy, Poor-law; health-administration and public medicine; medical education and the public law relating to the practice of medicine; the settlement of such questions as the legal treatment of confirmed drunkards, and revision of the legal tests of lunacy; the uses and abuses of hospitals, infirmaries, and dispensaries; and many other questions of national importance and of interest to almost every medical man. On most of these questions the British Medical Association has already rendered important services; they are progressive questions of which the development advances with time, and which will, in the changes that time brings, call for all the wisdom, care, and combined influence which the members of the medical profession in Scotland can join their brethren in England in bringing to bear on them.

It is, therefore, much to be desired that every opportunity be used of giving a formal voice to the combined members of our Association in Scotland. This may be aided by the constitution of a Branch having its seat in Edinburgh; one meeting annually for the purpose of electing officers is all that the laws require. An address at that meeting might be the means of raising a discussion on some of the more important topics of the year; or it might be left to the Council or members to arrange for summoning special meetings for this latter purpose when occasion should occur. We desire that the powers of the Association for combined usefulness and common exertion for the professional and public good may be everywhere developed to the utmost; and it has always been found that Branch organisation largely subserves this end by keeping alive local initiative and affording the readiest means of the independent and free development, and ready and powerful expression, of local opinion on all subjects of interest.

THE CHOICE OF ANÆSTHETICS.

WE publish in another column a letter from Mr. George Pollock, which will be read, we believe, with general satisfaction. The humane sentiment which prompted Mr. Pollock's utterance on the subject in the *Times* could not be doubted. The letter was in many ways incautious, and in some unjust, in the palpable inferences which could be drawn from it. But the failings which lean to virtue's side are those most easily condoned; nay, they extort admiration even when we are bound to point out that they inflict injustice. None can feel, perhaps, more strongly than ourselves the very solemn responsibility which is involved in the choice of anæsthetics. We have acted up to our sense of that responsibility and the duties which it imposes, by sparing no pains to ferret out all the cases of chloroform accidents and chloroform deaths. We have repeatedly and urgently impressed on all our readers the public and professional duty of giving the fullest and most candid publicity to all details of such accidents, and to every circumstance connected with them which can, however remotely, throw light upon their nature or

causes. Collecting from every source information as to the administration of ether as an anæsthetic, we have invited from all quarters comment and communication calculated to completely inform the professional mind. Many scores of such communications have been published in our columns, and we have had the satisfaction of producing and maintaining a "chloroform-panic" and an "ether-revival". The papers by Clover, Haward, Braine, Norton, Bowditch, and Fifield of Boston, Hutchinson, the late John Murray, and a host of others, appeared to us to establish the superior safety of ether over chloroform, and they led to a very large and general substitution of ether for chloroform as a surgical anæsthetic. The word "surgical" should here be noted, because, as we pointed out long since, and as others have shown, there is, so far as we know, no recorded case of death from chloroform administered during parturition. For the purposes also of dental surgery, nitrous oxide, which was likewise first pressed on the attention of the profession in these pages, appears to have superior advantages, and to be equally safe with ether. We have never admitted that greater rapidity of effect, or other reasons of convenience, could justify the use of a more rather than a less dangerous anæsthetic; but, inasmuch as the alleged inconveniences of delay, loss of time, and atmospheric diffusion of the vapour, have undoubtedly produced a prejudice against ether, we think it to the point to observe that ether, administered skilfully and properly, is found, in the hands of experienced operators, not to cause much if any greater delay than chloroform. Anæsthesia is, we believe, in practised hands, produced at our hospitals by ether in about five minutes. The unpleasant diffusion of ether through the air is obviated by the use of a suitable inhaler. The very satisfactory apparatus which has been introduced and improved by Mr. Hawksley certainly obviates this source of discomfort, together with most others which are complained of.

There is one point, however, to which we desire to direct attention, and as to which we should be glad to have information for the guidance of the profession. Is the ether (ether sulphuricus) of the *British Pharmacopœia* that which is most desirable for use as an anæsthetic, or the ether purus (washed ether), of the *Pharmacopœia*? In standard authorities, such as Garrod, the ether sulphuricus is that which is specially recommended for use as an anæsthetic. It has a specific gravity of 0.735. On the other hand, we are assured by a distinguished practical authority, that the ether which should be used, to insure the highest degree of safety, is the ether purus (washed ether), pure from alcohol and water, and having a specific gravity not exceeding 0.720. Perhaps Dr. Garrod will kindly state on what ground he recommends the sulphuric ether. And, on the other hand, we should be glad to hear from Mr. Clover, Mr. Norton, Mr. Braine, or others who are now employing ether, which kind they prefer, and why. Garrod mentions among the drawbacks to ether, its nauseous odour and taste, and the laryngeal spasm and violent struggling which it causes at the outset. The struggling and spasm may, we believe, be overcome by a little practice in freely admitting pure air for a moment when they threaten; and with an apparatus such as Hawksley's this is easily effected. In a word, the practical inconveniences of ether are such as may be overcome by skill; its greater safety is an over-mastering and all-powerful recommendation. The question of cheapness we do not discuss; it is really one which cannot enter into serious consideration. The question of mixtures of alcohol, ether, and chloroform, requires possibly further investigation. They have an enthusiastic supporter in Mr. Ellis of Sloane Street. They do not meet with general favour, owing to the impression that, as these fluids evaporate at different temperatures, and with varying rapidity, they add to the uncertainties and risks of anæsthetics; that, in inhaling such mixtures, the patient is at one time receiving nearly pure chloroform; at another, nearly pure ether or pure alcohol. We earnestly commend this subject to renewed attention. It is certain that those whose duty it is often to administer anæsthetics, are deeply interested in the question of the choice of anæsthetics; to them and to their experiences we must chiefly look for guidance. But we are all concerned to arrive at a just conclusion in so

grave a matter. And, if that conclusion be in favour of ether, the sooner we all attain it, and the more quickly more dangerous anæsthetics, such as chloroform and bichloride of methylene, are relegated to their proper place, the better for patients and for surgeons.

We regret to announce the death of Dr. Peter Mere Latham, at the ripe age of eighty-six, at Torquay. This accomplished, amiable, and distinguished physician had long retired from practice. In the leisure of his old age, he collected, for the benefit of our readers, his notes of past experience. We shall publish a further notice of his life and work.

THE sentence of death passed upon Michael Murphy at the last session of the Central Criminal Court for murder has been respited, the convict having been certified to be insane by two physicians specially appointed by the Secretary of State to examine into the state of his mind. He will, therefore, be placed in a convict prison appropriated for the detention of insane prisoners.

THE CHOLERA IN SYRIA.

OUR Constantinople correspondent writes:—Much anxiety is felt here amongst us, and it is with grave alarm that we witness the increasing dimensions of the recent outbreak of cholera in Syria. Whether it is endemic or epidemic, is at present undecided; a fierce controversy concerning the same is now being carried on by the Turkish and Frank physicians. Medical assistance has been urgently demanded by the Sali of Damascus; and a letter has been addressed to Marco Pacha, the Medical Director of the Turkish Military School of Medicine, begging that he will send to, and place at the disposal of, the cholera-stricken inhabitants a number of the young military surgeons who have lately passed through and qualified in the Army Medical School, of which he is an able and efficient director. The request has been acceded to, and a number of young military surgeons leave immediately for Beyrout. A Sanitary Council was held last week in Constantinople, presided over by Caboli Pacha, Minister of Commerce, to devise measures against its further spread, etc. From trustworthy advices lately received by telegram, it appears that the mortality and likewise the number of cases are on the increase both at Antioch and at Damascus. At Damascus, from the 5th to the 12th of July inclusive, there were 1,118 cases, 506 of which proved fatal. The worst day was the 12th, when there were 190 cases and 107 deaths. At Antioch, from the 6th to the 11th, there were 115 cases and 66 deaths. No cases have been reported from Damascus.

INSANE BUT GUILTY.

THE newspapers this week have been much exercised, because the jury who tried George Blampied at Maidstone last week pronounced him not accountable for his acts on the ground of insanity, in the teeth of the judge, Mr. Justice Brett, who summed up most strongly for a conviction, and recited to the jurors the whole of the judge's answers in the Macnaghten case, by which they must have been greatly edified. The prisoner was in Barming Heath Asylum from 1868 to 1872, a long period. He was attended by the surgeon of the dockyard in 1874 for swimming in the head and melancholia, and now, without any cause, quarrel, or provocation, he suddenly struck a fellow workman on the head with his adze. At the trial he was undefended. We were under the impression that an undefended prisoner was specially protected by the presiding judge; but here the latter requested one of the counsel present to defend, and himself did all he could to bring about a conviction. The surgeon of the gaol, however, said that Blampied had been under his observation for three months, and that he was undoubtedly of unsound mind, being mad on the subject of religion. And the jury, in spite of the judge's remarks about controllable or uncontrollable impulses, the knowledge that he was doing wrong, and the like, acquitted him as an insane man. Of course we read the usual remarks about the "mad doctors'" views; but it is notice-

able that in this case there were no "mad doctors" at all. Probably if there had been they would have said that the man was suffering from religious melancholia, and that the delusions under which he laboured were such as would be likely to lead to homicide. Mr. Justice Brett told the jury that swimming in the head had nothing at all to do with insanity, and might have been merely a symptom of the stomach being out of order. He further said, that if he had religious delusions, that was not such insanity as the defence required; in fact, he assumed that the man was insane, yet directed a conviction. The jury, however, exercising their own common sense, acquitted him, thus furnishing another reason, in addition to those laid down by Lord Chief Justice Cockburn, Mr. Justice Blackburn, and others, for the alteration of the existing law.

RECENT URBAN MORTALITY.

DURING last week, 5,413 births and 3,555 deaths were registered in London and twenty other large towns in the United Kingdom. The annual mortality was at the rate of 24 per 1,000 living; in Portsmouth it was 13 per 1,000; Norwich, 17; Edinburgh and Wolverhampton, 21; Birmingham, London, Sunderland, and Sheffield, 22; Bristol and Liverpool, 23; Dublin, Salford, and Oldham, 24; Bradford, 25; Leeds, Hull, and Newcastle-upon-Tyne, 29; Leicester, 30; Glasgow and Manchester, 31; and Nottingham, 34. The annual zymotic death-rate averaged 5.5 per 1,000 in the eighteen English towns, and ranged from 1.3 both in Portsmouth and Norwich, to 9.2 and 11.3 in Salford and Nottingham. Measles and diarrhoea prevailed in Salford; scarlet fever and diarrhoea in Nottingham. Scarlet fever showed a markedly increased fatality in Bristol; and the annual death-rates from diarrhoea were 5.2 and 5.7 per 1,000 in Leicester and Nottingham respectively. In London, 2,330 births, and 1,471 deaths were registered. The births exceeded the average by 100; the deaths were 162 below the average. The annual death-rate was 22.3 per 1,000. The 1,471 deaths included 35 from measles, 96 from scarlet fever, 11 from diphtheria, 58 from whooping-cough, 22 from different forms of fever, 138 from diarrhoea, and not one from small-pox; in all, 360 deaths, which were 116 below the average. The 96 fatal cases of scarlet fever exceeded the number in any week since the middle of November last. The 138 deaths referred to diarrhoea were 66 less than the number recorded in the previous week, and were 141 below the average. In greater London, 2,824 births and 1,713 deaths were registered, equal to annual rates of 35 and 21.2 per 1,000 of the population. In outer London, the general and zymotic death-rates were 16.6 and 3.1 respectively, against 22.3 and 5.5 in inner London. The mean reading of the barometer at Greenwich for the week was 29.62 inches; the mean temperature of the air 60.2 deg., or 2.2 deg. below the average. The mean humidity of the air was 91; the general direction of the wind, W. S. W.; and the horizontal movement of the air averaged 8.9 miles per hour. Rain fell on five days to the amount of .49 of an inch. The amount of rain measured in fifteen other large towns during the week, varied from .90 of an inch in Bristol, to 5.13 inches in Birmingham.

THE HOSPITAL FOR SICK CHILDREN, GREAT ORMOND STREET.

THE new Hospital for Sick Children in Great Ormond Street has been thrown open for inspection during the past week, and has been visited by numbers of the friends and supporters of the institution, including a large contingent from the medical profession. The new building faces Powis Place, and occupies what was the garden of the old hospital. Only half of the new hospital is as yet ready for occupation. To complete the design, the old houses in Great Ormond Street, which are rapidly becoming insecure, must be pulled down. The whole will then accommodate two hundred patients; the portion just opened will contain a hundred and ten or fifteen. The new building is of red brick, with terra-cotta mouldings; and, although the Committee insist strongly on the fact that they have spent nothing in ornament, the external effect is decidedly handsome. Internally, also,

great taste is displayed, as well as evidence of careful attention to practical details. The general result is, accordingly, highly satisfactory. There should be six large wards, each about 70 feet long, by 24 feet wide, and 12 feet high, arranged in pairs right and left of the central staircase; but one of the top wards has been subdivided, to provide accommodation for special or contagious cases. The walls of the wards are of coloured glazed bricks set in cement; the floors are of polished teak, and the ceilings of parian. Great ingenuity has been shown in contrivances for the saving of labour. Attached to each ward are three lifts, one for coals, another from the kitchen, and a third from the dispensary. There is also a shoot for dust and ashes, and another for dirty linen. The out-patient department occupies nearly the whole of the basement, and is exceedingly well arranged. The kitchen and staircase are, however, crowded in between the two large waiting-rooms; and we fear it will be difficult to prevent the inevitable effluvia from these from invading the upper storeys. The kitchen and chapel both struck us as disproportionate to the size of the hospital. In the chapel, quality has evidently been studied before quantity; the decorations are most gorgeous. The cost of the new building, exclusive of the chapel, has been nearly £40,000; and to this another £4,000 must be added for furnishing. Both the architect (Mr. Edward Barry) and the hospital subcommittee must have taken great pains, and they are certainly to be congratulated on the very considerable measure of success which has rewarded their efforts.

CHOLERA IN THE EAST.

AN outbreak of cholera has occurred at Alibang, but energetic measures have been taken to limit its course as much as possible. A slight outbreak has also occurred at the Sassoon Reformatory for Boys. Three cases occurred, one of which ended fatally. The next day, twenty-two other cases had been reported; but eventually it was discovered that in these cases the boys were "shamming", under the guise of which they contrived to make their escape.

SANITARY WORK WITH PAY.

WE have before us printed copies of a letter addressed by Dr. Strange, Medical Officer of Health, Worcester, to the Board of Guardians of that town, complaining of the conduct of Dr. Woodward, District Poor-law Medical Officer, in neglecting to inform him (Dr. Strange) of the occurrence of cases of epidemic or contagious disease which had come under Dr. Woodward's observation; and of the reply of that gentleman thereto. This correspondence occupies much space in the *Worcester Journal*, and fully exemplifies the impolicy of the course followed by Mr. Stansfeld in framing his Public Health Act. It was the wish of the late President of the Local Government Board, contrary to the opinion of all those who had practical experience of the subject, to constitute district Poor-law medical officers sole health-officers in their respective districts. At the time, we strongly objected to this proposal, and our conviction that it would not work satisfactorily was borne out by the result; for, as soon as the Act was put in operation, so large a number of Poor-law medical officers refused to accept the position, that the department was compelled to make other and even more objectionable arrangements, whereby the great majority of district medical officers were left out in the cold. Finding that the health-officers were utterly at a loss, from the want of information which the district Poor-law medical officers were alone able to supply, and which, if our suggestion had been adopted, they could have safely furnished, the department, in the early part of last spring twelvemonth, issued a circular letter to all boards of guardians, requesting them to direct their medical officers to furnish to the health-officers information respecting the occurrence of epidemic or contagious disease, but omitting to suggest any mode whereby such officers should be remunerated for such extra trouble. Prior even to the issue of this letter, it appears that Dr. Strange had requested Dr. Woodward to furnish him with a copy of his quarterly return of sickness, and with information as regards the occurrence of contagious disease. This Dr. Woodward

declined to do, unless he were remunerated for his labour. It would appear that erysipelas has been epidemic in Worcester during the last twelvemonth, and Dr. Woodward has reported its existence in the column set apart for that purpose in his medical relief-book. The attention of the Board having been directed thereto, and the matter having acquired publicity, Dr. Strange makes complaint of Dr. Woodward for alleged neglect of duty, to which the latter gentleman vigorously replies, stating that, when appointed, no arrangement was made with him that he was to supply to any other officer information as regards the sickness in his district, and protesting against the assumption that he was bound by virtue of his office to supply him with information; and also pointing out that it was competent for Dr. Strange to attend at the workhouse and make such extracts from the medical officer's report-book as he required. In regard to this correspondence, we confess that, however desirable it may be that early information should be given of the outbreak of preventable disease, our sympathies go rather with the ill-paid Poor-law medical officers, upon whom it is hard that extra work should be demanded of them without remuneration. The Registrar-General has successfully resisted a like demand upon metropolitan registrars; but the Poor-law medical officers seem to have no official protectors.

MEDICAL LITERATURE IN CHINA.

THROUGH the courtesy of Mr. Curling, we have been favoured with a sight of a highly interesting specimen of medical literature; viz., a translation into Chinese of his well-known classical work on the *Diseases of the Testis*. The translation has been made by Dr. Patrick Manson of Amoy, who, in an English preface, says that his object in publishing a translation of so elaborate a book is to supplement the works on general surgery already in the possession of the Chinese, and to supply the earnest student with the opportunity of acquiring a thorough knowledge of at least one very important branch of the art.

"I have chosen this particular department of surgery—the diseases of the testis—partly because it is a well defined one, but principally because eight years' experience of Chinese hospital practice in Formosa and Amoy has taught me the great frequency of those diseases, and the ease, when an accurate diagnosis has been arrived at, with which they may be cured."

The book is published in three volumes; and at the end of the third the plates illustrating Mr. Curling's work are reproduced with great accuracy. This is, we believe, the first instance of the translation into Chinese of a monograph on a medical subject.

SOCIETY FOR RELIEF OF WIDOWS AND ORPHANS OF MEDICAL MEN.

THE quarterly court of the directors of the Society was held in the rooms of the Royal Medical and Chirurgical Society, 53, Berners Street, on the evening of July 14th. Mr. Charles Hawkins, Vice-President, took the chair. The sum of £1,116 : 10 was voted to be distributed among fifty-seven widows now receiving grants; a sum of £75 : 10 to be divided between seventeen children; and a further sum of £19 : 10 was granted to three children from the Copeland Fund. The expenses of the quarter amounted to £66 : 10.

THE INTERNATIONAL CONGRESS OF OPHTHALMIC SURGEONS.

DRS. AGNEW, Noyes, and St. John Roosa, the Provisional Committee appointed in 1872 to organise the next International Congress of Ophthalmology, announce that the meeting will be held in New York city on the second Tuesday in September, 1876. The following extracts from the rules of the Congress will give an idea of the general character of the society and of the terms of membership. 1. The object of the International Periodic Congress of Ophthalmology is to promote ophthalmological science, and to serve as a centre to those who cultivate it. It will entertain no discussion foreign to this object. 2. The number of members is unlimited. 3. Every member must be either a doctor of medicine, or of surgery, or of science, or possess some other equivalent degree, or be distinguished for his scientific knowledge. 4. Candidates for admission into the society shall be

admitted on presentation of their diploma or of their scientific title, unless ten members demand a ballot. 5. The sessions of the society shall take place every fourth year, and be limited to ten days. Before the opening of each session, a card available for admission to all the meetings, and signed by the President and Secretary, shall be given to each member on payment of his subscription (fixed at two dollars), and upon signature of his name on the register of those attending the meeting. The Committee are making all efforts to secure a large attendance, and one that will leave its mark upon the progress of scientific ophthalmology. The co-operation of the profession of Great Britain in securing these objects is earnestly desired by the Provisional Committee.

THE RELATION OF THE MEDICAL STAFF TO THE MANAGING COMMITTEE OF A HOSPITAL.

WE have over and over again maintained that the medical officers of our hospitals have not that share in the management of these institutions to which they are entitled by their special knowledge and important services. At the special meeting of governors of the Queen's Hospital, Birmingham, to which we referred last week, and which was called to consider several radical alterations which the Committee proposed to make in the management, the Chairman, the Rev. C. Clarke, F.L.S., who has devoted a good deal of time to the subject of hospital management, is reported to have said, in reply to the assertion made by a previous speaker that the Medical Board ought to have been consulted before the changes in question were recommended to the governors for adoption, that "the Committee did not wish to trouble the Medical Board. Their medical friends were members of the Managing Committee, and rendered to that Committee official and valuable help; but, as a Medical Board, they had to deal with clinical affairs, *to look after their instruments and drugs*, and to do things that needed the collective wisdom of their body. He fancied, however, that they had nothing whatever to do, in that collective capacity, with the arrangements of the hospital. Every man to his last; let every man mind his own business. He was quite sure the Committee did not step out of their province to invade that of the Medical Board, and it would be quite as well if the latter did not step out of their province to invade the functions which belonged to the Committee." We reproduce this statement, because it briefly and well describes the views held by many lay hospital committeemen on this subject of medical representation in the management of these institutions. We pass over the illogical conclusion of Mr. Clarke that, although an honorary officer, as a member of the General Committee, is fully competent to give a valuable opinion upon all points, still, for some unexplained reason, the honorary staff, when assembled in their collective capacity as a Medical Board, have no right, because they are not competent, to give an opinion. We are fully convinced that the system at the London Hospital of having a Medical Committee acting independently, and giving distinct opinions upon all points in the management of the hospital which relate to their department—and how very little does not in some way do this!—is the best solution of this vexed question, because it ensures to the honorary medical staff a powerful and irresistible voice in the management, and at the same time protects them from the undignified position in which they are often placed by the action of the lay Committee when they are themselves members of that body, and when the Medical Board becomes, as it does under this system, simply a subcommittee. We regret that Dr. Hleslop, who at one time loyally held and acted up to these views, has, when tempted by the power which the position of Chairman of the Medical Committee of the Queen's Hospital would place in his hands, or by some other reason, so far departed from his avowed convictions as to become an active member not only of the General Committee, but, in addition, of the House and other Subcommittees also. "Familiarity breeds contempt" in this, as in other matters; and, if the honorary medical staff of our hospitals are to have that share in the management which they are entitled to both by their ability and by justice, and are at the same time to receive that respect-

ful treatment from the lay Committees which is, alas! so often wanting now-a-days, they must insist upon their right to be constituted an independent and distinct Committee, and must at the same time secure for their Board so constituted the same privileges and responsibilities now enjoyed by their *confères* at the London Hospital.

DEATH FROM CHLOROFORM.

FOR the following detailed report of the case to which we referred last week, we are indebted to Mr. G. E. Wherry, House-Surgeon to Addenbrooke's Hospital. Ann Shaw, aged 45, was admitted into Addenbrooke's Hospital on Wednesday, July 14th, 1875, with inflammatory disease of the left eyeball, consequent on an injury. The eye was lost; the anterior chamber was full of blood; and there was the mark of a wound in the sclerotic near the upper margin of the cornea. She complained of some pain in the right eye, and considerable pain in the damaged eyeball. On Thursday night, she was tremulous and sleepless; and on Friday night she was violently delirious, requiring a careful watch through the night. This was an evident attack of delirium tremens. On Saturday morning, Dr. Humphry saw her. She complained of severe pain and "flashing lights" in the eye, which she said prevented her from sleeping. Dr. Humphry decided on that account to remove the eye. She expressed a wish to have chloroform. She walked into the operating-room, got on to the table, and lay down, without assistance. I have been accustomed to give ether, administering at first a small quantity of chloroform; and it was the intention in this case to give ether, with only a preliminary slight inhalation of chloroform. Dr. Humphry examined the heart, and found no evidence of disease. The pulse was good. I proceeded to give chloroform with the inhaler (a thin flannel stretched upon a hoop of wire). Less than a drachm (by measure from a graduated bottle) had been inhaled by the patient, when she began to struggle. The inhaler was at once removed, and no more chloroform given. I could still feel the pulse in the temporal artery. She continued struggling; but the pulse suddenly stopped, though after this she breathed distinctly and deeply several times. Artificial respiration was at once commenced, and very effectually kept up for nearly an hour. Nélaton's method, the battery, and cold affusion, were also employed, but without avail; and the action of the heart was never in the least degree restored. At the examination, twelve hours after death, all the organs were healthy, excepting the heart, in which there was a growth of the size of a nut in the anterior wall of the right ventricle, and projecting into the interior. This growth presented to the naked eye all the appearances of cancer. On examining a scraping of the fresh section under the microscope, cells of varied and irregular shape and size, with free nuclei, were found, which were recognised as of cancerous nature by all the medical officers who examined them. The specimen is preserved. I should add that the eye was examined, and all the other organs, including the brain, lungs, liver, kidneys, spleen, mesentery and intestines, uterus and ovaries, not omitting the mammary glands, and no trace of cancer found in them.

THE WORCESTER INFIRMARY.

THREE weeks ago we alluded to the vote of censure which the Committee of the Worcester Infirmary lately passed upon Dr. Inglis for an alleged breach of rules; though, as we pointed out, Dr. Inglis, while unable from the circumstances of the case to fulfil the letter of the law, had taken the best means to comply with its spirit, and to secure the interests of his patients. It is with regret, though not with surprise, that we have now to report that he has sent in his formal resignation as one of the honorary medical staff of the infirmary. Indeed, it was scarcely possible for him to act otherwise, considering the hard measure that has been dealt out to him, notwithstanding his fourteen years of service at the hospital. As the rest of the medical staff entirely sympathise with Dr. Inglis's views in respect to the rule in question, and as, under the exigencies of practice, there is no saying upon whom the rod may next fall, it remains to be seen what action they will think fit to take with the view of checking the Committee in

their present course. We trust, however, that it will not be necessary for them to follow the example of their colleague; but, we agree with the local journal that, if permanent injury to the institution is to be avoided, and if the Committee are to be restored to harmonious concert with their medical officers, it is high time that the governors should step in, and put an end to the discord which their representatives have created by their indiscreet zeal.

SCOTLAND.

THE public analysts of Greenock, in reporting that they have been unable to find, in the samples of water and milk submitted to them, anything likely to account for the recent severe outbreak of fever in the town, indicate that a real danger is being incurred by those who are using carbolic acid and certain powders as disinfectants. These mixtures are sometimes, it seems, largely adulterated with hurtful foreign substances, and may really introduce disease instead of warding it off.

DR. CROMBIE, the Medical Officer of Health of North Berwick, writes to the *Scotsman* to contradict rumours which have been afloat as to the prevalence of scarlet fever in the town. These reports, he says, are greatly exaggerated, there having been only a few mild cases at the beginning of the month, which are now convalescent, and no more cases having occurred for ten days.

WATER-SUPPLY OF EDINBURGH.

THE water-supply of Edinburgh continues to show a decrease. Although there has been a considerable rainfall during the past fortnight, we have had nothing like the deluges which have done so much damage in the midland counties of England, and, indeed, no more than an average July rainfall in the Edinburgh district. There is a decrease of seven million cubic feet during the past fortnight, the delivery remaining the same, viz., 27.84 gallons a head for a population of 275,700.

CURIOUS ACCIDENT.

ON Saturday, a young man died in Kilmarnock Infirmary, from the effects of an accident of an unusual character. In climbing a tree he fell a distance of about sixteen feet, and was impaled on the point of a paling. It was found that the foreign body had entered the pelvis through the great sacro-sciatic notch, and was left impacted in the wound. Its removal caused a very severe hæmorrhage, which, it was found, came from the gluteal artery. The wound was enlarged, and the injured vessel tied above and below the seat of laceration. At first the patient progressed favourably, but subsequently gangrene set in, and he died on Saturday.

CLOSURE OF THE SUMMER SESSION IN EDINBURGH.

THE summer session of the Edinburgh School of Medicine, both in the University and the extramural school, closed on Friday last, a week earlier than usual, in view of the approaching meeting of the Association. The class prizes were distributed, as usual, by the University professors, and the lecturers and a number of the students have already taken wing. There remain behind, however, a much larger proportion than is usual at the end of a summer session, who intend to take advantage of the students' tickets, which are to be issued, to enable them to attend at the sectional meetings of the Association. The session has been a highly successful one, and the University bids fair to keep up, or even to surpass, the exceptionally high numbers of matriculated students which have marked the past two or three *anni medici*.

HEALTH OF EDINBURGH.

THE report of the Medical Officer of Health shows that, during June, the mortality of the city was at the rate of 22.87 per 1,000, being 19.69 for the New Town, and 26.54 for the Old Town; while that of the southern suburbs was only 15.06. A large proportion, 27.2 per cent. of the whole mortality, was due to diseases of the chest, while 41 per cent. occurred in children under five years of age. Scarletina and whooping-cough are still prevalent to a considerable degree.

THE ALMOND POLLUTION CASE.

THIS is one of a series of actions brought by the riparian proprietors along the course of the river Almond, against the manufacturers, in order to put a stop to the pollution of the river by refuse matter ejected from their works. In this case, the skilled men, appointed by the court, reported that an elaborate scheme adopted by the defenders to prevent any polluting matter from finding its way from their works into the stream, is perfectly satisfactory and thoroughly answers its purpose. It was decided, at the pursuers' request, that the scheme should remain on for the summer, and the approval of the report be delayed till the court meets after the vacation.

THE WATER-SUPPLY OF GALASHIELS.

A DECREE of the Court of Session, in this case, was pronounced last week, by which the local authority were ordered to take immediate steps to introduce a sufficient supply of water into the town according to the statute; and it was decided that, as no objections had been made by the local authority to the scheme prepared by Messrs. Leslie for providing 500,000 gallons *per diem*, they were bound to take the steps required by the statute according to that scheme.

THE ANNUAL MEETING IN EDINBURGH.

THE final arrangements for the reception of the Association are now being made, and, by the end of the week, all the machinery of a large gathering will be in readiness to come into operation on Tuesday morning. The sectional work promises a more than usually studious meeting, and if all the papers are got through, allowing for a short discussion upon each, much good steady work will have been done; while the many attractions of Edinburgh and its neighbourhood combine, with the social gatherings promised, to make a very attractive programme for those who make these annual gatherings a holiday rather than a solemnity, and a pleasure trip rather than a journey in the pursuit of knowledge. We may remind old Edinburgh men that Monday, August 2nd, is the graduation day or capping, when the medical and surgical graduates of the year will take their degrees, and a number of M.B.'s will be promoted to the full Doctorate. After the ceremony, an address will, as usual, be delivered to the new graduates by one of the professors of the medical faculty.

RECOGNITION OF EXTRAMURAL LECTURES ON SURGERY BY GLASGOW UNIVERSITY.

WE learn from the daily papers that Dr. H. C. Cameron has obtained recognition from the University Court of his lectures on Systematic Surgery, to be delivered in the Royal Infirmary during the ensuing session. This notice is worthy of attention, as it is, so far as we are aware, the first time that Glasgow University has recognised an extramural lecturer, as it will be the first occasion of the delivery of a systematic course of lectures on surgery in the Royal Infirmary.

UNIVERSITY INTELLIGENCE.

UNIVERSITY OF OXFORD.

EXETER COLLEGE: SCHOLARSHIPS AND EXHIBITIONS.—An examination for the election of four scholarships and three exhibitioners on the foundation of Exeter College will be held on October 14th. Two of the scholarships, value £80 each, tenable for four years, will be given for proficiency in natural science. There is no limit to age in these scholarships. The examination will be in biology, chemistry, and physics. The candidate must be proficient in two of these subjects. The successful candidates will be required to read for honours in biology in the School of Natural Science. Collegiate candidates must have passed responses or the equivalent examination of the Oxford and Cambridge Schools examination. Non-collegiate candidates will not be admitted to residence until they have shown their ability to pass responses or the equivalent examination. The examination for matriculation at the College will take place on October 14th. Students desirous of entering should present themselves to the Rector, with the necessary credentials, on the 13th. Candidates for the scholarships and exhibitions should give notice of their intention to the Rector not later than October 7th.

ASSOCIATION INTELLIGENCE.

BRITISH MEDICAL ASSOCIATION:
FORTY-THIRD ANNUAL MEETING.

THE Forty-third Annual Meeting of the British Medical Association will be held in the University Buildings at Edinburgh, on Tuesday, Wednesday, Thursday, and Friday, August 3rd, 4th, 5th, and 6th, 1875.

President.—E. COPEMAN, M.D., Senior Physician to the Norfolk and Norwich Hospital.

President-elect.—Sir ROBERT CHRISTISON, Bart., M.D., D.C.L., LL.D., F.R.S.E.

An Address in Medicine will be given by JAMES WARRURTON BEGGIE, M.D., F.R.C.P.Ed.

An Address in Surgery will be given by JAMES SPENCE, F.R.C.S.Ed., F.R.S.E., Professor of Surgery in the University of Edinburgh.

An Address in Physiology will be given by WILLIAM RUTHERFORD, M.D., F.R.S.E., Professor of the Institutes of Medicine in the University of Edinburgh.

The business of the Association will be transacted in Six Sections, viz.:

SECTION A. MEDICINE.—*President*: Dr. Quain, F.R.S., London. *Vice-Presidents*: Professor W. T. Gairdner, Glasgow; Dr. Grainger Stewart, Edinburgh. *Secretaries*: Dr. Claud Muirhead, 7, Heriot Row, Edinburgh; Dr. Stephenson, 33, Buccleuch Street, Edinburgh.

SECTION B. SURGERY.—*President*: Professor Lister, F.R.S. Edinburgh. *Vice-Presidents*: Professor Pirrie, Aberdeen; Professor Macleod, Glasgow. *Secretaries*: Thomas Amundale, Esq., Charlotte Square, Edinburgh; Dr. John Duncan, 8, Ainslie Place, Edinburgh.

SECTION C. OBSTETRIC MEDICINE.—*President*: Dr. Matthews Duncan. *Vice-Presidents*: Dr. Keiller; Professor Simpson. *Secretaries*: Dr. Peel Ritchie, 16, Hill Street, Edinburgh; C. J. Cullingworth, Esq., 260, Oxford Street, Manchester.

SECTION D. PUBLIC MEDICINE.—*President*: Right Hon. 1-30 Playfair, M.P., C.B., F.R.S. *Vice-Presidents*: Inspector-General Smart, M.D., C.B.; Dr. Arthur Mitchell. *Secretaries*: Dr. Andrew Smart, 24, Melville Street, Edinburgh; Dr. Fraser, Knutsford.

SECTION E. PSYCHOLOGY.—*President*: Dr. Lowe, F.R.S., Edinburgh; *Vice-Presidents*: Dr. Sibbald; Dr. Clonston. *Secretaries*: Dr. Brown, Royal Asylum, Edinburgh; Dr. Saundby, Saughton Hall, Edinburgh.

SECTION F. PHYSIOLOGY.—*President*: Professor Burdon Sanderson, F.R.S., London. *Vice-Presidents*: Dr. McKendrick; Professor J. Dewar. *Secretaries*: Dr. Lauder Brunton, F.R.S., 23, Somerset Street, Portman Square, London; Dr. Caton, 18, Abercrombie Square, Liverpool; and Dr. Wm. Stirling, Physiological Laboratory, University of Edinburgh.

Honorary Local Secretaries.

Dr. John Batty Tuke, 20, Charlotte Square, Edinburgh.

John Chiene, Esq., 21, Ainslie Place, Edinburgh.

Dr. J. G. McKendrick, 2, Chester Street, Edinburgh.

Dr. J. Bishop, 28, Alva Street, Edinburgh.

Tuesday, August 3rd.

11 A.M.—SERVICE IN ST. GILES'S CHURCH. Sermon by the Rev. Dr. Alexander.

1 P.M.—MEETING OF COMMITTEE OF COUNCIL.

3 P.M.—MEETING OF THE COUNCIL, 1874-75.

3.30 P.M.—GENERAL MEETING.—President's Address; Annual Report of Council; and other business.

9 P.M.—PRESIDENT'S RECEPTION IN ASSEMBLY ROOMS, MUSIC HALL.

Wednesday, August 4th.

9.30 A.M.—MEETING OF COUNCIL, 1875-76.

11.30 A.M.—SECOND GENERAL MEETING.

11.30 A.M.—ADDRESS IN MEDICINE.

2 P.M.—SECTIONAL MEETINGS.

9 P.M.—CONVERSAZIONE GIVEN BY THE ROYAL COLLEGE OF PHYSICIANS IN THE INDUSTRIAL MUSEUM.

Thursday, August 5th.

9 A.M.—MEETING OF THE COMMITTEE OF COUNCIL.

10 A.M.—THIRD GENERAL MEETING.—Reports of Committees.

11 A.M.—ADDRESS IN SURGERY.

2 P.M.—SECTIONAL MEETINGS.

6.30 P.M.—PUBLIC DINNER IN MUSIC HALL.

Friday, August 6th.

10 A.M.—ADDRESS IN PHYSIOLOGY.

11 A.M.—SECTIONAL MEETINGS.

1.30 P.M.—CONCLUDING GENERAL MEETING.

4 P.M.—PARTY IN THE ROYAL BOTANIC GARDENS, GIVEN BY THE UNIVERSITY OF EDINBURGH.

Saturday, August 7th.

EXCURSIONS.—Bass Rock, Melrose, Trossachs, Roslin, Dalmeny Park, and Hopetown House. Messrs. Currie and Co., Leith, have placed at the disposal of the Excursion Committee a large Steamer for the excursion to Bass Rock.

ARRANGEMENTS FOR ADDRESSES, SECTIONS, SOIRÉES, ETC.

It is particularly requested that Members on their arrival will at once proceed to the Reception Room, in Lower Library Hall, University Buildings, and record their names and addresses, and obtain their tickets and programmes; they should also inquire for letters and telegrams.

President's Address—Tuesday, 3.30 P.M., Queen Street Hall, 6, Queen Street.

Addresses in Medicine, Surgery, and Physiology—Lecture Room in the Industrial Museum.

President's Reception—Assembly Rooms and Music Hall, George Street.

The *conversazione*, given by the Royal College of Physicians, will be held in the Industrial Museum.

University Garden Party—Botanical Gardens, Inverleith Row.

