In 1863 the Schleswig-Holstein question became prominent by the death of Frederick VII of Denmark. The London Protocol provided that he should be succeeded by Prince Christian of Glucksburg as Christian IX. When the incorporation of Schleswig with Denmark was attempted in 1863, that province stood on a different footing from Holstein, which was a member of the German Bund. Holstein was occupied by a force of Saxons and Hanoverians. Prussia and Austria, having both signed the London Protocol, were in an embarrassed position. Prussia protested against the incorporation of Schleswig, and Bismarck declared that the first cannon-shot fired in the attempt to enforce it would destroy the obligation imposed on Prussia by the Protocol. Austria could not afford to sacrifice her influence by abandoning the Germans in Schleswig, and therefore favored the protest of Prussia. England withdrew from the dispute on the ground that, as the Protocol was the joint act of the great powers, none of them could act singly to enforce its provisions. At the same time the English encouraged the Danes to resist. Prussia and Austria sent an army into the disputed country and drove out the Danes, following them to the extremity of Jutland. In 1864 a peace was concluded, by which the King of Denmark ceded all his claims upon Schleswig-Holstein and Lauenburg to the King of Prussia and the Emperor of Austria. Difficulties immediately sprang up between the two great German states over the duchies, which they were supposed to hold in trust. Bismarck in fact declared that Germany held Schleswig-Holstein and Lauenburg for Frederick of Augustenburg, but subsequently he demanded that the troops of the duchies should be incorporated with the Prussian army, that their foreign relations should be under the control of Prussia, and that the fortress of Kiel be given to the same power. Austria expected to establish in the duchies a state which would embarrass Prussia in its plans for supremacy, and supported Frederick in his refusal to accede to the Prussian terms. At a personal interview held between the King and the Emperor at Gastein in 1865, Lauenburg was ceded to Prussia, and a money indemnity therefor paid to Austria, while Schleswig was to be governed by the former power, and Holstein by the latter. Austria encouraged Frederick of Augustenburg in his claims as against Prussia. That power determined to enforce its demands upon the duchies, and to require of several other states that their military organizations be placed under her control. Austria threatened to pass the Schleswig-Holstein controversy over to the Confederation, which could be depended upon to decide against Prussia. Early in 1866 the Austrian government called on all the states under its influence to prepare for war. Bismarck issued a circular letter to the German states setting out that to conserve German interests a reorganization of the Confederation was necessary; that if Prussia's strength were broken, Germany would cease to be a power in Europe. He also called upon them to state specifically how far Prussia could rely on them for support if attacked by Austria. In addition to this he demanded the assembling of a German parliament. With a hope of rescuing Venetia from Austrian domination, Italy concluded an alliance with Prussia. The Schleswig-Holstein question was passed over to the Confederation by Austria. Bismarck at once declared the Gastein convention broken, and the Prussian troops drove the Austrians out of Holstein. In the meantime the opposition in the Prussian House of Deputies denounced the course of its own government, which continually violated the constitution, but Bismarck, relying on the loyalty of the people, went on with his preparations for war, proposing to strike down Austria with one blow. The Confederation assembled in Vienna, and, on its adoption of a motion inimical to Prussia, the ambassador of that country declared the Bund dissolved because of its unconstitutional proceedings. At the same time he brought forward a new constitution, which the states were asked to accept. The war came on at once. Oldenburg, Brunswick, Coburg-Gotha, Mecklenburg and other northern principalities joined with Prussia, while Austria was allied with Hanover, Saxony, Hesse, Bavaria, Wurtemburg, Darmstadt and Baden. Hanover, Saxony and Hesse-Cassel were at once seized by Prussia. The Prussian forces entered Bohemia and pressed rapidly forward. The Austrian army under Benedek consisted of two hundred and thirty thousand Germans, Hungarians, Slavs and Italians, the latter from the Austrian provinces in Italy, serving unwillingly. The Prussians were superior in numbers, and under the discipline and organization of Von Moltke had reached a high state of efficiency. The two armies met at Königgratz July 3rd, 1866, and when the day closed on the defeated and dispersed army of Austria that power had sunk to a minor place and Prussia occupied the proud position of the leader of Germany. In a frantic attempt to maintain herself, Austria endeavored to secure an alliance with the French emperor, and to set free her own troops in Italy, by the cession of Venetia to Louis Napoleon. This act was viewed throughout the states as decidedly un-German, and alienated all the nationalists from the cause of Austria. Napoleon accepted the cession, but interfered no farther than to offer a peaceable mediation. An armistice was entered into July 22nd at Nikolsburg, which was followed by the Peace of Prague, August 23rd, 1866. Results of the most substantial kind were secured to Prussia by this treaty. Hanover, Schleswig-Holstein, Hesse-Cassel, Nassau and Frankfort were annexed, uniting the hitherto geographically separated sections of Prussia. The voice of discontent in the kingdom was hushed by the decisive victory of Königgratz; the King, Bismarck and Von Moltke became objects almost of worship. The unconstitutional usurpations by the Crown were ratified, and an act of indemnity was passed for all acts and expenditures which had gone beyond legitimate authority. Nor was the effect less in the direction of German unification. Bismarck was as relentless in the prosecution of his project as he had been in his operations for the supremacy of Prussia, which was only a first step. In conformity with a plan brought forward by him in 1867, all the states north of the Main were formed into a Confederation with Prussia at its head. This union was more than a mere confederation. It was a united state, in which Prussia held control of the military forces, foreign affairs, the postoffice and the telegraphs, weights and measures, and coinage; to the smaller states were left their own matters of internal administration. Secret treaties of offensive and defensive alliance were made by Prussia with Wurtemburg, Baden, Bavaria and Hesse-Darmstadt, which effectually separated those states from Austria. That empire with its mixed nationalities was excluded from the German Confederation. The South German states, except Austria, were also bound to the Confederation by the Zollverein, which was firmly established by a customs-parliament of all the states. The wise government of the Confederation by Prussia soon reconciled petty rivalries, and expressions of regret were frequently heard that the line of the river Main had been permitted to shut out the South German states from membership in the new Bund.

Königgratz.

Italy had also profited by the day of Koniggratz. The Italian army and navy were both defeated by the Austrians, the first at Custozza and the latter at Lissa, but the Prussian victory caused the annexation of Venetia to Italy, and the long intimacy and conflict between the two countries was signalized by a friendly act of the German power looking to the formation of an undivided Italian state, occupying the whole peninsula.

Causes of discontent.

Notwithstanding the treaties with the south German states, there was developed in them a dislike of Prussia, founded among the political radicals upon the arbitrary, unconstitutional methods of Bismarck, and among the Catholics upon the fact that the leader in German affairs was a great Protestant state. The socialistic element also began to make head. Centuries of caste had so fixed the social status that an aspirant for higher honors than those which were recognized as legitimate to his class found himself surrounded by an iron wall, to be overleaped only by transcendent genius. Through ages the peasants in the fields had had for ancestors other peasants of the fields, doomed to a life of toil without adequate reward. To them and to the toilers in the workshops the socialistic equality springing from the annihilation of all rank, wealth and position, offered an apparent elysium.

Threatened war with France.

In this situation nothing could more effectually silence internal discontent and forward the cause of unification than a victorious foreign war. The opportunity was soon presented. Louis Napoleon had looked for a long contest between Prussia and Austria, and was both surprised and alarmed by the Prussian victory, which threatened not only to raise up a great German empire, but to destroy the "balance of power" in Europe, to preserve which England and France had taken part in the Crimean war. The events of the Austro-Prussian conflict had followed one another so rapidly, and so uniformly favoring Prussia, that the French emperor had been able to do no more than proffer a peaceable mediation. On the conclusion of the war Napoleon demanded "Compensation for Sadowa" (Koniggratz) in the form of a cession to France of the territory on the west bank of the Rhine. Failing in this, the French emperor exhibited a desire to absorb Belgium, and subsequently proposed to annex Luxembourg and part of Limburg. These last named provinces had been placed by treaty in 1815 and 1839 under the sovereignty of the King of Holland. When the German Confederation was dissolved by the events of 1866, they lost entirely their connection with Germany. This demand of Napoleon, made in 1867, threatened to precipitate a war between north Germany and France, but the danger was tided over, ostensibly by a treaty providing that Luxembourg and Limburg should remain under the control of the King of Holland, with a guarantee of neutrality, but really by the unprepared state of the French army. During the next three years both powers were engaged in strengthening their army organizations and endeavoring to make alliances. The great superiority of the needle-gun, demonstrated in the Austro-Prussian war, was sought to be neutralized by the introduction into the French army of the Chassepot rifle, which was really a much better small-arm than the Prussian weapon. The reorganization of the French army, which was effected by Marshal Neil, was more nominal than real, and the emperor was deceived as to the strength of his forces until the stress of the campaign was felt, when the deception became apparent. but too late to be remedied. The French were as thoroughly deceived by the traditions of the First Empire and the supposed invincibility of the soldiers of France as were the Prussians when they confronted the great Corsican with the boasted soldiers of Frederick the Great. On the German side. Moltke in his cabinet busied himself with the strategy and tactics of the coming war. while Bismarck peremptorily demanded and obtained the necessary legislation. An alleged cause being necessary, it was not difficult to find. In 1870 the Spaniards. who had dethroned Queen Isabella in 1868. offered the crown of Spain to Prince Leopold of Hohenzollern-Sigmaringen, a descendant of a younger branch of the house of which the King of Prussia was a member. Napoleon at once objected, announcing that France would never consent to such an extension of the German power. On the advice of King William, Leopold declined the proffered crown. The French minister then demanded that the Prussian king record a pledge that he would never support the candidacy of a Hohenzollern prince for the Spanish crown, and also that the king write a letter of apology to the French emperor. Both propositions were received with a curt refusal. and the French ambassador at Berlin was dismissed. On the insult to the Prussian king, a great wave of patriotism rolled over Germany and the voice of the nation was raised for war. The dismissal of the French minister was received in France as an attack on the national honor, and the French people became as eager for hostilities as were the Germans. A diet of the north German Confederation met July 19th, 1870, and unanimously placed the military resources of the nation at the disposal of the government. In France orders were issued for the mobilization of the army, and war was declared. Napoleon had received assurances which warranted him in thinking that Austria, Denmark and Italy would join him in the war. It was also supposed that the dislike of Prussian methods among the south German states would secure their aid for the French cause. Revolts were even expected in Saxony, Hesse and Hanover. Napoleon was leaning on a broken reed, for both Italy and Austria maintained a strict neutrality, and all the German states under an irresistible impulse of race pride leagued their forces with the armies of the Confederation. Napoleon knew that his troops were numerically inferior to the united German forces, but hoped to imitate the lightning-like movements of the First Emperor, and dash upon a dispersed German army, giving it no time to concentrate. The conditions, however, were entirely different from those which existed at the time of the great campaigns of 1805, 1806 and 1809. The admirable discipline which then characterized the veteran French army was now found transferred to the German forces, and a silent. stern soldier, without the commanding genius of the great Napoleon, but fully as expert in strategic combinations held the Teutonic troops in leash. The French emperor collected one-hundred thousand troops at Strasburg. His main army, which he proposed to command in person, was assembled, one hundred and fifty thousand strong, at Metz. A reserve of fifty thousand men garrisoned the fortified camp at Chalons. A junction was to be effected between the army at Strasburg and the one at Metz, the two to cross the Rhine together.

The German plan contemplated an invasion of south Germany by the French. which would be neutralized by the assembling of the German army in the Palatinate on the French flank. In the first days of August four hundred and fifty thousand Germans were concentrated between Treves and Landau, while one hundred thousand more were on the march to the front. The French emperor advanced first. moving upon Saarbrucken on the 2nd of August and driving out a small German detachment which occupied the town. This affair was proclaimed in France as a great victory. On August 4th, the Crown Prince of Prussia moved across the frontier, attacking a French division at Weissenburg. The French fought heroically, but were forced to retire with heavy loss. Marshal MacMahon, in command of this division of the French army, hastily withdrew to Woerth, but before he could collect his forces. a part of whom were coming up from the rear. the Crown Prince attacked him. on the 6th of August, and after a severe contest. in which the French Turcos and Zouaves distinguished themselves, drove MacMahon from the field into the passes of the Vosges Mountains. Part of the discomfited French army fled to the south and took refuge in Strasburg. On the same day a Prussian force assaulted General Frossard, who had taken position on the Spicheren Heights near Saarbrucken, and at the close of the fight Frossard retired to Forbach. beyond the frontier of Lorraine. By these operations MacMahon was cut off from a junction with the main French army at Metz. By a circuitous march he reached Chalons. So far the whole French plan of campaign. which contemplated an immediate advance on Berlin, was defeated. but the reverses already sustained were not yet beyond remedy, for the finest part of the French army had not been engaged. and in the defensive campaign forced upon them, advantages of position might be made to compensate for inferiority in numbers. A rapid concentration of the imperial armies was attempted by a backward movement to the Moselle. **Retreat of the French.** The three German armies advanced into France at once. The passes of the Vosges were forced and the retreating French under MacMahon were pursued by a division while the remainder of the Germans moved toward Metz. Abandoning everything to the eastward except Metz and Strasburg, the French army under Bazaine endeavored to concentrate near Chalons, with the design of ultimately falling back on Paris. Passing through Metz, Bazaine reached the left bank of the Moselle. but at Courcelles his rear-guard was overtaken and compelled to fight. In this battle the French Third and Fourth corps were beaten and driven under the walls of Metz. Bazaine moved out toward Verdun. Arriving at Vionville on the 16th, **Battle of Vionville** he was attacked in flank, and as the successive divisions of the two armies came up a desperate battle was fought, which resulted in such an obstruction of the road toward Verdun that Bazaine gave up his attempt. He held his position with the intention of continuing the battle, but his danger was extreme, because of the heavy reinforcements which the enemy were receiving. On the 17th two hundred thousand Germans were concentrated before Gravelotte, commanded by the king **Battle of Gravelotte** in person. The French force was decidedly inferior in numbers. In the maneuvers which preceded the battle the positions of the two armies were so changed that the German line faced the east, and the French stood with their backs toward Germany. The latter, intending to fight a defensive battle, strengthened their line and took all possible advantage of the heights and the numerous ravines with which the position was intersected. The Germans attacked at nine o'clock in the morning of the 18th. The fighting was desperate, and the assailants were unable to force the position until, toward evening, a flank attack by their Twelfth corps compelled the French to give way. During the night Bazaine withdrew into Metz. The French loss was about twelve thousand, and that of the Germans twenty thousand, but the disparity in losses was more than compensated for by the shutting up of the French army in Metz. Masking that fortress with a force of one hundred and sixty thousand men under Prince Frederick Charles, the German army moved toward Chalons. In the meantime the French in Paris had turned against their emperor, deposing him, and declaring for a Republic. A plan was devised by General Palikao which required the French at Chalons, under Napoleon and MacMahon, to move along the Belgian frontier in order to effect a junction with the army of Bazaine at Metz. The Germans, receiving information of the movement, marched across the country to intercept it. The French were moving on an arc of a circle, while the Germans marched on a chord of the same arc. The German advance encountered the French on the 29th of August at Nouart. On the 30th a part of the French army was beaten in the battle of Beaumont, and by the 31st their whole force was hemmed in by the Germans. Under these circumstances the battle of Sedan was fought on the 1st of September. After a day of fighting, the French were driven into Sedan, where they were subjected to a murderous fire from the German artillery. Reduced to despair, Napoleon surrendered. Paris having declared against him, he was compelled to throw himself on the generosity of the Germans, who assigned him as a residence the castle of Wilhelmshohe in Cassel. MacMahon was severely wounded during the combat. The surrendered army numbered between eighty and ninety thousand men, with three hundred and thirty pieces of artillery. At Metz, Bazaine made several unsuccessful sorties, and was forced by lack of supplies to surrender the fortress on the 27th of October, with about one hundred and eighty thousand men. Meanwhile Strasburg had been besieged, and held out under General Uhrich until September 28th, when the city was surrendered with eighteen thousand troops.

After the capitulation of Metz the German army advanced on Paris and besieged it. Upon the deposition of Napoleon, the city had been placed under a provisional government and General Trochu intrusted with the defense. Paris was defended by about three hundred thousand men, including the troops of the line, the marines and the national guard. The German force was numerically inferior, but the disparity in numbers was more than made up by the indecision of Trochu's character and the superior organization and discipline of the besieging army. The marines, who manned the forts, and the troops of the line as well as the mobiles from the provinces who fought outside the walls of the city, sustained the old-time reputation of the French as a martial race, but the national guard of Paris did little more than consume provisions and indulge in mock heroics. The German lines of investment were drawn about the city in the fall and early winter, and the siege resolved itself into a starving-out operation with occasional sorties by the beleaguered French. While the siege was in progress several armies were raised in the provinces and advanced to the relief of the capital. One of these exterior forces, commanded by Garibaldi, carried on a partisan warfare in the southeast ot France, but was defeated by Gen. Werder at Pasque, near Dijon, in the latter part of November. A German division under Gen. Von der Tann advanced to Orleans, where it was attacked by an improvised French army and driven back. Reinforced by the troops under Prince Frederick Charles, who took command of the whole German strength in this part of France, the invaders moved on Orleans and drove across the Loire the army of Aurelles de Paladine. The hastily raised French Army of the North, commanded by Gen. Bourbaki, was confronted by Gen. Manteuffel at Amiens and forced back to Arras. Manteuffel then occupied Rouen and stretched his lines across the country to protect the besiegers of Paris from attack on the north and west. Late in November a sortie was made by the French from Paris in a southeasterly direction for the purpose of effecting a junction with the Army of the Loire. Moving toward Paris, the Loire Army was checked by Frederick Charles at Beaune la Rolande. The sortie from the capital, which was led by Gen. Ducrot, was unsuccessful, the French being thrown back into the city after a fierce struggle in which both armies sustained heavy losses. The German force at Orleans pushed out southward in the first days of December. A detachment of the French was driven through Tours to Gien, where it was dispersed. The main body of the Army of the Loire, under Gen. Chanzy, who had succeeded Paladine, met the enemy at Beaugency, and, after several days of skirmishing and fighting, was defeated and pushed back to Le Mans. On December 18th Gen. Werder engaged a French division at Nuits in the eastern department, but fell back to Vesoul on the reception of a report that he was about to be attacked by a large force under Garibaldi and Bourbaki.

About the middle of December the French Army of the North, now under Gen. Faidherbe, advanced upon Amiens in concert with a projected sortie from Paris. Manteuffel attacked the northern army, and after a well-fought battle the French retreated to Arras. From Paris the French moved out to the northeast and reached the village of Le Bourget; here their advance was stayed, and they were soon pressed back into the city. Provisions in the besieged capital were nearly exhausted, and the troops and inhabitants were fed on a reduced ration. Horses were slaughtered and eaten, and the fine collection of rare animals in the Jardin des Plantes was converted into food. There was as yet no actual starvation, but the pinchings of hunger began to be felt. Notwithstanding this, the citizens and soldiers unitedly cried out against surrender. The organized French forces outside of Paris were included in Faidherbe's army of sixty thousand at Arras, the force under Gen. Chanzy, one hundred and fifty thousand strong, near Le Mans, and about twenty thousand under Garibaldi and Crémer in the eastern districts. In addition to these, numerous bands of Franc-tireurs carried on a sort of guerilla warfare in the rear of the German armies. In the beginning of January, 1871, Frederick Charles moved against Chanzy, who was himself on the march to attack the Germans. The French fell back fighting to Le Mans, where, in a decisive battle, the Germans beat and dispersed their opponents. Bourbaki, with the Army of the East, numbering about one hundred and fifty thousand undisciplined and ill supplied men, undertook to cut the enemy's line of communication with Germany, designing ultimately to invade that country. Gen. Werder occupied a position near Montbéliard, where the French attacked him, but were compelled to retreat after an indecisive action. Bourbaki was pursued to Pontarlier, near the Swiss line, and was there attacked by Manteuffel on the first of February. Several thousand of the French were captured and the remainder escaped into Switzerland, in which neutral territory they were disarmed. Faidherbe, with his little Army of the North, advanced resolutely to St. Quentin, where, in a battle with a superior force on the 19th of January, he was decisively defeated. In the meantime the fortresses of Thionville, Montmedy and Mézières, with others, fell into the hands of the Germans, to whom scarcely any organized resistance was opposed except at the capital. The bombardment of Paris began January 5th. Trochu conducted a last desperate sortie toward St. Cloud on the 19th of the same month, but made no permanent impression on the German lines. Food supplies were now so reduced, and the impossibility of relief from the outside was so evident, that the capitulation of Paris was seen to be unavoidable. That city surrendered January 28th, 1871, and during an armistice of twenty-one days a National Assembly met at Bordeaux and agreed to the German terms. A treaty of peace was negotiated at Frankfort on the 10th of May, by which France ceded to the victors the German part of Lorraine, including the fortress of Metz, and all of Alsace except Belfort. The French also agreed to pay to Germany five thousand millions of francs as a war indemnity. As security for the payment of the indemnity, the Germans were to occupy with their troops the forts north and east of Paris and the northeastern departments of the country. In the war the Germans captured nearly four hundred thousand men and more than seven thousand cannon. While the Siege of Paris was in progress a proposition to reconstitute the German Empire as a Confederation by a union of all the states except Austria, with the King of Prussia as emperor, was accepted generally throughout the nation. On the 3rd of December, 1870, Prince Leopold of Bavaria, in the name of the German governments, tendered the Imperial Crown to the Prussian Monarch. The necessary legislation was had in the various states, and at Versailles, on the 18th of January, 1871, King William of Prussia was proclaimed Emperor of Germany. The German army made a triumphal entry into Paris on the 1st of March, and retired after occupying the city thirty-six hours. On the 7th of March the German headquarters were removed from Versailles, and the Emperor set out on his return home, whither his chancellor had preceded him. He passed over the memorable fields of Vionville and Gravelotte on his way, and it was not until the 17th of March that he arrived in Berlin. That was a day long to be remembered in the Prussian capital. The venerable Marshal Wrangel, Bismarck, Moltke, Roon, Steinmetz and Falckenstein were on the platform to meet him, and the greetings which the veteran Emperor received from these tried and trusted servants, from the members of his own household, and from the people were full of affection and patriotic enthusiasm. On the 19th, a solemn thanksgiving service was held at the cathedral. On the 22nd, the Emperor's seventy-fifth birthday was celebrated, the festivities being attended by most of the German princes in person, while Austria, Spain and Italy sent congratulations. The Emperor took occasion to reward his officers who had so well stood by him in the past troubles; Bismarck was created a prince, and General Moltke was raised to the peerage with the title of Count. On the 16th of June a grand military display was held in honor of the success of the war, when 50,000 troops who had borne a part in it entered Berlin in triumph and were reviewed by the Emperor, who had stationed himsel under the statue of Blucher. After the review, William unveiled a statue of his father, Frederick William III, and at night the city was illuminated—the only dark spot being the building occupied by the French embassy.

Peace being assured abroad, the Emperor and his chancellor set about consolidating the institutions of the new empire. They soon found that they had two antagonistic parties above all to deal with—the Ultramontane Catholics on one hand and the socialists on the other—and for the next ten years the history of the empire is mainly concerned with the struggle between these two parties and the Imperial Government. Trouble came almost immediately from the Ultramontanes, spurred on by the Vatican, which viewed the rise of a powerful Protestant German empire with dismay. The first united German parliament met on the 21st of March, 1871, and a passage in the Emperor's opening speech, in which he said that Germany would leave to every nation to find its way to unity, and to every state to determine the form of its own constitution, was interpreted by the Catholics as an intimation that the Imperial Government would not interfere in behalf of the Pope's temporal sovereignty. They moved an amendment to the Address to the Throne, but Bismarck's influence was too powerful for them. They were defeated by 243 votes to 63, a few socialists voting with the minority. Shortly after this, a manifesto was addressed to the Emperor by the Archbishop of Cologne and twelve other prelates, complaining of the course of the Minister of Public Worship in retaining in office a religious teacher who adhered to the Old Catholic doctrines. The Old Catholics were a party who opposed the new dogma of papal infallibility, which the Vatican Council had proclaimed during the Franco-Prussian war. The Emperor replied that, whether his hopes of harmonious co-operation in promoting the new empire were fulfilled or not, he would continue as before to grant to each community the fullest liberty consistent with the rights of others, and their equality before the law. The religious freedom thus accorded to the Old Catholics was very distasteful to the Ultramontane bishops. A further blow to their intolerance was dealt by the Bavarian minister, Von Lutz, who introduced in the diet a bill making it penal for clergymen to abuse their office by political agitation in the pulpit. In the Rhenish provinces, the Roman Catholic priesthood had been in the habit, during elections, of delivering sermons describing in pathetic terms the situation of the Pope, and urging their hearers to elect Ultramontane candidates. The bill was carried by a large majority.

In 1872 the conflict with the Romish party deepened in intensity. Both sides were in an uncompromising temper: and Bismarck was determined that the state should not yield. "We will not go to Canossa," he said. He resolved to settle once for all the old quarrel between Pope and Emperor, and to crush the priest under the supremacy of the sovereign. William was convinced that the Catholic clergy were wanting in loyalty, and adopted entirely the views of his ministry. He placed at the head of the Department of Public Worship Dr. Falck, a Protestant advocate, who was thoroughly in sympathy with the policy of the government, and under Falck's administration a system of legislation was inaugurated for the purpose of placing the Romish church in Germany and all its institutions, clerical, monastic and educational, under the control of the state. It was a struggle, the Berlin cabinet declared, for the well-being of civilization, of which the Church of Rome had become the declared enemy; it was a "kulturkampf"—a battle for culture—as an eminent Deputy of the advanced Liberal party termed it. The collision between the State and the Romish church was precipitated by an occurrence purely accidental. Bismarck happened to enter the House of Deputies one day when Dr. Windthorst, the leader of the Catholic reactionary party, was making a speech, in which he complained of the diminished advantages open to Catholics in the state and in education. The chancellor delivered an impromptu reply, severely arraigning the clerical party for their disloyal attitude. "When I returned from France to devote myself to home affairs," he said, "the Clerical, or Centre party, which had just been formed, seemed to me a party whose policy was directed against the predominance and unity of the state. I will not conceal from you that the Government had hoped to rely upon the assistance of the orthodox element. I thought it had a right to expect that they, above all, would render unto Cæsar the things that are Cæsar's. Instead of this we find ourselves systematically withstood in the South, and most violently attacked in the papers and in speeches destined for the instruction of the lower classes." The first fruit of this debate was the introduction of a School Inspection bill, providing that the state should have the supervision of all educational institutions, public and private; and that all officers appointed as inspectors should be servants of the state, and in no way responsible to the various religious denominations. The Catholics, of course, opposed the bill strenuously, but, oddly enough, the orthodox Protestants united with the Ultramontanes, while the Poles were against it because they looked upon it as a step toward Germanizing the Polish provinces. The Liberals, however, of all shades of opinion, supported the chancellor. In the royal circle, the only friend of the measure was the Crown Prince, both the Emperor and Empress being very lukewarm, but inclined to favor the old denominational system. Bismarck's vigorous pleading carried the bill by a majority of 197 to 171. The bill then went to the Upper House An unforeseen circumstance strengthened its chances there. A Polish youth was arrested on a charge of conspiring to assassinate Prince Bismarck, and his examination revealed the fact that he had been living in the house of a Jesuit priest, where the police seized some important papers When the School Inspection bill came before the Upper House, Bismarck read aloud several passages from the confiscated correspondence which were very damaging both to Dr. Windthorst and to the Bishop of Mayence. in regard to ultramontane intrigues. He charged that the aims of the Clerical party were incompatible with the interests and policy of the new empire. and read a dispatch from one of his diplomatic representatives to the effect that France hoped to gain revenge by stirring up religious trouble in Germany, and that the Pope sought to overthrow the empire so that he might re-establish his secular power in Italy. He concluded with a powerful appeal to the Conservative opposition. "While two Catholic powers existed on our borders," he said, "each supposed to be stronger than Prussia. and more or less at the disposal of the Catholic church, we were allowed to live in peace and quiet. Things changed after our victory of 1866, and the consequent ascendency of the Protestant dynasty of Hohenzollern. And now that another Catholic power has gone the same way, and we have acquired a might which with God's help we mean to keep, our opponents are more embittered than ever, and make us the butt of their constant attacks." The chancellor was again victorious. The bill passed the Upper House by 125 votes to 56. Soon afterward there was an open quarrel between Germany and the papacy, owing to the Pope's refusal to receive Cardinal Prince Hohenlohe as the German representative at the Vatican. The Prince was "*non grata*" because he was not only a Liberal German unionist, but an opponent of the infallibility dogma as well. The matter was discussed in the Reichstag on the 14th of May. when Bismarck, after expressing regret at the discourtesy of the Pope, said that regard for the interests of the Catholic population of Germany alone determined him to nominate another envoy. A majority of the Deputies were for striking out of the estimates the cost of an envoy to the Vatican, but Bismarck again prevailed, and the charge was sanctioned. On the 15th of May, petitions for the expulsion of the Jesuits were presented by the hundred, and it was shown that while in 1864 that order had only 69 convents in Germany, they had increased to 243 in 1865, to 481 in 1866, and in 1869 to 826. In accordance with a resolution of the House, the Government introduced a bill placing the Society of Jesus under police supervision. giving the Federal Council power to remove its members from any part of Germany where their presence seemed inconsistent with the public interests, abolishing all Jesuit convents, and expelling all foreign members of the order from German soil. The bill was passed. and received the Emperor's sanction. Among those who advocated it was Prince Hohenlohe. the late Bavarian premier. The suppression of the Jesuits threw the Roman Catholic church into a militant attitude. A union of German Catholics was organized at Mayence with the avowed object of supporting that church in its conflict with the empire. The members of the union met at Fulda in September, and issued a memorial explicitly asserting that the canon laws were more binding than those enacted by the secular power, and that the Church and not the State was supreme in ecclesiastical matters, in education, and in marriage contracts. They also upheld the Episcopal right of excommunication. The Pope's Christmas allocution contained a reference to the situation of affairs in Germany, which added fuel to the flame on both sides.

Bismarck and the papacy.

The Jesuits curbed.

The response of the Imperial Government to the Fulda manifesto and the Pope's allocution was the introduction on the 9th of January, 1873. of the celebrated Falck laws, called also the "May laws," from the month in which they were passed. The Prussian Minister for Public Worship. Dr. Falck. brought in four important bills. by which the state proposed to take into its own hands the supervision of the education of the clergy, and to ensure the training of a German national instead of an ultramontane clergy. Hitherto all churches had been left free to govern themselves and to educate their own clergy, and in the case of the Roman Catholics special seminaries had been established for the education of those destined for the priesthood from their youth upward. All institutions of the kind now in existence were by the proposed law to be placed under rigorous state inspection. while the opening of new ones was forbidden. Candidates for the priesthood were required to attend the State Gymnasia and Universities. so that a portion at least of their training might be received among the laity, and before they could be ordained they must pass a state examination. The Government was henceforth to exercise supervision over all clerical appointments, and heavy fines were imposed for violations of this law.

A supreme court was to sit at Berlin to deal with cases involving ecclesiastical discipline. These bills were discussed at great length and with much fervor, but ultimately all of them were passed by both Houses of the Prussian Parliament. The German diet opened on the 12th of March. In consequence of a report prepared by the committee on religious orders, the Federal Council decided to expel from the Empire the monastic orders of Redemptorists and Lazarists, and the congregations of the Holy Cross and the Sacred Heart. This decision gave rise to a warm debate in the diet, when Bismarck again denounced the ultramontane leaders as enemies of the empire, and appealed to the judgment of history against them. The Prussian Catholic bishops met at Fulda in April, and drew up a solemn protest against the ecclesiastical laws. which was circulated amongst the clergy in their dioceses. Active resistance to the law began to be offered, and prosecutions were promptly instituted, the most notorious of those against whom criminal proceedings were taken being Ledochowski, Archbishop of Posen, who had systematically made appointments to benefices in defiance of the laws. He was condemned to a fine of 200 thalers, or four months' imprisonment, but he still kept on the same course. The conflict between the government and the Ultramontanes continued all through the year. In October, a great sensation was caused in Germany and throughout Europe by the publication of a correspondence between the Pope and Emperor William. Writing on the 7th of August, the Pope charged the German government with aiming more and more at the destruction of Catholicism. but said he had heard that the Emperor did not approve of the harshness of the measures adopted by the government, and that those measures could have no other effect than to undermine his Majesty's own throne. "I speak with frankness," Pio Nono added, "for my banner is truth. I speak in order to fulfil one of my duties, which consists in telling the truth to all, even to those who are not Catholics, for every one who has been baptized belongs in some way or other—which to define more precisely would be here out of place—belongs. I say to the Pope." On the 3rd of September the Emperor replied saying that he was glad his Holiness had done him the honor to write to him. because it afforded him an opportunity to correct errors which must have occurred in the communications his Holiness had received relative to German affairs. "If the reports which are made to your Holiness respecting German questions only stated the truth," wrote William. "it would not be possible for your Holiness to entertain the supposition that my government enters upon a path which I do not approve. According to the constitution of my states, such a case cannot happen. since the laws and government measures in Prussia require my consent as sovereign. To my deep sorrow, a portion of my Catholic subjects have organized for the past two years a political party which endeavors to disturb, by intrigues hostile to the state, the religious peace which has existed in Prussia for centuries. Leading Catholic priests have unfortunately not only approved this movement, but joined in it to the extent of open revolt against existing laws." The Emperor expressed a hope that his Holiness would, upon being informed of the true position of affairs, use his authority to put an end to the agitation carried on amid deplorable distortion of the truth and abuse of priestly authority. He could not pass without contradiction the expression that every one who has received baptism belongs to the Pope. He accepted no other mediator with God than Jesus Christ. "This difference of belief," he concluded, "does not prevent me from living in peace with those who do not share mine, and I offer your Holiness the expression of my personal devotion and esteem." It was generally conceded that William had the best of the argument, and congratulations poured in upon him from all parts of Germany. The city of Augsburg in particular sent a remarkable address signed by Catholics and Protestants alike, expressing satisfaction and pride at the independent attitude of the Emperor, declaring the papal complaints of persecution to be a wanton perversion of the truth, and urging his Majesty to continue to enforce the laws. As the Emperor's letter came opportunely just before the elections to the Prussian and Imperial diets, it had the effect of gaining many votes in favor of the policy of William and his premier. In the session now inaugurated another important bill was passed, sanctioning civil marriage and civil registration of births and deaths throughout the Prussian dominions. The functions of the registrar were made obligatory, while those of the clergy were left optional. On the 7th of December, William, as King of Prussia, issued a decree requiring all Catholic bishops, previous to receiving recognition from the state, to take an oath to observe the laws of the Prussian kingdom, and not to allow the clergy subject to them to teach resistance. They had hitherto sworn only to obey the laws, but reserved to themselves all rights with regard to their spiritual obligations. Pius IX grew more and more morose over the state of things in Germany, and in an encyclical described the Old Catholics as "wretched sons of perdition," and excommunicated their newly appointed leader, Bishop Rheinkens.

The year 1874 was marked by continual friction between Bismarck and the Catholic party. Although both the Ultramontanes and Social Democrats opposed his repressive ecclesiastical policy, it was supported as a necessity by nearly all the influential and liberal classes of Germany. Bismarck had said, "We will not go to Canossa." He now considered it necessary to supplement the Falck laws by three additional bills. The first simply explained certain terms which had been obscurely worded in the first laws, and had received conflicting interpretations in the law courts. The second and third provided for the administration of dioceses which might be deprived of their bishops. Before many weeks had elapsed, four out of the twelve Roman Catholic bishops of the Prussian kingdom came to a rupture with the government. Three of these, Archbishop Ledochowski, the Archbishop of Cologne, and the bishop of Treves, were arrested and imprisoned for refusing to pay the fines imposed upon them for their persistent violation of the Falck laws. A bill was passed during the spring session of the Reichstag to prevent the re-assertion of their claims by offenders whose terms of imprisonment should expire. Such persons could be ordered by the administrative authorities of their several states to leave, or take up their residence in districts assigned to them. Should an offender still decline to conform to the law, the government of his state was authorized to strip him of his citizenship, and to expel him from the territory of the German empire. The Imperial Diet passed this measure by the enormous majority of 257 to 95. The supplementary Falck laws were likewise confirmed, and it was decreed that under certain conditions Roman Catholic congregations should be permitted to choose their own priests, and have a hand in the management of church property. Prince Bismarck went to drink the waters at Kissengen in July, and while there a journeyman cooper named Kullmann, imbued with hatred of the ecclesiastical laws, fired a pistol at him. The Prince escaped unhurt, and his would-be assassin was arrested, tried, and sentenced to seven years' penal servitude. In 1877 a colossal statue of Bismarck was unveiled at Kissengen near the spot where this attempt upon his life was made. Throughout the year 1874, Bismarck's anti-Romish policy was pursued with vigor. Numerous arrests of recalcitrant priests were made, and diplomatic relations with the Vatican were entirely broken off. This led to another vehement debate, in which Dr. Windthorst attacked the foreign policy of Bismarck. In the course of his reply the chancellor said, "I know from the very best sources that Napoleon was dragged into the war very much against his will by the Jesuitical influences rampant at his court; that at the eleventh hour he determined to maintain peace; that he stuck to this determination for half an hour; and that he was ultimately overpowered by persons representing Rome." This speech made a deeper and more lasting impression than any yet delivered by Bismarck since the commencement of the conflict with the church. One of the first acts of the German Diet in 1875 was to pass a comprehensive measure extending the civil registration of births, deaths, and marriages over the whole empire, abolishing clerical jurisdiction in suits for divorce, and allowing Catholic priests, monks and nuns to marry. The Pope issued an encyclical declaring the Falck laws to be invalid and contrary to the divine institution of the church. Bismarck replied by giving the Ultramontanes another stringent Falck measure. In March a bill was passed by the Prussian Diet withdrawing the state grants from Roman Catholic bishops. Another bill was passed excluding all religious orders and societies of the Catholic church from Prussian territory. The elections to the German Reichstag of 1877 were less favorable than formerly to the government. The Ultramontanes lost considerably, but there was a great Conservative reaction as well as a notable increase in the socialist vote. Bismarck was not slow to perceive that with the complete triumph of his ecclesiastical policy the tide of feeling against the Catholics had about reached its culminating point, and began quietly to shape his course towards reconciliation with the Vatican; but it was not until after the accession of Pope Leo XIII in 1878 that a *modus vivendi* between the Romish church and the German government was finally established.

Next to the Ultramontanes, the most formidable opponents of the imperial government were the socialists, who had been secretly organizing and growing in numbers since 1862, when Ferdinand La Salle began his agitation by addressing audiences of working men in Berlin and Leipsic. La Salle was a gentleman of fortune and a philanthropist, and his views were moderate from the socialistic standpoint. He thought the method by which working men might rise above their condition was by forming protective associations with the aid of the state. Those who championed the cause after his death were extremists who aimed at nothing short of communism, and did not hesitate to advocate revolution if necessary to bring about their Utopia. After the close of the war with France, this party began to figure more and more largely at the annual elections, until in 1877 it was estimated that they could control one-tenth at least of the voting power of the state. They thought the time had come for them to show their hand openly as early as 1871, when Herr Bebel gave utterance to their views in the Prussian Parliament. After remarking that what the Communists had done in Paris was but an outpost skirmish, which would be followed up some day by a great European battle, he exclaimed, "War to the palaces, peace to the cottages, and death to luxurious idleness, is and ever will be the watchword of the proletariat in all parts of the world." Several strikes of workmen, notably in

Berlin, occurred in the fall, and before the year closed a meeting of working men was convened in the capital by the Social Democratic Union. Its objects were to protest against the petty remuneration given to the landwehr and reserves as compared with the munificent grants made to the generals and other officers, and to adopt some plan for greater industrial co-operation among the Berlin working men. As a counterbalancing movement, when the manufacturers assembled for their annual meeting at Leipsic, they took into consideration the interests of the capitalists, and sought to contrive measures for overcoming the hostility of the workmen. Notwithstanding the complaints of the socialists, the commercial condition of the empire was very prosperous. The war had not appreciably interfered with business, and the taxes yielded as much in 1870 and 1871 as in the preceding years of peace. The commerce of the country was sound at heart, and after the conclusion of peace with France the commercial prosperity of the German Empire advanced by leaps and bounds, money being so plentiful that means could scarcely be found to employ it. Seven years of tranquillity and prosperity passed, and while Bismarck's hands were full with the Catholic troubles, the socialists made no overt demonstration of opposition to his government. But in 1878 the whole civilized world was shocked by an attempt, as cruel as it was foolish, to take the life of the aged Emperor while he was driving in the avenue called Unter den Linden with his daughter, the Grand Duchess of Baden. A mechanic named Hœdel came behind the carriage and fired twice at William, missing both times. "Is it possible these shots are intended for me?" was the comment of the astonished Emperor. Hœdel was tried and executed. All Europe joined in expressing detestation of the crime, and among the most gratifying messages of congratulation received by William was one from Marshal MacMahon, President of the French Republic. In consequence of Hœdel's attempt, the government introduced in the Reichstag an anti-socialist bill of a very stringent character. It was earnestly opposed by Bismarck's own friends, the National Liberals, Herr von Bennigsen and Dr. Lasker making speeches against it. The government was badly defeated, chiefly by liberal votes, and withdrew the bill. But on the 2nd of June a far more serious attack than Hœdel's was made upon the Emperor. As he was passing through Unter der Linden on foot, two shots were fired at him from the second floor of a house by Dr. Nobiling, who was immediately arrested. He fired repeatedly upon those who forced their way into his apartment, and then turned his pistol on himself, inflicting wounds upon his head before he was overpowered, of which he soon died.

Attempted assassination of the Emperor by Hœdel.

The would-be assassin Nobiling.

The Emperor was taken in a carriage to the palace, where thirty small shot were extracted from his arms, neck, and shoulders, when the operation had to be suspended because of the inflammation of the wounds "It is well thou wast not with me this time," said William to his beloved daughter. He was incapacitated for public business for six months, during which time the Crown Prince Frederick acted as regent. For some time a fatal issue was dreaded. These crimes made a deep impression upon Prince Bismarck. The American general Grant, who was then making a tour of Europe, was in Berlin at the time of Nobiling's attempt, and had a conversation with the Prince on that subject. The American general having expressed the horror with which he and all his countrymen regarded the act, Bismarck gave free vent to his feelings. "We see an attack made on the life of an old man," he said, "one of the best men in the world. There never was a man with a more modest, generous, humane character than the Emperor. He is quite distinguished from those born in so high a position, or at least from most of them. You know that people of his rank, born in the purple, come to believe themselves different from their fellowcreatures. They attach little importance to the feelings and wishes of others. Their whole education tends to suppress human sympathy. The Emperor, on the contrary, is sympathetic and humane in everything. He has never in his life injured anyone, or treated him with harshness. He is one of those whose kind nature wins the hearts of all. He is always occupied with the happiness and welfare of his subjects and his entourage. It is not possible to conceive a type of gentleman more noble, amiable and generous. He is adorned with all the lofty qualities of a Prince, and all the virtues of a man. I thought that the Emperor could pass through his empire alone and unattended without the slightest danger, and yet we see that people have attempted to murder him. Our Emperor is in all things so republican that even the most bitter republican would admire him if his judgments were impartial." The parliament would doubtless now have reconsidered their action, and passed the bill for the suppression of socialistic meetings and publications, but Bismarck would not give them the chance. On the 11th of June an imperial ordinance pronounced the dissolution of parliament in consequence of the rejection of the law. At the elections which followed, the socialists returned fewer members, though they polled a larger number of votes, only 9 instead of 12 being elected. The conservatives largely increased their strength, while the liberals were greatly weakened. The Emperor's speech, which was read by deputy at the opening of the German diet on the 9th of September, dealt chiefly with the attempts made upon his life and the anti-socialist bill to be laid before the house. A hope was confidently expressed that the deputies would not refuse to grant the means of giving the peaceful development of the empire the same security against attacks from within as it had enjoyed against those from without, and that the spread of the socialist movement would be arrested. When the bill was introduced, Count Stolberg, as spokesman for the government, admitted that the measure was one of great severity, but insisted that halfway measures would only do harm. The Ultramontane party opposed the bill, and recommended its reference to a select committee. Herr Bebel denied that there was any connection between the Social democracy and the crimes of Hœdel and Nobiling. Prince Bismarck was reproached for having formerly courted the socialists whom he now sought to repress. In his vindication, the chancellor admitted that he had been on intimate terms with La Salle, but maintained that, so far from being an extreme revolutionist, that prominent socialist was deeply imbued with national and even with monarchical principles. The bill was ultimately referred to a committee of 21 members, was reported back, and finally passed the Reichstag by 221 votes to 149. By this bill it was left to the authorities to decide what socialist and communist doctrines were, and to take peremptory measures for the suppression of socialist writers and agitators. It came into force immediately, and four clubs in Berlin and a large number of publications were at once suppressed by the police. It was as promptly and rigorously enforced throughout the country, and, at the close of the year, 171 associations and 45 newspapers had been suppressed, and 150 books and pamphlets prohibited. In the following year 457 injunctions were issued under the anti-socialist law, 189 being directed against clubs and societies, 58 against periodical publications, and 210 against books and pamphlets. This repressive law was not the only result of the attempts to accomplish socialistic ends by murder. The government undertook a vast legislative labor, embracing the whole social and economical domain; and when Bismarck's projects were rejected by a hostile majority the Emperor openly interposed to give the Prince's proposals the weight of his sanction. At the opening of Parliament on the 12th of February, 1879, William said that repressive laws were not sufficient to solve the socialistic problem, but that it was necessary to do something to cure the evils from which the working classes were suffering. Two years later, on the 17th of November, 1881, he put forth the same idea still more emphatically. He again recommended the Parliament to adopt laws for the working classes, saying that while the reforms which he desired could not be suddenly realized, he felt himself bound before God and man to take the initiative without considering the probability of immediate success. Dissatisfied with the dilatoriness of the parliament in dealing with the Workmen's Accident Insurance bill, which was brought forward by the government and provided for a state insurance, the employers being called upon to guarantee the premiums. William sent them a special message on the 14th of May, 1883, requesting them to terminate the debate on the Budget in the first part of the session, so that they might devote themselves to an examination of the economic measures which were before them. In the session of 1884, a bill for the continuation of the repressive law against the socialists was introduced and met with a violent and tenacious opposition, and on the 22nd of March, when William received the Parliamentary Deputation which came to congratulate him on his birthday, he again expressed in strong terms his surprise at the dilatory manner in which this question was being treated by them. He said that the opposition seemed to have forgotten the circumstances by which the law was called forth. He had to shed his blood before the dangers menacing society were recognized. The opposition to the anti-socialist law was therefore directed against his own person. On the other hand he was firmly attached to the laws for the benefit of the working classes, and he requested the members of the Deputation to use all their influence for their adoption.

The Emperor's allusion to the shedding of his own blood as a result of socialistic agitation was justified not alone by Dr. Nobiling's attack on him. In September, 1883, the national monument at Niederwald near Rudesheim on the Rhine—a colossal figure representing Germania looking out across the frontier—was unveiled by his Majesty to commemorate the victories of the war of 1870. This imposing monument, which strikes the eye of every tourist on the Rhine to-day, was dedicated by William "in memory of those who fell; in gratitude to those who live; in emulation of those to come." Little did he or any of the brilliant staff who were present with him at this ceremony imagine the horrible plot which had been laid at that moment to destroy his Majesty's life. While addressing the assembled throng, William was literally standing upon a volcano, but happily there was no eruption. It was not until some months afterwards that the knowledge of a third diabolical plot to assassinate William was brought to the authorities. A stone bottle containing dynamite was found in a drain running across the road by which the Emperor was to pass. Three men, Reinsdorf, Kuchler, and Rupsch, were arrested and tried for the conspiracy. Rupsch confessed while in prison that he had placed the bottle with the dynamite in the drain at the instigation of Reinsdorf, but said he did not light the match, because he had intended from the first to frustrate the plot. His story was not believed, and he and his accomplices were sentenced to death. The Reichstag at once passed a bill on May 15th, 1884, providing that the manufacture, sale and possession of explosives, and their importation from abroad, should only be permitted by authority of the police, and imposed the punishment of penal servitude upon anyone who wilfully endangered life or property by means of explosives, or incited to the commission of such a crime by speeches or the publication of pamphlets. Another bill provided for the extension of the law against socialism until September, 1886. The parliament made more difficulty about the passage of the latter bill, and the Emperor was obliged personally to remonstrate with them for their slowness. Bismarck spoke earnestly in favor of the bill, and even held out a threat of dissolution; the measure finally passed by the narrow majority of 189 to 157.

Dynamite plot to kill the Emperor.

Meanwhile the parliamentary policy of Bismarck had been silently undergoing a considerable change. By the help of the Liberals he had carried on the "Kulturkampf," and now that its objects had been attained, he found himself face to face with the equally dangerous problem of socialism, in dealing with which his former allies, the Liberals, had become an opposition. Some of the Falck measures had been distasteful to the Emperor, and all of them especially so to the Dowager Queen Elizabeth, for whom William had a profound regard. Influences from opposite directions were thus operating upon the chancellor to break with the Liberal party. He, therefore, welcomed every chance of renewing old ties with the Conservatives. Both the Emperor and the Empress Augusta deplored the "Kulturkampf" as a national calamity, which could not too speedily be brought to an end. The pressure they put upon Bismarck was strengthened by overtures which Pope Leo XIII made to the Emperor immediately after his accession in 1878. Very soon the German government began a course of legislation which gave the wits of the press and diplomatic circles occasion to suggest that Bismarck was going to Canossa after all. On the 7th of February, 1878, Pius IX died, and Leo XIII lost no time in writing to William expressing his regret at the interruption of the friendly relations which had formerly existed between Germany and the Holy See. To this William replied, on the 24th of March, gladly accepting the Pope's assurance that he would use his influence "to induce those who have hitherto proved refractory to follow the example set them by their flocks, and conform to the laws of the land in which they dwell." On the 17th of April, the Pope again wrote to congratulate the Emperor on his escape from Hœdel's murderous attempt upon his life, but declined to use his influence with the clergy in the sense demanded by the emperor, and referred to some of the Falck laws as a direct violation of the rights of the church. This letter arrived in Berlin while the Crown Prince Frederick was acting as regent, and his reply, while expressing the firm determination of the Prussian sovereign to remain independent of the control of the church, professed a readiness to approach the questions at issue in a liberal spirit. "The demand advanced in your letter of the 17th of April, that the constitution and laws of Prussia should be modified to meet the principles of the Roman Catholic church," wrote Frederick, "is one which no Prussian sovereign will be able to admit, because the independence of the monarchy, which it is now my duty to defend as an inheritance received from my fathers and an obligation owed to my country, would cease to be absolute if the free development of its legislation were to be subordinated to the control of another power without. Though it is, therefore, not in my power, and perhaps not in that of your Holiness either, to remove an antagonism of principles which has for a thousand years been more keenly felt in the history of Germany than in that of any other country, I am nevertheless prepared to meet the difficulties which both parties have inherited in this conflict in the peace-loving and liberal spirit which my convictions as a Christian enjoin." The ice being thus broken by Frederick's tact, a high dignitary of the church suggested that Rome might be reached without passing through Canossa, and Bismarck was eager to act upon the hint. His old allies, the Liberals, were going too fast for him, and the alarming spread of socialism and rationalism convinced him that it was full time to break away from them. In June, 1879, he accepted the resignations of Dr. Falck and of the Ministers of Finance and Agriculture, and on the 9th of July openly announced his separation from the National Liberal party. In the session of 1882, Dr. Windthorst carried a bill through the Prussian Parliament for the repeal

Reconciliation with the papacy.

of the law prohibiting the exercise of ecclesiastical functions without authority from the government, and another measure was also passed restoring to their sees several of the deposed bishops, who had for some years been living in Rome. A plenipotentiary was appointed to the Vatican, and at last the Emperor was able to announce to the Prussian Chambers that the "Kulturkampf" was ended, and that Prussia was once more on friendly terms with the Pope. One by one the offensive features of the "laws of May" were relaxed. The grants from the state to Catholic bishoprics and parishes, which had now been provided with pastors acceptable both to the Pope and the government, were restored. The Prussian government, however, held out firmly against allowing Ledochowski to return to the archbishopric of Posen, and refused to permit a Polish priest to be his successor. The Pope settled the difficulty by making Ledochowski a cardinal and nominating a German priest of East Prussia to the archbishopric of Posen. The Crown Prince Frederick was sent on a mission to strengthen still further the new friendship between Berlin and the Vatican. In December, 1883, he paid a visit to the King of Spain at Madrid, and returned home by way of Italy. Victor Emmanuel had paid his respects to Emperor William at Berlin in 1873, and William had in return visited him in 1875 at Milan, then the Italian capital. The relations between Germany and the Vatican at that time prevented William from going to Rome, but in the spring of 1884 the Crown Prince, on his way home from Spain, paid a visit as his father's representative to both the King of Italy, now installed in the palace of the Quirinal, and to the Pope. Frederick's tact enabled him to perform both errands without offending the susceptibilities of either King or Pope. The Pope received the Prince with cordiality and with royal honors, and expressed a hope that he might live to see all differences between the church and the German government terminated by a lasting peace. Bismarck still further gratified his Holiness in the course of the year 1885 by asking for his mediation between Germany and Spain in regard to the protectorate of the Caroline islands. Spain had claimed the suzerainty of these islands since the seventeenth century, but had never taken actual possession of the territory. In pursuance of Bismarck's new colonial policy, of which we have yet to speak, Germany had repudiated the Spanish claim and hoisted her own flag upon one of the islands. Spain protested, and Bismarck asked for the Pope's mediation. By this stroke of policy he not only gratified the Pope, but silenced for the time his clerical opponents, the "party of the Centre," at home. Spain could not do otherwise than consent, and in a month the decision of Leo XIII was given, upholding the claim of Spain to the sovereignty of the islands, but granting to Germany the right of forming agricultural colonies there, and establishing coaling and naval stations. Further concessions were made to the Vatican by the Prussian parliament in the same year, amounting almost to a total abandonment of the famous "laws of May." A bill was passed restricting government control over the Catholic seminaries, abolishing the ecclesiastical tribunal, and giving back to the Pope and the bishops supreme jurisdiction over the clergy. The truce thus concluded has remained unbroken through the reigns of William's successors to the present time.

The modern empire has had two other disturbing elements to deal with, one dynastic and the other national and it has dealt with them successfully. Several of the princes who had been deposed in 1866 made their peace with William after the war of 1870. The Elector of Hesse Cassel having died in exile in 1875, his son made a compromise with the Emperor, by which he and his family renounced all their claims to the Electorate. The Duke of Nassau had long resigned himself to the loss of his crown, and the marriage of his daughter in 1885 with the eldest son of the Grand Duke of Baden and grandson of Emperor William I, confirmed his reconciliation to the court of Berlin. Another marriage removed the last trace of the ill feeling caused by the Schleswig-Holstein question, when Prince William, the eldest son of the Crown Prince Frederick, married Victoria, daughter of the Duke of Augustenburg, in 1880. The emperor made his consent to this match conditional upon the acknowledgment of the status quo by Duke Frederick; and the Duke issued a declaration stating that the duchies of Schleswig and Holstein having been liberated from Denmark and become an integral part of Germany, he relinquished his personal interest to that of German unity. He died at Wiesbaden in January, 1880, at the very moment when this declaration was placed in the Emperor's hands. Frederick's son and heir, Duke Ernst Gunther, as well as Prince Christian, brother of the deceased duke and son-in-law of Queen Victoria, confirmed that declaration and received pecuniary indemnities for so doing. The King of Hanover still remained unreconciled, and had partisans in both the Prussian Chamber and the Imperial Parliament, calling themselves the Guelph faction, who always voted with the opposition. George V of Hanover died on the 12th of June, 1878, but his son and heir followed the same course as his father. He took the title of Duke of Cumberland, and in December, 1878, married a daughter of the King of Denmark. When the Duke of Brunswick died in 1885, he was the next heir, but the Federal Council of the empire declared him incapable of succeding to the vacant duchy, and appointed Prince Albert of Prussia, a nephew of the emperor, as regent. "The future will show," says a French writer, M. Simon, "whether this regency is the prelude to the creation of a state for the younger branch of the house of Hohenzollern, or to incorporation with the Prussian monarchy; in any case it adds another success to the many successes of the Emperor William."

The government of the conquered provinces of Alsace and Lorraine was a serious problem for the cabinet of Berlin. These provinces could not be placed under the rule of Louis of Bavaria, the promoter of William's imperial dignity, passing by the Grand Duke of Baden, William's son-in-law; and William himself was aware that there were insuperable obstacles to their annexation to his own hereditary dominions. The inhabitants of Alsace, who had been in sympathy with France in the Waterloo era, were so still, and Bismarck concluded that the best way to humor their susceptibilities was to make of the conquered provinces a "Reichsland," an autonomous state, governed by a lieutenant of the emperor. But as a first experiment he decided upon a dictatorial regime, and obtained the passage of a law on the 3rd of June, 1871, providing that these provinces should be governed by imperial decrees from Berlin until the first of January, 1873. When the Deputies from Alsace-Lorraine took their seats in the Imperial Parliament, they sided with the other discontented groups who voted with the Opposition. In 1874 the constitution of the empire was introduced into Alsace-Lorraine, and Strasburg became the seat of a deputy of the Emperor, surrounded by ministers and a parliament, who ruled the country independently of the German administration. The spirit of the people has shown little change, but this may be owing to the strict rule of General Manteuffel, the first governor, whose antecedents as Minister of Frederick William IV and as Governor of Schleswig after the Danish war made him singularly unfit for the duties of a pacificator. The Emperor visited Alsace several times to preside over local solemnities or to direct military manœuvres, and always met with the respect due to his great age and personal character, but while welcomed by the upper classes, the multitude stood aloof, and it was not till after the death of Manteuffel, and the appointment of Prince Hohenlohe as his successor in 1885, that the reserve of the people toward the Imperial house began to abate.

Alsace and Lorraine.

The Poles in the provinces of Posen and eastern Prussia have always been a thorn in the side of the Prussian government. In 1871 the inhabitants of these provinces protested against being swallowed up in the German Empire, and demanded autonomy, but they were sternly silenced by Bismarck. Their race antipathy to the Germans was aggravated by the antagonism between the State and the Catholic church. The Polish priests united their efforts with the political agitation of the upper classes, and it became difficult to determine whether a Polish Deputy in the Parliament of Berlin had been elected to defend the cause of Poland or that of the Church of Rome. In 1885, in consequence of the disaffection of this Slavic people, brought about by the priests under the influence of Ledochowski, the Prussian Parliament passed a law for the expulsion of all Poles who were not Prussian subjects. Some of them took refuge in Austria and many in the United States. Another bill was approved granting one hundred million marks for the purchase by the State of mortgaged Polish districts, and for transferring to the State the supervision in such districts of popular education. The result of this legislation is yet to be seen.

The military organization of the empire was always a question of the first importance to William and his advisers. The constitution of the Northern Confederation had fixed the effective force and the military expenses for a period ending in 1871, and at the end of that period the Confederation itself had been absorbed by the new empire. It therefore became necessary in the first session of the Imperial Parliament to pass a new army bill. William would not be satisfied with anything else than the application to all Germany of the system prevalent in the North. He would not have an army depending for support on the votes of parliamentary majorities. As he had formerly expressed himself, "I desire a royal, not a parliamentary army." But as things were yet in a state of transition, the government contented itself with fixing the military budget for three years. In 1874 the question had again to be passed upon by the diet. The government demanded an effective force of 401,600 men, to be maintained as long as the law did not decree otherwise. But a law of the empire which could only be modified by the united consent of the Emperor, the Federal Council and the Parliament, was recognized by all as an infringement of the Parliament's control over the Budget. The Opposition were vainly appealed to by the leaders of the army, who pointed out that foreign powers were jealous and hostile, and that France in particular was only awaiting her opportunity for revenge. "If you wish for peace, be prepared for war," said Count Von Moltke. Finally it was agreed, by way of compromise, that the effective force of the army should remain invariable for a period of seven years. The septennial military grant was voted on the 14th of April. Some months later the organization of the army was completed by the creation of the "landsturm," comprising the men who had left the ranks and the reserve, who were required to undertake the defence of fortresses and of German territory. Through these various organizations the German army numbered on the 1st of January, 1878, in time of war, 1,283,791 men, to whom were added 900,000 of the "landsturm," making a total of over two million soldiers. But even this number did not appear sufficient to the Emperor and his ministers. The Septennial period ending on the 31st of December, 1881, the government proposed in the session of 1880 its prolongation until the 31st of March, 1888, and also demanded an increase of the effective force in time of peace to 427,270 men, and the calling out of the first class of reserve for the periodical manœuvres. After violent debates, the new law was passed on the 15th of April, 1880. The result was highly gratifying to William. A few months afterwards, his grandson, the present Emperor William II, who had just been married to the young Princess of Augustenburg, received his Colonelcy in the 1st Foot Guards, and the Emperor, in presenting him his commission, took occasion to review the military history of the empire.

With the concentration of formidable military power in the hands of the Emperor, was combined a policy of resistance to parliamentary demands which were thought to encroach upon the imperial prerogative. William made a point of showing that he was the only initiator and promoter of all the acts of the government, and he boldly assumed the full responsibility of these measures, as we have seen in his correspondence with Pope Pius IX. In this respect his ideas had not been modified since his coronation as King of Prussia in 1861. On the contrary, his years and his brilliant triumphs only fortified his conception of Royal authority. In his opening speech at the autumn session of the Prussian Parliament in 1871, he drew a broad line of demarcation between the jurisdiction of the German Reichstag and that of the Prussian Parliament; while the maintenance of the national power and security belonged to the Empire, it was for the Prussian representatives to devote themselves to the healthy development of internal institutions. Some years afterwards, when the Reichstag protested against the expulsion of the Poles, he applied the same doctrine to them, and told them plainly they had nothing to do with measures which solely concerned the internal policy of Prussia. While keeping both Parliament and Reichstag in their proper place, he in 1872 administered a check to the power of the nobles. A bill to remodel the administration of the six provinces of East Prussia was introduced in the Prussian Chamber, which proposed to abolish the last remnant of feudal government in the Prussian Kingdom. Heretofore the magistrates and county assemblies of these provinces had been exclusively composed of landed proprietors. It was now proposed to admit a large number of townspeople and villagers to the county assemblies, and to bestow upon the villages the right of choosing their municipal officers. The bill passed the Lower House, but was thrown out by the Upper, although the Emperor had intimated to Count Bruhl, the President of the Upper Chamber, that he desired and expected it to pass. The feudal lords, whose arbitrary rights were struck at by the bill, of course declined to vote for the extinction of their own power and influence. A constitutional crisis was the result. To carry the measure, William was obliged, reluctantly, to create twenty-five new peers, and a letter which he wrote to a Conservative member of the Lower House had the effect of turning many votes, so that ultimately the bill was passed.

Imperial and Prussian jurisdiction defined.

Feudalism abolished.

The just and humane solicitude shown by the Emperor and his first minister for the material welfare of the masses was injuriously misinterpreted by a new band of agitators, comprising members of the aristocracy and ministers of the Protestant church, who abused, in language as violent as the socialists had ever used, the "rapacious middle class," whose leaders they asserted to be of the Jewish persuasion. Thus began the "Judenhetze," or persecution of the German Jews, in 1880. Herr Stocker, the Emperor's court chaplain, was the leader of this disgraceful movement. He made himself temporarily notorious by his extreme activity in forming an anti-Semitic political party, in organizing meetings and inducing people to sign petitions. The Jews were referred to in these documents as a dangerous class, and it was pointed out that while the census of 1871 showed a Jewish population in France, Italy and Great Britain amounting altogether to only 40,000, there were in Germany 512,000. Riots broke out in Berlin, sometimes caused by the Jews themselves, but in most cases by their nominally Christian antagonists. The Emperor did not bestow serious attention on an agitation which, however much it may have alarmed the Jews and excited the multitude, he considered merely ephemeral, and which the

Persecution of the Jews.

Crown Prince had blamed in public in the severest terms. When the Prussian Chambers assembled in October, 1880 a petition was laid before them asking that the Jews should be placed under police supervision, and that restraints should be placed by the government on Jewish immigration. No action was taken, but the government announced its determination not to permit the civil rights of citizens of any religious denomination to be interfered with. The constituents of Herr Stocker showed their appreciation of his zeal by retiring him in the following year.

The victories of 1870 made William the arbiter of continental Europe. The excesses of the Commune in Paris drew the three emperors into a closer intimacy. In 1871 the Emperors of Germany and Austria had several interviews on Austrian territory, at Ischl, Salzburg, and Gastein, at which a plan of general policy was agreed upon. The principle of non-intervention was applied to Italy on the Roman question, and to France in her internal affairs; Germany was to assist Austria should she be attacked by Russia, and united opposition was to be made to the excesses of social democracy. A sponge was passed over the events of 1866. Next year there was a grand conference of the Emperors of Russia, Austria and Germany at Berlin, and while they were discussing affairs from their point of view, the three Chancellors, Bismarck, Gortschakoff, and Andrassy, were also holding consultations. The hopes of France for an alliance against Germany were shattered, and the Pope had to give up the prospect of an ally in the Austrian emperor, "the born defender of the church." The cabinet of Berlin obtained the recognition by Russia and Austria of the conquests of 1870, and the closer union of these two powers under the auspices of Emperor William. From that date the three emperors confirmed their amity by visits to the respective territories of each. In 1877, when Russia declared war against Turkey Germany remained neutral in spite of the remonstrances of England. But when Russia had arrived at the gates of Constantinople, and imposed upon Turkey the treaty of San Stefano, which deprived the Sultan of nearly all his European possessions, England and Austria joined in armed protest; Austria mobilized her troops, and England sent a squadron into Turkish waters. The mediation of Germany was called for by Russia, and a congress met at Berlin during the regency of the Crown Prince Frederick. William would probably have intervened in favor of his nephew, the Czar, but England and Austria found powerful supporters in the Crown Prince and Bismarck. Turkey was condemned to pay the costs, and be shorn of much of her territory. Some provinces in Europe and Asia fell to the share of Russia; Cyprus to England; but what annoyed Russia the most was that Austria was installed in the possession of the western portion of the Balkan peninsula, comprising Bosnia and Herzegovinia. Such a division of the spoils so disgusted Prince Gortschakoff that he exclaimed, "This congress is the blackest part of my career." A coolness grew up between Russia and Germany in consequence, and on the 15th of October, 1879, a treaty was concluded between Germany and Austria ostensibly for defensive purposes, but plainly directed against Russia. The two powers agreed to maintain the state of things established in central Europe, and to assist each other to repel foreign aggression. The assassination of Alexander II in March, 1881, brought the courts of Berlin and St. Petersburg into more friendly relations. Gortschakoff resigned, and in 1883 a league of peace, or triple alliance, was formed by the three great empires, which has not since been disturbed. With England the German Empire has always been on good terms, notwithstanding the fact that in 1872 William decided the San Juan question in favor of the United States and against Great Britain; and the same can be said of its relations with the United States, the disagreement with regard to the importation of American animal products having been easily adjusted by diplomacy.

Russo-Turkish war.

In 1884 Bismarck turned his attention to colonial settlements, with a view to providing new markets for the products of German industry, and opening a vent for the superfluous energy which was too often spent in mischievous agitation. Some German merchants, who had settled in Africa and Australia, solicited in 1876 the protection of the German flag for their enterprises, but the Parliament of Berlin gave no encouragement to this new idea, and it startled William himself. Not so with Bismarck. He encountered British diplomacy in this field, and succeeded in obtaining recognition for German settlements on the Congo. Great Britain welcomed Germany as a neighbor in the district of Cape Colony, and as a further step in German colonization, a convention was concluded between Germany and the Transvaal republic. The German government now took its place among the colonial powers in West Africa. Shortly afterwards a dispute arose with England about the Cameroons and a part of New Guinea, but on both questions England came to terms with Germany. The future of Bismarck's colonial policy is as yet unrealized. The military system of the empire excludes the use of German troops in distant countries, and though the Germans are ready, without any government incentive, to emigrate to America to improve their fortunes, war in a tropical climate has no charms for them.

Death of Emperor William I.

The year 1888 was a sad one for the imperial house of Germany. William's health had for some time been breaking, and the end of his honored life was known to be near; but a cancerous malady which had attacked the Crown Prince caused all the loyal subjects of the empire still greater alarm. It was a question during some months whether the aged Kaiser or his son would be the first to die. The Crown Prince had been suffering from the effects of a cold, but was sufficiently recovered to be able to attend the ceremonies in honor of Queen Victoria's jubilee in 1886, and after that was over he took up his abode at the Villa Zirio, at San Remo, in Italy. His malady progressed so rapidly that in February, 1887, the doctors attending him decided to perform the operation of tracheotomy, and he then had to breathe through a tube inserted his throat. The news of his son's condition greatly depressed the Emperor, and hastened his end. On the 9th of March, 1888, William I passed to his fathers. His son, Frederick III, arrived at Berlin on the night of the 11th, in the midst of a snow and sleet storm, which told seriously on his enfeebled constitution. King Humbert of Italy accompanied him as far as Genoa. Prince Bismarck and the other members of the imperial government met him at Leipsic, and escorted him to the capital. Frederick was unable to attend the funeral of his father, but watched the procession from a window of the palace, as it went past toward the mausoleum in the Garden of Charlottenburg, where Queen Louisa and Frederick William III lie side by side.

Frederick III.

Illness and death of Frederick III.

The reign of Frederick III lasted only three months. The final crisis of his disease set in soon after his removal to the old chateau at Potsdam, where he was born, and to which he now gave the name of "Friedrichskron." Here, surrounded by his family, he died on the 15th of June. He had left behind him a rescript addressed to Prince Bismarck, setting forth his projects of government. It stated that the constitutional rights of all the federal governments must be recognised as much as those of the Imperial diet; urged the necessity of keeping up the army and the growing navy and commanded toleration of all religious sects. He expressed his desire to support "every movement toward furthering the economic prosperity of all classes of society, reconciling their conflicting interests, and mitigating if possible unavoidable differences, without encouraging the anticipation that every social evil can be remedied by state intervention." "I consider," he said, "as intimately connected with the social question the control of the education of youth while the higher education must be extended. We must beware of the danger of half education, awakening demands which the nation's economic development is unable to satisfy." The memory of Frederick III is regarded not only in Germany but throughout the world with respect and admiration. A great general, as he proved himself to be in the Austrian and French wars, he was also an enlightened statesman. He held his ground against papal aggression in 1878, and he opposed the persecution of the Jews in 1880. After the victory of Sedan, it was his duty to inspect the military forces of the south German states, and his personal popularity among them did much to inspire among the south German soldiers a loyalty to the changed order of things. To him and to his consort, the Princess Royal of England, several institutions for the encouragement of art owe their origin in Berlin; and to the princess, now known as Empress Frederick, civilization is indebted for such institutions as the Victoria lyceum, the school for the training of nurses, and the school for the higher education of women. During the wars with Austria and France, the Crown Princess had personally superintended the nursing of wounded soldiers in the hospitals. The institution for the training of nurses, which is still performing a beneficent work, was organized by her as the result of her experience during those campaigns.

William II. The eldest son of Frederick succeeded him under the title of William II. His accession was contemplated with concern and apprehension throughout all Europe, because this young prince had shown as yet no indication of the liberal spirit of his father, but on the other hand had given proof of a strong leaning toward military rule. Those fears have been greatly allayed, if not entirely overcome, by the conduct of William II, since he came to the throne. During the summer months of 1888 he visited the courts of Russia, Sweden, Denmark and Italy, and succeeded in confirming the friendly relations existing between them and Germany. During the year 1889 he still further strengthened the military and naval armament of Germany, and demonstrated his business and executive ability by settling dangerous strikes and discontent among the working men. A temporary misunderstanding between himself and the Empress Frederick relative to the disposal of some private papers of the late Emperor which she claimed as her own property, and which William thought should be deposited among the royal archives of Prussia, gave rise to some newspaper speculation as to a possible rupture of friendly relations between the governments of England and Germany; but this cloud also passed away, and in August, 1890, William made a friendly visit to his grandmother, the Queen, and his royal relatives in England.

International labor conference. In March, 1890, an international labor conference was held at Berlin under William's auspices, presided over by Baron von Berlepsch, the Prussian minister of commerce.

Under William I, Bismarck had been the absolute head of the government, and notwithstanding all his notions of kingly prerogative, the simple-hearted old soldier monarch was accustomed to lean entirely upon the advice of Bismarck. The young Emperor determined to change this system of things, and issued a cabinet order revoking that of 1852 and requiring all Ministers, Bismarck included, to report to him direct instead of making the chancellor their mouthpiece as theretofore. The chancellor felt humbled and slighted by this order; he was now no more prime minister, but a mere head of a department; he who had made and unmade other ministers was now reduced to a level with them. On the 18th of March, three days after the assembling of the labor conference, Bismarck tendered his resignation to the Emperor, alleging age and failing health as his reason. The resignation was accepted, and General von Caprivi was appointed Chancellor of the Empire and president of the Prussian ministry. William publicly thanked Bismarck for his long services to the Imperial house, and conferred upon him the title of Duke of Lauenburg. The departure of Prince Bismarck for his country home at Friedrichsruhe was the occasion of the greatest public demonstration in Berlin since the return of the victorious troops in 1871. The station was literally heaped with flowers, the Emperor and Empress each sending a beautiful floral tribute to the retiring chancellor. The crowd was so great that the police were unable to keep order. As the train passed out of the station the crowd joined in singing "Die Wacht am Rhein." In August, 1890, in virtue of a treaty with the English government, William took possession of the island of Heligoland, which will now become an important station for the German navy. England obtained as compensation the consent of Germany to her protectorate of Zanzibar, which was also ratified by France. The Emperor on taking possession of Heligoland issued a proclamation in which he promised to protect the islanders in the observance of their old customs, in their freedom of religious worship and the education of their youth. The year 1890 closes with every prospect that Germany will be able to maintain and preserve the peace of Europe, of which she has been, ever since the Berlin Congress of 1878, the recognized arbiter.

PART III.—LANGUAGE.

In its ordinary sense the name German Language or *Deutsche Sprache* is now generally used to denote, in all their stages from the earliest time to the present day, the different languages and dialects of Teutonic origin spoken in the German and Austrian empires and in Switzerland, not including, however, the Frisian language, which once was spoken, and still in a few remnants survives, on the shores and islands of the German Ocean, nor the dialects of the Danish population of northern Schleswig. Flemish and Dutch, although very closely connected with German, are likewise excluded. But the word *Deutsch* has also been, and still continues to be, used in a wider sense. Jacob Grimm introduced it, in his famous *Deutsche Grammatik*, as a comprehensive name for that family of the so-called Indo-European or Aryan languages, for which English writers generally use the name of "Teutonic," and of which the principal branches are represented by Gothic, the Scandinavian languages, English, Frisian, and German. In this Grimm has had many followers, but scarcely anywhere out of Germany; and even there the fact that the name, in this application, besides being incorrect from an historical point of view (as the word has never been used thus by any one of the people to whom it has been applied by Grimm), is also liable to be misunderstood, has caused a growing tendency towards confining it again to its original meaning described above, and using *Germanisch*, or *Germanic*, in the collective sense of the English "Teutonic." But even in the stricter sense the designation *Deutsch* is not of very long standing, nor has the word always been a real proper name for a distinct people or tribe. In Bishop Ulfilas's Gothic version of the Bible we find the adverb *thiudisko* (ἐθνικῶς), Gal. ii. 14, which is clearly a derivative from *thiuda* (ἔθνος), meaning primarily "after the manner of the people." German writers of the earlier centuries were therefore as fully justified in calling their own language *diutisc*, or, in a Latinized form, *theudiscus*, *theotiscus*, that is, their popular or vernacular language, as were those mediæval Latin writers of all nations who distinguished their national languages by the name of *lingua vulgaris* from Latin, the only literary language fully acknowledged in their time. It was not until the 10th century that another Latinized form frequently used in later times, viz., *teutonicus*, began to be used instead of the older *theotiscus*, of which the only rivals in former times had been such local names as *franciscus* (*frenkisc*) or *saxonicus*, which were no doubt derived from the names of single tribes, but were often also used in the same comprehensive sense as *theotiscus*, without necessarily implying any allusion to dialectal differences between the languages of the tribes they properly belonged to. The last name we have to mention here is the Latin *Germanus*, with its different derivatives in the modern languages, including the English form *German*. Many attempts have been made to elucidate the origin of this word, but as yet nothing can be taken for certain beyond the fact that it is neither of Latin nor of German origin. Most probably it was a Celtic word, and, according to what Tacitus says in his *Germania* (ch. ii.), it was originally the name of a Celtic tribe, from which, by some strange error of the Roman and Greek historians, it has been transferred to the non-Celtic inhabitants of Germany. Accordingly the name has never been used by the Germans themselves except in imitation of its use in the works of Latin writers.

As to its geographical extension the German language has undergone very great changes in the course of the last two thousand years. At the dawn of history no Germans were to be found to the left of the Rhine, and even to the right of it Celtic tribes occur in the earliest times. There were Celts also in the south of the present Germany as far north at least as the Danube and the Main; Bohemia, too, derives its name from an early Celtic population, the Boii. Only the midland and north were inhabited by Germanic nations or tribes, stretching as far east as Poland, and perhaps covering even parts of the adjoining territories of Russia, where Slavonic and Finnish tribes were their neighbours. But of these Germanic tribes and their languages some have left no equivalents in our modern German tribes and dialects. We have mentioned the Frisian language as not belonging to German in its proper sense, although the Frisians have kept their original residence up to the present day, and have always been in constant connexion and frequent intercourse with their "German" neighbours. Many other tribes have wandered from their seats and colonized other countries. It was as late as the middle of the 5th century that the Jutes, Angles, and Saxons began their voyages of conquest to England, where they founded a new people and a new language,[1] leaving their native soil open to Danish invasions. Much earlier the midland tribes had already been slowly pushing on to the west and south, and expelling or subduing and assimilating the Celtic owners of the territories they invaded. But what was gained in these parts was counterbalanced by great losses in the north and east. The territories about the lower and middle Elbe, Oder, and Vistula, abandoned by the Lombards, the Burgundians, the Goths, and some other Germanic tribes, as well as Bohemia, which for some short time had been in the possession of the German Marcomans, were soon filled up by the immigration of numerous tribes of the great Slavonic family. Without going into details of the facts which are well known to the student of history,[2] we may simply state that, since about 500 A.D., when the great migration of the nations had come to an end so far as Germany was concerned, no further change of any great importance has taken place in the western and southern parts. In the east the German population at this time did not go beyond a line that may be drawn from about Kiel to the Böhmerwald, passing near Hamburg, Magdeburg, Naumburg, Coburg, and Baireuth. As is well known, it is in later centuries that almost all the eastern districts have been recovered for the German language.[3]

In the 6th century the remains of the numerous smaller Germanic tribes, mentioned before and during the migration of the nations, had consolidated into seven larger bodies or aggregations of tribes. The Frisians still held the extreme north of Holland and Germany. Their midland and eastern neighbours were then called by the new name of Saxons, borrowed from the Saxons who had left the Continent for England. In the main parts of the Netherlands and Belgium, along both sides of the Rhine, and across Germany to the Thuringian and Bohemian Forests, the powerful Frankish confederation had established itself, and it soon incorporated the smaller and less vigorous tribes of the Hessians and Thuringians, which were surrounded by the midland or eastern Franks, the Saxons, and the Slavs. Alsatia, Switzerland, and South Germany eastward to the river Lech were occupied by the Alemannians, while the inhabitants of the remaining districts of the present Bavaria and Austria bore the collective name of Bavarians.

The history of the German language cannot be severed from the history of these tribes, for Frisian, Saxon, Frankish (Hessian, Thuringian), Alemannian, and Bavarian are the leading dialects of the Continental branch of the Teutonic family. What Dr J. A. H. Murray has pointed out about the origin of the principal English dialects[4] may equally well be said of these Continental idioms. Having no specimens of the languages of the Continental tribes for nearly three centuries after their final settlement, we cannot tell to what extent they originally agreed with or differed from each other, although there must have been some dialectal differences to begin with, which were afterwards increased and multiplied, partly by phonetic changes (most probably resulting from scarcely discernible phonetic peculiarities, which, even in the earliest times, must have prevailed in those idioms), and partly by such alterations of the inflexional systems as are known to occur frequently in all languages whose character is not merely literary. But, however scanty our means of illustrating the earliest history of these idioms may be, there is no doubt that they were not all of them related to each other in the same

---

degree. Three main groups are easily distinguishable :—(1) Frisian and Saxon, whose nearest relation is English; (2) Frankish, Hessian, and Thuringian; and (3) Alemannian and Bavarian. Frisian is generally considered as a separate language. From Saxon the later Low German dialects (*Niederdeutsche Mundarten*) have sprung. The members of the third group (generally designated as *Oberdeutsch*, or Upper German), combined with *Mitteldeutsch*, or the midland dialects, viz., Thuringian, Hessian, and part of the Frankish dialects, are the sources of the later *Hochdeutsch* or High German. The greatest difference prevails between the first and third groups; the second may be characterized as containing various transition dialects. The southern Frankish dialects are very closely akin to the adjacent Upper German idioms, while Dutch, the utmost offshoot of the Frankish language to the north, does not very materially differ from Saxon or Frisian in the earliest period. The most striking phonetic feature of the languages of the first group is their regular dropping of the nasal sounds before the spirants *f*, *th*, *s*, accompanied by subsequent lengthening of the preceding vowels. Thus we have in Anglo-Saxon or Old English *fíf*, *óðer*, *cúð*, *gós* (Mod. English *five*, *other*, (*un-*) *couth*, *goose*), in Old Frisian *fíf*, *óthar*, *cúth*, *gós*, in Old Saxon *fíf*, *óthar*, *cúth*, *gós*, corresponding to such Gothic forms as *fimf*, *anthar*, *kunths*, or the ordinary High German *fünf*, *ander*, *kund*, *gans*. Since, however, Dutch partakes of this peculiarity to some extent, we cannot easily form a decisive opinion as to the value of this fact as a distinctive mark; but more stress may be laid on a very remarkable difference in the inflexional system of the verb. Here the languages of the first group have melted together the forms of the three persons of the plural number, thus *wê*, *gê*, *hie findað*, or *fundon*, we, you, they find, or found, in Old English; *wí*, *gí*, *hia findað*, or *fundon* in Old Frisian; *wí*, *gí*, *sia findað*, or *fundon* in Old Saxon. The corresponding Old High German forms are *wir findam*, *ir findat*, *sie findant* for the present, *wir funtum*, *ir funtut*, *sie funtun* for the perfect tense. Old Dutch joins, in this case, the German branch; from *werthan*, to become, for instance, are derived *wí werthun*, *gí werthið*, *sia werthunt*, &c. The declension of the substantives shows another remarkable difference. While the languages of the first group have retained the original *s* in the nominative plural of such words as Old English *dagas*, days, Old Saxon *dagos*, or changed it to *r*, as Old Frisian *dagar*, Dutch and German have dropped it altogether, the corresponding forms being *daga* and *taga*. These facts must be taken for decisive, as it seems to be certain that they existed before any distinction of Low and High German in their modern sense (a distinction chiefly dependent on subsequent changes in their mute system) could be thought of. From a purely grammatical point of view, Dutch, although generally considered a separate language (which no doubt it is, with regard to its literary and political position), is entitled to claim a closer relation to High German than even Low German, whose non-literary character, taken along with the political union of northern and southern Germany, has led to the current opinion that it is only a dialect of "German" in its narrower sense. We do not mean to deny that there is, at present, a more conspicuous conformity between Dutch and Low German than between Low German and High German; but this is only due to the fact that High German, after the final settlement of the German tribes, has deviated much more from its original features than either Dutch or Low German. The most striking peculiarities of High German, as opposed to all other Teutonic idioms, have mainly been caused by the second or High German "Lautverschiebung," or change of mute consonants, which forms part of a long series of sound-changes generally comprehended under the name of Germanische Lautverschiebung or Grimm's Law. This Lautverschiebung began, perhaps as early as the 7th century, in the south, and thence slowly spread northward, but with decreasing vigour and consistency, Dutch and Low German not being touched at all. It was only thus that the idiom of the Netherlands Franks of the later centuries was separated from the dialects of their "German" relations. Before, however, the first literary documents are met with, this separation is complete; and we may therefore restrict ourselves here to a short history of High and Low German alone.

The German language presents, as do most of the cognate tongues, three main stages of development,—Old, Middle, and Modern,—distinguished by their inflexional and literary character. In accordance with Mr Henry Sweet's description of the stages of the English language,[1] Old German may be defined as the period of *full* inflections (Old Low German, *dages*, *dage*, *dagu*; *dagôs*, *dago*, *dagun*; Old High German, *tages*, *tage*, *tagu*; *tagâ*, *tago*, *tagum*), while the Middle period is that of *levelled* inflections (Middle Low German, *dages*, *dage*, *dagen*; Middle High German, *tages*, *tage*, *tagen*); but it is chiefly the literary character that distinguishes Modern High German from Low German and its own earlier stages. A special form of High German is established in this period for all literary purposes, supplanting the dialects both of Low and of High German that formerly were freely used in literary intercourse. Assuming two periods of *transition* besides, we have the following divisions, with the approximate dates:

Old High German	to 1050
Early Middle High German	1050 to 1150
Middle High German	1150 to 1350
Late Middle High German	1350 to 1500
Modern High German	1500 onward.

The same divisions have to be made for Low German, but the scheme cannot be so fully carried through, as the time between 1000 and 1200 is almost destitute of literary monuments.

Old German.—The inflexional characteristics of Old German are almost identical with those of Old English. Nouns had the same five cases,—nominative, accusative (only in a few instances kept distinct), genitive, dative, and instrumental. Strong and weak declensions of nouns and their subdivisions are likewise the same. The dual of the first and second personal pronouns is almost extinct in Old High German, but is quite common in Low German. In the verb we find the same distinction of the subjunctive from the indicative mood, and the same two inflected tenses, present and past,—the former also used for the future, the latter for all shades of past time. The order of the sentence corresponds generally to the modern use, but is not kept so strictly as now, especially in the oldest prose texts, which are often materially influenced by the Latin sources from which they have been derived or translated.

The earliest extant specimen of Low German belongs to the beginning of the 9th century. It is a short formula of renunciation of the devil to be used before the ceremony of baptism.[2] It begins thus:—"Forsachistu diobole? et respondeat: ec forsacho diabole. End allum diobolgelde? respondeat: end ec forsacho allum diobolgelde. End allum dioboles uuercum? respondeat: end ec forsacho allum dioboles uuercum and uuordum, Thuner ende Uuoden ende Saxnote ende allum them unholdum the hira genotas sint." "Forsakest thou (the) devil? I forsake (the) devil. And all devil-sacrifice? And I forsake all devil-sacrifice. And

[1] See article ENGLISH LANGUAGE, vol. viii. p. 391.

[2] It has been published, along with all the minor pieces of Old Saxon still extant, by M. Heyne. *Kleinere altniederdeutsche Denkmäler*, 2d edit., Paderborn, 1877. See also K. Müllenhoff and W. Scherer, *Denkmäler deutscher Poesie und Prosa*, 2d edit., Berlin, 1873.

all (the) devil's works? And I forsake all the devil's works and words, Thuner and Woden and Saxnot and all the uncouth (beings) that their companions are."

We cannot, unfortunately, tell what special dialect of Low German this piece belonged to, nor even whether it was originally written in German, as several forms occurring in it have rather an Old English look. No more certain are the place of origin and the dialect of the most important relic of the Old Saxon language, the great poem of the *Hêliand*, or the History of our Saviour, composed in the old alliterative verse by a Saxon cleric or monk, about the year 830. We quote as a specimen the following lines from the Munich MS.[1] :—

> "Quamun managa
> Iudeon an thene gastseli; uuard im thar gladmod hugi
> blidi an iro breostun: gisahun iro baggebon
> uuesen an uuinneon. Drog man uuin an flet
> skiri mid scalun, scenkeon huurbun,
> gengun mid goldfatun; gaman uuas thar inne,
> hlud an thero hallu, helidos drunkun."

"(There) came many Jews to the guest-hall; became to them there glad (their) mind, blithe in their breasts: (they) saw their ring-giver be in joy. Wine was borne into (the) hall bright in cups; cup-bearers walked about, went with golden vessels, joy was therein loud in the hall, the knights drank."

Much more numerous and various in age and dialect are the documents of Old High German, some of which date as far back as the 8th century. Welcome as they may be to the student of grammar, not much can be said for their intrinsic value. Almost all the prose pieces are mere translations (many of them could not be worse) from the Latin; and even such poetical works as Otfrid's *Life of Christ*[2] are no more than prose thoughts forced into bad verse. Only a very few relics of true poetry have reached us, among which the *Hildebrandslied* (in a mixed dialect), the fragments of the *Múspilli* (a poem about the Last Judgment, in the Bavarian dialect, belonging, like the *Hildebrandslied*, to the beginning of the 9th century, and also written in alliterative verse), and the *Ludwigslied* (881 or 882, in one of the Frankish dialects) may be mentioned here.[3]

High German, as already hinted, is chiefly distinguished from the other Teutonic languages by a certain transformation of its mute system. The ordinary changes,—that is to say, those received in the modern High German literary language,—are the following:—*d* is changed to *t* in all positions; *t* to *z* (either pronounced *ts* or *ss*); *p* to *pf*, *ff*, or *f* according to its position in the word; *k* initial and following a consonant is kept, but after a vowel *k* passes into *ch* (pronounced as Scotch or Modern German *ch*). Thus we get the following comparisons:—

Old English	Old Saxon.	Old High German.	Modern High German.	Modern English.
dón	dón	tuon	thun	do
tó	tó	zuo	zu	to
sealt	salt	salz	salz	salt
settan	settian	sezz	setzen	set
etan	etan,	ezzan	essen	eat
pund	pund	pfunt	pfund	pound
hearp	harpa	harpfa, harfa	harfe	harp
slǽpan	slápan	sláffan	schlafen	sleep
cyning	kuning	kuning	könig	king
thencan	thenkian	thenken	denken	think
macian	makon	machon	machen	make

This is the state of things in the High Frankish or Eastern Frankish dialect, spoken in the south-east of the Frankish territory. In the earliest period, as may be seen from the above list, it still preserved the *th* sound in many cases; in the later stages *d* is found to have been substituted, as in Modern High German. The Upper German dialects show the same change at a much earlier time, and, in addition to this, they have also changed *k* initial and following a consonant into *ch*, and *b* and *g* initial into *p* and *k* (representing most likely voiceless soft stops, as still pronounced in South Germany and Switzerland); Bavarian admits *p* for *b* even in the middle of words. Thus we have, for instance, *denchen* for Frankish *thenken*, to think; *pitten* for Frankish *bitten*, to bid; *keban*, or Bavarian *kepan*, for Frankish *geban*, to give. In illustration of these distinctions and some other variations of spelling we may quote three contemporaneous versions of the Lord's Prayer which have fortunately been preserved[4]:—

Frankish Version.	*Alemannian Version.*	*Bavarian Version.*
Fater unser thu in himilombist, giuuihit si nàmo thin. Queme richi thin. Uuerdhe uuilleo thin samaso in himile endi in erthu. Broot unseraz emezzigaz gib uns hiutu. Endi farlaz uns sculdhi unsero samaso uuir farlazzem scolom unserem. Indi ni gileiti unsih in costunga, auh arlosi unsih fona ubile.	Fater unsar thu pist in himile, uuihi namun dinan. Qhueme rihhi din. Uuerde uuillo diin samaso in himile sosa in erdu. Prooth unsaremezich kip uns hiutu. Oblaz uns sculdi unsaro so uuir oblazem uns sculdikem. Enti ni unsih firleiti in khorunka, uzzer losi unsih fona ubile.	Fater unser, du pist in himilum. Kauuihit si namo din. Piqhueme rihhi din. Uuesa din uuillo samaso in himile est, sams in erdu. Pilipi unsraz emizzigaz kip uns eogauuanna. Enti flaz uns unsro sculdi samaso uuir flazzames unsrem scolom. Enti ni princ unsih in chorunka, uzzan kaneri unsih fona allem sunton.

It is impossible to give here a sufficient idea of the variability of Old High German, as, indeed, out of several hundred pieces that have come to our knowledge, there are not two representing exactly the same dialect to all its shades or at least in exactly the same spelling. We shall therefore restrict ourselves to a short notice of the more important documents. South-western Frankish is best represented by a very old translation of a treatise by Isidorus Hispalensis, *De Fide Catholica*,[5] and Otfrid's *Life of Christ*, mentioned above. The chief source of Eastern Frankish is a translation of the *Harmony of the Gospels* erroneously ascribed to the Syrian father Tatianus.[6] For Bavarian we may quote some old glossaries,[7] for Alemannian the interlineary versions of the Benedictine Rule[8] and some Latin church hymns,[9] besides several glossaries. For later Old High German, the works of Notker Labeo, or Teutonicus, a monk of St Gall who died in 1022, are the fundamental sources.[10] What Ormin did for English phonetics, Notker may be said to have done, even more completely, for those of Germany. He not only carefully marks the quantities of vowels, but also points out the phonetic difference between such diphthongs as *ei*, *ou*, *iu*, and *ie*, *uo* by his way of accentuating them (*éi*, *óu*, *íu*, and *îe*, *ûo*); even such phonetic minutiæ as the change of initial voiced stop consonants into voiceless stops after a pause or a voiceless consonant are duly registered, as may be seen from the following specimen.

[1] This MS. gives the poem in a pure Saxon dialect, while the dialect of the Cotton MS. in some respects resembles the Frankish idiom. Both texts are printed in the latest edition by E. Sievers, Halle, 1878.

[2] Otfrid, a monk of Weissenburg, in Alsace, formerly a pupil of Hrabanus Maurus, at Fulda, wrote his work (in the South-Frankish dialect) in 867 or 868. It is for the most part due to him that the rhymed stanza (imitated from that of the Latin Church hymns) was introduced into German poetry, instead of the earlier alliterative metre. The latest editions are by J. Kelle, Ratisbon, 1856, 1869, and by P. Piper, Paderborn, 1878.

[3] The minor pieces of Old High German, both verse and prose, are collected in Müllenhoff and Scherer's *Denkmäler*, 1873.

[4] Ten different versions of the Lord's Prayer (down to the 14th century) are given, in a synoptical order, by Massmann, *Die deutschen Abschwörungs-, Beicht-, und Betformeln*. Quedlinburg and Leipsic, 1839, p. 158 *sq.*

[10] Hattemer, *op. cit.*, vols. ii., iii.

"Sanctus paulus kehîez tîen dîe in sînêu zîten uuândon des sûonetagen, taz er êr ucchâme êr romanum imperium zegîengê únde antichristus rîchesôn begóndi. Uuér zuîuelôt romanos íu uuésen állero rîcho hêrren únde íro geuuált kân ze énde dero uuérlte?" "St Paul assured those who in his time expected the day of judgment that it would not come before the Roman Empire was dissolved, and Antichrist began to reign. Who doubts that the Romans are the masters of all kingdoms, and that their power reaches to the end of the world?"

It will be clear from what has been said above that the main feature of the Old High German period is the total absence of a common literary language. No voluntary modifications of the form of speech are to be found, but such as are naturally involved in any attempt to adapt a spoken idiom to literary use. Nevertheless it has been suggested by K. Müllenhoff[1] and others that idioms of a more refined character than the ordinary popular dialects were spoken at the principal courts of the empire, and especially at the imperial court itself, and that the authority of these *Hofsprachen* was great enough to exercise a modifying influence on the literary productions throughout the empire, or in those parts at least where High German was the vernacular speech. But how these suppositions can be proved does not appear, or how they can be reconciled with the fact that all literary documents of the period *are* dialectal.

Middle German.—The transition to Middle High and Low German is conspicuously marked by a decided improvement in the poetic faculties of the nation.[2] While the 10th century has left only a very few specimens of poetry, and these of poor quality, the number of poems (mainly of a theological bearing) dating from the 11th century is not inconsiderable, and the 12th century shows a rapidity of literary development almost unparalleled. At first indeed religious and legendary poetry is still prevalent, but soon literature begins to take a more historical or epic turn. This tendency is clearly visible in the *Kaiserchronik*, or Emperor's Chronicle, in which the first attempt is made to give a survey of universal and German history in a poetical form. The romantic tales of Alexander the Great and of the battle of Roncesvalles were translated from the French,—the *Alexanderlied* by the Pfaffe Lamprecht, the *Rolandslied* by the Pfaffe Konrad; while old national traditions contributed fitting subjects for such epic poems as that concerning the adventures of the Lombard King Rother. Lyric poetry, hitherto altogether neglected, sprang suddenly into vigour in the remote east of Austria about the middle of the century, and soon found its way to other countries. But the most decided advance was not made till about 1180, when the new forms of social life that had crept in among the more cultivated classes, in imitation of the laws and customs of French chivalry, began to exercise a powerful reforming influence on all branches of poetry. The example set by the Netherlands poet, Heinrich von Veldeke (who for some time lived, and partly wrote, in Germany), in his *Eneit*, or *Æneid*, was soon followed by the three great epic masters of the period, Hartmann von Aue, Gottfried von Strasburg, and Wolfram von Eschenbach. About the same time the *Nibelungenlied* and other compositions of a more national character were composed, while lyric poetry was raised to a height of excellence never attained at any other period of the Middle Ages, and best represented in the songs of Walther von der Vogelweide. It is true enough that this new chivalrous poetry was not always very original in thought; indeed, most epic poems of this class, and many lyric stanzas, have been directly copied from French models; but its influence on the culture of the language was immense. It was then for the first time that Germany possessed a real literary language, undoubtedly homogeneous as far as style and metre are concerned. Whether a similar unity of the outer form of speech had already been reached at that period is a point very difficult to decide. The question was raised for the first time as early as 1820, by Karl Lachmann, in his *Auswahl aus den hochdeutschen Dichtern des XIII. Jahrh.* Lachmann's opinion was that the poets of the 13th century spoke a definite, unchangeable sort of High German, a few minor dialectal peculiarities being excepted, and that uneducated scribes had been guilty of introducing older or corrupt forms of the common speech into our manuscripts. These views were at the time unanimously accepted, and are still held (though in a somewhat modified form, admitting two literary idioms, one in the south, the other in the midland) by a majority of the German philologists of the present day. As a consequence of this, most of the "critical" editions of Middle High German poetry that have appeared since Lachmann's time do not reproduce the original readings of the manuscripts, but give the texts in a "corrected" form, commonly called "correct Middle High German," which is assumed to appear in its purest form in the works of Hartmann von Aue. It is chiefly Alemannian, or Swabian, with some Frankish peculiarities of spelling in the use of the consonants, in order to produce a greater resemblance to ordinary Modern High German orthography. No manuscript, however, is known to be written in exactly the same language or orthography; nor are there any poets, except those of Swabia, who do not clearly show by their rhymes the existence of dialectal forms in their speech. All incongruities in the rhymes disappear when they are transferred to the forms peculiar to the local dialects of their authors.[3] It was therefore but natural that a reaction against Lachmann's views should ultimately have set in;[4] and this reaction appears to have been right in denying that dialectal forms were purposely and studiously avoided, even by the classic authors of the period, with a view to the approximation of their language to a certain universal idiom never existing anywhere but in the fancy of certain modern writers. How injurious to the study of Middle High German dialects the views of Lachmann, had they prevailed, must have been, it is easy to see; but on the other hand it must not be forgotten that the only method of investigating the dialects of the single authors was that followed by Lachmann, viz., to reconstruct them by a careful study of the rhymes, for the dialects of the manuscripts are often, nay in most cases, clearly different from those of the writers themselves, as shown by the rhymes. It is therefore not so much the principle of reconstruction that has been resisted by Lachmann's opponents as the way in which this reconstruction has been practically carried out. For prose writings of course no such reconstruction is possible; still, prose documents, especially such as were destined for local use only (charters, &c.), and therefore less liable to adulterations of the original, are often the main sources for German dialectology.

The prominent feature of German (Low German included) in this period is the levelling of the unaccented vowels of the inflexional and some of the derivative syl-

[1] See his *Denkmäler*, Introduction.

[2] See W. Scherer, *Geschichte der deutschen Literatur im XI. und XII. Jahrhundert*, Strasburg, 1875.

[3] This has been exemplified in a most masterly manner by W. Braune, in his *Untersuchungen über Heinrich von Veldeke*; see *Zeitschrift für deutsche Philologie*, iv. p. 279 *sqq.* Braune has conclusively shown that Heinrich von Veldeke never tried to write German (although he wrote for German readers), as had generally been supposed before, but simply wrote in his familiar Netherlands dialect.

[4] See especially H. Paul, *Gab es eine mittelhochdeutsche Schriftsprache?* Halle, 1873. Paul seems, however, to go too far in denying the existence of some peculiarities of style pointed out by Lachmann and his followers.

lables already mentioned. As to the former there is only one exception, viz., the retaining of the termination *iu* (pronounced as Modern German *ü* or French long *u*) for the nom. sing. fem. and the nom. and acc. plur. neutr. of the adjectives (*blindiu*, while all other cases have the levelled *e*); and even this seems to be a speciality of Upper German, the corresponding Midland form being *blinde* as in Modern German. The unaccented *e* is frequently dropped in all dialects, especially in the south, where the dropping is almost regular after an *r* or *l* closing a short syllable, as in *bern*, *steln*, for *beren*, *stelen*, to bear, to steal; Old High German, *beran*, *stelan*. In the Midland dialects *i* is often written for this *e*, thus *berin*, *stelin*. The accented vowels of the root syllables are greatly changed in this period by the "Umlaut," or mutation of sounds, being an assimilation of these vowels to an *i* or *y* originally following. Thus *a*, *ā*, *o*, *ō*, *u*, *ū*, *uo* are changed to *e*, *æ*, *ü* or *ö*, *œ*, *ü*, *iu* (long *ü*), *üe*, as may be seen in the following instances:—*hant*, hand, pl. *hende*; *rāt*, council, pl. *ræte*; *golt*, gold, *güldîn*, golden, or *mohte*, I might, subj. *möhte*; *grōz*, great, *grœze*, size; *kus*, a kiss, *küssen*, to kiss; *mūs*, mouse, pl. *miuse*; *guot*, good, *güete*, goodness. The Umlaut, however, is not always expressed in the spelling of the manuscripts, though it must have existed in the living language. Of the diphthongs, *iu* has been changed into long *ü*, but the old spelling is often retained in the MSS. (*liute*, modern *Leute*, Old High German *liuti*, people). As to the consonants, the *th* sound had nearly disappeared at the beginning of the period, and was lost entirely in its course; *sk* has passed into the *sh* sound, written *sch* as in Modern German. Spelling in general is simpler, and in some points more rigidly phonetic than in Old German. Final voiced consonants, as *b*, *d*, *g*, are generally changed into the corresponding voiceless sounds, as *p*, *t*, *c* (in High German *grap*, grave, gen. *grabes*, *pfat*, path, gen. *pfades*, *tac*, day, gen. *dages*; in Low German *graf graves*, *pat pades*, *dach dages*). Double consonants are simplified in the same position, as in Old German (*bal*, ball, gen. *balles*). The use of the letter *v* has greatly increased; in High German it means simply *f*, and is therefore quite superfluous; in Low German its pronunciation is *f* at the beginning of words, while in the middle of words it has the same sound as English *v*.

The leading dialects of the period are those of Old German, the most noteworthy difference being the accession of the dialects of the kingdom of Saxony (*Obersächsisch*, or Upper Saxon) and Silesia to the midland dialects, and those of some eastern provinces of Prussia (*Niedersächsisch*, or Low Saxon) to Low German, in consequence of the German colonization of these countries. Low German, to begin with, has retained the phonetic structure of its consonantal system unaltered, except by the loss of the *th* sound. The spelling of the vowel system is very imperfect. Umlaut is not expressed in the older manuscripts, except in the case of *a* and *e*. A long *e* corresponds to both High German *ei* and *ie*, a long *o* to High German *ou*, *öu*, and *uo*, *üe*, the only diphthong generally admitted being *ou* before a *w*, as in *houwen*, to hew. The pronunciation of *ē* and *ō* must, however, in these cases have been different according to their etymological values, for all the High German sounds mentioned above are distinctly kept asunder in the modern Low German dialects, and *ei* and *u* or *ů* are often written for *ē* and *ō* where they stand for High German *ei* and *uo* or *üe*, but never otherwise. It is most likely, judging from the present state of things, that open *e*, *o* were the equivalents for High German *ei*, *ou*, *öu*, while close *e*, *o* corresponded to High German *ie*, *uo*, *üe*. The prefix *ge* is dropped, as in English and in the Scandinavian languages (thus *bort*, birth, High German *geburt*). But the most remarkable fact in the history of Low German sounds is the restoration of *nd* or *un* for *th* after a dropped nasal sound (see above, p. 516), as in *ander* or *anner*, other, for Old Saxon *ōthar*, or in *munt*, mouth, for Old Saxon *mūth*. This transition cannot be explained by any phonetic laws, but must necessarily be ascribed to High German influence. As to the inflexional system, a similar influence seems to have introduced the High German terminations of the plural of verbs (*wi geven*, *gi gevet*, *se geven* we, you, they give). The Old Saxon *-s* in the nominative plural has been dropped, as in High German. The following lines quoted from the municipal laws of the town of Hamburg (written 1270) may be taken as a fair specimen of 13th-century Low German:—"Dat nement syn erue verkopen schal, he ne bede id erst synen negesten. So we syn erue vorkopen wil, dat bynnen desser stad vnde bynnen dessem wicbelde belegen is, de schal id beden twen synen negesten vrunden, dar syn erne vp vallen mach, vnde wil it erer nen kopen, so mot he syn erue wol vorkopen deme de eme dar vmme allermest geuen wil." "That nobody shall sell his inheritance, unless he offer it first to his nearest (relations). Whosoever is willing to sell his inheritance, that is situated within this town and within these precincts, shall offer it to two his nearest friends (relations), to whom his inheritance may fall, and if neither of them is willing to buy it, he must (may) well sell his inheritance to him who is willing to give him most for it."

The differences of the main dialects of High German are not very striking during the first stage of this period. Alemannian is best characterized by its rigidly keeping its original vowel qualities, some of the modern Swiss dialects showing exactly the same system as about 1200. Swabian is easily discovered by its frequent use of *au* for *ā*, as in *gaun*, to go, for *gān*. A very important change of vowel qualities is found to have taken place, at a very early time, in the Bavarian dialect. While *ie*, *uo*, *üe* were preserved as in Alemannian, *ei*, *ou*, *öu* were changed into *æi* (or *ai*), *au*, *eu* (or *áu*), and three new diphthongs, *ei*, *ou*, *eu*, sprang up from the long vowels *ī*, *ū*, *iu* (*ǖ*). In the Midland dialects again, *ei*, *ou*, and *ī*, *ū*, *ǖ* were kept, as in Alemannian (although *ü* is generally not distinguished from *u* in writing, as in most Midland manuscripts no special signs for the Umlaut vowels are used, except *e*), but *ie*, *uo*, *üe* were contracted to simple *ī*, *ū* (*ǖ*), differing from the old *ī*, *ū*, *iu* only in their open quality. The system of these changes may be illustrated by the following list:—

Alemann.	diep	guot	süeze	mīn	hūs	miuse	stein	boum	fröude
Bavarian	diep	guot	süeze	mein	hous	meuse	stain	paum	freude
Midland	dīp	gūt	sūze	mīn	hūs	mūse	stein	boum	freude
Low Ger.	dēf	gōd	sōte	mīn	hūs	mūse	stēn	bōm	froude
English	thief	good	sweet	mine	house	mice	stone	beam	(joy)

As to the consonants, Alemannian and Bavarian still clung to the use of *ch* or *kch* for ordinary *k*, as *chomen*, for *komen*, to come. *P* initial for *b* is especially Bavarian, and was rather more frequent in the 14th and 15th centuries than before; *w* initial is often expressed by *b* in Bavarian manuscripts since the 13th century; thus we find *paideu*, both, for *beidiu* or *peidiu* in Alemannian, or *beide* in the Midland dialects, and *beip*, wife, or even *zbai*, two, for ordinary *wīp*, *zwei*; *k* initial for ordinary *g* went altogether out of use. In Midland orthography the two sounds of Old High German *z*, viz. *ts* and *ss*, were expressed by *çz* or *zc*, and *z* or *zz* respectively. The following specimens of the language of this period are taken from the *Schwabenspiegel*, or Swabian Law, for Alemannian (13th century); the *Spiegel deutscher Leute*, or Mirror of German People, for Bavarian (14th century); and a Midland version of the *Sachsenspiegel*, or Saxon Law [1]:—

[1] The editions whence the extracts are taken are—for the *Schwabenspiegel*, that of Lassberg, Tübingen, 1840, p. 5; for the *Spiegel deutscher Leute*, that of J. Ficker, Innsbruck, 1859, p. 35; and for the *Sachsenspiegel*, that of Hildebrand, Leipsic, 1870, p. 3.

Schwabenspiegel.	*Sp. deutscher Leute.*	*Sachsenspiegel.*
Dem pabest ist gesetzet in bescheidenlicher zit ze rihten vf einem blanchen pherde, vnd der cheiser sol dem pabest den stegreif haben, daz sich der satel nit entwinde. Daz bezeichent daz, swaz dem pabest widerste des er mit geistlichem gerihte niht betwingen mac, daz sol der cheiser vnd ander weltliche rihter betwingen mit der ehte.	Dem babst ist gesetzet ze richten ze beschaidener zeit auf einen blanchem rosse, vnd der chaiser sol im den stegraif haben durch daz sich der satel icht entwende. Ditz ist dev beschaidenunge: swaz dem babest widerste, daz er mit geistleichem gerichte nicht betwingen müge, daz sol der chaiser vnd ander wertleich richter mit der æchte betwingen vnd das geistleich sol twingen mit dem panne.	Deme babste ist ouch gesaczt zu ritene zu bescheidener zcit uf eime blanken pferde, und der keiser sal im den stegereif halden, durch daz der satel nicht enwinde. Daz ist die bezcechenunge: swaz deme babste widerste, des her nicht mit geistlichem gerichte getwingen mag, daz ez der keiser mit werltlichem gerichte twinge deme babste gehorsam zu wesene.

"To the pope it is set (ordained) that he shall judge at a certain time, (sitting) on a white horse, and the emperor shall hold the stirrup to the pope, that the saddle may not slide off. This means that whatsoever resists the pope, so that he cannot overcome it with spiritual censure, the emperor and other secular judges shall overcome with the proscription, (and the spiritual [court] shall exercise discipline with the ban)."

In the 14th and 15th centuries the development of the dialects rapidly advanced. The greatest changes were those occurring in the vowel system. The new diphthongs *ei*, *ou*, *eu*, for older *ī*, *ū*, *iu*, which had originated in the south-eastern parts of the Bavarian district gradually spread to the north and west; even some of the South Midland dialects, as Bohemian and Silesian, began to partake of this change, while the north Midland dialects and Alemannian remained unaltered. Short root syllables ending in a single consonant began to be lengthened in almost all dialects, as *gēben*, *nēmen*, for *gĕben*, *nĕmen*, to give, to take. Unaccented *e* was dropped in the southern dialects, especially in Bavarian, to the utmost extent possible. Such forms as *pschæch*, *gtorst*, *kœrt*, for *beschæhe*, happened (subj.), *getorste*, I durst, *gehœret*, heard (part.), began to be quite familiar. Even before a final *l* or nasal sound *e* was now and then dropped in Bavarian, as in *gebm* for *geben*, to give, *gegnt* for *gegende* country, which are exactly the forms still used in our time. Midland and Low German dialects continued to be much more conservative in all these respects. In the consonantal system we have to mention the loss of the *z* sound in all dialects, where it was a simple spirant (not *ts*); although the letter *z* was still often preserved in spelling, it was frequently confounded with *s* in the rhymes, a thing which never occurred in the earlier centuries. Alemannian is chiefly distinguished by its constant change of *sm*, *sn*, *sl*, *sw*, *sp*, *st* into *schm*, *schn*, *schl*, *schw*, *schp*, *scht*, as in *schmit*, smith, *schne*, snow, *schlahen*, to slay, *schwimmen*, to swim, *geschprochen*, spoken, *geischtlich*, "ghostly," spiritual. Late Bavarian favours such spellings as *chrankch*, *pekch*, for *krank*, *becke*. Spelling in general was much neglected, although it was not quite so bad as often in the 16th century, when there was a strong tendency towards crowding as many letters into a word as possible.

While the 15th century was thus marked by great divergencies of the spoken dialects, important steps towards gaining a greater uniformity of literary speech were made in the same period by the invention of the art of printing, and by the development of certain *Kanzleisprachen*, or literary idioms of the imperial and other chanceries. There is no need to explain how the habit of reading books printed in dialects not familiar to the reader must have obliged the learned public of the time to acquire a certain amount of knowledge of dialects in general, and must have made them better aware of the peculiarities of their own idioms than was either necessary or possible at the time when manuscripts written expressly in the local dialects of the readers were the only means of conveying literary information. Besides, writers as well as printers must soon have found it profitable to publish their works in a language readily understood by readers in all parts of the country. The principal work, however, was done in Germany by the chanceries. Among these the imperial chancery naturally held the most prominent position; and, inasmuch as its public acts were addressed to readers of all dialects existing throughout the empire, it obviously had also the greatest interest in calling into existence a general idiom. In the 14th century no difference between the language of the imperial chancery and the local idioms of the particular emperors was yet visible.[1] The public Acts of Louis of Bavaria (1314–1347) were written in the Bavarian dialect. The succession of Charles IV. (1347–1378) was accompanied by the introduction of the Bohemian dialect into the imperial charters. This dialect, as was natural from its local position, was neither purely Southern nor purely Midland. *Ei*, *ou*, *eu* for *ī*, *ū*, *iu* were frequently adopted from the Southern dialects, but *ch* for *k* and *p* for *b* were generally rejected; unaccented vowels were preserved to about the same extent as in Midland German. In the reign of Wenceslaus of Bohemia (1378–1400) the same state of things was maintained; but in the charters of Rupert, the elector palatine (1400–1410), we find the Midland dialect of the Palatinate. Sigismund (1410–1437) reintroduced the Bohemian dialect, which by this time had, with the exception of a very short period, prevailed for nearly a hundred years in the imperial chancery. It was therefore but natural that Duke Frederick of Austria should exchange the Austrian dialect of his ducal chancery (which abounded with *kch*, *kh*, *kg* for *k*, and *p* for *b*) for the Bohemian chancery dialect of his predecessors, when he succeeded to the imperial throne (1470–1493). His example was followed by Maximilian (1493–1519), but only so far as public Acts were concerned. In charters destined for local Austrian use as well as in his private correspondence he always kept his vernacular Austrian dialect, showing thus that no change of the spoken idioms had been caused as yet by the introduction of the new artificial language. In the same manner and at the same time the Midland dialect of the electoral chancery of Saxony came to be better adapted for general use by the adoption of the Southern *ei*, *ou*, *eu* for *ī*, *ū*, *iu*, and the abolition of several prominent Midland peculiarities.

Modern High German.—In the preceding paragraph we have tried to give a short sketch of the origin of literary Modern High German; and it is this very idiom of the imperial and Saxon chanceries that Luther made afterwards popular by his translation of the Bible and his numerous other writings. We may quote his own words in confirmation:—

"Ich habe keine gewisse, sonderliche, eigne sprache im deutschen, sondern brauche der gemeinen deutschen sprache, das mich beide Ober- und Niederländer verstehen mögen. Ich rede nach der sechsischen cantzlei, welcher nachfolgen alle fürsten vnd könige in Deutschland; Alle reichsstedte, fürstenhöfe schreiben nach der sechsischen vnd vnsers fürsten cantzeley. Darumb ists auch die gemeinste deutsche sprache. Kaiser Maximilian vnd churfürst Friderich, hertzog von Sachsen, haben im römischen reiche die deutschen sprachen also in *eine* gewisse sprach zusammengezogen."[2]

Luther's language, again, was soon acknowledged by German grammarians, as Sebastian Franck (1531) and Johannes Clajus (1578), and was accordingly imitated, as the

[1] The particulars which follow are chiefly taken from an able sketch by Dr E. Wülcker, *Die Entstehung der kursächsischen Kanzleisprache.* See *Zeitschrift des Vereins für thüringische Geschichte*, ix. p. 349.

[2] *Tischreden.* ch. 69. Dr Wülcker assigns these words to the year 1545.

best pattern of High German. It is true that in the 16th century many writers, especially in Switzerland and Lower Germany, still clung with great pertinacity to their native dialects. But about 1600 Luther's language was fully established as the only idiom of literary intercourse throughout Germany.[1] The changes the language has undergone since Luther's time mostly concern the inflexional system. In the strong verbs the differences between the singular and plural and the indicative and subjunctive of the past have been levelled in the course of time: thus, *ich fand, wir fanden*, I, we found, subj. *ich fände*, or *ich schnitt, wir schnitten*, I, we cut, for *ich fand, wir funden, ich fünde*, or *ich schneit, wir schnitten*. At present the verb *werden*, to become, is the only specimen left of the old regular inflexion:—*ich ward, wir wurden, ich würde*; but even here a new irregular form, *ich wurde*, has come into use and almost superseded the more archaic *ich ward*, which is now chiefly confined to poetry. Many other vowel changes have taken place besides, as in *webe, wob, gewoben*, weave, wove, woven, for Middle High German *wibe, wap, geweben*, so that the old system of "Ablaut," or vowel change in the root syllables of the strong verbs has often become quite indistinct. A great number of verbs have passed from the strong inflexion to the weak, and *vice versa*. The declension of substantives has also been greatly altered. Umlaut is now regularly used as a plural sign with most monosyllabic and many dissyllabic masculine words, as in *baum, bäume*, or *nagel, nägel*, for Middle High German *boum, boume*, and *nagel, nagele*; originally it was confined to a much smaller number of words (*i*-stems, as *gast, gäste*, Middle High German *gast, geste*). Other masculine words have adopted the plural *-er*, together with Umlaut of the root syllables, from the neuter declension, as *mann, männer, geist, geister*, besides frequent exchanges between the strong and weak declensions, which cannot be specified here. The strong and the weak declension of feminine words originally ending in *e* have been melted together, one form (ending in *e* or a consonant) being used for all singular, and one (ending in *en* or *n* after a consonant) for all plural cases, as *gabe, gaben, zahl, zahlen, zunge, zungen*, for Middle High German *gābe, gābe*, gen. and dat. *gāben*; *zal, zal*, gen. and dat. *zaln*; *zunge*, gen. dat. and acc. *zungen*, pl. *zungen* throughout. As to phonology, no change of vowel quality is noticeable in literary German. Modern High German still has the Midland sounds *ī* (often spelt *ie*), *ū, ǖ*, for Southern *ie, uo, üe*, as well as the Bavarian diphthongs *ei, au, eu (äu)*, for the older sounds *ī, ū, iu*, the latter not being distinguished either in spelling or in educated pronunciation from the older diphthongs *ei, ou, öu*. We have thus *zwei, drei, baum, haus, freude, häuser, leute* for Middle High German *zwei, drī, boum, hūs, vröude, hiuser, liute*. Change of vowel quantity is the most prominent phonetic feature of Modern High German when compared with the earlier stages of the language. All root-syllables ending formerly in a short vowel followed by a simple consonant have now become long, either by lengthening the vowel or by doubling the consonant, thus *tāg, tāge, sāl, bōte*, or *gott, gottes, blatt, blätter*, for Middle High German *tăg* (or *tăc*), *tăge, săl, bŏte, gŏt, gŏtes, blăt, blĕter*. The rules for dropping unaccented vowels have often been changed accordingly. It must not be forgotten, however, that all these rules are only applicable to the literary idiom; the dialects, and even those of the educated people, often differ very materially from the rules laid down above. There is, indeed, no such thing as a generally recognized standard pronunciation of German, except perhaps on the stage, which no doubt has exercised and still exercises a certain influence on the current opinions as to how one ought to pronounce, but has not been powerful enough to abolish all dialectal peculiarities in the case of even the highest classes. Only a very few general rules can be given. Englishmen will do well to pronounce the vowels as in Italian: *ü* and *ö* are rounded or labialized *i* and *e* sounds, formed by pouting the lips while trying to pronounce *i* or *e*. Long vowels are always pronounced simple, never as diphthongs (which is frequently the case in English, especially with *a* and *o*). Unaccented *e* is invariably dropped in the terminations *el, en*, the real pronunciation of such words as *handel, bitten, lippen, haben, nehmen* being *handl, bittn, lippn* or *lippm, hābn* or *hābm, nēm* (with a lengthened *m*).[2] Among the peculiarities of the consonantal system we may mention the sound of *ch* (in two distinct varieties as in *ach* and *ich*), the *z*, which is a combination of *t* and *s*, and the *r*, which ought to be trilled with the tip of the tongue, but is often pronounced as a uvular or guttural sound. *S* initial is generally sounded like the English *z*, in stage pronunciation, but not usually elsewhere; *st* and *sp* initial are never pronounced on the stage like English *st* or *sp*, but are always *sht, shp*, as in *stein, spiel*, pronounced (to use English spelling) as *shtine, shpeel*. The English *w* ought to be avoided. The German *w* sound is more like English *v*, but somewhat softer; in Midland pronunciation a sound intermediate between English *w* and *v* takes its place. German *v* is simply *f*.[3]

The varieties of the German dialects of the present are too numerous to be described here. It may suffice to state that the old divisions of Low German, Midland, and Upper German dialects are still applicable. Among the first, the Western or Westphalian dialects are distinctly marked by the pronunciation of *g* initial as a *gh*, or voiced *ch* (sometimes even voiceless), and the use of numerous diphthongs, both long and short, instead of simple vowels. The principal subdivisions of Midland German are the Lower Rhenish or Middle Frankish dialect (including the German dialects of Transylvania), South-Western and Eastern or High Frankish, Hessian, Thuringian, Saxon, and Silesian. Alemannian is divided into the three main groups of Swabian, Alsatian, and Swiss, while Bavarian is constituted by several subdialects spoken in Bavaria and Austria. The study of these dialects has been carried on in Germany for a considerable time,[4] but not always very successfully, especially so far as phonology is concerned; for many observers, while well-trained in all the disciplines of the older school of philology, have been totally ignorant of the simplest laws of phonetics. It is only within the last few years that the value of phonetic studies (although they began in German researches) has been duly recognized in the country of their origin, and dialectology has not hitherto gained much by the more theoretical study of general phonetics. Some excellent beginnings indeed have been made, among which Dr Winteler's book on his native Swiss dialect holds by far the foremost rank;[5] but it is probable that a long time must yet elapse before Germany can possess so well trained and independent a school of phonetists as that which already exists in England headed by Mr A. Melville Bell and Mr Alexander J. Ellis. Not till then, however, can a real history of the German language be written. (E. SI.)

PART IV.—LITERATURE.

Ancient poetry. There is a deep vein of poetry in the Teutonic nature, and it appears to have revealed itself in the earliest ages. According to Tacitus, the Germans of his time had ancient songs relating to the god Tuisco, his son Mannus, and the three forefathers of the Teutonic race. They had also poems in honour of Arminius, the original subject of which was probably the god Irmin, whose pillar Charles the Great overthrew long afterwards in his first campaign against the Saxons. A song called "barditus," celebrating the greatness of the war-god whom Tacitus calls Hercules, was sung or chanted by the freemen as they advanced to battle. The name "barditus" led some ingenious writers of the 18th century to speculate respecting an order of bards among the ancient Germans; but there is no evidence that any such order existed. "Barditus" meant in the first instance a shield, and was transferred to the song because, while the singing went on, the shield was held to the mouth to make the sound more terrible. It is the opinion of many critics that the stories of "Reynard the Fox" and "Isengrim the Wolf" may be traced back to these remote times. If so, the probability is that they were brought by the Teutons from Asia, and were originally common to the Aryan family. There is every reason to believe that some elements of the *Nibelungenlied* belong to the prehistoric age. The legend of Siegfried has all the marks of extreme antiquity, and it seems to have had at first a purely mythological character. Of the rhythm in which these primitive conceptions were embodied we have no certain knowledge; but as the most ancient poems which have been preserved are in alliterative verse, it is reasonable to assume that this had grown up long before writing came into use.

Opposition of the clergy. I. *The Early Middle Age.*—When the German tribes began to accept Christianity the clergy everywhere opposed the native poetry, and strove to replace its rude conceptions by the milder images of the gospel. Among the Goths of the 4th century Bishop Ulfilas took the most effectual means of achieving his purpose by preparing a clear, faithful, and simple rendering of the Scriptures,—a translation which has been of inestimable value in the scientific study of the Teutonic languages. No clergyman of like genius arose in Germany itself; but there, too, pagan compositions were steadily discouraged. Charles the Great was the first to check this hostile movement. He showed his love of his native speech, not only by beginning to put together a German grammar, but by issuing orders for a collection of old German poetry. Louis the Pious had little sympathy with the taste of his father, but he could not efface the impression produced by the great emperor. Many of the clergy ceased to dislike that which so mighty a friend of the church had approved, and in some monasteries there were ardent collectors of ancient epic fragments and ballads.

These treasures of Old High and Low German literature are nearly all lost, but from the small portions which have come down to us, and from hints in Latin chronicles, we can at least make out the themes with which many of them dealt. Ermanrick, or Ermanaricus, the famous Gothic king of the 4th century, was the subject of a large number of poetical legends. Siegfried continued to be a great epic hero, and from about the 7th century he appears to have been no longer treated as superhuman. The legend of the overthrow of the Burgundian king, Gundicarius or Günther, by Attila assumed many forms, and was at a later time connected with the story of Siegfried. Around the name of Theodoric the East Goth, as Dieterich, several legends soon grouped themselves; and from about the 9th century he was associated with Attila, with whom in history he had nothing to do. Unfortunately, the fragments which have been preserved—all of which are alliterative—do not treat of these supreme heroes; their subjects are of subordinate importance and interest. The *Hildebrandslied*, which was written from traditional narratives early in the 9th century, and is in a mixed dialect, introduces us to a follower of Dieterich. Hildebrand, returning from the wars carried on by his lord, is compelled to fight his own son; but we are left in uncertainty whether father or son is conqueror. The *Ludwigslied* is a ballad of the latter part of the 9th century, written in honour of a victory gained over the Northmen by Louis III., the West-Frankish king. The author was probably a monk who had been a favourite at the court of Charles the Bald. There is also an Old High German ballad celebrating the reconciliation of Otto I. with his brother Henry; and similar ballads are known to have kept up the fame of Duke Ernest of Swabia, who rebelled against Conrad II., and of many other popular heroes. Walter of Aquitania, who flies with his bride from the court of Attila, and at Worms fights King Günther and his warriors, is the hero of a Latin poem of the 10th century, written by a monk of St Gall, whose materials were evidently taken from a more vigorous German original. The *Merseburger Gedichte*, two songs of enchantment, were written in the 10th century, but must have come down from a much more remote period. They are chiefly interesting for the light they throw upon the religious beliefs and customs of ancient Germany.

Minstrels. The old ballads. which were intended to be sung as well as recited, were handed down from generation to generation, and necessarily underwent many changes. They were preserved from an early period in the memory of the people by professional minstrels, who were held in considerable honour in the time of Charles the Great, but were afterwards rather tolerated than encouraged by the higher classes. Many of them were blind men, and in their solitary wanderings the ancient stories must often have assumed in their minds new shapes. They usually accompanied their singing with the zither or the harp.

Religious poetry. Of the works with which the church sought to counteract pagan influences very few remain. The most important is *Heliand*, a Low German poem in alliterative verse said to have been written by a Saxon at the request of Louis the Pious. It is a narrative of the life of Christ, and follows closely the Four Gospels, whose separate accounts it attempts to harmonize. The author has considerable force and freedom of expression, and seems to have been so absorbed in the grandeur of his theme as to have deliberately rejected rhetorical ornament. The so-called *Krist* of Otfrid, a High German poet, who dedicated his work to Louis the German, has the same subject, but is not nearly so effective. It is the first rhymed German poem, and the necessities of rhyme often compel Otfrid to fill out his line with words and phrases which obscure his meaning. His lyrical passages are too didactic to rank as genuine poetry. The fragment of *Muspilli*, a Bavarian poem of the 9th century on the Last Judgment, indicates power of a much higher order. Its form is alliterative; and reminiscences of paganism are strangely mingled with its Christian ideas.

Monastic learning. During the reigns of Charles the Great and Louis the Pious secular learning was zealously cultivated in the monasteries of Germany as well as in those of other portions of the Frankish empire. The school established by Hrabanus Maurus in the famous abbey of Fulda vied with that of Tours, where Hrabanus had been a pupil of Alcuin, in the excellence of its teaching. In the wars with the Northmen, with the Magyars, and with the Slavs under the later Carolingian kings, many of the ecclesiastical institutions were destroyed; but they sprang up again under the protection of Henry I. From the time of his son Otto I. the Germans stood in direct relation with Italy; the marriage of Otto II. with the princess Theophano brought them into connexion with the learning and refinement of the Byzantine court; and Gerbert, the friend of Otto III., afterwards Pope Silvester II., introduced them to some of the achievements of Arabian science. These influences quickened the energies of enlightened churchmen, and originated an intellectual movement which to some extent continued during the vigorous reigns of the first two Franconian sovereigns, Conrad II. and Henry III. The chief subject of study was the scholastic philosophy, to which, however, in its earlier stages, Germany made no supremely important contribution. The Neo-Platonic tendencies of Scotus Erigena were opposed by Hrabanus Maurus, who remained loyal to Aristotle and Boetius; and his example was generally followed, not only by his successors in Fulda, but by the members of all other German schools. The school of St Gall was exceptionally active, and one of the monks, Notker Labeo, who died in 1022, wrote some original philosophical books, and translated into German the *De Consolatione* of Boetius and two of Aristotle's works. In pure literature very little was done; but there are several well-written Latin histories belonging to the 11th century. The best thought of the age was manifested in its Romanesque architecture, and in the then subordinate arts of painting, sculpture, and music.

Hohenstaufen period.

II. *The Age of Chivalry.*—The reign of Henry IV., during which the struggle between the empire and the papacy began, had a disastrous effect on the national culture; and the evil was not remedied under the disturbed rule of his two immediate successors. But under the Hohenstaufen dynasty, during the period of Middle High German, the country passed through one of the greatest epochs of its literature. The more learned of the clergy interested themselves deeply in the development of scholasticism through the nominalists and the realists; and in the 13th century Albertus Magnus, a native of Swabia, produced the first systematic exposition of Aristotle, in the full light of Arabian research. It was, however, in poetry that Germany achieved the highest distinction; and her most important poets were members of the knightly class, which at this time rose to its utmost power and fame. There were many reasons why the members of this class became sensitive to the higher influences of the imagination. In the first place, they had the elevating consciousness of a life shared with a vast community which set before itself the loftiest aims. Historians sometimes take a malicious pleasure in contrasting the mean performance of many knights with their high vows; but these vows at any rate introduced into the life of rough nobles an ideal element, and inclined them to take interest in the gentler and nobler aspects of existence. In the Italian wars of Frederick Barbarossa the German knights saw more than they had ever before done of Southern civilization, and their minds were continually stimulated by the varying fortunes of their adventurous emperor. Of still greater importance was the influence of the crusades, in which the Germans first took an active part under Frederick's predecessor, Conrad III. The crusaders had a remote and unselfish aim, connected with all that was most sacred and most tender in their religious ideas; and this alone would have created a sentiment favourable to poetic aspiration. But, besides this, the far-off Eastern lands, with their strange peoples and mystical associations, awoke dreams which could not have other than harmonious utterance, and on the return of the warriors they stirred the fancy of their friends with reports of a new and greater world. While the crusades lasted, the knights were forced into intimate acquaintance with the clergy, whose refined culture inevitably to some extent softened their rudeness; they also formed friendships with representatives of French chivalry. In France the works of the troubadours and the trouvères formed one of the most prominent elements of the national life, and the French nobles did not forget in Palestine the songs and romances of their home. The better minds in the German armies caught the inspiration, and longed to distinguish themselves by like achievements. And their desire was deepened when, by the acquisition of the Free County of Burgundy, Frederick Barbarossa opened a new pathway by which intellectual influences might pass from the western to the eastern bank of the Rhine.

The poetic impulse which thus entered Germany affected a wide circle; the highest princes as well as the humblest knights felt its power. Even the emperor Henry VI. himself is said to have been moved by the prevailing feeling, and to have composed verses. At the imperial and princely courts poets were encouraged to give expression to their genius; and the ladies whose beauty and virtues they delighted to praise stimulated their endeavours by marked appreciation. Thus the national imagination found in the whole temper of the age an atmosphere well adapted to the blooming of its first spring-time.

Poetical romances.

The most characteristic outcome of this active era is the series of poetical romances produced in the 12th and 13th centuries. The German poets might have found magnificent material in their old, native legends; but for the most part they preferred subjects which had already been artistically wrought by the trouvères, whose methods and style they also closely imitated. Among the themes they selected may be mentioned the legends of Alexander the Great, of Charles the Great and his paladins, of Arthur and the knights of the Round Table, with the allied legend of the Holy Grail. The fortunes of Tristram and Iseult also exercised a powerful charm over many minds. These and all other chosen subjects were treated wholly in the spirit of chivalry. The poets of the Middle Age had no idea of being true to the characteristics of a particular epoch; their own time was the only one they attempted to understand. Ancient heroes became in their hands mediæval knights; men who had died long before the rise of Christianity were transformed into devoted servants of the Church. And in every romance the supreme aim was to present an idealized picture of the virtues of knighthood.

Romance writers.

One of those who prepared the way for the chief romance-writers was Conrad, a priest in the service of Henry the Proud, who, before 1139, composed the *Rolandslied*, setting forth, in imitation of the French *Chanson de Roland*, the overthrow of Roland, the favourite paladin of Charles the Great, in the pass of Roncesvalles. He was followed by another priest, Lamprecht, who, also working upon a French original, relates in the *Alexanderlied* the deeds of the Macedonian hero. Greater than either of these was Heinrich von Veldeke, the first of the poets who may claim to rank as German trouvères. His great work was the *Eneit*, written between 1175 and 1190. It is not only in armour and in dress that Virgil's characters are here changed; in thought and feeling they are recreated. The language of the poem is so carefully chosen, and the incidents are narrated with so much spirit, that it is still possible to understand the immense popularity it once enjoyed. Hartmann von Aue, in *Der Arme Heinrich* and other poems, selected themes that are extremely repulsive to modern feeling; but he was endowed with genuinely plastic force, and interests us by touching certain mystical aspects of mediæval senti-

Hartmann von Aue.

ment. The master in whom these aspects were most fully represented was Wolfram von Eschenbach, a member of a noble family of Franconia, who was born during the reign of Frederick Barbarossa and died during that of his grandson, Frederick II. He was one of a group of poets who established themselves at the Wartburg, the court of the brilliant landgrave Hermann of Thuringia; and his chief poem, *Parzival*, was composed there towards the end of the 12th century. Germany did not produce during the Middle Ages a more truly poetic mind, and it is curious to observe how exactly he anticipated some of the qualities for which she long afterwards became famous. He has all the dreaminess, the sentiment, the passion for the ideal, which are, or rather at one time were, her most attractive characteristics. The hero, trained by his mother amid circumstances of idyllic simplicity, suddenly passes into a world of movement and adventure, and he is brought by accident to the gorgeous palace of the Holy Grail, of whose kingdom he ultimately becomes lord. The object of the poem is evidently to depict the strivings of a restless but noble spirit, dissatisfied with passing pleasure, having always before it a high and spotless aim. It is difficult for modern readers to detect the spiritual significance of many of the scenes; the poet seems to escape from us into a far-off region, whence his words reach us rather as dim echoes than as clear, ringing sounds. And some of the descriptions are in themselves tedious and superfluous, while advance from one stage of the tale to another apparently proceeds according to the arbitrary whim of the moment. Nevertheless, the character of Parzival is a true conception of genius, and enables us to understand, better than any other imaginative creation of mediæval Germany, that discontent with life as it is, that sense of being haunted by visions of spiritual loveliness, which, throughout the Middle Ages, existed side by side with unrestrained delight in the outward world.

A complete, almost a dramatic, contrast to Wolfram von Eschenbach is found in Gottfried of Strasburg, the greatest of his literary contemporaries. These two men are representatives of a distinction which incessantly recurs,—that between the poet who fashions spirits of a finer mould than those we actually know, and the poet who contents himself with penetrating into the innermost recesses of existing character. Gottfried's theme is Tristram and Iseult; and the charming tale, which unfortunately he did not live to carry to the end, was perhaps never more beautifully told. There are no mystic longings in the men and women he presents to us: they love the earth and the sky, with their gorgeous colours, graceful forms, and happy sounds; they care not to inquire what may lie behind these, or whether in the scheme of things there is a place for moral law. Few poets have set forth so powerfully the fascination of youthful passion. In his glowing pictures we find no shadowy figures like those of Wolfram, with step so light that they appear to be the figures of a dream; his images are clear, sharply cut, like those of the world from which they are taken. And although psychological analysis was unknown to him, the actions of his characters display keen insight into the secrets of human hearts when entangled in the most confused meshes.

Mediæval romance bore its richest fruit in the works of these two great poets; and most of their successors imitated one or other of them. Those who followed in Gottfried's steps came nearest to a happy result, for Wolfram was one of those lonely and daring spirits in whose remote path it is given to few to tread without stumbling. The best known of Gottfried's imitators was Conrad von Würzburg, who wrote on the Trojan war and many other subjects, and is considered one of the most artistic of mediæval writers. Towards the end of the 13th century the movement showed signs of exhaustion, and romances began to make way for rough popular tales and rhymed chronicles.

Fortunately the poets of the age of chivalry did not all occupy themselves with the subjects of French romances. A few, whose names we do not know, turned towards the rich material in the metrical legends of their native land. Of these poets the most important was he who collected and put into shape the ancient ballads which make up the *Nibelungenlied*. How far he modified them we cannot tell. In the form in which we possess them, they probably owe something of their force to his genius; but he needed rather to arrange and to curtail than to invent, and, although a genuine poet, he was not at all times competent for his task. The work includes the legends of Siegfried, of Gundicarius, or Günther, king of Burgundy, of Dieterich, and of Attila; and the motives which bind them into a whole are the love and revenge of Kriemhild, the sister of Günther and Siegfried's wife. She excites the envy of Brunhild, the Burgundian queen, whose friend, Hagen, one of Günther's followers, discovers the vulnerable point in Siegfried's enchanted body, treacherously slays him, and buries in the Rhine the treasure he has long before conquered from the race of the Nibelungen. There is then a pause of thirteen years, after which Kriemhild, the better to effect her fatal purpose, marries Attila, king of the Huns. Thirteen years having again passed, her thirst for vengeance is satiated by the slaying of the whole Burgundian court. The Germans justly regard this great epic as one of the most precious gems of their literature. It has little of the grace of courtly poetry; its characters are without subtlety or refinement; we are throughout in the presence of vast elemental forces. But these forces are rendered with extraordinary vividness of imagination, and with a profound feeling for what is sublime and awful in human destiny. The narrative begins with epic calmness, but swells into a torrent, and dashes vehemently forward, when the injured queen makes a fearful return for her wrongs, and is herself swept away by the tragic powers she has called to her service. In the management of the story there are occasional traces of mediævalism; but its spirit is that of a more primitive time, when the German tribes were breaking into the Roman empire, when passions were untamed by Christian influence, and when the necessities of a wandering and aggressive life knit closely the bonds that united the chief to his followers. Deliberate villany hardly appears in the poem; the most savage actions spring either from the unrestricted play of natural feeling, or from unquestioning fidelity to an acknowledged superior. Here and there we come upon touches which indicate that the poet who preserved the ancient legends was not incapable of appreciating finer effects than those at which he generally aims. The sketch of the hospitable and chivalrous Rudiger, who receives the Burgundians on their way to the court of Attila, and afterwards dies while unwillingly fighting them in obedience to his queen's command, is not surpassed in the most artistic of the mediæval romances.

Nibelungenlied.

Gudrun is another epic in which a poet of this period gave form to several old legends. They had for centuries been current along the coasts of Friesland and Scandinavia, and the society they represent is essentially the same as that of the *Nibelungenlied*,—a society in which the men are rude, warlike, and loyal, the women independent and faithful. Although full of serious episodes, *Gudrun* is as happy in its ending as the greater poem is tragic; and we feel throughout that the beautiful Princess Gudrun of Seeland, whom the Northmen have carried from her home, and on whom the cruel Queen Gerlind heaps indignities, will at last be restored to King Herwig, her brave and passionate lover. The characters stand out clearly in their rough vigour; and several happy strokes call up a vision of the bleak coasts and changeful northern sea which are the scenes of their adventures.

In the 15th century a German writer brought together in a single volume which he called the *Heldenbuch*—the "Book of Heroes"—a number of old legendary tales that must have been frequently on the lips of the people and of the wandering minstrels, while the knightly poets were singing of Tristram or of Arthur. This work, which was partly written by Kaspar von der Rhön, will not compare in imaginative force with its more famous rivals. The most powerful of the stories is probably the "Grosser Rosengarten," in which a monk, Ilsan, displays a very unclerical, but truly Teutonic, passion for war.

Minnesänger. The age of chivalry was remarkable not only for its romances and epics but for its lyrics. All the leading writers of the time exercised themselves in lyrical poetry, and it was laboriously cultivated by multitudes who did not feel equal to the task of a prolonged effort. Among those who gained more or less distinction may be named Heinrich von Morungen, Reinmar der Alte, and Gottfried von Neifen. The poets of this class were known as Minnesänger, because their favourite theme was Minne or love. They began by imitating the troubadours, whose metres they often reproduced when not penetrated by the emotion which originally found in these forms a genuine expression. At a later stage it was considered a point of honour for each poet to invent a stanza of his own, whether or not those already existing were appropriate to his feeling. Thus many of the minne songs produce an impression of unreality and coldness, seeming at best to be but clever pieces of handiwork. But when the utmost deduction has been made, it is surprising how much of what was achieved by these ardent writers still appeals to us. The best among them strike notes which respond in every age to a master's touch; and they do it with a fine sense of beauty, a trained instinct for the appropriateness of words, and an evident delight both in simple and in subtle melody.

Perhaps no group of writers has ever had a deeper undertone of sadness than is to be detected in the greatest of the minnesänger. They had a vivid consciousness of the evanescence of human pleasure, an abiding feeling that corruption lurks behind the gayest forms and brightest colours. But they caught with proportional eagerness the passing rapture, letting no drop escape from the cup that would soon fall from their grasp. This intensity of feeling is reproduced in their lays, yet it was purified and generalized as it passed from the fleeting reality to the permanent realm of art. Their treatment of love, although sometimes, according to modern ideas, extravagant and fantastic, often displays genuine elevation of sentiment. They sing also in impassioned strains the loyalty of the vassal to his lord, the devotion of the Christian to his church. If they do not exhibit the soaring spiritual ambition of Wolfram's *Parzival*, they have a kind of pathetic memory of a lost paradise, a vague longing, by some distant difficult service, in battle with the infidel, to attain to a world in which the discords of the present life may be forgotten or harmonized. And behind all their images is the background of nature, whose loveliness they do not the less appreciate because they refrain from elaborately describing it. To the dwellers in dreary towers winter had often a cheerless and melancholy aspect; but this made all the more enchanting the new life of spring. It is in hailing the returning warmth and colour of the young season that the minnesänger attain their happiest triumphs.

Walther von der Vogelweide. Of all the minnesänger the first place belongs without question to Walther von der Vogelweide, probably of Tyrol whom Gottfried of Strasburg praises as heartily as he slyly depreciates Wolfram von Eschenbach. Walther lived some time at the Wartburg, and was the friend of King Philip and Frederick II; he died on a little estate which the latter gave him in fief. Other Minnesänger lavished praise on generous princes; Walther was of a more manly character, and seems always to have maintained an independent bearing. Besides the usual themes of the lyrical poetry of his time, he wrote with enthusiasm of his native land; he also frequently alludes to the strife between the spiritual and secular powers, and sternly rebukes the ambition of the papacy. Beyond all his rivals he gives us the impression of writing with ease and delight. The structure of his stanzas does not hamper the movement of his feeling; it appears to provide the conditions of perfect freedom. Such a lyric as his *Unter der Linden an der Heide*, with its musical refrain *Tandaradei*, although a masterpiece of art, is exquisite in its childlike simplicity; it has the unaffected grace of a flower, the spontaneity of a bird's song.

Ulrich von Lichtenstein. As the expression of all that was fantastic and ridiculous in the age of chivalry, must be mentioned the *Frauendienst* of Ulrich von Lichtenstein, a work which was written about the middle of the 13th century, and had a certain popularity in its time. It is an autobiography, with a number of lyrics interwoven to give variety and animation to the narrative. The solemn gravity with which the author relates the amazing tasks imposed upon him by his mistress shows how easily the worship of womanhood degenerated into almost incredible childishness. Ulrich is sometimes compared to Don Quixote, but this is to do extreme injustice to Cervantes's hero. Amid all his illusions the fictitious knight maintains a certain pathetic dignity; the knight of reality passes from absurdity to absurdity without a touch of idealism to redeem his folly. And his lyrics are the tasteless manufacture of a thoroughly prosaic spirit.

Didactic poets. Several of the minnesänger, Walther von der Vogelweide especially, display at times a strongly didactic tendency. From the beginning of the period this tendency was developed by writers who took little interest in poetry for its own sake, and it became more and more prominent as the purely lyrical impulse passed away. The didactic poet, however significant his labours may be to his contemporaries, has necessarily the stamp of commonplace for posterity; and the gnomic writers of the 13th century form no exception to this rule. But several of them have at least the interest that attaches to sincerity and earnestness. There is genuine enthusiasm for pure morality in the *Welsche Gast* of Thomasin Zerklar; and the *Bescheidenheit* of Freidank expresses so high a conception of duty, and expresses it so well, that the work was ascribed to Walther himself. Reinmar von Zweter and Heinrich Frauenlob came a little later, and they were followed by Hugo von Trimberg, whose *Renner* sets forth unimpeachable lessons in homely and satirical verses. A higher tone is perceptible in *Der Winsbecke*, a collection of sayings in which we find an echo of the reverence for noble women that marked the epoch at its dawn. Among didactic writings must be classed the well known *Der Krieg auf der Wartburg* ("The Contest at the Wartburg"). It includes the verses supposed to have been sung at a tournament of poets attended by Heinrich von Ofterdingen, Walther von der Vogelweide, and Wolfram von Eschenbach.

As Latin continued to be the speech of scholars, and the passion for metrical expression pervaded the higher classes, there was not much scope for the growth of prose. Nevertheless, it is in this age that we find the first serious attempts to secure for German prose a place in the national literature. The *Sachsenspiegel* and the *Schwabenspiegel*, two great collections of local laws, although of a scientific character, and mainly interesting because of their social importance, had considerable influence in encouraging the respect of the Germans for their own language. The preachers, however, were the principal founders of prose style. Preaching became about the middle of the 13th century an agency of great power in the life of Germany. A number of the clergy, dissatisfied with the technicalities of scholasticism, and with the mere forms under which spiritual aspiration was often crushed, strove to attain to a fresh vision of religious truth, and to kindle their own enthusiasm in the minds of others. Of this generous band the most popular was Brother Berthold, a Franciscan monk, a man of a noble and commanding temper, and an orator of the highest rank. Love for the poor was his dominant motive, and he sometimes expressed it in language a modern socialist might envy. Having something of the imaginative glow of the minnesänger, he gave such colour to his abstract teaching as made it at once intelligible and attractive. Of a less poetical nature than Berthold, Master Eckhart, the next early master of religious prose, was more deeply philosophical. Although familiar with the scholastic systems, he broke away from their method, and became the founder of the mystical school which was one of the most potent factors in preparing the way for the Reformation. Eckhart's reasonings are sometimes hard to follow, but he is not a confused thinker; his obscurity arises rather from the nature of his themes than from his mode of handling them. He occasionally touches profound depths in the spiritual nature of man, and it is refreshing to pass from the formal hairsplitting of the scholastic philosophers to the large conceptions of a mind which obeys its own laws and is evidently in direct contact with the problems it seeks to solve.

Declination of chivalry.

III. *The Later Middle Age.*—After the fall of the Hohenstaufen dynasty the age of chivalry in Germany virtually came to an end. The breaking up of the old duchies set free a large number of petty nobles from their allegiance to mediate lords; and as there was no longer a strong central authority, either to hold them in check or to provide them with such outlets for their energy as they had found in the crusades and in the imperial expeditions into Italy, nearly the whole class sank from the high level to which it had temporarily risen. Many knights became mere robbers, and thought themselves honourably employed in taking part in the innumerable little wars which shattered the prosperity of the nation. Men of this kind were not very likely to inherit the free and poetic spirit of Walther von der Vogelweide. In the course of the 14th and 15th centuries attempts were still made by Wolkenstein, Muskatblüt, and other writers to imitate his style; but in their hands the lyre of the minnesänger gave forth only feeble or discordant notes. For a long time the princes were no more inclined to literature than the nobles; they were too much occupied with mutual jealousies, and with incessant attempts to shake themselves free of the crown, to give heed to anything so removed from practical interests as poetry.

It so happened that during this period the cities rose to a position of higher importance than they had ever before occupied. There was a while when it even seemed possible that by their leagues, and by alliance with those emperors who had insight enough to recognize their strength, they might become the preponderating element in the state. Driven from the castles of the princes and the towers of the nobles, literature took refuge in these young and growing centres of a vigorous life. Not one or two here and there, but multitudes of honest citizens, became possessed by the desire to distinguish themselves in the arts in which they had been so much surpassed by the nobles of a previous generation. Unfortunately, they had no literary training; they were not familiar with any great models; few of them had leisure for the cultivation of style; and the character of their daily employments was not such as to kindle thoughts that demand poetic utterance. At that time every trade had its guild; and they now formed guilds of poetry, the task of whose members was in intervals of leisure to produce songs according to a body of strict rules, as in hours of business they produced shoes or loaves. The rules were called the "Tabulatur," and the rank of each member was determined by his skill in applying them. The lowest stage was that of a man who had simply been received into the guild; the highest, that of a master, who had invented a new melody. Between these were the scholar, the friend of the school, the singer, and the poet. Literature produced under such conditions could not have much vitality. It amused the versifiers, and developed a certain keenness in the detection of outward faults; but the spirit of poetry was wanting, and there is hardly a "meistersänger" whose name is worthy of being remembered.

Meistersanger.

Beginning of the drama.

Much more important than these tedious manufacturers of verse were the unknown authors of the earliest attempts at dramatic composition. In the 10th century Hroswitha, the abbess of Gandersheim, wrote Latin imitations of Terence; but they were without influence on the progress of culture. The real beginnings of the modern drama were the crude representations of scriptural subjects with which the clergy strove to replace certain pagan festivals. These representations gradually passed into the "Mysteries" or "Miracle Plays," in which there was a rough endeavour to dramatize the events celebrated at Easter and other sacred seasons. They were acted at first in churches, but afterwards in open courts and market places; and for many hours, sometimes day after day, they were listened to by enormous audiences. The fragment of a Swiss "Mystery" of the 13th century has survived; but the earliest that has come down to us in a complete form is a play of the first half of the 14th century, treating of the parable of the ten virgins. Like those of France and England, these mediæval German dramas display little imagination; and they are often astonishingly grotesque in their handling of the most awful themes. Along with them grew up what were known as "Shrove Tuesday Plays," dialogues setting forth some scene of noisy fun, such as a quarrel between a husband and wife, with a few wise saws interspersed. They were declaimed without much ceremony in the public room of an inn, or before the door of a prominent citizen, and gave ample occasion for impromptu wit. Nuremberg seems to have been particularly fond of "Shrove Tuesday Plays," for one of its poets, Hans Rosenblüt, who flourished about the middle of the 15th century, was the most prolific author of them. A little later he was extensively imitated by Hans Folz, a Nuremberg barber and meistersänger.

Miracle plays.

Mystics.

By far the most interesting writers of the 14th century were the mystics, who continued the movement started by Eckhart. Johannes Tauler of Strasburg (1300–61) had not the originality and force of his predecessor, but the ultimate mysteries of the world had an intense fascination for him, and his tender and sensitive spirit opened itself to lights which find no way of entrance into more robust and logical intellects. He did not in the main pass beyond the speculations of Eckhart, but he added grace and finish to their expression, and made them a greater popular power than they could have become through the master's writings. Heinrich Suso, of Constance (1300–65), who has been called "the minnesänger of the love of God," made the doctrines of Eckhart an occasion for the outpourings of a full and sometimes extravagant fancy. Eckhart's teaching was also put into shape by an unknown author, whose work was afterwards published by Luther under the title *Eyn deutsch Theologia*. To all these writers the phenomenal world is in its nature evil, but it is also unreal; the only reality they recognize is a world outside the limits of space and time, in union with which man rises to his true life. They are chiefly of importance in the history of speculative thought, but even from the point of view of literature they were of high service in the development of a rich and vigorous prose.

A plain narrative prose style was cultivated in the chronicles which began at this time to be written in different parts of Germany. The Limburg Chronicle written between 1336 and 1398, the Alsace Chronicle about 1386, and the Thuringian Chronicle, by Rothe, a monk of Eisenach, about 1430, have all considerable historical value; and the fact that they are in German, not like previous chronicles in Latin, proves the rising respect among the people for their native speech.

During the latter part of the 15th century there was in Germany, as in the other leading European nations, a great revival of intellectual life. And it was due to the same causes as prevailed elsewhere,—especially the rediscovery of Greek literature and the invention of printing. The movement was naturally most powerfully felt in the universities. The first of these institutions had been founded early in the 14th century by Charles IV. in Prague. Soon afterwards others were established in Vienna, Heidelberg, Cologne, and Erfurt; and in the 15th century universities were set up also in Rostock, Greifswald, Tübingen, Leipsic, and elsewhere. For a long time law and divinity were almost the only subjects studied; but when the Renaissance passed from Italy into Germany, university teaching became the instrument of a freer and larger culture. Scholastic philosophy fell into disrepute; the most active minds occupied themselves only with the intellectual treasures of the ancient world. The men devoted to the new studies were called "Humanists," and they carried on continual warfare with the more ignorant and intolerant of the clergy. Unfortunately they knew nothing of the value of their own language; they wrote, as the scholastic philosophers had done, solely in Latin, and they gave but slight and contemptuous attention to the movements of popular literature.

Popular literature of 15th century.

Yet the popular literature of their time was quite worthy of study, for the stir of new life had affected not only scholars but all classes of society, citizens and even peasants included. It is surprising how many books found their way to the public between 1450 and the outbreak of the Reformation; every one seemed anxious that the newly discovered process by which writers could appeal to so wide an audience should be turned to the utmost possible advantage. Of this great mass of literature a comparatively small proportion was created in obedience to the free impulses of the intellect. The problems of the time were mainly social and practical; men were less moved by ideal interests than by questions as to the tyranny of the princes, the greed and sensuality of the clergy, the worldliness of the papacy, the powerlessness of the crown to enforce peace and order. Multitudes of little tales in prose and verse appeared, in which the princes, the nobles, the clergy, and sometimes rich citizens, were held up to ridicule. The "Shrove Tuesday Plays," which now became extremely popular, also expressed the general discontent; and there were even "Miracle Plays" whose object was to reveal the wrongs of the people. In one of them, the leading character of which was Joanna, the mythical female pope, a clerical author did not hesitate to pour contempt on the Roman see itself.

Reineke Vos.

By far the greatest of these satirical writings was the epic narrative, *Reineke Vos.* It has been already stated that the stories of "Reynard the Fox" and "Isengrim the Wolf" probably belong to prehistoric ages. They became current through the Franks, in Lorraine and France; and from the 11th to the 15th century they formed the subject of many works in Latin, French, and German. The epic to which allusion is now made appeared in 1498, and was probably by Hermann Barkhusen, a printer of Rostock. It is in Low German, and its materials were obtained from a prose version of the tale which had appeared some years before in Holland, and of which Caxton printed an English translation. Originally, the story had no satirical significance; it was a simple expression of interest in what may be called the social life of wild animals. In the hands of the author of this Low German poem it becomes an instrument of satire on some enduring tendencies of human nature. He does not lash himself into fury at the vices he chastises; he laughs at while he exposes them. His humour is broad and frank, and he did more than any one else to make Reynard the type of the resource and cunning which overmaster not only brute force but even truth and justice. There are several renderings of the poem into High German, the most important being the well-known work of Goethe in hexameters.

Brandt.

Another popular satirical work was the *Narrenschiff* ("Ship of Fools") of Sebastian Brandt, published in Basel in 1494. It is an allegorical poem of more than a hundred sections, in which the vices are satirized as fools. This work passed through many editions, and was rendered into more than one Low German dialect, and into Latin, French, and English; it was even made the subject of a series of sermons by Geiler, of Kaisersberg, a well-known preacher of the day, who had himself some satirical talent. Brandt was personally of a mild and unassuming character, and the fact that he became a satirist in spite of himself is a striking proof of the confusion which had fallen upon both church and state. Now that the occasion of his book has passed away, it is difficult to realize that it once enjoyed almost unprecedented popularity. We cannot but feel that the writer was an honest man; but his allegories are without force or charm, and his moral lessons have been the commonplaces of every civilized society. A satirist of a bolder type was Thomas Murner, who, although he lived far into the age of the Reformation, belongs in spirit altogether to the preceding period. He was a preacher, and both in sermons and in secular writings attacked without mercy the classes who were the butts of his fellow-satirists. After the beginning of the Reformation he included Luther among the objects of his comprehensive dislikes. His laughter was loud and harsh, and can hardly have been favourable to any small buddings of charity that may have revealed themselves among the antagonisms of his generation.

Murner.

Tyll Eulenspiegel.

One of the favourite books of this time was *Tyll Eulenspiegel.* It was published in 1519, and the author (probably Murner) seems to have included in it many anecdotes already well known. According to the preface, Tyll was a Brunswick peasant of the 14th century, who went about the country perpetrating practical jokes. The force of his humour mainly consists in taking every word addressed to him in its most literal sense, and in giving it applications altogether different from those intended by the speaker. There are readers who still find amusement in his rough pleasantries.

During the better part of this stirring period Maximilian I. was emperor, and he interested himself a good deal in the current literature. As in politics, however, so in poetry, his sympathies were altogether with an earlier age; and he attempted to revive the taste for mediæval romance. From a sketch said to have been prepared by him, Melchior Pfinzig celebrated in *Theuerdank* the emperor's marriage with Princess Mary of Burgundy. The work was splendidly printed, and attracted much notice; but romantic poetry, once so fascinating, produces in its pages the effect of an elderly coquette who, refusing to believe in the ravages of years, tricks herself out in the gay adornments of youth. An earlier book, the *Weiss Kunig*, an autobiography of Maximilian, written by his direction in prose by his secretary Treizsauerwein, has the excellence neither of a chronicle nor of a romance; it is for the most part the fantastic work of a mind which misunderstood its epoch and its own powers.

Popular poetry. Behind the strife and noise of contending sections there was slowly growing up an admirable intellectual product of Germany,—its popular poetry. One of the earliest writers who struck the note of the popular poets was Veit Weber, a Swiss who fought with his countrymen against Charles the Bold, and who celebrated in vigorous verses the battles of Granson, Murten, and Nancy. From this time the German people had always a living poetry of their own, created by unknown authors, but caught up by the masses, passed on from village to village till it was everywhere known, and handed down by each generation to its successors. This popular poetry ultimately reflected every aspect of daily life among the humbler classes; each section among them had its appropriate lyrics, and there were songs of youth, of age, and of middle life. There is no elaboration in these offshoots of the popular fancy, but many of them have an artless beauty which touches the fountains of smiles and tears, and which had an irresistible fascination for the poets of the greatest period of German literature.

Reformation period. IV. *The Century of the Reformation.*—It is possible that if there had been no Reformation the Renaissance would have revealed itself in Germany in a great literary movement, as in France and England, or in a great artistic movement, as in Italy. The conditions of both movements were present in the labours of the humanists on the one hand, and of the Holbeins, Albert Dürer, and Lucas Cranach on the other. But the questions of the Reformation were too profound and agitating for the mind of the nation to turn seriously to any task save that which they imposed. Thus it happened that the young shoots of the Renaissance withered almost before they were in leaf. It was settled that Germany must wait until a much later time for the full exercise of her highest energies.

Luther. In literature not less than in religion Luther (1483–1546) was the commanding spirit of the age; but he was so rather by accident than by choice. For form for its own sake he cared little; he studied it solely that he might the better produce the moral effect at which he aimed. It is hardly possible for any one to sympathize now with the violence and the dogmatism of his tracts, addresses, and sermons; but they had the high merit of addressing the nation in a language it could understand. They are always clear, simple, warm with the glow of a passionate nature; and amid their noise and fury an attentive ear will sometimes catch the still small voice of a spirit touched to finer issues than mere party warfare. "My husk may be hard," he himself said, "but the kernel is soft and sweet." We do extreme injustice to Luther if we do not recognize in him a strongly poetic element,—an element which had free play only in the best of his private letters, and in his still popular hymns. By the highest of his literary achievements, his translation of the Bible, he made a truly splendid contribution to the spiritual life of his people. No body of literature has been so fortunate in its translators as the Scriptures; and Luther's rendering ranks with the best. Its absolute simplicity brings it to the level of a child's understanding; its strength and grace give it an enduring place as a work of art. Germany instantly felt its charm; and for three centuries it has been to innumerable millions the supreme consoler and sanctifier, the power associated with their tenderest, most pathetic memories, the one link which has connected sordid lives with noble and sublime ideas. And for the first time it gave the nation a literary language. Up to this stage every author had written in the dialect with which he was himself familiar; henceforth for the men of Swabia, of Bavaria, of Saxony, and of all other districts there was a common speech, which the writers of each state could use without any sense of inferiority to those of another. It is thus to Luther that the Germans owe the most essential of all the conditions of a truly national life and literature.

The writer who deserves to stand next to Luther is Ulrich von Hutten (1488–1523). An accomplished humanist, he effectively attacked the enemies of the new culture in the *Epistolæ Obscurorum Virorum*, of which he was one of the chief writers. This was before the special work of Luther began; and at a still earlier period he had assailed in a series of fine Latin orations the tyranny of Duke Ulrich of Würtemberg, who was accused of murdering a member of Hutten's family. He had little real sympathy with Luther's religious aims; but he threw himself heartily into a movement by which it seemed possible to purge the state of the spiritual and secular ills which were in deadly antagonism to the progressive energy of humanism. His German writings are mainly short satirical poems and prose dialogues and addresses. Their style is direct, bold, and trenchant; but they are now interesting mainly because of the spirit of freedom which breathes through them, the lofty political ideals of the writer, and his generous ardour for the popular welfare. Ulrich von Hutten.

A far more voluminous author than Hutten or Luther was Hans Sachs, meistersänger of Nuremberg (1494–1576). He was, indeed, one of the most prolific of German writers, having composed, according to his own calculation, more than 6000 poems. Although extremely popular in his own time, Sachs was almost forgotten after his death. His memory was revived by Wieland and Goethe, and he is now universally admitted to have been the chief German poet of the 16th century. Every species of verse then known he freely cultivated, and there is no important element of his age which is not touched in one or other of his works. He had little of the culture of the schools, and many of his verses are excessively rude. But Hans had considerable force of imagination, sly humour, and, in his happiest moments, a true feeling for melody. His best works are his "Shrove Tuesday Plays." It is true he makes hardly more attempt than Rosenblüt to develop a dramatic action, but his characters have life, and in many individual scenes are artistically grouped. His didactic dialogues and satirical tales present a remarkably vivid picture of the ideas, controversies, and moral sentiments of his generation; and some of his lyrics still live in the memory of the nation. The song in which he hailed the "Wittenberg Nightingale" gave fine utterance to the reverence of the Lutherans for their chief, and in his hymn, *Warum betrübst du dich, mein Herz?* he so happily met the spiritual need of the day that it was soon translated into eight languages, including English, French, and Greek. Hans Sachs.

If Hans Sachs was the most industrious poet of the century, Johann Fischart was beyond all comparison its greatest satirist. There was a distinctly Rabelaisian touch in this restless, bizarre, and effusive spirit,—a man of upright and manly character, keenly alive to the evils of his time, and continually opening fire at new points on his enemies. He was an enthusiast for the Reformation, and did it more lasting service among the middle class than half the theologians. His chief work was an adaptation of Rabelais's *Gargantua*, which he rendered with an insight into its purpose, and a fulness of sympathy with its Fischart.

methods, unsurpassed even by Urquhart. In the poem, *Das Glückhaft Schiff*, he gives evidence of a faculty for stirring narrative verse, but his prose is richer, fuller, and more free. Considering how imperfectly prose style was then developed, he had an astonishing command over the resources of the language. He delighted in new and complicated word-formations, and by means of them often succeeded, while dealing with his main theme, in casting side lights on its subordinate branches. Even he, penetrating and enlightened as he was, could not rise so far above his age as to condemn the burning of witches; but hardly another popular folly escaped his glance. From the evil practices of hypocritical priests to the impudence of astrologers and weather prophets every abuse found in him a watchful critic; and nothing of the kind could be more admirable than the skill with which he excites contempt while professing to write in a spirit of respect and credulity. The secret of his power lay also partly in his profound humanity, for this scathing satirist was at heart thoroughly genial; his mockery had its root in an abiding faith in justice.

ose ters. Several other cultivators of prose style deserve mention. Albert Dürer, whose paintings, drawings, and engravings gave to the age of transition between mediævalism and the modern world its most perfect artistic expression, wrote several scientific treatises, one of which, on the proportions of the human body, is a masterpiece of calm, clear, and systematic exposition. Johann Thurmmeier, called Aventinus (1466–1534), Sebastian Franck (1500–45), and Ægidius Tschudi, of Glarus (1505–72), wrote histories which, as ordered narratives, rank considerably above mere chronicles. The autobiography of Götz von Berlichingen, if its style is without merit, has an enduring interest as a sketch of the rude lives of the petty nobles at the time when the old social order was breaking up under the influence of new ideas. Huldrich Zwingli, the Swiss Reformer (1484–1531), could state an argument with logical precision, but his style is thin and weak in comparison with the nervous force of Luther. Johann Agricola (1492–1566) wrote some theological works on the Catholic side; he is chiefly important, however, for a collection of German proverbs, which afford important evidence as to the currents of popular thought. Of a far higher class as a religious writer was

ıdt. Johann Arndt (1555–1621), who wrote the most widely read work of the 16th century, *Vier Bücher vom Wahren Christenthum* ("Four Books on True Christianity"). Soon after Luther's death the doctrines of the Reformation lost nearly all vitality; becoming the subjects of vehement controversy among contending theologians, they ceased to interest the masses, who turned to simpler and more congenial themes. Arndt, like Eckhart, Tauler, and Luther himself, being a man of religious genius, saw the futility of these noisy disputes, and brushing them aside went to the heart of Christianity as a power fitted to nourish spiritual feeling and to govern conduct. His work appeared in Magdeburg in 1610, passed through edition after edition, and was translated into eleven languages. It still has a place of its own, for beneath the forms of a past age there burns the fire of a true enthusiasm. Sebastian Franck, already mentioned as a historian, wrote some religious works in a spirit akin to that of Arndt; but he lacked the intensity, the power of touching the popular mind, which was possessed by the later writer. Less practical in tendency, but incomparably deeper in philosophic thought, were the writings of the

ehme. Görlitz theosophist, Jacob Boehme (1575–1624). Boehme is in many respects one of the most striking figures in the history of German speculation. A man of mild and humble temper, working in patient obscurity as a shoemaker, he spent his life in grappling with the vastest problems which perplex humanity. Starting from the dogmas of Christianity, he sought to ground them in the deepest reason; and although he often appears to darken counsel by words, yet his writings contain many bold suggestions, which have profoundly influenced later philosophical systems. There are times when one feels that his struggling thought is imperfectly uttered only because it is not expressed in poetic forms. For Boehme was one of those thinkers who occupy the borderland between philosophy and poetry, a fact often perceptible in the concrete shape which the most abstract ideas assume in his hands. There is a touch of poetry in the very title of his first and best known, although not perhaps his best, book, *Aurora*.

The secular poetry of this period, if we except the works of Hans Sachs and Fischart, is without value. An ambitious didactic poem by Rollenhagen, *Der Froschmäusler*, gained a certain reputation; but it stands far beneath *Reineke Vos*, of which it is partly an imitation. The religious lyrics of the age are, however, of high excellence; they, indeed, are the sole works in which a perfect marriage was effected between idea and form in the epoch of the Reformation. In his grand battle-hymn *Ein feste Burg ist unser Gott*, in his pathetic verses *Aus tieffer Not schrey ich zu dir*, and in other lyrics, Luther led the way; and he was, as we have seen, followed by Hans Sachs. Nicolaus Herrmann in his *Erschienen ist der herrlich Tag*, Paul Eber in his *Wenn wir in höchsten Nöthen sein*, Philip Nicolai in his *Wie schön leucht uns der Morgenstern*, and several other writers not less distinguished, created, in moments of genuine inspiration, lyrics which must move men while religious instincts survive. The adherents of the Reformation everywhere opened their hearts to these beautiful poems, for in them alone, not in creeds or sermons or controversial treatises, were the deepest emotions of the time freely poured forth. Next to the translation of the Bible, nothing did so much as the popular hymns to unite the Protestants, to stimulate their faith, and to intensify their courage. Religious lyrics.

During this century the drama made considerable progress. Besides the "Mysteries" and "Shrove Tuesday Plays," "School Comedies," in imitation of Terence and Plautus, were written and acted in the universities and public schools. Luther, with the large humanity characteristic of him when dogmatic disputes were not in question, encouraged these comedies, and was, indeed, friendly to dramatic effort of all kinds. To persons who complained that modesty was often offended by the actors he replied that if they carried out their principle they would have to refrain from reading the Bible. When the Jesuits began to agitate in opposition to Protestantism they detected at once, with their usual tact, the importance of this element in popular life; and through their influence more attention was paid not only to the plays but to the manner in which they were represented. Towards the end of the 16th century Germany was visited by a band of English comedians, who went about acting in their own language. They appear to have produced a deep impression; and at least one of their importations, the clown, the "Pickelhäring" of the Dutch survived in Hanswurst or Jack Pudding, who was for more than a century an indispensable character in every play designed to gratify the prevailing taste. In imitation of the English comedians, wandering companies, consisting largely of idle students, now began to be formed, and thrilled both rustic and city audiences with blood-and-thunder tragedies, and with comedies too coarse to deserve even the name of farces. About the middle of the century a theatre was built in Nuremberg, and Augsburg and other cities soon followed the example. Duke Julius of Brunswick (1564–1613) not only built a theatre in his capital but maintained a permanent company; and he amused himself by writing for it comedies and tragedies in the approved style of the day. Growth of the drama.

It is significant of the stage of literary culture reached by Germany that she enjoyed the barbarous productions of this scribbling prince while English audiences were appreciating "Hamlet" and "Othello."

Thirty Years' War.

V. *The Period of Decay.*—The period at which we have now arrived is in many respects the most dismal in German history. From 1618 to 1648 the country was desolated by the Thirty Years' War, a struggle which—as Gustavus Adolphus, its greatest hero, declared—absorbed into itself all the other wars of Europe. It completed the disintegration of Germany, blurred every great national memory, fastened upon the people hundreds of petty despotisms, reduced the population by more than half, caused a whole generation to grow up in ignorance, accustomed all classes to an almost incredible brutality of manners, and put an end to the material prosperity which had been steadily growing during the 16th century. It is not surprising that pure literature drooped and nearly died out during the time which followed this tremendous war, for the conditions of pure literature were almost wholly wanting. Had a man of high genius arisen, the buds of his fancy must have faded for lack of light and air.

The only species of literature for which the conditions were favourable was the religious lyric. Under the pressure of grinding care, with no hope that a better day would dawn for them in this world, meditative and gentle spirits devoted their thoughts to another life; and many of them linked themselves to the truest poets of the previous century by giving musical voice to their spiritual fears and joys. Their prevailing tone in regard to "things seen" is one of profound melancholy; but all the brighter are the strange lights from the invisible which break through the gloom. The greatest of these writers is Paul Gerhardt (1606–75), many of whose hymns—such as *O Haupt voll Blut und Wunden, O Welt sieh hier dein Leben*—penetrate to the essence of Christianity as the religion of humility, of sacrifice, and of sorrow. He had worthy associates among the Protestants in Johann Rist (1607–67), Joachim Neander (1610–88), and Louise Henriette of Brandenburg, wife of the Great Elector (1627–67). Some of the wiser Jesuits also attempted the lyrical expression of religious feeling; and one of them, Friedrich von Spee (1592–1635), fell little short of the best among his Lutheran rivals. Spee was a man of admirable moral as well as literary qualities. Asked by the elector of Mainz how it happened that at the age of forty his hair was white, he answered, "It is because I have accompanied to the stake so many women accused of witchcraft, not one of whom was guilty."

Literary societies.

The standard of pure speech set up by Luther in his translation of the Bible had not been maintained by later writers. The innumerable dialects of Germany are an almost inexhaustible fountain for the renewal of the youth of her literary language, but when the literary language was less fixed than it is now, they were also a temptation to barbarism. In addition to the evils of excessive provinciality, the written speech had suffered from a too generous importation of Latin, Spanish, and French words. In the early years of the 17th century the prevailing laxity suggested to an enlightened prince, Louis of Anhalt-Köthen, that it would be desirable to introduce into Germany institutions resembling the Italian academies. Accordingly, in 1617, the "Fruchtbringende Gesellschaft" ("The Fruit-bearing Society") was established,—a union which took the form of an order, with a palm tree for its emblem, and the words "Alles zu Nutzen" ("Everything for use") for its motto. It immediately became fashionable for members of the highest classes of central Germany to belong to this society; and at a somewhat later time other societies were started in imitation of it. Of these the most famous was the "Order of the Pegnitzschäfer" ("Shepherds of the River Pegnitz") in Nuremberg, which to some extent took the place of the school of meistersänger on which honour had been reflected by Hans Sachs.

These societies were associated with much pedantic folly, and from none of them proceeded any great work of genius; but they did good service by at least protesting against unlawful forms of speech. One of the earliest writers who worked in their spirit was Weckherlin (1584–1651), who, being associated with the German embassy in London, became intimately acquainted with some of the many forms in which the English genius then revealed itself. He wrote a number of odes, idylls, and sonnets, with an evident desire to give them a careful artistic finish. To him belongs the doubtful honour of having introduced alexandrines into German poetry,—a measure totally unsuited to the national spirit, but which for more than a century was in general use. The fame of Weckherlin was soon overshadowed by that of Martin Opitz (1597–1639). The beginnings of modern German poetry are often dated from the publication of his critical book, *Die deutsche Poeterei*, which appeared in 1624, and enjoyed an astonishing popularity. It became a sort of secular Bible to the "Fruit-bearing Society," of which Opitz was a member, and was regarded by several generations of verse-makers as an almost infallible guide. In regard to merely outward forms, it deserved its reputation, for Opitz was the first German writer who attempted sharply to distinguish the different species of poetry, to bring together some of the external laws which govern them, and to insist with emphasis that purity of style is essential to high literary effect. He altogether missed the fact, however, that poetry must be the expression of an emotional life; it became in his exposition a mere handicraft, for excellence in which industry and familiarity with good models are alone necessary. The result is seen in his own lyrical and didactic poems, which are laudably correct in language and in metre, but are hardly once lighted up by the fire of intense feeling.

Opitz was born in Silesia; and from this circumstance the writers who shared his tendency or came under his influence are known as the first Silesian school. By far the most distinguished member of this so-called school was Paul Fleming (1609–40), the only secular German poet of the 17th century of whom it can be confidently said that he was endowed with true genius. He did not live long enough to reveal his full capacity; he confined himself to short rapid flights, and all his lyrics are contained in a moderately sized volume, *Geistliche und Weltliche Poemata*. This single volume, however, comprises enough to secure for him an enduring place in literature. He moves freely over the whole range of lyrical poetry, but his charm is at once strongest and most delicate in his love verses, which sometimes recall the gaiety of Herrick, although a touch of sentimentalism distinguishes the German writer from the more worldly Englishman. A fine spirit of manliness is the note of Fleming's sonnets; and in several hymns he almost equals the religious depth of Gerhardt. Even in its artistic qualities his best work is higher than anything achieved by Opitz; in its power of awakening permanent human sympathies it stands alone in its era.

Paul Fleming.

Gryphius.

Another writer of the first Silesian school was Andreas Gryphius (1616–64), who sought to create a drama in accordance with the laws laid down by Opitz. He was the first German dramatist who divided his tragedies—of which he wrote five—into five acts; but his characters are roughly conceived, and he produces his effects rather by violence and bombast than by the gradual evolution of a definite plan.

His comedies, although also rude, have more life than his tragedies. In one of them, *Peter Squenz*, there are traces of Shakespeare's *Midsummer Night's Dream*, of which Gryphius appears to have had some knowledge through a third writer. Friedrich von Logau (1604–55) applied the principles of Opitz in epigram. He had a decided talent for terse, emphatic expression, and a considerable number of the vast collection of his epigrams have a keenness of edge which must have made him a dreaded enemy. His prevailing tone is satirical, and the chief object of his satire is the moral corruption of his time. Joachim Rachel (1618–69) was another satirist who strove by means of polished verses to castigate popular vices; but he lacked force and invention. There was much more vigour in the *Scherzgedichte* of Hans Wilmsen Lauremberg (1591–1659), who wrote in Platt Deutsch; he, however, can hardly be claimed as a member of the first Silesian school. Philip von Zesen (1619–89), a writer of some versatility, wrought in the spirit of Opitz by warring against foreign words which had intruded into German,—a warfare in which his zeal was not always as wise as it was patriotic. He founded in Hamburg, in imitation of the "Fruit-bearing Society," an association (the "Deutschgesinnte Gesellschaft") inspired by his enthusiasm for Teutonic purity of speech.

While the admirers of Opitz were striving, with the best intentions, to introduce a correct poetic style, a movement of a very different kind originated among the "Pegnitzschäfer" of Nuremberg. The members of this society, conscious of the barrenness of existing poetry, and not feeling in themselves the sources of a higher activity, turned for help to Italian literature. Instead of studying the great Italian poets they attached themselves to Marino and his extravagant school; and the chief result was a number of fantastic pastorals, the writers of which seemed to have no other aim than to show how much silly affectation the German language may be made to express. Their tendency was carried to its utmost development by the second Silesian school, whose leading representatives were Hoffmannswaldau (1618–79) and Lohenstein (1635–83). Hoffmannswaldau wrote odes, pastorals, and heroic epistles, which are marked by a childish foppery of manner, and whose tone affords startling evidence of the moral laxity of the society to which they were addressed. Lohenstein chiefly cultivated the drama, and he has the distinction of having written perhaps the worst plays ever accepted as literature by a modern community. They are so wild and bombastic that, even if presented as burlesques, they would now be condemned as ridiculously extravagant. The lyrics of this pretentious writer are not less crude and unnatural than his plays.

Court poets. As the century advanced, the German courts passed more and more under the influence of France. Pocket editions of Louis XIV. were to be found in all the little capitals, courtiers talked more French than German, and it was unfashionable not to know, or not to affect to know, contemporary French literature. It was, therefore, inevitable that some writers should turn away from the path of the second Silesian school, and compete for court favour by imitating the French style. This was done by Canitz (1654–99), Besser (1654–1729), König (1688–1744), and many other authors of the same class. These "court poets" took Boileau for their guide, and had, therefore, the negative merit of avoiding the absurdities of Lohenstein and Hoffmannswaldau. But they were, as a rule, tame, cold, and dull. In Canitz alone, who was a Prussian statesman and wrote for his pleasure, is there any evidence of original energy; the others were professional versifiers who produced appropriate odes and sonnets at the bidding of their employers.

During the greater part of the 17th century Germany produced few prose works that can now be tolerated. Notwithstanding the efforts of the purists, the language became more and more corrupt, and most writers were either artificial, or pedantic, or coarse. One of the small number whose power we can still feel was Grimmelshausen, whose *Simplicissimus* (1659) has qualities bordering upon genius. The hero is a peasant's son, who tells his own tale. Torn from his parents during the Thirty Years' War, he is brought up by a hermit; afterwards in the service of a commandant, he makes himself notorious for tricks like those of Tyll Eulenspiegel; he then becomes a soldier, rises to wealth and rank, but ultimately loses both, passes through many wild adventures, and retires from the world to a desert island, in which he devotes himself to religion. The value of the book consists in its graphic pictures of the horrors of the Thirty Years' War,—pictures relieved by touches of rough, sometimes of the coarsest, humour. Another writer of great but insufficiently cultivated talent was Moscherosch, author of *Gesichte Philanders von Sittewalt* (1650), which is partly an imitation of the Sueños of Quevedo. It is made up of a number of visions or dreams, some of which, like passages of *Simplicissimus*, convey a vivid idea of the sufferings of Germany during her great struggle; in others the writer strikes with effect at popular follies, including the extravagances of the second Silesian school. Sigmund von Birken wrote a history of the house of Austria, which, although one-sided, is not without merit as a plain narrative; and an ecclesiastical history by Gottfried Arndt has some interest as an attempt to do justice to heretics condemned by the church. A very good book of travels was written by Adam Olearius, describing the adventures of a mission to Persia, of which the author and Paul Fleming were subordinate officials. A Protestant pastor, Balthasar Schupp (1610–61), was the author of several didactic prose works, which, although rough in form, display native wit, and pour wholesome ridicule on the follies and barbarisms of contemporary writers. Against these more or less valuable prose writings we must set piles of enormous romances in the style of D'Urfé and Mademoiselle Scudéry. The favourite authors of these astonishing productions were Buchholtz, who wrote *Hercules und Valisca*, and *Herculiscus und Herculadisla*; Anton Ulrich, duke of Brunswick, whose *Octavia* was loudly applauded by aristocratic readers; and Von Ziegler, the writer of *The Asiatic Banise*, an incredibly foolish book which, published in 1688, took Germany by storm, and maintained its popularity for more than a generation. Lohenstein was also the author of a romance, dealing with the fortunes of Arminius and Thusnelda. It is hard to understand the interest which works of this class once excited; they are barren of every imaginative quality, with no kind of relation to life, and grotesque in style. They were ultimately driven from the field by imitations of *Robinson Crusoe*, which, notwithstanding the charm of their model, display no more talent than the romances. Various writers imitated *Simplicissimus*, but they succeeded only in reproducing in an exaggerated form its occasional brutalities. Abraham a Sancta Clara (1642–1709), a Vienna priest, whose real name was Megerlin, revealed considerable power of satire in his *Judas der Erzschelm* ("Judas the Arch-Rogue"), and in pamphlets and sermons; but his naturally rich fancy was wholly uncontrolled, and his humorous passages are marred by a far larger number in which he is pedantic or vulgar.

Romances.

No progress was made during the 17th century towards the formation of a national drama. At the courts the Italian opera was the favourite entertainment, and the wandering companies of actors represented for the most part barbarous plays of their own devising, in which Hanswurst was generally the popular character. Occasionally a man of some talent found his way into these companies; and one such actor, Velthen, showed so much insight as to include in his repertory some of the works of Molière. But the general tendency of what passed for the drama was from bad to worse, and the usual character of the plays to a considerable extent justified the hatred with which they were denounced by the clergy.

For a time it almost seemed as if Germany could never hope to emerge from the intellectual degradation into which she had sunk; but in reality the higher forces of the nation were rallying in preparation for a new era. One of the first symptoms of revival was presented by the remarkable pietistic movement, which, although it ultimately led to the formation of the pettiest of petty sects, was in its origin noble both in aim and in method. Its originators were the ardent, generous, and eloquent Jacob Spener (1633–1705), and August Hermann Francke (1663–1727). The labours of these writers and preachers, who had close affinity to the mystics, not only gave more sincerity to religious forms, but did service to literature by quickening the popular intellect, and awakening emotions which could find no satisfaction in the tedious writings of the day. Of still greater importance were the beginnings of modern German philosophy. It was in this dreary period that Germany gave birth to one of the most brilliant of her thinkers, Leibnitz (1646–1716). The prevailing style of the day—"Mischmasch," he called it—seems to have disgusted him with his own language, for nearly all his writings are in French or Latin. Nevertheless, he exercised a profound influence on the best minds of his generation. His monadology, his doctrine of the pre-established harmony, his theory of the best of possible worlds, while carrying on the central current of European thought, offered Germany new problems for solution, and helped to replace a rigid orthodoxy by a spirit of disinterested curiosity. The task of giving shape to his ideas was undertaken by Wolf (1679–1754), who had none of Leibnitz's genius, and often crushed his fruitful suggestions under a burden of logical proofs. The disciple, however, so far taught in his master's spirit as to exalt the claims of reason over mere authority; he also encouraged habits of systematic thinking, and proved by his practice that serious writers had no excuse for clothing their doctrines in any other language than their own. Less philosophical than Leibnitz, and even than Wolf, Christian Thomasius (1655–1728) was an impressive popular thinker. He edited the first German periodical, a sort of monthly magazine, in which he vigorously attacked pedants and bigots. His style, although not pure or graceful, received glow and warmth from his moral earnestness. Through him literature became a great practical power, for it was mainly he who put an end to the burning of witches and to punishment by torture.

Philosophy. Leibnitz. Wolf. Thomasius.

Even in poetry, before the close of this period, there were a few glimmerings of dawn. Wernicke, a man of cultivated and severe taste, published a volume of epigrams (1697) in which he thrust home at the follies of Lohenstein and his followers; and that his mockery had effect was plain from the outcry of two noisy members of the school, Postel and Hunold. Günther (1695–1723), who died too soon for his genius, wrote lyrics in which the voice of nature was once more heard. "A poet in the full sense of the word," Goethe calls him; and no one can realize how great was his achievement without making some acquaintance with his truly dismal predecessors. Brockes (1680–1747) had not Günther's fine spontaneity, but he had the merit of giving simple expression to unaffected pleasures,—a virtue for which historians of literature, remembering the formality of the court poets and the insincere posturing of the second Silesian school, readily forgive his occasional flatness and garrulity. He was the first German poet who displayed some knowledge of English literature. Although unacquainted with Shakespeare, he directed his countrymen to Milton, Young, and Pope; and he appended to his chief work, *Irdisches Vergnügen in Gott*, a fair translation of Thomson's *Seasons*.

Wernicke.

VI. *The Period of Revival.*—For five centuries there had been no great literary period in Germany which deserves to be named with the famous periods in the history of England, France, Italy, and Spain. The Reformation was a spiritual achievement of splendid originality, but in literature Germany had for the most part followed timidly in the footsteps of her neighbours. She was soon to make up amply for this tardy progress; and we have now reached the age in which she fairly awoke to a consciousness of her strength,—an age mainly of preparation, but one which has also an independent interest, since it includes names that rank high in the history of European as well as of German culture. We have seen that in the midst of the period of decay there were already symptoms of revival. These became more and more numerous, and while they increased, Germany was suddenly startled by the appearance in her midst of a great warrior and statesman. It is impossible to estimate with any approach to exactness the impression produced by Frederick II.; but it is beyond doubt that he profoundly affected the intellectual life not only of Prussia but of Germany. After the Thirty Years' War the people had lost confidence in themselves. They forgot that they had a magnificent history; they only saw that the structure of society had been rudely battered, and that nearly every enterprise of the nation as a whole ended in failure. Frederick the Great restored to them faith in their own vigour; he convinced them that it depended on themselves whether or not they should rise to their ancient place in Europe; and by the prompt, faithful, and energetic discharge of his personal duties he set before them an example which was widely felt. Literature shared the impulse which penetrated the national life. It became stronger, more independent, and moved forward with the assured step of a power conscious of high destinies.

Frederick the Great.

Several causes of a purely literary character contributed to promote this advance. One of these was the revival of classical study in the best sense. Classical study had been pursued with ardour by the humanists; but after them it became dry, pedantic, and tedious, and was subordinated to theological controversy. In the 18th century a number of scholars arose, who, ceasing to interest themselves in merely verbal criticism, sought to pierce to the meaning of classical writers, to understand and enjoy their imaginative effects, their ideas, and their style. They also strove to construct what the Germans call "Alterthumswissenschaft," the science of antiquity—that is, to comprehend the life of the Greeks and Romans, their religion, art, and philosophy, and to interpret their literature in the light of this knowledge. The movement passed from one university to another and soon made itself felt in the public schools. Thus the best class of minds were familiarized with higher ideals than they had yet known, and received, almost without being aware of it, the germs of new activity. Another cause, which co-operated with the more intelligent study of the classics, was acquaintance with English literature. Hitherto the foreign influences which had affected the Germans had come from Italy, Spain, and, above all, France; but now they began to know something of contemporary English writers, and gradually worked their way back to Shakespeare. The English genius was instinctively recognized as more in harmony with that of Germany than any other, and its products stimulated the free exercise of the imagination and the reason, while the ancient classics led to the perception of the greatest laws of form.

Classical study.

Among the poets who helped to effect the revival of a truly national literature a place of honour belongs to Haller (1708-77), who, although chiefly famous as a man of science, revealed imagination and poetic sympathies in his descriptive and didactic poem *Die Alpen* ("The Alps"). Hagedorn (1708-54) was for a time the most popular poet of his day in virtue of his songs, odes, fables, and narratives in verse. He was of a genial and happy temper; and no author who preceded him was master of so clear, bright, and animated a style. One of the chief characteristics of the time was the tendency of writers to group themselves in schools. If two or three writers who lived in the same place happened to become friends, they forthwith called themselves a school; and the result was that they usually developed some marked common characteristics. These coteries inevitably became more or less narrow and exclusive; but they also stimulated each other to fresh effort, and the clash of their ideals sometimes helped the outside world to new points of view. The Saxon school, whose headquarters were in Leipsic, was for some years more prominent than any of its rivals. It was founded by Gottsched (1700-66), who, although he made himself ridiculous by pedantry and vanity, became the ruling literary man of Germany. He was appointed a professor in Leipsic in 1724, and founded there "The German Society," which soon became the centre of a number of similar bodies for the cultivation of literature. Gottsched aimed at nothing short of the complete reformation of German poetry. He had the sense to see that if he wished to reach the people he must begin with the drama, and he was fortunate enough to find in Frau Neuber, who had formed a company in Leipsic, an intelligent actress capable of giving effect to his ideas. With her help he banished Hanswurst from the stage; and she was forthwith supplied with plays by himself, by his clever wife Louisa Victoria, and by several disciples. He gave his attention chiefly to tragedy, and unfortunately he had but one idea in regard to it—that it had reached the utmost possible excellence in the classic drama of France. The English drama, he admitted, had some merit, but only in so far as it had modelled itself on the work of Corneille and Racine. Hence, in his chief tragedy *Der Sterbende Cato* ("The Dying Cato") he availed himself freely of Addison's *Cato*; the Elizabethan dramatists, of whom his direct knowledge was slight, he believed to be mere barbarians. His taste gave the law in nearly every theatre in which German plays were acted; and it was certainly a good consequence that Lohenstein fell into permanent disrepute, while even the groundlings began to feel that the uncouth works which actors themselves had hitherto produced were, to say the least, far from perfection. On the other hand, the German genius was forced to submit to arbitrary laws antagonistic to its true nature; and so long as its submission lasted, a genuinely native drama was impossible. It was not only in regard to drama that Gottsched insisted on absolute subservience to France. In regard to all species of verse his sympathies were with the court poets, and both by example and by critical precept he insisted that in poetry as in everything else the understanding must be supreme, and that clearness of statement, correctness in the management of figures, and logical arrangement are the highest literary virtues. Regarding the function of imagination and feeling in poetry he had no suggestion to offer.

