

MMS Meta: How Can Artificial Intelligence Serve Wiki in Oral African Languages?

WikiIndaba 2023 - Agadir, Morocco

wikiindaba

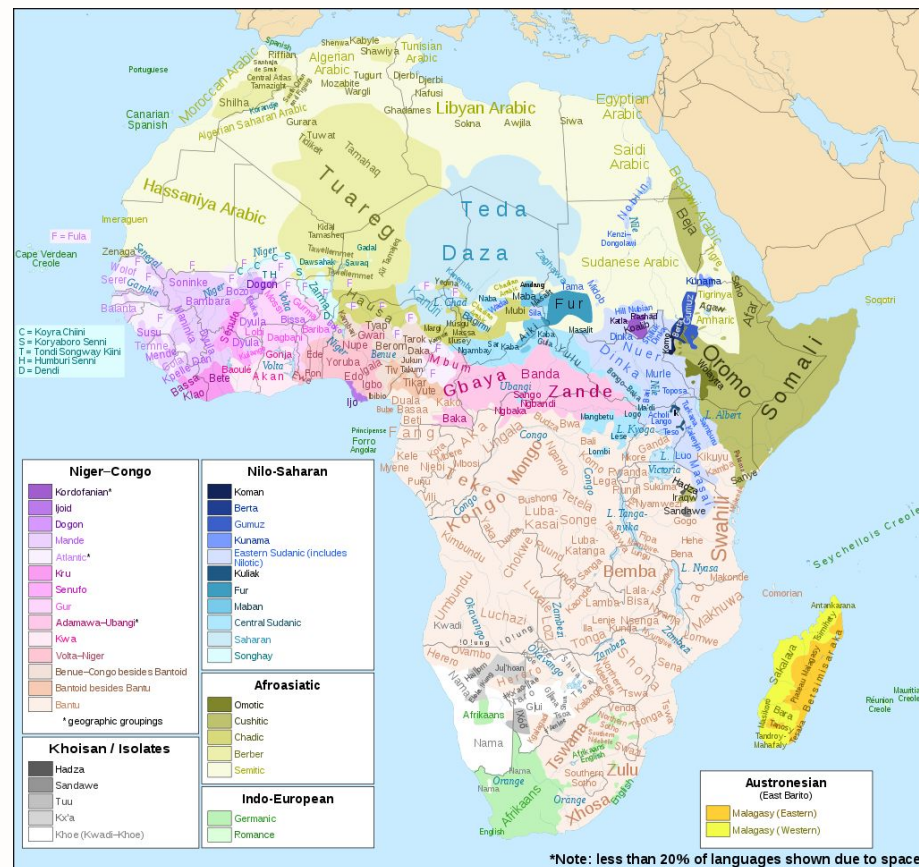

wikimediamorocco

The number of languages natively spoken in Africa is variously estimated at between **1,250** and **2,100**.

The majority of African languages are **primarily spoken, lacking a strong tradition of written literature**.

A significant percentage of the population in Africa is **illiterate** in their own language.

Introduction

Wikipedia's main goal is to make **information accessible to everyone**, including those who are illiterate or visually impaired.

To achieve this, some African Wikis (Darija for example) have initiated the practice of adding **audio recordings**, allowing people to **listen** to the articles rather than reading them.

Challenges Encountered During Implementation

Unlike Darija (+40M speakers), most african Wikipedia's:

- Lack a sufficient number of dedicated volunteers who are willing to invest their time in tasks such as reading articles, uploading audio recordings, and adding them to the articles.
- Struggle with engaging a sizable and active user base that can effectively collaborate in both creating written content and audio recording of articles.

But these smaller, oral languages deserve this as well.

What is MMS META ?