Rooms for Sections:

A. Medicine—Mathematical Class Room.

B. Surgery—Anatomy Class Room.

C. Obstetric Medicine—Materia Medica Class Room.

D. Public Medicine—Chemistry Class Room.

E. Psychology—Hebrew Class Room.

F. Physiology—Physiology Class Room.

Meetings of Council; Latin Class Room. Reception Room; Reading and Writing Room; Lower Library Hall. Editor's and General Secretary's Room; Court Room. Local Secretaries, Treasurer, and Editor of *Daily Journal*; Professors' Reading Room. Annual Museum; Practical Chemistry Class Room.

In the Vestibule of the Library (all in University Buildings)—Post Office and Telegraph Office; Registration Office; Ticket Office; Cab Office; Inquiry Office.

Refreshment Room.—By permission of T. C. Archer, Esq., Director of the Industrial Museum, the Buffet and Refreshment Rooms attached to that institution will be open to members of the Association during the meeting. They can be reached either by the main entrance of the Industrial Museum, or (which will be more convenient for members) by a lobby communicating with the University Quadrangle. A moderate tariff has been arranged for Luncheons, etc. Lavatory, etc., adjoining Refreshment Rooms.

All places will be carefully placarded.

It is expected that Dr. Burdon Sanderson will shew his experiments on the Electrical Phenomena which attend the Contraction of the Irritable Organs of Plants, on Friday afternoon. The Demonstration will probably be given in the Natural Philosophy Class-Room.

Messrs. Maclachlan and Stewart, opposite the University, have kindly offered the use of their Saloon, as a Writing and Reading Room, to the members during the meeting of the Association, when every new work in medical literature will be on view.

Papers.—The following papers are offered.

Section A.—MEDICINE.

Anderson, T. McCall, M.D. On the Treatment of Aneurism of the Arch of the Aorta by means of Galvano-puncture.

Black, D. Campbell, M.D. On certain Aspects of Medical Advertising.

Boyd, Robert, M.D. Effect of Various Diseases on the weight of the Brain in 2050 sane and insane Adults of both sexes.

Braidwood, P. M., M.D. Severe Cerebro-spinal Symptoms produced by a fall at Foot-ball.

Brown, James, Esq. Typhoid Fever in the Isle of Skye.

Browne, J. Crichton, M.D. F.R.S.E. Rhythmical Neuroses.

Browne, Lennox, Esq. On the Treatment of some Diseases affecting simultaneously the Voice, Speech, and Hearing.

Craig, William, M.D. 1. Note on Jaborandi. 2. On the External Uses of the Hydrate of Chloral.

Croom, J. Halliday, M.B. On Melæna in the New-born Child.
Daldy, Thomas M., M.D. On Functional Cardiac Murmurs.
Deas, P. Maury, M.D. Notes on an unusual Case of Epilepsy.
Dowse, Thomas S., M.D. On Bulbar Paralysis.
Fox, Cornelius, M.D. Is Enteric Fever ever spontaneously Generated?

Fox, J. M., Esq. Scarlet Fever: its Prevention.

Hovell, D. De Berdt, F.R.C.S.Eng. On Emotional Aphasia.

Jagielski, V. A., M.D. Some Further Remarks on the Use of Spirometry in Medicine, demonstrated by a new Double Spirometer.

Johnston, James, M.B. On Rheumatic Fever and its Treatment.

Lee, R. J., M.D. Remarks on Hooping Cough, and its Treatment by the Inhalation of Carbolic Acid Vapour.

Lucas, T. P., L.R.C.P.Ed. On the Action of Stimulants.

Maclagan, T. J., M.D. On the Nature of Contagion.

Martyn, Samuel, M.D. Hospital Registration.

Morison, Alexander, M.B., C.M. A rare Case of Disease of the Pulmonary and Tricuspid Valves of the Heart; with Remarks.

Rickards, E., M.B. Epitome of Notes of Four Cases of Thoracic Aneurism.

Ross, James, M.D. Comparative Pharmacology.

Shuttleworth, G. E., M.D. Notes of a Series of Cases of Rubella Notha.

Torrance, Robert, Esq. On the Appearance of the Tongue in Health and in Disease.

Section B.—SURGERY.

Adams, William, Esq. On a New Subcutaneous Operation for the Obliteration of Depressed Cicatrices.

Acton, William, Esq. On the Modern Treatment of the Advanced Stages of Constitutional Syphilis.

Althaus, Julius, M.D. Further Observations on the Electrolytic Treatment of Tumours.

Bradley, S. M., Esq. The Surgical Treatment of Lymphatic and Glandular Tumours of the Neck.

Brotherston, Peter, Esq. Provincial Surgery in Scotland, illustrated by Cases treated in the Alloa Hospital.

Brunton, T. Lauder, M.D., F.R.S. On the Means of preventing Death from the Extraction of Teeth under Chloroform.

Buchanan, George, M.D. (Glasgow). Tracheotomy in Croup and Diphtheria.

Cassells, James P., M.D. On Conservative Aural Surgery.

Charles, J. J., M.D. The Treatment of Patent Urachus.

Chiene, John, Esq. 1. Dislocation of the Astragalus; 2. Value of an Antiseptic Catheter.

Dix, John, Esq. Two Cases of Aneurism, one of the Carotid and one of the Femoral Artery, treated by the Wire Compress.

Drysdale, C. R., M.D. Tertiary Sore-throat.

Duncan, John, M.D. 1. On the Modes of Administering Mercury in Syphilis; 2. On the Treatment of Nævus.

Duncanson, J. J. Kirk, M.D. On Fibrous Tumours of the Auricle: with Specimens and Microscopical Sections.

Hardie, James, M.D. 1. On a Case in which a New Nose was formed by Transplanting a portion of one of the Fingers; 2. On the Treatment of some forms of Ulcer by Incision of the Edges.

Hill, Matthew, Esq. A New Operation for Ununited Fractures.

Hirschfeld, John C., M.B. On Extirpation of the Tongue.

Hoggan, George, M.D. On a Case of Transfusion by Aveling's Apparatus.

Jordan, Furneaux, Esq. Note on a Peculiar Variety of Encysted Hydrocele of the Cord.

King, Kelburne, M.D. Two Cases of Punctured Fracture of the Frontal Bone, treated by Trephining; and resulting, one in total, the other in partial Loss of Vision.

Little, W. J., M.D. 1. Latest Experiences on the Treatment of Congenital Club-foot of Infants. 2. The Varieties of Wry-neck, with some Observations on their Treatment.

Lund, Edward, Esq. 1. Case in which Adams's Operation for Subcutaneous Division of the Neck of the Thigh-bone was performed on both sides in the same patient for Straight Ankylosis; 2. On the Use of Steel Screws in the Treatment of Ununited Fractures, Resections of Joints, etc.

Mackenzie, Morell, M.D. On the Treatment of Enlarged Strumous Glands by Hypodermic Injection.

Maclaren, R., M.D. On some Cases of Subperiosteal Excision.

M'Rae, Alexander E., M.D. Case of Perforation of the Abdomen (*per Vaginam*); with Remarks.

Maunder, C. F., Esq. A Subcutaneous Operation for the Relief of Fibrous Ankylosis of the Knee-joint.

Meade, R. H., Esq. A Case of Tubercular Disease of the Breast simulating Cancer.

Morton, James, M.D. The Treatment of Spina Bifida.

Ogston, Francis, jun., M.D. The Nourishment of the Head of the Femur after Intracapsular Fracture.

Pemberton, Oliver, Esq. On Ligature of the Common Femoral Artery, and especially on Ligature by an Antiseptic Material.

Rivington, Walter, Esq. A Case of partial Rupture of the Popliteal Artery and complete Rupture of the Popliteal Vein, for which Primary Amputation of the Thigh was Successfully performed: with Remarks.

Solomon, J. V., Esq. Section of the Cornea in certain Diseases of the Eye.

Taylor, C. Bell, M.D. On the Modern Methods of Extracting Lenticular Cataract: with Illustrative Cases.

Thomas, Llewelyn, M.D. The Causes and Results of Otorrhœa.

Watson, Eben, M.D. A Case of Femoral Aneurism, with Ligature of the External Iliac.

Watson, P. Heron, M.D. Excision of the Thyroid Gland.

Wolfe, J. R., M.D. 1. On Conjunctival Transplantations from the Rabbit to the Human Subject.—2. On Egyptian Ophthalmia and Cataract Complications: with Cases.

Section C.—OBSTETRIC MEDICINE.

Anderson, Mrs. E. Garrett, M.D. On Dysmenorrhœa.

Braithwaite, James, M.D. The Use of Nitric Acid as a Caustic in Uterine Practice, and its superiority as such to Nitrate of Silver.

Coghill, J. G. S., M.D. On Uterine Flexions and Displacements; and their Mechanical Treatment.

Donovan, W., L.R.C.P.Ed. On Placenta Prævia.

Edis, Arthur W., M.D. On the Prevention and Management of Miscarriages.

Ewart, J. H., Esq. Case of Inversion of the Uterus of Three Months' standing.

Haddon, John, M.D., M.A. On Intemperance in Woman, with special reference to its Effects on the Reproductive Organs.

Haining, William, M.D. On Death of the Child from Shock from Injury caused by Rupture of the Umbilical Cord.

Hill, Charles, M.D. On Placenta Prævia.

Hime, T. Whiteside, M.D. On the Management of the Lying-in Woman.

Keiller, A., M.D. Embryotomy: its various Modes of Procedure, with Illustrative Cases.

McClintock, A. H., M.D. Life of William Smellie, M.D.

McDonald, William, L.R.C.P.Ed. The Nature, Cause, Cure, and Prevention of Puerperal Fever.

Madden, T. More, M.D. Turning *versus* the Forceps in cases of Difficult Labour.

Roberts, D. Lloyd, M.D. Two Cases of Occlusion of the Os Uteri after Labour.

Robertson, Alexander, M.D. Observations on the Unilateral Phenomena of Mental and Nervous Disorders.

Smith, H. Fly, M.D. Vomiting connected with Pregnancy.

Smith, Protheroe, M.D. Ovarian Dropsy: some points in its Pathology and Treatment.

Swayne, J. G., M.D. On Obstetrical Statistics.

Tait, Lawson, Esq. On the Existence of Capillaries in the Umbilical Cord.

Tilt, Edward J., M.D. On Internal Metritis.

Section D.—PUBLIC MEDICINE.

Aitken, Lauchlan, M.D. On the Sanitary State of Rome.

Bartlett, H. C., Esq. On Drinking and Table Waters.

Beldoe, John, M.D., F.R.S. On the Mortality of Adolescence.

Braidwood, P. Murray, M.D., and Vacher, Francis, Esq. First Contribution to the Life History of Contagion.

Cooper, James, Esq. On some points relating to Cottage Hospitals.

Davenport, John A., Esq. On the Drainage and other Sanitary Conditions of Rural Districts.

Dickson, Walter, M.D. The Numerical Ratio of Disease in the Adult Male Middle-class Population, as deduced from the Sanitary Statistics of Her Majesty's Customs, London, 1857-74.

Drysdale, C. R., M.D. Tobacco: its Effects on the Health of Males.

Eassie, W., Esq. On the Sanitation of Houses.

Fergus, Andrew, M.D. Some Sanitary Remarks on Traps and Soil-pipes.

Freer, Alfred, Esq. On the Evils of Medical Men undertaking the Duties of Nurses.

Goldie, George, L.R.C.P.Ed. On Ventilation; with Model and Apparatus.

Haviland, Alfred, Esq. The Geographical Distribution of Heart and other Diseases in England and Wales.

Kenyon, G. A., M.B. On the Comparative Merits of the Water-carriage and Dry Systems of Sewage-disposal from a Sanitary and Economical Point of View.

Mackintosh, Angus, M.D. On the Outbreak of Enteric Fever at Killamarsh, Derbyshire.

Mitchell, Arthur, M.D., and Buchan, Alexander, Esq. Some of the Relations of Weather to Death-rate.

Nicolson, David, M.D. The Causes of Invaliding among Convicts in the Government Prisons of England.

Page, David, M.D. On a Village Outbreak of Enteric Fever traceable to a specifically polluted Water-supply.

Rogers, Joseph, M.D. The Anomalies and Deficiencies of Parochial Medical Relief in Scotland.

Ross, George, M.D. The Relation of Mortality and Dwellings.

Russell, Henry, M.D. The Expense of Ventilation and Warming, as Sanitary Requirements.

Smart, William R. E., M.D., C.B. On the Ratios of Deaths by Violence in the Army and Navy relatively to each Service and to Civil Life.

Tripe, John W., M.D. On the Death-rate at Different Ages from Epidemic Diseases.

Wilson, George, M.D. On the Sanitary Improvements of Country Villages.

Wanklyn, J. A., Esq. On the Mineral Constituents of Drinking Water.

Waters, Edward, M.D. 1. On the Propagation of Typhus Abdominales. 2. On the Training of Nurses in Provincial Hospitals.

Yeld, H. J., M.D. State Medicine in Relation to Education.

Section E.—PSYCHOLOGY.

Bodington, G. F., M.D. On the Control and Restraint of Habitual Drinkers.

Clouston, T. S., M.D. On Disorders of Speech in Insanity.

McDiarmid, John, M.B. On the Hypodermic Injection of Morphia in Insanity.

Peddie, A., M.D. The Necessity of Legislation for the Control and Treatment of Insane Drinkers.

Shuttleworth, G. E., M.D. Two Cases of Microcephalic Idiocy.

Sibbald, John, M.D. 1. The Relative Amount of Pauper Lunacy in Town and Country. 2. The Extent to which Medical Knowledge can contribute to the Determination of Criminal Responsibility.

Section F.—PHYSIOLOGY.

Caton, R., M.D. Report on the Electric Currents of the Brain.

Coats, J., M.D. The Results of Injection of the Kidneys in Bright's Disease in Relation to Albumen and Hæmoglobin.

Ferrier, David, M.D. The Localisation of Centres of Special Sense.

Fothergill, J. Milner, M.D. The Action of Drugs upon the Intracranial Circulation.

Hoggan, Mrs. Frances E., M.D. On a New Histological Process for Staining Tissues.

Nairne, John S., Esq. On the Psychology of Muscle.

Ord, William M., M.B. On the Form of Uric Acid as affected by Urea; and on a new Compound containing Uric Acid and Urea.

Power, Henry, Esq. On the Action of Certain Drugs on Muscular Contraction.

Rutherford, William, M.D., F.R.S.E. and Vignal, M. On the Biliary Secretion.

Shettle, R. C., M.D. The Magnetic Conditions of Arterial and Venous Blood, considered in relation to the Influence which Arterial Blood exercises in promoting the Functions of Life; and the consequent value of Magnetism as a Therapeutic Agent.

Stirling, William, M.B., D.Sc. 1. On the Effects of Division of the Sympathetic Nerve in the Neck in Young Animals. 2. On the Summation of Electrical Stimuli to the Skin.

Woakes, Edward, M.D. On the Existence of Correlated Vasomotor Nerve-Tracts.

ANNUAL MUSEUM.

The Eighth Annual Museum of the British Medical Association will be held in the Practical Chemistry Class-room in the University on the 3rd, 4th, 5th, and 6th of August, 1875, and will be open from 10 A.M. to 6 P.M. The Honorary Secretaries are Dr. Charles Underhill and Dr. John Playfair.

FRANCIS FOWKE, *General Secretary.*

36, Great Queen Street, July 30th, 1875.

LANCASHIRE AND CHESHIRE BRANCH: ANNUAL MEETING.

THE thirty-ninth annual meeting of this Branch was held in the Town Hall, Chester, on Wednesday, June 30th; about fifty members and seven visitors were present.

In the absence of JOHN SKAIFE, Esq., the President, Dr. E. WATERS (Chester) was called to the Chair, and, with a few remarks, introduced the President-elect, T. DAVIES-COLLEY, M.D.

President's Address.—The President delivered an address, an extract of which was published at page 66 of the JOURNAL for July 17th.

Report of Council.—The Secretary (Dr. STEELE) then read the report of the Council, which stated that the Branch was in a prosperous and satisfactory condition. The number of members at the commencement of the year was 461; 19 new members had been elected during the year, while they lost from death 3, and from removals and other causes 17, making a total of 20, thus leaving 460 as the present number of members. These figures indicated the progress the Branch had made since it last met in Chester in 1867. Then the number of members was 233, showing that the numerical strength of the Branch had doubled in about eight years. It was by far the highest number of members in any of the Branches, with the single exception of the Metropolitan Counties Branch. In the two counties which constituted the Branch, there was scope for a considerable increase of members, and the Council urged that members should avail themselves of every opportunity of bringing under the notice of their professional brethren who had not joined the privileges and advantages gained by being members of the Branch and of the Parent Association. As it was probable that the annual meeting of the Parent Association would be held in Lancashire in the autumn of next year, the Council hoped that that a considerable number of new members would join the Branch. The Council had received a communication from the editor of the JOURNAL, calling attention to the question of the propriety of advertising medical books in the daily papers as one that specially concerned the medical practitioner and the profession at large, and they had drafted a resolution on the subject which would be submitted to the meeting, and the adoption of which was unanimously recommended by the Council. The report concluded by stating that the Council had received a deputation representing the medical profession at Southport, giving the Branch a cordial invitation to hold their annual meeting at that town next year.

Medical Advertising.—The following motion was put from the Chair, and carried unanimously:

"That this Branch, having considered the prevalence of advertising in the daily and other newspapers medical works avowedly addressed only to medical readers, and not calculated to enlighten or intended for the perusal of the public generally, is of opinion that, in the majority of instances, this practice can in no way tend to public edification; that it is largely used as a means of indirectly advertising the names and departments of practice of the authors of such books; that it tends to confuse and mislead the public by confounding the distinction between medical men of real eminence and laborious work and others who find such advertisements a means of notoriety, and a costly, but still lucrative mode, of commercially pushing their professional fortunes; resolved, therefore, that this Branch is of opinion, that medical works intended for medical readers should not be advertised in any but the medical journals."

Annual Meeting in 1876: President and Vice-President-Elect.—It was resolved—"That the annual meeting in 1876 be held at Southport, and that George Woods, Esq., F.R.C.S., be the President-elect; and Dr. Laing and John Harrison, Esq., F.R.C.S. (Chester), the Vice-Presidents-elect, for the ensuing year."

Council.—The following members were elected. *Representatives in the General Council of the Association:* R. Beales, M.D.; T. Davies-Colley, M.D.; L. E. Desmond, M.D.; James Hardie, M.D.; Reginald Harrison, Esq.; John Harrison, Esq.; C. Johnson, Esq.; E. Lund, Esq.; C. E. Lyster, M.D.; W. McCheane, Esq.; W. Martland, Esq.; W. McEwen, M.D.; Thomas Mellor, Esq.; J. E. Moreton, Esq.; E. G. Morley, Esq.; G. W. Mould, Esq.; A. Ransome, M.D.; Wm. Roberts, M.D.; T. L. Rogers, M.D.; H. Simpson, M.D.; A. T. H. Waters, M.D.; Charles White, Esq.; M. A. Eason Wilkinson, M.D.

Ordinary Members of Council: G. Barron, M.D.; E. Bowen, M.D.; C. J. Cullingworth, Esq.; W. M. Conliffe, Esq.; W. H. Fitzpatrick, M.D.; W. Garstang, M.D.; J. H. Gornall, Esq.; John Haddon, M.D.; William Hall, Esq.; M. J. Jennett, Esq.; Leslie Jones, M.D.; D. J. Leech, M.B.; W. H. Manifold, Esq.; J. E. Morgan, M.D.; Daniel Noble, M.D.; J. Thorburn, M.D.; James Vose, M.D.; Edward Waters, M.D.; F. P. Weaver, M.D.; George Woods, Esq.

Communications.—The following communications were read:

1. Lymphoma or Lymphadenoma, with pathological and microscopical specimens. By Dr. ONLEY.
2. Supracondyloid Amputation of Thigh. By Dr. C. E. LYSTER.
3. Note on a case of Sudden Death after Thoracentesis. By Dr. GLYNN.
4. Specimen of Cancer of Mediastinal Glands. By Dr. GLYNN.
5. Case of Hydrophobia. By Dr. HADDON.
6. Note on the management of the third stage of Labour. By Dr. STEELE.
7. Note on a case of Prostatic Calculus, and exhibit of the results of Lithotomy in the Chester General Infirmary during the last six years. By Dr. HAINING.

A Vote of Thanks to the Mayor and Corporation for the use of the Town Hall brought the meeting to a close.

Dinner.—Fifty members and visitors dined together at the Grosvenor Hotel. Dr. Davies-Colley occupied the Chair.

NORTH OF ENGLAND BRANCH: ANNUAL MEETING.

THE eleventh annual meeting was held in the Town Hall, Darlington, on Thursday, July 8th. There were present thirty-nine members and five visitors. Previously to the meeting, the members were entertained at luncheon by the President, S. E. PIPER, Esq., at his residence.

The retiring president, Dr. LEGAT, in resigning his office, congratulated the meeting upon the present satisfactory position of the Branch, and expressed his gratification at the steady increase of the number of the members, but stated that, although they were progressing, they ought not to rest satisfied until they had enlisted every registered medical man resident in the district into its ranks.

The New President, S. E. PIPER, Esq., then took the chair, and delivered an address, which was principally directed to sanitary medicine, the causes of the unhealthiness of towns being carefully discussed, and compared with the salubrity of rural districts.

Vote of Thanks to the President.—It was moved by JOHN JOBSON, Esq., seconded by Dr. GIBSON, and granted, "That the warmest thanks of the meeting be accorded to the president for his able address."

Vote of Thanks to the Retiring President.—It was moved by E. H. MALING, Esq., seconded by S. FIELDEN, Esq., and resolved, "That the best thanks of the meeting be given to the retiring president, Dr. Legat, the council of management, and the other officers for their services during the past year."

Report of Council.—The Council reported favourably of the stability and usefulness of the Branch. During the year, twenty-eight new members had been elected. At the present time, the Branch consists of two hundred and thirty-one members, sixteen more than at the annual meeting in 1874. During the year, three meetings, including the annual meeting, had been held. The attendance at the meetings had been large, and the interest of the papers had called forth animated discussion.

The Treasurer's Account showed a balance in favour of the Branch amounting to £5 5s. 3d.

The Subscription to the Rumsey Testimonial amounted to £20 8s. 6d.

Officers for 1875-6.—Dr. EASTWOOD proposed, Dr. ROUTH seconded, and it was unanimously carried, "That the next annual meeting be held at Morpeth, the autumnal meeting at Sunderland, and the spring meeting at Newcastle; that Matthew Brumell, Esq., be President-elect; Dr. Philipson, Honorary Secretary and Treasurer; and Drs. Gibson, Byrom Bramwell, Dixon, and Frain, the Council of Management."

Representatives in the General Council of the Association.—It was moved by J. B. PEACOCK, Esq., seconded by JAMES MACKIE, Esq., and carried unanimously, "That the following gentlemen be the representatives of the Branch in the General Council of the Association: Byrom Bramwell, M.B.; S. W. Broadbent, Esq.; Matthew Brumell, Esq.; Martin Barnup, M.D.; W. H. Dixon, M.D.; J. W. Eastwood, M.D.; Charles Gibson, M.D.; G. Y. Heath, M.D.; C. S. Jeaffreson, Esq.; Andrew Legat, M.D.; S. E. Piper, Esq.; R. N. Robson, Esq.; and G. H. Philipson, M.D."

Representative in the Parliamentary Committee of the Association.—Mr. S. W. BROADBENT proposed, Mr. EDWARD HEFFERNAN seconded, and it was unanimously carried, "That Dr. Philipson be the representative of the Branch in the Parliamentary Committee of the Association."

Vote of Thanks.—On the motion of the PRESIDENT, a vote of thanks was carried to the Mayor and Corporation of Darlington, for their kindness in granting the use of the Town Hall for the purposes of the meeting.

Dinner.—The members and their friends afterwards dined together at the King's Head Hotel, Darlington; the chair was occupied by the President, who was supported by the Mayor of Darlington, and the Rev. Mr. Stephens. The vice-chair was filled by Dr. Philipson.

SOUTH WALES AND MONMOUTHSHIRE BRANCH: ANNUAL MEETING.

The fifth annual meeting of this Branch was held at the Corn Exchange, Abergavenny, on July 16th. The President, Dr. EDWARDS of Cardiff, took the chair at one o'clock; and there were about thirty-five members present. Dr. Edwards resigned the chair to the President-elect, S. H. STEEL, M.B., Abergavenny; and a vote of thanks was unanimously accorded to the retiring President.

President's Address.—The PRESIDENT delivered an address on the Origin and Mode of Dissemination of Enteric Fever.

The Report of Council, from which it appeared that the Branch now numbered 147, and the statement of accounts, showing a balance in the hands of the Treasurer of £15:16:4, were read and adopted.

New Members.—The following gentlemen were elected: T. D. de B. Stanistreet, Esq., Cowbridge; J. G. Roberts, Esq., Aberdare; J. D. Hutcheson, M.B., Aberdare; Lewis Jones, M.A., M.B., Dowlais; J. T. Griffiths, Esq., Dowlais; T. G. Anthony, Esq., Tredegar; John Evans, Esq., Swansea; C. E. Hardyman, Esq., and W. Campbell, M.D., Cardiff.

Election of Officers.—The following were appointed. *President-elect:* Andrew Davies, Esq., Swansea. *Members of Council:* P. R. Cresswell, Esq.; Ebenezer Davies, Esq.; H. N. Davies, Esq.; J. Robert, Esq.; and Jabez Thomas, Esq. *Representatives in General Council:* P. R. Cresswell, Esq.; H. N. Davies, Esq.; J. G. Hall, Esq.; Evan Jones, Esq.; Talfourd Jones, M.B.; A. Sheen, M.D.; Jabez Thomson, Esq.; T. Williams, M.D.; and Andrew Davies, Esq., Honorary Secretary. *Honorary Secretaries:* Andrew Davies, Esq., Swansea; and A. Sheen, M.D., Cardiff.

Membership of the Association.—The members present proceeded to sign a declaration of membership of the British Medical Association, under the provisions of the Joint Stock Companies Act, with limited liability.

Medical Advertisements in Non-Medical Papers.—The following resolution, proposed by Mr. A. DAVIES, was carried unanimously.

"That this Branch desires to express its opinion that the system permitted by many authors of medical works of advertising their works in the non-medical papers is one which, being open to much abuse, ought to be discouraged and condemned."

Papers, etc.—1. Mr. CRESSWELL (Dowlais) gave a demonstration of the mode of application of Professor Lister's Antiseptic Treatment.

2. Dr. SHEEN read a paper on Medical Book keeping, and also showed some forms to facilitate the same.

3. Dr. SHEEN read a case of Inflammation of the Vermiform Appendix, from a foreign body ulcerating through it, and producing general and fatal peritonitis, in a male aged 7.

4. Dr. SHEEN (for Mr. G. Robathan of Risea) read a case of extensive Compound Comminuted Fracture of the Skull, with loss of bone and paralysis, resulting in complete recovery.

5. Mr. EVAN JONES (Aberdare) showed a Lithotrite which he had recently and successfully used in breaking down vesical calculi weighing 5½ and 5 ounces respectively.

6. Dr. GRIFFITHS (Swansea) related a case in which he had successfully adopted Dr. Copeman's suggestion for the treatment of the Sickness of Pregnancy, by means of digital dilatation of the os uteri, in a primipara at seven months.

Medical Benevolent Fund.—Dr. EDWARDS (Cardiff) brought the claims of the Medical Benevolent Fund before the Branch, and it was unanimously resolved, "That a donation of £5 be made from the funds to the Medical Benevolent Fund."

Dinner.—Twenty-eight members, with the Vicar of Abergavenny, afterwards dined together at the Angel Hotel. A very pleasant day was passed.

PRESENTATION.—A substantial testimonial in recognition of public services was recently presented to Dr. Robert Mungall of Cowden Heath. Subscriptions for the purpose flowed in liberally from all classes in the surrounding neighbourhood to the amount of £250 in a fortnight. The forms of the testimonial had the merit of combining the useful with the ornamental, consisting of an epergne with side ornaments, a carriage and horse, with trappings and livery, and a purse of sovereigns in addition.

CORRESPONDENCE.

DEATHS FROM ANÆSTHETICS.

SIR,—With reference to your note on this subject, in which my name is mentioned, I desire to say that, if my letter to the *Times* could be considered to imply any imputation on those who do not at present employ ether as an anæsthetic, it implied that which was not in my mind. I was led to write that letter from a sense of duty, and from the belief that, by prominently directing attention to the safety of ether as an anæsthetic on an occasion when two deaths simultaneously were recorded from chloroform, I might be the means of saving life and of shielding my fellow-practitioners from the intense pain of seeing a patient die under the inhalation of an anæsthetic administered by their hands.

I believe you share with me the conviction of the greater safety of ether; and its present reintroduction into this country as an anæsthetic is certainly mainly due to the persevering and laudable efforts of the BRITISH MEDICAL JOURNAL during the past three years, by which the dangers of chloroform have been brought clearly into view, and the advantages of ether as the safer anæsthetic repeatedly enforced.

I am, sir, yours truly,

G. POLLOCK.

36, Grosvenor Street, July 27th, 1875.

THE UNIVERSITY OF DUBLIN AND THE VISITORS OF EXAMINATIONS.

SIR,—At a meeting of the professors of the School of Physic in Ireland, thirteen being present, held on the 9th October, 1874, the following resolution was passed *unanimously*:

Resolved—"That, in the opinion of the professors, while every facility should be given to the visitors of the General Medical Council to inspect the examination papers and answers thereto, it is not expedient that the Medical Registrar should surrender the custody of the examination papers, or permit any extracts to be made from them for the purpose of publication."

Dr. Stokes, Dr. Apjohn, and Dr. Aquilla Smith were present at that meeting and concurred in the resolution, which was forwarded to the Board of Trinity College, who approved it, and gave me instructions to carry it into effect, which, of course, I did. It was, therefore, with extreme surprise that I read, in the BRITISH MEDICAL JOURNAL of the 10th July, 1875, the following.

Dr. Apjohn: "It was a mistake to state that this was in consequence of a recommendation of the professors."

Dr. Stokes: "He was ignorant of any recommendation of the professors regarding the written answers."

Dr. Aquilla Smith "had no recollection of it".

Dr. Haldane telegraphed to me, on 23rd June, to know whether such a resolution had been passed or not; and I telegraphed to him in reply, stating that it had been passed; but until I saw the discussion in the BRITISH MEDICAL JOURNAL of the 10th July, I could not understand Dr. Haldane's reason for wishing me to confirm by telegram what I had already informed him of.

The resolution itself was passed after mature deliberation, and on weighty grounds; and I may add that the Board of Trinity College were unanimous on the question as well as the professors.—I am, yours faithfully,

SAMUEL HAUGHTON, Medical Registrar.

Trinity College, Dublin, July 21st, 1875.

P.S.—Dr. Stokes was in the chair at the meeting of the 9th October, 1874; and Dr. Apjohn assisted in wording the resolution.

VOTING BY PROXY AT THE ROYAL COLLEGE OF SURGEONS.

SIR,—I trust the country Fellows will one and all send in their names *en masse* without delay to Mr. Smee, so that the oft-mooted question of voting by proxy may be fully discussed, its equity duly acknowledged, and not only so, but, better still, its request speedily settled by Act of Parliament, ere another election takes place; for it is very clear that, without this concession, the interest and future well-being of the College must be at stake. To expect that justice can be done a constituency so cosmopolitan as the Fellows of the English College of Surgeons, under the present state of things, is a delusion.

I remain, sir, your obedient servant,

OCTAVIAN N. ROYLE.

Milnthorpe, Westmorland, July 13th, 1875.

IN MEMORIAM. MR. J. F. CLARKE.

SIR,—My attention (as solicitor to the *Lancet*) has been directed to an article in your JOURNAL of last week, headed "In Memoriam J. F. Clarke", in which grave charges are made against the editor of the *Lancet* in reference to the dismissal of the late Mr. Clarke from the staff of that journal, caused by an act impossible to be passed over. The written proofs of the correctness of this statement have remained in my custody ever since, and are now before me.

The motives of delicacy which restrained the *Lancet* from noticing the matter until the present time give way before the necessity of repelling the insinuations of your article, and I must request the insertion of this letter in your next issue, in rectification of the wrong impression made upon the minds of your readers.

I am, sir, your very obedient servant,
SAMUEL POTTER.

36, King Street, Cheapside, London, July 26th, 1875.

* * * Such a letter as the above must, of course, have caused great pain to those who felt it necessary that it should be written. It gives us not less pain and surprise to be requested to publish it, concerning a man whose reputation during life was spotless, and to whose general character and career we paid what we believed to be only a just tribute.

MEDICAL ADVERTISING.

SIR,—Will you allow one who differs from the members of the Lancashire and Cheshire Branch of the British Medical Association, with respect to the advertising of medical books as the authors or proprietors may deem fit, to inquire if the denunciation embodied in their recent resolution applies to other modes of advertising? For example, is it considered advertising to establish a large hospital? Is it considered advertising to establish a small hospital or institution, which, by the way, seems to be a favourite term?

Which line of conduct redounds most to the credit of a professional man: to be able to write an useful book, and advertise it as he pleases, and for the edification of any one who can understand it; or to take one or two rooms, designate them a hospital or institution, advertise the same in every conceivable way, and appeal to the public for aid towards defraying the attendant expenses?

If it be justifiable to found and advertise a large hospital, it must be equally justifiable to do likewise with a small one; and what a body of men can do, must be equally within the liberty of an individual. Have not many of the most prominent members of the profession in the metropolis made their position by special institutions and the advertising of books in non-medical journals? Is this line of conduct not at present the rule? If so, what course is open to the friendless and possibly penniless medical man entering on practice?—I am, etc.,

Glasgow, July 1875. D. CAMPBELL BLACK.

* * * Two wrongs can never make one right; and the advertising of medical books in lay papers cannot be more right for a poor man than for a rich one. There are, no doubt, abuses connected with the foundation of special hospitals; and we have many times pointed them out. How does the existence of such abuses justify other evils?

DENTAL SURGERY AND MECHANICAL DENTISTRY.

SIR,—In the paragraph referring to Mr. Hamilton Cartwright's letter in your issue of last week, you ask whether it would not be well if the surgeon-dentist were to confine himself to the surgical care of the diseases of the teeth, and to entrust to other hands—those of the mechanic—the business part of dentistry, the manufacture of teeth. The question of the separation of the two apparently distinct branches of dentistry has been carefully considered in past years by the leading members of the profession, and the unanimous opinion has been formed that it is impossible for the mere artisan, however skilful, to practise successfully even what—as you say—seem at first sight simple mechanical operations, the construction of artificial teeth and their adaptation to the mouth. To practise this art safely, a professional education is required, such as is undergone by candidates for the license in dental surgery of the College of Surgeons. This course of study, besides practical instruction in dental surgery and mechanics, provides that the candidate shall go through a course of instruction in general anatomy and surgery, so that, having an acquaintance with the nature of disease and the principles of medical practice, he may avoid error and be able to deal with confidence with the special region of the body to which his treatment will be confined. Not to speak of the mechanical treatment of cleft palate, of deformities of the jaws, of irregularities of the teeth,

I may safely affirm that every dental surgeon meets almost daily with cases which could have presented originally no difficulty, but which, having been treated by uneducated mechanics, without regard to the physiology of the teeth, and of the parts influenced by the apparatus, have resulted in the infliction of unnecessary, intense, and prolonged suffering.

In mechanical dentistry, as in every other department of surgery, we have in every case to deal more or less with living structures; and ignorance on the part of the practitioner, being very closely allied to cruelty, cannot under any circumstances, be tolerated. It is customary to estimate lightly the suffering which arises from dental disease, and from the ignorance of the dental mechanic—perhaps because it does not directly endanger life; but I may venture to assert that there are well nigh as many lives rendered wretched from this cause as there are from any other kind of physical pain which afflicts mankind.

Your obedient servant,
HENRY SEWILL.

* * * Mr. Sewill appears to us completely to misunderstand the argument, and to confuse things which it is the gist of the matter to discuss separately. The treatment of cleft palate, deformities, etc., is a branch of dental or, as it is more properly called, oral surgery. The making of instruments for the purpose, and the making of sets of teeth, is mechanical work. All that Mr. Sewill says of the necessity of surgical knowledge in devising, modifying, and directing the application and fitting of them, is equally true of trusses, orthopædic instruments, and other contrivances. Surgeons do not, however, on that account make the instruments themselves; and we are still of opinion that Mr. Sewill entirely fails to show that the dental surgeon would not have a higher average skill, capacity, and status, if he separated his profession from the *métier* of the mechanical dentist.

THE COLLEGE TEST.

SIR,—It is difficult to understand for what purpose the statistics were published under the imposing title of College Tests in your last impression, unless it be to draw attention to the respective educational merits of the different medical schools.

It would be a most desirable thing if a fair comparison could be made of the teaching capacities of these; but this cannot be done by means of the table you have published. Firstly, some of the schools examine those of their members who wish to present themselves for examination at the Royal College of Surgeons, to prevent as far as possible any from going up whom they consider unfit. The result is, that many men for the primary examination are kept for at least three months, possibly longer, at their anatomical studies; thus either diminishing the time they have afterwards for preparing themselves for the pass examination, or increasing the term of residence at the hospital. Another tendency of this system is to increase the proportion of men who leave the hospital as unqualified assistants, and who thus delay indefinitely the date of their qualification. At other schools, this arbitrary restriction is either not imposed, or not imposed so rigidly. Any comparison, therefore, based upon the number of men rejected at these examinations must be unfair.

It may be seen from the table that some of the schools which appear to the greatest advantage in the primary do not figure so well in the pass examinations, possibly on account of the time for preparation for the latter having been curtailed.

Secondly, statistics such as these are always more or less fallacious. They can generally be turned and twisted to one side or the other, as those who draw them up choose. For instance, a very different inference might be made from these tables, if arranged as follows.

Primary Examinations.

	Total Exam.	Number Passed.	Number Rejected.	Percentage of Rejections
Three London Schools not represented on the Court of Examiners of the College.....	83.	51.5	32	38.55
Six London Schools represented each by one Examiner on the Court.....	263.63	168.83	94.33	35.77
Two London Schools represented each by two Examiners on the Court....	158.	127.3	31.5	19.93
Provincial Schools.....	219.88	156.83	63.29	28.78

Pass Examinations.