Saxon school.

Gottsched.

Swiss School.

There were writers who instinctively felt that this could not be a complete theory; and of these the chief were Bodmer and Breitinger, the leaders of the Swiss school, which was formed in Zürich. These writers, although destitute of creative genius, had nourished their imagination on English poetry, especially on *Paradise Lost*, and it was incredible to them that a critical doctrine could be correct which left out of account or condemned their favourite writers. At first they were on friendly terms with Gottsched, but when the latter harshly criticized a translation of Milton's epic issued by Bodmer, his Swiss rivals prepared to defend themselves; and thus broke out a literary controversy which made much noise at the time, and in which the angry critics, to the edification of onlookers, pelted each other unmercifully with abusive epithets. Neither party was fully conscious of the significance of its attack, and sometimes the warriors seemed almost to change sides. But the general tendency of the dispute was that the Swiss school, amid much exaggeration, defended the claims of free poetic impulse, while the Saxon school, in a narrow and pedantic spirit, maintained those of conscious art. It is hard work now to follow their arguments, but at the time they interested a considerable public in literature, and opened fresh lines of investigation. One of the results was that Baumgarten, a disciple of Wolf, published a book which Germans regard as the beginning of modern æsthetics,—a branch of mental science to which their philosophers have ever since devoted thought and labour.

While this warfare of critics was going on, there were in Leipsic a number of young writers who more or less attached themselves to Gottsched, but who gradually shook off his authority. They founded a periodical, the *Bremer Beiträge* (the "Bremen Contributions"), which had considerable influence in forming their own style, and in keeping alive the popular interest excited by the central controversy. After a while many of them were scattered over different parts of Germany, but they retained their original impulse, and continued to be known as members of the Saxon school. Gellert (1715-69) was by far the most famous of the circle. It is impossible to mention without respect this amiable writer. His plays are unimportant, but his fables and tales reveal so gentle and pure a spirit that we cannot wonder at his great popularity. He was a favourite among all classes, even Frederick the Great himself, who rarely condescended to notice a German author, declaring after a long interview that he was "the most reasonable of German scholars." His supreme defect was a tendency to weak sentimentalism and pious commonplace. Rabener (1714-71) acquired fame as a good-humoured satirist. His prose is fresh and clear, but he has not sufficient grasp of any important principle to entitle him to very high rank among moralists. Christian Felix Weisse (1726-1804), the friend of Lessing's youth, failed as a writer of tragedy, but was a favourite author of comic operettas. He was also the first successful German writer for children, and edited for many years a periodical (the *Bibliothek der schönen Wissenschaften*) which had a favourable influence on popular culture. Johann Elias Schlegel (1718-49), uncle of the two Schlegels who became long afterwards leaders of the Romantic school, gave evidence of high dramatic talent, but died when he was beginning to be conscious of his power. Arnold Ebert distinguished himself by good translations from English; and Zachariä wrote with some success mock heroics in the style of *The Rape of the Lock*. Kästner, whose disputations at the Leipsic university were diligently attended by young Lessing, made himself feared as a biting epigrammatist. Cramer became one of the most eloquent preachers of the day, wrote popular religious odes, and edited *The Northern Guardian*, a well-meaning but rather commonplace imitation of the *Guardian* of Steele. These writers, who from being Gottsched's friends all became more or less hostile to him, have a clearness and grace of style which were unknown in the previous century. Another author who was from the beginning Gottsched's enemy, but who had no relation with this particular school, may be here mentioned.—Liscow (1701-60).

Bremer Beiträge

His prose has nerve and animation, and few satirists have dealt severer blows at literary pretence.

Halle School. The Halle school of poets was in some respects different both from the Saxon and the Swiss schools. Its original members were Gleim (1719–1803), Uz (1720–96), and Götz (1721–81). These three writers formed a friendship in their student days at Halle, where they came under the influence of the poets, Pastor Lange, and the tutor of his children, Immanuel Pyra, ardent disciples of Bodmer and Breitinger. The young students, while feeling sincere respect for the Swiss critics, did not attempt any very serious flight; they preferred to amuse themselves with lively little anacreontic verses, which they soon brought into high repute. Afterwards Gleim settled in Halberstadt, where he lived to an extreme age. His didactic poem *Halladat*, which he wrote, he himself modestly explained, in order to gratify a wish of his youth to produce a book like the Bible, has no vitality; but during the Seven Years' War he composed *War Songs of a Grenadier*, which were everywhere read, and have not yet lost their popularity. They were edited by Gleim's friend Lessing, who, however, protested against their patriotic vehemence. Gleim was one of the most kindly of men, and became the patron of young poets, several of whom he always had in his pleasant bachelor's home. He also kept up an extensive correspondence with other writers, which is now an important source of information respecting the movements of contemporary literature. One of his most intimate friends, who resembled him only in geniality of disposition, was the noble-hearted Ewald Christian von Kleist (1715–59), who was fatally wounded on the battle-field of Kunersdorf. He would still deserve to be remembered as the man whom, of all others, the equally noble Lessing most loved. His descriptive poem *Frühling* ("Spring") is partly an imitation of Thomson; but it is also the work of an independent lover of nature, who knew how to give beautiful utterance to true and simple feeling. Ramler (1725–98), another friend of Gleim, and the friend, too, of Kleist and Lessing, wrote spirited odes in Horatian metres, which, like the *War Songs of a Grenadier*, gave pleasure because of their strongly patriotic tone,—the direct result in both cases of Frederick's influence. Anna Louisa Karsch (1722–91), a poetess who owed much to Gleim's goodness, was a favourite among the literary men of the day, but her verses are ruder than they ought to have been at so late a date. Idyllic poetry, which Kleist and Götz to some extent cultivated, was taken up in earnest by Solomon Gessner (1730–87), whose prose idylls, *The Death of Abel*, *The First Sailor*, and others, were translated into French and English, and were better received in their foreign dress than in their original form. They are written in an easy style, and express much harmless although somewhat tedious sentiment. He was imitated by Xaver Bronner, a Catholic priest, whose idylls have not half the merit of his autobiography, which affords remarkable insight into the religious life of Catholic Germany about the middle of the 18th century.

The religious lyric, which had shared the general decay during the latter half of the 17th century, displayed more vitality during part of this period. It owed its fresh life mainly to the pietists, who reopened fountains of spiritual feeling that had been apparently dried up by theologians. Among the best of this younger generation of hymn writers were Freylinghausen, Neumeister, and Tersteegen. Their fame was, however, less extensive than that of Count von Zinzendorf (1700–60), the founder of the sect of Herrnhüter or Moravian Brethren. Besides hymns he wrote religious works in prose, and made himself one of the most prominent figures of his time by ardent missionary zeal. His followers, like all deeply religious sects in Germany, delighted in hymns; and many of those they produced are remarkable for the sensuous, sometimes almost sensual, forms in which their emotions are expressed.

Fabulists. Fables were at this time an extremely popular class of writings, and nearly every imaginative writer sought to distinguish himself as a fabulist. The Swiss school, indeed, in their zeal for a combination of the wonderful and the useful in literature, maintained that the fable was the highest type of literature. As a rule, Lafontaine was taken as the model in works of this kind, but we look in vain among his German imitators for his exquisite grace and naiveté Gellert stands at the head of the more sentimental fabulists; after him may be named Willanow, and Lichtwer. The latter (1719–83) has humour as well as sentiment, and some of his fables have an artistic finish that indicates a faculty by which he might have won distinction in more important labours.

Popular philosophers. From about the middle of the 18th century onwards a number of prose writers, who may be classed together as popular philosophers, worked effectively for the enlightenment of ordinary readers. They attached themselves to some extent to Wolf; they also came under the influence, although not in any great degree, of the French Encyclopedists; and they were admiring students of the English deists, and of Locke, Shaftesbury, and Hutcheson. They are often condemned for the shallowness of their thought; and if we compare them with the great thinkers who followed them, the condemnation is just. They did not grasp the significance of the problems which had been handed down by Descartes, Spinoza, and Leibnitz, with which Hume was now grappling, and which were soon to enter upon a new phase in the critical philosophy of Kant. In regard to religion they had a very imperfect appreciation of every element that could not be expressed in clear logical statements; feeling and imagination were rigidly subordinated to the understanding. And they had not even a remote suspicion of what is now familiar as the historical spirit, so that they displayed amazing narrowness of vision in their treatment of past spiritual developments, and of contemporary creeds with which they did not happen to agree. But if we are to do justice to these popular philosophers, they must be compared rather with their predecessors than with their successors. An important place belongs to them in the movement by which vital human interests have been raised above theological disputes, by which morality has received a basis independent of dogmatic religion, and by which toleration has been secured for men of every faith. They were penetrated by a truly humane sentiment; and it must be counted a high merit that in a country which had been more or less dominated by pedants, and whose great writers of a later age have not always attempted to be both profound and clear, they sought to express themselves in unpretending and straightforward German. The chief of the popular philosophers was Moses Mendelssohn (1729–86), not a deep or massive thinker, but a man of fine moral sympathies, an enthusiast for freedom—from the lack of which he himself, as a Jew, keenly suffered—and an incisive psychological analyst. His friend, Frederick Nicolai (1733–1811), the Berlin bookseller, had the misfortune to outlive his epoch. He had only words of contempt for Goethe and Schiller; and Kant, whom he did not profess to understand, seemed to him a sort of cross between a bungler and an impostor. These terrible mistakes have made poor Nicolai, notwithstanding his lifelong warfare against bigotry, the type of a narrow-minded bigot. Yet in his earlier days he was recognized by such a judge as Lessing, with whose friendship he was honoured, as a writer of talent. And his *Bibliothek* ("Library"), the most important literary periodical of his day, did excellent service by providing the popular philosophers with a medium for the expression of their opinions on all the great questions which then agitated Germany. Other popular philosophers were George Sulzer (1720–79), who devoted himself to æsthetics in the spirit of the Swiss school, but with the advantage of later lights; Thomas Abbt (1738–66), whose style was one of uncommon vigour; Christian Garve (1742–98), who did not attempt any great original work, but in letters and articles examined many individual philosophic questions from new points of view; and Johann Jacob Engel (1741–1802), whose *Philosoph für die Welt* ("Philosopher for the World") interested a class of readers who would have been unable to follow a more adventurous guide. Zimmermann (1728–95) hardly deserves to be mentioned in such good company; but his *Betrachtungen über die Einsamkeit* ("Observations on Solitude") by its sentimentalism and rhetoric carried his name far beyond the bounds of Germany. *Liberal theologians.* Some theologians, without exactly sharing the beliefs of the popular philosophers, were profoundly affected by them. Among these were Mosheim, the ecclesiastical historian; Spalding, the translator of Shaftesbury; and Jerusalem, the father of the young writer whose suicide suggested some elements in Goethe's *Werther*. These liberal theologians did not hold a very intelligible logical position, but they were of some importance by their attempts to introduce a freer and more polished style of eloquence than had hitherto marked the German pulpit. In regard to the permanent movements of thought, their influence was greatly inferior to that of Michaelis and Semler, whose labours heralded the approach of modern Biblical criticism.

Historians. In history Germany produced at this time at least one writer of high eminence, Justus Möser (1720–94), author of the *Osnabrückische Geschichte* ("History of Osnabrück") and *Patriotische Phantasien* ("Patriotic Fancies"). *Möser.* Möser was the first German historian who wrote a good style and attempted to penetrate to the meaning of events and to present them in the light of great principles. He also produced a strong impression by his enlightened patriotism and by his burning scorn of wrong. Schröck and Schlözer were prominent historians, and the latter made himself known as a clear writer on contemporary politics. Karl von Moser, of Stuttgart, applied to political subjects a faculty for wit and satire that was estimated highly in his own day.

It has been already stated that the revival of classical study was one of the chief causes by which the mind of Germany was awakened to new effort. Professors Christ and Ernesti, of Leipsic, who were the favourite teachers of many young students, including Lessing, were two of the chief writers to whom this revival was due. *Winckelmann.* Incomparably greater than either, however, was Johann Joachim Winckelmann (1717–68), whose *History of Ancient Art* (1764) opened a new era in the appreciation of ancient life. Later investigation has corrected Winckelmann on many points, but no critic has displayed a keener feeling for the beauty and the significance of such works as came within his knowledge, or a truer imagination in bridging over the gulfs at which direct knowledge failed him. And his style, warm with the glow of sustained enthusiasm, yet calm, dignified, and harmonious, was worthy of his splendid theme. What he did for ancient art was to some extent done for ancient literature by the untiring editorial labours of Christian Gottlob Heyne (1729–1812).

National literature. Important as were many of these writers, Winckelmann above all, they exercised slight influence on the national mind compared with the three men whom the Germans justly regard as the founders of their classical literature—Klopstock (1724–1803), Wieland (1733–1813), and Lessing (1729–1781).

Klopstock stood in direct relation to the Swiss writers. When a pupil at Schulpforta, one of the great Saxon schools which sent forth many of the best authors of the day, he was a diligent student of Bodmer, by whose critical principles he guided himself in reading Homer, Virgil, and Milton. The *Messiah*, on which his fame mainly rests, is now little read, and it is impossible even to glance through it without becoming conscious of glaring faults. Klopstock's genius was essentially lyrical; he lacked the plastic force of imagination necessary for a great epic. His central figure is nowhere presented in clear sharp outlines; it wavers between two distinct conceptions, that of a divine and that of a human character. And the facts to which he turns our gaze in the crisis of his narrative are not such as kindle the deepest sympathies; he exhausts the powers of language to convey an impression of the Messiah's sufferings, but we hear nothing of the qualities of soul which these sufferings rouse into action. The subordinate characters are innumerable, and except Abaddona, a repentant fallen angel, between whose character and whose fate there is an effective contrast, none of them can be said to live; they exist only as an excuse for the utterance of Klopstock's feelings. They talk incessantly, weep, embrace, and kiss, but they never do anything that exhibits more than a vast quantity of obtrusive sentiment. Notwithstanding its obvious defects, however, the *Messiah* has qualities which must still command admiration; it reveals a nature full of lofty aspiration and deep humanity, and it contains individual images of striking force and beauty.

It would be difficult to imagine anything more dreary than Klopstock's plays, the subject of three of which is Arminius, while the others deal with scriptural themes. He knew enough neither of life nor of the stage to be a true dramatist; his characters are mere names, and the incidents are grouped according to no principle of art. His odes, which he continued to write from the beginning to the end of his long career, are of far higher excellence. Those which derive their inspiration from Northern mythology are too remote from general sympathy and too obscure in construction to awaken interest; but the stamp of genius is upon several of the lyrics in which he expresses his passionate feeling for the grander phenomena of nature, his ardent patriotism, his enthusiasm for freedom, and his elevated sense of human worth and destiny. Both as an epic poet and as a writer of odes he had many imitators, who, like most others of their class, exaggerated the defects of their model and left his virtues alone. His influence upon the intellectual life of Germany was deep, and, on the whole, beneficent. He encouraged the self-respect of his countrymen, intensified their desire for an independent literature, and by handling high themes, sometimes powerfully, always seriously, suggested that the national imagination would reveal its full capacity only by undertaking greater enterprises than any it had yet attempted.

Although Klopstock was one of the central literary figures during two generations, he was not a prolific writer; Wieland, on the other hand, was one of the most prolific of German authors. He was continually at his desk, and in the course of his career produced a considerable library. Of his many works the romantic poem *Oberon* is by far the most famous, and the only one that really pleases modern readers. *Agathon* is perhaps the best of the prose romances in which he endeavoured to depict ancient Greek life. He was not endowed with great vividness of imagination, and his prevailing tendency is to extreme diffuseness; but some of his descriptive passages, especially those in *Oberon*, have a touch of ideal grace which enables us to return to them with fresh relish. He had a fine appreciation of style, and by the study of Greek and French masterpieces persistently strove to acquire lightness, clearness, and ease. Even yet few German writers will compare with him in these qualities. In all his works he had a strongly didactic tendency, but his teaching was the opposite of that inculcated by most modern writers who deliberately aim at ethical effect. Above all, he differed from his great contemporary, Klopstock. Writing at first as a strict pietist, he ultimately became a pronounced Epicurean in the popular sense, and made it his object to proclaim an Epicurean theory of life, discouraging enthusiasm, laughing at such aspirations as those of his own youth, exalting the claims of the senses, and placing the highest virtue in kindliness and good humour. This tendency often conducts him to more slippery ground than any on which a German writer of his standing would now venture; but it also gives him innumerable occasions for the play of a gentle and refined irony.

Whatever may be the excellences of Wieland and Klopstock, both are essentially writers of the past. This cannot be said of Lessing, the third great German of this period; he is still a living influence. He is, indeed, the only writer before Goethe whom Germans can now read without feeling themselves in a world foreign to their sympathies. Throughout his career he strove to renew and fructify the intellectual life of his nation, and he achieved his aim by important creative activity, and by the clearest, freest, and most drastic criticism of the 18th century.

Lessing.

As an imaginative writer he was chiefly distinguished in the drama, and his most important dramatic work is *Minna von Barnhelm*. If it cannot be said that this is, in the highest sense, a comedy of genius, it is at any rate a comedy which contains elements of permanent interest. The characters are vividly presented; the plot is systematically, yet naturally, unfolded; the dialogue is clear, fresh, and animated. And the work has the high merit of giving artistic shape to elements taken by the dramatist from the living world around him. *Emilia Galotti* is marred by a deep flaw in the conception of the central figure; but every other character in the tragedy is conceived with bold imaginative force, and it is possible for a competent actress to soften, if not to harmonize, even the clashing elements in Emilia herself. No drama making even a distant approach to the excellence of these two plays had been produced in Germany; they thus gave literature in its highest department a fresh start.

But valuable as were Lessing's imaginative creations, they were inferior to his labours as a thinker. Here he was absolutely supreme among his contemporaries; and in some respects he has not since been surpassed. His method is invariably critical, but he aims at rising to the highest, most universal aspects of every subject with which he deals. As a master of style he ranks with the greatest European writers. The structure of his sentences is clear, precise, and compact; and he keeps the mind awake by vivid images drawn from nature and from human life, by interesting, sometimes remote, allusions, by rapid strokes of wit, and by unexpected turns of thought, as if he were abandoning his main theme, while he is in reality indirectly advancing it. He has often been called the most critical of poets; it would be equally just to call him the most poetical of critics.

The greatest of Lessing's purely critical writings is *Laocoon*, a fragment, but a fragment containing the germs of much of the best thought of his own and the immediately succeeding generations. It has an enduring value as the first serious and great attempt to distinguish sharply the realms of art and poetry, and to foster both by subjecting each to its own laws. Next in importance stands his *Hamburgische Dramaturgie*, a series of criticisms on plays represented at the Hamburg National Theatre. By these splendid criticisms, which are based in the main on Aristotle's *Poetics*, with many side-references to Diderot's theories, he put an end to the abject submission of dramatic writers to French traditions. In his later years he issued the *Wolfenbüttel Fragments*, portions of a theological work by Reimarus, a deistical writer of admirable force and clearness. He thus became involved in a hot controversy with indignant professors and pastors, the noisiest of whom was Pastor Goeze of Hamburg. The tracts issued by Lessing in the course of this controversy are in form among the most perfect of his writings; they are at once learned, keen, and witty. And in the history of Western thought they are of deep significance. His immediate object was to secure for criticism absolute freedom of movement; but he did very much more. He foreshadowed, as a vital element of the coming time, inquiry as to the origin and growth of the Scriptures, the rise of Christianity, and the fundamental character of religion. And he indicated a far higher standpoint than that of the popular philosophers by vindicating the claims of feeling in spiritual life as opposed to those of the bare understanding. In his *Education of the Human Race* he gave systematic shape to the fruitful principle that a religion which is not true absolutely or for all time may be of vast importance by meeting the needs of a portion of the race in special epochs, and that there is in history, notwithstanding apparent reactions, a progressive movement towards higher intellectual and moral ideals. The suggestions thrown out in controversy he developed artistically in one of the greatest of his writings, the fine dramatic poem, *Nathan the Wise*, a work which enshrines all that was noblest in the struggles and the aspirations of his age, and connects the thought of the 18th with that of the 19th century. As a drama, it has serious faults; but it powerfully effects its purpose by revealing, in the enlightened Jew, its hero, the grandeur of a nature which, instead of binding itself in dogmatic fetters, cultivates a spirit of free and disinterested humanity.

Thus in all directions this great writer laboured for the intellectual regeneration of his people. If Goethe, Schiller, and Kant found a nation prepared to receive their work, they owed the fact to many causes; but among these the chief were the political activity of Frederick II. and the literary activity of Lessing.

VII. *The Classical Period.*—At the close of the Seven Years' War the conditions of public life were very unfavourable to literature. The country was impoverished, and Frederick the Great and Maria Theresa were almost the only sovereigns who showed the least regard for the welfare of their subjects. But the mind of the nation had been thoroughly aroused from its long slumber. It had been startled into patriotism by Frederick's unsurpassed energy, while the labours of the chief writers had imbued the better part of the middle class with a desire for a more varied and interesting life. As political freedom was still a dream of the future, they turned more and more to books for refreshment and stimulus. Multitudes of young men who in other circumstances would have occupied themselves solely with practical duty became authors, and they urged each other to an activity without parallel in any previous period.

After Seven Years' War.

Most of these young writers were deeply influenced by the men of the older generation—Lessing, Wieland, and Klopstock. They were also ardent students of Shakespeare, Ossian, and Dr Young, poets who were oddly supposed to be on the same level and to share the same tendencies. Rousseau excited almost as much enthusiasm in Germany as in France, and the criticism of Diderot found many warm admirers. Under these diverse influences a curious movement began which is known as that of "Sturm und

Sturm und Drang movement.

Drang" ("Storm and Pressure"). It lasted, from about 1770, for ten or twelve years, and included nearly all the writers who still had fame to win. Their most prominent quality was discontent with the existing world. They detested not only tyranny and superstition but everything which prevented, or seemed to prevent, the free exercise of any powerful impulse. To break down conventionalities appeared to the "Sturm und Drang" poets their true function; but even this did not satisfy them. They longed for some knowledge deeper and more intimate than that attained by science, philosophy, or history, for some emotion intenser than can arise from any known human relation. All these conflicting feelings they expressed in their writings. From slavish submission to French critical laws they were of course completely emancipated. Most of them despised laws of every kind in literature as well as in life, and continually proclaimed that the duty of a man of genius was to write precisely as nature dictated. By "genius" they meant vehement sensations, by "nature" a free use of vigorous epithets.

The writer who formed the connecting link between Lessing on the one hand and Goethe and Schiller on the other, and whom the best writers of the "Sturm und Drang" movement regarded as their critical guide, was Johann

Herder.

Gottfried Herder (1744–1803). Herder is sometimes compared with Lessing, but while Lessing has a cosmopolitan touch which makes him intelligible and attractive to all the world, Herder is in the strictest sense a German, and is only slightly studied beyond his own nation. He was less boldly original than his older contemporary, and never attained the clearness, force, and classic beauty of Lessing's style. Nevertheless he is justly ranked among the most distinguished spirits Germany has produced. His mind was receptive in many different directions, and what he absorbed he made his own by independent thought, giving it out in new and suggestive forms. As an original poet, Herder does not rank high; yet genuine poetic impulses are visible in the poem in which he gave shape to the Spanish legends of the Cid. The literature in which he looked for the highest manifestation of thought and feeling was that which appeals to popular sentiment and has its root in popular life. Lessing had already called attention to the songs and ballads of the people; but Herder was the first German who decisively followed the impulse which led in England to the publication of Percy's *Reliques*. In his *Stimmen der Völker* ("Voices of the Peoples") he brought together an admirable collection of the lyrical utterances of many races; and it would be difficult to overrate the service he thus rendered, for he conducted his countrymen to a source of imaginative pleasure and revival in which their literature is exceptionally rich. By far his most important prose work was his *Ideen zur Philosophie der Geschichte der Menschheit* ("Ideas towards the Philosophy of the History of Humanity"), in which, working to some extent on the lines laid down in the brief paragraphs of Lessing's *Education of the Human Race*, he develops the conception of progress, and indicates that we can fully understand any single element of history only by seeing it in the light of human evolution as a whole. This excellent book elevated the aims and enlarged the scope of historic inquiry in Germany; and it still produces a powerful moral effect by its noble spirit of humanity. To the end of his days Herder was animated by a fine enthusiasm for human happiness, and it lights up his pages even when his subject does not lead to its direct expression.

To Herder belonged the high honour of stimulating and directing, at a critical stage, the young genius of Johann Wolfgang Goethe (1749–1832). In naming Goethe we mention the writer who holds in German literature the place held by Shakespeare in the literature of England, and by Dante in that of Italy. He towers high above even the greatest of his contemporaries, predecessors, and successors,—Schiller himself, who is most worthily associated with him, being far inferior in breadth of sympathy and splendour of creative impulse. Goethe, indeed, is one of the few writers who, while marked by strongly national characteristics, belong to the world rather than to a particular country. The special phases of his age have begun to pass away, but his best work has lost none of its freshness; it cannot become old, since it is rooted in elements of human life that eternally endure.

All things co-operated to render worthy of his destiny this favoured child of fortune. During his long life he enjoyed almost uninterrupted physical vigour; he was born into a family of prosperous circumstances, although not so highly placed as to satisfy his ambition; he received the best intellectual training his epoch could afford; in Weimar he was free to adapt the plan of his life to his inclinations; and he appeared at the very time when, by an era of sincere poetic endeavour and unparalleled critical labour, the mind of the nation had been prepared for the boldest efforts of genius. Nature has seldom lavished so many advantages on the greatest of her great men.

The quality in Goethe which immediately arrests attention is the extraordinary range of his activity. Hardly any aspect of human existence was strange to him. He possessed in an unsurpassed degree the faculty of dramatically thinking himself into phases of life to which his personal impulses would not have led him; and he deliberately enlarged his experience by exercising this power at every stage of his career. It was his prevailing conviction that all ideals which fascinate or have fascinated humanity must have a touch of vitality; and none was so remote from him but he sought to penetrate to its meaning. He could be just to Hellenic culture without doing wrong to mediævalism; he appreciated the spirit of Christianity without being indifferent to the faith of the Parsees or the Buddhists; he presented the ascetic aspirations of a "beautiful soul," while setting forth the gaiety of the brightest and most careless tempers; he felt the charm of art at the same time that he carried on profound researches in science; he loved his country, and yet, even when it was overrun by Napoleon's troops, he would not join the patriots in saying a harsh word of France. This absolute universality destroyed enthusiasm for special practical movements; but it gave astonishing variety to his literary achievements. Goethe's was in every respect a thoroughly poetic nature. He could not pass through a profound experience, an image of beauty could not cross his vision, without an accompanying impulse to find for his emotion an adequate sensuous representation. So vast a body of writings as his inevitably includes much that is tedious, but in his happiest moments his genius moved with the ease, the certainty, the calmness of the great forces of nature; he could be as perfect in the lightest stroke of delicate feeling as in the grandest flight of soaring imagination. The world he reflects is the world we actually know; but he is not, therefore, in any narrow sense, a realist. The facts he images are shaped and coloured by his thought and feeling; he breathes into them a life by which they are made of universal significance. This combination of realism and idealism is one of the chief secrets of his power. His art aims at producing the most general effects, yet it is kept fresh, vivid, and true by incessant contact with the concrete life of men.

Heine relates that he felt inclined to address Goethe in Greek, so like was the calm dignified old man to an earthly Zeus; and this is probably the image suggested to most minds by his name. But in youth he was full of eager life, restless, and passionate, and his early works bear the impress of turbulent feeling. Of these the first published was *Götz von Berlichingen*, which instantly established his fame as one of the chief writers of the "Sturm und Drang" school. It is almost as formless as their inartistic writings. The language is sometimes excessively rude, and there is no attempt to combine the different scenes into an harmonious picture. Yet it is sharply separated off from the tasteless plays with which it was compared, for everywhere we find traces of immature power. The characters are alive; they act and react upon each other as we should expect men and women to do in a stormy and troubled epoch; and by a few touches of apparently unconscious art we are made to realize the vital change through which the society of the age of the Reformation was passing. *Die Leiden des jungen Werthers* ("The Sufferings of Young Werther") gave Goethe a European reputation. Much of its sentimentalism now excites smiles instead of tears; but with all its faults it has an enduring fascination. It breathes a warm love of nature, of which it presents vivid pictures; it conveys a powerful impression of the mingled force, sweetness, and unreasonableness of early passion; and it expresses with deep pathos that weariness of life which forms one of the moods of poetic youth, and the manifestation of which was a favourite pastime of the less sincere "Sturm und Drang" versifiers. The promise of *Götz* and *Werther* was not sustained by all the works produced in the first part of his career. *Clavigo* is only a fairly good acting play; and *Stella* has even more than the extravagant sentimentalism of *Werther*, with only an occasional touch of its poetry. On the other hand, it was now that Goethe began *Faust*; and the fragment, *Prometheus*, expresses a grand defiance that is the more impressive because of the deep philosophic thought which may be traced in the background. It was, however, in his lyrics that the richly varied life of Goethe's youth most perfectly revealed itself. There are no German lyrics, if we except Heine's, which deserve to be compared with Goethe's; perhaps none in any literature have a more subtle charm. Profiting by the teaching of Herder, he studied the artless beauty of the best songs of the people, to some of which he gave new form, while retaining their primitive simplicity. His own lyrics are at once popular and artistic; he takes as his themes the joys, the longings, the regrets which all men understand, and weds them to melodies of delightful ease and grace. Almost every poem was suggested by some passing emotion of his own; yet his feeling is so purified that his words become the voice rather of humanity than of an individual man. His ballads are not, as a rule, so powerful as his songs, but both have one quality in common—without elaborate descriptions they continually call up by an apparently accidental word or phrase a clear vision of some natural object or scene. He is equally master of himself in rendering nature as a mirror in which we see the reflection of our own experience, or as a power moving on in calm indifference to our hopes and fears.

In 1775 Goethe settled in Weimar, where Wieland already was, and whither he was ultimately followed by Herder and Schiller, so that the little town became the centre of the intellectual life of Germany. After an interval of ten years, during which he published nothing, he paid his famous visit to Italy. Here his genius was kindled anew, and a close study of sculpture and painting suggested to him the necessity of submitting more fully than he had yet done to the permanent laws of art. The fruits of this experience were *Iphigenia*, *Tasso*, and *Egmont*, all of which he took with him to Italy in an unfinished form. The first two of these dramas were accepted as imitations of the antique; but they are so only in the sense that in each the parts are rigidly subordinated to the intention of the whole, that there is an orderly sequence in the development of the action, and that they are marked by elevation and simplicity of style. While incomparably more finished as works of art than any of the greater works he had before produced, they indicated no falling off in energy of imagination. *Iphigenia*, although its subject is Greek, is in tone and motive altogether Christian; and it would be difficult to name a more attractive picture of a modern lady than the pure and high-minded heroine. In *Tasso* Goethe draws in strong and sure outlines the sorrows of a poetic nature which will not sharply discriminate the real from its own ideal world. This dramatic poem is hardly more remarkable for the truth and vividness of its conceptions than for the charm of its versification and the wealth and beauty of its language. *Egmont*, however, has more movement, and touches human experience at deeper points. Most readers agree with Schiller's criticism, that there is too much melodrama in the closing scene, in which Clärchen appears to the hero as the spirit of freedom, and that, notwithstanding the liberties taken with history, Goethe has hardly succeeded in making Egmont the type of an enemy of despotism. But Clärchen is a beautiful study of a mind stirred by love to great resolves; and there is splendid portraiture in the characters of Alva, William of Orange, and the Princess of Parma.

Meanwhile, a new literary force had revealed itself in the life of Germany: Schiller (1759–1805), Goethe's great rival, had begun to divide with him the public attention and interest. The names of these two poets, in virtue of whose labours their period deserves to be called classical, are indissolubly connected, yet they were marked off from each other by profound distinctions. Goethe is often called the poet of culture, and it is true that he never ceased to subject his powers to systematic discipline. He was also one of the keenest critics of modern times. But the charm of his best writings is not dependent on criticism or culture; it springs from the spontaneous movement of a great imaginative faculty. Schiller, on the other hand, while also endowed with imagination, possessed it in a much less degree. His poetry would probably have lived even if he had not had the advantage of a thorough grasp of æsthetic laws; but it would certainly have had no claim to the distinguished place it now holds in European literature. He did not attempt so wide a range as Goethe, and within his scope he was not, like Goethe, a disinterested observer; he flung himself into the midst of the struggles of his time, and fought valiantly as the champion of a side. Fortunately for Germany, his side was always that of a truly chivalrous mind; for Schiller was one of the most unselfish of men, with lofty aspirations for the race, and a generous confidence in its essential goodness. These qualities determined the character of his conceptions. Goethe presents us with idealized pictures of the world; Schiller's creations are not so much pictures of the world as the figures of a realm distinct from actual life. His supreme aim was to express great sentiments and ideas, and as the medium for their utterance he conceived characters which are to be found only in a poet's dreams. Schiller.

Schiller began his literary career as a youth of two-and-twenty, inspired by revolutionary ardour, detesting every conventionality of society, dreaming of a world in which will and passion should have absolute licence. He relieved himself of his vehement emotions in his first three plays, *Die Räuber* ("The Robbers"), *Fiesco*, and *Cabale und Liebe* ("Intrigue and Love"). Genius never beat with more Titanic energy against an unsympathetic world than in these dramas; the impulse of the "Sturm und Drang" period, as it was about to die away, spoke in them its wildest, most passionate word. *Don Carlos*, his next drama, still manifested inability to form an organic whole; it contains scenes which have no bearing on the central action, and there is hardly an attempt to explain deeds by natural and intelligible motives. But we are no longer in the presence of one who merely raises an outcry against the existing world; furious resistance to despotism has become enlightened enthusiasm for freedom, humanity, and progress. Although the part of Marquis Posa is imperfectly worked into the scheme of the play, he is a nobly ideal creation; through him Schiller pours forth his own aspirations for the welfare of mankind. There is admirable art in the momentary elevation caused by his greatness of soul even in the dark and selfish Philip and the restless and wayward Don Carlos.

After he settled in Jena in 1789 as professor of history, Schiller was often in Weimar; but for a time he and Goethe held apart. By and by they began to approach each other, and from about 1794 their acquaintance ripened into fast friendship. The friendship of Goethe and Schiller is one of the most beautiful in the history of literature. It made no essential change in Goethe's modes of thought or expression, but it spurred him to the highest activity of which his genius was capable. His friend, he himself declared, "created for him a second youth, and again made him a poet, which he had almost ceased to be." On the other hand, in contact with Goethe's larger intellectual life, Schiller was raised to new points of view, and he acquired for the first time that mastery of artistic methods which secured for him his highest triumphs. He now became as remarkable for the perfection of his form as for the depth and warmth of his feeling.

The two friends worked harmoniously in connexion with Schiller's journal *Die Horen*, and wrote in common the *Xenien*, a number of epigrammatic verses meant to wound their literary enemies. On the whole, it is surprising that comparatively so few of the arrows in this rather large quiver are delicately pointed and feathered. A very different stage of excellence is reached by Schiller's well-known ballads, which were written during the period of his intimacy with Goethe. Nearly all of them are marked by force of conception and by purity and dignity of style. In lyrical poetry he had acquired some distinction before he knew Goethe, but it was in competition with his friend that he achieved his masterpiece, *Das Lied von der Glocke* ("The Song of the Bell"), in which within a small compass he presents an impressive picture of the course of human life, varying his melody with subtle art to suit the changing aspects of his theme. Less artistically perfect than the *Glocke*, other lyrics, such as *Der Genius*, *Die Ideale*, *Der Spaziergang*, have the power which belongs to deeper personal emotion. In ease and spontaneity none of Schiller's lyrics equal Goethe's, in which, as Heine says, "the word embraces you while the thought kisses you." But they express in clear and noble language some of the highest feelings excited in a poetic mind by contemplation of human life and destiny.

In his dramatic writings Schiller was influenced by Goethe even more than in his lyrics and ballads. The whole series of tragedies which he now wrote have historic or legendary themes, and he displays remarkable skill in unfolding through the past his greatest ideas respecting the future At the same time he evokes from it a company of finely ideal figures, whose qualities are revealed by the systematic development of large and carefully conceived schemes. *Wallenstein*, the earliest of the series, consists of two plays, *The Piccolomini* and *Wallenstein's Death*, the former of which is preceded by a number of scenes presenting a vivid picture of Wallenstein's camp. The tragic motive of this great work is somewhat obscure. We are made conscious by many artful touches of the ultimate issue; but Schiller does not render fully intelligible the play of the influences which result in disaster. There is, however, high imaginative faculty in his conception of Wallenstein's powerful, dark, and wavering character; and every reader feels the charm of the love passages between Max Piccolomini and Thekla. In *Maria Stuart* Schiller triumphs over an obvious difficulty by admitting the heroine's guilt, while he stirs our pity for her sufferings and our admiration for the spirit of endurance with which they are met. In the *Jungfrau von Orleans*, "The Maid" would have given purer pleasure if she had not been represented as loving one of the English commanders; but this only slightly mars the splendid picture of her patriotic devotion. As a work of art, the *Braut von Messina* is the least successful of the later dramas, for it attempts to combine romantic and classic elements which are irreconcilable; it contains, however, some of the most brilliantly rhetorical passages in the German language. The last of his completed works, and in some respects the best, was *Wilhelm Tell*. Here his love of freedom shaped for itself forms of immortal beauty. At a time when the French emperor threatened the independence of all Europe, men felt the power of the play more keenly than can be done in a calmer period; but it has permanently enriched the life of humanity by its conception of a character dominated by high, ideal passions. Schiller never saw Switzerland, yet in this powerful drama he renders with astonishing vividness the grander effects of Alpine scenery.

During his friendship with Schiller Goethe wrote in competition with him many lyrics and ballads. In works of the latter class, as Goethe himself thought, he was surpassed by his friend. He is incomparably more subtle and suggestive than Schiller; but for this very reason he is less effective. A ballad does not deserve its name if it is not popular; and we hear the voice of the people themselves in Schiller's free, bold, and simply harmonious verses. One of the longer works published by Goethe during this period was *Hermann und Dorothea*. His delicately chosen language and dignified hexameters are not always in keeping with the somewhat prosaic life they are here used to portray; but the poem is the nearest approach that has been made to the successful epic treatment of an ordinary theme. And it rises to a high level of imaginative power in the contrast it suggests between the still life of the humble village, with its little idyll of satisfied love, and the far-off desolation of the revolutionary wars, of which we are reminded by the band of emigrants. The genius of Goethe moves more freely in *Wilhelm Meister*, of which the first part was now published. This work has perhaps given rise to more contradictory criticism than any other book in modern literature. We may safely disregard the opinion of those who find in it all the excellences that can be combined in a prose romance, for it is without plan, and its style is singularly unequal. When Goethe himself admitted that he did not possess the key to its full significance, his warmest admirers may allow that perhaps there is no key to possess. Yet few of his writings present more striking evidence of the fertility of his power. He interests us equally—to recall only a few of the characters—in the gay and worldly Phillina, in the romantic Mariana, and in that most mysterious, lovely, and fascinating of creations, Mignon, whose *Kennst du das Land* is perhaps the noblest of those pathetic poems in which a soul in an uncongenial world calls up a momentary vision of its true home. It is not only in its dramatic conceptions that *Wilhelm Meister* is great; it contains some of Goethe's deepest thoughts on life and literature.

After the death of Schiller Goethe turned his attention more and more to science, his achievements in which have been fully appreciated only since the growth of the doctrine of evolution. Still, it was in his latest period that he completed the most famous and the greatest of his works, *Faust*, a poem which he began in youth and did not finish

Goethe's ballads.

Hermann und Dorothea.

Wilhelm Meister.

Faust.

until nearly his last birthday. The Faust of legend was a vulgar magician; Goethe so conceives the character that it indicates the deepest mysteries of human existence. The second part, in which the problem of the poem is solved, can hardly be regarded as a work of art; it is, or seems to be, confused and dark. And the individual elements of the first part are not completely welded; they form rather a series of poems than a single creation. In these individual elements, however, we find the grandest sweep of imaginative thought yet achieved by the German genius. The episode of Gretchen reflects with perfect art the most alluring and the most sorrowful facts of life; and philosophy and religion in their highest aspects meet in Faust's aspirations and struggles.

It might have been supposed that at the age of seventy Goethe had no new imaginative worlds to conquer; yet he then published his *Westöstlicher Divan*, representing, with dramatic sympathy and lyric force almost unabated, the combined mysticism and sensuousness of Oriental life. Ten years before, he had issued *Wahlverwandtschaften* ("Elective Affinities"), a powerful picture of impulses which law cannot control, and in which are concealed the germs of tragic issues. It has, however, less charm than another prose work, *Dichtung und Wahrheit* ("Poetry and Truth"), in which he draws a slightly idealized sketch of his early life. This fascinating book has made the figure of young Goethe as familiar as his chief dramatic characters; and no creations of the fancy are better known than the Frederikas and the Lilis, who had long before occasioned his sweetest lyrics, and the memory of whom in old age gave delicacy and music to his style.

French Revolution.

While Goethe and Schiller were in the midst of their career, Europe was startled by the French Revolution. At first it stirred as much interest in Germany as in England. The aged Klopstock greeted it with odes full of the fiery energy of youth, and for a time Schiller almost fancied that his loftiest hopes were about to be realized. Sympathy, however, was transformed into bitter opposition by the Reign of Terror; and when Germany was trodden under foot by Napoleon, she turned more and more from every kind of French influence. Thus it happened that, although the ideas of the Revolution have indirectly affected the literature of Germany as deeply as that of the rest of Europe, their immediate effect was slight and transitory.

Kant

An event of the highest importance in the intellectual growth of Germany was the publication, in 1781, of Kant's *Kritik der Reinen Vernunft.* It is hard for men of a later time, accustomed to metaphysical speculation, to realize the impression produced by this great book. Its effect in philosophy was not unlike that caused in our own day in science by Mr Darwin's *Origin of Species.* Everywhere among thoughtful men, at the universities especially, philosophy became the absorbing subject of study; and it was taken up at a point from which its whole past development was for the first time intelligible. Goethe, without neglecting the movement, was perhaps less stirred by it than any other prominent writer; Schiller became one of Kant's most enthusiastic students, and traces of the new system are to be found in many of his later lyrics and dramas. He also applied its principles to æsthetics in several admirable critical writings. By and by, dissatisfied with the gulf left by Kant between mind and matter as "things in themselves," philosophers started in search of some principle which should harmonize all the elements of existence; and thus grew up, one after the other, the systems of Fichte, Schelling, and Hegel. For more than a generation these thinkers excited deeper interest than imaginative writers; the most serious minds were fascinated by speculations which placed in new lights all the greatest questions relating to human thought and action.

Sturm und Drang poets.

Of the poets or versifiers who began their career with Goethe, the one who for some time attracted most notice was Klinger (1753–1831), whose play, *Sturm und Drang*, is at least memorable through its title. Other plays of his were *Conradin* and *Medea*; and he also wrote romances, of which the best known were *Faust's Leben, Thaten, und Höllenfahrt* and *Der Weltmann und der Dichter.* His writings are violent and noisy, without a touch of true art; what he mistook for imagination was a power of crude and unmeasured declamation. His later works express the bitterness of a deeply disappointed man. Lenz (1750–92), whose name is usually connected with that of Klinger, did not make even so distant an approach to imagination as his rival; his plays are the wild outgrowths of a mind which has made no sincere observation of life, and has submitted neither to intellectual nor to moral discipline. A man of much greater talent than either was Daniel Schubart (1739–91), the restless, licentious, and unfortunate poet who, for publishing a piece of false news, was confined for ten years in a fortress, where he suffered incredible hardships. In his attempts to portray the horrible he is sometimes extremely grotesque, but his best verses have both music and pathos, and they had the good fortune to exercise some influence on Schiller. He was one of the earliest publicists of Germany, and his hatred of despotism was the real cause of the infamous act which deprived him of freedom. Writers who shared the spirit of "Sturm und Drang," and applied it in new directions, were Lavater and Basedow. Lavater enjoyed the friendship of nearly every distinguished man of his day, yet he was vain and fanatical. His *Physiognomische Fragmente* ("Fragments on Physiognomy") were supposed by thousands of readers to find in the relations of mind and body the materials of a new and mysterious science; but the pretended science was in reality a mixture of commonplace and extravagance. Basedow, although with too passionate a faith in the power of education to effect an immediate transformation of the race, did excellent service by advocating, after Rousseau, a more humane and natural system of mental training than had before prevailed. The same cause was more temperately promoted by Campe, who wrote some admirable books for the young; and the Swiss educational reformer, Pestalozzi, set forth methods of instruction in earnest didactic works which had some effect in nearly every country in Europe.

Hainbund or Göttingen school.

The excitement of the "Sturm und Drang" writers was shared by a band of young poets who in other respects displayed a wholly different temper. Most of them were students at Göttingen, where they gathered round Boie, editor of the *Musenalmanach*, a journal he had started in imitation of *Le Mercure de France*, and to which Goethe and many of the best of the younger men of the day contributed. They called themselves the "Hainbund" ("Grove Confederation"), because of their dancing one night by moonlight round an oak tree, swearing eternal friendship, and vowing to devote themselves to their native land. The god of their idolatry was Klopstock, whose somewhat fantastic enthusiasm for primitive Germany they fully shared, and whose labours on behalf of virtue they never ceased to celebrate, while they loathed and despised Wieland. Several members of the "Hainbund" afterwards acquired distinction, and all of them were more or less remarkable for the genuinely popular tone of their writings. By far the greatest of them was Bürger (1748–94), who, although he never did full justice to himself, gave evidence of an original and adventurous genius. His *Lenore*, a translation of which was Scott's first published work, is full of weird power, and his sonnets are among the most perfect in German literature. His faculty of meeting the popular taste was possessed by Hölty (1748–76), who, however, delighted

Bürger.

in mild and calm expression, while the best of Bürger's poems are full of stir and action. Johann Martin Miller (1750-1814) became known chiefly as the author of the romance *Siegwart*, a rather weak imitation of *Werther*. Some irreverent spirits ventured to laugh at its tedious pathos, but it was welcomed by the majority of the middle class, who took especial delight in the songs it includes. Christian, Count Stolberg, and his brother, Frederick Leopold, were also members of the Göttingen school. Besides imitations of Greek plays, they issued odes, ballads, and songs. Of the two the most powerful was Frederick Leopold (1750-1819), in some of whose briefer pieces there is true feeling for nature. He continually verges, however, on extravagance, and often takes the fatal step from the sublime. A stronger writer was Johann Heinrich Voss (1751-1826), author of a famous idyll, *Louise*, which was received by Schiller as a poem of first-rate importance, and suggested to Goethe the idea of his *Hermann und Dorothea*. Its homeliness of style is perhaps more in keeping with its simple and commonplace theme than the classic grace of Goethe's verses. Voss acquired a better title to fame by an admirable translation of Homer, which did for the *Iliad* in Germany what Pope's translation did in England. Voss's rendering is less polished than Pope's, but incom-
Claudius. parably more faithful. Matthias Claudius (1740-1815), although not a member of the "Hainbund," is usually associated with it because of his general sympathy with its tone. The *Wandsbecker Bote* ("Wandsbeck Messenger"), in which he brought together all his writings, contains much simple poetic feeling, and some of his songs are still popular favourites.

Imitators of Wieland. While these writers attached themselves to Klopstock, others showed traces of Wieland's influence. The most important of this class was Wilhelm Heinse (1749-1803), whose chief work was *Ardinghello*, a prose romance. He shares Wieland's general theory of life, but, instead of expressing it in the calm, ironical style of his master, he is vehement, tumultuous, and enthusiastic. Amid his wild exaggerations he sometimes displays a remarkable power of describing physical beauty. He was an ardent student of art, and was the first German writer who succeeded in reproducing in glowing language the impression produced upon him by pictures and music. Other imitators of Wieland were Aloys Blumauer, who mistook vulgar burlesque for satire; Alxinger, whose *Doolin von Mainz* may be taken to represent a large class of tiresome poems of chivalry; and Von Thümmel, who, with considerably more ability than these writers, spoiled his good qualities by
Imitators of Goethe and Schiller. cynical grossness. An indefinite number of mediæval plays were written in imitation of Goethe's *Götz*, and robber romances in imitation of Schiller's *Räuber*. Of the latter the earliest and most famous was the *Rinaldo Rinaldini* of Vulpius. Jung Stilling (1740-1817) continued the sentimental tone of *Werther* in a number of curious autobiographic tales, which acquired extraordinary popularity, and threw much light on the inner tendencies of the later pietists. Among imitators of Schiller's lyrical poetry the best were Matthison and Salis-Seewis; but they were more successful in reproducing his moral feeling than in rivalling his high art. For many years the stage was in the possession of Iffland (1759-1814) and Kotzebue (1761-1819). The former, who was a distinguished actor, wrote dramas chiefly of domestic interest. They are without genius, but had the merit of almost displacing the foolish mediæval plays of Goethe's imitators. Kotzebue was a most prolific writer; and although he had no imagination, and wrote merely to catch the applause of the moment, his comedies still deserve to be named among the few works of this class which have hitherto been produced in Germany.

A writer who exercised some influence over the youth **Jacobi.** of Goethe was Frederick Jacobi (1743-1819). He was the author of two romances, *Alwill* and *Woldemar*, in both of which there is a little of Werther's sentimentalism, although their main purpose is didactic. He also wrote a number of philosophical works. His main principle is that the sources of religion and morality are to be found in intuition; and by a constant reiteration of this doctrine he worked in opposition to Spinoza, to Kant, and to Schelling. There are occasional gleams of philosophical genius in Jacobi, and he is of some interest to English readers because of the attention Sir William Hamilton appears to have devoted to his writings. An author of a very different type, and of far greater eminence, was Jean Paul Richter, usually called Jean Paul (1763-1825). It is difficult to do justice to Jean Paul, for he commits almost every fault of which a writer of romance can be guilty; he is at different times pedantic, extravagant, sentimental, and tedious. He prescribed for himself no limits; everything that occurred to him at the moment of his writing went down exactly as it suggested itself. Yet it is impossible even to look into any of his innumerable books without recognizing his genius. The work which has maintained the strongest hold over the nation is perhaps his charming prose idyll, *Die Flegeljahre* ("The Years of Wild Oats"); but his great romance, *Titan*, and the less ambitious *Siebenkäs*, or "Flower, Fruit, and Thorn Pieces," have also kept their place as works of permanent excellence. The most admirable quality of Richter is his humour. No German writer plays with his subject more delightfully, and he produces his most striking effects in dealing with the simplest, most unpretending relations of life. He is usually very near the sources of pathos when he smiles, and Jean Paul's pathos, at its best, is full of power, awakening the deepest feeling by its obvious sincerity. Sometimes it is associated with lofty imagination, as in the famous dream in which he describes a universe without religion. His feeling for the periodic changes of season in nature is that of a poet in the highest sense, his descriptions of spring being perhaps unsurpassed for their glowing yet tender beauty. To his other excellences we must add the manly spirit which led him to scoff, occasionally without due measure, at every kind of vulgarity and pretence, and at the same time preserved in its original freshness his sympathy with his fellow-men and his passion for their enlightenment and progress.

The most important literary movement which originated **Romantic school.** during the lifetime of Goethe was that of the Romantic school, whose leading members at first attached themselves to him, but gradually diverged more and more from his spirit. The rise of the school was in some measure due to the philosophy of Fichte, whose theory of the ego as the principle which freely creates its own world gave new importance to the individual as opposed to law and convention. Schelling still more effectually prepared the way for the Romanticists by his poetic treatment of the relations between the mind and nature; and several of his disciples, especially Steffens, worked in the same direction by dwelling on the possibilities of mystery in human life and in the external world. The aim of the Romantic school was to assert for modern feeling the right of a freer, more varied utterance than can be provided for it by the forms of classic literature. They were not in sympathy with their own time; they found it tame, prosaic, colourless; and to enrich it with new elements they went back to mediævalism, in which, as they conceived it, daily life had not been divorced from poetry. They drew enthusiastic pictures of the Middle Ages, of the charms of chivalry, of the loyalty of each class to the class above it and to society as a whole of the devout piety which was supposed to regulate the conduct of prince and peasant alike, and which revealed itself in splendid architecture and a gorgeous ritual. With a like purpose the Romanticists pointed to Oriental life, and began the serious study of Sanskrit and Persian poetry. The chief writers whom they opposed to the classical poets both of antiquity and of modern times were Shakespeare and Calderon; but they also brought to light many mediæval authors who had previously been neglected, and stimulated the Germans to a systematic study of the whole of their past literature.

The Romanticists did not strike out a wholly original path, for there were in the writings of Lessing, Goethe, and Schiller—especially of Goethe—elements in full harmony with all that was best in the new tendency. They were guilty of grotesque exaggeration in their descriptions of the superior happiness of mediæval nations and Oriental peoples, and they did much harm by checking the rising appreciation of measure and order in literary form which had been encouraged by the great classical writers. In practical life, too, their labours led to results opposed to the progressive tendencies of the age; for in the case of many adherents of the Romantic school, enthusiasm for the Middle Ages soon ceased to be a mere literary fancy,—they strove to reproduce obsolete mediæval ideas. Large numbers of them joined the Catholic Church, and became the most vehement opponents of spiritual and political freedom. Still the Romanticists gave prominence to certain vital principles. That we now feel the charm of what was great and beautiful in the Middle Ages, is in part the result of their teaching; and to some extent we owe to them the recognition of deeper elements in the world than reason can formulate, and the conviction that the thought of each age must create for itself a medium of expression adapted to its special nature.

Novalis.

The writer known as the prophet of the Romantic school was Frederick von Hardenberg, generally called Novalis (1772–1801). In his unfinished romance, *Heinrich von Ofterdingen*, he revealed a mystical and sensitive spirit, penetrated by religious aspiration, and feeling itself ill at ease in the hard rough world. These qualities are still more pathetically expressed in his poems, the best perhaps being those in which he directly utters spiritual emotions.

The brothers Schlegel.

The critical leaders of the school were the brothers August Wilhelm von Schlegel (1767–1845) and Friedrich von Schlegel (1772–1829). It is to be feared that many English readers have derived their impression of the former mainly from Heine's malicious caricature. In reality, although destitute of creative power, he was a man of great intellectual distinction. His translations from Shakespeare are masterly, and his rendering of Calderon has also genuine merit. He did much to promote the scientific study of Sanskrit, and his lectures on dramatic art and literature, and on the theory and history of plastic art, contain many fruitful suggestions. Friedrich von Schlegel, who was a writer of greater depth and versatility than his brother, caused much scandal by his romance, *Lucinde*, in which the school appeared for the moment as a powerfully dissolving force in regard to the most sacred of human relations. His most important work, however, is his *History of Ancient and Modern Literature*. Throughout his exposition he is a propagandist of his special ideas; but the book is of lasting importance as the earliest attempt to present a systematic view of literary development as a whole. The period in which the brothers worked most effectually for their school was between 1796 and 1800, when they lived in Jena, and formed the centre of a brilliant circle which included Fichte, Schelling, Tieck, and Wilhelm von Humboldt. Here they edited the *Athenæum*, in which they chastised feeble and pretentious writers, and awoke general interest in mediæval art and literature, and in the systems of philosophy that harmonized with their special tendency.

Tieck.

The most productive, and for a time the most famous, writer of the Romantic school was Ludwig Tieck (1773–1853). Many of the smaller tales in his *Phantasus* have not yet lost their interest. They are, indeed, as far as possible from representing the real life of mediævalism, but they have a mystic and fairy-like charm which is not the less powerful because it is purely imaginative. In his later novels he took his themes from modern life, and they display a remarkable talent for keen and searching satire. Most of them, however, are already practically forgotten, for Tieck was unable to give form to his ideas, and his imagination was wayward and eccentric. In his lyrical poetry he seldom touches a true note, and his dramas have no high qualities to make up for their utter and deliberate lack of plan. Yet his dramatic criticism, of which he wrote a great deal in Dresden,—where he lived for many years, the centre of an adoring body of disciples,—is often happy and suggestive; and his completion of Schlegel's translation of Shakespeare is poetic in feeling, and indicates a rare mastery of language and versification.

Wackenroder.

A writer of less importance, but who exercised considerable influence over Tieck at an early period of his career, was W. H. Wackenroder (1772–98), whose *Phantasien über die Kunst* ("Fancies concerning Art") was published by Tieck after the writer's early death. Both in this book and in his *Overflowings from the Heart of an Art-loving Friar* he expresses a deep feeling for Christian, especially allegoric, art. He was here in full sympathy with the whole Romantic school, which derived intense delight from the spiritual art of the early mediæval painters, but cared little for the noble beauty of Greek art or of the art of the Renaissance.

Among the authors who wrote in the spirit of the Romantic school, and who were for a long time extremely popular, one of the chief was E. T. A. Hoffmann (1776–1822). His treatment of ghostly and horrible themes is often very grotesque; but he has flashes of vivid narrative which indicate a deep appreciation of some of the more mysterious aspects of human nature. Clemens Brentano (1777–1842) was one of the most ambitious of the Romanticists, and he had originality both of thought and fancy; but he was too confused, too indifferent to form, to produce more than a passing impression. Of far more enduring excellence than anything he himself wrote was *Des Knaben Wunderhorn*, a book of popular lyrics which he collected with his brother-in-law, Achim von Arnim. Arnim (1781–1831) revealed imagination and feeling in his *Kronenwächter* ("Guardians of the Crown"); and his *Countess Dolores* gives evidence of great natural power. His works, however, suffer the penalty which attaches to the total neglect of art. De La Motte Fouqué (1777–1843) does not, in the majority of his writings, rise above the level of his fellows; like them, he usually lacks clearness, precision, and genuinely human interest. But in one little book, *Undine*, he achieved a masterpiece. This charming tale, with its sweetness, pathos, and dream-like beauty, is now above criticism; it has taken its place as one of the select class of creations which appeal to all the world, and do not depend for their popularity on the tendencies of a particular time. Joseph von Eichendorff (1788–1857) is an adherent of the Romantic school only in some of his tales; his lyrics combine its depth of emotion with clear and musical expression, and his best stories are written in a frank and attractive style. Adelbert von Chamisso (1781–1838), although usually classed as to some extent a Romanticist, has none of the dreaminess and mysticism of the school. He became a German both in thought and feeling; but his ordered and vigorous style presents many traces of his French origin. He is now chiefly remembered by *Peter Schlemihl*, a tale of quaint and suggestive humour. The most distinguished dramatist of the Romantic school was Heinrich von Kleist (1776–1811), whose dramas were not represented till after his death, but have since then attracted much attention. Some of his characters are conceived with great vigour, but in his tragic motives he lacks invention, and all his works are more or less marred by morbid sentimentalism. Allied to the Romantic school, although not directly connected with it, were the writers of the so-called fate-tragedies. The originator of this curious class of works was Werner (1768–1823). It would be difficult to imagine a more trivial conception of fate than that which he develops in his *Twenty-Fourth of February*, which represents a series of disasters as occurring at intervals on a particular day in consequence of a father's curse. The notion, however, struck the popular fancy, and for ten years even Kotzebue could not contest the supremacy of the fate-tragedians. The chief followers of Werner were Müllner and Houwald. Franz Grillparzer (1791–1872) began his career with a play—*Die Ahnfrau* ("The Ancestress")—in the style of these popular writers, but in his later tragedies he strove to attain classic force and dignity; and by at least one play, *Sappho*, he achieved a place among the most distinguished German dramatists.

Influence of Romantic school.

The whole life of Germany was to some extent influenced by the Romantic school. In politics it was represented, among others, by Joseph Görres, who agitated with constantly growing enthusiasm for the revival of mediævalism both in church and state. In philosophy Franz Xaver von Baader followed a like tendency by entering deeply into the spirit of Jacob Boehme's mystical philosophy, and interpreting its principles in accordance with Catholic doctrine. Frederick Schleiermacher (1768–1834) was a thorough Protestant, and his services to serious literature were incomparably higher than those of Baader. He was an admirable dialectician, and did more than any other writer to promote in Germany a sympathetic study of Plato. Yet there is a touch of Romanticism in the vague, shadowy, and mystic language in which he presents the elements of Christian thought and life. The love of the Romantic writers for previous epochs of German history and literature led to the great researches of the brothers Grimm, who founded the scientific study of the German language and of German antiquities. They were followed by many devoted scholars, among whom may be named Beneke, Lachmann, Moritz Haupt, and Franz Pfeiffer. The Oriental studies of the Romanticists also promoted comparative philology, which acquired something of the character it now bears through the labours of the illustrious scholars, Wilhelm von Humboldt and Franz Bopp.

Schleiermacher.

Philological writers.

Patriotic writings.

During the calamitous period when Germany was beaten and humbled by Napoleon the Romantic school, by continually recalling the past glories of the nation, contributed largely to the revival of patriotic feeling. A like result was achieved by Fichte, whose addresses to the German people, delivered in Berlin while it was occupied by French soldiers, are models of fervid yet thoughtful and dignified eloquence. In the war of liberation the popular excitement was expressed with great spirit by Theodor Körner (1791–1813) and Ernst Moritz Arndt (1769–1860). Of these two writers Arndt is the most poetic, but few even of his lyrics have much literary value. To judge them fairly we must think ourselves back into the epoch in which the nation spontaneously arose to avenge its wrongs and assert its independence. It was as a writer of patriotic war-songs that Frederick Rückert (1789–1866) opened his career. Afterwards he moved over a wide range, distinguishing himself especially as a translator of Oriental poetry. He was master of almost every form of lyrical expression, and had hardly less facility in narrative and didactic verse. As regards the substance of his poetry, he is perhaps chiefly remarkable for the tone of calm resignation which he learned from his Eastern masters. In his preference for Oriental modes of thought he has been followed in recent times by Daumer, Bodenstedt, and other poets, who, however, chiefly aim at contrasting the ascetic ideals of Christianity with a gayer, brighter scheme of life. The whole movement had its origin, and was virtually exhausted, in Goethe's *Westöstlicher Divan.*

Rückert.

Had the hopes of German patriots been realized after the war of liberation, literature might have profited by the growth of an intelligent national spirit. But the reward of the German people for their immense sacrifices was bitter opposition on the part of their Governments to every aspiration for freedom and unity. Arndt himself, who had done so much to kindle patriotic ardour, was dismissed in disgrace from his professorship at Bonn, which he did not regain till 1840, when Frederick William IV. mounted the Prussian throne. And the brothers Grimm with other scholars were ignominiously turned out of Göttingen. The mass of the people lost interest in high thought and endeavour, and nourished itself on weak poetry like the *Urania* of Tiedge, and detestable novels like those of Clauren. Yet even in poetry the period was not destitute of important names. Ludwig Uhland (1787–1862), whose first volume of poems appeared in 1815, ranks with the greatest of modern lyrical writers. He is truly popular and patriotic in tone, yet his songs and ballads have an ease and grace of style which raise him far above any of the Romantic school. Uhland was the founder of the so-called Swabian school of poets, of whom the most cultivated was Gustav Schwab. Other Swabian poets were Justinus Kerner, who attempted, not unsuccessfully, to combine pathos and humour, and Eduard Mörike, whose poetry is generally of a melancholy tone, relieved, however, by touches which indicate a fine sympathy with nature. The theatre was dominated by Raupach (1784–1852) and Freiherr von Auffenberg (1798–1857), the former reigning in Berlin, the latter in Carlsruhe. Both had talent and knowledge of the stage, but there is neither genius nor art in their plays. Immermann (1796–1840), although not without poetic power, lacked the faculty of controlling his dramatic conceptions. He was more successful in romance—his *Epigonen*, and still more his *Münchhausen*, displaying vivid fancy and a quaintly original humour. Sir Walter Scott, who was deeply influenced by German literature, repaid his obligations by influencing it in turn. One of the best of his imitators was Wilhelm Hauff (1802–1827), who had the merit of nearly putting an end to Clauren's popularity by satirizing his style. Hauff's chief work was *Lichtenstein*, which excited hopes that were too soon extinguished by death. Wilhelm Häring, known as Wilibald Alexis (1798–1876), also began as an imitator of Scott, but he afterwards wrote more original historical romances, the scenes of which he laid in Brandenburg. Johanna Schopenhauer, mother of the philosopher, was considered in her day an attractive writer of romance, but she is now remembered only for the sake of her son. She was surpassed in vigour of thought and style by Caroline Pichler (1769–1843), who wrote several well-known historical novels.

Throughout the whole of this period Germany maintained her eminence in classical study, contributions of the highest importance to the knowledge of ancient life being made by Wolf, Hermann, Boeckh, and Otfried Müller. In history she produced several writers of distinction. Spittler (1752–1810) was a worthy successor of Justus Möser in the free and artistic treatment of historical subjects; in youth he was kindly treated by Lessing, whose clear style he appears to have taken as his model. Johannes von Müller (1752–1809), the historian of Switzerland, used to be considered by the Germans an eloquent writer, almost a prose poet, but he is now generally regarded as an affected rhetorician. Raumer, in his chief work, *History of the Hohenstaufen*, gave forth the results of deep research in an animated and vigorous narrative. Schlosser, author of a *History of the Eighteenth Century*, was also an historian who combined purity and strength of style with learning. Niebuhr, in his *Roman History*, pushed his scepticism too far, but he profoundly modified opinion in regard to the tests of historic credibility.

VIII. *The Latest Period.*—With the death of Goethe in 1832 began a new era in German literature, an era not yet closed. The period has been one of intense political excitement. In 1848 the national aspiration for freedom and unity found decisive expression in action; since that time Germany has achieved unity by the sword, while she still slowly feels her way towards freedom. It was inevitable that in such an epoch much of the best energy of the nation should be devoted to politics, but there has also been great literary activity—activity deeply influenced by the practical struggles, hopes, and fears of the time.

Philosophical speculation has been continued without interruption, and in many respects it has been, and still is, the deepest current in the intellectual life of Germany. From 1818 till his death in 1831, when he was a professor in Berlin, Hegel dominated the highest thought. His vast system, in which he attempted to explain the ultimate facts of the world and to bind by a chain of deductive reasoning the elements of all knowledge, found enthusiastic adherents among the more ambitious of the younger literary men, and for many years after his death it determined the character of their work. Gradually, however, the school broke up into three distinct divisions, the right, the centre, and the left. Of these the most active were the members of the latter party, who interpreted Hegel's doctrine in a revolutionary sense. Arnold Ruge, one of the most brilliant writers of the school, applied Hegelianism to politics, in which he associated himself with the extreme radicals. David Friedrich Strauss, who also started as a follower of Hegel, in his memorable *Leben Jesu* resolved the narratives of the Gospels into a series of myths, and found the vital element of Christianity in its spiritual teaching. Feuerbach, going still further, warred against all religion, urging that it should be replaced by a sentiment of humanity. While the different sections of Hegelians opposed each other, Schelling developed the later phases of his system; and thought was turned into a new channel by Herbart, whose psychological work has been carried on at a later time by Lotze. Krause also attracted attention by philosophical ideas through which he aimed at solving the practical difficulties of modern life. Ulrici and the younger Fichte have exercised considerable influence as the advocates of a pantheistic doctrine by which they endeavour to reconcile religion and science. None of these names, however, have the importance which attaches to that of Arthur Schopenhauer, who, although his chief book was written in the lifetime of Goethe, did not secure a hearing until long afterwards. At the present time he stirs deeper interest than any other thinker. German philosophers have, as a rule, been utterly indifferent to style, but Schopenhauer's prose is clear, firm, and graceful, and to this fact he owes much of his popularity. He expressed bitter contempt for his philosophical contemporaries, and, going back to Kant, claimed to have corrected and completed his system. His main doctrine is that will is the fundamental principle of existence; but his importance arises less from his abstract teaching than from his descriptions of the misery of human life. History seemed to him but a record of turmoil and wretchedness; and there is high literary genius as well as moral earnestness in his graphic and scornful pictures of the darker aspects of the world. Eduard von Hartmann, the latest original philosopher of Germany, works on essentially the same lines, but seeks to reconcile Schopenhauer not only with Hegel and Schelling but with Leibnitz.

The growth of science has been one of the most powerful factors in the recent intellectual development of Germany, and some of the best books of the period have been works presenting in a popular form the results of scientific labour. Among these the first place still belongs to the *Cosmos* of Alexander von Humboldt. Its fundamental conceptions are no longer in full accordance with the best thought; but it is made enduringly impressive by the writer's power of handling vast masses of facts, by his poetic feeling for the beauty and the order of nature, and by the purity and nobility of his style. Some of the greatest men of science, such as Liebig, Virchow, and Helmholtz, have also made admirable attempts to render their subjects intelligible and interesting to ordinary readers. Büchner and Vogt have considerable merit as popular scientific authors, but their writings are marred by a polemical tendency, which induces them to dogmatize on metaphysical questions beyond their proper range.

In historical literature Germany has recently produced many eminent writers. The historian who enjoys the widest popularity is Leopold Ranke, who has instructed two generations by communicating in an agreeable style the results of extensive research in many different fields of inquiry. Gervinus acquired a permanent place as an historian by his excellent *History of the Nineteenth Century*. Works of high value have also proceeded from Giesebrecht, who has written on the Holy Roman Empire with enthusiastic appreciation of the great emperors; from Droysen, the diligent historian of Prussia; from Dahlmann, whose labours included German, English, French, and Danish history; from Häusser, whose masterpiece is an elaborate history of Germany since the death of Frederick the Great; from Waitz, the chief authority on the growth of the German constitution; from Sybel, by whose researches much new light has been thrown on the French Revolution; from Mommsen, the vigorous historian of ancient Rome; and from Curtius, whose history of Greece is not more remarkable for its learning than for the clear and attractive arrangement of its materials. Of late years much attention has been devoted to "Culturgeschichte," which describes the life of a people in all its phases, either through the whole past or during a particular epoch. A favourable example of works of this class is Karl Biedermann's *Germany in the Eighteenth Century*.

Historians.

Recent German literature is extraordinarily rich in histories of the individual elements of intellectual development. In its histories of philosophy it is absolutely supreme. Hegel still ranks as one of the greatest historians of philosophy, although the value of his expositions is lowered by a tendency to find his own doctrine in preceding thinkers. Erdmann, Schwegler, and Ueberweg were among the most important workers in the same department; and with them may be named Kuno Fischer, who writes the history of philosophy with a striking power of sympathetic appreciation and in a fascinating literary style. Less attractive in manner than Fischer, Lange, in his *History of Materialism*, did full justice for the first time to the different phases of materialistic philosophy, and is especially happy in the skill with which he traces the growth of a recognition of law in the phenomena of nature. Since Lessing, æsthetics have always formed a prominent branch of philosophy among the Germans; and they have hardly been less successful as historians of art than as historians of metaphysics. High distinction has been achieved, among other art historians, by Kugler, Vischer, Carrière, and Lübke. Of historians of literature, especially German literature, there is almost a small army. One of the earliest of these was Gervinus, who, although his critical canons are not now in favour, had an unusual faculty for grouping his materials and sharply defining what seemed to him the essential qualities of particular writers and movements. The history of German literature by Vilmar, although written in an eloquent style, is too partial in its judgments to have permanent value. Koberstein is remarkable rather for industry than for insight; but the literary histories of Julian Schmidt and Gottschall are both marked by decisive, often penetrating, critical judgment. One of the best works of this kind for style, thought, and research is Hettner's elaborate *History of Literature in the Eighteenth Century*.

The Germans possess a vast mass of biographical literature, a large proportion of which is rendered almost worthless by inartistic treatment. Luther alone forms the subject of more than one hundred and fifty biographies; yet a satisfactory study of the Reformer has still to be written. In recent times, however, there has been a marked improvement, several biographers having conscientiously striven not only to be thorough in research but to write simply, clearly, and vividly. The first to set a good example was Varnhagen von Ense, whose numerous biographies are masterpieces of well ordered and dignified prose. Germany owes an admirable biography of Ulrich von Hutten to Strauss, who also wrote interesting sketches of several prominent modern authors. Other biographies which deserve mention are Karl Grün's philosophical study of Feuerbach, Rosenkranz's scholar-like life of Diderot, and Justi's life of Winckelmann. The popularity of Mr Lewes's life of Goethe for a long time deterred German writers from touching a subject he had handled with so much talent; but of late there has been a remarkable revival of interest in Goethe, and Hermann Grimm has ventured to present a fresh study of his intellectual and moral character.

Heinrich Heine. In imaginative literature the greatest writer of the latest period is Heinrich Heine. No German writer since Goethe and Schiller has excited so much interest throughout Europe, and among the Germans themselves his fame is steadily rising. He professed to care little for what men said of his poetry, yet it is mainly as a lyrical poet that his name lives. His *Buch der Lieder* is one of the most fascinating collections of lyrics in European literature. Although a deadly enemy of the Romantic school, he had moods, especially in youth, in which he shared its dreaminess and mysticism; and these qualities he expressed in some of his best songs, but with perfect grace of style and melody. He struck with equally finished art chords of passion and aspiration beyond the range of even the chief Romanticists, for Heine was in every respect a modern man, penetrated by a love of freedom, and by a high enthusiasm for beauty. Except Goethe, no other German poet achieves his effects by such simple means; with the language of a village maiden he gives shape to feelings and ideas of exquisite refinement and subtlety. His satirical poems are sometimes gross and cynical; but none of them are without touches of humour. In his prose, which deals with a wide range of subjects, he is rather French than German in his love of sparkling epigram and biting wit. Almost every theme, however sacred, gives Heine occasion for mockery, but in the midst of cruel laughter he is often restrained by a pathetic memory, which he expresses with unsurpassed delicacy. This combination of pathos, wit, and humour gives him a unique place in the literature of his country.

Platen, who belongs rather to the previous period, was one of the many writers whom Heine bitterly attacked, but he was a poet of considerable power. Like Heine himself, he failed in the drama; and even in his successful writings he is not remarkable for wealth of thought or depth of feeling. His odes and sonnets, however, are in language and metre so artistically finished as to rank among the best classical poems of modern times. Börne was another writer whose fame, although the two men were at one time warm friends, suffered from Heine's satire. He was a manly literary critic, and as a political writer dealt at the despotic Governments of Germany blows which they keenly felt.

A school of writers known as Young Germany was deeply influenced by Heine, and had the good fortune to be singled out for persecution by the confederate diet. Their object was to effect a complete revolution in the political and social institutions of Germany, and at the same time they became the propagandists of ideas intended to undermine the church. The most important member of the school was Karl Gutzkow, who wrote a number of dramas which maintain their hold of the stage. He was also the author of many romances, of which the chief were *Die Ritter vom Geiste* ("The Knights of the Mind") and *Der Zauberer von Rom* ("The Magician of Rome"). These works are of enormous length, and their polemical tendency has already begun to weaken their interest. But the leading characters are genuine creations, and the incidents are interwoven with great artistic skill. Heinrich Laube, another member of the group, is the author of an historical romance, *The German War*, which represents, in a clear, fresh, and vivid style, the condition of Germany during the Thirty Years' War. He has also enriched the stage with several excellent plays. Less important authors associated with these writers were Gustav Kühne, Theodor Mundt, and Ludolf Wienbarg—the latter universally recognized as a keen and vigorous critic.

Novelists. The novel has acquired the same important place in Germany as in France and England, and it need scarcely be said that the vast majority of works of this class are forgotten almost as soon as they are issued. One of the most distinguished of recent novelists is Gustav Freytag, whose chief work, *Soll und Haben* ("Debit and Credit"), is a study of commercial life intensely realistic in tendency. Lately he has undertaken a series of romances, *Die Ahnen* ("The Forefathers"), intended to represent in a highly poetic form the different epochs of German history. Important historical romances have been written by Levin Schücking, who is remarkable for his power of vividly conceiving character. The Countess Ida Hahn-Hahn is the writer of a number of novels in an artificial style, affecting to represent good society. Her manner has been cleverly satirized by Fanny Lewald, who is one of the best German novelists, keen and true in observation of life, and artistic in method. Paul Heyse's short tales have firmness of outline, and are at the same time full of delicate grace; as a writer of elaborate romance, he has also achieved success. The humour of Hackländer is generally considered to surpass that of any other recent writer; and among the novelists of simple village life Auerbach easily takes the first place. Frederick Spielhagen has penetrated deeply into the spirit of the age, and in *Problematische Naturen* ("Problematic Natures") and other works reveals its tendencies with cultivated imaginative force. The novels of Fritz Reuter, although written in Platt Deutsch, take high rank; they are fresh in style, and combine keen observation of life with a fine appreciation of comic effect.

Dramatic writers. Contemporary literature has not, as in England, been divorced from the stage; the best imaginative writers find scope for their energies in work for the theatre. Besides Gutzkow and Laube, Gottschall has been a fertile writer both of tragedy and comedy; Freytag also, and Prutz, are original dramatic authors. The dramas of Christian Grabbe, full of eccentricity, but with a certain wild power, originated a movement resembling to some extent that of the "Sturm und Drang" poets. Its chief representative was Hebbel, a writer endowed with imaginative gifts, but who marred every play by affectation and extravagance. Freiherr von Münch-Bellinghausen, known as Friedrich Halm, author of *Der Fechter von Ravenna* ("The Gladiator of Ravenna"), and Mosenthal, author of *Deborah*, achieved distinction by aiming at something higher than mere stage effect. Paul Lindau is the author of some refined comedies, and Adolf Wilbrandt has written both comedies and tragedies which meet the taste of Vienna. Charlotte Birch-Pfeiffer and Roderich Benedix were prolific writers of plays with the sort of merit that belongs to an intimate knowledge of the technical necessities of the stage.

Lyrical and narrative poets.

Many recent writers have attempted lyrical and narrative poetry, some of them with sufficient power to maintain worthily the traditions of German literature. From about 1830 onwards, a group of Austrian poets, more or less political in tendency, commanded the respect of all Germans. The chief was Count von Auersperg, who assumed the name of Anastasius Grün. His first important work was *Walks of a Vienna Poet*, published in 1831, but his fame rests chiefly on two volumes of lyrics issued some years later. He had enthusiastic faith in the future, and expresses his hopes in verses full of colour, sometimes brilliant and effective. Another Austrian writer, Nicholas Strehlenau, generally called Lenau, gives powerful utterance in several poems to the sorrows of a deeply melancholy nature. Meissner and Hartmann, Bohemian poets, have a considerable reputation, the latter as a writer of great artistic merit, the former as a poet of vivid imagination and free sympathies. Leopold Schefer was for a long time a popular poet, and the genial optimism of his chief book, the *Laienbrevier*, is interesting because of the contrast it presents to the pessimist tone of more recent writers Before the revolutionary movements of 1848 a number of writers attempted to force poetry into the service of freedom. Of these one of the best known is Herwegh. He advocated liberty with a vehemence that won for him immense popularity, but the interest of his writings is rather historical than literary. Ferdinand Freiligrath was of a more truly poetic temperament. His poems, although without delicacy, have graphic force, and in his earlier writings he displayed a remarkable talent for reproducing the gorgeous colours of tropical landscape. Other poets who have made verse a means of awakening in the popular mind a passion for political justice are Hoffmann von Fallersleben, who has a considerable command of musical expression, and Franz Dingelstedt, a versatile writer who has done good work as a novelist and dramatist. Gottschall, already named as a dramatist and an historian of literature, began as a political poet, but afterwards gave evidence of disinterested imagination in two narrative poems, *Göttin* and *Zeno*. The lyrics of Emmanuel Geibel, some of which are also political, with a conservative tendency, have found favour with nearly all classes; they reveal a gentle and refined spirit, and are written with something of Uhland's grace. Among the most distinguished contemporary writers is Robert Hamerling, whose poetry is remarkable for the boldness of its conceptions and its almost vehement passion.

Since the middle of the 18th century Germany has never been without writers of deep thought and vast research; and in her supreme writers — in Lessing, Goethe, Schiller, and Heine—these qualities have been associated with a feeling for artistic finish which has not been surpassed in England or even in France. But the tendency of German authors beneath the highest rank has been to neglect the laws of expression. Thus there is in Germany an extraordinary quantity of literature which, although the result of great labour, and full of ideas, makes intolerable demands on the patience of readers. The lack of measure and precision has in many cases deprived of nearly all value powers of imagination, reason, and industry, which would have made the literary fortune of a Frenchman. This deficiency of style is in some degree explained by the fact that an undue proportion of German literature has hitherto been addressed, not to the public, but to specialists, who naturally concern themselves more with substance than with form. During the present generation there have been symptoms of a remarkable change. Ever since the Germans began to feel that they are one people, and to strive after political unity, an increasing number of scholars and thinkers have displayed an ambition to extend their influence, while several imaginative writers have consciously appealed to the nation as a whole. The inevitable result has been that they have aimed at more methodical arrangement than their predecessors, and have cultivated greater force, simplicity, and directness of speech. Nothing has fostered this wholesome tendency so much as the growing respect of the nation for the great masters of its language, a respect indicated by the new editions of their writings which appear year after year. The higher class of poets, dramatists, and novelists have also profited by the deepening conviction that the function of art is not to battle with practical evils, but to create a world of ideal beauty in which the mind may find refuge from the perplexities of real life.

INDEX.

GERMERSHEIM, a fortified town in Rhenish Bavaria, the chief town of a circle, is situated at the confluence of the Queich and the Rhine, 8 miles S.W. of Spires. It possesses a Catholic and a Protestant church, a Latin school, and a hospital. The industries include fishing, shipbuilding, brewing, the manufacture of cigars, and the cultivation of vegetables, fruit, flax, and hemp. The number of the garrison in the town is usually about 2500.

Germersheim existed as a Roman stronghold under the name of Vicus Julius. The citadel was rebuilt by the emperor Conrad II., but the town itself was founded in 1276 by the emperor Rudolph I., who granted it the rights of a free imperial city. He died here in 1291. From 1330 to 1622, when it was conquered by Austria, the town formed part of the Palatinate of the Rhine. From 1644 to 1650 it was in the possession of France; but on the conclusion of the peace of Westphalia it was again joined to the Palatinate. In 1674 it was captured and devastated by the French under Turenne, and after the death of the elector Charles in 1685, it was claimed by the French as a dependency of Alsace, on which account followed the Germersheim succession war, which lasted till the peace of Ryswick in 1697. Through the intervention of the pope in 1702, the French, on payment of a large sum, agreed to vacate the town, and in 1715 its fortifications were rebuilt. On the 3d July 1744 the French were defeated there by the imperial troops, and on the 19th and 22d July 1793 by the Austrians. In 1835 the beautiful new town was built, and the present extensive fortifications commenced. Population in 1875, including the garrison, 6456.

GERONA, a city of Spain, the chief town of the province of Gerona (one of the four into which Catalonia was divided), is situated about 54 miles N.E. of Barcelona on the railway to Perpignan in France, near the junction of the Ter and the Oña. The older part of the town occupies the steep slope of the hill of the Capuchins, and with its old-fashioned buildings presents a picturesque appearance against a background of loftier heights; while the newer portion stretches down into the plain and beyond the river, which adds to the effect of the scene by a bridge of three arches. The old city walls with their bastions still remain, though in a dilapidated state; and the hill is crowned by what were at one time very strong fortifications. At present Gerona is a comparatively insignificant place, although it is the seat of a bishop, has four parish churches, an *instituto*, a seminary, a public library, and a theatre, numbers about 15,000 inhabitants, and carries on the manufacture of paper and cotton and woollen goods. To the ecclesiologist, however, it offers unusual attractions. The cathedral is one of the grandest specimens of Gothic architecture in Spain, the nave being the widest pointed vault in Christendom, as it measures no less than 73 feet from side to side, while Albi, the next in size, is only 58 feet, and Westminster Abbey is only 38. The old cathedral on the same site was used as a mosque by the Moors, and on their expulsion in 1015 it appears to have been very greatly modified, if not entirely rebuilt. During the 14th century new works were again carried out on an extensive scale; but it was not till the beginning of the 15th that the proposal to erect the present magnificent nave was originated by the master of the works, Gullielmo Boffiy. "The keystone of the last division of the vault," says Mr Street, "seems to have been placed in the time of Bishop Benito, so late as *circa* 1559," and in 1581 the same bishop laid the first stone of the bell tower. "At the east end of the nave three arches open into the choir and its aisles, which with their many subdivisions give an extraordinary impression of size to the vast vault of the nave, and make it look larger than it really is." The general appearance of the exterior is rather ungainly, but there is a fine approach by a flight of 86 steps to the façade, which rises in tiers and terminates in an oval rose-window. Among the interior decorations the most remarkable is the retablo and baldachin of the 14th century; and among the tombs may be mentioned those of Bishop Berenger (*ob.* 1408), Ramon Berenger (Cap de Estopa), and the Countess Ermesinda (*ob.* 1057). The collegiate church of San Felio (St Felix) is mainly of the 14th century, but it was considerably modified in the 16th, and its façade dates from the 18th. It is one of the few Spanish churches that can boast of a genuine spire, and it thus forms a striking feature in the general view of the town. Besides the tomb of Alvarez and the sepulchre of the patron saint, it contains an image of St Narciso, which, according to the local superstition, had the power of producing swarms of poisonous flies, as was sufficiently proved by the destruction of the French investing the city in 1285 and again in 1684. The Benedictine church of San Pedro de los Gallos is an interesting Romanesque building of early date; and in the same vicinity is a small church worthy of notice as a rare Spanish example of a transverse triapsal plan.

Gerona is the ancient *Gerunda*, a city of the Ausetani. It boasts that it is the place in which St Paul and St James first rested when they came to Spain; and it became the see of a bishop about 247. For a considerable period it was in the hands of the Moors, and their emir, Soleiman, was in alliance with Pepin about 759. It was taken by Charlemagne in 785; but the Moors regained and sacked it in 795, and it was not till 1015 that they were finally expelled. At a later date it gave the title of count to the king of Aragon's eldest son. Into the details of its later vicissitudes it is needless to enter; but its historians tell how it has been besieged no fewer than twenty-five times in all, and that only four of the sieges have resulted in its capture. The investment by the French under Marshal Hocquisicourt in 1653, that of 1684 by the French under Marshal Belfond, and the successful enterprise of Marshal Noailles in 1694, are the three great events of the 17th century. Surrendered by the French at the peace of Ryswick, it was again captured by Marshal Noailles in 1706, after a brilliant defence; and in 1717 it held out against the Austrians. But its noblest resistance was yet to be made. In May 1809 it was besieged by the French, with 35,000 troops, under Verdier, Augereau, and St Cyr; forty batteries were erected against it, and a heavy bombardment maintained; but under the leadership of Mariano Alvarez it held out till famine and fever compelled a capitulation on 12th December. The French, it is said, had spent 20,000 bombs and 60,000 cannon balls, and their loss was estimated at 15,000 men.

GERRHA, an ancient city of Arabia Felix, on the west side of what is now the Persian Gulf, described by Strabo as inhabited by Chaldæan exiles from Babylon, who built their houses of salt and repaired them by the application of salt water. Three identifications of the site have been attempted, D'Anville choosing El Katig, Niebuhr preferring Koneit, and Forster suggesting the ruins at the head of the bay behind the islands of Bahrein.

GERS, a department of France, composed of the whole or parts of the five old districts of Gascony, viz., Armagnac, Astarac, Lomagne, Comminges, and Condomois. It is bounded N. by the department of Lot-et-Garonne, E. by Tarn-et-Garonne and Haute-Garonne, S. by Hautes-Pyrénées and Basses-Pyrénées, and W. by Landes. It lies between 43° 17′ and 44° 5′ N. lat., and between 1° 10′ E., and 0° 18′ W. long., being about 72 miles in length from E. to W., and 53 in breadth from N. to S. This department is hilly, particularly in the south, where it is mostly covered with ramifications of the Pyrenees. Some of these in the south rise nearly 1200 feet above the level of the sea, but they rapidly decrease in height towards the north. The principal of them run from N.E., N., and N.W., and are separated by longitudinal valleys of great beauty and fertility, narrow in the south, but opening in the north to a width of 3 or 4 miles. The greater part of the department belongs to the basin of the Garonne, while a small portion in the west is drained by the Adour. The chief affluents of the former are the Save, Gimone, Arratz, Gers, and Baise; and those of the latter, the Arros, Midou, and Douse, the last two uniting and taking the name of Midouse, before joining the Adour. The climate is temperate and salubrious, but very changeable. There is seldom any snow, and there is scarcely any frost. More than half of the department is arable; about one-seventh is occupied by vines, and the rest is meadows, wood, or heath. The soil is not of great fertility, but is tolerably well cultivated, and the grain produced is more than sufficient for home consumption. Wheat, maize, oats, and rye are the principal grain crops. About one-third of the wine produced is used for home consumption, and the remainder is chiefly manufactured into brandy, known by the name of Armagnac. The amount of brandy distilled in the department annually is about 22 million gallons. Horned cattle, sheep, mules, swine, game, and poultry, particularly ducks and geese, are abundant. The minerals and manufactures are unimportant. There are quarries of red and green marble; and gypsum, marl, white clay, and sand for the manufacture of glass are obtained. Gers is divided into the arrondissements of Auch, Lectoure, Mirande, Condom, and Lombez, with 29 cantons and 467 communes. The chief town is Auch. The total area is 2425 square miles, and the population in 1866 was 295,692, and 283,546 in 1876.

GERSON, JOHN (1363–1429), otherwise John Charlier of Gerson, Johannes Gersonus, John de Gersone, J. Jarson, De Jarsone, or Gersen, the famous chancellor of the university of Paris, and the ruling spirit in the œcumenical councils of Pisa and Constance, was born at the village of Gerson, in the bishopric of Rheims and department of Ardennes, on December 14, 1363. We learn a good many details about his family and early upbringing from allusions in some of his devotional tracts. His parents, Arnulph Charlier and Elizabeth de la Chardenière, "a second Monica," belonged to the peasant class, were of eminent piety, and rejoiced to see seven of their twelve children, four daughters and three sons, devoting themselves to a religious life. Young Gerson was sent to Paris to the famous college of Navarre when fourteen years of age. After a five years' course he obtained the degree of licentiate of arts, and then began his theological studies under two very celebrated teachers, Giles Des Champs (Ægidius Campensis) and Peter D'Ailly (Petrus de Alliaco), rector of the college of Navarre, chancellor of the university, and afterwards bishop of Puy, archbishop of Cambray, and cardinal. D'Ailly remained his life-long friend, and in later life the pupil seems to have become the teacher (see pref. to *Liber de Vita Spir. Animæ*). Gerson very soon attracted the notice of the university. He was elected procurator for the French nation in 1383, when barely twenty years of age, and re-elected the year afterwards. In 1384 he took the degree of bachelor of theology. Three years later a still higher honour was bestowed upon him; he was sent along with the chancellor and others to represent the university in a case of appeal taken to the pope. Dr John Montson had been condemned by the faculty of theology because he had taught that the Virgin Mary, like other ordinary descendants of Adam, was born in original sin; and the Dominicans, who were fierce opponents of the doctrine of the immaculate conception, were expelled the university. Montson appealed to Pope Clement VII. at Avignon, and D'Ailly, Gerson, and the other university delegates, while they personally supported the doctrine of the immaculate conception, were content to rest their case upon the legal rights of the university to test in its own way its theological teachers. Gerson's biographers have compared his journey to Avignon with Luther's visit to Rome. It is certain that from this time onwards he was zealous in his endeavours to spiritualize the universities, to reform the morals of the clergy, and to put an end to the schism which then divided the church. In 1392 Gerson became doctor of theology, and in 1395, when D'Ailly was made bishop of Puy, he was, at the early age of thirty-two, elected chancellor of the university of Paris, and made a canon of Notre Dame. This great university was then at the height of its fame, and its chancellor was necessarily a man prominent not only in France but in Europe, sworn to maintain the rights of his university against both king and pope, and entrusted with the conduct and studies of a vast crowd of students attracted from almost every country in Europe. Gerson's writings bear witness to his deep sense of the responsibilities, anxieties, and troubles of his position. He was all his days a man of letters, and an analysis of his writings is his best biography. His work has three periods, in which he was engaged in reforming the university studies, maturing plans for overcoming the schism (a task which after 1404 absorbed all his energies), and in the evening of his life writing books of devotion.

Gerson wished to banish scholastic subtleties from the studies of the university, and at the same time to put some evangelical warmth into them. He was called at this period of his life Doctor Christianissimus; later his devotional works brought him the title Doctor Consolatorius. His plan was to make theology plain and simple by founding it on the philosophical principles of nominalism. His method was a clear exposition of the principles of theology where clearness was possible, with a due recognition of the place of mystery in the Christian system of doctrine. Like the great nominalist William of Occam, he saved himself from rationalism by laying hold on mysticism—the Christian mysticism of the school of St Victor. He thought that in this way he would equally guard against the folly of the old scholastic and the seductions of such Averroistic pantheism as was preached by heretics like Amalric of Bena. His plans for the reformation of university studies may be learned from his *Tract. de Examinatione Doctrinarum* (*Opp.* i. 7), *Epistolæ de reform. Theol.* (i. 121), *Epistolæ ad Studentes Collegii Navarræ, quid et qualiter studere debeat novus theologiæ auditor, et contra curiositatem studentium* (i. 106), and *Lectiones duæ contra vanam curiositatem in negotio fidei* (i. 86). The study of the Bible and of the fathers was to supersede the idle questions of the schools, and in his *Tract. contra romantiam de rosa* (iii. 297) he warns young men against the evil consequences of mediæval romance-reading. He was oftentimes weary of the chancellorship,—it involved him in strife, and in money difficulties; he grew tired of public life, and longed for learned leisure. To obtain it he accepted the deanery of Bruges from the duke of Burgundy, but after a short sojourn he returned to Paris and to the chancellorship.

Gerson's chief work was what he did to destroy the great schism. Gregory XI. had died in 1378, one year after Gerson went to the college of Navarre, and since his death the church had had two popes. To the mediæval mind, imaginatively apprehending great thoughts in picture-representations, two popes meant two churches and a divided Christ. The spiritual unity of the church, which is founded on the spiritual union of all believers to Christ, was unintelligible to it. Gerson and his contemporaries could not disentangle the invisible from the visible, and if daring spirits like Wickliffe and Huss declared that the elect were the true church, the practical consequences which they drew from this showed that they also were unable to escape from the confusion. The schism had practically been brought about by France. The popes had been under French influence so long that it appeared to France a political necessity to have her own pope, and pious Frenchmen felt themselves somewhat responsible for the sins and scandals of the schism. Hence the melancholy piety of Gerson, D'Ailly, and their companions, and the energy with which they strove to bring the schism to an end. During the lifetime of Clement the university of Paris, led by D'Ailly, Gerson, and Nicholas Clamenges, met in deliberation about the state of Christendom, and resolved that the schism could be ended in three ways,—by cession, if both popes renounced the tiara unconditionally, by arbitration, or by a general council. Clement died. The king of France, urged by the university, sent orders that no new pope should be elected. The cardinals first elected, and then opened the letter. In the new elections, however, both at Rome and Avignon, the influence of Paris was so much felt that each of the new popes swore to "cede", if his rival would do so also.

Meanwhile in 1395 the national assembly of France and the French clergy adopted the programme of the university—cession or a general council. The movement gathered strength. In 1398 most of the cardinals and most of the crowned heads in Europe had given their adhesion to the plan. During this period Gerson's literary activity was untiring, and the throb of public expectancy, of hope and fear, is revealed in his multitude of pamphlets. At first there were hopes of a settlement by way of cession. These come out in *Protest. super statum ecclesiæ* (ii. 1), *Tract. de modo habendi se tempore schismatis*, *De Schismate*, &c. But soon the conduct of the popes made Europe impatient, and the desire for a general council grew strong—see *De Concilio generali unius obedientiæ* (ii. 24). The council was resolved upon. It was to meet at Pisa, and Gerson poured forth tract after tract for its guidance. The most important are—*Trilogus in materia Schismatis* (ii. 83), and *De unitate Ecclesiæ* (ii. 113), in which, following D'Ailly (see Tschackert's *Peter v. Ailli*, p. 153), Gerson demonstrates that the ideal unity of the church, based upon Christ, destroyed by the popes, can only be restored by a general council, supreme and legitimate, though unsummoned by a pope. The council met, deposed both anti-popes, and elected Alexander V. Gerson was chosen to address the new pope on the duties of his office. He did so in his *Sermo coram Alexandro Papa in die ascensionis in concilio Pisano* (ii. 131). All hopes of reformation, however, were quenched by the conduct of the new pope. He had been a Franciscan, and loved his order above measure. He issued a bull which laid the parish clergy and the universities at the mercy of the mendicants. The great university of Paris rose in revolt, headed by her chancellor, who wrote a fierce pamphlet—*Censura professorum in theologia circa bullam Alexandri V.* (ii. 442). The pope died soon after, and one of the most profligate men of that time, Pope John XXIII. (Balthasar Cossa) was elected his successor. The council of Pisa had not brought peace; it had only added a third pope. D'Ailly despaired of general councils (see his *De difficultate reformationis in concilio universali*), but Gerson struggled on. Another matter too had roused him. The feuds between the houses of Orleans and Burgundy had long distracted France. The duke of Orleans had been foully and treacherously murdered by the followers of the duke of Burgundy, and a theologian, John Petit, had publicly and unambiguously justified the murder. His eight verities, as he called them—his apologies for the murder—had been, mainly through the influence of Gerson, condemned by the university of Paris, and by the archbishop and grand inquisitor, and his book had been publicly burned before the cathedral of Notre Dame. Gerson wished a council to confirm this sentence. His literary labours were as untiring as ever. He maintained in a series of tracts that a general council could depose a pope; he drew up indictments against the reigning pontiffs, reiterated the charges against John Petit, and exposed the sin of schism—in short, he did all he could to direct the public mind towards the evils in the church and the way to heal them. His efforts were powerfully seconded by the emperor Sigismund, and the result was the council of Constance. This council, unlike its predecessor at Pisa, was summoned by a pope—Pope John XXIII. Sigismund was present, resolutely determined to unite and reform the church, and guided by Cardinals D'Ailly and Zarabella, and above all by Gerson. Gerson indeed practically ruled the council up to the election of a new pope. It was he that dictated the form of submission and cession made by John XXIII., and directed the process against Huss. Many of Gerson's biographers have found it difficult to reconcile his proceedings against Huss with his own opinions upon the supremacy of the pope; but the difficulty has arisen partly from misunderstanding Gerson's position, partly from supposing him to be the author of a famous tract—*De modis uniendi ac reformandi ecclesiam in concilio universali*. All Gerson's high-sounding phrases about the supremacy of a council were meant to apply to some time of emergency. He was essentially a trimmer, and can scarcely be called a reformer. He never wrote the bold tract of Abbot Andrew of Randolf (*cf.* Schwabe, *Johannes Gerson*, p. 483–491), and he hated Huss with all the hatred the trimmer has of the reformer. The council of Constance, which revealed the eminence of Gerson, became in the end the cause of his downfall. He was the prosecutor in the case of John Petit, and the council, overawed by the duke of Burgundy, would not affirm the censure of the university and archbishop of Paris. Petit's justification of murder was declared to be only a moral and philosophical opinion, not of faith. The utmost length the council would go was to condemn one proposition, and even this censure was annulled by the new pope, Martin V., on a formal pretext. Gerson dared not return to France, where, in the disturbed state of the kingdom, the duke of Burgundy was in power. He lay hid for a time in Germany, and then returned to France, to Lyons, where his brother was prior of the Celestines. It is said that he taught a school of boys and girls in Lyons, and that the only fee he exacted was to make the children promise to repeat the prayer, "Lord, have mercy on thy poor servant Gerson." His later years were spent in writing books of mystical devotion and hymns. He died at Lyons on July 12, 1429. Tradition declares that during his sojourn there he translated or adapted from the Latin a work upon eternal consolation, which afterwards became very famous under the title of *The Imitation of Christ*, and was attributed to Thomas à Kempis. Recent researches, however, have proved beyond a doubt that the famous *Imitatio Christi* was really written by Thomas, and not by John Gerson or the Abbot Gersen.

The literature on Gerson is very abundant. See Dupin, *Gersoniana*, including *Vita Gersoni*, prefixed to the edition of Gerson's works in 5 vols. fol., from which quotations have here been made; Charles Schmidt, *Essai sur Jean Gerson, Chancelier de l'Université de Paris*, Strasburg, 1839; Schwabe, *Johannes Gerson*, Würzburg, 1859. On the relations between Gerson and D'Ailly, see Paul Tschackert, *Peter von Ailli*, Gotha, 1877. On the authorship of the *Imitatio Christi*, see the editions of Dibden, Genæ, and Kettlewell. On Gerson's public life, see also histories of the councils of Pisa and Constance, especially Herm. v. der Hardt, *Con. Constantiensis libri IV.*, 1695–9. (T. M. L.)

GERSONIDES, or BEN GERSON, LEVI, a distinguished Jewish philosopher and commentator, was born at Bagnolo in Languedoc, towards the close of the 13th century, probably in 1288. As in the case of the other Jewish writers on philosophy during the Middle Ages, extremely little is known of his life. His family had been distinguished for piety and exegetical skill, but though he was known in the Jewish community by commentaries on certain books of the Bible, he never seems to have accepted any Rabbinical post. Possibly the freedom of his opinions, which drew on him the suspicion of infidelity, may have put obstacles in the way of his preferment. He is known to have been at Avignon and Orange during his life, and is believed to have died at Perpignan in 1370. Part of his writings consist of commentaries on the portions of Aristotle then known, or rather of commentaries on the commentaries of Averroes. Some of these are printed in the early Latin editions of Aristotle's works. His most important treatise, that by which he has a place in the history of philosophy, is entitled *Milhamoth Adonai* (The Wars of God), and is said to have occupied twelve years in composition. A portion of it, containing an elaborate survey of astronomy as known to the Arabs, was translated into Latin in 1342 at the request of Clement VI. The *Milhamoth* is throughout modelled after the plan of the great work of Jewish philosophy, the *Moré Nebuchîm* of Moses Maimonides, and may be regarded as an elaborate criticism from the more philosophical point of view (mainly Averroistic) of orthodoxy as presented in that work. The six books pass in review (1) the doctrine of the soul, in which Gersonides defends the theory of impersonal reason as mediating between God and man, and explains the formation of the higher reason (or acquired intellect, as it was called) in humanity,—his view being thoroughly realist and resembling that of Ibn Gebirol (see AVICEBRON); (2) prophecy; (3) and (4) God's knowledge of facts and providence, in which is advanced the curious theory that God does not know individual facts, and that, while there is general providence for all, special providence only extends to those whose reason has been enlightened; (5) celestial substances, treating of the strange spiritual hierarchy which the Jewish philosophers of the Middle Ages accepted from the Neo-Platonists and the Pseudo-Dionysius, and also giving, along with astronomical details, much of astrological theory; (6) creation and miracles, in respect to which Gerson deviates widely from the orthodox position of Maimonides.

A careful analysis of the *Milhamoth* is given in Rabbi Isidore Weil's *Philosophie Religieuse de Lévi-Ben-Gerson*, Paris, 1868. See also Munk, *Mélanges de Phil. Juive et Arabe*; and Joel, *Religionsphilosophie d. L. Ben-Gerson*, 1862. The *Milhamoth* was published in 1560 at Riva di Trento, and has been republished at Leipsic, 1866.

GERSTÄCKER, FRIEDRICH (1816–1872), who enjoyed a most extensive popularity as a novelist and a writer of travels both at home and abroad, was born at Hamburg on 10th May 1816. Having lost his father at the age of nine, he was placed under the guardianship of an uncle a

Brunswick, who sent him to a house of business at Cassel as clerk. He soon got tired, however, of the monotonous commercial routine, and selected the more active life of a farmer, in which capacity he spent the years from 1835 to 1837 in Saxony. But the uneventful agricultural life was unable to repress in him the innate roving instinct which, according to his own statement, had received a strong impulse in his eighth year by the perusal of *Robinson Crusoe.* The word "America" had from that time exercised on him an irresistible charm, and so he went in 1837 from Bremen to New York. He travelled on foot over all parts of the United States, working as he went for his bare subsistence, and then settled for some time in Arkansas, where he led the life of a roving sportsman. Only now and then he visited inhabited places to see civilized society, and to earn some means by whatever work he could obtain. Thus he went in 1842 to Point Coupée in Louisiana, where he undertook the management of a hotel. This time, however, he did not return with the acquired means to the backwoods, but repaired to his German home to see his mother and other relatives, after having led an adventurous life for six years and a half. On his return to Germany he found himself, to his great surprise, known as an author, on a limited scale at least. His mother had shown his diary, which he regularly sent home, and which contained descriptions of his adventures in the New World, to the editor of the *Rosen*, who readily published them in his periodical. The travelling sketches having found great favour with the German public, Gerstäcker issued them, in 1844, in a collected form, under the title of *Streif- und Jagdzüge durch die Vereinigten Staaten Nordamerikas.* His next literary labours consisted of translations from the English, during the performance of which it occurred to him that he might himself become an original author, since he was able to delineate original characters, to relate remarkable occurrences, and to describe romantic scenery from his own experience, whilst others were obliged to draw upon their imagination only in producing works of fiction. Accordingly Gerstäcker issued, in 1845, his first novel, *Die Regulatoren in Arkansas,* and henceforth the stream of his productiveness flowed on uninterruptedly. In 1849 he again repaired to America, being this time provided with a grant from the then "German Government," and acting at the same time as correspondent to the *Augsburger Allgem. Zeitung.* After having made very extensive travels both in America, Polynesia, and Australia, he returned in 1852 to Leipsic. In 1860 his innate restlessness drove him to South America, chiefly with a view of inspecting the German colonies there. After having traversed nearly all the principal South American countries he returned to Germany, but for a short time only, for in 1862 he accompanied the Duke Ernest of Coburg-Gotha to Egypt and Abyssinia. This was his last great journey, after the return from which he lived first near Gotha and then at Brunswick, where he died on May 31, 1872.

Gerstäcker was greatly esteemed and liked as a man, on account of his genial temper and straightforward character, and as an author he enjoyed an almost unprecedented popularity at home and was very favourably known abroad. The charm of his productions consists in the natural freshness of his descriptions, nearly all of which have an exotic background, and in the originality of his characters, the most prominent of which are drawn from real life. He did not possess any high literary power, and probably never touched up what he had once written; his writings lack therefore on the whole that artistic finish which forms one of the principal elements of a good writer. This defect, however, impresses even on his works of fiction the stamp of probability, nay of truthfulness. His writings nowhere betray that intention of producing an effect which so often destroys the illusion of the reader in elaborately worked out productions. He generally writes in a homely, ungarnished manner, just as a traveller would relate his adventures amidst a circle of friends. His writings, therefore, nearly always rivet the attention of the reader from beginning to end. The works of Gerstäcker have, besides, the merit that they formed a wholesome counterpoise against the too idealistic tendency of the literature of Germany, against the lax and realistic school of France, and against the morbid sensationalism which prevailed in England. A number of his works have been translated into several modern languages, but mostly into English; their descriptions of exciting adventures on land and sea affording, with their sturdy humour, congenial reading to the English-speaking community in the Old and New World. His best works, from a literary point of view, are, besides the above-mentioned *Regulatoren*, his *Flusspiraten des Mississippi*, his South Sea novel *Tahiti*, his Australian romance *Die beiden Sträflinge*, his *Matrosenleben* and *Blau Wasser.* His collected works have been issued in a cheap and handy edition published at Jena.

GERVAIS, Paul (1816–1879), an eminent palæontologist, was born September 26, 1816, at Paris, where he obtained the diplomas of doctor of science and of medicine, and in 1835, as assistant to De Blainville in the laboratory of comparative anatomy at the Museum of Natural History, commenced palæontological research. In 1841 he obtained the chair of zoology and comparative anatomy at the Faculty of Sciences in Montpellier, of which he was in 1856 appointed dean. In 1848–52 appeared his important work *Zoologie et Paléontologie Françaises*, supplementary to the palæontological publications of G. Cuvier and De Blainville; of this a second and greatly improved edition was issued in 1859. In 1865 he accepted the professorship of zoology at the Sorbonne, vacant through the death of Gratiolet; this post he left in 1868 for the chair of comparative anatomy at the Paris Museum of Natural History, the anatomical collections of which he greatly enriched by his exertions. He was elected a member of the Academy of Sciences at Paris, in the place of Coste, January 26, 1874. Gervais was remarkable for the disinterestedness with which he devoted himself to the cause of science. He died February 10, 1879, in the sixty-third year of his age.

Besides his *Zoologie et Paléontologie Françaises*, Gervais wrote:—The "Zoologie" for Laplace's *Voyage autour du Monde*, 1833, &c. (with F. Eydoux), *Hist. naturelle des insectes aptères*, 1837, &c. (with Walkenaer), *Le jardin des plantes*, 1842, &c. (with P. Bernard); *Atlas de Zoologie*, 1844; *Zoologie de la France*, 1847 (with Aicard and others), *Hist. naturelle des mammifères*, 1853, &c.; part of Thiollière's *Description des poissons fossiles*, 1854, &c.; *Théorie du squelette humain*, 1856; *Zoologie médicale*, 1859 (with Van Beneden) *De la métamorphose des organes et des générations alternantes*, 1860; *Un million de faits*, 1861 (with Aicard, Desportes, and others) *De l'ancienneté de l'homme*, 1865; *Zoologie*, 1866, in the series *Éléments des sciences naturelles*; *Recherches sur l'ancienneté de l'homme et la période quaternaire*, 19 pl., 1867; *Zool. et paléontologie générales*, 1867, *Éléments de zoologie*, 1868 and 1869; *Ostéographie des Cétacés*, 1869, &c. (with Van Beneden); *Notions élémentaires d'histoire naturelle*, 1869 and 1872 (with Marchand and Raulin). His scientific papers are exceedingly numerous. See E. Blanchard, "Nécrologie," *Revue Scientifique*, Feb. 15, 1879, p. 783; S. Meunier, *La Nature*, March 15, 1879, p. 225.

GERVAISE of Canterbury, born about 1150, was one of the monks of the priory of Christ Church, Canterbury, and witnessed the burning of the cathedral in 1174. His earliest known literary effort was a *Tractatus de Combustione et Reparatione Dorobornensis Ecclesiæ*, being an account of that conflagration and of the subsequent process of rebuilding, written probably about 1184. This was followed about 1194 by *Imaginationes de discordiis inter monachos Cantuarienses et Archiepiscopum Baldewinum*, a detailed relation of clerical disputes which had occurred during the episcopate of Baldwin from 1185 to 1190. Gervaise's

Chronica de tempore regum Angliæ, Stephani, Henrici II., et Ricardi I., brings the history down to the death of the last named (1199); but his *Vitæ Dorobornensium Archiepiscoporum* closes with that of Reginald Fitz-Joceline (1191). These works, which are all of them characterized by laboriousness and trustworthiness, are reprinted in Twysden's *Historiæ Anglicanæ Scriptores* (vol. x.). In the library of Corpus Christi College, Cambridge, there is an unpublished MS., also by Gervaise, containing a work entitled *Mappa Mundi*, and also an English chronicle from the fabulous ages to the death of Richard. The year of the death of Gervaise is not recorded, but the fact that he does not appear to have accomplished any part of his promised chronicle of the reign of John may fairly be taken to imply that he did not live long after 1200. See Wright, *Biographia Britannica* (1846).

GERVASE, or GERVAISE, of Tilbury (*Gervasius Tilburiensis*), an English Latin writer of the 13th century, was probably born at Tilbury in Essex. He is frequently said to have been a nephew of Henry II. of England; but if this was the case, it is strange that in speaking of Henry to Otto IV. he makes no allusion to this relationship, but simply calls him "my master the illustrious king of the English, Henry II., your uncle *vestri avunculi*." The truth probably is that the statement owes its origin to some careless copyist or reader either taking *vestri* for *nostri* in this passage, or, as M. Petit Radel suggests, the contraction *vri* for *mei*. Gervase was present at the peace of Venice in 1177, was professor of canon law some years later at Bologna, and afterwards entered the service of William II. of Sicily. Having obtained the favour of Otto IV., who had close intercourse with England, he was by him appointed about 1200 chancellor and marshal of the kingdom of Arles. He subsequently received the provostship of the nunnery at Ebsdorf, and died about 1235. His best known, if not his only important work, is the *Otia Imperialia*, which he composed about 1212 for the entertainment of his imperial patron. The first two books are a sort of geographical and historical compendium, and the third is devoted to all kinds of curious facts and beliefs. The history begins at the beginning with the creation of the world, but it only comes down to the author's own days, as he confesses he had not the gift of prophecy. It is a fairly learned but on the whole very dry digest of the ordinary narratives handed on from chronicler to chronicler, relieved at times with curious disquisitions, or passages from the writer's own experience. It is mainly the third book which justifies Mr Wright's assertion that Gervase was "one of the most amusing writers of the period," for in it he collects a great many popular myths and legends about such matters as the magnet, asbestos, the sirens of the British sea, the veronica, the horn of St Simon, and so on.

The *Otia* was printed by Leibnitz in vol. i. of *Scriptores rerum Brunsvicensium*, and corrections from MSS. appeared in vol. ii. A portion of the second book had already been printed by J. J. Maderus as *Gervasii Tilb. de Imperio Romanorum*, Helmstadt, 1673; and Liebrecht has since made selections from the non-historical portions, Hanover, 1856. The *Dialogus de Scaccario*, now recognized as the work of Nigel bishop of Ely, was long attributed to Gervase; and he had consequently the credit also of the *Tricolumnus* (now lost) claimed by the author of the dialogue. It is needless to mention the works assigned to him by Bale; but we have his own authority for the statement that he wrote a *Liber Facetiarum*, or book of anecdotes, for Henry II. See Petit Radel in *Hist. Litt. de la France*, vol. xvii.

GERVINUS, GEORG GOTTFRIED, (1805-1871), one of the most eminent literary and political historians of Germany, was born on May 20, 1805, at Darmstadt. His well-to-do parents, belonging to the middle classes, had him educated at the gymnasium of the town, where he studied with great success. At the age of fourteen they chose for him a commercial career, but Gervinus continued his classical studies privately, and made himself fully acquainted with the polite literature of Germany and other countries. He also cultivated his literary and musical taste by frequenting the theatre of the Hessian capital, which was then in an excellent condition. In 1825 he relinquished the uncongenial commercial life, and repaired, after a brief preparation, to the university of Giessen to study philology. The short interruption in his school education helped to develop in him, in an eminent degree, his social qualities, and taught him to employ methodically and usefully every hour of his life. In 1826 he went to Heidelberg, where he attended the lectures of the great historian Schlosser, who became henceforth his guide and his model. From 1828 to 1830 he held a mastership in a private institution at Frankfort-on-the-Main, issuing at the same time, in conjunction with Morstadt and Hertlein, a comprehensive edition of Thucydides, and writing an essay on Bloomfield's English translation of the Greek historian. In 1830 he returned to Heidelberg, and wrote among other essays one on Probert's *Ancient Laws of Cambria.* The year 1832 he spent in Italy as travelling tutor to a young Englishman, and on his return to Heidelberg he wrote several historical treatises, which he issued in 1833, in a collected form, as the first volume of his *Historische Schriften.* This publication procured him the appointment of professor extraordinarius; and the first volume of his *Geschichte der poetischen Nationalliteratur der Deutschen* brought him, through the special recommendation of the historian Dahlmann, the appointment to a regular professorship of history and literature at Göttingen. He settled there at Easter 1836, and married a wealthy young lady, who proved a true "companion to his intellect." In the following year he wrote his *Grundzüge der Historik*, which is perhaps the most thoughtful of his philosophico-historical productions. The same year brought his expulsion from Göttingen in consequence of his manly protest, in conjunction with six of his colleagues, against the unscrupulous violation of the constitution by Ernest Augustus, king of Hanover and duke of Cumberland. After applying himself to his literary and artistic studies at Heidelberg, Darmstadt, and Rome, he returned once more to Heidelberg, where he continued, among other works, his history of German literature, and was appointed in 1844 honorary professor. He zealously took up in the following year the cause of the German Catholics, hoping it would lead to a union of all the Christian confessions, and to the establishment of a national church. He also came forward in 1846 as a patriotic champion of the Schleswig-Holsteiners, and when, in 1847, King Frederick William IV. promulgated the royal decree for summoning the so-called "United Diet" (Vereinigte Landtag), Gervinus hoped that this event would form the basis of the constitutional development of the largest German state; and, thinking that the hour of publicistic activity had arrived, he founded, in common with some other patriotic scholars, the *Deutsche Zeitung*, which certainly was one of the best-written political journals ever published in Germany. His appearance in the political arena secured his election as deputy for the Prussian province of Saxony to the National Assembly sitting in 1848 at Frankfort. The weight of his name and his journalistic activity were of considerable advantage to the liberals in that short-lived parliament; but when he saw that all their endeavours were frustrated by the indecision of the king of Prussia, who declined accepting the imperial crown of Germany, he retired in gloomy disappointment from all active political life. So embittered was he against the royal house of Hohenzollern that neither the formation of the North German Confederation in 1866, which in former years he would have hailed with the greatest satisfaction, nor the glorious establishment in 1870 of an united German empire, could reconcile him to a dynasty one sickly scion of which had foiled the national aspirations of Germany. Gervinus now took refuge among his literary and historical studies, more especially devoting himself to the study of Shakespeare, the result of which was his great work *Shakespeare* (1849, 1850), in four volumes. He also revised his *magnum opus*, the *History of German Literature*, for a fourth edition (1853), and began at the same time to plan his *History of the* 19*th Century*, which was to be a continuation of the *History of the* 18*th Century* by his guide and teacher, Schlosser He heralded that voluminous work by a programme or manifesto entitled *Einleitung in die Geschichte des neunzehnten Jahrhunderts*, which was issued in 1853, and made a great stir in the literary and political world, chiefly owing to the circumstance that the Government of Baden imprudently instituted a prosecution against the author for high treason. Gervinus had prophesied in his famous pamphlet the final victory of democracy, and based his prediction on the theory that all the great revolutionary outbreaks follow each other in a kind of geometrical progression,—to wit, 1820, 1830, and 1848. Hence he concluded that the next great revolutionary shock would take place about 1888-1890, and that it would insure the final victory to democracy, just as the same decade brought in former centuries freedom and independence to the Americans, the French, the English, and the inhabitants of the Netherlands. Arraigned before a tribunal, he defended himself with a great display of ability and manly courage, but was nevertheless condemned to an imprisonment of two months, and all the copies of the "seditious publication" were to be destroyed. Fortunately for Germany, this disgrace was spared her, the verdict having been rescinded by a higher tribunal. This occurrence, which would have aroused a more elastic temper to greater political activity, had the contrary effect upon the sensitive mind of Gervinus. He buried himself still more among his books, and even forebore to deliver lectures. With unwearied energy he now devoted himself to his above-mentioned great historical work, *Geschichte des neunzehnten Jahrhunderts seit den Wiener Verträgen*, which he issued in eight volumes, the first in 1855 and the last in 1866. In the midst of his historical studies he found relief in his devotion to the works of his favourite musician Handel. He founded, and liberally supported, the Handel Society in Germany, whose object it was to restore the compositions of the great master in an authentic form, and to issue German versions of the texts suitable to the compositions. The result of his Handel studies was his critical and æsthetical work *Händel und Shakespeare, zur Æsthetik der Tonkunst* (1868), in which he drew an ingenious parallel between his favourite poet and his favourite composer, showing that their intellectual affinity was based on the Teutonic origin common to both, on the same healthiness of their mental capacities, on their analogous intellectual development, and even on a similarity of their inclinations and fates. This philosophical treatise fell flat on the German public, who could not forgive the author for having extolled Handel above the great national masters, Haydn, Mozart, and Beethoven. The ill-success of that publication, and the indifference with which the latter volumes of his *History of the* 19*th Century* were received by his countrymen, together with the feeling of disappointment that the unity of Germany had been brought about in another fashion and by other means than he wished to see employed, combined to embitter in the highest degree the writer and the politician, but it could not sour in him his kindly and humane disposition, nor did it in the least affect his sociable temper, and he cultivated refined society to the last. He died rather suddenly, on the 18th of March 1871.

The works which will, above all others, insure to Gervinus a lasting fame, are his *Geschichte der Deutschen Dichtung*, and his work on *Shakespeare*. The former, a fifth edition of which was edited (1871-74) by the eminent literary historian and philologist, Professor Karl Bartsch of Heidelberg, was the first comprehensive history of German poetry in a connected form, and was executed with a literary skill, a profound erudition, and a lofty enthusiasm for the subject, which imprinted upon it the stamp of a national work of permanent value. The author represented the literary activity of Germany in its successive stages as it grew out of her political life, thus making political history the foil and basis of literary history. His judgment was sincere and independent, and although his criticism often assumed a censorious and pedantic tone against the most prominent poets of Germany, the German people, without allowing themselves to be misguided in their judgment regarding the merits of Goethe, Schiller, Jean Paul, &c., gratefully accepted his work as a national homage to that subject of which they have most reason to be proud. The object of Gervinus in writing his literary history was, besides, a patriotic one. He endeavoured to show that Germany, having already attained great eminence in literature, should henceforth exclusively devote herself to political activity, and surpass other nations also in this respect. He had a no less patriotic object in view in writing his commentary on *Shakespeare*, which has been made popular in England by an excellent translation. This work is not so much a philological or æsthetical commentary as a treatise pointing out the ethical or moral precepts which may be deduced from his productions, and this circumstance makes it of considerable value and interest also to English readers. Gervinus, who considered Shakespeare the intellectual property of Germany, in the same way as he considered Handel the artistic property of England, wished above all to inculcate on his countrymen the teachings of healthy practical activity to be found in the works of the English dramatist. The object for which he wrote, viz., the moral improvement of his readers from a practical point of view, seemed to him the easier to be accomplished through the productions of Shakespeare, because the poet was descended from a kindred race, and the fructifying seeds of his thoughts and sentiments, falling upon a congenial soil, would be sure to take root there kindly. As a political historian, Gervinus was the antipode of Ranke. Following the principles of F. C. Schlosser, he slighted all documentary history. He had such a deep distrust of all state papers and diplomatic documents that he considered them as most untrustworthy sources for any historical record. He confined himself, therefore, chiefly to taking into account the political events and their results just as they lay on the surface; and, not consulting the state archives for the secret springs which set them in motion, he based his historical narratives almost entirely on his subjective judgment. Many brilliant passages will be found in his general *History of the* 19*th Century*, such as the accounts of the South American and Greek revolutions, and of the July revolution in 1830; and his *Historische Schriften* also contain a number of valuable treatises and essays, which may be said to have paved the way to a new era in the art of writing history. Gervinus entertained a kindly feeling towards England, which he called the land of political mastery; and though he was, what is both the bane and the glory of so many Germans, rather a cosmopolitan, he nevertheless remained a German patriot to the core. He was, besides, distinguished by a rare nobleness and manliness of character, and considering that he was a powerful factor in the literary and political progress of modern times, we may fully agree with Ranke's opinion "that he will never be forgotten." (C. A. B.)

GESENIUS, Friedrich Heinrich Wilhelm (1786–1842), Orientalist and biblical critic, was born at Nordhausen, Hanover, on the 3d of February 1786. From the gymnasium of his native town he passed in 1803 as a student of philosophy and theology to the university of Helmstadt, where Henke was his most influential teacher; but the latter part of his undergraduate course was taken at Göttingen, where Eichhorn and T. C. Tychsen were then at the height of their popularity. In 1806, shortly after graduation, he became "repetent" and "privat-docent" in that university; and, as he was fond of afterwards relating, had Neander for his first pupil in Hebrew. In 1809, on the recommendation of Johann von Müller, he was appointed to a mastership in the gymnasium of Heiligenstadt, Westphalia, whence, in the following year, he was transferred to the university of Halle, where, from being professor extraordinarius in theology, he was in a very short time promoted to an ordinary chair (1811). Many offers were subsequently made to him of high preferment elsewhere, but he clung to Halle for the remainder of his life, and taught with great regularity for upwards of thirty years, the only interruptions indeed being that of 1813–14, occasioned by the war of liberation, during which the university was closed, and those occasioned by two prolonged literary tours, first in 1820 to France and England in the society of his colleague Thilo for the examination of rare Oriental manuscripts, and afterwards in 1835 to England and Holland in connexion with his Phœnician studies. At a very early period he became the most popular teacher of Hebrew and of Old Testament introduction and exegesis in Germany; and during his later years the annual number of students attending his lectures on these and kindred subjects, such as church history and Biblical archæology, amounted to nearly 500. Of his pupils many have risen to great eminence in the departments he specially cultivated; among these the names of Von Bohlen, Hoffmann, Hupfeld, Rödiger, Tuch, Vatke, and Benfey may be mentioned. In 1827 Gesenius was made a consistorialrath; but, unless account be taken of the violent attacks to which he, along with his friend and colleague Wegscheider, was in 1830 subjected by Hengstenberg and his party in the *Evangelische Kirchenzeitung*, there are few noteworthy occurrences to be recorded in his biography. His death took place at Halle, October 23, 1842. It would be difficult to overestimate the services rendered by Gesenius to Semitic philology. To him belongs in a large measure the credit of having freed it from the trammels of theological and religious prepossession by which it had previously been hampered, and of inaugurating the strictly scientific method which has since been so fruitful in valuable results. Nor can it be doubted that as an exegete he has exercised a powerful, and on the whole a beneficial, influence on the tendencies of modern theological investigation.

Of his very numerous works the earliest, published in 1810, entitled *Versuch über die Maltesische Sprache*, was a successful refutation of the widely current opinion that the modern Maltese was of Punic origin. In the same year appeared the first volume of the *Hebräisches u. Chaldäisches Handwörterbuch*, completed in 1812 (8th ed., 1878; English translation by Tregelles, 1846–52). The *Hebräische Grammatik*, published in 1813 (22d ed., by Kautzsch, 1878), was followed in 1815 by the *Geschichte der Hebräischen Sprache* (now very rare), and in 1817 by the *Ausführliches Lehrgebäude der Hebräischen Sprache*. The first volume of his well-known commentary on Isaiah (*Der Prophet Jesaja*), with a translation, appeared in 1821; but the work was not completed until 1829. The *Thesaurus philologico-criticus Linguæ Hebraicæ et Chaldaicæ V. T.*, begun in 1829, he did not live to complete; the latter part of the third volume is edited by Rödiger (1858). The other works of Gesenius are *De Pentateuchi Samaritani Origine, Indole, et Auctoritate* (1815), supplemented in 1822 and 1824 by the treatise *De Samaritanorum theologia*, and by an edition of *Carmina Samaritana*; *Paläographische Studien über Phönizische u. Punische Schrift* (1835), a pioneering work which he followed up in 1837 by his collection of Phœnician monuments (*Scripturæ linguæque Phœniciæ monumenta quotquot supersunt*); an Aramaic lexicon (1834–39); and a treatise on the Himyaritic language written in conjunction with Rödiger in 1841. Gesenius also contributed extensively to Ersch and Gruber's *Encyclopädie*, and enriched the German translation of Burckhardt's *Travels in Syria and the Holy Land* with valuable geographical notes. For many years he also edited the Halle *Allgemeine Literaturzeitung*. A well executed sketch of his life was published in 1843 (*Gesenius: eine Erinnerung für seine Freunde*).

GESNER, Johann Matthias (1691–1761), a distinguished German classical scholar, was born at Roth near Ansbach, 9th April 1691. He studied at the university of Jena, and in 1714 published a work on the *Philopatris* ascribed to Lucian. In 1715 he became librarian and corrector at Weimar, in 1729 rector of the gymnasium at Ansbach, and in 1730 rector of the Thomas school at Leipsic, where he had for colleagues Joh. A. Ernesti and Joh. Sebastian Bach. On the foundation of the university of Göttingen he became professor of rhetoric and subsequently librarian also. He died at Göttingen 3d August 1761. His special merit as a classicist is the attention he devoted to the explanation and illustration of the subject matter of the classical authors.

His principal works are editions of the *Scriptores de re rustica*, of Quintilian, Claudian, Pliny the Younger, Horace, and the Orphic poems; *Primæ lineæ isagoges in eruditionem universam*; an edition of Faber's *Thesaurus eruditionis scholasticæ*, afterwards continued under the title *Novus linguæ et eruditionis Romanæ thesaurus*; *Opuscula varii argumenti*; and *Thesaurus epistolarum Gesneri*. See Ernesti, *Opuscula oratoria*, 1762; and *Göttinger Professoren*, Gotha, 1872.

GESNER, or Gessner, Konrad (1516–1565), a very famous naturalist and author, surnamed the German Pliny and literarum miraculum on account of his vast erudition, was born of poor parents at Zürich, 26th March 1516. He received the first elements of education from Chaplain Frick, his maternal uncle; and it was while gathering plants in his relative's garden that he became imbued with that enthusiastic love of science which remained with him through life. In 1513 he went to Strasburg, then to Bourges, and in 1534 to Paris, studying at all those places with characteristic passionate zeal. In 1535 we find him again in Zürich, where he married somewhat imprudently, for he was very poor, and had no immediate prospect of bettering his condition. His whole day was occupied in teaching, but at least the night was his own, and too great a portion of the time that others give to rest was occupied by Gesner in adding to his already great stock of erudition. In 1537 he was appointed professor of Greek at Lausanne, and in 1541 professor of physics and natural history at Zürich. But in neither of these offices was he well paid, and during those years he wrote a large number of books, partly to support himself, partly from the interest he felt in their subjects. He wrote several works on ancient medicine and on botany, and a treatise on milk (in which he described the rural economy of Switzerland), translated into Latin a Greek logical manual and some works on the moral interpretation of Homer, carefully edited a new edition of *Johannis Stobæi Sententiæ* (Zürich, 1543) and an expurgated edition of Martial (1544), prepared a new edition of the Latin dictionary of Ambrosius Calepinus (Basel, 1544), and wrote besides some lesser dissertations and translations. All this, however, was only mere side work, for in 1545 he issued at Zürich the first part of his justly renowned *Bibliotheca Universalis*, a catalogue of all the works in Latin, Greek, and Hebrew, extant and not extant, published or as yet unpublished. Under each important name there was given a vast mass of bibliographical information and criticism, original and selected. Three years later the second part of this stupendous work appeared, likewise at Zürich, under the title of *Pandectarum sive partitionum universalium Conradi Gesneri Tigurini Libri XXI.* Only nineteen of these books then appeared; the twenty-first, which was a theological encyclopædia, was published in 1549, but the twentieth, which was to contain the medical writings, and which he intended should represent the quintessence of the labours of a lifetime, was never finished and never published.

The next few years were spent in writing small treatises, and in the preparation of another *magnum opus*, a zoological work entitled *Historia Animalium*, which was published in six books (the last of these unfinished) at Zürich between 1551 and 1587. To prepare himself for the worthy execution of this undertaking he read 250 authors, travelled over nearly all Europe, received hints from hosts of learned friends, and did not disdain the information which he obtained from hunters and shepherds. He also made himself a proficient artist, in order that he might by drawings assist his labours. This work contained the names of all known animals in the ancient and modern languages, a description of each as to every important particular, and a mass of interesting literary information, embracing facts and legends regarding them. After this he again occupied himself with lesser writings for some years. He devoted some attention to philology, aided in the preparation of a German-Latin dictionary, and pointed out the force and undreamt-of beauty that lay in that then vulgar and half-developed tongue. But again these and other publications were only secondary labours, for he had a third great work in preparation. He had for some time given great attention to botany, and he now proposed to publish a work on that science corresponding to his great work on zoology. He had made a large collection of materials towards this when his health, never very good, completely gave way. A few hours before his death he desired to be carried into his museum, and there he spent the last moments of life. He died 13th December 1565, not having completed his fiftieth year.

Gesner's intense devotion to science, and his almost incredible powers of acquisition, are seen from the recital of the facts of his biography, and from a mere catalogue of his labours. It deserves to be added that his life was singularly pure and blameless, that his love of knowledge was as disinterested as it was engrossing, that he was always ready and glad to acknowledge any help he received. When obliged to engage in controversy, he did so in a dignified and courteous manner. His medical writings show him to have been far above the silly prejudices of his day. A cheerful and amiable piety was a prominent feature in his character—a character chastened, not soured, by the trials of a hard lifetime.

After Gesner's death his unpublished writings went through a career of vicissitudes not unlike that of their author. A part of them, edited by Professor Schmiedel, was published at Nuremberg in 1753. Other parts followed, but the work was never completed. Lives of Gesner have been written by J. Simmler (Zürich, 1566) and J. Hanhart (Winterthur, 1824). See also Lebert's *Gesner als Arzt* (Zürich, 1854), and Gesner's autobiography in his *Bibliotheca Universalis* (1st ed., p. 180).

GESSNER, Salomon (1730–1788), Swiss painter and poet, and once a very favourite and widely-read author, was born at Zürich 1st April 1730. With the exception of some time spent in Berlin, and a visit to Hamburg undertaken in order to see Hagedorn, he passed the whole of his life in his native town, where he carried on the business of a bookseller. He died 2d March 1788. The first of his writings that attracted attention was his *Lied eines Schweizers an sein bewaffnetes Mädchen* (1751). Then followed *Daphnis* (1754), *Idyllen* (1756), *Inkel and Yariko* (1756), a version of a story already worked out by Gellert and Bodmer, and *Der Tod Abels* (1758), "a sort of idyllic prose pastoral." It is somewhat difficult for us now to understand the reason of Gessner's universal popularity, unless it was the taste of the period for the conventional pastoral. His writings are marked, it is true, by sweetness and melody, but the sweetness soon becomes insipidity, and the melody monotony. He represents in most of his works the existence of shepherds in a golden or rather tinsel age, and nothing more unreal could possibly be imagined. His men and women are inane and lifeless representations. They are all alike, and all equally uninteresting. They never give utterance to any powerful, genuine, human sentiments. Their talk is but meaningless platitude. As a painter Gessner represented "still country scenes, rocks, springs, and waterfalls, shepherds and shepherdesses"—in short, the conventional classical landscape. His son, Konrad Gessner (1764–1826), was also a painter of some reputation.

Collected editions of Gessner's works were repeatedly published (2 vols. 1777–78, finally 2 vols. 1841, both at Zürich). They were translated into French (3 vols., Paris, 1786–93), and versions of the *Idyllen* appeared in English, Dutch, Portuguese, Spanish, Swedish, and Bohemian. Gessner's life was written by Hottinger (Zürich, 1796); see also his *Briefwechsel mit seinem Sohn* (Bern and Zürich, 1801).

GESTA ROMANORUM, a Latin collection of anecdotes and tales, probably compiled about the end of the 13th century or the beginning of the 14th, which still possesses a twofold literary interest, first as one of the most popular books of its time, and secondly as the source, directly or indirectly, of much which has since become current under the stamp of genius. Of its authorship nothing certain is known; and there is little but gratuitous conjecture to associate it either with the name of Helinandus or with that of Petrus Berchorius (Pierre Bercheure). It is even a matter of debate whether it took its rise in England, Germany, or France; while Mr Douce was disposed to give the credit of it to the Germans, Herr Œsterley is inclined to recognize the priority of the English. The work at least was evidently intended as a manual for preachers, and was probably written by one who himself belonged to the clerical profession. The name, *Deeds of the Romans*, is only partially appropriate to the collection in its present form, since, besides the titles from Greek and Latin history and legend, it comprises fragments of very various origin, Oriental and European. The unifying element of the book is its moral purpose: everything is made serviceable for reproof and doctrine, the powerful chemistry of the allegorical method extracting the sunshine of Christian truth from the cucumbers of the most worldly and wicked circumstance. The style is barbarous, and the narrative ability of the compiler seems to vary with his source; but he has managed to bring together a considerable variety of excellent material. He gives us, for example, the germ of the romance of "Guy of Warwick," the story of "Darius and his Three Sons," versified by Occleve, part of Chaucer's "Man of Lawes' Tale," a tale of the emperor Theodosius, the same in its main features as that of *Lear*, the story of the "Three Black Crows," the "Hermit and the Angel," so well-known from Parnell's version, and a story identical with the *Fridolin* of Schiller. Owing to the loose structure of the book, it was easy for a transcriber to insert any additional story into his own copy, and consequently the MSS. of the *Gesta Romanorum* exhibit considerable variety. Œsterley, who has bestowed the fullest investigation on the subject, recognizes an English group of MSS. (written always in Latin), a German group (sometimes in Latin and sometimes in German), and a group which is represented by the vulgate or common printed text. The earliest editions are supposed to be those of Ketelaer and De Lecompt at Utrecht, of Arnold Ter Hoenen at Cologne, and of Ulrich Zell at Cologne; but the exact date is in all three cases uncertain.

An English translation, probably based directly on the MS. Harl. 5369, was published by Wynkyn de Worde about 1510–1515, the only copy of which now known to exist is preserved in the library of St John's College, Cambridge. In 1577 Richard Robinson published a revised edition of Wynkyn de Worde, and the book proved highly popular. Between 1648 and 1703 at least eight impressions were issued. In 1703 appeared the first vol. of a translation by B. P., probably Bartholomew Pratt, "from the Latin edition of 1514." A translation by the Rev. C. Swan, first published in 2 vols. in 1824, forms part of Bohn's Antiquarian Library, and was re-edited by Wynnard Hooper in 1877. The German translation was first printed at Augsburg, 1489. A French version, under the title of *Le Violier des histoires romaines moralisêz*, appeared in the early part of the 16th century, and went through a number of editions; it has been reprinted by G. Brunet (Paris, 1858). Critical editions of the Latin text have been produced by A. Keller (Stuttgart, 1842), and Œsterley (Berlin, 1872). See also Warton, "On the Gesta Romanorum," dissertation iii., prefixed to the *History of English Poetry*; Douce, *Illustrations of Shakespeare*, vol. ii.; Frederick Madden, Introduction to the Roxburghe Club edition of *The Old English Versions of the Gesta Romanorum*, 1838.

GETA, Publius Septimus Antoninus (189–212), younger son of the Roman emperor Severus, was born at Milan, 189 A.D. Between him and his brother Caracalla there existed from their early years a keen rivalry and antipathy. On the death of their father in 211 they were, in accordance with his instructions, proclaimed joint emperors; and after the failure of a proposed treaty by which Caracalla was to retain Europe and western Africa, and Geta Asia and Egypt, Caracalla, on the pretence of a desire for reconciliation, arranged a meeting with his brother in his mother's apartments, and by means of assassins murdered him in her presence (212). His name was obliterated from all public inscriptions; all coins bearing his effigy were to be destroyed; and the use of his name, either in conversation or in writing, was forbidden under pain of death.

GETHSEMANE. See Jerusalem.

GEULINCX, Arnold (1625–1669), one of the most distinguished of the earlier Cartesians, was born at Antwerp in 1625. Few details are known with regard to his life, and his more important works are extremely rare. He studied philosophy and medicine at the university of Louvain, and took there the degree of doctor. For twelve years he continued at the same university as lecturer, and was noted as one of the most successful teachers. For what reason he left is quite uncertain, but he seems to have been obliged to fly from Louvain and to take refuge in Leyden, where he appears to have been in the utmost distress. Only the generous assistance of a friend, by name Heidanus, prevented his death from absolute want of means. At Leyden he entered the Protestant Church, having been previously a Catholic, and it has been supposed that his flight from Louvain was due to doubts excited there as to his orthodoxy. This, however, is merely conjecture. In 1663, through his friend Heidanus, he obtained leave to lecture at Leyden, and devoted himself with the utmost zeal to his new duties. He died in 1669. His most important works were published posthumously. During his lifetime there seem to have been made public only the theses which he defended on graduating at Louvain (*Saturnalia, seu quæstiones quodlibeticæ in utramque partem disputatæ*, 2d ed. 1665). The *Metaphysica vera*, 1691, and the *Γνῶθι σεαυτόν, sive Ethica, post tristia auctoris fata*, 1696 (first part, 1665), are the works by which he is known in the history of philosophy. In addition to these were published *Physica Vera*, *Logica restituta*, and *Annotata in Principia Philosophiæ R. Cartesii.* Geulincx takes up principally the doctrine, left in an obscure and unsatisfactory state by Descartes, of the relation between soul and body. Extension and thought, the essences of spiritual and corporeal natures, are absolutely distinct, and cannot act upon one another. External facts are not the causes of mental states, nor are mental states the causes of physical facts. So far as the physical universe is concerned, we are merely spectators. The influence we seem by will to exercise over bodies is only apparent; volition and action only accompany one another. I cannot be the author of any state of which I am unconscious, for my very nature is consciousness; but I am not conscious of the mechanism by which bodily motion is produced, hence I am not the author of bodily motion. Body and mind are like two clocks which act together, because at each instant they are adjusted by God. A physical occurrence is but the occasion on which God excites in me a corresponding mental state. Geulincx is thus definitely the originator of the theory called Occasionalism. But the principles on which that theory was founded compelled a further advance. God, who is the cause of the concomitance of bodily and mental facts, is in truth the sole cause in the universe. No fact contains in itself the ground of any other; the existence of the facts is due to God, their sequence and co-existence are also due to him. He is the ground of all that is. My desires or volitions and my thoughts are thus the desires, volitions, or thoughts of God. Apart from God, the finite being has no reality. Geulincx is thus the precursor of Spinoza, and, like Spinoza, he gave out his final results under the title of Ethics. Descartes had left untouched, or nearly so, the difficult problem of the relation between the universal element or thought and the particular desires or inclinations. All these are regarded by Geulincx as modes of the divine thought and action, and accordingly the end of human endeavour is the end of divine will, or the realization of reason. The love of right reason is the supreme virtue, whence flow the cardinal virtues, diligence, obedience, justice, and humility. Liberty is obedience to reason; *nemo servit qui rationi servit.*

Geulincx has not directly touched the problem which evidently must have caused the greatest difficulty to the Cartesians,—how we perceive extended reality,—though he plainly indicates the opinion that we do not perceive it, but have the idea of it from God. He thus carried out to their extreme consequences the irreconcilable elements in the Cartesian metaphysics, and his works have the peculiar value attaching to the vigorous development of a one-sided principle. The abrupt contradictions to which such development leads of necessity compels revision of the principle itself.

See Damiron, *Phil. en France au 17me siècle*, 1846; Bouillier, *His. de la Phil. Cartesienne*, i. ch. 14; Erdmann, *Versuch einer Gesch. d. neu. Phil.*, i., *b.*, sec. 2; Ritter, *Gesch. d. Phil.*, xi. pp. 97–169 (Ritter's account of Geulincx is the fullest in any history of philosophy); K. Fischer, *Gesch. d. neu. Phil.*, i. 2, 11–27.

GEX, a town of France, the chief town of an arrondissement in the department of Ain, is beautifully situated, 2000 feet above sea-level, at the base of the Jura chain on the Journant, 3 miles from the Swiss frontier, and 10 miles N.W. of Geneva. It has tanneries, saw-mills, and corn-mills, and a considerable trade in cheese and wine. The town gives its name to the old *Pays de Gex*, situated between the Alps and the Jura, which was successively under the protection of the Swiss, the Genevese, and the counts of Savoy, until in 1602 it came into the possession of France, retaining, however, until the Revolution its old independent jurisdiction, with Gex as its chief town. The population of the town in 1876 was 1469.

GEYSERS, Geisers, or Geisirs, are fountains of a peculiar construction, in virtue of which they shoot up into the air, at more or less regular intervals of time, a column of heated water and steam or of mud. Those of Iceland have been known at least from the time of Saxo Grammaticus, who briefly mentions them in his *Danorum regum historiæ*; but no satisfactory explanation of the phenomena was advanced till near the middle of the present century, when Bunsen brought his scientific knowledge and power of investigation to bear on the subject. Sir George Mackenzie, in his *Travels in Iceland*, 1811, had written as follows:—"Let us suppose a cavity C (fig. 1), communicating with the pipe PQ, filled with boiling water to the height AB, and that the steam above this line is confined so that it sustains the water to the height P. If we suppose a sudden addition of heat to be applied under the cavity C, a quantity of steam will be produced which, owing to the great pressure, will be evolved in starts causing the noises like discharges of artillery, and the shaking of the ground." He admitted that even to his own mind this could be only a partial explanation of the facts of the case, and that he was unable to account for the frequent and periodical production of the necessary heat; but he has the credit of hitting on what is certainly the proximate cause—the sudden evolution of steam. By Bunsen's theory the whole difficulty is solved, as is beautifully demonstrated by the artificial geyser designed by Professor J. H. J. Müller of

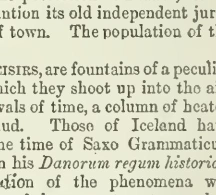

Fig. 1.

Freiburg (fig. 2). If the tube *ab* be filled with water and heated at two points, first at *a* and then at *b*, the following succession of changes is produced. The water at *a* beginning to boil, the superincumbent column is consequently raised, and the stratum of water which was on the point of boiling at *b* being raised to *d* is there subjected to a diminished pressure; a sudden evolution of steam accordingly takes place at *d*, and the superincumbent water is violently ejected. Received in the basin *c*, the air-cooled water sinks back into the tube, and the temperature of the whole column is consequently lowered; but the under strata of water are naturally those which are least affected by the cooling process; the boiling begins again at A, and the same succession of events is the result (see R. Bunsen, "Physikalische Beobachtungen über die hauptsächlichsten Gisire Islands," in *Poggendorff's Annalen der Physik and Chemie*, vol. lxxii., 1847; and J. Müller, "Ueber Bunsen's Geysertheorie," *ibid.*, vol. lxxix., 1850). The principal difference between the artificial and the natural geyser-tube is that in the latter the effect is not necessarily produced by two distinct sources of heat like the two fires of the experimental apparatus, but by the continual influx of heat from the bottom of the shaft and the differences between the boiling points of the different parts of the column owing to the different pressures of the superincumbent mass. This may be thus illustrated:—AB is the column of water; on the right side the figures represent approximately the boiling points (Fahr.) calculated according to the ordinary laws, and the figures on the left the actual temperature of the same places. Both gradually increase as we descend, but the relation between the two is very different at different heights. At the top the water is still 39° from its boiling point, and even at the bottom it is 19°; but at D the deficiency is only 4°. If, then, the stratum at D be suddenly lifted as high as C, it will be 2° above the boiling point there, and will consequently expend those 2° in the formation of steam.

Any hot spring capable of depositing siliceous material by the evaporation of its water may in course of time transform itself into a geyser, a tube being gradually built up as the level of the basin is raised. And every geyser continuing to deposit siliceous material is preparing its own destruction; for as soon as the tube becomes deep enough to contain a column of water sufficiently heavy to prevent the lower strata attaining their boiling points, the whole mechanism is deranged. In geyser districts it is easy to find thermal springs busy with the construction of the tube; warm pools, or *laugs*, as the Icelanders call them, on the top of siliceous mounds, with the mouth of the shaft still open in the middle, and dry basins from which the water has receded with their shafts now choked with rubbish.

Geysers exist at the present time in many volcanic regions, as in the Eastern Archipelago, Japan, and South America; but the three localities where they attain their highest development are Iceland, New Zealand, and Wyoming in the United States. The very name by which we call them indicates the historical priority of the Iceland group. It is an old Icelandic word—*geysir*, equivalent to gusher or rager—from the verb *geysa*, itself a derivative of *gjosa*, to gush. In native usage it is the proper name of the Great Geyser, and not an appellative—the general term *hver*, a hot spring, making the nearest approach to the European sense of the word (see Cleasby and Vigfusson, *Icelandic English Dictionary*, s.v.).

The Iceland geysers are situated about 50 miles N.W. of Hecla, in a broad valley of alluvial formation, at the foot of a range of hills from 300 to 400 feet in height. Within a circuit of about two miles, upwards of one hundred hot springs may be counted, varying greatly both in character and dimensions. The Great Geyser in its calm periods appears as a circular pool 72 feet in diameter and 4 feet in depth, occupying a basin on the summit of a mound of siliceous concretion; and in the centre of the basin is a shaft, about 9 feet in diameter and 70 feet in depth, lined with the same siliceous material. The clear sea-green water flows over the eastern rim of the basin in little runnels. On the surface it has a temperature of from 76° to 89° Cent., or from 168° to 188° Fahr. Within the shaft there is of course a continual shifting both of the average temperature of the column and of the relative temperatures of the several strata. The results of the observations of Bunsen and Descloizeaux in 1874 were as follows (*cf. Poggendorff's Annalen*, loc. cit., and *Comptes Rendus*, vol. xxiii.):—About three hours after a great eruption on July 6th, the temperature 6 metres from the bottom of the shaft was 121·6° C.; at 9·50 metres, 121·1°; at 16·30 metres, 109° (?); and at 19·70 metres, 95° (?). About nine hours after a great eruption on July 6th, at about 0·3 metres from the bottom, it was 123°; at 4·8 metres it was 122·7°; at 9·6 metres, 113°; at 14·4 metres, 85·8°; at 19·2 metres, 82·6°. On the 7th, there having been no eruption since the previous forenoon, the temperature at the bottom was 127·5°; at 5 metres from the bottom, 123°; at 9 metres, 120·4°; at 14·75 metres, 106·4°; and at 19 metres, 55°. About three hours after a small eruption, which took place at forty minutes past three o'clock in the afternoon of the 7th, the temperature at the bottom was 126·5°; at 6·85 metres up it was 121·8°; at 14·75 metres, 110°; and at 19 metres, 55°. Thus, continues Bunsen, it is evident that the temperature of the column diminishes from the bottom upwards, that, leaving out of view small irregularities, the temperature in all parts of the column is found to be steadily on the increase in proportion to the time that has elapsed since the previous eruption; that even a few minutes before the great eruption the temperature at no point of the water column reached the boiling point corresponding to the atmospheric pressure at that part; and finally, that the temperature about half-way up the shaft made the nearest approach to the appropriate boiling point, and that this approach was closer in proportion as an eruption was at hand. Observations made by Mr Robert Walker in August 1874 remarkably confirm those of Professor Bunsen (see *Proceedings of Roy. Soc. of Edinburgh*, vol. viii. p. 514). The Great Geyser has varied very much in the nature and frequency of its eruptions since it began to be observed. In 1809 and 1810, *e.g.*, according to Hooker and Mackenzie, its columns were 100 or 90 feet high, and rose at intervals of 30 hours, while, according to Henderson, in 1815 the intervals were of 6 hours, and the altitude from 80 to 150 feet.

About 100 paces from the Great Geyser is the *Strokkr* or churn, which was first described by Stanlay in 1789. The shaft in this case is about 44 feet deep, and, instead of being cylindrical, is funnel-shaped, having a width of about 8 feet at the mouth, but contracting to about 10 inches near the centre. By casting stones or turf into the shaft so as to stopper the narrow neck, eruptions can be accelerated, and they often exceed in magnitude those of the Great Geyser itself.[1] During quiescence the column of water fills only the lower part of the shaft, its surface usually lying from 9 to 12 feet below the level of the soil. Unlike that of the Great Geyser, it is always in ebullition, and its temperature is subject to comparatively slight differences. On the 8th of July 1847 Bunsen found the temperature at the bottom 112·9° C.; at 3 metres from the bottom, 111·4°; and at 6 metres, 108°; the whole depth of water was on that occasion 10·15 metres. On the 6th, at 2·90 metres from the bottom, it was 114·2°; and at 6·20 metres, 109·3°. On the 10th, at 0·35 metres from the bottom, the reading gave 113·9°; at 4·65 metres, 113·7°; and at 8·85 metres, 99·9°.

The great geyser-district of New Zealand is situated in the south of the province of Auckland in or near the upper basin of the Waikato river to the N.E. of Lake Taupo. In many respects the scene presented in various parts of the districts is far more striking and beautiful than anything of the same kind to be found in Iceland, but this is due not so much to the grandeur of the geysers proper as to the bewildering profusion of boiling springs, steam-jets, and mud-volcanoes, and to the fantastic effects produced on the rocks by the siliceous deposits and by the action of the boiling water. At Whakarewarewa, near Lake Loto Rua, there is a group of eight geysers, one of which, the Waikate, throws the column to a height of 30 or 35 feet (see Hochstetter, *New Zealand*, 1867). But it is in the Yellowstone Park, in the north-west corner of Wyoming, that the various phenomena of the geysers can be observed on the most portentous scale. The geysers themselves are to be counted by hundreds, and the dimensions and activity of several of them render those of Iceland and New Zealand almost insignificant in comparison. The principal groups are situated along the course of that tributary of the Upper Madison which bears the name of Fire Hole River. Many of the individual geysers have very distinctive characteristics in the form and colour of the mound, in the style of the eruption, and in the shape of the column. The "Giantess," as observed by Langford (1870) and Dunraven (1874), lifts the main column to a height of only 50 or 60 feet, but shoots a thin spire to no less than 250 feet. The "Castle" varies in height from 10 or 15 to 250 feet; and on the occasions of greatest effort the noise is appalling, and shakes the ground like an earthquake. Strong distinct pulsations, says Lord Dunraven, occurred at a maximum rate of seventy per minute, having a general tendency to increase gradually in vigour and rapidity until the greatest development of strength was attained, and then sinking again by degrees. The jets grew stronger and stronger at every pulsation for ten or twelve strokes, until the effort would culminate in three impulses of unusual power. The total display lasted about an hour. "Old Faithful" owes its name to the regularity of its action. Its eruptions, which raise the water to a height of 100 or 150 feet, last for about five minutes, and recur every three-quarters of an hour. The "Beehive" sometimes attains a height of 219 feet; and the water, instead of falling back into the basin, is dissipated in spray and vapour. Very various accounts are given of the "Giant." Hayden saw it playing for an hour and twenty minutes, and reaching a height of 140 feet, and Lieutenant Doane says it continued in action for three hours and a half, and had a maximum of 200 feet; but at the earl of Dunraven's visit the eruption lasted only a few minutes. For further details see Dunraven's *Great Divide* (1874), and the *Reports* of Professor Hayden.

[1] According to Professor Tyndall (see *Royal Institution Notices*, 1853, and *Heat as a Mode of Motion*, 1863), this effect of the stopper is simply due to the fact that it is an impediment to the normally gradual ascent of the heated aqueous strata, and that it is an impediment which at last is suddenly removed.

GEZER (גזר), a royal Canaanite city on the boundary of Ephraim in the maritime plain (Josh. xvi. 3-10). It was allotted to the Levites, but its original inhabitants were not driven out until the time of Solomon, when the Egyptians took the city, which was given to Solomon's wife (1 Kings ix. 16). Under the form Gazera it is mentioned as being in the neighbourhood of Emmaus-Nicopolis ('Amwâs) and Jamnia (Yebnah) (1 Macc. iv. 15). Throughout the history of the Maccabean wars Gazera plays the part of an important frontier post. It was first taken from the Greeks by Simon the Asmonean (1 Macc. xiv. 7). Josephus also mentions that the city was "naturally strong" (*Antiq.*, viii. 6, 1). The position of Gezer is defined by Jerome (*Onomasticon*, s.v.) as 4 Roman miles north (contra septentrionem) of Nicopolis ('Amwâs). This points to the ruined site called *Tell Jezer*, near the village of Abu Shûsheh, about 4 miles north-west of 'Amwâs. The site is naturally very strong, the town standing on an isolated hill, commanding the western road to Jerusalem just where it begins to enter the mountains of Judah. The name Gezer (from a root signifying "insulated") was no doubt derived from the position of the place. The ruins include rock-cut tombs, wine-presses, caves, and quarries, with foundations of a citadel on the hill top. A very fine spring ('Ain Yerdeh) exists on the east, and in 1874 a curious discovery was made on the hill side near the spring. The words Tahum Gezer, "boundary of Gezer," were found cut in Hebrew letters on the live rock in two places, and in each case the Greek name Alkios occurred with them. The genuineness of this curious inscription has not been disputed.

GFRÖRER, August Friedrich (1803–1861), historian, was born at Calw, Würtemberg, on the 5th of March 1803, and at the close of his preliminary studies at the seminary of Blaubeuren, entered the university of Tübingen in 1821 as a student of evangelical theology. After passing his final examinations in 1825, he spent a year in Switzerland, during part of which time he acted as companion and secretary to Bonstetten; the year 1827 was spent chiefly in Rome. Returning to Würtemberg in 1828, he first undertook the duties of repetent or theological tutor in Tübingen and afterwards accepted a curacy in Stuttgart; but having in 1830 received an appointment in the royal public library at Stuttgart, he thenceforth gave himself exclusively to literature and historical science. His first work on Philo (*Philo u. die jüdisch-alexandrinische Theosophie*, 1831) was rapidly followed by an elaborate biography, in two volumes, of Gustavus Adolphus (*Gustav Adolf, König von Schweden*, 1835–37), and by a critical history of primitive Christianity (*Kritische Geschichte des Urchristenthums*, 1838), in three volumes, consisting of three parts, entitled respectively "The Century of Salvation" (*Jahrhundert des Heils*), "Sacred Legend" (*Die heilige Sage*), and "Truth" (*Die Wahrheit*). In both of the last-named works, Gfrörer had manifested opinions unfavourable to Protestantism, which, however, were not openly avowed until fully developed in his church history (*Allgemeine Kirchengeschichte bis Beginn des 14ten Jahrhunderts*, 1841–46). In the autumn of 1846 he was appointed to the chair of history in the university of Freiburg, where he continued to teach until his death, which took place at Carlsbad on the 10th of July 1861. In 1848 he sat as a representative in the Frankfort parliament, where he supported the "High German" party, and in 1853 he publicly went over to the Church of Rome, influenced, however, in this, it is said, more by regard for what he conceived to be its political value, than by any purely religious consideration. Among his later works the most important is the *Geschichte der ost- u. westfränkischen*

Karolinger (1858); but those on the pseudo-Isidorian Decretals (*Untersuchung über Alter, Ursprung, u. Werth der Decretalen des falschen Isidorus*, 1848), on the primitive history of mankind (*Urgeschichte des menschlichen Geschlechts*, 1855), on Hildebrand (*Papst Gregor VII. u. sein Zeitalter*, 1859–61), on the history of the 18th century (*Geschichte des 18ten Jahrhunderts*, 1862–73), on German popular rights (*Zur Geschichte deutscher Volksrechte*, 1866), and on Byzantine history (*Byzantinische Geschichte*, 1872–74), are also works of real value. The fruit of much original research, they convey a great quantity of fresh information, and are unusually rich in suggestion; their chief fault may be said to lie in an excess of ingenuity, which leads their author to imagine combinations which never existed, and to invent the most recondite causes for historical occurrences, the explanation of which is rather to be sought in the region of the obvious.

GHÁTS, or GHAUTS (literally "the Landing Stairs" from the sea, or "Passes"), two ranges of mountains extending along the eastern and western shores of the Indian peninsula. The *Eastern Gháts* run in fragmentary spurs and ranges down the Madras coast. They commence in the Orissa district of Balasor, pass southwards through Cuttack and Purí, enter the Madras presidency in Ganjám, and sweep southwards through the districts of Vizagapatam, Godávari, Nellore, Chengalpat, South Arcot, Trichinopoli, and Tinnevelly. They run at a distance of from 50 to 150 miles from the coast, except in Ganjám and Vizagapatam, where in places they almost abut on the Bay of Bengal. Their geological formation is granite, with gneiss and mica slate, with clay slate, hornblende, and primitive limestone overlying. The average elevation is about 1500 feet, but several hills in Ganjám are between 4000 and 5000 feet. The *Western Gháts* start from the north of the Tápti valley, and run south through Khándesh, Násik, Tanna, Satara, Ratnagiri, Kanara, and Malabar, and the states of Cochin and Travancore, meeting the Eastern Gháts at an angle near Cape Comorin. The range of the Western Gháts extends uninterruptedly, with the exception of a gap or valley 20 miles across known as the Palghát gap. The length of the range is 800 miles from the Tápti to the Palghát gap, and south of this about 200 miles to the extreme south of the peninsula. In many parts there is only a narrow low strip of coast between the hills and the shore; at one point they rise in magnificent precipices and headlands out of the ocean. The average elevation is 3000 feet, precipitous on the western side facing the sea, but with a more gradual slope on the east to the plains below. The highest peaks in the northern section are Mahábaleswar, where is the summer capital of the Government of Bombay, 4700 feet; Purandhar, 4472; and Sinhgarh, 4162 feet. South of Mahábaleswar the elevation diminishes to about 1000 feet above sea-level. Further south the elevation again increases, and attains its maximum towards Coorg, where the highest peaks vary from 5500 to 7000 feet, and where the main range joins the interior Nilgiri hills. South of the Palghát gap, the peaks of the Western Gháts rise as high as 7000 feet. The geological formation is trap in the northern and laterite in southern section.

GHÁZIÁBÁD, a town in Meerut district, North-Western Provinces of India, distant 12 miles from Delhi and 28 miles from Meerut, in 28° 39′ 55″ N. lat., 77° 28′ 10″ E. long. The town was founded in 1740 by Ghází-ud-dín, brother of Nawáb Salábat Jang, ruler of the Deccan, and takes its name from its founder. It has considerably risen in importance of late years, from having been selected as the point of junction of the East Indian, and the Sind, Punjab, and Delhi railways. A branch into Delhi city diverges from Gháziábád. Population (1872) 7365.

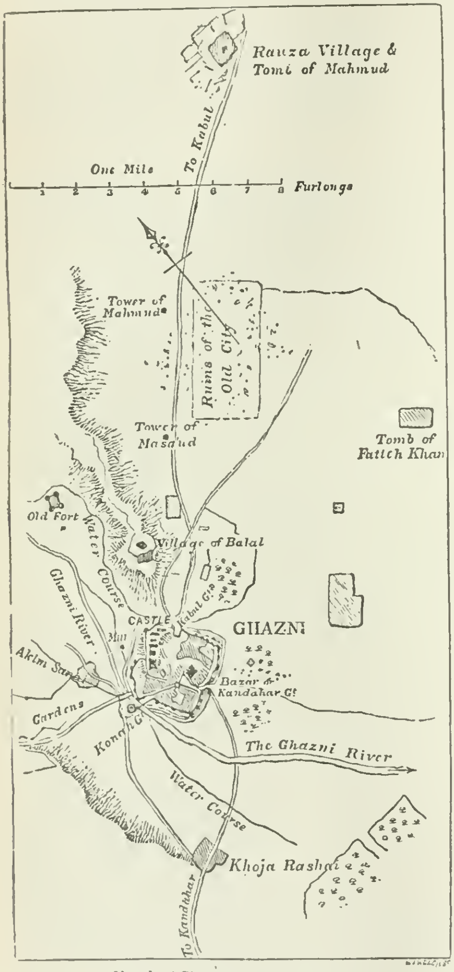
GHÁZÍPUR, a district of British India, in the lieutenant-governorship of the North-Western Provinces, and included in the Benares division. It is bounded on the N. by Azimgarh and Sáran, E. by Sáran, S. by Sháhábád, and W. by Benares and Jaunpur. Gházipur forms part of the great alluvial plain of the Ganges, which divides it into two unequal portions. The northern subdivision lies between the Gumtí and the Gográ, whose confluences with the main stream mark its eastern and western limits respectively. The southern tract is a much smaller strip of country, enclosed between the Karamnása and the great river itself. No hill or natural eminence is to be found in the district. A few lakes are scattered here and there, formed where the rivers have deserted their ancient channels. The largest is that of Suráha, once a northern bend of the Ganges, but now an almost isolated sheet of water, 5 miles long by about 4 broad.

Gházípur is a closely cultivated district, and out of a total area of 2168 square miles 1546 are actually under cultivation. The harvests are the same as those common to the whole of the plain districts of the North-Western Provinces. The census of 1872 returned a total population in Gházípur district of 1,345,570 souls (males 696,572, females 648,829), dwelling in 3725 villages or townships, and inhabiting 285,007 houses. The Hindus numbered 1,221,810, or 90·7 per cent., and Mahometans, 123,455. Of the three higher Hindu castes there were — Bráhmans, 123,012; Rajputs, 295,355; and Baniyás 49,538. The lower castes are represented by the Ahirs, 171,216; Chamárs, 122,075; Káyasths, 22,480; and Kurmis, 18,136. Amongst the Mussulmans, the Shaikhs numbered 26,940; Sayyids, 4525; Mughals, 570; and Patháns, 18,452. The district is rich, and in the eastern parts the soil is extremely fertile, so that the cultivators are, on the whole, in easy circumstances. Sixteen towns contain a population exceeding 5000, viz., Gházípur, 38,853; Mahatwar Khás, 8975; Shinpur Diar, 9279; Gahmar, 9050; Sherpur, 7958; Riotipur, 9323; Bára, 5424; Chit, 5821; Narhi, 5527; Bansdih, 7319; Rioti, 7700; Maniar, 5285; Ballia, 8521; Bairia, 5589; Sonbarsa, 7162; and Rasra, 7261. The chief imports into the district are English piece goods and thread, cotton, salt, spices, and grain; the principal exports, country cloth, sugar, fuller's earth, oil seeds, and hides. The headquarters of the Government opium manufacture is at Gházípur town. Carbonate of soda is manufactured from the *reh* or saline efflorescence of the barren *usar* plains, and largely exported. Saltpetre is also largely prepared from the same source. The great trade route is the Ganges, but good roads connect all the principal centres with each other. The East Indian Railway runs for 24 miles through the district, with stations at Zamániah, Dildarnagar, and Gahmar. The total amount of imperial, local, and municipal revenue of the district in 1876 was £200,000. Gházípur is said to be one of the hottest and dampest districts in the North-Western Provinces. In 1869 the annual mean temperature was 80° Fahr., the lowest monthly mean being 61° Fahr., in January, and the highest 98°, in May. The average total rainfall for 11 years from 1860 to 1871 was 40·1 inches, the maximum being 50·5 inches, in 1861, and the minimum 21·5 inches, in 1868.

GHÁZÍPUR TOWN, the capital of the district, stands on the low alluvial northern bank of the Ganges, in 35° 23′ 36″ N. lat. and 83° 35′ 13″ E. long., covering an area of 416 acres, and with a population in 1872 of 38,853. There is considerable trade in sugar, tobacco, long cloth, and rose water. It is the headquarters of the Government opium department, where all the opium from the North-Western Provinces is collected and manufactured under a monopoly. A metalled road runs from Gházípur to Zamániah station on the East Indian Railway, 13½ miles. Lord Cornwallis, the governor-general of India, died at Gházípur in 1805, and a monument and marble statue are erected over his grave.

GHAZNI (called in European books often Ghaznah, Gazna, Ghizni, or Ghuznee, in the Oriental histories more generally Ghaznin), a famous city in Afghanistan, the seat of an extensive empire under two different mediæval dynasties, and again of prominent interest in the modern history of British India. Ghazni stands on the high table-land of central Afghanistan, in 68° 20′ E. long., 33° 34′ N. lat., at a height of 7726 feet above the sea, and on the direct road between Kandahar and Cabul, 233 miles by road N.E. from the first, and 85 miles S.W. from the second. It also stands at the head of the Gomal route from the Indus, one much followed by trade.

Ghazni, as it now exists, is a place in decay, and probably does not contain more than 4000 inhabitants. It stands at the base of the terminal spur of a ridge of hills, an offshoot from the Gul-Koh, which forms the watershed between the Arghandáb and Tarnak rivers (see AFGHANISTAN). The castle stands at the northern angle of the town next the



Sketch of Ghazni and its Envirous.

hills, and is about 150 feet above the plain. The town walls stand on an elevation, partly artificial, and form an irregular square, close on a mile in circuit (including the castle), the walls being partly of stone or brick laid in mud, and partly of clay built in courses. They are flanked by numerous towers. There is also a loopholed fausse-braye wall, and a ditch which can be filled (partially at least) from the Ghazni river, which flows close to the west of the town. There are three gates. The town consists of dirty and very irregular streets of houses several stories high, but with two straighter streets of more pretension, crossing near the middle of the town. New fortifications had been erected previous to 1857, but their present state is not known. In 1839 they were of no real power to resist artillery of moderate calibre, though imposing in aspect and highly picturesque, judging from the views given by Sir Keith Jackson and others. Of the strategical importance of Ghazni there can hardly be a question. The view to the south is extensive, and the plain in the direction of Kandahar stretches to the horizon. It is bare except in the vicinity of the river, where villages and gardens are tolerably numerous. Abundant crops of wheat and barley are grown, as well as of madder, besides minor products. The climate is notoriously cold,—snow lying two or three feet deep for about three months, and tradition speaks of the city as having been more than once overwhelmed by snow-drift. Fuel is scarce, consisting chiefly of prickly shrubs. In summer the heat is not like that of Kandahar or Cabul, but the radiation from the bare heights renders the nights oppressive, and constant dust-storms occur. It is evident that the present restricted walls cannot have contained the vaunted city of Mahmúd. Probably the existing site formed the citadel only of his city. The remarks of Ibn Batuta (*c.* 1332) already suggest the present state of things, viz., a small town occupied, a large space of ruin; for a considerable area to the N.E. is covered with ruins, or rather with a vast extent of shapeless mounds, which are pointed out as Old Ghazni. The only remains retaining architectural character are two remarkable towers, rising to the height of about 140 feet, and some 400 yards apart from each other. They are similar, but whether identical, in design, is not clearly recorded. They belong, on a smaller and far less elaborate scale, to the same class as the Kutb Minar at Delhi. Views of one of the minarets will be found in Fergusson's *Indian Architecture*, in Vigne's *Visit to Ghazni, Cabul, &c.*, in Atkinson's *Sketches in Afghanistan*, and other works. Arabic inscriptions in Cufic characters show the most northerly to have been the work of Mahmúd himself, the other that of his son Masa'úd. On the Cabul road, a mile beyond the Minaret of Mahmúd, is a village called Rauzah ("the Garden," a term often applied to garden-mausoleums). Here, in a poor garden, stands the tomb of the famous conqueror himself. It is a prism of white marble standing on a plinth of the same, and bearing a Cufic inscription praying the mercy of God on the most noble Amír, the great king, the Lord of church and state, Abul Kásim Mahmúd, son of Sabuktigin. The tomb stands in a rude chamber, covered with a dome of clay, and hung with old shawls, ostrich eggs, tiger-skins, and so forth. The village stands among luxuriant gardens and orchards, watered by a copious aqueduct. Sultan Baber celebrates the excellence of the grapes of Rauzah.

The famous "Gates of Somnath" (so-styled) were attached to the building covering Mahmúd's tomb until their removal to India, under Lord Ellenborough's orders, on the evacuation of the country in 1842. The governor-general's intention, as announced in a famous prose pæan addressed to the Hindu princes, was to have carried them solemnly through Upper and Central India to Guzerat, and there to have restored them to the (long-desecrated) temple. Calmer reflexion prevailed, and the gates were consigned to the arsenal at Agra, where they now remain. These gates (11 feet in height, $9\frac{1}{2}$ in width) are ascertained to be of Himalayan cedar (deodar), and are richly carved in geometric Saracenic patterns, so that there is no likelihood of any real connexion with Somnath. But tradition did ascribe to them such a connexion. And when Sháh Shúja in 1831 treated with Maharája Ranjit

Singh for aid to recover the throne of Cabul, one of Ranjit's stipulations was the restoration of the gates to Somnath, a circumstance which probably suggested the notion to the eccentric governor-general. A still more remarkable fact (stated in a report by Capt. Claude Wade, dated 21st Nov. 1831) is that the sháh reminded the maháraja of a prophecy that foreboded the downfall of the Sikh dominion on the removal of the Ghazni gates. The gates were removed to India in the end of 1842; and the Sikh kingdom practically collapsed with the death of Sher Singh in September 1843. Another relic of Sultan Mahmúd is the *Band-i-Sultán*, a great dam on the Ghazni river, some 12 miles above the city. Baber describes it as 80 or 100 feet in height, probably along the slope, and about 600 feet long. It had lain ruined in his time since its destruction by Aláuddin Jahánsoz, but Baber sent money to restore it. Vigne calls it only 25 feet in height. He found it much out of repair. It supplies irrigation to the plain west of Ghazni.

There are many holy shrines about Ghazni surrounded by orchards and vineyards. Baber speaks of them, and tells how he detected and put a stop to the imposture of a pretended miracle at one of them. These sanctuaries make Ghazni a place of Moslem pilgrimage, and it is said that at Constantinople much respect is paid to those who have worshipped at the tomb of the great Ghází. To test the genuineness of the boast, professed pilgrims are called on to describe the chief *notabilia* of the place, and are expected to name all those detailed in certain current Persian verses.

The city is not mentioned by any narrator of Alexander's expedition, nor by any ancient author so as to admit of positive recognition. But it is very possibly the *Gazaca* which Ptolemy places among the *Paropamisadæ*, and this may not be inconsistent with Sir H. Rawlinson's identification of it with *Gazos*, an Indian city spoken of by two obscure Greek poets as an impregnable place of war. The name is probably connected with the Persian and Sanskrit *ganj* and *ganja*, a treasury (whence the Greek and Latin *Gaza*). We seem to have positive evidence of the existence of the city before the Mahometan times (644) in the travels of the Chinese pilgrim, Hwen Thsang, who speaks of *Ho-si-na* (*i.e.*, probably *Ghazna*) as one of the capitals of *Tsaukuta* or Arachosia, a place of great strength. In early Mahometan times the country adjoining Ghazni was called *Zábul*. When the Mahometans first invaded that region Ghazni was a wealthy entrepôt of the Indian trade. Of the extent of this trade some idea is given by Ibn Haukal, who states that at Cabul, then a mart of the same trade, there was sold yearly indigo to the value of two million dínárs (£1,000,000). The enterprise of Islám underwent several ebbs and flows over this region. The provinces on the Helmand and about Ghazni were invaded as early as the caliphate of Moáwia (662-680). The arms of Ya'kúb Leis swept over Cabul and Arachosia (Al-Rukhaj) about 871, and the people of the latter country were forcibly converted. Though the Hindu dynasty of Cabul held a part of the valley of Cabul river till the time of Mahmúd, it is probably to the period just mentioned that we must refer the permanent Mahometan occupation of Ghazni. Indeed, the building of the fort and city is ascribed by a Mahometan historian to 'Amrú Leis, the brother and successor of Ya'kúb (d. 901), though the facts already stated discredit this. In the latter part of the 9th century the family of the Samání, sprung from Samarkand, reigned in splendour at Bokhara. Alptigín, originally a Turkish slave, and high in the service of the dynasty, about the middle of the 10th century, losing the favour of the court, wrested Ghazni from its chief (who is styled Abú Bakr Lawík, wáli of Ghazni), and established himself there. His government was recognized from Bokhara, and held till his death. In 977 another Turk slave, Sabuktigín, who had married the daughter of his master Alptigín, obtained rule in Ghazni. He made himself lord of nearly all the present territory of Afghanistan and of the Punjab. In 997 Mahmúd, son of Sabuktigín, succeeded to the government, and with his name Ghazni and the Ghaznevid dynasty have become perpetually associated. Issuing forth year after year from that capital, Mahmúd carried fully seventeen expeditions of devastation through northern India and Guzerat, as well as others to the north and west. From the borders of Kurdistan to Samarkand, from the Caspian to the Ganges, his authority was acknowledged. The wealth brought back to Ghazni was enormous, and contemporary historians give glowing descriptions of the magnificence of the capital, as well as of the conqueror's munificent support of literature. Mahmúd died in 1030, and some fourteen kings of his house came after him; but though there was some revival of importance under Ibrahim (1059-1099), the empire never reached anything like the same splendour and power. It was overshadowed by the Seljuks of Persia, and by the rising rivalry of GHUR (*q. v.*), the hostility of which it had repeatedly provoked. Bahram Sháh (1118-1152), put to death Kutbuddin, one of the princes of Ghúr, called king of the Jibál or Hill country, who had withdrawn to Ghazni. This prince's brother, Saifuddín Súri, came to take vengeance, and drove out Bahram. But the latter recapturing the place (1149) paraded Saifuddín and his vizier ignominiously about the city, and then hanged them on the bridge. Alá-uddín of Ghúr, younger brother of the two slain princes, then gathered a great host, and came against Bahram, who met him on the Helmand. The Ghúri prince, after repeated victories, stormed Ghazni, and gave it over to fire and sword. The dead kings of the house of Mahmúd, except the conqueror himself and two others, were torn from their graves and burnt, whilst the bodies of the princes of Ghúr were solemnly disinterred and carried to the distant tombs of their ancestors. It seems certain that Ghazni never recovered the splendour that perished then (1152). Alá-uddín, who from this deed became known in history as *Jahán-soz* (*Brûle-monde*), returned to Ghúr, and Bahram reoccupied Ghazni; he died in 1157. In the time of his son Khusru Sháh, Ghazni was taken by the Turkish tribes called Ghuzz (generally believed to have been what are now called Turkomans). The king fled to Lahore, and the dynasty ended with his son. In 1173 the Ghuzz were expelled by Ghiyássuddín Sultan of Ghúr (nephew of Ala-uddin Jahansoz), who made Ghazni over to his brother Muizuddin. This famous prince whom the later historians call, it is not clear why, *Shaháb-uddín* Ghúri, shortly afterwards (1174-5) invaded India, taking Multán and Uchh. This was the first of many successive inroads on western and northern India, in one of which Lahore was wrested from Khusrú Malik, the last of Mahmúd's house, who died a captive in the hills of Ghúr. In 1192 Prithvi Rái or Pithora (as the Moslem writers call him) the Chohán king of Ajmír, being defeated and slain near Thanesar, the whole country from the Himálaya to Ajmír became subject to the Ghúri king of Ghazni. On the death of his brother Ghiyássuddín, with whose power he had been constantly associated, and of whose conquests he had been the chief instrument, Muizuddin became sole sovereign over Ghur and Ghazni, and the latter place was then again for a brief period the seat of an empire nearly as extensive as that of Mahmúd the son of Sabuktigín. Muizuddin crossed the Indus once more to put down a rebellion of the Khokars in the Punjab, and on his way back was murdered by a band of them, or, as some say, by one of the *Muláhidah* or Assassins. The slave lieutenants of Muizuddin carried on the conquest of India, and as the rapidly succeeding events broke their dependence on any master, they established at Delhi that monarchy of which, after it had endured through many dynasties, and had culminated with the Moghul house of Baber, the shadow perished in 1857. The death of Muizuddin was followed by struggle and anarchy, ending for a time in the annexation of Ghazni to the empire of Khwarazm by Mahommed Sháh, who conferred it on his famous son, Jaláluddin, and Ghazni became the headquarters of the latter. After Jenghiz Khan had extinguished the power of his family in Turkestan, Jaláluddin defeated the army sent against him by the Mongol at Parwán, north of Cabul. Jenghiz then advanced and drove Jaláluddin across the Indus, after which he sent Okkodai his son to besiege Ghazni. Henceforward Ghazni is much less prominent in Asiatic history. It continued subject to the Mongols, sometimes to the house of Hulákú in Persia, and sometimes to that of Chaghatai in Turkestan. In 1326, after a battle between Amir Husain, the viceroy of the former house in Khorasan, and Tarmashirín, the reigning khan of Chaghatai, the former entered Ghazni and once more subjected it to devastation, and this time the tomb of Mahmúd to desecration. The statement in a recent book on Afghanistan, that a new Ghori dynasty reigned at *Ghazni* from 1336 to 1383, is erroneous.

Ibn Batuta (*c.* 1332) says the greater part of the city was in ruins, and only a small part continued to be a town. Timur seems never to have visited Ghazni, but we find him in 1401 bestowing the government of Cabul, Kandahar, and Ghazni on Pír Mahommed, the son of his son Jahángír. In the end of the century it was still in the hands of a descendant of Timur, Ulugh Beg Mirza, who was king of Cabul and Ghazni. The illustrious nephew of this prince, Baber, got peaceful possession of both cities in 1504, and has left notes on both in his own inimitable Memoirs. His account of Ghazni indicates how far it had now fallen. "It is," he says, "but a poor mean place, and I have always wondered how its princes, who possessed also Hindustan and Khorasan could have chosen such a wretched country for the seat of their government, in preference to Khorasan." He commends the fruit of its gardens, which still contribute largely to the markets of Cabul. Ghazni remained in the hands of Baber's descendants, reigning at Delhi and Agra, till the invasion of Nadir Shah (1738), and became after Nadir's death a part of the new kingdom of the Afghans under Ahmed Sháh Durráni. We know of but two modern travellers who have recorded visits to the place previous to the war of 1839. George Forster passed as a disguised traveller with a kafila in 1783. "Its slender existence," he says, "is now maintained by some Hindu families, who support a small traffic, and supply the wants of the few Mahometan residents." Mr Vigne visited it in 1836, having reached it from Multan with a caravan of Lohâni merchants, travelling by the Gomal pass. The historical name of Ghazni was brought back from the dead, as it were, by the news of its capture by the British army under Sir John Keane, 23d July 1839. The siege artillery had been left behind at Kandahar; escalade was judged impracticable; but the project of the commanding engineer, Captain George Thomson, for blowing in the Cabul gate with powder in bags, was adopted, and carried out successfully, at the cost of 182 killed and wounded. Two years and a half later, the Afghan outbreak against the British occupation found Ghazni garrisoned by a Bengal regiment of sepoys, but neither repaired nor provisioned. They held out under great hardships from 16th December 1841 to 6th March 1842, when they surrendered. In the autumn of the same year General Nott, advancing from Kandahar upon Cabul, reoccupied Ghazni, destroyed the defences of the castle and part of the town, and carried away the famous gates. Since then Ghazni has not been entered by any Englishman; for when Colonel Lumsden's mission passed this way in 1857 they were not allowed to approach the place.

GHEE (Sanskrit, *Ghrita*), a kind of clarified butter made in the East. The best is prepared from butter of the milk of cows, the less esteemed from that of buffaloes. The butter is melted over a slow fire, and set aside to cool; the thick, opaque, whitish, and more fluid portion, or ghee, representing the greater bulk of the butter, is then removed. The less liquid residue, mixed with groundnut oil, is sold as an inferior kind of ghee. It may be obtained also, according to the *Indian Domestic Economy and Receipt Book*, p. 16, 6th ed., 1865, by boiling butter over a clear fire, skimming it the while, and, when all the water has evaporated, straining it through a cloth. Ghee which is rancid or tainted, as is often that of the Indian bazaars, is said to be rendered sweet by boiling with leaves of the *Moringa pterygosperma* or horse-radish tree. In India ghee is one of the commonest articles of diet, and indeed enters into the composition of everything eaten by the Brahmans. It is also extensively used in Indian religious ceremonies, being offered as a sacrifice to idols, which are at times bathed in it. Sanskrit treatises on therapeutics describe ghee as cooling, emollient, and stomachic, as capable of increasing the mental powers, and of improving the voice and personal appearance, and as useful in eye-diseases, tympanitis, painful dyspepsia, wounds, ulcers, and other affections. Old ghee is in special repute among the Hindus as a medicinal agent, and its efficacy as an external application is believed by them to increase with its age. Ghee more than 10 years old, the *purána ghrita* of Sanskrit materia medicas, has a strong odour, and the colour of lac. Some specimens which have been much longer preserved—and "clarified butter a hundred years old is often heard of"—have an earthy look, and are quite dry and hard, and nearly inodorous. Medicated ghee (Sanskrit, *ghrita páka*) is made by warming ordinary ghee to remove contained water, melting, after the addition of a little turmeric juice, in a metal pan at a gentle heat, and then boiling with the prepared drugs till all moisture is expelled, and straining through a cloth.

See Udoy Chand Dut, *The Materia Medica of the Hindus, compiled from Sanskrit Medical Works*, Calcutta, 1877, and, on the uses of ghee in culinary operations, the above quoted *Receipt Book*, and *The Indian Cookery Book*, Calcutta (1869 ?).

GHEEL, or GEEL, a town of Belgium, in the province of Antwerp, about 25 miles E. of Antwerp, on the railway between Herenthals and Moll, with a population, according to the census of 1876, of 10,265. Situated in the midst of that half barren stretch of moorland which is known as the Campine or Kampenland, it would have been of little importance, in spite of its manufactures of cloth, leather, wooden shoes, and wax-lights, had it not for long centuries been the seat of a unique method of dealing with the insane. A local legend, tracing the origin of the town back to a chapel of St Martin erected in the 7th century, goes on to tell how an Irish princess, fearing the fate that long afterwards befel Beatrice Cenci, sought refuge in this remote asylum, but was pursued by her relentless father and put to death, along with a priest Gerrebert, the companion of her flight. The tomb of the victims was soon discovered to have a healing virtue for minds diseased; the sainted Dymphna became the patroness of the insane; and a large and beautiful church in her honour was erected on the site of St Martin's chapel. Commenced in the 12th century, it was finished in 1340, and consecrated by the bishop of Cambray; and the pilgrimages to the tomb were sanctioned by a brief of Eugenius IV. In 1538 Jean de Mérode, within whose domains the church was situated, instituted a vicariate of nine priests and a director, and in 1562 Henri de Mérode transformed the vicariate into a regular chapter of nine canons and a dean. The church still remains to bear witness to the importance formerly attached to the shrine; and though the tomb of St Dymphna has long been a cenotaph, a few stray enthusiasts still pass beneath it in hopeful imitation of the thousands in byegone years, whose knees have worn deep furrows in the pavement as they made their ninefold transits on nine successive days. As food and lodging had to be provided for the patients who were brought to the saint, the inhabitants of Gheel grew accustomed to the treatment of the various kinds of mental alienation, and gradually discovered that forcible measures were much less frequently necessary, and danger less likely to result from free intercourse with the insane, than was generally believed throughout Europe. When M. Pontecoulant was appointed by Napoleon prefect of the Revolution department of the Dyle, his attention was called to the success of the domestic régime in force at Gheel, in contrast to the sad condition of affairs in the asylum at Brussels, and he caused the patients to be removed from the capital to the little country town. His example was freely followed by the authorities of different districts, and Gheel received full official recognition. Investigations undertaken about 1850 by M. Ducpétiaux, inspector-general of benevolent establishments in Belgium, resulted in the reform of such abuses as had crept into the system; and the relations of the patient and his protectors were placed on a strict legal footing by the law of 1st May 1851. Further ameliorations have been introduced in 1852, 1857, 1858, &c. The whole management of the system is under the supervision of officially appointed physicians, and the advantages of a regular establishment are thus combined with those of domestic comfort, social freedom, and activity. Permission to receive patients is granted not only to the town residents, but also to the villagers of the vicinity.

Among the numerous works and papers descriptive of Gheel and its régime, the following may be mentioned:—Gazot, *Hist. ecclésiastique des Pays Bas*, 1614; Biffi, "Memorie originali," in *Gazetta medica Italiana*, 2d Oct. 1854; Brown, in *Asylum Journal*, 1858; Bucknill, *Ibid.*, 1858, 1859; Bulckens, *Rapport*, &c., Brussels, 1857; papers by Auguste Droste, in *Allg. Zeitsch. fur Psychiatrie*, 1853, *Corr. Blätter der Deutschen Ges. für Psychiatrie*, 1856, *Hygea*, 1857, and *Deutsche Klinik*, 1858; Esquirol, *Mal. mentales*, vol. ii.; Jules Duval, *Gheel, ou Une colonie d'aliénés*, Paris, 1860; Ruedy, *Gheel, Beitrag zur Gesch. der prakt. Psychiatrie*, Berlin, 1875.

GHENT, in Low Latin *Ganda* or *Gandavum*, in French *Gand*, in Flemish *Gend*, in German *Gent*, a city of Belgium, at the head of the province of East Flanders, is situated about 30 miles to the west of Antwerp on the Scheldt and the Lys. The two streams branch out to such an extent as to partition the town into 26 islands, which are connected by about 270 bridges, 42 being of stone, and 28 of the others being wooden structures of considerable size. In general Ghent is well built, and, though the older portion has narrow and gloomy lanes, it occupies as a whole a larger area than most European towns in proportion to the population and the number of houses. A striking and pleasing feature is the number of promenades, the most noteworthy being the Coupure or "Cutting," so called from the branch of the Bruges canal constructed in 1758. Gardens, orchards, and corn-fields are enclosed within the ancient boundaries of the walls, which extended nearly 8 miles in circumference. An excellent view of the city and its environs is obtained from the belfry of the grand old watch-tower erected by the men of Ghent between 1183 and 1339, from whose summit the voice of the famous bell Roland called the burghers together for fire or fray. The present

Plan of Ghent.

1. Great Beguinage.
2. Church of St Sauveur.
3. Library and Royal Athenæum.
4. Church of St Jacques.
5. Statue of Artevelde.
6. Cannon (Dulle Griete).
7. Counts' Castle.
8. Fish Market.
9. Church of St Michel.
10. Church of St Nicholas.
11. Hôtel de Ville.
12. Watch Tower (Belfry).
13. Cathedral of St Bavon.
14. University.
15. Court-House.
16. Theatre.
17. Baths.
18. Abbey St Bavon.
19. Béguinage.
20. Church of Ste Barbe.
21. Theatre.
22. Gas-Works.
23. Church of St Anne.
24. Little Béguinage.
25, 26, 27. Barracks.

spire of cast iron dates from 1854, but it is still surmounted by the golden dragon brought to Ghent from the church of St Sophia in Constantinople, not long after the conquest of that city by the crusaders. Roland was removed by Charles V., and its place is now supplied by a chime of 44 bells.