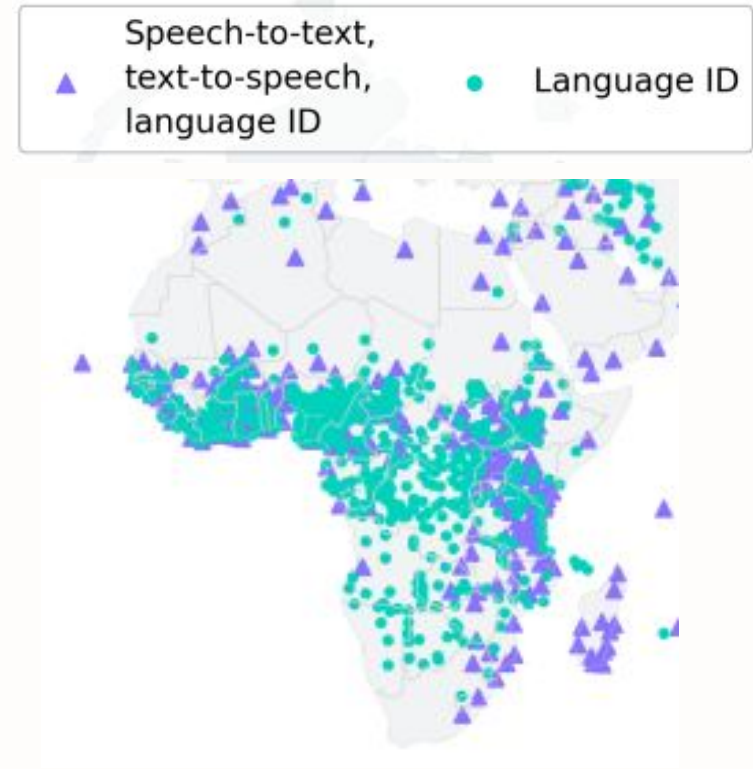

Massively Multilingual Speech (MMS) models expand **text-to-speech** and speech-to-text technology from around 100 languages to more than **1,100** — more than 10 times as many as before — and can also identify more than 4,000 spoken languages, 40 times more than before.

This is an open-source model and code so that others in the research community can build on our work and help preserve the world's languages and bring the world closer together.

What is MMS META ?

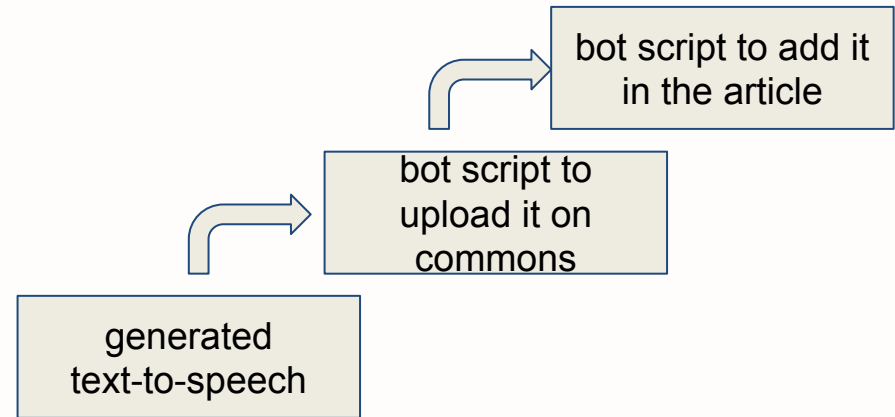

More than 1,100 languages worldwide, including numerous small and oral African languages, are now accessible for **text-to-speech**, as illustrated by the graph, thanks to the availability of this open-source model.

How can we also apply this to these Wikipedias?

My idea is to :

Utilize this **AI model** in the cloud (as it needs high configuration) to automatically generate text-to-speech audio, which will then be uploaded to Commons platform and added to articles using a bot script.

Is it fine to use AI generated files on Wikimedia project.

There have been a lot of discussions about a specific topic in the Commons community. Please check here: [Commons:AI-generated media](#).

As long as the MMS Project is open source, it is safe to use the media and upload them to Commons.

If you have any ideas about this, please let me know.

What will this look like if applied?

To test the feasibility of this idea, I tried to implement it on shi.wikipedia.

Let's take the article Iznzarn as an example.

Iznarn

(Tmmatti d zy Iznarn abdlhadi)

Iy ur igi wad amgrad lli tsiggilt, kcm s tasna n Aznarn bac ad tzrt akk w imgradn nna dar illa yism zun d wad !

Tarabbut n **Iznarn** (s tiffinay: ⵉⴽⵏⴰⵔⵏ nⵓ d ⵉⴽⵏⴰⵔⵏ ⵉⴽⵏⴰⵔⵏ) tga yat zy trubba timzwura lli ittyssanin y tmazirt n **Lmyrib** d yad y tilli ittuzylayn y yigr n uzawan atrar amaziy wala amyribi. Mac ur tgi yat, rad tt furtnt mnawt yaḍn fkint atig i uzawan Amrṭuki y isgg*asn wis id sḍis d mraw y uzgn igg*ran y tsuta n 1900. Future related projects ideas

Implementing this for oral languages, but not limited to them.

Implementing a live text-to-speech feature for all Wikipedias in all languages (similar to the one already used on many websites like Google Translate). This would assist people who have visual impairments, cannot read, or prefer listening to reading etc.

Thank you