	No. Exam.	No. Passed.	No. Rejected.	Percentage of Rejections
Three London Schools not represented on the Court of Examiners of the College....	43.16	26.16	17	39.38
Six London Schools represented each by one Examiner on the Court.....	192.96	156.1	36.83	19.07
Two London Schools represented each by two Examiners.....	158.33	124.13	34	21.47
Provincial Schools.....	123.79	85.46	38.13	30.8

A better comparison could be made, if tables showing the number of

students attending each hospital, classed according to their years, were annually published, together with a specification of the examinations passed by these, and the period of study at which they were passed. From such tables, many fair inferences might be drawn, and the general efficiency of a particular school roughly sketched. Such information could only be obtained from the schools; but, if one or two of the larger ones set the example of publishing it, the others would soon follow.

I am, sir, yours faithfully, R.

PUBLIC HEALTH AND POOR-LAW MEDICAL SERVICES.

THE Hartlepool Board of Guardians have increased the salary of Dr. George Moore, as Medical Officer of the Workhouse, from £40 to £65 *per annum*.

THE Leamington Urban Sanitary Authority have increased the salary of Mr. Joseph S. Baly, the medical officer of health, from £50 to £80 *per annum*.

VACCINATION.—Mr. John H. Gornall has been awarded for efficient vaccination, as Public Vaccinator for the Borough of Warrington, grant of £69 : 4.—The Local Government Board have awarded to Dr. H. Heygate Phillips of Reading an extra grant of £8 : 19, as a gratuity for efficient vaccination in the Caversham District, Henley Union.

POOR-LAW MEDICAL APPOINTMENTS.

BOOKEY, Thomas, L.K.Q.C.P.I., appointed Medical Officer for the Iscody District of the Whitchurch Union, Shropshire, *vice* J. Parker, M.R.C.C.S.Eng.
 BOREHAM, W. T., L.R.C.P.Ed., appointed Medical Officer for the Morden and First Wareham Districts of the Wareham and Purbeck Unions.
 DOVE, Harry, M.R.C.S.Eng., appointed Medical Officer for the Workhouse and the First District of the Stow Union, *vice* S. Freeman, M.R.C.S.Eng., resigned.
 GREY, Frederick A., L.R.C.P., appointed Medical Officer for the Fourth District of the Hamiton Union, *vice* R. B. Morell, L.R.C.P.Ed., resigned.
 LUCE, James J., M.D., appointed Medical Officer for the Alveston District of the Stratford-on-Avon Union, *vice* H. Lupton, L.R.C.P., resigned.
 PALMER, Frederick S., M.R.C.S.Eng., appointed Medical Officer and Public Vaccinator for the Mortlake District of the Richmond Union, *vice* Alexander Crichton, L.R.C.P.Ed., deceased.
 PATTERSON, Thomas, M.D., appointed Medical Officer for the Workhouse of the Oldham Union, *vice* S. Jackson, L.R.C.P.Ed., resigned.
 PENNY, W. L., M.B., appointed Medical Officer for the Colton District of the Ulverstone Union, *vice* G. Stunt, M.R.C.S.Eng., resigned.

MEDICO-PARLIAMENTARY.

HOUSE OF LORDS.—Thursday, July 22nd.

The Pharmacy Bill (Ireland).—The Duke of RICHMOND, in moving the second reading of this Bill, said its object was to institute a Pharmaceutical Society, and regulate the qualification of chemists and druggists in Ireland. At present no person could keep open a shop in Ireland for compounding poisons and medical prescriptions except licentiates of Apothecaries' Hall. Permission was given to them under the Act of 1791, which contained provisions of a very stringent character, and the consequence had been that, comparatively speaking, very few persons had applied in Ireland for licenses under that Act, not liking to submit themselves to such an examination; and there was a difficulty in many parts of Ireland in getting medicines properly compounded. The Bill at first proposed that there should be reciprocity between the Pharmaceutical Society of England and the Pharmaceutical Society of Ireland to be constituted under this Bill; but, in consequence of the objections taken by the former to such a provision being introduced into the measure, the clause was struck out. The main provisions of the Bill were to establish a Pharmaceutical Society for Ireland; to name the first members of the Council to be appointed under the Bill; that the President should be Sir Dominic Corrigan, and the Vice-president Dr. Aquilla Smith; and that the Council should have power to make rules and regulations, and to regulate examinations to be held under the Bill when it became law. It also provided for two grades of chemists, one to be called pharmaceutical chemists, and the other—those who passed an inferior examination—to be called chemists and druggists; and no person would be able to keep open shop for the sale of poisons and the compounding of drugs unless he was registered in one of the two grades, a licentiate of the Apothecaries' Hall, or a duly registered medical practitioner. The Bill reserved existing rights, and would allow phar-

maceutical chemists to fill the office of apothecary in district lunatic asylums in Ireland, and he should propose, in committee, to extend that privilege to the office of apothecary in county gaols in Ireland.—Earl GRANVILLE said he had a great deal to do with settling the law upon this subject with regard to England, and he was in favour of the general principle of this measure. In England, pharmaceutical chemists had to pass three examinations, and chemists and druggists only two; and, as there was a desire and a possibility of reciprocity between the two societies, he should, in committee, move an amendment that the examinations of pharmaceutical chemists in Ireland should be of the same standard as in England.—The Bill was read a second time.

The Sale of Food and Drugs Bill.—On the order for the third reading of this Bill, the Duke of RICHMOND moved the insertion of the following Clause after Clause 4: "That no person shall be liable to be convicted under either of the two last foregoing sections of this Act in respect of the sale of any article of food or of any drugs, if he shows, to the satisfaction of the justices or court before whom he is charged, that he did not know of the article of food or drug sold by him being so mixed, coloured, stained, or powdered, as in either of these sections mentioned, and that he could not, with reasonable diligence, have obtained that knowledge."—Agreed to.—The Duke of RICHMOND then moved the omission of Clause 5, and the substitution of the following: "No person shall sell, to the prejudice of the purchaser, any article of food or any drug which is not of the nature, substance, and quality of the article demanded by such purchaser, under a penalty not exceeding £20, provided that an offence shall not be deemed to be committed under this section in the following cases: that is to say, when any matter or ingredient not injurious to health has been added to the food or drug because the same is required for the production or preparation thereof as an article of commerce, in a state fit for carriage or consumption, and not fraudulently to increase the bulk, weight, or measure of the food or drug, or to conceal the inferior quality thereof; when the drug or food named is a proprietary medicine, or is the subject of a patent in force, and is supplied in the state required by the specification of the patent; where the food or drug is compounded, as in this Act mentioned, and where the food or drug is unavoidably mixed with some extraneous matter in the process of collection or preparation."—Agreed to.—Some other amendments were also agreed to, and the Bill was read a third time, and passed.

Tuesday, July 27th.

Pharmacy (Ireland) Bill.—The report of the amendments made in this Bill was brought up and agreed to.

HOUSE OF COMMONS.—Friday, July 23rd.

Mortuary at Shoreditch Workhouse.—Mr. PULESTON asked the President of the Local Government Board whether his attention had been called to the report of the Local Government Inspector on the condition of the Shoreditch Workhouse, where it was stated decomposing bodies were brought into proximity with the wards of the infirmary, the health of the patients and of the people of the neighbourhood being endangered thereby; whether action could be taken to ensure the immediate erection of a suitable mortuary; and whether, in view of the importance of the matter, he would consider the desirability of causing special inquiries to be made in other crowded districts, with the object of enforcing such sanitary regulations as would prevent the evils above referred to.—Mr. SCLATER-BOOTH said, with reference to the first question, that the report had been addressed to himself, and, therefore, had come under his notice. From that report, it appeared that the mortuary at Shoreditch workhouse had been unduly and improperly used by the vestry of the parish, with the permission of the guardians, for a purpose in reference to which the vestry was bound to find accommodation of its own. As soon as the attention of the guardians was called to circumstances set out in the report of the inspector, notice was given to the vestry that the mortuary could no longer be used for the purposes of the parish. In reply to the second question, he was happy to say he had received a letter from the vestry clerk, stating that, after great difficulties, they had succeeded in making arrangements which would enable them to provide a mortuary for their own use. The House would not be surprised to hear that there had been difficulty in procuring such a place, because there was no power of compulsory purchase in respect of land for a mortuary. Replying to the third question, he might say that one of the new provisions of the Public Health Bill, now passing through Parliament, conferred on the Local Government Board the power of compelling local authorities to provide mortuaries where necessary. Though the provisions of the Bill did not extend to the metropolis, there were crowded localities in the country where mortuaries would be found necessary, and when the Bill came into operation he should cause inquiries to be made in respect to them.

Army Medical Department.—Replying to Mr. M. Henry, Mr. HARDY said he had no objection to the Army Medical Department following the example of the Indian Medical Service by declaring the number of vacancies offered when advertising the date of the competitive examinations, though hitherto that course had not been adopted.

Unqualified Medical Practitioners.—In answer to Mr. O. Lewis, Mr. CROSS said his attention had been called to the verdict of the jury at the inquest upon the body of Emma Jane Plain, aged nine months, viz., that, while they found that death was from natural causes, they pointed out the fact that the deceased received medical treatment at a dispensary in Copenhagen Street, where medicines were administered by an irresponsible unqualified medical practitioner. This was an unfortunate case. All he had to say about the state of the law was that the question now raised by the honourable member was discussed at the time of the passing of the present Act—whether absolutely unqualified practitioners ought to be allowed to administer medicine. The law was that, if an unqualified person held out, in any shape or form, that he was a qualified practitioner, he was liable to punishment; otherwise not. As the question was one which came within the province of the Lord President of the Council, he would call his noble friend's attention to it.

Lunatic Asylums (Ireland) Bill.—This Bill, as amended, was considered and advanced a stage.

OBITUARY.

SIR CHARLES LOCOCK, BART., M.D., D.C.L., F.R.S.

ON Friday last, July 23rd, Her Majesty's First Physician-Accoucheur passed quietly away in his retreat at Binstead Lodge, near Ryde. For many years, this once prominent physician had been retired from anything like active professional duty; but he carried with him into his retirement alike the affection of his friends and of his patients. From 1840 to 1857, Sir Charles Locock was one of the most prominent figures in the medical world, having attended Her Majesty in all of her accouchements.

Sir Charles Locock was born in 1799, at Northampton, and was the son of Mr. Henry Locock of that town. Having chosen medicine as his vocation, he turned his steps northwards, and passed his student life in Edinburgh, whence, with his degree of M.D., he went to London. Like many more of the graduates of Edinburgh University, who have tempted fortune in the great metropolis, he had to start at the first round of the ladder of success, and climb by degrees. It was his good fortune at an early part of his career to come into contact with Dr. Gooch, who was struck by the intelligence displayed by Dr. Locock in the treatment of a troublesome case. This acquaintance soon ripened into friendship, and Dr. Gooch was often in a position to do friendly acts towards the rising physician, of which he availed himself. While a very young man comparatively, he was elected a physician to the Westminster General Lying-in Hospital. He was elected a Fellow of the Royal College of Physicians in 1836, and was a Councillor of that body in 1840, 1841, and 1842. By the advice of Sir James Clark, he was appointed Physician-Accoucheur to Her Majesty, and acted in that capacity at the birth of the present Crown Princess of Germany. In 1857, he was created a baronet; and in the same year was elected President of the Royal Medical and Chirurgical Society of London. In 1863, he was elected President of the Obstetrical Society of London; and in 1864, he was made a Fellow of the Royal Society. For many years before his decease, he retired from all practice, though he kept up his door-plate for several years after his practical retirement, and was always glad to give his advice in a friendly way to those of his medical brethren who knew him well, and who from time to time informally consulted him. For the last year of his life he was an invalid, and gradually died from no very distinguishable malady. His last appearance among his friends was at the last meeting of the St. Alban's Club, of which he was President. On that occasion, he was very feeble, and evidently declining; but was able to receive a deputation from the Club this year to present him with a gold snuff-box as an evidence of their goodwill towards him.

In his domestic relations, he was very fortunate; and, in his twenty-seventh year, married Amelia, youngest daughter of Mr. John Lewis, of Southampton Place, Euston Square, a lady of large means. This lady lived until 1867, long enough to see her husband rise to the highest position in his branch of medicine, and bore him five sons, the eldest of whom is a barrister, now Sir Charles Brodie Locock.

As a man, Sir Charles Locock was small in person and slight, firm and decided in manner, and to strangers undemonstrative to the extent of coldness. To those who knew him well, he was far from cold, and was kindly and sympathising to a degree. His intimates were warmly attached to him, and his patients placed implicit confidence in him. In diagnosis, he was quick and clear-sighted; he soon formed his opinion, and gave it candidly and outspokenly, though always in a manner free from offence to other medical men. His decision and firmness produced their effect in procuring the obedience of his patients, who always fulfilled his orders. His relations with Her Majesty were always those of an attached servant, whose affectionate services were required by the gracious friendship and confidence of his illustrious patient. This was shown by the request of the Queen that he should be present at Windsor on the occasion of the accouchement of the Princess Alice of Hesse, when Dr. Arthur Farre was the official Physician-Accoucheur. It was not that he had any duties to perform, but it pleased Her Majesty to know that he was at hand. Dr. Farre always speaks in the kindest manner of the way in which Sir Charles Locock conducted himself in his somewhat difficult position. His friendly relations with the Royal Family were shown by the interest Her Majesty felt in his last illness; and on the Wednesday before his death she drove over to Brinstead to see him for the last time. The official notice which appeared in the *Gazette* expressed Her Majesty's personal regard and respect for her physician.

Sir Charles Locock did not make himself in any way prominent in medical politics, and never held any other office in the College of Physicians than that of Councillor. Neither did he contribute much to medical literature; his best known writings are his articles in the *Cyclopædia of Practical Medicine*. The articles are Amenorrhœa, Convulsions (Infantile and Puerperal), Dysmenorrhœa, Lactation, Leucorrhœa, Menorrhagia, and the Pathology of Menstruation, all of which testify to his acuteness of observation and perception of the indications for treatment. These articles were written during the time when he was physician to the Westminster General Lying-in Hospital, and doubtless did much to establish the reputation of the rising obstetrician. It was not, however, by his writings or his public appearances that Sir Charles Locock rose to position and reputation in his profession. It was rather by his personal qualities which always attracted those who knew him, and converted his patients into partisans, so that he built around him a phalanx of attached patients who believed in him implicitly. He was a wary, shrewd practitioner, who gained the entire confidence of his patients. He did little, however, to advance even his own department of medicine; and his name is not associated with any improvement in obstetric or gynecological practice. He was a good practitioner, and was one of the first to perceive the utility of bromide of potassium in cases of epilepsy, associated with an excitement in the reproductive organs; and used chloroform in the later accouchements of the Queen.

Though he lived to his seventy-sixth year, Sir Charles Locock was never a robust man, and was almost a valetudinarian. He had a feebly acting heart, and was rejected by many insurance offices. A story is told of personal anxiety about his health in his early days. He often corresponded with Dr. Davies, known as "Chest-Davies", but they did not know each other personally. Sir C. Locock took advantage of this, and one day presented himself to Dr. Davies as a patient, with a note from Dr. Locock, in which he wished to have in writing Dr. Davies's opinion about the patient's heart. After examining him, Dr. Davies sat down and wrote a note to Dr. Locock. His anxiety was such that he had scarcely left Dr. Davies's door-step when he tore open the letter and read: "Dear Dr. Locock,—I have examined your patient's heart, and he has no more heart-disease than you or I have." This was, of course, a very satisfactory announcement, and gave him much relief; but all his life he was anxious about his heart.

Sir Charles Locock was an example of the successful physician who mounted to the highest place in medicine by the quieter bye-paths of personal regard rather than by the more conspicuous road of public reputation. He did not even study abroad ere entering on practice in London; and his name is not conspicuous in medical literature. He was, however, a man whom his profession regarded with esteem; and, now that death has removed him, his worth will be remembered and his loss regretted by all his friends.

DR. JAMES WELSH, of Kinghorn, Fifeshire, has been presented with a black marble timepiece and a purse of sovereigns. The timepiece bears the following inscription: "Presented to James Welsh, M.D., with a purse of one hundred sovereigns, by numerous friends in Kinghorn and surrounding district, as a token of their appreciation of his professional zeal and personal worth. 19th July, 1875."

MEDICAL NEWS.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—The following gentlemen were admitted Licentiate on July 19th, 1875.

Anningson, Thirkell, Burnley
 Baly, William, St. Mark's Hospital, City Road
 Blackmore, George Henry, Shaftesbury Road, Hammersmith
 Childs, Christopher, 121, Warwick Street
 Clarke, Arthur, Brill, Buckinghamshire
 Clayton, Joseph Everett, 4, Rutland Street
 Collins, Charles Edward, 47, Crowndale Road
 Cooper, Ernest Frederick, 13, St. Paul's Road
 Haines, Edmund William, 5, Tavistock Place
 Hood, Francis Edward Charles, Guy's Hospital
 Irving, Charles, St. Bartholomew's Hospital
 Jackson, Ernest Carr, 91, Harley Street
 Kebbell, William, Brighton
 Kempe, John Arthur, 74, Wimpole Street
 Murrell, William, 12, York Street, St. James's Square
 Pasley, Nicholas Claude Burgoyne, 19, Palace Road
 Peck, Awdry, Yalding, Kent
 Peavor, George Hamilton, 4, Portsdown Road
 Phillips, Arthur Owen Henry, Bethlem Hospital
 Poynder, George Frederick, Wexham, Brandon
 Ree, Frederick George, Ealing
 Reid, Thomas Whitehead, St. Bartholomew's Hospital
 Rendall, John, Maiden Newton, Dorchester
 Robson, Arthur William Mayo, Leeds
 Romano, Frederick William Richard, 17, Albany Road
 Rudd, Leonard, Guy's Hospital
 Spooner, Frederick Henry, Plymouth
 Thompson, Alfred, Spitsby
 Waylen, George Swithin Adee, 19, Granville Square
 Williamson, Francis, 5, Durham Place

The following candidate, having passed in Medicine and Midwifery, will receive the College License on obtaining a qualification in Surgery recognised by this College.

Sykes, John Frederick Joseph, 20, Fitzroy Square

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following gentlemen, having undergone the necessary examinations for the diploma, were admitted members of the College at a meeting of the Court of Examiners, on July 22nd.

Messrs. R. A. Stevenson, M.D. McGill, London, Canada West; E. J. Le Quesne, Jersey; M. H. H. Vernon, Battle, Sussex; R. F. Godfrey, M.D. Bellevue College, Montreal; N. Williams, B.A. Cantab., Ruthin; G. H. Jameson, M.B. Edin., Heywood; C. C. Turnour, Millman Street, W.C.; J. G. Hancock, Halse, Taunton; H. Bartlett, L.S.A., Great Dover Street, S.E.; G. H. Makins, L.S.A., Walton-on-Thames; A. G. Lacy, L.S.A., Guernsey; P. Bruce, L.S.A., Valparaiso, Chili; H. B. Briggs, L.S.A., Horncastle; St. C. B. Shadwell, Walthamstow; C. J. Hancock, Bath; W. Cock, Rediuth—H. A. Collins, L.S.A., Bayswater, who passed in Surgery at a previous meeting of the Court, having subsequently obtained a medical qualification, was also admitted a Member.

Three candidates passed in Surgery; and, when qualified in Medicine, will be admitted members of the College.—Six candidates were referred to their hospital studies for six months' further attendance.

Candidates who passed on July 23rd.

Messrs. W. A. E. Hay, L.S.A., Bridport; T. M. Hovell, Clapton; A. L. Bowen, Ludlow, Salop; W. Roughton, The Grove, Hammersmith; G. R. Corndell, L.S.A., Lock Hospital; J. Todd, Tufnell Park; F. H. Carter, Pewsey, Wilts; R. Humphry, Kensington; T. Burtonshaw, L.S.A., Hackney Road; E. Ground, Whittlesea; C. Rees, L.S.A., Cape Town; G. C. Karop, L.S.A., Camden Town; J. V. Continho, Ladbrooke Road; C. M. Johnson, L.S.A., Lancaster; J. K. Barton, Doughty Street; J. G. Langley, Mildmay Grove; A. J. W. Pettigrew, L.S.A., Hounslow.

Three candidates passed in Surgery; and, when qualified in Medicine, will be admitted Members of the College.—Five candidates were referred for six months.

APOTHECARIES' HALL.—The following gentlemen passed their examination in the science and practice of medicine, and received certificates to practise, on Thursday, July 22nd, 1875.

Branson, John, Rotherham, Yorkshire
 Clarke, Arthur, Brill, Buckinghamshire
 Davies, John, Queen Street, Worship Street, E.C.
 Eames, James Crompton, Kearsley, near Manchester
 Laverick, John Valentine, Hindewell, Yorkshire
 Morgan, William, Vnyismudw, Swansea Valley
 Richardson, Joseph Berridge, Castle Bytham, near Stamford

The following gentlemen also on the same day passed their primary professional examination.

Campbell, Robert Huntley, St. Thomas's Hospital
 Carlyn, Thomas Baxter, St. Bartholomew's Hospital
 Owen, Charles James Kayley, St. Mary's Hospital
 Pritchard, Ernest James, Guy's Hospital

MEDICAL VACANCIES.

THE following vacancies are announced:—

ARMY MEDICAL DEPARTMENT—Surgeons. Examination on August 9th and following days.
 BOROUGH OF ROCHDALE—Medical Officer of Health. Salary, £300 per annum. Applications on or before August 7th.
 BOURNEMOUTH GENERAL DISPENSARY—Resident Medical Officer and Secretary. Salary, £120 per annum, with furnished apartments, coals, gas, and attendance.
 BURY UNION—Medical Officer for the Radcliffe District.
 CHERTSEY UNION—Medical Officer for the Chobham District.
 CHRISTCHURCH UNION—Medical Officer for the Eastern District. Salary, £90 per annum, and fees. Applications on or before August 16th.
 DUDLEY DISPENSARY—Resident Medical Officer at Michaelmas.
 GREAT NORTHERN HOSPITAL—House Surgeon. Ophthalmic Surgeon. Applications on or before August 6th.
 HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton—Resident Clinical Assistants. Applications on or before August 2nd.
 INDIAN MEDICAL SERVICE—Ten Surgeons. Examination on August 9th and following days.
 LEEK UNION—Medical Officer for the Norton District.
 LIVERPOOL ROYAL INFIRMARY SCHOOL OF MEDICINE—Demonstrator of Anatomy. Salary, £100 per annum, and other emoluments. Applications on or before the 31st instant.
 LYMINGTON UNION—Medical Officer for the Hordle, Lympington, and Milford Parishes.
 MACCLESFIELD GENERAL INFIRMARY—House Surgeon. Salary, £90 per annum, with board and residence. Applications on or before August 6th.
 MARLBOROUGH UNION—Medical Officer for the Second District. Salary, £80 per annum, and fees. Applications on or before July 31st.
 NORTHERN LONDON CONSUMPTION HOSPITAL—Two Physicians. Applications on or before August 5th.
 NORWICH DISPENSARY—Salary, £120 per annum, with unfurnished residence and apartments.
 ORMSKIRK UNION—Medical Officer for the Second District.
 OUNDLE UNION—Medical Officer for the Weldon District. Salary, £60 per annum, and fees. Applications on or before August 4th.
 QUEEN'S HOSPITAL, Birmingham—Ophthalmic Surgeon. Applications on or before August 2nd.
 ROYAL CORNWALL INFIRMARY—House-Surgeon, Secretary, and Dispenser. Salary to commence at £120 per annum. Applications on or before the 31st instant.
 ROYAL FREE HOSPITAL, Gray's Inn Road—Senior House-Surgeon. Salary, £104 per annum, with board and residence.—Two Junior House-Surgeons. Applications on or before August 4th.
 ROYAL SURREY COUNTY HOSPITAL—House-Surgeon. Salary, £75 per annum, with board, residence, and washing. Applications on or before July 31st.
 ROYSTON UNION—Medical Officer for No. 5 District. Applications on or before September 6th.
 ST. IVES UNION—Medical Officer for the Warboys District.
 TIVERTON UNION—Medical Officer and Public Vaccinator for the Western District. Salary, £70 per annum. Applications on or before August 9th.
 TOWNSHIP OF MANCHESTER—Assistant Medical Officer at the Workhouse Hospital. Salary, £120 per annum, with furnished apartments, fire, light, washing, and attendance. Applications on or before August 12th.

MEDICAL APPOINTMENTS.

Names marked with an asterisk are those of Members of the Association.

CARTWRIGHT, Alexander, M.R.C.S. Eng., appointed Surgeon-Dentist to the Hospital for Sick Children, Great Ormond Street, *vice* T. Edgelow, L.R.C.P. Lond., resigned.
 JONES, J. T., L.R.C.P.I., appointed Medical Officer to the Brixton, Streatham, and Herne Hill Dispensary, *vice* J. T. Mercer, M.B., deceased.
 LEFTWICH, R. W., M.B., appointed Resident Medical Officer to the East London Hospital for Children and Dispensary for Women.
 RENDLE, Richard, F.R.C.S. Eng., appointed Resident Medical Officer to the Hospital for Consumption and Diseases of the Chest, Brompton, *vice* Vertue Edwards, M.R.C.S. Eng., retired, after nearly twenty-five years' service.
 *WOODS, Oscar T., M.D., Senior Assistant at the Warwick County Asylum, appointed Medical Superintendent to the Killarney District Asylum, *vice* W. Murphy, M.D., deceased.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths, is 3s. 6d., which should be forwarded in stamps with the communication.

MARRIAGES.

ATKINSON—TIMINS.—On July 28th, at the Parish Church, Kingston-on-Thames, by the Rev. John Brass, M.A., Frederick Page Atkinson, M.D., of Surbiton Road, eldest son of J. C. Atkinson, M.D., Kew Green, Surrey, to Eliza Henrietta, only daughter of A. Kier, M.D., Tufbridge Wells, late H.E.I.C.S., and widow of the late Rev. Douglas C. Timins, A.M., of Hilfield, Aldenham, Herts.
 HAINING—ROBERTS.—On July 27th, at St. Thomas's Church, Chester, William Haining, M.D., L.R.C.S. Eng., to Mary Ellen, eldest daughter of Robert Roberts, Esq., The Firs, near Chester.

DEATH.

ELLIS.—On July 22nd, at Beechhurst, Poole, Mary, the wife of *Heber Ellis, Esq., aged 34.

A CONVALESCENT home at Ilkley, for the accommodation of sixty inmates, was formally opened last week by the wife of Mr. C. Semon, by whom it has been built at a cost of £8,000. A small sum will be charged to those who use it, to avoid the taint of charity, and foster a feeling of independence.

OPERATION DAYS AT THE HOSPITALS.

MONDAY Metropolitan Free, 2 P.M.—St. Mark's, 9 A.M. and 2 P.M.—Royal London Ophthalmic, 11 A.M.—Royal Westminster Ophthalmic, 1.30 P.M.

TUESDAY Guy's, 1.30 P.M.—Westminster, 2 P.M.—Royal London Ophthalmic, 11 A.M.—Royal Westminster Ophthalmic, 1.30 P.M.—West London, 3 P.M.—National Orthopaedic, 2 P.M.

WEDNESDAY . . . St. Bartholomew's, 1.30 P.M.—St. Mary's, 1.30 P.M.—Middlesex, 1 P.M.—University College, 2 P.M.—St. Thomas's, 1.30 P.M.—London, 2 P.M.—Royal London Ophthalmic, 11 A.M.—Great Northern, 2 P.M.—Samaritan Free Hospital for Women and Children, 2.30 P.M.—Cancer Hospital, Brompton, 3 P.M.—King's College, 2 P.M.—Royal Westminster Ophthalmic, 1.30 P.M.

THURSDAY . . . St. George's, 1 P.M.—Central London Ophthalmic, 1 P.M.—Royal Orthopaedic, 2 P.M.—Royal London Ophthalmic, 11 A.M.—Hospital for Diseases of the Throat, 2 P.M.—Royal Westminster Ophthalmic, 1.30 P.M.—Hospital for Women, 2 P.M.

FRIDAY Royal Westminster Ophthalmic, 1.30 P.M.—Royal London Ophthalmic, 11 A.M.—Central London Ophthalmic, 2 P.M.—Royal South London Ophthalmic, 2 P.M.

SATURDAY . . . St. Bartholomew's, 1.30 P.M.—King's College, 1.30 P.M.—Charing Cross, 2 P.M.—Royal London Ophthalmic, 11 A.M.—East London Hospital for Children, 2 P.M.—Royal Westminster Ophthalmic, 1.30 P.M.—St. Thomas's, 9.30 A.M.—Royal Free, 9 A.M. and 2 P.M.

NOTICES TO CORRESPONDENTS.

CORRESPONDENTS not answered, are requested to look to the Notices to Correspondents of the following week.

PUBLIC HEALTH DEPARTMENT.—We shall be much obliged to Medical Officers of Health if they will, in forwarding their Annual and other Reports, favour us with *Duplicate Copies*.

AUTHORS desiring reprints of their articles published in the *JOURNAL*, are requested to communicate beforehand with the printer, Mr. T. Richards, 37, Great Queen Street, W.C.

CORRESPONDENTS, who wish notice to be taken of their communications, should authenticate them with their names—of course, not necessarily for publication.

WE CANNOT UNDERTAKE TO RETURN MANUSCRIPTS NOT USED.

COMMUNICATIONS respecting editorial matters, should be addressed to the Editor: those concerning business matters, non-delivery of the *JOURNAL*, etc., should be addressed to the General Manager, at the Office, 36, Great Queen Street, W.C.

VOTING AT THE ROYAL MEDICAL BENEVOLENT COLLEGE.

SIR,—I have just received an appeal for my vote and interest on behalf of a lady 68 years of age, who, as a candidate for a pensionship, seeks for the third time the support of the governors of the Royal Medical Benevolent College. The medical profession know well the anxiety and worry that all contested elections occasion, not to say anything of the expense. Surely it is bad enough to require the young and vigorous to engage in such ordeals, but to extend it to the old, the decrepid, and the orphan, is simply trafficking in human miseries, and ought to be discontinued by any institution that appeals for support on the grounds of its charitable work.—I am, sir, yours, etc.,
REGINALD HARRISON.
38, Rodney Street, Liverpool, July 24th, 1875.

DR. J. A. COUTTS (Banchory).—Your question shall be answered in an early number.

SEEGEN ON DIABETES.

THE second edition of Professor Seegen's valuable work *On Diabetes* contains a résumé of his views, the chief points of which are these. Healthy urine contains no sugar. All sugar in the urine, excepting its mere momentary presence from a passing cause, is an expression of a morbid process in the organism: one cannot distinguish, in its origin or its results, between diabetes mellitus as a disease and as a harmless increase of a physiological process. The sugar-excretion is the result of an anomalous conversion of the liver-glycogen into sugar; a direct excretion of the food-sugar does not take place. There are two forms of diabetes: one, in which only the glycogen formed out of the carbohydrates is converted into sugar; the other, in which the glycogen originating in the albuminates is also changed into sugar. A morbid condition of the central nervous system is in most cases to be traced as the cause of this anomalous process. Whatever the origin, the excretion of sugar is the cause alone of all the characteristic symptoms. There exists an intimate connection between excessive fat-formation and sugar-secretion. Corpulence, especially in the young, is often a forerunner of diabetes. The symptoms of diabetes fall into two groups; one occasioned by the presence of sugar in the blood; the other, the result of defective nourishment. An hereditary disposition is by no means infrequent. The course of the disease is most favourable when there still exists some tolerance of amylaceous food: the second form runs much more quickly to a fatal termination. Cure of diabetes, so that starchy food may be freely eaten, is not observed. The prognosis depends on the form of the disease, the age of the patient, the power of living on a flesh diet, and the temperament. In the treatment of diabetes, the regulation of the diet is of first and primum importance. Among remedies, alkalies and alkaline mineral waters have proved themselves the best. The use of Carlsbad water has always a favourable influence on the symptoms of diabetes; the amount and the duration of the influence varies with the severity of the disease. Opium and its preparations have, among all known means, the most decisive influence on the excretion of sugar; but the duration of the action is only exceptionally an enduring one.

L.D.S., R.C.S. Eng. (Torquay).—The persons mentioned have no right whatever to the title. Perhaps the "L.D.S." is an American title; but if they add "R.C.S.," or lead the public to suppose their diploma is obtained from the Royal College of Surgeons, they can be prosecuted. The advertisements, which are disgraceful, have been forwarded to the College.

CORRESPONDENTS are particularly requested by the Editor to observe that communications relating to Advertisements, changes of address, and other business matters, should be addressed to Mr. Francis Fowke, General Secretary and Manager, at the Journal Office, 36, Great Queen Street, W.C., and not to the Editor.

A PARTNER.—Both in law and equity you are bound by the agreement. It is not only necessary that you should not reside within three miles, but that you should not attend any patient residing within that distance.

WASHING OUT THE UTERUS.

SIR,—In the *JOURNAL* of July 17th is a letter from A Learner, alluding to the washing out of the uterus in an offensive condition of the secretion after childbirth, and asking for further information on the matter. As the discussion at the Obstetrical Society did not embrace treatment, the matter was only alluded to; but if A Learner will refer to the *JOURNAL* (No. 463, Nov. 13th, 1869), he will find the report of a paper read by me at the Leeds Meeting of that year, entitled *On the Use of the Intrauterine Douche after Labour as a Rule of Treatment*. In that paper, I gave preference to permanganate of potass, but said any other disinfectant would do. Dr. Wynn Williams prefers iodine. Both answer very well. Weak carbolic lotion (one to 200), or chloralum (one to 200), or chloride of zinc, or even common salt, if others cannot be obtained, about one teaspoonful to a pint; or perchloride of iron, very weak, one teaspoonful of the tincture to one pint of water; either of these may be employed, the great point being to use plenty, and to carry the tube well up to the fundus.—I am, etc.,
J. BRAXTON HICKS.

SIR,—Like many others, I have taken a deep interest in the discussion which has been held in the London Obstetrical Society on the subject of puerperal fever. There was great need for such a discussion, and no doubt much good will arise out of it. In the report which appeared in your issue of the 12th ultimo, we had some very practical remarks from Dr. Wynn Williams and Dr. Tilt. They were specially interesting in being practical, and as the outcome of, in my humble opinion, a very rational theory; and I think if Dr. Tilt, whose valuable paper in vol. xvi of the *London Obstetrical Transactions*, on *Lymphangitis in Pelvic Pathology*, must be known to many of your readers, and who laid most stress on the benefit to be derived from the washing out the uterus, would kindly develop his views on this point in your *JOURNAL*, and tell us circumstantially how he does it, what instrument he recommends, what disinfectants, and of what strength, etc., he would, I have no doubt, confer a very great benefit on the community. I am satisfied many want information and instruction on this point; and he seems well qualified to give both. Most practitioners use vaginal injections only; and I have heard more than one maintain that these find their way into the uterus, but of this I have very great doubt.

In the hope that Dr. Tilt will, at an early date, comply with this request, I am, sir, your obedient servant,
WM. MORTIMER.
Turiff, July 5th, 1875.

* * We have received a paper from Dr. Tilt which contains answers to the questions in Dr. Mortimer's letter; and will publish it at an early date.

A MEMBER OF THE ASSOCIATION.—The *Illustrated London News* published an engraving of the dinner in the Hall of Christ Church College, Oxford, when the Association met there.

HABITUAL DRUNKARDS.

SIR,—I have been very much struck, as I am sure have the majority of the profession, by the observations of Sir T. Watson at the recent deputation to Mr. Cross. Never in the history of his long career did he make out so urgent a case for legislative interference, than when pleading the cause of that unfortunate being, the dipsomaniac. I could instance many cases where I was totally at a loss how to act or what to advise, the general impression being that the dipsomaniac was irremediable. Within the past few days I was consulted about a deplorable case of a female, of most respectable parentage, who had reduced herself to the poorest circumstances by drink. As she was suffering from a suppurating tumour, I got her, with some difficulty, into a hospital, from which, having conducted herself most violently, she had to be removed after a few hours. Now here is an instance where a reformatory might restore to this poor creature her reason, and, possibly, to society. I fully coöperate with Sir Thomas's view on the matter.—I have the honour, dear sir, to be yours faithfully,
J. J. MURPHY, L.R.C.P. & S.E., etc.

74, Camden Street, Dublin, July 20th, 1875.

MRS. M.—The session commences in October. Our Students' Number will give you the desired information.

ROYAL COLLEGE OF SURGEONS.

THE following were the questions in surgery and medicine submitted to the candidates for the diploma of membership on July 16th and 17th. They were required to answer at least four out of the six questions, including one of the first two. 1. Describe the ischio-rectal fossa, mentioning the structures which bound and occupy that space. 2. If the throat be cut across between the os hyoides and the thyroid cartilage down to the vertebra, what parts would be divided, and in what order? 3. In a case of severe compound fracture of the leg, what indications would lead you to infer that traumatic gangrene had commenced? and what would be your treatment under such circumstances? 4. State the diseases which give rise to extravasation of urine, and the treatment to be adopted in its progress. 5. Describe the treatment of an incised wound penetrating the knee-joint; mention the consequences which may follow such an injury, and the treatment which may be required. 6. What are the symptoms and appearances of a well marked case of syphilitic iritis? How would you treat it? What may be the unfavourable permanent results?

DR. CAMBELL.—John Heurnius was, according to Hutchinson, the first who taught anatomy by lectures on dead bodies at Leyden.

COTTAGE HOSPITALS.

SIR,—Will any of your readers kindly inform me how I am to gain information as to the practical working of Cottage Hospitals in England.
Caledon, July 1875. I am, etc., M.D.

A YOUNG MEMBER.—The reason why Mr. Birkett does not wear the President's robe at the examinations is, because he has not yet reached that distinction. The President (Sir James Paget) and the Senior Vice-President (Mr. Hewett) decline to become members of the Court of Examiners; hence Mr. Birkett, the Junior Vice-President, has been elected Chairman of the Court.

NOTICE TO ADVERTISERS.—Advertisements for insertion in the BRITISH MEDICAL JOURNAL, should be forwarded direct to the Publishing Office, 36, Great Queen Street, W.C., addressed to Mr. FOWKE, not later than *Thursday*, twelve o'clock.

THE CONTAGIOUS DISEASES ACT: THE LATE DIVISION.