Almost all the houses of the wealthier classes of Ghent are constructed after the Italian fashion, with wide portes-cochères, spacious courtyards, and lofty staircases; but along the quays and in the older streets there are still numerous specimens of the quainter and grander architecture of the 16th and 17th centuries. The industrial classes live for the most part in long monotonous rows of poor-looking houses. Among the public squares the most noteworthy are the Friday Market (*Marché du Vendredi*), where in former days the counts of Flanders were inaugurated and the trades unions used to assemble; the *Kauter* (the word in Flemish means field), which became the Place d'Armes in 1812, and is the favourite rendezvous of the fashionable world; the Plaine de St Pierre, especially used for military reviews; the Corn Market, which is one of the busiest spots in the town; and the Place Sainte Pharailde, which contains the façade of the fish-market and the gate of the Counts' Castle, and is annually the scene of the so-called Fair of the Little Presents (*Presentjesmarkt*). The Plaine des Recollets, which takes its name from the convent of the Reformed Franciscans (1225–1796), was in 1836 chosen as the site of the new court-house. Near the Friday Market is an enormous cannon, 18 feet long, 10 feet in girth, and nearly 3 feet wide at the mouth, formed in the same fashion as "Mons Meg" in Edinburgh Castle, and surnamed *Dulle Griete*, or "Mad Meg or Margaret."

The cathedral of St Bavon (Flem. *Baefs*) ranks as one of the most splendid of the churches of Belgium. Though the original foundation dates from the 9th or 10th century, the crypt and choir of the actual edifice have no higher antiquity than the 13th century, and the other parts were not completed till the 16th. The roof of the nave has been erected since the destructive fire of 1822. Originally dedicated to St John, the church received its present name only in 1540, when Charles V. made it the seat of the collegiate chapter of the abbey of St Bavon; and it was not till 1559 that it was constituted a cathedral at the request of Philip II. of Spain. In its exterior St Bavon's is rather heavy in style, but it is surmounted by a fine octagonal tower, which, before the destruction of the spire by lightning in 1603, had a height of 360 feet, and still reaches 270 feet. The interior is remarkable for the richness and variety of its decorations. The choir and transepts are lined with black marble, and the balustrades are of white or variegated marble. A statue of St Bavon in his ducal robes adorns the high altar, and in front are four tall copper candlesticks which belonged to Charles I., and bear the royal arms of England. Beneath the windows of the choir are affixed the arms of the knights of the golden fleece, whose last chapter was held by Philip II. in St Bavon's in 1559. The chapels are twenty-four in number; their gates are of brass, and almost every available spot has its painting or statue. The eleventh is known as the Chapel of the Lamb, as it contains the central and principal portion of the famous Adoration of the Lamb painted by John Van Eyck in 1432. Hubert Van Eyck, his brother and compeer, and Margaret, his sister, lie buried in the crypt. The church of St Nicholas—an early Gothic structure, with a great tower of the 15th century and a modern portico—has the credit of being the oldest in the town; and St Michael's, dating from about 1450, but frequently restored, is memorable as the scene of the worship of reason during the French Revolution. Previous to the Revolution there existed in Ghent a large number of convents and monasteries (thirty-seven establishments of this class, with 1122 inmates, are recorded in 1781); and one of its most famous institutions at the present day is the Béguinage of St Elizabeth, a community of about 600 or 700 nuns, who inhabit a separate quarter of the town, consisting of little brick-built cottages arranged in streets and squares within a common wall.

Among the secular buildings of Ghent one of the finest is the Hôtel de Ville, its northern façade being an exceptionally rich example of flamboyant Gothic of the 15th century, and its eastern façade presenting a curious contrast, with its rows of Doric, Ionic, and Corinthian columns after the style of the Italian Renaissance. The court-house or palais de justice is a heavy but imposing structure in the Romanesque manner, erected between 1835 and 1843 by the architect Roelandt at the common expense of the state, the province, and the town. The minor apartments of the lower floor have been all more or less sacrificed to the great Hall of the Lost Footsteps, which is 240 feet long and 70 feet wide. About the same time the same architect was entrusted with the designs for the casino, a building adapted for the flower-shows of the Botanical Society and the concerts of the choral union of St Cecilia. The so-called Government house, which is partly occupied by the provincial administration and partly by the governor as his residence, was assigned by Charles V. to the provost of St Bavon, became in 1581 the property of William of Orange (the Silent), at a later date served as episcopal palace, and in the time of Napoleon was the prefecture. The present episcopal palace was built in 1845 as an appendage to the cathedral.

With benevolent institutions of various kinds Ghent is abundantly supplied. A lunatic asylum, the Hospital of the Byloque, founded as early as 1225, a maternity hospital dating from 1827, a blind asylum (1854) due to the beneficent bequests of L. Van Caneghem, a deaf and dumb institution (1822), and an *atelier de charité*, or establishment for giving work to the unemployed, which has been in operation since 1817, are worthy of special mention. It would be less of a paradox than might be supposed if the great penitentiary (Rasphuis, or Maison de Force) had been included in the list; for it is remarkable, not only for the sumptuous style of its buildings, but for the philanthropic character of its administration. It was erected between 1772 and 1825 at a cost of 2,150,000 francs, and can accommodate 2600 prisoners.

The spacious university buildings were erected between 1819 and 1826, at the expense of the city, under the auspices of William I., king of Holland. They were designed by Roelandt in the Greek style, and one of the principal features is a portico after the model of the Pantheon at Rome. The university library, containing upwards of 100,000 volumes, and reckoned one of the most valuable in Belgium, was formerly the property of the town. Along with the royal athenæum or high school, it occupies the old abbey of Baudeloo, founded by Baldwin of Constantinople in 1199. The abbey gardens were transformed in 1797 into a botanical garden, which now ranks as one of the finest in Europe. A royal academy for the encouragement of art, founded in 1751 by Charles Marissal, and a musical conservatory originated by the communal council in 1835 are both flourishing institutions; and the technical school with about 800 pupils is one of the very best in Belgium. The Natural History Society, dating from 1851, has established a zoological garden.

Though Ghent has no longer the industrial pre-eminence that it enjoyed in the 14th and 15th centuries, it is still the principal seat of the cotton and leather manufactures of Belgium. Flax-spinning, calico-printing, and sugar-refining are also extensively carried on, and there are engineering works, chemical works, iron-foundries, soap-works, paper-mills, and breweries. No fewer than sixty considerable firms, trading with Germany, France, Italy, and Russia, are engaged in commercial floriculture; and, as a consequence, the flower-shows of Ghent, as they were perhaps the earliest, are still among the finest exhibitions of the kind in Europe. The trade of the town, which deals mainly with the products and raw materials of the industries, is fostered by a good railway system and numerous canals. There is direct communication with the sea by a grand canal, which, however, unfortunately for the Belgians, enters the sea at Terneuse in Dutch territory. The harbour, completed in 1828, is capable of accommodating 400 vessels, and vessels drawing 17 feet of water can unload under the walls of the town. At Sas van Gend, 15 miles north of the city, on the frontier of Holland, there are sluices by which the district can be laid under water.

In 1812 Ghent had no more than 55,161 inhabitants; by 1856 they had increased to 109,668, and by 1869 to 121,469. The census of 1876 gave 127,653. Among the celebrities born in the city are Henry Goethals, distinctively Henry of Ghent, a famous theologian and member of the Sorbonne (d. 1295); Philippe Mouskes, the chronicler, P. Vanderberghe or Montanus, the geographer; Daniel Heinsius; Jacques van Zevecote, one of the principal Flemish poets; Lauren Delvaux, a sculptor; C. L. Diericx, the local historian; and J. Guislain, the lunacy physician.

The investigations of local antiquaries leave it still doubtful whether Ghent had a Roman origin, as Petrarch supposed (*Gandavum Cæsare conditore superbum*). That there was a military fortress on the spot in the 7th century, is proved by Baudemont's life of St Amand, the first missionary of Christianity in the district (*Acta Sanctorum* vol. i.). Of the two monasteries founded by the saint in honour of St Peter, the one near the Antwerp gate was richly endowed by St Bavon, and his name became attached, not only to the building, but to the part of the city. About the year 1000 Baldwin Ironarm, first count of Flanders, took possession of Ghent, and a few years after he erected the Gravensteen or Counts' Castle. Trade and manufactures, especially of linen and woollen, were encouraged by Baldwin and his successors, and by the close of the 12th century the men of Ghent were able to purchase commercial and political privileges, and to establish a form of municipal government. They established a court of justice, elected sheriffs, joined the association of the Hanse Towns, and obtained the free navigation of the Rhine from the emperor Frederick I. By the charter of 1192 they obtained the right of fortifying their city, and the first circumvallation carried out between that date and 1214 had a development of 6560 feet. By the end of the 13th century Ghent was a greater city than Paris. In the 14th, under the leadership of the famous Jacob van Artevelde and his son Philip (1332–1382), it raised frequent insurrections against the counts of Flanders, and took a prominent part in the political movements of the Low Countries. In 1385 it was obliged to submit to the duke of Burgundy, but its rights and privileges were left uninjured. At the commencement of the 15th century it had upwards of 40,000 men employed in the woollen manufactures alone, and was able to place in the field from 18,000 to 20,000 men-of-arms. When in 1452 the duke of Burgundy, Philip the Good, imposed a tax on salt and grain, it rose in rebellion, but after a few years' conflict the defeat at Gaveren left it at the duke's mercy. The independence of the burghers was far from being crushed. They showed themselves as turbulent as ever under Mary of Burgundy, who made the city her principal residence; and when she made certain unpopular concessions to Louis XI., they took the law into their hands, and on April 3, 1477, put to death in her presence the two councillors Hugonet and Himber-Court, whom she had intrusted with the mission. After her marriage at Ghent (August 17) with Maximilian of Austria, matters were more peaceful. On Mary's death in 1482 the discontent of the people again broke out. In 1488 they restored their ancient form of government, and held out against the emperor Frederick, who led an army against them in person, but at length in 1492 they came to terms. In 1500 Charles V. was born in the palace at Ghent, the site of which is now occupied by the street called the Cour des Princes. His reign was a critical one for the city, for though it had a population of 175,000, it was but a drop in the bucket of his vast dominions, and he treated it with but little consideration. When in 1536 his sister Maria, at that time in command of the Netherlands, demanded the extraordinary subsidy of 1,200,000 gold florins from Flanders, the citizens refused to contribute, and in 1539 they took arms in self defence. Charles himself appeared on the scene in 1540, forced them to submission, deprived them of their privileges, executed 26 of the principal leaders of the revolt, confiscated the public buildings, and erected a citadel at a total expense of 411,334 livres, the greater part of which had to be defrayed by Ghent itself. Even this did not crush the spirit of the city. It was by the pacification of Ghent, signed in the town-hall Nov. 8, 1578, that Holland and Zeeland, and the southern states of the Netherlands, formed an alliance against the Spanish supremacy, and three days after the Spanish garrison capitulated to the citizens. In 1584, however, the duke of Parma captured the town for Philip, and the citadel, which had been almost completely demolished, was restored. The attempts of the French in 1641 and 1642 to get possession of Ghent were frustrated by laying the country under water; but in 1678, though in the meanwhile the fortifications had been considerably extended, the feeble garrison under Don Francisco de Pardo was unable to defend the place against Marshals Humières, Luxembourg, Schomberg, and Vauban. Ghent continued in French hands till the peace of Nimwegen. It played an important part in the war of the Spanish succession, being captured in 1706 by Marlborough, recovered in 1708 by the French Marquis de Grimaldi, and again captured by Marlborough in 1709. In the war of the Austrian succession, Louis XX. made his entry into the city on 25th July 1745, and remained in possession till the treaty of Aix-la-Chapelle in 1748. By order of Joseph II. in 1781, the citadel and fortifications were dismantled, and the grounds on which they were built were sold. Under the régime of the French Revolution the city was made the chief town of the department of the Scheldt.

By the peace of Paris (1814) it passed with Belgium to Holland; but it took an active part in the movement for the separation of the two kingdoms, and after the separation was accomplished (1830) continued to be the headquarters of the agitation of the Orange party. On the recommendation of the duke of Wellington, who visited the town in 1821 to give his opinion on the plans, a new citadel was erected according to the designs of M. Gey van Pittius (1822–1830).

GHENT, Jodocus, or Justus, of (1465–75). The public records of the city of Ghent have been diligently searched, but in vain, for a clue to the history of Justus or Jodocus, whom Vasari and Guicciardini called Giusto da Guanto. Flemish annalists of the 16th century have enlarged upon the scanty statements of Vasari, and described Jodocus as a pupil of Hubert Van Eyck. But there is no source to which this fable can be traced. The registers of St Luke's guild at Ghent comprise six masters of the name of Joos or Jodocus who practised at Ghent in the 15th century. But none of the works of these masters have been preserved, and it is impossible to compare their style with that of Giusto. It was between 1465 and 1474 that this artist executed the Communion of the Apostles which Vasari has described, and modern critics now see to the best advantage in the museum of Urbino. It was painted for the brotherhood of Corpus Christi at the bidding of Frederick of Montefeltro, who was introduced into the picture as the companion of Caterino Zeno, a Persian envoy at that time on a mission to the court of Urbino. From this curious production it may be seen that Giusto, far from being a pupil of Hubert Van Eyck, was merely a disciple of a later and less gifted master, who took to Italy some of the peculiarities of his native schools, and forthwith commingled them with those of his adopted country. As a composer and draughtsman Giusto compares unfavourably with the better known painters of Flanders; though his portraits are good, his ideal figures are not remarkable for elevation of type or for subtlety of character and expression. His work is technically on a level with that of Gerard of St John, whose pictures are preserved in the Belvedere at Vienna. Vespasian, a Florentine bookseller who contributed much to form the antiquarian taste of Frederick of Montefeltro, states that this duke sent to the Netherlands for a capable artist to paint a series of "ancient worthies" for a library recently erected in the palace of Urbino. It has been conjectured that the author of these "worthies," which are still in existence at the Louvre and in the Barberini palace at Rome, was Giusto. Yet there are notable divergences between these pictures and the Communion of the Apostles. Still, it is not beyond the range of probability that Giusto should have been able, after a certain time, to temper his Flemish style by studying the masterpieces of Santi and Melozzo, and so to acquire the mixed manner of the Flemings and Italians which these portraits of worthies display. Such an assimilation, if it really took place, might justify the Flemings in the indulgence of a certain pride, considering that Raphael not only admired these worthies, but copied them in the sketch book which is now the ornament of the Venetian Academy. There is no ground for presuming that Giusto da Guanto is identical with Justus d'Allamagna who painted the Annunication (1451) in the cloisters of Santa Maria di Castello at Genoa. The drawing and colouring of this wall painting shows that Justus d'Allamagna was as surely a native of South Germany as his homonym at Urbino was a born Netherlander.

GHERARDESCA, Ugolino della (c. 1220–1289), count of Donoratico and head of the Gherardeschi, one of the leading Ghibelline houses of Pisa, began to take part in public affairs about the time when the dissensions which had arisen about the partition of Sardinia had resulted in sending over the entire clan of the Pisan Visconti to the Guelphs. For having given his sister in marriage to one of these—Giovanni Visconti of Gallura—he was banished from Pisa by his own party, who seem to have had good reason otherwise for suspecting his loyalty; but he was permitted to return in terms of the peace of 1267. Notwithstanding the ambiguous character of his politics, he soon succeeded in gaining a high place in the public service of his native city; and in the battle of Meloria (6th August 1284), which terminated the long war with Genoa, he was one of the three Pisan admirals. It was by his cowardly or traitorous flight at a critical moment, it is said, that the contest was decided in favour of the Genoese; but, be this as it may, whether by means of his treachery, or in spite of it, he almost immediately afterwards (October 1284) was nominated by the citizens who remained to the twofold office of capitano and podestá for one year; and some months afterwards (February 1285) this term was extended to ten years. In this capacity of virtual dictator he, by the banishment of ten leading Ghibelline citizens of Pisa, secured peace with the Florentines; he also endeavoured to propitiate the Genoese by the offer of Castro in Sardinia, and the Lucchese by the actual surrender of Ripafratta and Viarreggio, but unsuccessfully. Meanwhile, though thoroughly alienated from the Ghibellines, he had not succeeded in gaining the confidence of the Guelphs; and in 1287 he was by them compelled to associate with himself in the government Nino Visconti, a nephew by the marriage already referred to, who had now reached manhood. But this arrangement was rendered nugatory by the disagreements of the two colleagues, and Ugolino found it necessary to resign his office in December of the same year. In his unscrupulous ambition after personal ascendency he now turned for support to the party he had so long deserted, and entered into an alliance with the Gualandi, Sismondi, Lanfranchi, and other uncompromising Ghibellines, who looked upon the archbishop Ruggiero degli Ubaldini as their head. But this unnatural combination soon terminated in an open rupture, the immediate occasion of which was the violence of Ugolino, who, on some sudden provocation, had killed a nephew of the archbishop. In August 1288 he was beset in the Palazzo del Popolo by the Ghibellines, and, after fire had been set to the building, taken prisoner, along with his sons Gaddo and Ugoccione, and his grandsons Nino (surnamed Brigatto) and Anselmuccio. (Some accounts mention a third grandson, named Henry.) After having been confined for twenty days in the Palazzo del Comune, they were removed to the Gualandi's Tower, Alle Sette Vie, afterwards called the Torre della Fame. Here they were kept till March 1289, when, by order of the archbishop, the door was locked and the keys thrown into the Arno. Nine days afterwards the tower was re-entered and the bodies removed to the church of San Francisco.

The story of Ugolino, though it is to be met with in other contemporary writers (see Villani, vii. cc. 120, 127), owes all its fame to Dante, who has placed him above Ruggiero on the inner margin of the second division (Antenora) of the ninth and lowest circle of his Inferno. Dante's powerful narrative, which includes "thirty lines unequalled by any other thirty in the whole dominions of poetry" (Landor), has been paraphrased, or rather almost translated, by Chaucer, in the *Monk's Tale*, and has also been reproduced in modern times by Shelley. It ought to be observed, however, with reference to Ugolino's alleged treachery, that the baser explanation of his conduct at Meloria is not to be met with in any document earlier than the 16th century; while with regard to the accusation of having sold the fortresses of Pisa to the Lucchese and Florentines, Dante, though evidently himself believing it, does not say more than that he "was alleged" (aveva voce) to have done so.

Ruggiero's share in the murder of Gherardesca has sometimes been doubted, but on very inadequate grounds. Only in one respect can the poet be fairly accused of having absolutely departed from strict historical accuracy, namely, with regard to the age of the sons and grandsons, who, though represented by him as children, appear to have been all of them grown up. The narrative of Villani has already been referred to; references to other sources may be found in Sismondi and in the annotated editions of Dante, particularly in that of "Philalethes" (the late king of Saxony).

GHERIAH, a town and fortress of British India, in the presidency of Bombay, about 170 miles south of Bombay, otherwise called Viziadrug. See Viziadrug.

GHIBELLINES. See Guelphs.

GHIBERTI, Lorenzo (1378–1455), whose name alone is worthy to rank with that of Donatello amongst the grand Italian sculptors of the Renaissance, was born at Florence in the year 1378. He learned the trade of a goldsmith under his father Ugoccione, commonly called Cione, and his stepfather Bartoluccio; but the goldsmith's art at that time included all varieties of plastic arts, and required from those who devoted themselves to its higher branches a general and profound knowledge of design and colouring. In the early stage of his artistic career Ghiberti was best known as a painter in fresco, and when his native city Florence was visited by the plague he repaired to Rimini, where he executed a highly prized fresco in the palace of the sovereign Pandolfo Malatesta. He was recalled from Rimini to his native city by the urgent entreaties of his stepfather Bartoluccio, who informed him that a competition was to be opened for designs of a second bronze gate in the baptistry, and that he would do wisely to return to Florence and take part in this great artistic contest. The subject for the artists was prescribed,—the sacrifice of Isaac; and the competitors were required to observe in their work a certain conformity to the first bronze gate of the baptistery, executed by Andrea Pisano about 100 years previously. Of the six designs presented by different Italian artists, those of Donatello, Brunelleschi, and Ghiberti were pronounced the best, and of the three Brunelleschi's and Ghiberti's superior to the third, and of such equal merit that the thirty-four judges with whom the decision was left entrusted the execution of the work to the joint labour of the two friends. Brunelleschi, however, withdrew entirely from the contest,—according to one account, from his cordial admiration of Ghiberti's genius, according to another, from his unwillingness to share so great an undertaking with any fellow-labourer. The first of his two bronze gates for the baptistry occupied Ghiberti twenty years, and when completed was justly regarded as the greatest work of its kind since the most glorious days of Grecian art. Ghiberti brought to his task a deep religious feeling and the striving after a high poetical ideal which are not to be found in the works of Donatello, though in power of characterization the second sculptor often stands above the first. Like Donatello, he seized every opportunity of studying the remains of ancient art; but he sought and found purer models for imitation than Donatello, through his excavations and studies in Rome, had been able to secure. The council of Florence, which met during the most active period of Ghiberti's artistic career, not only secured him the patronage of the pontiff, who took part in the council, but enabled him, through the important connexions which he then formed with the Greek prelates and magnates assembled in Florence, to obtain from many quarters of the Byzantine empire the precious memorials of old Greek art, which he studied with untiring zeal. The unbounded admiration called forth by Ghiberti's first bronze gate led to his receiving from the chiefs of the Florentine guilds the order for the second, of which the subjects were likewise taken from the Old Testament. The Florentines gazed with especial pride on these magnificent creations, which must still have shone with all the brightness of their original gilding when, a century later, Michelangelo pronounced them worthy to be the gates of paradise.[1] Next to the gates of the baptistry Ghiberti's chief works still in existence are his three statues of St John the Baptist, St Matthew, and St Stephen, executed for the church of San Michele, among which three works, from the ideal character of the entire figure and the peculiar felicity of expression, the palm is generally awarded to the St Stephen. In the bas-relief of the coffin of St Zenobio, in the Florence cathedral, Ghiberti put forth much of his peculiar talent, and though he did not, as is commonly stated, execute entirely the painted glass windows in that edifice, he furnished several of the designs, and did the same service for a painted glass window in the church of San Michele. He died at the age of 77.

We are better acquainted with Ghiberti's theories of art than with those of most of his contemporaries, for he left behind him a commentary, in which, besides his notices of art, he gives much insight into his own personal character and views. Every page attests the religious spirit in which he lived and worked. Not only does he aim at faithfully reflecting in his creations Christian truths; he regards the old Greek statues with a kindred feeling, as setting forth the highest intellectual and moral attributes of human nature. He appears to have cared as little for money as Donatello, and expressly thanks heaven that he had not been cursed with a sordid and mercenary spirit, but had ever loved and laboured at art for art's own sake.

Benvenuto Cellini's criticism on Ghiberti that in his creations of plastic art he was more successful in small than in large figures, and that he always exhibited in his works the peculiar excellences of the goldsmith's quite as much as those of the sculptor's art, is after all no valid censure, for it merely affirms that Ghiberti faithfully complied with the peculiar conditions of the task imposed upon him. More frequent have been the discussions of late years as to the part played by perspective in his representations of natural scenery. These have acquired a fresh importance since the discovery of the data, from which it now appears that Fabio Uccelli, commonly regarded as the first great master of perspective, worked for several years in the studio or workshop of Ghiberti, and it becomes difficult to determine to what extent Uccelli's successful innovations in perspective were due to Ghiberti's teaching.

Cicognaro's criticism on Ghiberti, in his *History of Sculpture*, has supplied the chief materials for the illustrative text of Lasinio's series of engravings of the three bronze gates of the baptistry. They consist of 42 plates in folio, and were published at Florence by Bardi in 1821. Still more vivid representations are the reproductions on a very large scale by the photographic establishment of Alinari. In the Florence edition of Vasari's *Lives* there is given at full length Ghiberti's commentary on art. Both Mr Perkins, in his *History of Tuscan Sculpture*, and Mr Rio, in his *Art Chrétien*, have treated Ghiberti's works with much fulness, and in a spirit of sound appreciation. But the most recent contributions to what may be termed the Ghiberti literature are the chapter expressly devoted to the history of the competition for the baptistry gates in Semple's *Donatello* (Vienna, 1875), and the articles by Adolf Rosemberg in Dohme's *Kunst und Künstler des Mittelalters* (Leipsic, 1877).

GHILAN, or Gilan, a province of Persia, lying along the S.W. shore of the Caspian, separated from the Russian district of Talish by the Astara, and bounded W. by Azerbijan, S. by Irak Adjemi, and S.E. by Mazanderan. It is about 150 miles in length, with a breadth varying from 15 to 50 miles; and its area is estimated at from 4500 to 5000 square miles. The greater portion of the province is

[1] Through long exposure to the dusty atmosphere of the town they have of late years begun to lose considerably in delicacy of outline; and it is much to be feared that, unless measures are speedily taken for their preservation, they will at no distant period suffer a still more marked deterioration.

a lowland region shut in by the mountains of the Elburz range; and though the Kyzyl Usen, which has its sources in the mountains of Kurdistan, is the only river of any size, the country is abundantly watered, and vast stretches of swamp are found in various directions. This is mainly due to the character of the climate, which is distinguished by a very heavy precipitation both in winter and summer. Vegetation is almost tropically luxuriant, and the forests are as dense as an Indian jungle. Oaks, maples, ash trees, *planeras*, lime trees, and *parrottias*, are among the prevailing types. The chestnut-leaved oak attains colossal proportions, and a height at times of 130 or 140 feet; and the box tree comes to rare perfection, and forms an important source of wealth. Vines and pomegranates, walnuts, plums, pears, and apples grow wild; and oranges, lemons, peaches, and other fruits are easily cultivated, though sometimes a severe winter proves fatal to the trees. The olive succeeds well in the valley of the Sefudrood, but the oil is extracted in a very primitive manner. Rice is largely cultivated, and forms the principal food of the inhabitants, except in the west, where its place is partially taken by wheat, a cereal indeed to which the Ghilanese farmer is more and more directing his attention. Cotton and sugar are both grown in small quantities, and the character of the climate gives reason to hope that tea plantations may be rendered profitable in some districts. Hitherto the most successful occupation has been silk-growing; but frequent failures in the crop have disheartened, if they have not ruined, many of the silk-masters. The quantity produced in 1866 was valued at £743,300, while the average between 1870 and 1875 was only about £270,000. In quality the silk does not rank very high, the greater portion being the produce of Japanese seed. Animal life is nearly as well represented in Ghilan as vegetable life. Tigers, wild boars, deer, and a considerable variety of snakes are found in the jungles; pheasants are a common form of game; aquatic birds of various kinds—pelicans, storks, heron, gulls, ducks, &c., swarm along the coast; and the fisheries in the Caspian are highly productive. The ordinary cattle, a small humped species like that of India, form an article of export; sheep and goats are not so plentiful, but they furnish very fine wool; and the horses are a hardy race, greatly prized in other parts of Persia, and especially in the capital. Wild horses are to be met with in the forests. Trade and commerce are in a very undeveloped state,—and no wonder when, with one trifling exception, there is no carriageable road in the province, and merchandise has to be transported on the backs of horses, mules, or camels. A striking instance of the primitive state of matters is furnished by Mr Mounsey, who tells how the machinery ordered by the Shah from Europe for his new mint was allowed to go to ruin in the sand at Enzelli, because it was found impossible to provide for its conveyance. The port of Enzelli, though it boasts of a lighthouse and three small forts, is little more than a natural harbour, and in rough weather it is not accessible to the mail steamers, which in the ordinary course call once a week.

The administration of the province is nearly as primitive as its system of roads, and consists of nothing but machinery for the collection of the taxes, which yield about £63,000 to the royal revenue. The capital is Resht, and the administrative districts are Resht, Lahijan, Fomen, Gesku, Talishan, Sheft, Rustemabad, Rudbar, Menjech, Lengerood, Siah Kuh, and Dilman. Every able-bodied man is enrolled in a sort of frontier guard in the district of Talishan, but no regular police is maintained throughout the province. The population is of very various composition; but the main stock, including the Tats and the Gileki, is of Iranian origin. The Gilek is strongly built, but lank, and his complexion is a sort of olive or copper colour; the Tat, on the other hand, has a tendency to corpulence, and his complexion is swarthy. According to different estimates, the inhabitants of the province number 150,000, 200,000, or 275,000; but it is more than usually difficult to ascertain the truth of the case, as they are for the most part scattered through the country in small hamlets. Ghilan is part of the ancient district of Hyrcania. The name is usually explained as equivalent to Mud-land; but Spiegel objects to this derivation, and says the true form of the word is Gelan, which has received no interpretation. There is nothing very distinctive about the history of the province, but its position, its climate, and its soil should secure it a flourishing future were its political condition improved.

See Melgunoff, *The Southern Shore of the Caspian* (in Russian) Mounsey, *Journey through the Caucasus*, &c., 1872; Tietze, *Zeitschrift der Ges. für Erdkunde*, Vienna, 1875; and Consular Reports.

GHIRLANDAJO, Domenico del (1449–1494), an illustrious Florentine painter. His full name is given as Domenico di Tommaso Curradi di Doffo Bigordi; it appears therefore that his father's surname was Curradi, and his grandfather's Bigordi. The painter is generally termed Domenico Bigordi, but some authors give him, and apparently with reason, the paternal surname Curradi. Ghirlandajo (garland-maker) was only a nickname, coming to Domenico from the employment of his father (or else of his earliest instructor), who was renowned for fashioning the metallic garlands worn by Florentine damsels; he was not, however, as some have said, the inventor of them. Tommaso was by vocation a jeweller on the Ponte Vecchio, or perhaps a broker. Domenico, the eldest of eight children, was at first apprenticed to a jeweller or goldsmith, probably enough his own father; in his shop he was continually making portraits of the passers-by, and it was thought expedient to place him with Alessio Baldovinetti to study painting and mosaic. His youthful years were, however, entirely undistinguished, and at the age of thirty-one he had not a fixed abode of his own. This is remarkable, as immediately afterwards, from 1480 onwards to his death at a comparatively early age in 1494, he became the most proficient painter of his time, incessantly employed, and condensing into that brief period of fourteen years fully as large an amount of excellent work as any other artist that could be named; indeed, we should properly say eleven years, for nothing of his is known of a later date than 1491.

In 1480 Ghirlandajo painted a St Jerome and other frescos in the church of Ognissanti, Florence, and a life-sized Last Supper in its refectory, noticeable for individual action and expression. From 1481–1485 he was employed upon frescos in the Sala dell' Orologio in the Palazzo Vecchio; he painted the apotheosis of St Zenobius, a work beyond the size of life, with much architectural framework, figures of Roman heroes, and other detail, striking in perspective and structural propriety. While still occupied here, he was summoned to Rome by Pope Sixtus IV. to paint in the Sixtine Chapel; he went thither not earlier than 1482. In the Sixtine he executed, probably before 1484, a fresco which has few rivals in that series, Christ calling Peter and Andrew to their Apostleship,—a work which, though somewhat deficient in colour, has greatness of method and much excellence of finish. The landscape background, in especial, is very superior to anything to be found in the works, which had no doubt been zealously studied by Ghirlandajo, of Masaccio and Masolino in the Brancacci Chapel. He also did some other works in Rome, now perished. Before 1485 he had likewise produced his frescos in the chapel of S. Fina, in the Tuscan town of S. Gemignano, remarkable for grandeur and grace,—two pictures of Fina, dying and dead, with some accessory work. Sebastian Mainardi assisted him in these productions in Rome and in S. Gemignano; and Ghirlandajo was so well pleased with his co-operation that he gave him his sister in marriage.

He now returned to Florence, and undertook in the church of the Trinita, and afterwards in S. Maria Novella, the works which have set the seal on his celebrity. The frescos in the Sassetti Chapel of S. Trinita are six subjects from the life of St Francis, along with some classical accessories, dated 1485. Three of the principal incidents are St Francis obtaining from Pope Honorius the approval of the Rules of his Order; his Death and Obsequies; and the Resuscitation, by the interposition of the beatified saint, of a child of the Spini family, who had been killed by falling out of a window. In the first work is a portrait of Lorenzo de' Medici; and in the third the painter's own likeness, which he introduced also into one of the pictures in S. Maria Novella, and in the Adoration of the Magi in the hospital of the Innocenti. The altar-piece of the Sassetti Chapel, the Adoration of the Shepherds, is now in the Florentine Academy. Immediately after disposing of this commission, Ghirlandajo was asked to renew the frescos in the choir of S. Maria Novella. This choir formed the chapel of the Ricci family, but the Tornabuoni and Tornaquinci families, then much more opulent than the Ricci, undertook the cost of the restoration, under conditions, as to preserving the arms of the Ricci, which gave rise in the end to some amusing incidents of litigation. The frescos, in the execution of which Domenico had many assistants, are in four courses along the three walls,—the leading subjects being the Lives of the Madonna and of the Baptist. Besides their general richness and dignity of art, these works are particularly interesting as containing many historical portraits—a method of treatment in which Ghirlandajo was pre-eminently skilled. There are no less than twenty-one portraits of the Tornabuoni and Tornaquinci families; in the subject of the Angel appearing to Zacharias, those of Poliziano, Marsilio Ficino, and others; in the Salutation of Anna and Elizabeth the beautiful Ginevra de' Benci; in the Expulsion of Joachim from the Temple, Mainardi and Baldovinetti (or the latter figure may perhaps be Ghirlandajo's father). The Ricci chapel was re-opened and completed in 1490; the altar-piece, now removed from the chapel, was probably executed with the assistance of Domenico's brothers, David and Benedetto, painters of ordinary calibre; the painted window was from Domenico's own design. Other distinguished works from his hand are an altar-piece in tempera of the Virgin adored by Sts Zenobius, Justus, and others, painted for the church of St Justus, but now in the Uffizi gallery, a remarkable masterpiece; Christ in glory with Romuald and other Saints, in the Badia of Volterra; the Adoration of the Magi, in the church of the Innocenti (already mentioned), perhaps his finest panel-picture, 1488; and the Visitation, in the Louvre, bearing the latest ascertained date, 1491, of all his works. Ghirlandajo did not often attempt the nude; one of his pictures of this character, Vulcan and his Assistants forging Thunderbolts, was painted for Lo Spedaletto, but (like several others specified by Vasari) it exists no longer. The picture attributed to him in the London National Gallery is dubious; it may perhaps have come from the atelier of Verrocchio. The mosaics which he produced date before 1491; one, of especial celebrity, is the Annunciation, on a portal of the cathedral of Florence.

In general artistic attainment Ghirlandajo may fairly be regarded as exceeding all his precursors or competitors; though the names of a few, particularly Giotto, Masaccio, Lippo Lippi, and Botticelli, stand higher for originating power. His scheme of composition is grand and decorous; his chiaroscuro excellent, and especially his perspectives, which he would design on a very elaborate scale by the eye alone; his colour is more open to criticism, but this remark applies much less to the frescos than the tempera-pictures, which are sometimes too broadly and crudely bright. He worked in these two methods alone—never in oils; and his frescos are what the Italians term "buon fresco," without any finishing in tempera. A certain hardness of outline, not unlike the character of bronze sculpture, may attest his early training in metal work. He first introduced into Florentine art that mixture of the sacred and the profane which had already been practised in Siena. His types in figures of Christ, the Virgin, and angels are not of the highest order; and a defect of drawing, which has been often pointed out, is the meagreness of his hands and feet. It was one of his maxims that "painting is designing." Ghirlandajo was an insatiate worker, and expressed a wish that he had the entire circuit of the walls of Florence to paint upon. He told his shop-assistants not to refuse any commission that might offer, were it even for a lady's petticoat-panniers: if they would not execute such work, *he* would. Not that he was in any way grasping or sordid in money-matters, as is proved by the anecdote of the readiness with which he gave up a bonus upon the stipulated price of the Ricci chapel frescos, offered by the wealthy Tornabuoni in the first instance, but afterwards begrudged. Vasari says that Ghirlandajo was the first to abandon in great part the use of gilding in his pictures, representing by genuine painting any objects supposed to be gilded; yet this does not hold good without some considerable exceptions,—the high lights of the landscape, for instance, in the Adoration of the Shepherds, now in the Florence Academy, being put in in gold. Many drawings and sketches by this painter are in the Uffizi Gallery, remarkable for vigour of outline. One of the great glories of Ghirlandajo is that he gave some early art-education to Michelangelo, who cannot, however, have remained with him long. Granacci was another of his pupils.

This renowned artist died of pestilential fever on 11th January 1494, and was buried in S. Maria Novella. He had been twice married, and left six children, three of them being sons. He had a long and honourable line of descendants, which came to a close in the 17th century, when the last members of the race entered monasteries. It is probable that Domenico died poor; he appears to have been gentle, honourable, and conscientious, as well as energetically diligent. (W. M. R.)

GHIRLANDAJO, Ridolfo (1483–1560), son of Domenico, was also a painter of considerable celebrity. Born on 14th February 1483, and being thus less than eleven years old when his father died, he was brought up by his uncle David. To this second-rate artist he owed less in the way of professional training than to Granacci, Piero di Cosimo, and perhaps Cosimo Rosselli. It has been said that Ridolfo studied also under Fra Bartolommeo, but this is not clearly ascertained. He was certainly one of the earliest students of the famous cartoons of Leonardo da Vinci and Michelangelo. His works between the dates 1504 and 1508 show a marked influence from Fra Bartolommeo and Raphael, with the latter of whom he was on terms of familiar friendship; hence he progressed in selection of form and in the modelling and relief of his figures. Raphael, on reaching Rome in 1508, wished Ridolfo to join him; but the Florentine painter was of a particularly home-keeping humour, and he neglected the opportunity. He soon rose to the head of the Florentine oil-painters of his time; and, like his father, accepted all sorts of commissions, of whatever kind. He was prominent in the execution of vast scenic canvases for various public occasions, such as the Wedding of Giuliano de' Medici, and the Entry of Leo X. into Florence in 1515. In his prime he was honest and conscientious as an artist; but from about 1527 he declined, having already accumulated a handsome property, more than sufficient for maintaining in affluence his large family of fifteen children, and his works became comparatively mannered and self-repeating. His sons traded in France and in Ferrara; he himself took a part in commercial affairs, and began paying some attention to mosaic work, but it seems that, after completing one mosaic, the Annunciation over the door of the Nunziata, patience failed him for continuing such minute labours. In his old age Ridolfo was greatly disabled by gout. He appears to have been of a kindly, easy-going character, much regarded by his friends and patrons.

The following are some of his leading works, the great majority of them being oil-pictures :—

Christ and the Maries on the road to Calvary, now in the Palazzo Antinori, Florence, an early example, with figures of half life-size. An Annunciation in the Abbey of Montoliveto near Florence, Leonardesque in style. In 1504, the Coronation of the Virgin, now in the Louvre. A Nativity, very carefully executed, now in the Hermitage, St Petersburg, and ascribed in the catalogue to Granacci. A Predella, in the oratory of the Bigallo, Florence, five panels, representing the Nativity and other subjects, charmingly finished. In 1514, on the ceiling of the chapel of St Bernard in the Palazzo Pubblico, Florence, a fresco of the Trinity, with heads of the twelve apostles and other accessories, and the Annunciation; also the Assumption of the Virgin, who bestows her girdle on St Thomas, in the choir loft of Prato cathedral. Towards the same date, a picture showing his highest skill, replete with expression, vigorous life, and firm accomplished pictorial method, now in the gallery of the Uffizi, St Zenobius resuscitating a child; also the Translation of the remains of the same Saint. The Virgin and various saints, at S. Pier Maggiore, Pistoja. In 1521, the Pietà, at S. Agostino, Colle di Valdelsa, life-sized. Towards 1526, the Assumption, now in the Berlin Museum, containing the painter's own portrait. An excellent portrait of Cosmo de' Medici (the Great) in youth. In 1543, a series of frescos in the monastery of the Angeli. A great number of altar-pieces were executed by Ghirlandajo, with the assistance of his favourite pupil, currently named Michele di Ridolfo. Another of his pupils was Mariano da Pescia. (W. M. R.)

GHIZNI. See GHAZNI.

GHOORKAS. See NEPAL.

GHÚR (*Ghor*, *Ghoor*, *Gour*, &c.) is the name of a territory in Asia, and GHÚRI (*Ghori*, *Ghoory*, &c.) that of a dynasty deriving its origin from that territory.

The name of Ghúr was, in the Middle Ages, and, indeed, locally still is, applied to the highlands east of Herat, and extending eastward to the upper Helmand valley, or nearly so. There is hardly any region of Asia regarding which we continue to be more in the dark than about this. Ghúr is the southern portion of that great peninsula of strong mountain country which forms the western part of modern Afghanistan, and which may be taken in a general way to represent the Paropamisus of the ancients. The northern portion of the said peninsula was in the Middle Ages comprehended under the names of *Gharjistán* (on the west), and *Juzjáná* (on the east), whilst the basin of the Herat river, and all south of it, constituted Ghúr. The name as now used does not perhaps include the valley of the Herat river; on the south the limit seems to be the declivity of the higher mountains (about 32° 45′ N. lat.) dominating the descent to the lower Helmand, and the road from Farrah to Kandahar. It is in Ghúr that rise all those affluents of the closed basin of Seistán, the Harút, the Farrah-rúd, the Khásh-rúd (see AFGHANISTAN), besides other considerable streams joining the Helmand above Girishk.

Ghúr is mentioned in the Shahnamah of Firdousi (1010 A.D.), and in the Arab geographers of that time, though these latter fail in details almost as much as we moderns, thus indicating how little accessible the country has been through all ages. Ibn Haukal's map of Khorasan (c. 976) shows *Jibál al-Ghúr*, "the hill-country of Ghúr," as a circle ring-fenced with mountains. His brief description speaks of it as a land fruitful in crops, cattle, and flocks, inhabited by infidels, except a few who passed for Mahometans, and indicates that, like other pagan countries surrounded by Moslem populations, it was regarded as a store of slaves for the faithful. The boundary of Ghúr in ascending the valley of the Hari-rúd was six and a half easy marches from Herat, at Chist, two marches above Obah (both of which are still in our maps).

The chief part of the present population of Ghúr are *Taimúnis* belonging to the class of nomad or semi-nomad clans called *Eimáks* (see AFGHANISTAN, vol. i. p. 235) There are also, according to Ferrier, *Súris*, who were formerly the main part of the population, apparently the same as the *Zoorees* of Elphinstone (*Caubul*, ii. 204), another of the Eimák clans; and in the north of Ghúr Ferrier mentions Mongols. Camels are kept in great numbers by the Eimáks, chiefly for their wool. Though the country is very mountainous, there are fruitful valleys of considerable width. But our knowledge is too slight for us to say more.

The people and princes of Ghúr first become known to us in connexion with the Ghaznevid dynasty, and the early mediæval histories of Ghúr and Ghazni are so intertwined that little need be added on that subject to what will be found under GHAZNI (*q.v.*). What we read of Ghúr shows it as a country of lofty mountains and fruitful valleys, and of numerous strongholds held by a variety of hill-chieftains ruling warlike clans whose habits were rife with feuds and turbulence,—indeed, in character strongly resembling the tribes of modern Afghanistan, though there seems no good reason to believe that they were of Afghan race. It is probable that they were of old Persian blood, like the older of those tribes which still occupy the country. It is possibly a corroboration of this that, in the 14th century, when one of the Ghúri kings, of the Kurt dynasty reigning in Herat, had taken to himself some of the insignia of independent sovereignty, an incensed Mongol prince is said to have reviled him as "an insolent *Tajik*" (*Journal Asiat.*, ser. v. tom. xvii. p. 509). Sabuktigín of Ghazni, and his famous son Mahmúd, repeatedly invaded the mountain country which so nearly adjoined their capital, subduing its chiefs for the moment, and exacting tribute; but when the immediate pressure was withdrawn, the yoke was thrown off, and the tribute withheld. In 1020 Masa'ud, the son of Mahmúd, being then governor of Khorasan, made a systematic invasion of Ghúr from the side of Herat, laying siege to its strongholds one after the other, and subduing the country more effectually than ever before. About a century later one of the princely families of Ghúr, deriving the appellation of Shansabi, or Shansabáníah, from a certain ancestor Shansab, of local fame, and of alleged descent from Zohák, acquired predominance in all the country, and at the time mentioned Malik 'Izzuddin al Husain of this family came to be recognized as lord of Ghúr. He was known afterwards as "the Father of Kings," from the further honour to which several of his seven sons rose. Three of these (see GHAZNI) were—(1) Amir Kutbuddín Mahommed, called the lord of the Jibál or mountains; (2) Sultán Saifuddín Súrí, for a brief period master of Ghazni,—both of whom were put to death by Bahram the Ghaznevid; and (3) Sultán Aláuddín Jahánsoz, who wreaked such terrible vengeance upon Ghazni. Aláuddín began the conquests which were afterwards immensely extended both in India and in the west by his nephews Ghiyássuddín Mahommed ibn Sám and Muizuddín Mahommed Sám (the Shahábuddín Ghúri of the historians), and for a brief period during their rule it was boasted, with no great exaggeration, that the public prayer was read in the name of the Ghúri from the extremity of India to the borders of Babylonia, and from the Oxus to the Straits of Ormus. After the death of Muizuddín (*alias* Shahábuddín), Mahmúd the son of Ghiyássuddín was proclaimed sovereign (1206) throughout the territories of Ghúr, Ghazni, and Hindustan. But the Indian dominion, from his uncle's death, became entirely independent, and his actual authority was confined to Ghúr, Seistán, and Herat. The whole kingdom fell to pieces before the power of Mahommed Sháh of Khwarazm and his son Jaláluddín (*c.* 1214–1215), a power in its turn to be speedily shattered by the Mongol flood (see GHAZNI).

Besides the thrones of Ghúr and Ghazni, the Shansabaníah family, in the person of Fakhruddín, the eldest of the seven sons of Malek 'Izzuddín, founded a kingdom in the Oxus basin, having its seat at BÁMIÁN (*q.v.*), which endured for two or three generations, till extinguished by the power of Khwarazm (1214). And the great Mussulman empire of Delhi was based on the conquests of Muizuddín the Ghurian, carried out and consolidated by his Turki freedmen, Kutbuddín Aibak and his successors. The princes of Ghúr experienced, about the middle of the 13th century, a revival of power, which endured for 140 years. This later dynasty bore the name of Kurt or Kart. The first of historical prominence was Malik Shamsuddín Kurt, descended by his mother from the great king Ghiyassuddín Ghúri, whilst his other grandfather was that prince's favourite minister. In 1245 Shamsuddin held the lordship of Ghúr in some kind of alliance with, or subordination to, the Mongols, who had not yet definitively established themselves in Persia, and in 1248 he received from the Great Khan Mangu an investiture of all the provinces from Merv to the Indus, including by name Sijistan (or Seistán), Cabul, Tírah (adjoining the Khaibar pass), and Afghanistan (a very early occurrence of this name), which he ruled from Herat. He stood well with Hulákú, and for a long time with his son Abaka, but at last incurred the latter's jealousy, and was poisoned when on a visit to the court at Tabriz (1276). His son Rukuuddin Kurt was, however, invested with the government of Khorasan (1278), but after some years, mistrusting his Tartar suzerains, he withdrew into Ghúr, and abode in his strong fortress of Kaissar till his death there in 1305. The family held on through a succession of eight kings in all, sometimes submissive to the Mongol, sometimes aiming at independence, sometimes for a series of prosperous years adding to the strength and splendour of Herat, and sometimes sorely buffeted by the hosts of masterless Tartar brigands that tore Khorasan and Persia in the decline of the dynasties of Hulákú and Chagatai. It is possible that the Kurts might have established a lasting Tajik kingdom at Herat, but in the time of the last of the dynasty, Ghiyassuddín Pir-'Ali, Tartardom, reorganized and re-embodied in the person of Timur, came against Herat, and carried away the king and the treasures of his dynasty (1380). A revolt and massacre of his garrison provoked Timur's vengeance; he put the captive king to death, came against the city a second time, and showed it no mercy (1383). Ghúr has since been as obscure in history as it is in its topography.

The proper capital of the kingdom of Ghúr when its princes were rising to dominion in the 12th century was Fírúz-Koh, where a city and fortress were founded by Saifuddín Súri. The true position of Fírúz-Koh does not seem to have been determined, but it was probably on or near the upper waters of the Hari-rúd or river of Herat; and it is possible that it may be represented by Shahrak, a place in that valley (about 65° 30′ E. long.), once a populous and flourishing town, which was described to Ferrier, who passed not far from it, as having been anciently the capital of Ghúr. The name of *Fírúz-Kohis* has been appropriated to one of the most numerous of the nomad tribes occupying the upper part of the Hari-rúd and part of the Murgháb, but it is doubtful if this has to do with the Ghúr capital, as the name is otherwise explained. Other places claim to have been the old capital. Thus Karrukh, a place visited by Khanikoff in 1858, in a rapid excursion from Herat, and lying on the north side of the valley, is one. But this seems too near Herat (only 30 miles distant). Ferrier, again, describes as the ancient capital a place, which he reached in his journey, called *Zarni*, about 150 miles by road from Herat towards the S.E. The population did not exceed 1200, belonging to the Súri and Taimúni tribes. The peak of Chalap Dalan, "one of the highest in the world," rose before Zarni in imposing majesty. The mountain, at half its height, has a compass of some 40 miles; the sides are covered with forests and pastures, villages and tents, and also exhibit naturally impregnable positions where successive chiefs have built strongholds. Ferrier, in accompanying the Afghan governor, who lived at Zarni, saw three ancient towns on the skirts of this mountain, all large and fortified, viz., Kala' Kaissar, Kala' Sangi, and Fakhrábád. These are described as only a few *farsakhs*, or hours' march, north-east of Teivereh, which last is in some of our maps. Doubts have indeed been cast on the authenticity of this part of Ferrier's book, chiefly on account of the extreme brevity of the time which he allows. But the professed journal was probably, under the circumstances, only an expansion from memory of the merest jottings; and several things are in favour of authenticity. His notices of the country, slight as they are, correspond notably in the impression conveyed with those of the *Tabakáti-i-Násiri* (see below). *Kaissar*, which he mentions, is a place that has already been referred to as the stronghold of Ruknuddin Kurt. *Zarni*, as roughly located by him, corresponds fairly with what was told Conolly on his journey between Herat and Kandahar, of the position and character of "the old city of Ghore . . . . now a ruinous, ill-inhabited town, the capital of a petty province, governed by one of Shah Kamran's sons, who has his residence there" (*Journey*, vol. ii. p. 61). Zarni is mentioned by Major Leech in connexion with Taiwara (Teivereh of Ferrier) and other places in the south of the Ghúr country, but not so as to determine its position. In some other points, moreover, as to names of chiefs, &c., Ferrier's statements agree with Leech's.

See the "Tabakát-i-Násiri," in the *Bibl. Indica*, transl. by Raverty; *Journal Asiatique*, ser. v., tom. xvii.; "Ibn Haukal," in *J. As. Soc. Beng.*, vol. xxii.; Ferrier's *Caravan Journeys*; Hammer's *Ilkhans*, &c. (H. Y.)

GIAMBELLI, or GIANIBELLI, FEDERIGO, a military engineer, was born at Mantua about the middle of the 16th century. Having had some experience as a military engineer in Italy, he went to Spain to offer his services to Philip II. His proposals were, however, somewhat lukewarmly received, and as he could obtain from the king no immediate employment, he took up his residence at Antwerp, where he soon gained considerable reputation for his knowledge in various departments of science. He is said to have vowed to be revenged for his rebuff at the Spanish court; and when Antwerp was besieged by the duke of Parma in 1584, he put himself in communication with Queen Elizabeth, who having satisfied herself of his abilities, engaged him to aid by his counsels in its defence. His plans for provisioning the town were rejected by the senate, but they agreed to a modification of his scheme for destroying the famous bridge which closed the entrance to the town from the side of the sea, by the conversion of two ships of 60 and 70 tons into infernal machines. One of these exploded, and, besides destroying more than 1000 soldiers, effected a breach in the structure of more than 200 feet in width, by which, but for the hesitation of Admiral Jacobzoon, the town might at once have been relieved. After the surrender of Antwerp Giambelli went to England, where he was engaged for some time in fortifying the river Thames; and when the Spanish Armada was attacked by fire-ships in the Calais roads, the panic which ensued was due to the conviction among the Spaniards that the fire-ships were infernal machines constructed by Giambelli. He is said to have died in London, but the year of his death is unknown. See Motley's *History of the United Netherlands*, vols. i. and ii., and the authorities therein referred to.

GIANNONE, PIETRO (1676–1748), the most distinguished historian of whom Naples can boast, and amongst all Italian historians second alone to Fra Paulo Sarpi for the strong and clear light thrown in his works on the growth of the papal power, was born at Ischitella, in the province of Capitanata, on the 7th of May 1676. Arriving in Naples at the age of eighteen, he devoted himself to the study of law, but his legal pursuits were much surpassed in importance by his literary labours. He devoted twenty years to the composition of his great work, *The Civil History of Naples*, which was ultimately published in 1723. Here, in his account of the rise and progress of the Neapolitan laws and government, he warmly espoused the side of the civil power in its conflicts with the Romish hierarchy. The position thus taken up by him, and the manner in which that position was assumed, gave rise to a life-long conflict between Giannone and the church; and we must know much more accurately than we at present do all the facts concerning his alleged retractation in prison at Turin, before we can withhold from him the palm—as he certainly endured the sufferings—of a confessor and martyr in the cause of what he deemed historical truth. Hooted by the mob of Naples, and excommunicated by the archbishop's court, he was forced to leave Naples and repair to Vienna. Meanwhile the Inquisition had attested after its own fashion the value of his history by putting it on the *Index*. At Vienna the favour of the emperor Charles VI. and of many leading personages at the Austrian court obtained for him a pension and other facilities for the prosecution of his historical studies. Of these the most important result was *Il Triregno, ossia del regno del cielo, della terra, e del papa*. On the transfer of the Neapolitan crown to Charles of Bourbon, Giannone lost his Austrian pension, and was compelled to remove to Venice. There he was at first most favourably received. The post of consulting lawyer to the republic, in which he might have continued the special work of Fra Paulo Sarpi, was offered to him, as well as that of professor of public law in Padua; but he declined both offers. Unhappily there arose a suspicion that his views on maritime law were not favourable to the pretensions of Venice, and, notwithstanding all his efforts to dissipate that suspicion, it was resolved to expel him from the state. On the 23d of September 1735 he was seized and conveyed to

Ferrara. After wandering, under the assumed name of Antonio Rinaldo, for three months through Modena, Milan, and Turin, he at last reached Geneva, where he enjoyed the friendship of the most distinguished citizens, and was on excellent terms with the great publishing firms. But in an evil hour he was induced to visit a Catholic village within the Sardinian territory, where he was kidnapped by the agents of the Sardinian Government, conveyed to the castle of Miolan, and thence successively transferred to Ceva and Turin. In the fortress of Turin he remained immured during the last twelve years of his life, though part of his time was spent in composing a defence of the Sardinian interests as opposed to those of the papal court, and though he was led to sign a retractation of the statements in his history most obnoxious to the Vatican. He died March 7, 1748, in his seventy-second year.

Giannone's style as an Italian writer has been pronounced to be below a severe classical model. But his very ease and freedom, if not classical, have helped to make his volumes more popular than many works of greater classical renown. In England the just appreciation of his labours by Gibbon, and the ample use made of them in the later volumes of *The Decline and Fall*, early secured his rightful place for him in the estimation of English scholars.

A good and complete edition of Giannone's works is still a desideratum. The more important facts of his life have been recorded by the Abbe Fernando Parizini in Italian, and in Latin by Fabroni; whilst a more complete estimate of his literary and political importance may be formed by the perusal of the collected edition of the works written by him in his Turin prison, published in Turin in 1859—under the care of the distinguished statesman Pasquale Stanislao Mancini, late minister of grace and justice, universally recognized as one of the first authorities in Italy on questions relating to the history of his native Naples, and especially to the conflicts between the civil power and the church.

GIANT is the Old English *geant*, derived through French and Latin from Greek *gigas* (*gigant*). The idea conveyed by the word in classic mythology is that of beings more or less manlike, but monstrous in size and strength. Figures like the Titans and the Giants whose birth from Heaven and Earth is sung by Hesiod in the *Theogony*, such as can heap up mountains to scale the sky, and war beside or against the gods, must be treated, with other like monstrous figures of the wonder-tales of the world, as belonging altogether to the realms of mythology. But there also appear in the legends of giants some with historic significance. The ancient and commonly-repeated explanation of the Greek word γίγας, as connected with or derived from γηγενής, or "earth-born," seems by no means sound as a matter of etymology, but at any rate the idea conveyed by it was familiar to the ancient Greeks, that the giants were earth-born or indigenous races (see Welcker, *Griechische Götterlehre*, vol. i. p. 787). The Bible (the English reader must be cautioned that the word giant has been there used ambiguously, from the Septuagint downwards) touches the present matter in so far as it records the traditions of the Israelites of fighting in Palestine with tall races of the land such as the Anakim (Numb. xiii. 33; Deut. ii. 10, iii. 11; 1 Sam. xvii. 4). When reading in Homer of "the Cyclopes and the wild tribes of the Giants," or of the adventures of Odysseus in the cave of Polyphemus (Homer, *Odyss.*, vii. 206; ix.), we seem to come into view of dim traditions, exaggerated through the mist of ages, of pre-Hellenic barbarians, godless, cannibal, skin-clothed, hurling huge stones in their rude warfare. Giant-legends of this class are common in Europe and Asia, where the big and stupid giants have often every token of uncouth native barbarians, exaggerated into monsters in the legends of the later tribes who dispossessed and slew them.

Besides the conception of giants as special races distinct from mankind, it was a common opinion of the ancients that the human race had itself degenerated, the men of primeval ages having been of so far greater stature and strength as to be in fact gigantic. This, for example, is received by Pliny (*Hist. Nat.*, vii. c. 16), and it becomes a common doctrine of theologians such as Augustine (*De Civitate Dei*, xv. 9), lasting on into times so modern that it may be found in Cruden's *Concordance*. Yet so far as can be judged from actual remains, it does not appear that giants, in the sense of tribes of altogether superhuman stature, ever existed, or that the men of ancient time were on the whole taller than those now living. It is now usual to apply the word giant to beings not superhuman in their height, but merely the tallest men and women of our nations. In every race of mankind the great mass of individuals do not depart far from a certain mean or average height, while the very tall or very short men become less and less numerous as they depart from the mean standard, till the utmost divergence is reached in a very few giants on the one hand, and a very few dwarfs on the other. At both ends of the scale, the body is markedly out of the ordinary proportions; thus a giant's head is smaller and a dwarf's head larger than it would be if an average man had been magnified or diminished. The principle of the distribution of individuals of different sizes in a race or nation has been ably set forth by Quetelet (*Physique Sociale*, vol. ii.; *Anthropométrie*, books iii. and iv.). Had this principle been understood formerly, we might have been spared the pains of criticizing assertions as to giants 20 feet high, or even more, appearing among mankind. The appearance of an individual man 20 feet high involves the existence of the race he is an extreme member of, whose mean stature would be at least 12 to 14 feet, which is a height no human being has been proved on sufficient evidence to have approached (*Anthropom.*, p. 302). In fact, Quetelet considers the tallest man whose stature has been authentically recorded to have been Frederick the Great's Scottish giant, who was not quite 8 feet 3 inches. Modern statisticians, though admitting that this may not be the extreme limit of human stature, cannot accept the loose conclusion in Buffon (*Hist. Nat.*, ed. Sonnini, vol. iv. p. 134), that there is no doubt of giants having been 10, 12, and perhaps 15 feet high. Confidence is not even to be placed in ancient asserted measurements, as where Pliny gives to one Gabbaras, an Arabian, the stature of 9 feet 9 inches (about 9 feet 5½ in. English), capping this with the mention of Posio and Secundilla, who were half a foot higher. That two persons should be described as both having this same extraordinary measure suggests to the modern critic the notion of a note jotted down on the philosopher's tablets, and never tested afterwards.

Under these circumstances, it is worth while to ask how it is that legend and history so abound in mentions of giants outside all probable dimensions of the human frame. One cause is that, when the story-teller is asked the actual stature of the huge men who figure in his tales, he is not sparing of his inches and feet. What exaggeration can do in this way may be judged from the fact that the Patagonians, whose average height (5 feet 11 inches) is really about that of the Chirnside men in Berwickshire, are described in Pigafetta's *Voyage round the World* as so monstrous that the Spaniards' heads hardly reached their waists. It is reasonable to suppose, with Professor Nilsson (*Primitive Inhabitants of Scandinavia*, chap. vi.), that in the traditions of early Europe tribes of savages may have thus, if really tall, expanded into giants, or, if short, dwindled into dwarfs. Another cause which is clearly proved to have given rise to giant-myths of yet more monstrous type, has been the discovery of great fossil bones, as of mammoth or mastodon, which have from early ages been supposed to be bones of giants, and have given rise to a whole class of giant-myths (see Tylor, *Early History of Mankind*, chap. xi.; *Primitive Culture*, chap. x.). Such anatomical inferences from the leg-bone or tooth of some huge extinct animal are rather creditable to the ingenuity of natives of America, or of barbarians of the Old World; but their late continuance in the midst of European culture shows how recently the principles of comparative anatomy obtained their present hold on the public mind. A tooth weighing $4\frac{3}{4}$ lb, and a thigh-bone 17 feet long, having been found in New England in 1712 (they were probably mastodon), Dr Increase Mather thereupon communicated to the Royal Society of London his confirmation from them of the existence of men of prodigious stature in the antediluvian world (see the *Philosophical Transactions*, vol. xxiv p. 85; D. Wilson, *Prehistoric Man*, vol. i. p. 54). The giants in the streets of Basel and supporting the arms of Lucerne appear to have originated from certain fossil bones found in 1577, examined by the physician Felix Plater, and pronounced to have belonged to a giant some 16 or 19 feet high. These bones have since been referred to a very different geological genus, but within the present century Plater's giant skeleton was accepted as a genuine relic of the giants who once inhabited the earth. See the dissertation of Le Cat, cited in the 5th edition of the *Encyclopædia Britannica* (1817). (E. B. T.)

GIANT'S CAUSEWAY, a promontory of columnar basalt, situated on the coast of Antrim in the north of Ireland. It is divided by whin-dykes into the Little Causeway, the Middle Causeway or "Honeycomb," as it is locally termed, and the Larger or Grand Causeway. The pillars composing it are close-fitting and for the most part somewhat irregular hexagons, made up of articulated portions varying from a few inches to some feet in depth, and concave or convex at the upper and lower surfaces. In diameter the pillars vary from 15 to 20 inches, and in height some are as much as 20 feet. The Great Causeway is chiefly from 20 to 30, and for a few yards in some places nearly 40 feet in breadth, exclusive of outlying broken pieces of rock. It is highest at its narrowest part. At about half a dozen yards from the cliff, widening and becoming lower, it extends outwards into a parade or platform, which has a slight seaward inclination, but is easily walked on, and for nearly 100 yards is always above water. At the distance of about 150 yards from the cliff it turns a little to the eastward for 20 or 30 yards, and then sinks into the sea. The neighbouring cliffs exhibit in many places columns similar to those of the Giant's Causeway, a considerable exposure of them being visible at a distance of about 100 roods in the bay to the eastward. A group of these columns, from their arrangement, have been fancifully named the "Giant's Organ." The most remarkable of the cliffs is the Pleaskin, the upper pillars of which have the appearance of a colonnade, and are 60 feet in height; beneath these is a mass of coarse black amygdaloid, of the same thickness, underlain by a second range of basaltic pillars, from 40 to 50 feet in height. Near the Giant's Causeway are the ruins of the castles of Dunseverick and Dunluce, situated high above the sea on insulated crags, and the swinging bridge of Carrick-a-Rede, spanning a chasm of 80 feet deep, and connecting a rock, which is used as a salmon-fishing station, with the mainland. Fairhead, a promontory composed of columnar greenstone, the highest point on the coast, has an altitude of 550 feet.

See Hamilton, *Letters from the Coast of Antrim*; Dubourdiew, *Statistical Survey of Antrim*; and articles ANTRIM and GEOLOGY.

GIARRE, a town of Sicily, in the province of Catania, between Etna and the sea, with a station on the railway from Messina to Catania, distant from the former 40 miles, and from the latter nearly 19. It is a flourishing place of 6956 inhabitants, according to the census of 1871, or of 9990 if the suburbs of Macchia, St Giovanni, and St Alfio are included; but it has little to show except a handsome modern church, and is mainly of interest as the point from which tourists start to visit the remains of the gigantic chestnut tree of the hundred horses (*di cento cavalli*).

GIAVENO, a market-town of Italy, in the province of Turin, and circondario of Susa, about 16 miles W. of Turin, at the foot of the Cottian Alps, and on the left bank of the Sangone, a head water of the Po. It possesses a fine old castle, an almshouse, a gymnasium, a children's asylum, several well-built churches, and an ancient abbatial residence; and its inhabitants manufacture paper and silk, and maintain a trade in wine and timber. Population of the town in 1871 5722, and of the commune 9638.

GIB, ADAM (1714-1788), the leader of the Antiburgher section of the Scottish Secession Church, was born April 14, 1714, in the parish of Muckhart, Perthshire, and, on the completion of his literary and theological studies at Edinburgh and Perth, was licensed as a preacher in 1740. In the following year he was ordained minister of the large Secession congregation of Bristo, Edinburgh, being the first in the city inducted into such a charge; and there his powerful intellect and his intensity of character soon secured for him a position of considerable prominence. In 1742 he caused some stir by the publication of an invective entitled *A warning against countenancing the ministrations of Mr George Whitefield*; and in 1745 he was almost the only minister of Edinburgh who continued to preach, and to preach against rebellion, while the troops of Charles Edward were in occupation of the town. When in 1747 "the Associate Synod," by a narrow majority, decided not to give full immediate effect to a judgment which had been passed in the previous year against the lawfulness of the "Burgess Oath,"[1] Gib led the protesting minority, who forthwith separated from their brethren and formed the Antiburgher Synod. It was chiefly under his influence that it was agreed by this ecclesiastical body at subsequent meetings to summon to the bar their "Burgher" brethren, and finally to depose and excommunicate them for contumacy. In 1765 he made a vigorous and able reply to the General Assembly of the Church of Scotland, which had stigmatized the Secession as "threatening the peace of the country;" and this apology was further developed in his *Display of the Secession Testimony*, published in 1774. From 1753 (when after protracted litigation he was compelled to leave the Bristo church) till within a short period of his death, which took place June 18, 1788, he preached regularly in Nicolson Street church, which is said to have been filled every Sunday with an audience of 2000 persons. Besides other publications, he wrote a volume of *Sacred Contemplations* (1786), to which was appended an "Essay on Liberty and Necessity" in reply to Lord Kames.

GIBBON. See APE, vol. ii. p. 150.

GIBBON, EDWARD (1737-1794), one of the most celebrated historians of any age or country, was also his own historian. He has left us one of the most piquant autobiographies ever written. In the following sketch the chief incidents of his life will be condensed from that authentic source. For more than facts, even for the setting of these, it is needless to say that it would be unwise to trust to any man's autobiography—though Gibbon's is as frank as most. There are points on which vanity will say too much, and perhaps others on which modesty will say too little.

Gibbon was descended, he tells us, from a Kentish family of considerable antiquity; among his remoter ancestors he reckons the Lord High Treasurer Fiennes, Lord Say and Sele, whom Shakespeare has immortalized in his *Henry VI.*

[1] This was an oath imposed upon all burgesses of Edinburgh, Glasgow, Perth, and some other towns, by which they "professed and allowed the true religion presently professed within this realm, and authorized by the laws thereof." The question was whether these words implied an approbation of the Established Church, with all its "corruptions."

His grandfather was a man of ability, an enterprising merchant of London, one of the commissioners of customs under the Tory ministry during the last four years of Queen Anne, and, in the judgment of Lord Bolingbroke, as deeply versed in the "commerce and finances of England" as any man of his time. He was not always wise, however, either for himself or his country; for he became deeply involved in the South Sea Scheme, in the disastrous collapse of which (1720) he lost the ample wealth he had amassed. As a director of the company, moreover, he was suspected of fraudulent complicity, taken into custody, and heavily fined; but £10,000 was allowed him out of the wreck of his estate, and with this his skill and enterprise soon constructed a second fortune. He died at Putney in 1736, leaving the bulk of his property to his two daughters—nearly disinheriting his only son, the father of the historian, for having married against his wishes. This son (by name Edward) was educated at Westminster[1] and Cambridge, but never took a degree, travelled, became member of Parliament, first for Petersfield (1734), then for Southampton (1741), joined the party against Sir Robert Walpole, and (as his son confesses, not much to his father's honour) was animated in so doing by "private revenge" against the supposed "oppressor" of his family in the South Sea affair. If so, revenge, as usual, was blind; for Walpole had sought rather to moderate than to inflame public feeling against the projectors.

The historian was born at Putney, Surrey, April 27 (Old Style), 1737. His mother, Judith Porten, was the daughter of a London merchant. He was the eldest of a family of six sons and a daughter, and the only one who survived childhood; his own life in youth hung by so mere a thread as to be again and again despaired of. His mother, between domestic cares and constant infirmities (which, however, did not prevent an occasional plunge into fashionable dissipation in compliance with her husband's wishes), did but little for him. The "true mother of his mind as well as of his health" was a maiden aunt—Catherine Porten by name—with respect to whom he expresses himself in language of the most grateful remembrance. "Many anxious and solitary days," says Gibbon, "did she consume with patient trial of every mode of relief and amusement. Many wakeful nights did she sit by my bedside in trembling expectation that each hour would be my last." As circumstances allowed, she appears to have taught him reading, writing, and arithmetic—acquisitions made with so little of remembered pain that "were not the error corrected by analogy," he says, "I should be tempted to conceive them as innate." At seven he was committed for eighteen months to the care of a private tutor, John Kirkby by name, and the author, among other things, of a "philosophical fiction," entitled the *Life of Automathes*. Of Kirkby, from whom he learned the rudiments of English and Latin grammar, he speaks gratefully, and doubtless truly, so far as he could trust the impressions of childhood. With reference to *Automathes* he is much more reserved in his praise, denying alike its originality, its depth, and its elegance; but, he adds, "the book is not devoid of entertainment or instruction."

In his ninth year (1746), during a "lucid interval of comparative health," he was sent to a school at Kingston-upon-Thames; but his former infirmities soon returned, and his progress, by his own confession, was slow and unsatisfactory. "My timid reserve was astonished by the crowd and tumult of the school; the want of strength and activity disqualified me for the sports of the play-field. . . . By the common methods of discipline, at the expense of many tears and some blood, I purchased the knowledge of the Latin syntax," but manifestly, in his own opinion, the *Arabian Nights*, Pope's *Homer*, and Dryden's *Virgil*, eagerly read, had at this period exercised a much more powerful influence on his intellectual development than Phædrus and Cornelius Nepos, "painfully construed and darkly understood."

In December 1747 his mother died, and he was taken home. After a short time his father removed to the "rustic solitude" of Buriton (Hants), but young Gibbon lived chiefly at the house of his maternal grandfather, at Putney, where, under the care of his devoted aunt, he developed, he tells us, that passionate love of reading "which he would not exchange for all the treasures of India," and where his mind received its most decided stimulus. Of 1748 he says, "This year, the twelfth of my age, I shall note as the most propitious to the growth of my intellectual stature." After detailing the circumstances which unlocked for him the door of his grandfather's "tolerable library," he says, "I turned over many English pages of poetry and romance, of history and travels. Where a title attracted my eye, without fear or awe I snatched the volume from the shelf." In 1749, in his twelfth year, he was sent to Westminster, still residing, however, with his aunt, who, rendered destitute by her father's bankruptcy, but unwilling to live a life of dependence, had opened a boarding-house for Westminster school. Here in the course of two years (1749–50), interrupted by danger and debility, he "painfully climbed into the third form;" but it was left to his riper age to "acquire the beauties of the Latin and the rudiments of the Greek tongue." The continual attacks of sickness which had retarded his progress induced his aunt, by medical advice, to take him to Bath; but the mineral waters had no effect. He then resided for a time in the house of a physician at Winchester; the physician did as little as the mineral waters; and, after a further trial of Bath, he once more returned to Putney, and made a last futile attempt to study at Westminster. Finally, it was concluded that he would never be able to encounter the discipline of a school; and casual instructors, at various times and places, were provided for him. Meanwhile his indiscriminate appetite for reading had begun to fix itself more and more decidedly upon history; and the list of historical works devoured by him during this period of chronic ill-health is simply astonishing. It included, besides Hearne's *Ductor Historicus* and the successive volumes of the *Universal History*, which was then in course of publication, Littlebury's *Herodotus*, Spelman's *Xenophon*, Gordon's *Tacitus*, an anonymous translation of Procopius; "many crude lumps of Speed, Rapin, Mezeray, Davila, Machiavel, Father Paul, Bower, &c., were hastily gulped. I devoured them like so many novels; and I swallowed with the same voracious appetite the descriptions of India and China, of Mexico and Peru." His first introduction to the historic scenes the study of which afterwards formed the passion of his life took place in 1751, when, while along with his father visiting a friend in Wiltshire, he discovered in the library "a common book, the continuation of Echard's *Roman History*." "To me the reigns of the successors of Constantine were absolutely new; and I was immersed in the passage of the Goths over the Danube, when the summons of the dinner bell reluctantly dragged me from my intellectual feast." Soon afterwards his fancy kindled with the first glimpses into Oriental history, the wild "barbaric" charm of which he never ceased to feel. Ockley's book on the Saracens "first opened his eyes" to the striking career of Mahomet and his hordes; and with his characteristic ardour of literary research, after exhausting all that could be learned in English of the Arabs and Persians, the

[1] The celebrated William Law had been for some time the private tutor of this Edward Gibbon, who is supposed to have been the original of the rather clever sketch of "Flatus" in the *Serious Call*.

Tartars and Turks, he forthwith plunged into the French of D'Herbelot, and the Latin of Pocock's version of Abulfaragius, sometimes understanding them, but oftener only guessing their meaning. He soon learned to call to his aid the subsidiary sciences of geography and chronology, and before he was quite capable of reading them had already attempted to weigh in his childish balance the competing systems of Scaliger and Petavius, of Marsham and Newton. At this early period he seems already to have adopted in some degree the plan of study he followed in after life, and recommended in his *Essai sur l'Étude*—that is, of letting his subject rather than his author determine his course, of suspending the perusal of a book to reflect, and to compare the statements with those of other authors,—so that he often read portions of many volumes while mastering one.

Towards his sixteenth year he tells us "nature displayed in his favour her mysterious energies," and all his infirmities suddenly vanished. Thenceforward, while never possessing or abusing the insolence of health, he could say "few persons have been more exempt from real or imaginary ills." His unexpected recovery revived his father's hopes for his education, hitherto so much neglected if judged by ordinary standards; and accordingly in January 1752 he was placed at Esher, Surrey, under the care of Dr Francis, the well known translator of Horace. But Gibbon's friends in a few weeks discovered that the new tutor preferred the pleasures of London to the instruction of his pupils, and in this perplexity decided to send him prematurely to Oxford, where he was matriculated as a gentleman commoner of Magdalen College, 3d April, 1752. According to his own testimony, he arrived at the university "with a stock of information which might have puzzled a doctor, and a degree of ignorance of which a school-boy might be ashamed." And indeed his huge wallet of scraps stood him in little stead at the trim banquets to which he was invited at Oxford, while the wandering habits by which he had filled it absolutely unfitted him to be a guest. He was not well grounded in any of the elementary branches, which are essential to university studies, and to all success in their prosecution. It was natural therefore that he should dislike the university, and as natural that the university should dislike him. Many of his complaints of the system were certainly just; but it may be doubted whether any university system would have been profitable to him, considering his antecedents. He complains especially of his tutors, and in one case with abundant reason; but, by his own confession, they might have recriminated with justice, for he indulged in gay society, and kept late hours. His observations, however, on the defects of the English university system, some of which have only very recently been removed, are acute and well worth pondering, however little relevant to his own case. He remained at Magdalen about fourteen months. "To the university of Oxford," he says, "I acknowledge no obligation; and she will as cheerfully renounce me for a son as I am willing to disclaim her for a mother. I spent fourteen months at Magdalen College; they proved the fourteen months the most idle and unprofitable of my whole life."

But thus "idle" though he may have been as a "student," he already meditated authorship. In the first long vacation—during which he, doubtless with some sarcasm, says that "his taste for books began to revive"—he contemplated a treatise on the age of Sesostris, in which (and it was characteristic) his chief object was to investigate not so much the events as the probable epoch of the reign of that semi-mythical monarch, whom he was inclined to regard as having been contemporary with Solomon. "Unprovided with original learning, unformed in the habits of thinking, unskilled in the arts of composition, I resolved to write a book;" but the discovery of his own weakness, he adds, was the first symptom of taste. On his first return to Oxford the work was "wisely relinquished," and never afterwards resumed. The most memorable incident, however, in Gibbon's stay at Oxford was his temporary conversion to the doctrines of the church of Rome. The bold criticism of Middleton's recently (1749) published *Free Enquiry into the Miraculous Powers which are supposed to have subsisted in the Christian Church*, appears to have given the first shock to his Protestantism, not indeed by destroying his previous belief that the gift of miraculous powers had continued to subsist in the church during the first four or five centuries of Christianity, but by convincing him that within the same period most of the leading doctrines of popery had been already introduced both in theory and in practice. At this stage he was introduced by a friend (Mr Molesworth) to Bossuet's *Variations of Protestantism*, and *Exposition of Catholic Doctrine* (see Gibbon, *Decline and Fall*, c. xv., note 79). "These works," says he, "achieved my conversion, and I surely fell by a noble hand." In bringing about this "fall," however, Parsons the Jesuit appears to have had a considerable share; at least Lord Sheffield has recorded that on the only occasion on which Gibbon talked with him on the subject he imputed the change in his religious views principally to that vigorous writer, who, in his opinion, had urged all the best arguments in favour of Roman Catholicism. But be this as it may, he had no sooner adopted his new creed than he resolved to profess it; "a momentary glow of enthusiasm" had raised him above all temporal considerations, and accordingly, on June 8, 1753, he records that having "privately abjured the heresies" of his childhood before a Catholic priest of the name of Baker, a Jesuit, in London, he announced the same to his father in an elaborate controversial epistle which his spiritual adviser much approved, and which he himself afterwards described to Lord Sheffield as having been "written with all the pomp, the dignity, and self-satisfaction of a martyr."

The elder Gibbon heard with indignant surprise of this act of juvenile apostacy, and, indiscreetly giving vent to his wrath, precipitated the expulsion of his son from Oxford, a punishment which the culprit, in after years at least, found no cause to deplore. In his *Memoirs* he speaks of the results of his "childish revolt against the religion of his country" with undisguised self-gratulation. It had delivered him for ever from the "port and prejudice" of the university, and led him into the bright paths of philosophic freedom. That his conversion was sincere at the time, that it marked a real if but a transitory phase of genuine religious conviction, we have no reason to doubt, notwithstanding the scepticism he has himself expressed. "To my present feelings it seems incredible that I should eve believe that I believed in transubstantiation," he indeed declares; but his incredulous astonishment is not unmixed with undoubting pride. "I could not blush that my tender mind was entangled in the sophistry which had reduced the acute and manly understandings of a Chillingworth or a Bayle." Nor is the sincerity of the Catholicism he professed in these boyish days in any way discredited by the fact of his subsequent lack of religion. Indeed, as one of the acutest and most sympathetic of his critics has remarked, the deep and settled grudge he has betrayed towards every form of Christian belief, in all the writings of his maturity, may be taken as evidence that he had at one time experienced in his own person at least some of the painful workings of a positive faith.

But little time was lost by the elder Gibbon in the formation of a new plan of education for his son, and in devising some method which if possible might effect the cure of his "spiritual malady." The result of deliberation, aided by the advice and experience of Lord Eliot, was that it was almost immediately decided to fix Gibbon for some years abroad under the roof of M. Pavilliard, a Calvinist minister at Lausanne. In as far as regards the instructor and guide thus selected, a more fortunate choice could scarcely have been made. From the testimony of his pupil, and the still more conclusive evidence of his own correspondence with the father, Pavilliard seems to have been a man of singular good sense, temper, and tact. At the outset, indeed, there was one considerable obstacle to the free intercourse of tutor and pupil: M. Pavilliard appears to have known little of English, and young Gibbon knew practically nothing of French. But this difficulty was soon removed by the pupil's diligence; the very exigencies of his situation were of service to him in calling forth all his powers, and he studied the language with such success that at the close of his five years' exile he declares that he "spontaneously thought" in French rather than in English, and that it had become more familiar to "ear, tongue, and pen." It is well known that in after years he had doubts whether he should not compose his great work in French; and it is certain that his familiarity with that language, in spite of considerable efforts to counteract its effects, tinged his style to the last.

Under the judicious regulations of his new tutor a methodical course of reading was marked out, and most ardently prosecuted; the pupil's progress was proportionably rapid. With the systematic study of the Latin, and to a slight extent also of the Greek classics, he conjoined that of logic in the prolix system of Crousaz; and he further invigorated his reasoning powers, as well as enlarged his knowledge of metaphysics and jurisprudence, by the perusal of Locke, Grotius, and Montesquieu. He also read largely, though somewhat indiscriminately, in French literature, and appears to have been particularly struck with Pascal's *Provincial Letters*, which he tells us he reperused almost every year of his subsequent life with new pleasure, and which he particularly mentions as having been, along with Bleterie's *Life of Julian* and Giannone's *History of Naples*, a book which probably contributed in a special sense to form the historian of the Roman empire. The comprehensive scheme of study included mathematics also, in which he advanced as far as the conic sections in the treatise of L'Hôpital. He assures us that his tutor did not complain of any inaptitude on the pupil's part, and that the pupil was as happily unconscious of any on his own; but here he broke off. He adds, what is not quite clear from one who so frankly acknowledges his limited acquaintance with the science, that he had reason to congratulate himself that he knew no more. "As soon," he says, "as I understood the principles, I relinquished for ever the pursuit of the mathematics; nor can I lament that I desisted before my mind was hardened by the habit of rigid demonstration, so destructive of the finer feelings of moral evidence, which must, however, determine the actions and opinions of our lives."

Under the new influences which were brought to bear on him, he in less than two years resumed his Protestantism. "He is willing," he says, to allow M. Pavilliard a "handsome share in his reconversion," though he maintains, and no doubt rightly, that it was principally due "to his own solitary reflections." He particularly congratulated himself on having discovered the "philosophical argument" against transubstantiation, "that the text of Scripture which seems to inculcate the real presence is attested only by a single sense—our sight, while the real presence itself is disproved by three of our senses—the sight, the touch, and the taste." Before a similar mode of reasoning, all the other distinctive articles of the Romish creed "disappeared like a dream"; and "after a full conviction," on Christmas day, 1754, he received the sacrament in the church of Lausanne. Although, however, he adds that at this point he suspended his religious inquiries, "acquiescing with implicit belief in the tenets and mysteries which are adopted by the general consent of Catholics and Protestants," his readers will probably do him no great injustice if they assume that even then it was rather to the negations than to the affirmations of Protestantism that he most heartily assented.

With all his devotion to study at Lausanne[1] (he read ten or twelve hours a day), he still found some time for the acquisition of some of the lighter accomplishments, such as riding, dancing, drawing, and also for mingling in such society as the place had to offer. In September 1755 he writes to his aunt, "I find a great many agreeable people here, see them sometimes, and can say upon the whole, without vanity, that, though I am the Englishman here who spends the least money, I am he who is most generally liked." Thus his "studious and sedentary life" passed pleasantly enough, interrupted only at rare intervals by boyish excursions of a day or a week in the neighbourhood, and by at least one memorable tour of Switzerland, by Basel, Zürich, Lucerne, and Bern, made along with Pavilliard in the autumn of 1755. The last eighteen months of this residence abroad saw the infusion of two new elements—one of them at least of considerable importance—into his life. In 1757 Voltaire came to reside at Lausanne; and although he took but little notice of the young Englishman of twenty, who eagerly sought and easily obtained an introduction, the establishment of the theatre at Monrepos, where the brilliant versifier himself declaimed before select audiences his own productions on the stage, had no small influence in fortifying Gibbon's taste for the French theatre, and in at the same time abating that "idolatry for the gigantic genius of Shakespeare which is inculcated from our infancy as the first duty of an Englishman." In the same year—apparently about June—he saw for the first time, and forthwith loved, the beautiful, intelligent, and accomplished Mademoiselle Susan Curchod, daughter of the pasteur of Crassier. That the passion which she inspired in him was tender, pure, and fitted to raise to a higher level a nature which in some respects was much in need of such elevation will be doubted by none but the hopelessly cynical; and probably there are few readers who can peruse the paragraph in which Gibbon "approaches the delicate subject of his early love" without discerning in it a pathos much deeper than that of which the writer was himself aware. During the remainder of his residence at Lausanne he had good reason to "indulge his dream of felicity"; but on his return to England, "I soon discovered that my father would not hear of this strange alliance, and that without his consent I was myself destitute and helpless.

[1] The *Journal* for 1755 records that during that year, besides writing and translating a great deal in Latin and French, he had read, amongst other works, Cicero's *Epistolæ ad Familiares*, his *Brutus*, all his *Orations*, his dialogues *De Amicitia* and *De Senectute*, Terence (twice), and Pliny's *Epistles*. In January 1756 he says:—"I determined to read over the Latin authors in order, and read this year Virgil, Sallust, Livy, Velleius Paterculus, Valerius Maximus, Tacitus, Suetonius, Quintus Curtius, Justin, Florus, Plautus, Terence, and Lucretius. I also read and meditated Locke *Upon the Understanding*." Again in January 1757 he writes:—"I began to study algebra under M. de Traytorrens, went through the elements of algebra and geometry, and the three first books of the Marquis de l'Hôpital's *Conic Sections*. I also read Tibullus, Catullus, Propertius, Horace (with Dacier's and Torrentius's notes), Virgil, Ovid's *Epistles*, with Meziriac's commentary, the *Ars Amandi*, and the *Elegies*; likewise the *Augustus* and *Tiberius* of Suetonius, and a Latin translation of Dion Cassius from the death of Julius Cæsar to the death of Augustus. I also continued my correspondence, begun last year, with M. Allamand of Bex, and the Professor Breitinger of Zürich, and opened a new one with the Professor Gesner of Göttingen. *N.B.*—Last year and this I read St John's Gospel, with part of Xenophon's *Cyropædia*, the *Iliad*, and Herodotus; but, upon the whole, I rather neglected my Greek."

After a painful struggle I yielded to my fate; I sighed as a lover, I obeyed as a son; my wound was insensibly healed by time, absence, and the habits of a new life."[1]

In 1758 he returned with mingled joy and regret to England, and was kindly received at home. But he found a stepmother there; and this apparition on his father's hearth at first rather appalled him. The cordial and gentle manners of Mrs Gibbon, however, and her unremitting care for his happiness, won him from his first prejudices, and gave her a permanent place in his esteem and affection. He seems to have been much indulged, and to have led a very pleasant life of it; he pleased himself in moderate excursions, frequented the theatre, mingled, though not very often, in society; was sometimes a little extravagant, and sometimes a little dissipated, but never lost the benefits of his Lausanne exile; and easily settled into a sober, discreet, calculating Epicurean philosopher, who sought the *summum bonum* of man in temperate, regulated, and elevated pleasure. The first two years after his return to England he spent principally at his father's country seat at Buriton, in Hampshire, only nine months being given to the metropolis. He has left an amusing account of his employments in the country, where his love of study was at once inflamed by a large and unwonted command of books and checked by the necessary interruptions of his otherwise happy domestic life. After breakfast "he was expected," he says, to spend an hour with Mrs Gibbon; after tea his father claimed his conversation; in the midst of an interesting work he was often called down to entertain idle visitors; and, worst of all, he was periodically compelled to return the well-meant compliments. He mentions that he dreaded the "recurrence of the full moon," which was the period generally selected for the more convenient accomplishment of such formidable excursions.

His father's library, though large in comparison with that he commanded at Lausanne, contained, he says, "much trash;" but a gradual process of reconstruction transformed it at length into that "numerous and select" library which was "the foundation of his works, and the best comfort of his life both at home and abroad." No sooner had he returned home than he began the work of accumulation, and records that, on the receipt of his first quarter's allowance, a large share was appropriated to his literary wants. "He could never forget," he declares, "the joy with which he exchanged a bank note of twenty pounds for the twenty volumes of the *Memoirs* of the Academy of Inscriptions," an Academy which has been well characterized (by Sainte-Beuve) as Gibbon's intellectual fatherland. It may not be uninteresting here to note the principles which guided him both now and afterwards in his literary purchases. "I am not conscious," says he, "of having ever bought a book from a motive of ostentation; every volume, before it was deposited on the shelf, was either read or sufficiently examined"; he also mentions that he soon adopted the tolerating maxim of the elder Pliny, that no book is ever so bad as to be absolutely good for nothing.

In London he seems to have seen but little select society, —partly from his father's taste, "which had always preferred the highest and the lowest company," and partly from his own reserve and timidity, increased by his foreign education, which had made English habits unfamiliar, and the very language in some degree strange. And thus he was led to draw that interesting picture of the literary recluse among the crowds of London: "While coaches were rattling through Bond Street, I have passed many a solitary evening in my lodging with my books. My studies were sometimes interrupted with a sigh, which I breathed towards Lausanne; and on the approach of spring I withdrew without reluctance from the noisy and extensive scene of crowds without company, and dissipation without pleasure." He renewed former acquaintance, however, with the "poet" Mallet, and through him gained access to Lady Hervey's circle, where a congenial admiration, not to say affectation, of French manners and literature made him a welcome guest. It ought to be added that in each of the twenty-five years of his subsequent acquaintance with London "the prospect gradually brightened," and his social as well as his intellectual qualities secured him a wide circle of friends. In one respect Mallet gave him good counsel in those early days. He advised him to addict himself to an assiduous study of the more idiomatic English writers, such as Swift and Addison,—with a view to unlearn his foreign idiom, and recover his half-forgotten vernacular,— a task, however, which he never perfectly accomplished. Much as he admired these writers, Hume and Robertson were still greater favourites, as well from their subject as for their style. Of his admiration of Hume's style, of its nameless grace of simple elegance, he has left us a strong expression, when he tells us that it often compelled him to close the historian's volumes with a mixed sensation of delight and despair.

In 1761 Gibbon, at the age of twenty-four, after many delays, and with many flutterings of hope and fear, gave to the world, in French, his maiden publication, an *Essai sur l'Étude de la Littérature*, which he had composed two years before. It was published partly in compliance with his father's wishes, who thought that the proof of some literary talent might introduce him favourably to public notice, and secure the recommendation of his friends for some appointment in connexion with the mission of the English plenipotentiaries to the congress at Augsburg which was at that time in contemplation. But in yielding to paternal authority, Gibbon frankly owns that he "complied, like a pious son, with the wish of his own heart."

The subject of this youthful effort was suggested, its author says, by a refinement of vanity—"the desire of justifying and praising the object of a favourite pursuit," namely, the study of ancient literature. Partly owing to its being written in French, partly to its character, the *Essai* excited more attention abroad than at home. Gibbon has criticized it with the utmost frankness, not to say severity; but, after every abatement, it is unquestionably a surprising effort for a mind so young, and contains many thoughts which would not have disgraced a thinker or a scholar of much maturer age. His account of its first reception and subsequent fortunes in England deserves to be cited as a curious piece of literary history. "In England," he says, "it was received with cold indifference, little read, and speedily forgotten. A small impression was slowly dispersed; the bookseller murmured, and the author (had his feelings been more exquisite) might have wept over the blunders and baldness of the English translation. The publication of my history fifteen years afterwards revived the memory of my first performance, and the essay was eagerly sought in the shops. But I refused the permission which Becket solicited of reprinting it; the public curiosity was imperfectly satisfied by a pirated copy of the booksellers of Dublin; and when a copy of the original edition has been discovered in a sale, the primitive value of half-a-crown has risen to the fanciful price of a guinea or thirty shillings."[2]

Sometime before the publication of the essay, Gibbon

[1] The affair, however, was not finally broken off till 1763. Mdlle. Curchod soon afterwards became the wife of Necker, the famous financier; and Gibbon and the Neckers frequently afterwards met on terms of mutual friendship and esteem.

[2] The *Essai*, in a good English translation, now appears in the *Miscellaneous Works*. Villemain finds in it "peu de vues, nulle originalité surtout, mais une grande passion littéraire, l'amour des recherches savantes et du beau langage." Sainte-Beuve's criticism is almost identical with Gibbon's own; but though he finds that "La

had entered a new and, one might suppose, a very uncongenial scene of life. In an hour of patriotic ardour he became (June 12, 1759) a captain in the Hampshire militia, and for more than two years (May 10, 1760, to December 23, 1762) led a wandering life of "military servitude." Hampshire, Kent, Wiltshire, and Dorsetshire formed the successive theatres of what he calls his "bloodless and inglorious campaigns." He complains of the busy idleness in which his time was spent; but, considering the circumstances, so adverse to study, one is rather surprised that the military student should have done so much, than that he did so little; and never probably before were so many hours of literary study spent in a tent. In estimating the comparative advantages and disadvantages of this wearisome period of his life, he has summed up with the impartiality of a philosopher and the sagacity of a man of the world. Irksome as were his employments, grievous as was the waste of time, uncongenial as were his companions, solid benefits were to be set off against these things: his health became robust, his knowledge of the world was enlarged, he wore off some of his foreign idiom, got rid of much of his reserve; he adds—and perhaps in his estimate it was the benefit to be most prized of all—"the discipline and evolutions of a modern battalion gave me a clearer notion of the phalanx and the legion, and the captain of the Hampshire grenadiers (the reader may smile) has not been useless to the historian of the Roman empire."

It was during this period that he read Homer and Longinus, having for the first time acquired some real mastery of Greek; and after the publication of the *Essai*, his mind was full of projects for a new literary effort. The Italian expedition of Charles VIII. of France, the crusade of Richard I., the wars of the barons, the lives and comparisons of Henry V. and the emperor Titus, the history of the Black Prince, the life of Sir Philip Sydney, that of Montrose, and finally that of Sir W. Raleigh, were all of them seriously contemplated and successively rejected. By their number they show how strong was the impulse to literature, and by their character, how determined the bent of his mind in the direction of history; while their variety makes it manifest also that he had then at least no special purpose to serve, no preconceived theory to support, no particular prejudice or belief to overthrow.

The militia was disbanded in 1762, and Gibbon joyfully shook off his bonds; but his literary projects were still to be postponed. Following his own wishes, though with his father's consent, he had early in 1760 projected a Continental tour as the completion "of an English gentleman's education." This had been interrupted by the episode of the militia; now, however, he resumed his purpose, and left England in January 1763. Two years were "loosely defined as the term of his absence," which he exceeded by half a year—returning June 1765. He first visited Paris, where he saw a good deal of D'Alembert, Diderot, Barthélemy, Raynal, Helvétius, Baron d'Holbach, and others of that circle, and was often a welcome guest in the saloons of Madame Geoffrin and Madame du Deffand.[1] Voltaire was at Geneva, Rousseau at Montmorency, and Buffon he neglected to visit; but so congenial did he find the society for which his education had so well prepared him, and into which some literary reputation had already preceded him, that he declared, "Had I been rich and independent, I should have prolonged and perhaps have fixed my residence at Paris."

From France he proceeded to Switzerland, and spent nearly a year at Lausanne, where many old friendships and studies were resumed, and new ones begun. His reading was largely designed to enable him fully to profit by the long contemplated Italian tour which began in April 1764, and lasted somewhat more than a year. He has recorded one or two interesting notes on Turin, Genoa, Florence, and other towns at which halt was made on his route; but Rome was the great object of his pilgrimage, and the words in which he has alluded to the feelings with which he approached it are such as cannot be omitted from any sketch of Gibbon, however brief. "My temper is not very susceptible of enthusiasm, and the enthusiasm which I do not feel I have ever scorned to affect. But at the distance of twenty-five years I can neither forget nor express the strong emotions which agitated my mind as I first approached and entered the Eternal City. After a sleepless night, I trod with a lofty step the ruins of the forum; each memorable spot, where Romulus stood, or Tully spoke, or Cæsar fell, was at once present to my eye; and several days of intoxication were lost or enjoyed before I could descend to a cool and minute investigation." Here at last his long yearning for some great theme worthy of his historic genius was gratified. The first conception of the *Decline and Fall* arose as he lingered one evening amidst the vestiges of ancient glory. "It was at Rome, on the 15th of October 1764, as I sat musing amidst the ruins of the Capitol, while the barefooted friars were singing vespers in the temple of Jupiter, that the idea of writing the decline and fall of the city first started to my mind."

The five years and a half which intervened between his return from this tour, in June 1765, and the death of his father, in November 1770, seem to have formed the portion of his life which "he passed with the least enjoyment, and remembered with the least satisfaction." He attended every spring the meetings of the militia at Southampton, and rose successively to the rank of major and lieutenant-colonel commandant; but was each year "more disgusted with the inn, the wine, the company, and the tiresome repetition of annual attendance and daily exercise." From his own account, however, it appears that other and deeper causes produced this discontent. Sincerely attached to his home, he yet felt the anomaly of his position. At thirty, still a dependant, without a settled occupation, without a definite social status, he often regretted that he had not "embraced the lucrative pursuits of the law or of trade, the chances of civil office or India adventure, or even the fat slumbers of the church." From the emoluments of a profession he "might have derived an ample fortune, or a competent income, instead of being stinted to the same narrow allowance, to be increased only by an event which he sincerely deprecated." Doubtless the secret fire of a consuming, but as yet ungratified, literary ambition also troubled his repose. He was still contemplating "at an awful distance" *The Decline and Fall*, and meantime revolved some other subjects, that seemed more immediately practicable. Hesitating for some time between the revolutions of Florence and those of Switzerland, he consulted M. Deyverdun, a young Swiss with whom he had formed a close and intimate friendship during his first residence at Lausanne, and finally decided in favour of the land which was his "friend's by birth" and "his own by adoption." He executed the first book in French; it was read (in 1767), as an anonymous production, before a literary society of foreigners in London, and condemned. Gibbon sat and listened unobserved to their strictures. It never got beyond that rehearsal; Hume, indeed, approved of the performance, only deprecating as

lecture en est assez difficile et parfois obscure, la liaison des idées échappe souvent par trop de concision et par le désir qu'a eu le jeune auteur d'y faire entrer, d'y condenser la plupart de ses notes," he adds, "Il y a, chemin faisant, des vues neuves et qui sentent l'historien."

[1] Her letters to Walpole about Gibbon contain some interesting remarks by this "aveugle clairvoyante," as Voltaire calls her; but they belong to a later period (1777).

unwise the author's preference for French; but Gibbon sided with the majority.

In 1767 also he joined with M. Deyverdun in starting a literary journal under the title of *Mémoires Littéraires de la Grande Bretagne.* But its circulation was limited, and only the second volume had appeared (1768) when Deyverdun went abroad. The materials already collected for a third volume were suppressed. It is interesting, however, to know that in the first volume is a review by Gibbon of Lord Lyttelton's *History of Henry II.*, and that the second volume contains a contribution by Hume on Walpole's *Historic Doubts.*

The next appearance of the historian made a deeper impression. It was the first distinct print of the lion's foot. "Ex ungue leonem" might have been justly said, for he attacked, and attacked successfully, the redoubtable Warburton. Of the many paradoxes in the *Divine Legation*, few are more extravagant than the theory that Virgil, in the sixth book of his *Æneid*, intended to allegorize, in the visit of his hero and the Sibyl to the shades, the initiation of Æneas, as a lawgiver, into the Eleusinian mysteries. This theory Gibbon completely exploded in his *Critical Observations* (1770),—no very difficult task, indeed, but achieved in a style, and with a profusion of learning, which called forth the warmest commendations both at home and abroad. Warburton never replied; and few will believe that he would not, if he had not thought silence more discreet. Gibbon, however, regrets that the style of his pamphlet was too acrimonious; and this regret, considering his antagonist's slight claims to forbearance, is creditable to him. "I cannot forgive myself the contemptuous treatment of a man who, with all his faults, was entitled to my esteem; and I can less forgive, in a personal attack, the cowardly concealment of my name and character."

Soon after his "release from the fruitless task of the Swiss revolution" in 1768, he had gradually advanced from the wish to the hope, from the hope to the design, from the design to the execution of his great historical work. His preparations were indeed vast. The classics, "as low as Tacitus, Pliny the Younger, and Juvenal," had been long familiar. He now "plunged into the ocean of the Augustan history," and "with pen almost always in hand," pored over all the original records, Greek and Latin, between Trajan and the last of the Western Cæsars. "The subsidiary rays of medals and inscriptions, of geography and chronology, were thrown on their proper objects; and I applied the collections of Tillemont, whose inimitable accuracy almost assumes the character of genius, to fix and arrange within my reach the loose and scattered atoms of historical information." The Christian apologists and their pagan assailants; the Theodosian Code, with Godefroy's commentary; the *Annals and Antiquities* of Muratori, collated with "the parallel or transverse lines" of Sigonius and Maffei, Pagi and Baronius, were all critically studied. Still following the wise maxim which he had adopted as a student, "multum legere potius quam multa," he reviewed again and again the immortal works of the French and English, the Latin and Italian classics. He deepened and extended his acquaintance with Greek, particularly with his favourite authors Homer and Xenophon; and, to crown all, he succeeded in achieving the third perusal of Blackstone's *Commentaries.*

The course of his study was for some time seriously interrupted by his father's illness and death in 1770, and by the many distractions connected with the transference of his residence from Buriton to London. It was not, indeed, until October 1772 that he found himself at last independent, and fairly settled in his house and library, with full leisure and opportunity to set about the composition of the first volume of his history. Even then it appears from his own confession that he long brooded over the chaos of materials he had amassed before light dawned upon it. At the commencement, he says, "all was dark and doubtful"; the limits, divisions, even the title of his work were undetermined; the first chapter was composed three times, and the second and third twice, before he was satisfied with his efforts. This prolonged meditation on his design and its execution was ultimately well repaid by the result: so methodical did his ideas become, and so readily did his materials shape themselves, that, with the above exceptions, the original MS. of the entire six quartos was sent uncopied to the printers. He also says that not a sheet had been seen by any other eyes than those of author and printer, a statement indeed which must be taken with a small deduction; or rather we must suppose that a few chapters had been submitted, if not to the "eyes," to the "ears" of others; for he elsewhere tells us that he was "soon disgusted with the modest practice of reading the manuscript to his friends." Such, however, were his preliminary difficulties that he confesses he was often "tempted to cast away the labour of seven years"; and it was not until February 1776 that the first volume was published. The success was instant, and, for a quarto, probably unprecedented. The entire impression was exhausted in a few days; a second and a third edition were scarcely adequate to the demand. The author might almost have said, as Lord Byron after the publication of *Childe Harold*, that "he awoke one morning and found himself famous." In addition to public applause, he was gratified by the more select praises of the highest living authorities in that branch of literature: "the candour of Dr Robertson embraced his disciple;" Hume's letter of congratulation "overpaid the labour of ten years." The latter, however, with his usual sagacity, anticipated the objections which he saw could be urged against the famous fifteenth and sixteenth chapters. "I think you have observed a very prudent temperament; but it was impossible to treat the subject so as not to give grounds of suspicion against you. and you may expect that a clamour will arise."

The "clamour" thus predicted was not slow to make itself heard. Within two years the famous chapters had elicited what might almost be called a library of controversy. The only attack, however, to which Gibbon deigned to make any reply was that of Davies, who had impugned his accuracy or good faith. His *Vindication* appeared in February, 1779; and, as Milman remarks, "this single discharge from the ponderous artillery of learning and sarcasm laid prostrate the whole disorderly squadron" of his rash and feeble assailants.[1]

[1] For a very full list of publications in answer to Gibbon's attack on Christianity reference may be made to the *Bibliographer's Manual*, pp. 885-6 (1858). Of these the earliest were Watson's *Apology* (1776), Salisbury's *Strictures* (1776), and Chelsum's (anonymous) *Remarks* (1776). In 1778 the *Few Remarks* by a Gentleman (Francis Eyre), the *Reply* of Loftus, the *Letters* of Apthorpe, and the *Examination* of Davies appeared, Gibbon's *Vindication* (1779) called forth a *Reply* by Davies (1779), and *A Short Appeal to the Public* by Francis Eyre (1779). Laughton's polemical treatise was published in 1780, and those of Milner and Taylor in 1781. Chelsum returned to the attack in 1785 (*A Reply to Mr Gibbon's Vindication*), and Sir David Dalrymple (*An Inquiry into the Secondary Causes*, &c.) made his first appearance in the controversy in 1786. Travis's *Letters on 1 John* v. 7 are dated 1784; and Spedalieri's *Confutazione dell' Esame del Cristianismo fatto da Gibbon* was published at Rome (2 vols. 4to) in the same year. It is impossible not to concur in almost every point with Gibbon's own estimate of his numerous assailants. Their crude productions, for the most part, were conspicuous rather for insolence and abusiveness than for logic or learning. Those of Bishop Watson and Lord Hailes were the best, but simply because they contented themselves with a dispassionate exposition of the general argument in favour of Christianity. The most foolish and discreditable was certainly that of Davies; his unworthy attempt to depreciate the great historian's learning, and his captious, cavilling, acrimonious charges of petty inaccuracies and discreditable falsification gave the object of his attack an easy triumph.

Two years before the publication of this first volume Gibbon was elected member of parliament for Liskeard (1774). His political duties did not suspend his prosecution of his history, except on one occasion, and for a little while, in 1779, when he undertook, on behalf of the ministry, a task which, if well performed, was also, it must be added, well rewarded. The French Government had issued a manifesto preparatory to a declaration of war, and Gibbon was solicited by Chancellor Thurlow and Lord Weymouth, secretary of state, to answer it. In compliance with this request he produced the able *Mémoire Justificatif*, composed in French, and delivered to the courts of Europe; and shortly afterwards he received a seat at the Board of Trade and Plantations,—little more than a sinecure in itself, but with a very substantial salary of nearly £800 per annum. His acceptance displeased some of his former political associates, and he was accused of "deserting his party." In his *Memoir*, indeed, Gibbon denies that he had ever enlisted with the Whigs. A note of Fox, however, on the margin of a copy of *The Decline and Fall* records a very distinct remembrance of the historian's previous vituperation of the ministry; within a fortnight of the date of his acceptance of office, he is there alleged to have said that "there was no salvation for this country until six heads of the principal persons in administration were laid upon the table." Lord Sheffield merely replies, somewhat weakly it must be said, that his friend never intended the words to be taken literally. More to the point is the often-quoted passage from Gibbon's letter to Deyverdun, where the frank revelation is made: "You have not forgotten that I went into parliament without patriotism and without ambition, and that all my views tended to the convenient and respectable place of a lord of trade."

In April 1781 the second and third quartos of his *History* were published. They excited no controversy, and were comparatively little talked about—so little, indeed, as to have extorted from him a half murmur about "coldness and prejudice." The volumes, however, were bought and read with silent avidity. Meanwhile public events were developing in a manner that had a considerable influence upon the manner in which the remaining years of the historian's life were spent. At the general election in 1780 he had lost his seat for Liskeard, but had subsequently been elected for Lymington. The ministry of Lord North, however, was tottering, and soon after fell; the Board of Trade was abolished by the passing of Burke's bill in 1782, and Gibbon's salary vanished with it,—no trifle, for his expenditure had been for three years on a scale somewhat disproportionate to his private fortune. He did not like to depend on statesmen's promises, which are proverbially uncertain of fulfilment; he as little liked to retrench; and he was wearied of parliament, where he had never given any but silent votes. Urged by such considerations, he once more turned his eyes to the scene of his early exile, where he might live on his decent patrimony in a style which was impossible in England, and pursue unembarrassed his literary studies. He therefore resolved to fix himself at Lausanne.

A word only is necessary on his parliamentary career. Neither nature nor acquired habits qualified him to be an orator; his late entrance on public life, his natural timidity, his feeble voice, his limited command of idiomatic English, and even, as he candidly confesses, his literary fame, were all obstacles to success. "After a fleeting, illusive hope, prudence condemned me to acquiesce in the humble station of a mute[1]. . . . I was not armed by nature and education with the intrepid energy of mind and voice—'Vincentem strepitus et natum rebus agendis.' Timidity was fortified by pride, and even the success of my pen discouraged the trial of my voice." His repugnance to public life had been strongly expressed to his father in a letter of a very early date, in which he begged that the money which a seat in the House of Commons would cost might be expended in a mode more agreeable to him. Gibbon was eight-and-thirty when he entered parliament; and the obstacles which even at an earlier period he had not had courage to encounter were hardly likely to be vanquished then. Nor had he much political sagacity. He was better skilled in investigating the past than in divining the future. While Burke and Fox and so many great statesmen proclaimed the consequences of the collision with America, Gibbon saw nothing but colonies in rebellion, and a paternal Government justly incensed. His silent votes were all given on that hypothesis. In a similar manner, while he abhorred the French Revolution when it came, he seems to have had no apprehension, like Chesterfield, Burke, or even Horace Walpole, of its approach; nor does he appear to have at all suspected that it had had anything to do with the speculations of the philosophic coteries in which he had taken such delight. But while it may be doubted whether his presence in Parliament was of any direct utility to the legislative business of the country, there can be no question of the present advantage which he derived from it in the prosecution of the great work of his life,—an advantage of which he was fully conscious when he wrote: "The eight sessions that I sat in parliament were a school of civil prudence, the first and most essential virtue of an historian."

Having sold all his property except his library—to him equally a necessary and a luxury—Gibbon repaired to Lausanne in September 1783, and took up his abode with his early friend Deyverdun, now a resident there. Perfectly free from every engagement but those which his own tastes imposed, easy in his circumstances, commanding just as much society, and that as select, as he pleased, with the noblest scenery spread out at his feet, no situation can be imagined more favourable for the prosecution of his literary enterprise; a hermit in his study as long as he chose, he found the most delightful recreation always ready for him at the threshold. "In London," says he, "I was lost in the crowd; I ranked with the first families in Lausanne, and my style of prudent expense enabled me to maintain a fair balance of reciprocal civilities. . . . Instead of a small house between a street and a stable-yard, I began to occupy a spacious and convenient mansion, connected on the north side with the city, and open on the south to a beautiful and boundless horizon. A garden of four acres had been laid out by the taste of M. Deyverdun; from the garden a rich scenery of meadows and vineyards descends to the Leman Lake, and the prospect far beyond the lake is crowned by the stupendous mountains of Savoy." In this enviable retreat, it is no wonder that a year should have been suffered to roll round before he vigorously resumed his great work,—and with many men it would never have been resumed in such a paradise. We may remark in passing that the retreat was often enlivened, or invaded, by friendly tourists from England, whose "frequent incursions" into Switzerland our recluse seems half to lament as an evil. Among his more valued visitors were M. and Mme. Necker; Mr Fox also gave him two welcome "days of free and private society" in 1788. Differing as they did in politics, Gibbon's testimony to the genius and character of the great statesman is highly honourable to both: "Perhaps no human being," he says, "was ever more perfectly exempt from the taint of malevolence, vanity, or falsehood."

When once fairly reseated at his task, he proceeded in this delightful retreat leisurely, yet rapidly, to its comple-

[1] In 1775 he writes to Holroyd, "I am still a mute; it is more tremendous than I imagined; the great speakers fill me with despair; the bad ones with terror."

tion. The fourth volume, partly written in 1782, was completed in June 1784; the preparation of the fifth volume occupied less than two years; while the sixth and last, begun 18th May, 1786, was finished in thirteen months. The feelings with which he brought his labours to a close must be described in his own inimitable words: "It was on the day, or rather night, of the 27th of June 1787, between the hours of eleven and twelve, that I wrote the last lines of the last page in a summer house in my garden. After laying down my pen, I took several turns in a *berceau* or covered walk of acacias, which commands a prospect of the country, the lake, and the mountains. The air was temperate, the sky was serene, the silver orb of the moon was reflected from the waters, and all nature was silent. I will not dissemble the first emotions of joy on the recovery of my freedom, and, perhaps, the establishment of my fame. But my pride was soon humbled, and a sober melancholy was spread over my mind by the idea that I had taken an everlasting leave of an old and agreeable companion, and that whatsoever might be the future date of my *History*, the life of the historian must be short and precarious."

Taking the manuscript with him, Gibbon, after an absence of four years, once more visited London in 1787; and the 51st anniversary of the author's birthday (27th April 1788) witnessed the publication of the last three volumes of *The Decline and Fall*. They met with a quick and easy sale, were very extensively read, and very liberally and deservedly praised for the unflagging industry and vigour they displayed, though just exception, if only on the score of good taste, was taken to the scoffing tone he continued to maintain in all passages where the Christian religion was specially concerned, and much fault was found with the indecency of some of his notes.[1]

He returned to Switzerland in July 1788, cherishing vague schemes of fresh literary activity; but genuine sorrow caused by the death of his friend Deyverdun interfered with steady work, nor was it easy for him to fix on a new subject which should be at once congenial and proportioned to his powers; while the premonitory mutterings of the great thunderstorm of the French Revolution, which reverberated in hollow echoes even through the quiet valleys of Switzerland, further troubled his repose. For some months he found amusement in the preparation of the delightful *Memoirs* (1789) from which most of our knowledge of his personal history is derived; but his letters to friends in England, written between 1788 and 1793 occasionally betray a slight but unmistakable tone of *ennui*. In April 1793 he unexpectedly received tidings of the death of Lady Sheffield; and the motive of friendship thus supplied combined with the pressure of public events to urge him homewards. He arrived in England on the following June, and spent the summer at Sheffield Place, where his presence was even more highly prized than it had ever before been. Returning to London early in November, he found it necessary to consult his physicians for a symptom which, neglected since 1761, had gradually become complicated with hydrocele, and was now imperatively demanding surgical aid; but the painful operations which had to be performed did not interfere with his customary cheerfulness, nor did they prevent him from paying a Christmas visit to Sheffield Place. Here, however, fever made its appearance; and a removal to London (January 6, 1794) was considered imperative. Another operation brought him some relief; but a relapse occurred during the night of the 15th, and on the following day he peacefully breathed his last. His remains were laid in the burial place of the Sheffield family, Fletching, Sussex, where an epitaph by Dr Parr describes his character and work in the language at once of elegance, of moderation, and of truth.

The personal appearance of Gibbon as a lad of sixteen is brought before us somewhat dimly in M. Pavilliard's description of the "thin little figure, with a large head, disputing and arguing, with the greatest ability, all the best arguments that had ever been used in favour of popery." What he afterwards became has been made more vividly familiar by the clever silhouette prefixed to the *Miscellaneous Works* (Gibbon himself, at least, we know, did not regard it as a caricature), and by Sir Joshua Reynolds's portrait so often engraved. It is hardly fair perhaps to add a reference to Suard's highly-coloured description of the short Silenus-like figure, not more than 56 inches in height, the slim legs, the large turned-in feet, the shrill piercing voice; but almost every one will remember, from Croker's *Boswell*, Colman's account of the great historian "tapping his snuff-box, smirking and smiling, and rounding his periods" from that mellifluous mouth. It has already been seen that Gibbon's early ailments all left him on the approach of manhood; thenceforward, "till admonished by the gout," he could truly boast of an immunity well-nigh perfect from every bodily complaint; an exceptionally vigorous brain and a stomach "almost too good," united to bestow upon him a vast capacity alike for work and for enjoyment. This capacity he never abused so as to burden his conscience or depress his spirits. "The madness of superfluous health I have never known." To illustrate the intensity of the pleasure he found alike in the solitude of his study and in the relaxations of genial social intercourse, almost any page taken at random, either from the *Life* or from the *Letters*, would suffice; and many incidental touches show that he was not a stranger to the delights of quiet contemplation of the beauties and grandeurs of nature. His manners, if formal, were refined; his conversation, when he felt himself at home, interesting and unaffected; and that he was capable alike of feeling and inspiring a very constant friendship there are many witnesses to show. That his temperament at the same time was frigid and comparatively passionless cannot be denied; but neither ought this to be imputed to him as a fault; hostile criticisms upon the grief for a father's death, that "was soothed by the conscious satisfaction that I had discharged all the duties of filial piety," seem somewhat out of place. His most ardent admirers, however, are constrained to admit that he was deficient in large-hearted benevolence; that he was destitute of any "enthusiasm of humanity"; and that so far as every sort of religious yearning or aspiration is concerned, his poverty was almost unique. Gibbon was such a man as Horace might have been, had the Roman Epicurean been fonder of hard intellectual work, and less prone than he was to the indulgence of emotion.

Of Gibbon's mental qualities it is interesting to read the estimate formed and recorded by himself on his twenty-sixth birthday [May 8th, N.S., 1762]: "Wit I have none. My imagination is rather strong than pleasing. My memory both capacious and retentive. The shining qualities of my understanding are extensiveness and penetration; but I want both quickness and exactness." Twenty-six years afterwards, he wrote on the same subject in his *Memoirs*:—"The original soil has been highly improved by cultivation; but it may be questioned whether some flowers of fancy, some grateful errors, have not been eradicated with the weeds of prejudice." No student of *The Decline and Fall* will accuse its author of immodesty or vanity in these self-appreciations, but will rather be surprised that he should have so considerably underestimated both his endowments

[1] An anonymous pamphlet, entitled *Observations on the three last volumes of the Roman History*, appeared in 1788; Disney's *Sermon, with Strictures*, in 1790; and Whitaker's *Review*, in 1791. With regard to the second of the above complaints, surprise will probably be felt that it was not extended to portions of the text as well as to the notes.

and his acquirements. Of the kind and amount of varied ability displayed in that truly immortal work it would be almost impossible to speak in language of exaggerated praise,—the grandeur and vastness of conception, the artistic grouping, the masterly fulness and accuracy of detail, the richness and vividness of description, the coruscating liveliness, the polished sarcasm, the pungent wit. The history of Rome is, for the many centuries which Gibbon treats, the history of the world; and it is nothing less than astonishing that he should have been able to work with so much ease the vast and incongruous materials into such a unity of design. It is the amplest historic canvas ever spread, the largest historic painting ever executed by a single hand; and only a comprehensive and orderly intellect of the highest rank could have grappled as Gibbon has done with the task of blending that vast array of nations, in all their varieties of costume, habit, language, and religion, into one picturesque and harmonious whole. If Gibbon had ever been conscious of any inexactitude in his mental habit, it was a defect which he very early and very successfully remedied. No man could declare more honestly than he that "curiosity as well as duty had led him carefully to examine all the original documents that could illustrate the subject which he had undertaken to treat." With incredible labour he was able to bring at last to his great life-work a mind capable equally of ascending to the most comprehensive, and of descending to the most minute surveys; of appreciating the beautiful and sublime in classic literature, and yet of delighting in the verbal criticism, the tedious collation, and dry antiquarian research by which the text is established or illustrated; of celebrating the more imposing events of history with congenial pomp of description, and of investigating with the dullest plodder's patience and perseverance the origin of nations, the emigrations of obscure tribes, and the unpromising yet instructive problems which ethnology presents. In his pages the widest deductions of historic philosophy alternate with attempts to fix the true reading of an obscure passage or a minute point of chronology or geography. It may even be said that in these last investigations he took almost as much delight as in depicting the grander scenes of history, and surrendered himself as absolutely for the time to the early migrations of the Goths and Scythians as to the campaigns of Belisarius or the conquests of the Saracens. Never has historian evinced greater logical sagacity in making comparatively obscure details yield important inferences, or held with firmer hand the balance in the case of conflicting probabilities; by no one has sounder judgment or greater self-control been, on the whole, more uniformly exhibited in cases where it is so easy for learned enthusiasm to run into fanciful hypotheses.

While thus entitled to great and manifold praise, *The Decline and Fall* has not been, and can never be, exempt from a certain measure of just censure. Even when the occasional Gallicisms and grammatical absurdities pointed out by the industry of critics have been willingly overlooked, there yet remains something to be said on the defects of its style. Precise, energetic, massive it is: splendid, when the pictorial demands of the narrative require it, as that of Livy; and sometimes, where profound reflections are to be concisely expressed, as sententious and graphic as that of Tacitus. But with all its great merits it is too often formal and inflexible, and is apt to pall on the ear by the too frequent recurrence of the same cadence at equal intervals, and the too unsparing use of antithesis. It is not veined marble, but an exquisite tesselation; not the fluent naturally-winding stream, but a stately aqueduct, faced with stone, adorned with wooded embankments, or flowing over noble arches, but an aqueduct still. It is a just criticism of Sir James Mackintosh that probably no great writer ever derived less benefit from his professed models. Pascal, Voltaire, Hume, were his delight; and he acknowledges, as so unsuccessful a pupil well might, that he often closed the pages of the last with a feeling of despair. Addison and Swift he read for the very purpose of improving his acquaintance with idiomatic English, yet, as the above critic remarks, "with so little success, that in the very act of characterizing these writers, he has deviated not a little from that beautiful simplicity which is their peculiar distinction."

In a work of such extent it is a venial fault that the workmanship should not in all parts be equally perfect; "aliquando bonus dormitat." That Gibbon has sometimes failed in that lucidity of statement which is one of his very strongest characteristics has often been successfully pointed out; and special reference may be made to the 59th chapter, where he treats of the crusades. In this instance by "a brief parallel" he has sought to save himself "the repetition of a tedious narrative," but has only succeeded in presenting a superficial sketch that cannot be otherwise characterized than as confused and badly written. Nor has his penetration enabled him in all cases to reach the true significance of some of the grander facts which, in order to the adequate discharge of his task, it was of the highest importance that he should have rightly understood. Here it is not necessary to adduce any minor instances, when it can be shown that he is out of harmony with the truth, or at least with the truth as apprehended by the 19th century, in a matter so fundamental as his conception of that empire which declined and fell, and of that Christianity which, as he rightly supposes, contributed to its overthrow.

In Mirabeau's correspondence there occurs a letter to Sir Samuel Romilly containing the following criticism:—"I have never been able to read the work of M. Gibbon without being astounded that it should ever have been written in English; or without being tempted to turn to the author and say, 'You an Englishman? No, indeed! That admiration for an empire of more than two hundred millions of men, where not one had the right to call himself free; that effeminate philosophy which has more praise for luxury and pleasures than for all the virtues; that style always elegant and never energetic, reveal at the most the elector of Hanover's slave.'"[1] Here Mirabeau speaks in his own language what every one who in the least values the characteristic features of modern political life must, however inarticulately, have often felt. Gibbon's enthusiasm for the empire of Trajan and the Antonines—that "solid fabric of human greatness"—is undisguised and perfectly sincere; to his thinking, if the earth ever enjoyed a golden age, it was then. The world was happy because it was under a government which it could never think of questioning or resisting,—happy because for once it had got rid of all unavailing enthusiasms, whether political or religious. Whether it was happy, and whether any happiness it really possessed was not rather in spite of than because of the prevalent political and religious indifference, are questions which not many historians will care to answer as Gibbon did. It is manifest, however, that to him, thinking of the Roman empire as he did, it was well nigh impossible to be just to Christianity. He could never forgive a religion which, in his opinion, had overthrown "the solid fabric of human greatness," and given to the world the sorry sight of bare-footed friars chanting psalms on the spot where once had been the august worship in which everybody took part and positively no one believed. This explains why one who can treat each and all of the ethnic religions with the cold impartiality of a Chinese literatus[2]

[1] See Sainte-Beuve, *Causeries*, viii. 460.

[2] "Il a du lettré chinois dans sa manière d'apprécier les religions. —Sainte-Beuve.

is unable when Christianity comes to be discussed to conceal his heartfelt dislike. Comparing "superstition" with "superstition," virtue with virtue, vice with vice, Gibbon had formed a deliberate preference for the religion and ethics of ancient Rome. Philosophical students of history, even though they may feel themselves unable to subscribe the Athanasian creed, may now be said to be almost unanimous, however, in finding that the phenomenon called Christianity did mean for mankind a higher conception of truth and a nobler conception of duty.

Upon the famous fifteenth and sixteenth chapters it is not necessary to dwell, because at this time of day no Christian apologist dreams of denying the substantial truth of any of the more important allegations of Gibbon. Christians may complain of the suppression of some circumstances which might influence the general result; and they must remonstrate against the unfair construction of their case. But they no longer refuse to hear any reasonable evidence tending to show that persecution was less severe than had once been believed; and they have slowly learned that they can afford to concede the validity of all the secondary causes assigned by Gibbon, and even of others still more discreditable. The fact is, as the historian himself has again and again admitted, that his account of the secondary causes which contributed to the progress and establishment of Christianity leaves the question as to the natural or supernatural origin of Christianity practically untouched; that question still continues to be agitated, but the battle is fought on a new field and with other weapons than those selected by Gibbon.

Of the original quarto edition of *The Decline and Fall*, vol. i. appeared, as has already been stated, in 1776, vols. ii. and iii. in 1781, and vols. iv.–vi. (inscribed to Lord North) in 1788. In later editions vol. i. was considerably altered by the author; the others hardly at all. The number of modern reprints has been very considerable; but the most important and valuable English edition is that of Milman (1839 and 1845), still more recently enriched under the editorship of Dr W. Smith (8 vols. 8vo, 1854 and 1872). As a curiosity of literature Bowdler's edition, "adapted to the use of families and young persons" by the expurgation of "the indecent expressions and all allusions of an improper tendency" (5 vols. 8vo, 1825), may be specially noticed. The French translation of Le Clerc de Septchênes, continued by Démeunier, Boulard, and Cantwell (1788–1795), has been frequently reprinted in France. It seems to be certain that the portion usually attributed to Septchênes was, in part at least, the work of his distinguished pupil, Louis XVI. A new edition of the complete translation, prefaced by a letter on Gibbon's life and character, from the pen of Suard, and annotated by Guizot, appeared in 1812 (and again in 1828). There are at least two German translations of *The Decline and Fall*, one by Wenck, Schreiter, and Beck (1805–1807), and a second by Sporschil (1862). The Italian translation (alluded to by Gibbon himself) was, along with Spedalieri's *Confutazione*, reprinted at Milan in 1823. Gibbon's *Miscellaneous Works, with Memoirs of his Life and Writings, composed by himself; illustrated from his letters, with occasional Notes and Narrative*, published by Lord Sheffield in two volumes in 1796, has been often reprinted. The new edition in five volumes (1814) contained some previously unpublished matter, and in particular the fragment on the revolutions of Switzerland. A French translation of the *Miscellaneous Works* by Marigné appeared at Paris in 1798. There is also a German translation (Leipsic, 1801). It may be added that a special translation of the chapter on Roman Law (*Gibbon's historische Uebersicht des Römischen Rechts*) was published by Hugo at Göttingen in 1839, and has frequently been used as a text-book in German universities. (H. RO.—J. S. BL.)

GIBBONS, Grinling (1648–1721), a celebrated English wood-carver, was born in 1648, according to some authorities of Dutch parents at Rotterdam, and according to others of English parents at London. By the former he is said to have come to London after the great fire in 1666. He early displayed great cleverness and ingenuity in his art, on the strength of which he was recommended by Evelyn to Charles II., who employed him in the execution both of statuary and of ornamental carving in wood. In statuary one of his principal works is a life-size bronze statue in the court of Whitehall, representing James II. in the dress of a Roman emperor, and he also designed the base of the statue of Charles I. at Charing Cross. It is, however, chiefly as an engraver in wood that he has acquired a reputation. He was employed to execute the ornamental carving for the chapel at Windsor, the foliage and festoons in the choir of St Paul's, the baptismal fonts in St James's, and an immense quantity of ornamental work at Burleigh, Chatsworth, and other aristocratic mansions. The finest of all his productions in this style is believed to be the ceiling which he devised for a room at Petworth. His subjects are chiefly birds, flowers, foliage, fruit, and lace, and many of his works, for delicacy and elaboration of details, and truthfulness of imitation, have never been surpassed. He, however, sometimes wasted his ingenuity on trifling subjects; many of his flowers used to move on their stems like their natural prototypes when shaken by a breeze. In 1714 Gibbons was appointed master carver in wood to George I. He died at London August 3, 1721.

GIBBONS, Orlando (1583–1625), like Johann Sebastian Bach, was the most illustrious of a family of musicians all more or less able. We know of at least three generations of musical Gibbons, for Orlando's father, William Gibbons, having been one of the waits of Cambridge, may be assumed to have acquired some proficiency in the art. His three sons and at least one of his grandsons inherited and further developed his talent. The eldest, Edward, was made bachelor of music at Cambridge, and successively held important musical appointments at the cathedrals of Bristol and Exeter; Ellis, the second son, was organist of Salisbury Cathedral, and is the composer of two madrigals in the collection known as the *The Triumphs of Oriana.* Orlando Gibbons, the youngest and by far the most celebrated of the brothers, was born at Cambridge in 1583. Where and under whom he studied is not known, but in his twenty-first year he was sufficiently advanced and celebrated to receive the important post of organist of the Chapel Royal. His first published composition "Fantasies in three parts, composed for viols," appeared in 1610. It seems to have been the first piece of music printed in England from engraved plates, or "cut in copper, the like not heretofore extant." In 1622 he was created doctor of music by the university of Oxford. For this occasion he composed an anthem for eight parts, *O clap your Hands*, still extant. In the following year he became organist of Westminster Abbey. Orlando Gibbons died before the beginning of the civil war, or it may be supposed that, like his eldest brother, he would have been a staunch royalist. In a different sense, however, he died in the cause of his master; for having been summoned to Canterbury to produce a composition written in celebration of Charles's marriage, he there fell a victim to small-pox on June 5, 1625. Of his life very little is known, but that little is well summed up in the article contributed by Mr W. H. Husk to Dr Grove's *Dictionary of Music and Musicians*, where a complete list of his compositions is also given. His portrait may be found in Hawkins's well-known *History.* The works of Gibbons may be divided into secular and sacred compositions, the latter being by far the most important portion. His vocal pieces, madrigals, motets, canons, songs, &c., are admirable specimens of part-writing, and prove him to have been a perfect master of polyphonous treatment. Many of them are for five voices, a very common number in those days; but pieces for four and for six voices also are by no means rare. To the first-named class belong a *Te Deum* in D minor, two sets of *Preces* and other compositions for church service, also most of the madrigals. We have also some specimens of his instrumental music, such as the six pieces for the virginals published in *Parthenia*, a collection of instrumental music produced by Gibbons in conjunction with Dr Bull and Byrd.

GIBEON, a town famous in Old Testament history, known under the name of El Jîb, situated 5 miles north-west of Jerusalem. It is now a small village standing on an isolated hill above a flat corn valley. The famous spring (2 Sam. ii. 13) comes out from under a cliff on the south-east side of the hill, and the water runs to a reserv lower down. The sides of the hill are rocky, and remarkable for the regular stratification of the limestone, which gives the hill at a distance the appearance of being stepped. Scattered olive groves surround the place. The name is derived from the Hebrew root *gabah*, signifying "prominence," and there are throughout Palestine many ancient sites situate on rocky knolls which receive names (*e.g.*, Gibeah, Geba, Gabe, Gaba—nearly all represented by the present Jeba) derived from this same root.

GIBRALTAR, a British fortress and town in the south of Spain, occupying a grand peninsular headland, which stretches almost due south in a line with the eastern coast of the province of Andalusia, separating the Bay of Algeciras from the open sea of the Mediterranean, and commanding the strait by which the Mediterranean communicates with the Atlantic. Its latitude is 36° 6′ 23″ N. and its longitude 5° 20′ 55″ W. The "rock," as the promontory is familiarly called, is about 2½ miles in length, with a varying breadth of from 2 to 6 furlongs. Rising abruptly from the low sandy isthmus which connects it with the mainland to a height of 1200 feet, the main ridge continues south for about 1½ miles, being separated by two transverse depressions, known respectively as the Northern and Southern Quebrada, into three pretty distinct summits—the Wolf's Crag or North Front, the Middle Hill or Signal Station (1255 feet high), and the Pan de Azucar or Sugar Loaf Hill, dominated by O'Hara's tower (1408 feet). This last summit descends somewhat abruptly on the south to the Windmill Plateau, an almost level area about half a mile in length by a quarter in breadth, which, from a height of 400 feet above the sea, slopes south till it is only 300 feet above the sea, and then in its turn sinks abruptly for about 200 feet to the Europa Plateau, which, also sloping seaward, terminates in a cliff about 50 feet high. Towards the east or Mediterranean side the promontory presents as precipitous and inaccessible a front as towards the north, but towards the west the ascent is comparatively gradual though interrupted by longitudinal cliffs and ravines, and a considerable space of fairly level ground at the foot affords a site for the town.

The basement rock of Gibraltar is for the most part a greyish-white or pale grey limestone, of compact and sometimes crystalline texture, arranged in beds, but in some places apparently amorphous. Above the limestone is a series of dark greyish blue shales with intercalated beds and bands of grit, sandstone, and limestone; and distributed here and there about the promontory are various limestone breccias, bone-breccias, and calcareous sandstones, as well as loose sand and debris. It is evident that the whole promontory has had an eventful geological history in comparatively recent periods. The limestone and the shales are both of Lower Jurassic age, but the rest of the formations are of much more ancient date. According to the researches of Professors Ramsay and Geikie ("Geology of Gibraltar," in the *Quarterly Journal of the Geological Society*, London, 1878), the oldest superficial accumulation is the unfossiliferous limestone breccia of Buena Vista, which must have been formed under somewhat severer climatic conditions than the present, and when the rock had a wider area of low ground at its base. This period was probably followed by one with a genial climate, during which the promontory, if indeed it was not rather an isthmus between Europe and Africa, was clothed with vegetation and inhabited by a rich mammalian fauna, whose remains are still found in the Genista caves. Next there came a subsidence of a large proportion of the rock to the extent of 700 feet below the present level, the consequent erosion of ledges and platforms, and the formation of the calcareous sandstones which have incorporated shells of recent Mediterranean species. The process of depression was apparently interrupted by pauses. On its re-elevation, the land was again of greater extent than now; Africa and Europe were perhaps reunited, and the climate was probably genial. By a new depression the rock was brought into its present geographical relations.

Like most masses of limestone formation, the promontory of Gibraltar is honeycombed with caverns and subterraneous passages, and the Genista cave, already incidentally mentioned, is only one of the many to which it owes the title of the Hill of Caves. A special interest attaches to

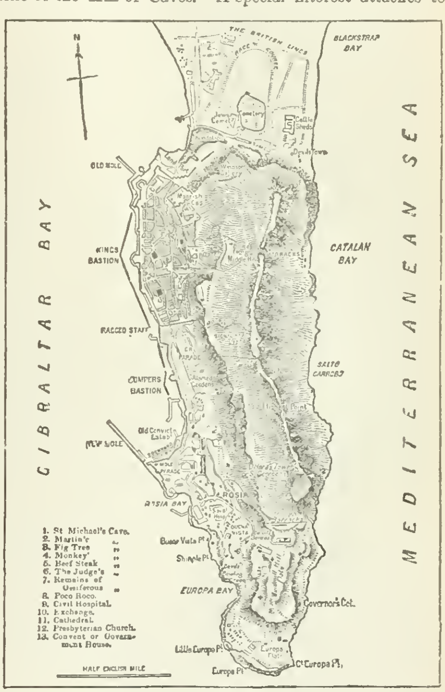

Chart of Gibraltar.

some of them for the palæontological and archæological remains which they yielded to the explorations of Captain Brome between 1863 and 1868. St Michael's Cave, which is the most frequently visited by strangers, has its entrance about 1100 feet above the sea on the western face of the rock in the line of the Southern Quebrada. A rapid slope of earth gives admission to a hall 200 feet long by 70 feet high, the roof of which appears as if it were supported by massive stalactite pillars; and from this hall access is obtained to a series of four similar caves connected with each other by tortuous passages, the last cave being situated about 300 feet below the surface, and about 400 feet of travelling distance south by west from the entrance. The first of the four was called Victoria cave by its discoverer Captain Brome, and the three others, being more closely associated, received the common name of Leonora's caves. "Nothing," says Captain Brome, "can exceed the beauty of the stalactites; they form clusters of every imaginable shape—statuettes, pillars, foliages, figures. Even the American visitors have been compelled to acknowledge that, as regards beauty and picturesqueness, even the Mammoth Cave would not come near them." The mammalian remains of the Genista cave have been investigated by Mr Busk ("Quaternary Fauna of Gibraltar," in *Trans. of Zool. Soc.*, vol. x. p. 2, 1877), and found to comprise specimens of a bear, probably *Ursus fossilis* of Goldfuss; a hyæna, probably *H. crocuta* or *spelæa*; various species of cats, from the size of a leopard to that of a wild cat; a rhinoceros similar to the species found in the valley of the Thames; two forms of ibex; and the hare and the rabbit. No trace has been discovered of *Rhinoceros tichorinus*, of *Ursus spelæus*, or of the reindeer, and the only relic of the elephant as yet registered within the peninsula is a perfect specimen of the penultimate upper molar tooth of *Elephas antiquus*. For further details see James Smith of Jordanhill "On the geology of Gibraltar," in *Quart. Journ. of Geol. Soc.*, vol. ii., and G. Busk and Hugh Falconer "On the Fossil Contents of the Genista Cave," in *Quart. Journ. of Geol. Soc.*, vol. xxi., reprinted in Falconer's *Palæontological Memoirs*, London, 1868.

To the voyager entering the straits the rock presents a bare and almost barren aspect, especially when the summer suns have dried up the verdure; but as he approaches he discovers a considerable clothing of vegetation, and closer acquaintance reveals the existence of an extensive flora. Here and there a grassy glen gives shelter to a group of trees, and the villas of the English residents are surrounded with luxuriant gardens and copses. Dr E. F. Kelaart in his *Flora Calpensis* (London, 1846) enumerates upwards of 400 flowering plants and ferns as indigenous to Gibraltar, and about fifty as introduced. Of the former a few appear to be species peculiar to the rock. White poplars, the cotton-tree, the pepper-tree or pimenta, the ilex, and the pine are the most noticeable of the larger trees; the bella-sombra (*Phytolacca dioica*), introduced by General Don, the aloe, and the prickly pear are common; and on the eastern side of the rock the dwarf palm (*Chamærops humilis*) covers large areas. Among the fruit trees, which, however, are cultivated rather for ornament than for profit, may be mentioned the almond, the olive, the orange, the lemon, the pomegranate, the fig, and the loquat. In January and February many portions of the rock present a charming sight from the profusion and beauty of the wild flowers. The fauna of Gibraltar is naturally poor,—rabbits, foxes, partridges, pigeons, and woodcocks being the principal species. The little Barbary apes, of which every schoolboy has heard, but which not every resident in Gibraltar has seen, are few in number, not more than twenty perhaps, and they usually inhabit the higher and eastern parts of the rock, except when they are driven towards the lower grounds by the cold winds from the north-east. They then do a little damage to the fruit trees; but they enjoy impunity as perfect as that of the storks in Holland or the ibis in Egypt. As to its climate Gibraltar belongs to the subtropical zone, with a dry summer and a rainy season in winter. More than half the rainfall of the year, which only amounts to about 28 or 30 inches, occurs in November, December, and January; and the three months of June, July, and August are hardly refreshed by a shower. The temperature is subject to frequent disturbances: from 93° to 87° is the highest reached (July), and 43° the lowest (February), and the mean for the summer months is from 74° to 79°. In summer the heat is tempered by a sea-breeze which blows from about 10 A.M. till shortly before sunset. Easterly winds or levanters are common from July to November, and during their prevalence every living creature seems to suffer. Heavy dews and thick fogs occur in autumn, and are as disagreeable as they are unhealthy. In the early part of the present century Gibraltar was notoriously filthy and ill-drained, and epidemic diseases committed great ravages from time to time; but great improvements have been effected, especially through the sanitary commission instituted in 1865. The inhabitants were formerly dependent on the rainfall for most of their water supply, the springs in the rock being both scanty and brackish; but in 1869 an abundant source of fairly good water was found to exist under the sands of the North Front, and pumps and conduits have been constructed for its distribution. In 1876 the quality of the water was reported to be deteriorating. Besides the private tanks, still numerous throughout the town, there are eight bomb-proof cisterns for rain-water, of a total capacity of 40,000 tons. The navy tank, for the supply of ships, holds from 9000 to 11,000 tons.

Gibraltar is emphatically a fortress, and in some respects its fortifications are unique. On the eastern side the rock needs no defence beyond its own precipitous cliffs, and in all other directions it has been rendered practically impregnable. Besides a sea-wall extending at intervals round the western base of the rock, and strengthened by curtains and bastions and three formidable forts, there are batteries in all available positions from the sea-wall up to the summit 1350 feet above the sea; and a remarkable series of galleries has been hewn out of the solid face of the rock towards the north and north-west. These galleries have an aggregate length of between 2 and 3 miles, and their breadth is sufficient to let a carriage pass. Port-holes are cut at intervals of 12 yards, so contrived that the gunners are safe from the shot of any possible assailants. At the end of one of the galleries hollowed out in a prominent part of the cliff is St George's Hall, 50 feet long by 35 feet wide, in which the governor was accustomed to give fêtes. Alterations, extensions, and improvements are continually taking place in the defensive system, and new guns of the most formidable sort are gradually displacing or supplementing the old-fashioned ordnance. The whole population of Gibraltar, whether civil or military, is subjected to certain stringent rules. For even a day's sojourn the alien must obtain a pass from the town-major, and if he wish to remain longer a consul or householder must become security for his good behaviour. Licences of residence are granted only for short periods—ten, fifteen, or twenty days—but they can be renewed if occasion require. Military officers may introduce a stranger for thirty days. A special permit is necessary if the visitor wishes to sketch.

Though the town of Gibraltar may be said to date from the 14th century, it has preserved very little architectural evidence of its antiquity. Rebuilt on an enlarged and improved plan after its almost complete destruction during the great siege, it is still on the whole a mean-looking town, with narrow streets and lanes and an incongruous mixture of houses after the English and the Spanish types. As a proprietor may at any moment be called upon to give up his house and ground at the demand of the military authorities, he is naturally deterred from spending his money on substantial or sumptuous erections. The area of the town is about 100 acres. The public buildings comprise the cathedral of the Holy Trinity, a poor imitation of Moorish architecture; the governor's house, formerly a Franciscan monastery and still familiarly known as "The Convent"; the exchange; the court-house; the civil hospital; the revenue offices; and the garrison library, planned by Colonel Drinkwater in 1793. The library has excellent reading-rooms, and contains from 40,000 to 45,000 volumes. At the north-east corner of the town stand the remains of the Moorish castle. Towards the south the lower grounds are occupied by the Grand Parade and the Alameda Gardens, laid out by General Don in 1814; and beyond these are the old convict establishment, the dockyard, and the new mole parade. Further south, at Rosia, is the naval hospital, erected in 1771.

Gibraltar has been a free port since the year 1705,—a distinction which it owes in part to the refusal of the emperor of Morocco to allow the export of materials for the fortifications unless his subjects obtained full liberty of trade. In the early part of the present century the commercial activity of the little colony was remarkably great. While the average value per annum of British manufactures exported to the rest of Spain during the ten years from 1831 to 1840 was less than £385,000, the corresponding average for Gibraltar was more than £486,000; and in the year 1840 the ratio of Spain and Gibraltar was £404,252 to £1,111,176. Since that date there has been comparatively little advance,—the average annual value of all the British and colonial produce and manufactures for the ten years from 1868 to 1877 being £1,074,785. Besides the legitimate trade fostered by the demands of the garrison and the neighbouring cities of Spain, Gibraltar has long had a large contraband traffic especially in tobacco and Manchester goods. Mainly carried on by Spaniards, it continued to thrive in spite of the exertions of the Spanish authorities, and is now kept down mainly to the action of British officials. About 1200 tons of tobacco are sold annually in the Jews' Market; no fewer than eleven houses import upwards of 1000 tons annually; and its manufacture and manipulation give employment, it is said, to about 1550 persons. Fully two-thirds of the tobacco comes from Calcutta and other Indian ports. "Wool, grain, and wax from Morocco, fruit, wine, oil, and other produce from Spain, are sent to Gibraltar for transhipment to England, France, Germany, Belgium, Holland, Portugal, America, ports in the Mediterranean, India, and China." As a port of call, the Bay of Gibraltar has recently increased in importance. Upwards of 5000 vessels enter the port annually, and of these more than half are propelled by steam. The average annual tonnage of the ships that entered between 1871 and 1875 was 2,069,508; and of this no less than 1,594,174 was British. Quarantine was established in 1830. By the shipping act of 1868 the governor was empowered to remove from the register any vessel guilty of a violation of the Spanish revenue laws discreditable to the British flag. In 1865 a duty was imposed on wines and spirits. Great commotion was caused among the mercantile population of Gibraltar in 1871 by a proposed customs ordinance, framed for the suppression of the smuggling. One of its chief provisions was that no tobacco should be exported or imported in vessels of less than 100 tons burden or in packets of less than 80 lb.

The population of Gibraltar in 1840 was 15,554, of whom 11,313 were British subjects and 4241 aliens; and by 1850 it had increased to 15,823, with 3641 aliens. In 1860 the civil population, including foreigners visiting the garrison, amounted to 17,647; but the number of resident inhabitants was only 15,467. According to returns for 1872 the total population was 18,695 (8969 males and 9726 females), the aliens numbering 2241 and the military 6521. The death-rate of the civil population varies from 25 to 31 per thousand, but it is almost always exceeded by the birth-rate. During the five years 1871–1875 the average number of births per annum was 592·4, and of deaths 538·2. Besides the natives, who themselves are of various origin, there are always in the town considerable numbers of Spaniards, Portuguese, and Italians, as well as stray representatives of almost every nationality engaged in the trade of the Mediterranean. Though by the treaty of Utrecht it was specially bargained by Spain that "no leave shall be given under any pretence whatever either to Jews or Moors to reside or have their dwelling in the town of Gibraltar," the native Jews by 1844 numbered no fewer than 1385.

The greater part of the population is Roman Catholic, but full religious liberty is of course enjoyed. The church of the Holy Trinity was constituted to be a cathedral and bishop's see of the Church of England in 1843. The Wesleyans and the Presbyterians have places of worship. St Andrew's, the new Presbyterian church, was built by the Free Church of Scotland in 1854. A proposal for concomitant endowment of "church bodies for the Anglican and Roman Catholic communities" with the annual sum of £500 was made by the governor in 1876, but it was not sanctioned by parliament. An annual grant to this amount is made to both bodies, but the Government no longer keeps the cathedral in repair. The Roman Catholic bishop of Antinoe is vicar apostolic of Gibraltar.

Gibraltar was long an ill-managed and expensive colony; but its expenditure is now sometimes even less than its revenue. During the five years from 1871 to 1875 the average expenditure, increased by several unusual items, was £43,988; and the average income was £42,464. For 1877 the expenditure was £41,585, or £1739 more than the income. The chief sources of the revenue are the port and quarantine dues, the excise on the consumption of wines and spirits, and the ground and house rents,—the three departments yielding respectively on the average from 1871 to 1875 £11,011, £11,512, and £6,206. It is worthy of note that the ground and house rentals have increased from £5629 in 1871 to £7078 in 1875. Among the heavier items of outlay are the governor's salary, which amounts to £5000 per annum, and the judicial and ecclesiastical expenses, which were, on an average from 1871 to 1875, respectively £3909 and £1061. The total cost of the military establishment was, on the average of four years from 1869 to 1873, £315,454,—of which £250,340 was the average cost of the regular troops, £1610 for the jails, and £19,293 for the barracks. The convict establishment was abolished in 1875. At that date it contained 238 prisoners, who were managed on the associated system; and grievous complaints were made of the difficulty of maintaining satisfactory discipline.

History.—Gibraltar was known to the Greek and Roman geographers as Calpe or Alybe, the two names being probably corruptions of the same local (perhaps Phœnician) word. The eminence on the African coast near Ceuta which bears the modern English name of Apes' Hill was then designated Abyla; and Calpe and Abyla, at least according to an ancient and widely current interpretation, formed the renowned Pillars of Hercules (Herculis columnæ, Ἡρακλέους στῆλαι) which for centuries were the limits of enterprise to the seafaring peoples of the Mediterranean world. The strategic importance of the rock appears to have been first discovered by the Moors, who, when they crossed over from Africa in the 8th century, selected it as the site of a fortress. From their leader Tarik ibn Zeyad it was called Gebel Tarik or Tarik's Hill; and, though the name had a competitor in Gebel al Futah or Hill of the Entrance, it gradually gained acceptance, and still remains sufficiently recognizable in the corrupted form of the present day. The first siege of the rock was in 1309, when it was taken by Alonzo Perez de Guzman for Ferdinand IV. of Spain, who, in order to attract inhabitants to the spot, offered an asylum to swindlers, thieves, and murderers, and promised to levy no taxes on the import or export of goods. The attack of Ismail ben Ferez in 1315 (2d siege) was frustrated; but in 1333 Vasco Paez de Meira, having allowed the fortifications and garrison to decay, was obliged to capitulate to Mahomet IV. (3d siege). Alphonso's attempts to recover possession (4th siege) were futile, though pertinacious and heroic, and he was obliged to content himself with a tribute for the rock from Abdul Melek of Granada; but after his successful attack on Algeciras in 1344 he was encouraged to try his fortune again at Gibraltar. In 1349 he invested the rock, but the siege (5th siege) was brought to an untimely close by his death from the plague in February 1350. The next or 6th siege resulted simply in the transference of the coveted position from the hands of the king of Morocco to those of Yussef III. of Granada; and the 7th, undertaken by the Spanish count of Niebla, Enrico de Guzman, proved fatal to the besieger and his forces. In 1462, however, success attended the efforts of Alonzo de Arcos (8th siege), and in August the rock passed once more under Christian sway. The duke of Medina Sidonia, a powerful grandee who had assisted in its capture, was anxious to get possession of the fortress, and though Henry IV. at first managed to maintain the claims of the crown, the duke ultimately made good his ambition by force of arms (9th siege), and in 1469 the king was constrained to declare his son and his heirs perpetual governors of Gibraltar. In 1479 Ferdinand and Isabella made the second duke marquis of Gibraltar, and in 1492 the third duke Don Juan was reluctantly allowed to retain the fortress. At length in 1501 Garcilaso de la Vega was ordered to take possession of the place in the king's name and it was formally incorporated with the domains of the crown. After Ferdinand and Isabella were both dead the duke Don Juan tried in 1506 to recover possession, and added a 10th to the list of sieges. Thirty-four years afterwards the garrison had to defend itself against a much more formidable attack (11th siege)—the pirates of Algiers having determined to recover the rock for Mahomet and themselves. The conflict was severe, but resulted in the repulse of the besiegers. After this the Spaniards made great efforts to strengthen the place, and they succeeded so well that throughout Europe Gibraltar was regarded as impregnable.

In the course of the War of the Spanish Succession, however, it was taken by a combined English and Dutch fleet under Sir George Rooke, assisted by a body of troops under Prince George of Hesse-Darmstadt. The captors had ostensibly fought in the interests of Charles archduke of Austria (afterwards Charles III.), but, though his sovereignty over the rock was proclaimed on July 24, 1704, Sir George Rooke on his own responsibility caused the English flag to be hoisted, and took possession in name of Queen Anne. It is hardly to the honour of England that it was both unprincipled enough to sanction and ratify the occupation, and ungrateful enough to leave unrewarded the general to whose unscrupulous patriotism the acquisition was due. The Spaniards keenly felt the injustice done to them, and the inhabitants of the town of Gibraltar in great numbers abandoned their homes rather than recognize the authority of the invaders. In October 1704 the rock was invested by sea and land; but the Spanish ships were dispersed by Sir John Leake, and the marquis of Villadarias fared so ill with his forces that he was replaced by Marshal Tessé, who was at length compelled to raise the siege in April 1705. During the next twenty years there were endless negotiations for the peaceful surrender of the fortress, and in 1726 the Spaniards again appealed to arms. But the Conde de la Torres, who had the chief command, succeeded no better than his predecessors, and the defence of the garrison under General Clayton and the earl of Portmore was so effective that the armistice of June 23d practically put a close to the siege, though two years elapsed before the general pacification ensued. The most memorable siege of Gibraltar, indeed one of the most memorable of all sieges, was that which it sustained from the combined land and sea forces of France and Spain during the years 1779–1783. The grand attack on the place was made on the 13th September 1782, and all the resources of power and science were exhausted by the assailants in the fruitless attempt. On the side of the sea they brought to bear against the fortress forty-six sail of the line, and a countless fleet of gun and mortar boats. But their chief hope lay in the floating batteries planned by D'Arcon, an eminent French engineer, and built at the cost of half a million sterling. They were so constructed as to be impenetrable by the red-hot shot which it was foreseen the garrison would employ; and such hopes were entertained of their efficiency that they were styled invincible. The Count d'Artois (afterwards Charles X.) hastened from Paris to witness the capture of the place. He arrived in time to see the total destruction of the floating batteries, and a considerable portion of the combined fleet, by the English fire. Despite this disaster, however, the siege continued till brought to a close by the general pacification, February 2d, 1783. The history of the four eventful years' siege is fully detailed in the work of Drinkwater, who himself took part in the defence, and in the *Life* of its gallant defender Sir George Augustus Eliott, afterwards Lord Heathfield, whose military skill and moral courage place him among the best soldiers and noblest men whom Europe produced during the 18th century.

Since 1783 the history of Gibraltar has been comparatively uneventful. In the beginning of 1801 there were rumours of a Spanish and French attack, but the Spanish ships were defeated off Algeciras in June by Admiral Saumarez. Improvements in the fortifications, maintenance of military discipline, and legislation in regard to trade and smuggling are the principal matters of recent interest.

GIBSON, EDMUND (1669–1748), bishop of London, the learned compiler of the *Codex Juris Ecclesiastici Anglicani*, was born at Bampton in Westmoreland in 1669. After a promising career at one of the local schools, he was in 1686 entered a scholar at Queen's College, Oxford, where, at the early age of twenty-two (1692), he distinguished himself by the publication of a valuable edition of the *Saxon Chronicle*, with a Latin translation, indices, and notes. This was followed in 1693 by an annotated edition of the *De Institutione Oratoria* of Quintilian, and in 1694 by a translation in two volumes folio of Camden's *Britannia*, "with additions and improvements," in the preparation of which he had been largely assisted by the volunteered aid of various English antiquaries. Shortly after Tenison's elevation to the see of Canterbury in 1694 Gibson was appointed chaplain and librarian to the archbishop, and at a somewhat later period he became rector of Lambeth and archdeacon of Surrey. In the discussions which arose during the reigns of William and Anne relative to the rights and privileges of the Convocation, Gibson took a very active part, and in a series of pamphlets warmly argued for the right of the archbishop to continue or prorogue that assembly. The controversy suggested to him the idea of those researches which resulted in the *Codex Juris Ecclesiastici Anglicani*, published in two vols. folio in 1713,—a work which discusses more learnedly and comprehensively than any other the legal rights and duties of the English clergy, and the constitution, canons, and articles of the English Church. In 1715 Gibson was presented to the see of Lincoln, whence he was in 1723 translated to that of London, where for twenty-five years he exercised an immense influence, being the authority chiefly consulted by the court on all ecclesiastical affairs. While a conservative in church politics, he yet respected the various forms of dissent, and discouraged all attempts to prevent dissenters from worshipping in the manner and according to the principles which they preferred. He exercised a vigilant oversight over the morals of all ranks and classes of the community committed to his charge; and his fearless denunciation of the licentious masquerades which had become highly popular at court finally lost him the royal favour. Among the literary efforts of his later years the principal were a series of *Pastoral Letters* in defence of the "gospel revelation," against "lukewarmness" and "enthusiasm," and on various topics of the day; also the *Preservative against Popery*, in 3 vols. folio (1738), a compilation of numerous controversial writings of eminent Church of England divines, dating chiefly from the period of James II. Gibson died on the 6th September 1748.

A second edition of the *Codex Juris*, "revised and improved, with large additions by the author," was published at Oxford in 1761. Besides the works already mentioned, Gibson published a number of *Sermons*, and other works of a religious and devotional kind. The *Vita Thomæ Bodleii* with the *Historia Bibliothecæ Bodleianæ* in the *Catalogi librorum manuscriptorum* (Oxford, 1697), and the *Reliquiæ Spelmannianæ* (Oxford, 1698), are also from his pen.

GIBSON, JOHN (1790–1866), sculptor, was born near Conway, in 1790, in very humble circumstances, his father being a market gardener. He is a notable example of one who, with no so-called start in life, carved his way to distinction by the force of a steady purpose and strong will. To his mother, whom he described as ruling his father and all the family, he owed, like many other great men, the energy and determination which carried him over every obstacle. He narrowly escaped emigration to America, the first step towards which took the family to Liverpool, where his mother's will interposed to keep them. He was then nine years of age, and was sent to school. The windows of the print shops of Liverpool riveted his attention; and, having no means to purchase the commonest print, he acquired the habit of committing to ocular memory the outline of one figure after another, drawing it on his return home. Thus early did he form the system of observing, remembering, and noting, sometimes even a month later, scenes and momentary actions from nature—a habit peculiar in that degree to himself, but of the utmost importance to all artists to practice. In this way he, by degrees, transferred from the shop window to his paper at home the chief figures from David's picture of Napoleon crossing the Alps, which, by particular request, he copied in bright colours as a frontispiece to a little schoolfellow's new prayer-book, for sixpence. At fourteen years of age Gibson was apprenticed to a firm of cabinetmakers,—portrait and miniature painters in Liverpool requiring a premium which his father could not give. This employment so disgusted him that after a year (being interesting and engaging then apparently as in after life) he persuaded his masters to change his indentures, and bind him to the wood-carving with which their furniture was ornamented. This satisfied him for another year, when an introduction to the foreman of some marble works, and the sight of a small head of Bacchus, unsettled him again. He had here caught a glimpse of his true vocation, and in his leisure hours began to model with such success that his efforts found their way to the notice of Mr Francis, the proprietor of the marble works. The wood-carving now, in turn, became his aversion; and having in vain entreated his masters to set him free, he instituted a strike. He was every day duly at his post, but did no work. Threats, and even a blow, moved him not. At length the offer of £70 from Francis for the rebellious apprentice was accepted, and Gibson found himself at last bound to a master for the art of sculpture. Francis paid the lad 6s. a week, and received good prices for his works,—sundry early works by the youthful sculptor, which exist in Liverpool and the neighbourhood, going by the name of Francis to this day. It was while thus apprenticed that Gibson attracted the notice of Mr Roscoe, whose taste in Greek art seems to have been superior to his judgment in Italian history. For him Gibson executed a basso rilievo in terra cotta, now in the Liverpool Museum. Roscoe opened to the sculptor the treasures of his library at Allerton, by which he became acquainted with the designs of the great Italian masters. A cartoon of the Fall of the Angels marked this period,—now also in the Liverpool Museum. We must pass over his studies in anatomy, pursued gratuitously by the kindness of a medical man, and his introductions to families of refinement and culture in Liverpool. Roscoe was an excellent guide to the young aspirant, pointing to the Greeks as the only examples for a sculptor. Gibson here found his true vocation. A basso rilievo of Psyche carried by the Zephyrs was the result. He sent it to the Royal Academy, where Flaxman, recognizing its merits, gave it an excellent place. Again he became unsettled. The ardent young breast panted for "the great university of Art"—Rome; and the first step to the desired goal was to London. Here he stood between the opposite advice and influence of Flaxman and Chantrey—the one urging him to Rome as the highest school of sculpture in the world, the other maintaining that London could do as much for him. It is not difficult to guess which was Gibson's choice. He arrived in Rome in October 1817, at a comparatively late age for a first visit. There he immediately experienced the charm and goodness of the true Italian character in the person of Canova, to whom he had introductions,—the Venetian puting not only his experience in art but his purse at the English student's service. Up to this time, though his designs show a fire and power of imagination in which no teaching is missed, Gibson had had no instruction, and had studied at no Academy. In Rome he first became acquainted with rules and technicalities, in which the merest tyro was before him. Canova introduced him into the Academy supported by Austria, and, as is natural with a mind like Gibson's, the first sense of his deficiencies in common matters of practice was depressing to him. He saw Italian youths already excelling, as they all do, in the drawing of the figure. But the tables were soon turned. His first work in marble—a Sleeping Shepherd modelled from a beautiful Italian boy—has qualities of the highest order. Gibson was soon launched, and distinguished patrons, first sent by Canova, made their way to his studio in the Via Fontanella. His aim, from the first day that he felt the power of the antique, was purity of character and beauty of form. He very seldom declined into the prettiness of Canova, and if he did not often approach the masculine strength which redeems the faults of Thorwaldsen, he more than once surpassed him even in that quality. We allude specially to his Hunter and Dog, and to the grand promise of his Theseus and Robber, which take rank as the highest productions of modern sculpture. He was essentially classic in feeling and aim, but here the habit of observation we have mentioned enabled him to snatch a grace beyond the reach of a mere imitator. His subjects were gleaned from the free actions of the splendid Italian people noticed in his walks, and afterwards baptized with such mythological names as best fitted them. Thus a girl kissing a child, with a sudden wring of the figure, over her shoulder, became a Nymph and Cupid; a woman helping her child with his foot on her hand on to her lap, a Bacchante and Faun; his Amazon thrown from her Horse, one of his most original productions, was taken from an accident he witnessed to a female rider in a circus; and the Hunter holding in his Dog was also the result of a street scene. The prominence he gave among his favourite subjects to the little god "of soft tribulations" was no less owing to his facilities for observing the all but naked Italian children, in the hot summers he spent in Rome.

In monumental and portrait statues for public places, necessarily represented in postures of dignity and repose, Gibson was very happy. His largest effort of this class—the group of Queen Victoria supported by Justice and Clemency, in the palace of Westminster—we agree with himself in pronouncing his finest work in the round. Of noble character also in execution and expression of thought is the statue of Mr Huskisson with the bared arm; and no less, in effect of aristocratic ease and refinement, the seated figure of Dudley North. He lays down the axiom in his journal that the Greeks represented "men thinking, and women tranquil," and to the departure from this rule we attribute the unattractive colossal statue of Sir Robert Peel in Westminster Abbey. The very animation he has given to the head is too individual to harmonize with the classic drapery, or with the real character of the man. The great statesman is here colloquial rather than eloquent in expression, while the position of the right foot suggests the idea of a walking figure. Great as he was in the round, Gibson's chief excellence lay in basso rilievo, and in this less disputed sphere he obtained his greatest triumphs. His thorough knowledge of the horse, and his constant study of the Elgin marbles—casts of which are in Rome—resulted in the two matchless bassi rilievi, the size of life, which belong to the earl of Fitzwilliam—the Hours leading the Horses of the Sun, and Phaethon driving the Chariot of the Sun. Most of his monumental works are also in basso rilievo. Some of these are of a truly refined and pathetic character, such as the monument to the countess of Leicester, that to his friend Mrs Huskisson in Chichester Cathedral, and that of the Bonomi children. In reviewing the qualities most characteristic of this great artist, that of passionate expression may be said to stand foremost. Passion, either indulged or repressed, was the natural impulse of his art:—repressed as in the Hours leading the Horses of the Sun, and as in the Hunter and Dog; indulged, as scarcely before seen in the same intensity in the whole range of sculpture, as in the meeting of Hero and Leander, a drawing executed before he left England. Gibson's power of drawing may be pronounced to have been unsurpassed by any modern. He had an iron hand, and used the pen in rapid action with as much certainty as if it had been the graver. Nowhere is the fire of his genius so unmistakably seen as in these first-hand productions. Nor can we wonder that marble, however highly wrought, could never entirely compensate for what was necessarily lost in the translation. Gibson was the first to introduce colour on his statues,—first, as a mere border to the drapery of a portrait statue of the Queen, and by degrees extended to the entire flesh, as in his Venus, and in the Cupid tormenting the Soul, belonging to Mr Holford. In both of these it amounts to no more than the slightest tint. Gibson's individuality was too strongly marked to be affected by any outward circumstances. In all worldly affairs and business of daily life he was simple and guileless in the extreme; but he was resolute in matters of principle, determined to walk straight at any cost of personal advantage. Unlike most artists, he was neither nervous nor irritable in temperament. It was said of him that he made the heathen mythology his religion; and indeed in serenity of nature, feeling for the beautiful, and a certain philosophy of mind, he may be accepted as a type of what a pure-minded Greek pagan, in the zenith of Greek art, may have been. Gibson was elected R.A. in 1836, and bequeathed all his property and the contents of his studio to the Royal Academy, where his marbles and casts are open to the public. He died at Rome in January 1866.

The letters between Gibson and Mrs Henry Sandbach, grand daughter of Mr Roscoe, and a sketch of his life that lady induced him to write, furnish the chief materials for his biography. A volume of engravings from his finished works renders them very indifferent justice. A volume of facsimiles from his drawings is more worthy of him. (E. E.)

GICHTEL, Johann Georg (1638–1710), founder of the mystic sect of Gichtelians or Angelic Brethren, was born at Ratisbon, where his father was a member of senate, on the 14th of March 1638. Having acquired at school, besides an ordinary elementary education, a considerable acquaintance with Greek, Hebrew, Syriac, and even Arabic, he proceeded to Strasburg to study divinity; but finding that the theological prelections of Schmidt and Spener there were not conducive to the growth of his piety, he removed to Spires, where he entered the faculty of law. In 1664 he was admitted an advocate at Ratisbon; but having become acquainted with the Baron von Weltz, an Hungarian nobleman who cherished enthusiastic if not extravagant schemes for the reunion of Christendom and the conversion of the world, he abandoned all interest in his profession, and became an energetic promoter of the "Christerbauliche Jesusgesellschaft," or Christian Edification Society of Jesus, in the interests of which he visited many parts of Germany and Holland. The movement in its beginnings provoked at least no active hostility; but when Gichtel began to attack the teaching of the Lutheran clergy and church, especially upon the fundamental doctrine of justification by faith, he exposed himself to a prosecution which ultimately resulted in sentence of banishment and confiscation (1665). After many months of wandering and occasionally romantic adventure, he in January 1667 reached Holland, and settled at Zwoll, where he co-operated with Breckling, a man who shared his views and aspirations. Having become involved in the troubles of this friend, Gichtel, after a period of imprisonment, was banished for a term of years from Zwoll, but finally in 1668 found a home in Amsterdam, where in a state of poverty (which, however, never became destitution), he lived out his strange life of visions and day-dreams, of prophecy and prayer. He became an ardent student and disciple of Jacob Boehme, whose works he published in 1682 (Amsterdam, 2 vols.); but before the time of his death, which occurred January 21, 1710, he had attracted to himself a small band of followers known as Gichtelians or Angelic Brethren, who propagated certain views at which he had arrived independently of Boehme. Seeking ever to hear the authoritative voice of God within them, and endeavouring to attain to a life altogether free from carnal desires, like that of "the angels in heaven, who neither marry nor are given in marriage," they claimed to exercise a priesthood "after the order of Melchizedek," appeasing the wrath of God, and ransoming the souls of the lost by sufferings endured vicariously after the example of Christ. The sect, never a numerous one, is said still to subsist in some districts of Holland and North Germany. Gichtel's correspondence was published without his knowledge by Gottfried Arnold, a disciple, in 1701 (2 vols.), and again in 1708 (3 vols.). It has been frequently reprinted under the title *Theosophia Practica*. The seventh volume of the Berlin edition (1768) contains a notice of Gichtel's life.

GIDEON, liberator, reformer, and "judge" of Israel, was the youngest son of Joash, of the "house" of Abiezer, and tribe of Manasseh, and had his home at Ophrah, the site of which is probably to be sought westward of Jordan, somewhat to the south of the plain of Jezreel. Gideon lived at a time when Israel, grown idolatrous, had been brought very low by periodic incursions of the "Midianites" and "Amalekites," nomad tribes from the east of Jordan, who in great numbers were wont to overrun the country, destroying all that they could not carry away. In the beginning of the narrative of his public life he is represented as an unambitious man, quietly engaged in agricultural pursuits, who yet had already distinguished himself as a "mighty man of valour," probably in guerilla warfare against the common foe. According to that narrative, his first exploit worthy of special commemoration was the destruction, by divine command, of the altar of Baal belonging to his father, and of the Ashera beside it, and the substitution of an altar to Jehovah. But immediately before this he had also been summoned by "the angel of the Lord" to undertake, in dependence on supernatural direction and help, the work of liberating his country from its long oppression, and, in token that he accepted the mission, had already erected in Ophrah an altar which he called "Jahveh-Shalom" (Jehovah is prosperity). The great gathering of the Midianites and their allies on the north side of the plain of Jezreel "stretching from the hill of Moreh"; the general muster first of Abiezer, then of all Manasseh, and lastly of the neighbouring tribes of Asher, Zebulun, and Naphtali; the signs by which the wavering faith of Gideon was steadied; the methods by which an unwieldy mob was reduced to a small but trusty band of energetic and determined men; and the stratagem by which the vast army of Midian was surprised and routed by the handful of Israelites descending from "above Endor," are indicated with sufficient clearness in the Scripture narrative, and need not be detailed minutely here. There is some difficulty in following the account of the subsequent flight of the Midianites, which seems to have taken place in two directions,—Oreb and Zeeb making for the lower fords of Jordan towards the south-east, while Zebah and Zalmunna took the upper passage, a little below the place where the river flows out of the Sea of Galilee. Leaving the Ephraimites (who had now risen in force) to deal with the former, Gideon with his 300 appears to have kept up the pursuit of the latter to Nobah and Jogbehah, points beyond Succoth and Penuel, where a bloody contest resulted in the destruction of that portion of the Midianite army, and in the ultimate capture and execution of Zebah and

Zalmunna. Almost simultaneously with these occurrences eastward of Jordan, messengers from Ephraim bearing the heads of Oreb ("raven") and Zeeb ("wolf"), who with their followers had been crushed at "the raven's rock" and "the wolf's den" respectively, announced the completeness of Israel's victory. Having taken unrelenting vengeance on the men of Penuel and Succoth, who had shown a timid neutrality when the patriotic struggle was at its crisis, Gideon returned to his native Ophrah, where he further distinguished himself by his pious magnanimity in refusing the kingship which had been put within his reach—an act of self-denial, however, which, according to the sacred historian, was somewhat neutralized by his subsequent folly in establishing a shrine which proved a snare to all Israel, not excluding his family or even himself. For forty years after the great victory he lived at his own house in Ophrah in considerable wealth and magnificence, yet always in a private station—there being no direct scriptural evidence at least that his judgeship lasted during all that period, or that it ever gave him any position of legally recognized authority. The name of Gideon occurs in Heb. xi. 32, in the list there given of those who became heroes by faith; but, except in Judges vi.–viii., it is not to be met with anywhere in the Old Testament. In 1 Sam. xii. 11 and 2 Sam. xi. 21 (LXX.) he is called Jerubbaal (the reading Jerubbesheth having been introduced into the latter passage in accordance with the usage explained in the article BAAL). The fact that in Judges ix., which appears to be the oldest part of the narrative, he is invariably called Jerubbaal, has suggested to Kuenen and others that this ought to be regarded as his original and proper name, that of Gideon (גִּדְעוֹן, *i.e.* "hewer" or "warrior," *cf.* Isa. x. 33) having been a later designation. In confirmation of this it is pointed out that the derivation of ירבעל as equivalent to יָרֶב בּוֹ הַבַּעַל ("Let Baal contend against him," v. 32, or "Let Baal contend for himself," v. 31) is much less probable than that which interprets it as precisely analogous with such names as Merib-baal, Jehoiarib or Joarib, Seraiah, Israel, and perhaps also Josadec, all meaning "God fights" or "contends." The nature of the grounds on which it is conjectured that Gideon's conquest of the Midianites was somewhat slower than the narrative on a first reading would lead one to suppose, and that his religious reforms, far from being confined to a solitary act of his early manhood, were rather the principal employment of his later life, is indicated in the histories of Israel by Ewald, Hitzig, and Kuenen. See also especially Wellhausen, *Geschichte*, i. 252 *sq.*

GIEN, a town of France, at the head of an arrondissement in the department of Loiret, is situated on the right bank of the Loire, 39 miles E.S.E. of Orleans. The Loire is crossed at Gien by a stone bridge of twelve arches, built about the end of the 15th century. The town is the seat of a tribunal of the first instance and of a justice of peace court. The principal buildings are the prison, the hospital, the old castle, originally built by Charlemagne, and reconstructed in 1494 by Anne de Beaujeu, daughter of Louis XI., and the church of Saint Pierre, a modern structure of no particular merit, but possessing an old square tower dating from the end of the 15th century. There are manufactures of serge, leather, and earthenware, and some trade in corn and wine. The population in 1876 was 6493.

GIESELER, JOHANN KARL LUDWIG (1792–1854), one of the most distinguished of the modern school of scientific writers on church history, was born at Petershagen, near Minden, where his father, a man of considerable vigour and independence of character, was minister, on the 3d of March 1792. In his tenth year he entered the orphanage at Halle, whence he duly passed to the university, his studies being interrupted, however, from October 1813 till the peace of 1815 by a period of military service, during which he was enrolled as a volunteer in a regiment of chasseurs. Having in 1817 taken his degree in philosophy, he in the same year became assistant head master in the Minden gymnasium, and in 1818 was appointed conrector of the gymnasium at Cleves. Here he published his earliest work (*Historisch-kritischer Versuch über die Entstehung u. die frühesten Schicksale der schriftlichen Evangelien*), a treatise which has had considerable influence on all subsequent investigations and discussions of the question as to the origin of the gospels, in so far as it may be considered to have finally disposed of that theory of a "primitive" written gospel to which most critics in the earlier part of the century had inclined. In 1819 Gieseler was appointed a professor ordinarius in theology in the newly-founded university of Bonn, where, besides lecturing on church history, he made important contributions to the literature of that subject in Rosenmüller's *Repertorium*, Ständlin u. Tschirner's *Archiv*, and in various university "programs." The first part of the first volume of his well-known *Church History* appeared in 1824. In 1833 he accepted a call to Göttingen, where the remainder of his life was spent, marked by few noteworthy events beyond the steady publication of volume after volume of his contributions to historical science. In 1837 he was appointed a consistorialrath, and shortly afterwards was created a knight of the Guelphic order. In the winter of 1853–4 symptoms of failing health began to appear, and towards the end of the session he was able to lecture only occasionally. His death occurred on the 8th of July 1854. The fourth and fifth volumes of the *Kirchengeschichte*, embracing the period subsequent to 1814, were published posthumously by Redepenning (1855); and they were followed in 1856 by a *Dogmengeschichte*, which is sometimes reckoned as the sixth volume of the *Church History*. Among church historians Gieseler continues to hold a very high place. Less vivid and picturesque in style than Hase, conspicuously deficient in Neander's deep and sympathetic insight into the more spiritual forces by which church life is always more or less pervaded, he excels these and all other contemporaries in the fulness and accuracy of his information. His *Lehrbuch der Kirchengeschichte*, in which indeed the text as compared with the notes often occupies a very subordinate place, is invaluable to the student who wishes at each step to be brought into direct contact with all the original sources of information which it is of importance that he should know. The work, which has passed through several editions in Germany, has partially appeared also in two English translations. That published in New York (*Text Book of Ecclesiastical History*, 4 vols.), brings the work down to the peace of Westphalia, while that published in "Clark's Theological Library" (*Compendium of Ecclesiastical History*, Edin., 5 vols.) closes with the beginning of the Reformation. For the life of Gieseler reference may be made to Redepenning's biographical sketch in the fifth volume of the *Kirchengeschichte*, and to Herzog's article in the *Real-Encyclopädie* (of which great work, it may be mentioned, Gieseler was an energetic promoter). Both biographers testify that with the habits of a devoted student he combined those of an energetic man of business. He frequently held the office of pro-rector of the university, and did much useful work as a member of several of its committees. He took a warm interest also in the Göttingen orphanage, where he was a daily visitor, knew all the children personally, and taught them to regard him as a counsellor and friend.

GIESSEN, a town of Germany, capital of the province of Upper Hesse, in the grand-duchy of Hesse-Darmstadt, is situated in a beautiful and fruitful valley at the confluence of the Wieseck with the Lahn, 33 miles N.N.W. of Frankfort. It is the seat of a bailiwick, a high court, and a district penal court. The old streets are narrow and irregular, but in the suburbs outside the old walls there are many elegant houses. Besides the university, the principal buildings are the provincial Government offices, comprising a portion of the old castle dating from the 12th century, the arsenal, the town-hall, the new gymnasium, and the town church. The university, founded in 1607 by the landgrave Louis V., has a large and valuable library, a botanic garden, an observatory, an anatomical theatre, an infirmary, a maternity hospital, a museum of natural history, and a chemical laboratory which was directed by Professor Liebig. The number of professors and teachers of the university in 1875 was 52, and of students 340. There is also a gymnasium and a real school. The industries include the manufacture of woollen and cotton cloth of various kinds, leather, candles, tobacco, and beer.

Giessen was formed in the 12th century out of the villages Selters, Aster, and Kroppach, for whose protection Count William of Gleiberg built the castle of Giessen. Through marriage the town came into the possession of the palgrave of Tübingen, who sold it in 1265 to the landgrave Henry of Hesse. It was surrounded with fortifications in 1530, which were demolished in 1547 by the emperor Charles V., but rebuilt in 1560. From 1807 they were gradually pulled down, and their side converted into promenades. The population of Giessen in 1875 was 13,980.

GIFFORD, William (1757–1826), publicist and man of letters, was born at Ashburton, Devon, in April 1757. Having as a shoemaker's apprentice manifested a remarkable aptitude for intellectual pursuits, he was by the charity of friends enabled to complete a previously imperfect school education, and ultimately to proceed in his twenty-third year to Oxford, where he was appointed a Bible reader in Exeter College. Leaving the university shortly after graduation in 1782, he for some years acted as tutor to Lord Belgrave, whom he accompanied on two prolonged Continental tours. After having settled in London, he in 1794 published his first work, a satirical piece, after Persius, entitled the *Baviad*, successfully aimed at a numerous school of second-rate writers then popularly known as the Della Cruscans. A second satire of a similar description, the *Mæviad*, directed against the corruptions of the drama, appeared in 1795. About this time Gifford became acquainted with Canning, with whose help he in August 1797 originated a weekly newspaper of Conservative politics entitled the *Anti-Jacobin*, which, however, in the following year ceased to be published. An English version of Juvenal, on which he had been for many years engaged, appeared in 1802; to this an autobiographical notice of the translator was prefixed. Two years afterwards Gifford published an annotated edition of the plays of Massinger; and in 1809, when the *Quarterly Review* was projected, he was entrusted with the management of that publication. It is on all hands conceded that the success which attended the *Quarterly* from the outset was due in no small degree to the ability and tact with which Gifford discharged his editorial duties. His connexion with the *Review* continued until within about two years of his death, which took place in London on the 31st of December 1826. Besides numerous contributions to the *Quarterly* during the last fifteen years of his life, he wrote a metrical translation of Persius, which appeared in 1821. Gifford also edited the poems of Ben Jonson, Ford, and Shirley. His edition of the first of these appeared in 1816, those of the other two, posthumously, in 1827 and 1833. The *Autobiography* was republished in 1827.

GIFT generally means an alienation of property otherwise than for a consideration, although in law it is often used to signify alienation with or without consideration. The effect of a gratuitous gift only need be considered here. Formerly in English law property in land could be conveyed by one person to another by a verbal gift of the estate accompanied by delivery of possession. The Statute of Frauds required all such conveyances to be in writing, and a later statute (8 and 9 Vict. c. 106) requires them to be by deed. Personal property may be effectually transferred from one person to another by a simple verbal gift accompanied by delivery. If A delivers a chattel to B, saying or signifying that he does so by way of gift, the property passes, and the chattel belongs to B. But unless the actual thing is bodily handed over to the donee, the mere verbal expression of the donor's desire or intention has no legal effect whatever. The persons are in the position of parties to an agreement which is void, as being without consideration. When the nature of the thing is such that it cannot be bodily handed over, it will be sufficient to put the donee in such a position as to enable him to deal with it as the owner. For example, when goods are in a warehouse, the delivery of the key will make a verbal gift of them effectual; but it seems that part delivery of goods which are capable of actual delivery will not validate a verbal gift of the part undelivered. So when goods are in the possession of a warehouseman, the handing over of a delivery order might, by special custom (but not otherwise it appears), be sufficient to pass the property in the goods, although delivery of a bill of lading for goods at sea is equivalent to an actual delivery of the goods themselves. A *donatio mortis causa* is a gift made by a person in contemplation of death, to take effect only in the event of his death. It is revocable so long as he lives. There must be actual or constructive delivery of the thing itself, and therefore it has been said that only chattels can be the proper subject of a *donatio mortis causa*, although policies of insurance, bills, notes, &c., have been allowed to pass by mere delivery as death-bed gifts. A *donatio mortis causa* is not an out-and-out gift, but is conditional on death.

GIJON, a town and seaport of Spain, in the province of Oviedo or Asturias, on the coast of the Cantabrian Sea, about 13 miles E. of the Cabo de Peñas and 2 miles E. of the Rio Aboño. The older part of the town, partly surrounded by its walls, occupies the upper slope of a peninsular headland, while the more modern portion extends to the beach. On the whole, it is a clean and flourishing place, with wide streets and good houses; but there are few buildings of individual note except the church of San Pedro of the 15th century, the town house, the mansion of the Marquis Revilla-Gigedo, and the Asturian Institute. The last, which was founded in 1797 by Jovellanos, has a fine library, and comprises classes for navigation, mathematics, Latin, French, and English. Besides the works in connexion with the railways which run inland from Gijon to Mieres del Camino and Sama on the Nalon, there is a large glass work, an iron foundry, and a tobacco factory which alone gives employment to upwards of 1400 females. An extensive trade is carried on in the export of coal, iron, jet, and hazel-nuts, and in the import of fish and colonial produce. The nuts amount to upwards of 1600 tons per annum, and a large proportion finds its way to the English market. Though the harbour is a mere roadstead between the small promontories of San Lorenzo and Torres, it is of considerable value on such a coast as that of Asturias, especially as it has a good bottom. A quay was constructed by means of a grant from Charles V. in 1552–4, and a new one by Pedro Menendez in 1766–8, and an extension was effected in 1859 at a cost of £65,000. The population of Gijon in 1860 was 24,802. During the summer there is a considerable influx of strangers.

Gijon is usually identified with the Gigia of the Romans, which, however, occupied the site not of the present town but of the adjoining suburb of Cima da Villa. Captured and strengthened by the Moors, who used the stones of the Roman city for their fortifications, it remained in their hands till after the battle of Canicas, when its governor Munuza surrendered to Pelayo. In 844 it held out against an attack by the Normans, and in the following centuries it gradually rose into importance. In the time of Philip II. it possessed good arsenals, and was able to undertake the repairs of the Invincible Armada. Jovellanos, the statesman and poet, and Cean Bermudez, a writer on art, were both natives of Gijon, and the former is buried in the church of San Andrea.

GILBART, JOHN WILLIAM (1794–1863), the author of a number of works on banking, was descended from a Cornish family, and was born in London, March 21, 1794. From 1813 to 1825 he was clerk in a London bank, after which he went to Birmingham. Shortly after his return to London in 1827 he was appointed manager of the Kilkenny branch of the Provincial Bank of Ireland, and in 1829 he was promoted to the Waterford branch. In 1834 he became manager of the London and Westminster Bank; and to his skill in developing the system of joint-stock banking it owed much of its success. On more than one occasion he rendered valuable services to the joint-stock banks by his evidence before committees of the House of Commons; and, on the renewal of the bank charter in 1844, he procured the insertion of a clause granting to joint-stock banks the power of suing by their public officer, and also the right of accepting bills at less than six months' date. In testimony of their obligations to him, the directors and shareholders of joint-stock banks presented him in 1846 with a handsome service of plate. In the same year he was elected a Fellow of the Royal Society. He retired on a pension from the management of the London and Westminster Bank, 1st January 1860, and died in London August 8, 1863. From an early period Gilbart took an active part in the Athenian Debating Society of London, and he was also connected with the Union Society, which numbered among its other eminent members J. S. Mill and Lord Macaulay. He also devoted much of his attention to the promotion of literary and scientific institutions among the middle and working classes.

The following are his principal works on banking, most of which have passed through more than one edition:—*Practical Treatise on Banking*, 1827; *The History and Principles of Banking*, 1834; *The History of Banking in America*, 1837; *Lectures on the History and Principles of Ancient Commerce*, 1847; *Logic for the Million*, 1851; and *Logic of Banking*, 1857.

GILBERT, SIR HUMPHREY (1539–1583), a celebrated English navigator, was born in 1539 in the county of Devon, second of the three sons of Otho Gilbert of Greenway. By his mother's side he was half-brother to Sir Walter Raleigh, who resembled him in many points of character, and whose early life was largely influenced and guided by his example. Educated first at Eton and then at Oxford, he was destined by his father for the law; but being introduced at court by Raleigh's aunt, Catherine Ashley, he obtained the special favour of the queen, and was thus enabled to follow his natural inclination for active enterprise. Recommended by royal letter to Sir Philip Sidney, he received from him an appointment in the army in Ireland; and his services contributed so powerfully to put down the rebellion raging there that in 1570 he was made a knight and rewarded with the government of Munster. He next served for about five years in the Netherlands, being the first English colonel entrusted with command of English forces in that country. On his return to his native land he wrote a remarkable treatise on a subject at that time before the minds of men, the possibility of a north-west passage to India; and in 1576 it was published without his knowledge by George Gascoigne as *Discourse of a Discoverie for a New Passage to Cataia* (London, Henry Middleton for Richarde Ihones). The theory in question was supported with no small force of argument, and the discourse was probably not without its influence in leading Frobisher to set out on his first voyage to the frozen north. In June 1578 Gilbert received letters patent authorizing himself, his heirs and assigns, to discover, occupy, and possess such remote "heathen lands not actually possessed of any Christian prince or people, as should seem good to him or them." Disposing not only of his patrimony but also of the estates in Kent which he had through his wife, daughter of John Aucher of Ollerden, he strenuously prepared to put his permission to use, and his brother Raleigh joined him in the enterprise. By the end of the summer of 1578 a fleet of 11 sail, with 400 mariners and men-at-arms, was collected off the coast of Devon; but the gallant projectors were singularly unfortunate in the character of some of their associates. Dissensions broke out among the captains and disorder among the crews. Knollys, for example, boasted that, as kinsman to royalty, he was of more value than twenty knights, and insolently rejected Gilbert's invitation to dinner; and his men, encouraged by their captain's conduct, filled the town of Plymouth with uproar and riot, which finally culminated in murder. It was not till the 19th of November that Gilbert set sail, with his forces reduced to 7 ships and 150 men. The history of the voyage is involved in obscurity; but about the beginning of summer or a little earlier in 1579, the fleet returned to England, with little, it would appear, to report except that it had lost one of its chief ships and one of its bravest captains, Miles Morgan, in an encounter with the Spaniards. Gilbert lent his three ships to the Government for service against the Spaniards on the Irish coast; but in July 11, 1582, we still find him complaining to Walsingham that he had not received the moneys that were due to him, and that thus he was prevented from doing more for his queen and country. He was already planning a new expedition; and at length in 1583 his fleet was got together. The queen, though she had at first dissuaded Gilbert from his purpose, and would not permit Raleigh to accompany him, wrote to him by his brother's hand that she wished him "as great good hap and safety to his ship as if herself were there in person," and sent him as a token a golden figure of an anchor guarded by a lady. On 11th of June he departed from Plymouth with 5 sail; but on the 13th the "Ark Raleigh," which had been built and manned at his brother's expense, "ran from him in fair and clear weather having a large wind." This desertion was a cause of no small displeasure to the admiral, and he wrote to Sir George Peckham to solicit his brother to make the crew an example to all knaves; but it appears not improbable (according to Hayes in Hakluyt's collection) that the reason of their conduct was the breaking out of a contagious sickness in the ship. On the 5th of August Gilbert landed in Newfoundland, and took formal possession of it in the queen's name; but proceeding southwards with three vessels, he lost the largest near Cape Breton, and was at last constrained to return homewards with the "Golden Hind" and the "Squirrel" as the only remnant of his fleet. "On Monday the 9th September," reports Hayes, the captain of the "Hind," "the frigate was near cast away, yet at that time recovered; and giving forth signs of joy, the general, sitting abaft with a book in his hand, cried out unto us in the 'Hind,' 'We are as near to heaven by sea as by land.' The same Monday night the frigate's lights were suddenly out, and it was devoured and swallowed up by the sea." So perished Sir Humphrey Gilbert.

Raleigh by Tytler, James Augustus St John, and Edward Edwards.

GILBERT, NICOLAS JOSEPH LAURENT (1751–1780), a French poet, was born at Fontenay-le-Château in Lorraine, in 1751. Having completed his education at the college of Dôle, he devoted himself for a time to a half scholastic half literary life at Nancy, but at length in 1774 he found his way to the capital. As he had already assumed a hostile and satirical position towards the Encyclopedists, he naturally received a warmer welcome from the conservative party;

and as he did not disdain to prostitute his muse to the celebration of the heroic and royal virtues of the despicable Louis XV., he was rewarded with pensions to a considerable amount. He died in October 1780 from the results of a fall from his horse. The satiric force of one or two of his pieces, as *Mon apologie* (1778), and *Le dix-huitième siècle* (1775), would alone be sufficient to preserve his reputation, and it has been further increased by the eulogies of those modern writers who, like Alfred de Vigny, consider him a victim to the spite of his philosophic opponents.

Among his other works may be mentioned *Les Familles de Darius et d'Éridame, histoire persane* (1770), *Le Carnaval des Auteurs* (1773), *Odes nouvelles et patriotiques* (1775). Gilbert's *Œuvres complètes* were first published in 1778, and they have since been edited by Mastrella (Paris, 1823) and by Charles Nodier (1840, 1859, &c.).

GILBERT, or GILBERD, WILLIAM (*c.* 1540–1603), was the most distinguished man of science in England during the reign of Queen Elizabeth. He was born at Colchester, where his father was recorder, but was a descendant of an ancient Suffolk family, long resident at Clare. Of his early years no account is left. He entered St John's College, Cambridge, in 1558, when eighteen years of age, and in due course took the degrees of B.A., M.A., and M.D.; he also became Symson fellow, and in 1569 was elected a senior fellow of his college. After leaving the university he went to the Continent, and, on his return in 1573, settled in London, where for thirty years,—that is, till his death,—he practised as a physician with "great success and applause." He was admitted to the College of Physicians, and filled various offices in it. He began in 1581 as censor, which duty he discharged for several years; then he became treasurer, consiliarius elect, and, at last, president in 1600. His professional skill and general ability drew the attention of Queen Elizabeth to him, and she appointed him royal physician. She also settled a pension on him to enable him to prosecute the scientific inquiries to which he was devoted. After this Gilbert seems to have removed to the court, and to have vacated his house, which was "on St Peter's Hill, between Upper Thames Street and Little Knight-Rider Street." At this house he seems to have had a society or college, which was broken up and the members dispersed by his promotion. In the year 1600 he published his work on the magnet. In 1603 the queen died, but Gilbert was reappointed by her successor. He did not long enjoy the honour, however, for he died November 30, 1603, some say at Colchester, others at London. He was buried at Colchester, in the chancel of the church of the Holy Trinity, where a monument was erected to him. To the College of Physicians he bequeathed his books, instruments, and minerals, but he gave his portrait to the School Gallery at Oxford. In it he is represented as tall of stature and of cheerful countenance, "holding in his hand a globe inscribed 'Terella'; over his head is the inscription '1591, ætatis 48;' and a little below his left shoulder, 'Magneticarum virtutum primus indagator Gilbertus.'" The date thus given does not tally with the conclusion of the inscription on his tombstone: "Obiit anno Redemptionis Humanæ 1603, Novembris ultimo, ætatis suæ 63." If the latter be correct, he was born in 1540; if the former, in 1543.