SIR,—Though there is, I trust, no danger of the mock philanthropists succeeding in getting these most useful and humane acts repealed, there is, I fear, more risk that they may suffer injurious mutilation, unless some of the *ad captandum* objections to them can be removed, or considerably diminished. One of the chief of these is, that women who have committed no offence (which, by the way, is not true; a public prostitute is, *ipso facto*, a disorderly character, and justly liable as such to such punishment as it is expedient to inflict) are compelled to submit to indecent examination by men, not for their own benefit, but merely to ascertain whether they are or are not diseased. Few would condemn surgical examination for a curative object, and with the consent of one who is suffering from disease that may be relieved or cured; but a compulsory examination, not for the benefit of the woman examined, cannot be justified unless a very important public benefit be not otherwise attainable, and many doubt if it would be justifiable even then. The practice of examination to ascertain the existence or absence of apparent disease, would be far less objectionable, and much less objected to, if made by women instead of by men; the surgeons would be very willing to be relieved from such disgusting duty, and women might easily be instructed so as to ascertain the existence of any irritant sore or discharge quite as well as surgeons can; and there need be no examinations at all by men except when disease is discovered needing surgical assistance, to which no fair opposition could be, and very little opposition would be, offered; and I submit that such a simple and obvious change in the operation of the Acts would be of unmixed benefit to all concerned, and would remove one of the most plausible objections urged against it.

Another popular objection to the Acts is, that diminishing the fear of infection encourages profligacy, as possibly it would if it gave, or was believed to give, complete immunity from danger, which the opponents of the Act complain, and its supporters allow, it does not give, and never will; all it does being, which is a great deal, to diminish both the frequency and severity of what cannot be altogether prevented. This, however, is unlikely to diminish the fear, for the fear of a danger is seldom in proportion to its reality, and is very often greater because the real danger is less, a rarely occurring evil affecting the imagination much more than one to which we are more accustomed. For example, the great majority fear hydrophobia, the risk of having which is almost infinitely small, more than they do fever, the danger of which is nearly two thousand times as great. A great part of the fear of hydrophobia is because it is so rare and so extraordinary. If as many died of it as die of fever, it would be no more dreaded. Sensible people fear fever far more, and with good reason. If a few venomous snakes had escaped, as it was lately feared they would, from the Zoological Gardens, people would for many months have been more afraid of walking in Regent's Park than they are in India or in Virginia, where venomous snakes are common. And if syphilis became very rare, as it is most desirable it should do, so long as the risk of contracting it continues at all, the fear of it will continue but little diminished, and it may even considerably increase. Those who think it wrong to diminish the risk lest profligacy should be increased, may be fairly asked if they would think it right to introduce the disease when it does not exist in order to check profligacy; and as doubtless they would not, they should be asked to explain why it is wrong to try to remove or diminish an evil they would certainly not increase, on the chance of increasing self-restraint by its existence. Surely if it be wrong to diminish the frequency and severity of disease arising from vice, it must be wrong to diminish the injury and suffering it produces; and all who, by their own fault, contract it, ought to be left unaided to endure the natural punishment of their sinful indulgence. This is only the logical conclusion of what it is polite to call the *argument*. But the case does not stop here; the immediate are not the only, sometimes not the most, severe sufferers from the disease. Wholly innocent wives and children may, and often do, suffer also; and perhaps the severest punishment that could be inflicted upon one who has brought this dire disaster upon his wife and child would be dooming them to suffer unaided. Would it be right to inflict this punishment upon him as a warning to others to avoid vice? If it be not right to diminish danger of contracting disease lest vice should not be discouraged, can it be right to diminish even this tremendous punishment, the indirect but not remote consequence of vice? The answer is very easy. It is our duty to guard against danger, and to relieve suffering, however caused; but it is not our duty to punish vice, if it be not also crime—*i.e.*, what is directly injurious or dangerous to others; nor can we innocently inflict greater suffering even on the criminal than is needed for the protection of society. We may, however, and ought, to discourage vice in innocent ways, and to help those who have fallen into vice to escape its thralldom; and experience has shown that one of the most successful modes of rescuing the vicious has been by the machinery of the Contagious Diseases Act; and what is, if possible, still more satisfactory, it has done much to save from falling many who, to all appearance, were in extreme danger. How humane men, who are doubtless well meaning, can persuade themselves that it is right to oppose such laws, is to me most wonderful. As to the amiable but mistaken women who have been misled by misrepresentations into opposing a law the merits of which they cannot understand, all that can be said for them is, they know not what they do, and forget that more suffering is often inflicted by well meaning ignorance than by intentional cruelty, but it is suffering nevertheless.—I am, etc.,
P. H. HOLLAND.

UNQUALIFIED ASSISTANTS.

SIR,—Will you kindly give me space for a few words on the question of qualified and unqualified assistants? J. L. selects as a specimen of the former class a man who has been hurried in and out of an anatomy room or the wards of an hospital for twenty-four months without a single patient being entrusted to his care; while of the latter, he takes a gentleman who has years of experience, after a few lessons at hospital and college. Doubtless there will be found older (which does not necessarily imply more experienced) men among unqualified assistants as a class than among qualified. But why? Simply because the latter generally get into practice for themselves, and so cease to be assistants, whereas the former are doomed to linger on in that capacity; and this is one of the chief reasons why they are preferred by principals, who, as a rule, dislike changing their assistants. But I deny that this is a fair specimen of the qualified assistant. Most men do not pass on twenty-four months' study, hurried or otherwise; besides, J. L. must remember that many students, being the sons of medical practitioners, have ample opportunities of becoming acquainted with the ordinary routine of general practice independently of their collegiate studies. His general assertion, that men pass without a single patient having been entrusted to their care, is not true. It

is the practice in many hospitals for the advanced students to have charge of a certain number of cases, reporting progress each morning to the physician or surgeon on duty; and if J. L. had seen, as I have, earnest students spending hours daily in hospital, after the usual clinical instruction, taking notes and thermometric observations, and making chemical and microscopic examinations of urine, etc., he would not write so glibly about men being hurried in and out of the hospital wards.

J. L. is altogether mistaken about the general salary of qualified assistants, when he fixes it as very seldom reaching £80 in-door. It may have been so formerly, but now it is very frequently £80 and £90, while some men I know get £100, and even £150 and £200 per annum in-door.

Why is J. L. not satisfied with defending unqualified assistants without making a general attack upon qualified men? "We are all aware that many qualified men who competed for appointments in the army and navy heretofore, were found wholly incapable to undertake any professional duties." Will J. L. kindly give his authority for this sweeping assertion? On the other hand, I consider the proposal to make unqualified assistants, acting under the guidance of qualified practitioners, amenable to the law, a very illiberal one indeed. What would then become of dressers and clinical clerks in hospitals?—I am, sir, yours obediently,
H. G. D.
Manchester, June 23rd, 1875.

SIR,—It is very kind of you to allow the assistant—*sine diploma*—a corner in which to defend himself, and I hope that you will find room for this answer to the attack of Vigilans and others. It has been stated, sir, in your pages that the unqualified man possesses "no guarantee whatever" as to the extent of his professional knowledge. I will endeavour to show that this is not a fact. The unqualified man is generally to be found engaged in a working class practice, among men who are anxious and impatient to return to their labours. They have the recollection of former accidents and illnesses to guide them, so have their friends. They ask blunt and unevadable questions as to the prognosis, and are keenly observant as to the success of the treatment. The most sublimely theoretical and newly fledged licentiate cannot deny these men the evidence of their own senses. Is not their approval a guarantee of competency? Throughout practice there are merciless judges upon all sides; every town has a telegraphy of gossip by which the doings of an assistant soon become known; and I fear that in some of the northern towns malpractice would result in the perpetrator being himself put under surgical care.

The unqualified assistant is generally an unfortunate and hardworking student, with the ultimate intention of "getting through". To state that his only prospect is that of "becoming a principal instead of a subordinate quack", is an unwarrantable and cruel slander. Why do not some of the practitioners who employ unlicensed gentlemen by preference (not economy) state their experience of the class whose existence they encourage?

In conclusion, I have no hesitation in stating that, as a body, the unqualified assistants will compare favourably with their registered opponents; but if they are to be purged from the profession, some provision must be made for those whose living it already is—many with wives and families. I hope that this important subject will be further discussed.—I am, sir, yours obediently,
Lancashire, July 10th, 1875. C. P., UNQUALIFIED ASSISTANT.

PRESIDENT'S ADDRESS,

DELIVERED AT

THE FORTY-THIRD ANNUAL MEETING OF THE
BRITISH MEDICAL ASSOCIATION,

Held in EDINBURGH, August 3rd, 4th, 5th, and 6th, 1875.

BY

SIR ROBERT CHRISTISON, BART.,

M.D., D.C.L., LL.D., F.R.S.E.D.

Ordinary Physician to the Queen in Scotland; Professor of Materia Medica in the University of Edinburgh.

GENTLEMEN,—My first duty is to bid you all welcome to this seat of medical learning, familiar of old to many as the school in which they were initiated into the mysteries of physic—to welcome you in the name of my medical brethren of the city, in name of my fellow-citizens at large, in behalf of the good town, too, herself, who, I see, means to put on her fairest sunshine smiles to greet your arrival,—no common favour, let me tell you, in this the usual week of the Lammas Floods.

My next duty is to offer you my gratitude and thanks for your great kindness in choosing me for your President during the meetings of your present annual session. You might fairly have bestowed that great honour on another; and perhaps I might have thanked you in that case also for sparing me a task which I find it not easy to perform to my own satisfaction. You might well have bestowed your favour on another; for, when this Association last met in Edinburgh, the health of your then President and my dear colleague Dr. Alison was such as to throw his work in a great measure upon me as his deputy, placing me virtually at your head, so that, were I inclined to take the most flattering view of my present position, I might almost claim for myself the singular distinction of now occupying for the second time the chair of the British Medical Association.

So much the more am I called on to look well to the next and most trying of the duties I have to discharge towards you now: the delivery of the address which you are now assembled to claim from me. Especially is it incumbent on me to look warily to its subject. Assuredly my subject should be a high one, when so many hundreds of the chosen among the members of our profession, as well as some from foreign countries, are met together, as they never do meet unless under the auspices of your annual convocation.

After hesitating between several topics coming up to this valuation, and well worthy of being considered by you, I ultimately thought I should fulfil my duty to you, to our medical brethren generally, and to the public interest, too, by fixing on a topic, which for some years has been uppermost in the minds of many thinking men of our profession: the question, "Whether, and what, change is desirable in the present system of education and of examination in the medical schools of our country?" I am led to choose this subject, among other reasons, because in the public prints only one side of the question has been hitherto shown, while there is unquestionably another, and a good one, too. I hope I shall not be thought to intend the slightest disrespect to this Association when I add that I am all the more inclined to take up the subject here, because my own views do not altogether coincide with those which are understood to be popular in the Association, and which at least have been powerfully advocated from time to time in its JOURNAL. My subject, then, is, What sound reason exists for a fundamental change in medical education and medical examinations?

I beg you not to be startled by my choice of a rather hackneyed theme. It would be very dry and hackneyed, indeed, alike to you and to myself, were I to undertake it methodically and in whole. I mean, with your leave, to view the question from a quarter whence it has not yet been looked at. I propose to give you historically some insight into the school life of one of our chief seminaries of medical education, in the hope that there may be found in its history some safe guidance in the present somewhat wild struggles of our profession to improve itself, to redress what seems faulty, and to frame, if possible, a masterpiece of medical examination and precursory study. In singling out for this end the medical school within whose walls we are to be assembled, I do so from no vain-glorious pride in the school to which I have myself for many years belonged, but because: firstly, I know its history, constitution, and work best; secondly, being here, you will probably take some interest in a subject with which most of you are but slightly acquainted; and, thirdly, because it is most surely worth while

to inquire in the present conjuncture into the causes which have led the medical department of the University of Edinburgh, situated in an outlying quarter of the kingdom, to become for wellnigh a century, with little interruption, the most populous medical school in the British Islands.

The University was founded by James I (of England) in 1582. In the following year, the Faculty of Arts was started at once by the teaching of six of the seven subjects now required for graduation in that faculty; and the Theological Faculty was instituted at the same time by the founding of a Chair of Divinity. A Law Faculty was not initiated till a few years after the commencement of last century; that of medicine had its beginning in 1685, through the energy and influence of three of the most remarkable medical men of the day in Scotland: Sir Andrew Balfour, Sir Robert Sibbald, and Dr. Pitcairn.

Botany seems to have been their first object. Fifteen years earlier, Balfour and Sibbald created the rudiments of a botanic garden, one object of which expressly was to introduce into Scotland the cultivation of foreign plants yielding medicinal products, which, in those days of not easy intercourse among nations, were not readily obtained when wanted. Our modern "Royal Botanic Garden" of twenty-seven acres, too small for its 340 students, had its origin, in 1670, in a little plot of ground close to Holyrood Palace, measuring forty feet square, in which, nevertheless, were reared no fewer than 900 plants. The site was soon transferred to a large garden, where now flourishes the City Station of the North British Railway. Dust and iron, hurrying engines, interminable rows of trucks and carriages, clouds of steam-vapour, and the scent of coal-gas from the neighbouring gas-works, have taken the place of the groves and avenues, the perfumed airs, and the scientific seclusion of the "Old Physic Garden." But one relic survives in a fine yew now adorning the garden in charge of Dr. Balfour and Mr. Macnab, twice transplanted successfully after becoming a considerable tree, and proving its own age by the *modulus* of De Candolle, according to which it must be above two hundred years old. The success of the Physic Garden was so great, owing to the fostering care of its promoters and the ability of its first keeper, James Sutherland, originally a clever young gardener, that, in 1676, an Act of the Town Council of the city, then the founders and patrons of professorships, established in Sutherland's favour a Chair of Botany in the University. But, for some unknown reason, the Act was not given effect to, so that a second Act of Foundation became necessary to make him effectually an University Professor in 1695.

In the meantime, Sibbald had influence enough to obtain also, in 1685, the establishment of a Chair of Medicine.

It is a fact not unworthy of notice, as throwing some light on the early history of medical education in this country, that, in every other university of what is now the United Kingdom, there existed for a long period of years only a single professorship of medicine. Oxford had its professor of medicine first in 1535, and no other medical professor for nearly a century. Cambridge had its Chair of Medicine in 1540, and no other till 1702. Dublin began in the same way in 1637, without addition till 1783. Of the Scottish Universities, Glasgow was slow to undertake the teaching of medicine, its professorship of medicine having been founded in 1713, of anatomy in 1718, of no other branch till 1807. St. Andrew's had its first professor of medicine in 1722. Singularly enough, the University of Aberdeen has the merit of having anticipated all others, even Oxford and Cambridge, and been the very foremost in the United Kingdom to possess a Chair of Medicine. Under the name of Mediciner, King's College, Aberdeen, had a professor "before 1522" (Calendar, 1875), probably so soon as 1505. In the younger Marischal College, there was a Professorship of Medicine in 1701, but no support to it till a Chair of Chemistry was erected in 1793.

Plainly, then, it was understood in all these universities for more than a century that one man was competent to educate students for the medical profession. Whether Sir Robert Sibbald and his coadjutors, trained at a continental school and by continental travel, were aware this was a faulty arrangement, we cannot now tell. But they were the means of establishing, for the first time in Britain, three professorships of medicine in the University of Edinburgh. Thus they may have introduced the valuable novelty of dividing its special branches among special men. But it is not now known how they taught, or even that they did all teach. If they did, it is quite possible that, according to the system pursued in the Faculty of Arts, each professor carried his students through a three years' course of study, taking up "freshmen" every third year, each in his turn. As little is now known of their success. They have left no mark upon the University, except the foundation of their own chair and of that of botany. Their teaching, at all events, made no graduates; for there was no medical graduation in Edinburgh till 1726, forty years almost after their appointment.

The University of Edinburgh was not the only theatre in which efforts were early made to institute medical education in the Scottish capital. The Royal College of Surgeons also appears to have given it encouragement. Alexander Monteith, a member of the College, and the chief surgeon of Scotland at the time, certainly so soon as 1699, and until at least 1702, delivered a six weeks' course of lectures on chemistry, followed by demonstrations in *materia medica*; and he divides with Dr. Pitcairn the distinction of first overcoming the prejudices of his countrymen, and persuading the city authorities to grant licence and means for pursuing anatomy by dissection of the human body. But the College of Surgeons never established a School of Anatomy and Surgery. I should add, perhaps, that lectureships, in default of professorships, were appointed for several branches of medicine by the Universities of Glasgow and Aberdeen; but not till last century was far advanced. In Edinburgh alone were the roots of a medical school, in the true sense of the word, fairly planted in its university so early as the end of the seventeenth century, and brought to maturity in the first quarter of the century following.

The school of Sibbald and Pitcairn was but a beginning, and probably not very successful; but soon afterwards matters took the right direction towards a separation of subjects, by the establishment of a lectureship on anatomy in 1705, and the foundation of a professorship of chemistry in 1713. In fact, it was not till the appointment of Alexander Monro *primus* to be professor of anatomy in 1720, that the University School of Medicine put on a shapely form, and entered upon its career of prosperity.

Monro has his place in history as one of the European anatomists of last century. But anatomy was not his sole gift by any means. Highly educated, favoured by his conspicuous office, which he entered when only twenty-three, and bringing to the task he had set himself an intimate knowledge of the organisation of the schools of Paris and Leyden, a profound knowledge of men, and polished affable manners, he won the confidence of men of station and influence, attained popularity with all ranks, and is understood to have had much weight in the general affairs of the city and country. Thus it was that he not only soon placed the University Medical School on a sound and prosperous footing, but likewise mainly created the Royal Infirmary. In the University he found ready to his hand a chair of chemistry and a chair of botany; there was also the old chair of medicine, capable of being moulded into the fitting shape of practice of physic. Anatomy and surgery were his own province. In 1724 was added a chair of theory of physic, which then embraced physiology, pathology, and therapeutics. In 1726 midwifery was also provided for; and *materia medica* was early taught by the professor of botany in the winter, botany itself occupying his attention during the summer months. Thus the whole round of medical science and practice came to be skilfully partitioned—*anatomy*, chemistry, botany, physiology, medical practice, and midwifery being each taught separately; surgery, too, by one of the six professors, and *materia medica* by another of them. This arrangement—extensive, complete, and harmonious for the times—was carried into effect very long before anything of the kind was attempted at any other University, or, indeed, so far as I can discover, in any other school of medicine in the United Kingdom. Several of these professorships have been subdivided since that time. Surgery has been assigned to a separate professor, pathology to another, and therapeutics has been transferred to *materia medica*. But all branches were taught from the first; and the only new creations in the University have been those for natural history, medical jurisprudence, and clinical medicine and surgery. The first of these is a general rather than a medical chair. In the establishment of the three others, the University of Edinburgh took the lead by a long way of all other British schools, as it had done in the organisation of a school, complete, according to the times, immediately after 1720.

I have said that Monro was mainly instrumental in originating the Edinburgh Royal Infirmary. For this end, he took advantage of his influence with the Royal College of Physicians, and also with a very able and enlightened man, of great weight in city affairs, Lord Provost Drummond. He must have set about this enterprise very early; for, in 1728, subscriptions enough had been raised to set on foot next year a small hospital. A larger one having been subsequently built and gradually extended, a Royal charter of incorporation was obtained in 1736. Monro evidently had designed from the first that the hospital should be devoted not more to the cure of the sick poor, than for the education of students of medicine. Repeated early minutes of the infirmary managers prove this, and show how zealously they concurred with him. The culmination of the fabric, so far as education is concerned, was the inauguration of the teaching of clinical medicine in 1748 by Dr. John Rutherford, Professor of the Practice of Physic. The hospital managers espoused warmly the cause of clinical teaching, as appears

from sundry minutes of their proceedings in favour of the University professors and their students. In consequence, Rutherford was joined ere long by some of his colleagues; and in 1756, as we find from the infirmary records, clinical instruction was given by Rutherford; Whytt, Professor of Theory of Physic; Cullen, then Professor of Chemistry; and Monro himself.

The coalition of four such men in training up a medical school from its infancy was a mighty element of success. Priceless, too, was its own organisation, as fashioned by the genius of Monro. What, then, was the success of this new University School of Medicine?

Monro himself began his lectures on anatomy and surgery in 1720 with 57 pupils, and increased them to 182 in 1746. It is impossible to arrive at a knowledge of the number of medical students generally for many years later. The earliest register, in 1772, when it was far from being complete, makes the matriculated medical students 269. In 1791, when Black taught chemistry, John Hope botany, James Gregory practice of physic, Monro *secundus* anatomy, Francis Home *materia medica*, Andrew Duncan *senior* theory of physic, and Alexander Hamilton midwifery, the list had risen to 430; and at the close of the century it exceeded 500. By this time, the youth of England, Ireland, and the British colonies flocked to Edinburgh to fill the classrooms of Monro, Black, Gregory, and their colleagues and successors. Of 383 medical graduates in the ten years following 1790, only 71, or scarcely a fifth, were Scotsmen, 102 were English, 113 Irish, and 35 from the West Indies. Of the remainder, 27 were from the United States, and chiefly Virginians, 15 Canadians, 7 Swiss, 7 Portuguese, 4 French, probably of refugee families; and the tale is made up with a Prussian and a Dutchman, whose patronymics, however, unmistakably betray British blood.

After the beginning of the present century, still farther progress was made; so that, in 1815, the medical matriculations were 929; in 1824, 939; and, till 1830, very close upon 900 every year. Subsequently, a succession of adverse events, betokening, however, the prosperity of the nation, conspired to bring down this great school population. It was inevitable that the University Medical School should feel the influence of the establishment, on its own model, of University College and King's College in London, the London University, and the Colleges of the Queen's University in Ireland, of the gradual advancement of the Universities of the United States, and of the great demand made by the rapidly increasing colonies and commerce on the supply of the half educated youth of the mother country. Thus it fell, that in thirty years more the Medical School sunk by degrees to about 500. A great change in 1861, made in the plan and conditions of graduation through the action of the Universities' Parliamentary Commission of 1858, brought about a further temporary fall, till the students in 1868 numbered only 445. But the elasticity of the University soon put the stamp of wisdom on the measures of the Commissioners. A steady annual increase of from 50 to 90 has restored the list to the high standard between 1815 and 1830, till at last in the present year the medical students number 898.

Graduation has marched, on the whole, in a line with matriculation—in the number, at least, of the recipients. During the five years preceding 1831, the graduates in medicine were 575, or, on an average, 115 annually. Of these, 187 were from Scotland, 168 from England, and 175 from Ireland, showing a nearly equal resort from the three countries of the kingdom; and the remainder was made up of 34 Colonists and 11 foreigners. At that time, the University gave no other medical degree but that of doctor. But, since 1861, the candidate who aims at the doctorate must pass through the stage of bachelor of medicine at least two years previously; and hitherto about a third only of bachelors go on to the higher degree. During the last five years, ending with 1874, the bachelors have been taken by 358 candidates, or 72 annually on an average; and 113, or 23 annually, have been made doctors of medicine. Their relative nationalities show a remarkable change during the last forty-five years in the sources whence the graduates, and consequently the students, have been derived. Of 113 doctors, 53 are from Scotland, 47 from England, 9 from the Colonies, 3 from foreign parts, and 1 from Ireland. Of 358 bachelors, 154 are Scotch, 126 English, 62 Colonists, 10 foreigners, and 6 Irish. The proportion of English to Scotch remains nearly the same as formerly. Colonial men have increased threefold. But the supply from Ireland has been almost dried up; for, in the ratio of the earlier period, the Irish bachelors, instead of 6, should have been 150, and the doctors 50, instead of 1.*

So far as the relations of Ireland to the Medical School of Edinburgh are concerned, it has accomplished the isolation aimed at by the Irish

* Yesterday were graduated, in all degrees, 35 Scotch, 47 English, 2 Irish, 14 Colonial, and 2 Foreign candidates.

people in weightier matters. In medical education, Home-Rule has been effectually attained. I hope it has been wisely exercised. In that case, Scotland's loss may be Ireland's gain. And, perhaps, the latter will not regret to learn that the loss she has thus occasioned has been fully compensated by the increased afflux to the University of Edinburgh from other quarters. Thus has been reached the old high standard of the period between 1815 and 1830. It is true that, had Ireland still entrusted the medical education of her sons to Scotland, there would have been above 1,100 medical students in Edinburgh, instead of 900. But, as matters actually stand, do not the attractions of its school stand out all the more conspicuously, since the present standard has been reached with scarcely any contribution from the sister island?

Such are the facts we have to deal with. On proceeding to inquire into the causes of this great prosperity, the first to catch the observer's notice is the organisation of the University—very different as it has been from the not less prosperous Universities of England.

The King who granted its charter did not himself, in strict language, found his College. He remitted that honour to the Town Council of the City. The Council naturally created themselves not only patrons, but likewise sole irresponsible governors. They were possibly led to take this step by the knowledge that the more independent universities elsewhere had proved very troublesome neighbours to a meddling municipality; and in their frequent squabbles and encounters, not always bloodless, always in the end won the victory on appeal to their mutual sovereign. The Town Council proved hard taskmasters during the first hundred years of their government. They appointed professors to hold office during pleasure only; and in the troublous times of alternate episcopal and presbyterian persecution they put them up and knocked them down like nine-pins. On one occasion, they delicately intimated that "the affairs of the College were to be treated of in the Council, and the professors sent for *pro re nata*". They interdicted the professors from electing their own representative in the General Assembly of the Church. They fixed the days and place of graduation, appointed even the College porter, and took fatherly charge of the College bell. In all things which concerned the professors, they never lost sight of proverbial Scottish parsimony. Founding, in 1586, one of the arts' professorships, they attached to it a salary equivalent to £3 6s. 8d. English, and 13s. 3d. for board. When, a century later, they founded, in 1685, the three Chairs of Medicine for Sir R. Sibbald, Dr. Pitcairn, and Dr. Halket, they did so "with express condition that they should never have any salary from the town". This was a disagreeable precedent, which their abler, wiser, and more liberal successors of last century scrupulously followed. Perhaps they thought it best that their professors, left to their fees only, should know they had to live by their wits alone. Some people are of that opinion still, and imagine that such provision was one of the sources of success of Monro, Whytt, Cullen, Black, Hope, Gregory, and the other University lights of last century. For my part, I should think a moderate salary scarcely capable of abating the zeal of such men, or of their successors; and, on the whole, the case of a professor with a moderate salary is probably much akin to that of the "frugal swain" in the tragedy of *Douglas*, "whose constant care was to increase his store".

Setting aside this peculiarity of unendowed chairs, as probably not requiring to be taken into account among the causes of prosperity, we see nothing yet in the organisation of the University to give it elasticity and progress. Nor had it yet come forth from obscure mediocrity. But early in last century, the genius of Monro and the high place in public esteem, at home and abroad, attained by him and his coadjutors, not medical alone, but also in all the other faculties, imposed a powerful check on town council interferences, to which greatly contributed the superiority of Lord Provost Drummond over municipal prejudices and jealousies, and his reliance on those who were now allowed to take charge of their own University affairs. So completely was University government thus thrown for full one hundred years into the hands of the principal and professors, at last really deserving their title of "Academic Senate", that within this body it came to be thought and assumed, that they were in University business legally the council and executive. But in 1825 they were painfully roused from this delightful dream; and two costly lawsuits proved that the town council still possessed autocratic authority in all things; and that the Senatus had scarcely any power whatever, except that of doing each man his special duty to his students. Softened by time, my memory shrinks from recalling the heart-burnings, the strife, and the decadence which ensued. Let it suffice, that the highest authorities here and at the seat of government came to see, not too soon, that things could not be allowed to go on so; and, as the result, there has been granted to the "College of King James the Sixth", by Queen and Parliament, a true University constitution. All matters are now ruled within the University itself by the Senatus Academicus as administrators, by a University court as

comptrollers in all affairs, and originators in some, by a general council of some thousand graduates as advisers,* and by Her Majesty in Council for certain specified objects. It is only thirteen years since the new constitution, granted in 1858, was set in free motion. During that time the matriculation list has increased by one-half; in the Medical Faculty it has been doubled; important professorships have been founded and endowed liberally; many good bursaries, scholarships, and prizes have been instituted; students,—and professors too, as I can see,—have been stirred up to renewed zeal; vast improvements have been made by the introduction, wherever it has been attainable, of thorough practical teaching; and this has been rendered possible by a material augmentation of the general University funds through the greater afflux of students, as well as the generosity of donors. Such are the natural results of free, liberal, self-government, duly controlled, however, but within itself.

Under the permissive government by the Senatus Academicus during last century, the Medical Faculty was organised by Monro and his colleagues or their immediate successors, as already partly indicated. Their first principle of action, borrowed from Continental schools, was to assign special subjects to special professors. Of all the schools in the British dominions theirs was the first to discover this now very obvious element of success. At first, indeed, they could not carry it into every branch of medical tuition. But this has been done gradually since with all but clinical medicine. Clinical medicine was systematically taught almost a century before it was similarly taught anywhere else in this country. Soon after its introduction it was entrusted to four of the medical professors; and such continues to be the practice in the present day,—three or four teaching every academic year. There were also, at first, other exceptions, the most instructive of which was the conjunction of surgery with anatomy. The first Monro, his son, and his grandson, whose singular fortune it was to fill the Chair of Anatomy in succession for a hundred and twenty-six years, kept fast hold of surgery also till near the close of that long period. A useful lesson is conveyed in the fact, that, until after the foundation of a chair of surgery in 1831, the University was almost unknown as a surgical school. Very different was the fortune of physiology. That subject was detached in 1724, alike from anatomy and from the practice of physic; and, as the result, physiology has flourished, and flourishes more and more in the hands of a succession of able professors. We know, on the other hand, what has been its fate in other British schools, where, till only a few years ago, it was linked with the great subject of anatomy,—as if that were not ample enough, singly, to strain the energy of the ablest instructor.

Another ruling principle with the originators of this Medical School was, that they should admit no slovenly half-measures into their school-work. Having chosen for their system of teaching, not the detached tutorial method of the English Universities, but the delivery of lectures by professors to the students in mass, they determined that each subject should be taught in all its details by full courses of lectures of five months' duration, which were afterwards, in the progress of medical knowledge, extended to six months about the close of their century. Thus it came about that, when I studied medicine from 1815 to 1819, the winter session began with the last week of October, and lasted till the end of April. Several professors disposed of their whole subjects in a hundred and twenty lectures; the professors of anatomy and of the practice of physic got through two-thirds of their materials, varying the omitted subjects in alternate years; and Dr. Hope, by making use of Saturdays and occasionally a second hour on other days, went over the whole chemistry of the period in a hundred and thirty-six lectures, so as to leave very little not illustrated by his luminous discourse and splendid never-failing experiments. A different opinion is now in vogue from what was then entertained of the utility of such full courses of oral instructions; and pressure on the University has led to the reduction of the winter session again to five months—with what advantage, I confess I have not been able to discover.

During last century, medical education consisted almost entirely of an elaborate system of lecturing. We may form some idea of the

* In an account, otherwise correct, which has been given of the University of Edinburgh, in last Saturday's BRITISH MEDICAL JOURNAL, the writer has unfairly represented the privileges of the General University Council, and the administration of the University Court in relation to the Council. In recounting the Council's privileges, he strangely omits one, to which most people would attach some value—that of choosing a Member of Parliament; and in stating their right to be consulted by the Court as to its measures for "improving the arrangements of the University", he adds that "this rule is generally honoured in the breach". The Court of eight members has had from the beginning the aid of one or more of them being of the first rank at the bar or on the bench, who are not very likely to have winked at such illegality; and I can testify, as a member since the commencement to the present day, that after the first year or two of experience of its novel functions, the Court has never failed to consult the General Council in all matters which by statute must be referred to them.

labour bestowed on it, as well as the high appreciation of it at the time, from many MSS. still extant—manuscripts so detailed, that they must have been written almost *verbatim*, and, indeed, have been mistaken by inexperienced book-hunters for originals by the professors themselves. Thus an enormous folio volume of Cullen's *Lectures on the Practice of Physic in 1775*, in our University library, would make three goodly octavo volumes, of five hundred pages each, of the close class-book print of the present day. One copy I have seen consists of a hundred and forty-six lectures.

But it is not a little strange that the able professors of that century seem not to have thought of helping their oral instruction by practical teaching. Anatomy, indeed, was made the subject of practical teaching; how soon, I have not been able to discover. But even so far down as 1815 it was by no means an universal study; and, though it became so not long after that date, it was not made an imperative part of education for the medical degree till 1832. Nothing else was taught practically. Botany, for example, was not taught thus till Dr. Graham introduced field-instruction on his succeeding Dr. Rutherford in 1820. Nor at that time was even chemistry taught otherwise than by lectures. In 1820, indeed, there was no school for practical chemistry for students in the British islands; so that in the same year I had to resort to Paris, and Dr. Edward Turner to Göttingen, to study chemical analysis. Matters are differently circumstanced now-a-days. Every branch of medicine taught in the University, save one, is now fully taught by the practical method; and those who desire to cultivate any one of them as the subject of special research may easily command the opportunity. The sole exception is my own subject—*materia medica*—one branch of which, pharmacy, eminently lends itself to practical teaching. I should have taken advantage of this circumstance long ago, had not the large accommodation required been absolutely unattainable in the present University buildings; but I have taken care that for this purpose ample provision shall be made in our new Medical College, for myself or my successor in office.

It is very difficult to account for the neglect of practical instruction by the great Scottish physicians and professors of last century; but, nevertheless, amidst the enthusiasm in the present day for practical instead of systematic instruction, let this lesson—handed down to us by the experience of the medical luminaries of the last age—never be forgotten by us, though it seems to be put out of sight by many; that their system of tuition bred physicians of great name in British medicine, and spread able practitioners over the whole British dominions, who, among other conspicuous incidents in their lives, filled many of the highest medical offices in the State, and often took, in medical practice, the foremost place not only in the great metropolis, but likewise everywhere in the large county towns of England and Ireland, as well as in Scotland.

From the commencement of the University Medical School till after the close of the first quarter of the present century, no measures were taken for securing regularity of attendance on the part of students. For that the professors trusted to the good sense of the students themselves. Nor were they trusted in vain. I am confident at least that, when I was one of them, attendance was quite as regular as now under the strictest regulations which could be well enforced at a populous school of gentlemen. Neither then nor now can those who are idly disposed be forced to attend. I am even afraid that the present regulation may call forth the natural contumaciousness of not a few youthful minds, so familiar with the Horatian maxim, "*Nititur in vitia semper*", as to consider it a necessity which must be obeyed, and who are restive under a rule for no other reason than that it is the rule. On the other hand, the present practice, though it may not check absenteeism, certainly detects it, and was expressly adopted to supply the want of such a test. A few years before 1830, one of the London licensing boards complained that men from England, after matriculating and entering their names in one or more class-books, returned home at once, and never looked upon the University again, producing their mere ticket of admission as their qualification, and, indeed, the only proof of attendance ever issued by their teachers. To end this malpractice, monthly signature was required. But the same London board subsequently urged that certificates of due attendance at each class should be given; to effect which, the regulation now in force, to ascertain the student's presence in each class very many times during the session, was passed in 1832—in my opinion, unfortunately. But occasional signature, to ascertain residence, was quite right, because some check of the kind was called for in consequence of another custom adopted by the founders of the University School, and adhered to ever since. This was, that there should be no rule of residence in College halls for the students. At the foundation of the University, when it possessed a Faculty of Arts and Philosophy only, College residence was evidently intended by its patrons; for in the following year, 1583, the

Town Council records bear that the Town Council "orders the chambers to be set at forty shillings" (Scotch, equal to about as many pence English), "and two to be in a bed". The scheme was a very humble one, suited to the scanty means for carrying it through; for it ought to be mentioned that, although King James, when founding his College, undertook to endow it, the promise was not kept by the parsimonious monarch. It is well that the poverty of the city prevented the continuance and extension of the rule of residence in College; for, apart from the fact that university education is attainable at less cost without it, grave doubts may be entertained whether harm, rather than good, may not come of gathering in college halls crowds of young men at the age of those who are undergoing their professional training. A few years ago, indeed, an attempt was made to establish a college hall; the projectors being moved thereto partly by the knowledge that some anxious parents, in sending their sons from home, hesitate to turn them adrift under nothing but their own guidance, and partly by the desirableness of providing home discipline and superintendence for the lazy, the giddy, and the evil-disposed. But the scheme failed; and it fairly admits of question whether residence in the families of medical men of the city, who receive and guide students of the University in their studies, is not far better provision for troublesome youths of these several denominations.

For enforcing diligence on the part of students, the only surety possessed for a long time in this University was examination.

Whether the early medical professors held class-examinations, I have not been able to discover. By some, however, though not by all, oral examinations were held in their classes early in the present century. The practice was easy then, because the paucity of subjects of study left abundance of free hours for work of this kind. It is otherwise now, and ever since the subjects of separate lectures have been doubled in number. The difficulty thus arising is not taken into account by many who inconsiderately urge that all teachers should practise frequent oral examinations. For some years, examination by written papers has been substituted, and practised with apparent success in all the medical classes. This method has the advantage of testing all who undergo the trial with far less consumption of their time; but it cannot be practised so often as some reformers would have it, who forget, or may not know, that the labour and consumption of time in examining the written papers of a large class is enormous, and a most ungrateful task.

For the degree examinations, when the faculty of medicine here was short-handed, examiners were supplied chiefly by the Royal College of Physicians. But, as soon as the professorial staff was complete, the professors themselves became for a long period the sole examiners. In 1861, the Universities' Commissioners, with the hearty approbation of the examining body, added three extra-university examiners; and last year, by recommendation of the medical faculty, the number was raised to thirteen; so that there may be an extra-academical examiner, qualified, like each professor, specially for each subject, and two examiners constantly present at each act of examination. In the old way, until the present century was well advanced, the rule was that one professor, in presence of the whole faculty of medicine, occupied about an hour in examining a candidate upon the anatomy and physiology of a particular organ, its diseases, their diagnosis and treatment, and the chemistry and pharmacy of some of the remedies mentioned; and then each of his colleagues put a few excursive questions on other topics, not necessarily belonging to his own professorship. If I may judge from my single experience as a candidate in 1819, these examinations were a true and searching test of competence and incompetence, of ignorance and knowledge, and of talent too. It had the advantage that all the judges heard all the examinations. I shall never forget the mastery and fair examination of Dr. James Gregory as examiner-in-chief. The subsequent short skirmishing by the other professors would probably amuse you, had I time for such details—more, probably, than it did me at the time—until the last question of all. I thought myself pretty safe with Dr. Rutherford on botany, as it was a favourite pursuit of mine. But he, thinking, I am sure, that success had made me overconfident, threw botany aside, and determined to cool my courage with a question very much out of the way of a tyro. He asked me the symptoms of a calculus passing down the ureter from the kidney. A few days earlier, and he would have attained his wish. A fortnight previously, however, a well marked case of the kind had passed through my hands as resident-physician's assistant in the Royal Infirmary, and interested me greatly; and so there was neither difficulty nor merit in both mortifying and satisfying Dr. Rutherford.

This old method of examination has been completely abandoned, as I understand, at every University in the kingdom, and in the University of Edinburgh has been given up for at least forty-five years in favour of the plan now followed, according to which every candidate

is examined specially on every branch of medicine by one or more—in Edinburgh by two—examiners specially qualified in one branch. Although I was actively instrumental in carrying through and perfecting the change, I do not feel confident that it has substituted a better test. While the old method is apt to degenerate in careless hands into superficiality, the newer way is apt to dilate into too great vigour in the hands of an examiner who may appreciate too highly the relative importance of his own branch of culture. It is also an objection to the latter mode that it prevents every examiner from hearing what the candidate has to say on every subject but one; viz., his own. At least double the time, too, is consumed as was in the old way; and I am afraid the candidate is liable to be oppressed with too minute and too numerous examinations, and, which is worse, with too much and too frequent preparation for them. I entertain no doubt, however, that either method is a full and fair test when in the hands of able, impartial, and faithful examiners.

I have thus put before you the leading particulars in the history of the medical department of this University during the last 150 years. I now beg to draw your attention to the inquiry proposed at the outset: Whether this narrative may not yield some useful lessons to the many who, with praiseworthy zeal, have lately proposed to alter and innovate largely in medical education and medical examinations.

Every one, I hope, will acknowledge it to be only justice and common sense, that all reforms of the kind should bear some relation and due respect to success. I submit that the Edinburgh school of medicine—as proved alike by the great afflux of students, and by the multitude of men of mark trained in it who have held a high professional place in all parts, and in all public medical offices, in the British dominions—has thus been so eminently successful, that its system deserves great consideration; perhaps for guiding other schools, but certainly in dealing with itself. Nevertheless, there are some essential parts of that system, which the opinions of some recent reformers, if acted on, would abrogate or dangerously injure.

Take, for example, the duration of the courses of lectures. The ordinance of the Universities' Commissioners of 1860, on medical education, which by statute has the force of an Act of Parliament, requires that the courses of instruction during the winter session shall extend to at least one hundred lectures, and during the much shorter summer session to fifty. But a late eminent authority, whose name, were I to mention it, would be received with universal high respect in his department, used to sneer at this regulation whenever it was spoken of, and held up his hands in horror at the idea of the poor student being compelled to listen to one hundred lectures in a session. Other men, taking more precise views of this subject, have urged that such full courses may be reduced to fifty, as sufficient at least for any branch except anatomy. It has even been propounded in print, that some branches of medical instruction, which in Edinburgh are taught in one hundred lectures in winter, may be advantageously disposed of in thirty-five summer lectures in London and the English county schools. At length, one confident writer in a weekly journal made the discovery, that it might be better if certain of these subjects were not lectured on at all; and in one sense of the question I am disposed to agree with him.

It is true that these thorough reformers go further, and contemplate the substitution of practical teaching and home study for lectures. Reading, however, at the student's home forms an essential ingredient equally of both systems of tuition. It is scarcely necessary to say, that every student who means to profit fully by a course of lectures, possesses works of reference for enforcing, recalling, and expanding what he hears in the lecture-room. But reading cannot be advantageously substituted altogether for what he hears. The poet's maxim,

*"Segnius irritant animum demissa per aures
Quam quæ sunt oculis subjecta fidelibus",*

applies to the relative influence of the description, and the exhibition, of visible things or events, not to the respective effect of hearing and of reading about them. On the contrary, the theatre, the pulpit, and the bar prove familiarly to all how impressive are the words of a speaker compared with the words in a book. There is a magic in the human voice, a contagion in the listening attitude of a surrounding crowd, which command and intensify attention. A speaker may thus stir up enthusiasm in all who hear him; an author never, except in those endowed with unusual sensibility. The few who possess the attribute of being thus impressed by reading owe it to a rare idiosyncrasy. But idiosyncrasy cannot be called in to countervail the general experience of mankind in all ages of civilisation.

Moreover, in teaching the medical sciences, demonstration to the eye may generally be employed to aid demonstration through the ear. Our predecessors of last century seem not to have been so fully aware of this as we ourselves are. Anatomy, chemistry, botany, and natural history were indeed taught by them with that aid. But during my four-years'

course of study the professor of the practice of physic did not so much as once make use of a specimen, a drawing, a diagram, or a black board. So was it with his colleagues of clinical medicine, of physiology and pathology, and even *materia medica*. It was not till my predecessor, Dr. Duncan, succeeded to this chair in 1821, that demonstration by specimens and experiment was added to lecturing. But now, in every branch of medical instruction, the eye is appealed to as well as the ear. Wisdom is let in at both entrances; and at small additional expense of time, and no pecuniary cost to the student.

In order that lectures may be attractive, however, they cannot be very brief, not so brief as many reformers of the present day would have them. When too much curtailed, they must consist mainly of bald principles, and naked facts enunciated with the scantiest garnishing; and thus all zest is lost. No observant lecturer can fail to notice that, so long as he is dealing with abstract principles, general statements, bare descriptions, and dry facts slightly associated, it is difficult to secure the attention of his students. It is quite different when his discourse is argumentative, when he supports his propositions by suitable instances, when his description of objects is made clearly diagnostic by comparison with others, and, above all, when he is under no restraint in the copiousness of illustration by examples. The attention of his hearers is then fixed; and if he can prop up a conclusion by a well-chosen telling case of his own, all heads are raised, and all ears on the alert to take in his information. This blending of general statements with richness of illustration it was which constituted the charm of some of the lecturers in my younger days, and eminently of Dr. James Gregory, Professor of the Practice of Physic. Gregory was the most captivating lecturer I ever heard. His course of a hundred and twenty lectures was attended to the last day with great regularity by classes of from three hundred to three hundred and sixty students. I never heard any one complain that they were tedious; and I am convinced that his success was chiefly owing to the tact with which he freely used illustrations drawn from the exuberant store of his own vast experience. Every one acquainted with the history of British medicine during the present century, knows how powerful an impression Gregory made on medical practice throughout the whole British dominions. Right or wrong, he was the apostle of blood-letting, which stood the test of half a century's experience. The sway of his doctrines was owing entirely to his lectures, and to the publications of his pupils; for he himself never published on any branch of the practice of medicine. But would Gregory have found scope for his rare talent in the beau-ideal course of fifty or eighty lectures—the hobby of present-day reformers? Let Gregory himself supply the answer. In his annual course of a hundred and twenty lectures he overtook only two-thirds of his subject.

Those teachers and guardians of youth who lament, and those students who complain, that it is found irksome to attend lectures at the schools where the very short courses of instruction I refer to have been adopted, will now probably understand the cause. I know some teachers at these schools who have themselves made the discovery. It will probably be also understood, why, when tuition by systematic lectures has been made so very barren on any subject, I agree with those most radical of all reformers that it is well to have on that subject no systematic lectures at all.

But I must keep in mind that the reformers, with whom I thus disagree so widely, propose to substitute practical instruction for full systematic courses of lectures. Their theory of medical education, short, systematic, and full practical instruction, is a favourite with many at the present time. Especially was it much in favour with some prominent members of the General Medical Council, while I was their colleague; and, if I mistake not, it has met with favour also from not a few members of the British Medical Association. This is a matter as to which there exists considerable misunderstanding and some risk of error.

Practical instruction cannot take the place of systematic instruction. For, in the first place, the latter is an essential preliminary to the former; and, secondly, the student's period of study is much too short for his acquiring an extensive acquaintance with the great leading details of all the required subjects by practical study.

Systematic instruction is an essential preparation for practical study. This no man, I presume, will deny. But the more thorough the systematic instruction, the better the preparation. Take anatomy for example. Practical anatomy is studied longer and more thoroughly by the general mass of students now than it was fifty years ago. But I have never understood that the systematic teaching of it has been curtailed on that account at any of the great medical schools. On the contrary, in consequence of the extension of anatomical science, what is called "Anatomical Demonstrations"—which formerly meant daily demonstration by the professor or his "demonstrator", of what had been done during the day by each dissector in the practical rooms—has been con-

verted at several schools into an additional course of systematic lectures on anatomy, carried on at a second hour.

How far ought other branches of medical education to be treated differently? What of chemistry, for instance, the importance of which to medical science and medical practice is becoming more and more apparent every year? Chemistry was the next science, after anatomy, which was taught effectively in this University in the practical way. For many years, Dr. Hope offered his students no opportunity of practical instruction. At length, in 1823, the teaching of practical chemistry was begun by his assistant, Dr. Anderson; it has been improved, and ever since continued, by Anderson's successors in office; it has been long adopted by every extra-academical lecturer on chemistry here; and it was considered by the Universities' Commissioners of such value to the medical student that it was added by them, in their education ordinance of 1860, to the curriculum of study for medical degrees. Dr. Hope, I have said, gave no opportunity for practical study. But, as I well know from personal experience, his course of a hundred and thirty-six lectures on systematic chemistry was so complete, and so fully illustrated by never-failing experiments, that no diligent student ought to have found difficulty in taking up any branch of the subject practically, after learning the use and the handling of instruments and apparatus. I found none at least, when subsequently, at Paris, I embarked in what were then the highest objects of chemical research, the analysis of the gases, the proximate analysis of vegetable poisons and medicines, and the elementary analysis of nitrogenous organic bodies. No such thorough preparation, however, could have been attained by the brief systematic course of sixty or eighty lectures, proposed by the practically-minded of the present day. The introduction of practical chemistry into the University qualifications for medical degrees was not the cause of the reduction of our winter session from six to five months; and I am much mistaken if that change has not been found to cramp the systematic instruction given by the professor of chemistry, to limit unduly the branches included in it, and to curtail the experimental illustrations of those which he is able to overtake.

A third branch of medicine in which practical study is imperative on candidates for graduation in the University of Edinburgh is pharmacy. It is enjoined to be taken at the laboratory of an hospital, dispensary, or private practitioner; and it cannot now be studied in the University. But provision will soon be made for supplying that defect; and when it is made, the course of lectures on *materia medica* may be relieved and shortened by being confined chiefly to therapeutics.

A fourth branch is midwifery, in which practical instruction may be taken at an hospital or dispensary, or by attending the private practice of a medical practitioner.

But, besides all these subjects, botany, physiology, pathology, and natural history have been successively made subjects of practical instruction by their respective professors; in several of its branches, surgery, too, is now taught practically; and there is no reason why medical jurisprudence should not be taught in the like manner. Great success has attended such instruction in every branch of medicine in which it has been undertaken, in none more than in physiology. Hence some have proposed to add several of these newer practical studies to the imperative list, especially physiology and pathology.

But now we meet in the face a formidable question. Trusting to found on the theory of practical education a mode of escape from one horn of a dilemma, are we not about to rush on another precisely similar? Can the usual time-limit of medical study admit of such diversified practical training? Systematic instruction cannot be given up, were it merely as preliminary to practical instruction; and it cannot be given in short space. Whatever extent of it be held to be necessary, no part of it can be curtailed, without practical instruction being extended to supply the loss. But for every detail thus withdrawn from the former, treble or even quadruple the time is required to teach it by the latter method. This will be acknowledged by all who are conversant with both—by teacher as well as by pupil. In the same space of time the lecturer can go over in his systematic course, even with the addition of demonstrations and experiments, three or four times the amount of details which the student can overtake in any plan of practical study. It is a mere hallucination, then, to suppose that the latter can materially take the place of systematic lectures. In every way in which we look at the question with the eye of experience, it will be seen that, in a sound system of medical instruction, systematic teaching must be the principal means, and practical teaching ancillary only. Care must, therefore, be taken, that the practical method be not extended beyond due bounds.

These considerations lead me to observe, that many labour under an exaggerated and mistaken idea of the extent to which the medical sciences can be acquired by the practical method in the course of a student's curriculum of study. In fact, some teachers, in consequence

of the same mistake, have erred, I think, as to the kind of practical instruction which they have endeavoured to impart. Some aim at covering a large extent of ground, and thus making the student acquainted practically with a great variety of objects. By this way, the knowledge acquired is necessarily superficial, and consequently fugitive; besides proving not very serviceable afterwards in actual practice. Others, confining the attention to comparatively few objects, teach familiarity with instruments and other means of research, the principles of scientific investigation, and skill and invention in inquiry. The information so gained, though limited as to its objects, is precise, profound, lasting, and such as enables the pupils to study any other similar subject with the same accuracy and success. The one method crams the student with surface knowledge, much of which he soon forgets. The other trains him to research, and teaches him, in short, how best to acquire knowledge for himself. The latter surely is the real object of school instruction; but it is apt to be lost sight of by modern theorists, who seem to think that the purpose of education at a medical school is to furnish the student with all the professional knowledge he needs, and to turn him out an accomplished physician or surgeon. I wish practical teachers would turn their minds to this question. For my part, I entertain considerable doubts of the practical utility of those courses of practical instruction which aim at embracing a great variety of matter. In regard to practical chemistry, for example, I well remember the time when a highly popular course of the kind was given in this school; and that, on one occasion, I found my four clinical clerks, who had all gone through it, were unable to make a filter, to pour a fluid securely into it, or to boil urine with confidence in a glass tube.

The conclusion I come to on the whole question of medical training is, that the most efficient system consists of full systematic lectures, and auxiliary practical instruction carefully chosen and limited. Such has been the system pursued in the University of Edinburgh; and, hitherto, the University of Edinburgh has been eminently successful.

I have purposely reserved for separate notice the most important of all practical training, clinical study; because it is somewhat peculiarly circumstanced. Clinical teaching ought to comprise lectures, demonstration of actual cases, and examination on them. This constitutes practical instruction auxiliary to the systematic courses on the practice of physic and practice of surgery. But by practical clinical instruction is meant something more; every student ought also to acquire such experience as is gained in the office of clinical clerk in a hospital. Unless he has served as a clinical clerk, or in a similar capacity at a dispensary, or with a private practitioner, so as to have been brought into close contact with cases of disease, and in a position of some responsibility for the knowledge and treatment, he is not yet prepared for entering upon independent medical practice.

Herein lay a great mistake of our predecessors. The majority of the graduates and licentiates were sent forth into independent practice, possessing no more practical acquaintance with disease than was got from clinical lectures; and, indeed, from most schools in the kingdom, with no more than they could pick up for themselves by what was aptly called "walking the hospitals"; that is, looking on as they best could, without lectures, bedside demonstrations, examination on cases, or any other help or guidance whatsoever. But now the rule, at least at this University, is for the graduate, if not already trained as clinical clerk, to seek that or some similar opportunity of thorough practical study, before taking advantage of his newly acquired legal right to settle in independent practice.

If this rule be so general—almost, indeed, universal—as I suppose it to be, here, at least, there is perhaps no call to enforce it by educational statute; and there is the serious objection to a statutory rule, that it is one very difficult to define and enforce without inflicting frequent hardships, owing to the impediment which is sure to start up in the way of all important additions to medical study, the limit of time allowable for a student's education. But if this, the most valuable of all his practical training, is to be demanded of all medical aspirants, it may be effected in one of two ways.

The first mode is to induce the student to commence his professional studies, not with the month of October or November, as is usual, but in the beginning of the previous May, so as to take his botany and natural history before commencing his statutory four years' curriculum. It is gratifying to find that very many of the students of the University of Edinburgh are now doing so of their own accord; if they could add to these chemistry, in the preceding winter of preliminary education, so much the better. The four usual "*Anni Medici*" would thus escape crowding, and the last six months might be left nearly clear for a clinical clerkship. This clear half year could be obtained with certainty, if the present courses of lectures were better co-ordinated. Some are too long; several are too short; and at least two, anatomy

and practice of physic, are much too short. But by altering the sessions, from a winter period of five or six months and a summer period of three months, to two equal periods of four months, with an interval of one month for holidays or graduation examinations, I am convinced that almost all our courses of lectures would be materially improved, none injured, and the concluding six months left free for clinical clerkships, or other practical training of the same kind.

Under the present system four years of study are rather too short a period; under a different system they would generally suffice. But it will be said, why not lengthen the period of study at once to five years? This measure was a favourite one in the General Medical Council during the first years of its life, but no more has been heard of it since the following objection was mentioned. The additional year cannot be subtracted from the years for preliminary education, but must be added to the four professional years, and, therefore, license or graduation must be postponed to the age of twenty-two. But if a man may join the church, the bar, or the senate at twenty-one, why not the profession of medicine too, especially as many years must elapse before he can attain to remunerative practice? Moreover, a careful examination of the books of this University prove that, although of two hundred graduates in two successive years, four-fifths took at least five years of medical study, and graduated at a greater age than twenty-one, the remaining fifth, who graduated at twenty-one after four years of study, comprised three-fourths of those who passed their trials with distinction. Why then should these forty young men be prevented from beginning professional life early, and thus be defrauded of the advantages of the talent with which they had been blessed by Providence? And why in the profession of medicine alone?

Another way of securing the advantage of some, such practical study as a clinical clerkship affords, is to require it to be taken, as I have said that a great proportion of the students of the Edinburgh school actually do take it, immediately after graduation, or license, and before settling in practice for themselves. In that case, let it precede registration; for which purpose, remove the present statutory prohibition against entering certain subordinate offices before being registered.

But it may be said that there ought also to be a further examination. By all means. I think there is an insane rage for examinations at the present time; but there can be no great objection to a clinical examination at any period of life. Every new case of disease which a medical practitioner has to treat is a clinical examination to him. Of course, a young man who has just passed through the required training, and who professes himself competent to enter upon independent practice, may well be called on to prove his competency by examination—that is, by exemplifying what his practice is to be.

Such examinations might be fitly conducted by any of the present examining boards; or, if a Government pass be advisable, as many believe, to serve as a check on these boards, and for a greater surety to the public, there is here offered a simple and effectual opportunity for interposing a separate and independent board, to secure the sole object for which a conjunct board, or Government board—which are one and the same thing—can be reasonably demanded; viz., to see that a young man is competent to enter upon the practice of medicine independently on his own account.

Thus I approach the last topic with which I propose to occupy your attention at the present time. It is one about which the general sense of this Association and my humble opinion may hitherto have been not much in accord; but I entertain hopes that the case may prove different before we part.

For many years past there has been an outcry in our profession, and murmuring even amongst the general public, against a multiplicity, or even a plurality, of examining boards for licensing entrants into the medical profession. Many have seen, as they think, such evils in that system as even to have advocated the establishment of a single board, to supersede, or at least to override, all those now existing. Out of this feeling has been engendered the scheme of a conjunct board, or boards, to be made up of examiners selected from the existing boards, and whose province it should be to examine all candidates whomsoever, and necessarily either to supersede existing examinations, or to repeat and multiply them.

At first, measures of this kind were very popular—very much so with the General Medical Council, and not less so, I believe, with some men of note, members of the British Medical Association. For my part, however, I very early took quite a different view of the proposed revolution. There was no opportunity of stating in the General Council what could be said against it before my retirement from that body; but I have raised my warning voice since then in several other Councils, and also in correspondence. Whether from this cause, or more probably through the influence of calm reflection, which time has allowed to all public bodies concerned, the result has been that every

licensing board in Scotland is now opposed to the change; and in the two other divisions of the kingdom, where all boards seemed about to rush into one another's arms, for the purpose of being conglomerated and individually extinguished, zeal has of late been greatly cooled in this direction, and there has arisen a prudent hesitation in coming to closer quarters. Let us now, then, look a little into the whole matter, with the aid of the light which time has thrown upon it.

At a period not very distant, some licensing examining boards were too short-handed; others were undoubtedly too facile. Corruption even was charged; with what justice it is needless now to inquire. To correct these faults was one of the well understood objects of the Medical Act of 1858, and one of the duties of the Medical Council which that Act has founded. Has the Act been found to fall short of its purpose in this particular? Certainly not. The Council may have set about the work of reforming the examinations rather slowly; but they are not to be blamed on that account. They had much besides on their hands. They were too numerous to deliberate promptly. It was well that they should gain public confidence before approaching the most delicate of their tasks. Their powers were thought not clear enough, nor sufficiently direct for vigorous action: nevertheless, much good has been done in several directions, and now the Council appear to have set about the duty of controlling examining boards with determination. It is well that they have done so in the present crisis, for the results will supply, if I mistake not, valuable advice in the present conjuncture. I have gone carefully over the reports of the able inspectors who have finished this year's duty, and I find that they pronounce various examinations to be all but faultless; that they point out an important fault in the examination of one of the most powerful medical bodies in the kingdom—a fault which, I doubt not, will be at once mended; and that they declare one board so far behind in duty, that both the examination and the board of examiners must be remodelled.

The Medical Council, therefore, now know that they can command the services of inspectors who will report to them the truth without fear or favour. The Council are also already made aware of insufficiency existing in some quarters; but have they power enough to correct? Hitherto they have carried all their other measures by persuasion merely; but if in the present matter persuasion fail, have they the power to employ force? Such power is given by statute, but it is round-about. A charge must be laid against the accused board before the Privy Council, who may or may not confirm it, and enforce the remedy. The statute has been thought in this respect too feeble; it must not, however, be treated as such until it is tested by actual trial, and the trial has not yet been made. If the statutory power prove too feeble when fairly tried—for example, against a powerful recalcitrant adversary—I see no reason why the Medical Council should not receive direct power to enforce its mandate, subject to appeal to the Privy Council. Such appeals are apt, indeed, to be costly; but, perhaps, so much the better: there will be no appeal by a board not quite satisfied of being in the right. But the Medical Council and the public now know also that no small number of the examining boards of the country are without fault; therefore they can point to models from which defective boards may take example—nay, must do so. Therefore, too, they may say to Government and the public, and the members of this Association who have taken a strong and laudable interest in the reform of examinations, "In regard to the former bodies, there is no call for any legislative interference; in respect to others, we know what is to be done with them; let us try whether we can do it with the powers already entrusted to us; it is probable that no further legislative aid will be required." This is a plain and reasonable policy. Surely it is right that the Medical Council be not disturbed in their present efforts, and perpetually paralysed at the opening of every parliamentary session by new medical bills, founded on mere theory, proposing to revolutionise and overturn what has gradually arisen as adapting itself to the wants and wishes of the nation.

One condition, however, must be admitted to be indispensable. As every physician ought to be educated in surgery, and every surgeon in physic, so every board, which simply qualifies a man for registration, must possess the power and the means of examining on all required subjects, medical and surgical. The Universities, with few exceptions, enjoy this advantage. The three corporate Colleges in Scotland have found no difficulty in acquiring it by combining together. In London, however, the medical corporations have hitherto been unable to unite, or mutually lend examiners, for reasons the cogency of which it is not easy to comprehend, but which assuredly ought to be put an end to one way or another. If these bodies cannot combine, why should they not obtain by charter the right to do, each of them, that which the Edinburgh University lately accomplished, without either difficulty or delay, under its new constitution granted by Parliament

in 1858? It possessed twelve professors specially qualified to examine, each on a special subject, and, in addition, three examiners from without who examined on any of the subjects. But the professors saw the advantage of having twelve non-professional examiners, specially qualified like themselves on each of the twelve subjects of examination, to do duty *pari passu* with themselves. In two or three months the legal forms were gone through, and twelve first-class men obtained—five in Edinburgh, two in the Scottish counties, five in England, and three of these in London. You will now understand what I meant by the "elasticity" of this University. There is, in fact, scarcely any right and wise thing wanted which may not be attained under its constitution, provided the cost be forthcoming; and that, too, is seldom long in being supplied. Why should not each of the important Royal Colleges of England possess, for their efficiency, the same power with the University of Edinburgh of borrowing all round them, completing their examinations, and each qualifying singly for admission to the *Register* in the fullest sense of a practitioner entitled to practise according to his education? Why not, indeed, but for mutual jealousy, and the antiquated fondness for keeping up a bygone distinction—a distinction which really exists no longer, except for the limited few who stand at the top of each branch of our profession? Nevertheless, these bodies are said to countenance at the same time a complicated project of conjunction with themselves, and, unhappily, for all their sisters, too, and for all the Universities likewise, which threatens to imperil the prosperity of all, and the very existence of several of them: this is the erection of a joint examining board for the whole kingdom.

Much has been said in Council and in print in praise of some such measure; but what has been uttered hitherto has been addressed to the general question only; and no one, so far as I am aware, has looked either to details or to consequences. Those who do so will not be much enamoured with it.

A favourite idea with many is, that there should be for entrance into the medical profession what they call a "one-portal system": a single-door scheme, a single examining board, to subject every candidate in the kingdom to one uniform system of examination. In England, no one has yet done more than announce the theory, which, however, has met with a favourable reception. From Ireland there was sent over, a few years ago, a scheme of the kind, which went so far as to recommend an examining board of twelve, and for each a fee of ten guineas a day. There are, however, ten subjects of examination, for each of which we must have two examiners sitting constantly together, or twenty in all.

Let us see what will be the amount of their work. From a return, for which I am indebted to the kindness of Dr. Hawkins, Registrar of the General Council, the annual addition to the *Register* may be taken in round numbers, for the last three years, at 900. To these may be added 60 for those who, going to the colonies, or for other reasons, do not require to register. On calculating the returns of all examinations for two years, as annually published by the General Medical Council, 240 rejections must be added, in order to make up the total number of persons to be annually examined by this single board.

Long experience warrants the conclusion that the oral examination of 1,200 candidates will occupy each examiner at least 400 hours. Experience also teaches that, for a moderate continuity of time, four hours of such monotonous unconstructive occupation are as great a strain upon the human mind as most persons will sustain. Further, large experience shows that the setting, watching, perusing, and judging written examinations, will take each member of the board 18½ days, on the assumption that 200 candidates are set to work at one time; but as this sort of labour is of a more contemplative kind, we may ask each examiner to give eight hours a day to it. Thus his whole annual duty will occupy 124 days; so that, deducting Sundays and half-holiday Saturdays, he will be engaged, if continuously, for five entire months.

As such lengthened absorption of time involves the surrender of almost every other ordinary professional object, and the members of such a board must be men of the first water in their several spheres, to secure public confidence, the proposed remuneration will not prove so unreasonable as it might appear at first. The cost of salaries would thus consequently be £27,000; and secretary, clerks, halls, offices, and examination expenses would certainly raise the whole cost of the single board to £30,000 annually.

What return is to be got for all this inordinate outlay? In the first place, as the scheme charges the cost upon the candidates, each of them will have to pay at least £25 for his examination. The candidate—at least in Scotland and Ireland—will be subjected to the additional expense of travelling a long distance to the seat of examination, which may be presumed to be destined to be London. Thirdly, one-half of them will have to wait for their turn three, four, or five months after being ready for examination on completing their studies. Fourthly, all

this trouble and expense are in addition to what are required for their degree from an university or their license from a corporation. Corporation licentiates, indeed, may be relieved of part of the expense, and all the superfluous annoyance, of a double examination, by adopting the provision of a different joint scheme, to be mentioned presently, which provision would make the single-door examination sufficient for obtaining also the license of any of the incorporated bodies. It will be seen by-and-by whether the Corporations can safely thus give up their own examinations. But, in the meanwhile, what about the Universities? The single-door examination, being the winding up of the General Medical Council's plan of medical study, which is avowedly a minimum, cannot be a major examination; if not also a minimum, it must at least be minor. The examination of the Universities, however, generally is, and must be made at all of them, a major examination; and the Universities cannot give it up for one which is lower. Thus would arise the absurd anomaly, that, after paying smartly in time and study for a high title obtained through a high examination, the University candidate would be called on to undergo another and minor examination, and to pay another large fee for the superfluity. Fifthly, it is unnecessary to add, in the present place, the risk of a single national board of examiners conducting a minor examination over all the kingdom, without rivalry, becoming the fountain of mediocrity in all things medical, in education, in professional qualifications, and in scientific advancement. This result of centralisation and loss of freedom was so luminously put by Mr. Lyon Playfair some years ago in the House of Commons, in his speech on one of the great education questions, that few can have forgotten the deep impression which it made upon the country.

So much for the candidate. The case of the examiner should also be looked to. I presume this single-door or national board, like the General Medical Council, would consist of a half from England and a quarter each from Scotland and Ireland. Hence one-half of the members would have to pass annually almost half the year from home. I have not hitherto met with an examiner of some experience who did not find his duty in no long time irksome. A fortnight of such work four hours a day would try the powers of most men of the stamp of which such a board ought to be composed, the duty is for the examiner so monotonous and so unimproving. Five continuous months of such mental torture would probably land half the examiners in a lunatic asylum.

In order to meet some of these evils, it might perhaps be proposed that the work should be divided between two, three, or any other necessary number of similar boards. The cost would be the same, the labour would be endurable, and the convenience of candidates would be consulted. The expense to candidates, however, would remain the same, as also the vexatious absurdity of a double examination. Moreover, what would become of the one portal theory with more than one board? The written questions might be made the same for all, but not the appraisement of the answer. As for the oral examinations, it is evident that the differences could not be slight, and might be quite as great as now. Changing the examiners, and centralising their place, but leaving a plurality of boards, could tend but little towards uniformity of examinations. Such a scheme, in short, is no one-portal system at all, and it differs in no material respect, even in details, from the scheme of conjunct boards which has been for some time before the General Medical Council and the licensing bodies of the kingdom.

According to that scheme, all the universities and all the corporations are to unite in forming three boards, one for each division of the kingdom. In England, however, the labours of a single board would be intolerable for the examiners; and their sittings would be too protracted for the reasonable convenience of candidates. In Ireland and in Scotland, the duration of duty would be less, yet still too great; and in Scotland the hardship on candidates would be severely felt, because all the school sessions come to an end at the same time, and consequently the candidates of one school, instead of being examined there at once, as now, would have to wait till the other schools set the examining board free. The work of such a conjunct board could not be done to the satisfaction of the schools and the country with less than three or four sets of examiners for England, three for Scotland, and two for Ireland. This so-called conjunct scheme has, therefore, some disjunctions, and it has no alliance to the device of a single board.

In order to escape as far as possible the absurdity of double examinations, one for license or graduation, and another for registration, a complex plan of equivalents and exceptions has been proposed under this scheme. The corporations are to accept the examinations of the conjunct board for their licenses, and give up their own examinations altogether. The conjunct board is to receive as equivalent to their own the University examinations on the fundamental medical sciences. The University examinations on practice, such as phisic, surgery,

midwifery, pathology, therapeutics, medical jurisprudence, are not to exempt graduates from the examinations of the conjunct board on these subjects; but graduates so re-examined are to be let off easy in the matter of fees. Why University graduates should be exempted from the operations of the Board in one class of subjects, and not in others, it is not very easy to perceive. The University examination is, or ought to be made, a major examination on every subject alike. Why a second, and minor, examination should be requisite, for security of the public, is to me, at least a profound mystery.

Another part of the conjunct scheme is, that the candidate whose aim is a corporation licence, shall receive one on passing his trials. For this favour the corporations are to divide among them a large proportion of the fees. That most ticklish of all points, their respective shares, has wisely not been mooted hitherto. But this much we know. The corporations will receive large fees, without taking the slightest trouble for them,—a provision which looks odd when thus plainly expressed, but which is necessary to compensate them for the loss of fees now received for their own examination and licence.

The reasonableness of some such compensation is apparent to us of the present generation, who will, therefore, easily submit to it. But our followers in the next generation, probably as restless and fond of change as ourselves, will be apt to take a different view, when they find themselves severely mulcted for little or nothing,—for no privilege whatever,—for an empty title only. It is mere vanity to set forth as an equivalent the advantages of museums and libraries, which no one can enjoy who is not a resident of one of the three capitals. In no long time a new agitation will arise upon the most hateful, but most potent, of all themes,—a money question; and it is easy to foretell the result. In fine, the Universities may withstand the threatened revolution. But the corporations will be in danger of becoming mere clubs. Universities are a necessity for the highest walks of professional education in every civilised land. Corporations are not so situated. In the whole Continental kingdoms there is not, and there never has been, anything approaching in constitution to our British Incorporated Colleges. Some, perhaps, may be disposed to ask: "Why, then, should corporations exist in any country?" and a rumour has reached us here that this question has been actually whispered among some vigorous reformers in the South. But I apprehend that such a question will find no resting-place in this Association or in any other public medical body; and I mention it merely to give a little cogency to my fears, that, if the corporations part with their present important privilege, and the most important of the duties for which they were chartered,—that of examining themselves the candidates for their licenses,—they may find they are opening the door for the question being seriously raised at some future period.

Why, then, venture on a complex plan of examination difficult to carry out, far from sure to attain its object, fraught with hidden dangers, and opposed by some of the chief professional bodies concerned? Why not rather take advantage of the present system, itself indeed complex enough, but nevertheless the gradual product of the wants and the wishes of a free people, not, therefore, to be lightly set aside? Why not correct it, and improve it through means which the legislature has not long ago put into the hands of our profession for the very purpose. The present entrance door to the medical profession is not really, though nominally, an University, a Royal College, an Apothecaries' Hall, or a Faculty of Physicians and Surgeons; it is an examination. There is no reason I can discover why the examinations of all these bodies, numerous though they be, may not be brought up to a reasonable standard of equivalence, now that the Medical Council have put forth their strength towards that end. Let their endeavours have a fair trial. Should the result prove unsatisfactory owing to insufficient control, support them in obtaining more direct powers; and allow time for further trial. This surely is a wiser course than to rush upon untried treacherous ground, and daring measures entirely novel, which, though on the surface they promise reform, at bottom threaten revolution.

Allow me, in conclusion, to add a brief word or two on the general question. In this kingdom, three denominations of practitioners are provided by education and examination—1. The ordinary class of general practitioners in town and country; 2. High-class physicians and surgeons, who practise chiefly in cities and large towns; and 3. An intermediate order, educated on the footing of the highest attainable education for the greatest possible number, and whom circumstances may attach, some to the first, some to the second class.

The corporations provide the first class by their license; and most of them, by means of their Fellowship, enable licentiates to pass into the second class, if they please. The two great and old English Universities, through means chiefly of a protracted education, and the London University by elaborate examinations, aim at producing the second class, at least in physic, ready made, so to speak. The founders of medical

education, as well as their successors, in the three Scottish University Schools, and likewise, I think, in those of Ireland, have aimed at supplying the third class, by supplying the highest education attainable by the greatest number.

It is no part of my present undertaking to settle which of the three educational aims is the most important. They are all highly so. It is as little a part of my present undertaking to inquire which of the three objects have been satisfactorily reached by the several bodies entrusted with them. All have undoubtedly been more or less successful; and none can be charged with failure. But I claim for the Scottish Universities, and eminently for the University of Edinburgh, that they have attained the object for which they were destined, by supplying to the greatest number the highest education of which that number can take advantage; that also they enable men of superior original talent or industry to go out from their schools with high qualifications, not inferior to those of the graduates of any of the English Universities; that these results flow from their system of education and examination, the fruit of long educational experience; and that their elasticity is such as to render it easy for them to adapt themselves to the progress of knowledge and of public opinion. It is well known that the Universities' Commissioners, under the Act of 1858, took infinite pains to effect such adaptation at that time. I have put before you the remarkable result. Surely, it is not too much to ask, that the Universities of Scotland shall not be disturbed by further and doubtful innovations during so important an experiment, following recent and serious changes; and I venture to submit, that their neighbours may do worse than watch a little longer the experiment going on here before they venture upon dangerous innovations for themselves.

GLYCERATE OF BORATE OF SODA.—M. E. Gandolphe, according to the *Pharmacie de Lyon*, June 20th, 1875, has remarked that cold medicinal glycerine dissolves its own weight of borate of soda; whilst 100 parts of distilled water dissolve only $8\frac{1}{2}$ parts of the salt, and 100 parts of hot water dissolve 50 parts, of which 41.67 parts are precipitated by cooling. To obtain the desired solution, M. Gandolphe recommends that 100 parts of medicinal glycerine and 100 parts of powdered borate of soda be triturated together in a glass mortar until the solution is complete. The solution of the borate of soda in the glycerine may be accelerated by placing the mixture in a stove, or by introducing it into a flask, and submitting this to the action of the water-bath. In gargles, the borate of soda is generally combined with honey, or honey of roses, or even with syrup of mulberries; that is to say, with products which dissolve a very small quantity of this salt. It would, therefore, be advantageous to compound these measures with equal parts of glycerine and borate of soda. A definite and considerably more active solution is thus obtained; for glycerine mixes well with honey, as well as with syrups.

INTERMITTENT SPINAL PARALYSIS.—In an inaugural dissertation (Halle, 1874), H. Hartwig describes the following case. A sugar-baker aged 23, who was exposed to great heat and sudden changes of temperature while very lightly clothed, had suffered in his eighteenth year for four or five weeks from an attack of tertian ague, from which he recovered. One day he perceived a numbness in his legs, which rapidly attacked his arms also, and finally led to complete paralysis of the muscles of the neck. Speech, deglutition, and respiration were somewhat impeded; the muscles of the eye were unaffected, as were also the alvine and urinary excretions, and sensation. After twenty-four hours, there was a remission of the symptoms; first the neck began to become movable, then the fingers, arms, body, and finally the legs. All this took place in half an hour, and was followed by an increase of perspiration. During the next twenty-four hours, the patient remained free from paralysis, but was dull; after which, the above described symptoms returned. The brain was always free; the cervical portion, especially the upper, was not always equally affected; the movements of the neck were often free; and difficulty in deglutition and respiration, inequality of the pupils, and myosis, were frequently present. The phrenic nerve was always unaffected. When there was not complete paralysis, the affected limbs were generally stiff, and there was contraction of the predominating groups of muscles; when complete paralysis was present, the muscles were soft and flabby. Electromuscular irritability was almost completely absent during the paralysis, and the violence of the muscles varied. Under the use of quinine, the patient's condition was on several occasions quickly improved, but he was not cured. He was under observation for more than six months. The author believes that the case was one of masked intermittent, and that the phenomena were due to hyperæmia of the cord and occasional increase of serous exudation.—*Centralblatt für die Medicin. Wissenschaft.*, June 5th.