Gilbert's principal work is his treatise on magnetism, entitled *De Magnete, Magneticisque Corporibus, et de Magno Magnete Tellure*, London, 1600 (later editions—Sedan, 1628, 1633; Frankfort, 1629, 1638). The merit of this work consists in its originality, containing, as it does, an account of the author's experiments on magnets and magnetical bodies, and also the great discovery that the whole earth is nothing but a large magnet, and that it is this which explains, not only the direction of the magnetic needle north and south, but also the variation and dipping or inclination of the needle. Gilbert's is therefore, not merely the first, but the most important systematic contribution to the science of magnetism, and its merits were freely acknowledged by his contemporaries. A posthumous work of Gilbert's was edited by his brother, also called William, from two MSS. in the possession of Sir William Boswell; its title is *De Mundo Nostro Sublunari Philosophia Nova* (Amsterdam, 1651). He is the reputed inventor besides of two instruments to enable sailors "to find out the latitude without seeing of sun, moon, or stars." An account of these instruments is given in Thomas Blondeville's *Theoriques of the Planets* (London, 1602). The only writing of Gilbert in English is a short epistle addressed to William Barlowe, printed at the end of his little work entitled *Magneticall Advertisements* (London, 1616),—a letter which has hitherto escaped the notice of all the writers about Gilbert. It is of interest both because it shows that he carried on a scientific correspondence with the Continent, and that his book had been very well received, and because he says that he was intending to add six or eight sheets to the book,—an intention, however, which was never carried into effect. The letter is dated 14th February, unfortunately without the year, but it must have been written between 1600 and 1603. In his preface Barlowe says that he had numerous letters from Gilbert, but these have long since disappeared. It is a matter of great regret for the historian of chemistry that Gilbert left nothing on that branch of science, to which he was deeply devoted, "attaining to great exactness therein." So at least says Fuller, who, in his *Worthies of England* (among whom he includes Gilbert), prophesied truly how he would be afterwards known: "Mahomet's tomb at Mecha," he says, "is said strangely to hang up, attracted by some invisible loadstone; but the memory of this doctor will never fall to the ground, which his incomparable book *De Magnete* will support to eternity."

GILBERT DE LA PORRÉE (*Gilbertus Porretanus* or *Pictaviensis*), an eminent scholastic logician and theologian of the 12th century, was born at Poitiers. He was educated under Bernard de Chartres and Anselm of Laon, and after completing his studies remained attached as teacher to the church at Chartres. In 1135 he is recorded as discharging these functions, but he seems soon after to have repaired to Paris and opened public courses on dialectics and theology. His fame caused him to be called to his native town, where in 1141 he was elected bishop. The heterodox opinions he was led to express regarding the doctrine of the Trinity drew upon his works the condemnation of the church. The synod of Rheims in 1148 procured papal sanction for four propositions opposed to certain tenets of Gilbert's, and the works of the latter were condemned until they should be corrected in accordance with the principles of the church. Gilbert seems to have submitted quietly to this judgment; he yielded assent to the four propositions, and remained on friendly terms with his antagonists till his death in 1154. Gilbert is almost the solitary logician of the 12th century who is quoted by the greater scholastics of the succeeding age. His chief logical work, the treatise *De Sex Principiis*, was regarded with a reverence almost equal to that given to Aristotle, and furnished matter for numerous commentaries. Albertus Magnus did not disdain to comment upon this work of an earlier logician. The treatise itself is an elaborate discussion of the Aristotelian categories, specially of the six subordinate modes. Gilbert distinguishes in the ten categories two classes, one essential, the other derivative. Essential or inhering (*formæ inhærentes*) in the objects themselves are only *substance, quantity, quality*, and *relation* in the stricter sense of that term. The remaining six, *when, where, action, passion, position*, and *habit*, are relative and subordinate (*formæ assistentes*). This suggestion has some interest, but it cannot be said to have great value, either in logic or in the theory of knowledge. More important in the history of scholasticism are the theological consequences to which Gilbert's realism led him. In the commentary on the treatise *De Trinitate*, erroneously supposed to be by Boetius, he proceeds from the metaphysical notion that pure or abstract being is prior in nature to that which is. This pure being is God, and must be distinguished from the triune God as known to us. God is incomprehensible, and the categories cannot be applied to determine his existence. In God there is no distinction or difference, whereas in all substances or things there is duality, arising from the element of matter. Between pure being and substances stand the ideas or forms, which subsist though they are not substances. These forms, when materialized, are called *formæ substantiales* or *formæ nativæ*; they are the essences of things, and in themselves have no relation to the accidents of things. Things are temporal, the ideas perpetual, God eternal. The pure form of existence, that by which God is God, must be distinguished from the three persons who are God by participation in this form. The form or essence is one, the persons or substances three. It was this distinction between Deitas or Divinitas and Deus that led to the condemnation of Gilbert's doctrine.

See Ritter, *Gesch. d. Phil.*, vii. 437–74; Hauréau, *Phil. Scolastique*, 2d ed., i. 447–78; Stöckl, *Phil. d. Mittelalters*, i. 272–88.

GILBERT OF SEMPRINGHAM, ST (*c.* 1083–1189), founder of the order of Gilbertines (Ordo Gilbertinorum Canonicorum, Ordo Sempringensis), was born about the year 1083 at Sempringham, Lincolnshire, where his father, Jocelyn de Sempringham, a Norman noble who had taken part in the Conquest, had settled. On the completion of a liberal education, received partly in England and partly in France, Gilbert was ordained a priest in 1123, having been presented by his father to the united livings of Sempringham and Tirington. About 1135 he established in the immediate vicinity of his parish church a religious house for the reception of some destitute girls; the rule he prescribed was substantially that of St Benedict, but the restrictions laid upon the communication of the inmates with the outer world were unusually severe. Subsequently the labourers who tilled the lands with which this establishment had been endowed were also formed into a religious community, under a rule resembling that of the Austin Friars, their house being placed close beside that of the nuns. Similar institutions elsewhere were encouraged by various English proprietors, and placed under the superintendence of Gilbert, who at last made application to Pope Eugenius III. to have them all merged in the Cistercian order (1148). This request, however, was refused, and Gilbert continued to act as superior of the monasteries he had founded for many years; although at the time of his death, on the 3d of February 1189, that dignity was held by Roger, one of his disciples. In 1189 the Gilbertines are said to have possessed thirteen monasteries, with almshouses, hospitals, and orphanages attached; and the community numbered in all upwards of 700 male and 1100 female members. At the time of their suppression the total number of Gilbertine houses in England and Wales had increased to about twenty-five. Gilbert, who had sided and suffered with the church in the quarrels between Henry II. and Thomas à Becket, was canonized by Innocent III. in 1202; and his name is commemorated in the martyrologies on the 4th of February. The *Gilbertinorum Statuta* and a series of *Exhortationes ad Fratres* are attributed to him (see the Bollandist *Acta Sanctorum*, Feb. 4).

GILBERT ISLANDS. See POLYNESIA.

GILDAS, or GILDUS (*c.* 516–570), the earliest of British historians, surnamed by some Sapiens, and by others Badonicus, seems to have been born in the year 516. Regarding him little certain is known, beyond some isolated particulars that may be gathered from hints dropped in the course of his work. Two short treatises exist, purporting to be lives of Gildas, and ascribed respectively to the 11th and 12th centuries; but the writers of both are believed to have confounded two, if not more, persons that had borne the name. It is from an incidental remark of his own, namely, that the year of the siege of Mount Badon—one of the battles fought between the Saxons and the Britons—was also the year of his own nativity, that the date of his birth has been derived; the place, however, is not mentioned. His assertion that he was moved to undertake his task mainly by "zeal for God's house and for His holy law," and the very free use he has made of quotations from the Bible, leave scarcely a doubt that he was an ecclesiastic of some order or other. In addition, we learn that he went abroad, probably to France, in his thirty-fourth year, where, after 10 years of hesitation and preparation, he composed, about 560, the work bearing his name. His materials, he tells us, were collected from foreign rather than native sources, the latter of which had been put beyond his reach by circumstances. The *Cambrian Annals* give 570 as the year of his death.

The writings of Gildas have come down to us under the title of *Gildæ Sapientis de Excidio Britanniæ Liber Querulus.* Though at first written consecutively, the work is now usually divided into three portions,—a preface, the history proper, and an epistle,—the last, which is largely made up of passages and texts of Scripture brought together for the purpose of condemning the vices of his countrymen and their rulers, being the least important, though by far the longest of the three. In the second he passes in brief review the history of Britain from its invasion by the Romans till his own times. Among other matters reference is made to the introduction of Christianity in the reign of Tiberias; the persecution under Diocletian; the spread of the Arian heresy; the election of Maximus as emperor by the legions in Britain, and his subsequent death at Aquileia; the incursions of the Picts and Scots into the southern part of the island; the temporary assistance rendered to the harassed Britons by the Romans; the final abandonment of the island by the latter; the coming of the Saxons and their reception by Guortigern (Vortigern); and, finally, the conflicts between the Britons, led by a noble Roman, Ambrosius Aurelianus, and the new invaders. Unfortunately, on almost every point on which he touches, the statements of Gildas are vague and obscure. With one exception already alluded to, no dates are given, and events are not always taken up in the order of their occurrence. These faults are of less importance during the period when Greek and Roman writers notice the affairs of Britain; but they become more serious when, as is the case from nearly the beginning of the 5th century to the date of his death, Gildas's brief narrative is our only authority for most of what passes current as the history of our island during those years. Thus it is on his sole, though in this instance perhaps trustworthy, testimony that the famous letter rests, said to have been sent to Rome in 446 by the despairing Britons, commencing:—"To Agitius (Aetius), consul for the third time, the groans of the Britons."

Gildas's treatise was first published in 1525 by Polydore Vergil, but with many avowed alterations and omissions. Forty-three years later Josseline, secretary to Archbishop Parker, issued a new edition of it more in conformity with manuscript authority; and in 1691 a still more carefully revised edition appeared at Oxford by Thomas Gale. It was frequently reprinted on the Continent during the 16th century, and once or twice since. The next English edition was that published by the English Historical Society in 1838, and edited by the Rev. J. Stevenson. Lastly, the text of Gildas, with elaborate introductions and the various readings of existing manuscripts, is included in the *Monumenta Historica Britannica*, edited by Petrie and Sharpe, London, 1848.

GILDING, the art of spreading or covering gold, either by mechanical or by chemical means, over the surface of a body for the purpose of ornament. The art of gilding was not unknown among the ancients. According to Herodotus, the Egyptians were accustomed to gild wood and metals; and gilding by means of gold plates is frequently mentioned in the books of the Old Testament. Pliny informs us that the first gilding seen at Rome was after the destruction of Carthage, under the censorship of Lucius Mummius, when the Romans began to gild the ceilings of their temples and palaces, the Capitol being the first place on which this enrichment was bestowed. But he adds that luxury advanced on them so rapidly that in a little time you might see all, even private and poor persons, gild the walls, vaults, and other parts of their dwellings. Owing to the comparative thickness of the gold-leaf used in ancient gilding, the traces of it which yet remain are remarkably brilliant and solid. Gilding has in all times occupied an important place in the ornamental arts of Oriental countries; and the native processes pursued in India at the present day may be taken as typical of the art as practised from the earliest periods. For the gilding of copper, employed in the decoration of temple domes and other large works, the following is an outline of the processes employed. The metal surface is thoroughly scraped, cleaned, and polished, and next heated in a fire sufficiently to remove any traces of grease or other impurity which may remain from the operation of polishing. It is then dipped in an acid solution prepared from dried unripe apricots, and rubbed with pumice or brick powder. Next, the surface is rubbed over with mercury which forms a superficial amalgam with the copper, after which it is left some hours in clean water, again washed with the acid solution, and dried. It is now ready for receiving the gold, which is laid on in leaf, and, on adhering, assumes a grey appearance from combining with the mercury, but on the application of heat the latter metal volatilizes, leaving the gold a dull greyish hue. The colour is brought up by means of rubbing with agate burnishers. The weight of mercury used in this process is double that of the gold laid on, and the thickness of the gilding is regulated by the circumstances or necessities of the case. For the gilding of iron or steel, the surface is first scratched over with chequered lines, then washed in a hot solution of green apricots, dried, and heated just short of red-heat. The gold-leaf is then laid on, and rubbed in with agate burnishers, when it adheres by catching into the prepared scratched surface.

Modern gilding is applied to numerous and diverse surfaces and by various distinct processes, so that the art is prosecuted in many ways, and is part of widely different ornamental and useful arts. It forms an important and essential part of frame-making (see CARVING AND GILDING); it is largely employed in connexion with cabinet-work, decorative painting, and house ornamentation; and it also bulks largely in bookbinding and ornamental leather work. Further, gilding is much employed for coating baser metals, as in button-making, in the gilt toy trade, in electro-gilt reproductions, and in electro-plating; and it is also a characteristic feature in the decoration of pottery, porcelain, and glass. As details of the processes employed in connexion with these various substances will be found in the parts of this work where the technical processes to which they are related are described, it is only necessary here to indicate how the processes of gilding differ from each other.

The various processes fall under one or other of two heads—mechanical gilding and gilding by chemical agency.

MECHANICAL GILDING embraces all the operations by which gold-leaf is prepared (see GOLD-BEATING), and the several processes by which it is mechanically attached to the surfaces it is intended to cover. It thus embraces the burnish or water-gilding and the oil-gilding of the carver and gilder, and the gilding operations of the house decorator, the sign-painter, the bookbinder, the paper-stainer, and several others. Polished iron, steel, and other metals are gilt mechanically by applying gold-leaf to the metallic surface at a temperature just under red-heat, pressing the leaf on with a burnisher, and reheating, when additional leaf may be laid on. The process is completed by cold burnishing.

CHEMICAL GILDING embraces those processes in which the gold used is at some stage in a state of chemical combination. Of these the following are the principal:—

Cold Gilding.—In this process the gold is obtained in a state of extremely fine division from a chemical compound, and applied by mechanical means. Cold gilding on silver is performed by a solution of gold in aqua-regia, applied by dipping a linen rag into the solution, burning it, and rubbing the black and heavy ashes on the silver with the finger or a piece of leather or cork. *Wet gilding* is effected by means of a solution of gold in ether, obtained by treating a dilute solution of chloride of gold with twice its quantity of ether. The liquids are agitated and allowed to rest, when the ether separates and floats on the surface of the acid. The whole mixture is then poured into a funnel with a small aperture, and allowed to rest for some time, when the acid is run off and the ether separated. The ether will be found to have taken up all the gold from the acid, and may be used for gilding iron or steel, for which purpose the metal is polished with the finest emery and spirits of wine. The ether is then applied with a small brush, and as it evaporates it deposits the gold, which can now be heated and polished. For small delicate figures a pen or a fine brush may be used for laying on the ether solution. *Fire-gilding* or *Wash-gilding* is a process by which an amalgam of gold is applied to metallic surfaces, the mercury being subsequently volatilized, leaving a film of gold or, according to Struve, an amalgam containing from 13 to 16 per cent. of mercury. In the preparation of the amalgam the gold must first be reduced to thin plates or grains, which are heated red hot, and thrown into mercury previously heated, till it begins to smoke. Upon stirring the mercury with an iron rod, the gold totally disappears. The proportion of mercury to gold is generally as six or eight to one. When the amalgam is cold it is squeezed through chamois leather for the purpose of separating the superfluous mercury; the gold, with about twice its weight of mercury, remains behind, forming a yellowish silvery mass of the consistence of butter. When the metal to be gilt is wrought or chased, it ought to be covered with quicksilver before the amalgam is applied, that this may be more easily spread; but when the surface of the metal is plain, the amalgam may be applied to it direct. When no such preparation is applied, the surface to be gilded is simply bitten and cleaned with nitric acid. A deposit of mercury is obtained on a metallic surface by means of "quicksilver water," a solution of nitrate of mercury,—the nitric acid attacking the metal to which it is applied, and thus leaving a film of free metallic mercury. The amalgam being equally spread over the prepared surface of the metal, the mercury is then sublimed by a heat just sufficient for that purpose; for, if it is too great, part of the gold may be driven off, or it may run together and leave some of the surface of the metal bare. When the mercury has evaporated, which is known by the surface having entirely become of a dull yellow colour, the metal must undergo other operations, by which the fine gold colour is given to it. First, the gilded surface is rubbed with a scratch brush of brass wire, until its surface be smooth; then it is covered over with a composition called "gilding wax," and again exposed to the fire until the wax is burnt off. This wax is composed of beeswax mixed with some of the following substances, viz., red ochre, verdigris, copper scales, alum, vitriol, borax; but, according to Dr Lewis, the saline substances alone are sufficient, without any wax. By this operation the colour of the gilding is heightened; and the effect seems to be produced by a perfect dissipation of some mercury remaining after the former operation. The dissipation is well effected by this equable application of heat. The gilt surface is then covered over with a saline composition, consisting of nitre, alum, or other vitriolic salts, ground together, and mixed up into a paste with water or weak ammonia. The piece of metal thus covered is exposed to a certain degree of heat, and then quenched in water. By this method its colour is further improved and brought nearer to that of gold, probably by removing any particles of copper that may have been on the gilt surface. This process, when skilfully carried out, produces gilding of great solidity and beauty; but owing to the exposure of the workmen to mercurial fumes, it is very unhealthy, and further there is much loss of mercury. Numerous contrivances have been introduced to obviate these serious evils; and the gilding furnace invented by M. D'Arcet is so arranged that the whole of the mercurial fumes are caught and recondensed for further use. Gilt brass buttons used for uniforms are gilt by this process, and there is an Act of Parliament yet unrepealed which prescribes 5 grains of gold as the smallest quantity that may be used for the gilding of 12 dozen of buttons 1 inch in diameter.

Electro-gilding, which has numerous and important applications, is described under ELECTRO-METALLURGY.

Gilding of Pottery and Porcelain.—The quantity of gold consumed for these purposes is very large. The gold used is dissolved in aqua-regia, and the acid is driven off by heat, or the gold may be precipitated by means of sulphate of iron. In this pulverulent state the gold is mixed with $\frac{1}{12}$th of its weight of oxide of bismuth, together with a small quantity of borax and gum water. The mixture is applied to the articles with a camel's hair pencil, and after passing through the fire the gold is of a dingy colour, but the lustre is brought out by burnishing with agate and bloodstone, and afterwards cleaning with vinegar or white-lead.

GILEAD (גִּלְעָד, *i.e.*, "hard" or "rugged") is sometimes used, both in earlier and in later writers, to denote the whole of the territory occupied by the Israelites eastward of Jordan, extending from the Arnon to the southern base of Hermon (Deut. xxxiv. 1; Judg. xx. 1; Jos., *Ant.* xii. 8. 3, 4). More precisely, however, it was the usual name of that mountainous district which is bounded on the N. by the Hieromax (Yarmuk), on the E. by the Jordan, on the S. by the Arnon, and on the W. by a line which may be said to follow the meridian of Ammân (Philadelphia or Rabbath-Ammon). It thus lay wholly within 31° 25′ and 32° 42′ N. lat., and 35° 34′ and 36° E. long. Excluding the narrow strip of low-lying plain along the Jordan, it has an average elevation of 2500 feet above the Mediterranean; but, as seen from the west, the relative height is very much increased by the depression of the Jordan valley. The range from the same point of view presents a singularly uniform outline, having the appearance of an unbroken wall; in reality, however, it is traversed by a number of deep ravines (wadys), of which the most important are the Yâbis, the Ajlûn, the Râjib, the Zerka (Jabbok), the Hesban, and the Zerka Maîn The great mass of the Gilead range is formed of Jura limestone, but there are also occasional veins of sandstone. The eastern slopes are comparatively bare of trees; but the western are well supplied with oak, terebinth, and pine. The pastures are everywhere luxuriant, and the wooded heights and winding glens, in which the tangled shrubbery is here and there broken up by open glades and flat meadows of green turf, exhibit a beauty of vegetation such as is hardly to be seen in any other district of Palestine.

The first mention of "Mount Gilead" in Scripture occurs in Gen. xxxi., where it is said that the place where Jacob's covenant with his father-in-law was ratified was thenceforward called "the hill of witness" (גַּלְעֵד). The locality contemplated by the sacred writer was doubtless somewhere on the ridge of what is now known as Jebel Ajlûn, and probably not far from Mahneh (Mahanaim), near the head of the wady Yâbis.[1] Gilead next comes under notice in connexion with the partition of the promised land among the twelve tribes of Israel. At the period of the conquest the portion of Gilead northward of the Jabbok (Zerka) belonged to the dominions of Og, king of Bashan, while the southern half was ruled by Sihon, king of the Amorites, having been at an earlier date wrested from Moab (Numb. xxi. 24; Deut. iii. 12–16). These two sections were allotted respectively to Manasseh and to Reuben and Gad, both districts being peculiarly suited to the pastoral and nomadic character of these tribes. A somewhat wild Bedouin disposition, fostered by their surroundings, was retained by the Israelite inhabitants of Gilead to a late period of their history, and seems to be to some extent discernible in what we read alike of Jephthah, of David's Gadites, and of the prophet Elijah.

After the close of the Old Testament history the word Gilead seldom occurs. It seems to have soon passed out of use as a precise geographical designation; for though occasionally mentioned by Apocryphal writers, by Josephus, and by Eusebius, the allusions are all vague, and show that those who made them had no definite knowledge of Gilead proper. In Josephus and the New Testament the name Peraea or πέραν τοῦ Ἰορδάνου is most frequently used; and the country is sometimes spoken of by Josephus as divided into small provinces called after the capitals in which Greek colonists had established themselves during the reign of the Seleucidæ. At present Gilead south of the Jabbok alone is known by the name of Jebel Jilad (Mount Gilead), the northern portion between the Jabbok and the Yarmuk being called Jebel Ajlûn. Jebel Jilad includes Jebel Osha, and has for its capital the town of Es-Salt. The cities of Gilead expressly mentioned in Scripture are Ramoth, Jabesh, and Jazer. The first of these has been satisfactorily identified with Es-Salt, and apparently ought not to be regarded as distinct from Mizpeh (Judg. xi. 11, 34), called also Mizpeh-Gilead (Judg. xi. 29), or Ramoth Mizpeh (Josh. xiii. 26).

[1] See Beke, "Notes on an Excursion to Harran," &c., in vol. xxxii. of the *Journal of the Royal Geographical Society* (1862). "It was not the river Jordan, but the ridge of Mount Gilead, which formed the natural boundary of the possessions of the children of Israel."

GILES, St (Ægidius, Egidio, Gil, or Gilles), according to the *Breviarium Romanum* (1st September) was an Athenian of royal descent, and from his earliest years distinguished for piety and charity. On the death of his parents he, while still young, distributed amongst the poor his entire patrimony, including his very tunic, which garment effected a miraculous cure upon the poor sick man to whom it had been given. Shrinking from the publicity involved in this and many other (apparently involuntary) miracles, he betook himself to Provence, where, after a residence of two years with St Cæsarius at Arles, he withdrew into the solitude of the neighbouring desert, living upon herbs and the milk of a hind which came to his cell at stated hours. Here he was discovered after some time by the king of France, who on a hunting expedition had tracked the hind to the hermit's cave. With the reluctant consent of Ægidius, a monastery was now built on the spot, he being appointed its first abbot. The functions of this office he discharged with prudence and piety until his death, which occurred some years afterwards.

Some uncertainty attaches to the date, as well as to several other circumstances stated in this narrative. It is known that a certain Ægidius, whose name at least (Αἰγίδιος, from αἴξ or αἰγίς) is suggestive of a Greek origin, held an abbacy in Provence in the 6th century, and, at the instance of Bishop Cæsarius, undertook, in 514, a mission to Pope Symmachus on a question relating to certain rivalries between the sees of Arles and Vienne (Labbe, *Conc.*, v. 439–40, ed. 1728); but the modern hagiologists, following the earliest *Acta*, which assign the legend to the period of a Catholic Visigothic king "Flavius" (Wamba or Ervigius), incline to distinguish the saint from the earlier abbot of the same name, and to fix the date of the former about the end of the 7th century. Of the existence of an abbey under the advocacy of St Giles towards the end of the 9th century there can be no question (Ménard, *Hist. de Nismes*); while Benjamin of Tudela makes special mention of the crowds of foreigners from all countries who in his time (1160) frequented that shrine, which is situated on the Petit-Rhône, about 12 miles westward of Arles. In the 11th and following centuries the cultus of the saint, who came to be regarded as the special patron of lepers, beggars, and cripples, spread very extensively over Europe, especially in England, Scotland, France, Germany, and Poland. The church of St Giles, Cripplegate, London, was built about 1090, while the hospital for lepers at St Giles-in-the-Fields was founded by Queen Matilda in 1117. In England alone there are 146 churches dedicated to this saint; and they occur in every county except in those of Westmoreland and Cumberland (Parker, *Calendar of the Anglican Church*). In Edinburgh the church of St Giles (*c.* 1359) could boast the possession of an arm-bone of its patron. Representations of St Giles are very frequently met with in early French and German art, but are much less common in Italy and Spain (Jameson, *Sacred and Legendary Art*, pp. 768–770).

GILFILLAN, George (1813–1878), a clergyman of the United Presbyterian Church of Scotland, and a well-known popular writer, was born 30th January 1813 at Comrie, Perthshire, where his father, the Rev. Samuel Gilfillan, also a man of some literary activity, was for many years minister of a Secession congregation. At Glasgow University and the theological hall, as at Comrie school, he took small help from formal lessons, and cared little for a high place in his classes or for proficiency in his prescribed studies, but applied himself to English literature, with a passion for reading, and a memory which held fast and arranged the contents of all the congenial books he met with. In March 1836 he was ordained pastor of a Secession congregation in Dundee. His first effort beyond the pulpit was in 1839, when he issued

Five Discourses, which, though neglected by the reading public, had many high merits, and gave the promise of more and of higher. Some time afterwards he rather unadvisedly published a sermon on "Hades," which, distinguished by bold but ill-sustained speculation, and by brilliant but irregular imagination, brought him under the scrutiny of his co-presbyters, and was ultimately withdrawn from circulation. Gilfillan next contributed a series of sketches of celebrated literary men to the *Dumfries Herald*, then edited by Thomas Aird; and these, along with several new ones formed his first *Gallery of Literary Portraits*, a volume which appeared in 1846, and had a wide circulation. It was quickly followed by a *Second* and a *Third Gallery*, until almost all our great men were delineated. In 1851 the *Bards of the Bible* appeared; and this has been his most successful work. His aim was that it should be "a poem on the Bible"; and it was far more rhapsodical than critical. Still the little criticism that was scattered throughout it was more than enough to keep it from soaring into poetry; and the poetry, when pure, was so fragmentary, that instead of making one poem, it consisted of many small pieces, though in these there were grand strokes and exquisite touches of description. His sketching powers were next exercised upon the "Scottish Covenanters," and some of the heroes and episodes of the struggle received a glowing commemoration. At a later date he published similar representations of English Puritans and of Scotch Seceders, as champions of the rights of conscience. The most extensive publication with which Gilfillan was connected was Nichol's edition of the *British Poets*; and his office was not only to secure the utmost accuracy in the text of each poet's works, but also to furnish both a biography and a critical estimate. This engagement, taking him again and leisurely through the studies in which he had most delighted, and with which he had been most conversant, stimulated him to finish the work on which he had resolved in youth, and to which he had long given the brightest moods of his most genial hours. *Night, a Poem*, came out in 1867, when he was fifty-four years of age; but the work which had received his labour and his polishing during his best thirty years was far less successful than his most ephemeral productions. It was, indeed, an absolute failure. The theme was vast, vague, and unmanageable, even though the poem had extended to ninety, instead of nine books. Then, though his nature was largely and essentially poetic, Gilfillan had never given himself a training or even any practice in verse. Besides he had already, in his many prose volumes, made use of all his poetic ideas and illustrations. There was not a line in *Night* that had not often sounded forth in his essays with stronger and finer melody. It was but a faint echo, and it had no music. His *History of a Man*, partly autobiographic and largely fabulous, was not written with his usual candour and geniality. Not less abundant and striking than his literature was his oratory; and wherever he appeared as a preacher, or as a lecturer on some literary or secular theme, he drew large crowds that were invariably thrilled by his eloquence. There was no token either of physical or of mental exhaustion when he died suddenly of heart disease, in the summer of 1878. He had just finished a new life of Burns designed to accompany a new edition of the works of that poet.

GILGAL. Three towns of this name are mentioned in the Bible. (1.) The first and most important was situated "in the east border of Jericho" (Joshua iv. 19), on the border between Judah and Benjamin (Joshua xv. 7). Josephus places it 50 stadia from Jordan and 10 from Jericho (*Antiq.*, v. 1, 4), but these measurements do not agree with the position of Jericho with respect to Jordan. Jerome (*Onomasticon*, s.v. Galgal) places Gilgal 2 Roman miles from Jericho, and speaks of it as a deserted place held in wonderful veneration ("mire cultu") by the natives. This site, which in the Middle Ages appears to have been lost,—Gilgal being shown further north,—has lately been recovered by a German traveller (Schokke), and fixed by the English survey party. It is about 2 miles east of the site of Byzantine Jericho, and 1 mile from the modern Eriha. A fine tamarisk, traces of a church (which is mentioned in the 8th century), and a large reservoir, now filled up with mud, remain. The place is called Jiljûlieh, and its position north of the valley of Achor (Wâdy Kelt) and east of Jericho agrees well with the Biblical indications above mentioned. A tradition connected with the fall of Jericho is attached to the site (see *Tent Work in Palestine*, vol. ii. p. 7). (2.) The second Gilgal, mentioned in Joshua xii. 23 in connexion with Dor, appears to have been situated in the maritime plain. Jerome (*Onomasticon*, s.v. Gelgel) speaks of a town of the name 6 Roman miles north of Antipatris (Râs el 'Ain). This is apparently the modern Kalkilia (vulgarly Galgilia), but about 3 miles north of Antipatris is a large village called Jiljûlieh, which is more probably the Biblical town. (3.) The third Gilgal (2 Kings iv. 38) was in the mountains (compare 2 Kings ii. 1–3) near Bethel. Jerome mentions this place also (*Onomasticon*, s.v. Galgala). It appears to be the present village of Jiljilia, about 7 English miles north of Beitîn (Bethel).

GILGIT (*Ghilghit*, &c.), properly a secluded valley-state on a tributary of the Upper Indus, but also applied to the tributary river and the whole of its basin, which is one of great interest in many respects, though as yet but imperfectly known. Captain J. Biddulph has for some time past been employed in Gilgit on the part of the Government of India, but no part of the information communicated by him has yet been made available. We shall describe the whole basin so far as materials allow.

About 10 miles below the elbow formed by the Indus (74° 42′ long., 35° 50′ lat.) in suddenly changing its course from a general direction north-west to a general direction south-west, in the vicinity of some of the highest mountains and vastest glaciers in the world, the Gilgit river enters it on the right bank, and with a general direction from the north-west. Thus the axis of the Gilgit valley is in fact a prolongation of that of the Indus valley in the direction maintained by the latter for some 300 miles above the elbow just mentioned. The length of the basin, so far as we know, on a line nearly west to east, is 120 miles; and its greatest width from north to south is about 75. The south limit of the basin is formed by the lofty watershed which divides the west-to-east Gilgit basin from the meridional basins of the (Lower) Indus, the Swat, and the Panjkora. At its intersection with the Indus-Swat watershed this limit rises to a peak of 19,400 feet, and at its intersection with the Panjkora-Chitral watershed to peaks of 18,490 and 19,440 feet. The western limit of the basin is the lofty watershed dividing it from the Mastúj valley on the upper waters of the Chitral river. This limit runs from the intersection last mentioned north-north-east and then north-east, till it joins the great mountain node in which the ranges of Hindu-Kush and the Muztagh (or Karakoram), according to our usual nomenclature, coalesce on the margin of the Pamir plateau. The northern limit of the basin is formed by the Muztagh itself, with peaks of 23,330 feet, 22,740 feet, 22,590 feet, 25,370 feet, 25,050 feet, and the basin is closed on the east by an offshoot of the Muztagh which, over the Indus elbow, forms that other great congeries of peaks and glaciers, of which the culminating point (Rákipúshi) rises to 25,550 feet, whilst seven others exceed 19,000 feet. South of the gorge through which the Gilgit waters force their way to the Indus this eastern barrier continues with summits rising to 14,000 and 15,000 feet, and joins the southern limit already described. This last-mentioned part of the barrier is known as the Niludar Hills, and has to be passed by the traveller who enters Gilgit from Kashmír, *i.e.*, from India. The remotest source of the Gilgit waters is in a lake called Shundar, close above Mastúj, and by which one of the chief passes leads from Gilgit and Yassin to Mastúj and Chitral. The Ghizar river runs out of this, and, after a course of 60 miles, is joined by the river of Yassin, coming from the north. These two may be considered to form the Gilgit river. The Yassin river itself is formed by two streams joining 6 or 8 miles above the village of Yassin, by each of which leads a pass. From the north-west comes the Tui or Moshabbar stream, by which lies the Moshabbar pass, probably at least 16,000 feet in height, and traversing a deep crevassed glacier for 8 miles. From where the road reaches the upper stream of Mastúj one path leads down the latter to Mastúj, and another up-stream, crossing by the Baroghil pass (12,000 feet), over the prolongation of Hindu-Kush watershed, into Wakhán and the basin of the Upper Oxus. By the other stream, called the Warchagam river, coming from the north, a path leads over the Darkot pass to the very source of the Mastúj river, and so also to the Baroghil pass. Another important stream, the Karambar, joins the Gilgit river from the north, about 21 miles below the confluence of the Ghizar

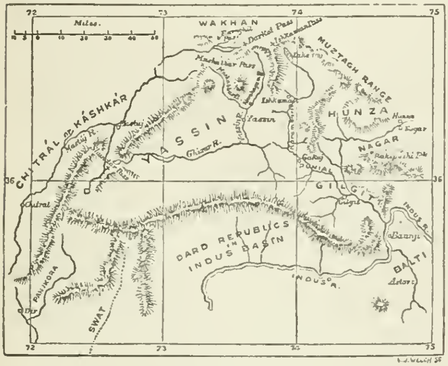

Chart of Gilgit.

and Yassin river. This flows through the Ishkaman valley, rising in a lake called the Karambar Sar, said to have been formed in recent years by glaciers damming up the stream, and by this runs the most easterly pass of those that lead from the Gilgit basin direct to Wakhán. It is believed to be very lofty and difficult, but it has not been explored. About 36 miles below the Ghizar-Yassin confluence, and 25 miles above the confluence with the Indus, on the right bank, stand the fort and village of Gilgit. Five miles below this the river is joined by the last important confluent, called the Nagar river. Recent information suggests that this stream has a very lengthened course, flowing, in fact, from the northern side of the Muztagh in the vicinity of the Karambar lake; and, if this be so, a large addition must be made to the Gilgit basin as a whole. But of this we have no defined knowledge.

The states occupying the basin of Gilgit are, or till lately were, the following:—

1. *Yassin.*—This embraces all the upper or western part of the basin, including the Ishkaman valley. For some generations, at least, the lations of this state with Gilgit were hostile, whilst it was in intimate or dependent connexion with the kings of Chitral, and held by a member of the same family. Indeed it was regarded and named as a subdivision of Upper Chitral. We have no present information as to the population or even the number of villages in this lofty district; but the route surveys show about thirty. The height of the chief place, Yassin, is 7770 feet. The country was visited twice in 1870 by a very gallant but not prudent traveller, Mr George Hayward, and on the second visit in July of that year he was murdered by the agents of the chief Mir Wali, whilst on his way to the Darkot pass, in hope of penetrating to Wakhán and the exploration of Pamir. It is believed that Yassin has recently been annexed by the troops of Kashmír.

2. Next below Yassin is the small state of *Puniál* or *Punyá*, long held by separate rajas, and held by them now in dependence on Kashmír. It occupies the narrow valley of the river for a length of 25 miles, and contains nine villages, varying in height from 7000 feet down to 5500 feet. The villages are all within little forts, so that (as in Khorasan, and in Marco Polo's narrative) villages and forts are synonymous. At evening, the people who have been occupied in their fields come within the wall, and the gates are closed. Sentries guard the towers all night, and at dawn an armed patrol goes forth and makes the round of all places that might harbour an enemy, before the people issue to their avocations. In this part of the valley there are frequent *mauvais pas* on the road, where passage is difficult, and where a few men might stop a host. These are called by the old Persian name of *darband* (porta clausa), like the famous Iron Gate on the Caspian. The upper village of Puniál, called Gákúj, was till recently the furthest point to which the power of Kashmír, and therefore the influence of the British Government, extended. It stands 6940 feet above the sea. Between Gákúj and Yassin the road passes through a natural gate of rock. The ruler of Puniál is, or was in 1873, Raja 'Isa Bágdur, an old man who, in his little kingdom of nine villages, displayed some of the best characteristics of a king,—feared by his enemies, liked and implicitly obeyed by his people. On meeting him they go up and kiss his hand.

Gilgit occupies the remainder of the main valley down to the Indus, but we shall first speak of Hunza and Nagar, lying in the eastmost part of the basin, on the Nagar river.

3 and 4. *Nagar* lies on the left bank of the river, *Hunza* opposite, and the two "capitals," so to call them, lie just over against one another. They are distinct states under distinct princes, and their people of distinct Mussulman sects. Whilst Nagar sends a small complimentary tribute to the maharaja of Kashmír, Hunza (also called Kanjúd), a more warlike country, has often been at active enmity with him, coming down upon his villages in Gilgit, sweeping off the inhabitants, and selling them into slavery. Though the people of both states seem to speak the same language, Dr Leitner says the Nagar people are shorter, stouter, and fairer than the Hunza folk, whom he calls "tall skeletons" and desperate robbers. He says he met a man of Nagar whose yellow moustache and general appearance made him believe almost that he had seen a Russian. The Kanjúdis are the terror of the Kirghiz on the upper waters of the Yarkand, and of the traders from Ladák to that territory.

5. *Gilgit* occupies all the lower part of the main valley to the Indus. If we take the whole length of the river, from the source in the Shundar lake to the Indus, at 135 miles (which, like the other distances here, is taken with a 5-mile opening of the compass, omitting minor windings), Yassin will occupy 75 miles of this, Puniál 25, and Gilgit 35. The lower part of Gilgit is a valley from 1 to 3 miles wide, bounded on each side by steep rocky mountains. The valley contains stony alluvial plateaus of various forms and at various levels above the river, which flows between cliffs worn in these. The greater part of this space is barren, but as usual in those high regions there is in front of each lateral ravine a cultivated space watered by the tributary stream, and on that a collection of houses. The village of Gilgit is 4800 feet above the sea, and stands on a flat plain of the river alluvium, forming a terrace 30 or 40 feet above the water. The cultivation here covers a square mile or thereabouts, irrigated from the nearest lateral stream. The houses are flat-roofed, scattered over the plain in twos and threes, among groups of fruit-trees. The destruction was great in the wars to which Gilgit has been subject in the last half-century, and it will take long before the village recovers the former abundance of fruit-trees. The fort of Gilgit is the chief stronghold of the maharaja of Kashmír in Dardistán.

There is very little snow-fall at Gilgit. The vegetable products are wheat, barley, naked barley, rice (at Gilgit village only), maize, millet, buckwheat, various pulses, rape, and cotton; and of fruits, mulberries, peaches, apricots, grapes, apples, quinces, pears, greengages, figs (poor), walnuts, pomegranates, and *elaagnus*, besides musk and water-melons. Silk is grown in very small quantity. There are three fabrics from it,—one half-wool, much worn by those above the common peasant, one half-cotton, and the third all silk, strong though loosely woven, and prized for girdles. Gold is washed from the river-gravels as in many other parts of the Indus basin. The vine is much cultivated in some parts of the valley. In Punial it is grown in small vineyards, the vines being often old trees; the whole vineyard is covered with a horizontal framework of sticks, 2 to 4 feet above the ground, and over this the vines are trained.

The people of the basin are all reckoned to be Dards, though there is this perplexing fact, that (setting aside dialects) two languages are spoken among them, which are entirely and radically different,—the *Khajuna* language, which is spoken in Hunza, Nagar, and Yassin, being one of which no relation has yet been traced to any other tongue, whilst the *Shina*, spoken in the rest of the basin, is clearly Aryan, and kindred to the Sanskritic languages of India. Now there seems to be no doubt entertained that the Yassin people at least have all the characters of undisputed Dards. It is worth while to exhibit the numerals from these two languages.

	Shina.	Khajuna.		Shina.	Khajuna.
One	*eyk*	*hann.*	Seven	*sath*	*tató.*
Two	*do*	*altàtz.*	Eight	*atsn*	*altambu.*
Three	*tré*	*uskó.*	Nine	*nau*	*untshò.*
Four	*tshar*	*waltó.*	Ten	*dáy*	*tóromo.*
Five	*poñ*	*tshudó.*	Eleven	*akáy*	*turma-hann.*
Six	*shá*	*mishindó.*	Twelve	*báy*	*turma-altatz.*

The Dards not only occupy the Gilgit basin, but also extend down the Indus basin, in which they form a number of small republican communities (whilst the states of the Gilgit basin are all, so to speak, monarchical), reaching to Batera, where the Pushto-speaking tribes who are of Afghan blood, or at least Afghanized, commence. The Dards are described as decidedly Aryan in features, broad-shouldered, well-proportioned, active, and enduring. The hair is usually black but sometimes brown, the eyes brown or hazel, the skin sometimes fair enough to show a ruddy complexion; the voice and manner of speech are harsh. In bearing they are cheerful, bold, and independent, not disobliging when rightly handled, and as a race decidedly clever. They do not care much for human life, but still are not blood-thirsty. They are, says Mr Drew, "a people who will meet one on even terms, without sycophancy or fear, and without impertinent self-assertion." The women are not pretty in Gilgit, but those of Yassin have a better repute, and indeed Hayward says: "The women have a more English cást of countenance than any I have yet seen in Asia, light-brown locks prevailing." The dress is entirely woollen, trousers, choga (long robe like a dressing-gown), and girdle. The cap is most characteristic; it is a long woollen bag rolled up at the edge till it fits close to the head. The feet are wrapt in scraps of leather, with a long strip as a binder. There is a distinct separation into castes, of which Drew counts five, others only four. The lowest caste is Dum, the name of a low caste found all over India to the extreme Deccan,—a notable circumstance. The middle castes, Shin and Yashkun, form the body of the Dard people. The pure Shin looks more like a European than any high-caste Brahman of India. A Shin man may marry a Yashkun woman, but a Yashkun man may not marry a Shin woman. The Yashkuns predominate in Gilgit basin; the Shins in Haramosh (up the Indus valley) and Astor (east of Gilgit), and in the states of the Indus basin below Gilgit. It is a notable circumstance that the Dards abhor the cow, much as the Mussulmans abhor swine. They will not drink cow's milk, nor make or eat butter. In this last point the Indo-Chinese nations generally and the Chinese resemble them, but not in the dislike to the animal. The Dards will not burn cow-dung nor touch the cow if they can help it.

All the Dards of the Gilgit basin are Mahometans, and of three different sects, Sunnis, Shiahs, and Moláis (Mullahis?), the last being a Shiah offshoot and modification. The last two drink wine, the Sunnis do not. Gilgit proper is half Sunni, half Shiah; Puniál, Molai; Hunza, Molai—these are great wine drinkers; Nagar, Shiah; Ishkaman, Molái; Yassin, Molái and Sunni, without any Shiahs. Till lately they were very loose Mahometans. Some of the Moslem officers in the Sikh and Dogra garrisons have spread greater rigidity. The wine is put in large earthenware jars, which are then buried for a time. The people do not understand clarifying the wine. Dr Leitner tasted some which was very palatable, but looked more like mutton-broth than wine. A kind of beer is also made. Polo is a favourite game throughout Dardistán, as in Balti, which is its home, or one of its homes, and it extends to the Chitral country. Wherever Baltis or Dards live, the polo-ground may be looked for. Target archery with firearms is also a favourite amusement; they use stones for bullets, with a thin coating of lead. They are excellent shots. The Jew's harp is played; and the invention is ascribed to King David.

History.—The Dards are located by Ptolemy with surprising accuracy (*Daradæ*) on the west of the Upper Indus, beyond the head-waters of the Swat river (*Soastus*), and north of the *Gandaræ*, *i.e.*, the Gandháras, who occupied Peshawar and the country north of it. The *Dardas* and *Chinas* also appear in many of the old Pauranic lists of peoples, the latter probably representing the *Shin* branch of the Dards. This region was traversed by two of the Chinese pilgrims of the early centuries of our era, who have left records of their journeys, viz., Fahian, coming from the north, *c.* 400, and Hwen-thsang, ascending from Swat, *c.* 631. The latter says: "Perilous were the roads, and dark the gorges. Sometimes the pilgrim had to pass by loose cords, sometimes by light stretched iron chains. Here there were ledges hanging in mid-air; there flying bridges across abysses; elsewhere paths cut with the chisel, or footings to climb by." Yet even in these inaccessible regions were found great convents, and miraculous images of Buddha. How old the name of *Gilgit* is we do not know, but it occurs in the writings of the great Mahometan savant Al-Birúni, in his notices of Indian geography. Speaking of Kashmír, he says: "When thou hast passed the defile which forms the entrance and hast penetrated into the plain, thou hast to thy left the mountains of Balaur and Shamilán. Two days' journey distant are the Turks called *Bhatáwarián*, whose king takes the name of *Bhatsháh*. The country which these Turks occupy is called *Kilkit* (or Gilgit), *Asora*, and *Shaltás*. Their tongue is Turk; the people of Kashmir have to suffer much from their raids"—(Reinaud, "Extraits," in *Journal Asiatique*, ser. iv. tom. iv.). There are difficult matters for discussion here. It is impossible to say what ground the writer had for calling the people *Turks*. But it is curious that the *Shins* say they are all of the same race as the Moghuls of India, whatever they may mean by that. Gilgit, as far back as tradition goes, was ruled by rajas of a family called Trakane. When this family became extinct the valley was desolated by successive invasions of neighbouring rajas, and in the 20 or 30 years ending with 1842 there had been five dynastic revolutions. The most prominent character in the history was a certain Gaur Rahman or Gauhar Aman, chief of Yassin, a cruel savage and man-seller, of whom many evil deeds are told. Being remonstrated with for selling a *mullah*, he said, "Why not? the Koran, the word of God, is sold; why not sell the expounder thereof?" The Sikhs entered Gilgit about 1842, and kept a garrison there. When Kashmír was made over to Maharaja Gúláb Singh of Jámú in 1846, by Lord Hardinge, the Gilgit claims were transferred with it. And when a commission was sent to lay down boundaries of the tracts made over, Mr Vans Agnew (afterwards murdered at Multán) and Lieut. Ralph Young of the Engineers visited Gilgit, the first Englishmen who did so. The Dogras (Gúláb Singh's race) had much ado to hold their ground, and in 1852 a catastrophe occurred, parallel on a smaller scale to that of the English troops at Cabul. Nearly 2000 men of theirs were exterminated by Gaur Rahman and a combination of the Dards; only one person, a soldier's wife, escaped, and the Dogras were driven away for eight years. Gúláb Singh would not again cross the Indus, but after his death (in 1857) the present Maharaja Ranbir Singh longed to recover lost prestige. In 1860 he sent a force into Gilgit. Gaur Rahman just then died, and there was little resistance. The Dogras have twice since then taken Yassin, but did not hold it. Now, recently, it is believed, they have not only occupied Yassin, but have invaded Chitrál also. They also, in 1866, invaded Darel, one of the most secluded Dard states, to the south of the Gilgit basin, but withdrew again.

The chief source of the information in this article is an excellent work by Mr Frederick Drew, who was long in the employment of the maharaja, *The Jummoo and Kashmir Territories, a Geographical Account*, 1875. Use has also been made of Dr Leitner's uncompleted work, *Results of Tour in Dardistan, &c.*; of Mr Hayward's letters (*Proc. Roy. Geog. Soc.*, vol. xv., and *Journ. Roy. Geog. Soc.*, vol. xli.); and of Col. Walker's *Report on the Survey Dept.* for 1877-78. The narrative of "the ullah," who performed the remarkable journeys noticed briefly in that report, has been for the present withheld from publication by the Indian Government, but the map corrected by his surveys is of extreme interest and value. By and by we may hope for the publication of Captain Biddulph's observations, which will doubtless throw much new light on this secluded and interesting region. (H. Y.).

GILL, JOHN (1697–1771), a Baptist minister and learned Rabbinical scholar, was born at Kettering, Northamptonshire, in 1697. On account of the limited means of his parents, he owed his education chiefly to his own perseverance. After receiving baptism in November 1716, he began to preach, and officiated at Higham Ferrers, as well as occasionally at his native place, until the beginning of 1719, when he became pastor of the Baptist congregation at Horsleydown, in Southwark, where he continued fifty-one years. In 1748 he received the degree of D.D. from the university of Aberdeen. He died at Camberwell, October 14, 1771.

His principal works are *Exposition of the Song of Solomon*, 1728; *The Prophecies of the Old Testament respecting the Messiah considered*, 1728; *Treatise on the Doctrine of the Trinity*, 1731; *Cause of God and Truth*, in 4 vols., 1731; *Exposition of the Bible*, in 10 vols., in preparing which he formed a large collection of Hebrew and Rabbinical books and MSS.; *Dissertation on the Antiquity of the Hebrew Language—Letters, Vowel Points, and Accents*, 1767; *A Body of Doctrinal Divinity*, 1767; *A Body of Practical Divinity*, 1770; and *Sermons and Tracts*, with a memoir of his life, 1773. An edition of his *Exposition of the Bible* appeared in 1816 with a memoir by Dr Ripon, which has also appeared separately. Various editions of several of his other works have also appeared.

GILLESPIE, GEORGE (1613–1648), a prominent member of the presbyterian party in the Westminster Assembly, was born at Kirkcaldy, where his father was parish minister, on the 21st of January 1613, and entered the university of St Andrews as a "presbytery bursar" in 1629. On the completion of a brilliant student career, he became domestic chaplain to Lord Kenmure, and afterwards to the earl of Cassilis, his conscience not permitting him to accept the episcopal ordination which was at that time in Scotland an indispensable condition of induction to a parish. While with the earl of Cassilis he wrote his first work, *A Dispute against the English Popish Ceremonies obtruded upon the Church of Scotland*, which, opportunely published (but without the author's name) in the summer of 1637, attracted considerable attention, and within a few months had been found by the privy council to be so damaging that by their orders all available copies were called in and burnt. In April 1638, soon after the authority of the bishops had been set aside by the nation, Gillespie was ordained minister of Wemyss (Fife) by the presbytery of Kirkcaldy, and in the same year was a member of the famous Glasgow Assembly, before which he preached a sermon so pronounced against royal interference in matters ecclesiastical as to call for some remonstrance on the part of Argyll, the Lord High Commissioner. In 1642 Gillespie was translated to Edinburgh; but the brief remainder of his life was chiefly spent in the conduct of public business in London. Already, in 1640, he had accompanied the commissioners of the peace to England as one of their chaplains; and in 1643 he was appointed by the Scottish church one of the four commissioners to the Westminster Assembly. Here he took a prominent part in almost all the protracted discussions on church government, discipline, and worship, supporting Presbyterianism by numerous controversial writings, as well as by an unusual fluency and readiness in debate. On the Erastian question, in particular, besides a series of vigorous pamphlets against Coleman (*A Brotherly Examination of some Passages in Mr Coleman's late printed Sermon*, &c.; *Nihil Respondes*; *Male Audis*), he published in 1646 a large work entitled *Aaron's Rod Blossoming, or the Divine Ordinance of Church-government vindicated*, which is deservedly regarded as a really able statement of the case for an exclusive spiritual jurisdiction of the Church. Shortly after his return to Scotland, Gillespie was elected moderator of the Assembly (1648); but the laborious duties of that office (the court continued to sit from 12th July to the 12th of August) told fatally on a constitution which, at no time very vigorous, had of late years been much overtaxed; and, after many weeks of great weakness, he died at Kirkcaldy on the 17th of December 1648. In acknowledgment of his great public services, a sum of £1000 Scots was voted, though destined never to be paid, to his widow and children by the committee of estates. A simple tombstone, which had been erected to his memory in Kirkcaldy parish church, was in 1661 publicly broken at the cross by the hand of the common hangman, but was restored in 1746. Among the other works of Gillespie may be mentioned the *Treatise of Miscellany Questions, wherein many useful Questions and cases of Conscience are discussed and resolved*, published posthumously (1649); and *The Ark of the Testament opened*, being a treatise on the covenant of grace, also posthumous (2 vols., 1661–1677).

GILLESPIE, THOMAS (1708–1774), one of the founders of the Scottish "Presbytery of Relief," was born in the parish of Duddingston, Midlothian, in 1708. On the completion of his literary course at the university of Edinburgh, he for a short time attended a small theological seminary at Perth, and afterwards studied divinity under Dr Doddridge at Northampton, where he received ordination in January 1741. In August of the same year he was admitted minister of the parish of Carnock, Fife, the presbytery of Dunfermline agreeing, not only to sustain as valid the ordination he had received in England, but also to allow a qualification of his subscription to the church's doctrinal symbol, so far as it had reference to the sphere of the civil magistrate in matters of religion. Having on conscientious grounds persistently absented himself from the meetings of presbytery held for the purpose of ordaining an unacceptable presentee as minister of Inverkeithing, he was, after an unobtrusive but useful ministry of ten years, deposed for contumacy by the Assembly of 1752; he continued, however, to preach, first at Carnock, and afterwards in Dunfermline, where a large congregation gathered round him; but it was not until 1761, and after repeated efforts to obtain readmission to the church, that, in conjunction with Boston of Jedburgh and Collier of Colinsburgh, he formed a distinct communion under the name of The Presbytery of Relief,—relief, that is to say, "from the yoke of patronage and the tyranny of the church courts." He died on the 19th January 1774. His only literary efforts were an *Essay on the Continuation of Immediate Revelations in the Church*, and a *Treatise on Temptation*, characterized by considerable laboriousness and some ability. Both works appeared posthumously (1774). See *Lives of Fathers of the United Presbyterian Church* (Edin. 1849).

GILLIES, JOHN (1747–1836), the historian of ancient Greece, was born in 1747 at Brechin, in Forfarshire. He was educated at the university of Glasgow, where he greatly distinguished himself, and where, at the age of twenty, he officiated for a short time as substitute for the professor of Greek. Subsequently he received an engagement as tutor in the family of Lord Hopetoun, who afterwards conferred on him a pension for life. In 1784 he completed his principal work, the *History of Ancient Greece, its Colonies and Conquests*, which he published two years later in 2 vols. 4to. This work gives a clear and generally accurate account of the various states of Greece, and the progress of each in literature and the arts. The learning it displays is considerable, but its reflexions are generally somewhat trite, and the style is abrupt and frequently diffuse. It enjoyed, however, for some time a great popularity, and was translated into French and German. It was long a favourite text-book for schools, but is now completely superseded. On the death of Robertson, Gillies was appointed historiographer-royal of Scotland. In his old age he retired to Clapham, where he died 15th February 1836, in the 90th year of his age.

Of his other works, none of which are much read, the principal are—*View of the Reign of Frederick II. of Prussia, with a Parallel between that Prince and Philip II. of Macedon*, 1789; *Translation of Aristotle's Rhetoric, and of his Ethics and Politics*; and *History of the World from Alexander to Augustus*, in 2 vols., 1807.

GILLRAY, James (1757–1815), one of the most eminent of caricaturists, was born at Chelsea in 1757. His father, a native of Lanark, had served as a soldier, losing an arm at Fontenoy, and was admitted first as an inmate, and afterwards as an out-door pensioner, at Chelsea Hospital. Gillray commenced life by learning letter-engraving, in which he soon became an adept. This employment, however, proving irksome, he wandered about for a time with a company of strolling players. After a very checkered experience he returned to London, and was admitted a student in the Royal Academy, supporting himself by engraving, and probably issuing a considerable number of caricatures under fictitious names. Hogarth's works were the delight and study of his early years. Paddy on Horseback, which appeared in 1779, is the first caricature which is certainly his. Two caricatures on Rodney's naval victory, issued in 1782, were among the first of the memorable series of his political sketches. The name of Gillray's publisher and printseller, Miss Humphrey—whose shop was first at 227 Strand, then in New Bond Street, then in Old Bond Street, and finally in St James's Street—is inextricably associated with that of the caricaturist. Gillray lived with Miss (often called Mrs) Humphrey during all the period of his fame. It is believed that he several times thought of marrying her, and that on one occasion the pair were on their way to the church, when Gillray said:—"This is a foolish affair, methinks, Miss Humphrey. We live very comfortably together; we had better let well alone." There is no evidence, however, to support the stories which scandalmongers have invented about their relations. Gillray's plates were exposed in Humphrey's shop window, where eager crowds examined them. A number of his most trenchant satires are directed against George III., who, after examining some of Gillray's sketches, said, with characteristic ignorance and blindness to merit, "I don't understand these caricatures." Gillray revenged himself for this utterance by his splendid caricature entitled A Connoisseur Examining a Cooper, which he is doing by means of a candle on a "save-all"; so that the sketch satirizes at once the king's pretensions to knowledge of art and his miserly habits.

The excesses of the French Revolution made Gillray conservative; and he issued caricature after caricature ridiculing the French and Napoleon, and glorifying John Bull. He is not, however, to be thought of as a keen political adherent of either the Whig or the Tory party; he dealt his blows pretty freely all round. His last work, from a design by Bunbury, is entitled Interior of a Barber's Shop in Assize Time, and is dated 1811. While he was engaged on it, he became mad, although he had occasional intervals of sanity, which he employed on his last work. The approach of madness must have been hastened by his intemperate habits. Gillray died on the 1st of June 1815, and was buried in St James's churchyard, Piccadilly.

The times in which Gillray lived were peculiarly favourable to the growth of a great school of caricature. Party warfare was carried on with great vigour and not a little bitterness; and personalities were freely indulged in on both sides. Gillray's incomparable wit and humour, knowledge of life, fertility of resource, keen sense of the ludicrous, and beauty of execution, at once gave him the first place among caricaturists. He is honourably distinguished in the history of caricature by the fact that his sketches are real works of art. The ideas embodied in some of them are sublime and poetically magnificent in their intensity of meaning; while the coarseness by which others are disfigured is to be explained by the general freedom of treatment common in all intellectual departments in the eighteenth century. The historical value of Gillray's work has been recognized by accurate students of history. As has been well remarked: "Lord Stanhope has turned Gillray to account as a veracious reporter of speeches, as well as a suggestive illustrator of events." His contemporary political influence is borne witness to in a letter from Lord Bateman, dated November 3, 1798. "The Opposition," he writes to Gillray, "are as low as we can wish them. You have been of infinite service in lowering them, and making them ridiculous." Gillray's extraordinary industry may be inferred from the fact that nearly 1000 caricatures have been attributed to him; while some consider him the author of 1600 or 1700. He is invaluable to the student of English manners as well as to the political student. He attacks the social follies of the time with scathing satire; and nothing escapes his notice, not even a trifling change of fashion in dress. The great tact Gillray displays in hitting on the ludicrous side of any subject is only equalled by the exquisite finish of his sketches—the finest of which reach an epic grandeur and Miltonic sublimity of conception.

Gillray's caricatures are divided into two classes, the political series and the social. The political caricatures form really the best history extant of the latter part of the reign of George III. They were circulated not only over Britain but throughout Europe and exerted a powerful influence. In this series, George III., the Queen, the Prince of Wales, Fox, Pitt, Burke, and Napoleon are the most prominent figures. In 1788 appeared two fine caricatures by Gillray. Blood on Thunder fording the Red Sea represents Lord Thurlow carrying Warren Hastings through a sea of gore: Hastings looks very comfortable, and is carrying two large bags of money. Market-Day pictures the ministerialists of the time as horned cattle for sale. Among Gillray's best satires on the king are—Farmer George and his Wife, two companion plates, in one of which the king is toasting muffins for breakfast, and in the other the queen is frying sprats; The Anti-Saccharites, where the royal pair propose to dispense with sugar, to the great horror of the family; A Connoisseur Examining a Cooper; Temperance enjoying a Frugal Meal; Royal Affability; A Lesson in Apple Dumplings; and The Pigs Possessed. Among his other political caricatures may be mentioned—Britannia between Scylla and Charybdis, a picture in which Pitt, so often Gillray's butt, figures in a favourable light; The Bridal Night; The Apotheosis of Hoche, which concentrates the excesses of the French Revolution in one view; The Nursery with Britannia reposing in Peace; The First Kiss these Ten Years (1803), another satire on the peace, which is said to have greatly amused Napoleon; The Handwriting upon the Wall; The Confederated Coalition, a fling at the coalition which superseded the Addington Ministry; Uncorking Old Sherry; The Plum-Pudding in Danger; Making Decent, *i.e.*, Broad-bottomites getting into the Grand Costume; Comforts of a Bed of Roses; View of the Hustings in Covent Garden; Phaethon Alarmed; and Pandora opening her Box. The miscellaneous series of caricatures, although they have scarcely the historical importance of the political series, are more readily intelligible, and are even more amusing. Among the finest are—Shakespeare Sacrificed; Flemish Characters (two plates); Twopenny Whist; Oh! that this too solid flesh would melt; Sandwich Carrots; The Gout; Comfort to the Corns; Begone Dull Care; The Cow-Pock, which gives humorous expression to the popular dread of vaccination; Dilletanti Theatricals; and Harmony before Matrimony and Matrimonial Harmonics—two exceedingly good sketches in violent contrast to each other.

A selection of Gillray's works appeared in parts in 1818; but the first good edition was Thomas M'Lean's, which was published with a key, in 1830. A somewhat bitter attack, not only on Gillray's character, but even on his genius, appeared in the *Athenæum* for October 1, 1831, which was successfully refuted by J. Landseer in the *Athenæum* a fortnight later. In 1851 Henry G. Bohn put out an edition, from the original plates, in a handsome folio, the coarser sketches being published in a separate volume. For this edition Thomas Wright and R. H. Evans wrote a valuable commentary, which is a good history of the times embraced by the caricatures. The next edition, entitled *The Works of James Gillray, the Caricaturist: with the Story of his Life and Times*

(Chatto and Windus, 1874), was the work of Thomas Wright, and, by its popular exposition and narrative, introduced Gillray to a very large circle formerly ignorant of him. This edition, which is complete in one volume, contains two portraits of Gillray, and upwards of 400 illustrations. Mr J. J. Cartwright, in a letter to the *Academy* (Feb. 28, 1874), drew attention to the existence of a MS. volume, in the British Museum, containing letters to and from Gillray, and other illustrative documents. The extracts he gave were used in a valuable article in the *Quarterly Review* for April 1874. See also the *Academy* for Feb. 21 and May 16, 1874.

For a contemporary life of Gillray, see George Stanley's notice in his edition of *Bryan's Dictionary of Painters*. There is a good account of him in Wright's *History of Caricature and Grotesque in Literature and Art*, 1865. See also the article CARICATURE.

GILLYFLOWER, a popular name applied to various flowers, but principally to the clove, *Dianthus Caryophyllus*, of which the carnation is a cultivated variety, and to the stock, *Matthiola incana*, a well-known garden favourite. The word is sometimes written gilliflower or gilloflower, and is reputedly a corruption of July-flower, "so called from the month they blow in." Phillips, in his *Flora Historica*, remarks that Turner (1568) "calls it gelouer, to which he adds the word stock, as we would say gelouers that grow on a stem or stock, to distinguish them from the clove-gelouers and the wall-gelouers. Gerard, who succeeded Turner, and after him Parkinson, calls it gilloflower, and thus it travelled from its original orthography until it was called July-flower by those who knew not whence it was derived." Dr Prior, in his useful volume on the *Popular Names of British Plants*, very distinctly shows the origin of the name. He remarks that it was "formerly spelt gyllofer and gilofre with the *o* long, from the French *giroflée*, Italian *garofalo* (M. Lat. *gariofilum*) corrupted from the Latin *Caryophyllum*, and referring to the spicy odour of the flower, which seems to have been used in flavouring wine and other liquors to replace the more costly clove of India. The name was originally given in Italy to plants of the pink tribe, especially the carnation, but has in England been transferred of late years to several cruciferous plants." The gillyflower of Chaucer and Spenser and Shakespeare was, as in Italy, *Dianthus Caryophyllus*; that of later writers and of gardeners *Mathiola*. Much of the confusion in the names of plants has doubtless arisen from the vague use of the French terms *giroflée*, *oeillet*, and *violette*, which were all applied to flowers of the pink tribe, but in England were subsequently extended and finally restricted to very different plants. The use made of the flowers to impart a spicy flavour to ale and wine is alluded to by Chaucer who writes—

> "And many a clove gilofre
> To put in ale";

also by Spenser, who refers to them by the name of sops in wine, which was applied in consequence of their being steeped in the liquor. In both these cases, however, it is the clove-gillyflower which is intended, as it is also in the passage from Gerard, in which he states that the conserve made of the flowers with sugar "is exceeding cordiall, and wonderfully above measure doth comfort the heart, being eaten now and then." The principal other plants which bear the name are the wallflower, *Cheiranthus Cheiri*, called wall-gillyflower in old books; the dame's violet, *Hesperis matronalis*, called variously the queen's, the rogue's, and the winter gillyflower; the ragged robin, *Lychnis flos cuculi*, called marsh-gillyflower; the water-violet, *Hottonia palustris*, called water-gillyflower; and the thrift, *Armeria vulgaris*, called sea-gillyflower. As a separate designation it has in modern times been chiefly applied to the *Mathiola* or stock, but it is now very little used.

GILPIN, BERNARD (1517–1583), rector of Houghton-le-Spring, distinguished by the unusual way in which he carried out his conception of the duties of a Christian pastor, was descended from a Westmoreland family, and was born at Kentmere in 1517. At Oxford he first adhered to the conservative side, and defended the doctrines of the church against Hooper; but his confidence was somewhat shaken by another public disputation which he had with Peter Martyr. In 1552 he preached before King Edward VI. a sermon on sacrilege, which was duly published, and displays the high ideal which even then he had formed of the clerical office; and about the same time he was presented to the vicarage of Norton, in the diocese of Durham, and obtained a licence, through William Cecil, as a general preacher throughout the kingdom as long as the king lived. Instead of settling down in England, however, he resigned his vicarage, and went abroad to pursue his theological investigations, and if possible satisfy his mind on some disputed matters. He carried out this intention at Louvain, Antwerp, and Paris; and from a letter of his own, dated Louvain, 1554, we get a glimpse of the quiet student rejoicing in an "excellent library belonging to a monastery of Minorites." Returning to England towards the close of Queen Mary's reign, he was invested by his uncle, Dr Tonstall, bishop of Durham, with the archdeaconry of Durham, to which the rectory of Effington was annexed. The freedom of his attacks on the vices, and especially the clerical vices, of his times excited hostility against him, and he was formally brought before the bishop on a charge consisting of thirteen articles. Tonstall, however, not only dismissed the case, but presented the offender with the rich living of Houghton-le-Spring; and when the accusation was again brought forward, he again protected him. Enraged at this defeat, Gilpin's enemies laid their complaint before Dr Bonner, bishop of London, and he immediately gave orders for his apprehension. Upon this Gilpin prepared for martyrdom; and, having ordered his house-steward to provide him with a long garment, that he might "goe the more comely to the stake," he set out for London. Providentially, however, he broke his leg on the journey, and his arrival was thus delayed till the news of Queen Mary's death freed him from further danger. He at once returned to Houghton, and there he continued to labour till his death in 1583. When the Roman Catholic bishops were deprived, he was offered the see of Carlisle; but he declined the honour. At Houghton his course of life was a ceaseless round of benevolent activity. His hospitable manner of living was the admiration of all. In his household, he spent "every fortnight 40 bushels of corn, 20 bushels of malt, and an ox, besides a proportional quantity of other kinds of provisions." Strangers and travellers found a ready reception; and even their horses were treated with so much care that it was humorously said that, if one were turned loose in any part of the country, it would immediately make its way to the rector of Houghton. Every Sunday from Michaelmas till Easter was a public day with Gilpin. For the reception of his parishioners he had three tables well covered,—one for gentlemen, the second for husbandmen, the third for day-labourers; and this piece of hospitality he never omitted, even when losses or scarcity made its continuance difficult. He built and endowed a grammar-school at a cost of upwards of £500, educated and maintained a large number of poor children at his own charge, and provided the more promising pupils with means of studying at the universities. So many young people, indeed, flocked to his school that there was not accommodation for them in Houghton, and he had to fit up part of his house as a boarding establishment. Grieved at the ignorance and superstition which the remissness of the clergy permitted to flourish in the neighbouring parishes, he used every year to visit the most neglected parts of Northumberland, Yorkshire, Cheshire, Westmoreland, and Cumberland; and that his own flock might not suffer, he was at the expense of a constant assistant. Among his parishioners he was looked up to as a judge, and did great service in preventing law-suits amongst them. If an industrious man suffered a loss, he delighted to make it good; if the harvest was bad, he was liberal in the remission of tithes. And all this he was enabled to do because his frugality was as great as his generosity; for his rectory was worth no more than £400 a year. The boldness which he could display at need is well illustrated by his action in regard to duelling. Finding one day a challenge-glove stuck up on the door of a church where he was to preach, he took it down with his own hand, and proceeded to the pulpit to inveigh against the unchristian custom.

A life of Bernard Gilpin, written by George Carleton, bishop of Chichester, who had been a pupil of Gilpin's at Houghton, will be found in Bates's *Vitæ Selectorum aliquot Virorum*, &c., London, 1681. A translation of this sketch by William Freake, minister, was published at London, 1629; and in 1852 it was reprinted in Glasgow, with an introductory essay by Edward Irving. It forms one of the lives in Christopher Wordsworth's *Ecclesiastical Biography* (vol. iii., 4th edit.), having been compared with Carleton's Latin text. Another biography of Gilpin, which, however, adds little to Bishop Carleton's, was written by William Gilpin, M.A., prebendary of Ailsbury, London, 1753, and 1854.

GILPIN, William (1724–1804), author of several works on the scenery of Great Britain, was born at Carlisle in 1724. He was educated at Oxford university, and, after holding for some time a small curacy in the north of England, established a school for sons of gentlemen at Cheam in Surrey. Among his pupils were Viscount Sidmouth, Lord Bexley, and Mitford, the author of the *History of Greece*, the last of whom presented him, when he had resolved to retire from teaching, with the living of Boldre, near the New Forest, Hampshire. Gilpin died there, April 5, 1804. He is author of a *Life of Bernard Gilpin*, several miscellaneous religious publications, and lives of a number of the Reformers, but is chiefly known for his works on the scenery of various parts of England and Scotland, illustrated by tasteful engravings in aquatint executed by himself.

The principal of these works are—*The River Wye and Southern Districts of Wales*, 1782; *The Lake Country*, 1789; *Observations on Picturesque Beauty made in the year* 1776 *in several parts of Great Britain, particularly the Highlands of Scotland*, 1778; two corresponding volumes on the *Lakes of Cumberland and Westmoreland*; *Forest Scenery*, 1791; *Three Essays on Picturesque Beauty, with a Poem on Landscape Painting*, 1782; *Essays on Prints and Early Engravings*; *Western Parts of England and Isle of Wight*, 1798; and *The Coasts of Hampshire, Sussex, and Kent*, published posthumously.

GIL VICENTE. See Vicente, Gil.

GIN, the name commonly given to an aromatized spirit for drinking, varieties of which are also known as Geneva, Hollands, and Schiedam. Gin is an abbreviation of Geneva, both being primarily derived from the French *genièvre* (juniper), from the fact that the characteristic flavouring ingredient of the spirit is juniper berries. Gin was originally and is still largely a Dutch compounded liquor, but it has long been a favourite stimulant beverage with the lower orders in London and other large English towns; and it is manufactured on a great scale by English rectifiers. As each separate distiller varies to some extent the materials and proportions of ingredients used in the preparation of gin, the varieties of the beverage are numerous; but generally a clear distinction exists between Hollands or Dutch gin and English gin. In the manufacture of Hollands a mash is prepared consisting of say 112 ℔ of malted bere or bigg and 228 ℔ of rye meal, with 460 gallons of water, at 162° Fahr. After infusion a proportion of cold water is added; and when the heat is reduced to about 80°, the whole, about 500 gallons, is run into the fermenting vat, to which about half a gallon of yeast is added. Fermentation speedily ensues, and in about two days the attenuation is complete, although at this stage nearly one-third of the saccharine matter in the liquor is undecomposed. The special features of the fermentation are the small proportion of yeast employed and the imperfect attenuation of the worts. The wash so obtained is distilled, and the resulting low wine is redistilled, with the addition of juniper berries and a little salt, sometimes with the addition of hops. Dutch gins vary much one from another, but generally they are much purer and mellower liquors than the more highly flavoured and frequently adulterated British gins. Good qualities of the latter have as their basis plain grain spirit from the ordinary whisky distilleries, the following being an example of a mixture for distillation :—

300 gallons of low wines.	47 ℔ crushed almond cake.
650 ,, rectified spirit	2 ,, angelica root.
95 ℔ juniper berries.	6 ,, powdered liquorice.
95 ,, corianders.	

There is, however, much variation in the ingredients employed, and several other flavouring substances—notably cardamoms and cassia or cinnamon—are freely employed. A kind of gin is also prepared by mixing proportions of essential oils by agitation with plain spirits without any redistillation, and much inferior liquor is said to be made with oil of turpentine and aromatic substances without the use of juniper berries at all. To prevent the cloudiness or turbidity that would arise in these inferior beverages when mixed with water, they are fined with alum, potassium carbonate, acetate of lead, or sulphate of zinc. To give factitious pungency and mellowness to such drinks, grains of paradise and Cayenne pepper are freely used, and the absence of spirit is also covered by the use of sugar. What is known as cordial gin is usually more highly aromatized than the other varieties, and sweetened so that it really ought to be classed as a coarse liqueur. In thirty-eight specimens of gin examined by Dr Hassall, the alcoholic strength of which ranged from 22·35 to 48·80 degrees, and the sugar present varied between 2·43 and 9·38 per cent., seven were found to contain Cayenne pepper, two had cinnamon or cassia oil, and nearly all contained sulphates. From the fact that the essential oil of juniper is the most powerful of all diuretics, gin is frequently prescribed in diseases of the urinary organs. Its beneficial effects in such cases is most marked; but, on the other hand, the grossly sophisticated liquors which are largely consumed under the name of gin are most detrimental in their effects. In the early part of the 18th century gin-shops multiplied with great rapidity in London, and the use of the beverage increased to an extent so demoralizing that retailers actually exhibited placards in their windows intimating that there people might get drunk for 1d., and that clean straw in comfortable cellars would be provided for customers. The legislature was obliged to interfere in order to try to curb the tide of debauchery, and what is known as the Gin Act was passed in 1736, under the provisions of which, dealers were prohibited from selling gin and other spirits in quantities less than 2 gallons without a licence of £50, and an excise duty of 20s. was charged on each gallon. The operation of the Act, however, gave rise to much confusion, to illicit trade, and to gin riots, and after a lapse of seven years the statute was repealed.

GINCKELL, Godart van (1640–1703), first earl of Athlone, general, was born in Guelderland about 1630 or 1640. He was the head of an ancient and noble family, and bore the title of Baron van Reede. In his youth he entered the Dutch army, and in 1688 he followed William prince of Orange in his expedition to England. In the following year he distinguished himself by a memorable exploit—the pursuit, defeat, and capture of the Scottish regiment which had mutinied at Ipswich, and was marching across the fens to their native land. It was the alarm excited by this mutiny that facilitated the passing of the first Mutiny Act. In 1690 Ginckell accompanied William III.

to Ireland, and commanded a body of Dutch cavalry at the battle of the Boyne. On the king's return to England General Ginckell was entrusted with the conduct of the war. He took the field in the spring of 1691, and established his headquarters at Mullingar. Among those who held a command under him was the marquis of Ruvigny, the recognized chief of the Huguenot refugees. Early in June Ginckell took the fortress of Ballymore, capturing the whole garrison of 1000 men. The English lost only 8 men. After reconstructing the fortifications ot Ballymore, the army marched to Athlone, then one of the most important of the fortified towns of Ireland. The Irish defenders of the place were commanded by a distinguished French general, Saint-Ruth. The firing began on June 19th, and on the 30th the town was stormed, the Irish army retreating towards Galway, and taking up their position at Aghrim. Having strengthened the fortifications of Athlone and left a garrison there, Ginckell led the English, on July 12th, to Aghrim. An immediate attack was resolved on, and, after a severe and at one time doubtful contest, the crisis was precipitated by the fall of Saint-Ruth, and the disorganized Irish were defeated and fled. A horrible slaughter of the Irish followed the struggle, and 4000 corpses were left unburied on the field, besides a multitude of others that lay along the line of the retreat. Galway next capitulated, its garrison being permitted to retire to Limerick. There the viceroy, Tyrconnel, was in command of a large force, but his sudden death early in August left the command in the hands of General Sarsfield and the Frenchman D'Usson. The English army came in sight of the town on the day of Tyrconnel's death, and the bombardment was immediately begun. Ginckell, by a bold device, crossed the Shannon and captured the camp of the Irish cavalry. A few days later he stormed the fort on Thomond Bridge, and after difficult negotiations a capitulation was signed, the terms of which were divided into a civil and a military treaty. Thus was completed the conquest or pacification of Ireland, and the services of the Dutch general were amply recognized and rewarded. He received the formal thanks of the House of Commons, and was created by the king first earl of Athlone and baron of Aghrim. The immense forfeited estates of the earl of Limerick were given to him, but the grant was a few years later revoked by the English parliament. The earl continued to serve in the English army, and accompanied the king to the Continent in 1693. He fought at Landen, and assisted in destroying the French magazine at Givet. In 1702 he took command of the Dutch serving under the duke of Marlborough. He died at Utrecht, February 10, 1705. On the death of the ninth earl without issue in 1844, the title became extinct.

GINGER (French, *Gingembre*; German, *Ingwer*), the rhizome or underground stem of *Zingiber officinale*, Roscoe, a perennial reed-like plant growing from 3 to 4 feet high. The flowers and leaves are borne on separate stems, those of the former being shorter than those of the latter, and averaging from 6 to 12 inches. The flowers themselves are borne at the apex of the stems in dense ovate oblong cone-like spikes from 2 to 3 inches long, composed of obtuse strongly-imbricated bracts with membranous margins, each bract enclosing a single small sessile flower. The leaves are alternate, bright green, smooth, tapering at both ends, with very short petioles. The plant, though unknown in a wild state, is considered with very good reason to be a native of the warmer parts of Asia, over which it has been cultivated from an early period, and the rhizome imported into England. From Asia the plant has spread into the West Indies, South America, western tropical Africa, and Australia.

The use of ginger as a spice has been known from very early times; it was supposed by the Greeks and Romans to be a product of southern Arabia, and was received by them by way of the Red Sea; in India it has also been known from a very remote period, the Greek and Latin names being derived from the Sanskrit. Flückiger and Hanbury, in their *Pharmacographia*, give the following notes on the history of ginger. On the authority of Vincent's *Commerce and Navigation of the Ancients*, it is stated that in the list of imports from the Red Sea into Alexandria, which in the second century of our era were there liable to the Roman fiscal duty, ginger occurs among other Indian spices. So frequent is the mention of ginger in similar lists during the Middle Ages, that it evidently constituted an important item in the commerce between Europe and the East. It thus appears in the tariff of duties levied at Acre in Palestine about 1173, in that of Barcelona in 1221, Marseilles in 1228, and Paris in 1296. Ginger seems to have been well known in England even before the Norman Conquest, being often referred to in the Anglo-Saxon leech-books of the 11th century. It was very common in the 13th and 14th centuries, ranking next in value to pepper, which was then the commonest of all spices, and costing on an average about 1s. 7d. per lb. Three kinds of ginger were known among the merchants of Italy about the middle of the 14th century:—(1) *Belledi* or *Baladi*, an Arabic name, which, as applied to ginger, would signify country or wild, and denotes common ginger; (2) *Colombino*, which refers to Columbum, Kolam, or Quilon, a port in Travancore, frequently mentioned in the Middle Ages; and (3) *Micchino*, a name which denoted that the spice had been brought from or by way of Mecca. Marco Polo seems to have seen the ginger plant both in India and China between 1280 and 1290. John of Montecorvino, a missionary friar who visited India about 1292, gives a description of the plant, and refers to the fact of the root being dug up and transported. Nicolo di Conto, a Venetian merchant in the early part of the 15th century, also describes the plant and the collection of the root, as seen by him in India. Though the Venetians received ginger by way of Egypt, some of the superior kinds were taken from India overland by the Black Sea. The spice is said to have been introduced into America by Francisco de Mendoça, who took it from the East Indies to New Spain. It seems to have been shipped for commercial purposes from San Domingo as early as 1585, and from Barbados in 1654; so early as 1547 considerable quantities were sent from the West Indies to Spain.

Ginger is known in commerce in two distinct forms, termed respectively coated and uncoated ginger, as having or wanting the epidermis. For the first, the pieces, which are called "races" or "hands," from their irregular palmate form, are washed and simply dried in the sun. In this form ginger presents a brown, more or less irregularly wrinkled or striated surface, and when broken shows a dark brownish fracture; hard, and sometimes horny and resinous. To produce uncoated ginger the rhizomes are washed, scraped, and sun-dried, and are often subjected to a system of bleaching, either from the fumes of burning sulphur or by immersion for a short time in a solution of chlorinated lime. The whitewashed appearance that much of the ginger has, as seen in the shops, is due to the fact of its being washed in whiting and water, or even coated with sulphate of lime. This artificial coating is supposed by some to give the ginger a better appearance; it often, however, covers an inferior quality, and can readily be detected by the ease with which it rubs off, or by its leaving a white powdery substance at the bottom of the jar in which it is contained. Uncoated ginger, as seen in trade, varies from single joints an inch or less in length to flattish irregularly branched pieces of several joints, the "races" or "hands," and from 3 to 4 inches long; each branch has a depression at its summit showing the former attachment of a leafy stem. The colour, when not whitewashed, is a pale buff; it is somewhat rough or fibrous, breaking with a short mealy fracture, and presenting on the surfaces of the broken parts numerous short bristly fibres.

The British market derives its supply of ginger from various parts of the world. The principal sorts, however, or those most commonly found in commerce, are Jamaica, Cochin, Bengal, and African, though each of these in its turn has its several varieties and qualities. The best or most valued kind of all is the Jamaica, and next to it the Cochin. For ordinary purposes uncoated ginger is considered the best; the largest and finest pieces, of a pale buff colour both outside and inside, and cutting softly and evenly, are considered the most valuable. The chief sources of supply are the East and West Indies, Sierra Leone, and Egypt.

The principal constituents of ginger are starch, volatile oil (to which the characteristic odour of the spice is due), and resin (to which is attributed its pungency). Its chief use is as a condiment or spice, but as an aromatic and stomachic medicine it is also used internally. "The stimulant, aromatic, and carminative properties render it of much value in atonic dyspepsia, especially if accompanied with much flatulence, and as an adjunct to purgative medicines to correct griping." Externally applied as a rubefacient, it has been found to relieve headache and toothache. The rhizomes, collected in a young green state, washed, scraped, and preserved in syrup, form a delicious preserve, which is largely exported both from the West Indies and from China. Cut up into pieces like lozenges, and preserved in sugar, ginger also forms a very agreeable sweetmeat. (J. R. J.)

GINGHAM is a woven cotton fabric, of a close stoutish texture, the distinguishing characteristics of which are that it is a plain (*i.e.*, untwilled) cloth, woven into yarn-dyed stripes or checks of two or more colours. In some cases as many as seven or eight colours are introduced in the warp and weft of a gingham; but no patterns are made that cannot be woven in a common plain loom. Gingham was originally an Indian product, but its manufacture was early introduced into the Lancashire and Glasgow districts; and during the first half of the present century the trade formed an important feature in the textile industries of the latter locality—the demand for the fabric coming chiefly from the United States and the West Indies. The trade distinction of gingham is now to a large extent superseded by other terms.

GINGUENÉ, Pierre Louis (1748-1815), the author of the *Histoire littéraire d'Italie*, was born on 25th April 1748 at Rennes in Brittany. He was educated at a Jesuit college in his native town, but he owed most of his literary tastes and accomplishments to his father, who early imbued him with a love of music and the languages of England and Italy. His first literary effort, a poetical piece entitled *Confession de Zulmé*, brought him into notice among the literary coteries of Paris, from the circumstance that, when published at first anonymously, it was claimed by six or seven different authors. Though the value of the piece is not very great, it is Ginguené's poetical *chef d'œuvre*. The part he took as a defender of Piccini against the partisans of Gluck made him still more widely known; and the reputation he acquired as a promising political writer secured employment for him in the public service in 1780. He hailed, however, the first symptoms of the Revolution, joined Rabaut, St Étienne, and Cerutti in producing the *Feuille Villageoise*, and celebrated in an indifferent ode the opening of the states-general. A more creditable effort was his *Lettres sur les Confessions de J. J. Rousseau*, 1791, in which he defended to the uttermost the life and principles of his author. Refusing to countenance the excesses of the Revolution, he was thrown into prison, whence he only escaped with life by the downfall of Robespierre. Some time after his liberation he assisted, as director-general of the "commission executive de l'instruction publique," in reorganizing the system of public instruction. When the Institute was established in 1796, he was elected a member of the division called the academy of moral and political sciences. In 1798 the directory appointed him minister-plenipotentiary to the king of Sardinia, whose ruin, begun by force of arms, they had determined to complete by treachery. A less promising tool could not have been found for carrying out their design. After fulfilling his duties for seven months, very little to the satisfaction of his employers, Ginguené retired to his country house of St Prix, in the valley of Montmorency, and there he prosecuted his literary labours till the Revolution of the 18th Brumaire called him once more before the world. He was appointed a member of the tribunate, which made a show of maintaining democratic opposition to the first consul; but Napoleon, finding that he was not sufficiently tractable, had him expelled at the first "purge," and Ginguené once more joyfully returned to his favourite pursuits. These were now more than ever a necessity of life to him, as his only other source of income was the small endowment attached to his seat in the Institute. Fortunately he was nominated one of the commission charged to continue the literary history of France, which had been brought down by the Benedictines to about the close of the 12th century; and the three volumes of this series which appeared in 1814, 1817, and 1820 are for the most part the result of his labours. But the work by which Ginguené will be longest remembered is his *Histoire littéraire d'Italie* (9 vols. 8vo, 1811-1819), to which he was putting the finishing touches when he was cut off by a painful disease, November 16, 1815. The first six volumes appeared before their author's death; the seventh is entirely his except a few pages; and of the eighth and ninth he wrote about a half, the other half being composed by Salfi, and revised by Daunou. The success of the history in Italy was astonishing: editions were published in various parts of the peninsula; with notes and comments by the best scholars, and three translations appeared respectively at Milan, Naples, and Venice.

Ginguené was originally led to make Italian literature his special study by finding how ill that subject was understood, and how little it was appreciated, by his countrymen. In the composition of his history he was guided for the most part by the great work of the Jesuit Tiraboschi, but he avoids the prejudices and party views of his model. His own style, though occasionally forcible and eloquent, is not unfrequently too tame for the subject, and he often trespasses on his reader's patience by over-minuteness of detail; but these faults are more than atoned for by fine critical discernment, impartiality, and freedom. On the score of accuracy, indeed, Ginguené sometimes offends, but seldom in matters of great moment; and his slips are such as are almost inevitable to a foreigner, who could hardly be said to have even seen the country whose literary history he relates. The Italians felt grateful to him for having placed their literature in its proper light, and readily forgave the excessive eulogies which he passed on many of their writers, whose very names had been forgotten in their own country.

During the latter years of his life Ginguené wrote extensively for the press, and he edited the *Décade philosophique, politique, et littéraire*, till it was suppressed by Napoleon in 1807. He contributed largely to the *Biographie universelle*, the *Mercure de France*, and the *Encyclopédie méthodique*; and he edited the works of Chamfort and of Lebrun. Among his minor productions are an opera, *Pomponin ou le Tuteur-mystifié*, 1777; *La Satire des Satires*, 1778; *De l'autorité de Rabelais dans la révolution présente*, 1791; *De M. Neckar*, 1795; *Fables inédites*, 1814. See "Éloge de Ginguené," by Dacier, in the *Mémoires de l'Institut*, tom. vii.; "Discours" by M. Daunou, prefixed to the 2d edit. of the *Hist. litt. d'Italie*; D. J. Garat, *Notice sur la vie et les ouvrages de P. L. Guingené*, Paris, 1817.

GINSENG, the root of a species of *Panax* (*P. Ginseng*, Meyer), belonging to the natural order *Araliaceæ*, is a very celebrated Chinese medicine. The demand is so great that many other roots are substituted for it, notably that of *Panax quinquefolium*, Linn., distinguished as American ginseng, and imported from the United States. At one time the ginseng obtained from Manchuria was considered to be the finest quality, and in consequence became so scarce that an imperial edict was issued prohibiting its collection. That prepared in Corea is now the most esteemed variety. The root of the wild plant is preferred to that of cultivated ginseng, and the older the plant the better is the quality of the root considered to be. Lockhart states that all the ginseng collected in the Chinese empire is imperial property, and is sold to those who have the privilege of dealing in it at its weight in gold. Great care is taken in the preparation of the drug. The account given by Kœmpfer of the preparation of nindsin, the root of *Sium ninsi*, Thunb., in the Corea, will give a good idea of the preparation of ginseng, ninsi being a similar drug of supposed weaker virtue, obtained from a different plant, and often confounded with ginseng. "In the beginning of winter nearly all the population of Sjansai turn out to collect the root, and make preparations for sleeping in the fields. The root, when collected, is macerated for three days in fresh water, or water in which rice has been boiled twice; it is then suspended in a closed vessel over the fire, and afterwards dried, until from the base to the middle it assumes a hard, resinous, and translucent appearance, which is considered a proof of its good quality."

Ginseng of good quality generally occurs in hard, rather brittle, translucent pieces, about the size of the little finger, and varying in length from 2 to 4 inches. The taste is mucilaginous, sweetish, and slightly bitter and aromatic. The root is frequently forked, and it is probably owing to this circumstance that medicinal properties were in the first place attributed to it, its resemblance to the body of a man being supposed to indicate that it could restore virile power to the aged and impotent. In price it varies from 6 or 12 dollars to the enormous sum of 300 or 400 dollars an ounce. Root of this quality can of course only be purchased by the most wealthy, and the greatest care is taken of such pieces by the vendors.

Lockhart gives a graphic description of a visit to a ginseng merchant. Opening the outer box, the merchant removed several paper parcels which appeared to fill the box, but under them was a second box, or perhaps two small boxes, which, when taken out, showed the bottom of the large box and all the intervening space filled with more paper parcels. These parcels, he said, 'contained quicklime, for the purpose of absorbing any moisture and keeping the boxes quite dry, the lime being packed in paper for the sake of cleanliness. The smaller box, which held the ginseng, was lined with sheet-lead; the ginseng further enclosed in silk wrappers was kept in little silken-covered boxes. Taking up a piece, he would request his visitor not to breathe upon it, nor handle it; he would dilate upon the many merits of the drug and the cures it had effected. The cover of the root, according to its quality, was silk, either embroidered or plain, cotton cloth, or paper." In China the ginseng is often sent to friends as a valuable present; in such cases, "accompanying the medicine is usually given a small, beautifully-finished double kettle, in which the ginseng is prepared as follows. The inner kettle is made of silver, and between this and the outside vessel, which is a copper jacket, is a small space for holding water. The silver kettle, which fits on a ring near the top of the outer covering, has a cup-like cover in which rice is placed with a little water; the ginseng is put in the inner vessel with water, a cover is placed over the whole, and the apparatus is put on the fire. When the rice in the cover is sufficiently cooked, the medicine is ready, and is then eaten by the patient, who drinks the ginseng tea at the same time." The dose of the root is from 60 to 90 grains. During the use of the drug tea-drinking is forbidden for at least a month, but no other change is made in the diet. It is taken in the morning before breakfast, from three to eight days together, and sometimes it is taken in the evening before going to bed.

At one time it was proposed by some Russians to establish ginseng plantations, with the view of growing the root as an important article of trade with China. Ginseng is also cultivated in Japan, having been introduced from Corea; but, although it grows more luxuriantly there than in its native country, the root is considered to be much less active. This may be due to the fact that, while in the mountains of Corea the root is perennial, in Japan the plant runs to seed the first year, and becomes annual. Europeans have hitherto failed to discover any remarkable properties in the drug. Dr Porter Smith, however, mentions having seen some cases in which life appeared to be prolonged for a time by its use; and M. Maack states that one of the Cossacks of his party, having chopped off a finger accidentally with an axe, applied ointment made from ginseng, and the wound healed rapidly. Its properties, which may be likened to those of the mandrake of Scripture, are perhaps dependent in great measure upon the faith of the patient.

GIOBERTI, VINCENZO (1801–1852) the ablest philosophical writer of modern Italy, and one of the most interesting actors in the recent history of the country, was born in Turin on the 5th April 1801, the only child of parents in moderate circumstances there, and was educated by the fathers of the Oratory with a view to the priesthood, to which he was ordained in 1825. His study of the ancient philosophers, and the fathers and doctors of the church, occupied him for years, during which he led a very retired life; gradually, however, he took more and more interest in the affairs of his country, as well as in the literature of the day, entering warmly into the new ideas then beginning to be discussed in connexion with politics. The freedom of Italy from foreign masters became his ruling motive in life, and this freedom in his conception of it was an emancipation, not only from armed masters, but from modes of thought alien to its genius, and detrimental to its European authority. This authority was in his mind connected with papal supremacy, though in a way quite novel—intellectual rather than political. One must remember this in considering nearly all his writings, and also in estimating his position, both in relation to the ruling clerical party—the Jesuits—and also in relation to the politics of the court of Piedmont after the accession of Charles Albert in 1831. He was now noticed by the king and made one of his chaplains. His popularity and private influence, however, were reasons enough for the court party to mark him for exile; he was not one of them, and could not be depended on. Knowing this, he in 1833 asked permission to resign his chaplaincy, but was suddenly arrested while walking with a friend in the public gardens, and, after an imprisonment of four months, sent out of the country in the escort of a carabineer, under decree of banishment. This was done without trial or process—simply, it would appear, by private influence of the clerical party, his name being at the same time struck off the list of theological doctors of the college of Turin. With broken fortunes and ruined plans Gioberti arrived in Paris in the beginning of October 1833. A year later he went to Brussels, where he spent the best period of his life from that time to 1845, teaching philosophy, and assisting in the work of a college superintended by his friend Gaggia, yet finding time, by rising early and sitting late, to write many works of great importance in philosophical inquiry, but bearing a special relation to his country and its position. His spirits never returned to him, however, as his whole being was bound up with the welfare of his native country. An amnesty having been passed by Charles Albert in 1846, Gioberti had liberty to return to Italy, just as Pius IX. in the beginning of his pontificate manifested strongly liberal sympathies. Gioberti took no step, however, till the end of 1847, and did not return to his native land till after certain negotiations, and the public expression of popular enthusiasm in his favour. On his entrance into Turin, 29th April 1848, there was a general ouburst of this enthusiasm, mainly caused, it appears, by his unjust banishment and by the large circulation of his books, especially the *Gesuita Moderno.* The city was illuminated; deputations waited upon him; the king made him senator, but, having been returned both by Turin and by Genoa as depnty to the assembly of representatives, now first meeting under the new constitution, he elected to sit in the lower chamber, for his native town. Previous to the opening he made a tour in various provinces, beginning at Milan and including Rome, where he had three interviews with the liberal pope, who at that moment seemed to be the representative of his ideal imagined in the work *Del Primato morale e civile*, which Pius had read and admired. While he was engaged in this tour, constantly addressing the people publicly, the chamber met and elected him president. In the same parliament sat Azeglio, Cavour, and other liberals, and Balbo was prime minister. At the close of the same eventful year, a new ministry was formed, headed by Gioberti; but with the accession of Victor Emmanuel in March 1849 his active life came to an end. For a short time indeed he held a seat in the cabinet, though without a portfolio; but an irreconcilable disagreement soon followed, and his removal from Turin was accomplished by his appointment on a mission to Paris, whence he never returned. There, refusing the pension which had been offered him and all ecclesiastical preferment, he lived frugally, and spent his days and nights as at Brussels in literary labour. Many other exiles gathered about him, and the Marquis Pallavicino became his bosom friend. He died suddenly, of apoplexy, on the 26th October 1852.

Gioberti's writings are more important than his political career. In the general history of European philosophy they stand apart. As the speculations of Rosmini, against which he wrote, have been called the last link added to mediæval thought, so the system of Gioberti, more especially in his greater and earlier works, is unrelated to other modern schools of thought. It shows a harmony with the Roman Catholic faith which caused Cousin to make the superficial criticism that "Italian philosophy was still in the bonds of theology." Method is with him a synthetic, subjective, and psychological instrument. He reconstructs, as he declares, ontology, and begins with the "ideal formula," "the Ens creates ex nihilo the existent." He is in some respects a Platonist, and transplants certain dogmata from the ancient idealist. He identifies religion with civilization, and arrives in his treatise *Del Primato morale e civile degli Italiani* at the conclusion that the church is the axis on which the well-being of human life revolves. His later works, the *Rinnovamento* and the *Protologia*, are sometimes thought to be less affirmative in this matter, and there is a division in opinion among his critics how far he shifted his ground under the influence of events before he died. His first work, written when he was thirty-seven, had a personal reason for its existence. A young fellow-exile and friend, Paolo Pallia, having many doubts and misgivings as to the reality of revelation and a future life, Gioberti at once set to work with *La Teorica del Sovrannaturale*, which was his first publication (2 vols., 1838). After this the enormous labours of his pen made up for the lateness of his commencement as an author. Philosophical treatises in two or three volumes, which would occupy, generally speaking, half a lifetime, followed in rapid succession, each one being a corollary to the last. The *Teorica* was followed by *Introduzione allo Studio della Filosofia* in three volumes, passing through the press in 1839-40. In this work he states his reasons for requiring a new method and new terminology. Here he brings out the doctrine that religion is the direct expression of the *idea* in this life, and is one with true civilization in history. Civilization is a conditioned mediate tendency to perfection, to which religion is the final completion if carried out; it is the end of the second cycle expressed by the second formula, the Ens redeems existences. Essays on the lighter and more popular subjects, *Del Bello* and *Del Buono*, followed the *Introduction*, but were not published as a volume till 1846, having first appeared in connexion with the writings of other authors. *Del Primato morale e civile degli Italiani* and the *Prolegomeni* to the same, and soon afterwards his triumphant exposure of the Jesuits, *Il Gesuita Moderno*, in five successive volumes (eight volumes altogether), began to be issued in 1843, and no doubt hastened the transfer of rule from clerical to civil hands. It was, as has been seen, the popularity of these semi-political works, heightened by other occasional political articles which fill two volumes, and by his *Rinnovamento civile d'Italia*, that caused Gioberti to be welcomed with such enthusiasm on his return to his native country All these works were perfectly orthodox, and aided in drawing the liberal clergy into the movement which has resulted since his time in the unification of Italy. The Jesuits, however, closed round the pope more firmly after his return to Rome, and in the end Gioberti's writings were placed on the *Index*, although with no unfavourable result as far as their influence is concerned. The remainder of his works need not be particularized, although they give his mature views on many points, especially *La Filosofia della Rivelazione* and the *Protologia*. The entire writings of Gioberti, including those left in manuscript, have been carefully edited by Giuseppe Massari in thirty-six volumes.

See Massari, *Ricordi Biografici e Carteggio* (Naples, 1863); *Lettere di Vincenzo Gioberti e Giorgio Pallavicino* (Milan, 1875); Rev. C. B. Smyth, *Christian Metaphysics* (London, 1851).

GIOJA, Melchior (1767-1828), a distinguished Italian writer on philosophy and political economy, was born at Piacenza in 1767. He was educated at the celebrated college of St Lazare in his native town, and showed special fondness for the philosophical sciences. Apparently he had been destined for the church, but he seems to have given up at an early period the study of theology, and after completing his course at the college spent some years in retirement. His first work was the philosophical treatise *Il nuovo Galateo* (1802), which was followed by the *Logica Statistica.* The arrival of Napoleon in Italy drew Gioja into public life. He advocated warmly the establishment of a republican government, and under the Cisalpine Republic he was named historiographer and director of statistics. After the fall of Napoleon he retired into private life, and does not appear again to have held office. He died in 1828. Gioja's fundamental idea is the value of statistics or the collection of facts. Philosophy itself is with him classification and consideration of ideas. Logic he regarded as a practical art, and his *Esercizioni Logici* has the further title, *Art of deriving benefit from ill-constructed books.* In ethics Gioja follows Bentham, and his large treatise *Del Merito e delle Recompense*, 1818, is a clear and systematic view of social ethics from the utilitarian principle. In political economy this avidity for facts produced better fruits. The *Nuovo Prospetto delle Scienze Economiche*, 6 vols., 1815-17, although long to excess, and overburdened with classifications and tables, contains much valuable material. In particular, Gioja must be credited with the finest and most original treatment of division of labour since the *Wealth of Nations.* Much of what Babbage taught later on the subject of combined work is anticipated by Gioja. His theory of production is also deserving of attention from the fact that it takes into account and gives due prominence to immaterial goods. Throughout the work there is continuous opposition to Smith. Gioja's latest work *Filosofia della Statistica*, 1828, contains in brief compass the essence of his ideas on human life, and affords the clearest insight into his aim and method in philosophy both theoretical and practical.

A notice of Gioja's life is given in the 2d edition of the *Filosofia della Statistica*, 1829. See Ferri, *Essai sur l'histoire de la Phil. en Italie au 19me Siècle*, 1869.

GIORDANO, Luca (1632-1705), a painter of great immediate celebrity, was born in Naples, son of a very indifferent painter, Antonio, who imparted to him the first rudiments of drawing. Nature predestined him for the art, and at the age of eight he painted a cherub into one of his father's pictures, a feat which was at once noised abroad, and which induced the viceroy of Naples to recommend the child to Spagnoletto. His father afterwards took him to Rome, to study under Pietro da Cortona. He acquired the nickname of Luca Fa-presto (Luke Work-fast). One might suppose this nickname to be derived merely from the almost miraculous celerity with which from an early age and throughout his life he handled the brush; but it is said to have had a more express origin. The father, we are told, poverty-stricken and greedy of gain, was perpetually urging his boy to exertion with the phrase, "Luca, fà presto." The youth obeyed his parent to the letter, and would actually not so much as pause to snatch a hasty meal, but received into his mouth, while he still worked on, the food which his father's hand supplied. He copied nearly twenty times the Battle of Constantine by Julio Romano, and with proportionate frequency several of the great works of Raphael and Michelangelo. His rapidity, which belonged as much to invention as to mere handiwork, and his versatility, which enabled him to imitate other painters deceptively, earned for him two other epithets, "The Thunderbolt" (Fulmine), and "The Proteus," of Painting. He shortly visited all the main seats of the Italian school of art, and formed for himself a style combining in a certain measure the ornamental pomp of Paul Veronese and the contrasting compositions and large schemes of chiaroscuro of Pietro da Cortona. He was noted also for lively and showy colour. Returning to Naples, and accepting every sort of commission by which money was to be made, he practised his art with so much applause that Charles II. of Spain towards 1687 invited him over to Madrid, where he remained thirteen years. Giordano was very popular at the Spanish court, being a sprightly talker along with his other marvellously facile gifts, and the king created him a cavaliere. One anecdote of his rapidity of work is that the queen of Spain having one day made some inquiry about his wife, he at once showed Her Majesty what the lady was like by painting her portrait into the picture on which he was engaged. After the death of Charles in 1700 Giordano, gorged with wealth, returned to Naples. He spent large sums in acts of munificence, and was particularly liberal to his poorer brethren of the art. He again visited various parts of Italy, and died in Naples on 12th January 1705, his last words being "O Napoli, sospiro mio" (O Naples, my heart's love !). One of his maxims was that the good painter is the one whom the public like, and that the public are attracted more by colour than by design.

At the present day, when the question is not how quickly Giordano could do his work, but what the work itself amounts to, his reputation has run down like the drops of heavy rain off a window, or like one of the figures in his own paintings, in which he was wont to use an excessive quantity of oil. His astonishing readiness and facility must, however, be recognized, spite of the general commonness and superficiality of his performances. He left many works in Rome, and far more in Naples. Of the latter one of the most renowned is Christ expelling the Traders from the Temple, in the church of the Padri Girolamini, a colossal work, full of expressive lazzaroni; also the frescos of S. Martino, and those in the Tesoro della Certosa, including the subject of Moses and the Brazen Serpent; and the cupola-paintings in the Church of S. Brigida, which contains the artist's own tomb. In Spain he executed a surprising number of works,—continuing in the Escorial the series commenced by Cambiasi, and painting frescos of the Triumphs of the Church, the Genealogy and Life of the Madonna, the stories of Moses, Gideon, David, and Solomon, and the Celebrated Women of Scripture, all works of large dimensions. His pupils, Aniello Rossi and Matteo Pacelli, assisted him in Spain. In Madrid he worked more in oil-colour, a Nativity there being one of his best productions. Another superior example is the Judgment of Paris in the Berlin Museum. In Florence, in his closing days, he painted the Cappella Corsini, the Galleria Riccardi, and other works. In youth he etched with considerable skill some of his own paintings, such as the Slaughter of the Priests of Baal. He also painted much on the crystal borderings of looking-glasses, cabinets, &c., seen in many Italian palaces, and was, in this form of art, the master of Pietro Garofolo. His best pupil, in painting of the ordinary kind, was Paolo de Matteis.

GIORGIONE (1477–1511), the name adopted both by his contemporaries and by posterity for one of the most renowned of Italian painters, signifies George the Big, or Great, and was given him, according to Vasari, "because of the gifts of his person and the greatness of his mind." Like Lionardo da Vinci, Giorgione appears to have been of illegitimate birth. His father belonged certainly to the gentle family of the Barbarella, of Castelfranco in the Trevisan; his mother, it seems probable, was a peasant girl of the neighbouring village of Vedelago; and he was born in or shortly before the year 1477. In histories and catalogues he is now commonly styled Giorgio Barbarella of Castelfranco; but it seems clear that he was humbly reared, and only acknowledged by his father's family when his genius had made him famous. Twenty-seven years after his death, the brothers Matteo and Ercole Barbarella were glad to inscribe the name of Giorgione among the members of their family in whose honour they built and dedicated a monument in the church of San Liberale in their native town. Presently this church was demolished and replaced by a new one. In the course of this operation the inscription in question perished. Not so a more important memorial of Giorgione's greatness, in the shape of an altar-piece which he painted for the same church on the commission of Tuzio Costanzo. Tuzio Costanzo was a famous captain of free lances, who had followed his mistress, the Queen Cornaro, from Cyprus to her retirement in the Trevisan, and at the beginning of the 16th century was settled at Castelfranco. The altar-piece with which Giorgione adorned the chapel of this patron in the old church of San Liberale, was afterwards transferred to the new church, where it remains to this day, so that there is something more than the mere memory of the great painter to attract the lover of art on a pilgrimage to his native town. Castelfranco is a hill fort standing in the midst of a rich and broken plain at some distance from the last slopes of the Venetian Alps. Giorgione's ideal of luxuriant pastoral scenery, the country of pleasant copses, glades, and brooks, amid which his personages love to wander or recline with lute and pipe, was derived, no doubt, from these natural surroundings of his childhood. We cannot tell how long he remained in their midst, nor what were the circumstances which led him, while still, it seems, a boy, to Venice. Once there, we do not hear of him until his genius is, so to speak, full-fledged. He appears all at once as a splendid presence, the observed of all observers; an impassioned musician, singer, lover; and, above all, as a painter winning new conquests for his art. His progress from obscurity to fame, probably under the teaching of Giovanni Bellini, must have been extraordinarily rapid, as he was still very young when he was employed to paint the portraits of two successive doges, and of great captains and princesses such as Gonzalvo of Cordova and Catharina Cornaro. Giorgione effected, in the Venetian school, a change analogous to that effected by Lionardo in the school of Florence,—a change, that is, which was less a revolution than a crowning of the edifice. He added the last accomplishments of freedom and science to an art that at his advent only just fell short of both. Venetian painting towards 1495 had reached the height of religious dignity in the great altar-pieces of Bellini, the height of romantic sentiment and picturesque animation in Carpaccio's series from the legend of St Ursula. The efforts of the school for nearly half a century had been concentrated on the development, with the help of the new medium of oil, of colour as the great element of emotional expression in painting. Giorgione came to enrich the art with a more faultless design; with a system of colour yet more ardent, melting, and harmonious; with a stronger sense of life and of the glory of the real world as distinguished from the solemn dreamland of the religious imagination. He had a power hitherto unknown of interpreting both the charm of merely human grace and distinction, and the natural joy of life in the golden sunlight among woods and meadows. His active career cannot have extended over more than fifteen years, since we know that he died in 1511,—according to one account, of a contagious disorder; according to another, of grief at discovering that his mistress had played false with a pupil. But in that brief career he had both deeply modified the older manner of the Venetian school, as represented even by a master so great and so austere as John Bellini, and had prepared the way for its final manner, as represented by the most complete master of all, Titian. Bellini, who outlived Giorgione, had not been ashamed to learn something from the practice of a teacher fully forty years younger than himself, who was probably in the first instance his own pupil. Titian, only ten years younger than Giorgione, succeeded to his conquests, and enjoyed the length of days which was denied him.

A consecutive biography of Giorgione it is impossible to construct, either from literary records or from extant works. The literary records only furnish us with a few general characteristics, and with the mention of a few of his productions, especially the frescos with which he adorned the front of the Fondaco dei Tedeschi or hall of the German traders at Venice, after its destruction by fire in 1504; and the frescos and altar-piece, sometimes attributed to the same year, which he executed for Tuzio Costanzo in his native town. The decorations of the Fondaco dei Tedeschi, which Vasari praises for their design and glowing colour, but blames for their too fantastic and enigmatical invention, have unhappily been utterly destroyed by the combined operation of weather and of reckless architectural changes in the building. The frescos of the chapel of Castelfranco were also sacrificed, while the altar-piece was preserved in the manner we have related. A fragment of a love-madrigal, which was once to be read on the back of this panel, addressed apparently by the painter to his model, is quoted as in character with our traditions of the man. The picture itself represents the Virgin and Child enthroned, with a group of saints, and prominent among them the warrior-saint Liberale, the patron of the church. A small and highly finished study in armour for this figure is now one of the treasures of the National Gallery in London, to which it was bequeathed by Mr Rogers. To Giorgione are also attributed pictures in almost all the public and private galleries of Europe, to a number ten times greater than could possibly be consistent with the short duration of his career, and with the fact that no inconsiderable portion of that career must have been occupied with the production of the perished frescos. These so-called Giorgiones of the galleries may to some extent be recognized and classified as the work of one or another of several groups of painters whose manner was more or less akin to, or influenced by, that of Venice in Giorgione's days. One such group belongs to Bergamo; another to Brescia; another is in alliance with Palma; another with Titian; another, again, consists of the later and looser imitators of the master himself, as Andrea and Schiavone, Pietro della Vecchia and Rocco Marcone. It is probable, indeed, that those distinguished authorities, Messrs Crowe and Cavalcaselle, have gone too far in excluding from the genuine work of Giorgione several of the most famous pictures which have hitherto passed as standards whereby to judge his manner, as, for instance, the Entombment of Christ at Treviso, and particularly the beautiful Concert of the Louvre. Without, however, entering upon disputed ground, there remains a reasonable number of undoubted pictures of the master, and these, while they possess in common the qualities of feeling and invention which we have above defined, in technical style vary from a minute and painstaking precision, almost like that of Antonello da Messina, or of Bellini in his earlier manner, to a degree of breadth, glow, and softness, which are the qualities more popularly associated with the name of Giorgione, and more commonly attempted by his imitators.

We conclude with a mention of a few of the principal undisputed examples of Giorgione's handiwork, following a chronological order, which, however, it should be understood, is necessarily but approximate and conjectural. Florence, Uffizi: an Ordeal of Moses, and a Judgment of Solomon,—small pictures with rich landscape accessories, and figures of extraordinary grace and delicacy, painted apparently in imitation or in rivalry of the New Testament allegory by Bellini, in the same manner, which is preserved in the same gallery; all three were originally in the summer residence of the Medici at Poggio Imperiale. London, collection of Mr Wentworth Beaumont: Holy Family, with the angel appearing to the shepherds in the background,—again a small picture, very delicately finished; formerly in the possession of Cardinal Fesch. London, National Gallery: the Study for San Liberale above mentioned. Castelfranco, Church of San Liberale: the altar-piece,—figures life size, exhibiting much of the manner of Bellini in his altar-pieces. Vienna, Belvedere Gallery: a Group of Astronomers in a Glade, known as the Chaldeans, ~ rich sunset landscape, with villages in the distance and trees in the foreground; beside the trees on the left, three figures in Oriental costumes, one-third of life size; formerly in the Taddeo Contarini gallery. Venice, Manfrini palace: man, woman, and child, known as the Family of Giorgione, in a landscape recalling the neighbourhood of Castelfranco,—one of the most beautiful works of the master, formerly in the house of Gabriel Vendramin at Santa Fosca. England, Kingston Lacy, collection of Mr Bankes: Judgment of Solomon,—a large unfinished picture of great beauty, of clearer tones and broader treatment than the foregoing, bought, at the suggestion of Lord Byron, from the Marescalchi gallery. Florence, Pitti: Concert,—a monk of the Augustinians, seated at the harpsichord; behind him, a clerk with a viol; on the left a young man with plumed hat and long hair. This is the most perfect of all the works which are assumed to belong to the later time of the master.

See Vasari, *Vite de' più eccellenti pittori*, &c., vol. vii. p. 80, ed. Lemonnier; Ridolfi, *Maraviglie dell' Arte*, vol. i. p. 121; Crowe and Cavalcaselle, *History of Painting in North Italy*, vol. ii. p. 119. (S. C.)

GIOTTINO (1324-1357), an early Florentine painter. Vasari is the principal authority in regard to this artist; but it is not by any means easy to bring the details of his narrative into harmony with such facts as can be verified at the present day. It would appear that there was a painter of the name of Tommaso (or Maso) di Stefano, termed Giottino; and the Giottino of Vasari is said to have been born in 1324, and to have died early, of consumption, in 1357,—dates which must be regarded as open to considerable doubt. Stefano, the father of Tommaso, was himself a celebrated painter in the early revival of art; his naturalism was indeed so highly appreciated by contemporaries as to earn him the appellation of "Scimia della Natura" (ape of nature). He, it seems, instructed his son, who, however, applied himself with greater predilection to studying the works of the great Giotto, formed his style on these, and hence was called Giottino. It is even said that Giottino was really the son (others say the great-grandson) of Giotto. To this statement little or no importance can be attached. To Maso di Stefano, or Giottino, Vasari and Ghiberti attribute the frescos in the chapel of S. Silvestro (or of the Bardi family) in the Florentine church of S. Croce; these represent the miracles of Pope St Sylvester, as narrated in the Golden Legend, one conspicuous subject being the sealing of the lips of a malignant dragon. These works are animated and firm in drawing, with naturalism carried further than by Giotto. From the evidence of style, some modern connoisseurs assign to the same hand the paintings in the funeral vault of the Strozzi family, below the Cappella degli Spagnuoli in the church of S. Maria Novella, representing the crucifixion and other subjects. Vasari ascribes also to his Giottino the frescos of the life of St Nicholas in the lower church of Assisi. This series, however, is not really in that part of the church which Vasari designates, but is in the Chapel of the Sacrament; and the works in that chapel are understood to be by Giotto di Stefano, who worked in the second half of the 14th century—very excellent productions of their period. It might hence be inferred that two different men produced the works which are unitedly fathered upon the half-legendary "Giottino," the consumptive youth, solitary and melancholic, but passionately devoted to his art. A large number of other works have been attributed to the same hand; we need only mention an Apparition of the Virgin to St Bernard, in the Florentine Academy; a lost painting, very popular in its day, commemorating the expulsion, which took place in 1343, of the duke of Athens from Florence; and a marble statue erected on the Florentine campanile. Vasari particularly praises Giottino for well-blended chiaroscuro. He left behind him various scholars in the art.

GIOTTO (1276–1336), relatively to his age one of the greatest and most complete of artists, fills in the history of Italian painting a place analogous to that which seems to have been filled in the history of Greek painting by Polygnotus. That is to say, he lived at a time when the resources of his art were still in their infancy, but considering the limits of those resources, his achievements were the highest possible. At the close of the Middle Age, he laid the foundations upon which all the progress of the Renaissance was afterwards securely based. In the days of Giotto, the knowledge possessed by painters of the human frame and its structure rested only upon general observation, and not upon any minute, prolonged, or scientific study; while to facts other than those of humanity their observation had never been closely directed. Of linear perspective they possessed few ideas, and those elementary and empirical, and scarcely any ideas at all of aerial perspective or the conduct of light and shade. As far as painting could ever be carried under these conditions, so far it was carried by Giotto. In its choice of subjects, his art is entirely subservient to the religious spirit of his age. Even in its mode of conceiving and arranging those subjects, it is in part still trammelled by the rules and consecrated traditions of the past. Thus it is as far from being a perfectly free as from being a perfectly accomplished form of art. Many of those truths of nature to which the painters of succeeding generations learnt to give accurate and complete expression, Giotto was only able to express by way of imperfect symbol and suggestion. But in spite of these limitations and shortcomings, and although he has often to be content with expressing truths of space and form conventionally or inadequately, and truths of structure and action approximately, and truths of light and shadow not at all, yet among the elements over which he has control he maintains so just a balance that his work produces in the spectator less sense of imperfection than that of many later and more accomplished masters. He is one of the least one-sided of artists, and his art, it has been justly said, resumes and concentrates all the attainments of his time not less truly than all the attainments of the crowning age of Italian art are resumed and concentrated in Raphael. In some particulars the painting of Giotto was never surpassed,—in the judicious division of the field and massing and scattering of groups,—in the union of dignity in the types with appropriateness in the occupations of the personages,—in strength and directness of intellectual grasp and dramatic motive,—in the combination of perfect gravity with perfect frankness in conception, and of a noble severity in design with a great charm of harmony and purity in colour. The earlier Byzantine and Roman workers in mosaic had bequeathed to him the high abstract qualities of their practice, their balance, their impressiveness, their grand instinct of decoration; but while they had compassed these qualities at an entire sacrifice of life and animation, it is the glory of Giotto to have been the first among his countrymen to breathe life into art, and to have quickened its stately rigidity with the fire of natural incident and emotion. It was this conquest, this touch of the magician, this striking of the sympathetic notes of life and reality, that chiefly gave Giotto his immense reputation among his contemporaries, and made him the fit exponent of the vivid, penetrating, and practical genius of emancipated Florence. His is one of the few names in history which, having become great while its bearer lived, has sustained no loss of greatness through subsequent generations.

No two men were ever more unlike than the rustic Giotto and the patrician Dante; but among the high places of history, their figures stand side by side on a common eminence. They were contemporaries, Dante being the elder of the two by eleven years, and friends, or, at the least, acquaintances. The poetry of Dante, reporting concerning things unseen with a definiteness not less than that of actual vision, served in many ways, until the days of Michelangelo, not only as an inspiration but as a law to the religious art of Italy. This inspiring and legislating authority of the sacred poet was exercised first of all upon Giotto,—partly, it appears, by means of personal intercourse between the two men. On the other hand, Giotto is celebrated in Dante's verse as the foremost painter of the new age. Nor is this the only tribute to his pre-eminence which we find in contemporary, or almost contemporary, literature. He is from the first a kind of popular hero. He is celebrated by the poet Petrarch and by the historian Villani. He is made the subject of tales and anecdotes by Boccaccio and by Franco Sacchetti. From these notices, as well as from Vasari, we gain a distinct picture of the man, as one whose nature was in keeping with his peasant origin; whose sturdy frame and plain features corresponded to a character rather distinguished for shrewd and genial strength than for sublimer or more ascetic qualities; a master craftsman, to whose strong combining and inventing powers nothing came amiss; conscious of his own deserts, never at a loss either in the things of his art or in the things of life, and equally ready and efficient whether he has to design the scheme of some great spiritual allegory in colour or imperishable monument in stone, or whether he has to show his wit in the encounter of practical jest and repartee. From his own hand we have a contribution to literature which helps to substantiate this conception of his character. A large part of Giotto's fame as a painter was won in the service of the Franciscans, and in the pictorial celebration of the life and ordinances of their founder. As is well known, it was a part of the ordinances of Francis that his disciples should follow his own example in worshipping and being wedded to poverty,—poverty idealized and personified as a spiritual bride and mistress. Giotto, having on the commission of the order given the noblest pictorial embodiment to this and other aspects of the Franciscan doctrine, presently wrote an ode in which his own views on poverty are expressed; and in this he shows that, if on the one hand his genius was at the service of the ideals of his time, and his imagination open to their significance, on the other hand his judgment was very shrewdly aware of their practical dangers and exaggerations.

Giotto di Bondone (a name, as it happens, also borne in the same generation by a distinguished citizen of Siena) was the son of a poor peasant of Vespignano. He was born in 1276, and drew, we are told, by natural instinct with whatever materials he could lay his hands on. He was ten years old when Cimabue, as the story goes, found him by the wayside, drawing a sheep with a piece of charcoal upon a stone or tile. The master, then at the height of his fame, took the peasant boy, with the glad consent of his father, to Florence to be his pupil. Of his early career after this we know no more until we find him at work as the foremost among many scholars employed under Cimabue at the interior decorations of the great memorial church of St Francis at Assisi. This church consists of two structures, one superimposed on the other; it is of the upper and not of the lower church that we speak at present. On the walls of this a great series of frescos, now more than half obliterated, was painted by the primitive masters of the Tuscan school, including some of older and some of younger standing than Cimabue. The series is in three tiers, the uppermost tier containing scenes from the Old Testament; the next, scenes from the New; the lowest, scenes from the life of St Francis. It is in this last tier than we can discern with certainty the hand of the youthful Giotto. The extent of his participation has been much debated. According to the more probable opinion, it can be traced even in the earlier scenes of the history; but it is in the later scenes only that the hand and promise of the master, the presence of a new and vital spirit, reveal themselves with fulness. Some interval (but the chronology of Giotto's career is at all points obscure) would seem to have elapsed between the execution of these frescos and of others, better known than these, which adorn the lower story of the same structure. In four lunette-shaped spaces in the vaulting of this lower church, Giotto has painted four vast compositions, of which the scheme was dictated to him, no doubt, by some pious and learned mouthpiece of the wishes of the order. One of these exhibits the mystical wedding of Francis with Poverty; a second is an allegory of Chastity; a third of Obedience; a fourth shows the saint glorified in heaven among the angels. To describe and explain these famous compositions would be beyond our scope. The ideas they embody cannot but seem strained and cold when we express them in modern language. Strained and cold, indeed, the ideas would have been in any other age of the world; but we must remember that the religious temperament of that age in Italy gave even to pedantry the colours of passion, and an ardent and solemn reality to the most far-drawn fantasies of devotion. And however cool the private judgment of Giotto in such matters may have been, it is not his private judgment which speaks to us from the painted allegories of Assisi; it is the sincere imagination of the men among whom he lived; it is the ardour and solemnity of the devotional spirit of his race. In one of the transepts of the same lower church there are frescos of the Passion of Christ, and others of the life of St Francis, which modern authorities hold against ancient, most likely with justice, to be also from the hand of Giotto.

Assuming that the later work of the master at Assisi belongs to the year 1296 or thereabouts, we have good evidence that two years afterwards he was working at Rome for the Cardinal Stefaneschi, nephew of Pope Boniface VIII. The remains of his industry in this employment may be seen in a mosaic of the *Navicella*, or Christ saving St Peter from the waves, now preserved in the portico of St Peter's at Rome, and in three panels, kept in the sacristy of the canons of the same church, which originally formed part of a ciborium. It is also recorded that Giotto adorned certain MSS. with miniatures for this patron; and in truth there exists in public libraries a very rare class of MSS., in which the miniatures bear the marks, if scarcely of the hand, at any rate of the immediate influence of Giotto. Lastly, a discoloured fragment of a fresco of the church of St John Lateran shows the figure of Pope Boniface VIII. announcing from a balcony the opening of the famous Jubilee of the year 1300. Soon after this, Giotto was once more in his native city. Recent research has again thrown in doubt the relative cares of the master and of his pupils in the decorations of the chapel, called by Ghiberti the chapel of the Magdalene, in the Bargello or palace of the Podestà at Florence. These were painted to celebrate the pacification between the Black and White parties in the state, effected by the Cardinal d'Acquasparta as delegate of the Pope in 1302, and consisted of a series of Scripture scenes, besides great compositions of Hell and Paradise. It is in the Paradise that the painter has introduced those groups, typical of pacified Florence, in which occur the portraits of Dante, Brunetto Latini, and Corso Donato, and which, amid the emotion of all who care for art or history, were recovered in 1841 from the whitewash that had overlain them.

The whole central period of Giotto's life, from about 1305 to about 1334, is divided between periods of residence at Florence and expeditions, of which we can in very rare instances trace the date or sequence, undertaken in consequence of commissions received from other cities of the peninsula. He was as much or more of a traveller as was Van Eyck a century later; and his travels exercised as much or more of the same fertilizing and stimulating influence on art in Italy as did those of the great Fleming in the north-west of Europe. The familiar story of the O belongs to a journey to France, which was projected by Giotto but never undertaken. Pope Benedict XI., the successor of Boniface VIII., sent a messenger to bring him proofs of the painter's powers. Giotto would give the messenger no other sample of his talent than an O drawn with a free sweep of the brush from the elbow; but the pope was satisfied, and engaged Giotto at a great salary to go and adorn with frescos the papal residence at Avignon. Benedict, however, dying at this time (1305), nothing came of this commission; and the Italian 14th century frescos, of which remains are still to be seen at Avignon, have been proved to be the work, not, as was long supposed, of Giotto, but of the Sienese master Simone Martini, called Simone Memmi. Another certain date in Giotto's career belongs to the close of the period we have defined. In 1328 he had painted in the palace of the Signoria at Florence a portrait (now lost) of Charles of Calabria kneeling before the Virgin. Two years later he was invited by the father of this prince, King Robert of Naples, to come and work for him in that city. Some frescos in the chapel of the Incoronata had been long erroneously supposed, on the authority of Petrarch, to represent a part at any rate of the industry of Giotto during the three years which he spent at Naples. It is the merit of Messrs Crowe and Cavalcaselle, while conclusively setting aside this tradition, to have called attention to a real and very noble work of the master existing in a hall which formerly belonged to the convent of Sta. Chiara in that city. This is a fresco celebrating the charity of the Franciscan order under the figure of the miracle of the loaves and fishes, with the personages of St Francis and St Clare kneeling on either hand.

Between these two dates (1305 and 1330), Giotto is said to have resided and left great works at Padua, Ferrara, Urbino, Ravenna, Rimini, Faenza, Lucca, and other cities; and in several of these paintings are still shown which bear his name with more or less of plausibility. But among them it is at Padua only that his authentic and mature powers can really be studied, and that in perhaps the greatest and most complete series of creations of all that he has left. These are the frescos with which he decorated the chapel built in honour of the Virgin of the Annunciation by a rich citizen of the town, Enrico Scrovegni, and called sometimes the chapel of the Arena, because it is on the site of an ancient amphitheatre. Since it is recorded that Dante was Giotto's guest at Padua, and since we know that it was in 1306 that he came from Bologna to that city, we may conclude that to the same year, 1306, belongs the beginning of Giotto's great undertaking in the Arena chapel. The scheme includes a Saviour in Glory over the altar, a Last Judgment over the entrance door, and on either side a series of subjects from the Old and New Testaments and the apocryphal Life of Christ, painted in three tiers, and lowest of all, a fourth tier with emblematic Virtues and Vices in monochrome, the Virtues being on the side of the chapel which is next the incidents of redemption in the entrance fresco of the Last Judgment, the Vices on that side which is next the incidents of perdition. There is no other single building, or single series of representations, in which the highest powers of the Italian mind and hand at the beginning of the 14th century may be so well studied as here. In the same city, the great Franciscan church of St Antonio contains also the remains of works by the master. And it was still for the same order, in their renowned church of Santa Croce, that Giotto executed most of the paintings which mark the periods of his residence in Florence. Besides a vast altar-piece or panel for the Baroncelli chapel, he decorated with frescos the walls of a number of private chapels in this church. The Baroncelli altar-piece still exists; the only chapels of which the frescos have been uncovered are those of the Bardi and Peruzzi. Nor are these the only walls in Florence which to this day bear record of the powers of Giotto—without taking into account many that are attributed to him, but are really by the hand of pupils like Taddeo Gaddi or Puccio Capanna, or of weaker followers like Giottino, Giovanni da Milano, or Agnolo Gaddi.

Meantime, Giotto had been advancing, not only in fame, but in years and in prosperity. He was married young, and had, so far as is recorded, three sons, Francesco, Niccola, and Donato, and three daughters, Bice, Caterina, and Lucia. He had added by successive purchases to the plot of land inherited from his father at Vespignano. His fellow-citizens of all occupations and degrees delighted to honour him. And now, in his fifty-eighth year, on his return from Naples by way of Gaëta, he received the final and official testimony to the esteem in which he was held at Florence. By a solemn decree of the Priori (April 12, 1334), he was appointed master of the works of the cathedral of Sta. Reparata (subsequently and better known as Sta. Maria del Fiore), and architect of the city walls and of the towns within her territory. Dying in 1336, he only enjoyed these dignities for two years. But in the course of these two years he had found time not only to make an excursion to Milan, on the invitation of Azzo Visconti and with the sanction of his own Government, but to plan and in part to superintend the execution of two monuments of architecture, of which the one remaining is among the most exquisite in design and richest in decoration that were ever conceived by man. These were, the west front of the cathedral, and its detached campanile or bell tower. The cathedral front was barbarously stripped of its enrichments in a later age, and stood naked until the other day, when the city of Florence undertook to restore it in a modern imitation. The campanile remains, except for inconsiderable repairs, as it was left by the pupils of Giotto after their master's death; and in the consummate dignity as well as consummate delicacy of its design, in its fair proportions and in the opulent but lucid invention and apportionment of its details, in the thoughtfulness and pregnant simplicity of its sculptured histories, it is the most fitting crown and monument of a strong and memorable career.

A complete bibliography of the earlier as well as the more recent authorities on Giotto would here be out of place. The main materials and references will be found in the following:—Vasari, ed. Lemonnier, vol. i. pp. 309 *sqq.*; Crowe and Cavalcaselle, *Hist. of Painting in Italy*, vol. i. chaps. 8 to 11; Ernst Förster, *Geschichte der Italienischen Kunst*, vol. ii. pp. 211 *sqq.*, and E. Dobbert in article "Giotto" in Dohme's *Kunst und Künstler*, vol. iii. (S. C.)

GIOVINAZZO, a town of Italy, in the province of Bari, about 11 miles from Bari, on the railway from Otranto to Bologna. Situated on the coast, it has a small harbour, and carries on an export trade in the olives, almonds, and carobs produced in the vicinity. It is also the seat of a bishop, and possesses a cathedral, a castle, and a famous *ospizio* or poorhouse, which was founded by Ferdinand I. of Naples, and is now used partly for the education of foundlings and orphans, and partly for the reformatory treatment of juvenile criminals. Cloth, carpets, thread, and shoes are among the manufactures of the place, and the children of the ospizio are largely trained in such industries. Whether the identification with the ancient town called Netium or Natiolum be well founded or not, it is certain that Giovinazzo was in existence at a very early date, and some portions of its sea-wall are supposed to belong to the later Roman period. The population of the town in 1875 was 8902, and of the commune 9108.

GIOVIO, PAUL. See JOVIUS.

GIPSIES, a wandering folk scattered through every European land, over the greater part of Asia and North America, and along the northern coast of Africa. Bell of Antermony speaks in his *Travels* (1763) of meeting at Tobolsk a band of sixty Tziggany on their way to China; Koster describes the Brazilian Ciganos (*Travels in Brazil*, 1816); and at the present day cases of Gipsy emigration to Australia are not unknown. No general estimate can be formed of their numbers outside Europe, but travellers agree that they are very numerous in Persia (3000 families in 1856), Armenia, Asiatic Turkey (67,000 in 1877), and Egypt (one alone of the three chief tribes, the Ghagars, being reckoned at 16,000); whilst in America, besides a multitude of British Gipsies, Gipsies from Spain, France, Germany, and Hungary are not unfrequent. The total, 700,000, at which Miklosich placed (1878) the European Gipsies, fairly agrees with the following fragmentary statistics. Turkey, before its late dismemberment, contained 104,750 (9537 in Bosnia and the Herzegovina in 1874); Servia had 24,691 in 1874, Montenegro 500 in 1873; and in Roumania there are from 200,000 to 300,000, according to the varying estimates of Cretzulesco (1876) and the *Annuaire général officiel de Roumanie* (1874). In 1876 Austria counted about 1000 (13,500 in Bohemia in 1846?), and Hungary 159,000 (78,923 in Transylvania in 1850, and 36,842 in Hungary proper in 1864); while Spain is credited with 40,000, France with from 2000 to 6000 (700 in the Basque country), Germany and Italy together with 34,000 (?), and Scandinavia with 1500. In Russia their number in 1834 was stated at 48,247, exclusive of Polish Gipsies, in 1844 at 1,427,539, and in 1877 at 11,654.[1]

Names.—Just as in every European land the Gipsy calls "Gentiles" (*i.e.*, non-Gipsies) *gajé*, he calls himself *Rom*, "a man or husband." This word *Rom*, connected by Paspati with the name of the Indian god *Ráma*, is by Miklosich identified with the Sanskrit *doma* or *domba*, "a low-caste musician."[2] Of names conferred by "Gen-

[1] In England the census of 1871 gives the number of "vagrants and Gipsies" as 2280, in Scotland of "vagrants" as 1793. These figures, however, while they include a good many non-Gipsy tramps and show-people, exclude all house-dwelling Gipsies, besides the Gipsy horse-dealers, basket-makers, hawkers, and tinkers, entered under their several headings, and are therefore utterly valueless.

[2] *Sinté*, another appellation current among the Gipsies of Germany, Poland, and Scandinavia, and possibly connected with the *Zincalo* of the Gitanos, has been likewise variously derived from the Sanskrit *Sindhu* (Indus), and from the Romani *sundó*, "famous," whilst Bataillard identifies it with the Σίντιες or Σίντιοι ἄνδρες of Homer, Strabo, &c. (*cf.* Pott, i. 32-35).

tiles," some point to the fancied cradle of the Gipsy race. Thus *Gipsy* or *Gypsy* itself (*Egyptian* in the 16th century), the Spanish *Gitano*, Albanian *Jevk*, modern Greek Γύφτος, Magyar *Pharao népek* ("Pharaoh's people"), and Turkish *Färäwni*, preserve the belief in its Egyptian origin, a belief which finds no confirmation except in the casual resemblance between *Rom* and the Egyptian *rôme*, "man" (*cf.* Rawlinson's *Herodotus*, vol. ii. p. 225), and which was possibly due to the Gipsies' skill in serpent-charming. The Scandinavian and Low-German *Tatare* identifies Gipsies with the Mongolian hordes, the terror of Europe in the 13th century; and their French name *Bohémiens* was probably due either to a confusion of some such form as *Secani* with *Czech* or to the belief that Gipsies originated in Bohemia. To the same class belong *Walachi*, *Cilices*, *Uxii*, *Saraceni*, *Agareni*, *Nubiani*, &c., cited by Fritschius (1660). Other names again denote the character, hue, or callings of the race, as Arabic *Harámí*, "villain;" Dutch *Heydens*, "heathens," Persian *Karáchí*, "swarthy;" and modern Greek Κατζίβελος, by Somavera derived from the Latin *captivus*, by Bataillard connected with βέλος, "a dart," and so with the Gipsies' name in Cyprus, *Kilindjiridès*, from the Turkish *gylidj*, "a sword." Their Scotch name *Tinkler*, which occurs in a charter of William the Lion (1165–1214), is commonly held to be a mere variant of *tinker*; but if its initial *t* correspond to *z* (*cf.* English *ten*, German *zehn*), it comes very near the Italian *Zingaro* or *Zingano*, which, like the German *Zigeuner*, Czech *Cingán* or *Cigán*, and Magyar *Cigány*, is a form of the most widespread of all the Gipsies' appellations—Bulgarian *Atzigan*, modern Greek Ἀτσίγκανος or Ἀθίγγανος. The last was also the title of a separatist sect in Asia Minor, so called, it is supposed, because its members kept themselves from contact with unbelievers (α privative, and θιγγάνω, "to touch"). Miklosich, finding in it the source of all the preceding forms, believes it to have been transferred by the Greeks to Gipsies, either because the latter entered the western parts of the Byzantine empire from Phrygia and Lycaonia, or because they were suspected of being adherents of the sect or simply as a nickname (Mikl., vi. pp. 57–66). Bataillard, on the other hand, identifying the heretic Ἀθίγγανοι with Gipsy Ἀτσίγκανοι, and these with the Σίγυνναι of Herodotus (v. 9), derives the name from σιγύνη, "a javelin;" while others among the countless etymologies proposed are Goeje's from Persian *chang*, "a kind of harp or cither;" Burton's from Persian *zang*, "Ethiopia;" and Newbold's from Persian *zīn*, "a saddle."

First Appearance in European History.—From whatever cause, it is certain that a confusion did exist between the Ἀτσίγκανοι and Ἀθίγγανοι, which renders it extremely difficult to determine whether the Byzantine historians are speaking of Gipsies or heretics in seven passages collected by Miklosich. It appears from these that Ἀθίγγανοι, described as magicians, soothsayers, and serpent-charmers, first emerge in Byzantine history under Nicephorus I. (802–11), were banished by Michael I. (811–13), and were restored to favour by Michael II. (820–29); but Miklosich's reasons for absolutely identifying them with Gipsies, and positively asserting the latter to have appeared at Byzantium in 810 under Nicephorus, are hard to recognize. Less dubious seems an extract from the Georgian *Life of Giorgi Mtharsmindel* (11th century), which describes how at Constantinople certain descendants of the race of Simon Magus, *Atsinkan* by name, sorcerers and famous rogues, slew wild beasts by their magic arts in the presence of Bagrat IV. Such passages are open to some doubt; hardly so the following from the *Itinerarium Symonis Simeonis* (ed. by J. Nasmith, Camb. 1778), where Fitz Simeon, a Franciscan friar of Dublin, describing his stay in Crete in 1322, says:—"We there saw a people living outside the city (of Candia), who worship according to the Greek rite, and declare themselves of the race of Ham. They rarely or never stop in one place more than thirty days, but, as though accursed of heaven, wander from field to field with little, oblong, black, low tents, like those of the Arabs, or from cave to cave." The empress Catherine de Valois, again, who died in 1346, granted to the suzerains of Corfu authority to reduce to vassalage certain *homines vageniti* coming from the mainland, who under the Venetians formed in 1386 the nucleus of a *feudum Acinganorum* that lasted down to the present century. About 1378 the Venetian governor of Nauplion confirmed the *Acingani* of that Greek colony in privileges granted by his predecessors; and in 1387 Mircea I., waiwode of Wallachia, renewed a grant made by his uncle Ladislaus to the monastery of St Anthony at Voditza of forty *salaschi* (tents) of *Acigani*. Other documents might be cited, but these are enough to show that in the 14th century Gipsies existed in the Balkan peninsula and islands of the Levant; that in Wallachia they were reduced to a state of bondage (from which they were only freed in 1856); and that nowhere were they regarded as new-comers, so that by these documents it is impossible to fix the date of the first Gipsy immigration. More than this, a metrical German paraphrase of Genesis, made by an Austrian monk about 1122, preserved at Vienna, and edited by Hoffmann in his *Fundgruben für Geschichte deutscher Sprache* (Breslau, 1837), goes far to prove that Gipsies were known in Austria three centuries before the commonly-accepted date of their appearance in that country. A passage relating to Hagar's descendants (Gen. xvi. 15) runs:—"So she (Hagar) had this son; they named him Ishmael. It is from him the Ishmaelites descend. They journey far through the world; we call them *chaltsmide* (lit. cold-smiths). . . . They have no house nor country; everywhere they are found alike; they wander over the country, abusing people by their knaveries. Thus they deceive men,—robbing no one openly." That here by *chaltsmide*, *Ishmaelites*, and *descendants of Hagar* Gipsies are meant, scarcely admits of doubt, seeing that the smith's is still the Gipsies' leading handicraft; that Lusignan in 1573 speaks of the Gipsies of Cyprus as "Cinquanes, otherwise called *Agariens*;" and that in German and Danish *Rotwälsch* or thieves' slang *Geschmeilim* and *Smaelem* (*i.e.*, Ishmaelites) signify "Gipsies." The κωμοδρόμοι also of Byzantine writers were possibly Gipsies, being defined by Ducange as "circulatores atque adeo *Fabri ærarii* qui per pagos cursitant: ut hodie passim apud nos, quos *Chaudronniers* dicimus." Theophanes (758–818) speaks under the date 544 of a κωμοδρόμος from Italy.

Later Movements.—Late in 1417 there came to Lüneburg a band of 300 wanderers, "black as Tartars and calling themselves *Secani*." At their head rode a "duke" and "count," splendidly dressed, and leading like nobles dogs of chase; next came a motley crew afoot; and women and children brought up the rear in waggons. They bore among other letters of safe-conduct one granted by the emperor Sigismund, and professed themselves engaged on a seven years' pilgrimage, imposed by their bishops in expiation of apostacy from the Christian faith. From Lüneburg they passed to Hamburg, Lübeck, Wismar, Rostock, Stralsund, and Greifswald, camping by night outside the walls, thieving by day, "wherefore several were taken and slain" (*cf.* the contemporary annals of Korner and Rufus, and Krantz's *Saxonia*, 1520). In 1418 they journeyed southwards through Meissen, Leipsic, and Hesse, and, entering Switzerland, arrived at Zurich on August 31st, visiting also Basel, Bern, and Solothurn, according to Conrad Justinger (died 1426), who speaks of them as "more than 200 baptized heathens from Egypt." They now split up into two bands, the first of which appeared before Augsburg (November 1, 1418), the second before Sisteron in Provence (October 1, 1419), where the terrified citizens bestowed on the "Saracens" a hundred loaves. Next comes a long notice of a troop of fully 100 lean, black, hideous Egyptians in the *Chronica di Bologna* (July 18, 1422), which tells how the sorceress, "Duke" Andrew's wife, could read the past and future of men's lives; but Bologna in fifteen days became too hot for them, so by way of Forli—where "certain said they were from India"—the pilgrims travelled on to Rome. Their object was to procure fresh letters from the pope; and such they afterwards produced, though of their sojourn in the imperial city no record has yet been published. To the burghers of Ratisbon Gipsies presented themselves in 1424; they pitched their tents again before its walls in 1426; and at Paris in 1427 the fair of Landit was attended by a duke, a count, and ten other mounted pilgrims, late renegades of "Lower Egypt," whose women practised palmistry and cleared everybody's pockets. Later we hear of Gipsies at Arnheim (1429), at Metz (1430), at Erfurt (1432), and in Bavaria (1433),—these and all notices of the seventeen years preceding referring probably to the movements of a single ubiquitous band, sent forward to spy out the lands of promise, and composed of from 600 to 1400 persons. For not until 1438 did the great tide of westward immigration begin to flow; then, not in hundreds but thousands, headed no longer by paltry "dukes" and "counts," but by a "king," King Zindl,[1] the Gipsies poured over Germany, Italy, and France, reaching Poland by 1501, Sweden by 1512, and having already appeared in Spain in 1447. We find them in England in 1514 (*A Dyaloge of Syr Thomas More*, 1529), but nothing is known of the date of their landing; and in Scotland the earliest certain record of their presence is an entry in the books of the Lord High Treasurer: "Apr. 22, 1505. Item, to the Egyptianis, be the kingis command, vij lib." (Pitcairn's *Criminal Trials*, Edin. 1833, vol. iii. p. 592). In a "King of Rowmais" (? *Rómas*, Gipsies), twice mentioned in entries of July 1492, as also in the "Erle of Grece" (1502), "King Cristall" (1530), and the "King of Cipre" (1532), one dimly recognizes four Gipsy chiefs; and with Gipsies perhaps the Saracens may be identified, whom a tradition represents as making depredations in Scotland prior to 1460 (Simson, p. 98). In no other country were Gipsies better received than in this, where they "dansit before the king in Halyrudhous" (1530); where James IV. gave (July 5, 1505) Anthonius Gagino, count of Little Egypt, a letter of commendation to the king of Denmark; and where James V. subscribed a writ (February 15, 1540) in favour of "oure louit Johnne Faw, lord and erle of Litill Egipt,"[2] to whose son and successor he granted authority to hang and punish all "Egyptians" within the realm (May 26, 1540). But in 1541 an Act was passed, commanding the "Egyptians to pass forth of the realm" under pain of death, and similar edicts were issued before and afterwards in most of the European states —Germany (1497), Spain (1499), France (1504), England (1531), Denmark (1536), Moravia (1538), Poland (1557), &c. Conveying across the seas was among the milder measures adopted; it is, however, noteworthy as one of the causes of the dispersion of the tribes. Under Henry VIII. Gipsies were shipped from England to Norway (Wright's *History of Ludlow*, pp. 389–92) or France; whilst by the latter power, so lately as 1802, the bands infesting Bayonne and Mauléon were caught by night as in a net, huddled on shipboard, and landed on the coast of Africa (Michel, *Pays Basque*, p. 137). In Scotland four Faas were hanged at Edinburgh in 1611 "for abyding within the kingdome, they being Egiptianis;" and in 1636 doom was pronounced on other "Egyptians" at Haddington, the "men to be hangit, and the weomen to be drowned; and suche of the weomen as hes children to be scourgit throw the burgh and brunt in the cheeke." Under the English statute of 1562 (repealed 1783) making it felony without benefit of clergy to be merely seen for a month in the fellowship of Gipsies, five men were hanged at Durham "for being Egyptians," 8th August 1592. Still greater were the cruelties and injustice suffered by Gipsies on the Continent, since there, to the charge of kidnapping, were added the weightier imputations of being cannibals and emissaries of the Turk. Quiñones recounts how in 1629 four Estremaduran Gitanos owned under torture to having eaten a friar, a pilgrim, and a woman of their tribe; and in 1782 forty-five Hungarian Gipsies were beheaded, quartered, or hanged on a like monstrous charge. First racked till they confessed the crime of murder, they were brought to the spot where their victims were said to be buried, and when no bodies appeared they were racked again. "We ate them" was their despairing cry; and forthwith the journals teemed with accounts of "eighty-five persons roasted by Gipsy cannibals"; straightway the "cannibals" were hurried to the scaffold. Then Joseph II. sent a commission down, whose inquiries showed that no one had been murdered—except the victims of the false accusation. The full, impartial annals of the race have still to be compiled, from edicts and law-books, from local histories and a few monographs like Dirk's *Geschiedkundige onderzoekingen aangaande het verblijf der Heidens of Egyptiërs in de Noordelijke Nederlanden* (Utrecht, 1850), or Weber's *Zigeuner in Sachsen*, 1488–1792, in vol. ii. of his *Aus vier Jahrhunderten* (Leip. 1861).

Language.—Until lately the information about the Gipsy language to be gathered from books was meagre in the extreme. The thirteen works published prior to 1840 which furnish specimens of the Anglo-Romani dialect—Boorde (1547), Bryant (1785), Bright (1818), Copsey (1818), Harriot (1830), Roberts (1836), &c.—together contain but 396 genuine stems, besides 69 doubtful words, and furnish scarcely any examples of the grammar. Nor are the Continental works cited by Pott, from Vulcanius (1589) downwards, much more copious. Even to-day there are still great gaps in our knowledge, especially of the dialects outside of Europe; but enough has been done to show that from the Nile to the Arctic Ocean, from the Euphrates to the Atlantic, the Gipsies speak, with dialectal variations, one and the selfsame speech. The Romani names for "water," "fire," "hair," and "eye," are in Persia *páni*, *aik*, *bál*, and *aki*; in Egypt *páni*, *ág*, *bal*, and *ankhi*; in Norway *pani*, *jag*, *bal*, and *jak*; in England *páni*, *yog*, *bal*, and *yok*. And these four instances, which might be multiplied indefinitely, serve further to show, by their resemblance to the Hindi *pānī*, *āg*, *bāl*, and *ānkh*, that in Romani we have an Indian tongue. Rüdiger first compared Romani, so long regarded as a thieves' jargon, with one of the New Indian dialects, and in 1782 published the result of the comparison in his *Neuester Zuwachs der Sprachkunde.* In 1783 Grellmann's *Historischer Versuch* reaped all the fruits of Rüdiger's research; and in the same

[1] The titles of king, duke, earl, count, and (in south-eastern Europe) waiwode were and are borne by the chiefs of greater or smaller bands, more to impress the vulgar than as denoting real authority. With British Gipsies one is bewildered by the host of *soi-disant* kings and queens, from King John Buclle, laid side by side with Athelstan in Malmesbury Abbey in 1657, down to the Gipsy queen of the United States, Matilda Stanley, royally buried at Dayton, Ohio, in 1878

[2] This letter has an especial interest, since it presents the earliest specimens of the Gipsy tongue, in the names of three of the Gipsies mentioned in it: Grasta (*grast*, "a horse"), Towla Bailyow (*túlo baúlo*, "fat pig"), and Matskalla (? *matchka*, "cat"). Paspati gives as female Turkish Gipsy names *Tchiricli*, "bird," and *Sappni*, "viper;" but probably the above were merely assumed by way of a jest, like *Corrie*, (Hoyland, p. 165) and *Gallimensch* (Pott, i. 52). See, on Gipsy names, Mr Crofton in *Notes and Queries* (5th ser., vol. ii. p. 349).

year Marsden was independently led to a like discovery. The conclusion that the Gipsies wandered forth from India is now almost universally accepted, but when, or from what part of India, are questions on which few have done more than idly speculate. Whether Romani is derived from Hindi, Marathi, &c., can only be determined by minute investigations, which, long neglected, are now being carried on by various Orientalists. They have at least established that Romani stands in the relation of a sister, not a daughter, to the seven principal New Indian dialects. Its forms are often more primitive than theirs, sometimes than those of Pali or the Prakrits, *e.g.*, *vast*, "hand" (Sanskrit *hasta*, Pali *hattha*), *kasht*, "wood" (Sanskrit *kāshtha*, Pali *kattha*), *vusht*, "lip" (Sanskrit *oshtha*, Pali *ottha*), *trash*, "fear" (Sanskrit *trāsa*, Pali *tas*), *trin*, "three" (Sanskrit *tri*, *trīni*; Pali *ti*, *tini*), and *pral*, "brother" (Sanskrit *bhrātā*, Pali *bhāta*). And while the archaisms of Romani forbid us to derive it from Hindi or Marathi, some of its seemingly modern forms are the result of independent development. On the other hand, our knowledge of Romani itself, and of the multitudinous spoken dialects of India, is not at present sufficient to warrant our pronouncing the former more primitive than any of them; and as a fact many of its archaisms may be paralleled in the languages of Dardistan and Kafiristan (*cf.* Miklosich, *Beiträge*, iv. 45–54). Thus there are difficulties on both sides in the way of adjudicating between the opinions of Ascoli and Miklosich. The former maintains (*Saggi Indiani*, vol. ii., 1875) that Romani, preserving certain consonantal *nexus* which had almost entirely disappeared at the epoch of the most ancient Prakrit texts, approaches Sanskrit more nearly even than Pali—conclusions, he observes, that harmonize well with Bataillard's pre-historic theory. Miklosich, on the other hand, opposes that theory in Meyer's *Konversations-Lexikon* (3d ed. 1878), where he infers from the agreement of Romani in its phonetic laws and system of case-endings with the modern Aryan languages of India that the emigration cannot have taken place till these were formed, *i.e.*, until after the Prakrit period.

In Europe Miklosich distinguishes thirteen Romani dialects—the Greek or Turkish, Roumanian, Hungarian, Moravo-Bohemian, German, Polo-Lithuanian, Russian, Finnish, Scandinavian, Anglo-Scottish, Italian, Basque, and Spanish. To these should be added the Welsh, which, generally unintelligible to the English Gipsy, is one of the most perfect, as it has also been the least studied, of all the dialects. As a general rule, the further these dialects remove from Turkey, the more corrupt have they become, so that the Gipsies of Spain, of Scandinavia, and in great measure of England, know no case or verb endings other than those of the lands of their adoption. From Turkish Romani, therefore, and Welsh the following examples will be drawn. The Turkish (marked T.) are taken from Paspati; the Welsh (W.) are derived from letters and stories written by John Roberts, the oldest living harper, whose thorough knowledge of his language is probably unique.

The definite article, wanting in Asia, is supplied in every European dialect by the Greek ὁ and ἡ — ὁ for the masculine, ἡ for the feminine and the oblique cases, *e.g.*, W. *Potchdas ow bearengaro e vaver tringengey*, "the sailor asked the other three," *E colley pendas*, "the Gipsy woman said." The indefinite article, in some dialects supplied by *yek*, "one," is still omitted by the Welsh and the "deeper" English Gipsies, *e.g.*, *Yeker porro gougeo ta porrey gougey jivenes undra borrow veshestay*, "once (an) old man and (an) old woman were living in (a) great wood." Romani has no trace of either a dual number or a neuter gender. Excepting monosyllables, most of its nouns terminate in *-o* (masc.) and *-i* (fem.), as *raklo*, "lad," *rakli*, "girl." Masculine nouns ending in a consonant form their feminines in *-ni*, as *rom*, "husband," *romni*, "wife." Inanimate objects are indifferently masculine or feminine: to the former belonging *gav*, "town," and *gad*, "shirt;" to the latter *nok*, "nose," and *bok*, "hunger." *Rom*, "a husband," and *rakli*, "a girl," are thus declined in Turkish Romani:—

	Sing.	Plur.		Sing.	Plur.
Nom.	Rom	Rom-á	Nom	Rakli	Rakli-á
Acc.	Rom-és	Rom-én	Acc.	Rakli-á	Rakli-én
Gen.	Rom-éskoro	Rom-éngoro	Gen.	Rakli-ákoro	Rakli-éngoro
Dat. i.	Rom-éste	Rom-énde	Dat. i.	Rakli-áte	Rakli-énde
Dat. ii.	Rom-eske	Rom-énghe	Dat. ii.	Rakli-áke	Rakli-énghe
Instr.	Rom-ésa	Rom-éndja	Instr.	Rakli-ása	Rakli-éndja
Abl.	Rom-éstar	Rom-éndar	Abl.	Rakli-átar	Rakli-éndar
Voc.	Róm-a	Rom-ále	Voc.	Rakli-e	Rakl-ále

Here the so-called genitive is in reality an adjective. It precedes and agrees in gender with its noun, *e.g.*, T. *e derviséskeri rakli*, "the dervish's daughter;" W. *sonekaiesko mochto*, "a golden box," and *dakey pen*, "mother's sister." Welsh Gipsies often use the dative where we should look for the genitive, as in *Te pogerel yeck e herrenday ow vodrestay*, "to break one of the legs of the bed." Datives and instrumentals are formed by suffixing to accusatives the separable post-positions *te* or *ke*, "to," and *sar*, "with;" and the *-tar* of the ablative (also occurring in *ká-tar*, "whence," lit. "where from") Pott (i. 188) compares with the Pali adverbial ending *-to* = Sansk. *tas* = Lat. *-tus* in *cœlitus*. In most European Romani dialects considerable confusion has arisen in the use of the oblique cases, but Welsh Gipsies employ the following rightly enough: Sing. acc. *te dickel ow krallises*, "to see the king;" dat. masc. *te dickel pesko jivamaskay*, "to look for his living;" dat. fem. *pendas e yougeackey*, "she said to the woman;" inst. *rokkerdas ow krallisesa*, "he spoke with the king;" voc. *Ria*, "Sir!"—Plur. acc. *te patsell e callen*, "to believe the Gipsies;" dat. *te kerrav les undra chichaw grengey*, "to make it into shoes for horses;" voc. *Chovollay*, "mates!" Nouns ending in *-o* form their plural in Welsh, as in Turkish Romani, in accented *-é*, *e.g.*, *chavay*, "children" (sing. *chávo*), and *chiriklay*, "birds" (sing. *chiriklo*); other nouns form it in *-a* or *-ia*, as *chaia*, "girls" (sing. *chai*), *tema*, "lands" (sing. *tem*), *penya*, "sisters" (sing. *pen*), &c. Of adjectives it need only be remarked that, with rare exceptions, they end in *-o* (masc.) and *-i* (fem.), and form the plural in *-é*, *e.g.*, W. *Java te kerra esa te rigeren tomen tatay*, "I go to make clothes to keep you (plur.) warm." The termination of the comparative is *-der*, *e.g.*, W. *porro*, "old," *poradare*, "older;" and the want of a true superlative is frequently supplied, as in French, by prefixing the definite article to the comparative, *e.g.*, W. *con see ow poradare*, "who is the eldest." Romani pronouns present an interesting study, since everywhere they have been better preserved than any other parts of speech. Turkish Romani gives *me*, "I," *man*, "me," *amén*, "we," &c., and *tu*, "thou," *tut*, "thee," *tumén*, "ye" (lit. thou-we), &c., all of which forms are employed by English and Welsh Gipsies. How strikingly indeed the Turkish and Welsh dialects agree may be seen from the instances following these paradigms, taken from Paspati, of *ov*, "he," *ói*, "she," and *ol* (Bohemian Romani, *jon*) "they":—

Nom.	ov	ói	ol	Dat. ii.	léske	láke	lénghe
Acc.	les	la	len	Instr.	lésa	lása	léndja
Gen.	léskoro	lákoro	léngoro	Abl.	léstar	látar	léndar
Dat. i.	léste	láte	lénde				

Now in Welsh Romani we find: Sing. Masc. nom. *Pendas yov*, "said he;" gen. *lesko pickoo*, "his shoulder;" acc. *cordas les poley*, "he called him back;" dat. i. *deyas lestay*, "he gave him;" dat. ii. *chotchy ow Rye leskay*, "quoth the gentleman to him;" inst. *bitcherdas vaver yeck lessa*, "he sent another one with him:" Sing. Fem. nom. *yoi comdas les*, "she loved him;" gen. *unrea lacko nogo drom*, "in her own way;" acc. *yov comdas la*, "he loved her;" dat. i. *ancy joncles yov chomancy trostel latay*, "whether he knew something about her;" dat. ii. *jalla te dickel lakey*, "he goes to look for her;" inst. *commesa to te jas lasa*, "wilt thou go with her:" Plur. nom. *yon jivenes*, "they were living;" gen. *saw e chava bitcherana lengo camyben*, "all the children send their love;" acc. *commos tokey te bichaves len*, "I should like you to send them;" dat. i. *trosel lenday*, "about them;" dat. ii. *potchdas lengey*, "he asked them;" instr. *potchday leskey so wantines lensa*, "they asked him what he wanted with them;" abl. *te tardel lovo from lenda*, "to extract money from them," where the English "from" is redundant. That nineteen out of the twenty-one forms of the Turkish dialect should be preserved in the Welsh after a separation of four centuries, Romani, moreover, being an unwritten language, is singular; hardly less striking is the similarity in the use of the reflexive pronoun *pes*, "himself" or "herself," *e.g.*, W. *dickel pesko drom glan pestay*, "he sees his way before him;" *ow Jack rivdas pes*, "Jack dressed himself;" *te den pengo lovo*, "to give their money;" *e trin morsh gillay pengay*, "the three men went away" (lit. "went to themselves," a curious use). The third pronoun, *lo*, "he," *li*, "she," and *lé*, "they," commonly only used after the auxiliary verb "to be," is also noteworthy, as playing an important part in the formation of the verb. Instances of its use are—W. *postey seslo kinno*, "till he was tired;" *vasavee chibalengerey ses le*, "she was a foul-tongued woman;" *trashaday seslay*, "they were frightened." The auxiliary verb runs in Turkish Romani: Pres. sing. *isóm*, *isán*, *isi* (*asti* in Asiatic R.); plur. *isám*, *isán*, *isi*: Imperf.

sing. *isómas, isánas, isás;* plur. *isámas, isánas, isás.* And in Welsh Romani occur the forms, *shom,* "I am;" *shan,* "thou art;" *se,* "he is" or "they are;" *sham,* "we are" (*e.g., sham betcherda te las a kai filashin,* "we are sent to get this mansion"); *shen,* "ye are;" *shomas,* "I was;" *shennes,* "thou wert" or "ye were;" *ses,* "he was" or "they were." The terminations of the present indicative in Turkish Romani are: Sing. *-va, -sa, -la;* Plur. *-sa, -na, -na,* which are joined immediately to the verbal stem (identical with the imperative) if it is monosyllabic and ends in a vowel, but otherwise are connected with it by a vowel. For example, *lá-va,* "I take;" *lá-sa* (*lésa*), *lá-la* (*léla*), *lá-sa, lé-na, lé-na;* and *ker-á-va,* "I make;" *ker-é-sa,* &c. Welsh Romani retains all these forms, *e.g., bitcherava,* "I send;" *shunesa,* "thou hearest;" *penela,* "he says;" *bitcherasa,* "we send;" *vena,* "ye come;" *bitcherena,* "they send." In *-va* (*-mi* in Asiatic R.), *-sa,* and *-la* (*cf. lo* above) may be recognized the first, second, and third personal pronouns; the *n* of the second and third persons plural may be compared with the *n* in *romén,* "husbands." The imperfect is formed from the present by the suffix of *-s,* or, in the Hungarian dialect, *-hi, e.g.,* T. *kerávа-s,* "I was making;" Hung. *kamesa-hi,* "thou wast loving;" W. *salles,* "he was laughing," *jivenes,* "they were living." This *-s* or *-hi* is the third person singular of the auxiliary verb, *isí,* "it is," so that literally *kerávas* means "I make + it is" (? some time ago). Perfects are compounded of participles—ending in *-do* (rarely *-to*), *-lo,* and *-no*—and the auxiliary verb. Thus from T. *pirávа,* "I walk," part. *pirdó,* comes *pird-óm,* "I walked," *pird-án,* "thou walkedst," *pird-ás,* "he walked," &c.; and from *dáva,* "I give," part. *dinó, dinóm,* "I gave." Here too the Welsh agrees generally with the Turkish dialect, *e.g., kerdom,* "I made," *keddan,* "thou madest," *kerdas,* "he made;" but *kedan,* "we made," should properly be *kerdám;* and for the third person plural Welsh R., like the German and other dialects, simply employs the plural participle, as *dicktia,* "they saw." In Continental dialects a pluperfect is formed from the perfect by adding to it *-a-s* or *-a-hi,* just as the imperfect from the present; and for a future *kama-* (*kamava,* "I love, wish, or will") is prefixed to the present, *e.g., kama-kerávа,* "I will do," *kama-kerésa,* "thou wilt do," &c. The sign of the subjunctive, which supplies the place of an infinitive, is the conjunction *te,* "that," prefixed to the indicative, which usually drops its vowel-ending, *e.g.,* T. *teréla dúi lav te pénel túke,* "he has two words to tell (lit. that he tells) you;" W. *trashaday seslay te dicken man,* "they were frightened to see (lit. that they see) me." Enough has been said to show that Romani is not so utterly "degraded in its grammar" as Max Müller has declared it to be; and the following short Welsh Gipsy story (printed literatim from Roberts) will illustrate some of the foregoing remarks:—

Yeker a doi ses bearengaro ta vaver store morsh; yek ses
Once there were (a) sailor and other four men; one was

peltanengero, ta ow vaver ses koramangaro, ta sivamangaro,
(a) blacksmith, and the other was (a) soldier, and (a) tailor,

to pallano ses kirchimackaro. Ow bearengaro potchedas e
and the last was (an) innkeeper. The sailor asked the

peltanengaro te vel apra ow doreav. Ow peltanengaro pendas,
blacksmith to come on the sea. The blacksmith said,

"Nau, shom te ja te kerra boottee." "So se tero bootee?" "Te
"No, (I) am to go to do work." "What is thy work?" "To

tasarra sastaro," chotchy ow peltenengaro, "ta te kerrowles undra
beat iron," quoth the blacksmith, "and to make it into

chichaw grengey." Potchdas ow bearengaro e vaver trinengey te
shoes for horses." Asked the sailor the other three to

ven adra ow bearo. Ow koramangaro pendas ta jalla te kel
come in the ship. The soldier said that he goes to make

moyaben ta javaben; to sivamangaro pendas, "Shom te ja te
facings and marching; and the tailor said, "(I) am to go to

make clothes to keep you warm." And the innkeeper said,

"Java ma te kerra lovina te kel tomen matay, te jan saw
"Go I to make beer to make you drunk, that may go all

to menday kai ow Beng." Okke saw dolestay.
you to the Devil." Here (is) all to that (*i.e.,* of that).

The Romani vocabulary reveals positively and negatively the route by which the Gipsies must have entered Europe, and the various ways by which they have since dispersed to their present quarters. The absence, for instance, of Arabic elements from every European dialect disproves a common belief that the earliest immigrants may have landed in the Balkan peninsula from Egypt. On the other hand, the presence of Persian and Armenian words shows that they must have traversed and halted in the lands where those languages are spoken. Among the Persian are *devruál,* "sea," *poshóm,* "wool," *vesh,* "forest," *ambról,* "pear," and *avgin,* "honey;" whilst the Armenian words number twenty-six, according to Miklosich—*grast,* "horse," *chor,* "deep," *kotór,* "a piece," *mortí,* "skin," &c. Again, every dialect presents a large number of Greek words, testifying to the long residence of the Gipsies in a Greek-speaking land. In the German Romani dialect Miklosich reckons forty-two, besides the article, in the English thirty, which latter number might be certainly augmented. Alike in Russia and Spain, England and Hungary, Gipsies call a road *drom* (δρόμος), time *chairos* (καιρός), a horseshoe *petul* (πέταλον), a hat *stadi* (σκιάδι), &c.; in every land of Europe ἑφτά, "seven," ὀχτώ, "eight," and ἐννέα, "nine," have superseded the *haut, asch,* and *nau* of Asiatic Gipsies. This identity of their borrowed words disproves the view that the Gipsies of different European countries are the result of successive immigrations. Next to the Greek, and almost more numerous than they, come the Slavonic elements. Miklosich cites 70 from the German dialect, 30 from the English, and from the Spanish 46, among them being *kralis,* "king," *kitchima,* "inn," *mátchka,* "cat," *lovina,* "ale," and *plashta,* "cloak." Similarly English Romani contains Wallachian, Magyar, German, and French words, showing that the Gipsies reached England after wandering among Greeks, Slavs, Magyars, Germans, and French. It must not, however, be inferred from the foregoing that Romani is essentially other than an Indian speech. The Gipsies' linguistic pilferings form but a small percentage in the 2332 articles gathered together by Pott. And though some of these articles, founded on error, must be struck out, their place might be more than filled up by omissions; and the sum total is largely multiplied when one considers how many derivatives are grouped under a single head. Altogether, the entire stock of Romani words probably exceeds 5000, though the number known to any individual Gipsy is often small.

Elements of Literature.—The Gipsies have no literature worthy of the name—nothing but some rude ballads, some love and dance songs, and a considerable mass of folk-tales. Valuable from a linguistic point of view, the songs have little merit of their own, and seem to be mainly echoes of Gentile strains. The folk-tales, however, would possibly repay a keener investigation than they have yet received. Alike in Wales and Turkey they may be identified with those of other Aryan races; scarce one has yet been published but its counterpart may be found in Grimm's, Ralston's, or other collections of European folk-lore. For instance Paspati's third story, taken down at Constantinople from a Gipsy professional *raconteur,* is unquestionably the same as Grimm's *Treuer Johannes.* Similarly in the Bukowina we meet with Romani versions of *Das tapfere Schneiderlein, Die zwei Brüder,* &c., whilst *Nazdriványu* may be matched from Ralston's *Russian Folk-tales,* p. 73, and frequent mention is made of the waters of life and death, of hills that butt together like rams (*cf.* Ralston, p. 236), and of other features common in Slavonic folk-lore. This resemblance of Romani to Gentile stories may be explained (1) by the common origin of the Aryan races, (2) by the Gipsies having borrowed from the nations among whom they wander, or (3) by these nations having received their stories from the Gipsies. Probably all three explanations are true by turns, but the first is sometimes excluded by an identity of details too close to have been preserved through untold ages, and as to the second it is hard to see how a story current at Paderborn should have travelled eastward to Constantinople, especially as Paspati's tales, enshrining words and phrases otherwise obsolete, are plainly of some antiquity. Accordingly the third explanation, that the Gipsies may have carried *Treuer Johannes* and other stories westward with them, deserves consideration. Some of the Gaelic stories collected by Campbell were, it should be remarked, taken down from Tinklers; and from a London Gipsy he obtained a version of *The Master Thief*, which is current also among Roumanian Gipsies. At present our information is far too scanty to warrant a definite conclusion; but could it once be shown that the Asiatic possess the same stories as the European Gipsies, it might be necessary to admit that Europe owes a portion of its folk-lore to the Gipsies.[1]

Religious Beliefs and Observances.—"The Gipsies," says Grellmann, "brought no particular religion with them, but regulate themselves in religious matters according to the country where they live, . . . wherefore most writers place them below the heathens." This author notwithstanding, the Gipsies mix with their beginnings of Christianity or Mahometanism the relics of an older faith. *Devel*, their name for God or sky, is akin to the Sanskrit "God" (*cf. dyaus*, "sky"), and the German Romani *Miro baro devel dela berschindo*, "my great God gives rain," *i.e.*, "it rains," preserves the original signification. *Gúriben*, "thunder" (lit. "bellowing of cattle"), is another reminiscence of nature worship; and *trúshul*, "cross" (Sanskrit *triśūla*, "the trident of Siva"), presents a curious instance of the transference of religious ideas. *Beng*, "devil," compared by Miklosich with the Sanskrit *bhēka*, "frog," is possibly a survival of serpent-worship, traces of which may be also found in various phrases, stories, emblems, and customs. Survivals also of phallic worship may probably be seen in the honour paid by the three great German Gipsy clans to the fir-tree, the birch, and the hawthorn (Liebich, p. 38); and in the veneration in which Welsh Gipsies hold the fasciated vegetable growth known as the *broado koro*. There are besides a number of other Gipsy superstitions interesting enough in themselves, but which lose their full significance by being at present isolated or insufficiently authenticated, such as, for instance, the alleged devotion of Norwegian Gipsies to a moon-god, Alako (Sundt, 105–10). In the *People of Turkey* (1878) the Tchinghianés are said to keep a fire continually burning in their camp; on the first of May to go all in a body to the sea-coast or banks of a river, where they thrice throw water on their temples, invoking the invisible *genii loci* to grant their special wishes; and annually to drink some potion, prepared in a way known only to the oldest and wisest of the tribe.

Modes of Life.—In Turkey, according to Paspati, the nomad Tchinghianés far outnumber the sedentary; but how far the same statement is true of Gipsies of other lands is hard to determine. Certain at least it is that in England few house-dwelling Gipsies are to be met with who do not remember that their forefathers followed a wandering life, or who do not themselves go temporarily under canvas as hop-picking or the great race-meetings come round. But though for centuries the tent has been the Gipsy's normal habitation, it would not seem to have been so always, if we look to the evidence of the Gipsy tongue. For had it been, assuredly the Romani name for "tent" would be everywhere the same, whereas the Persian Gipsy calls it *guri*, the nomad Tchinghiané *katúna* (modern Greek κατούνα), the sedentary *tchèrga* (Turkish *cherkeh*), the Polish Gipsy *czater*, the German *tattin* (from *tatto*, "hot"), the English *tan*, &c. On the other hand, *ker*, "a house," occurs in every dialect. From the time, however, of Fitz-Simeon onwards Gipsies have everywhere been found dwelling in tents, and his description of these tents as "like those of the Arabs, low, black, and oblong," tallies with Mr Boswell's:—

"The tents are made of rough blankets. They are nearly always brown ones, because the white blankets are not so good for the rain. First of all they measure the ground with a ridge-pole, then they take the kettle-prop and make the holes exactly opposite each other. Then they take up the ridge-pole and stick all the rods into it. Then there is a blanket that goes behind, and is pinned on with pin-thorns; next to that come the large ones over the top of all, also pinned with the same pins."

In the matter of dress, Mr Crofton, in *Papers of the Manchester Literary Club* (1876), infers that "Gipsies formerly had a distinctive costume, consisting of a turban-like headdress of many colours, together with a large cloak, worn after the fashion of a toga, over a long loose under-skirt." The Gipsies, however, of to-day can hardly be said to have a distinctive garb, though certain minutiæ of dress still render them easily recognizable. In Transylvania, for instance, their women's ear-rings differ in pattern from those of the natives; the Hungarian Gipsy chief wears silver buttons, bearing a serpent crest; and his old-fashioned English brother decks his Newmarket coat with spade-guineas or crown-pieces. The English Gipsy woman may be known by her bright silk handkerchief, her curiously-plaited hair, her massy rings, her coral or bead necklace, and by the *monging-guno*, a tablecloth arranged bagwise over her back. In August 1878 Queen Victoria was welcomed to Dunbar by a Gipsy "queen," one of the Reynolds family, who was "dressed in a black robe with white silk trimmings, and over her shoulders wore a yellow handkerchief. Behind her stood two other women, one of them noticeable from her rich gown of purple velvet, and two stalwart men, conspicuous by their scarlet coats." On the other hand, the dress of the children upon the Continent is simple, not to say scanty.

Everywhere Gipsies ply an endless variety of trades. In Egypt they monopolize the art of serpent-charming; in France and Spain they sit as professional models; in England we meet Gipsy Methodist preachers, actors, quack doctors, chimney-sweeps, carpenters, factory hands, &c. But everywhere the men have three principal callings—workers in metals, musicians, and horse-dealers; everywhere the women are "pleasaunt dauncers" as in the days of Andrew Boorde, and by peddling and fortune-telling contribute their share—often more than their share—to the family purse. Gipsies have long been famous as copper and iron smiths in south-eastern Europe, where their horseshoes are reckoned unrivalled. The *calderari* (coppersmiths) of Hungary and Transylvania, at certain intervals make trading tours to Germany, France, England, Norway, and even Spain and Algeria. The workers in iron, on the other hand, seldom or never quit the land of their adoption, as neither naturally do the few remaining *aurari*, or Gipsy gold-washers of Transylvania. Simson describes a primitive Tinkler method of smelting iron, and the caves of Granada still echo to the clink of Gipsy anvils; but in England the surname *Petulengro*, "smith" (from *petul*, "horseshoe"), alone recalls the days when Gipsies surpassed the Gentile in the farrier's craft. Liszt, in his work *Des Bohémiens et de leur Musique en Hongrie* (Paris, 1859), ascribes to the Gipsies the creation of Hungary's national music. Bartalus (1868) contests the theory, but few would hesitate to admit its plausibility who at the Paris Exhibition (1878) or elsewhere have listened to the Gipsies' thrilling performance of a *czardas*, or are familiar with the undoubted compositions of Bihary, Csermak, and other Gipsy *maestri*. The Gipsy's favourite instrument is the violin, but few are the instruments he has not successfully essayed. The Eisteddfods of Wales have witnessed the triumphs of Gipsy harpists; and hundreds have been charmed by the concerts of the Roberts family, not knowing they were hearing a Gipsy band. "The Egyptians," as Krantzius drily remarked in 1520, "frequently change their horses;" horse-dealing and horse-stealing are too often synonymous terms with them. Fortune-telling is on the wane with Gentiles' waning belief in the fortune-

[1] See Paspati (pp. 594–629), Miklosich (part iv.), Professor Friedrich Müller's *Beiträge zur Kenntniss der Rom-Sprache* (2 parts, Vienna, 1869–72), and Dr Barbu Constantinescu's *Probe de Limba si Literatura Tiganilor din Romania* (Bucharest, 1878).

teller's powers. The Gipsy crone can no longer persuade the yeoman's wife to bury her treasure in the earth, and return in a fortnight's time to find it—gone. Those halcyon days of *maánzin* are passed by; the servants' hall is now the only El Dorado left. Enclosure Acts have struck a deadly blow at English Gipsydom, driving the wanderers from breezy common and turf-edged lane to the smoky suburbs of great towns, or at best the outskirts of some watering place. Here, surrounded by Gentiles, the younger generation forget the wisdom of the Egyptians, relinquish time-honoured customs, and, wedding with the sons and daughters of the land, widen the stream of Romani blood, and so diminish its "depth." Several accounts have been furnished of Romani marriages, but they rarely tally, and some (Bright's, Borrow's, and Simson's) do not bear quotation. On the Continent one common feature is the breaking by the chief of a flower-crowned pitcher, from whose fragments, as they are many or few, he argues the fortunes of the bridal pair. There are many curious Gipsy practices relating to death and burial, such as waking the corpse, burning the deceased's effects, the fasting of his kinsfolk, and a species of *tabu*. The earliest record of Gipsies burning the property of their dead occurs in the *Annual Register* for 1773, p. 142: "The clothes of the late Diana Boswell, queen of the Gipsies, value £50, were burnt in the Mint, Southwark, by her principal courtiers, according to ancient custom" (*cf.* Liebich, p. 55). Abstention from flesh or some other delicacy is not always a sign of mourning for the dead (*cf.* Crofton in *Papers of the Man. Lit. Club*, 1877); but its most interesting form is where a Gipsy wife or child for ever renounces the favourite delicacy of the dead husband or parent. Like motives prompt the dropping of the dead Gipsy's name entirely out of use, any survivors who happen to bear the same changing it to another. Much might be written of a kind of ceremonial purity prescribed by Gipsy law, and indicated in the language by the distinction between *chiklo*, "dirty," and *mokado*, "unclean." To wash a tablecloth with clothes is *mokado*, since it is connected with food; and a German Gipsy woman may not cook for four months after childbirth, while a vessel touched by the skirt of a woman's dress is held to be defiled. But with one other widespread practice we must take our leave of Gipsy customs, that, namely, of leaving at a cross-road a handful of grass or leaves, a heap of stones, a stick or some such mark (*patrin*, "leaf") to guide the stragglers of the band. See Liebich, p. 96, and Smart and Crofton, p. 199; and compare "Pola," in Sleeman's *Ramaseeana, or a Vocabulary of the Thugs* (Calcutta, 1836).

Character.—The Gipsy character, strange medley of evil and of good, presents itself as black and hateful to the outside world, whilst to the Romani race it is all that is fair and lovable. "There 's nothing worse than mumply Gentiles" is a saying often in Gipsy mouths, which affords a clue to much that is puzzling in the Gipsy's nature. He is at war with mankind, for centuries his oppressors, and, all being fair in war, may plunder and beguile at will, so that he be not caught. Gipsies' light-heartedness and courtesy are patent to all men; but only to true or adopted members of the tribe are their inmost hearts revealed. Their principal faults are childish vanity, professional cunning, indolence (caused by the absence of ambition), and a hot passionate temper. But they are as ready to forgive as they are quick to resent a wrong; and before implicit confidence their cunning gives place to inviolate honour, a fact borne strongly out by an incident in the *Life* of the actor Charles Mayne Young (p. 186, ed. 1871). Their family affection is intensely strong, prompting a parent never to chastise a younger child, a grown-up son meekly to take a thrashing from his father; and they are lavishly generous to such as are poorer than themselves, even though Gentiles. Their love of nature reveals itself in a hundred quaint, poetic phrases, in a familiarity with beasts and herbs; their love of dumb creatures in the number of their pets. Quick and versatile, all Gipsies readily adapt themselves to any state of life; they have so wonderful a gift of tongues that formerly it was reckoned against them for a proof of sorcery. That hitherto the race has produced, outside the realm of music, none but mute geniuses, is rather due to lack of education than of ability; but "Zingaro" seems to have only been a nickname of the Quentin Matsys of the South, Antonio Solario (1382–1455), and John Bunyan from parish registers does not appear to have had one drop of Gipsy blood (*cf. Notes and Queries*, 5th ser. vol. ii.).

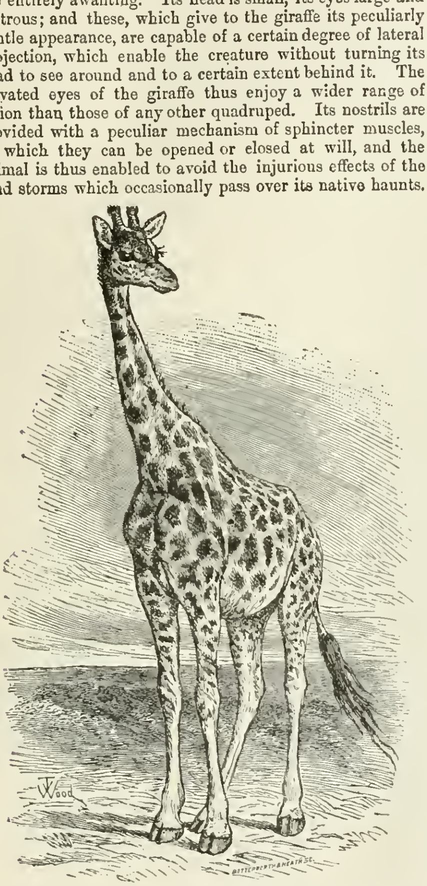
Physique.—Outwardly as within Gipsies present strong contrasts, some being strangely hideous, others very beautiful, though not with a regular, conventional beauty. Finely proportioned, they are as a race of middle stature, but lithe and sinewy, insensible to cold or wet, capable of supporting great fatigue. They pride themselves on their small hands and feet; corpulence rarely occurs, and only with the older women. The hair, black or dark brown, inclines to coarseness, is often frizzled, and does not soon turn grey; the complexion, a tawny olive, was compared by the Plymouth Pilgrims (1622) to that of the Indians of North America. The teeth are of dazzling whiteness and perfect regularity, the cheekbones high; and the aquiline nose is overhung by a strongly-marked brow, knit often in deep lines of thought. But the most striking feature is the full, dark eye, now lustreless, then changing to an expression of mysterious, childlike sorrow, presently blazing forth with sudden passion. As is the case in other Oriental races, the Gipsies early develop and early fade. See, in the *Archiv für Anthropologie* (1872), M. Isidor Kopernicki's learned and exhaustive treatise on Gipsy craniology.

Theories as to Origin.—Several attempts have been made to identify Gipsies with nomad Indian tribes: Grellmann, for example, discovers them in the Sūdras, Richardson in the Nāts (*Asiatic Researches*, vol. vii. 1784), Leland in the Doms, and B. R. Mitra in the Bediyás (*Memoirs of London Anthrop. Soc.*, vol. iii., 1870). These theories, however, need not detain us long; they rest merely on analogies, real or imagined, between the manners of Gipsies and such Indian vagrants, and not on the evidence of language. Nor, were it even shown that any or all of these pariahs speak Romani among themselves, would such a discovery throw of necessity much light on the origin of our European Gipsies; it might simply prove that India has its Gipsy tribes. It is otherwise with the identification of Gipsies with the Jats, who in the Punjab alone numbered (1871) 1,309,399,—a theory started by Pott, elaborated by Bataillard, and supported by Newbold, Sir H. Rawlinson (*Proceedings of the Geogr. Soc.*, vol. i., 1857), Professor de Goeje (*Bijdrage tot de Geschiedenis der Zigeuners*, Amst., 1875), Captain Burton (*Academy*, March 27, 1875), and a writer in the *Edinburgh Review* (July 1878). About 420 A.D., says Firdousi (*circa* 1000), the Persian monarch Behram Gur imported 10,000 minstrels from India, assigning them lands and cattle. But they, wasting their substance, angered the king, who bade them take their instruments, and roaming through the land procure by their songs a livelihood, "wherefore the *Lūri* now wander about the world." Hamza, the Arab historian of Ispahan (c. 940), had already told how Behram dispersed through the cities of his realm 12,000 Indian musicians, "whose descendants are known as *Zuth*;" and of three writers who repeat the tale Mirkhond (15th century) calls the musicians *Djatt*. Thus *Lūri* (mod. Pers. "Gipsy") appears to be synonymous with *Zuth* or *Jat*, the name on the one hand of Damascus Gipsies (?), on the other of an agricultural and cattle-breeding race inhabiting the valley of the Indus. Neither are records lacking of westward migrations of Jats from the Indus, as in 714 to Mopsuestia and Antioch, while in 810 we hear of them in the Tigris valley, in 834 in the marshes of Khuzistan, in 855 in the territory of the Byzantine empire (Goeje). Jat theorists differ as to the date of the great migration that gave Europe its Gipsies, the *Edinburgh Review* writer placing it at 1025, while Sir Henry Rawlinson regards our Gipsies as lineal descendants of Firdousi's Lūri. These writers, however, all agree in making the Gipsies Jats; but none have essayed the necessary comparison of Romani and Jātaki (the idiom of the living Indian Jats), though Captain Burton himself has published a grammar of the latter in the *Journal of the Bombay Asiatic Society*

(Bombay, 1849). We have seen that the dialect of the Turkish Gipsies has remained unchanged for near five centuries, and the Jats are said to "preserve their vernacular tongue wherever they go." Supposing Gipsies then to have broken off from the main Jat stem so late as the eleventh, or even as early as the fifth century A.D., we should look for a striking resemblance between Játaki and Romani. Compare, however, with the foregoing paradigms the following from Burton's grammar:—SING. nom. *ghorá*, "a horse;" gen. *ghore-dá*; dat. *ghore-nún*; acc. *ghorá*; abl. *ghore-te* or *-ton*, "from a horse;" PLUR. nom. *ghore*; gen. *ghorián* or *ghoren-dá*; dat. *ghorián nún*, &c. The Játakí third personal pronoun, again, runs:—SING. nom. *uha*, "he;" gen. *usadá*; dat. and acc. *usnún*; abl. *uste*; PLUR. nom. *uhe*; gen. *uhindá*, &c.: its verbal formation is almost equally unlike the Romani. In the face of the great unlikeness of Romani and Játakí one may well concur with Bataillard in the rejection of this theory, and proceed to consider the later views of that writer as advanced in *Les Origines des Tsiganes* (Par., 1875), *Les Tsiganes de l'Âge du Bronze* (Par., 1876), and *État de la question de l'ancienneté des Tsiganes en Europe* (Par., 1877). He now believes the Gipsies to have existed in Europe from immemorial times,—a conclusion to which he is led by the absence of any record of their passage across the Bosphorus, by their enslaved condition in Wallachia in the 14th century, by the casual notices cited above of their presence at a still earlier date, and by their present monopoly of metallurgical arts in South-Eastern Europe. These mainly negative proofs lose some of their force when we remark that neither is any record known to exist of the passage of Gipsies to England, Scotland, or America; and that at Corfu in 1346 (*i.e.*, in historic times) we read of Gipsies being reduced to vassalage. Assuredly it is a mighty leap from the Athingani of the 9th century A.D. to the Sigynnæ of Herodotus (v. 9), whom Bataillard claims for the ancestors of the Gipsy race. The strength, however, of the theory lies less in attempted identifications than in its explanation of the unsolved problem, What was the race that carried bronze to Northern and Western Europe? Referring for a general survey of the question to the article ARCHÆOLOGY, to E. Chantre's *Âge de Bronze* (4 vols., Paris, 1877), and to Lubbock's *Prehistoric Times* (2d ed., London, 1869), we extract from the last-named work the following passages:—"The absence of implements made either of copper or tin seems to indicate that the art of making bronze was introduced into Europe, [a view confirmed by the fact that] wherever we find the bronze swords or celts they are the same, not similar in character, but identical. . . . The discovery of moulds proves that the art of casting in bronze was known and practised in many countries. Hence it appears most probable that the knowledge of metal is one of those great discoveries which Europe owes to the East. . . . The implements of bronze appear to have belonged to a race with smaller hands than those of the present European nation. . . . As regards the smallness of the hands, we must remember that Hindus share this peculiarity with Egyptians. . . . The Phœnicians were well acquainted with the use of iron. . . . We have still very much to learn in regard to the race by whom the knowledge of metal was introduced into our continent." Each passage suggests or is explained by the supposition that this was no other than the small-handed and eastern Gipsy race. The Calderari work exclusively in copper, never in iron; no Gipsy bronze-smith would have spoilt his trade by introducing iron. Traces might perhaps yet be found in Norway of the workings of a band of Calderari, who visited that country in 1874; and certainly the utensils they wrought in France were exactly similar to those that they wrought in Norway. Bataillard's theory is strengthened by the fact that so high an authority as M. de Mortillet—who is followed by Chantre and Burnouf—had been independently led to a like conclusion in 1874. Its strongest confirmation, however, is the important discovery of Dr Kopernicki that in Eastern Galicia there survive to the present day certain *Zlotars* (Ruth. "goldsmiths"), Gipsy workers in bronze, whose processes Bataillard minutely describes in *Les Zlotars* (Paris, 1878). Difficulties there are in accepting the theory:—the unsettled question of the antiquity of the Romani tongue; the yawning chasm of a thousand years; above all, the unnoticed fact that nearly all the metallurgical terms of Romani seem to be borrowed from Greek—*kalái*, "tin" (καλαίον); *khárkoma*, "copper" (χάλκωμα); *moliv*, "lead" (μολύβιον); *kakkaví*, "kettle" (κακκάβη); *amuní*, "anvil" (ἀμόνι); *rin*, "file" (ῥινί); *sivrí*, "hammer" (σφυρί); *ksilávi*, "pincers" (ξυλάβιον); *karfin*, "nail" (καρφί); *klidí*, "key" (κλειδί); *gampána*, "bell" (καμπάνα); and *pétalo*, "horseshoe" (πέταλον). This looks like an insuperable objection, since certainly no Calderari of to-day would borrow from French or German the names for these the most familiar objects of his long-practised calling; and unless Bataillard be prepared to maintain that Greek took the terms from Romani, not *vice versa*, his theory falls.

Bibliography.—The literature on the Gipsies is richer in appearance than in reality. Miklosich (i. 54-59) and Bataillard (*Les derniers Travaux relatifs aux Bohémiens*, Paris, 1872) give the titles of 118 works, a number which might be largely increased. But many of these "works" are articles hidden away in periodicals, as "The English Gipsies," by the Rev. S. James, in *The Church of England Magazine*, 1875; many are mere *réchauffés* of earlier publications. Imperfect though it be, Grellmann's *Historischer Versuch über die Zigeuner* (1783; 2d and enlarged ed., Gött., 1787; Eng. translation by M. Raper, 1787) remains the only attempt at a full history of the Gipsy race; its grave deficiencies are best supplied by Sprengler's *Dissertatio historica-juridica de Cinganis sive Zigeunis* Leyden, 1839), by Hopf's *Einwanderung der Zigeuner in Europa* (Gotha, 1870), by the historical portions of Miklosich's work, and above all by Bataillard's *De l'Apparition et de la Dispersion des Bohémiens en Europe* (Paris, 1844), *Nouvelles Recherches* (Paris, 1849), and *État de la Question*, &c. (Paris, 1877). On the language viewed as a whole the chief authorities are—*Die Zigeuner in Europa und Asien* (2 vols., Halle, 1844-45), by A. F. Pott; *Zigeunerisches* (Halle, 1865), by G. H. Ascoli; and *Ueber die Mundarten und die Wanderungen der Zigeuner Europa's* (8 parts, Vienna, 1872-78), and *Beiträge zur Kenntniss der Zigeunermundarten* (4 parts, Vienna, 1874-78), by F. von Miklosich. From works on the Gipsies of different European lands the following may be given as a selection (the more important being marked with an asterisk):—for Turkey, **Études sur les Tchinghianés* (Constan., 1870), by A. G. Paspati; for Roumania, the unsatisfactory *Grammaire, Dialogues, et Vocabulaire de la Langue des Cigains* (Paris, 1868), by J. A. Vaillant; for Hungary, *A' czigány nyelv elemei* (Pesth, 1853), by J. Bornemisza; for Bohemia, **Románi Czib* (Prague, 1821), by A. J. Puchmayer; for Germany, **Die Zigeuner in ihrem Wesen und ihrer Sprache* (Leipsic, 1863), by R. Liebich; for Poland, *Rys historiczny ludu cygánskiego* (Wilna, 1830), by T. Narbutt; for Russia, *Ueber die Sprache der Zigeuner in Russland* (St Pet. 1853), by O. Böhtlingk; for Norway, *Beretning am Fante- eller Landstrygerfolket i Norge*, (5 parts, Christian., 1850-65), by E. Sundt; for Denmark, *Tatere og Natmandsfolk i Danmark* (Copenh., 1872), by F. Dyrlund; for England, **The English Gipsies and their Language* (London, 1873), by C. G. Leland, *Romano Lavo-Lil: Word-book of the English Gipsy Language* (1874), by G. Borrow, and **The Dialect of the English Gipsies* (1875), by B. Smart and H. T. Crofton; for Scotland, *A History of the Gipsies* (London, 1865), by W. Simson; for Italy, *Zigeunerisches* (Halle, 1865), by Ascoli; for the Basque Country, *Vocabulaire de la Langue des Bohémiens habitant les Pays Basques Français* (Bord. 1862); for Spain, *The Zincali* (2 vols., Lond., 1841; new ed. 1873), by Borrow. From works on non-European Gipsies selection is unnecessary, since their sum total is as follows:—"Ueber die Sprache der Zigeuner in Syrien," by Pott, in *Zeitschrift für die Wissenschaft der Sprache* (Berlin, 1846); *Reisen durch Syrien, Palastina*, &c. (Berlin, 1854), by U. J. Seetzen, containing a Syro-Romani vocabulary; *"The Gipsies of Egypt," in the *Journ. of the Roy. Asiatic Soc.* (Lond., 1856), by Captain Newbold, comprehending vocabularies from Egypt, Syria, and Persia; "Die Zigeuner in Ægypten," in *Petermann's Mittheilungen* (Gotha, 1862), by A. von Kremer; *Notes et Questions sur les Bohémiens en Algerie* (Paris, 1874), by P. Bataillard; and *Travels in the East* (Lond., 1823), by Sir W. Ouseley, vol. iii. of which gives a Karáchi vocabulary. To these may be added the specimens of the Gipsy dialects of Asia Minor, furnished by Paspati, and vocabularies from Armenia and Siberia in Miklosich's *Beiträge* (iv. pp. 38-41). (F. H. G.)

GIRAFFE (*Camelopardalis giraffa*), a mammal belonging to the ruminant group of the Artiodactyle Ungulates, and the single living representative of the family *Camelopardalidæ*. Intermediate between the members of the deer and ox families, the giraffe differs from both in having neither true horns nor antlers. It possesses however two solid, bony, and persistent appendages, attached partly to the frontal and partly to the parietal bones; and not to the former only as in the true horned ruminants, and these, unlike the processes of the latter, are distinct bones, separable, at least in the young animal, from those of the forehead. These horn-like peduncles are completely covered over by the skin of the forehead, and are terminated by a tuft of bristles, while in front of them there is a protuberance caused by a thickening of the bone, sufficiently prominent in the male to have been frequently described as a third horn. The giraffe is the tallest of existing animals, measuring usually from 15 to 16 feet high—the females being somewhat less—but attaining in the largest examples a height of 18 feet. This exceptional elevation is chiefly due to its great length of neck and limb, the cervical vertebræ, although only seven in number as in other mammals, being in this case exceedingly long. Its body is proportionately short, measuring only 7 feet between the breast and rump, and slants rapidly towards the tail—a peculiarity which has given rise to the erroneous impression that the fore legs of the giraffe are longer than the pair behind. Its feet terminate in a divided hoof, which, says Sir Samuel Butler, "is as beautifully proportioned as that of the smallest gazelle"; and the accessory hoofs found in most ruminants are entirely awanting. Its head is small, its eyes large and lustrous; and these, which give to the giraffe its peculiarly gentle appearance, are capable of a certain degree of lateral projection, which enable the creature without turning its head to see around and to a certain extent behind it. The elevated eyes of the giraffe thus enjoy a wider range of vision than those of any other quadruped. Its nostrils are provided with a peculiar mechanism of sphincter muscles, by which they can be opened or closed at will, and the animal is thus enabled to avoid the injurious effects of the sand storms which occasionally pass over its native haunts.



Giraffe.

Its tongue is remarkable for its great length, measuring about 17 inches in the dead animal, and for its great elasticity and power of muscular contraction while living. It is covered with numerous large *papillæ*, and forms, like the trunk of the elephant, an admirable organ for the examination and prehension of its food. The graceful appearance presented by the giraffe, to which it owes its name through the Arabian *Xirapha*, is greatly heightened by the orange-red colour of its hide, mottled as it is all over with darker spots; while in its long tail, ending in a luxurious tuft of dark-coloured hair, it possesses an admirable fly-whipper, without which it would probably be impossible for the giraffe to maintain its ground against the seroot fly and other stinging insects of central Africa. It lives on open plains in the neighbourhood of low woods, high forest being scrupulously avoided, as depriving it of the extensive prospect which forms its chief defence against the attacks of its two great enemies—the lion and man. It feeds almost exclusively on the foliage of trees, showing a preference for certain varieties of mimosa, and for the young shoots of the prickly acacia, for browsing on which the prehensile tongue and large free lips of the giraffe are specially adapted. It is gregarious in its habits, living in small herds rarely of more than twenty individuals, although Sir S. Baker, who hunted it in Abyssinia, states that he has seen as many as a hundred thus herding together.

There is probably no animal more difficult of approach than the giraffe, owing to that exceeding wariness which prompts it to place sentinels to give the herd timely warning of approaching danger, as well as to its ability, from the elevated position of its eyes, and the openness of the ground it frequents, to see danger, and from its keenness of scent to smell it from afar. It is a fleet though by no means graceful runner, its awkward, shambling gait being due to its moving the fore and hind legs of the same side simultaneously. In hunting it on horseback the rule to be observed, according to the traveller already mentioned, is to press the giraffe the instant he starts; "it is the speed that tells upon him, and the spurs must be at work at the very commencement of the hunt, and the horse pressed along at his best pace; it must be a race at top speed from the very start, but should the giraffe be allowed the slightest advantage for the first five minutes the race will be against the horse." In pursuing it thus on horseback the experienced hunter avoids too close an approach to the creature's heels, a blow from which he has probably learnt to regard, with Dr Livingstone, as leaving little to choose between it and "a clap from the arm of a windmill." Although trusting for safety to flight, it will, when brought to bay, even turn upon the lion; and not seldom does it defend itself successfully against his attacks by the vigorous blows of its powerful limbs. It is, however, powerless against the "king of beasts" when taken unawares, and with this object the latter lies in wait by the banks of streams, and springs upon the giraffe as it seeks to quench its thirst. In captivity it is said to make use of its skin-covered horns as weapons of defence, giving impetus to the blow, not by depressing and then elevating the head, as in the butting of an ox or sheep, but by a sidelong swing of its muscular neck. The skin of the giraffe is in many parts so thick that the bullet of the hunter often fails to pierce it, the surest method of hunting it being that pursued by the Hamran Arabs of Abyssinia who run it down, and when galloping at full speed cut the tendons of its legs, or "hamstring" it, as this operation is called, with their broadswords, and thus completely disable it.

The giraffe is only found wild in Africa, where it ranges throughout the open country of Ethiopia as far south as the confines of Cape Colony. Until about fifty years ago it was almost totally unknown in Europe; it is now, however, to be found in most of the European zoological gardens, where it appears to thrive as well on corn and hay as on the mimosas of its native haunts. It also breeds freely in confinement, so that it may now be regarded as acclimatized in Europe. The giraffe family was more largely represented and enjoyed a wider distribution during the Miocene period, fossil remains of extinct species having been found in Greece and the Siwalik Hills; while an allied genus, *Helladotherium*, with less neck and more body than the existing giraffe, extended during the same period from the south of France to north-west India.

The skin of the giraffe forms a valuable leather material, that made from the thicker parts being in special request for sandals; its flesh, according to Sir S. Baker, was, when roasted, the best he had ever tasted; the tendons of its long legs are valued by the Arabs as thread for sewing leather, and as strings for their musical instruments; while its leg bones, which differ from those of other ruminants in being solid, are largely used in England in the manufacture of buttons and other articles of bone.

GIRALDI, GIGLIO GREGORIO (1479–1552), or Lilius Gregorius Gyraldus, one of the scholars and poets of the golden age of Italian literature, was born June 14, 1479, at Ferrara, where he early distinguished himself by his talents and acquirements. On the completion of his literary course he removed to Naples, where he lived on familiar terms with Pontano and Sannazaro; and subsequently to Lombardy, where he enjoyed the favour of the Mirandola family. At Milan in 1507 he studied Greek under Chalcondylas; and shortly afterwards, at Modena, he became tutor to Ercole (afterwards Cardinal) Rangone. About the year 1514 he removed to Rome, where, under Clement VII., he held the office of apostolic protonotary; but having in the sack of that city (1527), which almost coincided with the death of Cardinal Rangone his most powerful patron, lost all his property, he returned in poverty once more to Mirandola, whence again he was driven by the troubles consequent on the assassination of the reigning prince in 1533. The rest of his life was one long struggle with ill health, poverty, and neglect; and he is alluded to with sorrowful regret by Montaigne in one of his *Essais* (i. 34), as having, like Sebastian Castalio, ended his days in utter destitution. He died at Ferrara in February 1552; and his epitaph makes touching and graceful allusion to the sadness of his end. Giraldi was a man of very extensive erudition; and numerous testimonies to his profundity and accuracy have been given both by contemporary and by later scholars. His *Historia de Diis Gentium* marked a distinctly forward step in the systematic study of classical mythology; and by his treatises *De Annis et Mensibus*, and on the *Calendarium Romanum et Græcum*, he contributed to bring about the reform of the calendar, which was ultimately effected by Pope Gregory XIII. His *Progymnasma adversus Literas et Literatos* deserves mention at least among the curiosities of literature; and among his other works to which reference is still occasionally made are *Historiæ Poetarum Græcorum ac Latinorum*; *De Poetis suorum temporum*; and *De Sepultura ac vario sepeliendi ritu*. Giraldi was also an elegant Latin poet. His *Opera Omnia* were published at Leyden in 1696.

GIRALDI, GIOVANNI BATTISTA (1504–1573), surnamed CYNTHIUS, CINTHIO, or CINTIO, Italian novelist and poet, born at Ferrara in November 1504, was educated at the university of his native town, where in 1525 he became professor of natural philosophy, and where, twelve years afterwards, he succeeded Celio Calcagnini in the chair of belles-lettres. Between 1542 and 1560 he acted as private secretary, first to Ercole II. and afterwards to Alphonso II. of Este; but having, in connexion with a literary quarrel in which he had got involved, lost the favour of his patron in the latter year, he removed to Mondovi, where he remained as a teacher of literature till 1568. Subsequently, on the invitation of the senate of Milan, he occupied the chair of rhetoric at Pavia till 1573, when, in search of health, he returned to his native town, where on the 30th of December he died. Besides an epic entitled *Ercole* (1557), in twenty-six cantos, Giraldi wrote nine tragedies, the best known of which, *Orbecche*, was produced in 1541. The sanguinary and disgusting character of the plot of this play, and the general poverty of its style, are, in the opinion of many of its critics, almost fully redeemed by occasional bursts of genuine and impassioned poetry; of one scene in the third act in particular it has even been affirmed that, if it alone were sufficient to decide the question, the *Orbecche* would be the finest play in the world. Of the prose works of Giraldi the most important is the *Hecatommithi* or *Ecatomiti*, a collection of tales told somewhat after the manner of Boccaccio, but still more closely resembling the novels of Giraldi's contemporary Bandello, only much inferior in workmanship to the productions of either author in vigour, liveliness, and local colour. Something, but not much, however, may be said in favour of their professed claim to represent a higher standard of morality. Originally published at Monteregale, Sicily, in 1565, they were frequently reprinted in Italy, while a French translation by Chappuys appeared in 1583, and one in Spanish in 1590. They have a peculiar interest to students of English literature, as having furnished, whether directly or indirectly, the plots of *Measure for Measure* and *Othello*. That of the latter, which is to be found in the *Hecatommithi* (iii. 7), is conjectured to have reached Shakespeare through the French translation; while that of the former (*Hecat.*, viii. 5) is probably to be traced to Wheatstone's *Promos and Cassandra* (1578), an adaptation of Cinthio's story, and to his *Heptamerone* (1582), which contains a direct English translation. To Giraldi also must be attributed the plot of Beaumont and Fletcher's *Custom of the Country*.

GIRALDUS CAMBRENSIS. See BARRI.

GIRARD, PHILIPPE HENRI DE (1775–1845), a celebrated French mechanician, was born at Lourmarin, in the department of Vaucluse, 1st February 1775. In his early life he manifested a strong aptitude for mechanical invention, and he also at that time devoted his attention to botany, painting, and literature. When at the Revolution his family took refuge in Italy he supported himself there for some time by painting, but afterwards, at the age of eighteen, he established a soap manufactory at Leghorn. Returning to France after the fall of Robespierre, he began to conduct a chemical work at Marseilles, but soon afterwards judged it prudent to go to Nice, where he obtained the professorship of chemistry and of natural history. Returning to Marseilles about 1800, he afterwards went to Paris, where, in company with his brother Frederick, he established a soap manufactory. In 1804 he and his brother took out a patent for what is known as the fountain lamp; and at the "Exposition" of 1806 he was awarded a gold medal for his one-cylindered direct acting steam engine. Napoleon having in 1810 decreed a reward of one million francs to whoever should invent a machine for the spinning of flax equally successful with those in use for the spinning of hemp, Girard, after a course of experiments, invented and patented a flax-spinning machine. In 1813 he established a flax mill at Paris and another at Charonne, in both of which he made use of his machine; but although he was declared to have earned the reward offered for the invention the fall of Napoleon in 1815 left the decree unfulfilled. Girard, who expected that the expenses connected with his experiments would be met by the promised premium, now got into serious money difficulties, and had to leave France for Austria, where, besides establishing a flax mill at Hirtenberg, he built the first line of steam ships on the Danube. In 1825, at the invitation of the emperor Alexander I. of Russia, he went to Poland, where he erected a flax manufactory, round which grew up a village which received the name of Girardow. He was also appointed chief engineer of the mines of Poland. In 1844 he returned to Paris, and exhibited at the Exposition a large number of inventions, including a machine for combing flax, a machine for making gunlocks, several new improvements in guns, a piano of double octaves, and a new instrument called the *Tremolophone*. For his inventions connected with the manufacture of flax a gold medal was decreed to him by the jury; and in 1845 the Society of Inventions awarded him a sum which raised the pension he received from the Russian Government to 6000 francs. Besides the inventions already mentioned, Girard was the author of a large number of others, many of them of considerable importance in connexion with various departments of industrial machinery. He died at Paris August 26, 1845. A pension of 6000 francs was bestowed in 1857 on his only surviving brother, and another on his niece.

GIRARD, STEPHEN (1750–1831), American philanthropist, was born at Bordeaux on 21st May 1750. At the age of thirteen he commenced life as a sailor, and followed his avocation with such assiduity that he was enabled, before the French requisitions of age and service allowed, to become master and captain, in October 1773. His first mercantile venture was to St Domingo in February 1774, whence he proceeded in July to the then colony of New York. After trading for three years between New York, New Orleans, and Port au Prince, he went to Philadelphia in May 1777, and gave up the sea for a mercantile career. While he was engaged most successfully in the prosecution of an extensive trade, the yellow fever in its most malignant type broke out in Philadelphia, sweeping away one-sixth of its population. When, during its height, a hospital was established, for which it seemed almost impossible to secure competent management, Girard devoted himself personally, fearless of all risks, to the care of the sick and the burial of the dead, not only in the hospital, of which he became manager, but throughout the city, supplying the poorer sufferers with money and provisions. Two hundred children, made orphans by the ravages of the fever, were in a great measure thrown upon his care. From this period his success commercially and financially was unexampled. He gave a portion of his time to the management of municipal affairs for several years, and rendered efficient service as warden of the port and as director of many public institutions. On the dissolution of the Bank of the United States, he instituted what is known now as the Girard Bank. During the war of 1812 "he rendered valuable services to the Government by placing at its disposal the resources of his bank at a time of difficulty and embarrassment, subscribing to a large loan which the Government had vainly sought to obtain." Girard added to his other avocations that of a practical agriculturist. He died December 26, 1831.

Girard College was founded by him for the education and support of the poor white orphans of his adopted city. His fortune amounted to about seven and a half millions of dollars. After specific legacies of two millions for the erection and endowment of the college, $140,000 to his relatives, $300,000 to the State for internal improvements, $500,000 to the city of Philadelphia to improve its eastern front, $116,000 to public charities, and various annuities and legacies, he bequeathed the residue of his estate to the city of Philadelphia, mainly for the improvement and maintenance of the college. The most minute directions were given by Girard in regard to the buildings to be erected, and the admission and management of the inmates. He specifically requires that the orphans be instructed in the purest principles of morality, so that on their entrance into active life they may evince benevolence towards their fellow creatures, and a love for truth, sobriety, and industry. As for religious belief they are left to adopt such tenets as their matured reason may lead them to prefer; and to secure this he interdicts the employment, and even the admission into the grounds, of any ecclesiastic whatever.

GIRARDIN, MADAME ÉMILE DE, a French authoress, was born at Aix-la-Chapelle, January 26, 1804, and died at Paris June 29, 1855. Her maiden name was Delphine Gay, and her mother, the well-known Madame Sophie Gay, brought her up in the midst of that brilliant literary society of which she was afterwards a conspicuous ornament. In 1822 she obtained peculiarly honourable mention from the Academy for a poem on the *Devotion of the Sisters of Sainte Camille at the Siege of Barcelona*; and not long after she published two volumes of miscellaneous pieces, *Essais poétiques* (1824) and *Nouveaux essais poétiques* (1825). A visit to Italy in 1827, during which she was enthusiastically welcomed by the literati of Rome and even crowned in the capitol, was productive of various poems, of which the most ambitious was *Napoline* (1833). Her marriage in 1831 to M. Émile Girardin opened up a new literary career. The contemporary sketches which she contributed from 1836 to 1839 to the feuilleton of *La Presse*, under the *nom de plume* of Charles Delaunay, were collected under the title of *Lettres Parisiennes* (1843), and obtained a success which has proved as permanent as it was brilliant. But it was to more elaborate efforts that the authoress would have preferred to entrust her reputation, and she indeed confesses, in a half serious half mocking mood, that it was almost a disappointment to find herself famous for so slight a thing. To the close of her life she continued to appear both as a novelist and as a writer for the stage, and in both departments she reaped a wide popularity through the wit and emotional force of her productions. *Contes d'une vieille fille à ses neveux* (1832), *La canne de Monsieur de Balzac* (1836), and *Il ne faut pas jouer avec la douleur* (1853) are among the best known of her romances; and her dramatic pieces include *L'École des journalistes* (1840), *Judith* (1843), *Cléopatre* (1847), *C'est la faute du mari* (1851), *Lady Tartufe* (1853), *La joie fait peur* (1854), *Le chapeau d'un horloger* (1854), and *Une femme qui déteste son mari*, which did not appear till after the author's death. In the literary society of her time Madame Girardin exercised no small personal influence, and among the frequenters of her drawing-room were Gautier and Balzac, Alfred de Musset and Victor Hugo. During the latter years of her life a pensive melancholy gathered round her: for long years she had prayed the prayer of Hannah, and her woman's heart had not been comforted. Her collected works were published in six volumes, 1860–1861.

See Sainte-Beuve, *Causeries du lundi*, t. iii.; G. de Molènes, "Les femmes poètes," in *Revue des Deux Mondes*, July 1842; Taxile Delord, *Les Matinées littéraires*, 1860; *L'esprit de Madame Girardin, avec une préface par M. Lamartine*, 1862: G. d'Heilly, *Madame de Girardin, sa vie et ses œuvres*, 1868.

GIRARDIN, SAINT-MARC (1801–1873), a politician and man of letters whose real name was Marc Girardin simply, was born at Paris in 1801, and died at Morsang-sur-Seine on the 11th of April 1873. His school career at the Lycée Henri IV. was a distinguished one, and he afterwards took university honours both in literature and law, but he never practised at the bar. During the reign of Charles X. he obtained several Academy prizes, and a mastership at the Lycée Louis le Grand, though his liberal principles stood a little in his way. In 1828 he began to contribute to the *Journal des Débats*, on the staff of which he remained for nearly half a century. At the accession of Louis Philippe he was appointed professor of history at the Sorbonne and master of requests. Soon afterwards he exchanged his chair of history for one of literature, continuing to contribute political articles to the *Débats*, and sitting as deputy in the chamber from 1835 to 1848. As a professor he directed his efforts chiefly against the clerical reaction. In 1844 he was elected a member of the Academy. During the revolution of February 1848 Girardin was for a moment a minister, but after the establishment of the republic he was not re-elected deputy, nor did he take any prominent part in politics during the second empire save with his pen. In the capacity of journalist he continued to be active, and interested himself not merely in moderate opposition to the Government at home but also in foreign politics, especially in the affairs of Syria, Greece, and Turkey. After the war of 1870 he was returned to the Bordeaux assembly by his old department—the Haute Vienne. His Orleanist tendencies and his objections to the republic were strong, and though he at first supported Thiers, he afterwards became a leader of the opposition to the president. He died, however, before Thiers was actually driven from power. Saint-Marc Girardin was one of the most distinguished of the many writers whose political and literary activities combined have raised them to distinction in France during this century, but to whom there cannot be assigned the highest rank either as politicians or as littérateurs. His political claims were not above those of a vigorous and intelligent journalist. His professorial lectures were popular and well attended; his literary knowledge was wide, and included German and Italian; his criticisms, on which his claims as a man of letters rest, were acute and well expressed, but not remarkable for great subtlety or novelty of thought or style.

His chief work is his *Cours de littérature dramatique* (1843–1863), a series of lectures, the delivery and publication of which lasted for over twenty years. This work has for second title *De l'Usage des Passions dans le Drame*, which describes it more accurately. The author goes through the list of the various passions, and of the chief situations which call them out, discussing at the same time the mode in which they are treated in the most celebrated dramas of ancient and modern times. The source of these illustrations is not indeed limited to drama, and the lecturer takes a wide range over the fields of poetry and romance. The result was doubtless as a course of lectures interesting and stimulating; as a book it is somewhat desultory. Among his other works may be noticed *Essais de Littérature* (1844, 2 vols.), made up chiefly of contributions to the *Débats*, his *Notices sur l'Allemagne* (1834), and many volumes of collected *Souvenirs, Reflexions*, &c., on foreign countries and passing events. His latest works of literary importance were *La Fontaine et les Fabulistes* (1867) and an *Étude sur J. J. Rousseau* (1870) which had appeared in the *Revue des Deux Mondes*.

GIRARDON, FRANÇOIS (1628–1715), a sculptor whose works are typically characteristic of the epoch of Louis XIV., was born at Troyes in 1628, and died in the Louvre in 1715. As a boy he had for master a joiner and wood-carver of his native town, Baudesson by name (*Arch. de l'Art Français*, v. 4), under whom he is said to have worked at the château of Liébault, where he attracted the notice of Chancellor Séguier. By the chancellor's influence Girardon was first removed to Paris and placed in the studio of François Anguier, and afterwards sent to Rome. In 1650 he returned to France, and seems at once to have addressed himself with something like ignoble subserviency to the task of conciliating Le Brun, who owed his start in life to the same patron. Girardon is reported to have declared himself incapable of composing a group, whether with truth or from motives of policy it is impossible to say. This much is certain, that a very large proportion of his work was carried out from designs by Le Brun, and shows the merits and defects of Le Brun's manner—a great command of ceremonial pomp in presenting his subject, coupled with a large treatment of forms which if it were more expressive might be imposing. The court which Girardon paid to the "premier peintre du roi" was rewarded. An immense quantity of work at Versailles was entrusted to him, and in recognition of the successful execution of four figures for the Bains d'Apollon, Le Brun induced the king to present his protegé personally with a purse of 300 louis, as a distinguishing mark of royal favour. In 1650 Girardon was made member of the Academy, in 1659 professor, in 1674 "adjoint au recteur," and finally in 1695 chancellor. Five years before (1690), on the death of Le Brun, he had also been appointed "inspecteur général des ouvrages de sculpture"—a place of power and profit. In 1699 he completed the bronze equestrian statue of Louis XIV., erected by the town of Paris on the Place Louis le Grand. This statue was melted down during the Revolution, and is known to us only by a small bronze model (Louvre) finished by Girardon himself. His Tomb of Richelieu (church of the Sorbonne) was saved from destruction by M. Alexandre Lenoir, who received a bayonet thrust in protecting the head of the cardinal from mutilation. It is a capital example of Girardon's work; but amongst other important specimens yet remaining may also be cited the Tomb of Louvois (St Eustache), that of Bignon (St Nicolas du Chardonneret), and decorative sculptures in the Galerie d'Apollon and Chambre du roi, in the Louvre. Although chiefly occupied at Paris, Girardon never forgot his native Troyes. In the Hôtel de Ville is still shown a medallion of Louis XIV., and in the church of St Rémy a bronze crucifix of some importance,—both works by his hand. In 1850 M. Corrard de Breban, who has given much time to researches concerning artists native to the town of Troyes, published a *Notice sur la vie et les œuvres de Girardon*.

GIRDLE, a band of leather or other material worn round the waist, either to confine the loose and flowing outer robes so as to allow freedom of movement, or to fasten and support the garments of the wearer. In southern Europe and in all Eastern countries the girdle was and still is an important article of dress. Among the Romans it was used to confine the *tunica*; and so general was the custom that the want of a girdle was regarded as strongly presumptive of idle and dissolute propensities. It also formed a part of the dress of the Greek and Roman soldier; the phrase *cingulum deponere*, to lay aside the girdle, was as equivalent to quitting the service. It was used as now in the East to carry money in; hence *zonam perdere*, to lose one's purse.

Girdles and girdle-buckles are not found in early Celtic interments, nor are they frequent in Gallo-Roman graves. But in Frankish and Burgundian graves they are almost constantly present, often ornamented with plaques of bronze or silver, and the clasps and mountings chased or inlaid with various ornamental designs, occasionally including figures of the cross, and rude representations of Scripture subjects. In later times girdles are frequently represented on brasses and monumental effigies from the 12th to the 16th century. They were either of leather or of woven materials, often of silk and adorned with gold and gems. The mode in which they were worn is shown on the effigies; usually fastened by a buckle in front, the long free end of the girdle was passed up underneath and then down over the cincture, and through the loop thus formed the ornamented end hung down in front. Among the sumptuary regulations of Edward III. there were prohibitions against wearing girdles of gold and silver unless the wearer were of knightly rank or worth £200 a year. Similar regulations against extravagance in girdles are occasionally found to the 16th century. The brasses of the 15th century present many beautiful examples of ladies' girdles, which were often worn like that of the knight with the ornamental end hanging down in front, sometimes with both ends depending from a large clasp or ornamental fastening in the centre. Allusions to the girdle are common in the poetry of the 16th and 17th centuries. The purse, the dagger, the rosary, the pen and inkhorn and the bunch of keys were carried suspended from it, and hence it was an ancient custom for bankrupts or insolvent persons to put off and surrender their girdles in open court. It is recorded that the widow of Philip I., duke of Burgundy, renounced her right of succession by putting off her girdle upon the duke's tomb. The girdle, which was a very important element in the dress of the Levitical priesthood, does not appear as an ecclesiastical vestment in the Christian Church until the 8th century. Germanus, who died in 740, mentions the girdle worn by deacons; and Hrabanus Maurus in the succeeding century speaks of the girdle as one of the regular vestments, and refers to its symbolism. Some centuries later the church had to discountenance extravagance in this article of attire, and splendour in the decoration of girdles was denounced as secular and unbefitting the ecclesiastical character.

GIRGEH, GIRGA, or JIRJEH, a town of Upper Egypt, situated on the left bank of the Nile, about 9 miles north-west of the ancient city of Abydus. It owes its name to the Coptic monastery of St George or Girgis, and is the seat of a Coptic bishop, possesses eight mosques and a Roman Catholic monastery which ranks as the oldest in Egypt, and numbers from 8000 to 10,000 inhabitants, of whom about 500 are Christians. For a long time it was the capital of the Sa'id, but this rank is now held by Soohag. The worst enemy of Girgeh is the river, which was a quarter of a mile to the east at the time of Pococke's visit about 1740, but has gradually crept nearer, and is now slowly undermining the very site of the town.

GIRGENTI, a city in the south of Sicily, at the head of a province of its own name, occupies a fine position about 3 miles from the coast on a platform of Mount Camicus, more than 1100 feet above the level of the sea. It lies about 60 miles S.S.E. of Palermo, with which it is connected by a railway 90 miles long. As seen from the lower ground Girgenti presents a grandiose but sombre appearance, with its buildings rising in close array from ancient substructions and the steep rocks of the mountain; but within it is for the most part mean, monotonous, and melancholy, the streets with few exceptions being confined, irregular, steep, and ill-paved, and the houses all presenting the same grey-brown walls, the same reddish roofs, and the same narrow doors and narrow windows. The cathedral, begun in the 14th century, has still an impressive effect, in spite of the incongruous mixture of styles; but the interior is a typical specimen of modern rococo. The acoustic conditions are sufficiently peculiar: a word spoken in the softest whisper at the entrance can be distinctly heard behind the choir, 100 paces off. One of the chapels contains the shrine and bears the name of St Gerlando, the first bishop of Girgenti; the altar-piece is a Virgin and Child by Guido Reni; and in the north aisle there stands a marble sarcophagus now used as a font, with fine rilievos, probably of Roman workmanship after a Greek original, representing the story of Hippolytus and Phædra. Not only are the archives of the cathedral rich in historic documents of the Norman period, but they profess to contain an autograph letter of the devil himself. Among the other churches, upwards of forty in number, S. Maria dei Greci is worthy of note as preserving two Doric pillars which had belonged to the temple of Zeus Polieus, founded in 570 B.C. by Phalaris, and are thus the oldest architectural remains in Girgenti. As the chief town of a province, Girgenti is the residence of a prefect and the military headquarters of the district. It is also the seat of the wealthiest bishopric in Sicily, dating from the pontificate of Urban II.; and it possesses a chamber of commerce and art, an industrial institute, a lyceum, a gymnasium, a technical school, and an episcopal seminary. Its principal library, Bibliotheca Lucchesiana, was presented to the town by Don Andrea Lucchese of the family of Campo Franco; the Casino Empedocleo, with well-appointed library and reading-rooms, was founded by a number of the wealthier citizens. In the early part of the century Girgenti was a poverty-stricken town, but it has attained a considerable degree of prosperity since 1850. It lies in the centre of the sulphur district of Sicily, and its port, formerly Molo di Girgenti, now Porto Empedocle, is the principal place of shipment. The harbour has been largely improved since 1870: the pier, originally constructed in the 17th century, in part at least from the ruins of the temple of the Olympian Jupiter, has been extended to a length of 4800 feet, so as to include an area of 330,000 square yards, and the depth, which was only 10 feet on the bar and 16 within, has been greatly increased by dredging. Around the port, which is 3 miles from the city proper, has gathered a cluster of houses and stores, and the spot is defended by a small fort. Almonds and grain are the only important articles of export besides sulphur; but, though the grain-pits hewn out of the rock are of large extent, the actual shipments of grain are not very great. The average value of the annual export of sulphur amounted, between 1868 and 1870, to £411,700, while that of the other articles was less than £15,000 each. The population of Girgenti was 18,802 in 1871, and that of Porto Empedocle 6691. In the history of Girgenti there is little of note; the historical interest of the district gathers round the splendid ruins of the older Agrigentum, which lie between Girgenti and the sea.

See Piccone, *Memorie storiche Agrigentine*; De la Salle's *Voyage pittoresque en Sicile*; Häckel's "Reiseskizzen aus Sicilien," in *Zeitschrift für Erdk. zu Berlin*, 1860; Renan, "Voyage in Sicile," in *Revue des Deux Mondes*, Nov. 1875.

GIRODET DE ROUSSY, ANNE LOUIS (1767–1824), better known as Girodet-Trioson, was born at Montargis, January 5, 1767. He lost his parents in early youth, and the care of his fortune and education fell to the lot of his guardian, M. Trioson, "médecin de mesdames," by whom he was in later life adopted. After some preliminary studies under a painter named Luquin, Girodet entered the school of David, and at the age of twenty-two he successfully competed for the Prix de Rome. At Rome he executed his Hippocrate refusant les présents d'Artaxerxes, and Endymion dormant (Louvre), a work which was hailed with acclamation at the Salon of 1792. The peculiarities which mark Girodet's position as the herald of the romantic movement are already evident in his Endymion. The firm-set forms, the grey cold colour, the hardness of the execution, are proper to one trained in the school of David, but these characteristics harmonize ill with the literary, sentimental, and picturesque suggestions which the painter has sought to render. The same incongruity marks Girodet's Danae, and his Quatre Saisons, executed for the king of Spain, (repeated for Compiègne), and shows itself to a ludicrous extent in his Fingal (St Petersburg, Leuchtenberg collection), executed for Napoleon I. in 1802. This work unites the defects of the classic and romantic schools, for Girodet's imagination ardently and exclusively pursued the ideas excited by varied reading both of classic and modern literature, and the impressions which he received from the external world afforded him little stimulus or check; he consequently retained the mannerisms of his master's practice whilst rejecting all restraint on choice of subject. The credit lost by Fingal Girodet regained in 1806, when he exhibited Scène de Deluge (Louvre), to which (in competition with the Sabines of David) was awarded the decennial prize. This success was followed up in 1808 by the production of the Reddition de Vienne, and Atala au Tombeau—a work which went far to deserve its immense popularity, by a happy choice of subject, and remarkable freedom from the theatricality of Girodet's usual manner, which, however, soon came to the front again in his Révolte de Caire (1810). His powers now began to fail, and his habit of working at night and other excesses told upon his constitution; in the Salon of 1812 he exhibited only a Tête de Vierge; in 1819 Pygmalion et Galatée showed a still further decline of strength; and in 1824—the year in which he produced his portraits of Cathelineau and Bonchamps—Girodet died on 9th December, aged fifty-nine.

The number of his paintings is inconsiderable; but he executed a vast quantity of illustrations, amongst which may be cited those to the Didot *Virgil* (1798) and to the Louvre *Racine* (1801–1805). Fifty-four of his designs for *Anacreon* were engraved by M. Chatillon. Girodet wasted much time on literary composition, his poem *Le Peintre* (a string of commonplaces), together with poor imitations of classical poets, and essays on *Le Genie* and *La Grace*, were published after his death (1829), with a biographical notice by his friend M. Coupin de la Couperie; and M. Delecluze, in his *Louis David et son temps*, has also a brief life of Girodet.

GIRONDE, a maritime department in the S.W. of France, formed from four divisions of the old province of Guyenne, viz., Bordelais, Bazadais, and parts of Périgord and Agénois. It is bounded on the N. by the department of Charente-Inférieure, E. by those of Dordogne and Lot-et-Garonne, S. by that of Landes, and W. by the Bay of Biscay. It lies between 44° 12′ and 45° 35′ N. lat. and between 0° 18′ E. and 1° 16′ W. long., being 106 miles in length from N.W. to S.E., and 80 in breadth from N.E. to S.W. It takes its name from the river or estuary of the Gironde formed by the union of the Garonne and Dordogne. The department divides itself naturally into a western and an eastern portion. The former, which is termed *Les Landes*, occupies more than a third of the department, and consists chiefly of morasses, or of sandy and unfruitful downs. The downs stretching along the sea-coast have, however, been now planted with pines, which, binding the sand together by means of their roots, afford an efficacious protection against the encroachments of the sea. Near the coast are two extensive lakes, Carcans and Lacanau, communicating with each other, and with the bay of Arcachon, near the southern extremity of the department. The Bay of Arcachon contains numerous islands, and on the land side forms a vast shallow lagoon, a considerable portion of which, however, has been drained and converted into arable land. The eastern portion of the department consists chiefly of a succession of hill and dale, and, especially in the valley of the Gironde, is very fertile. The estuary of the Gironde is about 45 miles in length, and varies in breadth from 2 to 6 miles. The principal affluent of the Dordogne in this department is the Isle. The feeders of the Garonne are, with the exception of the Dropt, all small. West of the Garonne the only river of importance is the Leyre, which flows into the bay of Arcachon. The climate is humid and temperate. Wheat, rye, maize, millet, and hemp are grown to a considerable extent. The corn produced, however, does not more than half meet the wants of the inhabitants. The culture of the vine is by far the most important branch of industry carried on, the vineyards occupying about one-seventh of the surface of the department. The wine-growing districts are the Médoc, Graves, Côtes, Palus, and Entre-deux-Mers. The Médoc country grows the three *grands crus*. The Graves country forms a zone 30 miles in extent, and is situated in the vicinity of the Garonne and Dordogne, extending from Châtillon-sur-Gironde to Langon. This is the Sauterne country. The wines of the Côtes district are St Émilion, Pommerol, St Laurent, St Hippolyte, St Christophe, and St George. The Palus and Entre-deux-Mers produce is inferior. Fruits and vegetables are increasingly cultivated, strawberries, cherries, apricots, prunes, artichokes, and peas being largely exported. Tobacco is also cultivated to a considerable extent. Large supplies of resin, pitch, and turpentine are obtained from the pine wood. There are stone quarries and smelting works, but few mines. The manufactures are various, and, with the general trade, are chiefly carried on at Bordeaux. Gironde is divided into the arrondissements of Bordeaux, Blaye, Lesparre, Libourne, Bazas, and La Réole, with 48 cantons, and 547 communes. The chief town is Bordeaux. The total area is 3761 square miles; and the population in 1866 was 701,855, and in 1876 735,242. For a graphic description of the scenery of *Les Landes* in Gironde see the novel *Maître Pierre* of Edmund About.

GIRONDISTS. See FRANCE.

GIRVAN, a burgh of barony and market-town, in the county of Ayr, Scotland, is situated at the mouth of the river Girvan, 21 miles S.W. of Ayr, and nearly opposite Ailsa Craig, a rocky island 10 miles distant. The principal industry was formerly hand-loom weaving, but the number of persons so employed has decreased from 3000 to 300. Of late years the herring-fishing has been greatly developed; in the spring of 1879 304 boats were engaged in it, the "take" exceeding 20,000 crans. The harbour is a tidal one, with a depth at high water of only 9 feet. The public buildings are very superior; and of late many handsome villas have been erected. The situation of the town is one of the finest in the west of Scotland, and the shore affords excellent facilities for sea-bathing. The population, which was 7319 in 1851, had fallen to 4776 in 1871, but it is now increasing.

GISORS, a town of France, department of Eure, is situated in a pleasant valley on the Epte, 45 miles E.N.E. of Paris. Of its ancient castle, which dates from the 12th century, and was at one time one of the principal strongholds in the kingdom, the octagonal keep, built by Henry II. of England, remains entire, and the rest of the ruins still present an imposing appearance. Its ancient ramparts have been converted into promenades. There is a fine old church, the choir of which was built in 1240, and contains windows with portraits of Blanche of Castile and Louis VIII. The north portal is a good specimen of the florid style of the Renaissance. The church contains some fine sculptures and paintings. The principal other buildings are the communal college, the convent, and the hospital. The industries include tanning, brewing, cotton-spinning, and bleaching. The population in 1876 was 3590.

GITSCHIN, the chief town of a circle in Bohemia, is situated on the Cydlina and on the North-West Austrian railway, 50 miles N.E. of Prague. The principal buildings are the parish church, erected after the model of the pilgrim's church of Santiago de Compostella in Spain; the prison, formerly a Jesuit college; the castle, built by Wallenstein in 1630; the gymnasium, the normal school, and the real school. There is a considerable trade in corn. Gitschin was made the capital of the duchy of Friedland by Wallenstein in 1627, at which time it contained only 200 houses. Wallenstein was interred at the neighbouring Carthusian monastery, but in 1639 the head and right hand were taken by General Banér to Sweden, and in 1702 the other remains were removed by Count Vincent of Waldstein to his hereditary burying ground at Münchengrätz. At Gitschin the Prussians gained a great victory over the Austrians, June 29, 1866. The population in 1869 was 6750.

GIULIO ROMANO. See PIPPI.

GIUNTA PISANO, the earliest Italian painter whose name is found inscribed on an extant work, exercised his art from 1202 to 1236; he may perhaps have been born towards 1180 in Pisa, and died in or soon after 1236. There is some ground for thinking that his family-name was Capiteno. In recent times some efforts have been made to uphold his deservings as an artist, thereby detracting so far from the credit due to the initiative of Cimabue; but it cannot be said that these efforts rest on a very solid basis. To most eyes the performances of Giunta merely represent a continuing stage of the long period of pictorial inaptitude. The inscribed work above referred to, one of his earliest, is a Crucifix now or lately in the kitchen of the convent of St Anne in Pisa. Other Pisan works of like date are very barbarous, and some of them may be also from the hand of Giunta. It is said that he painted in the upper church of Assisi,—in especial a Crucifixion dated 1236, with a figure of Father Elias, the general of the Franciscans, embracing the foot of the cross. In the sacristy is a portrait of St Francis, also ascribed to Giunta; but it more probably belongs to the close of the 13th century. This artist was in the practice of painting upon cloth stretched on wood, and prepared with plaster.

GIURGEVO, in Roumanian *Giurgiu* or *Shursha*, a town of Roumania (formerly of Lower Wallachia), at the head of the district of Vlashka, lies on the left or northern bank of the Danube, over against Rustchuk in Bulgaria, and is distant about 40 miles from Bucharest, with which it has been connected by railway since 1869. It presents on the whole rather a mean appearance, rising out of the mud embankments of the river, but its population is increasing, its commerical advantages as the port of Bucharest are becoming more generally recognized, and improvements are consequently being effected in the town itself. It is the seat of a court of primary instance, and has a normal school and a gymnasium. The fortifications to which it was formerly indebted for no small part of its importance were destroyed in 1829, and its only defence is a castle on the island of Slobosia, with which it communicates by a bridge. Giurgevo, or, as it was called by its founders, San Zorzo, that is, San Giorgio, or St George's, owes its origin to the Genoese of the 14th century. It has frequently figured in the wars whereby the lower Danube has so often been laid waste. The population in 1875 was about 15,000.

GIUSTI, Giuseppe (1809–1850), Tuscan satirical poet, was born at Monsummano, a small village of the Valdinievole, on May 12, 1809. His father, a cultivated and rich man, accustomed his son from childhood to study, and himself taught him, among other subjects, the first rudiments of music. Afterwards, in order to curb his too vivacious disposition, he placed the boy under the charge of a priest near the village, whose severity did perhaps more evil than good. At twelve Giusti was sent to school at Florence, and afterwards to Pistoia and to Lucca; and during those years he wrote his first verses. In 1826 he went to study law at Pisa; but, disliking the study, he spent eight years in the course, instead of the customary four. He lived gaily, however, though his father kept him short of money, and learned to know the world, seeing the vices of society, and the folly of certain laws and customs from which his country was suffering. The experience thus gained he turned to good account in the use he made of it in his satire.

His father had in the meantime changed his place of abode to Pescia; but Giuseppe did worse there, and in November 1832, his father having paid his debts, he returned to study at Pisa, seriously enamoured of a woman whom he could not marry, but now commencing to write in real earnest in behalf of his country. With the poem called *La Ghigliottina* (the guillotine), Giusti began to strike out a path for himself, and thus revealed his great genius. From this time he showed himself the Italian Béranger, and even surpassed the Frenchman in richness of language, refinement of humour, and depth of satirical conception. In Béranger there is more feeling for what is needed for popular poetry. His poetry is less studied, its vivacity perhaps more boisterous, more spontaneous; but Giusti, in both manner and conception, is perhaps more elegant, more refined, more penetrating. In 1834 Giusti, having at last entered the legal profession, left Pisa to go to Florence, nominally to practice with the advocate Capoquadri, but really to enjoy life in the capital of Tuscany. He fell seriously in love a second time, and as before was abandoned by his love. It was then he wrote his finest verses, by means of which, although his poetry was not yet collected in a volume, but for some years passed from hand to hand, his name gradually became famous. The greater part of his poems were published clandestinely at Lugano, at no little risk, as the work was destined to undermine the Austrian rule in Italy. After the publication of a volume of verses at Bastia, Giusti thoroughly established his fame by his *Gingillino*, the best in moral tone as well as the most vigorous and effective of his poems. The poet sets himself to represent the vileness of the treasury officials, and the base means they used to conceal the necessities of the state. The *Gingillino* has all the character of a classic satire. When first issued in Tuscany, it struck all as too impassioned and personal. Giusti entered heart and soul into the political movements of 1847 and 1848, served in the national guard, sat in the parliament for Tuscany; but finding that there was more talk than action, that to the tyranny of princes had succeeded the tyranny of demagogues, he began to fear, and to express the fear, that for Italy evil rather than good had resulted. He fell, in consequence, from the high position he had held in public estimation, and in 1848 was regarded as a reactionary. His friendship for the marquis Gino Capponi, who had taken him into his house during the last years of his life, and who published after Giusti's death a volume of illustrated proverbs, was enough to compromise him in the eyes of such men as Guerrazzi, Montanelli, and Niccolini. On May 31, 1850, he died at Florence in the palace of his friend.

The poetry of Giusti, under a light trivial aspect, has a lofty civilizing significance. The type of his satire is entirely original, and it had also the great merit of appearing at the right moment, of wounding judiciously, of sustaining the part of the comedy that "castigat ridendo mores." Hence his verse, apparently jovial, was received by the scholars and politicians of Italy in all seriousness. Alexander Manzoni in some of his letters showed a hearty admiration of the genius of Giusti; and the weak Austrian and Bourbon Governments regarded them as of the gravest importance.

His poems have been often reprinted, the best editions being those of Le Monnier of Florence, and also that published in Verona, with valuable annotations, by Professor Giovanni Fioretti in 1876. Besides the poems, and the proverbs already mentioned, we have a volume of select letters, full of vigour and written in the best Tuscan language, and a fine critical discourse on Giuseppe Parini, the satirical poet of the last century, whose poetical works are published in a volume by Le Monnier. In some of his compositions the elegiac rather than the satirical poet is seen. Many of his verses have been excellently translated into German by Paul Heyse. Good English translations were published in the *Athenæum* by the late Mrs T. A. Trollope.

GIUSTINIANI, the name of a prominent Italian family which originally belonged to Venice, but established itself subsequently in Genoa also, and at various times had representatives in Naples, Corsica, and several of the islands of the Archipelago.

In the Venetian line the following are most worthy of mention. I. Lorenzo (1380–1465), the Laurentius Justinianus of the Roman calendar, at an early age entered the congregation of the canons of Saint George in Alga, and in 1433 became general of that order. About the same time he was made by Eugenius IV. bishop of Venice; and his episcopate was marked by considerable activity in church extension and reform. On the removal of the patriarchate from Grado to Venice by Nicholas V. in 1451, Giustiniani was promoted to that dignity, which he held for fourteen years. He died on January 8, 1465, was canonized by Pope Alexander VIII., his festival (semi-duplex) being fixed by Innocent XII. for September 5th, the anniversary of his elevation to the bishopric. His works, consisting of sermons, letters, and ascetic treatises, have been frequently reprinted,—the best edition being that of the Benedictine P. N. A. Giustiniani, published at Venice in 2 vols. folio, 1751. They are wholly devoid of literary merit. His life has been written by Bernard Giustiniani, by Maffei, and also by the Bollandists. (2.) Leonardo (1388–1446), brother of the preceding, was for some years a senator of Venice, and in 1443 was chosen procurator of St Mark. He translated into Italian Plutarch's *Lives of Cinna and Lucullus*, and was the author of some poetical pieces, amatory and religious, as well as of rhetorical prose compositions. (3.) Bernardo (1408–1489), son of Leonardo, was a pupil of Guarino and of George of Trebizond, and entered the Venetian senate at an early age. He served on several important diplomatic missions both to France and Rome, and about 1485 became one of the council of ten. His orations and letters were published in 1492; but his title to any measure of fame he possesses rests upon his history of Venice, *De Origine Urbis Venetiarum rebusque ab ipsa gestis historia* (1492), which was translated into Italian by Domenichi in 1545, and which at the time of its appearance was undoubtedly the best work upon the subject of which it treated. It is to be found in vol. i. of the *Thesaurus* of Grævius. (4.) PIETRO, also a senator, lived in the 16th century, and wrote an *Historia rerum Venetarum* in continuation of that of Bernardo. He was also the author of chronicles *De Gestis Petri Mocenigi* and *De Bello Venetorum cum Carolo VIII.* The latter has been reprinted in the *Script. Rer. Ital.*, vol. xxi.

Of the Genoese branch of the family the most prominent members were the following. (1.) PAOLO, DI MONIGLIA (1444–1502), a member of the order of Dominicans, was, from a comparatively early age, prior of their convent at Genoa. As a preacher he was very successful, and his talents were fully recognized by successive popes, by whom he was made master of the sacred palace, inquisitor-general for all the Genoese dominions, and ultimately bishop of Scio and Hungarian legate. He was the author of a number of Biblical commentaries (no longer extant), which are said to have been characterized by great erudition. (2.) AGOSTINO (1470–1536), was born at Genoa, and spent some wild years in Valencia, Spain. Having in 1487 joined the Dominican order, he gave himself with great energy to the study of Greek, Hebrew, Chaldee, and Arabic, and in 1514 commenced the preparation of a polyglot edition of the Bible. As bishop of Nebbio in Corsica, he took part in some of the earlier sittings of the Lateran council (1516–17), but, in consequence of party complications, withdrew to his diocese, and ultimately to France, where he became a pensioner of Francis I., and was the first to occupy a chair of Hebrew and Arabic in the university of Paris. After an absence from Corsica for a period of five years, during which he visited England and the Low Countries, and became acquainted with Erasmus and More, he returned to Nebbio about 1522, and there remained, with comparatively little intermission, till in 1536, when, while returning from a visit to Genoa, he perished in a storm at sea. He was the possessor of a very fine library, which he bequeathed to the republic of Genoa. Of his projected polyglot only the Psalter was published (*Psalterium Hebræum, Græcum, Arabicum, et Chaldaicum*, Genoa, 1516). Besides the Hebrew text, the LXX. translation, the Chaldee paraphrase, and an Arabic version, it contains the Vulgate translation, a new Latin translation by the editor, a Latin translation of the Chaldee, and a collection of scholia. Giustiniani printed 2000 copies at his own expense, including fifty in vellum for presentation to the sovereigns of Europe and Asia; but the sale of the work did not encourage him to proceed with the New Testament, which he had also prepared for the press. Besides an edition of the book of Job, containing the original text, the Vulgate, and a new translation, he published a Latin version of the *Moreh Nevochim* of Maimonides (*Director Dubitantium aut Perplexorum*, 1520), and also edited in Latin the *Aureus Libellus* of Æneas Platonicus, and the *Timæus* of Chalcidius. His annals of Genoa (*Castigatissimi annali di Genova*) were published posthumously in 1537.

The name Giustiniani has also been borne by the following:—(1.) POMPEIO (1569–1616), a native of Corsica, who served under Alessandro Farnese and the marquis of Spinola in the Low Countries, where he lost an arm, and, from the artificial substitute which he wore, came to be known by the soubriquet Bras de Fer. He also defended Crete against the Turks; and subsequently was killed in a reconnaissance at Friuli. He left in Italian a personal narrative of the war in Flanders, which has been repeatedly published in a Latin translation (*Bellum Belgicum*, Antwerp, 1609). (2.) GIOVANNI (1513–1556), born in Candia, translator of Terence's *Andria* and *Eunuchus*, of Cicero's *In Verrem*, and of Virgil's *Æneid*, l. viii. (3.) ORSATTO (1538–1603), Venetian senator, translator of the *Œdipus Tyrannus* of Sophocles, and author of a collection of *Rime*, in imitation of Petrarch. He is regarded as one of the latest representatives of the classic Italian school. (4.) GERONIMO, a Genoese, flourished during the latter half of the 16th century. He translated the *Alcestis* of Euripides and three of the plays of Sophocles; and wrote two original tragedies, *Jephte* and *Christo in Passione.* (5.) VINCENZO, who in the beginning of the 17th century built the Roman palace and made the art-collection which are still associated with his name (see *Galleria Giustiniana*, Rome, 1631). The collection was removed in 1807 to Paris, where it was to some extent broken up. In 1815 all that remained of it, about 170 pictures, was purchased by the king of Prussia and removed to Berlin, where it forms a portion of the royal museum.

GIVET, one of the strongest fortified towns of France, on the Belgian frontier, situated in the department of Ardennes, on the river Meuse, 40 miles N.N.E. of Mezières. The Eastern French railway connects it with Rheims, and the Belgian railways connect it with Namur and Charleroi. It is divided into three portions—the citadel called Charlemont, and Grand Givet on the left bank of the river, and on the opposite bank Petit Givet, connected with Grand Givet by a stone bridge of five arches. The citadel of Charlemont, built by the emperor Charles V. in 1555, is situated at the top of a precipitous rock 705 feet high, and on the east side, by which alone it is accessible, is fortified by six bastions and several other works. Grand Givet has four bastions and three ravelins, and Petit Givet 3 bastions. The fortress has accommodation for 25,000 men, but can be held by 3000 or 4000. The town is famed for its clay tobacco-pipes. There are also manufactures of nails, lead pencils, sealing wax, white lead, glue, earthenware, and leather, and the town has some trade. The population in 1876 was 5275.

GIVORS, a town of France, department of Rhône, is situated on the Rhone and the canal of Rive-de-Gier, near the railway between Lyons and St Étienne, 14 miles south of Lyons. It has glass and tile works, potteries, tanneries, foundries, silk factories, and dyeworks, and is the principal entrepôt for the coal and coke of the Gier valley. Near it are the ruins of the château of St Gerald and of the convent of St Ferréol. Population (1876), 10,856.

GLACIER,[1] a name given to a mass of ice, having its origin in the hollows of mountains where perpetual snow accumulates, but which makes its way down towards the lower valleys, where it gradually melts, until it terminates exactly where the melting, due to the contact of the warmer air, earth, and rain of the valley, compensates for the bodily descent of the ice from the snow reservoirs of the higher mountains.

The diminution of temperature as we ascend the slopes of mountains, is indicated by successive zones of vegetation, and finally by the occurrence of perpetual snow (see GEOLOGY, p. 280). It was first shown by Baron Humboldt and Von Buch that the limit of perpetual snow depends principally on the temperature of the summer, and not upon that of the whole year.

[1] The following are synonyms in different languages and dialects:—French, *glacier*; German, *gletscher*; Italian, *ghiacciaja*; Tyrolese, *fern*; in Carinthia, *käss*; in the Valais, *biegno*; in part of Italy, *vedretto*; in Piedmont, *ruize*; in the Pyrenees, *serneille*; in Norway, *iisbræ* or *iisbrede*; in Lapland, *geikna* or *jegna*; in Iceland, *jökull* or *falt-jökull*.

A glacier usually protrudes into a valley far below the limit of perpetual snow, and terminates amidst a wilderness of stones borne down upon its surface and deposited by its fusion. This earthy and rocky rubbish is termed moraine matter, and has already been described (GEOLOGY, p. 281). Lying in front of the lower end of a glacier, it marks in a characteristic and certain manner the greatest limit of extension which the glacier has at any one time attained. Sometimes a glacier is seen to have withdrawn very far within its old limits, leaving a prodigious barren waste of stones in advance of it, which, being devoid of soil, nourishes not one blade of grass. At other times the glacier pushes forward its margin beyond the limit which it has ever reached (at least within the memory of man), tears up the ground with its icy ploughshare, and shoves forward the yielding turf in wrinkled folds, uprooting trees, moving vast rocks, and scattering the walls of dwelling-houses in fragments before its irresistible onward march.[1]

The lower end of a glacier is usually steep,—sometimes with a dome-shaped unbroken outline, more frequently broken up by intersecting cracks into prismatic masses which the continued action of the sun and rain sharpen into pyramids, often assuming (as in the glacier of Bossons at Chamouni) grotesque or beautiful forms. From a vault in the green-blue ice, more or less perfectly formed each summer, the torrent issues which represents the natural drainage of the valley, derived partly from land springs, partly from the fusion of the ice. The united or crevassed condition of the glacier generally depends almost entirely on the slope of its bed. If it incline rapidly, numerous transverse fissures are formed from the imperfect yielding of the ice during its forced descent along its uneven channel. These cracks often extend for hundreds of yards, and may be hundreds of feet in depth; but their greatest depth is not accurately known, since they are rarely quite vertical. In many cases, however, the crevasses are comparatively few in number, and the glacier may be readily traversed in all directions. This is especially the case if a glacier of considerable dimensions meets with any contraction in its course. The ice is embayed and compressed, and its slope lessens, just as in the case of a river when it nears a similar contraction preceding a fall. Such level and generally traversable spaces may be found about the middle regions of the Mer de Glace, the lower glacier of Grindelwald, the lower glacier of the Aar, and in many other cases. The last-named glacier is perhaps the most remarkably even and accessible of any in Switzerland. The slope of its surface is in many places only 3°. The Pasterzen glacier in Carinthia is even less inclined. It is in such portions of a glacier that we commonly find internal cascades, or "moulins." These arise from the surface water being collected into a considerable mass by a long course over its unbroken surface, and then precipitated with violence into the first fissure it meets with. The descending cascade keeps open its channel, which finally loses the form of a fissure, presenting that of an open shaft, often of immense depth.

Nearly connected in their origin with the internal cascades are the "gravel cones," occasionally seen on the surface of glaciers, which appear to be formed in this way. A considerable amount of earthy matter derived by the superficial water-runs from the moraine accumulates in heaps in the inequalities of the ice, or at the bottom of the "moulins." As the glacier surface wastes by the action of the sun and rain, these heaps are brought to the surface, or rather the general surface is depressed to their level. If the earthy mass be considerable, the ice beneath is protected from the radiation of the sun and from the violent washing of the rain; it at length protrudes above the general level of the glacier, and finally forms a cone which appears to be entirely composed of gravel, but is in fact ice at the heart, with merely a protecting cover of earthy matter. These singular cones are very well seen on the glacier of the Aar, but on most others they are comparatively rare. The similar protective action of large stones detached from the moraines and lying on the surface of the ice often produces the striking phenomenon of "glacier tables." Stones of any considerable size almost invariably stand upon a slightly elevated pillar of ice; but when they are broad and flat they occasionally attain a height of 6 and even of 12 feet above the general level.

The superficial waste of a glacier is thus a very important phenomenon. Owing to it the body of the ice has its vertical thickness rapidly diminished during the heats of summer, and, as we have already intimated, the lower end of a glacier has its position determined by the amount of this waste. Suppose a glacier to move along its bed at the rate of 300 feet per annum, and imagine (merely for the sake of illustration) its yearly superficial waste to be 20 feet; then the thickness of the glacier will diminish by 20 feet for every 300 feet of its length, or at the rate of 360 feet per mile, so that the longitudinal section of a glacier has the form of a wedge; and however enormous its original thickness, after a certain course we must at length come to the thin end of the wedge, and that the more rapidly as the causes of melting increase towards the lower extremity. These causes are indeed so various that it is difficult to estimate them with accuracy. We have (1) the direct solar heat, (2) the contact of warm air, and (3) the washing of rain. All these causes act on the surface and produce the "ablation" of the surface. Besides these, the ice of the glacier wastes somewhat beneath by the contact of the soil and the washing of the inferior streams. This may be called its "subsidence." Further, the natural slope of the rocky bed of the glacier causes any point of the surface to stand absolutely lower each day in consequence of the progressive motion. These three causes united produce the "geometrical depression" of the surface. Principal J. D. Forbes showed how the several effects may usually be distinguished by observation. During the height of summer, near the Montanvert, he found the daily average ablation to be 3·62 inches, the daily subsidence to be 1·63 inches. Seventh-tenths of the geometrical depression are due therefore to the former cause, and three-tenths to the latter. This is a very large amount, and it is certain that during the colder period of the year, and whilst the glacier is covered with snow, the subsidence is not only suspended, but the glacier recruits in thickness a portion of its waste during the seasons of summer and autumn. To this subject we shall again return.

The middle region of the great glaciers of the Alps extends from the level of about 6000 to 8000 feet above the sea. The inclination is usually there most moderate—say from 2½° to 6°. But this is not invariably the case. Beyond 8000 feet we reach the snow-line. The snow-line is a fact as definite on the surface of a glacier as on that of a mountain, only in the former case it occurs at a somewhat lower level. It cannot be too distinctly understood that the fresh snow annually disappears from the glacier proper. Where it ceases entirely to melt, it of course becomes incorporated with the glacier. We have therefore arrived at the region where the glacier *forms*; everywhere below it only *wastes*. This snowy region of the glacier is called in French *névé*, in German *firn*. As we ascend the glacier it passes gradually from the state of ice to the state of snow. The

[1] Such a sudden and disastrous increase took place in many of the glaciers of Switzerland and Savoy in 1818 (occasioning the catastrophe of the Val de Bagnes), and in those of the Bergenstift in Norway about 1740. The retreat of a glacier far within its old moraines is well exemplified in most of the glaciers of the latter country, and especially in that of Nygaard.

superficial layers are more snowy and white, in fact nearly pure snow; the deeper ones have more colour and consistence, and break on the large scale into vast fragments, which at Chamouni are called *seracs*. The *névé* moves, as the glacier proper does, and it is fissured by the inequalities of the ground over which it passes. These fissures are less regular than those of the lower glacier. They are often much wider, in fact of stupendous dimensions, and, being often covered with treacherous snowy roofs, constitute one of the chief dangers of glacier travelling. The constitution of the *névé* may be well studied on the Glacier du Géant, a tributary of the Mer de Glace. The mountain-clefts in which large glaciers lie usually expand in their higher portions (in conformity with the ordinary structure of valleys) into extensive basins in which snow is perpetual, and which therefore contain the *névé*, the true origin and material of the glacier, which is literally the overflow of these snowy reservoirs. The amount of overflow, or the discharge of the glacier—upon which depends the extent of its prolongation into the lower valleys—depends in its turn on the extent of the *névé* or collecting reservoir. Glaciers with small reservoirs of necessity perish soon. Their thickness being small, the wedge of the glacier soon thins out. They are common in confined *cirques* of the higher mountains. Such are the glaciers of the second order described by De Saussure. Their slope is often very great—from 20° to 40°.

The ice of the glacier proper has a very peculiar structure, quite distinct from the stratification of the snow on the *névé* (the relics of its mode of deposit), and one which requires special notice. When we examine the appearance of the ice in the wall of an ordinary crevasse (especially if it be tolerably near the side of the glacier) we are struck with the beautiful vertically laminated structure (first observed by Principal Forbes) which it commonly presents, resembling delicately veined marble (especially the variety called in Italy *cipollino*), in shades varying from bluish-green, through green, to white. When we trace the direction of the planes constituting the laminated structure, by observing them on the surface of the glacier (where they are usually well seen after rain, or in the channels of superficial water-runs), we find that where best developed (or not very far from the sides of the glacier) these laminæ are nearly parallel to the sides, but rather incline from the shore to the centre of the ice stream as we follow the declivity of the glacier.

Forbes found that certain superficial discolorations in the form of excessively elongated hyperbolas are due to the recurrence (at intervals of some hundred feet along the course of the glacier) of portions of ice in which the veined structure is more energetically developed than elsewhere, and where, by the decomposition of the softer laminæ, portions of sand and dirt become entangled in the superficial ice, and give rise to the phenomena of "dirt bands," which thus at a distance display (though in a manner requiring some attention to discover) the exact course of this singular structure on the surface of the glacier. Fig. 1 displays

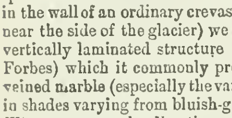


Fig. 1.

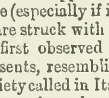

Fig. 2.

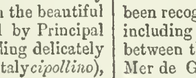

Fig. 3

the superficial form of the dirt bands, and the course of the structural laminæ projected horizontally. Fig. 2 shows an ideal transverse section of the glacier, and fig. 3 another vertical section parallel to its length. These three sections in rectangular planes will serve to give a correct idea of the course of this remarkable structure within the ice, but a more popular conception will be formed of it from the imaginary sections of a canal-shaped glacier in fig. 4. The structure of the compound glacier, originally double, becomes gradually single; and the "frontal dip" of the laminæ at the loop of the horizontal curves, which in the upper region is nearly vertical, gradually

Fig. 4.

slopes forwards until at the lower termination it has a very slight dip inwards, or indeed may be reversed and fall outwards and forwards. The general form of a structural lamina of a glacier rudely resembles that of a spoon.

This structure and the accompanying dirt bands have been recognized by different observers in almost all glaciers, including those of Norway and of India. The interval between the dirt bands has been shown in the case of the Mer de Glace (and therefore probably in other cases) to coincide with annual rate of progression, and in the higher parts of the glacier (towards the *névé*) to be accompanied by wrinkles or inequalities of the surface which are well marked by the snow lying in them during the period of its partial disappearance.

The Motion of Glaciers and its Causes.—There is something about a glacier which almost inevitably conveys to the mind the idea of a stream. This may be traced in the descriptions of unscientific tourists, of poets, and of some of those who have addressed themselves more seriously to the question of the real nature of these bodies. To the latter class of observers belong Captain Basil Hall and Monseigneur Rendu, bishop of Annecy, who had much more than hinted at the possibility of a true mechanical connexion between the descent of a glacier and that of a mountain torrent, or of a stream of lava. But until the actual conditions of motion were reduced to rule, it was impossible to know how far the analogy was real.

The most characteristic and remarkable feature of glaciers is their motion downwards from the *névé* towards the lower valley. The explanation of it is by far the most important application of mechanical physics connected with the subject. The principal theories to account for the progressive motion of glaciers which were prevalent previous to 1842 may be briefly characterized as De Saussure's and De Charpentier's, though each had been maintained long before by the earlier Swiss writers. The first may be called the *gravitation* theory, the latter the *dilatation* theory. Both suppose that the motion of the ice takes place by its sliding bodily over its rocky bed, but they differ as to the force which urges it over the obstacles opposed by friction and the irregularities of the surface on which it moves.

The following quotation from De Saussure explains his views with his usual precision:—"These frozen masses, carried along by the slope of the bed on which they rest, disengaged by the water (arising from their fusion owing to the natural heat of the earth) from the adhesion which they might otherwise contract to the bottom—sometimes even elevated by the water—must gradually slide and descend along the declivity of the valleys or mountain slopes (*croupes*) which they cover. It is this slow but continual sliding of the icy masses (*des glaces*) on their inclined bases which carries them down into the lower valleys, and which replenishes continually the stock of ice in valleys warm enough to produce large trees and rich harvests." Very sufficient objections have been urged against this theory. It is evident that De Saussure considered a glacier as an accumulation of icy fragments, instead of a great and continuous mass, throughout which the fissures and "crevasses" bear a small proportion to the solid portion; and that he has attributed to the subglacial water a kind and amount of action for which there exists no sufficient or even probable evidence. The main objection, however, is this, that a sliding motion of the kind supposed, if it commence, must be accelerated by gravity, and the glacier must slide from its bed in an avalanche. The small slope of most glacier-valleys, and the extreme irregularity of their bounding walls, are also great objections to this hypothesis.

The dilatation theory ingeniously meets the difficulty of the want of a sufficient moving power to drag or shove a glacier over its bed, by calling in the well-known force with which water expands on its conversion into ice. The glacier being traversed by innumerable capillary fissures, and being in summer saturated with water in all its parts, it was natural to invoke the freezing action of the night to convert this water into ice, and by the amount of its expansion to urge the glacier onwards in the direction of its greatest slope. In answer to this, it is sufficient to observe, in the first place, that during the height of summer the portions of those glaciers which move fastest are never reduced below the freezing point, and that, even in the most favourable cases of nocturnal radiation producing congelation at the surface, it cannot (by well-known laws of conduction) penetrate above a few inches into the interior of the glacier. Again, the ascertained laws of glacier-motion are (as will be immediately seen) entirely adverse to this theory, as it is always accelerated by hot weather and retarded by cold, yet does not cease even in the depths of winter.

It is singular how slow observers were to perceive the importance to the solution of the problem of glacier-motion of ascertaining with geometrical precision the amount of motion of the ice, not only from year to year, but from day to day, in summer and winter, whether constant or variable at the same point, whether continuous or by starts; if variable, on what circumstances it depended, and in what manner it was affected at different points of the length and breadth of a glacier.

This method of studying the question was taken up by Forbes. His observations were commenced on the Mer de Glace of Chamouni, in June 1842. Between the 26th and 27th of that month the motion of the ice opposite a point called the "Angle" was found, by means of a theodolite, to be 16·5 inches in 26 hours; between the 27th and 28th, 17·4 inches in 25½ hours; and from about 6 A.M. to 6 P.M. on the 28th the motion was 9·5 inches, or 17·5 inches in 24 hours; whilst the proportional motion during even an hour and a half was observed. No doubt could therefore remain that the motion of the ice is continuous and tolerably uniform—in short, that it does not move by jerks. He also ascertained about the same time that the motion of the ice is greatest towards the centre of a glacier and slower at the sides, contrary to an opinion then maintained on high authority. He next found that the rate of motion varied at different points of the length of the same glacier, being on the whole greatest where the inclination of its surface is greatest. As the season advanced, he observed notable changes in the rate of motion of the same part of the ice, and connected it by a very striking direct relation with the temperature of the air. These facts were established during the summer of 1842, and promptly published. By means of occasional observations during the following winter and spring by his guide, Auguste Balmat of Chamouni, and by a more full comparison of the entire motion of a glacier for twelve months with its motion during the hot season of the year, another generally received error was rectified: the motion of the glacier continues even in winter, and it has a very perceptible ratio to the summer motion. Last of all, it was found that the surface of a glacier moves faster than the ice nearer the bottom or bed.

These and some minor laws of motion, being undoubted expressions of the way in which glaciers move, were formulated by Forbes in an approximate theory: "A glacier is an imperfect fluid or a viscous body, which is urged down slopes of a certain inclination by the mutual pressure of its parts." The analogy subsisting between the motion of a glacier and that of a river (which is a viscous fluid,—were it not so, its motion would be widely different) will be best perceived by stating more precisely its laws of motion.

1. Each portion of a glacier moves, not indeed with a constant velocity, but in a continuous manner, and not by sudden subsidences with intervals of repose. This, of course, is characteristic also of a river.

2. The ice in the middle part of the glacier moves much faster than that near the sides or banks; also the surface moves faster than the bottom. Both these facts obtain in the motion of a river in consequence of the friction of the fluid on its banks, and in consequence also of that internal friction of the fluid which constitutes its viscosity.

Thus, at four stations of the Mer de Glace, distant respectively from the west shore of the glacier......100 230 405 365 yds., the relative velocities were .... 1·000 1·332 1·356 1·367.

3. The variation of velocity (as in a river) is most rapid near the sides, whilst the middle parts move nearly uniformly. This and the preceding laws are also fully brought out by the subsequent experiments of M. Agassiz on the glacier of the Aar, and of MM. Schlagintweit on the Pasterzen glacier.

4. The variation of velocity of a glacier from the sides to the middle is nearly in proportion to the absolute velocity of the glacier,—whether that absolute velocity change in the same place in consequence of change of season, or between one point and another of the length of the same glacier, depending on its declivity. See (5) and (6) below.

5. The glacier, like a stream, has its pools and its rapids. Where it is embayed by rocks it accumulates, its declivity increases, and its velocity at the same time. When it passes down a steep, issuing by a narrow outlet, its velocity increases. Thus the approximate declivities of the inferior, middle, and superior regions of the Mer de Glace (taken in the direction of its length) are..15° 4½°. 8° and the relative velocities are as the numbers .. 1·398 ·574 ·925.

6. A fact not less important than any of the preceding is that increased temperature of the air favours the motion of the ice, and generally whatever tends to increase the proportion of the watery to the solid constituents of a glacier, as mild rains, and especially the thawing of the superficial snow in spring. The velocity does not, however, descend to zero even in the depth of winter. Indeed, in the lower and most accessible portions of the Mer de Glace (or Glacier des Bois) and the Glacier des Bossons, the ratio of the winter to the summer motion is almost exactly 1 : 2. On endeavouring to establish a relation between the velocity of the glacier and the temperature of the ambient air, we find that these diminish together almost regularly down to the freezing-point, below which the velocity seems to remain constant.

Any mechanical theory of glaciers must be more or less imperfect which does not explain the remarkable veined or ribboned structure of the ice, with its peculiar course through the interior of the glacier, as above described. According to Forbes the fundamental idea is that the veined or ribboned structure of the ice is the result of internal forces, by which one portion of ice is dragged past another in a manner so gradual as not necessarily to produce large fissures in the ice, and the consequent sliding of one detached part over another, but rather the effect of a general bruise over a considerable space of the yielding body According to this view, the delicate veins seen in the glacier, often less than a quarter of an inch wide, have their course parallel to the direction of the sliding effort of one portion of the ice over another. Amongst other proofs of this fundamental conception that the veined structure is the external symbol of this forced internal motion of a body comparatively solid, Forbes cited a striking instance from the glacier of La Brenva, on the south side of Mount Blanc. In this case the ice of the glacier, forcibly pressed against the naked rocky face of an opposing hill is turned into a new direction; and in thus shoving and squeezing past a prominence of rock, he observed developed in the ice a "veined structure" so beautiful that "it was impossible to resist the wish to carry off slabs, and to perpetuate it by hand specimens." This perfectly developed structure was visible opposite the promontory which held the glacier in check, and past which it struggled, leaving a portion of its ice completely embayed in a recess of the shore behind it. Starting from this point as an origin, the veined laminæ extended backwards and upwards into the glacier, but did not spread laterally into the embayed ice. They could, however, be traced from the shore to some distance from the promontory into the icy mass. The direction of lamination exactly coincided with that in which the ice must have moved if it was shoved past the promontory at all. That it did so move was made the subject of direct proof, by fixing two marks on the ice opposite the promontory, one on the nearer, the other on the farther side of the belt of ice which had the lamination best developed. The first mark was 50 feet from the shore, and moved at the rate of 4·9 inches daily; the other mark was 170 feet further off, and moved almost three times faster, or 14·2 inches daily. Throughout this breadth of 170 feet there was not a single longitudinal crevasse which might have facilitated the differential motion. A parallelogram of compact ice, only 170 feet wide, was therefore moving in such a manner that, whilst one of its sides advanced only a foot, the other advanced a yard. No solid body, at least no rigid solid body, can advance in such a manner; Forbes therefore concluded that glacier-ice is plastic, that the veined structure is unquestionably the result of the struggle between the rigidity of the ice and the quasi-fluid character of the motion impressed upon it, and that this follows, not only from the direction of the laminæ, but from their becoming distinct exactly in proportion to their nearness to the point where the bruise is necessarily strongest. The subsequent experiments of Sorby on the cleavage structure of rocks proved that it has arisen as the result of intense lateral compression, and could be imitated in many artificial substances. Tyndall obtained it even in beeswax, the analogy between which and the veined structure of ice is very close.

Though Forbes termed his expression of the laws of glacier motion the "viscous" or "plastic theory," it was rather a statement of fact than an explanation of the physical processes concerned in the descent of glaciers. Against his views it was of course objected that ice is by its nature a brittle solid, and not sensibly possessed of any viscous or plastic quality. But he cogently replied that the qualities of solid bodies of vast size, and acted on by stupendous and long-continued forces, cannot be estimated from experiments on a small scale, especially if short and violent; that sealing-wax, pitch, and other similar bodies mould themselves, with time, to the surfaces on which they lie, even at atmospheric temperatures, and whilst they maintain, at the same time, the quality of excessive brittleness under a blow or a rapid change of form; that even ice does not pass at once, and *per saltum*, from the solid to the liquid state, but absorbs its latent heat throughout a certain small range of temperature (between 28°·4 and 32° of Fahrenheit), which is precisely that to which the ice of glaciers is actually exposed; that, after all, a glacier is not a crystalline solid, like ice, tranquilly frozen in a mould, but possesses a peculiar fissured and laminated structure, through which water enters (at least for a great part of the year) into its intrinsic composition. He insisted that the quasi-fluid or viscous motion of the ice of glaciers is not a theory but a fact. A substance which is seen to pour itself out of a large basin through a narrow outlet without losing its continuity; the different parts of which, from top to bottom, and from side to centre, possess distinct though related velocities; which moves over slopes inconsistent with the friction between its surface and the ground on which it rests; which surmounts obstacles, and even if cleft into two streams by a projecting rock, instead of being thereby anchored as a solid would necessarily be, reunites its streams below, and retains no trace of the fissure, leaving the rock an islet in the icy flood,—a substance which moves in such a fashion cannot, Forbes maintained, in any true sense of the word, be termed a rigid solid, but must be granted to be ductile, viscous, plastic, or semifluid, or to possess qualities represented by any of these terms which we may choose to adopt as least shocking to our ordinary conception of the brittleness of ice.

The problem of the cause of glacier-motion cannot yet be considered to be satisfactorily solved. One of the most important contributions to the solution of this question was made by Professor James Thomson when he predicted that the freezing point of ice must be lowered by pressure, and when he sought by means of this property to explain the plastic or viscous behaviour of glaciers contended for by Forbes. This prediction was experimentally verified by his brother, Sir W. Thomson. Tyndall subsequently to Forbes's work brought forward an explanation termed the "pressure or fracture and regelation theory." Some experiments of Faraday in 1850 had shown that two pieces of ice with moistened surfaces would if in contact adhere, owing to the freezing of the thin film of water between them, while at a lower temperature than 32°, and with consequently dry surfaces, no adhesion took place. The freezing was obtained even under warm water. Starting from those observations Tyndall was led to make experiments on the effects of compression upon ice, and found that a quantity of pounded ice could be moulded into a compact homogeneous mass. This property possessed by ice of reuniting by pressure after fracture was termed regelation, and was applied by Tyndall in explanation of the motion of glaciers. He maintained that the ice of a glacier is a solid brittle substance, and that its descent down a valley is due to constant rupture produced by the effects of gravitation and to the consequent sliding forward of the mass in which the surfaces of fracture speedily reunite. He pointed more particularly to the ice-falls of glaciers where the ice in passing over a steep descent and undergoing great tension does not yield as a viscous body, but is fractured as a solid. More recently Canon Mosely investigated the physics of glaciers, especially by determining the shearing force of the ice. He found that in a glacier of such a uniform section and slope, moving at such a uniform rate, as the Mer de Glace at Les Ponts, the aggregate resistance offered by the ice to its descent is about 34 times greater than the force of gravitation. He therefore concluded it to be physically impossible that a glacier could slide down its valley by its own weight, and consequently that the gravitation or fracture and regelation theory could not be maintained. The slow descent of sheet lead on a roof of moderate inclination, and its ability even to draw out from the rafters the nails with which it had been fastened, led him to propound another theory of glacier-motion, viz., that it is due to expansion and contraction caused by changes of solar heat. He contended that the ice, like the lead, is expanded by heat, and that, as it cannot on expansion move up the valley without overcoming the resistance of gravitation as well as of friction, it necessarily moves chiefly downward, in which direction gravitation co-operates. Contraction on the other hand must also tend to send the ice downward, for a larger part will move with the force of gravitation than against it. Dr Croll, objecting to Canon Mosely's views that no observed alternations of glacier temperature warrant the conclusion that the ice can be impelled downward by that cause, has proposed yet another explanation. He regards the motion of the ice of a glacier as molecular, resulting from the very conduction of heat through the mass of the glacier. He contends that from the thermal conditions of glacier-ice its molecules will melt before their temperature can be raised. Any given molecule on melting will transmit its extra heat or part of it to the next molecule, which in turn may melt, and thus a wave of thaw will travel through the ice. But as each molecule loses its heat again it freezes, and in the act of solidification exerts an enormous pressure on the walls of the interstice into which while fluid it entered. Hence in proportion to the amount of heat received by it the ice is subjected to great molecular pressure. As the glacier cannot expand laterally on account of the walls of its channel, and as gravitation opposes its expansion up the valley, it necessarily finds relief by a downward movement—the direction in which gravitation co-operates.

GLADBACH, usually called BERGISCH-GLADBACH, a town of Prussia, circle of Mülheim, government district of Cologne, is situated 8 miles N.E. of the latter town. It possesses an iron foundry, and manufactories of paper, pasteboard, powder, percussion caps, nets, and machinery. Ironstone, peat, and lime are found in the vicinity. The population in 1875 was 7030.

GLADBACH, or MÖNCHEN-GLADBACH, a flourishing and rapidly increasing manufacturing town of Rhenish Prussia, capital of a circle in the government district of Düsseldorf, is situated 16 miles W.S.W. of the town of that name. It is one of the chief manufacturing seats of Rhenish Prussia, its principal industries being the spinning and weaving of cotton, the manufacture of silks, velvet, ribbons, and damasks, and dyeing and bleaching. There are also tanneries, tobacco manufactories, machine works, and foundries. The town possesses a chamber of commerce, a gymnasium, and a female school of the higher grade. There are an Evangelical and three Catholic churches, one of which possesses a choir of 1250, a nave dating from the beginning of the 12th century, and a crypt of the 8th century. Gladbach existed before the time of Charlemagne, and a Benedictine monastery was founded near it in 972 by Archbishop Gero of Cologne. The population in 1855 was only 4398; but it had increased in 1858 to 13,965, in 1861 to 17,074, in 1871 to 26,354, and in 1875 to 31,962.

GLADIATORS, professional combatants with men or beasts in the Roman arena. That this form of spectacle, which is almost peculiar to Rome and the Roman provinces, was originally borrowed from Etruria is shown by various indications. On an Etruscan tomb discovered at Tarquinii there is a representation of gladiatorial games; the slaves employed to carry off the dead bodies from the arena wore masks representing the Etruscan Charon; and we learn from Isidore of Seville that the name for a trainer of gladiators, *lanista*, is an Etruscan word meaning butcher or executioner. These games are evidently a survival of the practice of immolating slaves and prisoners on the tomb of illustrious chieftains, a practice recorded in Greek, Roman, and Scandinavian legends, and traceable even as late as this century in the Indian suttee. Even at Rome they were for a long time confined to funerals, and hence the older name for gladiators was *bustuarii*; but in the later days of the republic their original significance was forgotten, and they formed as indispensable a part of the public amusements as the theatre or the circus.

The first gladiators are said, on the authority of Valerius Maximus, to have been exhibited at Rome in the Forum Boarium 264 B.C., by Marcus and Decimus Brutus at the funeral of their father. On this occasion only three pairs fought, but the taste for these games spread rapidly, and the number of combatants grew apace. In 174 B.C. Titus Flamininus celebrated his father's obsequies by a three days' fight, in which 74 gladiators took part. Julius Cæsar engaged such extravagant numbers for his ædileship, that his political opponents took fright, and carried a decree of the senate imposing a certain limit of numbers; but notwithstanding this restriction he was able to exhibit no less than 300 couples. During the later days of the republic the gladiators were a constant element of danger to the public peace. The more turbulent spirits among the nobility had each his band of gladiators to act as a body guard, and the armed troops of Clodius, Milo, and Catiline played the same part in Roman history as the armed retainers of the feudal barons or the condottieri of the Italian republics.

Under the empire, notwithstanding sumptuary enactments, the passion for the arena steadily increased. Augustus, indeed, limited the shows to two a year, and forbade a prætor to exhibit more than 120 gladiators, yet allusions in Horace and Persius show that 100 pairs was the fashionable number for private entertainments; and in the Marmor Ancyranum the emperor states that more than 10,000 men had fought during his reign. The imbecile Claudius was devoted to this pastime, and would sit from morning till night in his chair of state, descending now and then to the arena to coax or force the reluctant gladiators to resume their bloody work. Under Nero senators and even well-born women appeared as combatants; and Juvenal has handed down to eternal infamy the descendant of the Gracchi that appeared without disguise as a *retiarius*, and begged his life from the *secutor*, who blushed to conquer one so noble and so vile. Titus, whom his countrymen surnamed the Clement, ordered a show which lasted 100 days; and Trajan, in celebration of his triumph over Decebalus, exhibited 5000 pairs of gladiators. Domitian instituted *venationes* by torchlight, and at the Saturnalia of 90 A.D. arranged a battle between dwarfs and women. Even as late as 200 A.D. an edict was passed forbidding women to fight. How widely the taste for these sanguinary spectacles extended throughout the Roman provinces is attested by monuments, inscriptions, and the remains of vast amphitheatres. From Britain to Syria there was not a town of any size that could not boast its arena and annual games. The following inscription copied from the pedestal of a statue shows the important part they played in provincial life:—"In four days, at Minturnæ, he showed eleven pairs of gladiators, who did not cease fighting till one half, all the most valiant men in Campania, had fallen. You remember it well, noble fellow citizens." After Italy, Gaul, North Africa, and Spain were most famous for their amphitheatres; and Greece was the only Roman province where the institution never took root.

Gladiators were commonly drawn either from prisoners of war, or slaves, or criminals condemned to death. Thus in the first class we read of tatooed Britons in their war chariots, Thracians with their peculiar bucklers and scimitars, Moors from the villages round Atlas, and negroes from central Africa, exhibited in the Colosseum. Down to the time of the empire only greater malefactors, such as brigands and incendiaries, were condemned to the arena; but by Caligula, Claudius, and Nero this punishment was extended to minor offences, such as fraud and peculation, in order to supply the growing demand for victims. For the first century of the empire it was lawful for masters to sell their slaves as gladiators, but this was forbidden by Hadrian and Marcus Aurelius. Besides these three regular classes, the ranks were recruited by a considerable number of freedmen and Roman citizens who had squandered their estates, and voluntarily took the *auctoramentum gladiatorium*, by which for a stated time they bound themselves to the *lanista*. Even men of birth and fortune not seldom entered the lists, either for the pure love of fighting, or to gratify the whim of some dissolute emperor; and one emperor, Commodus, actually appeared in person in the arena.

Gladiators were trained in schools (*ludi*) owned either by the state or by private citizens; and though the trade of a lanista was considered disgraceful, to own gladiators and let them out for hire was reckoned a legitimate branch of commerce. Thus Cicero, in his letters to Atticus, congratulates his friend on the good bargain he had made in purchasing a band, and urges that he might easily recoup himself by consenting to let them out twice. Men recruited mainly from slaves and criminals, whose lives hung on a thread, must have been more dangerous characters than modern galley slaves or convicts; and, though highly fed and carefully tended, they were of necessity subject to an iron discipline. In the school of gladiators discovered at Pompeii, of the sixty-three skeletons buried in the cells many were in irons. But hard as was the gladiator's lot,—so hard that special precautions had to be taken to prevent suicide,—it had its consolations. A successful gladiator enjoyed far greater fame than any modern prize-fighter or athlete. He was presented with broad pieces, chains, and jewelled helmets, such as may be seen in the museum at Naples; poets like Martial sang his prowess; his portrait was multiplied on vases, lamps, and gems; and high-born ladies contended for his favours. Mixed, too, with the lowest dregs of the city, there must have been many noble barbarians condemned to the vile trade by the hard fate of war. There are few finer characters in Roman history than the Thracian Spartacus, who, escaping with seventy of his comrades from the school of Lentulus at Capua, for three years defied the legions of Rome; and after Antony's defeat at Actium, the only part of his army that remained faithful to his cause were the gladiators whom he had enrolled at Cyzicus to grace his anticipated victory.

There were various classes of gladiators, distinguished by their arms or modes of fighting. The Samnites fought with the national weapons—a large oblong shield, a vizard, a plumed helmet, and a short sword. The Thraces had a small round buckler and a dagger carved like a scythe; they were generally pitted against the Mirmillones, so called from the fish (μορμύλος) which served as the crest of their helmet. In like manner the Retiarius was matched with the Secutor: the former had nothing on but a short tunic or apron, and sought to entangle his pursuer, who was fully armed, with the cast-net (*jaculum*) that he carried in his right hand; and if successful, he despatched him with the trident (*tridens, fuscina*) that he carried in his left. We may also mention the Andabatæ, who wore helmets with closed vizors; the Dimachæri of the later empire; the Essedarii, who fought from chariots like the ancient Britons; the Hoplomachi, armed like a Greek hoplite; and the Laqueatores, who tried to lasso their antagonists.

The estimation in which gladiatorial games were held by Roman moralists deserves notice, and the influence that they exercised upon the morals and genius of the nation. The Roman was essentially cruel, not so much from spite or vindictiveness, as from callousness and defective sympathies. This element of inhumanity and brutality must have been deeply ingrained in the national character to have allowed the games to become popular, but there can be no doubt that it was fed and fostered by the savage form which their amusements took. That the sight of bloodshed provokes a love of bloodshed and cruelty is a commonplace of morals. To the horrors of the arena we may attribute in part, not only the brutal treatment of their slaves and prisoners, but the frequency of suicide among the Romans. On the other hand, we should be careful not to exaggerate the effects or draw too sweeping inferences from the prevalence of this degrading amusement. Human nature is happily illogical; and we know that many of the Roman statesmen who gave these games, and themselves enjoyed these sights of blood, were in every other department of life irreproachable,—indulgent fathers, humane generals, and mild rulers of provinces. In the present state of society it is difficult to conceive how a man of taste can have endured to gaze upon a scene of human butchery. Yet we should remember that it is less than half a century since bear-baiting was prohibited in England, and we are only now attaining that stage of morality in respect of cruelty to animals that was reached in the 5th century, by the help of Christianity, in respect of cruelty to men. We shall not then be greatly surprised if hardly one of the Roman moralists is found to raise his voice against this amusement, except on the score of extravagance. Cicero, in a well-known passage commends the gladiatorial games as the best discipline against the fear of death and suffering that can be presented to the eye. The younger Pliny, who perhaps of all Romans approaches nearest to our ideal of a cultured gentleman, speaks approvingly of them. Marcus Aurelius, though he did much to mitigate their horrors, yet in his writings condemns the monotony rather than the cruelty. Seneca is indeed a splendid exception, and his letter to Lentulus is an eloquent protest against this inhuman sport. But it is without a parallel till we come to the writings of the Christian fathers, Tertullian, Lactantius, Cyprian, and Augustine. In the *Confessions* of the last there occurs a narrative which is worth quoting as a proof of the strange fascination which the games exercised even on a religious man and a Christian. He tells us how his friend Alipius was dragged against his will to the amphitheatre, how he strove to quiet his conscience by closing his eyes, how at some exciting crisis the shouts of the whole assembly aroused his curiosity, how he looked and was lost, grew drunk with the sight of blood, and returned again and again, knowing his guilt yet unable to abstain. The first Christian emperor was persuaded to issue an edict abolishing gladiatorial games (325), yet in 404 we read of an exhibition of gladiators to celebrate the triumph of Honorius over the Goths, and it is said that they were not totally extinct in the West till the time of Theodoric (see GAMES).

Gladiators formed admirable models for the sculptor. One of the finest pieces of ancient sculpture that has come down to us is the Wounded Gladiator of the National Museum at Naples. The so-called Fighting Gladiator of the Borghese collection, now in the Museum of the Louvre, and the Dying Gladiator of the Capitoline Museum, which inspired the famous stanza of *Childe Harold*, have been pronounced by modern antiquaries to represent, not gladiators, but warriors. In this connexion we may mention the admirable picture of Gérome which bears the title, Ave, Cæsar, morituri te salutant.

The attention of archæologists has been recently directed to the *tesseræ* of gladiators. These tesseræ, of which about sixty exist in various museums, are small oblong tablets of ivory or bone, with an inscription on each of the four sides. The first line contains a name in the nominative case, presumably that of the gladiator; the second line a name in the genitive, that of the *patronus* or *dominus*; the third line begins with the letters SP, for *spectatus* or approved, which shows that the gladiator had passed his preliminary trials; this is followed by a day of a Roman month; and in the fourth line are the names of the consuls of a particular year.

GLADIOLUS, a genus of monocotyledonous or endogenous plants, belonging to the natural order *Iridaceæ*, and representative of the tribe *Gladioleæ*, a group of bulbous plants in which the perianth is irregular, and the stamens unilateral and arched, with the filaments free. It belongs to a subdivision of the *Gladioleæ*, in which the segments of the limb of the perianth are very unequal, and is specially distinguished by having the perianth tube curved, funnel-shaped, and widening upwards, and by the segments equalling or exceeding the tube in length. About ninety species are described, of which number upwards of fifty are from the Cape, and the rest from tropical Africa, the central and southern regions of Europe, Persia, the Caucasus, and the Levant. One species, *G. illyricus*, is found apparently wild in England, in the New Forest, Hampshire. Some of the species have been cultivated for a long period in our flower-gardens, where both the introduced species and the modern varieties bred from them are very ornamental and popular. *G. segetum* has been cultivated since 1596, and *G. byzantinus* since 1629, while many additional species were introduced during the latter half of the 18th century. One of the earlier of the hybrids originated in gardens was the beautiful *G. Colvillii*, raised in the nursery of Mr Colvill of Chelsea in 1823 from *G. concolor* fertilized by *G. cardinalis*. In the first decade of the century, however, the Hon. and Rev. W. Herbert had successfully crossed the showy *G. cardinalis* with the smaller but more free-flowering *G. blandus*, and the result was the production of a race of great beauty and fertility. Other crosses were made with *G. tristis*, *G. oppositiflorus*, *G. hirsutus*, *G. alatus*, and *G. natalensis*; but it was not till after the production of *G. gandavensis* about 1843, by the crossing of *G. natalensis* with *G. oppositiflorus* (sometimes erroneously attributed to *natalensis* and *cardinalis*), that the gladiolus may be said to have become a general favourite in gardens. Since that time the varieties have been greatly multiplied in number, and improved in size and quality, as well as marvellously varied in colour and marking, so that they have now become exceedingly popular. A few years since large numbers of novel varieties were annually introduced by the French florists, but the English-raised varieties are now in great measure superseding them. One cultivator, Mr Kelway of Langport, devotes a space of not less than 8 acres to gladioli, and cultivates annually from 10,000 to 60,000 each of some of the more popular kinds, while seedlings are raised to the extent of half a million a year. The seeds are sown in the open ground about April, glass culture with so large a number being out of the question; and in the first season the young plants make bulbs averaging the size of peas. The time occupied from the sowing of the seed until the plant attains its full strength is from three to four years. The approved sorts, which are identified by name, are multiplied by means of bulblets or offsets which form around the principal bulb or corm; but in this they vary greatly, some kinds furnishing abundant increase and soon becoming plentiful, while others persistently refuse to yield offsets. The stately habit and rich glowing colours of the modern gladioli render them exceedingly valuable as decorative plants during the late summer months. They are, moreover, very desirable and useful flowers for cutting for the purpose of room decoration, for while the blossoms themselves last fresh for some days, the undeveloped buds open in succession, if the stalks are kept in water, so that a cut spike will go on blooming for a considerable period.

GLAMORGAN (Welsh, *Gwlad Morgan*), a maritime county of South Wales, bounded on the N. by Brecknock and Carmarthen, on the W. by Carmarthen and its bay, on the S. by the Bristol Channel, and on the E. by Monmouth, the boundary line of which is the Rhymney. Its greatest length from E. to W. is about 53 miles, its greatest breadth from N. to S. about 29; its coast-line is about 60 miles, and its area 547,070 acres.

Glamorgan, with the exception of some flat tracts on the borders of the Bristol Channel, consists of a succession of hills and valleys, the country inland growing more and more mountainous, after a broad tract of plain on the south coast, until on the borders of Brecknock its surface is a sea of hills. None of the mountains rise to a great height, the most lofty, Mynydd Llangeinor, being but 1859 feet, and the escarpment of Craig y Llyn about the same height or a little higher. Yet their bold forms add grandeur to the scenery of the county, and their lower slopes are clothed with picturesque though not large timber.

The valleys of Glamorgan have been long famous for great beauty of scenery. The vale of Glamorgan, some 8 miles in breadth, has been truly called the "Garden of Wales," and its climate is so mild that myrtles and other tender plants flourish in the open air. The vale of Neath is known to tourists as the waterfall district of South Wales, the finest falls being betwixt Hirwain and Neath, near the Vale of Neath Railway, viz. Cilhepstè fall, the three Clwngwyns, the falls of the Pyrddin, Scwd-Einon Gam, Scwd-Gladys, and Scwd Hen Rhydd on the Llech, with Melincourt and Abergarwedd still nearer Neath. The highest of these falls are above 80 feet. Swansea valley has also fine scenery. Other valleys are those of the Rhymney, the Taff, the Rhondda, and the Llwchwr, the first two giving their names to important railways.

The rivers of Glamorgan are not large. The chief are the Rhymney, forming the county's eastern boundary; the Ogwr or Ogmore, which flows into the Bristol Channel near Porth-Cawl harbour; the Taff, which rises in the Brecon Beacon, flows southward through the county, and forms the important harbour of Cardiff; the Neath and Tawe, flowing south into Swansea Bay; and the Llwchwr, which is the boundary of the county on the west, and, falling into Carmarthen Bay, forms the estuary of the Burry river.

The chief geological feature of Glamorgan is the Coal-measures, which are of the greatest thickness near Neath, but extend nearly over the whole county, and are bounded by a narrow band of Millstone Grit and Mountain Limestone, nearly coincident with the county boundary on the north. In the extreme south and south-west the Devonian, Magnesian Limestone, and the Lias show themselves.

The climate is mild, and the plains on the coast as well as inland are very fertile. The soil is a deep rich loam, improved by lime. Agriculture is as yet not so forward as it might be with such a soil and climate; but the farms are seldom large, and the buildings are not suited to high farming. The crops chiefly raised are wheat, beans, pease oats, barley, vetches, turnips, and potatoes. The cattle are of good useful breeds; and good sheep and ponies are reared in the hill-country. According to the agricultural statistics for 1878, the extent under the different crops (the total area being 547,070 acres), and the numbers of live-stock, were as follows:—

Corn crops (two-thirds wheat and oats, and nearly one-third barley)	37,139	acres
Green crops (two-thirds turnips and swedes)	15,054	,,
Grass under rotation	26,468	,,
Permanent pasture	186,697	,,
Bare, fallow, and uncropped arable land	33,359	,,
Total under crops, bare fallow, and grass	268,707	,,

Live Stock:—Horses, including ponies	13,727
Cattle	46,545
Sheep	283,389
Pigs	15,572

According to the Owners and Heritages Return 1872–73, the county was divided among 8426 proprietors, holding 428,386 acres, with a gross estimated annual rental of £1,609,379. The estimated amount of commons and waste lands was 47,018 acres. Of the owners, 78·8 per cent. possessed less than one acre, and the average value per acre was £3, 1s. 8¼d. There were 16 proprietors holding 5000 acres and upwards, viz., C. R. M. Talbot, 33,920; Earl of Dunraven, 23,706; Marquis of Bute, 21,402; Lord Windsor, 12,016; Earl of Jersey, 7110; Edward Rees Wingfield, 6463; Lord Tredegar, 6157; Major Vaughan Lee, 6128; Mrs Blandy Jenkins, 6082; Col. K. Lynte, 5933; Sir Iver B. Guest, 5640; T. Penrice, 5411; Mrs Chetwode, 5399; R. F. L. Jenner, 5381; C. Bailey, 5343; John D. Llewellyn, 5000.

The industry of Glamorgan is chiefly applied to its coal and iron mines, which practically underlie the whole superficies of the county, and give it its pre-eminence among Welsh counties. In 1872 there were no less than 420 coal-pits in Monmouthshire and South Wales, and the yield of some 15 million tons a year came in very large proportion from the Glamorganshire vales of Neath, Taff, Rhondda, Ely, &c. Within the last twenty years the iron works were carried on at an enormous scale of labour and enterprise, there being near Merthyr-Tydvil alone upwards of 60 blast furnaces; but in 1873 it appeared that of 57 furnaces in Glamorganshire 27 were out of blast, and at present (1879) the industry is, from various causes, in a backward state. Excellent means of export for coal and iron are afforded by the unrivalled docks at Cardiff, the enterprise of the late and present marquis of Bute, and by those also at Penarth at the mouth of the Ely. These have within considerably less than a century transformed an insignificant Welsh town into a leading port and emporium with a first rate harbour and anchorage; whilst another dock at Swansea serves a like purpose for the export of the copper ore smelted at Swansea, Neath, Aberavon, and Treforest, and chiefly sold at public ticketings in the first-named town. Cardiff and Swansea, especially the latter, also have a very large export trade in patent compressed fuel prepared from culm and tar.

Glamorgan can boast historic ruins, such as Caerphilly, and Castle Coch near Llandaff, the former a Norman fortress held for Edward II. by the younger De Spencer, the latter an early English fortress on an escarpment of mountain limestone. Other ruined castles are Oystermouth and Pennard in Gower, and Coity near Bridgend; while as restored castles, resided in by their present owners, are Cardiff, the residence of the marquis of Bute, St Fagan's, near Ely station, and St Donat's and Dunraven, both on the verge of the Bristol Channel. The county has some fine cromlechs at St Nicholas and St Lythan's on the Dyffrin estate, at Cotterell near Peterston, and at Arthur's Stone in Gower. The Sarn Helen, an ancient road, traverses the county. At Llantwit Major, near Cowbridge, was the once famous divinity school founded by St Germanus, and presided over for an incredible term of years by St Iltyd. Every stone in this old-world town is "of old memorial." Coity, Coychurch, and Ewenny, near Bridgend, present a fine trio of cross churches, with fortified or embattled towers, characteristic of the county.

South of Swansea lies the promontory of Gower, famed for the beauty of its coast scenery, its people of Flemish descent, planted here by Henry I., and its bone-caves. The last, in the limestone cliffs, accessible only at low water, are at Bacon Hole, Paviland, and Rhosilly Bay.

Besides its ports, Glamorgan has abundant means of transit in four railways and a canal, beside numerous tramways. The county is divided into 128 parishes and 10 hundreds, and is situated in the diocese of Llandaff. The cathedral, 2 miles from the county town of Cardiff, having fallen into decay through the neglect of ages previous to 1844, owed its restoration to a beauty befitting the prestige of the earliest Christian see to the energetic endeavours of Dean Thomas Williams. It was completed in 1869.

The great changes of recent years in elementary education have curiously affected the statistics of schools in Glamorgan. Whereas in 1847 there were 327 day schools in all, with 15,674 scholars, in 1877 the parliamentary return shows a great reduction in the number of schools, though these have probably a much larger aggregate of scholars. This return exhibits 226 public elementary schools in Glamorgan, of which 56 were board-schools, 30 British and foreign, 12 Roman Catholic, 1 Wesleyan, and the remainder national, parochial, and Church of England schools. Of these schools, 41 had each in average attendance upwards of 300 scholars, and 2 had upwards of 1000. Fourteen only had night schools in operation. As in other south-west counties, the Welsh language is losing ground, except in remote agricultural districts.

In 1851 the population of the county was 231,849, 120,748 males and 111,101 females; and in 1871 it was 397,859, 205,660 males and 192,199 females. The population has increased since the first census in 1801 by 326,980 persons, or 451 per cent. The county returns two members to parliament, the borough of Merthyr one, and the Cardiff and Swansea districts of boroughs one each, a total of five in all. In the year ending April 1871 the amount of real property assessed to income and property tax was £1,219,922. The principal towns with the populations in 1871 were—

Aberavon[1]	3,574	Llantrisaint[2]	2,039
Aberdare	36,112	Lloughor[1]	1,220
Bridgend	3,539	Merthyr Tydvil	51,949
Cardiff[2]	39,536	Neath[1]	9,319
Cowbridge[2]	1,134	Swansea[1]	51,702
Kenfig[1]	591		

The bibliography of the county is stronger in such old chronicles as the *Brut y Tywysogion* than in modern researches. Among its important contributions to the *Archæologia Cambrensis* may be mentioned the Rev. H. H. Knight's *Account of Newton Nottage in* 1853; and Dr Thomas Nicholas's *History of the Annals and Antiquities of Glamorganshire* is the foundation of his *Counties and County Families of Wales*. (J. DA.)

GLANDERS, or EQUINIA, a specific infectious disease to which certain animals, chiefly those possessing an undivided hoof, are liable, and which is communicable from them to man. The term farcy is also employed to designate a variety of this affection, but there is no pathological distinction between the two. The disease as it affects animals belongs to the subject of Veterinary Medicine.

Glanders is happily a rare form of disease in man, there being evidently less affinity for its development in the human subject than in the equine species. It occurs chiefly among those who from their occupation are frequently in contact with horses, such as grooms, coachmen, cavalry soldiers, veterinary surgeons, &c., and seems always produced either by direct inoculation of the virus from a diseased animal into the broken skin, or by the respiration of air containing the poison. It is said to have occasionally been transmitted from man to man, but such an occurrence is extremely rare.

A period of incubation, lasting from three to five days, generally follows the introduction of the virus into the system. This period, however, appears sometimes to be of much longer duration, especially where there has been no direct inoculation of the poison. The first symptoms are a general feeling of illness, accompanied with pains in the limbs and joints resembling those of acute rheumatism. If the disease has been introduced by means of an abraded surface, pain is felt at that point, and inflammatory swelling takes place there, and extends along the neighbouring lymphatics. An ulcer is formed at the point of inoculation which discharges an offensive ichor, and blebs appear in the inflamed skin, along with diffuse abscesses, as in phlegmonous erysipelas. Sometimes the disease stops short with these local manifestations, but more commonly goes on rapidly accompanied with symptoms of grave constitutional disturbance. Over the whole surface of the body there appear numerous red spots or pustules, which break and discharge

[1] Contributory to Swansea parliamentary district of boroughs.
[2] Contributory to Cardiff parliamentary district of boroughs.

a thick mucous or sanguineous fluid. Besides these there are larger swellings lying deeper in the subcutaneous tissue, which at first are extremely hard and painful, and to which the term farcy "buds" or "buttons" is applied. These ultimately open and become extensive sloughing ulcers.

The mucous membranes participate in the same lesions as are present in the skin, and this is particularly the case with the interior of the nose, where indeed, in many instances, the disease first of all shows itself. This organ becomes greatly swollen and inflamed, while from one or both nostrils there exudes a copious discharge of highly offensive purulent or sanguineous matter. The lining membrane of the nostrils is covered with papules similar in character to those on the skin, which form ulcers, and may lead to the destruction of the cartilaginous and bony textures of the nose. The diseased action extends into the throat, mouth, and eyes, while the whole face becomes swollen and erysipelatous, and the lymphatic glands under the jaws inflame and suppurate. Not unfrequently the bronchial tubes become affected, and cough attended with expectoration of matter similar to that discharged from the nose is the consequence. The general constitutional symptoms are exceedingly severe, and advance with great rapidity, the patient passing into a state of extreme prostration. In the acute form of the disease recovery rarely if ever occurs, and the case generally terminates fatally in a period varying from two or three days to as many weeks.

A chronic form of glanders and farcy is occasionally met with, in which the symptoms, although essentially the same as those above described, advance much more slowly, and are attended with relatively less urgent constitutional disturbance. Cases of recovery from this form are on record; but in general the disease ultimately proves fatal by exhaustion of the patient, or by a sudden supervention, which is apt to occur, of the acute form. On the other hand, acute glanders is never observed to become chronic.

In the treatment of this malady the main reliance is to be placed on the maintenance of the patient's strength by strong nourishment and tonic remedies. If the point of inoculation of the virus can be early made out, its active cauterization, as in the case of any poisoned wound, should be resorted to. The opening of abscesses antiseptically, as well as the use of antiseptic lotions for the affected mucous membranes, is recommended. In all cases of the outbreak of glanders it is of the utmost consequence to prevent the spread of the disease by the destruction of affected animals, and the cleansing and disinfection of infected localities.

GLANVIL, GLANVILL, or GLANVILLE, RANULPH DE (died 1190), the oldest writer on English jurisprudence and chief justiciary of England in the reign of Henry II., was born at Stratford in Suffolk, but in what year is unknown. There is also almost no information regarding his early life. Butterley Abbey was founded by him in 1171. In 1174, along with other barons of Yorkshire, he raised a body of knights to oppose William the Lion, king of Scotland, who had invaded the north of England, and it was he who took the king prisoner at Alnwick. In 1175 he was appointed sheriff of Yorkshire, in 1176 justice of the king's court and a justice itinerant in the northern circuit, and in 1180 chief justiciary of all England. It was under his direction that Henry II. completed his judicial reforms, but the principal of them had been carried out before he came into office. After the death of Henry in 1189 Glanvil was removed from his office by Richard I., and imprisoned till he had paid a ransom, according to one authority, of £15,000. Shortly after obtaining his freedom he joined the order of the cross, and he died at the siege of Acre in 1190. At the instance, it is supposed, of Henry II., Glanvil wrote or superintended the writing of the *Tractatus de legibus et consuetudinibus regni Angliæ*, which is divided into 14 books, and is chiefly a practical treatise on the forms of procedure in the *curia regis* or king's court, the principles of law involved in these forms being only incidentally referred to. As the source of our knowledge regarding the earliest form of the *curia regis*, and for the information it affords regarding ancient customs and laws, it is of great value to the student of English history. It is now generally agreed that the work of Glanvil is of earlier date than the *Regiam Majestatem*, a work which bears a close resemblance to his. To him is also ascribed the recension of English laws made in the reign of Henry II.

The treatise of Glanvil was first printed in 1554. An English translation, with notes and introduction by John Beames, was published at London in 1812. A MS. copy of a Norman-French translation, made apparently in the reign of King John, is contained in the library of the duke of Northumberland at Alnwick Castle.

GLANVILL, or GLANVIL, JOSEPH (1636–1680), was born at Plymouth in 1636, and was educated at Oxford university, where he graduated as M.A. in 1658. In 1666 he obtained the cure of Abbey Church at Bath; in 1678 he became prebendary of the church of Worcester, and acted as chaplain in ordinary to Charles II. He died at Bath, November 16, 1680, in the forty-fourth year of his age. Glanvill's first work, *The Vanity of Dogmatizing, or Confidence in Opinions, manifested in a Discourse of the shortness and uncertainty of our Knowledge, and its Causes, with Reflexions on Peripateticism, and an Apology for Philosophy*, 1661, is interesting as showing one special direction in which the new method of the Cartesian philosophy might be developed. Pascal had already shown how philosophical scepticism might be employed as a bulwark for faith, and Glanvill follows in the same track. The philosophic endeavour to cognize the whole system of things by referring all events to their causes appears to him to be from the outset doomed to failure. For if we inquire into this causal relation we find that though we know isolated facts, we cannot perceive any such connexion between them as that the one should give rise to the other. In the words of Hume, "they seem conjoined but never connected." All causes then are but secondary, are merely the occasions on which the one first cause operates. It is singular enough that Glanvill who had not only shown, but even exaggerated, the infirmity of human reason, himself paid a strange tribute to its weakness; for, after having combated scientific dogmatism, he not only yielded to vulgar superstitions, but actually endeavoured to accredit them both in his *Scepsis Scientifica*, 1665, and in his *Philosophical Considerations concerning the existence of Sorcerers and Sorcery*, published in 1666, in 4to. The story of the pretended drum, which was said to have been heard every night in the house of an inhabitant of Wiltshire (Mr Mompesson), a story which made much noise in the year 1663, and which is supposed to have furnished Addison with the idea of his comedy of the *Drummer*, appears to have given occasion to the latter work. At his death Glanvill left a piece entitled *Sadducismus Triumphatus*, which was printed in 1681, reprinted with some additions in 1682, and translated into German in 1701. He had there collected twenty-six relations or stories of the same description as that of the drum, in order to establish, by a series of facts, the opinion which he had expressed in his *Philosophical Considerations*. Glanvill supported a much more honourable cause when he undertook the defence of the Royal Society of London, under the title of *Plus Ultra, or the Progress and Advancement of Science since the time of Aristotle*, 1658, a work which shows how thoroughly he was imbued with the ideas of the empirical method as in Bacon. The style of Glanvill is clear, easy, and animated; and to the student of philosophy his works are of considerable interest.

Besides the works already noticed, Glanvill wrote—*Lux Orientalis*, 1662; *Philosophia Pia, or Discourse on the Religious Character, and the Tendency of Experimental Philosophy*; *Essays on Several Important Subjects in Philosophy and Religion*, 1676; *An Essay Concerning Preaching*; and *Sermons*. After his death in 1681, there were published other sermons, &c., in one volume 4to. See Rémusat, *Hist. de la Phil. en Angleterre*, bk. iii. ch. xi.

GLARUS, or GLARIS, a canton of Switzerland, is bounded on the N. and N.E. by St Gall, on the E. and S. by the Grisons, and on the W. by Uri and Schwyz. Its area is 266 or 267 square miles, its greatest length about 33 miles, and its greatest breadth about 16. A thoroughly Alpine district, sloping northwards from the lofty range which comprises the Tödi (11,887 feet), the Biferten Stock (11,237), and the Scheibe (9587), and including within its limits the Glärnisch (9584) and the Mürtschen Stock (8012), Glarus is almost completely cut off from the neighbouring cantons, except towards the south. Of the three passes, the Segnes, the Kisten, and the Panix, which communicate with the Grisons, the first and second are over the snow, and the third has only a bridle path; and the Klausen pass and the Pragel pass, which conduct respectively to Schwyz and Uri, have also mere bridle paths. As far as it is a habitable country it may be said to consist of the valley of the Linth, which extends from the Tödi southward to the Wallenstadt Lake along with the lesser valleys of the Sernf (or Sernft) and the Klön, which branch off to the east and the west. The climate, it need hardly be said, is a severe one, the snow generally remaining, even in the lowlands, till near the beginning of May. The föhn at times blows with terrific violence; and, by a law enforced in the town of Glarus, every fire in the place must be extinguished as soon as it sets in. The chief sources of wealth in the canton are the pastures and the manufacturing industries. Though copper, silver, and iron mines were formerly wrought, the only mineral production now of commercial importance is slate, which is extensively quarried in the Plattenberg. Not more than a fifth of the soil is capable of cultivation by the plough, and the agricultural produce has consequently to be supplemented by foreign supplies. About 9000 or 10,000 head of cattle are pastured in the canton, and according to the census of 1876 there are 2000 sheep, 6900 goats, and 3000 swine. Neither butter nor ordinary cheese is made in sufficient quantities for the local consumption, but the *Schabzeiger*, *Schotter Käse*, *Kräuterkäse*, or "green cheese," made of skim milk, whether of goats or cows, mixed with butter-milk and coloured with powdered *steinklee* (*Melilotus cærulea*), is still largely manufactured. The curd is brought down from the mountain chalets in sacks, which contain about 200 ℔ each. After being ground for about 2½ hours in a mill along with the *klee* powder, which is added in the proportion of 3 ℔ to the 100, the curd is put into shapes, and pressed in the usual way. It grows ripe in about a year and keeps a long time. Large quantities are exported to America. The cotton manufacture is the staple of the canton, and gives support to about a fourth of the population. Formerly distributed through the country as a domestic industry, it is now concentrated in a few factory towns and villages, which in the aggregate keep about 250,000 spindles going. The cotton goods are sent to the East, America, and Africa. It is not only in their own little country that the people of Glarus find a field for their energies; they have contributed to the industries of many parts of Europe, and their poorer emigrants have founded three flourishing settlements in Wisconsin—New Glarus, Vilten, and New Elm. The population, which in 1851 was 30,213, had increased by 1870 to 35,150, and was estimated in 1876 at 36,179. The vast majority are Protestants, only 6,888 being Catholics according to the census of 1870. The constitution of Glarus is of the simplest kind and extremely democratic. According to the law of 1842, revised and sanctioned by the federal council in 1851, the government rests in the hands of a Landesgemeinde or assembly of the whole male population above the age of eighteen, which usually meets on the first Sunday in May, and elects the cantonal officials, votes the income and poll-taxes, and passes or rejects any laws that may be presented by the cantonal council or Landesrath. The cantonal council consists of 117 members. A council of 45 members, and a committee of 9 members have control of the executive. The landamman is president of the committee, the executive council, the cantonal council, and the assembly. Justice is administered by five courts completely independent of the Government. Freedom of the press, freedom of religious worship, and freedom of trade and industry are all guaranteed. Aliens are readily naturalized and admitted to the rights of citizens. The canton is divided into 25 communes, only one of which, that of Glarus, has more than 5000 inhabitants, while 16 have less than 1000, and the smallest has only 231.

GLARUS, the capital of the canton, is a flourishing little town on the left bank of the Linth, about 1495 feet above the sea-level. Its environment is a remarkable one: to the S. the Glärnisch rises 6153 feet; to the N.W. the Wiggis, 6033, and to the E. the Schild, 6010. The fire of 1861 devastated the greater part of the town, destroying its Gothic church of the 10th century, the casino, the Government houses, and all its principal buildings; 2000 of the inhabitants were rendered houseless, and property to the value of 8,000,000 francs was destroyed. Contributions however were sent in from far and near to the amount of 2,754,606 francs, the federal authorities of Switzerland voted a loan of 1,000,000 at two per cent., and the canton furnished a subsidy at 3 per cent.; the town was rapidly rebuilt in a substantial and regular style, and the public edifices restored. The church is used in common by the Protestants and the Roman Catholics. The high school accommodates 700 pupils. Most of the population, which in 1870 numbered 5516, are supported by the cotton manufacture carried on in the town and the vicinity. A certain trace of rustic life is still maintained, as the operatives have each a bit of ground in the "almend." On the opposite side of the river lies the industrial village of Enneda.

In the end of the 5th century an Irish monk, Fridolin, the founder of the convent of Seckingen on the Rhine, built a church on the site of the present town, and the name of St Hilarius, which he gave it in honour of his patron the bishop of Poitiers, in course of time became corrupted to Glarus or Glaris. The whole valley was reckoned to the estates of the abbey of Seckingen, and it was governed by a mayor or bailiff whose nomination was vested ultimately in the Hapsburg family. The tyranny of these officers constrained the people of Glarus to join the Helvetic confederation in 1352, and in 1388 they secured their independence by a victory over the Austrians at Näfels, the anniversary of which is still celebrated on the second Thursday of April. Zwingli the Reformer was curate of Glarus from 1506 to 1516, and by 1530 the new doctrines had been accepted by five-sixths of the population of the canton. The two religious parties, though they were happily prevented from appealing to arms, continued long in a state of mutual alienation and suspicion; the Protestants, for example, would have nothing to do with the Gregorian calendar because it was introduced by the papal party. At length a settlement of a peculiar kind was effected in 1683. Each confession was allowed to have a cantonal assembly, a cantonal council, and officials of its own; while for all matters in which both parties were interested there was a cantonal assembly and a cantonal council for discussion and administration in common. It was in the beginning of the 18th century that the present prosperity of the canton received its original impulse. Cotton-spinning was introduced in 1712 by Heidegger of Zurich, and weaving and calico-printing followed before 1750. The population of the canton increased from 15,000 to 20,000 during the century. The effects of the great Revolution were beneficially experienced, and the early part of the 19th century was marked by numerous improvements, political and social. Till 1811 the lower course of the Linth was extremely irregular, and its inundations had gradually turned a large stretch of country into a swamp; but, under the patronage and direction mainly of Escher (von der Linth, as he came afterwards to be called), there was constructed a magnificent system of canals which completely remedied the evils, and the desolate region soon became one of the finest parts of the canton. The whole cost of the works up till 1823 was 974,553 francs. When the new constitution of 1836 was introduced, the Roman Catholic minority, whose influence it greatly diminished, were urged on by Bossi, the bishop of Chur (Coire), to break off from their Protestant countrymen; but the Government expelled the few priests who refused to take the oath, and separated the canton from its connexion with the diocese of Chur. After Bossi's death the decree of separation was revoked. In the Sonderbund war of 1847 Glarus was true to the federation; and the same spirit was shown in the voting about the constitution in 1872-75.

GLAS, JOHN (1695-1773), the founder of the sect generally known as Glassites or Sandemanians, was born at Auchtermuchty, Fife, where his father was parish minister, on the 5th of October 1695. On completion of his education for the ministry at the universities of St Andrews and Edinburgh, he was licensed as a preacher by the presbytery of Perth, and soon afterwards ordained by that of Dundee as minister of the parish of Tealing (1719). During his ministry there he gradually formed peculiar opinions, which as early as 1725 found expression in the formation of a society "separate from the multitude," numbering nearly a hundred, and drawn from his own and neighbouring parishes. The members of this *ecclesiola in ecclesia* pledged themselves "to join together in the Christian profession, to follow Christ the Lord as the righteousness of His people, to walk together in brotherly love and in the duties of it in subjection to Mr Glas as their overseer in the Lord, to observe the ordinance of the Lord's Supper once every month, to submit themselves to the Lord's law for removing offences" (Matth. xviii.), and so on. From the scriptural doctrine of the essentially spiritual and heavenly nature of the kingdom of Christ, Glas in his public teaching drew the conclusions, not only that the church, as being identical with that kingdom, ought to consist of none but truly spiritual Christian men, but also that the civil establishment of the church was unlawful and utterly inconsistent with the spirit of Christianity.[1] For the promulgation of these views, which were confessedly at variance with the doctrines of the standards of the national Church of Scotland, he was summoned (1726) before his presbytery, where, in the course of the investigations which followed, he affirmed with still more explicitness than formerly his belief that "every national church established by the laws of earthly kingdoms is antichristian in its constitution and persecuting in its spirit," and further declared opinions upon the subject of church government which amounted to an entire repudiation of Presbyterianism and an acceptance of Independency. For these opinions he was in 1728 suspended from the discharge of ministerial functions, and finally in 1730 deposed; the members of the society already referred to, however, for the most part continued to adhere to him, thus constituting the first "Glassite" or "Glasite" church. The seat of this congregation was shortly afterwards transferred to Dundee, whence Glas subsequently removed to Edinburgh, where he officiated for some time as an "elder." He next laboured in Perth for a few years, but ultimately returned to Dundee, where the remainder of his life was spent. In 1739 the General Assembly, without any application either from him or from his friends, removed the sentence of deposition which had been passed against him, and restored him to the character and exercise of a minister of the gospel of Christ, though declaring that he was not to be esteemed a minister of the Established Church of Scotland, or eligible for a charge, until he should have renounced the principles embraced and avowed by him that were inconsistent with the constitution of the church. Besides the *Testimony* Glas wrote a number of papers, expository, polemical, or practical, which were published in a collected edition at Edinburgh in 1761 (4 vols. 8vo), and again at Perth in 1782 (5 vols. 8vo). He died in 1773

The Glassite denomination, which has never been a numerous one, is distinguished by a number of peculiarities alike in doctrine, discipline, and worship, some of which have already been indicated. One of the most characteristic of its tenets is that which owes its elaboration to Robert Sandeman (1718-1771), the son-in-law of Glas, from whom is derived the name of Sandemanians, by which the sect is principally known in England and America. In a series of letters (1757) to Hervey, the author of *Theron and Aspasio*, he maintained that justifying faith is a simple assent to the divine testimony concerning Jesus Christ, differing in no way in its character from belief in any ordinary human testimony. No distinctive theological system, however, has as yet been elaborated from this point of view. In their practice the Glassite churches aim at a strict conformity with the primitive type of Christianity as that is understood by them. Each congregation has a plurality of elders, pastors, or bishops, who are chosen according to what are believed to be the instructions of Paul, without regard to previous education or present occupation, and who enjoy a perfect equality in office. To have been married a second time disqualifies for ordination, or for continued tenure of the office of bishop. In all the action of the church unanimity is considered to be necessary; and if any member differ in opinion from the rest, he must either surrender his judgment to that of the church or be shut out from its communion. To join in prayer with any one who is not a member of the denomination is regarded as unlawful, and even to eat or drink with one who has been excommunicated is held to be a heinous sin. The Lord's Supper is observed weekly; and between forenoon and afternoon service every Sunday a love feast, at which it is incumbent on every member to be present, is held after the manner of the primitive Christians. Mutual exhortation is practised at all the meetings for divine service, it being lawful for any member who possesses the gift to speak. The practice of washing one another's feet was at one time observed; and it is still customary for each brother and sister to receive new members, on admission, with a holy kiss. "Things strangled" and "blood" are rigorously abstained from; the lot is regarded as sacred; the accumulation of wealth is regarded as unscriptural and improper, and each member considers his property as liable to be called for at any time to meet the wants of the poor and the necessities of the church. The number of adherents at present belonging to the denomination is probably a little under 2000.

GLASER, CHRISTOPHER, one of the minor chemists of the 17th century, concerning the details of whose life very little is known. He was a native of Basel, came to Paris, succeeded Lefebvre as demonstrator on chemistry in the Jardin du Roi, and was appointed apothecary to Louis XIV. and to the duke of Orleans. He is best known to us by his *Traité de la Chymie* (Paris, 1663), which gives a very favourable idea of the chemical science of his time. The little work went through some ten editions in about five-and-twenty years, and was translated into both German and English. Dumas and other writers indeed have spoken very disparagingly both of the *Traité* and of the author's merits and character, but this adverse judgment appears to rest on altogether insufficient grounds. One thing very much against Glaser is his alleged connexion with the marchioness de Brinvilliers. It does not appear, however, that he had any share in the notorious poisonings beyond making the deadly substances which the marchioness and others employed in secret. He appears to have died some years before 1676. A salt (the normal sulphate of potassium) which he showed how to prepare, and the medicinal properties of which he pointed out, was named *Glaseri sal polychrestum*, or salt of many uses. The native sulphate is still known as *glaserite*.

[1] His argument is most fully exhibited in a treatise entitled *The Testimony of the King of Martyrs concerning His Kingdom* (John xviii. 36, 37) *Explained and Illustrated* (1729).

GLASGOW, the most populous city in Great Britain next to London, is situated on the banks of the river Clyde, in the Scottish county of Lanarkshire, about 20 miles above Greenock, where the river spreads out into a noble estuary, with branching lochs running deep into the heart of the Western Highlands. It is within ten hours' railway run ($405\frac{1}{2}$ miles) of the metropolis, and an hour and a quarter (45 miles) of Edinburgh, the latitude being 55° 51′ 32″ N., and the longitude 4° 17′ 54″ W. The extreme breadth of the city is about $3\frac{1}{4}$ miles from north to south, and the extreme length 5 miles from east to west. The circumference is about 10 miles; and the area embraced within the municipal boundaries is now (1879) $6111\frac{1}{2}$ acres. The population when the last census was taken in 1871 was 477,732, but during the eight years that have elapsed, the increase of inhabitants both in the city proper and in its suburbs has been very great. It is within the mark to say that above 100,000 have been added to the population of the city; this indeed is the estimate given in official registration returns, which set down the population estimated to the middle of 1879 as 578,156. The smaller burghs which have sprung up round Glasgow within the last twenty or thirty years have kept pace with the mother burgh in development, and now contain a population amongst them of about 170,000. As these burghs are essentially parts of Glasgow, having been formed by the overflow of its population, they ought to be added to the city in any estimate of its size and importance. The population of Glasgow, taking this basis, is therefore close upon three quarters of a million (750,000). The increase of the population during the present century has been greater perhaps than that of any other city or town of the Old World. In 1801 it was only 77,385; in 1821 it was 147,043; in 1841, 255,650; in 1861, 395,503; and in 1871, 477,732. In 1877 the dwelling-houses numbered 105,062, and the rental exceeded £3,250,000.

Plan of Glasgow (central portion).

Unlike the "grey metropolis of the north," Glasgow shows rather poorly in the history of Scotland. Its own real history—the history of its commerce and industries—can hardly be dated farther back than the beginning of the last century, when the union of England and Scotland roused into extraordinary activity the trading spirit of its inhabitants. And yet Glasgow is an old city. Its foundations were laid when the half-mythical Kentigern sat down by the banks of the Molendinar, to teach the rough Celts of Strathclyde the truths of Christianity. It was about the middle of the 6th century that this apostle of truth made his appearance in the west of Scotland, and built his little wooden church on the spot upon which some centuries later his successors reared the noble cathedral which still stands in perfect beauty. One can only guess that the inhabitants of this portion of Strathclyde gathered round the abode and church of St Mungo, and that as the site was pleasant, and the Molendinar and the Clyde supplied ample store of trout and salmon, the village under the fostering care of the monks grew slowly till it became a place of importance. Of that growth, however, nothing is really known till we reach the 12th century. In the year 1115 an investigation was ordered by David, then prince of Cumbria, of the lands and churches belonging to the bishopric of Glasgow, and from the deed which still exists it is evident that at that time a cathedral had been endowed. A few years later David succeeded to the Scottish throne on the death of his brother, Alexander I., and among the many endowments he made for religious purposes, we find that he gave to the see of Glasgow the lands of Partick, besides restoring many possessions of which it had been despoiled. Jocelyn was bishop of Glasgow for a long period, and is memorable for the efforts he made to rebuild the cathedral which had been destroyed by fire. He collected funds with so much success that in 1197 the new structure was sufficiently advanced to be dedicated. The next bishops of note were Bodington and Wisheart. The former carried on the building work of Jocelyn; the latter was a patriotic Scot who resisted the conquering army of Edward I., and was among the first to join in the revolt of Wallace, and to receive Robert Bruce when he was proscribed by Edward and lay under the ban of the church for the murder of the Red Comyn. Wisheart was a prisoner from the year 1306 to the battle of Bannockburn, and he lived to see Bruce firmly established upon the Scottish throne. Bishop Rae deserves mention for having built a stone bridge over the Clyde (1345). Bishop Turnbull was the greatest benefactor the city had till then found; for he was the founder of Glasgow university (1450). He also received a charter from James II. in 1420, erecting the town and the lands of the bishops into a regality. In 1491 the see was made metropolitan through the influence of James IV., who had been a canon of the cathedral in early life. The last Roman Catholic archbishop of Glasgow was James Bethune, consecrated in 1552. At the Reformation in 1560 the archbishop fled to France, carrying with him all the relics, documents, and valuables belonging to the see. The cathedral, upon which so much care had been bestowed by the successors of Bishop Jocelyn, very nearly suffered the devastation which was inflicted upon so many abbeys and churches by the more bigoted of the Reformers. It was saved by the craftsmen of Glasgow turning out in their strength and chasing away the destroyers of the "rookeries," who had already begun to lay sacrilegious hands upon the venerable building. After the Reformation, and till the Revolution of 1688, which re-established Presbyterianism as the religious form of worship in Scotland, the see of Glasgow was occupied by a number of archbishops, the tenure of whose office in many cases was precarious. The most notable fact after the Reformation in the history of the Glasgow Church was the Assembly of 1638 which was held in the city, when Episcopacy was energetically abjured, the Solemn League and Covenant accepted, and its signature made binding upon all who claimed the ordinances of the Presbyterian Church. The fact that the craftsmen were zealous for the preservation of their fine old cathedral indicates probably that the Reformation doctrines were not received so enthusiastically in Glasgow as in many other places in Scotland; but they took deep root latterly, and in the struggles for religious and civil liberty in the 17th century the inhabitants were among the foremost to assist and endure in the good cause.

Glasgow owed its erection into a burgh to its ecclesiastic lords. One of these obtained a royal charter from William the Lion in the last quarter of the 12th century (between the years 1175 and 1178), which made the town a burgh, and gave it a market with freedom and customs. Another charter, it is supposed, was granted in 1190, and according to a deed dated 1268 the town was governed by a provost and bailies, and had courts of justice for settling disputes among the inhabitants. There are no records, however, till almost quite recent times. A few incidents of national history with which Glasgow was connected may be noted, to fill up the blank from the period when it was an ecclesiastical town to the date at which it started its great career as the capital of Scottish industry and commerce. Wallace fought one of his successful battles for Scottish liberty in the High Street of Glasgow in the year 1300. In 1350 the plague raged in the city, and returned thirty years afterwards, though not in so severe a form. About 1542 the bishop's castle, which was garrisoned by the earl of Lennox, was besieged by the earl of Angus, then regent, and after its surrender on terms which were dishonoured, a skirmish took place between the parties at the Butts to the east of the town. The regent's troops were successful, and to punish the inhabitants for their devotion to the Lennox family the town was pillaged. The unfortunate Queen Mary visited her husband Darnley when he lay ill at his father's house Limmerfield, near Glasgow—a visit which afterwards was made of fatal significance to her when her case was heard before Queen Elizabeth in council. The inhabitants of Glasgow had no liking for the fair queen, for many of them fought against her at the battle of Langside, where she lost her crown and kingdom. Glasgow seems to have been fairly prosperous after the accession of James VI. and the union of the crowns of England and Scotland. It was recovering from the loss which it sustained by the Reformation through the dispersion of the wealth of its ecclesiastical lords. A little trade was springing up with foreign parts, chiefly with the Low Countries. But the city suffered somewhat severely in the reign of Charles I. Its inhabitants had become fiercely anti-prelatical, and were obnoxious to the ruling powers. When Montrose in his victorious course marched into the city after the battle of Kilsyth he levied a heavy contribution, although the city was suffering at the time from one of the periodical visits of the plague. In 1648 the provost and his bailies were deposed for contumacy to Charles I., and were imprisoned for a few days, while four regiments of foot and horse were quartered on the magistrates, council, and session. Plague and famine prevailed during the following year; in 1652 there was a great fire which destroyed about a third of the town and £100,000 worth of property. After the restoration of Charles II., and during the persecutions of his and his brother's reign, Glasgow suffered severely. It was a centre of disaffection against the Government, the headquarters of the Whigs of the west of Scotland. Glasgow prison was filled to overflowing with the rebels, as they were called, and it is a proof of the sympathy with which they were regarded by the citizens that on the occasion of another great fire in 1678 the doors of the prison were thrown open, and the prisoners set at liberty. The Government retaliated by sending an army of wild Highlanders to the city, who savagely oppressed the inhabitants and roused up the spirit of resistance which vented itself at Loudon Hill and Bothwell Bridge. With the Revolution peace and prosperity came to Glasgow, only to be partially interrupted by the risings in 1715 and 1745. A regiment of 500 men was raised in Glasgow to support William and Mary and Presbyterian rights and privileges; and in return the city was declared free by a charter, the citizens having the right of electing their own municipal rulers.

Glasgow was not aware of the vast benefits that were conferred upon her by the union of England and Scotland in 1707. The measure was stoutly resisted by the inhabitants, and its proclamation nearly led to a riot; but the merchants very soon saw that by the water highway which flowed through the town they could have access to the profitable trade that had been opened up in North America. Glasgow's situation for the western foreign traffic was the best in Scotland, and inferior to none of the great towns of England. The Treaty of Union put every Scottish port, so far as trade was concerned, on an equal footing with the English ports; and there was no reason why Glasgow should not share in the wealth which in ever-increasing amount was yearly coming across the Atlantic. As has been already stated, after the troublous times of the Reformation the trade prosperity of Glasgow was considerable. In the middle of the 16th century there were ten towns in Scotland above it in population and importance, but by the close of the 17th century it had risen to the second rank, with a population of about 10,000 or 11,000. This increase is to be ascribed to the monopoly which the inhabitants had secured in the middle of the 17th century of the sale of raw and refined sugars for the most of Scotland. Besides this they had the right of distilling spirits from molasses free of duty; they conducted a considerable trade in cured herrings and salmon, were manufacturers of soap, and sent to the English ports hides and linen, bringing back in exchange tobacco and manufactured goods, which they distributed north of the Tweed. Bristol was then the great emporium of tobacco, and Glasgow's commercial connexions with it naturally turned the attention of its traders to that lucrative branch of commerce. When it became possible for Glasgow merchants to enter into competition with the merchants of Bristol, companies were formed to carry on the trade with the North American colonies, and a large trade was soon established. Ships were chartered, and as wealth poured in were built, and sailed regularly for Virginia, Maryland, and Carolina, taking out goods in barter for cargoes of tobacco. In 1760 Glasgow had completely rivalled Bristol in the tobacco trade, and in 1772 its importations were more than half of the entire quantity brought into the United Kingdom. The Virginian trade being exceedingly lucrative, Glasgow flourished under it. The town rapidly extended westward, handsome mansion-houses for the "tobacco lords" were erected, and the austerity of manners which had come down from the covenanting days was somewhat relaxed. The money made by tobacco found its way into other branches of commerce and stimulated new industries. The tobacco trade however received a crushing blow at the outbreak of the American War,—a blow from which it never wholly recovered, for after the war was over, and the thirteen colonies had become the United States of North America, Glasgow was engaged in other commercial enterprises. The distress in the city was keen during the first years of the war, and Glasgow capitalists turned their attention to the West Indies and the cultivation of the sugar cane. The manufacture of cotton goods was introduced also about this time, and proved a new source of wealth and prosperity. Calico printing, which was soon to develop into a great industry employing thousands of persons, was started at Pollokshaws in 1742; the inkle loom was set up in 1732; glass-making was established in a feeble way in 1730; and the brewing of beer and ale on a large scale was attempted with success. In 1764 James Watt perfected his first model of a steam engine in a small workshop, which had been granted to him by the senatus of the university, within the college walls. From the Treaty of Union down to the end of the 18th century, the progress of the city had been remarkable. In 1708 the population was estimated to be upwards of 12,000; at the end of the century it was close upon 80,000.

The Harbour.—The energies of the traders of Glasgow were naturally somewhat confined by having a port so far away as Port-Glasgow, and there is little wonder that, when their commerce began to extend, they should have cast about for plans to deepen the water-way and enable them to bring their merchandise to their own warehouses in the city. The task which lay before them was one involving numerous difficulties. "A hundred years ago," says Mr Deas, the engineer of the Clyde trust, in his interesting sketch of *The Rise and Progress of the Harbour of Glasgow*, "the river was almost in a state of nature, and was fordable on foot at Dumbuck Ford, more than 12 miles below Glasgow." As early as 1566 the authorities of the towns of Glasgow, Renfrew, and Dumbarton endeavoured to remove a sandbank, a little above the latter town, and though operations were intermittingly carried on for some years, they do not appear to have been very successful. Prior to 1658 the shipping port of Glasgow was Irvine in Ayrshire, but the passage of lighters from that place was tedious and the land carriage expensive. It was determined in 1658 by the magistrates of Glasgow to purchase ground at Dumbarton, and construct a spacious harbour there. The magistrates of that royal burgh, however, objected, on the plea that "the great influx of mariners and others would raise the price of provisions to the inhabitants." The Glasgow authorities, however, were determined to have a harbour nearer than Irvine, and in 1662 they purchased 13 acres of ground on the south side of the river (now Port-Glasgow), where they built harbours and constructed the first graving dock in Scotland. In 1688 a quay was built at the Broomielaw, although nothing had yet been done for the deepening of the river. It was only after the city had experienced the vast importance of foreign traffic that the magistrates, most of whom were "tobacco lords," seriously turned their attention to the question. In 1740 the town council authorized the expenditure of £100 in making a deepening experiment below the Broomielaw quay, and fifteen years later they employed Smeaton the well-known engineer to report on the subject. He found the two shallowest places at the Pointhouse Ford, now the western boundary of the harbour, and at Hirst, now within the harbour. The depth at low water at the former was 15 inches and at the latter 18 inches, while at high water it was 3 feet 3 inches and 3 feet 8 inches respectively. Smeaton proposed a lock and dam, four miles below Glasgow Bridge, so as to secure 4 feet 6 inches of water at the Broomielaw quay. Fortunately his report was not adopted. In 1768 the first beginnings were made on the report of Mr John Golborne, who suggested the contraction of the river by the construction of rubble jetties and the removal of the shoals by dredging. James Watt reported in 1769 to the magistrates on the declivity of the bed of the Clyde from Broomielaw quay to that obdurate obstacle Dumbuck Ford. In 1773 Mr Golborne contracted with the town council to make this ford 6 feet deep at low water and 300 feet wide, and carried out his contract successfully in 1775. Rennie reported on the river in 1799, and recommended "the shortening of some of the jetties, the construction of new ones, and the building of low rubble walls from point to point of the jetties so as to render the channel uniform, and prevent the accumulation of shoals." His suggestions were carried out, and upwards of 200 jetties were constructed between Glasgow and Bowling, the result being a considerable improvement in the navigation, and reclamation of land to the proprietors on both banks from the alveus of the river, the greater portion of which has since had to be purchased at high prices for other improvements. Telford reported in 1806, and Rennie again in 1807, and the deepening process went on without pause. In 1836 the engineer of the Clyde Trust reported to the trustees that there was then from 7 to 8 feet of water at the Broomielaw quay at low water, that the lift of a neap tide, which was only sensible in 1755, was 4 feet, and of a spring tide 7 or 8 feet, making a depth of 12 feet at high water of a neap and of 15 feet of a spring tide. The river had become capable of taking craft of 400 tons to Glasgow. In 1840 parliament sanctioned an Act for carrying out plans for the further improvement of the navigation of the entire river under the jurisdiction of the trustees. Upon the lines then laid down the improvements have ever since proceeded, with only very slight modifications, but the result may probably be best expressed in the following figures. In 1839 vessels of 17 feet draught of water were safely navigated to and from the harbour, in 1854 of 19 feet draught, in 1861 of 20 feet draught, in 1862 of 21 feet draught, and in 1870 of 22 feet draught. Only a few years ago vessels of 15 feet draught were two and often three tides in the river in their passage up and down, but now vessels of 22 feet draught leaving Glasgow two or three hours before high water get to sea in one tide. The rapidity of the deepening process has been due almost entirely to the powerful steam dredgers employed by the trustees, to the use of the diving bell for blasting purposes, and latterly to the introduction of steam drilling and dynamite. The quantity of dredged matter taken from the river every year is somewhere about a million and a quarter of tons, which is carried off by barges and deposited in Loch Long, an arm of the Firth running up into the Western Highlands. During the last thirty-one years upwards of 20 million tons have been dredged from the river, and since the year 1770 the cost for dredging and depositing alone has been between £500,000 and £600,000. The total expenditure upon the river since the year above named has been upwards of seven millions sterling; and the revenue, which a hundred years ago was £1733, is now about £210,000. The first dock constructed at the Glasgow harbour was opened so late as 1867. Though Acts of Parliament had been obtained more than twenty years before, the sides of the river were utilized for quayage extension; but within the last ten or twelve years the pressure for space became very great, and the new dock, which is tidal, and covers 5¼ acres of water space, was found to be quite inadequate. A new Act was obtained in 1870 to construct docks at Stobcross, and these, which are now nearing completion, will have an area of 30 acres, and will accommodate one million tons of shipping. The estimated cost, including the purchase of land, is £1,163,000.

The traffic on the Clyde received an extraordinary impetus by the application of steam to navigation, and from the date of the "Comet," which was built on the Clyde in 1811–12 for Mr Henry Bell, Glasgow has been the true home of steam navigation. The steam shipbuilding trade has become one of the largest industries of the city, and with its growth the commerce of Glasgow has kept pace.

The river has been the fruitful source of the city's greatness. As the accessibility of the water-way became greater year by year, so the commerce and the industries of the city developed, and the material wealth increased. Glasgow, too, is fortunate in being the centre of an enormous coal and iron field, in the working of which she has greatly benefited. Her industries, now very numerous, are referred to in detail below. They embrace almost every species of manufacture to be found in Great Britain; and this variety is probably the reason for the all but uninterrupted prosperity of the city, for it is rare that every department of manufacture and commerce is dull at the same time. Her resources are so numerous that she is not much affected by stagnation in one or two branches. But Glasgow has undoubtedly come through one or two crises of a serious character in the course of her industrial career. In 1857 the failure of the Western Bank struck a hard blow at her trade and commerce, though it was wonderful how soon she recovered from the heavy loss and the derangement of commercial affairs which were caused by the failure. The American Civil War paralysed the cotton manufactures of Glasgow, as it did those of Lancashire; but otherwise it did little harm, and the stimulus that was given to shipbuilding by the carrying trade of the world practically falling into British hands more than compensated for other losses. The close of the American War was followed by a period of commercial and industrial activity in the city, which, however, sustained a severe check within the last two years, during which time trade has been languishing everywhere. While enterprising citizens were looking forward with some slight hope for signs of a revival, the collapse of the City of Glasgow Bank on the 2d October 1878 fell upon them like a thunderbolt. In a few days after the stoppage it was known that matters were far worse than the most sinister prophet of evil could have imagined, much less foretold. The whole of the capital and reserve of the bank, amounting to close upon a million and a half sterling, was squandered, and nearly five and a quarter millions besides. The total loss cannot be set down at much less than eight millions sterling, and the most of this enormous sum had gone to support great Indian and colonial firms, which had been hopelessly bankrupt for years. The inquiry into the affairs of the bank revealed such recklessness and misconduct on the part of some of those who were responsible for its management that the manager and the directors were tried on a charge of fabricating and uttering false balance sheets. They were all convicted, and sentenced to varied terms of imprisonment. Since this gigantic failure Glasgow has been passing through the greatest crisis of its existence.

Administration.—The affairs of Glasgow are managed by a corporation consisting of 48 representatives of the 16 wards into which the city is municipally divided, and by one representative from the Trades' and one from the Merchants' House. The lord provost is the head of the corporation, and is assisted in his executive functions by 10 bailies. The bailies hear and decide cases in the police courts, aided by assessors, who are local legal practitioners of good standing. There is also a stipendiary magistrate who sits every day in the central police court, and undertakes the heavier portion of the cases. The dean of guild court has a certain jurisdiction over the construction of new and the alteration of old buildings. The corporation of Glasgow, since it became popularly elected, has shown great and enlightened interest in the welfare of the city. It has during the last quarter of a century acquired three public parks for the recreation of the citizens, and laid them out in an ornamental manner. Within the same period, too, it has undertaken and carried out immense works for a supply of water unequalled in the kingdom, has bought up the old gas-works and supplies artificial light within and beyond the municipal boundaries, and is at present engaged in bringing to a successful close a series of city improvements on a very large scale.

City Improvements.—As the last-mentioned work is the most important upon which the corporation has been engaged since the introduction of Loch Katrine water, and formed the model upon which Mr Cross, the home secretary, framed his Artisans Dwellings Act, a slight sketch of the plan upon which it was founded may be given here.

The city had grown so fast in population during the present century that it had become greatly overcrowded, especially in the central portions. From the leading thoroughfares of High Street, Saltmarket, Trongate, Gallowgate, and Argyll Street long narrow closes and wynds penetrated into the densely-built spaces behind. The population in these regions varied from 400 to 1000 per acre, and the dirt, darkness, and foul air in which the poor creatures lived, made their homes breeding-places of fevers and disease of every kind. In some of the worst spots the death-rate was 70 per 1000 per annum. The closes and wynds, besides being dens of disease, were the haunts of the criminal class of the population, who were able to dispose of their plunder and escape the police with comparative ease in these deep alleys, many of them connected with each other by ways only known to the experienced criminal. Some benevolent citizens made a small effort at improvement about twenty years ago, by buying up one of the most notorious of these closes; but it was not till the City Union Railway was projected that the attention of the municipality was fairly called to the question, or that any step was taken by it. The Union Railway passed through some portions of the old town which were densely overcrowded, and it was suggested by the late Mr Blackie, who was then chief-magistrate, that the corporation might work in harmony with the railway company, and clear out old and densely-crowded properties, which the railway only touched at certain spots. Mr Carrick, the city architect, drew out improvement plans, and in 1866 an Act was passed by parliament enabling the corporation to acquire old overcrowded localities, to borrow money, and to levy rates. The improvements contemplated involved the destruction of 10,000 houses, all of them really unfit for habitation, but which were filled by upwards of 50,000 souls. The corporation was bound by the Act to find accommodation for the dispossessed when the numbers exceeded 500. In point of fact, the corporation never required to build houses, as private enterprise more than kept pace with the operations of the improvement scheme. By the Act the corporation was empowered to borrow £1,250,000, and to levy a rate of 6d. per pound on the rental for five years, and 3d. per pound for ten years, by which time it was calculated the whole work would be completed. No sooner was the Act passed than the trustees—all of them members of the town council—proceeded to purchase the properties scheduled, a delicate and difficult task, which, however, was most economically carried out, first by Sir James Watson, and afterwards by Mr James Morrison, the conveners. The work of demolition also went on; the densely-built districts were cleared out, open spaces and squares secured, streets driven through huge blocks of building, others widened, till now there is hardly a remnant left of the old notorious abodes of fever and crime. There is still a good deal to do, and it may be necessary to get an extension of the time fixed in the Act, as it expires in 1881; but up to the present time upwards of 30,000 people have been turned out of their unhealthy homes, and have been provided with better ones elsewhere. So far the improvements have been very cheaply executed. The great amount of demolition effected by the trustees and the railway companies greatly raised the value of building ground in the central portions of the town; and the corporation has been able to sell the properties which it had acquired at considerable profit, after utilizing large portions of them for streets and open spaces. The cost to the citizens will be the rates which have been and are to be levied; but perhaps to this should be added an uncertain amount represented by the rise of house rents. Up to May 1878 the sum raised by rates was £305,867; and, adding to that other three years' rates, the total amount which the improvements will cost will be about £375,000, £40,000 of which was spent in buying a park for the use of the people in the north-eastern district of the city.

Public Health.—The result of these improvements has been a marked decrease in the mortality. In 1866 Glasgow was one of the least healthy towns in Great Britain; in 1877 it was nearly as healthy as London. In 1866 the annual death rate was 29·6 per thousand, and continued slightly rising or falling till 1875, when there was a fall to 28·7. This was the year in which the work of the improvement trustees began to tell. In 1876 the death rate was 25·2 per thousand, in 1877 it was 24·9, and in

1878 it was 25·0. The improvement scheme has done good otherwise in directing attention to sanitary questions of all kinds. There is now in Glasgow a public department of health, at the head of which there is a most efficient medical officer, and provision has been made for the isolation of contagious diseases immediately on their breaking out. Great attention is paid to cleansing the city, and fever epidemics, which not long ago were seldom absent, are now very rare, and hardly ever assume large proportions. Crime has also diminished as one of the results of the city improvements, and its detection is much surer.

There can be no doubt that the demolition of so large a number of small dwelling-houses in such a short period was no small grievance to those who inhabited them; not that there ever was any lack of accommodation, but because families had in many cases to remove to places at inconvenient distances from their work, and into houses which, though much better in a sanitary sense, were somewhat dearer. The distance difficulty, however, was greatly mitigated by the construction of tramways throughout the town, and by the authorities providing for the running of morning and evening workmen's cars at exceedingly low fares; and it is scarcely doubtful that the change from unhealthy and overcrowded houses into others roomier and built with some regard to sanitary principles has been a blessing to the lower class of the population. When the works are completed, Glasgow in its older regions will be a city transformed.

Water Supply.—Previous to 1859 Glasgow was supplied by water from the river Clyde and from ponds erected some miles south of the city, to which the water was conveyed by gravitation. The supply was insufficient, and the Clyde water bad. In 1848 the idea of bringing water from Loch Katrine was first spoken of. The citizens at that time began to see that something far more extensive than had ever been attempted was required to supply the rapidly growing wants of the city. Between 1848 and 1855 many schemes were proposed by the water companies and by private individuals, none of which came to anything. In 1852 the corporation took the matter up, and, after a long and arduous struggle, the Act for tapping Loch Katrine was carried in 1855. The corporation it is believed would have been defeated again but for the attention which Lord Palmerston paid to a subject in which Glasgow was so deeply interested, and for the influence which he brought to bear in favour of the works. The engineer selected to bring the water from a distance of 34 miles was Mr J. F. Bateman, and four years after the passing of the Act the waters of the Highland loch, at the touch of Her Majesty the Queen, flowed into the city.

The sources of the supply are Loch Katrine with a surface of 3000 acres, Loch Vennacher with an area of 900 acres, Loch Drunkie 150 acres,—altogether about 4000 acres of water surface, and containing within the limits to which they may be raised or lowered about 1,600,000,000 cubic feet of water. The drainage area is 45,800 acres, and the rainfall is from 80 to 90 inches per annum. The source is ample for the supply of a population double that which is at present supplied, but the works are not more than sufficient to provide 50,000,000 of gallons of water per day, and it will be necessary before many years are past to construct other works, probably to double that quantity. Loch Katrine is 360 feet above the tide at Glasgow, which, allowing for the loss of fall, secures a pressure of 70 or 80 feet above the highest summit in the city. The water is conveyed by mined tunnels, built tunnels, aqueducts, and iron pipes. There are altogether 70 tunnels, one of which is 2650 yards and another 2325 yards in length, and 8 feet in diameter. One of these works is 600 feet below the surface. The aqueducts over rivers and ravines of an important character are 27 in number; some of these are of iron and some of masonry. Twenty-six miles from Loch Katrine and 7 or 8 from Glasgow a large reservoir was constructed, 70 acres in extent and capable of holding 500,000,000 gallons of water; and from this reservoir the water, having undergone a filtering process, is conveyed in pipes to Glasgow. The engineering cost of the works was £700,000, or ten per cent. above the estimate, but as the contract was only for 20,000,000 gallons per day, and the actual product was 30,000,000 gallons, the cost cannot be said to have been excessive. There have been great additions made to the works since they were opened in 1859, the total capital expenditure at the end of 1877 being a little over £2,000,000. The quantity of water brought into the city from Loch Katrine is now 30,000,000 gallons per day, but the area of distribution is much larger than Glasgow. In a very short time the corporation will be able to bring in 50,000,000 gallons a day, which is the limit of the capacity of their present works. The cost of the water to the inhabitants is 8d. per pound on the rental, and 1d. per pound is charged for public purposes. The quality of the water is excellent, and there can be no doubt that it has been an active agent in improving the health of the city. Besides the Loch Katrine works there is a supply of water from the Gorbals gravitation works amounting to rather more than four millions of gallons per day. The consumption of water over the area of distribution is thus 34,000,000 gallons in the 24 hours, or 45 gallons for every man, woman, and child,—a very large supply even when deduction is made for the water used in large public works, and for purposes other than domestic.

Lighting.—In the parliamentary session of 1868–9 the corporation applied for and obtained powers to purchase the works of the two gas-light companies which had until that period supplied Glasgow and its suburbs with gas. The capital of these companies consisted of £415,000, on £300,000 of which the shareholders were entitled to profits not exceeding 10 per cent. per annum, the remaining £115,000 paying dividends at the rate of 7½ per cent. per annum. The corporation agreed to give for the works to the shareholders annuities of 9 per cent. on the stock which paid 10 per cent., and of 6¾ per cent. on the stock which paid 7½ per cent. These annuities were guaranteed by a sixpenny rate upon the whole rental within the municipality. Besides these rates the corporation took over mortgages amounting to £119,265. It is needless to state that, no rate has ever been levied upon rental for the maintenance of the gas-works, the manufacture having proved remunerative at a moderate charge per thousand cubic feet. The gas-works, as taken over by the corporation, were capable of producing 6,500,000 cubic feet; but since then they have been greatly extended at a cost of half a million sterling, and are now capable of making 12 million cubic feet of gas. The consumption varies between 2 million cubic feet in twenty-four hours in summer and 11 million cubic feet during the same time in winter. The area of supply includes nearly all the surrounding suburbs, in addition to the city. The cost of gas to the consumer is 4s. per thousand cubic feet, and no rent is charged for the use of meters.

Tramways.—The next project with which the corporation has had to do in recent years has been laying down lines of tramways along the principal throughfares of the city. This work was undertaken for the purpose of preventing the control of the streets and the street traffic from passing out of the hands of the corporation; the cost was about £200,000 for 13½ miles of tramway; but this sum, with interest at 4½ per cent. per annum, is to be repaid in the course of twenty-three years by the lessees, who also keep up the roadway between the tramway lines, and pay a rent of £150 per mile per annum. The fares are one penny per mile, and the number of passengers carried is very great. Pecuniarily the tramways have been successful.

Income and Expenditure.—The income and expenditure of Glasgow are larger than those of many a flourishing state. The trusts, which till quite recently were semi-independent, but are now simply committees of the town council, are the police board, the water commissioners, the gas commissioners, the city improvement trustees, parks and galleries trust, market trust, &c. The revenues which they collect and distribute amount altogether to close upon one million sterling per annum. The common good of the city, that is to say, property belonging to the corporation, is estimated as being worth about £300,000, the interest of which is expended in maintaining what are called the city churches, and generally on municipal purposes for which the citizens are not taxed. The number of parliamentary voters in 1877–8 was 60,582, and the list of school-board electors, which includes all ratepayers, when the roll was last made up, numbered 112,897. Glasgow returns three representatives to the House of Commons since 1868, each elector having, however, only two votes. Previous to this, and from the passing of the great reform measure of 1832, the city had only two representatives. Glasgow has a police force of about 1000 men, which is maintained at an expense of £78,000 per annum, half of which is paid by the Government. The sheriff-depute of Lanarkshire holds his court in Glasgow, and is assisted by five sheriffs-substitutes resident in the city. The amount of legal work which is gone through in the disposal of civil and criminal cases is very great, being equal to about one-third of the whole disposed of in Scotland, including the supreme courts in Edinburgh.

Bridges and Railway Stations.—There are three fine bridges over the river within the municipal boundaries, and two iron suspension bridges. One railway bridge was erected a few years ago by the City Union Railway Company, and another by the Caledonian Railway Company is now nearly completed. All the bridges are free. Glasgow is the centre of a vast railway system, the Caledonian and Glasgow & South-Western Railways having their termini in the city; these work with the great English lines, the Midland and the London & North-Western Companies. The St Enoch's Square station, which provides for the traffic over the Glasgow & South-Western, City Union, and Midland Companies, is one of the most spacious in the United Kingdom. The same companies are erecting an equally commodious goods station in High Street; the Caledonian Company, finding themselves greatly hampered for room at the old terminus in Buchanan Street, are building a colossal structure in Gordon Street; and the North British Company, which have their headquarters in Edinburgh, are greatly extending their present limited accommodation in Dundas Street.

Public Buildings.—There are not many of these of importance in Glasgow. The one which naturally attracts the greatest attention of strangers is the cathedral, which is now in a complete state of repair, and a few years ago, through the munificence of Glasgow citizens and of noblemen and gentlemen of the vicinity, its windows were filled with richly stained glass from one of the great stained glass establishments of Munich. The cathedral is acknowledged to be a fine specimen of Early English Gothic. It is situated in a good position in the north-east quarter of the city, and is about 104 feet above the Clyde level. Its form is that of a Latin cross with short transepts. The length from east to west is 319 feet, its breadth 63 feet, the height of the choir 93 feet, and of the nave 85 feet. At the intersection it has a tapering octagonal spire, the height of which is 225 feet. It contains 147 pillars and 159 windows. The crypt under the choir is exceedingly fine and complete. The Royal Exchange in the centre of the city contains a newsroom 122 feet in length by 60 feet broad. Its portico is formed of 12 fluted Corinthian columns, supporting a rich frieze and pediment; the north and south sides of the building are ornamented by a colonnade of Corinthian pillars. The Royal Infirmary is in the Roman style of architecture from a design by Adams. It has been greatly extended since its erection in 1792. The City Hall is a plain building capable of holding upwards of 3000 people. The new Public Halls, opened in 1877, are the most recent addition to the architecture of the city. The building cost upwards of £80,000, and since its opening has been mainly used for musical entertainments, music being one of the arts which has been cultivated with the greatest success in Glasgow of late years. The principal hall in this fine building, which is of the classic style of architecture, is capable of holding between 4000 and 5000 persons. By far the grandest building in Glasgow, however, is the new university structure on Gilmorehill, which is described below. During the last thirty years a vast improvement has been made in Glasgow in church architecture. Dissenters who were satisfied in the earlier part of the century with plain meeting-houses now vie with each other, and with the Church of Scotland, in the elegance and adornment of their places of worship. There is probably no town in the United Kingdom which has spent more upon ecclesiastical buildings in recent times than Glasgow, or which in this respect has made greater improvements in taste. The Roman Catholics and Episcopalians, nearly one-fourth of the population of the city, have also erected some very fine ecclesiastical edifices. The street architecture of Glasgow has greatly improved, many of the large business firms having rebuilt their warehouses upon a splendid scale. The new post-office buildings in George Square also deserve mention. The work of the post-office of Glasgow has increased with the increase of the city, and is now practically larger than that of any other town save London. It was found necessary a few years ago to extend the accommodation, and now the greater part of one side of George Square is devoted to postal and telegraph purposes. The new buildings are plain but massive, and seem to have been planned on the principle of the least ornament with the most room. The corporation have obtained an Act for the erection of municipal buildings on the east side of George Square. Not without reason has Glasgow been called one of the best built cities of the empire, its substantial masonry owing much to the excellent quality of the material, a sandstone quarried in abundance all round the city.

Statues.—The public statues in Glasgow are not numerous, though several of them are very fine. Most of them are in George Square. The equestrian statue of the great duke of Wellington stands opposite the main entrance to the royal exchange, and that of William III. is close to the junction of Trongate with the Saltmarket, High Street, and Gallowgate, the ancient cross of the city. In George Square there are equestrian statues of the Queen and the late Prince Consort, a seated figure of James Watt, statues of Sir John Moore, Lord Clyde, Sir Robert Peel, Sir Walter Scott, James Oswald of Auchincruive, Thomas Graham the celebrated chemist, Robert Burns, Thomas Campbell, and David Livingstone. The statue of Burns, executed by Mr George E. Ewing, a Glasgow sculptor, was subscribed for in shillings by the working classes of Scotland.

University and Schools.—Of the educational institutions of Glasgow precedence must be given to the university. As already stated this great seminary of learning was founded by Bishop Turnbull, who obtained a papal bull for the purpose, dated 7th January 1450. By this bull a corporate body was formed, consisting of a chancellor, rector, and dean, with doctors, masters, regents, and students, in the several faculties into which it was divided. One of these was known as the pedagogium, or college of arts. This school of learning was first situated in Rottenrow (1459). James, Lord Hamilton, bequeathed to the principal regent of that college some buildings and several acres of land, on part of which in the High Street the college was afterwards erected. The college of arts was restored and endowed by James VI. During the period which intervened between 1577 and 1688 the university underwent many changes; but in the year 1693, each of the Scottish colleges having received a grant of £300 per annum out of the bishops' rents, the Glasgow institution again revived; and having received other public and private gifts, its progress has been since uninterrupted. The academic body of the university consists of the chancellor, the lord rector, the dean of faculty, the principal and vice-chancellor, and the professors. The whole business of the university is transacted in three distinct courts, viz., the senatus, the faculty, and the comitia. There are many bursaries connected with the college, the most important being those bequeathed by Mr Snell, by Mrs Black, the widow of a late minister of the Barony church, and by Mr Orr-Ewing, M.P. for Dumbartonshire. The college buildings in High Street were principally erected in 1593 and 1658. The spire, which was 153 feet in height, possessed a lightning conductor which was reared under the auspices of Franklin in 1772.

The present university buildings at Gilmorehill occupy a magnificent site above the Kelvin, overlooking the Kelvingrove Park, and commanding a splendid view of the valley of the Clyde. In 1860 the commissioners under the "Universities Scotland Act" reported that in the interests of the university it was necessary that the college should be rebuilt, and that the site which it occupied in High Street was most ineligible for the purpose of the university. In 1863 the promoters of the City of Glasgow Union Railway Company offered to purchase the college grounds for the sum of £100,000, which was ultimately accepted; and during the negotiations Government offered to give £21,400, on condition that £24,000 for the erection of an hospital was raised by private subscription. On the 29th July 1864 the lands of Gilmorehill, consisting of 43 acres, were purchased by the senate for £65,000; about six months later the adjacent lands of Donaldshill were secured for £16,000, and the property of Clayslaps, containing 5 or 6 acres, was bought for a hospital site for the sum of £17,400. Part of the lands of Gilmorehill not required for the university were advantageously sold to the corporation of Glasgow. Sir Gilbert Scott was appointed architect of the new buildings at the end of September 1864, and the plans were completed and approved of in the beginning of 1866. The estimated cost of the building, including hospital, was £266,000,—a sum far beyond the means of the university authorities. The citizens of Glasgow, however, came heartily to their help, and subscribed liberally to the building fund. In January 1868 Government agreed to give £120,000, on condition that the same amount was raised by private subscriptions. The work at once progressed under these assurances of support, and on the 8th October 1868 the foundation stone of the new buildings was laid by the Prince of Wales. In 1870 the buildings were so far completed that the removal from High Street took place, the last meeting of the senatus in the old college buildings having been held on 28th July of that year. The financial difficulty, however, proved a very serious one. The cost of the buildings greatly exceeded the estimate, and went far beyond the funds placed at the disposal of the senatus, although the public subscriptions amounted to nearly £160,000. The fine building is therefore up to the present time incomplete. The tower had to be stopped when less than half-way up, and the grand hall, designs of which were prepared by Sir Gilbert Scott, is still untouched. The senatus, however, has now been practically relieved of its difficulties by the splendid contributions of the marquis of Bute and of Mr Charles Randolph, one of the pioneers of steam shipbuilding on the Clyde. The marquis has given £40,000 for the erection of the common hall, and Mr Randolph bequeathed £60,000 for the completion of the buildings. With these sums at its disposal the senatus will no doubt in a few years finish this noble structure, and it will then be unequalled, so far as the building is concerned, as an educational institution.

The following notes, descriptive of the new buildings, are from the pen of the architect:—

The architectural style of the building is founded on that of works of the 14th century, subject to some modifications introduced with a view to giving the building a character allied to that of the old Scottish buildings. It is probable, however, that during the 14th century this specific character may not have prevailed in Scotland. It seems, in fact, to have been introduced from France at a later period, and worked up with so much originality into buildings in Scotland as to have become quite received as the style of the country. In France it had existed at least from the 13th century, so that what has been done in the design of the college is to *translate back* the characteristics in question, and to unite them with the general style of the architecture of the 14th century, though in Scotland they may not probably have actually existed till a later date. As the building stands on the crown of a hill, whose principal and rapid slope is toward the south, it has been made to occupy, as far as may be, the whole of the ridge facing in that direction by a long and continuous front of about 540 feet in length. In advance of this lengthened façade is a system of terraces, bringing the ground down by gradual steps towards the Kelvin, which flows through a deep ravine along its base. The southern façade comprises three more lofty portions, a central block and two corner towers, between which are two ranges of buildings of smaller elevation. The centre of the line of building facing the south is occupied by a lofty tower, through which, on the ground floor, is the principal entrance to the building. There is also a gateway through the centre of each of the lower ranges of building, arched and groined, leading into the east and west quadrangles. Another main entrance is provided in the central block of the northern range of building. This entrance consists of a double gateway, the passages from which turn round to meet one another in the basement within the building. Much in the same manner, the north side of the building is divided into five parts, the angle blocks forming towers, similar to those in front; but facing each quadrangle there is a building of great dimensions, one of which is devoted to the museum and the other to the library. Between these is a central block, in this case of less elevation than the main side portions, containing the students' reading-room below and the hall of the Hunterian museum above.

The whole rectangular range of buildings, thus briefly described, is about 540 feet in length by 300 feet in breadth, occupying the greater part of the crown of the hill. From it to the west extend the different ranges of the principal's and professors' houses, while towards the south-east the outline is prolonged and diversified by the chemical laboratory, a partially detached building of octagonal form, and, at the north-east, by the anatomical rooms. The library and museum are alike in design. There are two great halls in each, occupying respectively the ground and first floors, these being 129 feet long by 60 feet wide.

Anderson's College, formerly called Anderson's (or the Andersonian) University, was founded by John Anderson, professor of natural philosophy in the university of Glasgow in 1795, and endowed by him with valuable philosophical apparatus, a museum, and a library. It is governed by 81 trustees, and its object is to bring literary and scientific education within the reach of the mass of the community. Every branch of study taught in Glasgow university is provided for, with the exception of divinity. Drs Garnett and Birkbeck were the original professors of natural philosophy and chemistry; Dr Ure and Thomas Graham also occupied chairs in this college; and it was there that the first mechanics' class was established in Great Britain. The trustees contemplate the removal of the institution to the west end of the city, where it is believed it will greatly extend its sphere of usefulness. The number of students in 1878 was 986; and those attending popular evening classes, at which lectures are delivered in various branches of science, numbered 992.

The High School or Grammar School, formerly in John Street and under the charge of the corporation, is the oldest educational institution in the city. It appears that a grammar school existed in Glasgow early in the 14th century, being then dependent on the cathedral church. Up to 1834 its masters taught only Latin and Greek, but at that period the school underwent a complete alteration. Two of the classical masterships were suppressed, and in lieu of these teachers of English grammar, foreign languages, writing, arithmetic, geography, mathematics, and drawing were introduced. The name was also changed from the grammar school to the high school. The school was up to 1873 under the control of the corporation, but it was in that year placed under the jurisdiction of the school board of the city. In 1878 the school was removed to Elmbank Street, to the premises occupied by the Glasgow academy—a commodious building. The high school has been greatly improved by the school board, and is now one of the best secondary educational establishments in Scotland. It has upwards of 500 pupils. There are other secondary schools in Glasgow that are doing good educational work. Among these may be mentioned the Glasgow academy, the Kirklee academy, and the schools belonging to Hutcheson's hospital. There is also a Government school of design well attended, a technical school recently instituted, the mechanics' institution, founded in 1832, for the purpose of diffusing a knowledge of science among the working classes, the athenæum, which draws its students principally from the lower middle class, and the normal schools belonging to the Church of Scotland and the Free Church, for the training of teachers.

The passing of the Education (Scotland) Act in 1872 gave Glasgow an opportunity of dealing practically with the dense ignorance that prevailed within her boundaries. Before the Act passed it was believed that at least 20,000 (possibly far more) children in the city received no education whatever. The school board has persistently dealt with these uneducated waifs, and the most of this large ignorant mass have been reached. There are now not more than 3000 children of school age who are not receiving some education in the board and other schools. The school board rate in the city is 4d. per pound on the rental. The amount raised per annum is about £30,000.

Libraries, Museums, &c.—The libraries open to the public are Stirling's public library, a large collection of literature, and famous for its tracts of the 16th and 17th centuries, and the Mitchell public library, established a few years ago by the munificence of a citizen of Glasgow, who left about £80,000 for the purpose. This library is under the management of the town council, and during the short period of its existence has collected a large number of valuable books. It is meant to be a consulting library. The college library is very extensive, but can only be used by alumni of the university. An industrial museum was instituted some years ago in the old residential building of the West End Park. An addition was made to it about three years since, and the collection is now very considerable. It is supported under the Parks and Galleries Act, as are also the corporation galleries of art, a collection of pictures and statuary, acquired partly by purchase but more largely by donation and bequest. The galleries contain a very valuable series of old Dutch masters, and there is a noble statue of Pitt by Chantrey. The Hunterian and Andersonian museums are accessible to the public. The Hunterian contains a noble collection of anatomical subjects, and a most valuable assortment of coins. There is a botanical garden in Glasgow, but this has never been worthy of the city.

Theatres.—The drama has always been tolerably well patronized in Glasgow, which now contains some half dozen theatres.

Commercial Institutions.—The Chamber of Commerce was instituted in 1783, for the purpose of encouraging and protecting trade, and keeping a watchful eye on whatever might be supposed to affect the commercial interests of Glasgow and its neighbourhood. There are eight banks and branch banks in the city, two of them being properly Glasgow institutions; they are all joint-stock companies. In 1815 the first attempt was made in Glasgow to establish an institution for the accumulation of the savings of the community, the Provident Bank. This and some others of a like kind in 1836 were all merged in the National Savings Bank, which has had a most successful career. The deposits now amount to about £2,771,066, and the depositors are 104,329 in number.

Parks.—The city is specially well provided with public parks, although not more than a quarter of a century has elapsed since it possessed only one—Glasgow Green—a noble expanse along the north bank of the river, which was long neglected and uncared for. Since that time Kelvingrove Park, in the Kelvin valley at the west end of the city, was acquired, and laid out under the direction of Sir Joseph Paxton, and it has been frequently added to. At a later date the Queen's Park, on the southern outskirts, was formed; and subsequently the city improvement trust expended £40,000 on the purchase and laying-out of the Alexandra Park on the north east side of the city. These parks are all liberally maintained by the parks and galleries trust of the town council.

Glasgow has been almost exclusively a commercial city within the last half century. As wealth increased culture also increased, though more slowly. The university has always been the centre of intelligence in the city, and many of its professors have been conspicuous for their devotion to the applications of pure science to the development of the arts and manufactures. Of the great names connected with this institution it may suffice to mention Baillie, whose letters on the troubles of the 17th century, recovered by the late Dr Laing of Edinburgh, added considerably to our knowledge of that period, and Professors Adam Smith and Thomas Reid. James Watt, though not a member of the university, was generously protected by it when the burgesses of Glasgow refused to allow him to open shop within the jurisdiction of the trades house and magistrates of the city. There are many literary men, and poets of the minor class, who claim Glasgow as their birthplace, but none of them reached sufficient eminence to claim particular notice. Of the practical workers who by their mechanical aptitude, amounting in many cases to genius, have pushed on the industries of the city, it is impossible here to give even meagre biographical details. The commercial capital of Scotland has prospered more by the general energy and indomitable perseverance of its inhabitants than by the special genius of individuals.

Industries.—The most outstanding feature in the industrial position of Glasgow is the great variety and wide range of its manufacturing and trading activity. While no one of the great industries occupies a position of predominant importance so as to stamp itself as the peculiar characteristic of the town, there are numerous leading departments of industry which have been long established and are prosecuted on a great scale, while a variety of special manufactures have found their principal centre in Glasgow and the Clyde valley. When to this fact is added the consideration that Glasgow is one of the three principal seaports of the United Kingdom, it will at once be obvious that the wealth and prosperity of the city are contributed to by many separate and important streams. The circumstances and conditions which have favoured the establishment of the leading industries in Glasgow are quite as varied as are the industries themselves. The abundance of pure water in the hill streams around the city led at an early date to the introduction of bleaching, calico-printing, and allied pursuits; and these, in their turn, reacted favourably on hand-loom weaving and other textile manufactures. In a similar way the first beginnings of the now great chemical industries are clearly related to the early stages of the bleaching and printing trades. The fact, however, that the town is actually built within the richest coal and ironstone field in Scotland has had, of all causes, the most important influence in determining the current and prosperity of local industries. Further, the river Clyde, rendered navigable for vessels of the largest tonnage, flowing through the centre of that great coal and iron region, presents incomparable facilities for the prosecution of shipbuilding and marine engineering. But beyond the advantages of natural position and mineral wealth it is right to say that Glasgow owes much of her industrial prestige to a long line of highly-gifted, ingenious, sagacious, and energetic citizens, whose influence has not only been stamped on local industries, but has been felt and acknowledged throughout the entire world.

The principal industries of Glasgow range themselves under the heads separately noted below. With respect to many of them it is a matter of regret that no trustworthy source of specific information exists; and thus the origin, vicissitudes, and progress of really important trades can only be recorded in vague and general terms.

Textile manufactures.—The industries embraced under this head were the first which gave Glasgow a place among the great manufacturing communities; but though, through many changes and fluctuations, they continue to yield extensive employment, they now occupy a comparatively secondary position. In the cotton trade, which originated about 1780, Glasgow possesses several factories which are reckoned among the largest in the trade; the industry has, however, for a number of years been in a stationary if not declining condition. The manufacture of light textures has always been the leading feature of the Glasgow trade,—plain, striped, and figured muslins, ginghams, and fancy fabrics forming the staple. Thread manufacture, although specially a Paisley industry, is also extensively prosecuted in Glasgow. According to a return obtained in 1875 the whole cotton industry of Scotland afforded employment to 33,276 individuals, and excepting about 10 per cent. it was entirely centred in Glasgow and the surrounding district. Jute and silk are staples worked only to an inconsiderable extent in Glasgow, though about a century ago the manufacture of silk gauze flourished extensively, and has left traces of its former importance to the present day. The most characteristic of woollen and worsted manufactures is carpet weaving, all the leading kinds of carpets being extensively made, and the "tapestry" curtains and portieres made by several firms are examples of highly artistic woollen fabrics.

Bleaching, Printing, and Dyeing.—These allied industries took root in the Glasgow district at an earlier period than that of their introduction into the rival regions of Lancashire, calico-printing having been begun near Glasgow in 1738. The use of chlorine in bleaching was first introduced in Great Britain at Glasgow in 1787, on the suggestion of the illustrious James Watt, by his father-in-law, a local bleacher; and it was a Glasgow bleacher—Charles Tennant—who first made and introduced bleaching powder (chloride of lime). The dyeing of Turkey red was begun as a British industry at Glasgow by two eminent citizens—David Dale and George M'Intosh—and that unequalled colour was long locally known as Dale's red. All these industries continue to hold a foremost place in Glasgow, a large amount of grey cloth being sent from the Lancashire looms to be bleached and printed in the Scotch works. In particular Turkey red dyeing and printing have developed to an extent unequalled in any other manufacturing centre.

Chemical Manufactures.—The operations of bleaching and calico-printing in the early part of last century gave rise to such chemical manufactures—the preparation of dye liquors, &c.—as these industries demand. The discovery of bleaching powder by Charles Tennant in 1799 led directly to the development of the great chemical works of C. Tennant & Co. at St Rollox and its various branches, and gave the first great impetus to chemical manufactures in Glasgow. Among the prominent chemical industries are to be reckoned the alkali trades—including soda, bleaching powder, and soap-making—the preparation of alum and prussiates of potash, bichromate of potash manufacture (an industry peculiarly identified with Glasgow), the extraction of iodine and other products from sea-weeds, dynamite and gun-powder manufacture, the making of flint glass, bottle glass, paper, white-lead and other pigments, and brewing and the distillation of spirits. The numerous chemical preparations used in the bleaching and calico-printing trades are also among the local manufactures, as well as the preparation of starch, British gum, and dextrine, and the manufacture of lucifer matches.

Iron Manufacture and other Metallurgical Industries.—Although the blast furnaces of Scotland are distributed over several of the midland counties, the great proportion of them are in Lanarkshire and Ayrshire, and the trade is entirely controlled and practically monopolized in Glasgow. The discovery of the value of blackband ironstone by Mushet and the invention of the hot-blast by Neilson were two events which exercised a wonderful influence on the development of iron smelting in Scotland. So rapid was the expansion of the industry during the earlier half of this century that in 1859 one-third of the whole iron produced in the United Kingdom was Scotch. For 20 years past the trade has shown little elasticity, the annual production averaging about a million of tons of pig iron,—the maximum output having been reached in 1870, when 1,206,000 tons were smelted. In 1877 of a total of 152 furnaces existing there were 109 in blast, and of the whole 131 were situated in Lanarkshire and Ayrshire, 102 of these being in operation. The entire output of pig iron in that year was 982,000 tons, while in 1878 from 90 furnaces in blast the production is estimated at 902,000 tons. The number of malleable iron works in Glasgow and its neighbourhood is 22, having had during 1877 345 puddling furnaces and 53 rolling mills in operation. Mild steel is manufactured on an extensive scale by the Siemens-Martin process, and a small amount of crucible cast steel is also made. Other metallurgical industries include the extraction of copper by Henderson's wet process, and a limited amount of zinc smelting.

Engineering.—With abundance of iron and coal, and great facilities of both land and water carriage, it is only to be expected that mechanical engineering should be carried on in Glasgow with peculiar energy and success. Almost all departments of engineering work are well represented in the district; and among the special features of the industries may be enumerated the great water and gas pipe casting establishments, sanitary and general iron-founding, malleable iron tube making, locomotive engine building, the manufacture of sugar machinery and of sewing machines,—two great establishments on the model of American factories for the latter trade being conducted by the Singer and the Howe Machine Companies respectively. The marine engineering works of the Clyde—which in many instances are worked in direct connexion with shipbuilding yards—are equipped on a scale worthy of the great industry of which they form an important part; and few establishments exist in any other quarter capable of producing the enormous forgings for propeller shafts, &c., of ocean steamers, which form a regular item in the undertakings of Glasgow engineering firms.

Shipbuilding is the greatest of all the modern industries of Glasgow, and the position attained by the shipbuilders of the Clyde is a matter of imperial consequence and national pride. The shipbuilding yards of the Clyde extend from Rutherglen above Glasgow to Greenock,—Dumbarton, Port Glasgow, and Greenock having an important stake in the industry. In some years about half the total tonnage built in the United Kingdom has been launched from the Clyde yards, as is shown by the following statement:—

	1871.	1872.	1873.	1874.	1875.	1876.	1877.
Tonnage launched, Clyde..............	196,229	230,347	232,926	262,430	211,482	174,824	169,383
Tonnage launched, United Kingdom	391,058	474,718	453,543	603,867	472,058	378,020	450,963

During the year 1878 the tonnage launched on the Clyde from the yards of 35 different firms amounted to 222,853 tons, one vessel, the "Gallia," built for the Cunard Company, being of 5200 tons burthen,—a tonnage, however, which has been exceeded by the Guion steamer "Arizona" (5500 tons), launched in 1879. The work turned out is very diversified, but as a rule of the highest class, and includes armour-plated and other vessels for the Royal Navy, mail and passenger ocean steamers for the great Transatlantic and other lines, river steamboats famous throughout the world for swiftness and elegance of appointments, merchant sailing vessels, dredging plant, and hopper barges. With the exception of a very insignificant proportion of wooden vessels, the whole of the shipping built on the Clyde is of iron and steel, the latter having recently been introduced with great success. The shipbuilding trade in Glasgow indeed owes its extraordinary expansion almost entirely to the rapid supplanting of wood by iron as a building material. Twenty years ago, in 1859, the tonnage launched measured only 35,709 tons, from which amount, by rapid strides, it reached in 1869 a total of 123,262 tons, and in 1874 the maximum amount of 262,430 tons was floated off.

COMMERCE.—For a century past the records of the Clyde Navigation Trust indicate that the trade of Glasgow, so far as regards shipping, has progressed, with few and unimportant fluctuations, with steady rapidity. In 1778 the annual revenue of the Clyde Trust was £1733; in 1828 it amounted to £17,669, a tenfold increase in 50 years; and in 1878 the total amounted to £217,100. Of course these figures do not necessarily indicate a corresponding expansion of shipping trade, though they probably bear a close relation to the comparative value of cargoes carried. In the year 1828 the tonnage of vessels of all kinds which arrived in the harbour of Glasgow was 696,261, the sailing vessels having numbered 4405 of 214,315 tons, and the steamers 7100 of 481,946 tons. For the year ending 30th June 1878 the arrivals of sailing ships numbered 2727, with 457,290 tons capacity, and of steamers there were 13,210, the tonnage of which amounted 2,154,733 tons,—in all 15,937 arrivals with a gross tonnage of 2,612,023 tons, being the greatest amount on record. In that year the weight of goods imported from abroad was 658,319 tons; and coastwise 586,576 tons were landed at Glasgow, making in all 1,244,895 tons. The foreign imports consisted in largest measure of Indian corn, wheat, flour, and other food substances, with timber, pyrites, iron ore, and sulphur, the coasting arrivals containing principally limestone, iron, cement, potter's clay, salt, timber, and food stuffs. The goods shipped to foreign ports amounted to 712,249 tons, and coastwise 603,374 tons left Glasgow, making in all 1,315,623 tons. The principal exports were coal, iron, cast pipes, chairs and other railway iron, chemical manufactures, and general machinery, with malt liquors and spirits; and in the coasting trade the leading articles were of a similar general description. The great bulk of the foreign trade is with New York and Canadian ports, India, France, Spain, and Belgium; and coasting traffic beyond the Clyde estuary is directed principally to Liverpool, Belfast, Dublin, Londonderry, Waterford, Bristol, and London; but there are few commercial ports throughout the world which have not more or less direct trading communication with the port and harbour of Glasgow. (J. H. S.—J. PA.)

GLASS

History.

THE art of glass-making, unlike that of pottery, would appear not to have been discovered and practised by different nations independently, but to have gradually spread from a single centre. No trace of it was observed among the inhabitants of America at the time when that continent was discovered, although considerable progress in the arts had been made by some among them, *e.g.*, the Mexicans and Peruvians; but the steps by which it reached China may be indicated with much probability. The credit of the invention was given by the ancients to the Phœnicians, as is shown by the well-known story of its fortuitous discovery by Phœnician merchants, who rested their cooking pots on blocks of natron (sub-carbonate of soda), and found glass produced by the union under heat of the alkali and the sand of the shore (Pliny, *Nat. Hist.*, xxxvi. 26, 65). A glassy mass may, however, be produced in the smelting of many metallic ores, silica being present, while the fuel supplies the alkali; or by the combustion of great masses of reeds or straw, in which the elements of glass are present,—lumps of coarse imperfect glass being often found on the spot where a stack of wheat has been burned. Now the Egyptians practised metallurgic operations from a very early period, and vast heaps of straw are, and no doubt have been from the earliest times, accumulated in that country, and probably not unfrequently set on fire. The adoption of glass as a substance capable of being made subservient to the use of mankind may therefore be due to the intelligence of some one who noticed its fortuitous production there. Be this as it may, by far the earliest examples of glass existing of which the dates are attested by inscriptions are of Egyptian origin. The earliest of these, a small lion's head of opaque blue glass of very fine colour, but changed externally to an olive green, was found at Thebes by Signor Drovetti, and is now in the British Museum;[1] on the underside are hieroglyphics containing the name of Nuantef IV., whose date according to Lepsius's chronology was 2423–2380 B.C. A bead of dusky green glass bears the prænomen of Hatasu, a queen who is conjectured to have lived about 1450 B.C. (Wilkinson, *Manners and Customs of the Ancient Egyptians*, vol. iii. p. 88). That such may be the real dates of these objects is confirmed by the fact that glass bottles containing red wine are represented on monuments of the fourth dynasty, more than 4000 years old; and in the tombs at Beni Hasan, dating from the reign of Usurtesen I., at least 2000 years B.C., the process of glass-blowing is represented in an unmistakable manner (Wilkinson, vol. iii. p. 89). Very many examples of glass found in Egypt may be seen in museums, but, as they rarely bear inscriptions, it would be difficult to trace the progress of the art through them; no competent person has hitherto undertaken the task. The manufacture probably continued to flourish as well during the period of the native monarchy as in that of the Greek dynasty; and its importance after the subjugation of the country to Rome was probably even increased by the new market then opened to its products. Martial (*Ep.*, xxi. 74) alludes to the importation of Egyptian glass into Rome; and it is mentioned in an ordinance of Aurelian Hadrian in a letter addressed to the consul Servianus mentions glass-blowing as one of the chief industrial occupations of the inhabitants of Alexandria. The manufacture was not confined to that city, but was also carried on in the lower Diospolis on Lake Mensaleh, as appears by a passage in the *Periplus Maris Erythræi* (c. 6).

Much of the Egyptian glass was uncoloured and of a somewhat dusky hue; of the coloured and ornamental varieties perhaps the most characteristic examples are the small vases usually in the form of either alabastra or amphoræ, but occasionally in that of an Egyptian column. In these the prevailing colour is a deep transparent blue; but not unfrequently the colour of the body of the vase is some shade of pale buff, fawn, or white (an imitation probably of arragonite, Egyptian alabaster), sometimes deep green, and in rare cases red. In almost every example the surface is ornamented by bands of colour, white, yellow, or torquoise blue, forming zigzag lines; in some examples there are only two or three such lines, in others the whole surface is covered by them. These lines are incorporated with the surface of the vessel, but do not penetrate through its entire thickness. By the Greeks and Etruscans such vessels were evidently much valued; the amphoræ have been occasionally found in tombs, furnished with a stand of gold. In Rhodes and elsewhere they have been found associated with objects which probably do not date from an earlier period than the 3d or 4th century before Christ, and it does not appear that they are met with in tombs later than the Christian era; when coloured or ornamental glass vessels are discovered in these last, they are of a different character. Another species of glass manufacture in which the Egyptians would appear to have been peculiarly skilled is the so-called mosaic glass, formed by the union of rods of various colours in such a manner as to form a pattern; the rod so formed was then reheated and drawn out until reduced to a very small size, a square inch or less, and divided into tablets by being cut transversely, each of these tablets presenting the pattern traversing its substance and visible on each face. This process was no doubt first practised in Egypt, and is never seen in such perfection as in objects of a decidedly Egyptian character in design or in colour. Very beautiful pieces of ornament of an architectural character are met with, which probably once served as decorations of caskets or other small pieces of furniture, or of trinkets; also tragic masks, human faces, and birds. Some of the last-named are represented with such truth of colouring and delicacy of detail that even the separate feathers of the wings and tail are well distinguished, although, as in an example in the British Museum, a human-headed hawk, the piece which contains the figure may not exceed three-fourths of an inch in its largest dimension. Works of this description probably belong to the period when Egypt passed under Roman domination, as similar objects, though of inferior delicacy, appear to have been made in Rome.