ADDRESS IN MEDICINE,

BY

J. WARBURTON BEGBIE, M.D., F.R.S.E.,

Fellow of the Royal College of Physicians, Edinburgh.

ANCIENT AND MODERN PRACTICE OF MEDICINE.

WHEN the late distinguished Professor of Logic and Metaphysics in the University of Edinburgh inquired, "Has the *practice* of medicine made a single step since Hippocrates?" and, in vindication of his own belief in the negative conclusion, referred to the recorded opinions of several eminent authorities of modern times in the profession, he put a question which no thoughtful mind within the pale of medicine will be inclined to evade, and the consideration of which, after some sort, may suitably engage our attention in such a meeting as the present.

Sir William Hamilton, in penning the question referred to, had under review "An Account of the Life, Lectures, and Writings of William Cullen, M.D.," the famous Professor of the Practice of Medicine in the University of Edinburgh from 1769 to 1790, by Dr. John Thomson; and having noticed, in terms of well-deserved commendation, the masterly execution of his task by the eminent author of the *Lectures on Inflammation*, and accompanied him in a brief survey of the doctrines promulgated by the renowned triumvirate of the early part of the eighteenth century, to wit, Hoffmann, Stahl, and Boerhaave, he was tempted by a mild reflection of Cullen on the practice of Stahl, which censure, indeed, was judged too indiscriminating by Dr. Thomson, to indulge in a philippic against the modern practitioners of the healing art, quoting what for his purpose appeared to be the apposite phrase of Hoffmann, "Fuge medicos et medicamenta si vis esse salvus", and that of Celsus, "Optima medicina est non uti medicinâ". The vehemence of Sir William Hamilton's denunciation is more fully explained by a note, published in 1853, to the original article, which had appeared in the *Edinburgh Review* for July 1832, where it is shown that the dangers which are to be apprehended in the practice of medicine arise, in Sir William Hamilton's opinion, from the illiterate rashness of its practitioners, for he transfers to his pages, with very evident satisfaction, the statement of Dr. Gregory: "I think it more than possible that in fifty or a hundred years the business of physician will not be regarded, even in England, as either a learned or a liberal profession." If the medical faculty of the University of Edinburgh had in any measure justly laid itself open to the charge of hastening the decadence of learning in the profession, it will be admitted by every dispassionate inquirer that the statutes and regulations of that University relative to degrees in medicine entitle it, at the present time, to be regarded as in the van of those bodies which are striving for the honour and advance of the medical profession. It is, indeed, impossible to read the animadversions of Sir William Hamilton without coming to the conclusion that learning in the practitioners of medicine, by which he evidently understood general culture and, in particular, classical attainments, was, in his opinion, the great desideratum. Between learning of the nature referred to, and usefulness in medicine, as dependent upon ample professional qualifications, there is really nothing antagonistic. Not a few of the most distinguished men in the profession in quite recent times have been accomplished scholars. But, while this holds true, let it be distinctly understood that learning of the kind in question is not supreme: it is secondary in importance to ability in the healing art. I make bold to say that not a few physicians, with no pretension whatever to learning, have served their generation well, and have done much to recommend the profession they zealously cultivated, if they cannot be said to have adorned it. If, therefore, it were necessary to decide between the claims of medicine as a learned or so-called liberal profession and as a useful art, the preference must be awarded to the latter. Let us be thankful, however, that no such issue is before us. Medicine is a liberal profession, and will, doubtless, continue to be so, although the diffusion throughout its ranks of polite learning may have become diminished, a result which is to be in no small measure attributed to the very great enlargement which has taken place in all that is proper to medicine itself. Think of the rapid advances which have been made during the last thirty years in such departments of medicine as animal chemistry, physiology, pathology, and psychology; and then consider how limited is the time at the disposal of him who is expected

to acquire at least a competent knowledge of these sciences, for the cultivation of other subjects, however elevating and attractive. That there exists nothing hostile in the study of medicine, as now pursued, to distinction in other walks, is evident from the circumstance that members of our profession, in no way favourably placed for the study, have achieved distinction in scholarship. Look at the career of the late Francis Adams, toiling as a country surgeon in Aberdeenshire, and yet distinguished as the translator of Hippocrates, Aretæus, and Paulus Ægineta. Who can fail to sympathise with the feelings of that accomplished man when, in drawing his *magnum opus* to a close, he thus expressed himself: "I shall conclude this argument and my present task, by quoting the memorable words in which Cicero apologises for his having spent a certain portion of his time in the cultivation of elegant literature and of philosophy, leaving the reader to apply the same in the case of Hippocrates, and, I may be permitted to add, in that of the humble editor of the present volume, who trusts he shall not be set down as an idle and unprofitable practitioner of the art because he has found leisure, amidst the turmoil and distraction of a professional life, to communicate to his countrymen the important opinions contained in the genuine remains of the Coan sage."

It has been my happy lot to meet with others who, although less distinguished, some indeed wholly unknown to fame, have cultivated, in circumstances quite as trying, their natural taste for classical and other learning.

"Along the cool sequester'd vale of life
They kept the noiseless tenor of their way."

In remote districts of the country, undergoing a daily round of fatigue and anxiety, which must needs try the strength both of body and mind to the very utmost, mine, moreover, has been the privilege to meet and have friendly intercourse with men, who were ably discharging the duties of their calling, and were at the same time being leant upon by the whole community in which their lot was cast, not only as the advisers in sickness, but as persons on whose counsel and judgment all reliance was to be placed.

Having formed the acquaintance of such men, I have with pride reflected on the circumstance that the individuals who were the recipients of so much confidence, and whose friendship was so highly prized, were members of the profession to which we have the happiness to belong. It is not the least of the advantages possessed by membership of this great Association, that in our annual meeting the bands of fellowship among us are apt to be greatly strengthened.

The question of Sir William Hamilton, to which reference has been made, leads us, in the first place, to a brief consideration of the practice of medicine at the period of Hippocrates.

Intimately acquainted, as Sir William Hamilton was, with the whole history of philosophy, he knew the close alliance which existed between philosophy and medicine in ancient times. The most renowned philosophers, antecedent to and contemporaneous with Hippocrates, applied themselves to the study of medicine. Numerous are the references to medicine in the writings of these philosophers. Take, for example, the following passage from the *Phædrus* of Plato, in which not only is the relation referred to, but the name of Hippocrates is introduced.

Socrates remarks: Rhetoric is like medicine.

Phædrus. How is that?

Socrates. Why, because medicine has to define the nature of the body, and rhetoric of the soul, if you would proceed not empirically but scientifically; in the one case, to impart health and strength by giving medicine and food; in the other, to implant the conviction which you require by the right use of the words and principles.

Phædrus. You are probably right in that.

Socrates. And do you think that you can know the nature of the soul intelligently without knowing the nature of the whole?

Phædrus. Hippocrates the Asclepiad says that this is the only method of procedure by which the nature of the body can be understood.

Socrates. Yes, friend, and he says truly. Still, we ought not to be content with the name of Hippocrates, but to examine and see whether he has reason on his side.

Phædrus. True.

Socrates. Then, consider what this is which Hippocrates says, and which right reason says about this or any other nature.

(*The Dialogues of Plato*, by B. Jowett, M.A., vol. i, page 605.)

But, while occupied with the study of medicine and engaged in speculations as to the phenomena of disease, it is in the highest degree improbable that these philosophers ever practised the healing art. It is, indeed, worthy of remark that in subsequent, although still ancient, times, the intimate connection which had subsisted between philosophy and medicine was not regarded as favourable to the growth of the latter, and the share he had in effecting their divorcement is held by Celsus as

a reason for eulogising Hippocrates. "Hujus autem, ut quidam crederunt, discipulus Hippocrates Cons, primus quidem ex omnibus memoriâ dignis, ab studio sapientiæ disciplinam hanc separavit, vir et arte et facundiâ insignis" (*De Medicinâ*, liber primus). Medicine, however, had been cultivated after a fashion long antecedent to the birth-time of philosophy. The doctor-priests of the Grecian temples, or Asclepiadæ, had acknowledged Æsculapius as its origin. The Asclepia, or temples, were erected in many parts of Greece, were ruled by the Asclepiadæ, and used in a manner not very unlike that in which hospitals are employed in modern times. To them the sick resorted for advice and cure. In one of the most distinguished of these temples, namely, that of Cos, built on the island of the same name, one of the Sporades, a group of scattered islands, as their appellation denotes, in the Ægean Sea, off the island of Crete and west coast of Asia Minor, Hippocrates, inheriting a recognised position, acted as an Æsculapian priest. He had been born, in all probability, in the four hundred and sixtieth year before the birth of Christ. But Hippocrates had not only the advantage of the most favourable study in the Asclepion of Cos; we know, on excellent authority, that, under the direction of Herodicus of Selymbria in Thrace, he became intimately acquainted with the practice then pursued in the gymnasia, while, through the instructions of Gorgias and Democritus, the former of Leontini in Sicily, the latter of Abdera in Thrace, and himself illustrious as the originator of the doctrine of atoms, he became thoroughly versed in the literature and philosophy of the age.

The foundation of the practice of Hippocrates, with which we are now more immediately concerned, was experience; but this experience of Hippocrates was rational in character, not a mere blind or misguided empiricism. No one could be more convinced of the fallaciousness of a blind empiricism than he was, and his condemnation of it may be recognised in the earliest, the best known, and, perhaps, the grandest of all the Hippocratic aphorisms, "ἡ πείρα σφαλερὴ, ἢ κρείσσει χαλεπή". "experimentum periculosum, judicium difficile". Hippocrates believed in the existence of a principle, a spiritual essence, the preserver of all things in nature, the restorer of whatever had become disordered. The regulation and superintendence of all the actions of the system were due to this principle, to which he gave the name of Φύσις, Nature. Thus, he was led to consider that the chief duty of the physician consisted in watching the operations of Nature, endeavouring, as might be the case, to promote or restrain these, possibly in some, but these very rare instances, to counteract them. "Our natures", he remarks, or, if not he, one of his immediate descendants, who may reasonably be supposed to be expressing the views of the master, "our natures are the physicians of our diseases". "Νούσων φύσις ἰητροί". It is in reference to this exposition of the function at once of Nature and the physician in relation to disease, that Sydenham, "the chief of English practical physicians", who in many particulars resembled the Father of Medicine, observes: "He it is whom we can never duly praise. He it is who then laid the solid and immovable foundation for the whole superstructure of medicine, when he taught that 'our natures are the physicians of our diseases'." And, again, "The great sagacity of this man had discovered that Nature by herself determines diseases and is of herself sufficient in all things against all of them". The belief which Hippocrates had in this "vis conservatrix", "vis naturæ medicatrix", would, in the first place, make him, as we know from his writings he really was, a very close observer of the operations of nature. It would further render him cautious in regard to interference with these, and resolute in his determination, as it has been said, "to have two special objects in view, with regard to diseases, namely, to do good, and to do no harm". There is, however, no ground for concluding that Hippocrates was an inert or purely expectant practitioner. On the contrary, there is abundant proof in the works which bear his name that, in limiting, as Sydenham has expressed it, "the province of medical art to the support of Nature when she was enfeebled, and to the coercion of her when she was outrageous", Hippocrates found occasion to be bold and decided in his method of treatment. His employment of powerful remedies is best exhibited in the instances of diseases which, according to the humoral doctrine promulgated by him, were to be relieved by the discharge of some peccant humour. Evacuants of various kinds were used with this intention, purgatives more especially, but likewise emetics, diuretics, and sudorifics. He drew blood by means of the lancet, the scarificator, and the cupping instrument, but with what careful consideration and thoughtfulness is well shown in the treatise *Περὶ Διαιτῆς Ὁξέων*, *On the Regimen in Acute Diseases*, in which he remarks concerning the treatment of pleuritis: "But if the pain be not removed by the fomentations, we ought not to foment for a long time, for this dries the lungs and promotes suppuration; but if the pain point to the clavicle, or if there be heaviness in the arm or about the breast, or above the diaphragm, one should open the inner vein at the elbow and

not hesitate to abstract a large quantity of blood, until it becomes much redder, or, instead of being pure red, it becomes livid; for both these states occur." What forcibly strikes the reader of the passage now quoted, and of those passages which immediately precede and follow it, is, as indeed Galen among the ancient and many of the modern commentators of Hippocrates have carefully noted, the manner in which the Father of Medicine commences with the milder means of affording relief from the pain of pleuritis, such as the employment of fomentations, the rules for the preparation and application of which, as laid down by him, are simply admirable; and only in the event of these failing to accomplish the object in view he counsels that recourse should be had to bloodletting and the use of other powerful remedies, including cathartics. In another part of the same treatise, the following rule is laid down for the employment of bloodletting: "Bleed in the acute affections, if the disease appear strong and the patients be in the vigour of life, and if they have strength." Surely, this is a most cautious limitation of the circumstances in which the remedy is, in the mind of the writer, to be advantageously employed. In one passage, however, if not in more than one of the Hippocratic writings, there is reference made to the production of "deliquium animi", "leipothymia", or "leipopsychia", as the Greeks termed it, by bloodletting in the treatment of acute diseases. This rule, which was opposed by the ancient authorities generally, cannot be said to have been invariably acted upon by Hippocrates.

A study of the method of treatment pursued by the Father of Medicine and his immediate descendants exhibits the fact that their rules of procedure were all based on experience. He had the merit of discovering the great truth, that accurate observation in medicine is the real foundation of all knowledge, and he proceeded in the true spirit of the inductive philosophy to generalise solely from the phenomena thus observed. It can never cease to afford material for wonder that through the genius of one man so much was accomplished, when we reflect on the circumstance that in the time of Hippocrates human anatomy had scarcely, if at all, been practised, that physiology was virtually unknown, and the use of remedial agents was almost entirely limited to articles of the vegetable kingdom, and these the indigenous plants of Greece and the neighbouring countries. To the subject of diet and regimen, however, Hippocrates paid the greatest attention. In the Hippocratic writings, there occur terms which exactly correspond with those we so frequently employ: full, ordinary, and low diet. In the treatise *Περὶ Ἀγμάτων*, the following passage occurs: "A diet slightly restricted will be sufficient in those cases in which there was no external wound at first, or when the bone does not protrude; but one should live rather sparingly until the tenth day, as being low deprived of exercise; and tender articles of food should be used, such as moderately loosen the bowels; but one should abstain altogether from flesh and wine, and then by degrees resume a more nourishing diet." And so, not to multiply quotations, in the treatise already referred to, and in *Ἀφορισμοί*, there are many interesting and instructive suggestions to be found regarding the administration of food and wine. It is sufficient, in passing, to make a brief reference to the paramount importance Hippocrates attached to the doctrine of crisis, and to the bearing which this had on the treatment of diseases. The doctrine of crisis, indeed, was an essential part of his system of humoralism, and had in consequence an intimate connection with the method of treatment he pursued. Critical events were evacuations of different kinds, occurring chiefly by the skin, bowels, and kidneys.

With the views he entertained as to crisis, there is further intimately blended the so-called Hippocratic doctrine of critical days. Galen expressly affirms that Hippocrates was the first author who treated of these; but, whether this be true or not, we know that he attached very considerable importance to the doctrine. "Fevers", he remarks, "come to a crisis on the same days as to number on which men recover and die." It was the particular attention given by Hippocrates to the tendencies manifested by diseases to recovery, or, on the other hand, to an unfavourable termination, also to the occurrence of evacuations or of crises in their course, that led to the remarkable care with which he studied the whole subject of prognosis. There is no more interesting or valuable work in the whole Hippocratic collection than the one entitled *Προγνωστικόν*, *Prenotiones, Prognostics*; and happily concerning its authenticity, as the undoubtedly genuine work of the Father of Medicine himself, there has never been any question.

Again, we should be doing serious injustice to the Father of Medicine were we not to notice, and that in terms of the very highest commendation, the profound sagacity exhibited by him in the observation of the influence of external agents on men in health and on disease. This is fully exhibited in the treatise *Περὶ Ἀερίων, Ὑδατίων, Τοπιῶν*, in which the operation of the atmosphere, of particular seasons, situation and dwellings of the people, in the production of health and dis-

eases of different kinds is discussed. Dr. Adams says of it that "it relates to a subject of commanding interest and deserves to be carefully studied, as containing the oldest exposition which we possess of the opinions entertained by an original and enlightened mind on many important questions connected with public hygiene and political economy, two sciences which of late years have commanded a large amount of professional attention". Since this passage was written by Dr. Adams, greatly increased interest has been awakened in these subjects. I venture to affirm that the most enlightened inquirer concerning public health, be he legislator or physician, will find much to instruct him in the pages of Hippocrates.

The narration of individual cases of disease commenced with Hippocrates; he may, indeed, be said to have been the originator of the clinical study of medicine. By way of comparison between ancient and modern medicine, some clinical observations of Hippocrates may be quoted in the first place, and thereafter certain passages cited from a modern clinical lecture not unworthy of being placed alongside of the former. In the first book of the *Epidemics*, *Ἐπιδημιῶν, α.*, it is thus written: "Philiscus, who dwelt near the wall, was laid up. On the first day, fever acute; he perspired; night very disturbed. Second day, aggravation of symptoms; in the evening, an injection procured a good stool; night quiet. On the morning of the third day, and up to noon, appeared free from pain; but in the evening, acute fever, with perspiration; thirst, tongue dry; passed black urine; night disturbed; he did not sleep at all; his mind wandered on all subjects. On the fourth day, general paroxysms; urine black; night more endurable; urine of improved colour. On the fifth day, about noon, a little blood escaped from the nostrils; urine varied in appearance with thready clouds resembling semen irregularly suspended in it. The urine did not deposit. A suppository caused passage of some feculent matter with wind. Night distressing; little sleep; talkativeness; delirium; extremities very cold, and could not be warmed; the patient voided black urine; he rested a little towards daybreak; lost speech; had a cold sweat; extremities livid. About the middle of the sixth day, he died. The respiration was throughout large and rare, like that of a person who required to be reminded to breathe. The spleen was swollen, and formed a roundish tumour. The perspiration continued to be cold till the end; the paroxysms were on even days." It is to the description here given of the patient's breathing that I wish particularly to call attention. The words employed by Hippocrates are "*Τύττω πνεύμα διὰ τέλειος ἀραιὸν μέγα*". Galen's commentary on the passage justifies the rendering which has been adopted. Further, we know that the word *ἀραιός*, when used by Hippocrates, whether in reference to the respiration or the pulse, invariably signifies "infrequent", "few in number", "with intervals". Before offering a few observations on this clinical history, I shall give an extract, or rather extracts, from a case recently recorded by Dr. Laycock (*Dublin Journal of Medical Science*, 1873). "J. O'H., aged 56, labourer, admitted to hospital November 18th, 1863. No family history obtainable. Previously to admission, was employed in sinking a well, which kept him constantly wet; he has not been a temperate man, but enjoyed good health up to four days before his admission. On that day, he complained of pain in the chest and some shortness of breath. He attributed this to overwork, but it was so severe as to oblige him to leave off work, and he consequently went to bed. Next day, felt better; but the day after he felt very giddy, and was forced to return to bed. On the 17th, about 7 A.M., his wife found him lying half out of bed, and passing urine on the floor; when spoken to, said his left arm felt very heavy, and he could not move it, and that the left leg was the same; he also complained of headache, frontal and temporal, but not severe." There follows a detailed and interesting statement regarding the patient's condition on admission to the Royal Infirmary. I quote the account of his breathing: "Breathing appears calm for the most part, with frequent intervals of accelerated and laborious breathing. When the act of respiration is suspended, the fact of coughing once or twice does not seem to bring it back; but, if the patient is roused and made to speak, respiration is resumed. The cessation appears to be quite regular in point of time, occupying generally about thirty seconds, and respiration then continues for about twenty-five respirations. The heart's action at such times was accelerated and tumultuous." The progress of the case is recorded as follows. "On December 1st, complained of pain in the right side; friction sounds detected; coughs slightly; no expectoration; delirium occurred during the succeeding night; the following morning, said he was better, and the ascending and descending respiration was not observed; friction heard in the right infra-axillary region; the right side moved but slightly in respiration, which was chiefly diaphragmatic; dulness was perceived over the right base posteriorly, where also friction and fine crepitation were heard. On the 3rd December, the respiratory phenomena were less marked; but on the

4th, weeping was observed in the afternoon, although the patient was cheerful about himself, and the peculiar breathing was again manifested. On the 5th, heart's action was calmer; œdema of the left hand commenced. On the 9th, œdema of the lower part of the left thigh; foot and lower part of leg very cold. On the 12th, a fresh pulmonary attack commenced, the left pleura now being the seat. During the three following days, there was considerable delirium; he was very troublesome at night, crying out and groaning. On the evening of the 16th, he had more frequent paroxysms of apnoea; the cardiac action was hurried, about 130 per minute, but regular. On the 18th, the symptoms were found to have subsided somewhat; but on the evening of that day dyspnoea came on, with greatly increased feebleness; pulse about 60, and irregular; respirations hurried and forcible, from 45 to 50 per minute. The pulmonary symptoms had become greatly aggravated, and the patient died about one o'clock on the morning of the 20th. *Post mortem* was not permitted."

The case of Philiscus, as recorded by Hippocrates, is one of great interest. The occurrence of accession of fever towards the evening of the third day, freedom from fever having been noted in the morning, with supervention of several unfavourable symptoms, in particular great thirst, dry condition of the tongue, black urine, delirium, and coldness of the extremities, led Galen, in his commentary, to remark that the fatal issue of the disease might have been anticipated. It is, however, in respect to the peculiar character of the breathing that the case of Philiscus acquires its chief interest, and it is in this particular that a resemblance is to be found between the ancient and the modern clinical examples now quoted. The attention of Hippocrates had been arrested by the peculiar character of the breathing which existed throughout the fatal illness of Philiscus. Surely, it is matter of interest and for reflection that the respiration described by Hippocrates as *ἀραιὸν μέγα*, "rare and large", and to which Galen has attached the meaning "like a person who forgot for a time the need of breathing, and then suddenly remembered", or "the respiration throughout, like that of a person recollecting himself, was rare and large", has attracted great attention in quite recent times. The expression used by French writers, "besoin de respirer", corresponds in some measure to the meaning which is sought to be conveyed by the Greek words. In Latin, the rendering is, "*Spiratio huic perpetuo rara et magna fuit*". Daremberg, the learned French editor of Hippocrates, thus translates the passage: "La respiration fut constamment grande, rare comme chez quelqu'un qui ne respire que par souvenir." The relation of this peculiar character of the breathing, with which, under the name of "ascending and descending inspiration" of the eminent Dublin physician Dr. Stokes, the profession is now familiar, to lesion of the nervous system, was, of course, unknown to Hippocrates, and for many subsequent ages could not be known to those who were ignorant alike of anatomy and physiology. In recent times, it has been described by the late Dr. Cheyne of Dublin. "For several days," wrote Dr. Cheyne, in 1816, in his account of a patient, aged 60, who had fatty degeneration of the heart, with irregular and intermittent pulse, and whose death was due to apoplexy, "his breathing was irregular; it would cease for a quarter of a minute, then it would become perceptible, though very low, then by degrees it became heaving and quick, and then it would gradually cease again. This revolution in the state of his breathing occupied about a minute, during which there were about thirty acts of respiration." Subsequently, Dr. Stokes connected the peculiar respiration with a weakened state of the heart, "a phenomenon to be looked for in many cases of fatty degeneration". I have never seen it, remarks the same authority, except in examples of that disease. In his description of it, Dr. Stokes observes: "It consists in the occurrence of a series of inspirations, increasing to a maximum, and then declining in force and length, until a state of apparent apnoea is established. In this condition, the patient may remain for such a length of time as to make his attendants believe that he is dead, when a low inspiration, followed by one more decided, marks the commencement of a new ascending and then descending series of inspirations. This symptom, as occurring in its highest degree, I have only seen during a few weeks previous to the death of a patient. I do not know any more remarkable or characteristic phenomena than those presented in this condition, whether we view the long continued cessation of the breathing, yet without any suffering on the part of the patient, or the maximum point of the series of inspirations, when the head is thrown back, the shoulders raised, and every muscle of inspiration thrown into the most violent action; yet all this without any *rdle* or sign of mechanical obstruction." Dr. Stokes refers to the fact of the sighing respiration, which is closely allied to the more formidable ascending and descending respiration, being observed in persons who are labouring under certain forms of gastric and hepatic derangement, and in connection with undeveloped gout, and likewise to the significant fact of Laennec having described a form of asthma with puerile

respiration, while the illustrious French physician attributed the malady to some special modification of nervous influence.*

Dr. Little of Dublin, in an able paper published in 1868, while alluding to the peculiar breathing, as Dr. Stokes had done, with organic disease of the heart, does not admit its special connection with fatty degeneration, but believes it to accompany atheroma of the aorta, valvular lesions, and hypertrophy, as well as dilatation of the left ventricle. Dr. Little has suggested as a theory of its causation, that, in consequence of the existence of one or other of the lesions mentioned, there is an unequal action of the two ventricles. Consequently, the left ventricle is unable to propel the aerated blood, and stops now and then. This blood, therefore, remains in the lungs, pulmonary veins, and left auricle; and, as it has already been fully oxygenated, it no longer stimulates the respiratory centre through the vagus. Thus, the venous blood which is requisite to excite the vagus branches is not supplied, consequently respiration ceases, and the breathing takes on this irregular action. By degrees, the contractions of the ventricle partially free the auricle and pulmonary veins; venous blood is again sent to the lungs, which stimulates the filaments of the pneumogastric and causes respiration to begin. Dr. Laycock, in his valuable contribution to the pathology of the ascending and descending respiration, or, as he terms it, "recurrent brief apnoea", from which I have already quoted, while offering objections to the completeness of the explanation according to Dr. Little's ingenious theory, does not hesitate to concur in the opinion that the vagus system is involved.

It is worthy of remark that, in the case of Philiscus detailed by Hippocrates, sleeplessness was a notable feature; and, although the febrile condition under which the patient laboured may be the explanation of this symptom, it is at least as reasonable to suppose that the neurosis of the vagus on which the peculiarity of his breathing depended was its cause.

Laennec, the illustrious French physician, the modern discoverer of auscultation, he to whom we are indebted for the introduction of auscultation and for the great light which his discovery shed on the diagnosis and treatment of diseases of the chest, has rendered due credit to Hippocrates. To the Father of Medicine indeed, and to Aretæus, among the ancients, Laennec confesses that he was alone indebted for any information on the subject which he has so signally made his own. He expressly states that Hippocrates practised immediate auscultation. "Hippocrate avait tenté l'auscultation immédiate"; and, in proof of his having made trial of this means of diagnosis, he refers to the well known passage in the treatise *Περὶ Νουρῶν, τὸ Δευτέρου, De Morbis, Liber secundus*, a work which there is good reason for believing, although not composed by Hippocrates himself, was written either by one or more of his contemporaries or by some among his immediate descendants in the school of Cos, in which it is made clear that Hippocrates fell into error in supposing his ability to distinguish between the presence of water and of pus in the chest, by the peculiar sound heard on applying the ear. It is in the same chapter, and in close relation to the same subject, that Laennec makes the remarkable statement—a statement which cannot be read without feelings of admiration for the candour and modesty of that distinguished man—that he had read the passage in Hippocrates many years before the commencement of certain experiments in physics, which suggested to him the idea of mediate auscultation, but he never entertained the idea of repeating the experiment of Hippocrates; it passed entirely into forgetfulness; he simply regarded it as one of the errors into which that great man had fallen. But the passage reverted to his mind when he commenced his researches; and he felt surprise that its consideration had not proved suggestive to some readers. The error made by Hippocrates, Laennec further remarks, might have led him to the discovery of many valuable truths. He concludes a remarkable passage in the following words: "But Hippocrates stopped with an incorrect observation, and his successors overlooked its import. This, at first sight, may appear surprising; nevertheless, nothing is more common. No man is permitted to embrace all the relations and consequences of the most simple fact; and the secrets of Nature are more frequently disclosed by accidental circumstances than they are wrested by scientific efforts" (*De l'Auscultation Médiate, Première Partie, chapitre iii*). Under the designation of Hippocratic succussion, we possess, as is well known, a means of physical exploration of the chest, which was practised by the Father of Medicine. In the same treatise as that already referred to, the method of

procedure in the use of this means is laid down. It is directed that, after the patient has been carefully washed with warm water, he is to be placed in a firm seat, and his hands held by an assistant; the physician meantime, taking him by the shoulders, shakes him, and attentively listens in order to determine on which side of the chest a sound is occasioned. Further, the rules for the treatment of empyema by operation are given with precision; it is directed that recourse is not to be had to paracentesis before the fifteenth day from the commencement of the effusion; where pain is chiefly felt and swelling is most conspicuous, the opening is to be made, while a preliminary incision through the integuments precedes the penetration of the pleura effected by a sharper and more pointed instrument, protected by a piece of cloth. In some instances, it is mentioned, the perforation of the thoracic parietes was made, not through an intercostal space but through a rib, a plan revived in recent times by M. Reybard. When a sufficient quantity of pus has been permitted to flow, the wound is to be closed by means of a portion of linen cloth attached to a thread. Daily a similar quantity of pus is to be evacuated. On the tenth day, when the whole of the collection has been allowed to escape, a mixture of tepid oil and wine is to be injected through the opening, for the purpose of cleansing the lung. This part of the operation is to be practised twice daily; the injection of the morning being withdrawn and replaced by a fresh quantity in the evening, and so on. At length, when the purulent fluid has become clear and thin, a metallic sound is to be introduced, the size of which is to be gradually lessened as the fluid itself diminishes; thus, the wound is permitted to cicatrize.

The interest attached to the description now quoted is heightened by a consideration of certain shrewd observations bearing on the same subject, and which occur not in the same treatise alone, but in other of the Hippocratic works, notably in the book of *Aphorisms*. An empyema on the left side, the author remarks, is less dangerous than on the right. When the pus was clear, and studded more or less with sanguinolent threads, that appearance indicated the probability of a satisfactory recovery; but, on the other hand, if, on the first day of its removal, the fluid possessed a colour like the yolk of egg, while on the succeeding day it was thick, having a pale green hue, and emitting a foetid odour, it was likely that the sufferer would not recover, but shortly die. Again, the sufferers from empyema and dropsies treated by incision or by the cautery, certainly perish if the pus or water be suddenly evacuated. Everyone acquainted with the history of paracentesis thoracis knows that it dates from the period of the Father of Medicine. The dogmatic statements which are to be found in the Hippocratic writings may not all be accepted without question in the present day, but it is remarkable how much truth there is in several of these. One of the highest living authorities on diseases of the chest, Dr. Walshe, comments the precept of Hippocrates, that paracentesis should not be performed before the fifteenth day of effusion, unless the accumulation of fluid be so great as *per se* to threaten life; while he questions the accuracy of the observation made in the ancient time, and adhered to pretty closely in subsequent ages, that success is less likely to follow operations when the fluid has been from the first purulent in character than when sero-albuminous (*Diseases of the Lungs*, 4th edition, page 281).

The modern history of thoracentesis is very interesting. Since the writings of Trousseau in its recommendation, and the still more powerful example of our transatlantic brethren, chiefly Dr. Bowditch, the remedy has become one commonly resorted to. In the article *Pleurisy*, contributed to the third volume of Dr. Reynolds's *System of Medicine* by a physician, whose premature death the profession had recently occasion to deplore, will be found an interesting account of what Dr. Anstie called a new era in the treatment of pleurisy. The new era is, however, signalled rather by the discovery and introduction of such new instruments as the suction-instrument of Dr. Wyman, so efficient in the hands of Dr. Bowditch, and the aspirator of M. Dieulafoy, than by any novel suggestion regarding the treatment of the disease. If, as is not unlikely, we have recently attained to something like perfection in the diagnosis and treatment of pleurisy, a dispassionate review of the history of the disease in ancient and modern times will justify the application of the dictum of Seneca, "Multum egerunt qui ante nos fuerunt sed non peregerunt".

It would be very easy to multiply references to important and suggestive passages in the Hippocratic writings tending to establish yet more fully the truth of the statement that the Father of Medicine was enabled, by the exercise chiefly of his most remarkable powers of observation, to acquire a really wonderful amount of accurate information regarding the causes and progress of diseases as well as the influence exerted by various remedies over them. Enough has, however, been stated to justify Sir William Hamilton in exalting the reputation and praise of Hippocrates. Was Sir William entitled to depreciate the medical practitioners of his own time, which he surely did when ex-

* "Cependant le malade étouffe; et, comme nous venons de le dire, il aurait besoin d'une respiration plus étendue que celle que permet son organisation: ou, en d'autres termes, la expiration est très parfaite, le besoin seul de respirer est augmenté. Ce n'est pas dans le poumon qu'il faut chercher la cause de la maladie; et lors même qu'adoptant en entier la théorie chimique de la respiration, on voudrait supposer qu'un besoin extraordinaire d'oxygénation du sang est la cause de la dyspnée, il faudrait encore remonter plus haut et reconnaître que le mal est dans l'innervation même."

claiming, "Has the practice of medicine made a single step since Hippocrates?" For centuries after the Hippocratic epoch, it may truly be said that little or no advance in medicine was effected. Many learned and ingenious men no doubt did appear in the ranks of the profession, and by them the position which had been achieved for medicine by Hippocrates was, at all events, maintained. In ancient times, by far the most renowned of these was Galen, who, embracing warmly the views of Hippocrates, was the first formally to expound and then systematically to formulate the doctrine of humoralism or humorism. It might be a sufficient answer to the query of Sir William Hamilton to signalise the discovery in modern days of vaccination and the introduction of sulphuric ether and chloroform as anesthetics; the last mentioned, as the author of *Rab and His Friends* says, "one of God's best gifts to his suffering children". These were unknown to Hippocrates, and surely our possession of them indicates at least one step in advance. But we are able to point to the abandonment of many remedies altogether worthless which were used in ancient times, and to the introduction, as well as much more satisfactory employment, of others: while, owing to the remarkable and altogether indisputable progress which has been made in the prosecution, first of all, of the study of anatomy, then of physiology, and subsequently of pathology, we are justly entitled to conclude that, the more advanced our knowledge of the minute structure of the body becomes, the more extensive our acquaintance with the function and uses of its several parts, and the more refined our understanding of the various morbid processes by which these are altered and destroyed, so much the more thorough and reliable will be our application and adaptation of the means of cure to the treatment of diseases. Any scientific practice of medicine before the physician had been able to acquaint himself with human anatomy was not to be expected; and it is truly marvellous that Hippocrates, Aretæus, Galen, and the Arabian physicians, notably Rhazes, were able to achieve so much, and to hand down to posterity a body of well-observed facts and careful deductions from these facts, wearing so much the aspect of science.

Medicine can, however, be said to have started on a scientific basis when Mundinus, early in the fourteenth century, applied himself with diligence to the dissection of the human body, and published a treatise on anatomy, *Anatomi Omnium Humani Corporis Interiorum Membrorum*, which, till the middle of the sixteenth century, was the recognised text-book of the schools. The statutes of the University of Padua prescribed that all anatomical lecturers were to adhere to the literal text of the Bologna professor. Mundinus died in 1326,* universally respected; and no advances in anatomical knowledge were made after his time till Berenger of Carpi published, in 1521, a commentary upon Mundinus. There succeeded Berenger, Vido Vidius, Jacob Sylvius, and the renowned Flemish anatomist Andreas Vesalius. Of the last named, Hallam remarks that "if he was not quite to anatomy what Copernicus was to astronomy, he has yet been said, a little hyperbolically, to have discovered a new world" (*Literary History*, vol. i, page 467). He was the first anatomist who ventured to emancipate himself, and that thoroughly, from the trammels of Galen, who, up to that time, had been regarded with an altogether blind veneration. Fallopius and Eustachius, two well known names, names not to be forgotten by anyone at all acquainted with anatomy, were the contemporaries, although younger, of Vesalius; and of the same period, or shortly subsequent, were Realdus Columbus, Arantius, and Fabricius ab Aquapendente, the discoverer of the valves in the veins and the instructor of our own immortal Harvey. The splendid discovery of the circulation of the blood was followed by that of the absorbent system, in which Asellius, a professor at Pavia; Rudbeck, a professor at Upsala; and Bartholin, a Dane, were chiefly concerned; while to Pecquet, a professor at Montpellier, belongs the credit of describing the thoracic duct and its uses. Other important anatomical discoveries, and discoveries also in physiology were being made simultaneously, or shortly thereafter, in connection with which the names of Malpighi, Glisson, Wharton, Higlmore, Richard Lower, Leeuwenhoeck, Ruysch, Valsalva, and many others start up. The most eminent of the pupils of Valsalva was the distinguished Morgagni, who, following the plan pursued by Bonnet in his *Septuaginta Anatomica*, first published at Geneva, the place of his birth, in 1679, described by Haller as "immortale opus", became himself professor in the University of Padua, and was the founder of pathological anatomy (*Der Begründer der Neuern Pathologischen Anatomie*, Haeser, seite 654). His works *Adversaria Anatomica*, and still more his celebrated treatise *De Sibus et Causis Morborum per Anatomiam Indagatis*, immensely advanced his favourite science.

* Mundinus, sagt John Adelphus in der von ihm besorgten Strassburger Ausgabe vom Jahre 1513, "quem omnis studentium universitas colit ac venerat ut deum."—Haeser, *Lehrbuch der Geschichte der Medizin*.