The Phœnicians probably derived their knowledge of the art from Egypt; whether this be so or not, they undoubtedly practised it from a very early period and to a very large extent. Probably much the same processes were employed in Phœnicia and Egypt during some centuries before the Christian era, as they certainly were in Phœnicia, Egypt, and Rome for some centuries after. It seems probable that the earliest products of the industry of Phœnicia in the art of glass-making are the coloured beads which have been found in almost all parts of Europe, in India and other parts of Asia, and in Africa. The "aggry" beads, so much valued by the Ashantees and other natives of that part of Africa which lies near the Gold Coast, have probably the same origin. These coloured beads are usually of opaque glass; they exhibit great variety of colour and

[1] See introduction to *Catalogue of Glass Vessels in the South Kensington Museum*, where an engraving of it is given.

pattern, and very different degrees of skill in manipulation. Their wide dispersion may be referred with much probability to their having been objects of barter between the Phœnician merchants and the barbarous inhabitants of the various countries with which they traded. It is probable, however, that many of the specimens which exist in our museums date from times several centuries later than those in which Tyre and Sidon flourished; for, as we may learn from the *Periplus* and Strabo, glass in various forms was an article imported in the 1st and 2d centuries, as well into the emporia of the Red Sea as into the ports of Britain. Even at the present day beads are very extensively made at Venice for export to Africa, which bear a resemblance, doubtless not accidental, to those which we have reason to believe to be of very early date.

Next in date to the earlier Egyptian examples mentioned above would appear to be the vase of transparent greenish glass found in the north-west palace of Nineveh, and now in the British Museum. On one side of this a lion is engraved, and also a line of cuneiform characters, in which is the name of Sargon, king of Assyria, 722 B.C. Fragments of coloured glasses were also found there, but our materials are too scanty to enable us to form any decided opinion as to the degree of perfection to which the art was carried in Assyria. Many of the specimens discovered by Layard at Nineveh have all the appearance of being Roman, and were no doubt derived from the Roman colony, Niniva Claudiopolis, which occupied the same site.

The Greeks, excellent in the ceramic art, do not appear to have cultivated the art of glass-making at a very early period; but it was probably made in many places on the shores of the Mediterranean for some centuries before the Christian era. At Mycenæ many disks of opaque vitreous pastes were found by Schliemann, and very similar objects at Ialyssus in Rhodes; but it is not certain that these may not have been brought from Egypt, where very similar objects have been found, or whether they ought not to be attributed to Greek or to Phœnician artisans. At Camirus in Rhodes, however, many vessels of glass of very elegant forms have been discovered, which were probably made in the island.

In Etruscan tombs in Italy are also found glass vessels of peculiar character; these are small bowls resembling in form the half of an egg; they are usually of the variety of glass which is mentioned further on as "madrepore," the ground green and transparent, the stars yellow, while patches of colour of gold and of filigree glass are sometimes interspersed. They differ from and appear to be earlier than the madrepore glass, fragments of which are so often found in Rome. They are also said to be found in Magna Græcia. Another variety found in tombs in the same district is of blue and opaque glass, with much gold in leaf, all twisted together; the most frequent form in which this kind of glass has been found is that of a bottle several inches long and about one inch in diameter, without a neck, having probably had a mounting of gold. It remains to be determined whether these should be attributed to a Greek or to a Phœnician origin. Glass, however, was occasionally used for purposes of architectural decoration during the best period of Grecian art, for Stuart and Revett, when describing the temple of Minerva Polias at Athens, give the following note:—"A remarkable singularity observed in the capitals of this portico is in the plaited torus between the volutes having been inlaid at the interstices with coloured stones or glass." Mr H. March Phillips states that he well remembers having remarked these decorations, and that he believes them to be of blue glass.[1]

In the first centuries of our era the art of glass-making was developed at Rome and other cities under Roman rule in a most remarkable manner, and it reached a point of excellence which in some respects has never been excelled or even perhaps equalled. It may appear a somewhat exaggerated assertion that glass was used for more purposes, and in one sense more extensively, by the Romans of the imperial period than by ourselves in the present day; but it is one which can be borne out by evidence. It is true that the use of glass for windows was only gradually extending itself at the time when Roman civilization sank under the torrent of German and Hunnish barbarism, and that its employment for optical instruments was only known in a rudimentary stage; but for domestic purposes, for architectural decoration, and for personal ornaments glass was unquestionably much more used than at the present day. It must be remembered that the Romans possessed no fine porcelain decorated with lively colours and a beautiful glaze; Samian ware was the most decorative kind of pottery which was then made. Coloured and ornamental glass held among them much the same place for table services, vessels for toilet use, and the like, as that held among us by porcelain. Pliny (*Nat. Hist.*, xxxvi. 26, 67) tells us that for drinking vessels it was even preferred to gold and silver. Trebellius Pollio, however, relates of the emperor Gallienus that he drank from golden cups, despising glass, than which, he said, nothing was more vulgar. Glass was largely used in pavements, and in thin plates as a coating for walls. It was used in windows, though by no means exclusively, mica, alabaster, and shells having been also employed. Glass, in flat pieces, such as might be employed for windows, has been found in the ruins of Roman houses, both in England and in Italy, and in the house of the faun at Pompeii a small pane in a bronze frame remains. Glass of this description seems to have been cast on a stone, and is usually very uneven and full of defects; although capable of transmitting light, it must have given at best an indifferent view of external objects. When the window openings were large, as was the case in basilicas and other public buildings and even in houses, the pieces of glass were, doubtless, fixed in pierced slabs of marble or in frames of wood or bronze.

The invention and ingenuity employed by the Roman artisans in producing variety in glass vessels are most remarkable; almost every means of decoration appears to have been tried, and many methods of manipulating glass, which have been considered inventions, have in reality been anticipated by the glass-workers of the period under consideration. The fertility of invention which devised so many modes of ornamentation and so many shades of colour, and the skill with which the manual execution is carried out, alike deserve great admiration. This prodigious variety seems to show that glass-making was at that time carried on, not as now in large establishments, which produce great quantities of articles identical in form and pattern, but by many artificers, each working on a small scale. This circumstance enables us to understand why very pure and crystalline glass was, as Pliny tells us, more valued than any other kind. To produce glass very pure and free from striæ and bubbles, long-continued fusion is required; this the system of working of the ancients did not allow, and their glass is in consequence remarkable for the great abundance of bubbles and defects which it contains.

[1] An example of the employment of glass in a like manner is indicated by the odd story which Pliny tells (*Nat. Hist.*, xxxvii. 5, 17) that on the tomb of Hermias, a prince of the island of Cyprus, was a marble figure of a lion with eyes of emerald which shone so brightly into the sea that they frightened away the tunnies from the adjacent fisheries, so that it became necessary to change the eyes. In the great marble lion discovered by Mr Newton near Cnidus, and now in the British Museum, in the place of the eyes are deep sockets which probably, like those of the Cypriote lion, were filled with coloured glass.

The Romans had at their command, of transparent colours, blue, green, purple or amethystine, amber, brown, and rose; of opaque colours, white, black, red, blue, yellow, green, and orange. There are many shades of the former as well as of the latter, particularly of transparent blue, and of opaque blue, yellow, and green. Of opaque colours many varieties appear to be due to the mixture of one colour with another. In any large collection of fragments it would be easy to find eight or ten varieties of opaque blue, ranging from lapis lazuli to turquoise or to lavender, and six or seven of opaque green. Of red the varieties are fewer; the finest is a crimson red of very beautiful tint, and there are various gradations from this to a dull brick red. One variety forms the ground of a very good imitation of porphyry; and there is a dull semi-transparent red which, when light is passed through it, appears to be of a dull green hue. With these colours the Roman *vitrarius* worked, either using them singly or blending them in almost every conceivable combination, sometimes, it must be owned, with a rather gaudy and inharmonious effect.

These combinations of colour were effected in two ways:—first, by glasses of two or more colours being combined so as to traverse the entire substance of the object; and, secondly, by the superposition of the one colour on the other.

To the former class belong all those termed mosaic and mille fiori, where the process of manufacture was the preliminary union, by heat, of threads of glass into a rod, which when cut transversely exhibited the same pattern in every section. Such rods were placed together side by side, and united by heat into a mass which was then formed into cups or other vessels. A vast quantity of small cups and pateras were made by this means in patterns which bear considerable resemblance to the surfaces of madrepores, and are of the same kind as those which by the Venetians are termed "mille fiori." In these every colour and every shade of colour seem to have been tried in great variety of combination with effects more or less pleasing, but transparent violet or purple appears to have been the most common ground colour. Although most of the vessels of this mille fiori glass were small, some were made of large size; a fragment in the possession of the present writer must have formed part of a dish not less than 20 inches in diameter. Another variety of glass, evidently much used, is that in which transparent brown glass is so mixed with opaque white and blue as to resemble onyx. This was sometimes done with great success, and very perfect imitations of the natural stone were produced. Sometimes purple glass is used in place of brown, probably with the design of imitating the precious murrhine. Imitations of porphyry, of serpentine, and of granite are also met with, but these were used chiefly in pavements, and for the decoration of walls, for which purposes the onyx-glass was likewise employed. Under this head must also be included the interlacing of bands and threads both of white and of coloured glass. Vessels are found composed of bands either so placed in sections as to present a plaited pattern, or simply arranged side by side; others, again, resemble the Venetian vitro di trina, threads of opaque white or yellow glass being twisted with clear transparent glass, and the vessel then formed by the welding together of the rods so made. Blue threads are occasionally intermixed, and several varieties of pattern may be found; but this branch of the art does not appear to have been carried by the Romans to anything like the perfection to which it was afterwards brought by the Venetians.

So few examples of glass vessels of this period which have been painted in enamel have come down to us that it has been questioned whether that art was then practised; but several specimens have been recently described which can leave no doubt on the point; decisive examples are afforded by two cups found at Vaspelev, in Denmark, engravings of which are published in the *Annaler for Nordisk Oldkyndeghed* for 1861, p. 305. These are small cups, 3 inches and 2½ inches high, 3¾ inches and 3 inches wide, with feet and straight sides; on the larger are a lion and a bull, on the lesser two birds with grapes, and on each some smaller ornaments. On the latter are the letters DVB. R. The colours are vitrified and slightly in relief; green, blue, and brown may be distinguished. They were found with Roman bronze vessels and other articles. Vessels also are not uncommon on the surface of which enamel colours appear in the form of spots; it is probable that these were applied in the form of melted glass, not, as in true enamel painting, in that of a finely divided powder tempered with an essential oil and applied cold.

The first place among those processes in which one colour was superimposed on another may be given to that by which the cameo glass was produced. In this a bubble of opaque white glass was formed at the end of the tube used by the glass-blower; this was coated with transparent blue, and that again with opaque white, and the vessel required was formed from this threefold globe. The outer coat was then removed from that portion which was to constitute the ground, leaving the white for the figures, foliage, or other ornamentation; these were then sculptured by means of the gem-engraver's tools. Pliny no doubt means to refer to this when he says (*Nat. Hist.*, xxxvi. 26, 66), "aliud argenti modo cælatur," contrasting it with the process of cutting glass by the help of a wheel, to which he refers in the words immediately preceding, "aliud torno teritur."

The famous Portland or Barberini vase is the finest example of this kind of work which has come down to us. and was entire until it was broken into some hundred pieces by a drunken medical student some years ago. The pieces, however, were joined together by Mr Doubleday with extraordinary skill, and the beauty of design and execution may still be appreciated almost as well as when it was intact. A letter written by Wedgwood in 1786 to Sir William Hamilton has been published in the life of the former by Miss Meteyard (vol. ii. p. 577), which contains some interesting remarks upon this beautiful work of art. He concludes with the assertion, "I do not think £5000 for the execution of such a vase, supposing our best artists capable of such a work, would be at all equal to their gains from the works they are now employed in." It is true that the gem-engravers of that day received very high pay for their work.

The two other most remarkable examples of this cameo glass are an amphora at Naples and the Auldjo vase. The amphora measures 1 foot ⅝ inch in height, 1 foot 7½ inches in circumference; it is shaped like the earthen amphoras with a foot far too small to support it, and must no doubt have had a stand, probably of gold; the greater part is covered with a most exquisite design of garlands and vines, and two groups of boys gathering and treading grapes and playing on various instruments of music; below these is a line of sheep and goats in varied attitudes. The ground is blue and the figures white. It was found in a house in the Street of Tombs at Pompeii in the year 1839, and is now in the Royal Museum at Naples. It is well engraved in Richardson's *Studies of Ornamental Design*. The Auldjo vase, a part of which is or was in possession of Mr Auldjo, and another in the British Museum, is an œnochoe about 9 inches high; the ornament consists mainly of a most beautiful band of foliage, chiefly of the vine, with bunches of grapes; the ground is blue and the ornaments white;

it was found at Pompeii in the house of the faun. It also has been engraved by Richardson.

Costly as these beautiful objects must have been, a very great number of them existed, for even now fragments of ten to fifteen may probably be met with in the hands of the curiosity dealers in Rome in the course of three or four months. The same process was used in producing large tablets, employed, no doubt, for various decorative purposes. In the South Kensington Museum collection is a fragment of such a tablet or slab; the figure, a portion of which remains, could not have been less than about 14 inches high.

The ground of these cameo glasses is most commonly transparent blue (often lined with opaque white to throw up the colour), but sometimes opaque blue, purple, or dark brown. The superimposed layer, which is sculptured, is generally opaque white. A very few specimens have been met with in which several colours are employed.

At a long interval after these beautiful objects come those vessels which were ornamented either by means of coarse threads trailed over their surfaces and forming rude patterns, or by coloured enamels merely placed on them in lumps; and these, doubtless, were cheap and common wares. But a modification of the first-named process was in use in the 4th and succeeding centuries, showing great ingenuity and manual dexterity,—that, namely, in which the added portions of glass are united to the body of the cup, not throughout, but only at points, and then shaped either by the wheel or by the hand. The attached portions form in some instances inscriptions, as on a cup found at Strasburg, which bears the name of the emperor Maximian (286–310 A.D.), on another in the Vereinigte Sammlungen at Munich, and on a third in the Trivulzi collection at Milan, where the cup is white, the inscription green, and the network blue. Probably, however, the finest example is a situla, 10½ inches high by 8 inches wide at the top and 4 inches at the bottom, preserved in the treasury of St Mark at Venice. This is of glass of a greenish hue; on the upper part is represented, in relief, the chase of a lion by two men on horseback accompanied by dogs; the costume appears to be Byzantine rather than Roman, and the style is very bad. The figures are very much undercut. The lower part has four rows of circles united to the vessel at those points alone where the circles touch each other. All the other examples have the lower portion covered in like manner by a network of circles standing nearly a quarter of an inch from the body of the cup.[1]

The art of glass-making no doubt, like all other art, deteriorated during the decline of the Roman empire, but it is probable that it continued to be practised, though with constantly decreasing skill, not only in Rome but in the provinces. Some few existing vessels, as two chalices of coarse blue glass in the British Museum, may perhaps be referred to this period, but the most remarkable production was mosaic for the decoration of churches. Examples of such decorations may be still seen in Rome dating from every century through the dark ages; and, though glass for mosaic was certainly made at Constantinople, and perhaps also at Ravenna, it is probable that it was also made in Rome. Glass was largely used in the immense windows of the churches built between the 3d and the 10th centuries. The first mention of coloured glass in a church window occurs in the time of Pope Leo III. (795–816); but probably it was used at a much earlier period.

Some of the Roman artificers in glass no doubt emigrated to Constantinople, and it is certain that the art was practised there to a very great extent during the Middle Ages. One of the gates near the port took its name from the adjacent glass-houses. St Sophia when erected by Justinian had vaults covered with mosaics and immense windows filled with plates of glass fitted into pierced marble frames; some of the plates, 7 to 8 inches wide and 9 to 10 high, not blown but cast, which are in the windows, may possibly date from the building of the church. Glass for mosaics was also largely made and exported. In the 8th century when peace was made between the caliph Walid and the emperor Justinian II., the former stipulated for a quantity of mosaic for the decoration of the new mosque at Damascus, and in the 10th century the materials for the decoration of the niche of the kibla at Cordova were furnished by Romanus II. In the 11th century Desiderius, abbot of Monte Casino, sent to Constantinople for workers in mosaic. The grounds of the Byzantine mosaics were usually either of gold or silver, a thin leaf of the metal having been enclosed between two layers of glass.

We have in the work of the monk Theophilus, *Diversarum Artium Schedula*, and in the probably earlier work of Eraclius, about the 11th century, instructions as to the art of glass-making in general, and then as to that of producing coloured, gilt, and enamelled vessels, which these writers speak of as being practised by the Greeks. But we look almost in vain for existing specimens of such works. Perhaps the only entire enamelled vessel which we can confidently attribute to Byzantine art is a small vase preserved in the treasury of St Mark at Venice, a very clever reproduction of which was exhibited by the Murano Glass Company at the Paris exhibition of 1878. This is decorated with circles of rosettes of blue, green, and red enamel, each surrounded by lines of gold; within the circles are little figures evidently suggested by antique originals, and precisely like similar figures found on carved ivory boxes of Byzantine origin dating from the 11th or 12th centuries. Two inscriptions in Cufic characters surround the vase, but they, it would seem, are merely ornamental and destitute of meaning. The presence of these inscriptions may perhaps lead to the inference that the vase was made in Sicily, but by Byzantine workmen.[2]

Of uncoloured glass brought from Constantinople several examples exist in the treasury of St Mark at Venice, part of the plunder of the imperial city when taken by the crusaders in 1204. The glass in all is greenish, very thick, with many bubbles, and has been cut with the wheel; in some instances circles and cones, and in one the outlines of the figure of a leopard have been left standing up, the rest of the surface having been laboriously cut away. The intention would seem to have been to imitate vessels of rock crystal.

Probably at Alexandria, one of the great seats of glass-making, the art survived the conquest of Egypt by the Saracens, for a glass disk serving as a weight has been met with in Egypt bearing the date 96 of the Hegira, corresponding with 715 A.D. (see memoir by Mr E. T. Rogers, *Journal of the Royal Asiatic Society*, vol. x. pt. 1). Numerous later examples leave no doubt that the manufacture of glass continued to exist in Egypt, though perhaps in a

Alexandria

[1] An example connected with the specimens just described is the cup belonging to Baron Lionel de Rothschild; though externally of an opaque greenish colour, it is by transmitted light of a deep red. On the outside, in very high relief, are figures of Bacchus with vines and panthers, some portions being hollow from within, others fixed on the exterior. The changeability of colour may remind us of the "calices versicolores" which Hadrian sent to Servianus.

[2] The Sano Catino at Genoa, supposed throughout the Middle Ages to have been an emerald but really composed of green glass, is a shallow hexagonal dish rather clumsily formed and finished by cutting. It was perhaps originally a paten, and was taken at the capture of Cæsarea in 1101. At Reichenau in the Lake of Constance, is (or was) preserved a slab of transparent green glass 2 feet wide by 13 inches high and 3 inches thick, which was also supposed to be an emerald. According to tradition it was sent to Charles the Great by the empress Irene.

languishing condition. In the 11th century, however, we find in the life of St Odilo, abbot of Fulda (*ob.* 1049), mention of a "vas pretiosissimum vitreum Alexandrini generis," and in the same century Nasir Ibn Khusru (*Safarnamah*, published by Royal Asiatic Society), who visited Jerusalem in 1060, says that pictures of our Lord and others in one of the churches of that city were covered with plates of glass. No examples of ornamental vessels dating from this period have, however, come down to us. But we have many very remarkable examples of the skill of Egyptian and Syrian glass-workers in the 13th and 14th centuries,—large bottles, basins, and lamps, very striking objects from the free use of enamel and gilding in their decoration. This is, as in most objects of Eastern art, chiefly composed of inscriptions written in large characters ornamentally treated; but figures of birds, lions, sphinxes, &c., may be found, especially on vessels made in Egypt. Although there may have been some indigenous practice of the art of glass-making in the East,—for in the cup of Chosroes I. of Persia (531–579) preserved in the Bibliothèque Nationale at Paris are medallions of coloured and moulded glass,—the arts of gilding and enamelling, as we see them exhibited in the Syrian and Egyptian works of the 13th and 14th centuries, were probably derived from the Byzantines. Damascus was also the seat of a like manufacture. In inventories of the 14th century, both in England and in France, mention may frequently be found of glass vessels described as of the manufacture of Damascus. That city was taken by Timur in 1402, and we are told by Clavijo, who visited his court in 1403–1406, that he carried off to Samarcand "men who made bows, glass, and earthenware, so that of these articles Samarcand produces the best in the world."

Persia. Glass no doubt continued to be made, as it still is, in Syria and Persia, but no very remarkable products of the manufacture are known in Europe, with the exception of some vessels brought from Persia, blue richly decorated with gold. These probably date from the 17th century, for Chardin tells us that the windows of the tomb of Shah Abbas II. (*ob.* 1666) at Kom, were "de cristal peint d'or et d'azur." At the present day bottles and drinking vessels are made in Persia which in texture and quality differ little from ordinary Venetian glass of the 16th or 17th centuries, while in form they exactly resemble those which may be seen in the engravings in Chardin's *Travels*.

India. Pliny states (*Nat. Hist.*, xxxvi. 26, 66) that no glass was to be compared to the Indian, and gives as a reason that it was made from broken crystal; and in another passage (xii. 19, 42) he says that the Troglodytes brought to Ocelis (Ghella near Bab-el-Mandeb) objects of glass. We have, however, very little knowledge of Indian glass of any considerable antiquity. A few small vessels have been found in the "topes," as in that at Manikyala in the Punjab, which probably dates from about the Christian era; but they exhibit no remarkable character, and fragments found at Brahminabad are hardly distinguishable from Roman glass of the imperial period. The chronicle of the Singhalese kings, the Mahawanso, however, asserts that mirrors of glittering glass were carried in procession in 306 B.C., and beads like gems, and windows with ornaments like jewels, are also mentioned at about the same date. If there really was an important manufacture of glass in Ceylon at this early time, that island perhaps furnished the Indian glass of Pliny; or it is possible that it really came from China. Glass is made in several parts of India—as Behar and Mysore—by very simple and primitive methods, and the results are correspondingly defective. Black, green, red, blue, and yellow glass is made. The greater part is worked into bangles, but some small bottles are blown (Buchanan, *Journey through Mysore*, vol. i. p. 147; vol. iii. p. 369)

The history of the manufacture of glass in China is obscure, but the common opinion that it was learnt from the Europeans in the 17th century seems to be erroneous. A writer in the *Mémoires concernant les Chinois* (vol. ii. p. 46) states on the authority of the annals of the Han dynasty that the emperor Ou-ti (140 B.C.) had a manufactory of the kind of glass called "lieou-li," that in the beginning of the 3d century of our era the emperor Tai-tsou received from the West a considerable present of glasses of all colours, and that soon after a glass-maker came into the country who taught the art to the natives.

The Wei dynasty, to which Tai-tsou belonged, reigned in northern China, and at this day a considerable manufacture of glass is carried on at Po-shan-hien in Shantung, which it would seem has existed for a long period. The Rev. A. Williamson (*Journeys in North China*, i. 131) says that the glass is extremely pure, and is made from the rocks in the neighbourhood. The rocks are probably of quartz, *i.e.*, rock crystal, a correspondence with Pliny's statement respecting Indian glass which seems deserving of attention.

Whether the making of glass in China was an original discovery of that ingenious people, or was derived *via* Ceylon from Egypt, cannot perhaps be now ascertained; the manufacture has, however, never greatly extended itself in China. The case has been the converse of that of the Romans; the latter had no fine pottery, and therefore employed glass as the material for vessels of an ornamental kind, for table services and the like. The Chinese, on the contrary, having from an early period had excellent porcelain, have been careless about the manufacture of glass. A Chinese writer, however, mentions the manufacture of a huge vase in 627 A.D., and in 1154 Edrisi (first climate, tenth section) mentions Chinese glass. A glass vase about a foot high is preserved at Nara in Japan, and is alleged to have been placed there in the 8th century. It seems probable that this is of Chinese manufacture. A writer in the *Mémoires concernant les Chinois* (vol. ii. pp. 463 and 477), writing about 1770, says that there was then a glass-house at Peking, where every year a good number of vases were made, some requiring great labour because nothing was blown (rien n'est soufflé), meaning no doubt that the ornamentation was produced not by blowing and moulding, but by cutting. This factory was, however, merely an appendage to the imperial magnificence. The earliest articles of Chinese glass the date of which has been ascertained, which have been noticed, are some bearing the name of the emperor Kienlung (1736–1796), one of which is in the South Kensington Museum.

In the manufacture of ornamental glass the leading idea in China seems to be the imitation of natural stones. The coloured glass is usually not of one bright colour throughout, but semi-transparent and marbled; the colours in many instances are singularly fine and harmonious. As in 1770, cutting is the chief method by which ornament is produced, the vessels being blown very solid.

The chief source from whence a knowledge of the art of glass-making spread through Europe was probably Rome; in the Roman imperial period glass was undoubtedly made, not only in Italy, but also in France, in Spain, and in all probability at or near Cologne, and perhaps in other places near the Rhine. Whether refugees from Padua, Aquileia, or other Italian cities carried the art to the lagoons of Venice in the 5th century, or whether it was learnt from the Greeks of Constantinople at a much later date, has been a disputed question. It would appear not improbable that the former was the case, for it must be remembered that articles formed of glass were in the later days of Roman civilization in constant daily use, and that the making of glass was carried on, not as now in large establishments, but by artisans working on a small scale. It seems certain that some knowledge of the art was preserved in France and in

Spain, possibly even in England, and it seems improbable that it should have been lost in that archipelago, where the traditions of ancient civilization must have been better preserved than in almost any other place. In 523 Cassiodorus writes of the "innumerosa navigia" belonging to Venice, and where trade is active there is always a probability that manufactures will flourish. However this may be, the earliest positive evidence of the existence at Venice of a worker in glass would seem to be the mention of Petrus Flavianus, phiolarius, in the ducale of Vitale Falier in the year 1090. In 1224 twenty-nine persons are mentioned as friolari (*i.e.*, phiolari), and in the same century "mariegole" or codes of trade regulations were drawn up (*Monografia della Vetraria Veneziana e Muranese*, p. 219). The manufacture had then no doubt attained considerable proportions; in 1268 the glass-workers exhibited decanters, scent-bottles, and the like; in 1279 they made, among other things, weights and measures. In the latter part of this century the glass-houses were almost entirely transferred to Murano. From thenceforward the manufacture continued to grow in importance; glass vessels were made in large quantities, as well as glass for windows. The earliest example which has as yet been described—a cup of blue glass, enamelled and gilt—is, however, not earlier than about 1440. A good many other examples have been preserved which may be assigned to the same century: the earlier of these bear a resemblance in form to the vessels of silver made in the west of Europe; in the later an imitation of classical forms becomes apparent. Enamel and gilding were freely used, in imitation no doubt of the much admired vessels brought from Damascus or Egypt. Many of the ornamental processes which we admire in Venetian glass were already in use or were invented in this century, as that of mille fiori, in which rods of various colours are joined by heat and so arranged as when cut transversely to form patterns resembling flowers or corallines. Such sections were then placed side by side and united by a lining of heated glass applied to them; the joint mass was then reheated and worked into the desired form. The beautiful kind of glass known as vitro di trina or lace glass, was made by a variation of the same process; the rods or canes, being composed of opaque white threads surrounded by transparent glass, were placed side by side in a mould, and a bubble of glass blown into the midst so as to adhere to the canes; the whole was then reheated and fashioned in the same manner as any ordinary glass. Sometimes two canes or cylinders were used, the lines of which ran in opposite directions, and a reticulated pattern was thus produced. An elaborate account of the process is given by M. Labarte (*Histoire des Arts Industriels*, iv. 575 *sq.*). Many of the examples of this process exhibit surprising skill and taste, and are among the most beautiful objects produced at the Venetian furnaces. Glass was made by the Romans in like manner, but no ancient example which has come down to us equals in correct execution some of those made at Venice. That peculiar kind of glass usually called schmelz, an imperfect imitation of calcedony, was also made at Venice in the 15th century. Avanturine glass, that in which numerous small particles of oxide of copper are diffused through a transparent yellowish or brownish mass, was not invented until about 1600.

The peculiar merits of the Venetian manufacture are the elegance of form and the surprising lightness and thinness of the substance of the vessels produced. The glass on the other hand wants brilliancy, and is often tinged with yellow, or if, as is not uncommon, too much manganese (which neutralizes the yellow tinge imparted by the presence of iron) has been used, a faint purple. This slight coloration may not, however, appear a defect to eyes fatigued by the brilliancy of modern flint glass. The Venetian workmen perhaps somewhat abused their skill by giving extravagant forms to vessels, making drinking glasses in the forms of ships, lions, birds, whales, and the like.

Besides the making of vessels of all kinds the factories of Murano had for a long period almost an entire monopoly of two other branches of the art,—the making of mirrors and of beads. Attempts to make mirrors of glass were made as early as 1317 A.D., but even in the 16th century mirrors of steel were still in use. To make a really good mirror of glass two things are required,—a plate free from bubbles and striæ, and a method of applying a film of metal with a uniform bright surface free from defects. The principle of applying metallic films to glass seems to have been known to the Romans and even to the Egyptians, and is mentioned by Alexander Neckam in the 12th century, but it would appear that it was not until the 16th century that the process of "silvering" mirrors by the use of an amalgam of tin and mercury had been perfected. During the 16th and 17th centuries Venice exported a prodigious quantity of mirrors, but France and England gradually acquired knowledge and skill in the art, and in 1772 only one glass-house at Murano continued to make mirrors.

The making of beads was probably practised at Venice from a very early period, but the earliest documentary evidence bearing on the subject does not appear to be of earlier date than the 14th century, when prohibitions were directed against those who made of glass such objects as were usually made of crystal or other hard stones. In the 16th century it had become a trade of great importance, and about 1764 twenty-two furnaces were employed in the production of beads. Towards the end of the same century from 600 to 1000 workmen were, it is stated, employed on one branch of the art, that of ornamenting beads by the help of the blow-pipe. A very great variety of patterns was produced; a tariff of the year 1800 contains an enumeration of 562 species and a vast number of sub-species. Beads to the value of £200,000 are still annually made in Venice (*Monografia della Vetraria Veneziana e Muranese*).

The efforts made in France, Germany, and England, in the 17th and 18th centuries, to improve the manufacture of glass in those countries had a very injurious effect on the industry of Murano. The invention of flint glass in England (about 1620?) brought in its train the practice of cutting glass, a method of ornamentation for which Venetian glass from its thinness was ill-adapted. One remarkable man, Giuseppe Briati, exerted himself, with much success, both in working in the old Venetian method and also in imitating the new fashions invented in Bohemia. He was especially successful in making vases and circular dishes of "vitro di trina," one of the latter in the Correr collection at Venice, believed to have been made in his glass-house, measures 55 centimetres (nearly 23 inches) in diameter. The vases made by him are as elegant in form as the best of the Cinquecento period, but may perhaps be distinguished by the superior purity and brilliancy of the glass. He also made with great taste and skill large lustres and mirrors with frames of glass ornamented either in intaglio or with foliage of various colours. He obtained a knowledge of the methods of working practised in Bohemia by disguising himself as a porter, and thus worked for three years in a Bohemian glass-house. In 1736 he obtained a patent at Venice to manufacture glass in the Bohemian manner. He died in 1772.

The fall of the republic was accompanied by interruption of trade and decay of manufacture, and in the last years of the 18th and beginning of the 19th century the glass-making of Murano was at a very low ebb. In the year 1838 Signor Bussolin revived several of the ancient processes of glass-working, and this revival was carried on by C. Pietro Biguglia in 1845, and by others, and later by Salviati, to whose successful efforts the modern renaissance of the glories of Venetian art glass is principally due. Salviati revived the former processes and practised them, not in mere slavish imitation, but with freedom, invention, and fine artistic instinct. Every general industrial exhibition has contained brilliant examples of the products of the Venice and Murano Glass Company, composed chiefly of English capitalists, and formerly managed by Salviati.

The fame of Venice in glass-making so completely eclipsed that of Italian cities that it is difficult to learn much respecting their progress in the art. It appears, however, that as early as 1295 furnaces had been established at Treviso, Vicenza, Padua, Mantua, Ferrara, Ravenna, and Bologna. In 1634 there were in Rome two and in Florence one glass-house; but whether any of these produced ornamental vessels, or only articles of common use and window glass, would not appear to have as yet been ascertained.

Western Europe during Roman period.

The history of glass-making in France, Spain, Germany, and England offers many points of resemblance. In the first three, and probably in England also, glass was made at the period of the Roman empire; in France about Lyons, as is shown by a monument in the Musée Lapidaire to one Julius Alexander, described as an "opifex artis vitriæ," in Normandy and Poitou, and probably in many other parts. In Spain glass, according to Pliny, was manufactured (*Nat. Hist.*, xxxvi. 26, 66) in many parts of the country, "per Hispanias," but the remains of Roman glass-making have been chiefly found in the valleys which run down to the coast of Catalonia, but also near the mouth of the Ebro, in Valencia and in Murcia (Señor Rico y Sinobus, *Del Vidrio*, p. 11).

Glass-making in Germany during the Roman period would seem to have been carried on extensively at Cologne, near which city many remarkable glass vessels of peculiar character have been discovered. The art was probably not lost during the period which followed the downfall of the Roman power. In the year 758 Cuthbert, abbot of Jarrow, wrote to Lullo, bishop of Mainz, to request him to send him a maker of glass vessels. It is scarcely probable that the art had been forgotten and revived between the 5th and the 8th centuries.

It is not equally clear that glass was made in England, though it is probable that this was the case. Both vessels and window glass have been found in almost all parts of the country, and at Buckholt, near the Roman road from Winchester to Salisbury, the remains of a glass furnace, among which were numerous fragments of glass which may possibly have been of Roman origin, and a fragment of undoubtedly Roman pottery. But associated with these were fragments of glass of the 14th and later dates, and of pottery of the 16th century.

The dark ages.

Very little has been ascertained as to the practice of the art in either of the four countries during the dark ages, but it would seem to have been preserved in France and Germany, and perhaps also in England and Spain. The fact narrated by Bede, in his history of the abbots of Wearmouth, that Benedict Biscop about 675 procured workmen from France to make glass for his monastery, shows at once that it was preserved in France and lost or nearly so in England. But a great quantity of drinking vessels are found in the tombs of the Anglo-Saxons while still pagan; and although the like are found both in France and in Germany, it is said that a greater number and more varieties occur in England, and it has thence been inferred that they were probably made in the country. Welsh poets of the 6th century (?), Aneurin and Llywarch Hen, both mention glass vessels by a name, "wydr," evidently derived from vitrum, and it is possible that the Welsh retained a knowledge of its manufacture. Some knowledge of the art of manipulating glass existed in Ireland in and before the 12th century, as is shown by cameo heads and small pieces of mosaic glass of quite peculiar patterns which occur on objects of Irish workmanship (*Transactions of the Royal Irish Academy*, vol. xxiv., Antiq., part. iv.).

In France "vitrarii" are mentioned in several centuries from the 6th to the 11th; in Germany, as has been shown above, there is ground for believing that the art was practised in the 8th century; and in the 12th artisans are found at Cologne with the designation "ustor" attached to their names, which Merlo (*Künst und Künstler in Köln*, p. 563) suggests may probably mean maker of glass. Nothing seems to have been ascertained about the existence of the art in Spain between the Gothic conquest and the 13th century, when it was practised at Almeria by the Moors.

During the mediæval period France produced large quantities of glass, as well in the form of vessels as in that of window glass. The first were made on a large scale in Dauphiné in the 14th century. In 1338 Humbert the dauphin granted a part of the forest of Chamborant to a glass-maker on condition that he should furnish him with more than 3000 vessels of glass annually (*Hist. Dalph.*, ii. 363). In 1302 window glass was made at Bezu le Foret, in the department of the Eure, for the king of France; a fragment of a roll of accounts for that year is preserved in the Bibliothèque Nationale. Glass was also made in Poitou, and a drageoir with the arms of Charles VIII. of France (1470–1498) has been engraved by M. Fillon (*L'art de Terre*, &c.) which is believed to have been made in that province.

Much glass was no doubt made for windows both in Germany and the Low Countries, during the Middle Ages, and in 1453 mention occurs of a fountain and four plateaux made for Philip the Good, duke of Burgundy, by a glass-maker of Lille; but if artistic objects were made, hardly any examples have been preserved. Glass-makers existed at Vienna in 1221 (Peligot, *Le Verre*, p. 342). In 1428 a Muranese artificer set up a furnace in the same city, and another was established by another Italian in 1486, which it is said was still at work in 1563. How far these efforts to rival the manufactures of Murano may have succeeded we have no information, but contemporaneously the native artificers continued to produce articles for common use, as we may see by the woodcut in the edition of George Agricola *De Re Metallica*, published at Basel in 1561, representing the interior of a glass-house. In this the tall cylindrical drinking-glasses known as wiederkoms, bottles with big bellies and slender necks, and retorts may be seen. A glass-house was founded at Daubitz in Bohemia in 1442, others in 1504 (Peligot, *Le Verre*, p. 343).

In England vessels of glass seem to have been but little used during the Middle Ages; they occur very rarely in inventories, and when they do, as in the Calendars of the Treasury of the Exchequer, they are usually described as mounted in gold or silver, or as painted, being probably enamelled glass vessels from Constantinople, Damascus, or Venice, objects rather of virtu than of daily use. It has even been asserted that there is no evidence that any description of glass was made in England before the 15th century, but in the roll of the taxation made at Colchester in 1295 three of the principal inhabitants are designated "verrer"; and it would seem hardly probable that so many in such a town were glaziers only and not glassmakers. In the 14th century Andrew le glasswright is mentioned in the records of Great Yarmouth. In 1439 (or 1447) English glass is mentioned in the contract for the windows of the Beauchamp chapel at Warwick, but disparagingly, as the contractor binds himself not to use it. In 1485, however, it is mentioned in such a manner as to lead to the conclusion that it was dearer and presumably better than either "Dutch, Venice, or Normandy glass"

(*Domestic Architecture of the Middle Ages*, by Hudson Turner, p. 78).

In Spain glass was made at Barcelona in considerable quantities in 1324; and Almeria, according to an Arab author of the 13th century, was famous for its manufacture of glass. In the 15th century the export of glass from Barcelona was considerable; Jeronimo Paulo in 1491 says that glass vessels of various sorts were sent thence to many places and even to Rome.

In the 16th century the fashion of using glass vessels of ornamental character spread from Italy into France, England, and the Low Countries. Henry VIII. had a large quantity, chiefly or wholly, it would seem, of Venetian manufacture (see inventory in 1542, *Archæological Journal*, vol. xviii.). This increasing use of glass led to the reflexion that large sums of money went annually to Venice for such wares, and to the question whether the manufacture might not be carried on at home. We therefore find that about the middle of this century attempts were made to introduce the Venetian methods of manufacture into the several countries; Henry II. of France established an Italian named Mutio at St Germain-en-Laye, and Henry IV. in 1598 permitted two "gentilshommes verriers" from Mantua to settle themselves at Rouen in order to make "verres de cristal et autres ouvrages qui se font à Venise." A like attempt was made in England about 1550, for in that year eight glass-makers from Murano addressed from London a petition to the Council of Ten at Venice praying to be excused from the penalties decreed by that body in 1549 against Venetian subjects who taught the art to foreigners (*Cal. State Papers*, Venetian, No. 648). The council allowed the eight workmen to remain until the end of the term for which they had engaged themselves. Other attempts followed: Stow says (*Chron.*, p. 1040) that Venice glasses were first made in London by one Jacob Vessaline about the beginning of the reign of Queen Elizabeth, and in 1565 one Cornelius de Lannoy (or Launoy) was working in the pay of the Government (*Cal. State Papers*, Dom.). Others, as Carre or Quarre, and Becku *alias* Dolin, from the Low Countries, were engaged in similar undertakings during the latter part of this century, but it does not seem that any great success was attained, as the importation of glass from Venice continued until long after.

These attempts to rival Murano seem to have been most successful in the Low Countries and in Spain. Ambrozio de Mongarda had a privilege in the former country to make "voirres de cristal à la faschon de Venise," which in 1599 was continued to Philippe de Gridolphi; his glass-house was at Antwerp. Glass-works also existed at Liége. Much glass in the 16th century was sent from Antwerp to England (Houdoy, *Les Verreries à la façon de Venise*). This manufacture went on during the following century, and many examples remain, more or less resembling the products of Murano.

In Germany Ferdinand I. established a glass-house at Weidlingen near Vienna, which was to work in the Italian manner; but no great success it would seem attended these efforts, partly no doubt because about the same time the native glass-makers struck out a new and original style of ornamentation for the great cylindrical beakers, sometimes 20 inches in height, usually called wiederkom (come again), but which M. Peligot says ought to be called willkomm (welcome). This was a somewhat coarse but very effective system of painting in enamel such subjects as the emperor and electors of Germany, or the imperial eagle bearing on its wings the arms of the states which composed the empire, &c. The earliest example which has been met with bears the date 1553, but the system had great vogue, and continued in use until about 1725.

Spanish writers have not as yet acquainted us with the precise means by which the Venetian methods of working were brought to their country; but Gaspar Baneiros in his *Chronographia*, published in 1562, says that the glass made at Barcelona was almost equal to that of Venice, and during this and the next century large quantities were exported. Venetian glass was imitated in several other places in Spain, and with considerable success, as several examples in the South Kensington Museum testify. The native forms and methods of working, however, went on contemporaneously, and it would appear do so down to the present day.

The branch of glass-making in which the greatest results were obtained in France during the 17th century was that of the manufacture of mirrors. In 1665 the services of eighteen Venetians were obtained, and a factory established in the Faubourg St Antoine at Paris, and another factory was founded at Tour-la-Ville near Cherbourg. These were united and worked with great success; the plates which ornament the "Galerie des Glaces" at Versailles were made at Tour-la-Ville. In 1688 the process of casting plates of glass was first adopted in modern times (for the window glass of Roman times was cast); and thus it became possible to make mirrors of dimensions which could not be attained as long as the plates were produced by blowing. The manufacture was carried on at St Gobain, still the seat of an immense production of glass.

English glass-making of the 17th century is distinguished by one of the most important innovations in the practice of the art which has at any time been introduced, that of using a large proportion of oxide of lead in combination with potash. Glass so made is more brilliant than other kinds, and is known in England as "flint glass," in France as "cristal." The employment of lead as one of the ingredients of glass was not a discovery, for it had been practised to a small extent and for certain purposes, as in the imitation of gems by the Romans, and through the Middle Ages. Neither the date when flint glass was first made nor the inventor of the process is known.

Sir William Slingsby before 1611 (*Cal. State Papers*, Dom.) had obtained a patent for making glass with sea coal; and in 1615 the use of wood for that purpose was forbidden by royal proclamation. How far this proclamation may have been obeyed does not appear, but Sir R. Mansel, who held a patent of monopoly for glass-making from 1616 until about 1634 (and perhaps even later), states in 1623 that furnaces erected in London, the isle of Purbeck, Milford Haven, and on the Trent, had all failed, but that he had established them successfully at Newcastle-on-Tyne. Probably coal was used at this last place, and it seems not unlikely that flint glass may have been first made there. Merret, however, writing about 1665 (in his edition of the *Ars Vitraria* of Neri), says that glass made with lead was not in use in the English glass-houses on account of its too great fragility; but in 1673 Evelyn notes in his diary a visit to the Italian glass-houses at Greenwich "where glass was blown of finer metal than that of Murano," and in 1677 a visit to the duke of Buckingham's glass-works (at Lambeth), "where they made huge vases of metal as clear, ponderous, and thick as crystal, also looking-glasses far larger and better than any that come from Venice." From this time much glass was made in England, and Dr Pococke, who travelled in Germany in 1736, gives the preference in point of quality to English glass over Bohemian.

During this century much art and labour were employed in Germany in the ornamentation of vessels for drinking, such as goblets and wiederkoms. Sometimes they were painted in grisaille, the subjects being battles, processions, and the like, sometimes engraved or etched; common subjects are escutcheons with arms, views of cities, ciphers, &c. Many excellent artists worked in these various styles (Beckmann, *Hist. of Inventions*, iii. 209; Doppelmayr, *Nürnbergische Künstler*, p. 231, 233, &c.), and their works brought high prices. Dr Pococke mentions seeing some at Rispen, to which the glass-works formerly carried on at Potsdam had been removed, which cost from £100 to £150. Excellent material for these artistic efforts was furnished by the Bohemian furnaces; the art was patronized by several German princes; the celebrated Kunkel was in 1679 director of the glass-houses at Potsdam, which were carried on at the cost of the elector, and where the beautiful ruby glass was produced. Etching and engraving on glass was also much practised in Holland.

In Spain glass was made in 1680, at San Martin de Valdeiglesias, in imitation of Venetian; and Barcelona, Valdemaquada, and Villafranca are named in a royal schedule of the same date, fixing the prices at which glass was to be sold in Madrid, as places where wares imitative of Venetian were made. There was also an important manufactory at La Granja (see Introduction to *Cat. of Spanish Glass in South Kensington Museum*, by Señor Riano). Some of the products of the Spanish furnaces closely resemble those of Murano, but rarely exhibit much beauty or much originality. Others again, attributed to the factory of San Ildefonso and to the 18th century, bear a very close resemblance to some of the Dutch glass of that period.

Although during the 18th and earlier part of the 19th century progress was made both in the purity and in the beauty of the material (especially in the case of glass for optical purposes), and in the organization and working of factories, it was a period marked in no country by much of novelty or of artistic effort in the manufacture of glass. M. Labarte even goes so far as to say (*Hist. des Arts Industriels*, iv. 597) that in France in 1759 the fabrication of "vases de verre" had so completely fallen into decadence that the Academy of Sciences offered a prize for an essay on the means by which the industry could be revived. In the beginning of the present century cut glass was much in vogue, and was produced in England of great brilliancy, though the forms of the objcts often left much to be desired in point of elegance.

The manufacture of coloured glass for windows was a consequence of the revival of Pointed architecture, and England, France, Belgium, and Germany have in this century rivalled each other in its production.

The Exhibition of 1851 did not perhaps produce a more marked effect on any of the industrial arts than on that of glass. The progress made since that date in the fabrication of artistic glass wares (the verrerie de luxe of the French) has been surprising, and at the present moment enlightened and enterprising manufacturers of glass are in every country studying the products of the furnaces of all times and all countries, as their predecessors at Murano in that great period of the art—that of the Renaissance—did the relics of Roman glass-working (Biringuccio, *Pirotechnia*, lib. ii.) in order to glean from them lessons and suggestions of further advance in their art. (A. NE.)

The Manufacture of Glass.

Glass, in its ordinary signification, is a brittle, transparent compound produced by the fusion, at a very high temperature, of silica (silicic acid) with one or more basic substances, one of which, in all cases, must be an alkaline metal. But the silicates of sodium and potassium, whether separate or combined, being soluble in water, and also readily acted on by other agents, are not in themselves suitable for most of the purposes to which glass is ordinarily applied. When, however, to these silicates, or to either of them, a silicate of an alkaline earth is added, the resulting body is not sensibly affected by water or ordinary solvents; and it is the fused amorphous mass thereby obtained that alone is glass in the restricted technical sense. Thus the definition given by Dumas that glass is a silicate of at least two metals belonging to different groups, one of which must be an alkaline metal, strictly embraces and limits all varieties of ordinary glass. Boracic acid, a substance closely allied in chemical properties to silica, has a similar influence on the alkalies and alkaline earths, producing by their mutual fusion a transparent amorphous compound; and indeed, for certain special purposes, a glass in which borates to a certain extent supplant silicates is used for optical purposes. The substances, however, which form the essential basis of all varieties of common glass are (1) silica as the acid element; (2) soda or potash as the alkaline base; and (3) lime and oxide of lead as the alkaline earths. To the alkaline earths commercially employed there ought also to be added baryta and alumina, the former being used in the place of lead, and the latter being a common ingredient in certain kinds of glass.

The following tabular statement shows the bodies capable of yielding transparent glass:—

Acid	Alkaline.	Earthy.	
		Colourless.	Coloured.
	Oxides of	Oxides of	Oxides of
Silica.	Potassium.	Calcium.	Iron.
Boracic acid.	Sodium.	Lead.	Manganese.
		Barium.	Copper.
		Strontium.	Chromium.
		Magnesium.	Uranium.
		Aluminium.	Cobalt.
		Zinc.	Gold.
		Thallium.	

Various authorities who have investigated the constitution of glass have endeavoured to establish a chemical formula for what they term normal glass. The results arrived at, however, by different investigators disagree among themselves; and the balance of opinion is in favour of the view that no such substance as normal glass exists, and that glass does not result from any definite chemical compounds, but is simply a mixture of silicates, with usually an excess of uncombined silica. The proportions in which the ingredients of glass are present, however, have not only a very great influence on the fusibility of the mass; but these conditions also very materially affect the qualities of the substance. In general the more nearly the proportion of silica approaches the amount necessary to form definite compounds with the basic ingredients, the better and the more stable is the quality of the glass. The conclusion of Otto Schott in his investigation of the constitution of glass, that the simplest formula for glass is represented by $\left.\begin{matrix} xNa_2O \\ yCaO \end{matrix}\right\} zSiO_2$, may be accepted as a safe statement.

The phenomenon of devitrification, which is exhibited most readily by glass of inferior quality, has important bearings on the chemical constitution of glass, as well as on the working of the material. Devitrification is a change which may be induced in all varieties, but only with difficulty in the finer kinds of potash glass—either by slowly cooling the glass from the state of fusion, or by heating it in a mixture of sand and plaster of Paris till it softens, and then allowing it to cool by very slow degrees. Thereby it partly or entirely loses its transparent amorphous form, and by the formation of innumerable minute crystals it becomes opaque. When such a change penetrates the entire mass it assumes a milky and porcelain-like appearance, whence it is in this condition known as Réaumur's porcelain—the phenomenon having been first investigated by that observer. Devitrification renders the material much harder and less fusible than the same glass in a transparent condition; and it is less subject to fracture on the application of heat. According to Pelouze, Splittgerber, and others, devitrification results simply from a rearrangement of the molecules into the crystalline form while the mass is soft, no alteration in the proportions of the constituents taking place concurrently; but Dumas and his followers maintain, on the contrary, that in undergoing the change the glass loses part of its alkali, and that crystallization takes place through the formation of compounds infusible at the temperature existing at the moment of crystallization. These compounds may result either from the dissipation of alkaline matter or from the separation of the mass into two strata,—that most highly alkaline retaining its amorphous condition more persistently than the other more siliceous portion.

The physical properties upon which the great value and utility of glass principally depend are (1) its well-known prevailing transparency combined with a brilliant lustre and great hardness; (2) its fusibility at a high temperature; and (3) its softness and viscosity at a red heat, whereby it can be moulded and otherwise worked with facility into any shape desired. Of great value also is its resistance to the influence of common solvents. Properly-made glass is not sensibly acted on by any of the acids except hydrofluoric acid, which attacks it powerfully, combining with and removing its silica. Water affects glass so feebly that for practical purposes its action may be disregarded; but when it is submitted for a prolonged period to water at a high temperature, it is slowly dissolved. Even prolonged exexposure to moist air so acts on glass, particularly on highly alkaline varieties, that the surface becomes clouded and obscure, and the beautiful iridescent scaling off observable in ancient glass is due to the exposure of the substance for long ages to the influence of moist air or damp earth.

Glass is an extremely bad conductor of heat, and from that property springs, in great measure, its brittleness. Owing to this imperfect conductivity it necessarily results that a mass of glass, or a glass object cooling from a state of fusion, becomes cooled and set or solidified on its outer surface before the internal molecules have parted with their heat, contracted, and established themselves in a stable relation to each other. The solidification of the superficial stratum thus necessarily hinders the contraction of the internal portion of the mass, and as the internal molecules cool down a state of tension is created, the central portion tending to draw the surface stratum inwards with a force held in check by the strain in the contrary direction of the outer range of molecules. In this condition a very moderate impact is sufficient to determine the fracture of the glass. The high degree of brittleness which results from unequal cooling is exhibited in a very marked manner by the philosophical toy known as "Rupert's drops." Such pear-shaped masses of glass are prepared by allowing molten glass to fall, drop by drop, into cold water, when the drops assume a more or less spheroidal form, with a finely tapering point. Of course a very sudden and rapid cooling of the surface takes place, while the interior is still at a high temperature, and correspondingly much dilated, the consequence of which is that a state of great tension is established between surface and centre. The breaking off of a small portion of the tail is sufficient to destroy the equilibrium established between the hard superficial and the dilate internal molecules; and immediately the whole mass is shattered to dust with explosive violence. Excessive brittleness is overcome by the operation of annealing to which glass is submitted,—a process which has been explained under ANNEALING, and which will be further referred to in dealing with a method of tempering or hardening glass which has been introduced by M. de la Bastie within the last few years.

It is difficult to give a consistent and systematic view of the manufacture of glass, because not only chemical constitution, but the mechanical operations by which glass is prepared, and the purposes to which the material is applied, have also to be taken into consideration A good classification, from a chemical point of view, is that given by Stein (in Bolley's *Technologie*), who distinguishes three classes:—

(1.) Glass containing one or two bases belonging to the same group. This class embraces only the soluble silicates which do not fulfil the ordinary functions of glass.

(2.) Glass with several bases which belong to different groups, comprehending two classes:—(1) calcium glass, under which come sodium-calcium glass and potassium-calcium glass; and (2) lead glass, which constitutes ordinary flint glass or crystal and strass.

(3.) Coloured and opaque glass, of which there are also two classes,—the first embracing the varieties of transparent coloured glass which may belong to any of the above classes, with the addition of colouring oxides, and the second being devoted to the various kinds of opaque glass.

The raw materials of the glass manufacture embrace the following principal ingredients. (1.) Silica is used in the forms of pure quartz (for very fine qualities of glass), crushed sandstone, pulverized flints, and especially sand of degrees of purity varying in proportion to the quality of the glass to be made. The finest iron-free sand in the United Kingdom is obtained from Alum Bay in the Isle of Wight, from Lynn, Norfolk, and from Leighton Buzzard, Bedfordshire; but much pure sand is imported into the United Kingdom from Fontainebleau in France, from Belgium, and other localities. (2.) Lime is employed in the form of chalk or marble, either burned or unslaked, and it also must for colourless glass be free from iron impurities. Of (3.) potash and (4.) soda any of the ordinary salts except chlorides, but especially the sulphates and carbonates, are indifferently utilized, the point of real importance being here also the freedom of the compound from contamination when fine glass is being made. At no very remote date kelp was the principal source of soda alkali in glass, but this is now entirely disused, and the principal source of potash is the salt mines of Stassfurt and Leopoldshall in Prussia, and at Kalusz in Galicia. Both potash and soda are frequently constituents of the same glass; but glass made from potash is free from the decided sea-green tinge which invariably is seen in soda glass, although the latter is the more brilliant in lustre. (5.) Lead is the characteristic ingredient of a distinct class of glass of which ordinary flint glass is the type. It is usually employed in the form of minium or red lead ($2PbO,PbO_2$), partly on account of its fine state of division and partly because by giving off oxygen it helps to purify the metal. (6.) Baryta and witherite or baric carbonate have been introduced with much success as a partial substitute for alkali in soda or potash glass, and for a part of the lead in ordinary flint glass, and in all probability barium compounds are destined to occupy a much more important place in glass manufactures than hitherto they have done. (7.) Cullet or waste and broken fragments of the special kinds of glass to be made is an important and essential ingredient, being added to the extent of about one-third of the whole charge in the melting and preparation of glass. These materials constitute the essential ingredients which go to the formation of glass. In coarse varieties, such as bottle glass, alumina and iron are present, but their presence simply results from the inferior and impure nature of the raw materials employed, and are neither essential nor desirable. Some portion of alumina too is taken up from the pots in which the materials are melted. Bleaching or oxidizing agents are also employed to produce a high degree of colourlessness in clear glass, and for this purpose peroxide of manganese, arsenious acid, and nitrate of potash are the materials generally used. These bodies oxidize carbon compounds which may be present, and neutralize to a large extent the colour yielded by iron by converting its protoxide into peroxide. Too much manganese, however, gives the glass a reddish tinge, and excess of arsenic produces a milky cloudiness. The various substances employed to produce coloured and opaque varieties of glass will be enumerated when these special kinds are described. The requisite proportions of the raw materials ground and prepared are intimately mixed with the aid of a mixing apparatus, and in this form constitute the "batch." Formerly it was the habit to frit or partially decompose and fuse the ingredients in a form of reverberatory furnace called a calcar arch, but since the use of kelp was abandoned that operation is no longer essential, and generally the well-mixed batch is placed at once in the melting pots, or the tank in the case of tank furnaces.

Melting Pots.—These pots or crucibles are made of the finest fire-clay, that from Stourbridge in Worcestershire being exclusively used for glass pots in Great Britain. Great care is requisite in the selection, and in cleansing the clay from extraneous particles, the presence of which, even in the smallest degree, will injure the pot. A fine powder procured by grinding old crucibles is generally mixed, in a proportion seldom larger than a fourth, with what is termed the virgin clay. This mixture dries more rapidly, contracts less while drying, and presents a firmer resistance to the action of the fire and alkali used in the composition of glass than the simple unmixed clay. These ingredients, having been mixed, are wrought into a paste in a large trough, and carried to the pot loft, covered in such a way as to exclude dust and other minute particles. Here a workman kneads the paste by trampling it with his naked feet, turning it from time to time until it becomes as tough as putty. It is then made into rolls, and wrought, layer upon layer, into a solid and compact body, every care being taken to keep it free of air cavities, which would, by their expansion in the furnace, cause an immediate rupture of the pots. After pots are made, very great care is necessary to bring them to the proper state of dryness before taking them to the annealing or pot arch. In drying they commonly shrink about 2 inches in the circumference. When pots are made during summer, the natural temperature is sufficient for drying them; but in winter they are kept in a temperature of from 60° to 70° Fahr. They remain in the room where they are made for a period varying from nine to twelve months. Being afterwards removed to another apartment, where the heat is from 80° to 90° Fahr., they are kept there for about four weeks. They are then removed for four or five days, more or less, according to their previous state of dryness, to the annealing arch, which is gradually and cautiously heated up till it reaches the temperature of the working furnace, whither, after being sufficiently annealed, they are carried as quickly as possible. Pots last upon an average from eight to ten weeks, and they form a costly item in the manufacturing operations, as each pot is worth on an average about £10; and many of them, notwithstanding all care, crack and give way as soon as they are placed in the melting furnace. For all varieties of glass, excepting lead glass, open pots in the form of a truncated cone, as represented in fig. 1, are employed; but for flint glass a covered pot with an opening at the side, as shown in fig. 2, is essential. Dr Siemens proposed a form of melting pot divided into three compartments, the materials being melted in the first, and passing into the second by an opening at the lower part of the partition, where the metal was to be fined and freed from included air-bubbles, and afterwards to pass by a like opening to the third compartment, whence it was to be drawn for working. The specific gravity of the charge in the first compartment would rise in proportion as the materials melted and became homogeneous in structure. Therefore the metal would sink in proportion as it melted;

FIG. 1.—Crown-Glass Pot.

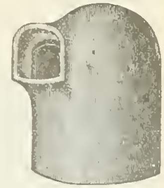

FIG. 2.—Flint-Glass Pot.

and the best melted portions pass into the second compartment, in which, under the influence of the direct furnace heat, it would be cleared. There, similarly, the perfectly fined glass falling to the bottom would pass into the cooler working compartment, which is protected by a covering cap. Dr Siemens's idea has been practically developed in his continuous tank referred to below.

Furnaces.—A glass-melting furnace or oven is a modified form of reverberatory furnace, which assumes many different shapes and arrangements according to the kind of glass to the manufacture of which it is devoted, and the nature of the fuel used. As regards the latter cause of difference it may be noted that, while coal is the principal fuel employed in Great Britain, dried wood and peat are extensively consumed in Germany, and in modern times gas furnaces on the Siemens and other principles are being freely introduced. In the construction of a furnace the principal objects to be kept in view are not only the production and maintenance of an intense heat, but its uniform distribution throughout the furnace, and the bringing of the charges of glass materials directly under its fusing influence. The form assumed by melting furnaces is, in general, square or oblong for sheet and plate-glass making, and circular in English flint-glass making. The fire-space or grate occupies the centre of the furnace, and the fire, when fuel is used for direct heating, is either fed or stoked from both ends, or raised from under the bars by a patented method The fire-grate is usually on a level with the floor of the house in which it is erected, but under it is an arched subterranean passage forming the "cave" or ash-pit, both ends of which extend to the open air outside the glass-house. The fire-grate bars are placed in the top of this arched passage, which thus serves as a canal for the atmospheric air required to maintain combustion within the furnace; and for regulating the admission of air, and so controlling the heat, there are doors at both ends of the archway. In some cases two such arched passages at right angles to each other, and intersecting at the fire-bars, are constructed, so that either can be used according to the prevailing direction of the wind, &c. In general no flue or chimney is directly connected with the furnace, the only exit for the products of combustion being the working holes, and thus the heat is directed around and over each pot placed opposite a working hole in the furnace. Within the furnace, around the grate space in the case of circular furnaces, or on both sides of it in quadrangular furnaces, is a raised bank or narrow platform termed the "siege," on which the melting pots are placed. The number of pots arranged in a furnace vary from four to ten, and each is reached, either for charging or for working off the prepared metal, by means of "working holes" in the side of the furnace situated directly over the pots. The general form and construction of a six-pot crown-glass furnace, which also may be taken as the type of sheet and plate-glass furnaces, is shown in Plate V., where fig. 3 is a ground plan at the level of the siege of a common form of furnace, while in fig. 1 is seen a front elevation of the same furnace, 1, 2, and 3 being the working holes, 4, 5, 6, and 7 pipe-holes for heating the blowing pipes, and 8, 9, and 10 foot-holes for mending the pots and sieges. The furnace

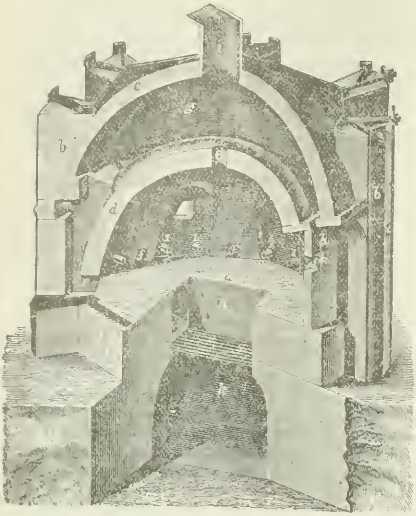

FIG. 3.—Section of Flint-Glass Furnace.

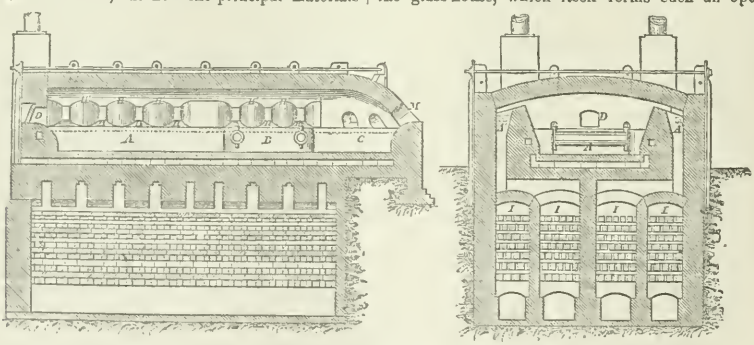
is covered with a low-roofed crown or dome, and the whole structure is bound together with a system of iron bars. The materials used in the construction and lining of all furnaces must be selected with the utmost care, and built with special regard to the enormous temperature to which they are subjected. Formerly a fine-grained purely siliceous sandstone was much used, but now the principal materials are large moulded bricks or blocks of fire-clay of the most infusible and refractory description. For the crown of the furnaces used in plate-glass melting Dinas silica blocks are employed. In laying the blocks and throwing the arches no mixture containing lime can be used, but only fire-clay or Dinas sand, in as small quantity as possible. Should any of the materials of the crown of the furnace gradually fuse under the influence of the heat, the dropping of the molten matter into the glass-pots is the cause of most serious annoyance and loss to the manufacturer.

An English flint-glass furnace furnishes the type of circular furnaces. Usually a large number of pots, sometimes ten, are provided for in such a furnace, because, the objects made in flint glass being in general of small size, the metal is worked off only slowly, and a large number of glass-blowers can be accommodated at the separate work-holes. The arrangements of the cave and fire-grate are the same as in the case of square or oblong furnaces, but flint-glass furnaces differ from the prevailing rule in others by being provided with a system of flues and chimneys, one flue being placed between each pair of pots. The general appearance presented within a flint-glass house is illustrated in Plate VI. fig. 1; and the accompanying woodcut (fig. 3) is a sectional illustration showing the construction and internal appearance of a seven-pot furnace. The furnace is composed of a double arch or vault springing from strong pillars or abutments *bb*. The space *c*, between the outer arch and the vault proper of the furnace *d*, is a common receptacle for the flues *ff* led from within the furnace, and the products of combustion escape by the chimney *i*. The work-holes are at *h*, and at that place the furnace wall is taken down when a pot requires to be removed and renewed. The "cave" or air canal is seen at *k*; *n* is the fire-grate, stoked in this case from one side only; *l* shows openings at which the blowing tubes are heated; *m* is an opening for cleaning the flues; and *a* is the bank or siege with the position of the pots indicated. Frequently instead of being arched the outer portion of the furnace is carried up in the form of a wide truncated cone or open chimney stalk, and in other cases short separate chimney stalks are built for each flue terminating within the glass-house, which itself forms such an open-topped



FIGS. 4 and 5.—Siemens's Continuous Tank Furnace.

cone or chimney. Of course in cases where such separate small chimneys are provided no second or outer vault is required.

In the year 1861 Dr C. W. Siemens introduced a form of furnace in which the use of melting pots was altogether abandoned, and the batch was introduced into, melted in, and worked from a tank which occupied the whole bed of the furnace. This furnace he heated from the sides by means of his well-known regenerative gas system described under FURNACE and IRON. In 1872 he effected a further development of the tank furnace by dividing the tank, on the principle of his melting pot, by means of two floating bridges or partitions into three compartments, and thus he elaborated what is termed Siemens's patent continuous melting furnace. Of this improved furnace fig. 4 shows a longitudinal section, and fig. 5 is a transverse

section. A is the melting compartment, B the refining compartment, and C the working-out compartment. The compartment A is fed with raw material (or batch) through the door D at the back end of the furnace; it is separated from the compartment B by the floating bridge E, under which the partially melted glass passes to reach the latter. In the compartment B the metal, by the influence of the higher temperature maintained on its surface, is completely purified, and sinks to flow under the bridge F in a complete workable condition. Suitable provision is made, by means of air-passages, to keep the sides of the tank of the requisite temperature to prevent any egress of glass through them, and the floating bridges E and F are renewed as often as necessary. The regenerative gas furnace is employed, and the gas and air ports H H′, leading from the regenerators I I′ respectively, are arranged along each side of the tank, so as to cause the flames to play across the furnace. The temperature of the different parts is regulated according to the various stages of preparation of the glass in the several compartments, this regulation being effected by constructing the gas and air ports of larger dimensions, or increasing their number, where the greatest heat is required; it is also facilitated by means of division walls (not shown in the figures) which may be built over the floating bridges to separate the compartments. The temperature of the working-out compartment C is controlled by regulating the draught of the furnace chimney, by diminishing which more or less flame must necessarily pass from B over the floating bridge F into C, and through the working holes M. The principal advantages resulting from the use of the continuous melting furnace are the following:—

1. An increased power of production, as the full melting heat may be employed without interruption, whilst with the old method of melting nearly half time is lost by cooling and settling the metal, the working it out, and the re-heating of the furnace.
2. An economy in working, as only half the number of men are required for the melting operations.
3. A greater durability of the tank and furnace, owing to the uniform temperature to which they are subjected.
4. A much greater regularity of working, and more uniform quality of the product than in other furnaces.
5. For the manufacture of window glass, the compartment C may be so arranged that the blowers can work without interfering with the gatherers; this would do away with the separate blowing furnace now in use.

Although the Siemens regenerative gas firing is generally used with tank furnaces, that system is not essential to the successful working of tanks. Mr Archibald Stevenson of Glasgow has patented a tank furnace fired by common coal from one end, with working holes on the other three sides, and furnaces on this principle are worked in a perfectly satisfactory manner with much economy of coal and working room. Tank furnaces are used principally in bottle works and in the manufacture of rolled plate. The following statement shows the extent to which Siemens furnaces and tanks have been introduced by manufacturers.

Formerly it was the habit that to the sides or wings of the main melting furnace there were attached calcar or fritting arches, annealing ovens, pot-firing arches, and other subsidiary furnaces required in certain stages of glass manufacture. These were heated by flues leading from the fire-space of the principal furnace; but such a practice is now generally abandoned, and distinct furnaces or ovens, arranged and fired according to the necessities of the case, are provided instead. In the manufacture of common bottle glass, however, for which highly impure materials are used, it is still the practice to prepare a frit in a side arch occasionally attached to the melting furnace.

The whole of the pots in a common furnace are charged or filled with the prepared "batch" at the same time. Immediately the heat is forced, and the stoking must thereafter be carefully regulated to maintain the high temperature. As the mass begins to fuse it settles down and occupies considerably less space in the pot, to which thereon a second quantity of material is added, and generally a third portion is subsequently filled in so as to have at the close of the melting process as large a quantity of metal as possible. When the fusion is complete a scum composed of uncombined salts, and known as glass gall or sandiver, rises and collects on the surface. It consists almost entirely of sulphate of soda, with sulphate of lime, and a small percentage of chloride of sodium. This scum of glass-gall is carefully removed with a perforated scoop, and the heat of the furnace is then forced to the most intense degree with the view of rendering the metal as fluid and limpid as possible, so as to free it from all included gaseous bubbles which it still contains. This process of "fining," "refining," or hot-stoking, as it is indifferently termed, involves a temperature which is estimated in certain cases to reach from 10,000° to 12,000° Fahr.; and the operation is sometimes assisted by stirring the molten mass with a pole of wood, in a manner analogous to the poling of copper in the refining of that metal. Throughout the operation of melting, test pieces are periodically withdrawn from the pots for the purpose of observing the progress and condition of the glass. When it is found that the vitrification is complete and the object of refining fully accomplished, the heat of the furnace is considerably reduced, so that the glass may be brought into that condition of viscosity in which it is capable of being worked. In contradistinction to the refining or hot-stoking period, this is known as cold-stoking.

Glass Working.—The means by which melted glass is caused to assume its varied forms for use are (1) by blowing; (2) by casting; and (3) by pressing in moulds—an operation in which the other two processes may be partly combined. Minor manipulative processes which do not fall under any of these heads are called into action; but these are for the most part merely subsidiary to the others, which really comprehend all the lines along which the formation of glass proceeds.

Having regard principally to the forms into which glass is worked and the uses to which it may be applied, the following classification embraces the principal departments of the glass-making industry.

- I. Flat glass.
  - Crown glass.
  - Sheet glass.
  - Plate glass.
- II. Hollow glass.
  - Flint glass, blown.
  - Bohemian glass.
  - Venetian glass.
  - Bottle glass.
  - Slag glass (Britten's).
  - Tube and gauge glass.
- III. Pressed and massive glass.
  - Flint glass.
  - Optical glass.
  - Strass.
  - Rod glass, marbles, and beads.
- IV. Coloured, opaque, and enamel glass, including glass mosaics and hot cast porcelain, &c.

So far as they involve distinct manufacturing processes, these varieties of glass will be here noticed in the above order. Such of the divisions as result from the application of special methods of ornamentation, and as come under the head of art glass, do not fall within the scope of this article.

CROWN GLASS.—This, with sheet or cylinder glass, forms all ordinary blown window glass. Both varieties are precisely the same in composition, being a mixture of sodic and calcic silicates, and differ only in the manner in which the sheets of finished glass are produced. The raw materials employed for this and all other kinds of glass vary within rather wide limits, and, as already explained, the form in which the sodic and calcic compounds are used may also be varied. The following composition of batch for window glass must therefore be regarded as only one out of very many mixtures in use :—

Sand, purified	100	parts
Chalk, or limestone	35 to 40	,,
Sulphate of soda	40 to 45	,,
Cullet	50 to 150	,,

To these materials a minute proportion of white arsenic and peroxide of manganese, as bleaching agents, may also be added.

Crown glass was, in the early part of the present century, the only form of window glass made in Great Britain, and consequently it was generally recognized as English window glass, having been manufactured only on a very limited scale in any other country. Since the introduction of sheet-glass making, the crown-glass industry has steadily declined, and now its manufacture may be regarded as practically a thing of the past, not more than one or two crown furnaces being in operation. Seeing that it possesses little more than an historical interest, it is now unnecessary to enter into much detail as to the processes employed in the manufacture of crown glass.

The metal being brought to a proper condition for working, the "gatherer" dips into the pot of metal an iron pipe or tube, 6 or 7 feet in length, of the shape shown in fig. 6, heated at that end which takes up the glass, and, by turning it gently round, gathers about $1\frac{1}{2}$ ℔

FIG. 6.—Blowing Tube.

of liquid glass on the end of it. Having allowed this to cool for a little, he again dips the rod into the pot, and gathers an additional quantity of from $2\frac{1}{2}$ to 3 ℔. This is also permitted to cool as before, when the operation of dipping is again repeated, and a sufficient quantity of metal, from 9 to 10 ℔ weight, is "gathered," to form what is technically called a table or sheet of glass. The rod, thus loaded, is held for a few seconds in a perpendicular position, that the metal may distribute itself equally on all sides, and that it may, by its own weight, be lengthened out beyond the rod. The operator then moulds the metal into a regular form, by rolling it on a smooth iron plate, called the "marver," a term corrupted from the French word *marbre*. He then blows strongly through the tube, and thus causes the red-hot mass of glass to swell out into a hollow pear-shaped vessel. The tube with the elongated sphere of glass at the end of it is then handed to the "blower," who heats it a second and third time at the furnace, pressing the end, between each blowing, against the bullion bar, so called from the part thus pressed forming the centre of the sheet or "bull's eye," and by the dexterous management of this operation, the glass is brought into a somewhat spherical form. The blower now heats a third time at the "bottoming hole," and blows the metal into a full-sized flattened spheroid. When this part of the process has been completed, and the glass has been allowed to cool a little, it is rested on the "casher box," and an iron rod, called a "pontil" or punty rod, on which a little hot metal has been previously gathered, is applied to the flattened side, exactly opposite the tube, which is detached by touching it with a piece of iron, dipped beforehand in cold water, leaving a circular hole in the glass of about 2 inches diameter. Taking hold of the punty rod, the workman presents the glass to another part of the furnace called the "nose hole," where the aperture made by its separation from the tube is now presented and kept until it has become sufficiently ductile to fit it for the operation of the flashing furnace. Whilst here, it is turned dexterously round, slowly at first, and afterwards with increasing rapidity; and the glass yielding to the centrifugal force, the aperture just mentioned becomes enlarged. The workman, taking great care to preserve, by a regular motion, the circular figure of the glass, proceeds to whirl it round with increasing velocity, until the aperture suddenly flies open with a loud ruffling noise, which has been aptly compared to the unfurling of a flag in a strong breeze; and the glass becomes a circular plane or sheet, of $4\frac{1}{2}$ feet diameter, of equal thickness throughout, except at the point called the bullion or bull's eye, where it is attached to the iron rod. The sheet of glass, now fully expanded, is moved round with a moderate velocity until it is sufficiently cool to retain its form. It is carried to the mouth of the kiln or annealing arch, where it is rested on a bed of sand and detached from the punty rod by a shears. The sheet or table is then lifted on a wide pronged fork, called a fascet, and put into the arch to be tempered, where it is ranged with many others set up edgewise, and supported by iron frames to prevent their bending. From 400 to 600 tables are placed in one kiln. A sketch of the interior of a crown-glass house, during the progress of these operations, has been given in Plate VI., fig 2. The kiln having been clayed up, the fire is permitted to die out, and the heat diminished as gradually as possible. When the glass is properly annealed, and sufficiently cold to admit of its being handled, it is withdrawn from the oven after the removal of the wall built into the front of the arch, and is then quite ready for use. The largest sized tables of crown glass made will cut into slabs 30 inches across, from which squared pieces measuring 38 by 24 or 35 by 25 inches may be obtained.

SHEET GLASS, as already mentioned, is the same in composition as crown glass, which it has now entirely supplanted. The success of sheet glass is due principally to the fact that it can be produced in sheets of much greater dimensions than is possible in the case of crown glass; it is free from the sharp distorting striæ and waves common in crown class; there is no loss of glass as there is with the bull's eye of crown; and modern improvements effected in the manufacturing process leave little distinction in brilliancy of surface between the two qualities. Sheet glass is made on the greatest scale in Austria, Germany, and Belgium, and it was long distinguished in the British market as German sheet glass. In 1832 Chance of Birmingham and subsequently Hartley & Co. of Sunderland introduced the manufacture into England, and in the hands of these firms, as well as of others who followed in their footsteps, the industry prospered and developed, till it has now attained dimensions equal to those it has reached in most of the Continental nations, where the art was long established before it came into use in England.

Sheet-glass making involves two principal operations,—(1) the blowing of the cylinder, and (2) the opening, flattening, or spreading of the glass. The structure and internal arrangements of the melting furnace is practically the same as in the case of crown glass. The ordinary type of oblong furnace usually contains 10 pots—5 in each side of the fire-grate—each pot being of a capacity of about 1 ton or 22 cwt. of metal. Radiating from the work-holes, and raised about 7 feet above the floor level, or a correspondingly deep sunk pit, are ten long stages with an open space between each sufficient to allow the workman to swing about his long tube freely in forming the elongated cylinder of glass. Fig. 7 is a ground plan of a common sheet-glass furnace and staging of planks *c*, at the extremities *d* of which are placed a tub of water and a wooden moulding-block. Instead, however, of having these stages erected in front of the melting furnace, it is now a common practice to gather and block the glass at the melting furnace, and to blow it in front of a separate oblong reheating or blowing furnace, from each opening of which the wooden stage runs out over a pit excavated to the depth of 7 feet or thereby. Common bricks may be used for the construction of this reheating furnace, as the heat required in it is by no means intense.

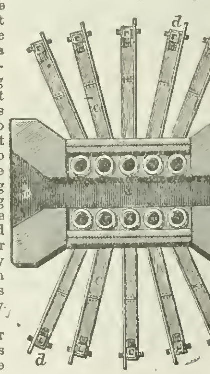

FIG. 7.—Plan of Sheet-Glass Furnace.

Blowing.—The charge or batch requires about 16 hours to melt, and other 8 hours are consumed in cooling it to the working consistency. When the metal is ready for working, the workmen take their stations, each having his own pot and stage and also an assistant, and commence making the cylinders. After gathering the quantity of metal required (which on an average amounts to 20 ℔), the workman places it in a horizontal position in the large hollow of a wooden block (fig. 8), which has been hollowed so that, when the workman turns the metal, it shall form it into a solid cylindrical mass. In the meantime, the assistant, with a sponge in his hand, and a bucket of water by his side, lets a fine stream of water run into the block, which keeps the wood from burning, and also gives a brilliancy to the surface of the glass. The water, the moment it comes in contact with the glass, is raised to the boiling point, and in that state does no injury to the metal; but it is only when the metal is at a high temperature that such is the case; for, whenever the glass is cooled to a certain degree, it immediately cracks upon coming in contact with water. When the workman perceives that the mass of metal is sufficiently formed and cooled (fig. 9), he raises the pipe to his mouth at an angle of about 75 degrees, and commences-blowing it, at the same time continuing to turn it in the wood block, till he perceives the diameter to be of the requisite dimensions (fig. 10), which are usually from 11 to 16 inches. The workman then reheats this cylindrical mass, and, when it is sufficiently softened, commences swinging it over his head, continuing to reheat and swing till he has made it the desired length, which is commonly about 45

Fig. 8.

Fig. 9

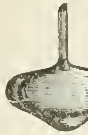

Fig. 10.

inches. It is now a cylinder of say 45 inches long by 12 inches in diameter, one end being closed, and the other having the pipe attached to it. The workman begins to open the end which is closed, for which purpose he encloses the air in the cylinder, by stopping the aperture of the pipe with his finger; and then placing the close end of the cylinder towards the fire, it becomes softened, while at the same time the air within is expanding, and, in about thirty seconds, the softened glass at the extremity of the cylinder gives way, forming an aperture as in fig. 12. The workman then turns the cylinder round very quickly, and, by keeping the opened extremity warm at the same time flashes it out perfectly straight as at *g*, fig. 13. If the burst edges are ragged in appearance they are trimmed by cutting with a pair of scissors before finally expanding. The bursting of the end of a thick heavy cylinder has to be determined by allowing a glowing drop of glass to fall on the spot to be burst before presenting it to the fire.

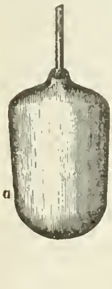

Fig. 11.

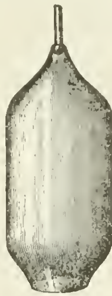

Fig. 12.

Fig. 13.

The other end, which is attached to the pipe, has now to be cut off, and is done in the following manner. The workman, having gathered a small quantity of metal on the pontil, draws it out into a thread of about one-eighth of an inch in diameter, laps it round the pipe end of the cylinder, and, after letting it remain there for about five seconds, withdraws it suddenly, and immediately applies a cold iron to the heated part, which occasions such a sudden contraction, that it cracks off where the hot string of glass has been placed round it. Another method is to draw a semi-cylindrical rod of iron *c* (fig. 13) heated to redness around the line *d* of desired fracture, and a drop of water then allowed to fall on the line so drawn determines its fracture. The stages in the development of a cylinder to its full length are illustrated in figs. 9 to 13.

Flattening.—The cylinder so blown and detached is now allowed to cool; and, previous to its flattening, the burst extremity being thinner than the remainder, and slightly contracted at its edge, has to be removed to the depth of about 2 inches. For this purpose the cylinder is placed vertically in the jaws of a cutting instrument, having a diamond cutter, pressing by a spring, inside the glass (fig. 14). The cutter moves by small wheels on the table on which it is placed, and being pushed around the cylinder it makes an accurate cut of uniform height. The cylinder has then to be split longitudinally to allow it to be opened out to a flat sheet. To accomplish this the practice was formerly to lay the cylinder horizontally on a bench, and draw a red-hot iron two or three times along the inner surface at the line of desired fracture. Now the splitting is done with a diamond cutter fixed in the cleft of a stick and (fig. 15) guided from end to end of the cylinder by a straight-edge K laid within it. The cylinder is now ready to be taken to the flattening kiln, which consists of two chambers built together, the one for flattening the cylinders, the other for annealing the sheets, the former being kept at a much higher temperature than the latter.

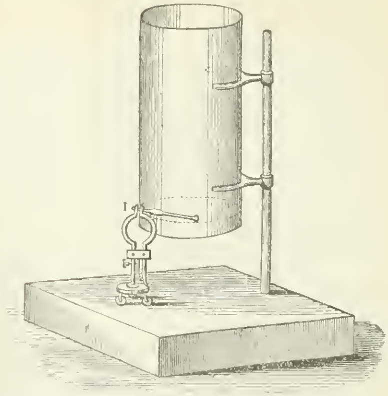

Fig 14.

The cylinder, after being gradually reheated, is placed in the centre of the flattening oven, upon a smooth stone, with the split side upwards. In a short time it becomes softened with the heat, and

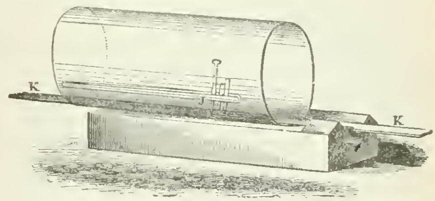

Fig. 15.

by its own weight falls out into a flat square sheet of 45 inches by 36. The flattener, with a piece of charred wood, rubs it quite smooth, and then places it on edge in the annealing arch, where it remains about three days to be annealed.

In the arrangement of the flattening and annealing ovens numerous improvements have been effected, which have resulted in greatly increased smoothness and uniformity of the glass, and in considerable economy of time and labour in the operations. Fig. 16

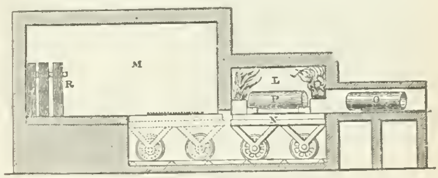

Fig. 16.

shows a section of a flattening (L) and annealing kiln (M) in common use. The split cylinder O is introduced and gradually pushed forward so as to be uniformly heated till it reaches P, the flattening stone or table, mounted on a movable waggon N. On this waggon after it has been flattened it is carried into the annealing arch M, as shown by the dotted outline. Here in a less heat it gradually stiffens, till it is ready to be moved by a forked tool to a horizontal position on the bed of the annealing oven. The waggon then goes back to the flattening arch, and when it is reintroduced with another sheet, that previously flattened is ready to be piled up on edge at R, and thus the work proceeds till the annealing oven is filled, when it is closed up and allowed to cool down by slow degrees. Chance Brothers & Co. of Birmingham are the introducers of a system of continuous flattening and annealing furnaces. This they accomplish by means of two contiguous circular kilns having revolving soles, the fires being arranged and the inside partitioned so that the split cylinder gradually approaches the greatest heat, where the flattening takes place, and then passes round in a decreasing temperature till at the opening into the annealing arch it has attained sufficient consistency to be moved into the yet cooler annealing arch, round which the sheet is slowly carried till it arrives fully annealed at the point where it is withdrawn.

Although the average size of finished sheet glass as now made is about 50 inches by 36 inches, very much larger sizes may be and occasionally are produced, the extreme trade limit being 85 inches long by 49 broad; but both these extremes cannot be obtained in the same sheet, and few workmen attain the dexterity necessary for properly manipulating the larger sizes. In Belgium sheets from blown cylinders measuring 10 feet by 4 feet have been made. The thickness of finished sheet glass is estimated by the amount it weighs per square foot, and the commercial range of weight is from 15 oz. to 42 oz. per foot, the thicker and heavier kinds, of course, selling at the highest price.

Polishing of Sheet Glass.—Polished sheet glass is known in commerce as patent plate glass, to distinguish it from ordinary polished cast-plate. The practice of polishing sheet glass was first introduced and patented by Chance of Birmingham, and polished sheet is now in considerable demand for photographic purposes, for framing engravings, and generally where a fine true surface combined with lightness or thinness is requisite. The polishing process involves two operations—smoothing and finishing or polishing. The smoothing is done on a thick slab of slate, which must possess a surface as smooth and level as possible. This is covered with a piece of wet cotton cloth, and, the sheet of glass to be smoothed being laid thereon, by gentle pressure all air is expelled from between the surfaces, and the atmospheric pressure then keeps the glass firmly in position. The process of smoothing and the subsequent finishing are from this point the same as in the case of ordinary plate glass, under which head these operations will be detailed. It is only selected plates of fine clear metal that are used for polishing.

PLATE GLASS is manufactured by a process entirely different from any of those yet described, consisting as it does of glass cast and spread in sheets. As plate glass is invariably thicker than blown sheet, it is of the utmost consequence that the "metal" should be prepared from the purest possible materials, and that the founding or melting should be done with great care to ensure the expulsion of air bubbles. It is only thus that the fine clear homogeneous and flawless plates aimed at in the manufacture can be produced. Formerly the French excelled all other nations in the manufacture of plate glass, and the manufactures of the great St Gobain Company yet command the highest prices in the market; but the increased care which has now for about a quarter of a century been given in England to the purity of materials, and the ingenious machinery which has been devised for polishing plate in England, have resulted in placing British-made plate glass on a level with the best productions of France.

The following is given as an example of the materials employed for the preparation of fine French plate:—

White quartzose sand	100·0	parts.
Sodic carbonate	33·3	"
Lime (slaked)	14·3	"
Manganese peroxide	0·15	"
Cullet	100·0	"

The materials are melted in furnaces and pots of the ordinary construction, but in some cases the melting pots are of greater capacity, and contain charges of from 2 to $2\frac{1}{2}$ tons. In French establishments, and in many others, two forms of pot are placed within the furnace—(1) the ordinary melting pot, and (2) a pouring pot or *cuvette*, quadrangular in form, made of the same material as the melting pot, and capable of holding sufficient metal for casting a single sheet of the superficial extent and thickness desired. Melting pots and cuvettes are placed side by side in the furnace, and the molten mixture is ladled with copper or malleable iron ladles from the pot into the cuvette, in which it is allowed to clear before casting. In some works, however, the molten glass is poured direct from the melting pots, and in other cases it is ladled to the casting table from the huge melting pots with large malleable iron ladles.

The casting table is a heavy thick flat table of cast-iron, of a length and breadth exceeding the size of the largest plate of glass which may be cast on it. At one end is placed a heavy cast-iron roller, the full breadth of the table, and fitted to roll the whole length of the table by means of spur wheels working into gearing along its sides. The cast-iron roller determines the thickness of the glass by the height at which it is caused to roll above the table, and that height is regulated by placing narrow strips or ribs of metal of the required thickness of the glass along the edges of the table on which the two extremities of the roller bear as it revolves. The breadth of the plate again is determined within the limits of the table by the two sides of the "gun," an apparatus consisting of two plates of cast-metal, placed in front of the roller, and bolted together by cross bars at a distance apart which can be easily altered and adjusted according to the breadth of plate the apparatus is intended to control. The edge of the plates abutting against the roller are accurately fitted to the roller curvature, and thus they and the roller form three enclosing sides for the molten mass poured on the table, and as they travel forward they carry in front of them all the semi-fluid mass except the uniform layer which represents the distance between the moving surface of the roller and the surface of the casting table on which the glass is spread. As the glass does not instantly solidify the moment the roller has past over and spread it into a sheet, the edges generally assume a rounded and somewhat wavy cast-like appearance. Immediately the plate has sufficiently solidified to bear moving, it is taken to the annealing furnace, the heat of which has been carefully raised to the proper pitch. The sole of the annealing oven on which the plate is to rest (for with large plates any piling on edge is impracticable) must be as smooth and level as possible, since the still semi-plastic mass moulds itself to the surface on which it is laid. As the oven only accommodates a single plate of the largest dimensions, and since the annealing process occupies several days, a large number of ovens, occupying a great space and involving the expenditure of much labour and fuel, are needed in works where many plates are cast. In dealing with plates of small size they may be laid horizontally on the furnace bed for a little till they come to the furnace temperature, after which they are piled up on edge in twenties or thirties, leaning against a range of iron bars running across the furnace. When the plates have been deposited in the annealing oven, the openings are all carefully stopped up, and the furnace with its contents is cooled by slow degrees down to a temperature at which the glass may safely be withdrawn and exposed to ordinary atmospheric influences. The cooling of such furnaces is now hastened as far as the safety of the plates and the completion of the annealing will permit by allowing cold currents of air to pass under their sole.

The plates, as withdrawn from the annealing oven, have a very irregular, rough, undulating surface, and although the glass is perfectly pure, they have, owing to their uneven surface, no transparency. In this condition they constitute the "common rough plate" of commerce, and as such they are extensively used for the glazing of roofs, for floor and cellar lights, and generally in positions where light without transparency is requisite.

Polishing.—When the annealed plates are withdrawn from the oven they are carefully examined for any defects, such as spots, air-bells, &c., which they frequently exhibit. If serious defects are found, the plates are cut into the largest pieces which can be obtained free from flaws, and the selected pieces are then submitted to the operations of polishing, consisting of—(1) grinding, (2) smoothing, and (3) polishing. Various forms of machine have been devised and introduced for effecting these operations. The grinding and smoothing table invented by Mr Daglish of Ravenhead works consists of a great revolving flat table A (fig. 17), with a strong fixed bar CE, stretched across it about 10 inches above its surface, to which two runner-frames B, B, shod with iron, are pivoted at Q. The glass to be ground is cemented with plaster of Paris on the surface of the table, and the runner-frames rest on that surface. When the table A is set in motion, each oblong runner-frame B has communicated to it a revolving motion also, owing to the excess of friction brought into action by the more rapid revolution of the outer edges of the revolving table. The effect of these compound revolutions is that every point of the surface of the glass is equally and uniformly abraded, when the apparatus in revolution is fed with sharp sand and water. When a level surface is thus prepared, the smoothing process is next begun on the same table, the only difference being that emery powder of increasing degrees of fineness is substituted for the sand, and as the operation approaches completion the utmost care must be exercised as to the purity and uniformity of the emery, seeing a single particle of grit would effectually destroy the smoothness of a whole plate. The quality of the emery is thus of essential consequence, and an ingenious apparatus is brought into use for arranging the sizes by means of a current of water of diminishing velocity, obtained by passing a uniform stream with agitation successively through cylinders or troughs of increasing

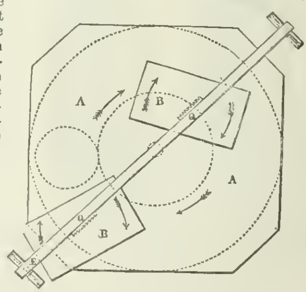

FIG. 17.—Plate-Glass Grinding Table.

size. In these troughs the emery powder is deposited in increasingly fine division, according to the growing capacity of the trough and the consequent slow replacement of its contents. The last touches of the smoothing process can only be given by the hand, which at once detects any appearance of grittiness. Both sides of the glass are in succession submitted to these operations, after which it is again bedded in plaster and fixed on the polishing table. The polishing is done with reciprocating rubbers, covered with fine felt, and supplied with rouge (peroxide of iron) in a liquid state. While a reciprocating motion is communicated to the rubbers, the table itself moves backward and forward in a transverse direction, so that all parts of the plate are equally brought under the polishing influence of the rubbers. About 40 per cent. of the weight of the rough plate is removed in the three polishing operations.

Ordinary finished plates vary in thickness from about $\frac{1}{4}$th to $\frac{5}{8}$th inch, and the largest sizes measure about 17 feet by 9 feet 6 inches. The great St Gobain Company of France quotes regular prices up to 324c. (10 feet 8 inches) by 204c. (6 feet 8 inches), beyond which size the price becomes special. In the Paris Exhibition of 1878 that company showed a silvered plate 24 feet by 14 feet, the largest piece of plate glass which has hitherto been polished.

Rolled Plate.—A form in which unpolished plate glass is extensively employed is the patent rolled plate, originally made by Hartley & Co. of Sunderland. The surface of the casting table on which the rolled plate is spread, instead of being smooth and plain, is engraved or otherwise indented with fine lines, grooves, or flutes, or it may be with small squares, lozenges, or even ornamental patterns, and the glass, of course, takes on its lower surface an accurate impression of any such pattern. Rolled plate is now very largely used for partitions, and in places where obscure lights are required. Such plates are always cast comparatively thin, and of moderate size, so that a large number may be piled in the annealing oven. They, as well as certain qualities of coloured glass, are cast by ladling the molten metal from huge pots which may contain about $2\frac{1}{2}$ tons of material. By this ladling numerous "air bells" are enclosed in the glass, but the circumstance does not affect the durability and usefulness of the glass.

FLINT GLASS OR CRYSTAL.—The name flint glass originated in the circumstance that at first the silica used in the manufacture of this variety of glass was in the form of ground flints. The industry belongs characteristically to the United Kingdom, where it was first established on a large scale, and to the present day flint glass is much more extensively manufactured in England than in any other country.

Flint glass is a compound entirely different from those above described, consisting as it does of a silicate of potassium and lead. As is the case with all kinds of glass, its composition and the proportion of ingredients used in its preparation vary widely. The average composition of a batch has been stated thus:—

Fine white sand	100 parts.
Minium (red lead)	66 "
Refined potash	33 "
Nitre	10 "
Cullet	60 to 100 "

Small portions of bleaching ingredients, as white arsenic or manganese, are also sometimes added. Purity of materials is of the utmost consequence in the manufacture of flint glass, which is prized in proportion to the transparency, uniformity, sparkle, and freedom from colour of the metal; and, as finished objects are in many cases massive, defects of colour are very obvious. Flint glass is much more fusible than the kinds destitute of lead; it possesses great brilliancy, owing to its high refractive and dispersive power, but being comparatively soft its surface is easily scratched and dulled. It is also slowly corroded by alkalies, and contact with solutions of sulphides blacken it. Its specific gravity varies according to the proportion of lead it contains; and, as the silicate of lead tends to sink when the glass is in the molten state, Faraday found glass from one melting to vary from 3·28 to 3·85, and in another instance from 3·81 to 4·75. The higher the specific gravity of the glass the greater is its refractive power and consequent brilliancy.

Flint glass is in no case used for architectural or structural purposes, but its purity and lustre peculiarly fit it for table glass, ornamental objects, glass globes and lustres, and for imitations of gems and precious stones. For the latter purpose a dense glass called strass, appropriately coloured when necessary, is employed, and a glass of still greater density and refractive power is used for optical puposes. The softness of flint glass adapts it for engraving, cutting, and polishing; and these methods of ornamenting the finished glass are very much employed.

The special covered form of pot (fig. 2, *supra*) and the arrangement of the furnace have already been alluded to. Plate VI., fig. 1, represents the various arrangements, tools, and processes connected with a flint-glass house, the building in the centre being the large cone or chimney built over the furnace, which is seen through the arches *a*. At 5 and 6 men are seen at the working holes withdrawing metal from the pots on their long iron tubes; 7 is the marver on which the gathering is rolled till it acquires a circular shape; at 8 a blower is seen in process of expanding a gathering of glass by blowing; and at 9 a servitor or second man is attaching a post or lump of metal he has gathered on a pontil or punty to the end of a blown globe of glass. The two masses of glass are thus united together, and that attached to the hollow tube is separated by touching it, near to where the tube enters the globe, with a small piece of iron wetted with water. By this means the glass cracks, and a smart blow on the iron tube completes the disunion. The workman now takes the punty from his assistant, and laying it on his chair arm, rolls it backward and forward with his left arm, while with his right he moulds it into the various shapes required, by means of a very few simple instruments. By one of these, called a pucellas, the blades of which are attached by an elastic bow like a pair of sugar-tongs, the dimensions of the vessel can be enlarged or contracted at pleasure. Any superfluous matter is cut away by a pair of scissors. For smoothing and equalizing the sides of the vessel a piece of wood is used. After the article is finished it is detached from the punty and carried on a pronged stick to the annealing oven.

The annealing oven or leer for flint glass is a low arched furnace, generally of considerable length, with several openings at each end between which narrow lines of rails run. On these rails, small waggons, or trays mounted on four wheels, are placed, and the articles to be annealed are filled into such waggons. They are slowly pushed to the hottest part of the chamber, and passing that point they very gradually approach the cold end of the oven, from which they are withdrawn fully annealed. As each waggon is withdrawn at one end, another is entered at the other so that the line from end to end is kept constantly full. The ordinary method of gradually decreasing the temperature around the articles stationary in the leer is also practised.

Flint-Glass Cutting, Engraving, and Etching.—The sparkle and brilliancy of flint glass is developed by the process of grinding and polishing technically called glass-cutting. In fig. 18 is seen a representation of a glass-cutter's mill, *a* being the pulley and band communicating motion to the mill *b*, which is made of wrought

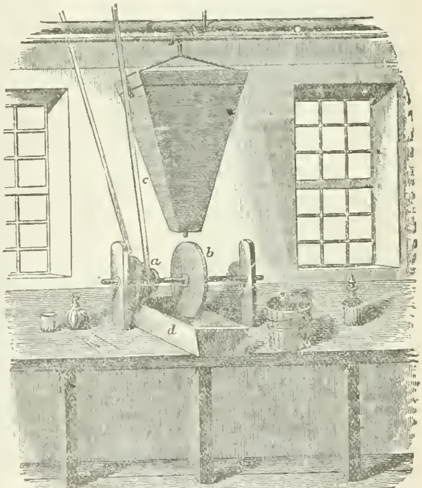

FIG. 18.—Glass-Cutter's Mill.

or cast iron. Over it is suspended a wooden trough or cistern *c*, containing a mixture of sand and water, which is fed on the wheel as required for the operation of grinding. Smoothing is done on a wheel of fine sandstone to which water alone is applied, and for polishing, a wooden wheel supplied with emery, and finally with putty powder (oxide of tin), is employed. The trough *d* under the wheel receives the detritus of the grinding and other operations. The articles are held in the hand, and applied to the mill while rotating. The punty marks are ground off tumblers, wine-glasses, and the like, by boys holding them on small stone mills. Ground or obscured glass is made by rubbing the surface with sand and water. Iron tools fixed on a lathe and moistened with sand and water are used to rough out the stoppers and necks of bottles, which are completed by hand with emery and water. Engraving is the production of ornamental surfaces by a fine kind of grinding mostly done with copper discs revolving in a lathe. Etching is variously done by submitting the portions to be etched or bitten to the influence of hydrofluoric acid, the remainder of the glass being stopped off or protected by a coating of wax or some pitchy compound.[1]

Pressed Glass.—The most brilliant effect is produced by cutting, but moulding or pressing is much cheaper, and this branch of the art has now reached a high state of excellence. Glass formed by pressing in moulds, known distinctively as pressed glass, is peculiarly an English industry, principally because it is only flint glass, or glass possessed of similar properties, that can with advantage be formed in that way. Although moulded glass has existed from early Roman times, it is only within the present century that the modern industry has been developed, and of late years the trade has assumed important dimensions. A metal that melts at a comparatively moderate heat, and does not quickly pass from the plastic state, is essential for success in pressed glass making, because it has not only accurately to fill all the intricacies of the mould, but it must also be susceptible of fire-polishing. This operation consists of a reheating sufficient to melt a thin superficial stratum of the glass, whereby the roughness and obscurity of surface incidental to moulding is removed, and a smooth brilliant effect brought out, inferior only to the sparkling appearance produced by cutting. The moulds for pressed glass are made of iron or bronze; with great accuracy of surface; and they are, in use, kept a little under a red heat. The various segments of the mould are so hinged or connected as to close and leave internally a space representing the form and size of the article to be made, the internal hollow not being produced by blowing but by the plunger of the press under which the mould is placed. The required quantity of metal being dropped into the mould, the plunger descends and forces it into all parts of the cavity, completing immediately the formation of the article, which is then fire-polished by reheating, and afterwards annealed. In this way glass with elaborate facets, bosses, flutings, or other bold ornaments can be produced with rapidity and ease; and the only bar to great cheapness is the heavy cost of the lead and potash in flint glass. Several manufacturers both in England and on the Continent, where the pressed glass industry is extending, now partially supply the place of these costly materials by lime and baryta; and indeed English pressed glass of excellent quality is now in the market containing neither lead nor potash to any appreciable extent.

Baryta Glass.—The high price of red lead, and various disadvantages connected with its use, have given rise to many efforts to find an efficient substitute for it in the manufacture of table and ornamental glass. Barium compounds, principally the native sulphate (common baryta or heavy spar) and the artificially prepared carbonate, have been more or less experimentally tried ever since 1830; but of late years the use of baryta has attracted much attention, and in several French and Belgian glass-works it is understood to have taken its place as a raw material, without, however, much being publicly said regarding the subject. H. E. Benrath, the scientific director of the Lisette glass-works near Dorpat has investigated the application of baryta in glass-making with great fulness. Baryta, it appears, can be used as a partial substitute for the alkalies in glass-making; and indeed it was affirmed by Peligot that carbonate of baryta could altogether supplant either potash or soda, and yield a glass perfectly free of alkali. Such a glass is, however, shown by Benrath to be without practical value; but he has demonstrated that baryta may be used in the place of either lead or lime, to produce an easily fused dense glass much more brilliant than common glass, and in appearance and properties intermediate between that and flint glass. The qualities of the glass and its usefulness for various purposes can be modified by using both baryta and lime in varying proportions. There seems little doubt that baryta will occupy an important place in the future of the glass industry.

Bottle Glass.—This department of glass manufacture is of importance on account of its enormous extent; and although the raw materials employed in the trade are coarse and impure, and though the finished product has little appearance of excellence, the quality of the glass is in the highest degree important. Glass bottles, for example, are used for storing and preserving all manner of liquid substances for food, some of which undergo active chemical change, throughout a period of many years. In such a case it is of the highest consequence that the glass should be capable of resisting the solvent and corrosive action of acids and other substances which may be imprisoned or generated within the bottle, and such an object is attained by the high proportion of alumina which is found in bottle glass. Bottle glass varies in tint from the dark-green, almost black, semi-transparent claret bottles to clear and transparent qualities such as are employed for bottling aerated waters. The difference in colour is partially due to the varying purity of the materials used, and partly to the action of bleaching or oxidizing agents. The materials ordinarily employed are common sand, gas-lime, brick-clay, common salt, and soap-boilers' waste; but local circumstances have much influence in determining the class of materials used. In Continental bottle works lava, basalt, and similar rocks of volcanic origin were formerly employed; and in Denmark and Sweden fluoride of calcium, left as a waste product of the manufacture of soda from cryolite, is used with marked advantage.

For bottle-making the tank furnace with or without compartments as already described is much used; but pot furnaces also continue in use. The arrangements of a common bottle house are seen in fig. 19, which is a ground-plan indicating a bilateral

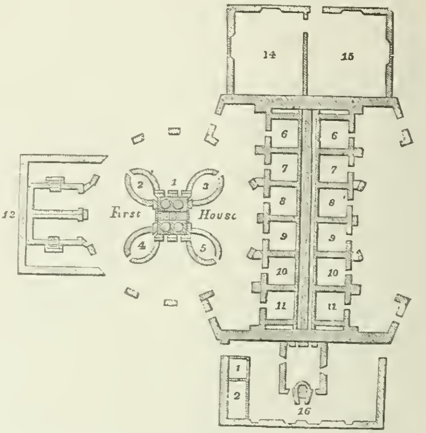

Fig. 19.—Plan of Bottle House.

arrangement of a double bottle house, with the complete plan of a four-pot furnace and ash arches. The furnace is oblong, similar to the crown furnace, but arched over in a barrel shape. It is erected in the centre of the brick cone, above a cave, which admits the atmosphere to the grating. The working holes of this furnace, opposite each pot, for putting in the materials and taking out the liquid glass, are each about 1 foot in diameter. At each angle of the furnace there is also a hole about the same size communicating with the calcining arch, and admitting the flame from the main furnace, which reverberates on and calcines the materials in the arch. In the figure, 1 shows the main furnace; 2, 3, 4, 5, the ash arches for calcining the materials; 6, 7, 8, 9, 10, 11, annealing arches; 12, two-pot arches; 14, clay-house for picking, grinding, sifting, and afterwards working the clay into paste for the purpose of manufacturing pots; 15, mill house for grinding clay; 16, a building containing a calcar furnace for experiments, or for preparing the materials, when the ash arch attached to the main furnace is under repair, including 1, a sand crib, and 2, an ash crib for sifting and mixing the materials, sufficient for two houses.

The following is an outline of the process of making a common bottle. After the metal has been skimmed, the person who begins the work is the gatherer, who, heating the pipe, gathers on it a small quantity of metal. After allowing this to cool a little, he again gathers such a quantity as he conceives to be sufficient to make a bottle. This is then handed to the blower, who, while blowing through the tube, rolls the metal upon a stone, at the same time forming the neck of the bottle. He then puts the metal into a brass or cast-iron mould of the shape of the bottle wanted, and, continuing to blow through the tube, brings it to the desired form. The patent mould now in use is made of brass, the inside finely polished, divided into two pieces, which the workman, by pressing a spring with his foot, opens and shuts at pleasure. The blower then hands it to the finisher, who touches the neck of the bottle with a small piece of iron dipt in water, which cuts it completely off from the pipe. He next attaches the punty, on which is a little metal gathered from the pot, to the bottom of the bottle, and thereby gives it the shape which it usually presents. This punty may be used for from 18 to 24 dozen of bottles. It is occasionally dipped into sand to prevent its adhering to the bottle. The finisher then warms the bottle at the furnace, and taking out a small quantity of metal on what is termed a ring iron, he turns it once round the mouth, forming the ring seen at the mouth of bottles. He then employs the shears to give shape to the neck. One of the blades of the shears has a piece of brass in the centre, tapered like a common cork, which forms the inside mouth; to the other blade is attached a piece of brass, used to form the ring. The bottle is then lifted by the neck on a fork by a boy, and carried to the

[1] A large proportion of the obscuring of the commoner varieties of glass and of the obscured ornamentation on plate and sheet as well as on flint glass is now produced by means of Tilghman's sand blast described below.

annealing arch, where the bottles are placed in bins above one another. This arch is kept a little below melting heat, till the whole quantity, which amounts to 10 or 12 gross in each arch, is deposited, when the fire is allowed to die out.

SLAG GLASS.—Under a patent obtained by Mr Bashley Britten, a manufacture of bottles has recently been established with every prospect of success, the leading peculiarity of the process being the use of blast-furnace slag, molten as it issues from the furnace, as a principal ingredient. The use of slag in bottle-making is by no means new, but the catching of the intensely hot liquid mass and its immediate use for glass-making had not before been attempted; and therein results the great saving in fuel and consequent economy of the manufacture. A company formed to work the process has erected glass-works in Northamptonshire in the immediate neighbourhood of a set of blast furnaces, and these works are now in constant and successful operation. A regenerative gas furnace applied to a glass tank working on Dr Siemens's continuous principle is used, and in it the ingredients of the glass are fed at one end of the tank, where they are fused and fined, and the fused "metal" flows through a bridge to the other end of the tank, whence it is worked out, blown into bottles, and annealed in the usual way. The tank is from time to time fed with fused slag taken as it flows from the blast furnaces, and with it is introduced the required proportion of the other ingredients. The slag furnishes more than half the total material of the glass, and, as it is already melted, its use effects a saving of about half the heat or fuel and also half of the time necessary for the production of the "metal." Thus the prime cost of the glass as it is worked out is considerably less than that of glass made in the ordinary way. The natural tint of the glass thus produced is greenish, but it can be coloured to any required tint, and by careful fining and bleaching it can be produced almost as colourless as common window glass. The working qualities of the glass are excellent; it comes from the furnace in that beautifully plastic condition which renders it capable of being blown, cast, pressed, or otherwise moulded into any desired form, and the company expects to manufacture other articles besides bottles from a material so cheaply produced.

OPTICAL GLASS is of two principal kinds—flint and crown—the combination of these two, with their different refractive powers, being necessary to produce perfect achromatism in the lenses of telescopes. For astronomical telescopes, for microscopes, and for all delicate scientific instruments in which optical glass occupies a place, glass of the utmost purity, transparency, freedom from colour, streaks, and striæ is of the highest importance; and to secure these qualities to the fullest extent much care, trouble, and expense are requisite. The first really successful maker of optical flint glass was M. Guinand of Solothurn in Switzerland who succeeded in making discs 9 inches in diameter free from striæ. Guinand died in 1823, and from his son, M. George Bontemps learned his secret, and at Choisy-le-Roi, near Paris, further improved the manufacture. In 1848 M. Bontemps was induced by Messrs Chance of Birmingham to establish the art in their great works. In the hands of that eminent firm the preparation of optical glass has attained a perfection not approached by any other glass workers, and the *chef d'œuvre* of optical glass hitherto made consists of a pair of flint and crown glass discs, 29 inches in diameter, exhibited by Chance Brothers at Paris in 1855. Regarding these Sir David Brewster said, "I have entertained the hope that the English Government would purchase these discs and construct with them the grandest achromatic telescope that ever was contemplated by the most sanguine astronomer." They were, however, purchased by the French Government in 1867.

Optical flint glass contains more lead, and is consequently heavier and more refractive, than the quality used for common purposes. It is made in a furnace having a single covered pot, and Guinand's secret consisted in constantly stirring the mass while it is in a molten condition so as to keep the heavier lead silicate from falling to the bottom. For the very highest qualities of optical glass, the contents of the pot are most scrupulously cleared, and the stirring is continued after the heat is lowered till the contents are cooled down to little more than a red heat. The furnace is then closed and the metal is allowed to cool and anneal gradually in the pot within the furnace. When withdrawn the pot is broken, and the mass of glass is polished on two opposite sides so that any imperfections may be detected by examination. From the mass, cut horizontally, perfect discs of such size as can be formed are then obtained. Optical glass is also blown into thick cylinders, and cast in slabs from ¼ inch to 1 inch in thickness.

Chance Brothers make six kinds of optical glass, of which the average densities and refractive indices for the three hydrogen lines and for the sodium line are given in the following table :—

	Density.	C.	D.	F.	G.
Hard crown	2·485	1·5146	1·5172	1·5232	1·5280
Soft crown	2·55	1·5119	1·5146	1·5210	1·5263
Light flint	3·21	1·5700	1·5740	1·5839	1·5922
Dense flint	3·66	1·6175	1·6224	1·6348	1·6453
Extra dense flint	3·85	1·6450	1·6504	1·6643	1·6716
Double extra dense flint	4·45	1·7036	1·7103	1·7273	...

In 1830 Faraday proposed the use of a compound silicate and borate of lead glass, with a density of 5·44, for optical use; and Maez and Clemandot have successfully introduced a boro-silicate of zinc. An optical glass of higher refractive and dispersive power than any previously known has been made by Lamy from a mixture of silica, red lead, and carbonate of thallium. The glass is perfectly homogenous, but of a yellow tint—an evil, however, said to be avoidable by the use of the sulphate instead of the carbonate of thallium. The extraordinary refractive power of the glass renders it peculiarly adapted for the fabrication of imitation precious stones.

STRASS.—Remarkably faithful imitations of every kind of precious stone can be made from suitably prepared and, when necessary, coloured glass. The transparent basis from which artificial precious stones is prepared is called *strass* or *paste*, a material which must of necessity be the purest, most transparent, and most highly refractive glass that can be prepared. These qualities are combined in the highest degree in a flint glass of unusual density from the very large percentage of lead it contains. Among various mixtures given by Donault-Wieland as suitable for strass the following is an example:—powdered quartz 300 parts, red lead 470, potash (purified by alcohol) 163, borax 22, and white arsenic 1 part by weight. Special precautions are adopted in the melting of the materials, and the finished colourless glass is used for imitating diamonds. When employed to imitate coloured precious stones the strass is melted up with various metallic oxides, to which reference will be made under coloured glass. Artificial precious stones are, of course, easily distinguished from real stones by their inferior hardness, and by chemical tests. They may also be generally detected by a comparatively soft warm sensation they communicate when applied to the tongue.

GLASS TUBES, used for gauge glass for steam boilers and for many other purposes, are made by a very simple process; but as the manufacture is a separate department of industry it demands some notice. A gathering of glass is made on a blow-pipe, which is marvered, and slightly blown, so as to form a thick-walled elongated globe. To the end of this globe opposite the blowing pipe a pontil-rod is attached by an assistant, and the two workmen move backwards the one from the other, drawing out the tube as they recede. One or two boys watch the process of elongation, and when the tube reaches the desired gauge they fan its surface so as to "set" the glass, and thus prevent further attenuation at that particular point. The relation of the mass of metal to the original cavity determines the comparative stoutness and bore or internal diameter of the tube, and it requires much dexterity to make a tube at once straight and of uniform gauge and diameter. In drawing out tubes of large gauge the operatives recede from each other at a slow rate; and in proportion as the size of tube decreases the rate of drawing out increases. In the Venetian factories, where small tubes for beads are made, the workmen move at a smart walking pace.

MASSIVE GLASS.—Under this term may be conveniently noticed the manufacture of various familiar solid glass objects which do not acquire their form either by blowing or pressing in the ordinary sense. *Glass Rods* form the basis of many of these objects; and the formation of a plain rod of glass is accomplished by a manipulation in all respects similar to that described under the head of glass tubes, the only difference being that the rod is drawn from a solid instead of from a hollow or blown gathering as in the case with tube drawing. From solid rod glass, glass buttons of various forms are "pinched" by heating the rod till it softens, and immediately pinching it in heated moulds made and worked like ordinary pincers, but having moulds of suitable form in place of the gripping surface of the pincers. The small facets of glass lustres and girandoles and glass marbles, are made by an analogous process.

SPUN GLASS.—Certain qualities of glass in the plastic condition are capable of being drawn out to threads of great tenuity, which, while possessing much brilliancy and beauty of colour, are perfectly flexible and elastic, and feel to the touch soft and smooth like fine wool. A good deal of attention has been given to glass spinning in Vienna and in the Bohemian glass-works, the thread produced being woven into many textiles for upholstery and wearing purposes. The material is specially useful in millinery ornaments owing to the fine colours in which it may be produced, and to the fact that it is unalterable in and unaffected by all kinds of weather.

A remarkable and novel application of glass was patented in 1878 by Mr J. B. Hannay. It consists in making glass a cementing or binding substance in the manufacture of emery wheels, now so much used instead of files. For preparing the wheels any broken fragments of glass are utilized. These are reduced to powder, mixed with proportions of powdered flints and emery, and in the form of a cake introduced on a layer of paper into a furnace where the material is submitted to a heat sufficient to fuse it into a compact ringing mass. The resulting cake is of intense hardness and durability, and cuts through ordinary emery wheels with ease. As the glassy emery wheels can be made very much cheaper than those at present in use, there is little doubt that this material will come into extensive use, in the rapidly increasing applications of emery to grinding, smoothing, and cutting.

COLOURED GLASS.—When to the ordinary materials in the melting pot small quantities of various metallic oxides and other mineral substances are added, coloured but still transparent glass is produced. The colours yielded vary in intensity according to the proportion of oxides used; and the temperature at which the fusion is effected, the length of time the molten glass remains in the melting pot, not only modify, but actually change altogether, the resulting colour. Indeed, it has been asserted by M. Bontemps that all the colours of the spectrum may be obtained by the use of one oxide alone, if employed in varying proportions and at different temperatures. The materials, temperatures, and other conditions employed by manufacturers for producing certain of their colour effects in glass are kept as trade secrets; although, in a general way, the substances which produce particular colours are perfectly well known. Blue is obtained by the use of cobalt,—the ordinary blue pigment smalt being a powdered cobalt glass. Yellow glass can be prepared from several sources: uranium yields a beautiful opalescent yellow; salts of silver are the source of fine shades of yellow; a different tone of the same colour may also be obtained from oxide of antimony; and a dull yellow is produced from powdered charcoal. Green was at one time prepared chiefly by the use of cupric oxide and of ferrous oxide; now oxide of chromium—which produces a beautiful emerald green—is much employed, that substance being mixed with other oxides when modified colours are desired. For red glass, cuprous oxide is employed to produce an intense ruby tint; and the purple of Cassius—a compound of gold with tin oxide —yields magnificent shades of ruby, carmine, and pink, while oxide of iron also is the source of a brownish-red colour. For the production of violet tints the black oxide of manganese is depended on, and a mixture of the oxides of manganese and cobalt is employed for black. The deep-black glass prepared at Venice for making glass beads contains a large percentage—about 11·40—of manganese. Avanturine an imitation in glass of the mineral bearing that name, is a warm, brown, opaque glassy body, studded with innumerable minute spangles having a metallic lustre. It was originally made in the Venetian glass-houses, but can now be manufactured generally throughout the Continent. According to Von Pettenkofer, the metallic spangles consist of cuprous oxide, and one means of preparing the glass consists of melting equal parts of cuprous oxide and ferrous oxide with the glassy mass. The other opaque varieties of coloured glass are obtained by using the various metallic oxides with the compounds that produce milky or white glass.

The uses of coloured glass are various, the most obvious and usual being for ornamental windows, for signal lights, for imitation precious stones and ornamental table glass, &c. For the imitation of precious stones the strass already alluded to forms the basis, and both flint glass and Bohemian (potash) glass are much used for coloured domestic glass. Window and signal coloured glass are made both as rough plate and as sheet glass. In the case of plate glass the metal is, of course, uniformly coloured throughout, but coloured sheet glass may either be composed of "pot metal" or it may be "flashed colours." Pot metal consists of glass uniformly coloured throughout; but in flashed colours the body of the glass is transparent sheet metal covered on one surface only with coloured glass. It is very simply made: the workman, taking up on the end of his blowing tube a gathering of clear metal from one pot, dips this into a pot of coloured metal, thus gathering over the transparent mass a uniform stratum of coloured glass. The whole is then blown in the ordinary manner, and according to the original relative proportions of clear and coloured metal will be the thickness of each in the finished sheet. It is obvious that this process admits of many variations, such as gathering the coloured metal first, or making alternate gatherings of coloured and clear metal so as to have clear within coloured, coloured within clear, and so on.

IRIDESCENT GLASS.—Ancient glass, which has for ages been submitted to the slow disintegrating influence of the damp of the earth and other gently operating agencies, in many instances displays an iridescent play of colours of a most magnificent description. The iridescence thus shown, it has been long known, is due to a process of decomposition resulting in the formation of excessively thin scales of glass. Numerous attempts have been made to imitate by artificial means the gorgeous display of colours thus produced by the slowly acting influences of many centuries, and a certain amount of success has attended some of these efforts. The Venetian glass workers possess the means of giving the surface of their glass a kind of metallic iridescence; and in certain Hungarian glass houses iridescent glass has been made for at least about 20 years. But in 1873, at the Vienna Exhibition, iridescent glass formed a prominent feature, and since that time it has become very common. The iridescent glass now generally seen is a plain flint glass having a slightly metallic tinge and a play of colours like a soap bubble. It is probable that several methods of producing iridescence in glass are practised, as the nacreous lustre in different examples varies considerably. The subject was investigated by MM. Fremy and Clemandot; and under a patent obtained by the latter gentleman, one method, commonly practised, has been made public. It consists in submitting the object to be iridized to the influence of a weak acid solution—such as water with 15 per cent. of hydrochloric acid—under the combined influence of heat and pressure. The effect certainly falls immensely short of the iridescence of ancient glass, but the glass assumes permanently a pearly iridescence, and, though the effect is tiresome, the process will doubtless continue to occupy a place among the methods of ornamenting table glass, &c.

OPAQUE GLASS.—Absence of transparency in glass may be due to any of three causes—(1) to the grinding, or roughening by other means, of the surface of ordinary clear glass; (2) to devitrification or crystallization of the substance; and (3) to the mechanical intermixture of an opaque substance in the glassy mass. Obscured glass was formerly principally prepared by a process of grinding the surface,—the means employed in the case of sheet and plate glass being simply the smoothing process, which forms an intermediate stage in the operation of polishing plate glass. Now the greater part of ordinary obscured glass is prepared by the agency of Tilghman's sand blast, an apparatus by which a fine stream of sand is blown with great violence against the glassy surface. The impinging grains of sand abrade the surface with extraordinary rapidity, and by protecting certain portions with suitable stencils, elaborate patterns in clear glass are produced in a very simple manner. Alabaster glass, so called on account of its resemblance to that substance, is an opaque variety of glass which has been long known and used. Its opacity is due to a process of devitrification it readily undergoes, favoured by the excess of uncombined silica used in its preparation. The material is prepared from a combination such as 100 parts of sand, 40 of potash, 5 of borax, and 5 of talc (silicate of magnesia). Into the composition of this glass it will be observed no lime enters, although sometimes bone-earth is added to the materials. For enamel glass a mixture of varying proportions of lead and tin oxides is prepared by calcining the two metals together, and using the compound in the preparation of a mixture for fusing, of which the following is an example:—sand 100 parts, pure potash 80, and mixed oxides 200 parts. The proportion of tin varies within wide limits, and oxide of antimony may be substituted for the tin. Bone glass, milk glass, and opal glass, differing in degree of opacity, are made by adding to the materials of clear glass large proportions of bone-ash, or of oxide of tin, or both together, and with these substances white arsenic may also be combined. The following is an example of a batch for opal-flint glass:—sand 100 parts, bone-ash 30, potash 30, borax 5, and red lead 5 parts. Such a glass was formerly in extensive use for the opal shades of gas lights and moderator lamps, &c.; but the ruddy glow possessed by the rays passing through the imperfectly opaque glass was an objectionable feature in the resulting material. During recent years an opal or milk glass free from such a defect has been introduced, and it is now in extensive use for globes. This preparation, which diffuses light from its surface in a clear pure white glow, owes its milky opacity to the use of cryolite—a mineral substance consisting of a double fluoride of aluminium and sodium (Al_2F_6, $6NaF$) obtained from Greenland. The cryolite glass was first brought prominently into public notice by the Hot-Cast Porcelain Company of Philadelphia, by whom it was made on a large scale, although the material had been in use in Bohemian and Silesian glass-works for some years previous to the commencement of the manufacture in America. For milk white glass the materials used are—sand 100 parts, cryolite 40, and zinc oxide 10 parts. The finished glass, which is remarkably strong, hard, and indifferent to acids contains about 15 per cent. of undecomposed cryolite, to which its opacity is due. The copious evolution of fumes of hydrofluoric acid during the melting, which continues even in the working, is the source of serious difficulty in the manufacture of cryolite glass.

TOUGHENED OR HARDENED GLASS.—In the year 1875 the announcement that a French gentleman, M. de la Bastie, had discovered a means of rendering glass practically unbreakable attracted a great amount of attention; and his statements were immediately made the subject of practical investigation throughout the glass-making community. All the experiments made in connexion with M. de la Bastie's process tended to confirm his claim to have discovered a method of rendering glass capable of bearing a shock or strain variously estimated at from 30 to 100 times greater than the same material annealed in the common way. De la Bastie was led to undertake the prolonged series of experiments, which ultimately resulted in his discovery, by the consideration that the brittleness of glass arises from weak cohesion of its molecules; and his efforts were first directed to improving its molecular arrangement, by submitting glass, in a molten state, to forcible compression. This series of experiments led to no practical result; and the line of investigation he ultimately pursued, as well as the merits and defects of his process, are thus succinctly stated by Mr H. J. Powell of Whitefriars Glass Works, with whom M. de la Bastie carried out his first practical experiments with hollow glass. Mr Powell, writing in August 1875, says of the process:—

"That it consists in plunging glass heated to the melting point into a bath containing an oleaginous mixture, at a high temperature, but considerably cooler than the glass itself; and that this, according to the specification of the patentee, is effected by re-heating already manufactured and annealed glass in a kiln, and passing it thence into the bath. After a rough trial of this process, which certainly answers well for flat or solid glass, we decided that it is defective, for hollow flint glass, as hollow vessels, left to themselves in a kiln, are almost certain to collapse on reaching the required heat. To avoid this difficulty, and knowing that a vessel in course of manufacture, however hot, is always under control whilst it remains on the workman's rod, we placed a bath as near the mouth of the working-pot as possible, and directed the workman, instead of sending the finished vessel to the annealing oven, to drop it into the bath. The vessel is caught in a wire net, and is ready for removal as soon as it has acquired the temperature of the bath. For all vessels made in one piece, *e.g.*, tumblers, finger basins, &c., this process answers well; and it is obvious that if it proves to be the best way of treating hollow flint glass, the use, for this description of glass, of the complicated machinery described in M. de la Bastie's specification will be done away with, and the glass will be tempered in the course of manufacture, instead of being re-heated and tempered after it has been already manufactured and annealed. We ascertained, with M. de la Bastie's aid, the right constituents and right temperature of a bath for flint glass; for although the conditions for sheet, plate, and flint glass are nearly the same, there is a difference, and it seems probable that every chemically different glass, and even every different thickness of glass, may require certain variations. In our experiments as to the hardness of the glass, we found that it could be marked, but not cut, with the diamond, and, although it could be smoothed and engraved in the ordinary way, that the disturbance caused by the wheel, when penetrating to any appreciable depth, tended to weaken, or even to cause the destruction of the entire mass. The value of the invention, as far as it concerns flint glass, is at present somewhat modified by difficulties in manipulation. 1. It seems to be impossible to heat a vessel made up of different pieces and of various thicknesses to an absolutely equal temperature throughout, so that the whole may be equally tempered. 2. It seems also impossible to displace the air from a narrow-mouthed vessel quick enough for the inside and outside to be tempered simultaneously. However, setting aside these difficulties, we come to a point which applies equally to all sorts of hardened glass: Hardened glass is not 'unbreakable'; it is only harder than ordinary glass, and though it undoubtedly stands rough usage better, it has the disadvantage of being utterly disintegrated as soon as it receives the slightest fracture, and up to the present, until broken, of being undistinguishable from ordinary glass. This glass is known as 'toughened' glass, and we have seen the terms 'malleable' and 'annealed' applied to it. Nothing can be more misleading than these unfortunate epithets. The glass is hard, and not tough or malleable, and is the very opposite to annealed glass. Annealed glass is that the molecules of which have been allowed to settle themselves; the molecules of hardened glass have been tortured into their position, and until the glass is broken are subject to an extreme tension. It is the sudden change of temperature that 'hardens'; glass heated up together with the oil may be annealed, but decidedly is not hardened. A piece of hardened glass is only a modified Rupert's drop, *i.e.*, it is case-hardened; the fracture of both is identical, both resist the diamond, and both can be annealed. Moreover, in the middle of imperfectly hardened glass a line is plainly visible, which seems to mark the extent of the case-hardening. This line resolves itself under the microscope into a mass of bubbles and striæ; it seems to be the nucleus of breakage, and consequently as soon as the cutting wheel approaches it, utter destruction ensues."

The great anticipations which at first were formed as to the extended use of hardened glass have not been realized. M. de la Bastie has improved several of his processes, but the demand for his productions, at no time great, is understood to decrease rather than to increase. For a short time the process was worked by both Messrs Powell and Messrs Pellatt in London, but both these eminent firms have given it entirely up. Sheet glass hardened by the process does not appear ever to have come generally into the market, tho most serious obstacle to its introduction being the impossibility of cutting it with the diamond, after which the utter destruction resulting from fracture is a serious defect. For laboratory purposes—as flasks and beakers, &c.—it has been suggested that the glass has great advantages, but experiments have proved that its great resistance is not absolutely reliable, and that hardened vessels submitted to a high heat lose their distinguishing peculiarities and become as common glass. Thus a glass, partially filled with water and heated considerably above the boiling point at the parts uncovered with water, broke, the bottom of the glass showing the fracture peculiar to hardened glass, while the upper uncovered part was broken into large sharp-edged fragments like common glass. A modified process of hardening, patented by Herr F. Siemens, consists in pressing and suddenly cooling the glass in moulds specially constructed to conduct away the heat with the various degrees of rapidity found to produce the best results.

STATISTICS OF THE GLASS TRADE.—According to a factory report of 1871, there were in that year 240 glass-works in the United Kingdom, employing, in addition to steam-power, 21,434 operatives, of whom 2116 were females. Of these works 213 were in England, 19 in Scotland, and 8 in Ireland. Further, there were at the same date 37 glass-cutting factories, employing 500 people, principally situated in the county of Warwick. The quantities and value of glass manufactures exported were as under in the year 1878:—

Plate glass	1,156,495	sq. ft.	£106,906
Flint glass	93,112	cwts.	239,966
Common bottles	575,160	„	308,481
Other glass manufactures	72,209	„	99,170
			£754,523

In 1878 the imports of manufactured glass were thus given:—

Window glass	652,325	cwts.	£452,202
Flint glass	143,665	„	489,518
Plate glass	91,198	„	233,602
Glass manufactures	335,751	„	879,733
	1,222,939		£2,055,055

The following table shows the comparative imports and exports of glass in the ten years ended 1877:—

	Imports, Foreign.	Exports of British Glass.	
		Plate Glass.	Other Kinds.
	Cwts.	Square Feet.	Cwts.
1868	609,806	911,[illegible]0	868,950
1869	6[illegible]1,070	1,076,130	933,475
1870	[illegible]2,376	1,357,508	799,252
1871	629,472	1,643,575	847,9[illegible]8
1872	688,156	2,1[illegible]1,924	1,[illegible]2,4[illegible]3
1873	897,410	2,183,106	1,148,640
1874	[illegible]	1,411,263	1,114,253
1875	[illegible]677	1,6[illegible]9,[illegible]80	8[illegible]0,[illegible]83
1876	1,[illegible]41	1,779,628	749,495
1877	1,14[illegible]4	1,1[illegible]7,0[illegible]3	792,424

In the *Bulletin de la Société d'Encouragement pour l'industrie nationale* for 1877 there is an elaborate statistical computation of the extent and value of the glass manufacture throughout the world, based chiefly on returns applicable to 1874. The writer, M. Henry de Fontaine, arrives at the conclusion that the annual production of glass has almost doubled in the past twenty years, and estimates the total yearly production throughout the world at a value of six hundred millions of francs.

Bibliography.—The literature of glass-making of English origin is scanty and imperfect. In France and Germany the subject has received much fuller attention. The following list embraces the principal works:—Antonio Neri, *Ars Vitraria, cum Merritti observationibus*, Amst., 1668 (Neri's work was translated into English by C. Merritt in 1662, and the translation, *The Art of making Glass*, was privately reprinted by Sir T. Phillipps, Bart., in 1826); Johann Kunkel, *Vollstandige Glasmacher-Kunst*, Nuremberg, 1785; Apsley Pellatt, *Curiosities of Glass-making*, London, 1849; A. Sauzay, *Marvels of Glass-making* (from the French), London, 1869; G. Bontemps, *Guide du Verrier*, Paris, 1868; E. Peligot, *Le Verre, son histoire, sa fabrication*, Paris, 1878; W. Stein, *Die Glasfabrikation* (in Bolley's *Technologie*, vol. iii.), Brunswick, 1862; H. E. Benrath, *Die Glasfabrikation*, Brunswick, 1875; J. Falck and L. Lobmeyr, *Die Glasindustrie*, Vienna, 1875. (J. PA.)

GLASS PAINTING.

The manufacture of coloured glass, which is the basis of the beautiful and interesting art of glass painting, originated at a period of remote antiquity, and the use of enamels, to vary or ornament its surface, was known to the ancient Egyptians; but the formation of windows of mosaics of coloured glass upon which the shapes of figures and ornaments are painted with an enamel fixed by fire is mediæval, and emphatically a Christian art. In all probability it was suggested by the mosaic pictures with which churches were adorned from an early period for the instruction of the illiterate, as was shown by the inscription which they bore, "sanctæ plebi Dei." The step from mosaic pictures to glass mosaic windows was merely a question of time; it is not known when the step was taken, but coloured windows existed in St Sophia at Constantinople in the 6th century, whilst the basilicas of St John Lateran and of St Peter at Rome were adorned about the same time in the same manner. In the year 709 Wilfrid, bishop of York, invited workers in glass from France ("artifices lapidearum et vitrearum fenestrarum primus in Angliam ascivit"). The French claim the honour of having invented the process of painting upon the mosaic windows of coloured glass, and of thus transforming them into works of art, and also of teaching this to the English, who in their turn instructed the Germans; but Muratori, in the second volume of his *Antichità Italiche* of the Middle Ages, printed a treatise on mosaic and painted glass written by an anonymous Italian in the 8th century, and probably not later than the 11th was written the interesting essay *Diversarum Artium Schedula Theophili Presbyteri et Monachi*, which details with minute accuracy the process of painted glass as it has been practised with some additions and modifications, throughout the best periods of the art; it may reasonably be assumed that Theophilus describes methods invented before his time. Probably the oldest specimen of glass painting now existing is a window of the 11th century in a church at Neuwiller, in Alsace, representing St Timothy. The figure is rudely designed, but, with the rich border of ornament, shows that the executant knew his art, which in the following century is further illustrated by windows in St Denis, near Paris, erected by the abbot Suger, which are still preserved. It was however in the 13th century, that great age of the revival of art, that glass painting attained its first great development, and notwithstanding the claims advanced by France, it is most probable that as all art radiated from Italy as a general centre of invention and progress, as well as of faith and dogma, so glass painting partook of the general impulse. It has indeed been asserted that glass manufactured in the north was superior to that produced in Italy, and this is admitted by Vasari, but an examination of old Italian windows throws doubt upon this statement, for the Italian glass will be found to be more even in texture, more diaphanous, and certainly not inferior in colour, whilst the beautiful, pearly, white glass of the earliest date in Italy is superior to the pale green representing white in northern glass, and assorts much more harmoniously with the glowing coloured glass with which it is associated. Considered as a branch of fine art, Italian painted glass occupied a very high position at all periods of its history, for the designs were frequently made by some of the most famous of that long roll of immortal artists who have had so few equals elsewhere. In Germany the family of Hirschvogel of Nuremberg and other eminent artists, including, it is popularly believed, Albert Dürer, and in France Jean Cousin, Bernard Palissy, Louis Fauconnier, and others, equalled the Italian glass-painters, whilst both German and French artists excelled them in technical processes.

The late Mr Charles Winston, author of *An Inquiry into the difference of style observable in Ancient Glass Painting, especially in England*, with his usual accuracy and profound knowledge of his subject, thus classifies the consecutive styles:—the Early English, from the date of the earliest specimens extend to the year 1280; the Decorated, which prevailed from 1280 to 1380; the Perpendicular from 1380 to 1530; and the Cinquecento from 1500 to 1550. The styles successively prevalent in Italy, although they have an affinity with those following each other in northern countries, cannot be accurately designated by the titles selected in England, the last excepted. Like other branches of painting they are most readily divided and understood by centuries; as the 13th century, a style principally influenced by Giunta Pisano and Cimabue; the 14th century, in which the spirit of Giotto and Orcagna and their followers prevailed; the 15th century, the first period of which was transitional, and the second early revival, as illustrated by the designs for windows of Lorenzo Ghiberti, Donatello, Paolo Ucello, Pietro Perugino, Andrea della Robbia, and other great artists of the time. The last age, called by Mr Winston the Cinquecento, lasted in Italy beyond the period assigned by him for its termination, and was characterized by florid magnificence of design and splendour of colour, imitative of the pictorial art of that age, and the ornament resembled that prevalent amongst the ornamentists of the schools of Raphael and Michelangelo.

In this brief analysis of the history and practice of glass painting, the Italian examples of the art are selected for description as being less known than those existing in other parts of Europe, which have been minutely and ably illustrated. Besides being classified by centuries, Italian glass painting may be appropriately arranged under the following heads or schools:—the Pisan, Florentine, Sienese, Umbrian, Lucchese, Bolognese, Lombard, and Venetian; for notwithstanding the lamentable destruction of painted glass in Italy even now in progress, specimens by artists belonging to these schools still exist, and the names of a numerous array of glass-painters of these provinces are preserved. The best examples extant of this art in Italy of the first half of the 13th century are two couplets in the apse of the famous basilica of St Francis at Assisi. In general arrangement and design they resemble windows of the same age in other parts of Europe classed by Mr Winston under the general head of Early English, being divided into panels of varied and admirably designed geometrical forms surrounded by diapers and borders of rich fancy and glowing colour, which, however, are rather more confused than similar details in contemporary glass elsewhere. The panels are filled with scripture subjects, and Italian skill and refinement are obvious in the design of the figures; this may be readily understood when it is considered that Italian artists of this time rendered the Greek art, universally followed, with more sentiment and power than any other people. The ornament shows the influence of Byzantine conventions, but the ornamentists imitated natural forms of foliage sooner than northern artists. A remarkable peculiarity of the early painted windows at Assisi, which are here taken as the best and almost the only specimens of 13th-century glass left in Italy, is that throughout the couplets the backgrounds in each light differ in colour. The subjects for instance in the right light are on a blue ground, on the left on a red ground, in other examples the grounds are alternately blue and green. It might be supposed that all unity of effect must have been destroyed in this way; but such is the skill with which the general harmony of colour is arranged, that the counterchanges are less objectionable than might appear possible. Early Italian glass painting, like that of other parts of Europe, is characterized by an obvious ignorance of perspective on the part of the designers, but there are manifest indications of attempts to represent retreating surfaces and lines; that these have not the effect intended was not due, as some suppose, to the maintenance of a principle appropriate to glass painting, but simply to a want of knowledge of perspective laws common to all, even the greatest artists of the time.

Besides executing panel windows with small figures, the artists of the 13th century painted figures of comparatively large proportions under canopies of simple and primitive forms. These figure windows were placed in positions at a distance from the eye, as above in the clerestory, or at the ends of aisles. At Assisi such figures are painted at the bases of some of the windows irrespective of the idea of distance, the upper portions being filled with panels and small figures. This irrational system gave way to the entire window being filled with large figures placed over each other within canopies or geometric borders, a method of design which survived in Italy to the close of the 15th century.

The coloured windows of the upper and of the lower church are associated with mural paintings which cover every available space on the walls and vaults. It might be supposed that the refulgent painted glass would either obscure the frescos or diminish their effect by contrast; but in the first place the glass is not so thick as that of northern manufacture, nor is it made opaque by the effect of climate, whilst, as already noticed, the white glass is purer, and the brilliant sun of a southern climate illumines the frescos sufficiently, notwithstanding the coloured medium through which the rays are transmitted. Such is the case at Assisi; but at Florence the coloured glass in the cathedral darkens the church too much, from causes which will be explained afterwards. The true method of combining coloured glass in a building with the presence of pictures and sculpture in a less sunny climate will be illustrated in describing glass painting of the 16th century, the subject being important at the present time.

In the next great age of art, that which commences with the triumphs of the genius of Giotto, glass painting evidently shared in the general progress. No windows remain which are associated with his name as designer, but in Santa Croce at Florence, by the will of Count Alberto di Lapo, dated the 9th of July 1348, money was provided for adorning the apse of the church with frescos and painted windows to be completed in three years. The frescos were painted by Angelo di Taddeo Gaddi, and it seems reasonable to suppose that he designed two of the three windows,—that in the centre being of later date. The following extract from the archives of the cathedral of Florence shows that Angelo Gaddi designed for glass-painters: "A window in Santa Reparata"—the ancient name of the cathedral—"over the door towards the street of the Cassettai is commissioned of Antonio of Pisa, master glass-painter, and the design is by Angelo Gaddi." The windows illustrate the system of ranging single figures under canopies over each other. The colouring is harsh; there is too great a prevalence of dark green; and the general design of ornament is meagre and confused. This is increased by the capricious changes of the colours of the canopies, which are not white, these being rare in Italian glass painting. Thus in one of the windows the first two canopies are respectively red and green, which colours are counterchanged in those immediately over; the next two in ascent are green and yellow, the next pair brown and yellow, the fifth order shows both yellow. Thus that variety of colour prevalent in the backgrounds of Italian 13th century work is found in the canopies of windows of the next century, a custom limited to glass painting, and not found as a rule either in mural or other pictures. There are in Santa Croce several windows of the 14th century, but they are generally inferior to those of the same period extant in St Francis of Assisi, where there are important examples of rare beauty of design and workmanship, more harmoniously coloured than those at Florence, and suggesting that the Umbrian excels the Florentine school of glass painting.

Throughout the whole of the painted windows existing in Florence, of the fully developed style of the 14th century, and for a considerable portion of the 15th, the influence of the architectural design of Giotto and Orcagna is very perceptible. The graceful twisted shafts common to the works of both architects, the richly adorned niches and gablets, the dome-like covering of the famous baldacchino in the church of Or San Michele, the work of Orcagna, are features which are imitated in various ways by Italian glass-painters. The colour is especially noteworthy; the canopy, somewhat squat in form, is adorned in every part with rich and diversified colours evidently imitative of the varied marbles and the infinity of marble inlay and mosaics, characteristic of so much of the mediæval architecture of Italy; whilst in northern countries the canopies in windows, with their beautiful details of form showing such rich fancy and such graceful lines, are chiefly white, not that they are altogether colourless, for it is of the perfection of mediæval architecture to associate colour with form. That which in Italy was done by the help of rich stores of marbles of many hues, was effected in the north, where these were not available, by means of polychromatic painting, which was imitated in window design by the glass-painters. Thus the canopies in Italian windows differ as much from those prevalent at the same period in the rest of Europe as the campanile of Giotto differs from the spires raised by the genius of northern architecture.

In the history of painted glass in Italy during the 15th century, the windows of the cathedral of Florence, dating from 1390 to 1503, occupy an important position, not only by reason of their interest as connected with that celebrated church, but also because they were designed and executed by artists of the highest reputation. The cathedral was founded on the 8th of September 1298, the architect being Arnolfo di Cambio di Colle di Valdelsa. In 1334 Maestro Giotto was architect, and commenced the famous belfry. In 1364 the church was vaulted over at its eastern end, and in 1420 Filippo Brunelleschi and Lorenzo Ghiberti, who built the clerestory of the nave with its round windows and Renaissance cornice, were appointed joint architects. Painted glass was introduced into the windows thirty-six years before the completion of the cupola, and thirty before that of the clerestory. These dates are an interesting testimony to the importance attached at the time to painted windows as portions of the design of so great a church. They were erected in the aisles, before the nave was finished, by Don Lionardo di Simone, monk of Vallombrosa, and Niccolo di Pietro della Magna, so early as 1390, and when the nave was roofed over by its architects, Fra Bernardino di Stefano executed the two first windows of the clerestory from designs by Lorenzo Ghiberti.[1] Ghiberti is also alleged to have designed many of the painted windows at the east end of the church; but those now existing, judging by the design and colour, as well as by the technical execution, cannot be his, for they are manifestly of earlier date, whilst the authorship of some of them is recorded in the archives without reference to Ghiberti. One only, on the north side of the apse and in the lower row, suggests the design of this great artist, the suggestion being strengthened by the fact that the diapered ornament on the ruby dress of the figure is made by the wheel, which brings this window within the 15th century, whilst the diapers in the other figures of the same series are executed in an older style. It has been stated that Ghiberti advised the municipality of Florence to invite a celebrated glass-painter of Lübeck, Francesco di Domenico Lievi da Gambassi, by letters, the second being dated October 15, 1436, to settle in Florence with special privileges; he came, and it is assumed that he painted Ghiberti's designs for glass, but of this there seems to be no satisfactory evidence. We find that in 1434, before his arrival, Maestro Domenico di Pisa painted the east window of the drum, representing the coronation of the Virgin, which was designed by Donatello in competition with Ghiberti, and preferred. As it was on the 12th of January 1434 that Brunelleschi completed the dome, evidently no time was lost in commencing the painted windows. Bernardo di Francesco del Boni is recorded in the archives as having executed in 1442 the following windows in the drum, called in Italian

[1] This circumstance has led to the erroneous statement, repeated to the present time in every guide-book and by every writer on the cathedral, and to the still prevalent belief, that the three windows in the façade of the church were designed by Ghiberti, who has himself recorded:—"I designed for the front of Santa Maria del Fiore, for the central round window of the façade, the Assumption of our Lady, and I designed those on each side." The windows which Ghiberti really designed were the great circle of the façade, a noble work still in its place, and the two of the clerestory on each side of it, long since removed and lost. That they were painted by Fra Bernardino di Stefano in 1423 is thus shown in the archives of the cathedral—"Fra Bernardino di Stefano, of the order of the Preachers of Santa Maria Novella, is to execute two round windows in the nave of Sa Maria del Fiore, one to the right and the other to the left,—that to the right representing Joachim driven from the Temple, that to the left the Death of the Virgin Mary, and the designs are by Lorenzo di Bartoluccio (Ghiberti)." It is thus evident that the windows of the clerestory of the nave were to be painted with the life of the Virgin Mary, of which these two were the first and last of the series, whilst the Assumption of the Virgin appropriately occupied the centre. Those in the clerestory having disappeared, it has invariably been supposed that the two remaining at the ends of the aisles are those described by Ghiberti, although they differ in subject and entirely in style from his work. They are in fact thus mentioned in the archives:—"In 1414 Nicolo di Pietro della Magna painted the two windows on each side of the front of the cathedral," which record settles the question.

the tribune:—the Resurrection, designed by Paolo Uccello, and the Ascension and the Prayer in the Garden, by Lorenzo Ghiberti, although by this time Francesco di Lievi da Gambassi had been some time in Florence. Bernardo del Boni is also recorded to have painted the Annunciation designed by Uccello, removed some years ago, and the Ascension described as being either by Ghiberti or Uccello; the uncertainty is curious. In 1448 the same artist painted the Presentation in the Temple, which was designed by Ghiberti. What windows then did the artist from Lübeck really execute? Born an Italian, he was instructed from his youth in Germany, and it is reasonable to suppose that his style would be German. Now several of the upper windows of the transepts contain figures which have a decided affinity with German ideas, and it is not unreasonable to suppose that these were by the new comer. He established furnaces by special permission, and it has therefore been hastily assumed that he manufactured coloured glass; but these no doubt were to burn his painted glass. The letter inviting "Franceschо Dominici Livi de Ghambasso comitatus Flor., magistro in omni et quocunque genere vitreorum de musayco et de quodam alio colore vitreorum," dated 15th October 1436, was preceded by another written on the 26th August 1434, which is thus recorded:—"Letter written to the master glass-painter Gambassi, then in Scotland, and who made works in glass of various kinds, and was held to be the best glass-painter in the world." It is now vain to express the feeling with which Scotch people must regret the destruction of the works of this excellent artist in Holyrood Chapel; the blow then inflicted upon ecclesiastical art never has been remedied.

Many other glass-painters executed windows in the cathedral, the last of whom, Sandro di Giovanni Agolanti, in 1486 glazed the windows of the lantern, showing that it was finished, and in 1503 inserted glass "in an aperture for the astrologers to see the sun through." The windows of the cathedral of Florence are of rich deep colours, but unfortunately they are incrusted with dirt inside and outside. Many of them which have been broken have been wretchedly repaired, and the modern glass is toned with glazings of oil paint. They darken the church to such an extent that works of art within it are seen to disadvantage. Michelangelo's group of the Pieta is merely a dark mass, and it may be mentioned that his statue of Christ in Santa Maria sopra Minerva is similarly sacrificed to the painted glass lately introduced.

The history of glass painting is illustrated by windows in other churches in Florence; those in Santa Croce have been alluded to, with the exception of the magnificent circular window of the façade designed by Ghiberti. It is of special interest, as showing this great sculptor's ideas of colour as well as of form. The subject is the Descent from the Cross, and the colour strongly recalls the bright clear system of Fra Beato Angelico. In Santa Maria Novella there is another very fine circular window of the 14th century, the history of which seems to be forgotten; but in design it recalls the style of Andrea Orcagna, to whom also may be attributed the fragments of a window in the Strozzi chapel, which he partly painted in fresco, and for which he also provided the admirable altarpiece. In another Strozzi chapel in the same church, painted by Filippino Lippi in fresco, there is a very rich window which is obviously also of his design, but so completely has all critical knowledge of glass painting disappeared in Florence, that this and other noble works excite no attention and no remark, and are in danger either from removal or from the clumsiest renovation. The great window of the chancel, a large triplet, is so excellent that it places Sandro di Giovanni Agolanti in the foremost rank as a designer and glass-painter of the 15th century. He was born in 1446, and of his numerous works this superb triplet, which was erected in 1491–2, is the only example now remaining, whilst there are twenty-one records of his productions, evidently a small portion of them; the last describes him as decrepit in 1515, and mentions that Niccolo di Giovanni di Paolo, master glass-painter, took his place.

A window in St Francis at Assisi by the Umbrian Angioletto da Gubbio, an artist of the early part of the 15th century, deserves special notice in connexion with the admirable works of this great age of the art. It was erected about a century after the death of Cardinal Gentili (who built the chapel) by his heirs. The window is so full of light, so delicate in its arrangement of colour, and so tenderly and skilfully painted, whilst the prevalent white ornament is so brilliant, that it is perhaps the most perfect type in existence of a painted window suitable for a building containing works of art, or where the climate is unfavourable and consequently the light imperfect. The close of the 15th century was in important respects the greatest epoch of painted glass in Italy: the general style of design of the great quattrocentista masters, their monumental and decorative methods of composition, simplicity of attitude and form, and rich unbroken colour, were eminently adapted for reproduction in glass painting, whilst the prevalent style of ornament was singularly graceful and pleasing. The influence of the Italian style was felt in France, Germany, and the Low Countries, in which very noble works of glass painting rivalling the Italian were produced by eminent artists, examples of whose works may be seen at Bourges and Rouen, at Antwerp and Brussels, and in various cities in Germany, although singularly enough one of the finest typical examples of this great epoch of German glass painting exists at Assisi,—the glazing panels of which the noble window has been composed being dispersed through two or three windows of the upper and lower church. The technical execution of the windows of this period in all these countries was superb, showing how thoroughly the artists were trained in every process of their art. In England the feeble Perpendicular style was contemporaneous, entirely devoid of good drawing, pallid in colour and weak in execution, a singular contrast in every respect to the state of the art on the Continent.

Amongst the most active and able glass-painters of the prolific 15th century in Italy the Gesuati monks, whose convent was close to Florence and was razed to the ground during the siege when Michelangelo aided in the defence of the city, were celebrated. They prepared colours for artists, supplying Michelangelo when he painted the Last Judgment, and they executed numerous windows of which there are records from 1467 to 1562. As glass-painters they painted the designs intrusted to them with forcible execution, but their drawing was less happy and their ornamentation heavy. There are several windows by these Brethren in Florence: in Santo Spirito the great circle of the façade shows every indication of having been designed by Pietro Perugino; in San Salvatore, near San Miniato, the east window, evidently by a Gesuato, has very probably been designed by Andrea della Robbia. In another window in the same church a figure of St John is a very fine specimen of their art. Several windows filled with small round panes of white glass, with richly coloured borders and sacred monograms or heraldry in the centre, are especially noteworthy as admirable types for domestic architecture. There are also works of the same character as the above in the church of Santa Maria Maddalena dei Pazzi.

A glass-painter was now to make his appearance in Italy who was destined, although a foreigner, to eclipse in the opinion of the Italians all previous masters of the art; this was Fra Guglielmo di Marsillat, born in the diocese of

Verdun in 1475. It is not known under whom he studied glass painting, but for protection from the consequences of some escapade he entered the Dominican order. Claude, an eminent French glass-painter, being summoned to Rome by Julius II. to decorate the Vatican with painted windows, induced Marsillat to accompany him. Of the numerous windows which they must have painted only two remain in the church of Santa Maria del Popolo, so complete has been the destruction of painted windows in the Eternal City. Marsillat executed a number of magnificent windows in his manner for the cathedral of Arezzo. The following is a form of contract made with him:—"The board of works of the cathedral have commissioned three windows of painted glass for the cathedral from Master William, son of Peter, Frenchman, that is, one window above the chapel of St Francis, one window above the chapel of Matthew, one window above the chapel of St Nicholas, for the price of fifteen livres the square braccio,"—nearly 2 square feet,—"to be burnt in the fire and not painted in oil, and they are to be finished by the end of June 1520." Marsillat, who painted well in oil and fresco, was the designer of his own windows. He was so impressed by the works of Michelangelo that he imitated his manner, and one of his windows at Arezzo, representing the Raising of Lazarus, is almost a transcript of the picture of the same subject designed by Michelangelo, and painted by Sebastian del Piombo, which is now in the National Gallery, London. The design of the Frenchman is rather more crowded, but is characterized by more life and action. He introduced into glass painting the magnificent architectural backgrounds, with figures on balconies and terraces, made familiar by the works of Paul Veronese; he drew the human figure admirably, and was very successful in the representation of motion, and his arrangement of colour was perfect in harmony. It is not to be wondered at that his works produced so great an effect upon the minds of his contemporaries. They also show upon his part a consummate knowledge of technical conditions, and his windows are so perfectly executed that except where injured by violence or carelessness they are in admirable condition at the present time. Marsillat also executed some fine glass paintings at Cortona, which have been removed and are now in Florence.

Without entering upon the description of a considerable number of interesting works of glass painting in various parts of Italy, and of detailed notices of the artists, enough has been done to illustrate the history and progress of the art from the 13th century to nearly the first half of the 16th. Later much less coloured glass came to be used, and a considerable change in taste took place in this art as in architecture; it is shadowed forth even as early as 1501 in the following record:—"Quod in dicto loco semper et pro omnia tempore in dicto loco et ecclesia sunt media die tenebre et ut vulgo dicitur buio et habeto colloquio cum consonbus Sancter Johannes de vietro faciat sumptibus opere unam finestram ex vitri cum ochi biacchi fregio d'allato et cum armo popoli." The desire for windows admitting more light led to the invention and adoption of a beautiful variety containing much white glass varied with yellow stain, and the introduction of a small quantity of coloured glass. These windows were painted with graceful arabesques executed in enamels and burnt in, and they never have been surpassed at any time for excellence of drawing and skill of execution. Such are the windows in the Laurentian library at Florence, attributed to Giovanni da Udine, but erected after his death. Other examples might be referred to, and they are now of great value as showing the best description of ornamental window suitable for buildings of the developed Renaissance style, adorned with works of painting and sculpture. They have enough of colour to harmonize them with painted decorations, and enough of white glass not to destroy the chiaroscuro of sculpture. It should be remembered that the 13th century produced beautiful windows possessing similar advantageous qualities suitable for mediæval buildings containing modern sculpture, such as the famous five sisters of York cathedral, or the white windows of the same period at Chartres.

The technical execution of the glass paintings still existing in Italy resembles that prevalent elsewhere, and the method of the old masters is clearly described by Theophilus. The glass used was either pot metal or coated; that is, the colour either pervades the whole body of the metal or is applied as a film over white glass, invariably the case with ruby, which would seem black but for this contrivance. The artist employed to design a window prepared a full size working drawing, which, according to Theophilus, was executed on a whitewashed board in his time; but later these were made on paper, as is proved by the following contract from the archives of the cathedral of Florence (1437):—"To Lorenzo di Bartoluccio (Ghiberti), sculptor, seven florins, being the half of the price of his skill and labour for drawing four figures on paper of bombagia (coarse cotton) for a window to be executed by Bernardo di Francesco, glass-painter, at three livres per figure." Guided by the firmly marked outlines, the glazier cut his mosaic of glass of the requisite colours by the aid of a hot iron, the diamond not being used for this purpose till the 17th century. The pieces of glass were futher reduced to the shapes and sizes needed by the aid of the grosing iron, still a familiar instrument; thus prepared they were ready for the painter, and at the present time are attached to a transparent easel formed of a large sheet of glass. Theophilus thus describes the enamel colour prepared for painting with:—"Take copper beaten small, burn it in a little pipkin until it is entirely pulverized, then take pieces of green glass and sapphire" (a blue paste used in mosaic work), "and pound them separately between two porphyry stones; mix these ingredients together in the proportions of one-third powder, one-third green glass, and one-third sapphire. Grind them on the same stone with wine or urine, put them into an iron or leaden vessel, and paint the glass with the utmost care. For with the three colours" (that is, shades of one colour), "if you are diligent in the work, you can make the lights and shadows of the draperies in the same manner as in coloured painting. When you have laid on the first touches in the drapery with the aforesaid colour, spread it in such a manner that the glass may be pure" (that is, untouched) "in that part which you are accustomed to make light in a picture, and let the touches be dark in one place and light in another" (that is, graduated), "and again yet lighter and distinguished with much care, that it may appear as if three shades of colour had been applied. This order you should observe below the eyebrows, and round the eyes, and nostrils, and chin, round the naked feet and hands, and other portions of the naked body; and thus let the glass painting have the appearance of a painting composed of many colours." It must be obvious from this description of the most ancient method of glass painting, in important respects the same as that still followed, that the art is regulated by certain necessary conventions distinguishing it from painting upon opaque surfaces. The features and accessories are drawn with sharp black lines making them out clearly to be seen at a distance, and in a very different way from the representation of such details in a picture. The highest lights are the local colour, that is, the pure colour of the glass; the deepest shadows are solid black produced by laying on the enamel thickly; all this is precisely the reverse of the system pursued at the same early period in painting pictures in which the shadows were the local colour and the lights white. As painting advanced it gradually approached more nearly to the scale of colour of the glass-painter, the lights instead of being white were painted of appropriate shades of the local colour, and the shadows were graduated into black in their deepest parts. It may have been that glass painting suggested this important change in ideas of colour and chiaroscuro. The glass being painted as described must be burnt to fix the enamel thereon with its flux. The separate pieces with the painted side upwards are placed upon the shelves of a kiln or iron box, covered with whiting; the kiln is placed in a brick oven, and a fire kindled which surrounds it with flames. Much experience is needed to determine when the glass is sufficiently burnt to fix the enamel. When this has been done the fire is withdrawn, the oven is hermetically sealed, and the glass is left to cool gradually, so as to be annealed. From the appearance of many Italian windows as compared with those executed elsewhere, it is reasonable to infer that the Italians were less skilful than their northern contemporaries in firing their glass. The next process is to unite the numerous pieces of mosaic, thus painted and burnt, into panels of a given size, which is done by means of ribbons of lead grooved on both sides, the ribbons being soldered at all their angles, thus firmly tying the mosaic together. When the painted window is erected, the leads are seen internally in contrast with the transparent glass as intensely black lines, but externally, where they catch the light, as meandering lines of metal dividing the surface. Mistaken attempts have repeatedly been made to get rid of these lines, but they are constituent parts of the art, can only be got rid of by changing its true character, and are only disfiguring when injudiciously introduced, as for instance in some 14th-century glass in Santa Croce, in which the white of the eyes are fixed with leads of the form of spectacles, so that all the saintly persons represented appear, ridiculously enough, to wear these aids to defective vision. The panels, which are technically called glazing panels, are inserted in their places in the windows by means of grooves prepared in the stone work, into which they are secured with cement and strengthened at intervals with cross bars of iron called saddle bars, to which the glass is made fast by ties of copper wire. Thus fixed, experience has shown that painted windows if duly cared for will last for many centuries. Regarded in their connexion with past history, no monuments of art surpass painted windows in interest; they are only equalled by the paintings still extant in the tombs of the Egyptians as illustrations of faith, history, and customs. It was almost the universal usage that persons of every rank and position, as well as corporate bodies and guilds, made offerings of painted windows to churches. Whilst they give the most vivid ideas of ancient taste and methods of decoration, the religious opinions of successive ages are interpreted by the manner in which sacred subjects are selected or represented; the actual state of art at different times, from its rudest forms to the most perfect, is admirably exemplified; and, as it was customary to introduce the donors in appropriate parts of their gifts, the prince or noble in knightly panoply, with his armorials, is seen kneeling, sometimes accompanied by his spouse. In like devout attitude the ecclesiastic appears in the robes and with the insignia of his office, or the wealthy merchant and his wife in appropriate costume. In other examples tradesmen, surrounded with the objects and materials of their commerce, sell to their customers articles of clothing or of food. Every occupation is illustrated in these ancient pictures in glass. How great then has been the loss to art and history caused by the reckless demolition of painted glass which has taken place in all parts of Europe, but especially in Italy, where the clergy have been the chief offenders! The Italians have not been impelled to this lamentable destruction of these precious records and beautiful creations by any of the convictions, changes of faith, or fanaticism, fatal to so many works of art in other countries, but by unreasoning transformations of taste, by ignorance, or by the paltry desire of gain. In northern climates ancient glass is found to have been affected by the action of the weather, its outside surface is roughened and pierced to a small depth by little pits, or is so altered as to resemble sheets of zinc; it is also covered with dirt, especially internally, the enamel rougher than the surface of the glass favouring this incrustation. These injuries and accumulations veil the glass paintings, and produce a mysterious confusion of form and colour, admired by many, who to obtain in modern work such effects of age, and to conceal the inharmonious crudity of colour, soil it artificially with varnish, paint, or enamel applied externally, or with dirt applied of set purpose, showing thereby their ignorance of art and their bad taste, by having recourse to processes which are outside the domain of art, for perfect harmony of colour and effect of chiaroscuro ought to be the results of the artist's cultivated knowledge and skill, and nothing should be done to hasten the obscuration of the windows or to anticipate the effects of time. Important improvements have been made in the art of glass painting, as well as in the manufacture of glass, since Theophilus wrote his treatise, but some of these have not been favourable to the art; for instance, old glass is much quieter in colour than modern, and as it was less diaphanous, and less smooth in texture, it was better adapted to the operations of the glass-painter. This being observed, eminent manufacturers of coloured glass in England and on the Continent have prepared imitations of the soft, pleasing hues of old glass, and of its varied texture, with considerable success. The addition of an enamel brown from iron, and much warmer in tone than that made from copper, has been an important aid to glass painting, whilst about the middle of the 16th century numerous coloured enamels were invented, which, however ingenious and beautiful, subsequently modified the art unfavourably. Vehicles composed of spirits of turpentine, fat turpentine, or gum senegal have advantageously replaced the primitive distempers already alluded to. An important addition was the discovery of the yellow stain, made from silver, the only purely transparent colour applicable to the surface of glass. It has been described as the invention of the Beato Giacomo of Ulm, who practised glass painting at Bologna, and died in the odour of sanctity in 1491; but the yellow stain was characteristic of glass paintings for more than a century before his time. The introduction of the system of coating white with coloured glass in the same way as it had been coated with ruby glass, and the invention in the 15th century of removing portions of the coloured glass by abrasion or with the wheel so as to lay the white bare in conformity with special designs, together with the practice of staining such white portions yellow, led to important modifications in the art. Embroideries on coloured garments and other ornaments were thus easily represented, and the system is very useful in painting heraldry. Instead of the wheel fluoric acid is now chiefly used to remove the film of coloured glass from its white backing. The leads with which the mosaic of glass is brought together in glazing panels have undergone various changes. Early lead-work is massive; but at the beginning of the 15th century it becomes lighter in appearance but without loss of strength, for although the grooves were made shallower, the lead was increased in thickness and was rounded on the outer surfaces. Alterations also were made in the method of fixing painted windows: the saddle bars, according to climate, were made more or less robust; and, instead of crossing the windows in straight horizontal lines, they were frequently bent to suit the design. Generally speaking, horizontal bars are not objectionable unless they cross faces, or hands and feet,—an arrangement which ought carefully to be avoided. Mosaic windows should be made waterproof, and the saddle bars should be painted at intervals of time, as otherwise the rust injures the glass.

Enamelled glass, that is to say, white glass enamelled with colours, finally took the place of mosaic glass. In England in the last century glass-painters of merit who practised enamel painting have left considerable works, amongst whom Francis Eginton, Forrest, Henry Giles, Robert S. Godfrey, Jarves, and especially Jervais, who in 1717 executed from designs by Sir Joshua Reynolds the great east window of New College, Oxford. Whatever may be thought of their method, these glass-painters were meritorious artists. Reference has been made to some of the works of the admirable glass-painters of other countries besides Italy, but the object of the present paper has been to illustrate the history and practice of the art by Italian specimens hitherto little observed, and very inadequately and generally inaccurately described.

At the present time the art of glass painting is practised in different countries with very divergent views of its character and limits. Some think that the more nearly it can be assimilated to pictures in oil or fresco the better, whilst others maintain that all such resemblance is beyond its distinctive conditions as a branch of decorative art. It is a common but erroneous belief that the art of glass painting was lost, and that it has been revived in the present century. It survived in its latest form of the enamel method, classed by Mr Winston as the intermediate style, which is still carried out with unsurpassed skill in Germany. Undoubtedly the mosaic system had disappeared, and it has been judiciously and ably restored wherever glass painting is now common, although with different modifications and ideas of its nature. In England glass-painters possessed of much technical skill and cultivated knowledge of old forms of the art, have produced meritorious works within the limits of almost servile imitation, insisted upon by prevalent but mistaken sentiment; and in too many instances this imitation has reduced the art to the state of mere trade, so that at no period of its history have worse specimens been executed, too often found in the windows of the grandest monuments of mediæval architecture, which ought to have been preserved from such profanation. Of the great value and interest of early painted windows, as well as of those of more matured art, every one who studies them with intelligence must be sensible; and this value and interest are increased by the fact that they illustrate, with perfect truth, the tastes and ideas, the faith and customs, of the periods during which they were created, but modern counterfeits do nothing of the kind, and can convey no such impressions to future times. It is only by the restoration of the old union which existed between the great artist and the glass-painter, dwelt upon in these columns, that the beautiful art of glass painting can be really restored, nor are we without a completely successful instance of the happy results of this union. A window in the parish church at Alnwick, designed by the late William Dyce, R.A., and painted on glass at Munich, is a magnificent specimen of the art, equal in design and execution to the works of its golden age.

In Germany the arts ornamental still flourish as branches of fine art. There, as generally throughout the Continent, the acquirement of a knowledge of ornament forms part of the curriculum of study of most artists; to the entire neglect of this in England, in academies of fine art, may be attributed the low estate into which these branches have fallen. The most eminent German artists of the present century have made designs for painted windows, which have been executed by highly-trained glass-painters, with that care which is so characteristic a national attribute. Such being the case, it remains a source of wonder that artists surrounded by precious remains of ancient genius remarkable for exquisite colour should notwithstanding show so little ability as colourists. They assimilate the coloured glasses of the best qualities, with every attention to the laws of harmony, but they do not bring them into union as the old masters did by forcible painting of the shadows and half tints. The shadows generally are too transparent, and the general effect is weak. The finest work of the Munich school of glass painting, and one of the best windows produced in the present century, is in the Parliament House Edinburgh. It is richer in colour than is usual; and, having been designed by the illustrious Wilhelm von Kaulbach, the general composition is of a noble character.

In France an imitative school, resembling that which has been dominant in England, has executed skilful mimicries of ancient glass painting, and has restored successfully ancient windows broken or otherwise injured in revolutionary times or by neglect. Glass-painters of this class may be found in France, who dispute the supremacy in bad art of their island rivals. In efforts to escape from this abject imitation, trained artists have produced original works of considerable power of form and colour, but too many aim at a picturesque eccentricity, and an affected design, inconsistent with the grave beauty of the art; and Jean Cousin and other great masters of the grand period of French glass painting have no successful followers, nor has any painted window been produced in France in the present century which equals that by the Scottish artist, William Dyce, or that by the German, Von Kaulbach.

In Italy there are glass-painters whose merits as draughtsmen, designers, and executants place them in the first rank, but their windows are almost invariably laborious imitations of pictures in oil; they have undoubtedly lost the methods as well as the ideas and style of their great predecessors, whose windows they not unfrequently injure deplorably by their restorations. It is to be regretted that artists so admirably trained in many respects should so little comprehend the magnificent works of former times which would be their best models, and which they have skill enough to rival but for their vicious method of execution.

In Belgium the art is practised with considerable skill, and works of merit have been executed, but here, as elsewhere, the modern glass-painter is inferior to his predecessors, although he is surrounded by so many admirable specimens of ancient art.

The following works on glass painting may be advantageously studied:—Ferdinand de Lasteyrie, *Histoire de la peinture sur verre d'après ses monuments en France*, Paris, 2 vols. folio, 1852; Id., *Quelques mots sur la Theorie de la peinture sur verre*, Paris, 12mo, 1853; Id., *Notice sur les vitraux de l'abbaye de Rathhausen, canton de Lucerne*, Paris, 1856; A. Lenoir, *Histoire de la peinture sur verre et description des vitraux anciennes et modernes*, &c., Paris, 1803; Id., *Notice historique sur l'ancienne peinture sur verre, sur les moyens pratiques dans cet art depuis l'époque de son invention jusqu'a nos jours, et par suite sur Jean Cousin, qui a excellé dans le même art*, Paris; E. H. Langlois, *Essai historique et descriptif sur la peinture sur verre ancienne et moderne*, Rouen, 1832; Pierre le Vieil, *L'art de la peinture sur verre et de la vitrerie*, Paris, 1774; *Glass: the manner howe to anneile or paint in glass: the true receptes of the cullors*, 1616; Gessert, *Rudimentary Treatise on Painting on Glass*, London, 1851; Mrs Merrifield, *Ancient Practice of Painting in Oil, Miniature, Mosaic, and on Glass*, &c., London, 1849; Charles Winston, *An Inquiry into the difference of style observable in ancient Glass Painting, especially in England*, Oxford, 1847; Padre L. V. Marchese, *Memorie dei piu insigni Pittori, Scultori, e Architetti Domenicani*, Florence, 1846; G. Gaye, *Carteggio inedito d'artisti dei secoli* xiv., xv., xvi., 3 vols., Florence, 1839; Gaetano Milanesi, *Le Opere di Georgio Vasari con nuove annotazioni e commente*, Florence, 1879. (C. H. W.)

GLASSIUS, SOLOMON (1593–1656), theologian and Biblical critic, was born at Sondershausen, in the principality of Schwarzburg-Sondershausen, in 1593, received his school-education at the gymnasium of Gotha, and in 1612 entered the university of Jena, where, with the exception of some months spent at Wittenberg in 1615, he passed the following nine years of his life. As a student of theology under John Gerhard he directed his attention especially to Hebrew and the cognate dialects; in 1619 he was made an "adjunctus" of the philosophical faculty, and some time afterwards he received an appointment to the chair of Oriental languages. From 1625 to 1638 he discharged the duties of superintendent in Sondershausen; but in the latter year, shortly after the death of Gerhard (1637), he was, in accordance with the last wish of that great man, appointed to succeed him in the chair of theology at Jena. He did not, however, continue long at that university; for in 1640, at the earnest invitation of Duke Ernest the Pious, he removed to Gotha, there to act as general superintendent in the execution of important reforms which had been initiated both in the ecclesiastical and in the educational establishments of the duchy. The delicate duties attached to this office he discharged with singular tact and energy; and when called upon to take part in what is known as the "syncretistic" controversy, by which Protestant Germany was so long vexed, he manifested a combination of firmness with liberality, of loyalty to the past with a just regard to the demands of the present and the future, which unhappily have only too seldom been equalled in theological disputes. His principal work, the well known *Philologia Sacra*, published originally in 1625 was and still is regarded as a work of great value in biblical hermeneutic; and it has an historical importance as marking the transition from the earlier views on questions of biblical criticism to those of the school of Spener. It was more than once reprinted during the author's lifetime, and appeared in a new and revised form, edited by Dathe and Bauer at Leipsic, towards the close of the century (1776–1797). Glassius succeeded Gerhard also in the editorship of the Weimar *Bibelwerk*, and he wrote the commentary on the poetical books of the Old Testament for that publication. A volume of his *Opuscula* was printed at Leyden in 1700. He died in 1656.

GLASTONBURY, a market town and municipal borough of England, is situated near the middle of Somersetshire, about 22 miles S.W. of Bath, on the great western road from London to Exeter. The spot occupied by the town is a sort of peninsula formed by the windings of the river Brue, which flows west through the valley between the Poldew and the Mendip Hills; and in earlier times it was to all intents an island, as the country round was an extensive marsh, broken, however, by the Tor of St Michael to the N.E. of the town. Of the public buildings the most important, besides the ruins of the great abbey, are the church of St John the Baptist, in the Perpendicular style, with a tower of fine proportions; the church of St Benedict, dating from between 1493 and 1524; the hospital of St John, founded in 1246; and the George Inn, erected about the time of Henry VII. or Henry VIII. There was formerly in the town a remarkable cross, which is figured in Warner's *Glastonbury*; but it fell into decay, and was replaced by the present insignificant monument in 1846. Though Glastonbury has a station on the Somerset and Dorset Railway, and communicates with the estuary of the Severn by means of a canal for vessels of 70 or 100 tons burden, it has comparatively little trade. The woollen manufacture was introduced by the duke of Somerset in the first half of the 16th century, as may be seen at length in Strype's *Life of Cranmer*; but neither that nor the manufacture of silk, which was also carried on to some extent during the 18th century, is now of any importance. There are tanneries, however, and tile-works. The population of the town in 1861 was 3496, and in 1871 it was 3670.

The abbey of Glastonbury is without doubt one of the very earliest ecclesiastical foundations in England. In the words of Mr Freeman ("King Ine," *Proc. of Somersetshire Arch. Soc.*, 1874), "it is on any showing a tie between the Briton and the Englishman, between the older Christianity of our island and the newer, the one church of the first rank which lived through the storm of English conquest, which passed into the hands of our victorious fathers as a trophy of victory undestroyed and unplundered." But unfortunately "everything relating to its early history is so enveloped in legend that one has to tread one's way with the greatest caution at every step." As Canon Stubbs remarks,[1] the extravagant claims of the monks in regard to the antiquity and celebrity of their church "doubtless provoked criticism, and criticism forced on them the need of a forged history to assert, and of forged monuments to support these pretensions. The fabrication of such evidence must have gone on at Glastonbury on a scale proportioned to the claims; and William of Malmesbury, it would almost seem, undertook to erect the story out of materials which he distrusted. This did not content his employers, and they interpolated his work to a degree which makes it impossible to rely with confidence on any part of it."

Though Glastonbury is not mentioned either by Bede or by the authors of the Saxon Chronicle as one of the early foundations, its existence (continues Prof. Stubbs) is proved by the incontrovertible authority of the letters of St Boniface and the life of the same by S. Willibald. The name of Glastonbury however is of comparatively modern origin, being a corruption of the Saxon *Glæstingaburh* or town of the Glæstings. By the Britons the spot seems to have been called Ynys yr Avallon (Latinized as Avallonia), the Island of Apples, or Ynyswitrin, the Glassy Island; and it became the local habitation of various fragments of Celtic romance.

According to the legends which grew up under the care of the monks, the first church of Glastonbury was a little wattled building erected by Joseph of Arimathea as the leader of the twelve apostles sent over to Britain from Gaul by St Philip. About a hundred years later, according to the same authorities, the two missionaries Phaganus and Deruvianus who came to king Lucius from Pope Eleutherius established a fraternity of anchorites on the spot, and after three hundred years more St Patrick introduced amongst them a regular monastic life. About 546 David of Menevia is said to have built a new church near the old one, and in the 7th century the old one was encased with boards and covered with lead by the care of Paulinus of York. In the early part of the 8th century the great West Saxon king Ine (*cf.* charter in Kemble, *Codex diplomaticus ævi Saxonici*, vol. i. No. lxxi.) built and endowed a monastery at Glastonbury, which, in spite of the preceding establishments, may almost be considered as a new foundation. From the decadent state into which, like other monasteries, Glastonbury was brought by the Danish invasions, it was brilliantly recovered by the powerful hand of Dunstan who had been educated within its walls and was appointed its abbot about 946. The church and other buildings of his erection remained till the installation, in 1082, of the first Norman abbot, who inaugurated the new epoch by commencing a new church. His successor Herlewin (1101–1120), however, dissatisfied with the meanness of the edifice, pulled it down to make way for a finer structure. Henry of Blois (1126–1172) added greatly to the extent of the monastery, building a bell tower, a chapter-house, a cloister, a dormitory, a refectory, a palace, a brew-house, &c. In 1184 (on 25th May) the whole of the buildings were laid in ruins by fire; but Henry II. of England, in whose hands the monastery then was, entrusted his chamberlain Rudolphus with the work of restoration, and caused it to be carried out with much magnificence. The great church of which the ruins still remain was then erected. In the end of the 12th century, and on into the following, Glastonbury was distracted by a strange dispute, caused by the attempt of Savaric the ambitious bishop of Bath to make himself master of the abbey. The conflict, carried on alternately by blows and bribes, was brought to a close by the decision of Innocent III., that the abbacy should be merged in the new see of Bath and Glastonbury, and that Savaric should have a fourth of the property. On Savaric's death his successor gave up the joint bishopric and allowed the monks to elect their own abbot. From this date to the Reformation the monastery continued to flourish, the chief events in its history being connected with the maintenance of its claims to the possession of the bodies or tombs of King Arthur and St Dunstan. As early at least as the beginning of the 11th century the tradition that Arthur was buried at Glastonbury appears to have taken shape; and in the reign of Henry II., according to Giraldus Cambrensis and others, the abbot Henry de Blois, causing search to be made, discovered at the depth of 16 feet a massive oak trunk with an inscription "Hic jacet sepultus inclitus rex Arthurus in insula Avalonia." After the fire of 1184 the monks asserted that they were

[1] *Introduction to Memorials of St Dunstan*, *Rolls Series*, 1874

in possession of the remains of St Dunstan, which had been abstracted from Canterbury after the Danish sack of 1011 and kept in concealment ever since. The Canterbury monks naturally denied the assertion, and the contest continued for centuries. In 1508 Warham and Goldston having examined the Canterbury shrine reported that it contained all the principal bones of the saint, but the abbot of Glastonbury in reply as stoutly maintained that this was impossible. The day of such disputes was, however, drawing to a close. On 1539 the last and 60th abbot of Glastonbury, Robert Whyting, was, in the words of a contemporary lettter (MS. Cotton, Cleop. E., iv. fol. 996), "arraigned, and next day put to execution for robbing of Glastonbury church." His body was quartered, and his head fixed on the abbey gate. A darker passage does not occur in the annals of our English Reformation than this murder of an able and high-spirited man, whose worst offence was that he defended as best he could from the hand of the spoiler the property of his charge.[1]

The ruins of the abbey are now comparatively few, and as the work of destruction has in many places descended to the very foundations it is impossible to make out the details of the plan. Of the vast range of buildings for the accommodation of the monks almost nothing remains except the abbot's kitchen, noteworthy for its octagonal interior, the porter's lodge, and the abbey barn. Considerable portions are still standing of the so-called chapel of St Joseph at the west end, which Mr Willis has identified with the lady chapel, occupying the site of the old wicker church. This chapel, which is the finest part of the ruins, is transition work of the 12th century. It measures about 66 feet from east to west and about 36 from north to south. Below the chapel is a crypt which Professor Willis shows to be a construction of the 15th century inserted in a building which had no previous crypt. Between the chapel and the great church is an Early English building which appears to have served as a Galilee porch. The great church itself was a cruciform structure with a choir, a nave, and transepts, and a tower surmounting the centre of intersection. From east to west the length was 410 feet, and the breadth of the nave was about 80 feet. The nave had ten severies, and the choir six. Of the nave three bays of the south side are still standing, and the windows have pointed arches externally and semicircular arches internally. Two of the tower piers and a part of one arch give some indication of the grandeur of the building. The old clock, presented to the abbey by Adam de Godbury (1322–1335), and noteworthy as the first recorded example of a clock striking the hours automatically with a count-wheel, is still preserved, although not in its entirety, in the cathedral at Wells.

The Glastonbury thorn, planted, according to the legend, by Joseph of Arimathea, has been the object of considerable comment. According to Loudon (*Arboretum et Fruticetum*) it was probably *Cratægus præcox*, and he reports that he received from Glastonbury in December 1833 a thorn branch in full blossom, having also on it ripe fruit. The actual thorn visited by the pilgrims was destroyed about the Reformation time, but specimens of the same variety are still extant in various parts of the country.

See William of Malmesbury, "De Antiq. Glastoniensis Ecclesiæ," in *Rerum Anglicarum Script. Vet.*, tom. i., 1684 (also printed by Hearne and Migne); John of Glastonbury, *Chronica sive de Hist. de Rebus Glast.*, ed. by Hearne, Oxford, 1726, 2 vols; Adam of Domerham, *De Rebus Gestis Glast.*, ed. by Hearne, Oxford, 1727, 2 vols.; *Hist. and Antiq. of Glast.*, London, 1807; *Avalonian Guide to the Town of Glastonbury*, 1839, 8th ed.; Warner, *Hist. of the Abbey and Town*, Bath, 1826; Rev. Ass.*, vol. xii., 1856; Rev. R. Willis, *Architectural History of Glastonbury Abbey*, 1866. Views and plans of the abbey building will be found, says Mr Willis, in Dugdale's *Monasticon*, 1655; Stevens's *Monasticon*, 1720; Stukeley, *Itinerarium Curiosum*, 1724; Grose, *Antiquities*, 1754; Carter, *Ancient Architecture*, 1800; Storer, *Antiq. and Topogr. Cabinet*, vols. ii., iv., v., 1807, &c.; Britton's *Architectural Antiquities*, vol. iv., 1813; *Vetusta Monumenta*, vol. iv., 1815; and *New Monasticon*, vol. i., 1817.

GLATZ (Slav. *Kladsko*), a fortified town of Prussian Silesia, chief town of a countship in the government district of Breslau, is situated 50 miles S.S.W. of the town of that name. It stands in a narrow valley on the left bank of the Neisse, not far from the Austrian frontier. It is strongly walled, and is further defended by an old castle built on a high hill on one side of the town, and by a regular modern fortress erected on a hill on the opposite side. Before the town on both banks of the river there is also a strongly fortified camp, by which its bombardment from the neighbouring heights may be hindered, and which affords accommodation for as many as 10,000 men. The town is the seat of a circle court and of an agricultural union, and possesses one Lutheran and three Catholic churches, one of which is very old and contains several monuments of Silesian dukes. Among the other buildings the principal are the nunnery, the royal Catholic gymnasium, the asylum for destitute children, and the military hospital. The industries include the manufacture of spirits, linen, damask, broad cloth, hosiery, beads, and leather. Glatz existed as early as the 11th century. In the Thirty Years' War it was several times besieged and taken. It surrendered to Frederick the Great in 1742, was retaken by the Austrians in 1760, and was restored to Prussia at the peace of 1763. The population in 1875 was 12,553.

GLAUBER, JOHANN RUDOLPH (1603–1668), alchemist and medicinal chemist, was born at Carlstadt in 1603, and died at Amsterdam in 1668. There is no authentic record of details concerning his life; his name has been somewhat marred by tradition, but it is not unreasonable to suppose that this originated with persons who did not heed the warning given by the chemist himself, in one of his more important memoirs, "let no one rashly judge of this work, until he be thoroughly informed concerning the same." Commencing his career as a chemist at the time he did, it was not unnatural that he imbibed the notion, prevalent among his contemporaries, of the existence of "alkahest," a liquid which was to be universal in its uses as a solvent and a medicine, and of the "philosopher's stone." But whatever the motive which induced him to toil in his laboratory, it is certain that he, by ascertaining the preparation of many valuable medicines, contributed largely to pharmacy. He undoubtedly was the first, in 1648, to procure hydrochloric acid by the action of oil of vitriol on common salt, and also in all probability to obtain nitric acid by means of oil of vitriol and nitre. Sodium sulphate, discovered by him, and commonly therefore termed Glauber's salt (see below), he obtained by the action of oil of vitriol on salt.

His treatises, about thirty in number, were published at Frankfort in 2 vols. 4to, in 1658–1659; at Amsterdam, in 1661, in 7 vols. 8vo; and at London, translated into English by Parke, in 1689, 1 vol. folio.

GLAUBER'S SALT, the popular term for neutral sulphate of sodium (Na_2SO_4), discovered by the chemist whose name it bears, and formerly known as "sal mirabile Glauberi." It occurs in nature in combination with calcium sulphate as the mineral glauberite, and uncombined in right rhombic prisms, as thenardite, being found in this form in Bolivia and Peru, and near Madrid; or in monoclinic prisms, with ten molecules of water as glauberite or ordinary Glauber's salt, in Austria, Hungary, Italy, and in great quantity as a deposit from the hot springs of Carlsbad. It is also a constituent of sea-water, and the chief active principle of medicinal waters, and occurs in minute traces in the blood. It has a bitter but not acrid taste. It is somewhat anomalous in its solubility, the maximum occurring at about 34° C. According to Löwel, it exists in aqueous solution at temperatures as high as 34° C. as a decahydrate, but above that temperature as an anhydride, the solubility of the former increasing, and of the latter decreasing, with a a rise of temperature (see CHEMISTRY, vol. v. p. 505). Under ordinary circumstances it crystallizes from solution in large colourless prisms; these, when exposed to the air or heated, effloresce, giving a white powder, which melts at a strong red heat, and on cooling forms a transparent mass. The salt has also been the subject of some interesting experiments made by Guthrie, who at −7° C. procured it in combination with 166 molecules of water. From his investigation of this and other substances, he concluded that the solution of a solid body consists in the formation of a liquid hydrate which ultimately diffuses into the rest of the solvent. In the manufacture of sodium carbonate from salt and sulphuric acid, this sulphate is prepared in large quantities. In medicine it is employed as a purgative.

[1] A curious relic of Abbot Whyting, his watch, was purchased in 1837 at the sale of T. Bowen's effects, and presented by C. K. Tynte to the duke of Sussex.

GLAUCHAU, one of the most important manufacturing towns of Saxony, circle of Zwickau, is situated on the right bank of the Mulde, 7 miles north of Zwickau and 17 west of Chemnitz. It is the seat of a royal administrative commission, of a district court, and of the ecclesiastical and secular courts of the countship of Schönburg. Its principal manufactures are woollen and half-woollen goods, in regard to which it occupies the first position in Germany. Besides 3000 hand-looms and 1000 power-looms in the town, the trade gives employment to many others in the neighbouring districts. There are also dyeworks, print works, and manufactories of paper, linen, thread, and machinery. Glauchau possesses a real school, an elementary school, a weaving school of the higher grade, an orphanage, and an infirmary. Some portions of the extensive old castle date from the 12th century, and the Gottesacker church contains interesting antiquarian relics. Glauchau was founded by a colony of Sorbs and Wends, and belonged to the lords of Schönburg as early as the 12th century. The mineralogist Agricola was born at Glauchau in 1494. While the population in 1834 was only 6292, it was 14,357 in 1858 and 21,743 in 1875.

GLAUCUS (Γλαυκος, *i.e.*, γλαυκος, "silvery" or "sheeny"), in Greek mythology, the name of several figures, the most important of which are the four described below:—

(1.) GLAUCUS, surnamed Pontius (ὁ πόντιος, equivalent to ὁ θαλάσσιος), according to the common legend had originally been an expert fisherman and diver at Anthedon (Bœotia), but, having eaten of the magical herb sown by Cronos, had leapt into the sea, where ultimately he was changed into a god, and endowed with the gift of unerring prophecy. A principal seat of his cultus was Anthedon, where the inhabitants claimed to be descended from him; but he was also worshipped extensively, not only on the coasts of Greece, but also on those of Sicily and Spain, it being customary for fishermen and sailors at certain seasons to watch during the night for the moment when he should come on his periodical rounds accompanied by his train, in order that they might consult him as an oracle. He is generally represented as endowed with most of the attributes of Nereus, but occasionally he is identified with Melicertes. He is sometimes said to have instructed Apollo in prophecy. In art he is depicted as a vigorous old man with long hair and beard, his body terminating in a scaly tail. The *Argonautica* represent Glaucus as having been builder and steersman of the "Argo," as having alone remained unhurt in the fight of Jason with the Tyrrhenians, and as having afterwards become a sea god, in which capacity he was able in various ways to assist the expedition. A poetical account of his metamorphosis is given by Ovid (*Met.*, xiii. 906), and his story has been also treated by Pindar and by Æschylus, the latter of whom is known to have made Glaucus Pontius the subject of one of his satyr-dramas (see Pausanias, ix. 22, 6; and compare Hermann, *De Æschyli Glaucis*). Allusions to the loves of Glaucus with Ariadne, Scylla, the Nereids, and Melicertes are frequently to be met with in ancient literature; and a considerable quantity of folklore concerning him will be found in the scholiast on Plato's *Republic*, p. 536, and also in Athenæus, *Deipnosoph.* vii. 47, 48. See also Gädechen's monograph (*Glaukos der Meergott*, 1860).