While chemistry, about the same time, was advancing towards the dignity of a science, chiefly through the genius of our distinguished countryman the Honourable Robert Boyle, there arose the sect of the so-called chemical physicians. Of this sect, the earliest was François Deleboe Sylvius (*Der berühmteste Vertreter der Iatrochemischen Schule*, Haeser, seite 571), who was born at Hanau in Flanders, in 1614, and, after a time, became professor of the practice of medicine at Leyden. The chemical theory of medicine had, however, passed from Paracelsus, who was born towards the close of the fifteenth century, through Van Helmont, by more than eighty years his junior, to Sylvius. The leading principles of the chemiatic physicians was that diseases owed their origin to derangement in a process of fermentation, which was constantly at work in the human body. While most of the maladies which were produced in this way arose from excess of acid, some were regarded as of alkaline origin. One eminent English physician embraced the doctrine of Sylvius. Thomas Willis was born in 1621, and in 1659 published his celebrated treatise entitled *Diatribe duæ Medico-Philosophicæ: quarum prior agit de Fermentatione, altera de Febrilibus*. The object of this work was to prove that, in every organ of the body, there existed its own special fermentation, and that disease of every kind resulted from the disturbance of these fermentative processes. Willis was one of the earliest members of the Royal Society, and left behind him the character of an orthodox, pious, and charitable physician.* It is recorded of Dr. Willis that, being consulted regarding the delicate condition of the children of the Duke of York, afterwards James II, he spoke his mind freely, and thereby gave great offence. Bishop Burnet has related that "Willis, the great physician, being called to consult for one of his, the Duke of York's, sons, gave his opinion in the words, 'mala stamina vitæ', which gave such offence that he was never called for afterwards." The reputation of Willis, unquestionably a very able man, has been obscured by that of another English physician, his junior by only three years. The physician in question was Thomas Sydenham, "whose character," as Dr. John Brown felicitously remarks in that delightful essay of his, *Locke and Sydenham*, "is as beautiful and as genuinely English as his name." He was born in Winford Eagle in Dorsetshire, in 1624. A parallel has been drawn between Hippocrates and Sydenham by more than one modern writer. *Wiederherstellung des Hippokratismus durch Thomas Sydenham*, is the title of a chapter by Haeser, the erudite German historian of medicine, and a very instructive one it is, on the life and writings of the English physician. He has frequently been called the English Hippocrates, and, in truth, the appellation is deserved; for, like the illustrious Greek physician, the great aim he set before him was the cure of disease, and, although possessing a mind which delighted in speculative inquiry, he never permitted the theories he formed and ably defended to interfere with his treatment. That was based on a rational empiricism, such as we have seen in the instance of Hippocrates; he carefully watched the operation of the remedies he employed, and from these he drew the indications for further guidance. Sydenham was humoral in his pathology, and he further agreed with Hippocrates in the doctrine of crisis, and the subsidiary views as to coction and crasis. We find him frequently referring to the Father of Medicine, as, for example, when he inquires what is gout? It is a provision of Nature to purify the blood of old men, and to purge the deep parts of the body; such at least is the language of Hippocrates. The same may be said of all other diseases, fully formed, and "That practice, and that alone, will do good which elicits the indications of cure out of the phenomena of the disease itself. This made Hippocrates divine." It was from Sydenham that the school of empirical physicians in England sprung—a term to be used, as Hallam has expressed it, "in a good sense", as denoting the regard its disciples had to observation and experience or to the Baconian principles of philosophy.

Another school of medicine had arisen in Italy through the instrumentality of Giovanni Alfonso Borelli, a profound mathematician, who endeavoured to explain the operation of the various functions of the body on mechanical principles. His views and principles were, through the excessive zeal of his pupils, carried beyond their legitimate length. Of these, Lorenzo Bellini, of Florence and Pisa, was the chief. There were other eminent adherents of the iatro-mathematical school in Italy; while Pitcairne, Friend, and Mead, in their time, were in this country attached to it; and it secured the sympathies of the illustrious nosologist François Boissier de Sauvages in France, in the eighteenth century.

To the chemiatic and iatro-mathematical schools there succeeded a third, of which Van Helmont was the founder. Embracing the views of the former to a certain extent, he made this important addition,

* The Roll of the Royal College of Physicians of London, by William Munk, M.D., vol. 1, page 524.

that all the changes occurring in the body, whether arising spontaneously or produced by remedies, are determined by a specific agent inherent in the living system, to which he gave the name of Archeus. This archeus explained, in Van Helmont's opinion, all physiological actions, and accounted for the maintenance of health as well as the occurrence of disease. Founding on the views promulgated by Van Helmont, although widely differing from him, came the earliest of the three distinguished men to whom a brief reference was made at the commencement of this address. Rejecting the doctrines of the chemical and mathematical physicians, Stahl concentrated attention on what he denominated vital actions. He, too, referred these actions to a dominating principle; and the Anima of Stahl—so he named it—resembles, in some measure at least, the Archeus of Van Helmont. To Stahl belongs the great merit of having pointed out that, contrary to the prevalent opinions of the schools, the operations of the animal economy cannot be explained by either chemical or mechanical laws; that there exists something over and above these; and that something is of the nature of vital action. The anima of Stahl, however, was a hypothetical principle, and he signally failed to gain for his theory any general support. Hoffmann, his distinguished colleague in the University of Halle, and his rival, conferred a lasting benefit on science by pointing out that the actions which were ascribed by Stahl to the government of his "anima" were in reality determined by nervous influence. "It was reserved for Hoffmann," says Dr. John Thomson, "to take a comprehensive view of the nervous system, not only as the organ of sense and motion, but also as the common centre by which all the different parts of the animal economy are connected together, and through which they mutually influence each other." Facts, and many of these most important in their nature, regarding the nervous system, had been recorded before the time of Hoffmann. The renowned professors in the early Alexandrian school, Herophilus, and Erasistratus, and Galen, with others among the ancients, Willis, Vieussens, Mayow, Baglivi, and Paechioni, much nearer his own day, had laid the foundation for the reasoning of Hoffmann; but, as Cullen has observed, "he was the first who gave any tolerably simple and clear system on the subject, or pointed out any extensive application of it to the explanation of diseases." There is little need for reminding you of the triumphant discoveries in the nervous system which have been made since the time of Hoffmann—such discoveries as have rendered the names of Charles Bell and Marshall Hall in particular, but many others in lesser degree, famous. In no department of pathological inquiry is there at the present time exhibited a greater amount of zeal, or are important facts being more frequently brought to light, than in that pertaining to the nervous system. How signal our advance in treatment also, as determined by that which can alone with any certainty determine treatment: a sound diagnosis! We can distinguish between functional and organic diseases of the brain, spinal cord, and nerves; and use our remedies in a way of which not only the ancient physicians, but many among the moderns, could not have dreamt.

The names of Stahl and Hoffmann, the German professors in Halle, of whom a few words have been said, are inseparably linked with that of the illustrious Dutch professor in the University of Leyden, Hermann Boerhaave. The aim of Boerhaave was essentially eclectic; he culled from the writings of his predecessors all that was valuable, and with these and the results of his own extended observation endeavoured to erect a system of medicine. His system was faulty in ascribing too little importance to the influence exerted by the brain and nervous system generally over the animal functions. The pathology of Boerhaave was as defective as his physiology; his explanations of morbid phenomena were more applicable to the body considered as an inert hydraulic machine, than as an organised living and sentient system. Intellectually and morally distinguished, few greater men than Boerhaave have adorned our profession in any age or country. After his decease, his reputation, which as a living teacher had been of the most exalted description, rather increased than declined. This result was due in great measure to the publication of commentaries on his works by two of his most distinguished pupils, Haller and Van Swieten. The former of these is justly considered as the father of modern physiology. The magnificent researches of Haller regarding development, growth of bone, and the circulation, deserve the praise and gratitude of posterity not more than the impulse of his ardent spirit and example in laborious inquiry, by which the zeal of his associates and successors was kindled. Of Haller's powerful opponent in the controversy regarding irritability and sensibility—Dr. Whytt—I can only make mention. Contemporaneously with Haller, and conferring benefits on the practice of medicine resembling those which Haller rendered to physiology, was William Cullen. A very erroneous impression of this great Scotch teacher has been entertained by many; more particularly, however, by foreigners. By such, Cullen has been

called a purely speculative physician. The condemnation of this opinion is readily supplied by his own words. "There is nothing," he observes, "I desire so much as that every disease we treat here should be a matter of experience to you; so that you must not be surprised that I use only one remedy when I might employ two or three; for in using a multiplicity of remedies, when a cure does succeed, it is not easy to perceive which is the most effectual. But I wish that you may always have some opportunity of judging with regard to their proper effects." Again, he says: "Every wise physician is a dogmatist; but a dogmatist physician is one of the most absurd animals that lives. We say he is a dogmatist in physic who employs his reason, and, from some acquaintance with the nature of the human body, thinks he can throw some light upon diseases, and ascertain the proper methods of cure; and I have known none who were not dogmatists, except those who seemed to be incapable of reasoning, or who were too lazy for it. On the other hand, I call him a dogmatist physician who is very ready to assume opinions, to be prejudiced in favour of them, and to retain and assert very tenaciously, and with too much confidence, the opinions or prejudices which he has already taken up in common life, or in the study of the sciences. Now, I profess to be a dogmatist, but I should be sorry if any person thought me dogmatical; for there are but few theoretical opinions which I have received or offered to communicate with regard to disease, concerning which I am not ready to doubt, and to admit grounds for doubting, as soon as they are offered to me. I know there are no universal rules in the practice of physic; but there are general rules, which all admit of, with more or fewer exceptions, in theory and practice." The foundation of the practice of physic was expressly stated by Cullen to lie in fact and experience. "All our knowledge of Nature consists," he says, "in experience."

To Cullen we are largely indebted for the introduction into general use by medical men in this country of such remedies as the acid tartrate of potash, tartar emetic, hyoseyamus, and James's powder, or the pulvis antimonialis. Tartar emetic Cullen largely employed as an antiphlogistic, sometimes after bloodletting, and sometimes in place of that remedy. He had noticed something of the contrastant action of antimony in the form of tartar emetic, described by Dr. Maryatt of Bristol in 1790, and afterwards so strongly insisted upon by Rasori, a professor in Pavia, and by others. A successor of Cullen, one of the most distinguished physicians in recent times, as he certainly was also one of the most benevolent of men, the revered Dr. Alison, who occupied the chair which you, sir, now so worthily fill, when this Association held its former meeting in Edinburgh, he, whom Dr. Stokes has recently described as "the best man I ever knew", and in so alluding to Dr. Alison may be said to have turned many hearts towards himself—for what student who knew Dr. Alison did not venerate him? and who can ever cease to cherish his memory?—when indicating the way by which, in his opinion, the further improvement in the art of medicine was likely to be effected, signalled the two following lines of inquiry: first, in the discovery of specifics which may counteract the different diseased actions of which the body is susceptible, as effectually as the cinchona counteracts the intermittent fever, citric acid the scurvy, or vaccination the small-pox; and, second, in the investigation of causes of disease, whether external or internal—i.e., of the conditions under which either the vital action of the solids or the vital properties of the fluids of the body may become liable to deviation from their natural state. It will be readily admitted by all candid inquirers that, under the latter head, very signal advances have been made during the last half century. Look, for example, at the etiological investigations regarding continued fevers, and the bearing of these upon treatment, with which the names of Jenner, Stewart, Bartlett, Murchison, and Buchanan, are so intimately connected. Again, consider the great advances in knowledge of parasitic diseases—the entozoa more particularly—and their appropriate treatment, for which we are largely indebted to Küchenmeister, Von Siebold, Davaine, and Cobbold. Nothing more interesting or more remarkable in the line of therapeutics has recently appeared than the wonderfully successful treatment of hydatids of the lung by the internal administration of turpentine in the hands of Dr. Bird of Melbourne, Australia.* This is a medicine in estimation of which, were time at my disposal, I could say much, having had occasion to watch its influence very closely when administered in cases of pulmonary gangrene and bronchial affections attended by copious expectoration of fetid pus. In these diseases, I regard turpentine as an invaluable remedy.

* Dr. Bird had formerly used bromide of potassium, twenty grains, with one fluid drachm of tincture of kamela in infusion of serpentry, three times a day regularly. (*On Hydatids of the Lung*. Melbourne: 1874.) I am, however, assured by a recovered patient that, in the treatment of pulmonary hydatids, Dr. Bird now places great reliance on turpentine administered internally.

Of specifics, we still possess but few; while the desire to increase their number is not only legitimate, but is likely sooner or later to be gratified. Of the class of specifics, no remedy better deserves the name than quinine. The potent action of quinine in intermittent fevers thoroughly justifies the application to it of the term specific; and it is to be noted that the curative action in question is to be seen not only in febrile disorders of the intermittent type, but in neuralgias which manifest a similar character. Many ingenious theories regarding the *modus operandi* of cinchona or quinine in these diseases have been advanced; but, up to the present time, we are compelled to admit that we are entirely ignorant respecting the method of action of a medicine in whose power we justly place the very highest confidence. The remarkable effects of quinine in reducing the temperature in pyrexia, and the still more remarkable influence of cold in the same way in hyperpyrexia, of which Dr. Wilson Fox has given some happy illustrations, are noteworthy facts in the recent history of therapeutics.

A remedy of marvellous power and usefulness, the virtues of which we are still only learning, is the iodide of potassium. This medicine was prepared soon after the discovery of iodine by Courtois in 1812, and has been chiefly employed as a deobstruent, alterative, and diuretic. I am satisfied that the diuretic properties of iodide of potassium deserve to be more widely recognised than is generally the case. Its specific action is seen in syphilitic periostitis; for truly the rapidity and completeness with which pain and swelling decline and disappear in instances of enlargements over the tibia and other bones in cases of secondary syphilis are not less remarkable than the readiness with which an attack of intermittent fever or neuralgia yields to quinine. The late Dr. Todd of London remarked: "If there is anything in addition to quinine which deserves the name of a specific, it is the iodide of potassium in syphilitic periostitis". Another remarkable action of this medicine is in aortic aneurism. Iodide of potassium, administered for the most part in tolerably large doses, in this terrible disease exerts a wonderful influence, not only in relieving the neuralgic pains, which are frequently so harassing, but in subduing the local pressure occasioned by encroachments of the aneurism, and in leading, apparently, to firm coagulation within the sac.

It is in the treatment of thoracic aneurism by iodide of potassium that physicians have learned the very remarkable tolerance of the drug manifested by sufferers from that disease. No reasonable suggestion has hitherto been offered regarding the *modus operandi* of iodide of potassium in aneurism. The influence it exerts on the progress of aneurism appears to have been discovered not only empirically, but by the merest hazard, writes Dr. Walsh, "in this point of view, the story of all our really valuable medicines is simply repeated". (*Diseases of the Heart*, 4th edition, page 512.) The names of Bouillaud, Nélaton, and Chuckerbutty are specially connected with the early employment of the iodide of potassium in the treatment of aneurism; while the profession is largely indebted to Dr. G. W. Balfour of Edinburgh for his patient investigation into the subject. (*Edinburgh Medical Journal*, 1868.)

Twenty years ago, little was known regarding the virtues of bromide of potassium. If any standard work on the materia medica of that date be consulted, it will merely be found recorded of this salt that it is diuretic and cathartic, and, like the preparations of iodine, a powerful deobstruent and alterative. Its dose, moreover, is stated in such works, at from three to twelve grains thrice daily. Since then, and more particularly within the last few years, bromide of potassium has rapidly advanced in professional estimation; and, at the present time, it may with confidence be affirmed that there are very few medicines which are more largely employed, and the use of which is attended by more signal benefits. As a calmative and hypnotic, bromide of potassium is largely confided in; but its specific operation in epilepsy is of the most striking description. "It is to be demonstrated, in my opinion," writes Dr. Russell Reynolds, "that there is something specific in the action of bromide of potassium in epilepsy." And the same author observes: "Bromide of potassium is the one medicine which has, so far as I know, proved of real service in the treatment of epilepsy." My own experience of the use of bromide of potassium in epilepsy has been of the most encouraging description. I have repeatedly witnessed cures in the strictest sense result from its employment. Let me briefly refer to one such.

S. A., a bookbinder, aged 50, had for twenty years been subject to severe fits, occurring irregularly by night and by day, often attended by biting of the tongue. The usual interval between the fits had been a fortnight, and on no occasion had a longer period than six weeks elapsed. In January 1870, this patient, whose mental capacity had at that time become considerably enfeebled, so much so as to make it necessary for him to give up his business, began the bromide of potassium, and continued it for eighteen months without any pause. The dose never exceeded twenty grains thrice daily. The result of this treatment was

an entire cessation of the epilepsy; there has been no recurrence of the disease. His mental vigour has returned. He long ago resumed his occupation, and has since been busily engaged in it without any interruption.

I could multiply instances of this kind; and so, I believe, could many practitioners who, in the treatment of epilepsy with bromide of potassium, have been mindful to adhere to the rule upon which Dr. Reynolds insists, that the remedy "should not be discontinued in the treatment of a case of epilepsy because of its apparent failure; but that the dose should be gradually increased, and the exhibition of the drug most patiently carried on for a period of many months, or even years". Epilepsy is a disease which specially attracted the attention of the ancient physicians. It was termed *ῥόσος ἱερὰ*, the sacred disease, by the Greeks; and Aretæus expressly mentions why the appellation sacred was given to epilepsy "for more reasons than one", he remarks, "from the greatness of the evil, for the word *ἱερὸς* also means great, or because the cure of it is not human, but divine; or from the notion that the disease occurred from the entrance of a demon into the man". Plato, in the *Timæus*, ascribes the use of the term sacred to the circumstance of the head or brain being the part of the body affected in epilepsy. "When the phlegm is mingled", he says, "with black bile, and dispersed about the courses of the head, which are the divinest parts of us, and disturbs them in sleep, the attack is not so severe; but when assailing those who are awake, it is hard to be got rid of; and being an affection of a sacred part, is most justly called sacred." Hippocrates combated the notion entertained by his countrymen that epilepsy was peculiarly a sacred disease, one specially inflicted by the gods. In the treatise *Περὶ Ἐpilepsίας Νοσήσου*, he emphatically points out that the incomprehensible nature of the malady is no reason for concluding it to be divine; inasmuch as many other diseases, and notably the paroxysms of intermittent fevers, are just as much above the reach of the human understanding. He believes that epilepsy, like other diseases, results from natural causes. The reader of the remarks on epilepsy in the pages of Hippocrates and Aretæus cannot fail to have his opinion of these great men enhanced; but he also cannot fail to reach the conclusion that the moderns, understanding the nature of convulsive diseases, their connection with altered conditions of the blood, with, for example, anæmia and uræmia, their dependence at one time on central, at another on peripheral, irritation of the nervous system, are infinitely better prepared for their treatment than they were; and this unquestionably holds true of epilepsy.

The use of the remedies we have been briefly reviewing has, in the first instance, been adopted either by mere accident or empirically; nor have we, on this account, any cause for feeling regret. We do not know in what the preservative power of vaccination consists; and yet millions of lives have already been saved by this precaution (Esterlen). A recent and very interesting example of the way in which therapeutical knowledge may be advanced is afforded by what has occurred in the Andaman islands. Dr. Dougall, a distinguished graduate of the University of Edinburgh, has apparently discovered that leprosy sores and other ailments attendant upon that disease can be cured by the aid of oil from the Gurgon tree, which is very common in these islands. Take another disease known to the ancients, although its pathology, still to a considerable extent obscure, has been carefully investigated only in recent times. I mean diabetes; and regarding it, we may compare the treatment pursued by Aretæus, for example, and that which we now employ, with the result of feeling thoroughly assured that many steps have been taken in the right direction, and with signal advantage to suffering humanity, since the writings of the distinguished Cappadocian physician. I do not think the opinion unfounded that, owing to the recent advances in the knowledge of tubercular diseases, etiologically and pathologically, we may look forward with confidence to a decided gain in their efficient treatment; but even now may we not be said to possess in cod-liver oil a very potent means of modifying the progress of pulmonary tuberculosis? In the treatment of this disease and of other allied constitutional disorders, cod-liver oil was first employed in the Manchester Infirmary, chiefly by the elder Bardsley, after the commencement of the present century. Previously to that time, however, an oil obtained by ebullition with water from the fresh livers of several fishes, the ling and skate as well as the cod, had long been a domestic panacea in strumous affections and chronic rheumatism. Subsequently to its use in the Manchester Hospital, cod-liver oil was largely used in Germany; but, falling into disuse in this country, its restoration to professional and public favour has followed the publication of Dr. Hughes Bennett's recommendation of its virtues, in his excellent treatise on that subject. Sir Thomas Watson has very happily expressed the characteristic effect of the remedy in phthisis, when he says: "It is antagonistic to a much greater extent than any other drug of the consuming power of the disease." There are probably few medical men who have seen much of this sad malady

who would hesitate to concur in the opinion of a very high authority—Dr. Williams—that cod-liver oil is more beneficial in the treatment of pulmonary consumption than any other agent, medicinal, dietetic, or regiminal, that has yet been employed. We may justly congratulate ourselves on the possession of cod-liver oil; but it becomes us to remember that the ancient physicians used oil inunction in phthisis. This is expressly stated by Aretæus; and he, as well as Hippocrates, lauds the use of milk in the same disease, preferring it to all other kinds of food. “For,” says the former, “milk is pleasant to take, is easy to drink, gives solid nourishment, and is more familiar than any other food from childhood. In colour it is pleasant to see; as a medicine, it seems to lubricate the windpipe, to clean as with a feather the bronchi, and to bring off phlegm, improve the breathing, and facilitate the discharges downwards. To ulcers, it is a sweet medicine, and milder than anything else. If one will, then, only drink plenty of milk, he will not require anything else. For it is a great thing that, in a disease, milk should serve both for medicine and nourishment.” In fevers, Hippocrates did not allow milk, more particularly in such fevers as were attended by bilious discharges from the bowels. The modern practice is not, in this very important particular, in agreement with the ancient: the highest authorities, as, for example, Gairdner, Murchison, and Parkes, the last mentioned on weighty theoretical grounds, considering milk the best food in fevers.

We have been alluding to the manner in which the practice of medicine has been advanced, and may doubtless be still further advanced, by the simple method of observation and experience. It is true that we cannot entirely depend upon empirical laws. We cannot, for example, feel assured that quinine will certainly cure an attack of intermittent fever, mercury syphilis; or, for that matter, that a dose or doses of any given medicine will exert their thoroughly ascertained physiological or therapeutic action; still, such laws are of the highest value, and we cannot help employing them.

The recent progress of chemistry, physiology, and pathology, has naturally led to the establishment of an advanced school of therapeutics, from whose labours signal benefits may not only be anticipated for medicine, but have already been conferred upon it. To Dr. Lauder Brunton, for example, belongs the great merit of conceiving accurately the therapeutic action of the nitrite of amyl from its physiological properties, and thereby of adding an useful remedy to our armamentarium. And so, also, to Dr. Fraser we are indebted for the elaborate investigations regarding the Calabar bean, which have resulted in a demonstration of its therapeutic value. Care must, however, be taken that the results of scientific inquiry and those of patient, oftentimes laborious, observation in the field of practical medicine running counter, do not interfere with the ultimate grand object of our profession—the healing of the sick.

We are not entitled to withhold remedies because we do not understand their exact nature, nor the minute changes they produce in the animal economy. (Esterlin has well expressed the attitude which, as practitioners of medicine, we are called upon to assume. “The patient requires our aid, and we must decide for or against the employment of a particular medicine, and upon the manner in which to employ it. If we possess sufficient experience, knowledge of the subject, and practical tact, we shall no doubt be able to do all for that patient which circumstances permit.”)

Let each one of us be fully persuaded in his own mind. While deeply interested in, and much instructed by, the experiments performed by a Committee of this Association, regarding the use of mercury, for example, I remain as thoroughly convinced as ever that the much abused drug in question exerts a powerful action on the function of the liver, and is to be trusted as a most efficient remedy in controlling not a few of its disorders.

I regard cold as a powerful antiphlogistic, and its external application, already briefly referred to, as a remedy of unquestionable value in the treatment of hyperpyrexia; but my own observation, and the fullest attention I have been able to give to the recorded observations of others, have convinced me that the real reason for the present abandonment of a remedy of superior power—to wit, bloodletting—does not lie alone in the advance of scientific pathology. “The thinking man,” writes one of the most philosophical of living physicians, Dr. Stokes, “finds it hard to believe that the fathers of British Medicine were always in error, or that they were bad observers and mistaken practitioners. They, indeed, have rested from their labours, but their works remain; and he who reads the writings of Sydenham, of Haygarth, and of Fothergill; of Heberden and Fordyce, of Gregory, Cullen, Alison, Cheyne, or Graves; must have a very inapprehensive mind if he fail to discover that there were giants in those days; and that the advocacy of such ideas only indicates a state of mind not consonant with the modesty of science.”

AN ADDRESS

DELIVERED AT THE OPENING OF

THE SECTION OF OBSTETRIC MEDICINE,

At the Annual Meeting of the British Medical Association,
in Edinburgh, August 1875.

By J. MATTHEWS DUNCAN, M.D.,
President of the Section.

CURSORY NOTES ON OVARIAN PATHOLOGY.

THE application of physical methods to the investigation of the diseases of the genital organs, brought to light, first, the most superficial or most easily observed of uterine lesions—the ulceration, as it was called, of the cervix; and it was inevitable that to this great importance should be attached, an importance far beyond what it really possesses. This importance has now, for at least a decade, been rapidly declining; and while it is admitted that the lesion is very significant, and forms an element of the most common disease of women, it is now well known that it has been not only exaggerated in importance, but misinterpreted as to its relation to the discharge; and that the treatment, by applying lunar caustic through the speculum to the visible ulceration, once so very widely used, is only rarely a good or successful method. Great improvements have recently been made in the theory and treatment of diseases of the neck of the womb; but we can only say that great and admirable attempts have been made to improve in a similar manner the theory and treatment of the analogous diseases of the body of the organ. Endometritis, even, is very inadequately described; and the attainment of this, or should be, our first step to knowledge of disease of the uterine body. The influence of displacements and their relation to uterine congestion are not settled matters, after all the voluminous writing which has been zealously devoted to them.

Advancing knowledge of gynecology brings more and more into view the cardinal importance of the ovaries: organs which have, from the earliest times of true anatomy and physiology, naturally attracted a great share of medical attention, and whose extensive pathological influence in the minor ailments peculiar to women fill and many others have long tried to demonstrate.

It has been very generally supposed that the ovaries are the *fons et origo* of all the sexual functions, reliance being placed on such evidence as is afforded by the history of their growth and activity and atrophy, contemporaneously with the rise, progress, and decline of menstruation and of childbearing; on the results of disorganising disease of both of them; on the results of their accidental absence, or of their removal, as in Pott's well known case. I do not know that this view of the ovarian influence has been entertained in recent times by professed physiologists; but, at any rate, it has extensively prevailed among practitioners, and has only lately been rudely shaken by the observations of ovariologists as to the continuance of menstruation and the occasional persistence of sexual appetite, or its increase even after complete extirpation of both ovaries. I think that of this occasional result of double ovariectomies there can be no doubt, although care must be taken that, in this human vivisectional experiment, all the conditions are truly fulfilled, the whole of both ovaries being removed, and not merely portions of them, or, instead of them, mere parovarian cysts. In antithesis to this argument from removal of the ovaries, we have evidence to the same effect from their occasional functional activity, as observed by Grohe in the newly born, without any evidence of sexual appetite or possibility of sexual potency.

This dethronement of the ovaries from the supreme position in all departments of sexual activity is, however, as yet, not complete; and there is, no doubt, much truth in the view described as being held by practitioners. The rather vague results of the experimental investigations of Eckhard, Obernier, Spiegelberg, and others, have been greatly added to by the further inquiries of many, including Oser and Schlesinger, Goltz and Freusberg. The researches of the two last-named seem to show that there is in the lumbar spine a nervous centre for the sexual function. The phenomena of erection of the penis and seminal emission are so easily made the basis of this experimental investigation that, as a matter of course, males have been used for it, but it is almost certain that the physiological results are true of the female also. These investigations afford, in various ways, possible explanations of the persistence of sexual appetite and activity after the destruction or removal of the organs in which undoubtedly commences the production of those germs for whose growth and development the whole of the complex generative function is arranged.

These physiological questions, purely scientific or merely theoretical though they may appear, are far from really being so; for already operations have been many times performed whose justification lies in the belief that the removal of the ovaries is the annihilation of all or some of the sexual activities. I allude to spaying, or what is called normal ovariectomy by Battey, who, as well as Thomas and Sabine, have done it with what is perhaps justly called success. The proper attitude in regard to it is to defer judgment till more is known about its theory and practice. The diseases against which its performance is recommended, such as nymphomania, menorrhagia, dysmenorrhœa, are not so dangerous to life as the great ovarian cystoma for which the very dangerous ovariectomy is now an operation everywhere admitted to be at least theoretically justifiable. Spaying will be able to produce better statistics of success than ovariectomy—indeed, a nearly uniform success—to be theoretically equally justifiable, for the diseases against which it is used are not nearly so dangerous as ovarian cystoma.

It will be observed that I introduce with care the words "theoretically" and "practically" when I speak of an operation being justifiable; and it is well worth while to point out the difference between being theoretically justifiable and being practically justifiable; and I am particularly interested in this important distinction, because I have been gravely misrepresented by one or two excellent professional brethren as having changed my mind as to ovariectomy. I have made no such change. It is they who have not properly appreciated the difference between theoretically justifiable and practically justifiable: a difference which explains any apparent, but not real, change in my opinion. My remarks will apply to spaying as well as to ovariectomy; but, to save time, I shall refer to ovariectomy only, which has a history convenient for the purpose.

Ovariectomy is theoretically justified, because the possible success of the operation far outweighs the danger of it and the dangers of the disease combined. But theoretical justification is not a sufficient sanction of its performance in any particular case: is not a practical justification. For that you must have other conditions satisfied, and an operator who may be presumed to have the needful surgical skill, or who has demonstrated that he has it by the statistics of his success. When I opposed the operation, I was, as I am now, living in the midst of surgical ability, and I knew of many ovariectomies; but they were, with scarcely an exception, failures, and failures often under the most terrible circumstances: disaster after disaster. The only justifiable practical cry was that of Syme, Miller, Spence, and myself, for mercy on the poor sufferers prematurely deprived of life. The operation was then and there practically unjustifiable. Sufficient trials had been made, and there was no success, or almost none. Who could justly do anything else than oppose ovariectomy there and then? There are at present, even after Spencer Wells has for a long time flourished, many districts, even countries, where ovariectomy, now happily justified theoretically by the whole world, is still practically unjustifiable, and accordingly little, if at all, resorted to. In such districts or countries, the good physician must say to his patient: "Go to some great ovariectomist. If you can't do that, stay at home and die. The operation is not practically justifiable, or not practically justified by success, here." Fortunately for Edinburgh, there appeared among us a true surgical genius. Long before Thomas Keith had achieved his unparalleled success, he had done enough to make ovariectomy here and now not merely theoretically, but also practically justified. Indeed, since he took up the scalpel, we have never heard a word among us against ovariectomy; and as this silence is logically proper, so was the opposition not only logical, but urgently called for.

I hope I have said enough to show the difference between the theoretical and practical justification of an operation; and I may be allowed to add a word as to the rarity of real surgical talent. I do so with the conviction that there are plenty of young surgeons in whom it may be cultivated; and that, in order to its wider development, encouragement, and ripening, we need not merely invaluable theory and systematic teaching, but also invaluable practical teaching, on the basis of the deficiency of present theory and the still persisting necessary distinction between theory and practice. It is very sad to have to say that operations have in practice to be condemned which are theoretically justifiable and supremely desirable. But it may come to pass that spaying gets recognition as an operation justified both theoretically and practically. It is not so yet.

We may anticipate the time when surgical inquiries shall have been advanced so far as to reveal the conditions essential for success in operations such as ovariectomy. At present, they are not known. We know that one operator has a great amount of success, while another has not; and to a very great extent we do not know the cause of the difference between the two. There is no reason to think that the cause of this difference between operators is beyond our powers of dis-

covery; and it is rational and natural to suppose that, when the discovery is made, it will enhance even the success of those previously most successful. Past attempts to discover this cause of difference have been limited to matters of form of clamps, or kind of ligatures, or dealing with the pedicle, or amount of sponging, or method of draining, or mode of after-treatment, and these are all truly important; but the causes of the differences are as yet not demonstrated. When they are so, then great operations will be rendered practically justifiable over a much wider field than at present. Yet, after all, there will never, within reasonable limits of time, be such progress as to reduce surgeons to a dead level. There will always be room for genius and for zealous care.

The subject of ovaritis, acute and chronic, has recently, through the labours of Rokitsansky and Slavjansky, made some progress; the former describing follicular and parenchymatous inflammation; the latter, parenchymatous and interstitial: a nomenclature which would seem to indicate a greater difference in their views than really exists. But, unfortunately, we have no means as yet of using this knowledge in practice. Our signs and symptoms have to be immensely improved before such a result can be attained. Rindfleisch, indeed, from the pathologist's point of view, and Churchill from the practitioner's, have well pointed out that we cannot tell where ovarian irritation, as it is called, ends, and inflammation begins. But, although this is true, we have now the authority of most of those who have devoted themselves to gynecology in this country for saying that we can, in a very great majority of cases of ovaritis, and especially of chronic ovaritis, and still more especially when adhesions are absent, diagnose, by bimanual examination and otherwise, the existence of the disease, with a degree of assurance that, at one time at least, Seanzoni was disposed to dispute. This diagnosis is a matter of very great moment to the practitioner, not only on its own account, for that is a matter of course, but also on account of the value of its discovery as a contraindication—to which Nélaton is said to have attached importance—of various other gynecological operations. There are few kinds of cases more frequent occasions for correction of treatment than those that occur under this category. How often is a pessary intolerable because an ovaritis has been neglected! How often is an uterine catarrh inveterate, or a displacement supposed to be painful, or a metritis supposed to be peculiar, when there is an explanation in the neglect of an ovaritis!

Symptoms and physical examination, especially the bimanual, are our reliance for diagnostic purposes; and, in the bimanual examination, a chief point is the size and consistence of the organ. An enlarged, and consequently a heavy and probably a descended ovary, can generally be felt; while a healthy one, or an ovary merely irritated, may escape the most expert bimanual examiner. The size and consistence of the organ were chief points in Boivin and Dugès's practical classification of kinds of ovaritis, and none better has been proposed. But size and consistence, although often well made out, always escape the examiner in two very important classes of cases: those where the ovary is surrounded by adhesions, and those where it has undergone cirrhotic atrophy. After all, I have no doubt that our improved modern knowledge of ovaritis is one of the greatest steps of progress of gynecology; and it is a blessed one, for the disease, although often obstinate and liable to return, is also often distinctly amenable to treatment. Further aid in diagnosis is offered to us by the rectal examination pushed even as far as Simon has recently recommended, or the examination *per vaginam* recently recommended and practised by Noeggerath. But rectal and vesical examination in such cases are not often required.

One of the most striking advances in gynecology in my day has been in our knowledge of hæmatocele, which I think is generally called by the name uterine to distinguish its origin. But it is well known that some eminent pathologists, and among them the great Virchow, bring in new inflammatory productions in the pelvis as the source of the bleeding; and, as no disease leads more frequently to such developments than ovaritis, so we find Klebs connecting this great disease with ovarian inflammation. The matter is of great importance with a view to the proper appreciation of such cases, and consequently their proper management. Upon the question I shall not further enter here, merely remarking that I cannot agree with Klebs in, as a rule, connecting retrouterine hæmatocele with any kind of ovarian disease. I speak of the great majority of cases; for I have myself seen in life, and dissected after death, cases in which disease, especially cystic degeneration, of the ovary was the cause of large pelvic hæmatocele. I believe that the majority of hæmatoceles are uterine, and not directly connected with ovarian pathology.

There is, alas, far more of darkness than of light in the field of gynecology, and I take this opportunity of stating a conviction I entertain which is founded on considerable experience. We all know how

far from uncommon are those simple follicular dropsies of the ovary, seeing them in autopsies as very thin-walled cysts, often less than an orange. Such cysts are, I am sure, the source of much difficulty in practice, and a retrospective diagnosis of them may be formed in this way. A distinct ovarian swelling is found larger than any ovaritis ever grows, clearly diagnosable as an enlarged ovary; but the diagnosis cannot be made more exact. The commencement of an ovarian dropsy is dreaded. After a time, the tumour disappears. Frequently its disappearance is accompanied by adhesive perimetritis. Now, what has happened in these cases? Of course, it may be said that it is a case of mere ignorance, or that the cysts were parovarian; but, to this latter explanation, there is, for me, the great objection that the cases occur more frequently by far than to admit of their being justly so explained. We must suppose, therefore, the bursting of the not infrequent small follicular dropsies. I would further add that the bursting of simple parovarian cysts does not appear to me to be followed by perimetritis, or accompanied by it, so generally in the case of the disease of which I have been speaking.

In connection with parovarian cysts, a great step of good progress in practice has been made, and progress also in pathology. Such cysts used generally to be described as never reaching a great size, but this is not true. They do certainly attain enormous dimensions, so as to be in competition in this respect with true ovarian cystic disease. After death, or when they are removed by gastrotomy, they may, at least frequently, be easily distinguished by characters which Bantock has recently described; chief among them are the non implication of the ovary, the almost invariable unilocularity (not surgical, but pathological or absolute unilocularity), and the easy separation of the peritoneum from the internal coat of the cyst-wall. During life, they are also, at least occasionally, diagnosable by examination of the fluid withdrawn by tapping from examples of them which have never been inflamed. Then we find the fluid to be limpid or very slightly opaline, of very low specific gravity, containing little or no albumen, and having in solution only a little saline matter, chiefly chloride of potassium and of sodium. Such cysts have been long known and partially described. Even yet they are imperfectly described; but it is interesting to note a kind of identification of them in those ovarian cysts which Boinet found to be most readily cured by the once famous iodine injection. Only the important fact is now known that many at least of such cases are far better cured by mere tapping than by that combined with iodine-injection; and the practitioner should always keep in mind these propitious circumstances when he meets with cases of this kind. The subject of parovarian cysts, when fully made out, will be still further interesting and fruitful in gynecology; for already we may presume that the numerous kinds and examples of cures of ovarian dropsy, without resort to ovariotomy, which have been described by many, including the highest authorities, were merely examples of delusion arising from imperfect knowledge. We know no one example of the cure, otherwise than by the operation of Ephraim McDowell, of an ovarian dropsy properly so-called; not one, however many may be found described, or whoever may be the describer. Cures by one or moreappings, cures by medicines, cures by spontaneous rupture, cures by advancing pregnancy, have been, if not mere egregious mistakes, almost certainly cures of parovarian cysts whose history, as already known, quite accords with and explains such erroneous allegations. These remarks are based chiefly on observations of parovarian cysts that have never been inflamed. The study of inflamed cysts is still in a very backward state. Their pathology and treatment are matters of great difficulty. It must also be kept in mind that simple inflammatory serous collections take place in the peritoneum, and may be mistaken for parovarian cysts.