(2.) GLAUCUS, usually surnamed Potnieus (ὁ ποτνιεύς), from Potniæ near Thebes, a deity worshipped chiefly in Corinth, is to be carefully distinguished from Glaucus Pontius. He was the son of Sisyphus by Merope, and the father of Bellerophon. According to the legend he was destroyed by his own mares,—the most common form of the story being that he was torn to pieces by them. Accounts differ as to the place of his violent death, and also as to the immediate occasion of it. Sometimes it is represented as having happened at Iolcus, at the funeral games of Pelias, but usually the scene is laid at Potniæ. He is most frequently represented as having offended Aphrodite by having kept his mares from breeding; but other versions of the myth are that he had fed them on human flesh to make them more spirited, or that they had been suffered to drink at a sacred well at Bœotia, or that they had eaten the herb hippomanes. On the isthmus of Corinth, and also at Olympia and Nemea, he was worshipped as ταράξιππος; and he was the subject of a lost tragedy of Æschylus. His affinities with Poseidon Hippius are obvious; and it may be taken for granted that the frantic horses of Glaucus Potnieus represent the stormy waves of the sea, just as Glaucus Pontius is himself a personification of the ocean in its friendlier and calmer moods.

(3.) GLAUCUS, the son of Minos by Pasiphae, when a child, playing at ball or pursuing a mouse, fell into a honey pot and was smothered. His father, after a vain search for him, consulted the oracle, and was referred for an answer to the person who should suggest the aptest comparison for one of the cows of Minos which had the power of assuming three different colours. Polyidus (Πολύϊδος) of Argos, who had likened it to a mulberry (or bramble), which changes from white to red and then to black, soon afterwards discovered the child. Minos then desired him to restore young Glaucus to life; and on his failure in this, he was sentenced to be entombed alive along with the corpse. Having in the sepulchre killed a serpent by which he had been attacked, he saw its companion revivify it by laying upon it a few leaves of a certain herb. The same herb he successfully applied to Glaucus. This curious myth is now very generally admitted to be of a solar character; but interpreters are far from unanimous as to the significance of the various details. The story, which is related by Apollodorus (iii. 3, 1), and also by Ælian, was a favourite subject with poets and artists. Æschylus, Sophocles, and Euripides are each of them said to have treated it dramatically; and, according to Lucian, it was often represented in mimic dances (Lucian, *De Saltatione*, 49; Welcker, *Die Griech. Tragoedie*). In some of its features at least the mythus is found to be very widely diffused. See Cox, *Aryan Mythology*, i. 161; Baring-Gould, *Myths of the Middle Ages*, ii. 145.

(4.) GLAUCUS, son of Hippolochus, and grandson of Bellerophon, mythical progenitor of the kings of Ionia, was a Lycian prince who, along with his brother Sarpedon, assisted Priam in the Trojan war The incident between Glaucus and Diomede, as related in the *Iliad*, is well known. He was afterwards slain by Ajax; but his body was carried back to Lycia, as that of his brother had been. It seems probable that these two sons of the Lycian land—the land of light—who leave it in youth, but are carried thither again (by Hypnos and Thanatos) when their course is done, originally were meant to represent respectively the creeping light of the early dawn (Sarpedon) and the brightness of the open day (Glaukos).

GLEBE, in ecclesiastical law, is the land devoted to the maintenance of the incumbent of a church. Burn (*Ecclesiastical Law*, s.v. "Glebe Lands") says:—"Every church of common right is entitled to house and glebe, and the assigning of them at the first was of such absolute necessity that without them no church could be regularly consecrated. The house and glebe are both comprehended under the word *manse*, of which the rule of the canon law is, *sancitum est ut unicuique ecclesiæ unus mansus integer absque allo servitio tribuatur.*" In the technical language of English law the fee-simple of the glebe is said to be in *abeyance*, that is, it exists "only in the remembrance, expectation, and intendment of the law." But the freehold is in the parson.

although at common law he could alienate the same only with proper consent,—that is, in his case, with the consent of the bishop. The disabling statutes of Elizabeth (1 Eliz. c. 19, and 13 Eliz. c. 10) made void all alienations by ecclesiastical persons, except leases for the term of twenty-one years or three lives. As to exchange of glebe lands, see 5 and 6 Vict. c. 54, and 17 and 18 Vict. c. 84. In Scotch ecclesiastical law, the manse now signifies the minister's dwelling-house, the glebe being the land to which he is entitled in addition to his stipend. All parish ministers appear to be entitled to a glebe, except the ministers in royal burghs proper, who cannot claim a glebe unless there be a landowner's district annexed; and even in that case, when there are two ministers, it is only the first who has a claim. See Bell's *Dictionary and Digest.*

GLEE is a musical term for a part song of a particular kind. The word, as well as the thing, are essentially confined to England. The technical meaning has been explained in different ways; but there is little doubt of its derivation from the Anglo-Saxon "gleov, gleo," *gaudium, delectamentum*, and hence *ludus musicus*. Gleeman, Anglo-Saxon "gleo-man," is translated simply as "musicus" or "cantor," to which the less distinguished titles of "mimus, jocista, scurra," are frequently added in old dictionaries. The accomplishments and social position of the gleeman seem to have been as varied as those of the Provençal "joglar." To return to the word "glee," there are early examples of its being used as synonymous with harmony or concerted music. The former explanation, for instance, is given in the *Promptorium Parvulorum*, a work of the 15th century. Glee in its present meaning signifies, broadly speaking, a piece of concerted vocal music, generally unaccompanied, and for male voices, though exceptions are found to the last two restrictions. The number of voices ought not to be less than three. As regards musical form, the glee is little distinguished from the catch,—the two terms being often used indiscriminately for the same song; but there is a distinct difference between it and the madrigal—one of the earliest forms of concerted music known in England. While the madrigal does not show a distinction of contrasted movements, this feature is absolutely necessary in the glee. In the madrigal the movement of the voices is strictly contrapuntal, while the more modern form allows of freer treatment and more compact harmonies. Differences of tonality are fully explained by the development of the art, for while the madrigal reached its acme in Queen Elizabeth's time, the glee proper was little known before the Commonwealth; and its most famous representatives belong to the last century and the first quarter of the present. Among the numerous collections of the innumerable pieces of this kind, only one of the earliest and most famous may be mentioned, *Catch that Catch can, a Choice Collection of Catches, Rounds, and Canons, for three and four voices*, published by John Hilton in 1652. The name "glee," however, appears for the first time in John Playford's *Musical Companion*, published twenty-one years afterwards, and reprinted again and again, with additions by later composers—Henry Purcell, William Croft, and John Blow among the number. The father of the glee in its modern form is Dr Arne, born in 1710. Among more recent English musicians famous for their glees, catches, and part-songs, the following may be mentioned:—Attwood, Boyce, Bishop, Crotch, Callcott, Shield, Stevens, Horsley, Webb, and Knyvett. The convivial character of the glee led, in the last century, to the formation of various societies, which offered prizes and medals for the best compositions of the kind, and assembled for social and artistic purposes. The most famous amongst these—The Glee Club—was founded in 1783, and at first used to meet at the house of Mr R. Smith, in St Paul's Churchyard. This club was dissolved in 1857. A similar society—The Catch Club—was formed in 1761, and is still in existence. A short historic survey of the subject is contained in Mr W. A. Barrett's *The English Glee and Madrigal Writers.*

GLEIG, GEORGE (1753–1839), bishop of Brechin, Scotland, was the son of a farmer, and was born at Boghall, Kincardineshire, May 12, 1753. He received his early education at the school of Arbuthnott, and at the age of thirteen entered King's College, Aberdeen, where he especially distinguished himself in mathematics and the moral and physical sciences. In his twenty-first year he took orders in the Scottish Episcopal Church, and was ordained to the pastoral charge of a congregation at Pittenweem, Fife, whence he removed in 1790 to Stirling. His pastoral duties allowing him considerable leisure for literary pursuits, he became a frequent contributor to the *Monthly Review*, the *Gentleman's Magazine*, the *Anti-Jacobin Review*, and the *British Critic*. He also wrote several articles for the third edition of the *Encyclopædia Britannica*, and on the death of the editor, Colin Macfarquhar, in 1793, was engaged to edit the remaining volumes. One of his principal contributions to this work was the article Metaphysics. He was twice chosen bishop of Dunkeld, but the opposition of the primus rendered the election on both occasions ineffectual. In 1808 he was consecrated assistant and successor to the bishop of Brechin, in 1810 was preferred to the sole charge, and in 1816 was elected primus of the Episcopal Church of Scotland, in which capacity he greatly aided in the introduction of many useful reforms, in fostering a more catholic and tolerant spirit, and in cementing a firm alliance with the sister church of England. He died at Stirling in February 1839.

Besides various sermons, Gleig was the author of *Directions for the Study of Theology*, 1827; an edition of *Stackhouse's History of the Bible*, 1817; and a life of Robertson the historian, prefixed to an edition of his works. See *Life of Bishop Gleig* by the Rev. W. Walker, 1879.

GLEIM, JOHANN WILHELM LUDWIG (1719–1803), a minor German poet, was born April 2, 1719, near Halberstadt, and died there February 18, 1803, after having occupied, during half a century, the situation of secretary to the chapter of Halberstadt. "Father Gleim" was the title accorded to him throughout all literary Germany on account of his kind-hearted though inconsiderate and undiscriminating patronage alike of the poets and poetasters of the period. He wrote a large number of feeble imitations of Anacreon, Horace, and the minnesingers, a dull didactic poem entitled *Halladat oder das rothe Buch* (Halberstadt, 1774, 4th ed. 1812), and collections of fables and romances (*Fabeln*, Berlin, 1756–57; *Romanzen*, Berlin and Leipsic, 1756; *Lieder, Fabeln, und Romanzen*, Berlin, 1758). Of higher merit are his *Preussische Kriegslieder eines Grenadiers* (Berlin, 1758). These, which were inspired by the campaigns of Friederick II., are often distinguished by genuine feeling and vigorous force of expression. They are also noteworthy as being the first of that long series of noble political songs in which later German literature is so rich. With this exception, Gleim's writings are for the most part tamely commonplace in thought and expression. His very best odes have only a certain feeble prettiness to recommend them. A few, as *Das Hüttchen* and *An Leukon*, have still some popularity, and appear in most collections of German poetry.

See Gleim's *Sämmtliche Werke* (7 vols., Halberstadt, 1811–1813), and Körte's *Gleim's Leben aus seinen Briefen und Schriften* (Halberstadt, 1811).

GLEIWITZ, a town in the Prussian province of Silesia, chief town of the circle of Tost-Gleiwitz, government district of Oppeln, is situated on the Klodnitz, and on the railway between Oppeln and Cracow, 40 miles S.E. of the former town. It is the seat of a royal mining board, a provincial court of justice, and a tax office. It possesses one Protestant and two Catholic churches, a synagogue, a gymnasium, a school of industry, two female schools of a higher grade, a convent, a hospital, an infirmary, two orphanages, and a barracks. Gleiwitz is the centre of the iron industry of Upper Silesia. Besides the royal foundry, with which are connected machine manufactories and boiler-works, there are other two foundries, meal mills, and manufactories of wire, gaspipes, cement, and paper. The population in 1875 was 14,156.

GLENDOWER, or GLYNDWR, OWEN, the last native who assumed the title of Prince of Wales, and the leader of the only formidable attempt made by the Welsh to regain their freedom, after they had been subjugated by Edward I., was born most probably at Glyndwrdy in Montgomeryshire, whence his name, about the year 1354. He was the son of Gruffydd Vychan, sprung from the lords of Bromfield, and through his mother he claimed descent from a daughter of Llywelyn, the last crowned prince of Wales. He was entered a member of one of the inns of court, and brought up to the profession of the law, but he does not seem to have practised. In 1385, in the great dispute between the Grosvenors and the Scropes as to their right to bear a certain coat of arms, he was a witness for Grosvenor—one of the witnesses for Scrope being the poet Chaucer. He found his way to court, where he became a favourite with King Richard, and was made an esquire of his body. When Richard went to Ireland Owen accompanied him, as he did also on his return to Wales. He was present when Richard placed himself in the hands of the treacherous Northumberland, and at Flint, where his deposition was decided upon. Owen thereupon retired into private life. He had the misfortune to have for a neighbour Reginald de Grey, earl of Ruthin; and between him and De Grey a feud existed, occasioned by a dispute about a piece of waste land. In the time of Richard, Owen was successful in a lawsuit; but no sooner was the king deposed than De Grey took forcible possession of the land. Owen in vain appealed to parliament, although the bishop of St Asaph entreated them to grant his request, and warned them that if they did not, Wales would rise in rebellion; and a little later Henry IV., on the ground that Owen, as a crown tenant, had neglected to join an expedition to Scotland (while the fact was that the summons, which had been entrusted to De Grey to give to Owen, was not delivered until it was too late), declared a forfeiture of his land held of the crown, and granted some of it to De Grey. With armed retainers De Grey took possession; but Owen mustered his followers, and after regaining his own, devastated the lands of De Grey. Henry took De Grey's part, and Owen set both at defiance. On the 20th September 1400 Owen struck the first blow for the freedom of his country at Ruthin, where a fair was being held. The town was burnt down. During that and the following year Owen steadily added to his strength, and the king, although he thrice invaded Wales at the head of a large army, failed to get at the enemy, who retired to the mountain fastnesses. This, and the stormy weather which the English seem to have invariably experienced, so awed them that they thought the Welsh chieftain was allied with the powers of darkness. Harsh laws were enacted against the Welsh, who thereby were only the more goaded to rebellion. The lord-marchers sided with the king, and Sir Edward Mortimer, uncle of the earl of March, gave Owen battle at Brynglas in Radnorshire, on June 22, 1402. 1100 Herefordshire men were left dead on the field, and Mortimer himself was made prisoner. It was at this battle that the Welsh women were guilty, as Shakespeare says, of inhuman conduct to the dead. This so alarmed the king that he invaded Wales in the autumn with three armies, but nothing came of it. At a parliament held at Machynlleth, at the close of this year (1402), Owen was formally proclaimed Prince of Wales. About this time it was that the first steps were taken which secured the league between Owen, Mortimer, and Percy. Early in 1403 Prince Henry—Falstaff's Hal—was appointed lieutenant of the king in Wales. He led an army into North Wales and destroyed Owen's residences, "and laid waste a fine and populous country." The next great event was the battle of Shrewsbury, at which Percy was defeated. Glendower has been accused of having neglected aid to his ally at this battle, but letters recently discovered exonerate him from blame in this respect, as he was elsewhere at the time. Meanwhile Owen was committing terrible ravages in the districts under the sway of the marchers, or where Norman castles overawed the natives; and in 1404 he sent ambassadors—his chancellor Griffith Young, and his brother-in-law John Hanmer—to Charles of France, who entered into treaty to aid Owen. In pursuance of this treaty a large force, under the command of Hugueville, landed at Milford Haven at the end of July 1405. But meanwhile Owen had sustained two crushing defeats from the army under Prince Henry, the first at Grosmont in Monmouthshire on the 11th March, and the second at Mynyddpwllmelin in Brecknockshire four days later. Still he was able to muster a force to join the French contingent, and with them he pushed on to the neighbourhood of Worcester, where the king met them but did not fight, and the French returned home. Owen's power appears to have suffered irrevocably at the defeats of the spring. For years afterwards he carried on a desultory warfare, but defections from his ranks so weakened his power that he was no longer the dangerous enemy he had been. But he never submitted. In July 1415—fifteen years after the first outbreak—the king, now Henry V., authorizes Sir Gilbert Talbot to treat with Owen, and to offer him and his followers free pardon, "in case they should desire it." A similar offer was made in February 1416. His death is believed to have taken place at the house of one of his daughters in Monmouthshire, but there is no certainty as to either the date or the place of his death.

GLEYRE, MARC CHARLES GABRIEL (1806–1874), a celebrated French painter, was of Swiss origin, having been born at Chevilly in the canton of Vaud, May 2, 1806. His father died, and then his mother, while he was yet a boy of some eight or nine years of age; and he was brought up by an uncle at Lyons, who sent him to the industrial school of that city. Going up to Paris a lad of seventeen or nineteen, he spent four years in close artistic study—in Hersent's studio, in Suisse's academy, in the galleries of the Louvre. To this period of laborious application succeeded four years of meditative inactivity in Italy, where he became acquainted with Horace Vernet and Léopold Robert; and six years more were consumed in adventurous wanderings in Greece, Egypt, Nubia, and Syria. At Cairo he was attacked with ophthalmia, and in the Lebanon he was struck down by fever; and he returned to Lyons in shattered health. On his recovery he proceeded to Paris, and, fixing his modest studio in the Rue de Université, began carefully to work out the conceptions which had been slowly shaping themselves in his mind. Mention is made of two decorative panels—Diana leaving the Bath, and a Young Nubian—as almost the first fruits of his genius; but these did not attract public attention till long after, and the painting by which he practically opened his artistic career was the Apocalyptic Vision of St John, sent to the Salon of 1840. This was followed in 1843 by Evening, which at the time received a medal of the second class, and afterwards became widely popular under the title of the Lost

Illusions. It represents a poet seated on the bank of a river, with drooping head and wearied frame, letting his lyre slip from a careless hand, and gazing sadly at a bright company of maidens whose song is slowly dying from his ear as their boat is borne slowly from his sight. In spite of the success which attended these first ventures, Gleyre retired from public competition, and spent the rest of his life in quiet devotion to his own artistic ideals, neither seeking the easy applause of the crowd, nor turning his art into a means of aggrandizement and wealth. After 1845, when he exhibited the Separation of the Apostles, he contributed nothing to the Salon except the Danse of the Bacchantes in 1849. And yet he laboured steadily and was abundantly productive. He had an "infinite capacity of taking pains," and when asked by what method he attained to such marvellous perfection of workmanship, he would reply, "En y pensant toujours." A long series of years often intervened between the first conception of a piece and its embodiment, and years not unfrequently between the first and the final stage of the embodiment itself. A landscape was apparently finished; even his fellow artists would consider it done; Gleyre alone was conscious that he had not "found his sky." Happily for French art this high-toned laboriousness became influential on a large number of Gleyre's younger contemporaries; for when Delaroche gave up his studio of instruction he recommended his pupils to apply to Gleyre, who at once agreed to give them lessons twice a week, and characteristically refused to take any fee or reward. By instinct and principle he was a confirmed celibate: "Fortune, talent, health,—he had everything; but he was married," was his lamentation over a friend. Though he lived in almost complete retirement from public life, he took a keen interest in politics, and was a voracious reader of political journals. For a time, indeed, under Louis Philippe, his studio had been the rendezvous of a sort of liberal club. To the last—amid all the disasters that befell his country—he was hopeful of the future, "la raison finira bien par avoir raison." It was while on a visit to the Retrospective Exhibition, opened on behalf of the exiles from Alsace and Lorraine, that he suddenly dropped down and expired May 5, 1874. He left unfinished the Earthly Paradise, a noble picture, which Taine has described as "a dream of innocence, of happiness, and of beauty—Adam and Eve standing in the sublime and joyous landscape of a paradise enclosed in mountains,"—a worthy counterpart to the Evening. Among the other productions of his genius are the Deluge, which represents two angels speeding above the desolate earth, from which the destroying waters have just begun to retire, leaving visible behind them the ruin they have wrought; the Battle of the Lemanus, a piece of elaborate design, crowded but not cumbered with figures, and giving fine expression to the movements of the various bands of combatants and fugitives; the Prodigal Son, in which the artist has ventured to add to the parable the new element of mother's love, greeting the repentant youth with a welcome that shows that the mother's heart thinks less of the repentance than of the return; Ruth and Boaz; Ulysses and Nausicaa; Hercules at the feet of Omphale; the Young Athenian, or, as it is popularly called, Sappho; Minerva and the Nymphs; Venus πάνδημος; Daphnis and Chloe; and Love and the Parcæ. Nor must it be omitted that he left a considerable number of drawings and water-colours, and that we are indebted to him for a number of portraits, among which is the sad face of Heine, engraved in the *Revue des Deux Mondes* for April 1852. In Clément's catalogue of his works there are 683 entries, including sketches and studies. Gleyre is in great favour in Switzerland; and a special exhibition of his works was held at Lausanne in the Arland Museum, August and September 1874.

See Fritz Berthoud in *Bibliothèque Universelle de Genève*, 1874; Albert de Montet, *Dict. Biographique des Genevois et des Vaudois*, 1877; and *Vie de Charles Gleyre*, 1877, written by his friend Charles Clément, and illustrated by 30 plates from his works.

GLINKA, Fedor Nikolaevich (1788–1849), a Russian poet and author, was born at Smolensk in 1788, and was specially educated for the army. In 1803 he obtained a commission as an officer, and two years later took part in the Austrian campaign. His tastes for literary pursuits, however, soon induced him to leave the service, whereupon he withdrew to his estates in the government of Smolensk, and subsequently devoted most of his time to study or travelling about Russia. Upon the invasion of the French in 1812, he re-entered the Russian army, and remained in active service until the end of the campaign in 1814. Upon the elevation of Count Milarodovich to the military governorship of St Petersburg, Glinka was appointed colonel under his command. On account of his suspected revolutionary tendencies he was, in 1826, banished to Petrozavodsk, but he nevertheless retained his honorary post of president of the Society of the Friends of Russian Literature, and was after a time allowed to return to St Petersburg. Soon afterwards he retired completely from public life, and died on his estates in 1849.

Glinka's martial songs have special reference to the Russian military campaigns of his time. He is known also as the author of the descriptive poem *Kareliya*, &c. (*Carelia, or the Captivity of Martha Joannovna*), 1830, and of a metrical paraphrase of the book of Job. His fame as a military author is chiefly due to his *Pisma Russkago Ofitsera* (*Letters of a Russian Officer*), 8 vols., 1815–16.

GLINKA, Michael Ivanovich (1804–1857), a celebrated Russian composer, was born at Novospassky, a village in the Smolensk government, in 1804, and not, as stated generally in the dictionaries, in 1803. His early life he spent at home, but at the age of thirteen we find him at the Blagorodrey Pension, St Petersburg, where he studied music under Carl Maier and John Field, the celebrated Irish composer and pianist, settled in Russia. We are told that in his seventeenth year he had already begun to compose romances and other minor vocal pieces; but of these nothing now is known. His thorough musical training did not begin till the year 1830, when he went abroad and stayed for three years in Italy, to study the works of old and modern Italian masters. His thorough knowledge of the requirements of the voice may be connected with this course of study. His training as a composer was finished under Dehn, the celebrated contrapuntist, with whom Glinka stayed for several months at Berlin. In 1833 he returned to Russia, and devoted himself to operatic composition. On November 27, 1836, took place the first representation of his *Life for the Czar*. This was the turning point in Glinka's life,—for the work was not only a great success, but in a manner became the origin and basis of a Russian school of national music. Subject and music combined to bring about this issue. The story is taken from the invasion of Russia by the Poles early in the 17th century, and the hero is a peasant who sacrifices his life for the czar. Glinka has wedded this patriotic theme to inspiring and in some places admirable music. His melodies, moreover, show distinct affinity to the popular songs of the Russians, and for that reason the term "national" may be justly applied to them. His appointment as imperial chapel-master and conductor of the opera of St Petersburg was the just reward of his dramatic successes. His second opera, *Russlan and Lyudmila*, founded on Poushkin's poem, did not appear till 1842; but in the meantime he wrote an overture and four entre-actes to Kukolnik's drama *Prince Kholmsky*. In 1844 he went abroad for a second time, and lived chiefly in Paris and Spain. On his return to St Petersburg he wrote and arranged several pieces for the orchestra, amongst which the so-called *Kamarinskaya* has achieved popularity beyond the limits of Russia. He also composed numerous songs and romances. In 1857 he went abroad for the third time, and died suddenly at Berlin, on February 14th of that year.

GLINKA, SERGY NIKOLAEVICH (1774-1847), Russian author, the elder brother of Fedor N. Glinka (noticed above), was born at Smolensk in 1774. In 1796 he entered the Russian army, but after three years' service retired with the rank of major. He afterwards employed himself in the education of youth and in literary pursuits, first in the Ukraine, and subsequently at Moscow, where he died in 1847. His poems are spirited and patriotic; he wrote also several dramatic pieces, and translated Young's *Night Thoughts.*

Among his numerous prose works the most important from an historical point of view are—*Russkoe Chtenie* (*Russian Reading: Historical Memorials of Russia in the 18th and 19th Centuries*), 2 vols., 1845; *Istoriya Rossii*, &c. (*History of Russia for the use of Youth*), 10 vols., 1817-19 (2d ed. 1822; 3d ed. 1824); *Istoriya Armyan*, &c. (*History of the Migration of the Armenians of Azerbijan from Turkey to Russia*), 1831; and his contributions to the *Russky Vyestnik* (*Russian Messenger*), a monthly periodical, edited by him from 1808 to 1820.

GLOBE. With the exception of illuminated portolani, the most interesting monuments of geography are globes. Celestial globes are much more ancient than terrestrial ones. The earliest of these with which we are acquainted is one made of copper engraved in the Arab-Cufic character of the 11th century. It is preserved in the Bibliothèque Nationale de Paris, Sect. Géog., No. 396 (see fig. 1). In Italy the

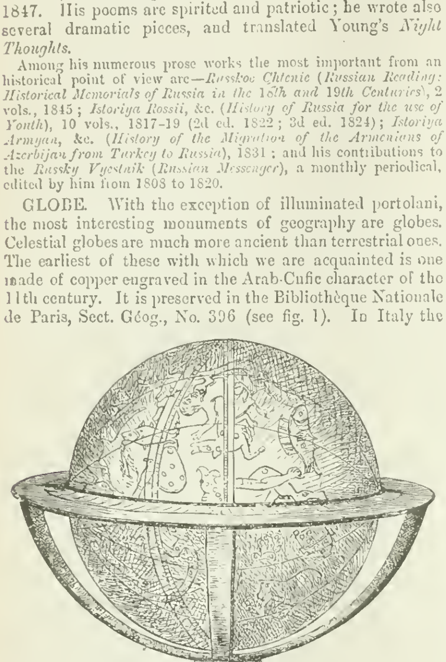

FIG. 1.—Globe in Bibliothèque Nationale, Paris.

emperor Frederick II. (1197-1250) possessed a celestial globe of gold, probably also of Arab manufacture, on which the stars were indicated by pearls; from the scanty information that has come down to us respecting it we should imagine that it partook somewhat of the nature of an armillary sphere, as representations of the planets were to be seen in the interior of it. To these succeed a series of globes ranging from the 15th to the 17th century.

One might suppose that many specimens of these globes would exist in public libraries, but diligent research has shown that the majority of those not made of metal are more perishable than maps, and much more so than books. The earliest terrestrial globe of any importance known to geographers is the well known one of Martin Behaim of Nuremberg, bearing the date of 1492. It is about 21 inches in diameter, and is made of pasteboard covered with parchment, on which are designed historical pictures with their legends written in Old German in various colours. The first meridian passes through Madeira, and the only other lines on it are those of the equator, the two tropics, and the polar circles. It has also a meridian of iron and an horizon of brass, but these were not added until 1500, which date they bear. As a monument of geography it is of the highest importance, being the only original document that has come down to us in this form embodying the geographical views of its author with those of his gifted contemporaries, Toscanelli, Columbus, &c. This globe represents with some slight modifications most of the disproportions of the Ptolemaic geography, into which is incorporated information evidently derived from the travels of Marco Polo and Sir J. Maundeville. It was executed by Behaim, assisted by Holtzschuer, while on a visit to his native city (1491-3), after a sojourn of five years at the Azores. It is still preserved in the house of his ancestors at Nuremberg. An exact and authenticated facsimile of it, mounted on a stand, is preserved in the Bib. Nat. de Paris, Section Géographique, No. 393.[1]

The Laon globe of 1493, in the possession of M. Leonce Leroux of the Administration Centrale de la Marine à Paris, is made of red copper engraved, about the size of a 36-pounder cannon ball, and pierced by a socket which at a former period held an axis. It has all the appearance of having formed part of the apparatus of an astronomical clock. On the globe are engraved many circles. The first meridian, as in the globe of Behaim, passes through Madeira. In the northern hemisphere meridian lines are drawn at every 15th degree; these meridians are again crossed by certain parallels of latitude corresponding somewhat to the seven climates usually found on maps of the period. Neither meridians nor parallels are to be traced on the southern hemisphere. Although this globe bears a legend upon it dated 1493, it is evident that the general geographical information recorded upon it is earlier than that on Behaim's globe by five or six years. In all probability it was that current in Lisbon between the voyage of Diego Cam to the Zaire or Congo river, 1484-5, and that of Bartholomeu Diaz to the Cape of Good Hope in 1487. The author is unknown. A heart-shaped projection of this globe was published in the *Bulletin de la Soc. de Géog. de Paris*, 4me série, tom. 20te, 1860.

In all probability the earliest post-Columbian globe extant is the one now preserved in the Lenox Library, New York. It was found in Paris some twenty-five years ago by Mr Richard M. Hunt, who, upon learning its value, presented it to the Lenox Library, of which he is the architect. This globe is of copper, about $4\frac{1}{2}$ inches in diameter and engraved. It is pierced for an axis, and probably, like the Laon sphere, formed the principal feature of an astronomical clock or armillary sphere. The date assigned to the Lenox globe by Mr Henry Stevens, who first recognized its importance, and had an accurately drawn projection made of it in the Coast Survey Bureau at Washington in 1869, is about 1506-7. A comparison of that projection, now published in reduced facsimile for the first time (see fig. 2), with several contemporary maps and globes, serves to show the accuracy of the date assigned to it, as also to suggest its French origin. The author is unknown.

[1] For other reproductions of it see J. C. Doppelmayr, *Historische Nachricht von den Nürnbergischen Mathematicis und Künstlern*, Nuremberg, 1730; Dr F. W. Ghillany, *Geschichte des Seefahrers Ritter Martin Behaim*, Nuremberg, 1853; and Jomard, *Monuments de la Géographie*, Paris, 1854.

The next globe that demands attention is the famous one made at Bamberg in 1520 by Johann Schöner, at the cost and charges of his friend Johann Sayler. It was afterwards taken to Nuremberg by Schöner, where it is still preserved in the town library. The importance attached to this globe is that hitherto it has always been regarded as the first of its kind to portray the discoveries in the New World, in combination with the notions that had previously prevailed of the space intervening between Europe and Africa on one side, and the eastern ends of Asia on the other. Schöner in this globe breaks up America into as many islands as possible. Thus North America is shown as one large island. He also represents South America as a large island, to which he applies several names, among which we observe, for the first time on a globe, the name "America." North America was not comprised under the name until a later date. Schöner's globe indicates two great series of North American discoveries, of which one, commencing with the Cabots in 1497, extended by degrees to Canada and Nova Scotia, while the other, commencing with Columbus in 1492, advanced from the Bahamas slowly northwards to Virginia and New England. Between these two points there remained a region more or less known which on this globe is indicated by open water. In depicting the east coast of Asia and the many islands there, including Japan and Java-major, the author follows the globe of Behaim. By some it has been regarded as a new edition of Behaim. There are in Germany several globes which depict the world nearly in the same manner as Schöner's. One, preserved in the city of Frankfort, bearing the same date (1520), is about $10\frac{1}{2}$ inches in diameter, and has been reproduced by M. Jomard in his *Monuments de la Géographie*, pl. 15 and 16. There is also another in the library of the grand-duke of Weimar. As all these globes give to North and South America the configuration they have in Schöner, Humboldt was of opinion that they all are, with respect to America, copies of an older chart "hidden perhaps in the archives of Italy or Spain."

There is at Nancy a terrestrial globe which is also a geographical curiosity. It is of chased silver gilt, about 6 inches in diameter; the land portions are represented in fine gilding, the water by azure blue enamel. One of the

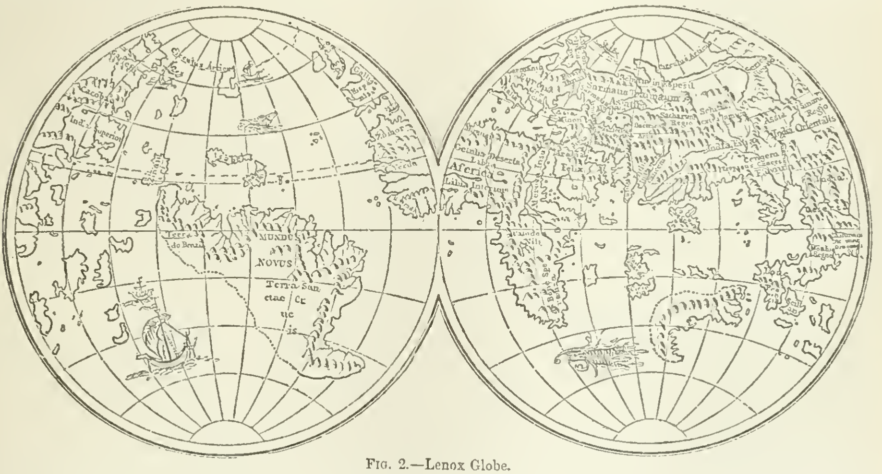

Fig. 2.—Lenox Globe.

hemispheres opens outwards horizontally, the interior being also gilt. It formerly served the purpose of a pyx on the altar of the church of Notre-Dame-de-Sion, to which church it was offered by Charles IV., duke of Lorraine, on his return in 1663. It is now preserved in the town library. It has all the appearance of having been made at a period immediately following the execution of the curious heart-shaped map by Oronce Finé of 1531, found in the Paris edition of Grynæus, 1532. In this map and the globe at Nancy we find the New World still regarded as an extension of eastern Asia or the Indies, the geography of Marco Polo being apparently mixed up with that of Cortez in Mexico. A stereographic projection of this globe was published in *Mem. de la Soc. Roy. de Nancy*, vol. viii., 1836.

There is another globe somewhat larger than the preceding, made of copper engraved, known as the De Bure globe. It has no date, but its geographical features in the main bear a close resemblance to the globe at Nancy. It is supposed to be of Spanish origin. It is preserved in the Bib. Nat. de Paris, Section Géographique, No. 427.

In the same section, No. 394, is preserved the Ecuy globe, made of brass. The word "Rhotomagi" (Rouen) is appended to the title, whence it seems to be of French origin. We have on this globe the first indications of a separation between East Asia and North America. The date appears to be about 1540.

In 1541 the illustrious Gerard Mercator constructed and published at Louvain a terrestrial globe, and in 1551 a companion celestial globe.[1] These are without doubt the most important monuments of the kind of the 16th century. They were to be found in nearly all the universities and libraries of Europe, in the private libraries of the rich, and the class room of the teacher of navigation. We also know from Blundeville's *Exercises* that up to the date of 1592 they were in common use in England. Six pairs at least of these globes were sold for Mercator by Camerarius of Nuremberg; others we know were sold at the book-fairs of Frankfort-on-the-Main; and Mercator himself presented one pair to the university of Louvain, of which he was a student and a master of arts. Yet only two sets of the original globes are known now to exist in Europe—one in the royal library at Brussels, discovered in 1868, the

[1] At a later period Mercator also made for Charles V. a pair of globes, the terrestrial one of wood, the celestial one of glass; these were destroyed in the subsequent troubles in the Low Countries.

other in the imperial court library at Vienna, discovered in 1875. These globes are about 2 feet high, and when first mounted on stands with all their accessories of meridians, horizons, &c., must have presented a noble appearance. They are only known to us by facsimiles of gores reproduced from the originals in their natural size, published at Brussels in 1875, with an introduction to their history by Dr J. Van Raemdonck. A comparison of the terrestrial globe with all those that preceded it shows it to be a monument at once of learning and of science, worthy of the greatest scientific geographer of his age.[1] The authors used by Mercator in his configurations of the continents of the Old World were chiefly Ptolemy and Marco Polo. For representing the New World he evidently acquainted himself with the narratives of all the most recent voyages, maps, and charts that were to be had in his time. These were used with the greatest possible skill and discrimination; and in consequence we have the best delineation of the world on a globe that it was possible to produce at the period. In Mercator's time the imperfect knowledge of pilots in general, and the defects of their charts in plano, made terrestrial globes much more useful to navigators than we can well realize to-day. Convinced of their importance Mercator neglected nothing in order to adapt them to the use of seamen; he therefore added to his globes the rhumbs hitherto found only on plain charts. He added yet another improvement, delineating about thirty leading stars of the principal constellations according to their magnitudes and their positions in the heavens. These important improvements appear to be quite peculiar to the globes of Mercator.

An examination of the celestial globe of 1551 also reveals many improvements introduced by Mercator in his delineation of the heavens. Without counting a great number of stars as yet unresolved into symbolical groups, Mercator gives us 934 fixed stars, distributed in 51 constellations. Two of the latter are entirely new, and are not met with on later celestial globes. These are Antinous, formed of six stars on the equator below the Eagle, and Cincinnus, or the Lock of Hair, formed of one star and two nebulæ in the north hemisphere, under the tail of the Great Bear.[2]

The Globe of Euphrosynus Ulpius of 1542.—This globe, apparently made in Rome, is now preserved in the museum of the New York Hist. Soc. It is $15\frac{1}{2}$ inches in diameter, made of copper, and is divided into two hemispheres on the line of the equator, and fastened together with iron pins. The normal position of the globe in its stand being vertical, the north pole with its hour-circle is surmounted by an iron cross. It is encompassed by a horizon, upon which are engraved the signs of the zodiac. The height of the whole apparatus, with its stand of oak, is 3 feet 8 inches. It was executed by Euphrosynus Ulpius, a name unknown to geographers, and is dedicated to Cardinal Marcellus Cervinus, D.D., who, thirteen years later, was elevated to the Roman see, under the title of Marcellus II., and survived his election only twenty-two days. The first meridian line passes through the Canaries; the remaining ones are repeated at intervals of 30 degrees. Great prominence is given to the line of demarcation between Spain and Portugal in the New World, laid down by Pope Alexander VI. The geographical features peculiar to this globe are two, evidently copied from the Verrazano map of 1529,—the legend found upon it recording the voyage made by Verrazano on behalf of Francis I. in 1524, and the rude line drawn south-east from about 57° to 36° N. lat. The latter, common to both map and globe, gave rise to the curious conception of the "Mare Verrazano," the origin of which has exercised the minds of geographers from Hakluyt down to our day.[3]

In the South Kensington Museum is a celestial globe $7\frac{1}{2}$ inches in diameter, made of gilt metal (it is supposed for Rudolph II.), by G. Roll and J. Reinhold at Augsburg, dated 1584.

Mollineux Globes of 1592.—The true successor of Mercator in the art of globe-making was neither J. F. Van Langren, Jodocus Hondius, nor W. J. Blaeu, as has been supposed, but an Englishman named Emerie Mollineux, the friend of Hakluyt, and of John Davis of Arctic fame. The earliest notice we have of the terrestrial globe made by him is the prospective one of its intended publication, to be found at the end of the preface to the 1st edition of Hakluyt's *Voyages* of 1589. The "comming out of the very large and most exact terrestriall globe" of Mollineux there referred to, with its companion celestial one, was accomplished in 1592. At the same time appeared a manual in English for their use, by Thomas Hood of Trinity College, Cambridge; and in 1594 appeared another manual, written expressly for them in Latin by Robert Hues, entitled *Tractatus de Globis et eorum usu.* Two years afterwards this latter was translated by J. Hondius, and published in Amsterdam, giving rise to the notion, apparently still prevalent in Holland, that Hues wrote this book expressly for Hondius,—a bibliographical blunder involving injustice to the memory of Mollineux. The only examples of these once famous globes known to exist are now preserved in the library of the Middle Temple, London. They are both 2 feet in diameter, mounted on stands, with the usual accessories of horizon, meridian, &c. The celestial globe still bears the date of 1592, but the terrestrial appears to have received additions, and the date has been altered by the pen to 1603. The best description of these two globes is a contemporary one to be found in Blundeville's *Exercises*, London, 1594, which enables us to realize the difference between these globes and Mercator's:—

> "The mappe which covereth Mr Molineux his terrestriall globe differeth greatly from Mercator his terrestriall globe, by reason that there are found out divers new places, as well towards the North Pole as in the East and West Indies, which were unknowne to Mercator. They differ also greatly in names, longitudes, latitudes, and distances of such places set down not only in Mercator's globe but also in divers maps more lately made. As touching the map of the stars which covereth the celestiall globe of Mr Molineux, I do not find it greatly to differ from that of Mercator, saving that Mr Molineux hath added to his celestiall globe certain southern images, as the Crosse, &c. In the great terrestriall globe the voyage, as well of Sir F. Drake as of Mr Th. Candish, is set down and shewed by help of two lines, the one red, and the other blew, whereof the red line doth show what course Sir Francis observed in all his voyage, as well outward as homeward; and the blew line showeth in like manner the voyage of Master Candish, and in that globe is also set down how farre Sir Martin Furbisher discovered towards the north parts. Nothing is set down in this globe but only the outermost end of his voyage, named Forbisher's Straights, having in N. lat. about 63 degrees."[4]

From a later inscription on the terrestrial globe we learn that it was still further repaired in 1818 by Messrs J. & W. Newton, globe makers, of Chancery Lane. These globes are of special interest as the first of the kind made in England and by an Englishman.

In the same year J. Van Langren, and Jodocus Hondius five years later (1597), put upon record their intention of bringing out pairs of globes; but no globes of their

[1] According to Dr F. Wieser, a third example of it is preserved at Weimar.

[2] A pair of Mercator's globes reproduced in facsimile, natural size, were conspicuous features in the Belgian section of the exhibition connected with the geographical congress held in Paris in 1875.

[3] The history of this curious geographical puzzle will shortly be dealt with by Mr Henry Stevens, to whom we are indebted for much information respecting this globe. A projection of a portion of it is to be seen in the *Mag. of American History*, vol. iii. p. 17, Jan. 1879.

[4] This last remark does not appear to be quite accurate, as John Davis says:—"How far I proceeded doth appear upon the globe made by Master Emery Mullineux" (*Hydrographical Description*, London, 1595).

manufacture are known to exist of a date anterior to the 17th century. To Mollineux succeeds William Jansson Blaeu (1571–1638), a celebrated mathematician, map-drawer, and publisher of Amsterdam, who secured a considerable reputation by publishing terrestrial and celestial globes, which excelled in beauty and accuracy everything that had preceded them. He was succeeded by his son John, editor of the well-known *Atlas Major* in 11 vols. folio. The elder Blaeu constructed globes in three sizes, the largest measuring 27 inches, the next about 14½ inches, the smallest about 7½ inches in diameter. The bodies of the globes were usually made of wood, covered with plastic composition upon which the maps were pasted in gores, thus admitting of corrections being made from time to time. In consequence of this no examples of his globes are known to exist without additions of the 17th century. Mr P. J. K. Baudet, who wrote the *Life and Works of W. J. Blaeu*, Utrecht, 1871, notwithstanding his utmost exertions, could find in Holland only two pairs, one in the astronomical observatory at Leyden, the other in the physical museum at Amsterdam, the latter being of the smallest size. Another pair, however, of the smallest size, dated 1603, are in the possession of Mr Henry Stevens; and a pair of the medium size, belonging to Mr Fred. Müller of Amsterdam, were exhibited at the geographical congress held in Paris in 1875. Of the last pair, the celestial globe bears the date of 1603. The terrestrial globe, though still bearing the date of the first edition of 1599, has received corrections of a much later date, embodying the geographical results of the first Dutch expedition to the East Indies under Houtman in 1598, and those of Oliver Van Noort in the same year, and of Le Maire in 1616. From a report presented to the French minister of public instruction by M. E. Cortambert in 1855 we learn that a pair of fine globes by Blaeu is preserved in the Bibliotheque de Bourges. Two pairs of the 27-inch globes of Blaeu's heirs have recently been found, the first in the library of Trinity House, Tower Hill, the second in the British Museum, of date about 1645. In their main features the globes of Blaeu coincide more or less with several well-known maps published at this period, and with others to be found in the atlases of Mercator and Hondius.

The only remaining globes of the 16th century known to us are two pairs by A. F. Van Langren; the first, preserved in the Bib. Nat. de Paris, Sect. Géog., No. 405; the second in the Bibliothèque de Grenoble, found by M. E. Cortambert in 1855. In the latter library is also to be seen a curious terrestrial globe in MS., made by some monks of the Grande Chartreuse; it is undated, but is supposed to be of the 17th century.

It remains to notice briefly the few globes of a later period that are remarkable either for their historical interest, peculiar form, or great size. In the Academy of Sciences at St Petersburg there are or were four that call for notice. The first is a terrestrial one, 3 feet in diameter, made at Pleskow by a deacon named Karpow Maximow. It is supposed to have been the first made in Russia. This is accompanied by a planetary 2½ feet in diameter, presented to Peter the Great by the company of English merchants established in Russia. Here is also preserved a large terrestrial globe of copper, made in 1664 by the heirs of W. J. Blaeu; it is 7 feet in diameter, and was brought from Moscow about 1747. In the same academy is preserved the famous Gottorp globe; it is a hollow sphere 11 feet in diameter, containing a table and seats for twelve persons. It was made by A. Bush in 1654, under the direction of Olearius, from designs found among the papers of Tycho Brahe, and was not finished until 1664. The outside represents the terrestrial globe, the interior showing the heavens; the stars are distinguished according to their respective magnitudes by gilt nails of various sizes. It was presented to Peter the Great by Frederick IV. of Denmark in 1713. The Czar was so pleased with his acquisition that he had it transported by water to Revel, and thence on rollers and sledges to his new capital. Being partly burnt in 1747, it was repaired again 1751, and adjusted to the horizon of St Petersburg, the meridian and horizon being made by an English mechanic named Scott.

The two largest complete globes existing are those preserved in the "Salle des Globes" in the Bibliothèque Nationale of Paris. They are each 12 feet in diameter, and were made under the direction of the famous Italian geographer Coronelli in 1683, by order of Cardinal d'Estrées, the Spanish ambassador, and presented by him to Louis XIV. They are made of wood, very solid, and are covered with cloth or canvas on which the configurations have been drawn by an able artist, particularly those on the celestial globe. The meridians and horizons are of bronze, the latter are sustained by eight columns of the same material, and the former by two bronze feet highly ornamented. Between the brackets that form the feet of the meridians is placed, under each globe, a compass in marble and bronze; the ascent to these is by five steps which encircle each globe. On the celestial globe painted blue are marked all the fixed stars, and their constellations with the paths of the comets, also the places of all the planets at the moment of the birth of Louis XIV. This last event is alluded to also in a hyperbolical inscription to be seen on a copper plate to be found on it. The geography of the terrestrial globe is based upon that of Sanson; the sea being painted in deep blue, and the land portions being white, the inscriptions upon it are very legible. There is also to be seen on it a bust of the king placed above a dedication somewhat like that on the celestial globe. Although these globes are without any great scientific value, they serve to indicate the astronomical and geographical knowledge prevalent in France at the end of the 17th century. A good illustration of these globes, accompanied by a detailed account of their history, by M. C. Letort of the Bibliothèque Nationale, will be found in *La Nature*, No. 116, August 21, 1875. In the Bib. Mazarine is preserved a terrestrial globe 8 feet in diameter, known as the Louis XVI. globe. It is made of copper engraved, the names of places being inlaid with black, and is mounted on a temporary wooden structure, the beautiful accessories of bronze cast for it never having been finished or utilized; they are, however, to be seen in another part of the library. We learn from a MS. description of this globe, also preserved here, that it was made for Louis XVI., himself no mean geographer, by the direction of Vergennes in 1784. The geography of it is based upon that of D'Anville, corrected by Robert de Vaugondy and Le Clerc; it also indicates the net results of all the voyages round the world made up to this period.

About 1764 Dr Roger Long of Cambridge, professor of astronomy and master of Pembroke, erected in an outbuilding of his hall a sphere 18 feet in diameter. The concave interior was lined with tin, upon which was depicted all the stars and constellations visible in England on the horizon of Cambridge. The lower part of the sphere was cut off at the diameter of 13 feet, and the truncated meridians were screwed down on to a circle which ran on rollers of lignum vitæ, the whole being movable by simple machinery provided for the purpose. It was capable of holding thirty persons, and had an entrance by six steps placed over the South Pole. In the centre was placed a planetarium. Although it is said funds were left for its preservation, it appears to have fallen into neglect and decay.

To these succeed in order of size the globes known as "Georamas." One exhibited in Paris in 1844 was 30 feet in diameter; another by Delanhard erected in 1823 was 40 feet in diameter; of the last the proprietor published a description. Then follows Wyld's well known "great globe," erected in Leicester Square, London, 60 feet in diameter. The largest appears to have been the one erected by Colonel Langlois in Paris in 1825, on the Champs Elysées. This was 120 feet in diameter. As has been truly said, these structures served more to satisfy curiosity than to impart scientific instruction. (C. H. C.)

Manufacture.—The manufacture of artificial globes has changed but little in character during the last hundred years. Such improvements as have been introduced have reference either to the quality of the maps or to the mode of mounting the globes. The number of sizes manufactured has also been increased. The diameter has always been used to indicate the size of the globes, and these now produced by the various makers vary from 1 to 36 inches.

The process of manufacture differs little if at all in the sizes of globes ranging between 3 and 25 inches. Thus supposing, for example, a 12-inch globe (the ordinary school globe) is required to be made, a spherical mould measuring some quarter of an inch less in diameter is prepared on which to form hemispherical caps that are to constitute a hollow foundation for the globe. This mould, made preferably hollow for lightness, and having a central axle terminating in poles, is well greased on the surface to enable it to resist damp. To form the caps, strips of white paper, damped in water, are first applied to the mould to form a coating thereon. Upon this coating is applied brown paper saturated with paste, and alternate layers of white and brown paper are added, until the required thickness of paper, say $\frac{1}{16}$th of an inch, is obtained. The change of colour is adopted simply as a guide to the workman, that he may know when he has completed a coating of paper. The mould thus covered is put aside to dry, and after two or three days the paper covering is severed into two hemispherical caps, which are then drawn off from the mould.

A wooden axle furnished with poles (which will eventually form the north and south poles of the globe) is provided, of such a length as will enable the caps, when fitted over the poles, to meet at their severed edges. By means of glue these edges are joined up, and the caps are firmly attached to the ends of the axle. Thus a hollow sphere of rude outline is formed, measuring somewhat less than 12 inches in diameter. The next operation is to bring this sphere to the required diameter for the globe, and to make it perfectly true. For this purpose the ball is coated with a plastic composition of whiting, boiled oil, and glue, and passed under the action of a steel semicircle fitted with bearings for receiving the poles of the ball, and retaining the same in place while the ball is being slowly rotated. By applying to the ball repeated coatings of this composition, and removing all superfluities by means of the gauging edge of this steel semicircle, a smooth spherical surface is eventually obtained. When the ball is finished and hard, it is tested in loose bearings to see whether it will remain quiescent in all positions. If it shows a tendency to run round, the ball is balanced by the introduction of a counterweight at the highest part of its periphery. When the ball is balanced, and the hole made good by which the counterweight was introduced, the surface is polished, after which it is ready to receive the map. For 12-inch globes the maps of the earth and of the heavens are engraved on steel or copper plates in 12 gores, measuring each 30 degrees in width, and extending from pole to pole, or more usually to the 70th degree of latitude, the remaining portion of the maps being made up by north and south pole plates. This arrangement is somewhat modified for larger globes. Thus, for globes above 15 inches in diameter, the gores are divided in the line of the equator, and they are also divided longitudinally for say one-fourth of their length at the 15th degree, in order to facilitate the laying down of the maps evenly upon the spherical surface. Preparatory to covering the sphere with the map, it is marked with lines corresponding to the equator, parallels of latitude, and lines of longitude on the map, such lines serving as a guide for the workman. The gores of the map having been carefully cut out, they are damped and laid down in proper order in a pile upon a pasting board. The workman then covers his polished ball, for the length and breadth of a gore, with paste, or, more properly, a preparation of starch, and having coated with starch the uppermost gore of the pile, he with an ivory knife lifts that gore, and lays it upon the pasted portion of the ball, fitting it to the lines marked thereon, and smoothing down creases, at the same time taking care that the latitude and longitude lines of the gore correspond exactly with the lines on the ball. Having laid down this gore in place, he next applies a second gore in like manner, taking care that the two gores shall join each other, and not expose any portion of the underlying surface. In this way the workman proceeds until all the gores are in place, and he finishes the pasting of the ball by applying the pole papers which fit respectively on to the opposite ends of the gores. The map has next to be sized, preparatory to its being coloured, in order to form a resist to the varnish which is subsequently to be applied to the globe. The map is tinted and outlined with water colours, and a coat of varnish is then applied. When this is dry the globe is ready for mounting; after which the varnishing operation is completed by the application in a heated room of several coats of spirit varnish following quickly the one on the other. Some skill is requisite in laying on the varnish, so as to obtain a surface as clear and smooth as glass. This result is unfortunately evanescent, as the best varnish is liable to discolour and to crack, and thereby obscure to some extent the legibility of the underlying map. After varnishing the globe will be fit to handle in from four to six days. For the purpose of mounting the globe a flat ring, termed the brazen meridian, is provided, and bearings are formed thereon to receive the poles of the globe. This ring is divided on its face into 360 degrees, the numbering of these degrees being from 0 (which corresponds with the equator) to 90 at the poles on one half of the ring, and on the other half the numbering starts from the poles at 0, running up to 90, which corresponds with the equator. Fitted to the poles, and capable of turning thereon, are hour circles, which underlie the brazen meridian, and are divided and numbered to correspond with the 24 hours of the day and night. The frame for the reception of the globe and ring is formed with a wooden horizon, which constitutes an imaginary line dividing the globe into two equal parts, the portion above the horizon being the visible half, and that below the horizon the invisible half of the sphere. This horizon is covered, like the globe, with papers which are varnished to protect them from injury. The horizon papers near their inner edge are divided into 360 degrees, by which are reckoned the azimuth and the amplitude; they also indicate the points of the compass in the space called the circle of the winds. The horizon of the frame is notched to receive the brass meridian, which rests in a step-bearing fitted to the central pillar or block of the frame, and is held therein by a screw stop, which, entering an annular groove in the back of the meridian, leaves the ring free to turn round in the frame, for the purpose of rectifying the globe, or bringing its axis to any desired angle with the horizon. The fitting of the globe is completed by the quadrant of altitude, consisting of a thin flexible slip of brass, jointed to a clamping nut, which is intended to embrace the brass meridian, and may be adjusted thereon by a tightening screw. This flexible strip or blade is divided off into 90 degrees, corresponding to those on the equator, and is intended to measure distances between any two places upon the curved surface of the earth, or the altitude of the sun, a star, or any planetary body in the heavens, and for this purpose its graduations are numbered from 0 to 90. A useful appendage to the globe frame is a mariner's compass, which facilitates the adjustment of the globes to their true polar position.

The value of a globe, whether terrestrial or celestiel, depends mainly on the quality of the map with which it is covered. Before the present century, English globes were not only poor specimens of the engraver's art, but they showed little attention to accuracy of detail. Now, however, they rank in quality with, if they do not surpass, the best foreign maps, notwithstanding that little encouragement is given to their manufacture. Specimens of globe plates published at the latter end of the 17th century in Italy are yet to be seen, which are a marvel of the cosmographer's art. Under the patronage of the Venetian republic, P. Coronelli, cosmographer to the republic, published a terrestrial and celestial globe of the unprecedented size of 4 feet in diameter, which embodied the utmost scientific knowledge of the time, and in the constellations of the celestial globe showed the finest quality of line engraving at its best period. The composition of these figures served as a basis for the remodelling of the constellations on English globes some 40 years since, at which time the drawing of the figures was not merely barbarous, but absurd. Whether these fine globes were ever manufactured it is now difficult to ascertain, but none are known to exist except a celestial globe produced by the late Mr William Newton, to whom the globe manufacture is indebted for such improvements as have been introduced during the present century, and another which is preserved in the Bibliothèque Nationale of Paris, bearing the name of Deuvez as the maker.

An amusing illustration of the difficulties which attend the delineator of globe plates is to be found in the preface of a book published in 1686, for its author, Mr J. Moxon, entitled *A Tutor to Astronomy and Geography*. Moxon appears to have been a globe-maker, and in expatiating on the improvements to be found in his new terrestrial globe, he says:—"California is found to be an island, though formerly supposed to be part of the main continent, whose north-west shore was imagined to thrust itself forth close to the coasts of Cathaio, and so make the supposed straits of Anian." On his globe, therefore, the peninsula was converted into an island. Precisely the same difficulties are now experienced by globe-makers; and those who have watched, for example, the varied forms which the lakes in Central Africa have taken during the last 25 years will understand at what risk the globe-maker corrects his costly plates, to bring them up to the current geographical knowledge.

The inconvenience attendant on the transport of large globes, manufactured as above explained, not to speak of their excessive cost, led to the introduction of flexible or compressible globes, both on the Continent and in the United States. It does not appear that they have been extensively manufactured, for at the best they were but toys, but they certainly displayed great ingenuity in their construction. A French manufacturer used a spherical bladder as a base for his globe, affixing to it rigid poles, and covering it with a map printed on soft white leather, which map was applied in the same way as the maps on the ordinary globe. By inflating the bladder through a mouth-piece which was fitted with a stop-cock and constituted also one of the poles, the spherical form of the globe was obtained; and by discharging the air, the globe could be compressed into a small space. A frame composed of detached pieces was also provided for this globe, to permit of its being used for working problems thereon. When not required for use, the globe and its fittings could be packed into a very small compass. The best globes of this class were to be seen in the American department of the 1851 Exhibition. These measured 24 inches in diameter, and were manufactured by the late Mr Goodyear, of india-rubber fame; but they never obtained a market in England, and were evidently intended for reference globes only.

Some 50 years ago, the late Mr William Newton designed a pocket globe of some merit. It was mounted in a spherical case, which, opening at a centre line, disclosed the globe mounted in a brass ring and within a fixed horizon. Upon this globe, measuring 3 inches in diameter, numerous problems could be worked with tolerable accuracy. His last and best improvement was what he termed the "Newtonian Globe." It was designed chiefly for common schools, and was set upon an iron pillar, which avoided the cost of a wooden frame. The principal object, however, of the author was to convey to children, in the most simple manner, an elementary acquaintance with the construction and movements of the heavenly bodies. The author's design may be thus briefly explained. The Newtonian globes are hung in stationary rings or meridians, and are capable of turning upon their axes or poles for the purpose of showing the real diurnal motion of the earth and the apparent diurnal motion of the heavens, according to the Newtonian system or real structure of the universe. In place of a wooden horizon, a sliding annular plate is substituted. On the terrestrial globe this plate acts as a terminator to indicate the line of demarcation between day and night. The globe is so mounted upon its pedestal that the axis always lies in its true inclined position, and points to the north polar star in the heavens. A small brass ball representing the sun is made to slide upon the meridian, and it is carried by an arched arm, which connects it with the annular terminator. This ball is adjustable to correspond to the declination or perpendicular position of the sun north or south of the equator, according as the sun's declination varies from day to day throughout the year; and the terminator follows the motions of the sun. Upon the celestial globe a similar sliding annular plate marks the visible horizon of any place on the earth's surface, and shows what part of the heavens would be there seen at a given time; it also assists in illustrating the rising and setting of the sun and moon at different seasons and periods of the year, and the apparent diurnal rotation of the planets and fixed stars. These globes have been well appreciated in the north of Europe, but as they are not in conformity with English school books, they have had little success in the United Kingdom. (A. V. N.)

GLOBE-FISH or SEA-HEDGEHOG. By these names some sea-fishes are known, which have the remarkable faculty of inflating their stomachs with air. They belong to the genera *Diodon* and *Tetrodon*. Their jaws resemble the sharp beak of a parrot, the bones and teeth being coalesced into one mass with a sharp edge. In the Diodonts there is no mesial division of the jaws, whilst in the Tetrodonts such a division exists, so that they appear to have two teeth above and two below. By means of these jaws they are able to break off branches of corals, and to masticate other hard substances on which they feed. Usually they are of a short, thick, cylindrical shape, with powerful fins (fig. 1).

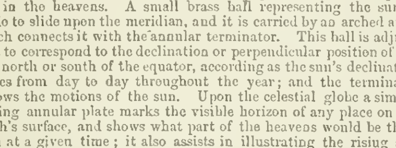

FIG. 1.—*Diodon maculatus.*

Their body is covered with thick skin, without scales, but provided with variously formed spines, the size and extent of which vary in the different species. When they inflate their capacious stomachs with air, they assume a globular form, and the spines protrude, forming a more or less formidable defensive armour (fig. 2). A fish thus blown out turns over and floats belly upwards, driving before the wind and waves. Many of these fishes are highly poisonous when eaten, and fatal accidents have occurred from this cause. It appears that they acquire poisonous qualities from their food, which frequently consists of decomposing or poisonous

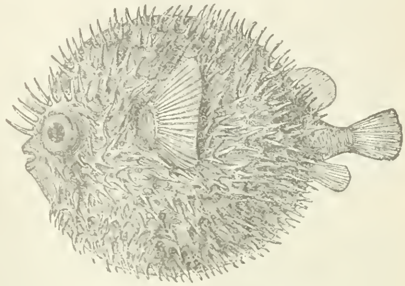

FIG. 2.—*Diodon maculatus* (inflated).

ous animal matter, such as would impart, and often does impart, similar deleterious qualities to other fish. They are most numerous between the tropics and in the seas contiguous to them, but a few species live in large rivers, as, for instance, the *Tetrodon fahaka*, a fish well known to all travellers on the Nile. Nearly 100 different species are known.

GLOBIGERINA. See FORAMINIFERA.

GLOGAU (sometimes called Gross or Great Glogau, to distinguish it from Klein or Little Glogau, in the government of Oppeln), is a fortified town of Prussia at the head of a circle in the Lower Silesian government of Liegnitz, situated partly on an island and partly on the left bank of the Oder, about 80 miles S.E. of Frankfort. Among its more important buildings are the cathedral, in the Gothic style, and a castle in the Renaissance style, now used as a courthouse; and it also possesses a new town-house, a synagogue, a poorhouse, an orphanage, a military hospital, two gymnasia, and several libraries. Situated as it is on a navigable river and at a junction of two or three railway lines, Glogau carries on an extensive trade, which is fostered by a variety of local industries, dealing with tobacco, beer, oil, sugar, vinegar, bone-meal, earthenware, &c. One of its publishing firms—that of Flemming & Company—has attained a wide reputation for maps. In 1871 the population of Glogau, inclusive of the garrison, amounted to 18,266,—of whom 6039 were Roman Catholics and 947 Jews; and in 1875 it was stated at 18,062.

In the beginning of the 11th century Glogau, even then a populous and fortified town, was able to withstand a regular siege by the emperor Henry V.; but in 1157 the duke of Silesia, finding he could not hold out against Frederick Barbarossa, set the place on fire. In 1252 the town, which had been raised from its ashes by Henry the Bearded, became the capital of a principality of Glogau, which continued till 1506, when town and district were united to the Bohemian crown. In the course of the Thirty Years' War Glogau suffered greatly. The inhabitants, who had become Protestants soon after the Reformation, were dragooned into conformity by Wallenstein's soldiery; and the Jesuits received permission to build themselves a church and a college. Captured by the Protestant allies in 1632, and recovered by the Imperialists in 1633, the town was again captured by the Swedish general Torstenson in 1642, and continued in Protestant hands till the peace of Westphalia in 1648. In 1741 the Prussians took the place by storm, and during the Seven Years' War it formed an important centre of operations for the Prussian forces. After the battle of Jena it fell into the hands of the French; and they have reason to be proud of the gallant defence made by Laplane, who held out against the Russian and Prussian besiegers, after the battle of Katzbach (August 26, 1813), till the 17th of the following April.

GLOSS, GLOSSOGRAPHER, GLOSSARY, GLOSSATOR. The Greek word γλῶσσα, meaning originally a tongue, hence a language or dialect, gradually came to denote especially any obsolete, foreign, provincial, technical, or otherwise peculiar word or use of a word (see Arist., *Rhet.* iii. 3, 2); and the making of collections and explanations of such γλῶσσαι was at a comparatively early date a well-recognized form of literary activity. Even in the 5th century, among the many writings of Democritus of Abdera was included a treatise entitled Περὶ Ὁμήρου ἢ ὀρθοεπείης καὶ γλωσσέων. It was not, however, until the Alexandrian period that the γλωσσογράφοι became very numerous. Of many of these it is probable that even the names have perished; but in the writings of Athenæus alone (*c.* 250 A.D.) allusions are to be found to no fewer than thirty-five. Among the earliest may be mentioned Philetas of Cos (d. *c.* 290 B.C.), the elegiac poet, to whom Aristarchus dedicated the treatise πρὸς Φιλητᾶν; he was the compiler of a lexicographical work, arranged probably according to subjects, and entitled Ἄτακτα or Γλῶσσαι (sometimes ἄτακτοι γλῶσσαι). Next came his disciple Zenodotus of Ephesus (*c.* 280 B.C.), one of the earliest of the Homeric critics and the compiler of Γλῶσσαι Ὁμηρικαί; Zenodotus in turn was succeeded by his greater pupil Aristophanes of Byzantium (*c.* 200 B.C.), whose great compilation περὶ λέξεων (still partially preserved in that of Pollux), is known to have included Ἀττικαὶ λέξεις, Λακωνικαὶ γλῶσσαι, and the like. From the school of Aristophanes issued more than one glossographer of name,—Diodorus, Artemidorus (γλῶσσαι, and a collection of λέξεις ὀψαρτυτικαί), Nicander of Colophon (γλῶσσαι, of which some twenty-six fragments still survive), and Aristarchus, the famous critic, whose numerous labours included an arrangment of the Homeric vocabulary (λέξεις) in the order of the books. Contemporary with the last named was Crates of Mallos, who, besides making some new contributions to Greek lexicography and dialectology, was the first to create at Rome a taste for similar investigations in connexion with the Latin idioms. From his school proceeded Zenodotus of Mallos, the compiler of Ἐθνικαὶ λέξεις or γλῶσσαι, a work said to have been designed chiefly to support the views of the school of Pergamus as to the allegorical interpretation of Homer.[1] Of later date were Didymus (Chalkenteros, *c.* 50 B.C.), who made collections of λέξεις τραγῳδουμέναι, κωμικαί, &c.; Apollonius Sophista (*c.* 20 B.C.), whose Homeric *Lexicon* has come down to modern times; and Neoptolemus, known distinctively as ὁ γλωσσογράφος. Coming down to the beginning of the first century of the Christian era we find Apion, a grammarian and rhetorician at Rome during the reigns of Tiberius and Claudius, following up the labours of Aristarchus and other predecessors with γλῶσσαι Ὁμηρικαί, and a treatise περὶ τῆς Ῥωμαϊκῆς διαλέκτου; Heliodorus or Herodorus was another almost contemporary glossographer; Erotian also, during the reign of Nero, prepared a special glossary for the writings of Hippocrates, still preserved. To this period also Pamphilus, the author of the λειμών, from which Diogenian and Julius Vestinus afterwards drew so largely, most probably belonged. In the following century one of the most prominent workers in this department of literature was Ælius Herodianus, whose treatise περὶ μονήρους λέξεως has been edited in modern times, and whose ἐπιμερισμοί we still possess in an abridgment; other names are those of Pollux, of Diogenian (λέξις παντοδαπή), of Julius Vestinus (ἐπιτομὴ τῶν Παμφίλου γλωσσῶν), and especially that of Phrynichus, who flourished towards the close of the 2d century. His *Eclogæ nominum et verborum Atticorum* has frequently been edited. To the 4th century belongs Ammonius of Alexandria (*c.* 389), who wrote περὶ ὁμοίων καὶ διαφόρων λέξεων, a dictionary of words used in senses different from those in which they had been employed by older and approved writers. Of somewhat later date is the well-known Hesychius, whose often-edited Λεξικόν rightly superseded all previous works of the kind; Cyril, the celebrated patriarch of Alexandria, also contributed somewhat to the advancement of glossography by his συναγωγὴ τῶν πρὸς διάφορον σημασίαν διαφόρως τονουμένων λέξεων; the names of Orus and Orion, of Philoxenus, and of the two Philemons also belong to this period. The works of Photius, Suidas, and Zonaras, as also the *Etymologicum Magnum*, to which might be added the *Lexica Sangermansia* and the *Lexica Segueriana*, have already been referred to (DICTIONARY, vol. vii. p. 183). In Latin lexicology the most prominent name is that of Festus, whose only extant work, however, is but an epitome of the treatise of Verrius Flaccus *De Verborum Significatu.* This last-named author had himself been preceded by Varro (*De Lingua Latina*), who in turn makes allusion to several before him "qui glossas scripserunt." The introduction of grammatical and linguistic studies into Rome is usually attributed to Crates of Mallos (*c.* 267 B.C.) mentioned above.

To a special category of technical glossaries belongs a large and important class of works relating to the law-compilations of Justinian. Although the emperor forbade under severe penalties all commentaries (ὑπομνήματα) on his legislation (*Const. Deo Auctore*, sec. 12; *Const. Tanta*, sec. 21), yet indices (Ἴνδικες) and references (παράτιτλα), as well as translations (ἑρμηνείαι κατὰ πόδα) and paraphrases (ἑρμηνείαι εἰς πλάτος), were expressly permitted, and lavishly produced. Among the numerous compilers of alphabetically arranged λέξεις Ῥωμαϊκαί or Λατεινικαί, and γλῶσσαι νομικαί (Glossæ nomicæ), Cyril and Philoxenus are particularly noted; but the authors of παραγραφαί, or σημειώσεις, whether ἔξωθεν or ἔσωθεν κείμεναι, are too numerous to mention. A collection of these παραγραφαί τῶν παλαιῶν, combined with νέαι παραγραφαί on the revised code called τὰ βασιλικά, was made about the middle of the 12th century by a disciple of Michael Hagiotheodorita. This work is known as the *Glossa Ordinaria* τῶν βασιλικῶν.[2]

In Italy also, during the period of the Byzantine ascendency, various glossæ (glosæ) and scholia on the Justinian code were produced;[3] particularly the Turin gloss (reprinted by Savigny), to which, apart from later additions, a date prior to 1000 is usually assigned. After the total extinction of the Byzantine authority in the West the study of law became one of the free arts, and numerous schools for its cultivation were instituted. Among the earliest of these was that of Bologna, where Pepo (1075) and Irnerius (1100–1118) began to give their expositions. They had a numerous following, who, besides delivering exegetical lectures ("ordinariæ" on the *Digest* and *Code*, "extraordinariæ" on the rest of the *Corpus Juris Civilis*), also wrote Glossæ, first interlinear, afterwards marginal.[4] The series of these glossators was closed by Accursius (see ACÇORSO) with the compilation known as the *Glossa ordinaria* or *magistralis*, the authority of which soon became very great, so that ultimately it came to be a recognized maxim, "Quod non agnoscit glossa, non agnoscit curia."[5] For some

[2] See Labbé, *Veteres glossæ verborum juris quæ passim in Basilicis reperiuntur* (1606); Otto, *Thesaurus juris Romani*, vol. iii. (1697); Stephens, *Thesaurus linguæ Græcæ*, vol. viii. (1825).

[3] See Biener, *Geschichte der Novellen*, p. 229 *sqq.*

[4] Irnerius himself is with some probability believed to have been the author of the BRACHYLOGUS (*q.v.*).

[5] Thus Villani (*De origine civitatis Florentinæ*) says of the Glossæ that "tantæ auctoritatis gratiæque fuere, ut consensu omnium publice approbarentur et spretis abolitisque penitus aliis solæ juxta textus legum oppositæ sunt et ubique terrarum sine controversia pro legibus observantur, ita ut propemodum nefas sit, non secus quam textui, Glossis Accursii contraire, sicut antiqua fama referente comperi." For similar testimonies see Bayle's *Dictionnaire*, *s.v.* "Accursius" and Rudorff. *Röm. Rechtsgeschichte*, i. p. 338 (1857).

account of the glossators on the canon law, see vol. v. p. 20 (CANON LAW).

Bible Glosses.—With the decay of learning and originality during the dark ages grew the necessity for making and the custom of transcribing on manuscript copies of the Vulgate various notes, explanatory or otherwise, of the text. Ultimately collections of these glosses or sets of glosses came to be made. They are distinguished as either marginal or interlinear. The most famous collection of *Glossæ marginales* was that made by Walafridus Strabus in the 9th century; it consists of notes grammatical, historical, and theological, culled from the writings of Augustine, Ambrose, Jerome, Gregory, Isidore, Bede, Alcuin, and Hrabanus Maurus, with additions by himself. The interlinear glosses (which as a rule were not so full as the marginal) were sometimes theological but more generally purely philological. A somewhat important collection of interlineal glosses belonging to the former class was made by Anselm of Laon (*c.* 1100). The philological glosses have considerable value to the linguistic student, especially those which originated in Germany during the Carolingian period. The MS. vocabularies in the libraries of St Gall, Munich, Vienna, &c., have been frequently examined of late years with results which have been fully indicated by Raumer in his treatise on the influence of Christianity upon Old High German (*Einwirkung des Christenthums auf die althochdeutsche Sprache*).[1] Some interlinear vernacular translations of portions of the Bible into the Anglo-Saxon, of the 9th and following centuries, have also been recently reprinted (see ENGLISH BIBLE).

GLOSSOP, a municipal borough of Derbyshire, is situated on the extreme northern border of the county, 14 miles E.S.E. of Manchester. It is the chief seat of the cotton manufacture in Derbyshire, and it has also woollen and paper mills, dye and print works, and bleaching greens. The town has for several years been rapidly increasing in size, and now consists of three main divisions, viz., the Old Town (or Glossop proper), Howard Town (or Glossop Dale), and Mill Town. The principal buildings are the town hall and market-house, the temperance hall, the grammar school, and the mechanics' institution. In the immediate neighbourhood is Glossop Hall, the seat of Baron Howard, lord of the manor, a picturesque old building with extensive terraced gardens. On a hill near the town is Milandra Castle, the site of a Roman station.

Glossop was granted by Henry I. to William Peverel, on the attainder of whose son it reverted to the crown. In 1157 it was gifted by Henry II. to the abbey of Basingwerk. Henry VIII. bestowed it on the earl of Shrewsbury, and it now belongs to the Howards. It was made a municipal borough in 1866. The population in 1871 was 17,046.

GLOUCESTER, a county in the west midland district of England, bounded on the N. by Worcester and Warwick, on the S. by Somerset, on the E. by Oxford and Wilts, and on the W. by Hereford and Monmouth. The river Wye forms the western boundary line, the Stratford Avon part of the northern, the Bristol Avon the south-western, and the Thames for some miles the south-eastern. The shape of the county is irregularly elliptical, its greatest length in direct line from Bristol to Clifford Chambers (N.E.) being 54 miles, its greatest width from Down Ampney to Preston, near Ledbury, at right angles, 33 miles. The area, according to the tithe surveys—deducting 3000 acres of detached land incorporated by an Act of 1844 with the counties of Worcester, Warwick, and Wilts, by which they were surrounded, and 17,688 acres of water—amounts to 805,102 acres, mostly cultivable. The county contains 29 hundreds, among which are grouped 351 parishes, 227 tithings, liberties, and hamlets; and the parishes are arranged in 17 poor law unions for the relief of the poor, and 21 petty sessional divisions for the administration of justice and sanitary purposes. Electorally Gloucestershire is divided into the two divisions of East and West Gloucestershire, each returning two members. The latter comprises Dean Forest to the Severn bank (the "Eye between Severn and Wye" of the local proverb), and the country S. of the former river to S.E. and N.E. of Dursley, the chief polling place of the division. East Gloucestershire, comprehending the rest of the county, has its chief polling places at Gloucester and Cheltenham, and besides these boroughs, the former of which returns two members and the latter one, has within its limits the boroughs of Stroud with two members, and Tewkesbury and Cirencester with one each. West Gloucestershire, sharing with North Somerset the city of Bristol, sends two more members to parliament, so that the total representation of the county is 13 members. Gloucestershire contains 28 market-towns and 2 cities.

The population of the county in 1851 was 458,805 (218,187 males and 240,618 females); in 1861 it was 485,770 (229,009 males and 256,761 females); and in 1871 it had increased to 534,320 (251,943 males and 282,377 females). Since the first census in 1801 the population has increased by 283,917 persons, or 113 per cent.

The population of the principal towns at the census of 1871 was as follows:—

Bristol city	182,552	Tetbury	3,349
Cheltenham	41,923	Newent	3,168
Gloucester	18,341	Dursley	2,617
Stroud	7,082	Wotton-under-Edge	2,314
Cirencester	6,096	Newnham	1,483
Tewkesbury	5,409		

The county has three natural divisions, the hill, the vale, and the forest, parallel to each other north and south. (1.) The hill country, which, except the high ground of the Forest of Dean, consists wholly of the Coteswolds, a range extending from Broadway near Chipping-Campden on the north to Bath on the south, and from Birdlip hills on the west to Burford on the east, and traversing the eastern side of the county at an average elevation of 700 feet, though in parts, as at Cleeve Hill near Prestbury, it is 1134 feet above the level of the sea. It covers nearly 300,000 acres of undulating table-land, locally subdivided into the Southwolds betwixt Bath and Badminton, the Stroudwater hills betwixt Tetbury and Woodchester, and the Coteswolds proper, or the rest of the hill country northward. (2.) The Vale, or that level tract extending from the base of the Coteswolds to the east bank of the Severn, the upper or northern part of which expanse is known as the vale of Gloucester, and embraces Gloucester, Cheltenham, Tewkesbury, and some 50,000 acres; whilst the lower is the vale of Berkeley, a tract of similar area reaching from Aust Cliff on the Severn opposite the mouth of the Wye to Robin's Wood hill, two miles south-east of Gloucester. The vale of Gloucester is a continuation of the vale of Evesham. (3.) The Forest division is the peninsula lying between the Wye and the Severn, in modern times limited to the Forest of Dean, but anciently occupying all Gloucestershire west of Severn, and covering some 43,000 acres. The area of the present forest is 23,015 acres, 11,000 of which are enclosed. Its length from north to south is 20 miles, its breadth (east to west) 10 miles.

Geology.—Though the igneous rocks are little developed, the great variety of sedimentary deposits makes Gloucestershire a rich field for the geologist. At

[1] Considerable interest of a similar kind attaches to the so-called *Glossæ malbergicæ* upon the Latin text of the Salic law. It was at one time held that in these glosses we have some relics of the ancient Celtic tongue; but their truly Germanic character was afterwards conclusively established by Jacob Grimm.

Damory, Charfield, and Woodford is a patch of greenstone, the cause of the upheaval of the Upper Silurian basin of Tortworth, in which are the oldest stratified rocks of the county. Of these the Upper Llandovery is the dominant stratum, exposed near Damory mill, Micklewood chase, and Purton passage, wrapping round the base of May and Huntley hills, and reappearing in the vale of Woolhope. The Wenlock limestone is exposed at Falfield mill and Whitfield, and quarried for burning at May hill. The Lower Ludlow shales or mudstones are seen at Berkeley and Purton, where the upper part is probably Aymestry limestone. The series of sandy shales and sandstones which, as Downton sandstones and Ledbury shales, form a transition to the Old Red Sandstone, are quarried at Dymock. The "Old Red" itself occurs at Berkeley, Tortworth Green, Thornbury, and several places in the Bristol coal-field, in anticlinal folds forming hills. It forms also the great basin extending from Ross to Monmouth and from Dymock to Mitcheldean, Abenhall, Blakeney, &c., within which is the Carboniferous basin of the Forest. It is cut through by the Wye from Monmouth to Woolaston. This formation is over 8000 feet thick in the Forest of Dean. The Bristol and Forest Carboniferous basins lie within the synclinal folds of the Old Red Sandstone; and though the seams of coal have not yet been correlated, they must have been once continuous, as further appears from the existence of an intermediate basin, recently pierced, under the Severn. The lower limestone shales are 500 feet thick in the Bristol area, and only 165 in the Forest, richly fossiliferous, and famous for their bone bed. The great marine series known as the Mountain Limestone, forming the walls of the grand gorges of the Wye and Avon, are over 2000 feet thick in the latter district, only 480 in the former, where it yields the brown hematite so largely worked for iron even from Roman times. It is much used too for lime and road metal. Above this comes the Millstone Grit, well seen at Brandon hill, where it is 1000 feet in thickness, though but 455 in the forest. On this rest the Coal-measures, consisting in the Bristol field of two great series, the lower 2000 feet thick with 36 seams, the upper 3000 feet with 22 seams, 9 of which reach 2 feet in thickness. These two series are divided by over 1700 feet of hard sandstone (Pennant Grit), containing only 5 coal-seams. In the Forest coal-field the whole series is not 3000 feet thick, with but 15 seams. At Durdham Down a Dolomitic conglomerate, of the age known as Keuper or Upper Trias, rests unconformably on the edges of the Palæozoic rocks, and is evidently a shore deposit, yielding dinosaurian remains. Above the Keuper clays come the Penarth beds, of which classical sections occur at Westbury, Aust, &c. The series consists of grey marls, black paper shales containing much pyrites and a celebrated bone bed, the Cotham landscape marble, and the white Lias limestone, yielding *Ostrea Liassica* and *Cardium Rhæticum*. The district of Over Severn is mainly of Keuper marls. The whole Vale of Gloucester is occupied by the next formation, the Lias, a warm sea deposit of clays and clayey limestones, characterized by ammonites, belemnites, and gigantic saurians. At its base is the insect limestone bed. The pastures producing Gloucester cheese are on the clays of the Lower Lias. The more calcareous Middle Lias or marlstone forms hillocks flanking the Oolite escarpment of the Coteswolds, as at Wotton-under-Edge, and Churchdown. The Coteswolds consist of the great limestone series of the Lower Oolite. At the base is a transition series of sands, 30 to 40 feet thick, well developed at Nailsworth and Frocester. Leckhampton hill is a typical section of the Lower Oolite, where the sands are capped by 40 feet of a remarkable pea grit. Above this are 147 feet of freestone, 7 feet of oolite marl, 34 feet of upper freestone, and 38 feet of ragstone. The Painswick stone belongs to lower freestone. Resting on the Inferior Oolite, and dipping with it to S.E., is the "fuller's earth," a rubbly limestone about 100 feet thick, throwing out many of the springs which form the head waters of the Thames. Next comes the Great or Bath Oolite, at the base of which are the Stonesfield "slate" beds, quarried for roofing, paling, &c., at Sevenhampton and elsewhere. From the Great Oolite Minchinhampton stone is obtained, and at its top is about 40 feet of flaggy Oolite with bands of clay known as the Forest Marble. Ripple marks are abundant on the flags; in fact all the Oolites seem to have been near shore or in shallow water, much of the limestone being merely comminuted coral. The highest bed of the Lower Oolite is the Cornbrash, about 40 feet of rubble, productive in corn, forming a narrow belt from Siddington to Fairford. Near the latter town and Lechlade is a small tract of blue Oxford Clay of the Middle Oolite. The county has no higher Secondary or Tertiary rocks; but the Quaternary series is represented by much northern drift gravel in the Vale and Over Severn, by accumulations of Oolitic detritus, including post-Glacial extinct mammalian remains on the flanks of the Coteswolds, and by submerged forests extending from Sharpness to Gloucester.[1]

Agriculture.—In the soil of the hill country is so much lime that a liberal supply of manure is required. This is provided by folding sheep, and by paring and burning the turf and strewing the ashes on the surface. Good crops of barley and oats are thus obtained, and even of wheat, if the soil is mixed with clay. But the poorest land of the hill country affords excellent pasturage for sheep, the staple commodity of the district; and the sainfoin, which grows wild, yields abundantly under cultivation. The Coteswolds have been famous for the breed of sheep named from them since the early part of the 15th century,—a breed hardy and prolific, with lambs that quickly put on fleece, and become attempered to the bracing cold of the hills, where vegetation is a month later than in the vale. Improved of late years by judicious crossing with the Leicester sheep, the modern Coteswold has attained high perfection of weight, shape, fleece, and quality. The ewes are good mothers; the wool produce, of which the staple is long and mellow to the hand though rather coarse in quality, is an important item, averaging from 7 to 8 ℔ a head in a Coteswold flock. An impulse has been given to Coteswold farming since the chartering in 1845 of the Royal Agricultural College at Cirencester, to instruct young men in farming and the kindred sciences. The pupils engage in the cultivation of a farm of 700 acres attached to the college, a Gothic structure near Circencester, which has hitherto accommodated on an average 100 inmates. Yet, despite the march of improvement, the aspect of the district is somewhat barren, owing to the absence of trees and hedgerows in the so-called "stone wall" country, and to the size of the farms, sometimes exceeding 1000 acres. Cattle are kept for home needs and to improve the soil. Oats and barley are the chief grain crops. In the Vale the deep rich black and red loamy soil is well adapted for cattle, and a moist mild climate favours the growth of grasses and root crops. A great proportion of the Vale is in permanent pasture; and its farmers look largely to hay as the winter food of their stock. The cattle, save on the frontier of Herefordshire, are mostly shorthorns, of which

GLOUCESTER

ENCYCLOPÆDIA BRITANNICA NINTH EDITION.

many are fed for distant markets, many reared and kept for dairy purposes. The rich grazing tract of the Vale of Berkeley is said to produce annually 1200 tons of the famous double Gloucester cheeses, and the Vale in general has long been celebrated for its cheese and butter. The Vale of Gloucester is the chief corn district. Its aspect is generally pastoral, characterized by grass-lands hemmed in with hedgerows and hedgerow timber, and dotted with apples, pears, and orchard fruit as if to compensate for the comparative barrenness of the Coteswolds. The Vale, from its position and climate, is subject to violent storms of wind and rain.

Statistics of Agriculture for Gloucestershire as returned on 4th of June 1878.

Total area	804,977 acres.
Total acreage under crops, bare fallow, and grass	648,795 ,,
Corn crops (nearly one-half wheat and one-fourth barley)	172,515 ,,
Green crops (about two-thirds turnips and swedes)	62,679 ,,
Grasses under rotation	94,279 ,,
Permanent pasturage	307,026 ,,
Bare and fallow	12,263 ,,
Flax and hops	33 ,,

Live Stock.

Horses	25,725
Cattle	107,236
Sheep	416,853
Pigs	69,331

According to the Owners and Heritages Return 1872–73, the county was divided among 37,705 proprietors, holding land whose acreage was 733,640, and whose gross estimated rental was £2,556,543. The estimated extent of commons and waste lands was 7429 acres. Of the owners 76 per cent. possessed less than one acre, and the average value all over was £3, 8s. 11¾d. There were 10 proprietors who possessed upwards of 5000 acres, viz.:—Lord Fitzhardinge, 18,264; Duke of Beaufort, 16,610; Lord Sherborne, 15,773; Earl Bathurst, 9967; Crown Property, 9575; R. S. Holford (Weston Birt), 9332; Thomas W. C. Master (Cirencester), 7226; Earl Eldon (Encomb), 6664; Lord Sudeley (Winchcomb), 6620; Earl Ducie, 5193.

Forest District.—The surface of this district is agreeably undulating to the height of from 120 to 1000 feet, and its sandy peat soil renders it most suitable for the growth of timber, which is the cause of its having been a royal forest from time immemorial. John Evelyn records that the commanders of the Armada had orders not to leave in it a tree standing. In the reign of Charles I. the Forest contained 105,537 trees, and, straitened for money, he granted it to Sir John Wyntour for £10,000, and a fee farm rent of £2000. The grant was cancelled by Cromwell; but at the Restoration only 30,000 were left, and Wyntour, having got another grant, destroyed all but 200 trees fit for navy timber. In 1680 an Act was passed to enclose 11,000 acres and plant with oak and beech for supply of the dockyards; and the present forest, though not containing very many gigantic oaks, has six "walks" covered with timber in various stages of growth. The two finest oaks of the Forest are a headless giant 45 feet in girth just outside the village of Newland, to the left of the road from Coleford to Monmouth, and "Jack of the Yat," with 19 feet of girth, on the right of the roadside from Coleford to Mitcheldean.[1]

Botany.—The flora of the county, representing that of the two main hydrographical areas of the kingdom and of various geological formations, is extremely rich. Its distinct forms of phanerogams number more than half the British flora. But there is little bog land in the county, and no true sea coast. Hence certain gaps in the list of indigenous plants. There are only some 25 species of ferns; but the rare flowers mentioned below are worthy of note as indigenous.[2] The quantity of mistletoe on the numerous apple trees in the cider orchards of the Vale is another botanical feature of the county, a parasite occurring on other trees also, notably on the Badham Court oak, Sedbury Park, Chepstow, and on the Frampton-on-Severn oak. The elm, used at Bristol for shipbuilding, the willow, and the maple form the chief hedge timber of the Vale, while in the Forest some fine hollies, 6 feet round, are found amongst the oaks. The Spanish chestnut at Tortworth, Piff's elm, Boddington, near Cheltenham, and the Lassington oak are the most notable trees of the county. Mustard was once much cultivated in the Vale, "few houses being without a cannon ball and bowl in which the seeds were bruised" (see Rudge's *General Views of Agriculture of Gloucester*, London, 1807).[3]

Communication and Trade.—Gloucestershire is, in virtue of its two city ports, Bristol and Gloucester, a maritime county. The approach to the first is by the Somerset Avon, to the second by the Severn, or, more strictly, by the Gloucester and Berkeley canal, for which, owing to the dangerous navigation of the Severn, an Act was obtained in 1793, though the works were not completed and opened for traffic till 1827. They consisted of a small tidal basin and lock at Sharpness Point, on the Severn, near Berkeley, connecting the estuary of the river by a ship canal 16 miles long with the city of Gloucester, where there was a suitable discharging dock, and where the canal was again connected with the river Severn by a lock. The gradual extension of the trade necessitated a corresponding extension of the works, and in 1869 a new and enlarged entrance, half a mile further down the river, was projected, with suitable discharging and repairing docks, which last form one large sheet of water on the same level as the old canal connecting them also with Gloucester. These were completed and opened in 1874. Through the river Severn from Gloucester to Worcester and Stourport the port is brought into direct communication with the great system of internal canals throughout the kingdom, and both at Sharpness docks and Gloucester is in direct communication with the Midland and Great Western railway systems. The following are the trade statistics of the year ending September 25, 1878.

	Tons.	Tons.
Foreign imports	428,532	
Coasting	105,224	
		533,756
Foreign exports	51,047	
Coasting	112,176	
		163,223
Total traffic		696,979

Of the foreign imports 253,643 tons, amounting to about 1,200,000 quarters, were grain and seed. The port is well situated for a corn port, its corn warehouses at Sharpness accommodating 100,000 quarters, and those at Gloucester about 130,000 quarters. The new works at Sharpness will accommodate vessels up to 2500 tons burden.

The Severn Bridge railway—5 miles in length—commences at Lydney by a junction with the Great Western Railway and the Severn and Wye railway, crosses the Severn at Purton Passage, and terminates at the Berkeley new docks by a junction with the Midland, thus forming a long-needed connexion between the two sides of the river, and shortening the distances from South Wales to London by 14 miles, and from South Wales to Bristol by 20.

[1] The Forest is locally governed by two crown-appointed deputy gavellers to superintend the woods and mines, and four verderers elected by the freeholders, whose office, since the extermination of the deer in 1850, is almost purely honorary. From time immemorial all persons born in the hundred of St Briavel's, who have worked a year and a day in a coal mine, become "free miners," and may work coal in any part of the Forest not previously occupied. At the present time the Forest laws are administered at the Speech House by the queen's officers and the free miners.

[2] *Anemone Pulsatilla*; *Arabis stricta*; *Thlaspi perfoliatum*; *Hutchinsia petræa*; *Polygala oxyptera* and *calcarea*; *Cerastium pumilum*; *Lotus angustissimus*; *Pyrus pinnatifida*; *Epilobium lanceolatum*; *Sedum rupestre*; *Trinia vulgaris*; *Limnanthemum nymphæoides*; *Veronica hybrida*; *Orobanche Hederæ*; *Cynoglossum montanum*; *Utricularia neglecta*; *Daphne Mezereum*; *Buxus sempervirens*; *Cephalanthera rubra*; *Galanthus nivalis*.

[3] *Authorities.*—Swete's *Flora Bristoliensis*, 1854; Buckman's *Botany of Cheltenham*, 1844; Marshall's *Rural Economy of Gloucestershire*, 1789; H. G. Nicholl's *Forest of Dean*, 1858; and MS. Floras of Gloucestershire, by Messrs Harker and Boulger.

Its great local importance consists in providing a communication from South Wales and Dean Forest and their coal-fields to the Berkeley new docks and the south of England, and is evidenced by the various competing schemes introduced in the same session of 1872 for bridges having the same object. The great iron bridge itself consists of girders constructed on a modification of the bow-string principle, and rests on piers composed of cast iron cylinders sunk down in the rock and filled with concrete. Commencing with the Lydney shore, the spans are as follows:—one of 134 feet, two of 327, five of 171 feet, thirteen of 134, and one of 196 feet (inclusive of swing bridge over canal), making in all 22. The width of the river is 1186 yards, and the total length of the bridge, including the masonry viaduct and swing span, 1387 yards. While the main object of this stupendous undertaking is the transit of coal, arrangements are also contemplated for passenger traffic across the river.

Another canal, once of great importance to the commerce of Gloucestershire, is the Thames and Severn canal, connecting the navigation of these two great rivers, the first of which rises at the back of Leckhampton Hill, at Seven Springs. The Thames and Severn canal begins at Lechlade on the former river, and joining the Stroudwater canal, which crosses the Gloucester and Berkeley, enters the Severn at Framilode. But this canal, though of considerable engineering skill, is now but little used, the Great Western railway having almost entirely superseded it; and it is the same with another canal running from the Severn at Gloucester to Newent and Ledbury.

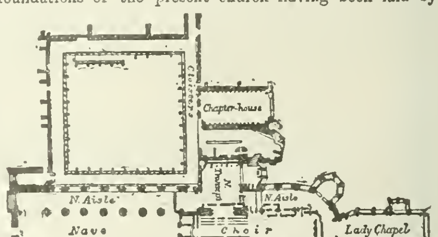
Manufactures.—Gloucestershire is also an important manufacturing county. In the time of Edward III. the manufacture of woollen cloth was introduced into its hill country by the Flemings, attracted probably by the facilities offered for felting by the numerous streams of water flowing from the Coteswolds. The manufacture gradually increased in spite of vexatious legislation, enacted with the view of encouraging native industry, but really tending to hamper the trade. Cirencester is mentioned as its seat in Henry IV.'s reign, and Strond in 1553. The raw material for the manufacture was long obtained from the produce of English flocks, but afterwards a better description of wool was imported from Spain, and towards the close of the last century a still finer quality was got from Germany. The main supply is now obtained from the British colonies in the southern hemisphere. The description of cloth for which Gloucestershire and the west of England have been and still are most famous is broad-cloth, dressed with teazles to produce a short close nap on the face, and made of all shades of colour, but chiefly black, blue, and scarlet. The most prosperous time of the Gloucestershire woollen trade was from 1800 to 1820, during which period the water-power of the various streams was keenly utilized, and a very large proportion of the population was engaged early and late on the several processes, either in their cottages or at the mills. The commercial crisis of 1825 very seriously crippled the trade; and though it afterwards recovered, it is probable that fewer persons have since been employed in it. The further introduction of machinery, enabling manufacturers to dispense with much manual labour, the passing of the factory laws, and the increased facilities of obtaining education, have greatly improved the social habits of the manufacturing population.

History.—Gloucestershire has not been unnoted in the annals of England. At Gloucester Henry III. was crowned; at Berkeley Castle Edward II. was murdered; the Wars of the Roses were ended at the battle of Tewkesbury, where in May 1471 Queen Margaret and Prince Edward were taken prisoners; the repulse which Charles I. sustained at Gloucester, when the earl of Essex compelled him to raise the siege, was the climax of his fortunes. The county is strewn with relics of antiquity. Four Roman roads intersect it; Roman pavements and vestiges are found at Cirencester, Gloucester, Woodchester, and Lydney, and camps—British, Saxon, Danish, and Roman—in numerous places, with many interesting relics of the Middle Ages. Among these are the restored castle of Sudeley, near Winchcombe, a manor house before the Conquest, a baronial castle in the days of Stephen, and the home in succession of the Botelers, Seymours, Queen Katherine Parr, and the Chandos family; Thornbury Castle, an interesting ruin instead of a castellated palace, as it would have been had not its pretensions provoked the jealousy of Wolsey against its builder, Edward Stafford, duke of Buckingham, who was beheaded in 1521; St Briavel's Castle, to the south of the Forest of Dean, an ancient seat of the Norman kings, if not the Saxon, which became the residence of the chief officer of the Forest, and retains in its ruined state a decorated chimney shaft surmounted by a horn, the warder's badge. Berkeley Castle, built prior to Henry II., is an almost unique specimen of a feudal residence in the actual occupation of a descendant of its founder, Baron Fitzharding. Edward II. was murdered in a detached upper chamber of the square tower. The chief mansions of the county are Badminton House (Duke of Beaufort); Oakley Park, Stroud (Earl Bathurst); Tortworth Park, with a chestnut measuring 52 feet, a boundary tree in King Stephen's reign (Earl Ducie); Sherborne Park, Northleach (Lord Sherborne); Clearwell Court, Coleford (Earl of Dunraven); Highnam Court (T. Gambier Parry); Sudeley Castle (J. Coucher Dent); Southam House, the oldest residential house in the county, built in the time of Henry VII., a timber and stone mansion of two stories (Earl of Ellenborough); and Prinknash Park, a 15th century residence of the abbots of Gloucester (B. St John Ackers). Besides these there are various other seats of somewhat lesser size. Among the eminent persons born in the county are the chronicler Robert of Gloucester, Sebastian Cabot, William Cartwright the poet, Thomas Chatterton, Robert Southey, the Rev. John Eagles, and George Whitfield.

Education.—According to the parliamentary returns of public elementary schools for the year ending 31st August 1876, there were in Gloucestershire 408 day schools, 34 of which were also used as night schools. Of these schools 314 were in connexion with the Church of England, or the National Society or parochial; 15 were board schools, 9 Roman Catholic, 36 British and Foreign, and 13 Wesleyan Methodist Conference schools.

See Atkyns's *Gloucestershire*, 1769; Rudder's *Gloucestershire*, a republication of Atkyns, with additions, 1779; Fosbrooke's *Abstract of Records and Manuscripts respecting the County of Gloucester*, 1807, 2 vols. 4to; *The Forest of Dean, an Historical and Descriptive Account*, by H. G. Nicholls, M.A., 1858.

GLOUCESTER, the capital city of the county named after it, 106 miles from London by road and 114 by railway, derives its name from the British Caer-Gloui, near which at Kingsholm the Romans formed their camp of Glevum, vestiges of which remain in four principal streets running N., S., E., and W., and crossing at the centre, as well as in Roman pavements, altars, coins, and pottery. A Roman station under Aulus Plautius, it became a city of Mercia, by name Gleauanceastre, under the Saxons, and is named by Bede as one of the noblest cities in the land. A monastery was founded here in 679, in which in 1022 Bishop Wulstan of Worcester established the Benedictine rule. In the 8th century the city was repeatedly ravaged and burnt by the Danish invaders, and endured ruinous conflicts up to the time of the settlement between Canute and Edmund Ironside. The abbey throve from the time of Canute, the foundations of the present church having been laid by



Gloucester Cathedral.

Abbot Serlo (1072–1104), and Walter Frocester, its historian, becoming its first mitred abbot in 1381. Edward the Confessor often resided at Gloucester, and it was a favourite resort of the Norman kings, of whom Henry I. met with his death from a surfeit of lampreys, for which he acquired a taste there. Henry II. held a great council there, and Henry III. was crowned in the abbey, and "loved Gloucester better than London." The "statutes of Gloucester" were passed in parliaments held there in succeeding reigns; but the tide of royal favour experienced an ebb when Charles I. subjected the city, garrisoned by the Parliamentarians, to a critical siege, which was eventually raised in September 1643 by the earl of Essex. Until 1541 the whole of Gloucestershire lay in Worcester diocese, but in that year it was constituted the see of Gloucester, with the abbey church for its cathedral, and John Wakeman, last abbot of Tewkesbury, for its first bishop. The cathedral may be succinctly described as "a Norman carcase," altered by additions in every style of Gothic architecture. It is 420 feet long, and 144 broad, with a beautiful central tower rising to the height of 225 feet, and topped by four graceful pinnacles. The nave is massive Norman with Early English roof; the crypt also, under the choir, aisles, and chapels, is Norman, as is also the chapter house. The south porch is Perpendicular, with fan-tracery roof, as also is the north transept, the south being transitional Decorated. The choir has Perpendicular tracery and an apsidal chapel on each side, and the triforium carried under the east window in a curve, so as to form a whispering gallery, is very noteworthy. Between the apsidal chapels is a cross lady-chapel, and north of the nave are the cloisters with very early example of fan-tracery, the carols or stalls for the monks' study and writing lying to the south. The beautiful tower is 15th century work. For several years an extensive process of restoration has been in progress. The finest monument is the canopied shrine of Edward II., who was brought hither from Berkeley. By the visits of pilgrims to this the building and sanctuary were enriched. At the step of the altar, too, is a monument in coloured bog oak of Robert Curthose, a great benefactor to the cathedral, the eldest son of the Conqueror, who was interred there; and those of Bishop Warburton and Dr Edward Jenner are also worthy of special mention. One of the oldest houses in the city is the "New Inn in the Northgate Street," a strong and massive timbered house with external galleries and court yards, built in 1450 for the pilgrims to Edward II.'s shrine, by Abbot Sebroke, a traditional subterranean passage leading thence to the cathedral. The timber is principally chestnut.

Plan of Gloucester.

1. St Mark's Church.
2. Ruins of St Catherine's Abbey.
3. St Bartholomew Hospital.
4. St Mary de Lode Church and Hooper's Monument.
5. Statue of Queen Anne.
6. St Nicholas Church.
7. Gas Works.
8. County Hall.
9. Theatre.
10. St John's Church.
11. Wesleyan Chapel.
12. New Hospitals.
13. Blue Coat School.
14. St Michael's Church.
15. Post Office
16. Corn Exchange.
17. Meat and Vegetable Market.
18. St Mary de Crypt.
19. County Gaol.
20. Custom House.
21. City Gaol.
22. St Luke's Church.

Gloucester is situated on a gentle eminence overlooking the Severn, and sheltered by the Coteswolds on the east, while the Malverns rise prominently to the west. The Tolsey or Guildhall stands at the cross, the point of intersection of the four principal streets, in each of which are various quaintly gabled and timbered houses, helping to preserve the ancient aspect of the city. The most modern quarter of it is in the region of the spa, to the south, where a chalybeate spring was discovered in 1814. The principal public buildings are the shire hall, the town hall or Tolsey (occupying the site of the ancient Roman capitol), the county gaol and penitentiary, the East-gate market, the corn market, the infirmary, the lunatic asylum, and the hospital erected in 1861 in place of the four old almshouses. There are 14 churches and several dissenting chapels, and it may have been the olden proverb, "as sure as God's in Gloucester," which provoked Oliver Cromwell to declare that the city had "more churches than godliness." Of the churches four are of special interest: St Mary de Lode, which is very old, and contains a monument of Bishop Hooper; St Mary de Crypt, a cruciform structure of the 12th century, with a beautiful and lofty tower; the church of St Michael, said to have been connected with the ancient abbey of St Peter, and from whose tower the curfew bell is still rung every evening; and St Nicholas church, originally of Norman erection, and possessing a tower and other portions of later date. A new episcopal palace was erected in 1862. There are three endowed schools: the College school, founded by Henry VIII., as part of the cathedral establishment; the Crypt school, founded by Dame Joan Cooke in the same reign; and Sir Thomas Rich's Blue Coat Hospital for 30 boys (1666). The first Sunday school was held in Gloucester, being originated by the Rev. Richard Raikes. Gloucester has returned two members to parliament since the 23d year of Edward I. The city was chartered by Richard III., and is now governed by a mayor, six aldermen, and eighteen burgesses. Its ancient industries were iron-founding, cloth-making, pin-making, and bell-founding, but the last two have been for some time discontinued. It now possesses iron and brass foundries, marble and slate works, chemical works, soap works, rope works, flour mills, manufactories of engines, machines, and agricultural instruments, and boat and ship-building yards. In 1877 the number of British ships that entered the port was 3762, with a tonnage of 272,391, and of foreign ships 549, with a tonnage of 167,200; the number of British ships that cleared was 3992, with a tonnage of 278,773, and of foreign ships 488, with a tonnage of 144,581. The principal imports are timber, corn, wine, and spirits, and the principal exports iron, coals, malt, salt, bricks, and pottery. The town is celebrated for its Severn salmon and lampreys. Near the canals and docks are the remains (a gateway and some walls) of Llanthony Priory, a cell of the mother abbey in the vale of Ewyas, Monmouthshire, which in the reign of Edward IV. had become the secondary establishment. The famous bore of the Severn attains its great height just below Gloucester. The area of the municipal borough is 415 acres, and of the parliamentary borough 1606 acres. The population of the municipal and parliamentary borough in 1861 was 16,512; that of the municipal borough in 1871 was 18,330, and of the parliamentary borough (extended since 1861) 31,804.

See *Handbook to the Cathedrals of England, Western Division*, 1864; *General Architectural Description of the Cathedral Church at Gloucester, with Plans and Sketches*, by Frederick S. Waller, F.R.I.B.A., 1856. (J. DA.)

GLOUCESTER, a city and port of entry of Essex county, Massachusetts, United States, is beautifully situated near the southern extremity of the peninsula of Cape Ann, 30 miles N.N.E. of Boston by rail. It includes six villages—Gloucester village, East Gloucester, West Gloucester, Annisquam, Bay View, and Lanesville. The harbour, opening out into Massachusetts bay, is one of the best on the coast, and is defended by a fort. The prosperity of Gloucester depends mainly on its cod and mackerel fisheries, which employ nearly 400 vessels, with upwards of 3500 men, and have an annual value of about 4,000,000 dollars. For the year ending June 30, 1878, the total value of imports was 81,450 dollars, of domestic exports 36,172 dollars, and of foreign exports 384 dollars. Steamers ply daily between the city and Boston. There are a number of manufactories connected chiefly with the fisheries, and in the neighbourhood there are extensive granite quarries. Gloucester possesses a fine city hall, a high school, seven grammar schools, and a free library. On account of its attractive situation, and the fine scenery of the neighbourhood, it is a favourite summer residence. About 2 miles from it is Norman's Woe, the scene of the wreck of the "Hesperus," celebrated in Longfellow's poem.

Gloucester received its name from the fact that many of its early settlers came from the county of Gloucester in England. It was occupied as a fishing station in 1624, was incorporated as a town in 1642, and was made a city in 1874. It was attacked by the English in 1775 and in 1814, in both cases unsuccessfully. The population in 1800 was 5313; in 1850, 7786; in 1860, 10,904; and in 1870, 15,389, of whom 4007 were foreigners.

GLOUCESTER, ROBERT OF. See ROBERT OF GLOUCESTER.

GLOVE (Saxon *glof*), a covering for the hand, with a separate sheath for each finger. Among our ancestors, to throw down the glove or gauntlet was equivalent to a challenge to single combat, and the person thus defied signified his acceptance of the challenge by taking up the glove, and casting down his own,—which ceremony was regarded as a mutual compact to meet at the time and place specified. This custom, according to Favyn (*Théâtre d'Honneur et de Chevalerie*), was derived from the Oriental mode of contracting sales of land and the like by giving the purchaser a glove, by way of delivery or investiture; and to this effect he quotes Ruth iv. 7 and Psa. cviii. 9, passages where the word commonly translated "shoe" is by some rendered "glove." Du Cange quotes from a charter of the 13th century an instance of re-investiture or restitution symbolized by the person depositing his glove on the earth. The use of gloves is of high antiquity. There is reason to believe the ancient Persians wore them, since it is mentioned in the *Cyropædia* of Xenophon that on one occasion Cyrus went without his gloves; and we know that some kind of protecting coverings for the hands were used by the Greeks and Romans in certain kinds of manual labour, although their precise form is unknown.

The word *gantus*, used for a glove in mediæval Latin, is obviously of Teutonic derivation. In the life of St Columbanus, written by Jonas, abbot of Bobbio, in the 7th century, gloves for protecting the hands in manual labour are spoken of as "tegumenta manuum quæ Galli *wantos* vocant." A pair of gloves are mentioned in the will of Bishop Riculfus, who died 915 A.D. Gloves did not become articles of ecclesiastical vestment till the 12th century. They do not appear in the Bayeux tapestry, and they did not come into general use in England till the 13th century. Matthew Paris, noticing the burial of Henry II. (1189), mentions that he was buried in his coronation robes, with a golden crown on his head and gloves on his hands. Gloves were also found on the hands of King John when his tomb was opened in 1797, and on the hands of Edward I. when his tomb was opened in 1774. In the 14th century they were in common use among the better classes. In the 16th century they were frequently embroidered with great elaboration, and in the reign of Charles II. the short sleeves of the ladies' dresses brought in long gloves reaching almost to the elbow. It is an old custom in England that a pair of gloves are given by the sheriff to the judge who presides at a maiden assize; and in Scotland white gloves are given to the judges on a maiden circuit,—that is, when there are no cases for trial.

The manufacture of gloves was early introduced into the British Islands, and such was the dignity of the craft that, as early as the reign of King Robert III., the incorporation of glovers of Perth was chartered—a wealthy guild still existing, although the calling has long ceased to characterize that town. The glovers' company of London received armorial bearings as early as 1464, but the body was not chartered till 1638; and in Worcester, which has long been the principal British centre of the trade, a company was incorporated in 1661.

The glove industry of the present day is both extensive and diversified, seeing that gloves are now almost universally worn, and made of various classes of material and in several different ways. Of yarn, thread, silk, and cloth gloves it is unnecessary to speak, as these varieties are, in comparison with leather gloves, of comparatively little importance. The leather employed by glovers is prepared from the skins of deer, sheep and lambs, goats and kids—the last being by far the most important. The skins are prepared either by the ordinary processes of shamoying for wash-leather and doe or buck leather gloves, or by a special method of tawing in the case of ordinary dress gloves. The kid-skins are principally collected by hawkers in the South European countries, and sold in the Leipsic and Naples fairs. The tawing industry is conducted on a great scale at Annonay, Paris, and Milhau in France. The tawing process differs from ordinary tanning in the greater care and cleanliness of all the operations, in the submission of the dressed skins to a brief fermentation by piling them under the influence of heat, which increases the softness and flexibility of the leather, and in tawing with a mixture of flour, the yellow of eggs, and alum. On the completion of this operation, they are stretched by hand and dried as rapidly as possible. Thereafter they are damped, placed in dozens between linen cloths, and worked about to render them soft and pliable, after which they are planed on the flesh side, dried, and again planed. They are then polished by rubbing with a heavy glass disc or other smooth substance, and dyed by brushing liquid dyes over one side. Finally they are stretched on a marble table, and smoothed with a blunt knife. From a kid skin so prepared the materials of three gloves are obtained. The skins are moistened and stretched, and the various parts are cut out by a machine having steel punches the shape and size desired. The thumb piece, the quirks and the fourchettes inserted between the fingers, and the wrist welt—the latter frequently white—are cut out separately. Machine sewing, in which a kind of button stitch is made, is to a small extent utilized in the manufacture of gloves; but the greater part of the sewing is done by hand. The pieces to be sewn together are placed in a machine between a pair of jaws, the holding edge of which is composed of fine saw teeth, between each of which the sewer passes back and forward her needle, and in this way a neat uniform stitch is secured. There are three kinds of hand-sewing in the glove trade—round sewing or ordinary glove stitch, piqué stitch, and prick seam. After sewing, the backs are stitched or tamboured, the button-hole is formed, the wrist attached, and the button sewed on, thus finishing the glove. After damping and stretching to its utmost length, the glove is ready to be stamped and put up for use.

Paris is, beyond question, the most important centre of glove-making, and for delicacy of material and beauty of workmanship the productions of some Parisian manufacturers are without any rivals; but it is at Grenoble that French gloves are most extensively manufactured. English gloves, of unfailing excellence of material and workmanship, are principally made at Worcester; and in one specialty—"dogskin" gloves made from Cape sheep-skin, having a warm tan colour—English makers have no competitors. A very large quantity of cheap but useful gloves are made at Brussels and Copenhagen. During the year 1876, 1,084,400 dozen pairs, of a value of £1,380,884, were imported into the United Kingdom from France; from Belgium there were 301,305 dozen pairs, valued at £345,174; and the total imports from all quarters amounted to 1,497,437 dozen pairs, of a value of £1,840,956. In 1878 the total imports were 1,060,040 dozen pairs, valued at £1,302,060.

Buckskin gloves are largely made in the United States, and that branch, together with a limited production of kid and other gloves, is chiefly centred in the village of Gloversville, Fulton co., N.Y. It is estimated that from about 140 separate glove factories in that village not less than two-thirds of the gloves made in the United States are sent out. Kid gloves are made to some extent in New York city.

GLOVER, RICHARD (1712-1785), an English poet, was born in 1712. He was the son of a London merchant, and received his education at Cheam in Surrey. While there he wrote in his sixteenth year a poem to the memory of Sir Isaac Newton, which was appended by Dr Pemberton to his *View of Newton's Philosophy*, published in 1728. Though Glover followed the business of his father, he devoted much of his attention to literary pursuits, and he acquired the reputation of being one of the best Greek scholars and most famous poets of his day. In 1737 he published an epic poem, *Leonidas*, written in celebration of the defence of Thermopylæ. As the praise of liberty formed the subject matter of the poem, it was thought to have a special reference to the politics of the time; and being warmly commended by the regent and his court, by Lord Lyttelton, and the novelist Fielding, it soon passed through several editions. Though exhibiting a well-cultivated taste and some skill in versification, it possesses, however, little poetical merit, and is totally wanting in the higher qualities of epic poetry. A continuation of the *Leonidas*, entitled *Atheniad*, subsequently appeared, but had little or no popularity. In 1739 Glover published a poem entitled *London, or the Progress of Commerce*; and in the same year, with a view to excite the nation against the Spaniards, he wrote a ballad, *Hosier's Ghost*, which is spirited and effective, and was one of the most popular of its day. He was also the author of two tragedies, *Boadicea* (1753) and *Medea* (1761), which, however, on account of their close imitation of Greek models, are unsuited for the modern stage. The success of Glover's *Leonidas* led him to take considerable interest in politics, and in 1760 he entered parliament as member for Weymouth, in which capacity his abilities as a speaker, and his knowledge of commercial questions, acquired for him considerable influence. He died in November 1785. His diary, entitled *Memoirs of a distinguished literary and political Character from* 1742 to 1757, was published in 1813. Glover is one of the reputed authors of *Junius*; but his claims—which were advocated in an *Inquiry concerning the author of the Letters of Junius, with reference to the Memoirs, &c.*, published in 1815—rest on very slight grounds.

GLOWWORM. See COLEOPTERA, vol. vi. p. 132.

GLUCINUM, or BERYLLIUM (Greek γλυκύς, sweet, from the taste of its salts), is a metal related most nearly in its physical properties to zinc and mercury, symbol G, atomic weight 9·3. It occurs in the beryl and emerald, $G_3Al_2Si_6O_{18}$, or $3GO,Al_2O_3,6SiO_2$ (see vol. iii. p. 613, and vol. viii. p. 170), from which its oxide was earliest obtained by Vauquelin in 1798; also in the minerals euclase ($H_2G_2Al_2Si_2O_{10}$, or $H_2O,2GO,Al_2O_3,2SiO_2$), phenacite (G_2SiO_4), chrysoberyl (GO,Al_2O_3), gadolinite, leucophanite, and helvite. Glucinum was first obtained by Wöhler and Bussy in 1828, in an impure pulverulent form, by the fusion of its chloride with potassium; and by Debray in 1854, in the compact state, by the decomposition in an atmosphere of hydrogen of the vapour of the chloride by that of sodium (*Ann. Chim. Phys.*, ser. iii. vol. xliv. 5). Heated in air the metal oxidizes superficially, or, if in a state of fine division, burns with brilliancy. The spark-spectrum of glucinum presents two brilliant blue lines. Glucinum may be estimated in minerals, after removal of their silica, in the insoluble form or as fluoride, by the separation of aluminium mostly as alum, what remains being then thrown down, with iron, by means of warm solution of ammonium carbonate; to the filtrate excess of hydrochloric acid is added; and finally the glucinum is precipitated as hydrate, $G(OH)_2$, which is washed, dried, and ignited. An alloy of glucinum with iron has been obtained by Davy and by Stromeyer.

On the chemistry of glucinum see further vol. v. pp. 526-8 and 543; also Watts, *Dict. of Chemistry*, ii.; W. Crookes, *Select Methods in Chemical Analysis*, pp. 45, 46, 66; and Roscoe and Schorlemmer, *Treatise on Chemistry*, ii. pt. 1, pp. 231-6.

GLUCK (not, as frequently spelt, GLÜCK), CHRISTOPHER WILLIBALD (1714-1787), a celebrated operatic composer, was born at Heidenwang, near Neumarkt, in the Upper Palatinate, on July 2, 1714. He belonged to the lower middle class, his father being gamekeeper to Prince Lobkowitz; but the boy's education was not neglected on that account. From his twelfth to his eighteenth year he frequented the Jesuit school of Kommotow in the neighbourhood of Prince Lobkowitz's estate in Bohemia, where he not only received a good general education, but also had lessons in music. At the age of eighteen Gluck went to Prague, where he continued his musical studies under Czernhorsky, and maintained himself by the exercise of his art, sometimes in the very humble capacity of fiddler at village fairs and dances. Through the introduction of Prince Lobkowitz, however, he soon gained access to the best families of the Austrian nobility, and when in 1736 he proceeded to Vienna, he was hospitably received at his protector's palace. Here he met Prince Melzi, an ardent lover of music, who invited Gluck to accompany him to Milan, where the young musician continued his education under Giovanni Battista San Martini, an interesting composer who, although self-taught, was one of the most accomplished musicians of the 18th century, and has been called the model of Haydn. His works belong chiefly to the class of chamber music. In this respect, however, the master's example was not followed by the pupil. Gluck's dramatic instinct was irrepressible, and soon we find him producing operas at the rapid rate necessitated by the omnivorous taste of the Italian public in those days. Eight of these works were produced at various Italian theatres between 1741 and 1745. Although favourably received, they were not much above the ordinary operatic level of the day, and it would be needless even to give their names. Only the first may be mentioned here, *Artaserse*, libretto by Metastasio, first performed at Milan in 1741. To the reputation thus acquired Gluck owed an invitation to London, where in 1745 he became composer for the opera house in the Haymarket. The first opera produced there was called *La Caduta dei Giganti* (1746, words by Metastasio), followed by one of his earlier operas, re-written for the purpose. It is stated that he also appeared as a performer on the musical glasses. The success of the two operas, as well as that of a so-called *pasticcio*, or dramatic medley entitled *Piramo e Tisbe*, was anything but brilliant, and Gluck accordingly left London. But his stay in England, although not accompanied by immediate success, was not without important consequences for his subsequent career. Gluck at this time was neither more nor less than an ordinary producer of Italian opera. Handel's well-known saying that Gluck knew no more counterpoint than his (Handel's) cook, whether true or not, was unfair, for the reason that, if Gluck had known as much counterpoint as the author of *Israel in Egypt* himself, it would have been difficult to make use of it in the style of music then exclusively cultivated by him. Had the young composer been successful in the ordinary *opera seria*, there is every reason to fear that the great dramatic reform, initiated by him, would never have taken place. The critical temper of the London public fortunately averted this calamity. It may also be assumed that the musical atmosphere of the English capital, and especially the great works of Handel, were not without beneficial influence upon the young composer. But of still greater importance in this respect was a short trip to Paris, where Gluck became for the first time acquainted with the classic traditions and the declamatory style of the French opera—the future scene of his own triumphs. Of these great issues little trace, however, is to be found in the works produced by Gluck during the fifteen years after his return from England. His first opera written for Vienna, called *La Semiramide reconosciuta* (1748), is again an opera seria of the ordinary kind, and little more can be said of *Telemacco* (Rome, 1749), *La Clemenza di Tito* (Naples, 1751), and numerous occasional pieces of a more or less serious kind written for the court at Vienna, where Gluck settled permanently in 1756, having two years previously been appointed court chapel-master, with a salary of 2000 florins, by the empress Maria Theresa. On a previous occasion he had received the order of knighthood from the pope, consequent upon the successful production of two of his works in Rome. During the long interval from 1756 (the date of his opera *Il Rè Pastore*) to 1762, Gluck seems to have matured his plans for the reform of the opera; and, barring a ballet named, like Mozart's opera, *Don Giovanni*, and some *airs nouveaux* to French words with pianoforte accompaniment, no compositions of any importance have to be recorded. His *pièce d' occasion*, *Il Trionfo di Clelia*, produced at Bologna in 1762, is still written in the old manner. But his *Orfeo ed Euridice*, played in October of the same year at Vienna, shows that the composer had entered upon a new career. It is significant that in the original score the work is described as a "dramma per musica" or music-drama, the title opera seria being avoided. Gluck also for the first time had deserted Metastasio, and Raniero Calzabigi furnished the highly dramatic book of *Orpheus*. Quite apart from its significance in the history of dramatic music, *Orpheus* is a work which, by its intrinsic beauty, commands the highest admiration, and does not fail to impress an audience, even now, wherever an adequate representative of the title-part can be found. Orpheus's air, "Che faro," is known to everyone; but finer even is the great *scena* in which the poet's song softens even the *ombre sdegnose* of Tartarus. The ascending passion of the entries of the solo (Deh! placatevi; Mille pene; Men tiranne), interrupted by the harsh but gradually-softening exclamations of the Furies, is of the highest dramatic effect. These melodies, moreover, as well as every declamatory passage assigned to Orpheus, are made subservient to the purposes of dramatic characterization; that is, they could not possibly be assigned to any other person in the drama, any more than Hamlet's monologue could be spoken by Polonius. It is in this power of musically realizing a character—a power all but unknown in the opera of his day—that Gluck's genius as a dramatic composer is chiefly shown. After a short relapse into his earlier manner, Gluck followed up his *Orpheus* by a second classical music-drama named *Alceste*, and first produced in December 1767 at Vienna. In his dedication of the score to the grand-duke of Tuscany, Gluck has fully expressed his aims, as well as the reasons for his total breach with the old traditions. "I shall try," he writes, "to reduce music to its real function, that of seconding poetry by intensifying the expression of sentiments and the interest of situations without interrupting the action by needless ornament. I have accordingly taken care not to interrupt the singer in the heat of the dialogue, to wait for a tedious *ritornel*, nor do I allow him to stop on a sonorous vowel, in the middle of a phrase, in order to show the nimbleness of a beautiful voice in a long *cadenza*." Such theories, and the stern consistency with which they were carried out, were little to the taste of the pleasure-loving Viennese; and the success of *Alceste*, as well as that of *Paris and Helena*, which followed two years later, was not such as Gluck had desired and expected. He therefore eagerly accepted the chance of finding a home for his art in the centre of intellectual and more especially dramatic life, Paris. Such a chance was opened to him through M. Bailli du Rollet, attaché of the French embassy at Vienna, and a musical amateur who entered into Gluck's ideas with enthusiasm. A classic opera for the Paris stage was accordingly projected, and the friends fixed upon Racine's *Iphigénie en Aulide*. After some difficulties, overcome chiefly by the intervention of Gluck's former pupil the dauphiness Marie Antoinette, the opera was at last accepted and performed at the Académie de Musique, on April 19, 1774. The great importance of the new work was at once perceived by the musical amateurs of the French capital, and a hot controversy on the merits of *Iphigénie* ensued, in which some of the leading literary men of France took part. Amongst Gluck's opponents were not only the admirers of Italian vocalization and sweetness, but also the adherents of the earlier French school, who refused to see in Gluck the legitimate successor of Lulli and Rameau. Marmontel, Laharpe, and D'Alembert were opponents, the Abbé Arnaud and others the enthusiastic friends of the German master. Rousseau took a peculiar position in the struggle. In his early writings he is a violent partisan of Italian music, but when Gluck himself appeared as the French champion, he willingly acknowledged the great composer's genius. In a letter to Dr Burney, written shortly before his death, Rousseau gives a close and appreciative analysis of the *Alceste*, the first Italian version of which Gluck had submitted to him for suggestions; and when, on the first performance of the piece not being received favourably by the Parisian audience, the composer exclaimed, "*Alceste* est tombée," Rousseau is said to have comforted him with the flattering *bon-mot*, "Oui, mais elle est tombée du ciel." The contest received a still more personal character when Piccini, a celebrated and by no means incapable composer, came to Paris as the champion of the Italian party. Into the details of the historic battle between Gluckists and Piccinists this is not the place to enter. Volumes have been written on the subject, and the whole affair has been denounced as a sign of the frivolity of the eighteenth century. But to those interested in music and in the drama, the question whether the vocal virtuoso or the true dramatic artist should reign on the lyrical stage is by no means without importance; although, perhaps, the gentlemen of the queen's court, and their friends who applauded her countryman and protegé Gluck from "le coin de la reine," hardly looked upon the matter in so serious a light. The victory at last remained, by common consent (including, it is said, Piccini's own), with Gluck. The succession of the operas written for Paris is the following:—*Orphée et Eurydice* (the *Orfeo* re-written), 1774; *Alceste* (also an adaptation of the earlier work, 1776); *Armide*, 1777; *Iphigénie en Tauride*, 1779. Some minor compositions, written partly by desire of the queen for the court festivals, it would be needless to mention. Gluck was engaged upon an opera *Les Danaides* when an attack of apoplexy compelled him to relinquish all thoughts of work. He left Paris for Vienna, where he lived for several years in dignified leisure, disturbed only by his declining health. He died on November 18, 1787.

To the general character of Gluck's music some allusion has already been made. He was essentially a dramatic composer, and no notice need be taken of the few works belonging to a different sphere. In connexion with its dramatic purpose his music ought always to be judged. He never was a great contrapuntist in the sense that Bach and Handel were. But neither was there much room for polyphonous display in the music-drama as he understood it. The chorus of Scythians in the second *Iphigenia* ("Il nous falloit du sang") would not gain in effect if it contained an elaborate fugue. This and other choruses in the same great work at the same time illustrate Gluck's power of rendering musically national as well as individual characteristics. As a masterly trait of psychological characterization may further be cited the accompaniment to Orestes's air, also in *Iphigénie en Tauride* ("Le calme rentre dans mon cœur"), where the unfortunate man in vain tries to find relief from the pangs of conscience, distinctly heard in the unceasing semiquavers of the orchestral accompaniment. The severe censure passed on Gluck for drowning the voices by the instruments posterity has converted into one of the composer's highest claims to fame. Not only has Gluck developed the orchestra as regards mere beauty and volume of sound, but he also has made it an important factor in the dramatic organism. Instances from the second *Iphigénie* alone might again be multiplied. The savage Scythians, for instance, are characterized by the noise of brass and percussion; while Iphigénie's simple prayer is accompanied by the strings and two oboes. The care bestowed by Gluck upon a correct and emphatic declamation of the words is another important point in his dramatic reform. Readers interested in the matter will have noticed the striking parallelism between the views and aims advocated by Gluck in the 18th century and by Wagner in the 19th century—a parallelism which may be extended to the bitter animadversions evoked by these theories amongst contemporary critics. The means, however, by which the theories were to be realized are very different in the two cases. Gluck's reform is essentially directed against the encroachments of the singer; Wagner's against those of the composer as an independent artist. Gluck, it is true, felt the necessity of a perfect unity between music and poetry, but he never intended to bring about this desirable effect by surrendering any of the strict forms of his own art. The consequence was that the poet was more than ever bound to adapt his work to the demands of the composer, and that the latter remained practically the omnipotent ruler on the operatic stage. Wagner at last has made dramatic purpose the supreme consideration to which the forms of music, as a separate art, have to submit.

An altogether satisfactory biography of Gluck remains still to be written. With regard to the life, Anton Schmid's *Chr. W. Ritter von Gluck* may be consulted. Herr Marx, in his *Gluck und die Opera*, has attempted to define the composer's position in the history of dramatic music. M. Desnoiresterres's *Gluck et Piccini* refers to the most important portion of the composer's career. For it must always be remembered that Gluck, although a German by birth, belongs as an artist to France rather than to his native country. His works form as it were the musical complement to the tragedy of Corneille and Racine. In France he was first appreciated, and in France also his traditions were continued by a school of highly gifted composers. (F. H.)

GLÜCKSTADT, a town of Prussia, in the province of Schleswig-Holstein, is situated on the right bank of the Elbe, where it receives the small river Rhin, and on the railway from Itzehoe to Elmshorn, 28 miles N.W. of Altona. It has a Protestant and a Catholic church, a synagogue, a gymnasium, a provincial prison, and a provincial penitentiary. The inhabitants are chiefly engaged in commerce and fishing; but the frequent losses from inundations has greatly retarded the prosperity of the town. It suffers at the same time from a very deficient water supply for culinary purposes.

Glückstadt was founded by Christian IV. of Denmark in 1616, and fortified in 1620. It was formerly the seat of the royal dukes of Schleswig-Holstein, who assumed from it the name of Holstein-Glückstadt. In 1627–8 it was besieged for fifteen weeks by Tilly, without success. In 1814 it was blockaded by the allies and capitulated, whereupon its fortifications were demolished. In 1830 it was made a free port. It came into the possession of Prussia along with the rest of Schleswig-Holstein in 1866. The population in 1875 was 5031.

GLUCOSE, a species of sugar, on the chemical and other properties and the occurrence and manufacture of which see articles CHEMISTRY, vol. v. pp. 564, 572; DEXTRIN and DIABETES, vol. vii. pp. 146, 147; FERMENTATION, vol. ix. pp. 93, 94, 96, 97; GALLIC ACID, vol. x. p. 41; and SUGAR.

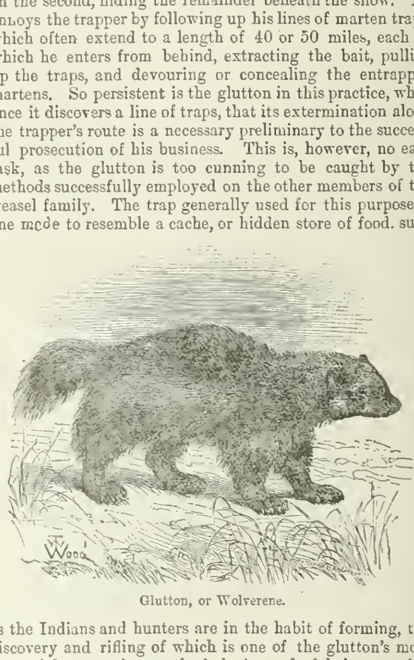
GLUE. See GELATIN.

GLUKHOFF, or GLUCHOW, as the name is transliterated in German, a town of Russia, at the head of a district in the government of Tchernigoff, 132 miles E. of Tchernigoff in 51° 54′ N. lat. and 33° 35′ E. long., on the highway between Moscow and Kieff. It is situated on the sloping banks of the Yasmin, a subtributary of the Desna, which in its turn unites with the Dnieper. Among its buildings are eleven churches and two Jewish meeting-houses, a district school, an almshouse, and a hospital. In 1860 its population, mainly engaged in agricultural pursuits and petty commerce, amounted to 10,008, of whom 4998 were males; in 1873 it was 10,747; and according to the *St Petersburg Calendar* for 1878, it has increased to 13,398. The Jews in 1860 numbered 2517. About 4 miles from the town, near the village of Poloshek, there exists an extensive deposit of white clay, which supplies nearly all the porcelain factories in Russia. Glukhoff is mentioned in the Laurentian Chronicle as early as 1152. For some time it was in the hands of a branch of the ducal family of Tchernigoff, which retired before the encroachments of the Tartars in the middle of the 13th century. Before its final incorporation with Russia, it passed under the sway first of the Lithuanians and then of the Poles. On the destruction of Baturin by Peter I. in 1708, it was made the residence of the hetmans.

GLUTEN, a tough, tenacious, ductile, somewhat elastic, nearly tasteless, and greyish-yellow albuminous substance, obtained from the flour of wheat by washing in water, in which it is insoluble. In Martin's apparatus for the preparation of gluten on the large scale, balls of dough are worked backwards and forwards in troughs by means of cylinders, whilst water plays upon them in fine jets delivered by copper pipes. A sack of flour may be thus made to yield about 110 ℔ of moist gluten, and twice that quantity of dry starch. Good samples of white English wheat contain some 10 or 11 per cent. of gluten; from hard Venezuela wheat as much as 22·75 per cent. has been procured. The outer and inner coats of wheat, separated from it as bran, contain respectively 4 or 5 and 14 to 20 per cent. of gluten. Gluten, when dried, loses about two-thirds of its weight, becoming brittle and semi-transparent; when strongly heated it crackles and swells, and burns like feather or horn. It is soluble in strong acetic acid, and in caustic alkalies, which latter may be used for the purification of starch in which it is present. When treated with ·1 to ·2 per cent. solution of hydrochloric acid it swells up, and at length forms a liquid resembling a solution of albumin, and lævorotatory as regards polarized light. Moistened with water and exposed to the air gluten putrefies, and evolves carbon dioxide, hydrogen, and sulphuretted hydrogen, and in the end is almost entirely resolved into a liquid, which contains leucin and ammonium phosphate and acetate. On analysis gluten shows a composition of about 53 per cent. of carbon, 7 per cent. of hydrogen, and nitrogen 15 to 18 per cent., besides oxygen, and about 1 per cent. of sulphur, and a small quantity of inorganic matter. It is not a simple substance, and according to Ritthausen consists of *glutencasein* (Liebig's vegetable fibrin), *glutenfibrin*, *gliadin* (Pflanzenleim), *glutin* or vegetable gelatin, and *mucedin*, which are all closely allied to one another in chemical composition. It is the gliadin which confers upon gluten its capacity of cohering to form elastic masses, and of separating readily from associated starch. In the so-called gluten of the flour of barley, rye, and maize, this body is absent (Kreusler and Ritthausen). The gluten yielded by wheat which has undergone fermentation or has begun to sprout is devoid of toughness and elasticity. These qualities can be restored to it by kneading with salt, lime-water, or alum. Koopmans found that a larger amount of raw gluten was digested in a relatively dilute than in a strong artificial gastric juice, the reverse holding good of albumin. From experiments on six pigs and three dogs, he came to the conclusion that the digestive fluid in the stomachs of living animals, even of the same species, dissolves unlike quantities of albumin and gluten, so that if much albumin be digested the loss of weight of gluten present with it is but small, and *vice versa* (see *Brit. and For. Med.-Chir. Rev.*, 1857, ii. pp. 318–25). Gluten is employed in the manufacture of gluten bread and biscuits for the diabetic (see DIABETES, vol. vii. p. 148), and of chocolate, and also in the adulteration of tea and coffee. For making bread it must be used fresh, as otherwise it decomposes, and does not knead well. Granulated gluten is a kind of vermicelli, made in some starch manufactories by mixing fresh gluten with twice its weight of flour, and granulating by means of a cylinder and contained stirrer, each armed with spikes, and revolving in opposite directions. The process is completed by the drying and sifting of the granules.

See H. Ritthausen, "Ueber die Bestandtheile des Weizenklebers," *Erdmann's Journ. f. praktische Chemie*, lxxxv., 1862, pp. 193-229; also *ib.*, lxxxvi., 1862, pp. 257-265; and lxxxviii., 1863, pp. 141-147; T. Langer, *Lehrbuch der Chemie*, pp. 361-371, Leipsic, 1878; and Payen, *Industrial Chemistry*, ed. B. H. Paul, 1878.

GLUTTON, or WOLVERENE (*Gulo luscus*), a carnivorous mammal, belonging to the *Mustelidæ* or weasel family, but differing from the typical forms of the genus *Mustela* in the greater heaviness and clumsiness of its body, presenting in this respect a striking resemblance to the bear. Its legs are short and stout, with large feet, the toes of which terminate in strong, sharp claws, considerably curved. Its mode of progression is semi-plantigrade. In size and form it is not unlike the European badger, measuring from 2 to 3 feet in length, exclusive of the thick bushy tail, which is about 8 inches long. Its head is broad, its eyes small, with defective vision, and its back arched. Its fur consists of an undergrowth of short woolly hair, mixed with long straight hairs, to the abundance and length of which on the sides and tail the creature owes its shaggy appearance. The colour of its fur is blackish-brown, with a broad band of chestnut colour stretching from the shoulders along each side of the body, the two meeting near the root of the tail; while, unlike the majority of arctic animals, the fur of the glutton in winter-time grows darker in colour. Like other weasels it is provided with anal glands, which secrete a yellowish fluid possessing a highly fœtid odour. The glutton is a boreal animal, inhabiting the northern regions of both hemispheres, but most abundant in the circumpolar area of the New World, where it occurs throughout the British provinces and Alaska, being specially numerous in the neighbourhood of the Mackenzie River, and extending southwards as far as New York and the Rocky Mountains. Many erroneous statements have been made regarding the glutton by early writers on natural history, from Olaus Magnus to Buffon, one of which has perpetuated itself in the animal's common name,—the fact being that the wolverene is not more gluttonous than are the majority of carnivorous animals. It feeds on grouse and the smaller rodents, and on foxes, which it digs from their burrows during the breeding season. Its want of activity, however, renders it dependent for most of its food on the dead carcases of animals. These it frequently obtains by methods which have made it peculiarly obnoxious to the hunter and trapper. Should the hunter, after succeeding in killing his game, leave the carcase insufficiently protected for more than a single night, the glutton, whose fear of snares is sufficient to prevent him from touching it during the first night, will, if possible, get at and devour what he can of it on the second, hiding the remainder beneath the snow. He annoys the trapper by following up his lines of marten traps, which often extend to a length of 40 or 50 miles, each of which he enters from behind, extracting the bait, pulling up the traps, and devouring or concealing the entrapped martens. So persistent is the glutton in this practice, when once it discovers a line of traps, that its extermination along the trapper's route is a necessary preliminary to the successful prosecution of his business. This is, however, no easy task, as the glutton is too cunning to be caught by the methods successfully employed on the other members of the weasel family. The trap generally used for this purpose is one made to resemble a cache, or hidden store of food, such



Glutton, or Wolverene.

as the Indians and hunters are in the habit of forming, the discovery and rifling of which is one of the glutton's most congenial occupations,—the bait, instead of being paraded as in most traps, being in this case carefully concealed, to lull the knowing beast's suspicions. One of the most prominent characteristics of the wolverene is its propensity, akin to that of certain members of the crow family, to steal and hide things, not merely food which it might afterwards need, or traps which it regards as personal enemies, but articles which cannot possibly have any interest for it except that of curiosity. An amusing instance of this is quoted by Coues in his valuable work, recently published, on the *Fur-bearing Animals of North America*, in which he says—"A hunter and his family, having left their lodge unguarded during their absence, on their return found it completely gutted—the walls were there, but nothing else. Blankets, guns, kettles, axes, cans, knives, and all the other paraphernalia of a trapper's tent had vanished, and the tracks left by the beast showed who had been the thief. The family set to work, and, by carefully following up all his paths, recovered, with some trifling exceptions, the whole of the lost property." The cunning it displays in unravelling the oftentimes complicated snares set for it forms at once the admiration and the despair of every trapper, while its great strength and ferocity render it a dangerous antagonist to animals much larger than itself, and occasionally even to man. The rutting season occurs in March, and the female, secure in her burrow, produces her young—four or five at a birth—in June or July. In defence of these she is exceedingly bold, and the Indians, according to Cowes, "have been heard to say that they would sooner encounter a she-bear with her cubs than a carcajou (the Indian name of the glutton) under the same circumstances." The wolverene has a curious habit which has not hitherto been observed in any other of the lower animals. On catching sight of its relentless human enemy, it may be observed, before finally determining on flight, sitting on its haunches, and, in order to get a clearer view of the danger, shading its eyes with one of its forepaws. When pressed for food it becomes fearless, and has then been known to come on board an ice-bound vessel, and in presence of the crew to seize on a canister of meat. The flesh of the glutton is uneatable; it is therefore only valuable for its fur, which, when several skins are sewn together, forms elegant hearth and carriage rugs.

GLYCAS, Michael, a Byzantine historian, often called Siculus. The time when he flourished is very uncertain. He is justly reckoned among the better Byzantine historians on account of the terseness and perspicuity of his style. His MS. letters still extant are addressed to the last Constantine; their authenticity, however, has been questioned. His chief work is Βίβλος χρονική, divided into four parts, treating of history from the creation of the world to the death of Alexis I. Comnenus (1118). The best edition is that by J. Bekker, in the Bonn collection of the Byzantines (1836).

GLYCERIN, Glycerine, or Glycerol (in pharmacy Glycerinum), a sugar-like substance obtainable from most natural fatty bodies by the action of alkalies and similar reagents, whereby the fats are decomposed, water being taken up, and glycerin being formed together with the alkaline salt of some particular acid (varying with the nature of the fat). Owing to their possession of this common property, these natural fatty bodies and various artificial derivatives of glycerin, which behave in the same way when treated with alkalies, are known as *glycerides*. This decomposition into an organic acid and a substance of more or less neutral character is a typical kind of reaction with numerous classes of organic bodies, and is termed *saponification*, from the circumstance that the ordinary process of soap-making consists simply in the formation from natural fatty bodies and alkalies of the alkaline salts of the fatty acids thence derivable, soap being a mixture of these alkaline salts in various proportions, according to the particular purposes for which it is required, and its price. In the ordinary process of soap-making the complementary product, glycerin, remains dissolved in the aqueous liquors from which the soap is separated, and is usually thrown away; in many other instances, however, in which a substance capable of undergoing a reaction of saponification is thus treated, the product complementary to the alkaline salt is the more important of the two.

The fact that soap is obtainable by boiling together oily or fatty substances and alkalies (such as potashes and natron or mineral alkali) was known at an early period of history, being mentioned by Pliny, Galen, Aetius, and Paulus Ægineta. On the other hand, substances referred to in the Old Testament and translated "soap" (*e.g.*, Jeremiah ii. 22, "For though thou wash thee with nitre [properly, natron], and take thee much soap;" Malachi iii. 2, "For he is like a refiner's fire, and like fuller's soap") refer to the alkali itself (viz., *borith* = vegetable alkali, potash; or *neter* = mineral alkali, soda), and not to the substances prepared from oily bodies and these alkaline matters. Similarly Homer makes no mention of soap whilst describing the laundry operations of Nausicaa. The discovery of glycerin, however, is of modern origin, the body having been first described in 1776 by Scheele under the name of oelsüss (principe doux des huiles—sweet principle of oils), and more fully investigated subsequently by Chevreul, Berthelot, and many other chemists, from whose researches it results that glycerin is a trihydric alcohol indicated by the formula $C_3H_5(OH)_3$, the natural fats and oils, and the glycerides generally, being substances of the nature of compound ethers formed from glycerin by the replacement of the hydrogen of the OH groups by the radicals of certain acids, called for that reason "fatty acids."[1] The relationship of these glycerides to glycerin will be more conveniently shown by an example, such as the series of bodies formed from glycerin by replacement of hydrogen by "stearyl" ($C_{18}H_{35}O$), the radical of stearic acid ($C_{18}H_{35}O.OH$):—

Glycerin.	Monostearin.	Distearin.	Tristearin.
$CH_2 . OH$	$CH_2 . O(C_{18}H_{35}O)$	$CH_2 . O(C_{18}H_{35}O)$	$CH_2 . O(C_{18}H_{35}O)$
$CH . OH$	$CH . OH$	$CH . O(C_{18}H_{35}O)$	$CH . O(C_{18}H_{35}O)$
$CH_2 . OH$	$CH_2 . OH$	$CH_2 . OH$	$CH_2 . O(C_{18}H_{35}O)$

These four substances evidently form a progressive series, each number of which differs from the preceding one in the same way, viz., that one more stearyl group replaces hydrogen in the original OH groups.

The process of saponification may be viewed as the gradual progressive transformation of tristearin, or some analogously constituted substance, into distearin, monostearin, and glycerin, or as the similar transformation of a substance analogous to distearin or to monostearin into glycerin. If the reaction is brought about in presence of an alkali, the acid set free becomes transformed into the corresponding alkaline salt; but if the decomposition is effected without the presence of an alkali (*i.e.*, by means of water alone, or by an acid fluid), the acid set free and the glycerin are obtained together in a form which usually admits of their ready separation. It is noticeable that with few exceptions the fatty and oily matters occurring in nature are substances analogous to tristearin, *i.e.*, they are trebly replaced glycerins. Amongst these glycerides may be mentioned the following:—

Tristearin—$C_3H_5(O.C_{18}H_{35}O)_3$. The chief constituent of hard animal fats, such as beef and mutton tallow, &c.; also contained in many vegetable fats in smaller quantity.

Triolein—$C_3H_5(O.C_{18}H_{33}O)_3$. Largely present in olive oil and other saponifiable vegetable oils and soft fats: also present in animal fats, especially hog's lard.

Tripalmitin—$C_3H_5(O.C_{16}H_{31}O)_3$. The chief constituent of palm oil; also contained in greater or less quantities in human fat, olive oil, and other animal and vegetable fats.

Triricinolein—$C_3H_5(O.C_{18}H_{33}O_2)_3$. The main constituent of castor oil.

Other analogous glycerides are apparently contained in greater or smaller quantity in certain other oils. Thus in cows' butter, *tributyrin*, $C_3H_5(O.C_4H_7O)_3$, and the analogous glycerides of other readily volatile acids closely resembling butyric acid, are present in small quantity; the production of these acids on saponification and distillation with dilute sulphuric acid is utilized as a test of a purity of butter as sold. *Triacetin*, $C_3H_5(O.C_2H_3O)_3$, is apparently contained in cod-liver oil. Some other glycerides isolated from natural sources are analogous in composition to tristearin, but with this difference, that the three radicals which replace hydrogen in glycerin are not all identical; thus kephalin, myelin, and lecithin are glycerides in which two hydrogens are replaced by fatty acid radicals, and the third by a complex phosphoric acid derivative. In no case, however, is the existence of a natural glyceride

[1] The name is often further extended so as to embrace other acids, analogous to the true acids of fats and oils in composition, properties, and chemical characters, but not yet found to exist in natural oils and fats.

analogous to distearin or monostearin substantiated with certainty, bodies of these classes being either formed synthetically by reversing the reactions of saponification, or being produced by the partial saponification of substances analogous to tristearin.

Glycerin is also a product of certain kinds of fermentation, especially of the alcoholic fermentation of sugar; thus it is a constituent of many wines and other fermented liquors, being formed together with small quantities of various other substances by reactions subsidiary only to the main change taking place, and hence varying in their nature and extent with circumstances. According to Pasteur, about $\frac{1}{30}$th of the sugar transformed under ordinary conditions in the fermentation of grape juice and similar saccharine liquids into alcohol and other products becomes converted into glycerin. In certain natural fatty substances, *e.g.*, palm oil, it exists in the free state, so that it can be separated by washing with boiling water, which dissolves the glycerin but not the fatty glycerides; but how far its occurrence in this form is due to the breaking up of the glyceride by a spontaneous saponification is open to some question.

Properties.—In a state of purity glycerin is a viscid, colourless liquid of sp. gr. 1·264, possessing a somewhat mawkish sweet taste; when exposed to a high degree of cold for a long time it sometimes solidifies to a crystalline mass, which then melts at about 7° C. The crystals when once melted often do not resolidify again readily, even when in contact with the solid substance, although sometimes contact with a crystal of the solid at a temperature of about 0° suffices to produce solidification of the whole. This solidification of glycerin is, however, a very exceptional phenomenon, only occurring with extremely pure substance under certain conditions not thoroughly understood, and then only after long continued exposure to a low temperature, as during a cold winter. When containing a minute quantity of water glycerin never solidifies, and to this circumstance several of its useful applications are due. A weak aqueous solution, when chilled sufficiently, allows crystals of ice to form, the glycerin accumulating in the unfrozen portion as alcohol does when a mixture of spirit and water is partially frozen. When heated alone it partially volatilizes, but the greater part decomposes; by reducing the pressure to about $\frac{1}{12}$th of an atmosphere, it can, however, be readily distilled unchanged, boiling under a pressure of 50 millimetres of mercury at about 20° C. In an atmosphere of steam, also, it distils without decomposition under ordinary barometric pressure. In water and alcohol it dissolves readily in all proportions; in ether it is insoluble. Under certain conditions, such as prolonged contact with poor cheese and chalk at about 35° to 40° C., it can be made to ferment partially, becoming changed into alcohol; but under any circumstances, only a small fraction, at most a tenth, becomes thus transformed, the rest remaining unaltered. It possesses remarkable solvent powers on many substances, whence it is employed for numerous purposes in pharmacy and the arts. Its viscid character, and its non-liability to dry and harden by exposure to air, also fit it for various other uses, such as lubrication, &c., whilst its peculiar physical characters, enabling it to blend with either aqueous or oily matters under certain circumstances, render it a useful ingredient in a large number of products of varied kinds. Applied to the living skin (and similarly to untanned leather) it produces a remarkable softening effect, whence it is largely employed as a cosmetic, either by itself or in admixture with other substances. Taken internally it is alleged to be valuable as a substitute for cod-liver oil for phthisical patients, not possessing the disagreeable fishy flavour of that valuable food, and having a fattening tendency. When it is given in moderately small repeated doses to the lower animals, it does not appear to possess any marked injurious action peculiar to itself; when, however, large doses of glycerin are subcutaneously injected into dogs, amounting to from 8 to 10 grammes per kilogramme of animal operated on (0·8 to 1·0 per cent. of the weight of the dog, corresponding to from 1 ℔ to 1½ ℔ of glycerin for the weight of an average man), death ensues within twenty-four hours, accompanied by symptoms analogous to those of acute alcoholism (Dujardin, Beaumetz, and Audigé). Like sugar it possesses antiseptic qualities, so that meat, albumin, &c., immersed in it do not for long periods of time undergo putrefactive changes.

Manufacture.—The simplest modes of preparing glycerin in a state of purity are based on the saponification of fats, either by alkalies or analogous basic substances, or by superheated steam, and on the circumstance that, although glycerin cannot be distilled by itself under the ordinary pressure without decomposition, it can be readily volatilized in a current of superheated steam; in this way the glycerin formed is separated from the non-volatile substances present. It was by means of saponification of olive oil or lard with litharge (lead oxide), whereby a lead soap insoluble in water, or nearly so, is formed, together with glycerin, that the existence of glycerin was first demonstrated by Scheele, who obtained it as a bye-product in the formation of the "lead-plaster" of pharmacy made from lard and lead oxide. For a long time this was the only known method of preparing glycerin, the aqueous solution obtained being treated with sulphuretted hydrogen to remove any soluble lead compounds, filtered, and evaporated until almost all the water was driven off, leaving the glycerin behind as a syrupy fluid. By evaporating down the spent leys of the soapmaker (after the soap is separated therefrom by "salting out," and any excess of alkali neutralized with sulphuric acid), and treating the residue with alcohol, glycerin can also be obtained, the alcoholic solution of it thus formed being simply evaporated to drive off the alcohol; but this process is far too costly for ordinary purposes. An improvement on this method was patented in 1858 by H. Reynolds, the concentrated leys being passed into a vessel where they are met by a stream of superheated steam at about 200° C.; the glycerin then passes over with the aqueous vapour, whilst the inorganic salts present are left behind. In the manufacture of stearic acid for candle-making (see CANDLE) one of the older processes was the saponification of tallow with lime, forming an insoluble lime soap and an aqueous solution of impure glycerin, from which the pure substance can be readily obtained by distillation with superheated steam. Less pure products were formerly obtained by treating the crude solution with sulphuric acid to separate lime, boiling to remove small quantities of volatile acids, evaporation, and filtration through animal charcoal to decolorize; or by evaporating, dissolving out by alcohol, and purifying by treating with lead oxide, filtering to separate an insoluble lead compound formed, removing lead from this filtrate by sulphuretted hydrogen, filtering again, and evaporating to a syrup. In practice all these older methods have, however, been superseded by the process patented in 1854 by Wilson & Payne. This consists in heating the fatty matter to be saponified in an appropriate still to a temperature of 290° to 315° C. (550° to 600° Fahr.), and passing in heated steam in such a way that it rises up through the fatty matter in numerous streams; saponification is thus rapidly effected, and the liberated glycerin and fatty acids are volatilized and carried along with the steam to the condensing arrangement. If the temperature do not exceed 310° C. there is no fear of the glycerin being decomposed, whilst under suitable conditions even higher temperatures than this can be employed without causing its decomposition; but there is always a great liability to destruction of glycerin when the temperature of 310° is exceeded. This arises from the tendency of the glycerin to char on heating, and to split up into water and *acrolein* (acrylic aldehyde), thus:—

$$C_3H_8O_3 = 2H_2O + C_3H_4O.$$

When a series of chambers is used as the refrigerator, the compartments nearest the still are found to condense little but fatty acids, the water and glycerin chiefly accumulating in the more distant chambers, the last of which is usually open to the air at the end; so that there is no excess of pressure in the still and condensers; the fatty acids readily separate from the aqueous solutions of glycerin, which only requires concentration by evaporation to be fit for the market. Since the date of Wilson's patent various special forms of apparatus for effecting the transformation have been patented by Wright & Fouché, Gilbee, and others.

This method of saponification is, strictly, only an improvement on former processes invented for the purpose of decomposing the glycerides and obtaining the fatty acids without the use of alkalies, lime, &c.; in these older methods the extraction of glycerin was not an important feature, and they were frequently worked in such a way as to decompose the whole or greater part of the glycerin *pari passu* with its liberation. Thus, as far back as 1825, Chevreul and Gay-Lussac sketched out the idea of the process of saponification by superheated steam, and the method was actually carried out with certain modifications by various chemists and manufacturers. For example, in 1842, E. Price & Co. patented, in the name of Jones & Wilson, a process of the kind, which was largely worked for some years; in this, the fatty matter freed from extraneous impurities is mixed with 6 to 8 per cent. of strong sulphuric acid, and then heated in copper boilers to about 180° C., by superheated steam blown through the mass for about two hours; after which hotter steam at about 300° to 350° is blown through, when fatty acids distil, but little or no glycerin passes over unaltered, almost the whole being charred or decomposed, forming acrolein, &c. Here the saponification and destruction of glycerin are largely effected by the sulphuric acid, as well as by the steam itself. Price's process was suggested to the inventors by Tilghman's method, brought out early in 1854, which consisted in making an emulsion of melted fatty matter and water (or solution of alkali) by agitation, and then pumping it through a long coil of iron tubing kept at a temperature near that of melted lead under a pressure of about 2000 ℔ to the square inch. In this way complete saponification is effected, fatty acids and an aqueous solution of glycerin being obtained when water is used, and soap with more or less water and glycerin when alkaline liquor is employed. It is noticeable that in this process it is not necessary that the alkali should be caustic, as it must be for the ordinary process of soap-boiling; sodium and potassium carbonates answer just as well as their respective hydrates (caustic soda, caustic potash).

Derivatives.—Among the numerous derivatives obtainable from glycerin by appropriate chemical reactions, may be more particularly mentioned *nitro-glycerin*, which is, strictly speaking, improperly named, inasmuch as it does not belong to the class of true nitro-substitution derivatives, but is simply constituted like tristearin, the radical of nitric acid displacing the hydrogen of the OH groups. By treating glycerin with nitric acid (preferably by dropping pure glycerin into a mixture of nitric and sulphuric acids) the following reaction ensues, the glycerin becoming what would be systematically termed *trinitrin* or *glycerotrinitrin*:—

$$\begin{cases} CH_2 . OH \\ CH . OH \\ CH_2 . OH \end{cases} + 3NO_2OH = 3H_2O + \begin{cases} CH_2 O NO_2 \\ CH . O NO_2 \\ CH_2 O . NO_2 \end{cases}$$

By treating the resulting "nitro-glycerin" with caustic potash, saponification ensues, potassium nitrate being formed and glycerin reproduced precisely as when tristearin is similarly saponified. Two other important products obtainable from glycerin are *isopropyl iodide* and *allyl iodide*, each of which serves as the starting-point of a large series of chemical products, many of them of utility in the arts. These substances are manufactured by heating glycerin with hydriodic acid, and are formed in virtue of the reactions:—

$$\underset{\text{Glycerin.}}{C_3H_5(OH)_3} + 5HI = 2I_2 + 3H_2O + \underset{}{\overset{\text{Isopropyl iodide.}}{C_3H_7I}}$$

$$C_3H_5(OH)_2 + 3HI = I_2 + 3H_2O + \overset{\text{Allyl iodide.}}{C_3H_5I}$$

Again, glycerin is employed in the manufacture of *formic acid*, which is prepared most conveniently by heating together glycerin and oxalic acid. The splitting up of oxalic acid into carbon dioxide and formic acid, which takes place only to a minute extent when oxalic acid is heated alone (owing to the further decomposition of the formic acid), then ensues with but little formation of bye-products, and especially with but little loss of formic acid through further decomposition. This arises from the occurrence of a cycle of changes highly interesting from a chemical point of view, and consisting essentially in the continual formation of a body analogous to monostearin, and its continual breaking up into formic acid, which distils over, and glycerin, which acts over again on a fresh portion of oxalic acid.

Technical Uses.—Besides its use as a starting-point in the production of "nitro-glycerin" and other chemical products, glycerin is largely employed for a number of purposes in the arts, its application thereto being due to its peculiar physical properties. Thus its non-liability to freeze (when not absolutely anhydrous, which it practically never is when freely exposed to the air) and its non volatility at ordinary temperatures, combined with its power of always keeping fluid and not drying up and hardening, render it valuable as a lubricating agent for clockwork, watches, &c., as a substitute for water in wet gas-meters, and as an ingredient in cataplasms, plasters, modelling clay, pasty colouring matters, dyeing materials, moist colours for artists, and numerous other analogous substances which are required to be kept in a permanently soft condition. From its softening property when applied to the skin, it constitutes a chief ingredient in many toilet preparations, creams, and the like. Many of these indeed, sold under fancy names, are nothing but glycerin diluted with water or weak alcohol, or mixed with some oleaginous emulsion or paste, and variously scented. Its solvent power for numerous substances renders it valuable in pharmacy as an ingredient in numerous preparations. In some of these the glycerin acts not merely as a solvent but also as a preservative against decomposition, owing to its antiseptic qualities, which also led to its being employed to preserve untanned leather (especially during transit when exported, the hides being, moreover, kept soft and supple); to make solutions of gelatin, albumen, gum, paste, cements, &c., which will keep without decomposition; to preserve meat and other edibles; to mount anatomical preparations; to preserve vaccine lymph unchanged; and for many similar purposes. Its solvent power is also utilized in the production of various colouring fluids, where the colouring matter would not dissolve in water alone; thus aniline violet, the tinctorial constituents of madder, and various allied colouring matters dissolve in glycerin, forming liquids which remain coloured even when diluted with water, the colouring matters being either retained in suspension or dissolved by the glycerin present in the diluted fluid. It has been proposed to use glycerin as a medium for the extraction of the odoriferous principle of flowers, &c., and as a substitute for sugar in the manufacture of some sorts of tobacco, the aroma of which is liable to be deteriorated should fermentation of the saccharine matter set in. Certain kinds of copying inks are greatly improved by the substitution of glycerin, in part or entirely, for the sugar or honey usually added. In fine, the number of useful adaptations of glycerin as an ingredient in order to confer certain special properties is almost unlimited, and its use in these directions is increasing yearly.

Impurities.—For some of these purposes it is essential that the glycerin should be of considerable purity. The chief impurities liable to be present vary with the mode of preparation. Substances made by saponification of oils, &c., with oxide of lead or lime, are apt to retain more or less of the metallic compounds, whilst glycerin extracted from soap-leys may also contain mineral matters. Such impure substances are readily purified by distillation with steam or under greatly diminished pressure. Glycerin prepared by saponifying clarified tallow, &c., by superheated steam, rarely contains fatty acids; if not deprived of practically all the water with which it is mixed in the distillate first obtained, it is less viscid and has a lower density, so that the specific gravity forms a good test as to whether it contains much water or not. Occasionally glycerin is met with intentionally adulterated with sugar-syrup, gum, mineral matters, &c., but such falsifications are comparatively rare. They may be detected by the substance being not wholly soluble in alcohol, by its leaving a residue on ignition in air, by its precipitating a solution of basic lead acetate (after being dissolved in water), or by other special tests, according to the nature of the impurity sought for. Thus, whilst pure glycerin does not reduce alkaline copper solutions so as to precipitate cuprous oxide when boiled therewith, the precipitation is readily produced by certain kinds of sugar, either without any previous treatment (*e.g.*, glucose), or after boiling for a short time with water acidulated with a mineral acid such as sulphuric acid (*e.g.*, cane sugar). (C. R. A. W.)

GMELIN, JOHANN GEORG (1709–1755), a distinguished naturalist, son of the chemist of the same name, was born at Tübingen, June 12, 1709. Having taken his degree in medicine, he in 1727 repaired to St Petersburg, where in 1731 he was appointed professor of chemistry and natural history. In 1733, by order of the empress Anna, he joined Deslisle, G. F. Müller, and Behring in an expedition for the exploration of Siberia, which was penetrated as far as the Lena. He returned to St Petersburg in 1743. In 1749 he was chosen professor of botany and chemistry at Tübingen, where he died, May 20, 1755. Linnæus named a genus of plants *Gmelina* in his honour.

His chief works are *Flora Sibirica* (4 vols., St Petersburg, 1749–50), and *Reisen Durch Sibirien* (4 vols., St Petersburg, 1752).

GMELIN, LEOPOLD (1788–1853), a celebrated chemist, was born August 2, 1788, at Göttingen, in the university of which city his father, Johann Friedrich Gmelin, was professor of medicine. He studied medicine and chemistry at Göttingen, Tübingen, and Vienna, and in 1813 commenced lecturing on chemistry at Heidelberg, where in 1814 he was appointed extraordinary and in 1817 ordinary professor of medicine and chemistry; the latter office he held till 1850. He died at Heidelberg, April 13, 1853.

Gmelin's fame rests chiefly on his chemical dictionary, the *Handbuch der Chemie*, the first edition of which, in 2 vols., was published at Frankfort in 1817-19. The fourth edition (Heidelberg, 1843, &c) was written by Gmelin himself as far as the end of vol. v., was continued by Drs List and Kraut and others, and completed by an eighth volume on physiological chemistry, the work of Professors Lehmann and Rochleder. A revision of the *Handbuch* by Kraut, in two parts, has since appeared. Of the fourth edition an English translation by H. Watts was published by the Cavendish Society in 1848-59. Gmelin was the author also of *Versuch eines neuen chem. Mineralsystems* (Heidelberg, 1825), and of numerous scientific papers. With Tiedemann he wrote *Versuche über die Wege auf welchem Substanzen aus dem Magen und Darmkanale in das Blut gelangen* (Heidelberg, 1820), and *Die Verdauung* (2 vols., Heidelberg, 1826-27).

GMELIN, SAMUEL GOTTLIEB (1743-1774), an eminent naturalist, nephew of J. G. Gmelin (see above), was born at Tübingen, June 23, 1743. He graduated there as M.D. in 1763, went to St Petersburg in 1767, and in 1768, with Pallas, Güldenstädt, and Lapuchin, commenced a journey for the scientific exploration of the south-east possessions of Russia. Having visited in succession the western districts of the Don, the Persian provinces to the south and south-west of the Caspian Sea, the regions of the Volga, and the eastern borders of the Caspian, he in 1774 was on his way back to St Petersburg when he was seized as a hostage by Usmey Khan, of the Kaitak tribe, through whose ill-treatment he died on July 27th of the same year.

His principal works are *Historia Fucorum iconibus illustrata* (St Petersburg, 1768), and *Voyages dans differentes parties des l'Empire de Russie* (4 vols. 4to, St Petersburg, 1770-84).

GMÜND, a town of Würtemberg, circle of Jaxt, formerly a free imperial town, is situated in a charming and fruitful valley on the Rems, here spanned by a beautiful bridge, 31 miles E.N.E. of Stuttgart. It is surrounded by old walls, flanked with towers, and has a considerable number of ancient buildings, among which are the church of the Holy Cross; St John's church, which dates from the time of the Hohenstaufens; St Leonard's church, situated on a height near the town, partly hewn out of the rock and much frequented by pilgrims; the chapels of St Joseph and God's Rest; and the Dominican convent, founded in 1204, now a house of correction. Among the modern buildings are the gymnasium, the drawing and tradeschools, the Roman Catholic seminary, the town hall, the royal deaf-mute and blind institute, the blind asylum, the lunatic asylum, and two hospitals. The industries include the manufacture of gold, silver, copper, bronze, and brass wares, silk and part-silk cloths, tobacco, wax, glue, leather, furniture, bone-dust, and lucifer matches. There is also considerable trade in corn, hops, and fruit. Population in 1875, 12,838.

Gmünd was surrounded by walls in the beginning of the 12th century by Duke Frederick the elder of Swabia. It received town rights from Frederick Barbarossa, and after the dying out of the Hohenstaufens became a free imperial town. In 1546 it was besieged and taken by the Protestants, and in 1793 it was burned by the Swedes. It retained its independence till 1803, when it came into the possession of Würtemberg. Gmünd is the birth-place of the painter Hans Baldung and of the architect Heinrich Arler. In the Middle Ages the population was about 10,000.

GNAT, a name (Anglo-Saxon, *gnæt*) properly applied to the members of the *Culicidæ* (a family of the insect order *Diptera*, division *Orthorrhapha*, subdivision *Nematocera*, section *Eucephala*), but sometimes also used for the *Chironomidæ*. The *Culicidæ* consist of about 150 known species, of the genera *Culex*, *Anopheles*, *Aedes*, *Psorophora*, *Corethra*, &c.; they are distributed over the chief divisions of the world, and, in spite of their very feeble build, reach as far north as man has penetrated (having been found during Nares's recent Arctic expedition). As regards time, examples of a *Culex* and a *Corethra* have been discovered in the Tertiary beds of the Lower White River, Colorado. The *Culicidæ* are distinguished from their immediate allies, amongst other characters, by having the parts of the mouth produced into a slender porrected rostrum, nearly half the length of the insect, and composed of many distinct pieces (seven, according to Westwood, who remarks that the mouth in these delicate creatures is formed of the same number of pieces, and on the same plan, as that of the robust *Tabani*), and many-jointed palpi, very long and pilose in the male, in which sex the antennæ are plumose and 14-jointed. The fibrils of the antennæ are considered by Mayer as auditory organs. The usual special representative of the family is *Culex pipiens*, the common gnat, whose blood-sucking propensities have rendered it too well known. It pierces the skin with the needle-like lancets of its rostrum, which are barbed at the tips, and gradually inserts the whole of those organs, at the same time liquefying the blood by some fluid secretion, which apparently adds to the subsequent irritation. The female, recognizable by her more simple antennæ and palpi, alone attacks man, and, in default of her favourite food, will feed on the honey of flowers. This blood-sucking taste is shared by the allied *Simuliidæ*. The dreaded mosquito is nothing but a species of *Culex*, so closely allied to *C. pipiens* that it is difficult to say where "gnat" ends and "mosquito" begins, though the original mosquito is a native of Cuba. The curious humming noise (from which the name *pipiens* is fancifully derived) accompanying the flight of the gnat is caused by the extremely rapid motion of its wings, which have been calculated to vibrate 3000 times in a minute,—the great relative bulk of the thoracic muscles accounting materially for this. In connexion with the gnat's wing it may be observed that, though apparently clear, "battledore scales" have been discovered upon it by microscopists. The habit of gnats to associate in clouds has been frequently noticed, from the poet Spenser downwards; and instances are even on record of their gatherings round church-spires having caused alarms of fire, from being mistaken for smoke. This apparently arises from the extreme spontaneity and ease of the individuals in their evolutions, which are so rapidly conducted as to enable them to fly unwet in a shower of rain. It has been observed that many of these large gatherings are exclusively composed of females. The transformations of the gnat have often been chronicled, and by none in a more interesting way than Réaumur. The female deposits her eggs in a little raft or boat-like mass, upon the surface of water, using her hind-legs while packing them together; the larvæ hatched from them are very active, diving in a jerky manner quickly, and often coming to the surface to breathe, suspending themselves head downwards, and taking in atmospheric air through a spiracle in one of the large tubes into which the end of the body subdivides. The pupæ are also capable of active motion by means of paddles at the tail, and also suspend themselves under the surface for respiratory purposes, though not breathing as in the larva, but through two little tubes on the back of the thorax. When the perfect insect makes its appearance, the pupa-skin is used by it as a floating foothold until it is ready to take to flight. So short a time is occupied by the entire series of metamorphosis that many generations are perfected in one summer.

GNESEN (Polish, *Gniezno*), the chief town of a circle in the Prussian province of Posen, government of Bromberg, is situated on the Wrzesnia, 30 miles E.N.E. of Posen. Besides the cathedral, which contains the remains of St Adalbert, there are nine Roman Catholic churches, and there is also a Protestant church, a synagogue, a clerical seminary, and a convent of the Franciscan nuns. The industries are cloth and linen weaving and brandy making. A great horse and cattle market is held annually. The population in 1875 was 11,203, of whom about half are Poles.

Gnesen is said to be the oldest town in Poland, and was the capital of the kingdom till 1320. It was made the seat of an archbishop early in the 11th century. It is still the seat of the cathedral chapter, but the archbishop now resides at Posen.

GNOSTICISM, a general name applied to various forms of speculation in the early history of the church. The term γνῶσις is found in the Septuagint translation of the Old

Testament, and in the Apocryphal Book of Wisdom, denoting the knowledge of the true God, or knowledge communicated by Him. In the New Testament the word is frequently used by St Paul (1 Cor. i. 5, xii. 8; 2 Cor. iv. 6, x. 5), and in the second epistle of St Peter (i. 5, 6; iii. 18), to express the saving knowledge of God in Christ; and in the first epistle to Timothy occurs the significant phrase, "Oppositions of Science (γνώσεως) falsely so called." It may be inferred, therefore, that the use of the simple term, in a bad as well as a good sense, was not unknown to the apostolic age, although the expression γνωστικός (Gnostic) is said not to be found till the beginning of the 2d century, when it was first employed by the sect of the Ophites, or, according to some, by Carpocrates. Both expressions were used by the early Christian fathers with the double meaning already indicated. Clement of Alexandria, in his *Stromata* or *Miscellanies*, entitles the enlightened or perfect Christian a Gnostic (*Strom.* i. 20, ii. 6). He points out at length the distinction between the true Gnostic and the disciples of false systems who laid claim to the name of Gnostics. It is only to systems of the latter kind that the name of Gnosticism is now applied.

The sources of Gnosticism are to be found in diverse forms of religious and speculative culture antecedent to Christianity, especially in the theology of the Alexandrian Jews, as represented in the writings of Philo, and again in the influences flowing from the old Persian or Zarathustrian religion and the Buddhistic faiths of the East. To the theosophic system of Philo, with its mixture of Platonic and Old Testament ideas, some of the most characteristic conceptions of Gnosticism are certainly to be traced, such as the infinite separation between God and the world, and the necessity of a mediating power or powers in the creation of the world. This class of ideas prevailed largely at the time of the introduction of Christianity, especially in Alexandria, which was the great meeting-point of Jewish and Hellenic culture. The more the state of the pre-Christian Jewish mind and Jewish literature is investigated, the more do we recognize everywhere a strange commingling of old with new thoughts, of tradition with philosophy, of religion with speculation. The age was in all its aspects eclectic, and the Jewish no less than the Gentile schools of the time were centres for the fusion of old streams of culture from many quarters, and the rise of broader intellectual tendencies. Ever since the captivity, Judaism had borne more or less the impress of the old state religion which it encountered in its exile. How far post-Exilian Judaism was moulded by Zarathustrian conceptions is a very difficult question; but no historical student can doubt that its cosmogony, its angelology, and even its anthropology, were largely modified by contact with Persia. But not only was Zarathustrianism active in and through Judaism. In itself, it spread westward, and became directly and indirectly both a precursor and a parent of Gnostic speculation. Certain forms of Gnosticism seem little else than adaptations of the Persian dualism to the solution of the great problem of good and evil. In other forms of it, again, the Pantheism of India seems to have been a pervading influence. This, too, has its representative in the Jewish schools of the time, in the secret doctrines of the Kabbala, which many carry considerably beyond the time of Christ, although the two books through which we alone know these doctrines—the *Book of Creation* and the book called *Zohar* or *Light*—are plainly of much later production. These doctrines sprang up in Palestine, and not among the Hellenistic Jews. The philosophy on which they rest is plainly pantheistic. Whereas the principle lying at the foundation of the theosophy of Philo makes almost an absolute distinction between the Supreme indefinable Source of all things and the world, the philosophic postulate of the Kabbala is the identity of God and the world—the one being the Eternal Substance of which the other is the manifestation and form. "In place of the personal God, distinct from the world, acknowledged in the Old Testament, the Kabbala substitutes the idea of an universal and infinite substance, always active, always thinking, and in the process of thought, developing the universe. In the place of a material world distinct from God and created from nothing, the Kabbalist substitutes the idea of two worlds—the one intelligible, the other sensible,—both being, not substances distinct from God, but forms under which the Divine Substance manifests itself" (Mansel's *Gnostic Heresies*, p. 35)

Gnosticism is found reproducing one and all of these conceptions, with the additional idea of *redemption* directly borrowed from Christianity. In all its forms, it may be said to represent the efforts made by the speculative spirit of the time to appropriate Christianity, and to make use of some of its most fertile principles for the solution of the mysteries lying at the root of human speculation. The more advanced writers of the present day refuse to recognize Gnosticism as a *heresy*, or to speak of the Gnostics as deserters from the Christian Church. And they are right so far. The Gnostic schools were always so far outside the church. They were not *heretical*, therefore, in the ordinary sense. But it is no less true that Gnosticism, in all its developments, is only intelligible in connexion with Christianity. It was the impulse of Christian ideas which alone originated it, which constituted the vital force of thought that made it one of the most significant phenomena of early Christian history; and it is only its connexion with Christianity which can be said to make it any longer interesting.

The question as to the date of its origin has been much investigated of late by such writers as the late Dean Mansel among ourselves, and Lipsius, Harnack, and Hilgenfeld in Germany. Do we find traces of it in the New Testament writings? or are the supposed allusions to it there to be otherwise explained? It is well known that this question has an important bearing upon other questions as to the origin of some of the New Testament writings, and the special object for which these writings were composed. Without entering into details, or attempting to examine the several passages which may be supposed to contain allusions to Gnosticism in the New Testament, it may be said that such allusions, more or less definite, seem to occur in the later epistles of St Paul, especially the epistles to the Ephesians and Colossians, and in the Pastoral epistles. A supposed allusion has also been traced in the first epistle to the Corinthians, where the word γνῶσις, for the first time in the New Testament writings, is found in a depreciatory sense, in the phrase ἡ γνῶσις φυσιοῖ, ἡ δὲ ἀγάπη οἰκοδομεῖ (1 Cor. viii. 1). In so very general a use of the expression, however, even in its connexion with the question of eating meats which had been offered to idols, it must be held very doubtful whether anything more than a general meaning is intended. And the same remark applies to many even of the more defined modes of expression, such as *Pleroma* and *Æon*, which occur in the later epistles. The true explanation of all these phrases, as well as much else in St Paul's writings, is probably the fact that the spirit of Gnosticism, and the language which it afterwards developed and applied, were "in the air" of the apostolic age. Its modes of thought, as already seen, were prevalent in Philo and in other quarters, and the tendencies which were afterwards worked up into systems were no doubt in existence in the time of St Paul, and still more in the later apostolic time. It seems plainly against such tendencies, rather than against any special sects or schools, that the cautions of St Paul are directed. In the Apocalypse, and in the epistles and gospel attributed to St John, these tendencies are seen in a more developed although hardly in a more distinct state. The second chapter (vv. 6–15) of the Apocalypse has been held to mention a sect of the Gnostics by name—the Nicolaitans—a sect supposed to derive its name from Nicolas, one of the seven deacons, who had departed from the faith and fallen into licentious doctrines and practices. Even in such a sect as this, however, we recognize rather the expression of those lax and restless tendencies which sought everywhere to corrupt the doctrines of the gospel, than any clear philosophical bias. Upon the whole, it may be concluded that what we see in the writings of the New Testament is exactly what we might expect. The Gnostical spirit is present, but Gnosticism is as yet undeveloped. The apostolic age is an age of transition, in which the speculative and ethical spirit of the time is everywhere seen encountering the new life of Christianity, and new seeds of creative thought are everywhere springing from the encounter. There are teachers of all kinds, especially Jewish teachers, busy throughout the Roman world. But Gnosticism properly so-called, as a series of speculative systems, is not yet born. Its approach is heralded by many tendencies forecasting it; but it is only in the Syrian and Alexandrian schools of the beginning of the 2d century that we see it coming forth into distinct shape. Men like Simon Magus and his pupil Menander, the former the opponent of St Peter, and again men like Cerinthus, the opponent of St John, may be called Gnostics. In such traditions of their teaching as survive, we see the workings of the Gnostical spirit—the spirit which sought to transmute the facts of Christianity into some ideological theory. But none of these leaders elaborated systems, or at least we are no longer able to trace with precision of outline the doctrines which they taught. Properly speaking, therefore, they are the precursors of Gnosticism, rather than the founders of Gnostic schools. It is implied by Irenæus (i. 25) that the followers of Carpocrates first called themselves Gnostics; and again by Hippolytus that this designation was first assumed by the Ophites (l. v.). But little can be gathered from writers like Irenæus, or even Hippolytus, as to the true order of development of the Gnostic systems. With the former, for example, Saturninus and Basilides stand not only before Carpocrates, but before Cerinthus, the Ebionites, and the Nicolaitans (i. 24, 26). The last thing to seek in the early fathers is either accuracy of chronology, or a clear sequence of thought. They handle topics, for the most part, quite irrespective of either; and the student is forced back mainly, if not exclusively, on internal evidence as his only trustworthy guide in analysing and classifying the systems of thought which prevailed in the first two centuries.

According to such evidence, and the bias of individual writers, the Gnostic systems have been very differently classified. Mosheim has divided them with reference to their greater or less recognition of the Dualistic principle; Neander with reference to their relation to Judaism; F. Baur with reference to their relation both to Judaism and heathenism. Lipsius, one of the most recent and careful writers on the subject, arranges the Gnostical systems in a threefold order—1st, in so far as they arise within the Jewish schools, and aim to distinguish between Christianity and Judaism; 2d, in so far as they appear within the broader sphere of Hellenism; and 3d, in so far as they approach the circle of Christian faith, and become more or less united with the doctrines of the church.

The most intelligible principle of classification seems to be that already indicated, which recognizes first an inchoate period corresponding to the New Testament age, and represented by many diverse teachers, chiefly of Jewish origin, and then fixes attention upon the great schools of Syria and of Egypt, with the addition of that of Asia Minor, represented by Marcion. These schools are distinguished by their internal features, and their respective relations to Judaism on the one hand and dualism on the other; but they stand out more clearly from their geographical centres, perhaps, than from any other distinguishing features.

I. The inchoate phase of Gnosticism is represented by men like Simon and Cerinthus, both prominently associated with apostles and sects, such as the Ophites or Naasseni (from נָחָשׁ, serpent), the Peratæ or Peratics, the Sethiani, and the followers of one Justinus, author of a book called the *Book of Baruch*, which was written probably not earlier than the beginning of the 2d century. All these sects are elaborately described by Hippolytus in the fifth book of his *Refutation of Heresies*. Simon Magus follows them in his order of treatment (l. v.). There can be little doubt, however, that Simon must be placed in the very front of the history of Gnosticism, in so far as he belongs to this history at all. This is the position that he occupies in the treatise of Irenæus (*Adv. Hæreses*, l. i. c. 23); and his association with St Peter, as well as the account of him in the apostolic history in which he appears (Acts viii. 5, 9, 10) within seven years of the ascension of our Lord, plainly indicates that this is his true position. The character of his teaching, moreover, points to the same conclusion. It is a form of anti-Christianism, rather than any mere depravation of the Christian system. It is true that he is represented in the passage of the Acts of the Apostles already referred to (viii. 13) as having professed himself a believer, and having been baptized; but his whole career afterwards, and the doctrines attributed to him, prove that, whatever may have been his feelings for the moment, he neither understood Christianity, nor came under its practical influence in any degree. Probably he regarded the apostles as only magicians of remarkable skill, and enrolled himself for a time in their company in order that he might learn their secrets and be able to exercise their powers. He was plainly an impostor of the first magnitude, who must be credited with a marvellous and unblushing audacity rather than with any clear philosophic or spiritual aims. He gave himself out as "the great power of God" (Acts viii. 10). "Ego sum sermo Dei," he said of himself, according to St Jerome (on Matt. xxiv. 5), with much blasphemous nonsense besides. He carried about with him a "certain woman named Helena," a prostitute whom he had purchased in the city of Tyre, and who he said "was the first conception (Ἔννοια) of his mind, the mother of all things, by whom in the beginning he conceived the thought of making the angels and archangels" (Iren., *Adv. Hær.*, i. 23). He recognized Christ as Redeemer, but only as occupying an inferior position to himself. He was the true Logos or Power of God, which had previously in an imperfect degree appeared in Jesus. He himself is "the God who is over all things, and the world was made by his angels" (*Ibid.*, i. 23). It is clear that a teacher of this kind had little relation to Christianity, except in so far as it came across his own designing and ambitious path. He had knowledge and intellectual address to avail himself of the prevailing conceptions of the Alexandrian philosophy, so as to impart some coherency to his own insane dreams; but he was characteristically a magician (as his character has survived in history) rather than a philosopher or spiritual thinker. He claims the position assigned to him in the history of Gnosticism mainly in virtue of his pupil and successor Menander who laid the foundation at Antioch of the Syrian Gnostic school more conspicuously represented by Saturninus and others.

For an account of Cerinthus and his system we refer our readers to the article CERINTHUS. The account of his relations with St John, as given by later Christian tradition, may be a mythical expression of the popular Christian feeling about an obnoxious teacher rather than a statement of actual facts; but there seems no doubt that Cerinthus represented, in the close of the 1st century, a type of doctrine especially opposed to that of the fourth gospel. He is supposed to have been of Jewish descent, to have been educated in Alexandria, and to have diffused his doctrine in Asia Minor. Opposed as he was to the Christianity of the church in attributing the creation of the world, not to the Supreme God, but to "a power separate and distinct from" Him, and in conceiving Jesus as a mere man to whom the Christ was united at baptism, and from whom the Christ departed before His death (Iren., i. 2; Hippolytus, vii. 33), he was yet far from being the mere anti-Christian impostor that Simon was. He makes no claim to miraculous or divine powers in himself, but holds a distinct, however erroneous, Christology. The idea of redemption is not only recognized by him, but recognized as verified in Christ and in Him alone. His chief conception of the Creator of the world being other than the Supreme God was probably borrowed by him from the Egyptian schools in which he seems to have taught.

The sects of the Naasseni, the Peratæ, the Sethiani, and the followers of Justin, placed, as we have said, by Hippolytus before Simon, may probably all be ranked along with him and Cerinthus in the early and still undeveloped stage of Gnosticism. It is very difficult to attain to any certainty as to their chronological position. Bunsen traces the origin of the Ophites as far back as the Pauline age; but on very definite grounds it may be concluded that the sect, if existent then, could hardly have acquired any prominence or intellectual interest,—not even in the time of St John; and certain details of their teaching cannot well be earlier than the beginning of the 2d century. Hippolytus gives a distinct and lengthened account of these several sects. The Naasseni, he says, borrowed their opinions from the Greek philosophers and the teachers of the mysteries; the Peratæ took them "not from the Scriptures, but from the Astrologers;" the Sethiani "patched up their system out of shreds of opinion taken from Musæus, and Linus, and Orpheus;" and Justin was indebted for his to the "marvels of Herodotus!" He says, moreover, of the Naasseni that they "call themselves Gnostics." We must leave here, as elsewhere, the more particular description of these sects to special articles. All of them, however, may, with Mansel (*Gnostic Heresies*, p. 96), be regarded as branches of a common sect to which the title of Ophites particularly answers. The serpent was more or less a common symbol with them all; and the idea of the serpent as in some manner a redeeming power for mankind—"a symbol of intellect by whose means our first parents were raised to the knowledge of the existence of bight beings than their creator"—seems to have run through them all. The serpent no doubt tempted man, but he fell from allegiance to the Demiurge, or Creator of the present world, only to rise to the knowledge of a higher world. Thus to identify the serpent with the Redeeming Word or Divine Son came very near to converting the power of Evil into the ideal of Good. This was the logical conclusion which probably lay more or less in all their systems; but it only showed itself fully in a cognate sect called the Cainites, the description of which follows that of the Ophites and the Sethians in the first book of the treatise of Irenæus (c. xxxi.). This sect carried to its extreme form the inversion of Biblical story, and raised the serpent into a creative and redeeming power. All the evil characters in the Old Testament, with Cain at their head, are set forth as the true spiritual heroes; and, in consistency with the same view, Judas Iscariot, in the New Testament, is represented as alone "knowing the truth," and so accomplishing the betrayal of the Saviour, as some later theorists have also supposed, in order that His good work might be completed. They had a gospel of their own in the interest of such views, which they styled "the gospel of Judas."

Another name in the history of Gnosticism, that of Carpocrates, may be classed in this earlier period, although he is said to have been still active as a teacher in the time of Hadrian (117–138). The followers of Carpocrates, as already mentioned, are represented by Irenæus (i. 25) as first styling themselves Gnostics. His opinions had a certain affinity both with those of Cerinthus and the Ophites. They are described at length by Irenæus (i. 25) and Hippolytus (vii. 20). Both writers also ascribe to this teacher and his disciples a great devotion to magical arts, and accuse them of voluptuousness and even licentiousness of life. They seem to have cherished an esoteric doctrine which inculcated the indifference of all actions, and that nothing was really evil by nature. Some of the teachers of the sect marked their pupils by branding them on the inside of the lobe of the right ear. Epiphanes, a son of Carpocrates, is associated with his father in the reign of Hadrian as actively promoting the spread of their heresy, and, dying young, he is said to have been worshipped as a god by the inhabitants of a town in Cephalonia, of which his mother was a native. He must have been a remarkable youth, credited as he is with a work on *Justice*, fragments of which have been preserved by Clement of Alexandria, advocating a very outrageous form of communism. Women of note allied themselves to this free confederacy, one of whom, Marcellina, came to Rome in the time of Anicetus (d. 168), and "led multitudes astray" (Iren. i. 25; see also CARPOCRATES).

II. But, as already indicated, it is not till the first quarter of the 2d century that we see Gnosticism in full and systematic development; and then it ranges from two main centres—Antioch in Syria, and Alexandria.

(1.) Menander, the pupil of Simon, settled at Antioch, and there laid the foundation of the Syrian Gnostic school, whose chief representatives in the 2d century are Saturninus, Tatian, and Bardesanes, the last two of whom were more or less connected with the church—Tatian, as a pupil of Justin Martyr, and the writer of a harmony of the four gospels under the name of *Diatessaron*, and Bardesanes as one of the first of the interesting series of hymn-writers for which we are indebted to the Syrian church. The Syrian Gnosis is distinguished by its admixture of Zarathustrian elements, and the consequent sharpness and precision with which it seizes the idea of conflict between the powers of Good and Evil—the Supreme God, on the one hand, and the Demiurge and his angels or æons, on the other hand. For a more particular account of the characteristics of the system, see articles on the names above mentioned.

(2.) Along with the Syrian school, and occupying a more prominent place in the development of the religious thought of the 2d century, stands the great school of Alexandrian Gnosticism, represented especially by Basilides and Valentinus and their followers. Basilides appears to have been a native of Syria, and to have taught in Alexandria about the year 125. "He is the first Gnostic teacher," says Bunsen (*Hippolytus and his Age*, p. 107), "who has left an individual personal stamp upon his age. . . . His erudition is unquestionable. He had studied Plato deeply. . . . All that was great in the Basilidean system was the originality of thought and moral earnestness of its founder." Bunsen also maintains that "Basilides was a pious Christian, and worshipped with his congregation," while admitting that his sect fell away from the church and from Christianity by refusing to recognize the authority of Scripture and the necessity of practical Christian communion.

Valentinus was probably educated in the school of Alexandrian Gnosticism, as he developed Gnostic ideas in their connexion with Hellenic, rather than Persian, modes of thought into the most elaborate and carefully reasoned system which they reached. He came to Rome about the year 140, and there formed a sect which exercised considerable influence over the commingling speculations of the time which met in that great centre. Bunsen vindicates his Christian character, and says that St Jerome speaks of him with great respect. If at any time he really belonged to the church, it seems to be admitted (Epiph., *Hær.*, xxxi. 7) that in Cyprus, whither he returned and where he died, he ultimately proclaimed himself outside its pale. The most illustrious disciples of the Valentinian Gnosticism, which prevailed on till the 6th century, were Ptolemæus, Heracleon, and Marcus. It is the tenets of these teachers, especially of the first, that are chiefly discussed in the opening chapter of the well-known treatise of Irenæus.

(3.) In addition to these two great schools of Gnosticism there is still a third, especially represented by the famous Marcion of Pontus, whose centre may be regarded as Asia Minor. Marcion was the son of a Christian bishop, by whom he is said to have been excommunicated. Following one Cerdon, a Gnostic of Antioch, Marcion distinguished himself by his extreme opposition to Judaism, and generally by a Gnostic attitude at variance with the Old Testament, the God of which is to him the Demiurge in conflict with the Supreme Being and the Christ whom He sent to redeem the world from the power of this Demiurge. His Christology was of course docetic,—the divine power being only united to the man Jesus for a time. He accepted only ten of St Paul's epistles, and a mutilated copy of the gospel of St Luke. The teaching of the Clementine fictions and a Jewish sect known by the name of Elkesaites, whose tenets seem to have resembled this teaching, is considered by Mansel and others to constitute a Judaizing reaction from the Pauline Gnosticism of Marcion.

Our readers are referred to special articles for a detailed exposition of these several Gnostic systems. It remains for us here to give a general sketch of the questions which Gnosticism discussed, and the broader features which characterized its main developments.