Ovarian cystoma is the great disease of the ovaries, and improved ovariotomy is the greatest recent step in therapeutics. It is probably to the inspiring influence of the beneficence of this operation that we owe the great amount of scientific exertion that is being made in the field of ovarian anatomy, physiology, and pathology; and already the student may catch glimpses of justly expected practical fruits of this scientific zeal which will enormously extend the utility of the practitioner.

The anatomy and physiology of the ovary, closely connected as they are, have recently received many additions, and more may still be expected from the application to them of the newest methods of investigation. First among these researches comes the histological anatomy of the organ, and here we find the most recent views of Waldeyer receiving, besides verification, addition also and correction by the excellent work of Foulis. Like Waldeyer, this author, beginning with the normal ovary, pushes his studies into the more difficult and more vexed inquiries as to the origin and growth of the multiple ovarian cyst. These points have by many, and frequently, been supposed to be settled; but it is a vain thought, as any one may find who tries to

unravel the divisions and subdivisions of recent pathological writers, and then peruses the most recent inquiries and setting forth of views by such authors as Malassez and Foulis.

To notice the whole of the work that is being carried on in connection with this department, is far beyond my present intention. I shall merely, in conclusion, make brief reference to the difficult questions in connection with the malignancy of ovarian cystoma. The uterus, although far from being an isolated organ, is generally regarded, among others by Walshe, as remarkable for the slowness or rarity of the spreading of cancerous disease from it as a centre, the slowness or rarity of what is now called the infection of neighbouring or distant parts. There is, on the other hand, no organ in the body which is actually more isolated than the ovary, whether in health or disease, at least so long as it has no adhesions; yet many pathologists, especially Klebs, who cites various authors, have attracted attention to cases of apparent infection, especially of the peritoneum, having malignant ovarian cystoma for their source. The diagnosis, especially in their earlier stages of growth, of even large malignant ovarian cystomata, is often a matter of great difficulty, and the examination of the fluids drawn off by tapping is anxiously made with this view, but, as yet, without completely satisfactory results. In fact, we have, in all departments of ovarian diagnosis, more to admire in the zeal and diligence of histologists, in regard to the fluids, than in the exactness and reliability of the practical results they can show. In connection with burst and unburst ovarian cystoma, it is well known that chronic peritonitis of great extent is often set up and long maintained; but the examination of the fluids has led Foulis to the belief that in the bursting of malignant ovarian cysts we have a new kind of evil, an explanation of the infection of other parts, and especially of the peritoneum, with malignant disease. While the diffuse chronic peritonitis is explained, to some extent, by a rude induction of analogies, the diffusion of cancer is less understood. Foulis believes he can identify in the fluids of certain ovarian cysts a peculiar richly proliferating epithelial cell which he regards as the seed sown broad-cast, when a malignant cyst bursts, over the peritoneum, finding in any part of this large surface a suitable soil for its further development into cancerous nodules, such as are seen in the ordinary malignant peritonitis, as it is sometimes called. To the discussion of this subject, Thornton and Lawson Tait have contributed, and we hope that, as a final result, the truth will be elicited. We shall then have ovariologists instructed and guided as to the special urgency and claims of a class of cysts that may be equally important and urgent with those which are in a condition of suppuration.

I might still further enlarge on the present state of ovarian pathology, had I not already overpassed the proper limit of time. Many diseases and many researches I have not even hinted at, and the silence is not to be attributed to neglect or to an estimate of inferior importance.

In opening the section with these remarks, I congratulate you on the promise of interest that is offered by the list of papers to be read, and I can assure you that everything which contributes to increase, improvement, or illustration of our knowledge, will be received with the respectful attention which it ought to command.

AN ADDRESS

DELIVERED AT THE OPENING OF

THE SECTION OF PUBLIC MEDICINE.

*At the Annual Meeting of the British Medical Association,
in Edinburgh, August 1875.*

BY THE RIGHT HON. LYON PLAYFAIR, M.P., C.B., F.R.S.,
President of the Section.

I HAVE recently delivered so many speeches and addresses on public health that you will not expect me to do more than give some practical remarks on the recent efforts of the legislature to improve the health of the people. The present session of Parliament has had under consideration several important sanitary measures. Modern sanitary legislation dates from the year 1846, when Parliament carried out many of the recommendations of the Health of Towns Commission by a large and comprehensive Act to promote the health of communities. Since that year, Act after Act has been supplemented on the main one, as the necessities for increased powers arose. And, at last, sanitary laws became so cumbersome and complicated that neither experts in law, nor experts in hygiene, could master the accumulated legislation on public health. A Royal Commission sat a few years ago, under the presidency of Sir Charles Adderley, and recommended a consolidation of sanitary law. The president of that Commission prepared, not without much labour, a Consolidating Bill, upon which the present Government

have considerably improved by judicious condensation; and now an Act has been passed which repeals the numerous Acts of previous years, and consolidates them into one statute. It is rarely wise to attempt such consolidation while law is in flux. Bacon long ago described the danger of such a proceeding, when he pointed out that the conversion into method of changing subjects results in fixing and stereotyping them into a form which resists further change, and therefore arrests their progress. Now, sanitary law is eminently in a state of flux. We have been groping our way very much in the dark as to the means of attaining the ends which we desire to reach. Organisation is altogether deficient. Medical officers of health, who more and more are being made the motive powers of sanitary administration, are appointed at haphazard, without being required to prove their knowledge of, or qualifications for, their important duties. Some of them have a single parish in charge, for which they receive a nominal fee, and probably give nominal work. Others have a thousand square miles, with a substantial salary, but with an area too large for efficient management, unless they are aided by assistant medical officers of health. Again, the sanitary law in regard to the prevention of disease is yet in its infancy. Our knowledge on this subject grows from day to day, and requires continued formulation into accreting law. If, then, the consolidation of law which has been accomplished this session meant, as it usually means, the stereotyping of law for a long period of time, you would join with me in deploring the result. But the responsible minister who introduced it, Mr. Selater Booth, gave the most distinct pledges that it was not to be considered in this sense. And with this assurance, we may well congratulate ourselves that a consolidated statute gives a firmer foundation than the old shifting patches of law, upon which our permanent sanitary edifice may be built. It is in this view alone that all sanitarians will gladly recognise the Consolidating Act of this session as an important contribution to sanitary law. As an amending Act, it is altogether trivial; as a consolidating Act, it is distinctly useful.

Another sanitary measure to improve the Dwellings in Large Towns has also become law. Its objects are excellent, and it has received much attention from Parliament. Will it be productive of much good? In towns animated with the spirit of Edinburgh, Liverpool, and Glasgow, it certainly will. They have already shown by local Acts how much may be done to improve the unwholesome dwellings of crowded populations. Let us hope that there are other towns which will follow their example. I am not confident that as yet many will do so; but the necessity for action will in time force itself upon local authorities. London will certainly use the Act, and root out some of its nests of disease and crime. But it takes a long period to remedy well recognised evils. Recollect how Queen Elizabeth, in her vigorous language, spoke and legislated against overcrowding of cities; and observe how little progress we have made to arrest ills which monarchs and legislators, several centuries ago, recognised as clearly as we do at the present day. The new statute is only permissive, and is limited to towns of twenty-five thousand inhabitants. It must be followed by an Act applicable to smaller towns and country districts, if it is to exert any marked effect on the general evil of overcrowding, which is common to all gatherings of people in civilised communities. In strictly rural districts, as in the Highlands of Scotland, you may have wretched houses, filthy outside and in, crowded and unventilated except by defects in the building; and yet the people have not a high death-rate. In the day they are out in the uncontaminated air of the mountains, and are isolated from epidemic influences. But the more that a community becomes congregated, the more marked becomes the influences of unsanitary homes. You see this especially in savage life. The American Indians on the war-track, daily changing their position, have remarkably small mortality; for the bullets of the whites strike them less surely than diseases do in their permanent wigwams. These Indians in peace die rapidly, not only from that introduction to fire-water which they owe to civilised man, but also from the unsanitary conditions of their dwellings. When things grow too bad, however, they change their encampments, and the mortality lessens. But when the Christian missionary comes among them they are doomed; for they become fixed in villages, with all the traditions of their modes of uncivilised life still clinging to them; and, unable to change their locality, the fatal effects of overcrowding and filth tell upon them with far more severity than the bullets of their enemies in their life of savage warfare. You see all this in a less degree among the inhabitants of country districts who flock into our towns. For this congregation into towns is the characteristic of the age. Hamlets rapidly become villages; villages concrete into towns; and towns become great cities. And with every increase of density of population, there is an increase of the rate of mortality, not as a necessity, but as a consequence of sanitary organisation being defective in the provisions for removing filth and giving an abundant supply of air to accumulating inhabitants. These are the evils which the new statute for im-

proving the dwellings of towns hopes to remove. But a permissive law depends upon a ready formed intelligence for its application, and I confess my misgivings as to the immediate or general utility of the measure.

The law relating to Adulteration of Food and Drugs has been remodelled this session. Its chief changes have been in relaxing its provisions in the interest of traders, and in diminishing the securities which the former law gave to the public. However, the main effects produced by the last law will be continued in the present one, so that the poor will still have the benefit of unadulterated bread and milk. These two staple articles of food are now scarcely adulterated, since detection became easy and certain. There is one kind of vitiation of food and drink at present altogether outside legislative prevention, but which must before long be brought under the dominion of law. I allude to common articles of food being made the vehicles for the transmission of contagious diseases by containing within them particulate contagia. Our evidence as to various articles of food is still inconclusive, but that in relation to water and milk is thoroughly convincing. Our knowledge as to the propagation of contagion is like all other knowledge, passing from occult to simple causation. The human mind seems incapable of accepting the most obvious and simple explanations of natural phenomena, till it has exhausted the most reconde and complex interpretations. So in olden times, and in part at the present day, men looked for sources of contagion above and beneath them, as in celestial conjunctions and emanations from the bowels of the earth, but not in their own surroundings. When we enter any new field of inquiry, we grope with our eyes bandaged, and traverse it in every direction, from one side to the other, though, when the bandage is removed, we are surprised to see how limited the field is in extent, and how easy it is to take a short cut across. We have reached this stage in regard to food and drink. We begin to see that in any case of common epidemic, such as scarlet fever and measles, we are not only to investigate epidemic waves propelled by some unknown law, but we must examine whether the food of the population may not be infected by some diseased person. Take the case of the epidemic of scarlet fever in St. Andrew's, investigated a few years ago with so much ability by the late Professor Bell. In that small town, the epidemic, though apparently general, was more frequent among a better class of houses. Then the able physician noticed that all the houses attacked were supplied with milk from one dairy. The dairy, on being visited, had scarlet fever on the premises, and the people who milked the cows were convalescents from the disease. A very instructive case of this kind occurred only a few weeks since in London. A member of the present Government had a dinner party, and an evening reception afterwards. None of the guests at the latter observed any particular effects from their visit, but eight of the dinner guests and seven of the household took scarlet fever. All of these partook of a cream which, it is believed, contained the particulate contagium. One or two streets off, there was another dinner party, and four of the guests took scarlet fever. This case has been investigated by one of the medical officers of the Local Government Board, and we may expect an exhaustive report on it. We have already numerous examples of this propagation of disease through food and drink. The Marylebone fever of 1873 is equally instructive. That enteric fever is known to have attacked 143 households, and was clearly traced to infected water, used for dairy purposes, connected with one particular quality of milk, which was distributed in sealed cans. The epidemic was arrested as soon as the milk-supply was no longer distributed. The enteric fever at Armley, in Leeds, was allocated to a particular dairy in the same way, and was stopped by chaining up the pump which supplied water to the dairy. Now, such illustrations of the distribution of contagium are very important, because the source of it may be altogether outside the locality in which the disease is manifested. In the case of the Marylebone epidemic, the polluted well which infected the milk was in Buckinghamshire, and, therefore, might naturally have escaped attention, unless the investigation had been minute and exhaustive. In the cases which I have mentioned of water-pollution, it is usually traced to the most foul of all filth, the intermixture of excrementitious drainage with the water which man uses as a beverage. When introduced into the system as a fluid, though the contagium is not soluble, it seems more certain in its effects than when respired as air. We may err on the side of grandfatherly legislation; but is it possible to allow the law in relation to food to remain as it is at present? You punish a soda water manufacturer if lead be in his distributed beverage; but hitherto he has been allowed to use what water he chose to make aerated drinks. If the water contained sewage, it was found by experience that lemonade would not keep under such conditions; but the common aerated drinks do. In the recent Adulteration Act, we managed to insert a clause requiring the use of pure water for aerated beverages; and this provision of law may become a precedent for future

legislation. For the distributors of food and drink must be made responsible that they do not distribute contagious diseases with them. When, for instance, we had Dr. Frankland's continued reports that the water of one London Company contains distinct evidences of excrementitious matter, the moral responsibility of a distributing water company becomes very serious, and its legal responsibility is only one step forward in the history of preventive hygiene.

We have lately suffered from a powerful epidemic wave of Small-pox; and it will be a matter of great interest to study Dr. Seaton's forthcoming report upon the results of our preventive measures in regard to this disease. If we have failed when we possess a specific preventive remedy in vaccination, we may well be despondent. But I do not think that there has been a failure. Small-pox epidemics are numerous; in fact, they occur at intervals of about four years. But since the great epidemic of 1837-41, there has been none so serious, either in extent or in malignancy, as the epidemic of 1870-3. It travelled as a wave over all Europe; and we are able to compare its attack upon this kingdom as contrasted with that on other countries. In last century, before vaccination was general, the annual small-pox rate of death was 3,000 per million of the population, including non-epidemic as well as epidemic years; as a mean of the late epidemic, it was 928 per million. But that difference, gratifying though it be, tells us little. Compulsory vaccination has only been reached by successive Acts; and the population below five years of age had scarcely been covered by them in 1870, when the epidemic struck us. Previous to these compulsory laws, three-fourths of the small-pox mortality were among children under that age; but, in the recent epidemic, less than a third of the mortality in England, and less than a fourth in Scotland and Ireland, was due to young children. Our compulsory laws gave them a large, though not complete, immunity from the force of the attack. We learned, moreover, by this attack that the protective power of vaccination wears itself out, and that it requires repetition at puberty. The most gratifying result of a general survey is that our protection laws against small-pox, defective as they still are, seem more efficiently administered than those of other countries. In former epidemics, our rate of mortality contrasted unfavourably with them; but, in the late epidemic, this was reversed. While less than 700 per million died in the chief towns of Scotland, and 1,180 in London, Berlin lost 3,448, Hamburg 5,717, Leipsic 6,200, and the large Dutch towns 6,455. The general result of our protective laws against small-pox may be summed up thus: at the rate of mortality in the last century, we should lose 70,000 of our population annually by this preventable disease; whereas our annual average mortality in England is now about 5,000, and was only 3,500 until the last severe epidemic raised the average.

Let us now consider the position of our ministry of Public Health, as represented in the functions discharged by the Local Government Board. That Board has two main purposes to discharge; viz., to superintend public health and pauperism. It is reasonable to join them under one administration, for they are closely connected as cause and effect. But, though both should be made subjects of prevention, pauperism is an existent evil of such persistence, that it is treated chiefly as one of economical administration, and thus it happens that sanitation is viewed in the same light, although its chief relation to public interests is in the prevention of disease. The Local Government Board has never yet fully realised its preventive functions. It looks upon its medical officers of health, much as it does upon its Poor-law medical officers, as curers, and not as preventors of disease. The difference of their functions was well described long ago by Xenophon, in his *Cyropædia*; for he states that ordinary doctors are "menders of garments which are already torn", while sanitary officers have "a care of health of a nobler kind; for it is their duty to prevent the men from becoming sick". As the name of the Central Board implies, it ought to foster and not to discourage local government. But, if there be one thing which local authorities might be expected to possess, without being imparted by a Central Board, it is common sense in the transaction of business; and, if there be one thing which a Central Government ought to give, it is scientific sense which is not common. But here the Local Government Board completely misunderstands its functions; for it crams common sense into local authorities already saturated with it, and refuses them the scientific sense which they cannot be expected to possess. Its estimates already amount to £695,000, of which only £93,000 are applied for all kinds of prevention, including the sanitary officers and inspectors of the Board, the vaccination system, the Alkali Act, the medical officers of health and inspectors of nuisances. The "menders of torn garments", as Xenophon would describe the Poor-law medical officers, absorb £127,000 more; but I am inclined to add that sum to the preventive staff; for I think they do very largely act as preventors of pauperism in the cure of disease. The Local Government Board, by its present and past ministers, uphold powerfully the

independence of local authorities from medical despotism. They think it a gross interference with local authority that the skilled medical experts in London should advise local boards as to their procedure in the eradication of local causes of disease; but they think it no encroachment of central authority when guardians are not allowed to change gruel for arrowroot in a workhouse dietary without the permission of the President of the Local Government Board. If there be some small excess in expenditure in a local authority, down goes one of the thirty-nine Poor-law auditors to audit the accounts. But the idea of auditing the death accounts of the same authority would be deemed to be a wanton interference with the independence of local government. Yet such an audit would be incalculably beneficial, in an economical point of view, both in its relations to the prevention of disease and of pauperism. If one district have a rate of mortality of seventeen and another locality one of thirty-four in the thousand, a rigid medical audit of the death accounts is called for, in order to discover why there is such an unequal local assessment of life, and why one population is taxed so heavily by a double rate of deaths. Such an audit of death accounts involves in its exercise the scientific sense which I have described as uncommon, and which cannot be possessed by the local authority, whose common sense the Local Government Board so rigidly bridles by central interference.

It is quite true that the Local Government Board sends down medical inspectors to localities to investigate diseases when they have become a scandal to the community; and these officers have often been useful in detecting the causes of the prevalent diseases; yet, practically, there are only three medical inspectors available for this duty. Out of 1,588 boards, they managed last year to visit 57, and this fractional aid was not very substantial. What I desire to urge is, that their duties should not be detective, but preventive. No doubt, prevention cannot be effectively carried out until there is a public registration of diseases as well as of deaths; for the former represent the wrecks which strew the shore after the storm has passed, while disease-registration would give us the rising and falling of the barometer required to give ample warning of the coming storms. It may be difficult to obtain full knowledge of contagious diseases in private practice, but there should be no difficulty in organising a system by which all such diseases as are treated at the public expense, in hospitals or by Poor-law medical officers, should be made available for the purposes of public hygiene.

I think that the House of Commons will soon take this matter into its own hands. A new department like the Local Government Board, with an expenditure of nearly £700,000, ought to be looked upon with much public watchfulness. If it have any justification at all in its relations to public health, that must rest in its powers of preventing disease in the localities which it governs. Does it succeed in this primary function? Is preventable disease, other than small-pox, prevented by its agency? I cannot answer these questions either in the affirmative or negative. There are no means for doing so, either in the reports of the Local Government Board or in those of its medical staff. In the latter, indeed, I find important investigations of epidemics which have run their course, and an excellent history of their causation. But I find no accounts of action taken to prevent these epidemics from occurring. I find no action described upon an audit of excessive rates of death. The President of the Local Government Board did tell me, in debate in the House of Commons, that he had quarterly returns of death-rates put upon his table, and that he directed inquiry if he found them excessive. Well, utterly inefficient as such a quarterly examination would be, I want to know the results of them. The nation has a right to a specific answer to the question, Is preventable disease prevented by our great expenditure on a central administrative machinery, and by the constant increase in local rates? For no less object is such expenditure justifiable, or should central interference with local government be tolerated. But all the elements for answering this important question are absent from the information given to us by the Local Government Board. I take this opportunity of giving notice that, as far as the influence of a single member of the House of Commons can be effective, I intend to use my constitutional rights to obtain the information necessary to enable the nation to judge whether the Local Government Board is effective in preventing preventable disease; for no lesser function justifies its existence, either in its relation to public health or to pauperism, which stands in such close causation with the insanitary state of communities. It is by a constant care in preventing the growth, or in removing the accumulations of filth in and about the dwellings of the people, that the watchful public officer of health can hope to prevail against disease. He knows well that pure air, pure water, and pure soil are the main conditions for the health of communities when they are earning wages enough for their comfortable existence. The simplicity of the ends in view is not disturbed by the

complexity of the problem how foulness acts in producing disease. There may be filth without disease of an epidemic sort. King Edward II, when in confinement at Berkeley Castle, was placed in a room contiguous to a well into which carcasses of horses and dogs were thrown, in order to poison him with their effluvia; but the poor monarch would not die, and his entrails were burned with red-hot irons. Yet a sanitarian would know that not only the king, but all in the castle were in jeopardy by the foul experiment; for a single particular microsome of a fatal disease might have planted itself on the filthy soil and multiplied exceedingly.

Even the septic living germs of disease may be wanting under certain conditions; but more generally they are present to attack the bodies of the living and to corrupt the bodies of the dead, if they find a filthy soil suitable to their growth. Though the royal captive escaped the deadly effects of his exposure, prisoners before the time of Howard were notoriously victims to like influences. Tennyson, in his recent drama, thus describes the effects of filth on captive heretics.

"In breathless dungeons over steaming sewers,
Fed with rank bread that crawled upon the tongue,
And putrid water, every drop a worm,
Until they died of rotted limbs; and then
Cast on the dunghill naked, and become
Hideously alive again from head to heel,
Made even the carrion-nosing mongrel vomit
With hate and horror."

Independently of all theories of causation, we know that diseases require filthy surroundings in the air, water, food, clothing, and soil before they become permanently located. A great wave of an epidemic may pass over all our sanitary barriers, though the ordinary and lesser waves are broken by them. The greater and lesser epidemic waves are, like storms in the air, beneficent remediators of a disturbed equilibrium; for pestilences, in relation to whole populations, resemble that angel of mercy who stood in the way of the prophet armed with a sword, ready to smite if he had not turned from his evil course. So, when mankind allows itself to be sapped and undermined by the insidious consequences of sanitary neglect, so that the members of a community lose their manly strength, their morality and liberty, then pestilence falls upon the degenerate society and rouses it to a sense of their danger. When the sanitary neglect is general, an epidemic gathers itself up in a wave and sweeps along till it meets with some barrier, like an outstretching headland, to break it in its course. Certain diseases, in their epidemic form, appear to break up entirely under the improvements of civilisation, or at least cease to travel in their former force. Instances of black death and sweating sickness are still said to appear in remote parts of India and Persia, but, like the typhus gravior of our large towns, are unable to accumulate into the waves which some centuries ago used to sweep all over Europe. The plague of the East, which still gathers itself up into a frowning crest, breaks before the sanitary barriers which the civilised communities of modern Europe have raised against its progress. But as yet these have been insufficient to meet the cholera wave which every few years threatens to pass over us. We have lately seen it pass with more or less strength over our continental neighbours; but it has broken upon our own shores, and has not traversed the country. Is this due to our sanitary improvements? It would be premature to answer in the affirmative; for at the present moment we see another threatening cholera wave gathering itself up in the East, and we will have more reason for confidence if it again break innocuously on our sanitary barriers. The recent serious epidemic of small-pox should teach us that, though we may be better prepared than other countries for such visitations, yet our preventive medicine has much to do before it has exhausted its powers for the protection of the people. It is because I earnestly desire that our State authorities charged with the care of the health of the people should constantly inform us of their successes and failures that I have, through you, to-day urged the necessity of a national audit of death and disease. But this audit should not be a mere central one. The Local Government Board ought, of all administrative departments, to develop a system of local government as distinguished from a central bureaucratic government. When improved local organisation of authorities renders that possible, the Central Board should more and more exert a guiding rather than a controlling influence. Registrars of sickness and death must first be made useful in each locality, for they stand small chance of accomplishing their work of prevention of disease if the whole responsibility for using them be thrown upon the central authority. Thence should emanate the scientific knowledge necessary to apply facts to a general system of useful application; but unless the medical officers of health are trusted by the local authorities as their immediate sanitary advisers, and are encouraged to use the knowledge of sickness and death, gathered in the locality, for the prevention of disease, local government will con-

tinue to be looked upon as an unpleasant machinery for augmenting rates, and not as one for economising the life and resources of communities. And so, in my opinion, not increased central administration, but more effective organisation of local authorities, is the crying want of sanitary progress.

An improved organisation would enable local authorities to obtain more highly qualified medical officers of health than they can possibly obtain at the small salaries frequently offered. Although many of them were appointed without adequate knowledge of public hygiene, there has been much growth of technical knowledge among them, and already about nine hundred furnish specific reports of their labours to the central government. Many of these are characterised by great ability, but their influence extends little beyond their own locality, and hard-won experience is lost for the public good. When local organisation is improved, and the central authority is brought into more effective scientific relations with it, we may see an immense impulse given to preventive medicine.

AN ADDRESS

DELIVERED AT THE OPENING OF

THE SECTION OF PSYCHOLOGY,

*At the Annual Meeting of the British Medical Association,
in Edinburgh, August 1875.*

By WILLIAM H. LOWE, M.D., F.R.S.,
President of the Section.

GENTLEMEN,—Allow me, in the first place, to thank you for the honour you have done me by placing me in this chair—an honour, I beg to assure you, I very highly appreciate. I must, at the same time, say, as I glance around me, I feel that you might easily have selected one who would have more ably fulfilled the duties now devolving upon me. As, however, it has been your good pleasure to elect me your President, it only remains for me to do my best to merit your choice. As I have only now for the first time become a member of the British Medical Association, I hardly know what may have been customary by my predecessors in office; but, in the face of this fact, that our secretaries, instead of having to beat up for papers to be read, are, on the contrary, rather embarrassed by their riches, and find it difficult to assign time for the perusal and due discussion of a variety of highly interesting topics, my own remarks will be extremely brief.

I have often contemplated that which I think must be admitted as an indisputable fact; viz., the fashion which obtains in medicine, what I may term the ebb and flow of medical opinion, both as to remedial agents and methods of treatment. For example, it is not long since the familiar antimonial wine was almost universally prescribed; now how little it is employed. Warm plasters to the loins, strengthening plasters to the chest, cupping and dry-cupping, and fifty other things easily remembered, were considered invaluable. I will not say the trade of the leech is gone; but certainly leeches now are scarcely sold; and, to point to a more recent instance of the caprice to which I allude, podophyllum was introduced within the easy recollection of us all by a practitioner of high and well deserved repute, and yet I am told by the druggists that at present it is rarely made up. Even cod-liver oil, as Dr. Bennett reminded us, was not a new remedial agent, only one revived after being out of fashion for an indefinite time. These medicines were not inert, nor the remedies inefficacious; nay, many of them were valuable, and amply bore out the reputation given by those who originally introduced them; still we see they have their day, and are then shelved and forgotten until, by a turn of fashion, they again appear. Nor will anyone, I think, deny that this fashion, this ebb and flow of opinion and practice, has not obtained in that particular branch of medicine which we call the Psychological School. At one time, Indian hemp was said to do wonders; at another, ergot of rye. A few years ago, we heard a good deal of the pack-sheet and Turkish baths, and very many other things we all know have from time to time been extolled, and then, without other reason, as far as I can see, than no longer possessing the charm of novelty, have fallen into disuse, or taken their place as measures to be occasionally resorted to by the intelligent physician; and who dare say but that chloral and bromide of potassium, our sheet-anchors at present, will not in turn give place to remedies themselves to have their day? I am not in the slightest degree depreciating either the remedies or practices to which I have alluded, but only ask how this perpetual revolution of opinion is indicative of progress, and I believe we shall be inclined to admit that ebb and flow may take place without advance: and yet this was all we had arrived at apparently until a few years ago, when something more than a tem-

porary fashion in psychological medicine might be seen to dawn on the horizon. It was, in this country at least, from the slight but brilliant scintillations which emanated from our venerable friend W. A. F. Browne at Dumfries that a truer and more lasting course of study was inaugurated. Psychology is only now in its infancy; happily, the infant is a vigorous one. I hardly know what our venerable friend already alluded to, Dr. Browne, will say to my having thus, in the evening of his days, affiliated upon him this promising infant; but I think we shall all be ready to acknowledge the paternity, and that it is one the distinguished father need not be ashamed of. I need not trace how the little rivulet from these small beginnings has swollen into the stately river, increasing year by year in volume and power; indeed, it would be impossible for me, in these hurried remarks, to trace the progress of psychology from those early shreds of information up to the present ample and systematic course of instruction which is now presented to the student; but those who have thus contributed to this great end are all known to you, and their well deserved merits are reiterated, and fondly reiterated, year by year; for who does not love to record and to dwell upon the successful labours of those so lately passed from among us? If to Dr. Browne belong the first steps in psychological instruction, can we forget the more recent and more systematic teaching of our late friend Dr. S. Rae? But the registration of undoubted facts in pathology, or the observations of experimental physiology, no wave of fashion can obliterate, no ebb and flow of opinion efface; and it is to these the psychological student of the present day applies himself, convinced that aberrations of mind must be connected in some way with lesion of the brain, or at most the nervous system. He devotes himself to these, content, perhaps, with small results, if only the facts observed be true. A very few years ago, the now well recognised disease of general paralysis was scarcely known; now, alas! how little is treatment available, except to prolong "a wretched existence"; but who shall say to what results the pathological observations of that disease, first made, I think, at the Royal Edinburgh Asylum by my friend Dr. Howden, may presently lead? At all events, let us contrast the value of such researches with the speculations and practices of a former generation, when we floated on the opinions of the day, guided by little else but phenomena of the cause of which we were entirely ignorant: with the pathological observations and microscopic structural examinations which now occupy the psychological student. Let me for a moment state what I can recollect, and what is now the case. It is even in my day, and in the remembrance of many here, that our asylums were, many of them, dens, or at best only receptacles for lunatics; they are now, throughout the country, a credit to our humanity and civilisation; and, instead of being dens or mere homes for the insane, each one may be regarded as a School of Psychology. Instead of psychology being tacked to the end of the course of medicine in the lectures of our university professor, public lectures and clinical teaching are provided for any who may desire to cultivate this most important branch of medicine.

If such be the progress made even in the remembrance of myself and many now present, is it too much to predict that, ere many years have passed, we shall see not only extramural teaching, but, in this University, a Chair of Psychological Medicine? This subject will never be justly estimated or fitly taught until this important step is gained. The present professor of medicine, Dr. Laycock, whose efforts have ever been directed in forwarding the science of psychology, will not, I know, be the one to retard its progress.

Were every commissioner in lunacy and every physician of an asylum compelled to produce his diploma in psychological medicine, and were the class at the same time, open to the general student, who can doubt but that this great measure would be realised, and, more, be self-supporting? Perhaps there are those now present who smile at my thus going into detail respecting a chair *in nubibus*; but, if our psychological infant have advanced in thirty or forty years' course of time to present such an aspect as he does this day, and to occupy in this great medical Association a distinct and definite position, constituting a special section in its comprehensive scheme, I believe I am neither too enthusiastic nor too sanguine in believing that in much shorter time than has accomplished the present hopeful state of things the imaginary chair I have sketched out will be attained.

Before sitting down, I shall beg to make one other observation of rather a practical character. It was recently remarked to me by an intelligent and well-educated physician, who had been listening to a discourse on insanity, that he had been deeply interested in it, and regarded the lecture as a most valuable one; but he added, impatiently, "Why can't the man speak in English?" I was so occupied in endeavouring to give the just meaning of some of those long words, that I

continually lost the thread of the discourse." I am well aware it is not easy to discuss a scientific subject in words merely Saxon, and that we are driven to employ a few terms more than our mother-tongue has taught us; still, is the exponent of science more learned because he shrouds his subject in language so obscure that his professional brethren cannot readily apprehend it? Will it further a subject, or tend to its more favourable reception, if it can only be understood by the aid of a glossary? At all events, I think we may take the hint from the gentleman alluded to, and refrain from the use of a Græco-Latino-German word where one of plain English will suffice.

With these few and imperfect remarks, we will pass on to the business of the day; viz., a most promising paper by Dr. Clouston, our metropolitan physician, as I will call him, of the asylums in Scotland.

REPORTS AND ANALYSES

AND

DESCRIPTIONS OF NEW INVENTIONS

IN MEDICINE, SURGERY, DIETETICS, AND THE ALLIED SCIENCES.

HAWKSLEY'S NEW ETHER-INHALER.

THE apparatus consists of a glass chamber (A) capable of holding ten ounces of ether. The sliding tube of the inlet valve (B) is graduated into ounces for the purpose of measuring the consumption of ether. The pipe (C D) conveys the ether-vapour to the face-piece (F), the edge of which is surrounded by a water-cushion, for the purpose of more closely

fitting the face. The shutter-valve (E) is for regulating the admission of air either at the beginning of an operation or during its progress. The pipe (I) and the valve (H) convey the expired air to the floor. The glass vessel (A) is half immersed in water, heated to 100 deg. Fahr., in order to promote a more rapid and equable evaporation of the ether. For this purpose, the metal case in which the apparatus is carried is used as a bath, the glass vessel being placed in the cell and surrounded by the warm water. The ether boils at about 90 deg. Fahr.; but before the quantity contained in the chamber (A) has reached that point, the temperature of the surrounding water has fallen; and, even were the temperature of the water sustained, the constant circulation of the external air prevents the boiling of the ether. The time required to produce insensibility to pain is from three minutes and a half to four minutes, and about an ounce of ether is used in a quarter of an hour.

This apparatus has been used with great success for nearly three years at the Middlesex and St. George's Hospitals, as well as at various county hospitals and infirmaries, and large numbers have been sent to Australia and America. At present, the apparatus is chiefly made for hospital use, and is capable of containing sufficient ether for five ordinary operations without being replenished.

The expiratory tube has proved of great advantage, for the expired air and vapour being heavier than the atmosphere, remain at a lower level than the air breathed by those about the patient. The inlet valve can be readily observed by the administrator, and indicates whether the patient be breathing or not, and also the number of respirations. By a judicious use of the shutter-valve, the majority of patients become insensible without that violent struggling so often witnessed when chloroform or ether-vapour, insufficiently diluted, is used.

BRITISH MEDICAL ASSOCIATION :
SUBSCRIPTIONS FOR 1875.

SUBSCRIPTIONS to the Association for 1875 became due on January 1st, Members of Branches are requested to pay the same to their respective Secretaries. Members of the Association not belonging to Branches, are requested to forward their remittances to Mr. FRANCIS FOWKE, General Secretary, 36, Great Queen Street, London, W.C.

BRITISH MEDICAL JOURNAL.

SATURDAY, AUGUST 7TH, 1875.

THE EDINBURGH MEETING, 1875.

THE British Medical Association has now, within brief intervals, held three great metropolitan meetings : in London, in Dublin, and, during the present week, in Edinburgh. Of this the last, that which is now in progress, is very far from being the least. It is indeed, in many respects, the most complete expression of the fullest development which has yet been attained of the capacity of the profession for completely united and fully representative action in congress of the three kingdoms.

The meeting of 1875, in Edinburgh, owes its undoubted success to a conjunction of many fortunate circumstances, none of which, however, except perhaps the singular favour of weather of unclouded splendour, is so wholly adventitious or accidental, that they may not furnish useful lessons for the future, as well as agreeable subjects for reflection at the present.

In the first place, the Association is peculiarly fortunate in its President. Sir Robert Christison is a man whom the profession delights to honour ; and, as professional honours are rarely won without high desert and great labour, so it may truly be said that Sir Robert Christison has earned by long years of faithful work, of sincere, unselfish, and unfeared activity, and of unsparing devotion to public interests, the right to all the highest honours which the profession can bestow. In professional and public questions, Sir Robert Christison has shown, for nearly half a century, that he has the faculty of leading ; he is a born "leader of men". And the choice which the British Medical Association has made since been followed by the British Association for the Advancement of Science. The choice was justified in advance, by the universal acceptance with which it met ; it has been sealed with success in the course of the preparations for, and the proceedings of, the meeting. No other man, we imagine, could so readily have united all parties, so thoroughly have propitiated adverse influences. As Sir Robert Christison intimated, in a truly graceful phrase, during the second day of meeting, there were some among those who desired to welcome the Association in Edinburgh, who were disposed to desire that the invitation should be deferred until the new University buildings were completed, which may not be for some few years. Those, however, who wisely determined in favour of the present year for the Edinburgh meeting, were unquestionably largely influenced by the fact that Sir R. Christison had accepted the office of President ; and in that they saw the pledge of assured success.

The prosperity of the meeting has been largely favoured by the excellent arrangements of the local secretaries and the business committee ; and among these we ought especially to mention, even at the risk of omitting for the moment fellow-workers of high desert, Dr. Matthews Duncan, Dr. Batty Tuke, Dr. Gillespie, Dr. McKendrick, Dr. Bishop, and Mr. Chiene. They have forgotten nothing which the experience of past years has shown to be conducive to the ease, convenience, and good working of the meetings ; and they have added many novelties which will be remembered and adopted in future years.

Every meeting has its own special characteristics ; the Edinburgh meeting will, we think, be remembered as one which was especially

remarkable for its scientific character, for the perfection of its arrangements, and for the serious work done. The great beauty of the city, and the universal hospitality of the profession which crowned the scientific doings of each day served as a setting for the daily work without diverting attention from it.

The general meetings and the Sections have been crowded. The President's address, remarkable as an example of sustained argument and severe thought, gave the tone to the meeting. For a much younger man, it would still have been a remarkable effort. It occupied two hours in delivery ; and it fully maintained the interest of the audience in a close and prolonged argument, which set forth views by no means popular with a great many of the auditory, and which will certainly evoke much discussion before their practical conclusions are adopted elsewhere than in the sphere to which Sir Robert Christison concludes that they are particularly applicable.

The address of Dr. Begbie, which we publish to-day, will be recognised as a masterpiece of polished erudition and accomplished skill. Such addresses supply a desideratum in medical literature, and recall medical thought to the higher spheres of contemplation of secular epochs of progress. The address of Dr. Russell Reynolds last year struck a like key-note of philosophic thought ; and, if a succession of such addresses can be secured from the great modern masters of medicine and surgery, that alone will suffice to secure for the Association a claim to the gratitude of the profession.

The meeting is in progress while we write. We abstain from commenting upon features of its business which are still, in legal phrase, "*choses in action*". The demonstrations of Professors Lister, Otis, Chandoner, and others ; the valuable papers of Drs. Braidwood and Vaclier, Caton and Rutherford—early results of the scientific grants—serve to increase the solid value of the work. Already, on Wednesday evening, more than one thousand members had entered their names as visitors ; and the universal verdict recorded is, that the Edinburgh meeting is a complete, a brilliant, and a national success.

PROGRESS IN MEDICINE.