III. The fundamental questions with which Gnosticism concerned itself are the same which in all ages have agitated inquiry and baffled speculation, viz., the origin of life and the origin of evil,—how life sprung from the Infinite Source,—how a world so imperfect as this could proceed from a supremely perfect God. The Oriental notion of matter as utterly corrupt is found to pervade all Gnostical systems, and to give so far a common character to their speculations. It may be said to be the ground-principle of Gnosticism.

Setting out from this principle, all the Gnostics agree in regarding this world as not proceeding immediately from the Supreme Being. A vast gulf, on the contrary, is supposed to separate them. In the general mode in which they conceive this gulf to be occupied they also agree, although with considerable varieties of detail.

The Supreme Being is regarded as wholly inconceivable and indescribable—as the unfathomable Abyss (Valentinus)—the Unnameable (Basilides). From this transcendent source existence springs by emanation in a series of spiritual powers (δυνάμεις). It is only through these several powers or energies that the infinite passes into life and activity, and becomes capable of representation. To this higher spiritual world is given the name of πλήρωμα, and the divine powers composing it, in their ever-expanding procession from the Highest, are called Æons.

So far a common mode of representation characterizes all the Gnostical systems. All unite in this doctrine of a higher emanation-world. It is in the passage from this higher spiritual world to the lower material one that a speculative distinction of an important character begins to characterize them. On the one hand, this passage is apprehended as a mere continued degeneracy from the Source of Life, at length terminating in the kingdom of darkness and death—the bordering chaos surrounding the kingdom of light. On the other hand, this passage is apprehended in a more precisely dualistic form, as a positive invasion of the kingdom of light by a self-existent kingdom of darkness. According as Gnosticism adopted one or other of these modes of explaining the existence of the present world, it fell into the two great divisions which, from their places of origin, have received the respective names of the Alexandrian and Syrian Gnosis. The one, as we have seen, presents more a Western, the other more an Eastern type of speculation. The dualistic element in the one case scarcely appears beneath the Pantheistic, and bears resemblance to the Platonic notion of the ὕλη—a mere blank necessity, a limiting void. In the other case, the dualistic element is clear and prominent, corresponding to the Zarathustrian doctrine of an active principle of evil as well as of good—of a kingdom of Ahriman (Auro-Mainyus) as well as a kingdom of Ormuzd (Ahura-Mazdâo).

In the Alexandrian Gnosis a link of subordination is preserved between the two kingdoms, separated as they are. For the ὕλη only becomes a living and active power of evil through the quickening impartation of some element from the higher kingdom in its progressive descent from the Supreme Source. The stream of being in its ever-outward flow at length comes in contact with dead matter, which thus receives animation, and becomes a living source of evil. Its life and power, however, are withal only derived from the higher kingdom. But in the Syrian Gnosis the kingdom of darkness has no such dependence upon the kingdom of light. There appears from the first a hostile principle of evil in collision with the good.

Out of this main distinction other more special distinctions arise, still more clearly defining the one form of γνῶσις from the other. According as the two kingdoms are recognized as subordinate the one to the other, or as opposed to each other, it is obvious that different views will prevail as to the character of the Δημιουργός, or maker of this world, whose name and functions are so prominent in all systems of Gnosticism. In the one case, his relation to the Supreme Source of life will be apprehended as more dependent—in the other, as more hostile. In the former view, the γνῶσις, while rising in its pride of speculation far above all mere earthly relations and historical religions, could yet find in these a point of contact, whereby the higher spiritual truth, penetrating this lower world, would gradually raise it to its own elevation. In the latter, no such point of contact is left between nature, or history, and the γνῶσις. Accordingly, while the Alexandrian form of Gnosticism was found to embrace Judaism, as a divine institution, although very inferior and defective in its manifestation of the Divine character, the Syrian rejected it as being wholly the work of the spirit of the lower world—the Δημιουργός warring with the supreme God. This anti-Judaical spirit is found developed to its extreme in Marcion.

The Gnostic conception of Christ, in so far uniform, is also of course greatly modified by the different relations which the systems thus bore to Judaism. In all he is recognized as a higher Æon, proceeding from the kingdom of light for the redemption of this lower kingdom of darkness. But, in the one case, however superior, he is yet allied to the lower angels and the Δημιουργός, governing this lower world. His appearance, accordingly, admits of being historically connected with the previous manifestations of the Divine presence upon earth. But, in the other case, he is apprehended as a being wholly distinct from the Δημιουργός, and his appearance takes place in this lower world without any previous preparation, in order that he may draw to himself all kindred spiritual natures held in bondage by the power of this lower world. If any point of connexion is admitted in this latter case betwixt Christianity and the lower world, it is certainly not found in Judaism or any historical religion, but in the theosophic schools, where an esoteric knowledge of the Supreme was cultivated.

IV. Vague, confused, and irrational as Gnosticism in most of its systems is, its influence upon the development of Christian thought was by no means detrimental. It compelled Christian teachers to face the great problems of which it attempted the solution in so many fantastic forms. It expanded the horizon of controversy within as without the church, and made men like Irenæus, and Clement, and Origen, and even Tertullian, feel that it was by the weapons of reason and not of authority that they must win the triumph of Catholic Christianity. Gnosticism, therefore, may be said to have laid the foundation of Christian science, and it is certainly interesting and deserving of notice that it is in the two great cities of Antioch and Alexandria,—where Gnosticism had chiefly planted itself,—that we see the rise of the first two schools of Christian thought. These centres of half-Pagan and half-Christian speculation became the first centres of rational Christian theology.

The several schools of Gnosticism seem to have gradually lost importance after the middle of the 3d century, although some of them continued to linger till the 6th century. Manichæism was little else than a revival of it in the Syrian form, and this system in the 4th and 5th centuries became so powerful as almost to be a rival to Christianity. The great Christian father St Augustine, as is well known, was long fascinated by its influence. Again, strangely, in the 12th century the same spirit burst forth afresh, and in special connexion with the name of the great apostle of the Gentiles. The sect of Paulicians, originating in the old Syrian haunt of heresy, Samosata, spread through Asia Minor, and then through Bulgaria and the borders of the Greek empire into Italy, Germany, and France. Gibbon, in the 54th chapter of his famous *Decline and Fall of the Roman Empire*, has given a vivid and powerful description of the fortunes and persecutions of the sect, and the readiness with which its doctrines seized upon whole populations. In southern France especially it spread like wildfire, and for a time almost entirely displaced Catholic Christianity. This Western development of the old Oriental dualism was characterized by many of the features of the earlier Gnosticism, such as the doctrine of the radical evil of matter, aversion to the Old Testament as the work of an evil Demiurge, and a docetic Christology. Extinguished in the horrors of the Albigensian war, it can hardly be said to have reappeared in the history of Christendom.

Literature.—Only one original Gnostic work has survived to modern times, the πίστις σοφία of Valentinus (edited by Petermann, Berlin, 1851); for all further knowledge of the system we are entirely dependent on the treatises of its avowed opponents,—especially on that of Irenæus (ἔλεγχος τῆς ψευδωνύμου γνώσεως) and on that of Hippolytus (ἔλεγχος κατὰ πασῶν αἱρέσεων), although reference may also be made to passages bearing on the subject in the writings of Justin Martyr, Tertullian, Clemens Alexandrinus, Origen, Eusebius, Philastrius, Epiphanius, Theodoret, Augustine, and Plotinus. The subject is taken up with more or less fulness in all the church histories, and histories of philosophy. Among the more important recent works bearing upon the elucidation of Gnosticism may be mentioned those of Neander (*Genetische Entwickelung der vornehmsten Gnostischen Systeme*, 1818), Matter (*Histoire critique du Gnosticisme*, 1828, 2d ed. 1843), Baur (*De Gnosticorum Christianismo Ideali*, 1827; *Die Christliche Gnosis*, 1835; *Die drei ersten Jahrhunderte*, 3d ed., 1863), Bunsen (*Hippolytus u. seine Zeit*, 1852–53), Lipsius (art. "Gnosticismus" in Ersch and Gruber's *Encyclopädie*, republished in a revised form with the title *Der Gnosticismus; sein Wesen, Ursprung, und Entwickelung*, 1860), Harnack (*Zur Quellenkritik der Geschichte des Gnosticismus*, 1873), Mansel (*Gnostic Heresies*, 1875), and Lipsius (*Die Quellen der ältesten Ketzergeschichte neu untersucht*, 1875). References to the monographs by Ritschl, Volkmar, Heinrici, Hilgenfeld, and others on special branches of the subject will be found under the several headings BARDESANES, BASILIDES, MARCION, VALENTINUS, &c. (J. T.)

GNU (*Catoblepas*), a genus of ruminant mammals constituting the equine group of the antelope family, and containing two species—the gnu or kokoon (*Catoblepas gnu*) and the brindled gnu (*Catoblepas gorgon*). Owing to their singular appearance, which has been aptly compared to that of a creature compounded of a bison's head, a horse's body, and an antelope's legs, their proper zoological position has been a matter of dispute—some placing them among the oxen, while others regard them as a connecting link between bovine animals and the true antelopes. The gnu measures about 4½ feet in height at the shoulders, and 9 feet in extreme length. Its nose is broad and flattened, and bears on its upper surface a crest of reversed hair, while there is an abundant growth of bushy black hair beneath the chin and between the forelegs. The horns, which are present in both sexes, are very broad at their base, forming a solid helmet on the forehead, from which they bend downwards and outwards, thereafter curving rapidly upwards to the tip. A mane of light-coloured hair, tipped with brown, and presenting a neatly clipped appearance, extends along the neck,

Gnu.

while the horse-like tail, which is more or less of a creamy colour, reaches to the ground. The nostrils are large, and are furnished with a muscular valve by which they can be closed. The gnu is a native of the arid plains of South Africa, where it congregates in considerable herds, its restlessness of disposition leading it to migrate frequently from place to place. The fantastic appearance of those creatures is fully equalled by the grotesqueness of their actions. Advancing, as they generally do, in single file, they may be seen wheeling and prancing in all directions, tossing their heads, switching their long tails, and then starting off, especially if alarmed by the appearance of a lion, at tremendous speed, raising columns of dust along their track, and leaving their pursuers hopelessly in the rear. Should they be surprised in their gambols by the sight of a caravan, their exceeding inquisitiveness impels them to approach the intruding object, which they do in a compact square, looking all the while the very picture of defiance. "During bright moonlight," says Captain Harris, "curiosity often prompted a *clump* of gnus to approach within a few yards of our bivouac, where they would stand for hours in the same position, staring wildly, lashing their dark flanks, and uttering a subdued note resembling the harsh croaking of a frog." The noise made by the old bulls, as they roam singly during the rutting season, is much more formidable, being usually compared to the roar of the lion; and many sportsmen who have hunted the gnu bear testimony to the remarkable likeness between the solitary males with their long manes, when seen at a considerable distance, and the "king of beasts." They are by no means the formidable creatures their ferocious aspect might lead one to suppose. However defiant the herd appears as it approaches a caravan, the report of a gun puts the whole troop of gnus to flight, and they are never known to attack man unless driven thereto in self-defence. The female has seldom more than a single young one at a birth, the calf at first being of a whitish colour. When captured young, the gnu may, according to Captain Harris, be reared by the hand on cows' milk; and although of uncertain temper, it can be got to herd with the cattle on the farm. The flesh of the calf is considered a delicacy, but that of the adult is insipid, being almost destitute of fat. Its long silky tail is in great request for chowries, and its hide is cut into strips and used for ropes and twine.

The brindled gnu is a more northerly form, never being found south of the Orange river. It is readily distinguished from the other species by the black colour of its tail and mane, the obscure vertical streaks on its body, its more elevated withers, and its extremely long aquiline nose. While equally grotesque in appearance and manner, it is much less spirited and active than the gnu. Its flesh is highly prized by the natives, who also convert its hide into mantles, rendered attractive to South-African taste by being dressed without removing the long hair of the mane and beard.

GOA, a Portuguese settlement on the Malabar or western coast of India, lying between 15° 44′ 30″ and 14° 53′ 30″ N. lat., and between 73° 45′ and 74° 26′ E. long. It is bounded on the N. by the river Tirakul or Auraundem, separating it from Sáwant Wári State, on the E. by the Western Gháts, on the S. by Kanara district, and on the W. by the Arabian Sea. Total area, 1062 square miles; population, 392,234.

This settlement forms a patch of foreign territory on the east of the Bombay coast, and is surrounded on all sides, except to the seaward, by British districts. Goa is a hilly country, especially the recently acquired portion known as the Novas Conquistas. Its distinguishing feature is the Sahyadri Mountains, which after skirting a considerable portion of the north-eastern and south-eastern boundary, branch off westwards across the territory with numerous spurs and ridges. The plains are well watered by large navigable rivers. The most important is the Mandavi river, on whose banks both the ancient and modern cities of Goa stand, with a fine harbour formed by the promontories of Bardez and Salsette. The port of New Goa or Panjim is divided into two anchorages by the projection of the *cabo* (cape) from the island of Goa, both capable of safely accommodating the largest shipping.

Goa ranks high as regards its early importance among the cities of western India. It emerges very distinctly in the 14th century, and was visited by the famous traveller Ibn Batuta. In the 15th century it formed the chief emporium of trade on the western side of India. Caravans of merchants brought down its products to the coast, and it was the only city in western India which enjoyed at this period a revenue of £10,000. Its wealth and advantageous situation attracted the Mahometan princes of the Deccan, and in 1469 it was taken by the Báhmani king. A fleet of 120 ships operated from the sea; the Báhmani troops forced their way down the passes of the Gháts; and Goa capitulated. It next passed under the Bijápur dynasty, and on the arrival of Albuquerque, at the beginning of the 16th century, its military and commercial capabilities at once struck his mind. In 1510 the fleet of Albuquerque, consisting of 20 sail of the line, with a few small vessels and 1200 fighting men, hove in sight off the harbour. A holy mendicant or *jogi* had lately foretold its conquest by a foreign people from a distant land, and the disheartened citizens rendered up the town to the strangers. Eight leading men presented the keys of the gates to Albuquerque on their knees, together with a large banner which was usually unfurled on state occasions. Mounted on a richly caparisoned steed, Albuquerque entered the city in a triumphal procession, with the Portuguese banners carried by the flower of the Lisbon nobility and clergy amidst the acclamations of an immense multitude, who showered upon the conqueror filigree flowers of silver and gold. Albuquerque behaved well to the inhabitants, but was shortly afterwards expelled by the Bijápur king. However, he returned a few months later with a fleet of 28 ships carrying 1700 men, and after a bloody attack, in which 2000 Mussulmans fell, forced his way into the town. For three days the miserable citizens were subjected to every atrocity. The fifth part of the plunder, reserved for the Portuguese crown, amounted to £20,000.

The conquest of Goa illustrates the essentially military basis on which the Portuguese power in India rested. The subsequent history of the town has been one of luxury, ostentation, and decay. After bearing a siege by the king of Bijápur, and suffering from a terrible epidemic, Goa reached the summit of its prosperity at the end of the 16th century, during the very years when the English Company was struggling into existence under Elizabeth. "Goa Dourada," or Golden Goa, seemed a place of fabulous wealth to the plain merchants who were destined to be the founders of British India. "Whoever has seen Goa need not see Lisbon," said a proverb of that day. Indeed, if the accounts of travellers are to be trusted, Goa presented a scene of military, ecclesiastical, and commercial magnificence, such as has had no parallel in the European capitals of India. The brilliant pomp and picturesque display of Goa were due to the fact that it was not only a flourishing harbour, but the centre of a great military and ecclesiastical power. The Portuguese based their dominion in India on conquest by the sword. They laboured to consolidate it by a proselytizing organization which throws all other missionary efforts in India into the shade.

Goa reached its climax of pomp and power about the year 1600. Immediately afterwards commenced the long struggle with the Dutch, which before the end of the century had stripped Portugal of its fairest possessions in the East. In 1603 the Dutch blockaded Goa, but had to raise the siege. In 1635 the old epidemic fever which had afflicted Goa in the preceding century again broke out, and raged for five years. In 1639 the Dutch once more blockaded Goa, but found their meagre force of twelve ships insufficient for its capture. In 1666 luxury and the plague and the Dutch privateers had effectually crippled the commerce of Goa. Thevenot in that year drew a powerful picture of the decayed city. In 1675 Dr John Fryer described the city as in a ruinous state, whilst the inhabitants still made pitiful attempts at display in spite of their increasing misery. In 1683 Goa narrowly escaped falling into the hands of the Marhattá hordes under Sambáji. Before 1687 the abandonment of Old Goa had taken place. "Many streets," says an official document of that year, "have now become lonely and uninhabited." The river had silted opposite its quays, ships could no longer approach the city, the fever had again broken out, and the population had moved out to suburbs nearer the mouth of the river. In 1695 only 20,000 inhabitants remained. In 1739 the whole territory was attacked by the Marhattás, and only saved by the unexpected appearance of a new viceroy with a fleet. Various attempts were made in vain to rebuild Old Goa, and by the middle of the 18th century "this fairest but poorest settlement had become a burden to the Portuguese Home Government, costing no less than 300,000 piastres a year."

In 1759 further attempts to rebuild Old Goa were given up, and the governor changed his residence to Panjim or New Goa, the present city, at the mouth of the river. In 1775 the population was reduced to about 1600 souls, of whom 1198 were Christians, almost entirely half-castes and native converts. In 1759 also the Jesuits were expelled. They had got into their hands what little commerce remained, and the last touch was put to the ruin of Old Goa. "The river washes the remains of a great city,—an arsenal in ruins, palaces in ruins, quay walls in ruins, churches in ruins,—all in ruins. We looked and saw the site of the Inquisition, the bishop's prison, a grand cathedral, great churches, chapels, convents, religious houses, on knolls surrounded by jungle and trees scattered all over the country. We saw the crumbling masonry which once marked the lines of streets and enclosures of palaces, dockyards filled with weeds and obsolete cranes."

Panjim or New Goa lies in lat. 15° 30′ N., long. 75° 53′ E., at the mouth of the river Mandavi, and is a modern town with few pretensions to architectural beauty. Ships of the largest tonnage can lie out in the harbour, but only vessels of moderate size can be brought alongside of the city. The population is estimated at 15,000. Panjim was the residence of the viceroy from 1759, and in 1843 was ranked the capital of the Portuguese possessions in India.

The territory of Goa, including the two cities of Old Goa and Panjim with the adjoining country under Portuguese rule, amounts, as already stated, to 1062 square miles. Of the total population, namely, 392,234, nearly two-thirds or 232,089 are Roman Catholics, 128,824 are Hindus, and 2775 Mahometans. The Roman Catholics are subject in spiritual matters to an archbishop, who has the title of primate of the East. The Hindus and Mahometans enjoy perfect liberty in their religious affairs, and have their own places of worship. Agriculture forms the chief industry of the country. The total area under cultivation is 234,754 acres. Rice is the staple produce; next is the cocoa-nut, which is deemed important from the variety of uses to which the products are applied. The chief exports are cocoa-nuts, betel-nuts, mangoes, water-melons, cinnamon, pepper, salt fish, gum, firewood, and salt; and the chief imports rice, cloth, sugar, wines, tobacco, glassware, and hardware. The district seldom suffers from great floods. Some parts are subjected to inundations during heavy rains, but little damage is done to the crops. The high-lying town of Panjim takes its name from the native word *Ponji*, meaning "arable land that cannot be inundated." The total revenue in 1873–74 was £108,148; the expenditure, £107,145. The police force numbers 919 men. In 1869–70 there were 137 lower schools, and 25 higher schools, including a National Lyceum with 2433 pupils. There are also medical and chemistry schools, and since 1870 a college for the study of practical sciences has been established. The prevailing endemic diseases are intermittent and remittent fevers, diarrhœa, and dysentery. The average annual rainfall for the three years ending 1875 was 100·22 inches.

GOA POWDER, a drug occurring in the form of a yellowish-brown powder, varying considerably in tint, which has recently been brought into notice by Dr Fayrer of Calcutta as a remedy for ringworm. It derives its name from the Portuguese colony of Goa, where it appears to have been introduced about the year 1852. In 1875 it was shown by Dr Lima that the substance had been exported from Bahia to Portugal, whence it found its way to the Portuguese colonies in Africa and Asia. The tree which yields it belongs to the genus *Andria* of the natural order *Leguminosæ*, and has been named *A. Araroba*. It is met with in great abundance in certain forests in the province of Bahia, preferring as a rule low and humid spots. The tree is from 80 to 100 feet high, and is furnished with imparipinnate leaves, the leaflets of which are oblong, about 1½ inch long and ¾ inch broad, and somewhat truncate at the apex. The flowers are papilionaceous, of a purple colour, and arranged in panicles. The Goa powder or araroba is contained in the trunk, filling crevices in the heartwood. To obtain it, the oldest trees are selected as containing a larger quantity, and after being cut down are sawn transversely into logs, which are then split longitudinally, and the araroba chipped or scraped off with the axe. During this process the workmen feel a bitter taste in the mouth; and great care has to be taken to prevent injury from the irritating action of the powder on the eyes. In this state, *i.e.*, mixed with fragments of wood, the Goa powder is exported in casks.

In India Goa powder has been used in the form of a paste, made by mixing the powder with vinegar or lime juice, as a local application for the cure of Indian ringworm. It appears to be one of the best remedies for that obstinate disease; and so highly is it valued that its price in Bombay averages £3, 12s. per lb. Its use in chloasma, intertrigo, and psoriasis, as well as in various other skin diseases, has also been attended with considerable success. The only disadvantages attending its use are—that it leaves a stain which is difficult to remove, and that the powder is apt to set up severe irritation of the eyes, if it come in contact with the conjunctiva. On this account Mr Balmanno Squire prefers to use it in the form of ointment. When given internally it has been found to act as an emetic and purgative. In England it is now regarded as one of the most efficacious remedies in intractable cases of ringworm.

GOÁLPÁRA, the most westerly district of Assam, between 25° 21′ and 26° 54′ N. lat. and between 89° 44′ and 91° 0′ E. long., bounded on the N. by Bhután, E. by Kámrúp, S. by the Gáro Hills, and W. by Kuch Behar and Rangpur. The district is situated on the Brahmaputra, at the corner where the river takes its southerly course into Bengal. The scenery is striking. Along the banks of the river grow clumps of cane and reed; farther back stretch fields of rice cultivation, broken only by the fruit trees surrounding the villages, and in the background rise the forest-clad hills overtopped by the white peaks of the Himalayas. The soil of the hills is of a red ochreous earth, with blocks of granite and sandstone interspersed; that of the plains is of alluvial formation. Earthquakes are common and occasionally severe shocks have been experienced. The Brahmaputra annually inundates vast tracts of country. Numerous extensive forests yield valuable timber. Wild animals of all kinds are found.

Goálpára has always formed the frontier between Bengal and Assam; originally it must have constituted part of the legendary Hindu kingdom of Kámrúp; from that it must have fallen into the hands of the early rájás of Kuch Behar, who, however, were unable long to retain their kingdom. From the east the wild Ahams came down the valley of the Brahmaputra, while from the west the Mughuls extended the limits of the Delhi empire. In 1608 the Mughuls came into collision with the Ahams, but were forced to retreat with a decisive defeat. The district came into British possession with the rest of Bengal in 1765. It has undergone several changes in administration, and in 1872, when Assam was constituted a separate administration, Goálpára was included within it.

In 1872 the population was 407,714,—311,419 being Hindus, and 89,916 Mahometans. Goálpára town, with between 3000 and 4000 inhabitants, is the most populous place, as well as the chief centre of trade. Dhubri is the point where the traffic of northern Bengal is shipped on board the Assam steamers. Gauripur and Lakhshmipur carry on a thriving trade in timber.

Rice forms the staple crop of the district. Mustard and jute are also largely grown. The area under cultivation is estimated at 600,000 acres, or about one-third of the total area. The district is not liable to any form of natural calamity; occasionally blights have been caused by worms and insects, but the harvests have never been affected. The manufactures consist of the making of brass and iron utensils and of gold and silver ornaments, weaving of silk cloth, basket-work, and pottery. The cultivation of tea has recently been introduced, and is advancing considerably. The chief centres of traffic are Goálpára town, Dhubri, Jogigopha, Bijni, Gauripur, and Singiwári. Local trade is in the hands of Márwári merchants, and is carried on at the *bázárs*, weekly *háts* or markets, and periodical fairs. The chief exports are mustard-seed, jute, cotton, timber, lac, silk cloth, india-rubber, and tea; the imports, Bengal rice, European piece goods, salt, hardware, oil, and tobacco. The Brahmaputra and its tributaries are the chief means of communication, and are navigated by river steamers and the largest native boats. Goálpára is considered an unhealthy district both for Europeans and for natives. The principal diseases are intermittent and remittent fevers, diarrhœa, dysentery, rheumatism, and chest complaints. Cholera frequently occurs in an epidemic form, and small-pox is more or less prevalent every year. The mean annual temperature is 75° Fahr.; and the average annual rainfall is 98·75 inches.

GOÁLPÁRA, the chief town of above district, situated on the left bank of the Brahmaputra, in 26° 11′ 0″ N. lat., 90° 41′ 0″ E. long. It was the frontier outpost of the Mahometan power in the direction of Assam, and has long been a flourishing seat of river trade. The civil station is built on the summit of a small hill commanding a magnificent view of the valley of the Brahmaputra, bounded on the north by the snowy ranges of the Himálayas and on the south by the Gáro hills. The native town is built on the western slope of the hill, and the lower portion is subject to inundation from the marshy land which extends in every direction. Population (1872) 4678.

GOAT. All the species of the genus *Capra* may be divided into two classes, the one being represented by the ibex (see IBEX) and the other the goat. The latter class is subdivided into the ægagrus or wild goat (*Capra ægagrus*) and the domestic goat (*Capra hircus*), of which there are many varieties.

The Wild Goat, or Paseng of the Persians (*Capra ægagrus*, Pall.), is an inhabitant of the mountainous regions of Central Asia from the Caucasus to the Himalayas, and is occasionally met with in troops at great elevations. It stands somewhat higher than any of the domesticated varieties of the goat, from which it further differs in its stouter limbs and more slender body. Its neck is short, and is thus fitted to bear the enormous horns, which in the male are larger proportionally than in any other ruminant animal. These measure nearly three feet in length, are obscurely triangular in form, transversely ridged, and are bent backward as in the domestic varieties. The wild goat of the Himalayas, according to Darwin, when it happens to fall accidentally from a height, makes use of its massive horns by bending forward its head and alighting on them, thus breaking the shock. In the female the horns are exceedingly diminutive, or are altogether awanting. The fur, which over the greater part of the body is short, is of a greyish-brown colour, with a black line running along the entire length of the back; the short tail and the muzzle are also black, while the under surface of the neck, and the beard, which is present in both sexes, are of a brown colour. . The paseng is exceedingly wary of the approach of man, and as its agility is no less remarkable there has been little opportunity of studying it closely. The concretions known as *bezoar-stones*, which were formerly much used in medicine and as antidotes of poison, are believed to have been originally obtained from the intestines of this species.

Considerable diversity of opinion has been expressed by naturalists as to the original stock of the domestic goat, which is met with in nearly every quarter of the globe,—the now prevalent and the most probable opinion being that the various domestic breeds are severally descended from wild stock now extinct. Both the ibex and the ægagrus interbreed freely with the common goat, though the produce is not always fertile. Instances of this are not unusual in the Alps and Pyrenees, where goats abound in a semi-domesticated state. Hybrids between the goat and the sheep are also known to have occurred, but are rare.

The following are the chief domestic breeds, possessing distinct characteristics:—the Common Goat, the Maltese, the Syrian, the Angora, the Cashmere, the Nubian or Egyptian, and the Dwarf Goat of Guinea.

The Common Goat.—This has many varieties which differ from each other in length of hair, in colour, and slightly in the configuration of the horns. The ears are more or less upright, sometimes horizontal, but never actually pendent, as in some Asiatic breeds. The horns are rather flat at the base and not unfrequently corrugated; they rise vertically from the head, curving to the rear, and are more or less laterally inclined. The colour varies from a dirty white to a dark-brown, but never black, which indicates Eastern blood. Most of the European countries possess more than one description of the common goat. In the British Isles there are two distinct types, one short and the other long haired. In the former case the hair is thick and close, with frequently an undercoat resembling wool. The horns are large in the male, and of moderate size in the female, flat at the base and inclining outwards. The head is short and tapering, the forehead flat and wide, and the nose small; the legs strong, thick, and well covered with hair. The colour varies from white or grey to black, but is frequently fawn, with a dark line down the spine and across the shoulders. The other variety owns a shaggy coat, generally of a reddish-black hue, though sometimes grey or pied and occasionally white. The head is long, heavy, and ugly, the nose coarse and prominent, the horns are situated close together, and often continue parallel almost to the extremities, being also large, corrugated, and pointed. The legs are long, and the sides flat, the animal itself being generally gaunt and thin. This breed is peculiar to Ireland, the Welsh being of a similar description, but more often white. The short-haired goat is the English goat proper. From the constant crossing however that takes place between these native breeds and imported foreign specimens, one meets in England with animals possessing very great diversity of form. Both the British breeds and those from abroad are frequently ornamented with two peculiar tassel-like appendages, which hang near together under the throat. It is supposed by many that these ornaments are traceable to some foreign origin; but although there are foreign breeds that possess them, they appear to pertain quite as much to the English native breeds as to those of distant countries, and indeed the peculiarity referred to is mentioned in very old works that describe the goats of the British Islands. The milk produce in the common goat as well as other kinds varies very greatly with individuals. Irish goats often yield a quantity of milk, but the quality is comparatively poor. The goats of France are very similar to these of Britain, varying in length of hair, colour, and character of horns. A French writer describes them as possessing "a particularly neat and compact head, small mouth, horns corrugated, and inclining upwards and outwards, a thin neck, narrow chest, and long body, long but muscular legs, and in colour white, black, fawn, or pied." The Norway breed is frequently pure white with long hair; it is rather small in size, with small bones, a short rounded body, head small with a prominent forehead, and short, straight, corrugated horns. The facial line is concave. The horns of the male are very large, and curl round after the manner of the wild goat, with a tuft of hair between and in front.

The *Maltese Goat* has its ears long and wide and perfectly pendulous, hanging down below the jaw. The hair is long and cream-coloured. Specimens of this kind are usually hornless, which is perhaps the cause of it having been called the "Hornless Variety." It would appear, however, that the absence of these appendages is simply a freak of nature, and not the peculiar characteristic of a particular species.

The Syrian Goat.—This breed is met with in various parts of the East, in Lower Egypt, on the shores of the Indian Ocean, and in the island of Madagascar. Both its hair and ears are excessively long, the latter so much so that they are sometimes clipt to prevent their being torn by stones or thorny shrubs. Its horns are somewhat erect and spiral, with an outward bend.

The *Angora Goat* is often confounded with the Cashmere, but is in reality quite distinct from it. The principal feature of this breed, of which there are two or three varieties, is the length and quantity of its hair, which has a particularly soft and silky texture, covering the whole body and a great part of the legs with close matted ringlets. The horns of the male differ from those of the female, being directed vertically and in shape spiral, whilst in the female they have a horizontal tendency, somewhat like those of a ram. The face has a sheepish expression. The coat is composed of two kinds of hair, the one short and coarse and of the character of hair, which lies close to the skin, the other long and curly and of the nature of wool, forming the outer covering. Both are used by the manufacturer, but the exterior portion, which makes up by far the greater bulk, is much the more valuable. The process of shearing takes place in early spring, and is conducted with the utmost care; the average amount of wool yielded by each animal is about 2½ lb. The best quality comes from castrated males, the females producing the next best. The annual export of wool from Angora is estimated at about 2,000,000 lb, and its value at £200,000. Large herds are shipped at Constantinople and sent to Cape Colony, where this breed thrives well and is largely propagated, the climate being specially suitable to the perfect development of the wool. A very valuable consignment of these animals arrived in London in May 1879 for transshipment to the Cape, having been procured from different parts of Asia Minor, by means of great personal exertion, by Mr J. B. Evans, a South-African goat farmer. The wool, or mohair, as it is technically termed, of these goats was remarkably long, fine, and heavy, the average weight of the produce of the herd being reckoned at 6 lb per head. So highly is this breed

FIG. 1.—Angora Male Goat.

esteemed by the Turkish farmers that it was with the greatest reluctance they were induced to sell them, and then only at exorbitant prices, some of the males costing £250 and females £150. £50 and £60 are common prices for these goats at Angora. Fig. 1 is from a photograph of the finest male of the flock, the fleece of which was estimated to weigh when shorn full 15 lb. The breed was introduced at the Cape about 1864. In 1878, according to the customs returns, 1,300,585 lb weight of mohair was exported, of the value of £105,313. The Angora is a bad milker and an indifferent mother, but its flesh is better eating than that of any other breed, and in its native country is preferred to mutton. The kids are born very small, but grow fast, and arrive early at maturity. This variety of the goat approaches nearest in its nature, form, and habits to the sheep, even the voice having a strong resemblance.

The Cashmere Goat.—This animal has a delicate head, with semi-pendulous ears, which are both long and wide. The hair varies in length, and is coarse and of different colours according to the individual. The horns are very erect, and sometimes slightly spiral, inclining inwards and to such an extent in some cases as to cross. The coat is composed, as in the Angora, of two materials; but in this breed it is the under coat that partakes of the nature of wool and is valued as an article of commerce. This undergrowth, which is of a uniform greyish-white tint, whatever the colour of the hair may be, is beautifully soft and silky, and of a fluffy description resembling down. It makes its appearance in the autumn, and continues to grow until the following spring, when if not removed, it falls off naturally; its collection then commences, occupying from eight to ten days. The animal undergoes during that time a process of combing by which all the wool and a portion of the hair, which of necessity comes with it, is removed. The latter is afterwards carefully separated, when the fleece in a good specimen weighs about half a pound, being worth between half to three quarters of a rupee. It is sold by the "turruk" of 12 lb. This is the material of which the far-famed and costly shawls are made, which at one time had such a demand that, it is stated, "16,000 looms were kept in constant work at Cashmere in their manufacture." Those goats having a short, neat head, very long, thin ears, a delicate skin, small bones, and a long heavy coat, are for this purpose deemed the best. There are several varieties possessing this valuable quality, but those of Cashmere, Thibet, and Mongolia are the most esteemed. About the year 1816 a small herd of Cashmeres was introduced into France with a view to acclimatize and breed them for the sake of their wool, but the enterprise failed. A few were purchased and brought over to England by Mr C. T. Tower, who, by careful treatment, so far succeeded with them that, in course of time, he had a shawl made from their fleece, which turned out to be of good quality. At the death of the owner some years later, the herd, which had then deteriorated through in-breeding, was presented to the Queen and placed in Windsor Park.

The *Nubian Goat*, which is met with in Nubia, Upper Egypt, and Abyssinia, differs greatly in appearance from all those previously described. The coat is in the female extremely short, almost like that of a race-horse, and the legs are very long. This breed therefore stands considerably higher than the common goat. One of its peculiarities is the strongly convex shape of the face, the forehead being very prominent and the nostrils sunk in, the nose itself extremely small, and the lower lip projecting from the upper. The ears are long, broad, and thin, and hang down by the side of the head like a "double lop" rabbit. The horns are quite black, slightly twisted, and very short, flat at the base, pointed at the tips, and recumbent on the head. But

FIG. 2.—Nubian Goat.

little was known of this breed in Europe—in the West at least—until some ten or twelve years ago, when some were imported into France by the Société d'Acclimatation of Paris, who found its milking qualities to surpass those of all other breeds. Among the goats that are met with in England a good many show unmistakable signs of a more or less remote cross with this breed, derived probably from specimens brought from the East on board ships for supplying milk during the voyage. It is no doubt on this account that they often go by the name of "Indian" goats.

The *Nepaul Goat* appears to be a variety of the last breed, it having the same arched facial line, pendulous ears, and long legs. The horns, however, are more spiral. The colour of the hair, which is longer than in the Nubian, is black, grey, or white, with black blotches.

The *Guinea Goat* is a dwarf species originally from the coast whence its name is derived. There are three varieties. Besides the commonest (*Capra recurva*, Linn.), there is a rarer breed (*Capra depressa*, Linn.), inhabiting the Mauritius and the islands of Bonrbon and Madagascar. The other variety is met with along the White Nile, in Lower Egypt, and at various points on the African coast of the Mediterranean. Some of these dwarf goats may be seen at the Jardin d'Acclimatation in Paris.

Habits and Management.—The milch goat has been aptly described as the "poor man's cow"—a designation it well merits, for with a couple of these animals the cottager may at an almost nominal expense enjoy the same advantages in a domestic point of view as the rich man with his "Alderney." Comparatively few are kept in England, because the advantages of goat-keeping are but very imperfectly known, and also on account of the large proportion of land under cultivation. The goat in a state of nature frequents hills and mountainous places, and in a domesticated condition it generally gives preference to elevated situations; but it is a mistake to suppose that it will not thrive on low ground. Being naturally adapted to rocks and dry soils, however, it should not be exposed in marshy places, as this brings on disease of the feet and general ill health; otherwise there is no animal more uniformly hardy. The common varieties will stand heat and cold equally well, but have a decided objection to storms of wind and rain; when they are left to roam loose, therefore, a rough shed should be erected to shelter them from the weather. Under this arrangement a goat may be left out day and night the whole year round; but, if it is kept for the sake of its milk, the yield is greater and it thrives better if housed during winter. Owing to the troublesome propensity of these animals to bark trees and destroy shrubs by nipping off all young and tender shoots, they should not be allowed to roam loose—except on a common—unless proper protection is afforded by wire netting or some such arrangement.

The goat breeds, generally speaking, but once a year. If well housed and under liberal treatment, it will bring forth young twice in twelve months; but this is not advisable. As a rule, at the first birth one kid only is produced, but afterwards two and sometimes three. One has been known for three consecutive years to drop four at a birth; but this is rare and by no means desirable, as the progeny are sure to be small and thrive badly,—the dam in most cases having insufficient milk for so large a family.

The goat propagates at a very early period of its life. The male is generally capable of engendering at seven months; and, in the case just referred to of four at a birth, the father on one occasion was barely six months old. One is sufficient for a hundred females. The latter bring forth at twelve months, and sometimes earlier. For the sake of the future growth and productiveness of the animal, however, it is unwise to permit intercourse between the sexes earlier than at eighteen or at least sixteen months. It is owing to the baneful practice of letting them breed as soon as they will, under the mistaken idea that a more rapid return is obtained, that so many diminutive specimens are met with, both dam and progeny being spoiled in consequence.

The best kind for milch purposes are those with long and deep bodies, not necessarily so broad at the chest as about the haunches, the belly ample, and the legs tolerably short; head fine and tapering, with prominent eyes, ears long, thin, wide, and inclining horizontally, horns short and not corrugated, neck thick, and coat close and short. The udder above all must be not only large but soft and elastic, with nice pointed teats. Hornless specimens are often the best milkers.

The goat has 32 teeth, and by these the age up to five years may be pretty accurately ascertained. The lower jaw possesses 12 molars and 8 incisers, and the upper 12 molars alone. The kid at its birth has 6 molars but no incisors; the latter, however, are generally all cut in about three weeks, the first cut molar being visible at three months. At a year or fifteen months old the two front "milk teeth," as the first set of incisors are called, fall, and are replaced by permanent ones; the next two at from two years to thirty months, the third pair from two and a half to three and a half years, and the fourth and last at from three and a half to four and a half years. When all are changed the mouth is said to be "full."

Between two and five years old the she-goat gives the best return in milk, continuing productive often for eight or nine years; its length of life is on an average from ten to fifteen. These animals vary very greatly in the quantity of milk they yield. An ordinary specimen gives from 2 to 3 pints, a superior one 2 quarts, and occasionally first-rate individuals are found supplying 3 quarts a day. The Nubian breed surpasses the common goat in this respect, as the following table from the French work of M. du Plessis will show, in which the yield of a Nubian is compared with that of a half-bred, itself a superior milker.

Half-bred Nubian and Native.	Milk.	Cream.	*Pure Nubian Breed.*	Milk.	Cream.
1st day	3·57 litres.	·22 litres.	1st day.	4·39 litres.	·3800 litres
2d „	3·42 „	·21 „	2d „	4·41 „	·3848 „
3d „	8·35 „	·20 „	8d „	4·53 „	·3850 „
4th „	3·62 „	·23 „	4th „	4·67 „	·3969 „
5th „	3·69 „	·24 „	5th „	4·94 „	·4030 „
	17·65 „	1·10 „		22·94 „	1·9497 „

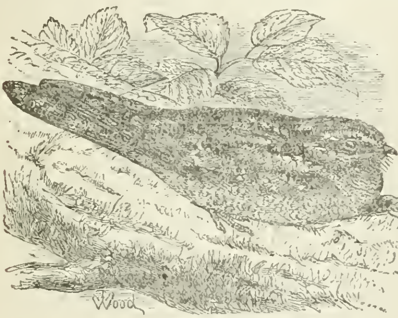
The litre being as near as possible $1\frac{3}{4}$ pints, the return in English measure is accordingly—from the half-bred 31 pints, or an average per day of 3 quarts, and from the pure Nubian 40 pints, or nearly 4 quarts daily, the richness of the quality being proportionately greater.

Milking should be performed at regular hours, morning and night; but with heavy milkers three times daily is better for the first two or three months, as the oftener the udder is emptied when once full the quicker it is replenished, a sufficient supply of food being of course provided. It is a good plan to accustom the animal to jump on a platform whilst being milked; the teats are thus more easily manipulated, and more command is obtained over the goat and the pail. Feeding and milking should always be carried on at the same time.

Many persons are under the wrong impression that the milk of the she-goat,—which by the way has no strong *hircine* scent attaching to her like the male, another common error,—possesses a flavour peculiar to itself; but this is quite a mistake. Out of dozens kept by the present writer, only one has been found to yield milk differing from that of the cow in taste. The peculiarity in this case seemed natural to the animal, and the milk was decidedly unpalatable.

The flesh of the common goat, although quite eatable, is not to be recommended in comparison with mutton, being rather hard and indigestible. Kid, however, is a great delicacy, and tastes like lamb or veal, according to the manner of dressing. It is preferable cooked like veal, with layers of bacon tied round and stuffed, for with the exception of the suet there is very little fat. A good rich gravy should accompany the joint when served, and there should be no lack of cooking. Hot or cold it is then equally acceptable. Suckling kids are the best eating, as they have then their milk flesh, and are nice and plump. The skins dressed and sewed together make handsome rugs. For food and other remarks on goat-keeping see AGRICULTURE, vol. i. p. 399. (S. H. P.)

GOATSUCKER, a bird from very ancient times absurdly believed to have the habit implied by the common name it bears in many European tongues besides our own—as testified by the Greek Αἰγοθήλας, the Latin *Caprimulgus*, Italian *Succiacapre*, Spanish *Chotacabras*, French *Tettechèvre*, and German *Ziegenmelker*. The common Goatsucker (*Caprimulgus europæus*, Linn.), is admittedly the type of a very peculiar and distinct Family *Caprimulgidæ*, a group remarkable for the flat head, enormously wide mouth, large eyes, and soft, pencilled plumage of its members, which vary in size from a Lark to a Crow. Its position has been variously assigned by systematists. Though of late years judiciously removed from the *Passeres*, in which Linnæus placed all the species known to him, Professor Huxley considers it to form, with two other Families—the Swifts (*Cypselidæ*) and Humming-birds (*Trochilidæ*), the division *Cypselomorphæ* of his larger group *Æjithognathæ*, which is equivalent in the main to the Linnæan *Passeres*. There are two ways of regarding the *Caprimulgidæ*—one including the genus *Podargus* and its allies, the other recognizing them as a distinct Family, *Podargidæ*. As a matter of convenience we shall here comprehend these last in the *Caprimulgidæ*, which will then contain two subfamilies, *Caprimulginæ* and *Podarginæ*; for what, according to older authors, constitutes a third, though represented only by *Steatornis*, the singular



Common Goatsucker.

Oil-bird, or Guacharo, certainly seems to require separation as an independent Family (see GUACHARO).

Some of the differences between the *Caprimulginæ* and *Podarginæ* have been pointed out by Mr Sclater (*Proc. Zool. Soc.*, 1866, p. 123), and are very obvious. In the former, the outer toes have *four* phalanges only, thus presenting a very uncommon character among birds, and the middle claws are pectinated; while in the latter the normal number of five phalanges is found, and the claws are smooth, and other distinctions more recondite have also been indicated by him (*tom. cit.*, p. 582). The *Caprimulginæ* may be further divided into those having the gape thickly beset by strong bristles, and those in which there are few such bristles or none—the former containing the genera *Caprimulgus*, *Antrostomus*, *Nyctidromus*, and others, and the latter *Podager*, *Chordiles*, *Lyncornis*, and a few more.

The common Goatsucker of Europe (*C. europæus*) arrives late in spring from its winter retreat in Africa, and its presence is soon made known to us by its habit of chasing its prey, consisting chiefly of moths and cockchafers, in the evening-twilight. As the season advances the song of the cock, from its singularity, attracts attention amid all rural sounds. This song seems to be always uttered when the bird is at rest, though the contrary has been asserted, and is the continuous repetition of a single burring note, as of a thin lath fixed at one end and in a state of vibration at the other, and loud enough to reach in still weather a distance of half-a-mile or more. On the wing, while toying with its mate, or performing its rapid evolutions round the trees where it finds its food, it has the habit of occasionally producing another and equally extraordinary sound, sudden and short, but somewhat resembling that made by swinging a thong in the air, though whether this noise proceeds from its mouth is not ascertained. In general its flight is silent, but at times when disturbed from its repose, its wings may be heard to smite together. The Goatsucker, or, to use perhaps its commoner English name, Nightjar,[1] passes the day in slumber, crouching on the ground or perching on a tree—in the latter case sitting not across the branch but lengthways, with its head lower than its body. In hot weather, however, its song may sometimes be heard by day and even at noontide, but it is then uttered, as it were, drowsily, and without the vigour that characterizes its crepuscular or nocturnal performance. Towards evening the bird becomes active, and it seems to pursue its prey throughout the night uninterruptedly, or only occasionally pausing for a few seconds to alight on a bare spot—a pathway or road—and then resuming its career. It is one of the few birds that absolutely make no nest, but lays its pair of beautifully-marbled eggs on the ground, generally where the herbage is short, and often actually on the soil. So light is it that the act of brooding, even where there is some vegetable growth, produces no visible depression of the grass, moss, or lichens on which the eggs rest, and the finest sand equally fails to exhibit a trace of the parental act. Yet scarcely any bird shows greater local attachment, and the precise site chosen one year is almost certain to be occupied the next. The young, covered when hatched with dark-spotted down, are not easily found, nor are they more easily discovered on becoming fledged, for their plumage almost entirely resembles that of the adults, being a mixture of reddish-brown, grey, and black, blended and mottled in a manner that passes description. They soon attain their full size and power of flight, and then take to the same manner of life as their parents. In autumn all leave their summer haunts for the south, but the exact time of their departure has hardly been ascertained. The habits of the Nightjar, as thus described, seem to be more or less essentially those of the whole Subfamily—the differences observable being apparently less than are found in other groups of birds of similar extent.

A second species of Goatsucker (*C. ruficollis*), which is somewhat larger, and has the neck distinctly marked with rufous, is a summer visitant to the south-western parts of Europe, and especially to Spain and Portugal. The occurrence of a single example of this bird at Killingworth, near Newcastle-on-Tyne, in October 1856, has been recorded by Mr Hancock (*Ibis*, 1862, p. 39); but the season of its appearance argues the probability of its being but a casual straggler from its proper home. Many other species of *Caprimulgus* inhabit Africa, Asia, and their islands, while one (*C. macrurus*) is found in Australia. Very nearly allied to this genus is *Antrostomus*, an American group containing many species, of which the Chuck-will's-widow (*A. carolinensis*) and the Whip-poor-will (*A. vociferus*) of the eastern United States (the latter also reaching Canada) are familiar examples. Both these birds take their common name from the cry they utter, and their habits seem to be almost identical with those of the Old-World Goatsuckers. Passing over some other forms which need not here be mentioned, the genus *Nyctidromus*, though consisting of only one species (*E. albicollis*) which

[1] Other English names of the bird are Evejar, Fern-Owl, Churn-Owl, and Wheel-bird—the last from the bird's song resembling the noise made by a spinning-wheel in motion.

inhabits Central and part of South America, requires remark, since it has tarsi of sufficient length to enable it to run swiftly on the ground, while the legs of most birds of the Family are so short that they can make but a shuffling progress. *Heleothreptes*, with the unique form of wing possessed by the male, needs mention. Notice must also be taken of two African species, referred by some ornithologists to as many genera (*Macrodipteryx* and *Cosmetornis*), though probably one genus would suffice for both. The males of each of them are characterized by the wonderful development of the ninth primary in either wing, which reaches in fully adult specimens the extraordinary length of 17 inches or more. The former of these birds, the *C. macrodipterus* of Afzelius, is considered to belong to the west coast of Africa, and the shaft of the elongated remiges is bare for the greater part of its length, retaining the web, in a spatulate form, only near the tip. The latter, to which the specific name of *vexillarius* was given by Mr Gould, has been found on the east coast of that continent, and is reported to have occurred in Madagascar and Socotra. In this the remigial streamers do not lose their barbs, and as a few of the next quills are also to some extent elongated, the bird, when flying, is said to look as though it had four wings. Specimens of both are rare in collections, and no traveller seems to have had the opportunity of studying the habits of either so as to suggest a reason for this marvellous sexual development.

The second group of *Caprimulginæ*, those which are but poorly or not at all furnished with rictal bristles, contains about five genera, of which there is here only room to particularize *Lyncornis* of the Old World and *Chordiles* of the New. The species of the former are remarkable for the tuft of feathers which springs from each side of the head, above and behind the ears, so as to give the bird an appearance like some of the "Horned" Owls—those of the genus *Scops*, for example; and remarkable as it is to find certain forms of two Families, so distinct as are the *Strigidæ* and the *Caprimulgidæ*, resembling each other in this singular external feature, it is yet more remarkable to note that in some groups of the latter, as in some of the former, a very curious kind of dimorphism takes place. In either case this has been frequently asserted to be sexual, but on that point doubt may fairly be entertained. Certain it is that in some groups of Goatsuckers, as in some groups of Owls, individuals of the same species are found in plumage of two entirely different hues—rufous and grey. The only explanation as yet offered of this fact is that the difference is sexual, but, as just hinted, evidence to that effect is conflicting. It must not, however, be supposed that this common feature, any more than that of the existence of tufted forms in each group, indicates any close relationship between them. The resemblances may be due to the same causes, concerning which future observers may possibly enlighten us, but at present we must regard them as analogies not homologies. The species of *Lyncornis* inhabit the Malay Archipelago, one, however, occurring also in China. Of *Chordiles* the best known species is the Night-hawk of North America (*C. virginianus* or *C. popetue*), which has a wide range from Canada to Brazil. Others are found in the Antilles and in South America. The general habits of all these birds agree with those of the typical Goatsuckers.

We have next to consider the birds forming the genus *Podargus* and those allied to it, whether they be regarded as a distinct Family, or as a Subfamily of *Caprimulgidæ*. As above stated, they have feet constructed as those of birds normally are, and their sternum seems to present the constant though comparatively trivial difference of having its posterior margin elongated into two pairs of processes, while only one pair is found in the true Goatsuckers. *Podargus* includes the bird (*P. cuvieri*) known from its cry as Morepork[1] to Tasmanian colonists, and several other species, the number of which is doubtful, from Australia and New Guinea. They have comparatively powerful bills, and it would seem feed to some extent on fruits and berries, though they mainly subsist on insects, chiefly *Cicadæ* and *Phasmidæ*. They also differ from the true Goatsuckers in having the outer toes partially reversible, and they are said to build a flat nest on the horizontal branch of a tree for the reception of their eggs, which are of a spotless white. Apparently allied to *Podargus*, but differing among other respects in its mode of nidification, is *Ægotheles*, which belongs also to the Australian Subregion; and further to the northward, extending throughout the Malay Archipelago and into India, comes *Batrachostomus*, wherein we again meet with species having aural tufts somewhat like *Lyncornis*. The *Podarginæ* are thought by some to be represented in the New World by the genus *Nyctibius*, of which several species occur from the Antilles and Central America to Brazil. Finally, it may be stated that none of the *Caprimulgidæ* seem to occur in Polynesia or in New Zealand, though there is scarcely any other part of the world suited to their habits in which members of the Family are not found. (A. N.)

GOBELIN, the name of a family of dyers, who in all probability came originally from Rheims, and who in the 15th century established themselves in the Faubourg Saint Marcel, Paris, on the banks of the Bièvre. The first head of the firm was named Jehan, and died in 1476. He discovered a peculiar kind of scarlet dye, and he expended so much money on his establishment that it was named by the common people *la folie Gobelin*. To the dye works there was added in the 16th century a manufactory of tapestry. So rapidly did the wealth of the family increase, that in the third or fourth generation some of them forsook their trade and purchased titles of nobility. More than one of their number held offices of state, among others Balthasar, who became successively treasurer general of artillery, treasurer extraordinary of war, councillor secretary of the king, chancellor of the exchequer, councillor of state, and president of the chamber of accounts, and who in 1501 received from Henry II. the lands and lordship of Briecomte-Robert. He died in 1603. The name of the Gobelins as dyers cannot be found later than the end of the 17th century. In 1662 the works in the Faubourg Saint Marcel, with the adjoining grounds, were purchased by Colbert on behalf of Louis XIV., and transformed into a general upholstery manufactory, in which designs both in tapestry and in all kinds of furniture were executed under the superintendence of the royal painter Lebrun. On account of the pecuniary embarrassments of Louis XIV., the establishment was closed in 1694, but it was reopened in 1697 for the manufacture of tapestry, chiefly for royal use and for presentation. During the Revolution and the reign of Napoleon the manufacture was suspended, but it was revived by the Bourbons, and in 1826 the manufacture of carpets was added to that of tapestry. In 1871 the building was partly burned by the Communists.

See Lacordaire, *Notice historique sur les manufactures impériales de tapisserie des Gobelin et de tapis de la Savonnerie, précédée du catalogue des tapisseries qui y sont exposées*, Paris. 1853: and also the article TAPESTRY

GOBI is the name usually applied by European geographers to a vast stretch of desert in Central Asia, which has its western limits in the neighbourhood of 75° E. long., and its eastern somewhere between 114° and 115°. Like many other geographical designations, the word is not only of doubtful origin, but in conventional usage has modified its meaning. According to Sir T. Douglas Forsyth, it is originally the Turki for "great"; and Richthofen informs

[1] In New Zealand, however, this name is given to an Owl (*Sceloglaux novæ-zelandiæ*).

as that by the Chinese it is employed, not as a proper name, but, like Shamo, as a general term for any sandy and desert piece of country. This being the case, the great German geographer proposes to displace the word Gobi in European usage by the Chinese Han-hai or Dry Sea, suggestive as he says not only of the present appearance but also of the former history of the region; but it is to be feared that the older designation has become too familiar, and the disadvantages arising from its use are of too recondite a character, to render it likely that his proposal will be generally accepted.

As a sea the Gobi or Han-hai must have been comparable in extent to the Mediterranean, and the ancient coast-line can be pretty clearly recognized. In its present state it may be divided into two distinct basins, the western taking its name from the river Tarim or Tarym, and the eastern from the Chinese Shamo or "Sand Desert." The Dzungarian valley stretches westwards like a gulf. The Tarim basin is bounded on the S. by the range of mountains which, under various names applicable to different portions, such as the Kwen-lun and the Altyntag, forms the northward rim of the great plateau of Thibet; on the west it comes up to the spurs of the Pamir plateau, and on the north it lies along the foot of the Thian Shan. If we measure from the source of any of its principal tributaries, the Tarim must have a course of more than 1000 miles. The head-waters rise in the mountains just named, and the more important of them in the south and west. The Khotan river and its confluent the Kara-Kash both descend from the Karakorum mountains, and flow in a generally northward direction; the Zarafshan or Yarkand River, rising in the same range, winds about in the first part of its course so as to enter the Gobi almost from the west; and the Kizil Su or Kashgar River has its numerous head streams in the Kizil Yart mountains belonging to the Pamir plateau. The Aksai River and the Shah Yar are the most important contributions from the Thian Shan. The course of all of these rivers after they enter the Gobi is largely matter of conjecture, and all that can be asserted with confidence is that they unite to form the Tarim, and find their final goal in an inland lake. They have probably all reached a common channel about 82° E. long.; but as the stream presses eastward it again breaks up into numerous branches, the arrangement of which, except along the route followed by Przhevalski, is still unknown. As it passes east the stream gradually loses in volume by absorption, evaporation, and the demands of riparian populations. In the neighbourhood of the Ugendarya, the breadth is about 300 or 360 feet, and the depth about 20. The course of the Tarim lies much nearer the northern side of the Gobi than the southern, but it gradually trends south east, and at length passing through Lake Karaburan, loses itself in Lake Chon-Kul (*i.e.*, great lake) or Kara-Kurchin. This last lake is identified with the famous Lob-nor, the position of which has been one of the outstanding problems of comparative geography. Against the identification a number of objections have been urged by Richthofen (*cf.* "Bemerkungen zu den Ergebnissen von Ober-lieut. Prejewalski's Reise" in *Zeitsch. für Erdk.*, Berlin, 1878), the most important of which are the prevailing tradition that the Lob-nor was a salt lake while the Chon-Kul is fresh, and the fact that the Chinese maps place the Lob-nor to the north of the position assigned to the Chon Kul, which according to Przhevalski lies about 39° 30' N. lat., immediately to the N. of the Altyntag range (13,000 to 14,000 feet high). The country through which the Lower Tarim flows is dreary and monotonous. "In general," reports the traveller, "the Lob-nor desert is the wildest and most unfertile of all that I have yet seen in Asia; it is sadder than the desert of Ala-Shan." A meagre vegetation of tamarisks and reeds lines the course of the river. Away towards the south-west there stretch, if we may trust to native reports, those vast fields of drifting and treacherous sands which have given so much of its terror to the legendary account of the desert of Gobi. That the reports are in the main true, and that the legends are founded on fact, appears to be rendered probable by the statements of Sir T. Douglas Forsyth, who has contributed an interesting paper on the subject to the *Proceedings of the Royal Geographical Society* (1876). The population of the Tarim basin is scanty and poverty-stricken. On the Lower Tarim there are nine villages with a total of 1200 souls. Cattle-rearing is more general than agriculture, which indeed is of the most recent introduction, and confines itself to barley and wheat. Mahometanism is the universal religion, and the language appears to be identical with the Taranchi and the Sart.

The Shamo or eastern basin is quite different in its character. Here we have no large river like the Tarim, and, instead of its boundaries being marked by lofty ranges of mountains from 13,000 to 20,000 feet high, the ground gradually rises in a series of scarcely marked terraces. The central point, at Ozon Khoshu, is the lowest discovered in Central Asia, being only 607 metres (1948 feet) above the level of the sea. "The aspect of the country," says Ney Elias, "who crossed in a north-westerly direction from China, is that of low hills or downs, with valleys and plains intervening, the whole of a rocky or stony nature rather than sandy, though patches of sand do occur every here and there. What little vegetation exists is chiefly composed of weeds, 'scrub,' and heath, there being scarcely any grass, and only a dwarfed and stunted tree here and there, in the gorges or passes of those low rocky ranges that at uncertain intervals cross the desert in almost parallel lines from east to west." Of the western portion of the basin we have no modern account.

Marco Polo was the first European who gave a distinct description of the desert of Gobi. He tells us how on quitting Charchan (the modern Chachan, according to Yule) "you ride some five days through the sands finding none but bad and bitter water; and then you come to a city called Lop at the edge of the desert . . . . The length of the desert is so great that it would take a year and more to ride from one end of it to the other. It is all composed of hills and valleys of sand." And then he goes on to speak of spirits that haunt the waste, and syllable men's names, and of strange noises like the tramp and hum of a great cavalcade, of the sound of drums, and a variety of musical instruments. Polo appears to have proceeded east from Khotan to Lob, and then further east to Etsina on the southern edge of the desert, and afterwards to have spent forty days in crossing the desert northwards to Karakorum.[1]

Later notices of the Gobi, especially of its eastern portions, are given by Gerbillon, 1688-98 (in Duhalde's appendix), by the Dutchman Evert Ysbrand Ides (1692-94), and by Lorenz Lange, who was sent in 1727-28 and in 1736 by Peter the Great to Peking.[2] But it was not till the present century that accurate information began to accumulate about the eastern portions, and the traveller who has lifted the veil from the western portions is still engaged in his explorations. In 1830-31 Fuss and Bunge crossed the eastern Gobi from Urga to Kalgan; and Dr Fritsche executed a series of journeys in the same district between 1869 and 1873.[3] The missions of the Russian officials Andre Gustavitch Prinz (1863) and Shishmaroff (1868) added little to the knowledge of the region; but in 1870 Pavlinoff, consul at Chuguchak, being accompanied by a Government topographer Matusovski, made valuable observations on the route from Suok to Kobdo, and from Kobdo to Uliassutai.[4] Of still greater moment were the travels of Ney Elias in 1872-73, and of Przhevalski between 1870 and 1877. In his earlier journey (1870-72) Przhevalski travelled across the Gobi in a line almost due south from Urga, and in 1877 he struck south-east from the Yulduz range, one of the outrunners of the Thian Shan.

GOBY. The Gobies (*Gobius*) are small fishes readily recognized by their ventrals (the fins on the lower surface of

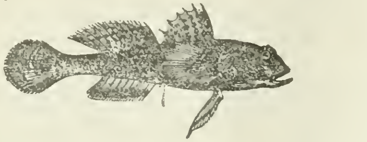

Fig. 1.—*Gobius lentiginosus.*

the chest) being united into one fin, forming a suctorial disk, by which these fishes are enabled to attach themselves in every possible position to a rock or other firm substances. They are essentially coast-fishes, inhabiting nearly all seas, but disappearing towards the Arctic and Antarctic Oceans. Many enter, or live exclusively in, such fresh waters as are at no great distance from the sea. Between 200 and 300 different kinds are known.

GOD. See Theism.

GODALMING, a municipal borough and market-town of England, county of Surrey, is situated 32 miles S.W. of London, in a valley on the right bank of the Wey, which is navigable thence to the Thames. It consists principally of one street nearly a mile in length, on the high road between London and Portsmouth. The chief public buildings are the town-hall and market-house, Wyat's almshouses for poor men, the public hall, and the parish church, an old cruciform building, of mixed architecture, but principally Early English and Perpendicular. The church was repaired in 1840, and also in 1867. It contains a large number of old memorials. Godalming has manufactures of paper, leather, parchment, and hosiery, and some trade in corn, malt, bark, hoops, and timber. The town obtained a market from Edward I. in 1300, and was incorporated in 1575. The population in 1871 was 2444.

GODÁVARI, a river of Central India, which flows across the Deccan from the western to the Eastern Gháts, for sanctity, picturesque scenery, and utility surpassed only by the Ganges and the Indus. The total length is 898 miles; the estimated area of drainage basin, 112,200 square miles. Its traditional source is on the side of a hill behind the village of Trimbak in Nasik district, Bombay, but according to popular legend it proceeds from the same ultimate source as the Ganges, though underground. Its course is generally south-easterly. After passing through Nasik district, it crosses into the dominions of the nizám of Hyderabad. When it again strikes British territory it is joined by the Pranhita, with its tributaries the Waraha, the Penganga, and Wainganga. For some distance it flows between the Nizám's dominions and the upper Godávari district, and receives the Indravati, the Sal, and the Sabári. The stream is now very imposing, with a channel varying from 1 to 2 miles in breadth, occasionally broken by alluvial islands. Parallel to the river stretch long ranges of hills; on the opposite side the country is more open and cultivated. Below the junction of the Sabári the scenery is such that the Godávari has got the name of the Indian Rhine. The channel here begins to contract. The flanking hills gradually close in on both sides, and the result is a magnificent gorge only 200 yards wide through which the water flows into the plain of the delta, about 60 miles from the sea. The head of the delta is at the village of Dhaulaishvaram, where the main stream is crossed by the irrigation anicut. The river has seven mouths, the largest being the Gautami Godávari. The Godávari is regarded as peculiarly sacred, and once every twelve years the great bathing festival called *Pushkaram* is held on its banks.

The upper waters of the Godávari are scarcely utilized for irrigation, but the entire delta has been turned into a garden of perennial crops by means of the anicut at Dhaulaishvaram, from which three main canals are drawn off. The river channel here is 3½ miles wide. The anicut is a substantial mass of stone, bedded in lime cement, about 2½ miles long, 130 feet broad at the base, and 12 feet high. The stream is thus pent back so as to supply a volume of 3000 cubic feet of water per second during its low season, and 12,000 cubic feet at time of flood. The canals have a total length of 528 miles, capable of irrigating 780,000 acres, while 463 miles are also used for navigation. In 1864 water-communication was opened between the river-systems of the Godávari and Kistna. Rocky barriers and rapids obstruct navigation in the upper portion of the Godávari. Attempts have been made to construct canals round these barriers but with little success, and lately the undertaking has been entirely abandoned.

GODÁVARI, a district of Madras presidency, British India, lying between 16° 15′ and 17° 35′ N. lat., and between 80° 55′ and 82° 38′ E. long.; and bounded N. by the Central Provinces and Vizagapatam district, E. by Vizagapatam and the Bay of Bengal, S. by the Bay of Bengal and Kistna district, and W. by the Nizám's dominions. The district is divided by the Godávari river into two nearly equal parts. The scenery along the course of the river is varied and striking. The only lake of importance is the Koléru, which is studded with islands and fishing villages. Building stone and limestone are abundant in the uplands. Iron is also found. The jungle products are myrobalans, soap-nuts, tamarinds, bamboo-rice, honey, and beeswax. Wild animals and game birds are numerous.

The population in 1871 numbered 1 592,939 (803,603 males, 789,336 females), showing a considerable increase on former years. The Hindus numbered 1,555,981, the Mahometans 35,173, the Christians 1483 (Protestants and Roman Catholics in nearly equal numbers); 39 were Buddhists, and 263 not separately classified. Nineteen towns each contain upwards of 5000 inhabitants,—the aggregate population of the three chief towns, Ellor, Rájahmandri, and Cocanada, being 63,064.

The total area of the district is 7345 square miles, of which 2713 square miles belong to Government. Of Government land, 356,400 acres are under cultivation; the rest either belongs to the *zamíndárí* estates, or is waste and uncultivable. The chief products are rice, grain, jute, hemp, gingelly, tobacco, sugar-cane, and indigo; rice and food grains have improved in quality owing to the extension of irrigation by canals. Government tenants have permanent right of occupancy so long as they pay the Government demand, while on the *zamíndárí* estates cultivators are merely yearly tenants. The district is well supplied with means of communication by 491 miles of good road and 431 miles of canals. The principal manufactures are cotton and woollen carpets, sheep wool blankets, uppada cloths, sugar, and indigo. The chief articles of trade are grain, cotton, jaggery, turmeric, cocoa-nut, flax-cloth, onions, garlic, lace cloths, tobacco, gingelly seed, lamp-oil, salt, tamarinds, cattle, teakwood, skins, opium, and indigo. Cocanada, Ellor, Rajahmandri, Mandapetta, Jaggampetta, Husanbada, Nasapur, Palakollu, Dowlaishvaram, Ambajipetta, and Jagannathpur are the most important seats of commerce. The estimated value of imports in 1874-75 was £204,238, and of exports, £903,253. The total revenue in 1875-76 was £558,812; the expenditure, £28,604: the total municipal income, £5152. There are 28 magisterial and 15 revenue and civil courts. There are 387 schools, attended by 7759 pupils. The administrative headquarters is at Cocanada. The prevailing epidemic diseases are *beri-beri* and fevers; cholera and small-pox occur during the hot season, but only the poorer classes are attacked. Cattle diseases also prevail. The average annual rainfall from 1871 to 1875 was 43·35 inches; the average mean temperature at Rájahmandri in 1876 was 82·7° Fahr. Two severe storms, which caused great destruction to property, occurred in 1832 and 1839.

The Godávari district formed part of the Andhra division of

Dravida, the north-west portion being subject to the Orissa kings, and the south-western belonging to the Vengi kingdom. For centuries it was the battlefield on which various chiefs fought for independence with varying success till the beginning of the 16th century, when the whole country may be said to have passed under Mahometan power. At the conclusion of the struggle with the French in the Carnatic, Godávari with the Circars was ceded to the English by the nawáb, and finally confirmed by the imperial *sanad* in 1765. The present district was constituted in 1859, by the redistribution of the territory comprising the former districts of Guntoor, Rájahmandri, and Masulipatam, into what are now the Kistna and Godávari districts.

GODFREY OF BOUILLON. See BOUILLON.

GODOLPHIN, SIDNEY GODOLPHIN, EARL OF (*c.* 1635–1712), was a cadet of an ancient family of Cornwall, and was born most probably in 1635. At the Restoration he was introduced into the royal household by Charles II., with whom he had previously become a favourite, and he also at the same period entered the House of Commons as member for Helstone Although he very seldom addressed the House, and, when he did so, only in the briefest manner, he gradually acquired a reputation as its chief if not its only financial authority. In March 1679 he was appointed a member of the privy council, and in the September following he was promoted, along with Viscount Hyde (afterwards earl of Rochester) and the earl of Sunderland, to the chief management of affairs. Though he voted for the Exclusion Bill in 1680, he was continued in office after the dismissal of Sunderland, and in September 1684 he was created Baron Godolphin of Rialton, and succeeded Rochester as first lord of the treasury. After the accession of James II. he was made chamberlain to the queen, and, along with Rochester and Sunderland, enjoyed the king's special confidence. In 1687 he was named commissioner of the treasury. He was one of the council of five appointed by King James to represent him in London, when he went to join the army after the landing of William prince of Orange in England, and, along with Halifax and Nottingham, he was afterwards appointed a commissioner to treat with the prince. On the accession of William, though he only obtained the third seat at the treasury board, he had virtually the chief control of affairs. He retired in March 1690, but was recalled on the November following, and appointed first lord. While holding this office he for several years continued, in conjunction with Marlborough, a treacherous intercourse with James II., and is said even to have anticipated Marlborough in disclosing to James intelligence regarding the intended expedition against Brest. After Fenwick's confession in 1696 regarding the Assassination Plot, Godolphin, who was compromised, was induced to tender his resignation; but when the Tories came into power in 1700, he was again appointed lord treasurer, and retained office for about a year. Though not a favourite with Queen Anne, he was, after her accession, appointed to his old office, on the strong recommendation of Marlborough. He also in 1704 received the honour of knighthood, and in December 1706 he was created Viscount Rialton and Earl of Godolphin. The influence of the Marlboroughs with the queen was, however, gradually supplanted by that of Mrs Masham and Harley earl of Oxford, and with the fortunes of the Marlboroughs those of Godolphin were indissolubly united. The services of both were so appreciated by the nation that they were able for a time to regard the loss of the queen's favour with indifference, and even in 1708 to procure the expulsion of Harley from office; but after the Tory reaction which followed the impeachment of Dr Sacheverel, the queen made use of the opportunity to take the initiatory step towards delivering herself from the irksome thraldom of Marlborough by abruptly dismissing Godolphin from office, 7th August 1710. He died 15th September 1712

Godolphin owed his rise to power and his continuance in it under four sovereigns chiefly to his exceptional mastery of financial matters; for if latterly he was in some degree indebted for his promotion to the support of Marlborough, he received that support mainly because Marlborough recognized that for the prosecution of England's foreign wars his financial abilities were an indispensable necessity. He was cool, reserved, and cautious, but his prudence was less associated with high sagacity than traceable to the weakness of his personal antipathies and prejudices, and his freedom from political predilections. Perhaps it was his unlikeness to Marlborough in that moral characteristic which so tainted Marlborough's greatness that rendered possible between them a friendship so intimate and undisturbed: he was, it would appear, exceptionally devoid of the passion of avarice; and so little advantage did he take of his opportunities of aggrandizement that, though his style of living was unostentatious,—and in connexion with his favourite pastimes of horse-racing, card-playing, and cockfighting he gained perhaps more than he lost,—all that he left behind him did not, according to the duchess of Marlborough, amount to more than £12,000. His treacherous intercourse with James II. was doubtless largely due to the spell of Marlborough's influence; but in any case it indicates that, if in other respects his political conduct was upright and trustworthy, this is to be accounted for by his prudence and certain other mental peculiarities, rather than by the strength of his moral principle or his keen sense of honour. His son and successor Francis, who had married Henrietta, eldest daughter of the duke of Marlborough, in 1698, died in 1766, leaving no male issue.

GODOY. See ALCUDIA.

GODWIN, FRANCIS (1561–1633), son of Dr Godwin, bishop of Bath and Wells, was born at Havington in Northamptonshire in 1561. He was elected student of Christ Church, Oxford, in 1578, took his bachelor's degree in 1580, and that of master in 1583. Entering holy orders, he became successively rector of Sampford-Orcais in Somersetshire, and vicar of Weston-in-Zoyland in the same county. In 1587 he was appointed subdean of Exeter. Having turned his attention to the subject of British antiquities, he became acquainted with Camden, whom in 1590 he accompanied in a journey through Wales. He was created bachelor of divinity in 1593, and doctor in 1595. In 1601 he published his *Catalogue of the Bishops of England since the first planting of the Christian Religion in this Island*, a work which procured him in the same year the bishopric of Llandaff from Elizabeth. A second edition appeared in 1615, and in 1616 he published an edition in Latin with a dedication to King James, who in the following year conferred upon him the bishopric of Hereford. The work was republished, with a continuation by Dr Richardson, in 1743. In 1616 Godwin published *Rerum Anglicarum, Henrico VIII., Edwardo VI., et Maria regnantibus, Annales*, which was afterwards translated and published by his son under the title *Annales of England*, 1630. The last of his works published before his death, which took place in 1633, was *Computation of the value of the Roman Sesterce and Attic Talent*, which appeared in 1630. He is also the author of a somewhat remarkable story, published posthumously in 1638, and entitled *The Man in the Moon, or a Discourse of a Voyage thither, by Domingo Gonsales*, written apparently sometime between the years 1599 and 1603. In this production Godwin not only declares himself a believer in the Copernican system, but adopts so far the principles of the law of gravitation by supposing that the earth's attraction diminishes with the distance. The work, which displays considerable fancy and wit, was translated into French, and was imitated in several important particulars by Cyrano de Bergerac, from whom Swift obtained valuable hints in writing his voyage to Laputa. Another work of Godwin's, *Nuncius Inanimatus in Utopia*, originally published in 1629, but subsequently suppressed, seems to have been the prototype of Wilkins's *Mercury, or Secret and Swift Messenger*, which appeared in 1641. Godwin's pamphlet was again published in 1657.

GODWIN, MARY WOLLSTONECRAFT (1759–1797), an English authoress of the last century, was born at Hoxton, on April 27, 1759. Her family was of Irish extraction, and Mary's grandfather, who was a respectable manufacturer in Spitalfields, realized the property which his son squandered. Her mother, whose maiden name was Dixon, was Irish, and of good family. Mr Wollstonecraft, after dissipating the greater part of his patrimony, tried to earn a living by farming, which only plunged him into deeper difficulties, and he led a wandering, shifty life. The family roamed from Hoxton to Edmonton, to Essex, to Beverley in Yorkshire, to Laugharne, Pembrokeshire, and back to London again.

After Mrs Wollstonecraft's death in 1780, soon followed by her husband's second marriage, the three daughters, Mary, Everina, and Eliza, sought to earn their own livelihood. The sisters were all clever women,—Mary and Eliza far above the average,—but their opportunities of culture had been few. They turned their thoughts towards the profession of teaching, and Mary, the eldest, was to make the first venture. She went in the first instance to live with her friend Fanny Blood, a girl of her own age, whose father, like Wollstonecraft, was addicted to drink and dissipation. As long as she lived with the Bloods, Mary helped Mrs Blood to earn money by taking in needle-work, while Fanny painted in water-colours. Everina went to live with her brother Edward, and Eliza made a hasty and, as it proved, unhappy marriage with a Mr Bishop. All the Wollstonecraft sisters were enthusiastic, excitable, apt to exaggerate trifles, and to magnify inattentions into slights; and Eliza had the family temperament in excess. Bishop was a man of violent temper, and when his wife's reason had almost given way under the miseries of her married life, Mary resolved to find some means of supporting her, and arranged her secret and sudden flight. A legal separation was afterwards obtained, and the sisters, together with Fanny Blood, took a house, first at Islington, afterwards at Newington Green, and opened a school, which was carried on with indifferent success for nearly two years. During their residence at Newington Green. Mary was introduced to Dr Johnson, who, as Godwin tells us, "treated her with particular kindness and attention."

In 1785 Fanny Blood married Hugh Skeys, a merchant, and went with him to Lisbon, where she died in childbed after sending for Mary to nurse her. "The loss of Fanny," as she said in a letter to Mrs Skeys's brother, George Blood, "was sufficient of itself to have cast a cloud over my brightest days. . . . I have lost all relish for pleasure, and life seems a burden almost too heavy to be endured." Her first novel, *Mary, a Fiction*, written in 1787, was intended to commemorate her friendship with Fanny. After closing the school at Newington Green, Mary obtained a situation as governess in the family of Lord Kingsborough, in Ireland, which she held for nearly a year. Her pupils were much attached to her, especially Margaret King, afterwards Lady Mountcashel; and indeed Lady Kingsborough gave the reason for dismissing her that the children loved their governess better than their mother. Mary now resolved to devote herself to literary work, and she was encouraged in this purpose by Johnson, the publisher in St Paul's Churchyard, in whose house she resided for a few weeks, before she obtained lodgings in George Street, Blackfriars. She acted as Johnson's literary adviser, and undertook translations, chiefly from the French. *Mary, a Fiction*, the story already mentioned, was not published till 1796. *The Elements of Morality*, an old fashioned book for children, and Lavater's *Physiognomy*, were among her translations. Her *Original Stories from Real Life* were published, with illustrations by Blake, and in 1792 appeared *A Vindication of the Rights of Woman*, the work with which her name is always associated.

It is not among the least oddities of this book that it is dedicated to M. Talleyrand Périgord, late bishop of Autun. Mary Wollstonecraft still believed him to be sincere, and working in the same direction as herself. In the dedication she states the "main argument" of the work, "built on this simple principle that, if woman be not prepared by education to become the companion of man, she will stop the progress of knowledge, for truth must be common to all, or it will be inefficacious with respect to its influence or general practice." In carrying out this argument she used extraordinary plainness of speech, and it was this that caused all, or nearly all, the outcry. For she did not attack the institution of marriage, nor assail orthodox religion; her book was really a plea for equality of education, passing into one for state education and for the joint education of the sexes. It was a protest against the assumption that woman was only the plaything of man, and she asserted that intellectual companionship was the chief, as it is the lasting, happiness of marriage. It may, however, be admitted that she discussed some subjects, not usually mentioned in print, with a certain want of reticence and delicacy. She dealt directly with dangerous and explosive questions, incidentally upheld greater freedom of divorce, and denied the eternity of the torments of hell.

Mrs Wollstonecraft, as she now styled herself, desired to watch the progress of the Revolution in France, and went to Paris in 1792. Godwin, in his memoir of his wife, considers that the change of residence may have been prompted by the discovery that she was becoming attached to Fuseli, but there is nothing to confirm this surmise; indeed, it was first proposed that she should go to Paris in company with him and his wife, nor was there any subsequent breach in their friendship. She remained in Paris during the Reign of Terror, when communication with England was difficult or almost impossible. Some time in the spring or summer of 1793 Captain Gilbert Imlay, an American, became acquainted with Mary—an acquaintance which ended in a more intimate connexion. There was no legal ceremony of marriage, and it is doubtful whether such a marriage would have been valid at the time; but she passed as Imlay's wife, and her brother, Charles Wollstonecraft, wrote from Philadelphia that he had seen a gentleman who informed him "that Mary was married to Captain Imlay of this country." Imlay himself terms her in a legal document, "Mary Imlay, my best friend and wife," and she believed that his love, which was to her sacred, would endure. In August 1793 Imlay was called to Havre on business, and was absent for some months, during which time most of the letters published after her death by Godwin were written. Towards the end of the year she joined Imlay at Havre, and there in the spring of 1794 she gave birth to a girl, who received the name of Fanny, in memory of the dear friend of her youth. Imlay became involved in a multitude of speculations, which rendered him restless and dissatisfied, and his affection for Mary and their child was already waning. He left her for some months at Havre, and when he allowed her to join him in England, it appears from her letters that she went with a heavy heart and forebodings of sorrow. In June 1795, in less than two months after their reunion, Mary again left England for Norway, empowered by the document in which Imlay calls her his wife, to act for him in his business relations with Norwegian timber merchants. Her *Letters from Norway*, divested of all personal details, were afterwards published. She returned to England late in 1795, and found letters awaiting her from Imlay, intimating his intention to separate from her, and offering to settle an annuity on her and her child. For herself she rejected this offer with scorn: "From you," she wrote, "I will not receive anything more. I am not sufficiently humbled to depend on your beneficence." They met again, and for a short time lived together, until the discovery that he was carrying on an intrigue under her own roof drove her to despair, and she attempted to drown herself by leaping from Putney bridge, but she was rescued by watermen. Imlay now completely deserted her, although she continued to bear his name.

In 1796, when Mary Wollstonecraft was living in London, supporting herself and her child by working, as before, for Mr Johnson, she met William Godwin. A friendship sprang up between them,—a friendship, as he himself says, which "melted into love." Godwin states that "ideas which he is now willing to denominate prejudices made him by no means willing to conform to the ceremony of marriage;" but these prejudices were overcome, and they were married at St Pancras Church on March 29, 1797. And now Mary had a season of real calm in her stormy existence. Godwin, for once only in his life, was stirred by passion, and his admiration for his wife equalled his affection. But their happiness was of short duration. A daughter, Mary, afterwards the wife of Percy Bysshe Shelley, was born August 30, 1797. At first all seemed to go well, but unfavourable symptoms set in, and on September 10th, the mother, after enduring all her sufferiugs with unvarying gentleness and sweetness of temper, passed away. She was buried in the churchyard of Old St Pancras, but her remains were afterwards removed by Sir Percy Shelley to the churchyard of St Peter's, Bournemouth.

Her principal published works are as follows:—*Thoughts on the Education of Daughters*, 1787; *The Female Reader* (selections), 1789; *Original Stories from Real Life*, 1791; *An Historical and Moral View of the Origin and Progress of the French Revolution, and the Effects it has produced in Europe*, vol. i. (no more published), 1790; *Vindication of the Rights of Woman*, 1792; *Vindication of the Rights of Man*, 1793; *Mary, a Fiction*, 1796; *Letters written during a Short Residence in Sweden, Norway, and Denmark*, 1796; *Posthumous Works*, 4 vols., 1798. It is impossible to trace the many articles contributed by her to periodical literature, or to identify the translations executed for Mr Johnson. A memoir of her life was published by Godwin soon after her decease. A large portion of the work, *William Godwin, his Friends and Contemporaries*, was devoted to her, and a new edition of the *Letters to Imlay*, London, 1879, of which the first edition was published by Godwin, is prefaced by a somewhat fuller memoir. (C. K. P.)

GODWIN, WILLIAM (1756–1836), an English political writer, historian, novelist, and dramatist, was born March 3, 1756, at Wisbeach in Cambridgeshire, at which place his father was a Nonconformist minister. His family came on both sides of worthy middle-class people, able to trace their descent in the same level of society for about 150 years; and it was probably only as a joke that Godwin, a stern political reformer and philosophical radical, attempted to trace his pedigree to a time before the Norman conquest and the great Earl Godwine. His father was a cold and dull man, his mother uneducated, but clever, shrewd, and full of sound common sense. Both parents were Calvinists: the father strict in observances beyond what was even then ordinary; the mother regretting in Godwin's maturer years, and when some of her sons had turned out ill, that she had given birth to so many children, who, as she thought, were heirs of damnation. Mr Godwin, senior, died young, and never inspired love or much regret in his son; but in spite of wide differences of opinion, the most tender affection always subsisted between William Godwin and his mother, until her death at an advanced age.

William Godwin was educated for his father's profession, and was at first more Calvinistic than his teachers, becoming a Sandemanian, of which sect he says, that they were the followers of "a celebrated north-country apostle [Glas], who after Calvin had damned ninety-nine in a hundred of mankind, has contrived a scheme for damning ninety-nine in a hundred of the followers of Calvin."

He officiated as a minister at Ware, Stowmarket, and Beaconsfield. At the second of these places the teachings of French Reformers were brought before him by a friend, and these, while they intensified his political, undermined his religious opinions. He came to London, still nominally a clergyman, to set about the work of the regeneration of society with his pen—a real enthusiast, who, theoretically, shrank from no conclusions from the premises which he laid down. These were the principles of the Encyclopedists, and his own aim was the complete overthrow of all existing institutions, political, social, and religious. He believed, however, that calm discussion was the only thing needful to carry every change, and from the beginning to the end of his career he deprecated every approach to violence. He was, like Bentham—whom, however, he does not seem to have influenced or been influenced by—a philosophic radical in the strictest sense of the term.

His first published work was an anonymous *Life of Lord Chatham*; the first to which he gave his name was still nominally clerical. Under the inappropriate title *Sketches of History*, he published six sermons on the characters of Aaron, Hazael, and Jesus, in which, though writing in the character of an orthodox Calvinist, he enunciates the pregnant proposition, "God himself has no right to be a tyrant." This was published in 1782, and for the next nine years he wrote largely in the *Annual Register* and other periodicals, producing also three novels, which have more completely vanished from the world than even the contributions to reviews. They were probably not worth preserving, but the "Sketches of English History" written for the *Annual Register* from 1785 onward still deserve study. He joined a club called the Revolutionists, and associated much with Lord Stanhope, Horne Tooke, Holcroft, and others, who, from their political principles and activity, were obnoxious to men in power. It is perhaps needless to say that the title of "reverend" dropped off from him without difficulty, and with no sense of discordance between the old and the new. Doubt and change never seem to have brought with them any keen sense of pain or outrooting. The equable calm of a cold temperament preserved him from much which affects warmer natures; but he also knew that he was at all times seeking after truth, and striving for what seemed right; and while such an one can scarcely be called modest, he is preserved for many qualms which affect more nervous and more self-distrustful persons.

In 1793 Godwin published his great work on political science, *The Inquiry concerning Political Justice, and its Influence on General Virtue and Happiness.* Although this work is little known and less read now, it was one of the epoch-making books of English thought. Godwin could never have been himself a worker on the active stage of life. But he was none the less a power behind the workers, and *Political Justice* takes its place with Milton's *Speech for Unlicensed Printing*, with Locke's *Essay on Education*, with Rousseau's *Émile*, among the unseen levers which have moved the changes of the times. It is therefore necessary to speak of this book more particularly. By the words "political justice" the author meant "the adoption of any principle of morality and truth into the practice of a community," and the work was therefore an inquiry into the principles of society, of government, and of morals. For many years Godwin had been "satisfied that monarchy was a species of government unavoidably corrupt," and from desiring a government of the simplest construction, he gradually came to consider that "government by its very nature counteracts the improvement of original mind." Believing in the perfectibility of the race, that there are no innate principles, and therefore no original propensity to evil, he considered that "our virtues and our vices may be traced to the incidents which make the history of our lives, and if these incidents could be divested of every improper tendency, vice would be extirpated from the world." All control of man by man was more or less intolerable, and the day would come when each man, doing what seems right in his own eyes, would also be doing what is in fact best for the community, because all will be guided by principles of pure reason. But all was to be done by discussion, and matured change resulting from discussion. Hence, while Godwin thoroughly approved of the philosophic schemes of the precursors of the Revolution, he was as far removed as Burke himself from agreeing with the way in which they were carried out. So logical and uncompromising a thinker as Godwin could not go far in the discussion of abstract questions without exciting the most lively opposition in matters of detailed opinion. An affectionate son, and ever ready to give of his hard-earned income to more than one ne'er-do-well brother, he maintained that natural relationship had no claim on man, nor was gratitude to parents or benefactors any part of justice or virtue. In a day when the penal code was still extremely severe, he argued gravely against all punishments, not only that of death. Property was to belong to him who most wants it; accumulated property was a monstrous injustice. Hence marriage, which is law, is the worst of all laws, and property the worst of all properties. A man so passionless as Godwin could venture thus to argue without suspicion that he did so only to gratify his wayward desires. Portions of this treatise, and only portions, found ready acceptance in those minds which were prepared to receive them. Perhaps no one received the whole teaching of the book. But it gave cohesion and voice to philosophic radicalism; it was the manifesto of a school without which the milder and more creedless liberalism of the present day had not been. Godwin himself in after days modified his communistic views, but his strong feeling for individualism, his hate of all restrictions on liberty, his trust in man, his faith in the power of reason remained; it was a manifesto which enunciated principles modifying action, even when not wholly ruling it.

In May 1794 Godwin published the novel of *Caleb Williams, or Things as they are*, a book of which the political object is overlooked by many readers in the strong interest of the story. It is one of the few novels of that time which may be said still to live. A theorist who lived mainly in his study, Godwin yet came forward boldly to stand by prisoners arraigned of high treason in that same year—1794. The danger to persons so charged was then great, and he deliberately put himself into this same danger for his friends. But when his own trial was discussed in the Privy Council, Pitt sensibly held that *Political Justice*, the work on which the charge could best have been founded, was priced at three guineas, and could never do much harm among those who had not three shillings to spare.

From this time Godwin became a notable figure in London society, and there was scarcely an important person in politics, on the liberal side, in literature, art, or science, who does not appear familiarly in the pages of Godwin's singular diary. For forty-eight years, beginning in 1788, and continuing to the very end of his life, Godwin kept a record of every day, of the work he did, the books he read, the friends he saw. Condensed in the highest degree, the diary is yet easy to read when the style is once mastered, and it is a great help to the understanding of his cold, methodical, unimpassioned characters. He carried his method into every detail of life, and lived on his earnings with extreme frugality. Until he made a large sum by the publication of *Political Justice*, he lived on an average of £120 a year. In 1797, the intervening years having been spent in strenuous literary labour, Godwin married Mary Wollstonecraft (see last article). Since both held the same views regarding the slavery of marriage, and since they only married at all for the sake of possible offspring, the marriage was concealed for some time, and the happiness of the avowed married life was very brief. Mrs Godwin died in giving birth to a daughter, afterwards the second wife of Percy Bysshe Shelley, on September 10, 1797, leaving Godwin, prostrated by affliction, and with a charge for which he was wholly unfit—his own little daughter Mary, and her stepsister, Fanny Imlay, who ever afterwards bore the name of Godwin. His unfitness for the cares of a family, far more than love, led him to contract a second marriage with Mrs Clairmont, in 1800. She was a widow with two children, energetic and painstaking, but a harsh stepmother; and it may be doubted whether the children were not worse off under her care than they would have been under Godwin's neglect. The second fiction which proceeded from Godwin's pen was called *St Leon*, and published in 1799. It is chiefly remarkable for the beautiful portrait of Marguerite, the heroine, which was drawn from the character of his own wife.

The events of Godwin's life were few. Under the advice of the second Mrs Godwin, and with her active co-operation, he carried on business as a bookseller under the pseudonym of Edward Baldwin, under which name he published several useful school-books and books for children, some by Charles and Mary Lamb. But the speculation was unsuccessful, and for many years Godwin struggled with constant pecuniary difficulties, for which more than one subscription was raised by the leaders of the Liberal party, and by literary men. In his later years the Government of Earl Grey conferred upon him the office known as "Yeoman Usher of the Exchequer," to which were attached apartments in Palace Yard, where he died in the full possession of his faculties, April 7, 1836, having completed his eightieth year.

In his own time, by his writings and by his conversation, Godwin had a great power of influencing men, and especially young men. Though his character would seem, from much which is found in his writings, and from anecdotes told by those who still remember him, to have been unsympathetic, it was not so understood by enthusiastic young people, who hung on his words as those of a prophet. The most remarkable of these was Percy Bysshe Shelley, who in the glowing dawn of his genius turned to Godwin as his teacher and guide. The last of the long series of young men who sat at Godwin's feet was Edward Lytton Bulwer, afterwards Lord Lytton, whose early romances were formed after those of Godwin, and who, in *Eugene Aram*, succeeded to the story as arranged, and the plan to a considerable extent sketched out, by Godwin, whose age and failing health prevented him from completing it.

Godwin's more important works are—*The Inquiry concerning Political Justice, and its Influence on General Virtue and Happiness*, 1793; *Things as they are, or the Adventures of Caleb Williams*, 1794; *The Inquirer, a series of Essays*, 1796; *Memoirs of the Author of the Rights of Woman*, 1798; *St Leon, a Tale of the Sixteenth Century*, 1799; *Antonio, a Tragedy*, 1801; *The Life of Chaucer*, 1803; *Fleetwood, a Novel*, 1805; *Faulkner, a Tragedy*, 1807; *Essay on Sepulchres*, 1809; *Lives of Edward and John Philips, the Nephews of Milton*, 1815; *Mandeville, a Tale of the Times of Cromwell*, 1817; *History of the Commonwealth*, 1824-1828; *Cloudesley, a Novel*, 1830; *Thoughts on Man, a series of Essays*, 1831; *Lives of the Necromancers*, 1834. A volume of essays was also collected from his papers and published in 1873, as left for publication by his daughter Mrs Shelley. Many other short and anonymous works proceeded from his ever busy pen, but many are irrecoverable, and all are forgotten. Godwin's place in literature is permanent, in that he produced one work which proved effective in changing the course of thought in its time, but not permanent in the sense that his writings will continue to be widely read. His life was published in 1876 in two volumes, under the title *William Godwin, his Friends and Contemporaries*, by C. Kegan Paul. The best estimate of his literary position is that given by Mr Leslie Stephen in his *English Thought in the 18th Century*. (C. K. P.)

GODWINE, son of Wulfnoth, earl of the West-Saxons, is the leading Englishman in the first half of the 11th century, and he holds a special place in English history generally. He is the first Englishman who plays the part of a minister and parliamentary leader, of one high in office under the crown who at the same time sways the assemblies of the nation by his power of speech. Such a position was perfectly possible before the Norman Conquest; it did not again become possible for some ages. Godwine appears as the chief champion of England against Norman influence, and as the father of the last English king of the native stock. In these two characters he drew on himself the fullest bitterness of Norman hatred; and to this hatred is doubtless largely, though not wholly, owing the extraordinary contradiction with which the chief events of his life are told, and the amazing slanders which have been heaped upon his memory.

His birth and origin are utterly uncertain. The highest authorities, the contemporary English Chronicles, are silent. There are two alternative statements, which are seemingly quite irreconcilable, but either of which alone would have much to be said for it. By putting together certain passages in the English Chronicles, in Domesday, and in the will of the Ætheling Æthelstan, son of King Æthelred, a strong presumption is raised that Godwine was the son of Wulfnoth the South-Saxon who was outlawed in 1009, and that his services in the war against Cnut were deemed to entitle him to a restitution of his father's forfeited lands. There is no direct statement to this effect, but a number of undesigned coincidences point towards such a belief. On the other hand, there is a story which appears in various quarters, and which seems to come from more than one independent source, which makes Godwine's father Wulfnoth a churl somewhere on the borders of Gloucestershire and Wiltshire, and which makes Godwine win the favour of the Danish earl Ulf by showing him his way after the battle of Sherstone in 1016. A third account connects Godwine with the family of Eadric the traitor of Æthelred's day; but this version seems at once to be impossible to reconcile with either of the other two stories, and to rest on less authority than either.

But, whatever was Godwine's origin, there is no doubt that, according to Cnut's rule of preferring Englishmen to high office, he rose to power very early in that king's reign. He was an earl in 1018. The next year he distinguished himself at the head of the English troops in Cnut's Northern wars, and received in marriage Gytha, the sister of the king's brother-in-law Earl Ulf. In 1020 he became earl of the West-Saxons, that is, of all England south of the Thames, a new office, doubtless connected with Cnut's frequent absences from England. All this again is not in the Chronicles, though particular points are incidentally confirmed by them. Still this stage of his history seems to be fairly made out from other sources.

From Cnut's death in 1035 the events of Godwine's life are recorded in the Chronicles, often with great minuteness. Much is also learned from the contemporary biographer of Eadward. He asserted the claims of Harthacnut, the son of Cnut and Emma, to the crown of his father; but he had to consent to a division of the kingdom, and could only secure Wessex for Harthacnut, while Harold reigned in Northumberland and Mercia. He then acted as the chief minister of Emma, while she was regent on behalf of Harthacnut during his first reign. During this time the Ætheling Ælfred, son of Æthelred and Emma, landed in England in the hope of winning back his father's crown; but coming into the power of Harold, he was blinded by his order, and died of his wounds. Godwine was said to have betrayed Ælfred to Harold, and the charge was eagerly seized upon by the Norman writers. But it was not invented by them. At the beginning of Harthacnut's second reign in 1040, Godwine was formally accused of the death of Ælfred, and was regularly tried and acquitted. His guilt is asserted in a poem inserted in one of the Chronicles, but the words which tell against him are carefully altered in another version. The story is told with great confusion and contradiction, and the version unfavourable to Godwine seems to be inconsistent with his position at the time as minister, not of Harold, to whom he is said to have betrayed Ælfred, but of Harthacnut, whose kingship seems to be forgotten in the story. Godwine remained in power during the reigns of Harold and Harthacnut, and on the death of the last-named king in 1042, he was foremost in promoting the election of Eadward, the son of Æthelred and Emma, to the vacant throne. As earl of the West-Saxons he was the first man in the kingdom, but his power was still balanced by that of the other great earls, Leofric in Mercia and Siward in Northumberland. His sons Swegen and Harold, together with Beorn, the nephew of his wife Gytha, were promoted to earldoms (1043–1045), and his daughter Eadgyth was married to the king (1045). We hear much of his good and strict government of his earldom, and of his influence with the king and with the whole nation. He was not, however, all-powerful; in one very remarkable case, which is most instructive as a piece of constitutional history, he was out-voted in the witenagemót on a question of foreign policy. In 1047, when his wife's nephew Swegen Estrithson, now king of the Danes, was at war with Magnus of Norway, Godwine proposed to help Swegen with fifty ships; but the notion was opposed by Leofric, and "all folk" accepted the amendment of the Mercian earl. Godwine had also to strive against the king's fondness for Normans and other strangers, above all in the disposal of ecclesiastical offices. Godwine's policy, in this and in other matters, was opposed to all French connexions of every kind. Next to Englishmen he favoured natives of the kindred Continental lands, and he supported a policy of alliance with the empire and its princes. In all this, at home and abroad, he had specially to withstand the influence of the king's Norman favourite Robert of Jumiéges, appointed bishop of London in 1044 and archbishop of Canterbury in 1051. Godwine was supported by the English bishops Stigand of Winchester and Lyfing of Worcester. The appointment of Robert to the archbishopric marks the decline of Godwine's power; the foreign influence was now at its height, and the English earl was to feel the strength of it.

In the course of 1051 a series of outrages committed by the king's foreign favourites led to a breach between the king and the earl. The king's brother-in-law, Eustace count of Boulogne, returning with his followers from a visit to the king, tried to obtain quarters by force in the houses of the burgesses of Dover. An Englishman who withstood them was killed; a fight followed, in which the count and his company were driven out of the town. The king, hearing the tale from Eustace, bade Godwine inflict military chastisement on the townsmen; the earl refused, and demanded a fair trial of the charge before the witan. About the same time men's minds were stirred by the outrages of several Normans who had received estates in Herefordshire. The influence of the archbishop was used against Godwine, and he was summoned to appear before the witan at

Gloucester as a criminal. He and his sons now gathered the whole force of their earldoms, and marched towards Gloucester in arms. They demanded the surrender of Count Eustace and of the other strangers who had done outrages, whether at Dover or in Herefordshire. The king called the other earls to his help; war was hindered by the mediation of Leofric, and matters were adjourned to another meeting in London. There the king appeared with an army; Godwine and his sons were arraigned as criminals, and, on refusing to appear without a safe-conduct, were outlawed. Godwine and his whole family now left the kingdom, except his daughter, the Lady Eadgyth, who was banished from court to the monastery of Wherwell. The foreign favourites of the king were now supreme.

The next year the tide turned; the feeling of the nation showed itself in favour of Godwine. When his petition for a removal of his outlawry was refused, he came back from his shelter in Flanders at the head of a fleet. In most parts of England he was welcomed; he sailed up the Thames to London; the army gathered by the king refused to fight against him; and, in a great meeting outside the walls of London, he and his family were restored to all their offices and possessions, and the archbishop and many other Normans were banished. Godwine's friend Stigand succeeded to the archbishopric. The next year Godwine was smitten with a fit at the king's table, and died three days later, April 15, 1052. His death was worked up into a fabulous tale by his Norman enemies.

The patriotism and good government of Godwine are undoubted; but it is plain that he accumulated vast wealth for himself. Sometimes, it was said, he showed little regard to the rights of the church; but in the only case where we hear both sides, that of some lands in Kent disputed between him and the Norman archbishop, it appears that he had a legal claim. It is much more certain that he was unduly bent on the promotion of his own family. His eldest son Swegen gave great and deserved offence by the seduction of Eadgifu, abbess of Leominster, and still more by the treacherous murder of his cousin Beorn. He was outlawed, but was afterwards restored to his earldom. He accompanied his father to Flanders, but did not come back, having gone on a pilgrimage to Jerusalem, on his return from which he died. Of his other sons, the second, Harold, succeeded Godwine in his earldom and Eadward in his kingdom; Tostig, Gyrth, and Leofric, all earls, play a part in the later history; Wulfnoth, the youngest, was a captive of William. Of his daughters the Lady Eadgyth survived her father, husband, and brother, and lived in great honour under the Conqueror. The others were Gunhild and Ælfgifu, the latter of whom appears in the story of Harold's oath to William.

See the English Chronicles and Florence of Worcester, 1035-52; the Life of Eadward, published in the Chronicles and Memorials; the *Encomium Emmæ* or *Gesta Cnutonis*, published by Pertz, and elsewhere; various notices in Domesday, and in the writers of the time generally. All the passages, historical and legendary, bearing on Godwine's life, are collected and examined in the appendices to Freeman's *History of the Norman Conquest*, vols. i. ii. (E. A. F.)

GODWIT, a word of unknown origin, the name commonly applied to a marsh-bird in great repute, when fattened, for the table, and formerly abundant in the fens of Norfolk, the Isle of Ely, and Lincolnshire. In Turner's days (1544) it was worth three times as much as a Snipe, and at the same period Belon said of it—"C'est vn Oyseau es delices des Françoys." Casaubon, who Latinized its name "*Dei ingenium*" (*Ephemerides*, 19th September 1611), was told by the "*ornithotrophæus*" he visited at Wisbech that in London it fetched twenty pence. Its fame as a delicacy is perpetuated by many later writers, Ben Jonson among them, and Pennant says that in his time (1766) it sold for half-a-crown or five shillings. Under the name Godwit two perfectly distinct species of British birds were included, but that which seems to have been especially prized is known to modern ornithologists as the Black-tailed Godwit, *Limosa ægocephala*, formerly called, from its loud cry, a Yarwhelp,[1] Shrieker, or Barker, in the districts it inhabited. The practice of netting this bird in large numbers during the spring and summer, coupled with the gradual reclamation of the fens, to which it resorted, has now rendered it but a visitor; and it probably ceased from breeding regularly in England in 1824 or thereabouts, though under favourable conditions it may have occasionally laid its eggs for some thirty years later or more (Stevenson, *Birds of Norfolk*, ii. p. 250). This Godwit is a species of wide range, reaching Iceland, where it is called *Jardræka* (=earth-raker), in summer, and occurring numerously, it is said, in India in winter. Its chief breeding-quarters seem to extend from Holland eastwards to the south of Russia. The second British species is that which is known as the Bar-tailed Godwit, *L. lapponica*, and this seems to have never been more than a bird of double passage in the United Kingdom, arriving in large flocks on the south coast about the 12th of May, and, after staying a few days, proceeding to the north-eastward. It is known to breed in Lapland, but its eggs are of great rarity. Towards autumn the young visit our coasts, and a few of them remain, together with some of the other species, in favourable situations throughout the winter. One of the local names by which the Bar-tailed Godwit is known to the Norfolk gunners is Scamell, a word which, in the mouth of Caliban (*Tempest*, act ii. scene 2), has been the cause of much perplexity to Shakespearian critics.

The Godwits belong to the group *Limicolæ*, and are about as big as a tame Pigeon, but possess long legs, and a long bill with a slight upward turn. It is believed that in the genus *Limosa* the female is larger than the male. While the winter plumage is of a sober greyish-brown, the breeding-dress is marked by a predominance of bright bay or chestnut, rendering the wearer a very beautiful object. The Black-tailed Godwit, though varying a good deal in size, is constantly larger than the Bar-tailed, and especially longer in the legs. The species may be further distinguished by the former having the proximal third of the tail-quills pure white, and the distal two-thirds black, with a narrow white margin, while the latter has the same feathers barred with black and white alternately for nearly their whole length.

America possesses two species of the genus, the very large Marbled Godwit or Marlin, *L. fedoa*, easily recognized by its size and the buff colour of its axillaries, and the smaller Hudsonian Godwit, *L. hudsonica*, which has its axillaries of a deep black. This last, though less numerous than its congener, seems to range over the whole of the continent, breeding in the extreme north, while it has been obtained also in the Strait of Magellan and the Falkland Islands The first seems not to go further southward than the Antilles and the Isthmus of Panama.

From Asia, or at least its eastern part, two species have been described. One of them, *L. melanuroides*, differs only from *L. ægocephala* in its smaller size, and is believed to breed in Amurland, wintering in the islands of the Pacific, New Zealand, and Australia. The other, *L. uropygialis*, is closely allied to and often mistaken for *L. lapponica*, from which it chiefly differs by having the rump barred like the tail. This was found breeding in the extreme north of Siberia by Dr von Middendorff, and ranges to Australia, whence it was, like the last, first described by Mr Gould. (A. N)

GOES, or TER GOES, a town of the Netherlands in the province of Zealand, on the island of South Beveland, with railway communication since 1868 with Bergen-op-Zoom, and since 1872 with Middelburg, its distances from these

[1] This name seems to have survived in Whelp Moor, near Brandon, in Suffolk.

places being respectively 12 and 15 miles. The Reformed church, called in the olden times St Mary Magdalen's, is considered the finest ecclesiastical building of Zealand, and dates from 1423. In the one half, known as the Preekkerk or preaching church, there is a splendid organ, and in the other half, known as the Wandelkerk or walking church, stands the tomb of Frans Naerebout the philanthropist. Goes further boasts of a fine old town-house, a high school, and the remains of the old castle of Ostende, which was the nucleus round which it began to form itself in the 14th century. The industries of the town are varied but not extensive, dealing with linen, dyes, chocolate, oil, flour, straw hats, wood, and cigars. Shipbuilding is also carried on, as well as a trade in wood and coals. The harbour, which is defended by a fort, is formed by a short canal communicating with the eastern Scheldt, extended and improved in 1818–19. The population of the town, which received its municipal rights in 1406, and was surrounded with a wall about 1420, numbered 4916 in 1860, 5205 in 1870, and 6063 in 1876.

GOES, HUGO VAN DER (? –1482), a painter of considerable celebrity at Ghent, was known to Vasari, as he is known to us, by a single picture in a Florentine monastery. At a period when the family of the Medici had not yet risen from the rank of a great mercantile firm to that of a reigning dynasty, it employed as an agent at the port of Bruges Tommaso Portinari, a lineal descendant, it was said, of Folco, the father of Dante's Beatrix. Tommaso, at that time patron of a chapel in the hospital of Santa Maria Nuova at Florence, ordered an altar-piece of Hugo van der Goes, and commanded him to illustrate the sacred theme of "*Quem genuit adoravit.*" In the centre of a vast triptych, comprising numerous figures of life size, Hugo represented the Virgin kneeling in adoration before the new-born Christ attended by Shepherds and Angels. On the wings he portrayed Tommaso and his two sons in prayer under the protection of Saint Anthony and St Matthew, and Tommaso's wife and two daughters supported by St Margaret and St Mary Magdalen. The triptych was sent to Florence, and placed on the altar upon which it still remains. Van der Goes, like Hubert Van Eyck and Jodocus of Ghent, has bequeathed but this one picture to posterity; but it is a picture which shows that he was an artist of whom Ghent might be proud, as Bruges was proud of John Van Eyck and Brussels of Roger van der Weyden. Unhappily the triptych of Santa Maria Nuova suffered so much from decay and restoring that the defects peculiar to the Flemings became unduly prominent as time and neglect effaced the brilliancy and harmony of the principal colours. We can only discern at the present day that the art of Van der Goes is a variety of that which characterizes Van Eyck and Van der Weyden. Less finished and less coloured than the work of the first, it is less subtle and expressive than that of the second. It lacks depth of religious feeling, and hardly rises above the common level of the school in respect of feeling or execution. It is a cold and stiff art, marked by hardness of surface, dryness of contour, angularity of drapery, overladen ornament, and ill-balanced light and shade. Imposing because composed of figures of unusual size, the altar-piece is more remarkable for portrait character than for charms of ideal beauty. There are small pieces in public galleries which claim to have been executed by Van der Goes, but none that are certified as the work of his hands. One of these pictures in the National Gallery in London is more nearly allied to the school of Memling than the triptych of Santa Maria Nuova; another, a small and very beautiful John the Baptist, at the Pinakothek of Munich, is really by Memling; whilst numerous fragments of an altar-piece in the Belvedere at Vienna, though assigned to Hugo, are by his more gifted countryman of Bruges. Any one who visits Continental collections will see that the name of Van der Goes was given to pictures of which he could not have been the author. None of the compositions mentioned by historians have survived except the altar-piece of Florence. But Van der Goes was not habitually a painter of easel pieces. He made his reputation at Bruges by producing coloured hangings in distemper. After he settled at Ghent, and became a master of his guild in 1465, he designed cartoons for glass windows. He also made decorations for the wedding of Charles the Bold and Margaret of York in 1468, for the festivals of the Rhetoricians and papal jubilees on repeated occasions, for the solemn entry of Charles the Bold into Ghent in 1470–1, and for the funeral of Philip the Good in 1474. The labour which he expended on these occasions might well add to his fame without being the less ephemeral. About the year 1475 he retired to the monastery of Rouge Cloitre near Ghent, where he took the cowl. There, though he still clung to his profession, he seems to have taken to drinking, and at one time to have shown decided symptoms of insanity. But his superiors gradually cured him of his intemperance, and he died in the odour of sanctity in 1482.

GOETHE

JOHANN WOLFGANG VON GOETHE (1749–1832) was born in Frankfort on August 28, 1749. His parents were citizens of that imperial town, and Wolfgang was their only son and their eldest child. His father was born on July 31, 1710, and in 1742 received the title of imperial councillor. He married on August 20, 1748, at the age of thirty-eight, Catherine Elizabeth Textor, a girl of seventeen. Her family was better than his own, and held a higher position in the town. Her father was imperial councillor, and had been schultheiss or chief magistrate. In December 1750 was born a daughter, Cornelia, who remained until her death, at the age of twenty-seven, her brother's most intimate friend. She was married in 1773 to John George Schlosser. The house in which Goethe was born is still to be seen in the Hirschgraben. Goethe has described to us how it was rebuilt, and it has since been much altered. His education was irregular; he went to no school, and his father rather stimulated than instructed him. But the atmosphere by which he was surrounded gave him, perhaps, the best education he could have received. Frankfort, a free town of the empire, still preserved the appearance of the Middle Ages. It had lost the reality of power, but its citizens naturally grew up with a strong sense of independence, and a power of realizing the unity of Germany which was wanting in a small state. The boy from his earliest youth was accustomed to the companionship of his elders. His father was strict and formal, his mother quick and lively, inspired with no small share of the genius of her son. Goethe lived in the freest intercourse with every kind of society in the town, in which he might expect some day to be an important personage. There was no capital like London or Paris to call him away; Berlin was poor and distant, Vienna half Italian and half Spanish. Goethe must have been brought up with the ambition to take his degree at the university as doctor, to return home and become an advocate, to make a rich marriage, to go through the regular course of civil offices, to inherit his father's house, and perhaps one day to be burgomaster. His home was a cultivated one. The father was fond of art and of the German poetry then in fashion. The influence of Lessing had scarcely made itself felt; Herder was only five years older than Goethe himself. Gellert and Gottsched were the two oracles of poetry,—Gottsched a pedantic product of the earlier French culture, Gellert old and immovable, and unable to comprehend the new spirit. The chief debt that Goethe owed to him was the improvement in his handwriting, on which Gellert laid great stress, and which he coupled with moral excellence. Goethe's father had a great respect for these rhyming poets, and he so strongly objected to the new German hexameters that Wolfgang could only read Klopstock's *Messiah* with his sister in the greatest secrecy and in terror of discovery. He did, however, read it, and learned much of it by heart. French culture gave at this time the prevailing tone to Europe. Goethe could not have escaped its influence, and he was destined to fall under it in a special manner. In the Seven Years' War, which was now raging, France took the side of the empire against Frederick the Great. Frankfort was full of French soldiers, and a certain Comte Thorane, who was quartered in Goethe's house, had an important influence on the boy. Still more strongly was he affected by the French company of actors, whom he came to know both on and off the stage. He learned to declaim in this manner passages of Racine without understanding a word of them. At a later period he knew French thoroughly well, and composed both prose and poetry in that language. His first writings were imitations of the French manner; his earliest play was the imitation of a French after-piece. We can understand how these different forces were to work upon his future life. From his father he derived the steadfastness of character which enabled him to pursue an independent career of self-culture and devotion to art in the midst of every kind of distracting influence; from his mother he inherited the joyous nature and lively sympathy, the flow of language and love of narration, without which he could not have been a poet. Before the age of sixteen he had seen every kind of life in a city particularly favourable to a richness of individual character; he was entirely free from the prejudices of a small state; and as far as he cared for Germany he cared for it as a whole. He was tinged at an early age with the influence of the clearest and most finished language in Europe, and this influence, uniting with the natural clearness of Goethe's mind, made his prose a new phenomenon in the literature of his country, unlike anything which had been seen before. Lastly, with the most passionate aspirations for freedom and independence of life, he was born into the slavery of a mechanical career of prosaic prosperity, the pressure of which was not strong enough to confine him, but was strong enough to stimulate all his efforts to break the bonds.

Goethe, if we may believe his autobiography, experienced his first love about the age of fifteen in the person of Gretchen, whom some have supposed to be the daughter of an innkeeper at Offenbach. He worshipped her as Dante worshipped Beatrice. She treated him as a child, much as Miss Chaworth treated Byron. But there is no other evidence of this first love, and it would be quite in accordance with Goethe's manner to enlarge on a very small foundation, or to concentrate on one person the feelings which were devoted to several individuals. His letters speak of a boyish love for one Charitas Meixner, a friend of his sister, two years younger than himself, the daughter of a rich merchant at Worms. He expresses his affection for her with all the fervour of French phraseology, and the passion did not leave him when he had removed to Leipsic. But Charitas was able to console herself with another engagement. She married in February 1773 a merchant of her native town, and died at the end of the following year.

In the autumn of 1765 Goethe, who had just completed his sixteenth year, travelled to Leipsic in the company of a bookseller, Fleischer, and his wife, who were on their way to attend the fair. On the 19th of October he was admitted as a student of the Bavarian nation, one of the four into which the university was divided. For his lodging he had two neat little rooms in the Feuerkugel, the Fire Ball, looking into the long court-yard which leads from the old market to the new. When we remember that his three years at Leipsic, about which so much has been written, correspond with the last three years of an English boy at a public school, we can form some idea of the singular individuality of his character and the maturity and ripeness of his genius. He was sent to Leipsic to study law, in order that he might return to Frankfort fitted for the regular course of municipal distinction. For this purpose he carried with him a letter to Professor Böhme, who taught history and imperial law in the university, but had no other distinction to recommend him. He told Professor Böhme that he intended to devote himself not to law but to belles lettres, or, to use the word which F. A. Wolf had invented, philology. Böhme did his best to dissuade him, and in this was assisted by his wife. The effect of their advice was rather to disgust Goethe with modern German literature, to make him despise what he had already written, and to drive him into the distractions of society, which wasted both his time and his money. He did, however, attend some lectures. He heard Ernesti on Cicero's *Orator*, but he dealt rather with questions of grammar than of taste. He attended Gellert's lectures on literature, and even joined his private class. Gellert held a high position among German men of letters, which was due quite as much to his character as to his genius. He advised Goethe to desert poetry for prose, and to take to authorship only as an employment subordinate to the serious occupations of his life. Goethe tells us that in his lectures upon taste he never heard Gellert mention the names of Klopstock, Kleist, Wieland, Gessner, Gleim, or Lessing. He also attended the lectures of another literary professor, Clodius, a young man about ten years older than himself. Clodius corrected Goethe's writings with red ink, and pointed out the faults without showing the way to mend them. Goethe had written a poem of congratulation for the marriage of his uncle Textor (February 17, 1766), which, according to the fashion of the time, was full of gods and goddesses and other mythological apparatus. Clodius was unsparingly hard upon this production, and Goethe then perceived that his critic was just as faulty as himself in the use of abstractions and strange outlandish words to give weight and authority to his verse. He satirized Clodius in a poem in praise of the cakes of the confectioner Händel, and by a parody of his drama *Medon*. His position towards the professors of his university was not an enviable one. His real university education was derived from intercourse with his friends. First among these was J. G. Schlosser, who afterwards married his sister. Goethe used to dine with him at a table d'hôte kept by a wine-dealer, Schönkopf, in the Bruhl (No. 79), in a house which still exists. Schlosser, who was at this time private secretary to the duke of Würtemberg and tutor to his children, was ten years older than Goethe. He had a great influence upon him, chiefly in introducing him to a wider circle of German, French, English, and Italian poetry. At the table of Professor Ludwig, where Goethe had previously dined, the conversation had generally turned on medical and scientific subjects. Another friend of Goethe's was Behrisch, tutor to the young Count Lindenau. He was a man in middle life, and he combined originality of character and clearness of literary judgment with a dry and caustic wit, and an ever-abiding sense of humour, much in the same proportions as were found in Merck, who exercised at a later period an important influence over Goethe's career. His friendship with Goethe was not at first of advantage to him. He was deprived of his tutorship from a suspicion that he did not always keep the most select society, and his successor was forbidden to allow his charge to associate with the young poet. This is supposed to have been caused by Goethe's disrespectful behaviour to Professor Clodius. Gellert obtained for Behrisch an educational post at the court of Dessau, and Goethe kept up a constant correspondence with him till his death in 1809. Behrisch would not allow Goethe to print his poems, but copied them out instead in a beautiful hand. He probably had a considerable effect in producing the simplicity and naturalness of Goethe's early style.

But the person who had the strongest effect on Goethe's mental development was Adam Frederick Oeser, at this time director of the academy of arts in Leipsic. Goethe took lessons from him in drawing, and, not content with this, tried his hand at etching. A little device of his for a book-plate or a bill-head is extant, in which a slab with the name C. G. Schönkopf is represented with three bottles above and a wreath of flowers below. Oeser had been a friend of Winckelmann's, and exercised great influence over his views of art. This was a source of considerable reputation to him, and Winckelmann's tragic death, the news of which reached Leipsic whilst Goethe was there, must have brought the relation between them into stronger relief. Goethe always spoke of Oeser's influence with the greatest affection and respect. He writes—"Oeser's discoveries have given me a fresh opportunity of blessing myself that I had him for my instructor. He entered into our very souls, and we must indeed have been without souls not to have derived benefit from him. His lessons will produce their effects through all the rest of my existence. He taught me that the ideal of beauty is simplicity and repose." We find Goethe at Weimar continually consulting Oeser for designs for furniture and for theatrical entertainments.

Goethe from his earliest years was never without a passion, and at Leipsic his passion was Kitty Schönkopf, the Aennchen of the autobiography, the daughter of the host at whose house he dined. She often teased him with her inconstant ways, and to this experience is due his first drama *Die Laune des Verliebten*, "Lovers' Quarrels," as it may be styled. It is a mere trifle, a pastoral in one act, written in alexandrines in the French style. Two happy and two unhappy lovers are contrasted. The only interest of the piece is that it is a fragment from Goethe's own life. A deeper chord is struck in *Die Mitschuldigen* (The Fellow Sinners), which forms a dismal and forbidding picture both of the time and of the experiences of the youth who wrote it. The daughter of an innkeeper has made an unhappy marriage, and is visited by a former lover who is in good circumstances. An assignation is arranged, and the interview is witnessed by the husband, who has come to steal the stranger's purse. The father comes in to read one of the stranger's letters. He is surprised, and is with his daughter suspected of the theft. The real culprit is discovered, but defends himself by accusing the stranger of his conduct to his wife. So they are all guilty. This play was first written in one act. It was afterwards enlarged to three acts, and published in 1787. The manuscript, which still exists, was given to Frederike Brion of Sesenheim. Besides these plays Goethe wrote at Leipsic twenty little songs of an erotic chararacter, which were set to music by his young friend Breitkopf. He describes them as moral-sensuous, but they are more sensuous than moral. They have the merit of a musical easy flow of expression, various moods of passion, with a happy readiness and elegance. Only a few of them were included in his collected works, and those very much altered. They show the influence of Wieland, but by one side of Wieland Goethe was never affected. He was never led to mingle classical ideas and emblems with the unrestrained and sensual frivolity which was disseminated from France. He never imitated Agathon or Musarion. Whatever may have been the bitterness of his experience of life, or the waywardness of his excited fancy, he conceived a true idea of the real nature of classical art. In this Winckelmann and Lessing were his teachers, and he was never untrue to the lessons which they inculcated. This was the most valuable possession he brought back from Leipsic. He had an opportunity of establishing his principles of taste during a short visit to Dresden, in which he devoted himself to the pictures and the antiques. The end of Goethe's stay at Leipsic was saddened by illness. One morning at the beginning of the summer he was awakened by a violent hemorrhage. For several days he hung between life and death, and after that his recovery was slow, although he was tended with the greatest anxiety by his friends. He finally left Leipsic far from well on August 28, 1768, his nineteenth birthday.

Goethe made an enforced stay of a year and a half in his native town. It was perhaps the least happy part of his life. He was in bad health. His cure proceeded slowly, and he had several relapses, and the weakness of the lungs, which was his first complaint, was succeeded by a weakness of the digestion, which was yet more troublesome and painful. The society of Frankfort seemed to him far less agreeable than that of Leipsic; he contrasted the cold, stiff, formal, old-fashioned life of the imperial city with the freshness, geniality, and intellectual activity of the Saxon university. His family relations were not pleasant. His grandfather Textor was struck with paralysis; his father showed but little sympathy with his aspirations for universal culture, and could imagine no career for him but that of a successful jurist. His sister had grown somewhat harsh and cold during his absence, and was possessed by a morbid self-consciousness, which she committed to the confidential pages of a secret diary. The tone of this diary, partly the result of family temperament, partly of the character of the age, throws an interesting light on the despair of Werther. Goethe's mother was always the same to him, a bright, genial, sympathetic friend. But her love could not ward off the pressure of circumstances, or supply a substitute for a wider and more unfettered life. Goethe, during his illness, received great attention from Fräulein von Klettenberg, a friend of his mother's, a pietist of the Moravian school. She initiated him into the mystical writings of those abstracted saints, and she engaged him in the study of alchemy, which served at once to prepare him for the conception of *Faust* and for the scientific researches of his later days. During his stay at Frankfort he wrote very little. It may be that the two Leipsic dramas received here their completed form. A farce in memory of his Leipsic life, a poetical letter to Frederike Oeser, the daughter of his teacher, a few songs, some of them religious, make up the tale of his productions, as far as we know them.

He arrived at Strasburg April 2, 1770. It was intended that after a sojourn in the university of that place he should visit Paris, the centre of refinement. Goethe stayed in Strasburg till August 28, 1771, his twenty-second birthday, and these sixteen months are perhaps the most important of his life. During them he came into active contact with most of those impulses of which his after life was a development. If we would understand his mental growth, we must ask who were his friends. He took his meals at the house of the Fräulein Lauth in the Krämergasse. The table was mainly filled with medical students. At the head of it sat Salzmann, a grave man of fifty years of age. His experience and his refined taste were very attractive to Goethe, who made him his intimate friend. Goethe was soon drawn by the studies of his companions to desert his own. A note-book of this date is preserved, which gives us a full account of his studies and employments. He attended lectures on anatomy, on midwifery, and on chemistry. His own studies were chiefly devoted to the last science; and he did not forget his favourite alchemy. He had brought with him to Strasburg introductions to pietistic circles, and this made him at first somewhat staid and retired in his pleasures, and disinclined for general society. This soon wore off, and the natural cheerfulness of his genial nature returned to him. Two songs, *Blinde Kuh* and *Stirbt der Fuchs so gilt der Balg*, refer to the social life of this period. He went on picnics, he wrote French poetry, he took dancing lessons, he learnt the violoncello. The table of the Fräulein Lauth received some new guests. Among these was Jung-Stilling, the self-educated charcoal-burner, who in his memoir has left a graphic account of Goethe's striking appearance, his broad brow, his flashing eye, his mastery of the company, and his generosity of character. Another was Lerse, a frank open character who became Goethe's favourite, and whose name is immortalized in *Götz von Berlichingen*. Goethe did not desert his studies in art. He learnt from the constant study of the cathedral of Strasburg the effect of Gothic architecture, and he shuddered when he saw the reception-rooms of the youthful Marie Antoinette hung with tapestries which represented the marriage of Jason and Medea, and seemed to forebode the coming doom. His diary also shows that he spent much time in philosophical speculation. But the most important event of his Strasburg sojourn was his acquaintance with Herder. He was five years older than Goethe. Herder was then travelling as tutor to the young prince of Holstein-Eutin, but was obliged to spend the whole winter of 1770–71 in Strasburg on account of an affection of his eyes. Goethe was with him every day, often all day. Herder, who was a pupil of a more original genius, Hamann, taught him the true value of nature in art, and the principles of what we should now call the romantic school. He made *Ossian* known to him, and the wealth of popular poetry in all nations which the publication of *Ossian* revealed; he enchanted him with the idyllic simplicity of the *Vicar of Wakefield*; but, above all, he shook his sensibility to the roots by revealing to him the power of the mighty Shakespeare. He now saw how far superior Homer was to his Latin imitators, and how false were the canons of French art. Goethe's spirit was liberated from its trammels, and *Götz* and *Faust* and *Wilhelm Meister* became possible to his mind. At a later period he forged for himself fetters of a different kind.

Goethe's stay at Strasburg is generally connected still more closely with another circumstance,—his passion for Frederike Brion of Sesenheim. The village lies about twenty miles from Strasburg, and her father was pastor there. Goethe was introduced by his friend Weyland, an Alsatian, as a poor theological student. Fresh from his study of Goldsmith, he found the *Vicar of Wakefield* realized. The father was a simple worthy man, the eldest of the three daughters was married, the two younger remained,—Maria Salome, whom Goethe calls Olivia, and Frederike, to whom the poet principally devoted himself. She was tall and slight, with fair hair and blue eyes, and just sixteen years of age. Goethe gave himself up to the passion of the moment; what he felt and suffered is known to us by his songs. At least ten songs are addressed to her, and several others were written for her. During the winter of 1770, in the intervals of his conversations with Herder, Goethe often rode over to Sesenheim. Neither storm, nor cold, nor darkness kept him back. He should have been busy with his dissertation for the degree of doctor. The subject he had chosen was the duty of providing an established church. But the attractions of Frederike were a great interruption to his labours. In the spring Herder went away. The fine weather drew him still more strongly to Sesenheim. Picnics, water parties, games, dances, illuminated by enthusiasm for literature, filled up the weeks. As his time for leaving Strasburg came nearer, he felt that this love was merely a dream, and could have no serious termination. Frederike felt the same on her side. A visit of the mother and daughters to Strasburg in July made this appear more clearly. On August 6 Goethe took his degree as doctor of law. Shortly afterwards he bade adieu to Sesenheim, and the tears stood in Frederike's eyes as he reached out his hand from horseback. From Frankfort he wrote his final farewell, and it was then, as he tells us, that he found from her answer for the first time how deeply she had loved him. The account of this love episode in the autobiography does Goethe injustice. There is nothing in the letters or the poems of the time to show that he had wantonly trifled with her affections. Eight years afterwards, on his way to Switzerland, he spent a night with the Brions at Sesenheim, and was received with the utmost kindness. He was shown the arbour where he had sat, the songs he had written, the carriage he had painted. He left them in the morning with content. Frederike lived till 1813, well known for her works of charity. She never married; the heart that Goethe had loved, she said, should never love another.

Goethe's return to Frankfort is marked by a number of songs, of which the "Wanderer's Sturmlied" is the most remarkable. He found his Frankfort existence more intolerable than before. He had outgrown many of the friends of his youth. Those with whom he felt most sympathy were the two Schlossers and his sister Cornelia. He found in her one who sympathized with all his aspirations. He cared nothing for his profession; he was more determined than ever to devote himself to letters, and not to law. He found in the neighbouring town of Darmstadt a literary circle which Frankfort did not supply. The landgravine Caroline set a good example, and had collected round her a number of kindred spirits, men and women. Among them were Wenck, and Petersen, and Caroline Flachsland, who was afterwards to marry Herder. But the soul of the literary circle was Merck, now thirty years of age, attached to the war office. Goethe has represented him in the autobiography as a cold and unfeeling cynic, a spirit who always said no, a prototype of Mephistopheles. History represents him otherwise as a man of cultivated and chastened judgment, a represser of enthusiasm, a respecter of the rules of art, anxious to hold the balance between the old school and the new. Goethe had dominated over all his other friends; Merck dominated over him. He has left but little of his own writings. He was one of those who inspire genius in others, and whose truest picture lives in the recollections of their friends. These months were full of literary activity. To them belong an oration on Shakespeare, delivered at Frankfort, an essay on Erwin von Steinbach, the builder of the Strasburg cathedral, two theological treatises of a neologistic character on the commandments of Moses and the miraculous tongues of Pentecost, and a number of reviews written for the *Frankfurter Gelehrte Anzeiger*, which had been founded by Merck. But the work into which he threw all his genius was the dramatization of the history of the imperial knight of the Middle Ages, Gottfried or Götz von Berlichingen. The immediate cause of this enterprise was his enthusiasm for Shakespeare. After reading him he felt, he said, like a blind man who suddenly receives his sight. The unities of time and place vanished into nothing. The true form of art was seen to be that which holds the wayward impulses together by an invisible bond, just as in the life of man necessity is wedded to free will. The study of a dry and dull biography of Götz, published in 1731, supplied the subject for his awakened powers. From this miserable sketch he conceived within his mind a complete picture of Germany in the 16th century. The chief characters of his play are creatures of his imagination representing the principal types which made up the history of the time. Every personage is made to live; they speak in short sharp sentences like the powerful lines of a great master's drawing. The first sketch of *Götz* was finished in six weeks, in the autumn of 1771. Cornelia was consulted at every stage in the work. Herder saw it, and gave his approval. On his return from Wetzlar in 1773 Goethe wrote the piece over again, and published it, with the help of Merck, in the form in which we now possess it. It ran like wild-fire through the whole of Germany. It was the progenitor, not only of the "Sturm und Drang" period to which it gave the tone, but of the romantic knightly literature which teemed from the German press. At a later period, in 1804, Goethe prepared another edition for the stage, which took five hours in acting. It has never been represented since.

With the manuscript of *Götz* in his pocket, Goethe left Frankfort in the spring of 1772 for Wetzlar, a quiet country town on the Lahn, one of the seats of government of the Holy Roman Empire. The emperors lived at Vienna; they were crowned at Frankfort; they held their parliaments at Ratisbon, and at Wetzlar their courts of justice. It was the custom for young lawyers to attend the sittings of these courts for a certain time before they could be admitted to practise on their own account. The company of these students, of the embassies from the component parts of the empire, and of various imperial officials, made the society a pleasant and lively one. Goethe soon found friends. The secretary of the Brunswick legation, Goué, formed a round table of knights,—a Ritter-tafel. The members adopted names from the age of chivalry, and apportioned among themselves the neighbouring villages as commanderies and fiefs. Goethe took the name of Götz. Deeds of prowess were performed in friendly rivalry, chiefly of eating and drinking. This masquerade at least served to keep the idea of Götz constantly before his mind. But the place has sadder associations. It is impossible to dissociate the name of Wetzlar from that of Werther. The Deutsches Haus, then the property of the knights of the Teutonic order, exists still in the main street of Wetzlar. It was occupied by one of the officials of the order, by name Buff, an honest man with a large family of children. The second daughter, Lotte, blue-eyed, fair, and just twenty years of age, was first met by Goethe shortly after his arrival at a ball at Wolpertshausen. She strongly attracted him; he became a constant visitor at the house. He found that Lotte was a second mother to her brothers and sisters, and he delighted to play games with them and tell them stories. Lotte was really though not formally engaged to Kestner, a man of two-and-thirty, secretary to the Hanoverian legation. The discovery of this relation made no difference to Goethe; he remained the devoted friend to both. He visited Lotte and her children; he walked with Kestner about the streets till midnight; they kept their common birthday together in the German house on the 28th of August; Kestner felt no jealousy; Goethe was content with Lotte's friendship; her heart was large enough for both. But the position was too critical to last. On September 10 they met in the German house for the last time. Lotte spoke of the other world, and of the possibility of returning from it. It was arranged between them that whoever died first should appear to the others. This conversation confirmed Goethe's purpose; he determined to go away. He made no adieu, but wrote a line to Kestner to say that he could not have borne to stay a moment longer. Merck had probably persuaded him to this step. To divert his mind he took him to Ehrenbreitstein and introduced him to Sophie Roche, the friend of Wieland's youth, and to her daughter Maximiliane, with whom Goethe was charmed. The places in the neighbourhood of Coblentz were visited. Goethe returned to Frankfort by the river in a yacht. Here he was possessed with the memory of Lotte. He fastened her silhouette over his bed. Kestner came to Frankfort in September; Goethe and Schlosser went together to Wetzlar in November. Here he heard of the death of Jerusalem, a young man attached to the Brunswick legation. He had been with Goethe at the university of Leipsic, but he had seen little of him at Wetzlar. Of a moody temperament, disheartened by failure in his profession, and soured by a hopeless passion for the wife of another, he had borrowed a pair of pistols from Kestner under pretence of a journey, and had shot himself on the night of October 29.

Goetho obtained a full narrative of the circumstances from Kestner, and immediately afterwards began his *Werther*, in which the circumstances above related are all interwoven. Goethe tells us that it was written in four weeks, but this can hardly have been the case. We have notices of its slow progress during the whole of the summer of 1773. In 1774 it is far advanced enough to be shown to some intimate friends. It is not till the middle of September 1774 that two copies of the book are sent in the greatest secrecy to Sophie la Roche and Lotte Buff. In October it spread over the whole of Germany. It was enthusiastically beloved or sternly condemned. It was printed, imitated, translated into every language of Europe, criticized in every periodical, with the fullest meed of praise or scorn. It made the round of the world, and penetrated even to China. The *Werther* fever wrung the hearts of men and women with imaginary sorrows; floods of tears were shed; young men dressed in blue coats and yellow breeches shot themselves with *Werther* in their hands. It opened the floodgates of pent-up sentimentalism which had been stirred by the philosophy of the time, and which the calamities of the next generation were sternly to suppress. It may be imagined that Kestner and Lotte were not well satisfied with the liberty which Goethe had taken with them. They were married on April 4, 1773, and Goethe provided the wedding ring. Notwithstanding the coolness which the publication of *Werther* produced between them, the correspondence between Goethe and Kestner continued to the end of the century. Lotte saw Goethe in Weimar in 1816, when she was 63 years old; she was still beautiful, but her head shook with palsy. She died in 1828. The second part of *Werther* represents the agony of a jealous husband. This was inspired by Bretano, an Italian merchant resident in Leipsic, a widower with five children, who had married Maximiliane, the daughter of Sophie la Roche. Goethe loved her as an elder brother, but her husband scarcely approved of the intimacy. Merck tells us that his ideas went very little beyond his business, and that it was dispiriting to have to look for his young girl friend among barrels of herrings and piles of cheeses. "Goethe," he says, "much consoles her for the smell of oil and cheese, and for her husband's manners." *Götz* and *Werther* formed the solid foundation of Goethe's fame. They were read from one end of Germany to the other. It is difficult to imagine that the same man can have produced both works, so different are they in matter and in style. *Werther* represents the languid sentimentalism, the passionate despair, which possessed an age vexed by evils which nothing but the knife could cure, and tortured by the presence of a high ideal which revealed to it at once the depth of its misery and the hopelessness of a better lot. *Götz* was the first manly appeal to the chivalry of German spirit, which, caught up by other voices, sounded throughout the fatherland like the call of a warder's trumpet, till it produced a national courage founded on the recollection of an illustrious past, which overthrew the might of the conqueror at the moment when he seemed about to dominate the world. *Werther* is the echo of Rousseau, the lamentation of a suffering world; *Götz* is the prototype of Stein, the corner stone of a renovated empire. *Götz*, in its short, sharp dialogue, recalls the pregnant terseness of mediæval German before it was spoilt by the imitators of Ciceronian Latinity. *Werther*, as soft and melodious as Plato, was the first revelation to the world of that marvellous style which, in the hands of a master, compels a language which is as rich as Greek to be also as musical.

These two great works were not the only occupations of Goethe at this time. In Wetzlar he had translated Goldsmith's *Deserted Village*, and had written a number of small poems addressed to Lotte. The spring of 1773, which witnessed the publication of *Götz*, saw him actively employed as an advocate. His relations with his father became easier. His literary success brought him a number of friends,—the young Counts Stollberg, and Von Schönborn, a friend of Klopstock's. He also began to correspond with Lavater the physiognomist and with Klopstock himself. To the latter half of this year are to be referred a number of satirical poems, aimed at prevailing follies of the time, clever and amusing, but of little permanent value. In *Peter Brey* he satirized the meddler Leuchsenring, who, with soft tread and lamblike manners, interfered with the family relations of Herder. *Satyros* is directed against the prophets of the school of nature, who bid us return to nature without remembering how coarse and repellent some aspects of nature are. Bahrdt had translated the Bible into modern cultivated German; Goethe wrote a prologue to this newest of divine revelations, in which the four evangelists appear each with his attendant animal. Of yet another kind is the *Fair of Plundersweilern*, in which the hucksters and booth-keepers represent the motley variety of human life and the characteristics of modern littérateurs. It is a foretaste of the second part of *Faust*. *Harlequin's Marriage* is only preserved in fragments; it was perhaps too coarse and personal to be published. The most important of these writings is *Gods, Heroes, and Wieland*, a dialogue in the style of Lucian written at a sitting over a bottle of Burgundy, in which Alcestis, Mercury, Hercules, Euripides, and other ancient worthies appear to Wieland in all their original greatness, and upbraid him with the mean and paltry representation of them which he had given to the world. Wieland was the apostle of an emasculated antiquity. Goethe would make the gods speak in their own large utterance if they spoke at all. Wieland revenged himself by recommending the satire in his paper, the *Deutsche Merkur*, as a delicate piece of persiflage worthy of the study of his readers. In November Goethe's sister Cornelia was married to Schlosser and left Strasburg. Goethe felt the loss deeply. She lived but a short time. Her married life was tortured with perpetual suffering, and she died in 1777.

The beginning of 1774 is marked by a new passion and a new work. Crespel had invented a plan for enlivening their social meetings; each man was to draw lots for a partner, and for the time to consider her as his wife. Three times Goethe drew the name of Anna Sibylla Münch, a pleasant girl of sixteen, daughter of a merchant. One of the favourite topics of the day was the trial of Beaumarchais, which ended on February 16, 1774. Immediately afterwards his *Mémoires* or pleadings were published, and from the fourth of these the play of *Clavigo* was arranged. It represents a young writer of ambition deserting the woman to whom he is engaged and breaking her heart. The fifth act, in which Clavigo kills himself, is Goethe's own. The real Clavigo died, a distinguished man of letters, in 1806. The piece was written in eight days, and published on June 1. It had a great success, and still keeps the stage. But Goethe's best friends were disappointed with it. Merck told him not to write such trash, as others could do that as well. In reality there is no period of Goethe's life in which his literary activity was so prodigious, or when he was more fully occupied with literary plans which had reference to the deepest problems of human nature. To this time belong the conceptions of *Cæsar*, *Faust*, *Mahomet*, the *Wandering Jew*, and *Prometheus*. The first was soon given up; of the second the first monologue, the dialogue between Faust and Mephistopheles, and part of the scenes with Gretchen, were now written. He has told us in his *Autobiography* what he intended to make of *Mahomet*. In five acts he was to show us how the purity of prophetic zeal is recognized by love, rejected by envy, sullied by human weakness, spiritualized by death. To write this drama he had studied the Koran through and through; only a few fragments were completed. Of the *Wandering Jew* very little remains to us. The design, conceived in Italy, of making a great work on the subject was never carried out. The *Prometheus* was completed in two acts. The monologue of *Prometheus* included in the *Lyrical Poems*, was written at the same time; but it is doubtful whether it was intended to form part of the drama. These works are to be referred to the study of the ethics of Spinoza, for whom he now began to feel a deep reverence, which continued throughout his life. The calm repose of Spinoza's mind spread over his own like a breath of peace; his systematic and well-ordered reasoning was the best antidote to Goethe's passionate waywardness. Goethe now acquired a wider view of all the relations of the moral and natural world; he felt that he had never seen the world so clearly. His time at Frankfort was also largely occupied with art. His room was covered with the works of his pencil, and a number of poems on the subject of the artist's life arose from the same influence.

The summer of 1774 was spent in a journey to the Rhine. On July 12 Basedow, the educational reformer, came to Frankfort; three days afterwards Goethe went with him to Ems, where he found Lavater, who had been with him in the previous month. The three went down the Lahn together, and reached Coblentz on July 18. Here the famous dinner took place at which Lavater explained the secrets of the Apocalypse to a clergyman, Basedow demonstrated the uselessness of baptism to a dancing master, while Goethe, the worldling between the two prophets, made the best of his time with the fish and the chicken. They then went down the Rhine to Elberfeld, where Goethe found his old Strasburg friend Jung-Stilling, and back to Pempelfort, near Düsseldorf, the house of Fritz Jacobi, where Goethe also met Jacobi's wife Betty, his sister Charlotte, his aunt Johanna Fahlmer, and his friend W. Heinse. Their letters are full of the effect which he produced upon them. Heinse says—"I know of no man in the whole history of learning who, at such an age, was so completely full of original genius." Jacobi writes—"Goethe is the man whom my heart required; my character will now gain its proper stability; the man is complete from head to foot." Again he says that you could not be an hour with him, without seeing that it would be ridiculous to suppose that he could think or act otherwise than he really thinks and acts. No change could make him fairer or better; his nature has followed its own development, as the growth of a seed, or of a flower on a tree. Nor were these impressions evanescent. Forty years afterwards he writes of these times —"What hours! what days! I seemed to have a new soul. From that moment forth I would never leave you."

Goethe returned to Frankfort at the beginning of August. The autumn brought new friends, drawn to him by the fame of the newly published *Werther*. Among these was Klopstock, twenty-five years older than Goethe, and author of the *Messiah*, the acknowledged head of German poets. On December 11 Goethe was surprised by the visit of a stranger, whom he at first took for Fr. Jacobi. It was Karl Ludwig von Knebel, who was travelling with the two young princes of Saxe-Weimar, the reigning duke Karl August, then just seventeen, and his younger brother Constantine. They were on their way to France with their tutor, Count Görz, and they could not pass through Frankfort without making the acquaintance of the new genius who had risen upon their country. Goethe went to see them, was warmly received, and talked with them about the condition and prospects of Germany. This meeting decided the future course of Goethe's life. Knebel thought Goethe "the best of men, the most lovable of mankind." The princes invited him to visit them at Mainz, where they would stay longer than at Frankfort. The visit lasted from December 13 to 15, when they went on to Carlsruhe, where the duke was to meet his intended bride. Goethe took the opportunity of reconciling himself with Wieland, who lived in Weimar. On his return he found Fräulein von Klettenberg dead. "My Klettenberg is dead," he writes, "before I had an idea that she was dangerously ill. Dead and buried in my absence! She who was so dear, so much to me." Frederike was lost to him, Charlotte, Maximiliane, and his sister married. Some attachment was a necessity of his nature. He now came under the influence of Lili Schönemann, the daughter of a rich banker, whose father was dead, but whose mother conducted the business, and held one of the most brilliant salons in Frankfort. This passion seemed to be of a more lasting nature than the others. Goethe was drawn into the whirl of society. He is described as moving in brilliantly-lighted rooms, in a gold-laced coat, passing from party to concert, from concert to ball, held captive by a fair-haired girl with a pair of bright eyes. Such was Goethe in the carnival time. To Lili's influence we owe several of his smaller poems, *Neue Liebe neues Leben*, *Herz mein Herz was soll das geben*, *Heidenröslein*, and two little vaudevilles, *Erwin und Elmire* and *Claudine von Villa Bella*. The first contains some pretty songs, notably "*Das Veilchen*," set to music by Mozart. It is founded on the ballad of "Edwin and Angelina" in the *Vicar of Wakefield*. The latter half belongs to an earlier period, and is complete in itself. *Claudine von Villa Bella* has one good character, the prodigal son Crugantino; and the ballad which is sung at the crisis of the plot was written during the Rhine journey with Jacobi. To this period also belongs *Stella*, a comedy for lovers, a strange, wild play, full of extravagant passion. The weak-minded hero Fernando marries two wives one after the other. They meet together in an inn, and he is reduced to extremity of misery. He loves them both, and they both love him. Finally, the first wife Stella surrenders her rights, and they agree all to live together. The play in this form suggested to Canning the parody of the *Rovers, or the Double Arrangement*. In 1806 Goethe altered the close by making Fernando shoot himself and Stella take poison. It is seldom performed, but Stella is a fine character for a great actress. It is said to be founded on an occurrence in the Jacobi family.

Neither family approved of the engagement between the youthful couple. Goethe's parents thought Lili too much of a fine lady; they had a suspicion, which was well founded, that her wealth had no very sure foundation. Frau Schönemann did not think that Goethe, with all his genius, would make a good husband for her child. Cornelia Schlosser was strongly opposed to the match. Goethe tore himself away, and went for a tour in Switzerland. His companions were the brothers Stolberg, noisy, wild young noblemen, who in May had stayed at Goethe's house. They gave Goethe's mother the name of Frau Aya, which she ever afterwards retained. On his journey Goethe visited the duke of Saxe-Weimar and his betrothed at Carlsruhe, his sister at Emmendingen, Lavater at Zurich. He bore with him the constant memory of Lili; he wore a golden heart which she had given him round his neck. He climbed the St Gotthard on her birthday, and looked with longing eyes to the promised land of Italy. But a stronger power drew him home again, and he returned. At Strasburg he met his old friends, and saw Zimmermann, the writer on solitude. He showed him a profile of Frau von Stein who lived at Weimar, with which Goethe was enchanted.

He returned to Frankfort on July 20. August was spent delightfully with Lili at Offenbach; his letters speak of nothing but her. September and the fair-time at Frankfort brought back his troubles. His position is described in the poem *Lili's Park*. He is the half-tamed bear who is held by magic bands amongst the birds and the fish, and yet sees a door left a little open for escape, and swears that he has the power to pass it. During this last period of his passion he translated part of the Song of Solomon. He wrote some scenes in *Faust*—the walk in the garden, the first conversation with Mephistopheles, the interview with the scholar, the scene in Auerbach's cellar. *Egmont* was also begun under the stimulus of the American Rebellion. A way of escaping from his embarrassments was unexpectedly opened to him. The duke of Weimar passed through Frankfort both before and after his marriage, which took place on October 3. He invited Goethe to stay at Weimar, and it was arranged that one of the duke's household, who was expected every day with a new carriage, should bring him with him. He took leave of everyone, including Lili. But the carriage did not come; a second leave-taking was impossible. He remained all day in the house working at *Egmont*, going out only at night. Once he stood by Lili's window, heard her sing his songs, and saw her shadow on the curtain. He could not linger longer in the town. He started for Heidelberg hoping to meet the carriage, determined if it did not come to go on to Italy. He was summoned hastily back by a messenger, found the carriage at Frankfort, and entered Weimar in the early morning of November 7, 1775. It was not for his happiness or for Lili's that they should have married. She afterwards thanked him deeply for the firmness with which he overcame a temptation to which she would have yielded.

At this time the smaller German courts were beginning to take an interest in German literature. Before the Seven Years' War the whole of German culture had been French. Even now German writers found but scant acceptance at Berlin or Vienna. The princes of the smaller states, shut out from the great world of politics, surrounded themselves with literature and art, and with men who would be likely to give an interest to their lives. The duke of Brunswick had made Lessing his librarian at Wolfenbüttel, and had not objected to the publication of *Emilia Galotti*. Emmerich Joseph, the worldly elector and archbishop of Mainz, was devoted to Munich and the theatre, and made his stage one of the best in Europe. The margrave of Baden had invited Klopstock to his court, and delighted to associate with himself the author of the *Messiah*, the "poet of religion and of his country." The duke of Würtemberg paid special attention to education he promoted the views of Schubart, and founded the school in which Schiller was educated. Hanover offered a home to Zimmermann, and encouraged the development of Schlegel. Darmstadt was specially fortunate. Caroline, the wife of the landgrave, had surrounded herself with a literary circle, of which Merck was the moving spirit. She had collected and privately printed the odes of Klopstock, and her death in 1774 seemed to leave Darmstadt a desert. Her daughte

Louise, the youngest of eight children, seemed to have inherited something of her mother's qualities, veiled by a serious and retiring temper. She married on October 3, 1775, the young duke of Weimar, who was just of age. She reigned over that illustrious court respected and admired, but repelled rather than attracted by its brilliancy and eccentricity. The place which she would naturally have occupied was taken by the duchess Amalia, mother of the grand-duke. She was of the house of Brunswick, and after two years of marriage had been left a widow at nineteen with two sons. She committed their education to Count Görz, a prominent character in the history of the time. She afterwards summoned Wieland to instruct the elder, and Knebel to instruct the younger. The *Deutsche Merkur*, founded in 1773 to diminish the influence of the school of Klopstock, gave Weimar importance in the literary world. The duchess was a great lover of the stage, and the best play writers of Germany worked for Weimar. The palace and the theatre were burnt down in 1774, and the duchess had to content herself with amateurs. After her son's marriage she lived in the simple country houses which surround the capital, the lofty Ettersburg, the low-lying Tiefurt, the far-seeing height of Belvedere. Each of these was awakened to new life by the genius of Goethe. The duke, eighteen years of age, was simple in his tastes, a hater of etiquette and constraint, true, honest, and steadfast, fond of novelty and excitement, of great courage and activity; his impulses, rarely checked, led him rather to chivalrous enterprise than to undesirable excess. His brother, Prince Constantine, had perhaps more talent but less character than the grand-duke. He took but little part in the Weimar life, and died in 1793.

Upon this society Goethe, in the strength and beauty of youth, rose like a star. From the moment of his arrival he became the inseparable and indispensable companion of the grand-duke. He subdued the affections of all he met with. Wieland said that his soul was as full of him as a dewdrop of the morning sun. He was, take him all in all, the greatest, best, most noble human being that God had ever created. The first months at Weimar were spent in a wild round of pleasure. Goethe was treated as a guest. In the autumn, journeys, rides, shooting parties, in the winter, balls, masquerades, skating parties by torchlight, dancing at peasants' feasts, filled up their time. Evil reports flew about Germany; the court of Weimar had a bad name; Klopstock wrote letters of solemn advice, and forbade his young friend Stolberg to accept an appointment which the duke had offered to him. We do not know, and we need not examine, how much of these reports was true. Goethe wrote to Klopstock that if Stolberg came he would find them no worse, and perhaps even better, than he had known them before. We may believe that no decencies were disregarded except the artificial restrictions of courtly etiquette. Goethe and the duke dined together and bathed together; the duke addressed his friend by the familiar *thou*. Goethe slept in his chamber, and tended him when he was ill. In the spring he had to decide whether he would go or stay. In April the duke gave him the little garden by the side of the Ilm, with its lofty roof, in which he lived for the next eight years. In June he invested him with the title, so important to Germans, of geheim-legationsrath, with a seat and voice in the privy council, and an income of £180 a year. By accepting this he was bound to Weimar for ever. We may here mention the different grades of service through which Goethe passed. In January 1779 he undertook the commission of war; on September 5, 1779, he became geheim-rath; in September 1781 he received an addition to his salary of £30. This was afterwards raised by £60 more, and in 1816 he received £450, with an additional allowance for the expense of a carriage. In April 1782 he was ennobled by the emperor, and took for his arms a silver star in an azure field; in June of the same year he became president of the chamber *ad interim*. We know that Goethe devoted himself with industry and enthusiasm to the public business; he made himself acquainted with every part of his master's territory; he did his best to develop its resources; he opened mines and disseminated education; he threw himself with vigour into the reconstruction of the tiny army. A complete account of his labours in this field cannot be known until the secrets of the Goethe house at Weimar, now hermetically closed, are opened to the curious. We shall then probably find that Goethe cannot be fairly charged with want of patriotism, or coldness to the national interest, and that his apparent indifference to the rising of 1813 must be considered in connexion with his resistance to the encroachments of Austria at an earlier time.

Goethe's life was at no time complete without the influence of a noble-hearted woman. This he found in Charlotte von Stein, a lady of the court, wife of the master of the horse. She was thirty-three years of age, mother of seven children. His letters to her extend over a period of fifty years. Until his journey to Italy he made her acquainted with every action, every thought of his mind, all the working of his brain. He calls her by every endearing epithet—the sweet entertainment of his inmost heart, the dear unconquerable source of his happiness, the sweet dream of his life, the anodyne of his sorrows, his happiness, his gold, his magnet, whom he loves in presence and absence, sleeping and waking, from whom he can never bear to be parted. Many of Goethe's writings were from this time inspired by the necessities of the court. One group of them is formed by the succession of masks or ballets which were performed to celebrate the birthday of the grand-duchess Louise. *The Four Seasons*, *The Procession of Laplanders*, *the Nine Female Virtues*, *The Dance of the Planets*, are sufficiently explained by their names. Others were called for by the amateur theatre, which now was forced to supply the place of the regular drama. The stage was often set in the open air, the seats cut out of turf; the side scenes, of trimmed box, still exist at Belvedere and Ettersburg. The actors were the duchess-mother and her sons, the civil servants and the officers, the ladies in waiting and the pages. Goethe was very good in comic parts; in solemn tragedy, as in his own *Orestes*, he could best interpret the dignity of the ancient stage. Musæus, head-master of the public school, was set to play low comedy; Knebel represented the dignified hero. The chief professional support of the stage was Corona Schröter, whom the duke and Goethe personally carried off from Leipsic. On this visit he saw, after a long absence, Catherine Schönkopf, Oeser, and other friends of his youth. Goethe represented most of his earlier pieces on the Weimar stage. He wrote nothing of great importance for it till the first sketch of his *Iphigenie*. But several smaller pieces owe their origin to this cause. *Proserpina* and *Die Geschwister* are melodramas; *Jery und Bätely* and *Die Fischerin* are little operas composed to suit the Weimar taste. *Scherz, List, und Rache* is an imitation of the Italian style.

Besides numerous visits to the court of the Thuringian princes, sojournings at Dornberg and at Ilmenau, that retired nook of the Weimar fatherland which still attracts many a pilgrim lover of Goethe, the first ten years at Weimar were interrupted by longer journeys. One of these was the winter Harz journey in December 1777, undertaken suddenly to make the acquaintance of Plessing, a self-torturing hypochondriac, who had written to the poet for advice. With Goethe's help Plessing recovered from his melancholy, visited him at Weimar, and entertained him as professor at

Duisburg on his return from the campaign in France. A visit to Dessau inspired the improvements of the park and grounds at Weimar, which now make it so attractive. The close of 1779 was occupied by a winter journey to Switzerland, undertaken with the duke and a small retinue. Two days were spent at Frankfort with Goethe's parents. Sesenheim was visited, and left with satisfaction and contentment. At Strasburg they found Lili happily married, with a new-born child. At Emmendingen Goethe stood by his sister's grave, and saw her successor Johanna Fahlmer, Jacobi's aunt. The Swiss journey began at Basel. The chief object of it was to forward the health and education of the young duke. It was a bold plan to execute in October and November. From Bern they made the tour of the Bernese Oberland. From Geneva, by the advice of De Saussure, they visited Mont Blanc and the valley of Chamouni; they crossed the Furka, not without danger, in the middle of November, descended the St Gotthard to Lucerne, and visited Lavater at Zurich, the seal and summit of their tour. From this time Lavater lost his influence over Goethe, and in 1786 he would gladly have run away from Weimar to avoid him. In December they went by the Lake of Constance and the falls of the Rhine to Stuttgart, where, on December 14, Goethe saw Schiller for the first time. He was a student at the Academy, and in Goethe's presence received the prize.

The return to Weimar, on January 13, was the beginning of a new era. The period of genius and eccentricity was at an end; that of order and regularity succeeded. As an outward sign of the change, the duke cut off his pigtail, an example which was long without imitators. Wieland said that the Swiss winter journey was the greatest of Goethe's dramas. In the same serious mood Goethe began to write history. He chose for his subject Duke Bernhard of Saxe-Weimar, the knight-errant of the Reformation. He spent much time and trouble in collecting materials, but at length reasonably concluded that his strength lay elsewhere. At this time also he began to write *Tasso*, and adapted the *Birds* of Aristophanes to modern circumstances. His deeper thoughts were concentrated in *Wilhelm Meister*. Countess Werther, the sister of the great minister Baron von Stein, whom he visited at Neunheiligen, was transferred in living portraiture to its pages. His efforts for the development of the duke's dominion naturally led him to the study of science. The opening and direction of mines induced him to study geology; the classification of ancient forms of life led him to osteology and anatomy. Goethe was always fond of children. The young Herders and Wielands spent much time in his garden, sometimes digging for Easter eggs which had been carefully concealed. In the spring of 1783 Fritz, the son of Charlotte von Stein, then ten years old, came to live with him in his garden house. In the autumn they took a journey together in the Harz. At Ilmenau was written the touching poem of that name on the duke's birthday. Goethe reviews in it their common friendship and activity as far as it has yet gone, and a few days afterwards, as he slept in the hut on the Gickelhahn, he wrote in pencil the world-known lines in which he anticipates for himself that rest and silence which then held enchained the summits of the hills and the birds of the wood. In the following year another journey was undertaken in the Harz for the study of mineralogy. But this was only a relaxation from more serious affairs. In 1785 the Fürstenbund or league of princes was formed, under the supremacy of Frederick the Great, to resist the ambition of Austria under Joseph II. The duke of Saxe-Weimar took an important part in forming this league, and in the negotiations which preceded it. Goethe was his indispensable adviser, and must on this occasion, if not on others, have taken a keen interest in politics and in the independence of Germany.

The year 1786 marks an epoch in Goethe's life. He had now been ten years in Weimar, and he must have felt that his own inward development, and the work which he was most fitted to do in the world, were not advancing as favourably as they should. He had written little of first-rate importance. His *Lyrics* were of intense beauty and of deep meaning, but they were short and fugitive. He had brought with him from Frankfort the sketches of *Faust* and *Egmont*, but little had been done to them since. His occasional writings for the amateur theatre, or for court festivities, were not such as to add to his solid reputation in Germany. *Iphigenie* was the one great work of poetry which belongs entirely to this period, but that had not received its final form. *Tasso* was conceived, but only two acts were written, and these in prose. *Wilhelm Meister* is the most exact expression of this portion of Goethe's life; but loftily as it now towers above the level of his dramas, it did not then satisfy the author, nor was it in a state to be published. For the completion of these works Goethe required leisure and repose, impossible to obtain in the distraction and pleasures of the court. This became more apparent to him as he set himself to collect his scattered writings. Four volumes were soon completed, but the preparation of the other four convinced him how much labour many of his poems still required for perfection. Another cause of discontent was his relation to Frau von Stein. It could not have been more intimate. She was all to Goethe and more than Gretchen, Frederike, Lili, or his sister Cornelia had been. He communicated to her every thought and every action of his life. The relation was blameless, to a character like Goethe's it was natural; but it became every year more difficult and more full of danger. The ardent devotion which sat well on the impetuosity of youth was less becoming and less possible to the man of middle age. Yet the tie could not be severed without a struggle, and the wrench could not be effected without an enforced absence. To these necessities, the need of quiet for composition, and for deliberately rearranging the circumstances of his life, was added the stress of other impulses. Goethe had all his life been fascinated by the practice of art. Indeed it was not until he had discovered at Rome the limitation of his powers that he definitely renounced the hope of becoming an artist. He tried almost every branch in turn. He drew in pencil and in sepia, sketched, painted in oil, engraved on copper and wood, and etched. For these occupations he had but little leisure; at this time he attributed his slow improvement rather to want of labour than to want of power. He saw infinite possibilities of advance in a life of freedom spent under the inspiration of sunny skies, and amidst the environment of the highest art.

Of still deeper interest and importance were his scientific researches. In these he aspired to detect the secrets of nature; he succeeded in seeing, as in a vision, the great scheme of evolution applied to all phenomena of the natural and moral world, which the labours of many workers have revealed to us in our own day. He longed for time and leisure to perfect these ideas, to base them on solid fact. Goethe has not added much of positive value to the treasury of scientific truth, but he deserves the credit of having discerned the right method of inquiry when it was obscure to many, and of having thrown that glow of imagination over dry and technical inquiry, without which no great discoveries can be made. His inquiries into the nature of light belong to a later time. He began with physiognomy under the auspices of Lavater. From this he was led to the study of anatomy, and especially to the comparison of the skeletons of men and animals. In this department he made a real discovery, that the intermaxillary bone which exists in the lower animals is found in the human subject in a rudimentary state,—that it is seen distinctly in youth, but as years advance is united with the body of the skull. The discovery that the skull itself is only a development of the vertebræ of the spine was made a little later. He was led to this further step by picking up the head of a sheep on the shore of the Lido at Venice. The care of his garden cottage naturally led him to the study of plants. He soon found himself attracted to wide and comprehensive generalizations. The *Metamorphoses of Plants* was not published till 1790, but the idea which had possession of his mind was a solid contribution to the science of botany. Goethe sought to discover an original or standard flower, from which, as from a Platonic ideal type, all existing flowers were deflexions and aberrations. In this he followed an unscientific method; but he clearly saw that all the different parts of the plant, except the stem and the root, might be regarded as modifications of the leaf; that leaf, calyx, corolla, bud, pistil, and stamen were all referable to the same type; and that whether a plant produced leaves, or flowers, or fruit, depended on the differentiation of the nutrition which it received. Less fortunate were his speculations in geology, to which he devoted a very large portion of his time and thoughts. It is something that he recognized the importance and reality of that science, then in its infancy, which has had to undergo more than its due share of obloquy and distrust. But he was of necessity a follower of Werner, who based his classification of rocks rather on the minerals which they contained than upon an examination of the fossil remains of organic life. All these causes contributed together to one end. His desire to complete the great poetical works which he had begun, to disentangle his life from the complexities which had entwined themselves round it, to give a fair trial to his impulses towards art, to afford opportunity for the careful and systematic interrogation of nature, and, above all, a longing to possess his soul in peace, and solemnly to probe in silence the depths of his own being, conspired together to drive him from Weimar to the land which he had yearned after from boyhood. The resolution, slowly formed, was boldly executed. In the summer of 1785 he had visited Carlsbad for the first time, passed a pleasant month in the company of the duchess Louise, Herder, and Frau von Stein. In July 1786 he paid it a second visit. After five weeks of brilliant society, very favourable to his health, spent in revising his works for the press, he stole secretly away. The duke alone knew that he designed an absence of some duration. In the strictest incognito, in the guise of a German merchant, he drove alone to the land of the citron and the orange.

Goethe's Italian journey, the most momentous epoch in the development of his intellectual life, lasted from September 3, 1786, to June 18, 1788. Assuming the common German name of Müller, in the strictest incognito he journeyed by way of Munich, where he studied the picture gallery and the collection of antiquities; by the Lake of Garda, where he began his metrical version of the *Iphigenie*; by Verona, where he saw the first specimen of Roman building in Italy in the stupendous amphitheatre; by Vicenza, where he was attracted by the grace and harmony of the classical Palladio; by Padua, where he neglected the frescos of Giotto, but rose to a clear conception of the form of the *original plant* by the marks on the leaves of a palm in the botanical garden; to Venice, where for the first time he was able to taste the charm and richness of southern life. As he proceeded farther, Ferrara spoke to him of Tasso; Bologna showed him the great masters of the academic school who have now grown pale and dim before the predecessors of Raphael; Florence interested him a little; Assisi drew his attention, not to the triple church of Saint Francis, the unrivalled museum of religious art, but to the little ruined temple which no modern traveller would notice but for the name of Goethe; Spoleto again delighted him with the remains of ancient architecture. He reached Rome on October 28. His first stay was till February. The constant companion of his studies was the painter Tischbein, who helped him to disentangle the many difficulties of the old Rome and the new. He lived chiefly among the German artists and men of letters who frequented the Caffé Greco. Among these were Angelica Kaufmann and Moritz, who deepened his knowledge of German versification, and prepared him for the composition of *Iphigenia*. Although Goethe occupied himself chiefly with drawing, he was able to announce on June 6 that this work was finished. The second *Iphigenie*, written in verse, was the first important fruit of the Italian journey. It is in very strong contrast with *Götz von Berlichingen*. It is written in the strictest classical form. Although based on the *Iphigenia in Tauris* of Euripides, it has little in common with it. In Euripides Thoas is represented as a cruel barbarian, against whom it is justifiable to employ every artifice of fraud or violence. In Goethe the characters are ennobled by a higher principle, and the struggle between truth and falsehood is made a prominent motive of the piece. When Thoas discovers that, according to the oracle of Apollo, the return of Orestes's sister to Greece will satisfy the anger of the gods, he gives his consent, and his last words are a friendly farewell. Towards the end of February Goethe left Rome for Naples. Here he was attracted less by the remains of antiquity, even the new revelations of Herculaneum and Pompeii, than by the prospects of nature, the bay, the islands, the volcano, the thousand beauties which make the gulf unrivalled in the world, and by the multitudinous and teeming life which throngs the endless quays that line the shore. Sorrento stimulated him to the revisal of *Torquato Tasso*, but he did not complete the drama till his return from Italy. It did not appear in print till the spring of 1790. The play had a special fascination for him as a picture of his own distracted life. He could depict with feeling the struggle between the actual and the ideal, the ill-assortment of a passionate poet with the jealous and artificial environment of a court. At the end of March Goethe sailed to Sicily; rolled up in his cloak he meditated the composition of his *Tasso*. Sicily struck him, as it must strike all travellers who have studied the ancient world, as a revelation of Greece. It is, if one may say so, more Greek than Greece itself. Its mountains, streams, trees, flowers, the form of its boats and pottery, the habits of the people, the quivering smile of the bright blue sea fringed with golden sand, represent completely the Greece of the *Odyssey* and of the choruses of Euripides. Goethe was overmastered by this powerful influence. He sketched and began *Nausicaa*, the story of the *Odyssey* in dramatic form, which always remained a fragment. He returned to Rome in June. The rest of the year was spent in the city and its neighbourhood, in the serious study of drawing, for which unfortunately he had but little talent, and in the composition of *Egmont*, a work begun with the approval of his father in the early Frankfort days. It was finished in September 1787, and appeared in the Easter of the following year. Although *Egmont* still keeps the stage, it has very grave faults. It is an unfortunate mixture of the natural and ideal treatment. The licence with which the scenes are transposed in modern performance shows how much the work lacks symmetry and cohesion. Schiller criticized it severely as being untrue to history. He described the close, where all difficulties are solved by the appearance of Clärchen, as a *deus ex machina* or a *salto mortale* into the world of opera. The music of Beethoven has contributed to it a charm of art which was necessary to its completeness. Besides this, Goethe rewrote for publication his early vaudevilles of *Erwin und Elmire* and *Claudine von Villa Bella*. The carnival of 1788 was of importance to his experience. He wrote some scenes of *Faust*: especially the scene in the witches' kitchen was composed in the Borghese gardens. At the end of April he took a sad farewell of Italy, and arrived at Weimar in the middle of June.

From this time his life takes a new colour. He had learned in Italy not only new principles of art,—not only that a work of art, whatever of Gothic ornament it may possess, must be solid, firm, and simple in its construction as a Grecian temple,—but he had also learned that life itself should be a work of art. He was determined henceforth to be himself, to break the bonds which had confined him and the distractions which had confused him, to possess his soul sacred and inviolable for the purposes of his life. He was relieved of the presidency of the chamber and of the war commission, but in a manner which did him the greatest honour. His relations with Frau von Stein, which had been one reason of his leaving Weimar, began to cool. One of their last friendly meetings was in a journey to Rudolstadt, where Goethe met Schiller. Neither knew the influence which the other would have upon his life. Their relations were those of shyness, and partly even of dislike. Goethe's friendship with Frau von Stein was to receive a final blow. In the autumn of 1788, walking aimlessly through the park, he met Christiane Vulpius, a young girl who presented him with a petition in favour of her brother. She had golden curling locks, round cheeks, laughing eyes, a neatly rounded figure; she looked, as has been said, "like a young Dionysus." Goethe took her into his house, and she became his wife in conscience, and the mother of his children. He did not marry her till 1806, when the terrors of the French occupation made him anxious for the position of his eldest son. She had but little education, and he could not take her into society; but she made him a good and loving wife, and her quick mother-wit made her available as an intellectual companion. To these days of early married life belong the Roman elegies, which, although Italian and pagan in form, in colour, and in sensuality, were written in Germany from home experiences.

We must pass rapidly over the next six years, until Goethe's genius received a new impulse and direction by his friendship with Schiller. In the spring of 1790 he travelled to Venice to meet the duchess Amalia. The Venetian epigrams, still more outspoken in sensuality than the Roman, were the fruit of this journey. In the autumn of the same year he accompanied the duke to Silesia, the first of those military journeys which strike so discordant a note in the harmonious tenor of his existence. The year 1791 offered a quiet contrast to the movement of the year before. He began to take a more special interest in the university at Jena, in which his young friend Fritz von Stein had now entered as a student, and his time was more and more occupied with the study of colours, the least happy and successful of his scientific labours. In the autumn of 1791 Goethe was able to devote himself regularly to a task which had informally occupied his first years in Weimar. The new theatre was completed, and Goethe was made director of it. It was in this capacity that he was best known to the citizens of Weimar. He had the final decision on every detail of piece, scenery, and acting; in later years his seat was in a large arm-chair in the middle of the pit, and applause was scarcely permitted until he gave the signal for it. The German stage owes perhaps as much to Goethe as to Lessing. The *répertoire* of the Weimar theatre was stocked with pieces of solid merit which long held their place. Shakespeare was seriously performed, and the actors were instructed in the delivery of blank verse. Stress was laid on the excellence of the *ensemble* as against the predominance of particular stars. The theatre was considered as a school not only of elevating amusement but of national culture. Goethe wrote the *Gross Cophta* for the Weimar stage, a piece founded on the history of Cagliostro and the diamond necklace. He was fascinated by the story as a foreboding of the coming horrors of the Revolution. In these events he was destined to take a more active part than he expected. In August 1792 he accompanied the duke to the campaign in the Ardennes. Passing by Frankfort, where he visited his mother, he joined the allied armies at Longwy. He beguiled the tedious siege of Verdun by writing an account of his theory of colours in a leaky tent; and on the disastrous day of Valmy, which he recognized as the birth of a new era, he sought the thickest of the fight that he might experience the dangerous rapture of the cannon-fever. He retreated with the Prussian army, spent five weeks with his friend Jacobi at Pempelfort, and on his return to Weimar at the end of the year found that the duke had built him a spacious house in the square where the joint statues of Goethe and Schiller now stand, in eternal memory of their friendship. In 1793 he went with his master to the siege of Mainz. He continued his optical studies during the bombardment, witnessed the marching out of the garrison, and was one of the first to enter the conquered town. He received leave to withdraw, and went to his mother at Frankfort, and persuaded her to sell the old house and its contents, and to provide a more convenient home for her old age. There was some talk of her coming to Weimar. In the autumn of this year the duke left the Prussian service, and Goethe could look forward to a period of peace. He was chiefly occupied with the management of the theatre, and for this he wrote two pieces, both of which had reference to the politics of the time. The *Bürgergeneral* is a satire on the Revolution, and was long a stone of offence to Goethe's friends, who thought that he should have hailed with delight the birth of a new era. The *Aufgeregten*, left unfinished, sketched the outbreak of the Revolution in a country town, and would have declared the author's views with greater distinctness. But the feelings of scorn and contempt which he felt for the cowardice, cunning, and perfidy of mankind were expressed in a work of greater magnitude. He had good reason to deplore the misery of the time. His mother's home in Frankfort was broken up; Schlosser, his brother-in-law, had retired to Auerbach; Jacobi was flying to Holstein. Goethe took the old German epic of *Reynard the Fox*, with which he had long been familiar, and which, under the guise of animals, represents the conflicting passions of men, and rewrote it in flowing German hexameters.

Thus far he had produced but little since his return from Italy. He was now to undergo the most powerful influence which had as yet affected his life. His friendship with Schiller was now to begin, an alliance which, in the closeness of its intimacy and its deep effect on the character of both friends, has scarcely a parallel in literary history. If Schiller was not at this time at the height of his reputation, he had written many of the works which have made his name famous. He was ten years younger than Goethe. The *Räuber* plays the same part in his literary history as *Götz* plays in that of Goethe. This had been followed by *Fiesco* and *Kabale und Liebe*. The second period of Schiller's life had begun with his friendship with Körner, and his residence in Saxony. Here he wrote the *Hymn of Joy*, and completed *Don Carlos*. In 1787 he settled at Weimar. He found the place deserted, the duke in the Prussian camp, Goethe in Italy. He applied himself to history, wrote the *Revolt of the Netherlands*, and studied the literature and art of Greece. In 1789, mainly upon Goethe's recommendation, he was made professor of history at the university of Jena, although he was afraid lest the scholars should discover that they knew more history than the teacher.

He made a successful marriage, and worked seriously at his *History of the Thirty Years' War*. In 1794 Schiller had arranged with the publisher, Cotta of Augsburg, whose name is from this time indissolubly connected with the history of German literature, for the production of a new literary journal. It was to be called the *Horen*, and the most distinguished German writers were to contribute to it. Goethe accepted the invitation willingly. The work was designed to mark an epoch in German taste, and it did so. It soon had two thousand subscribers. Among those who promised to contribute were not only Matthisson, Herder, Knebel, Fritz Jacobi, and Gleim, but the brothers Humboldt, the veteran Kant, the youthful Fichte, who had just begun to lecture in Jena, and, at a later period, the brothers Schlegel. Schiller opened the first number of the journal with his letters on the "Æsthetic Education of the Human Race." Goethe contributed the "Unterhaltungen deutscher Ausgewanderten," a series of stories told by a number of German emigrants who had been driven to cross the Rhine by the invasion of the French. The most remarkable of these stories is the "Märchen," a wild and mystic tale, which has been the subject of as much controversy and of as many interpretations as the second part of *Faust*. Goethe also published in the *Horen* the "Römische Elegien," the flavour of which even Karl August found a little too strong. The first effect of Schiller's influence on Goethe was the completion of *Wilhelm Meisters Lehrjahre*. He had conceived the plan of the work twenty years before, and the first six books had been written before the Italian journey. It was now finished by the addition of two more books. It stands in the first rank of Goethe's writings. He has aimed in it to attain to perfect objectivity of tone, to represent men as they are, and to pass no judgment upon them. The hero passes with weak irresolution through a number of ordinary circumstances, apparently the sport of fortune and the plaything of chance, yet all these experiences have their definite result in the training of his character. Like the son of Kish, he goes forth to seek his father's asses and finds a kingdom. The unearthly charm of the child Mignon, the dark fate which shrouds the aged harper like the doom of Œdipus, the uncertain yearning after a happier home in brighter climes, give a deeper undertone to the prevailing lightness of the story. The style is exquisitely soft and flowing. It has the sweetness and simplicity of *Werther*, but is more mellow and more mature. The sixth book is occupied with the *Bekentnisse einer schönen Seele*, a piece of the autobiography of Goethe's early friend Fräulein von Klettenberg, altered to suit its new surroundings. The *Musen Almanach* for 1796, edited by Schiller, was enriched by some of Goethe's most exquisite poems—*Die Nahe des Geliebten*, *Meeres Stille*, and *Glückliche Fahrt*. The storm of criticism which was aroused by the *Horen*, and the little success which, after the first numbers, it met with from the public, determined the two friends to retaliate upon their aggressors. The poems of Martial contain a number of epigrams written in two lines, describing the numberless little presents or *xenia*, which it was customary for friends to exchange at Rome during the time of the Saturnalia. The name was borrowed by the two poets, and the *Xenien* was a convenient vehicle for the expression of their opinion on every subject. The newspapers of the day were the first object of attack, but they soon went farther afield. The epigrams were written in Schiller's rooms at Jena. It is impossible to fix the authorship of the *Xenien*; one conceived the idea, the other wrote the lines; one wrote the hexameter, the other the pentameter; they intended the authorship as well as the ownership of the copyright to be one and indivisible. Notwithstanding this, the collection has been broken up. There is no guarantee that the epigrams which appear in the separate works of either poet were really written by the authors to whom they are ascribed; some are reprinted in the works of both; some have remained unprinted altogether. They appeared in the *Musen Almanach* for 1797, together with the Venetian elegies mentioned above. It is needless to say that they roused the writers whom they attacked to unspeakable fury, and were the occasion of a copious literature. A more solid result of the friendship between the poets was the production of *Hermann und Dorothea*. It is a German idyll; the story is taken from the sufferings of Lutherans driven out in the early part of the 18th century from the province of Salzburg, but Goethe has given it the character of his own time. He had seen much of the suffering produced by the French Revolution, and he wished this poem to be a reflexion in a tiny mirror of the storms and convulsions of the great world. In its literary form it is a descendant of Voss's *Luise*. It was conceived at Ilmenau in August 1796, and finished in the following spring. Schiller tells us how it was composed with extraordinary ease and rapidity. During nine days Goethe produced 150 lines a day. You have only to shake the tree, as Schiller said, and ripe apples will tumble down about you. The lines thus hastily written underwent a careful revision. Contemporaneous with *Hermann und Dorothea* is the production of *Wallensteins Lager* by Schiller, which was written with the advice and assistance of his brother poet. The completion of this cycle of plays falls two years later.

The year 1797 is the year of ballads. In his garden house at Jena Schiller worked diligently at this vein, that perhaps for which he was best suited, and in which he most nearly rivals Goethe. Goethe wrote *Die Braut von Korinth*, *Gott und die Bayadere*, and *Der Zauberlehrling*; and the whole collection was published in the *Musen Almanach* for 1798. The latter half of this year was occupied with a tour in Switzerland. Before its commencement he visited his mother at Frankfort for the last time, and presented to her his wife and his son. It was a year of extraordinary activity. Besides the ballads and his researches in the morphology of plants and insects, he translated a great part of the autobiography of Benvenuto Cellini, wrote a number of essays on the question of æsthetics, and worked at his long neglected *Faust*. Of this he wrote the dedication, the "Prologue in Heaven," and the "Golden Marriage of Oberon and Titania"—so powerful was the effect of intellectual sympathy and stimulus. The six years which succeeded Goethe's return from his third Swiss tour, although they embrace the period in which he and Schiller were in daily co-operation, have left us little of permanent worth from the older poet. On the other hand, they are the years of Schiller's greatest activity. The great trilogy of *Wallenstein*, perhaps the highest point of Schiller's genius, was followed by *Maria Stuart*, the *Jungfrau von Orleans*, the *Braut von Messina*, and *Wilhelm Tell*. From the end of 1799 Schiller was permanently settled in Weimar; a dramatic school was founded, and the representation of these classical dramas was the glory of the Weimar stage. During these years Goethe was occupied with *Faust*, with his researches into the theory of colours and of biological development, with the conduct of the theatre and the practical encouragement of art. In 1798 the *Horen* died a natural death, and was succeeded by the *Propyläen*, a journal of literature and criticism, which, although it contained many essays by Goethe, never exceeded a circulation of 300. In the spring 1799 the study of Homer incited Goethe to sketch a long epic poem on the subject of Achilles. Schiller did his best to encourage the work. The first canto was rapidly completed, but it had no successor. Goethe contented himself with translating the works of others, and prepared the *Mahomet* and *Tancred* of Voltaire for the Leipsic stage. In the first days of the new century he suffered a dangerous attack of scarlatina. His friends feared for his life. Frau von Stein recalled her forgotten friendship, and showed kindness to his son. After his recovery he sketched out what was the most important work of these years, a trilogy on the subject of the French Revolution; of this only the first part, the *Natürliche Tochter*, was completed. The story was a true one of a princess of the French house of Conti. The play is written with the full beauty of Goethe's style, and some passages and effects are worthy of his highest genius. But as a whole it fails. It has the quality, which in a drama must be a fault, so characteristic of Goethe's later writing, of too great universality of treatment. The characters are not living beings but abstractions, and the language is vague and general rather than clear and defined. The play was performed at Weimar on April 2, 1803. Two masterpieces of Schiller—the *Braut von Messina* and the *Jungfrau von Orleans*—preceded and followed it by a few weeks. At the end of this year Madame de Stael arrived in Weimar accompanied by Benjamin Constant. She had heard of the fame of this new Parnassus, and she was bent on proclaiming the intellectual superiority of Germany to the world. Goethe at first fled from her, as Byron did at a later period. He hid himself in Jena, but was recalled by order of the duke. The result of the conversations in the salons of Weimar is contained in her book *De l'Allemagne*. In March she was suddenly recalled by the death of her father, the minister Necker. Goethe was at this time the centre to which the most distinguished men of all kinds in Germany naturally turned. He was most intimate with Zelter the musician, with whom he maintained a full correspondence; with Wilhelm von Humboldt, the statesman-scholar; with F. A. Wolf, the founder of the science of philology; with Gottfried Hermann, the best authority on Greek metres. But the friendship which was worth all these was soon to be severed. In the beginning of 1805 Goethe was convinced that either he or Schiller would die in that year. In January they were both seized with illness; Schiller had finished his *Phädra* and begun to work at his *Demetrius*. Goethe was translating the *Neveu de Rameau* of Diderot. Schiller was the first to recover, and visiting Goethe in his sick room, fell on his neck and kissed him with intense emotion. On April 29 they saw each other for the last time. Schiller was on his way to the theatre whither Goethe was too ill to accompany him. They parted at the door of Schiller's house. Schiller died on the evening of the 9th of May. No one dared to tell Goethe the sad news, but he saw in the faces of those who surrounded him that Schiller must be very ill. On the morrow of Schiller's death, when his wife entered his room, he said, "Is it not true that Schiller was very ill yesterday?" She began to sob. He then cried, "He is dead!" "Thou hast spoken it thyself," she answered. Once more he cried, "He is dead!" and turning aside covered his weeping eyes with his hands. He at first intended to have completed *Demetrius* as a memorial of his friend, but a happier inspiration was to arrange a performance of Schiller's great poem of *The Bell*, and to crown it by an epilogue. Since that time Schiller and Goethe have been inseparable in the minds of their countrymen, and have reigned as twin stars in the literary firmament. If Schiller does not hold the first place, it is at least true that he is more beloved, although Goethe may be more admired. It would be invidious to separate them. But it is evident that the best fruits of Schiller's muse were produced when he was most closely under Goethe's influence, and the foreign student of German culture has ground for believing that at some future time the glory of the lesser luminary will be absorbed in that of the greater, and the name of Goethe will represent alone and unrivalled the literature of his age and country.

Schiller was happy in the occasion of his death. He did not see the troubles which immediately afterwards burst upon Thuringia. On October 14, 1806, the battle of Jena was fought. The court had fled from Weimar; only the duchess Louise remained. In the evening of the defeat Weimar was plundered by the conquering troops. Many of Goethe's friends lost everything they possessed. His property and perhaps his life was saved by the firmness of Christiane, and afterwards by the billeting of Marshal Augereau in his house. On the 15th Napoleon entered the town, but Goethe did not go to see him. The duchess obtained her husband's pardon by her entreaties. It was not till the autumn of 1808 that Napoleon and Goethe, perhaps the two greatest men then living in Europe, met and conversed. It was at the congress of Erfurt, where the sovereigns and princes of Europe were assembled. Goethe's presence was commanded by the duke. He was attracted at least as much by the prospect of seeing Talma as of meeting Napoleon. He was invited to an audience on October 2; Talleyrand, Berthier, and Savary were present. The emperor sat at a large round table eating his breakfast. He beckoned Goethe to approach him, and said to him, "Vous êtes un homme!" He asked how old he was, expressed his wonder at the freshness of his appearance, said that he had read *Werther* through seven times, and made some acute remarks on the management of the plot. Then, after an interruption, he said that tragedy ought to be the school of kings and peoples; that there was no subject worthier of treatment than the death of Cæsar, which Voltaire had treated insufficiently. A great poet would have given prominence to Cæsar's plans for the regeneration of the world, and shown what a loss mankind had suffered by his murder. He invited Goethe to Paris; that was the centre of great movements; there he would find subjects worthy of his skill. They parted with mutual admiration. The bust of Napoleon was a prominent ornament in Goethe's study.

In the same year, 1808, an edition of Goethe's works in thirteen volumes was published by Cotta at Tübingen. It is remarkable as containing the first part of *Faust* in its complete form. The principal portions of the drama had already been published as a fragment in 1790. It had then attracted but little attention. Heyne wrote of it—"There are fine passages in it, but with them there are such things as only he could give to the world who takes other men to be blockheads." Wieland and Schiller were apparently dissatisfied with it. It had perhaps the appearance of patchwork, as it was made up of fragments which had been written at very different periods of his life. The idea of writing *Faust* seems to have come to Goethe in his earliest manhood. He was brooding over it at the same time with *Götz von Berlichingen*, but at Strasburg he spoke to Herder of neither. He apparently began to write it down at the same time as *Werther* in 1774, and we find mention of its progress in the two following years; indeed, all the important parts of the fragment which appeared in 1790 were known to Jacobi before 1776. He took the work with him to Italy, where he added little to it except the scene in the witches' kitchen. The dedication, the "Prologue in Heaven," which presents to the reader the idea of the whole work, the prelude on the stage copied from the Indian drama, the lyrical intermezzo, the scene with Wagner before the city gate, and the scene with Mephistopheles in the study were written before 1800. In that year he was busy with Helena for the second part, and he added nothing afterwards to the first except the "Walpurgis Night" and the scene of Valentine's death. *Faust* justly stands at the head of all Goethe's works, and it deserves a very high place among the best works of every age. Founded on a well-known popular tale, indebted for its interest and pathos to incidents of universal experience, it deals with the deepest problems which can engage the mind of man. In this combination of qualities it is perhaps superior to any one of Shakespeare's plays. The plot is as simple and as well known to the audience as the plot of a Greek tragedy. The innocence and the fall of Gretchen appeal to every heart; the inward struggles of Faust, like those of Hamlet, and the antagonism of the sensual and moral principles, interest the reader just in proportion as his own mind and nature have been similarly stirred. Each line is made to stand for eternity; not a word is thrown away; the poem has entered as a whole into the mind and thought of modern Germany; nearly every expression has become a household word. Characters are sketched in a single scene; Valentine lives for us as clearly as Faust himself Deeper meanings are opened up at every reading, and the next age will discover much in it which is concealed from this. Goethe, writing of *Faust* in his eightieth year, says with truth, "The commendation which the poem has received far and near may be perhaps owing to this quality, that it permanently preserves the period of development of a human soul which is tormented by all that afflicts mankind, shaken also by all that disturbs it, repelled by all that it finds repellent, and made happy by all that it desires. The author is at present far removed from such conditions; the world likewise has to some extent other struggles to undergo; nevertheless the state of man, in joy and sorrow, remains very much the same, and the latest born will still find cause to acquaint himself with what has been enjoyed and suffered before him in order to adapt himself to that which awaits him."

In 1809 he finished *Die Wahlverwandtschaften* (The Elective Affinities), a story which is always cited to prove the immoral tendency of his works. A married couple, Edward and Charlotte, are thrown into constant companionship with two unmarried persons, the Captain and Ottilie. A cross attraction takes place similar to that which is often seen in chemical experiments. Edward unites himself with Ottilie, Charlotte with the Captain. The psychological changes by which this result is produced are portrayed with a masterly hand. The moral may be held by some to exalt the preponderance of fatality in human affairs, and the uselessness of contending against irresistible circumstances. Others may believe that the story is intended to show the disastrous calamities which may be wrought by a weak and self-indulgent will. Ottilie, though she cannot resist her passion, has strength enough to starve herself to death; Edward is the prototype of Arthur Donnithorne and Tito Melema. The work is replete with earnest purpose and terrible warning.

In 1810 Goethe finished the printing of his *Farbenlehre* (Theory of Colours), a work which had occupied his mind ever since his journey to Italy. His theories were rejected and disregarded by his contemporaries, but he left them with confidence to the judgment of posterity. Goethe's labours in this domain fall into two natural divisions—one in which he tries to prove that the hypotheses of Newton are unsatisfactory, and another in which he promulgates a theory of his own. In his first work, published in 1791 and 1792, he describes with great accuracy and liveliness the experiments which he has made. They consist chiefly of the appearances presented by white discs on a black ground, black discs on a white ground, and coloured discs on a black or white ground when seen through a prism. There are two points which he considers fatal to Newton's theory,—that the centre of a broad white surface remains white when seen through a prism, and that even a black streak on a white ground can be entirely decomposed into colours. The scientific friends to whom he communicated these observations assured him that there was nothing in them opposed to Newton's theory,—that they were even confirmations of it. He would not be convinced, and took no pains to acquire that exact knowledge of mathematics and geometrical reasoning without which the more abstruse problems of physical optics could not be intelligible. He went on further to formulate a theory of his own. His views on the subject are contained in their shortest form in a letter addressed to Jacobi from the camp at Marienburg in July 1793. They are divided into six heads, of which the following is an abstract. (1.) Light is the simplest matter we have knowledge of, the least capable of analysis, the most homogeneous. It is not a compound body. (2.) Least of all is it compounded of coloured lights. Every coloured light is darker than colourless light. Brightness cannot be compounded of darkness. (3.) Inflexion, refraction, reflexion, are three conditions under which we often observe apparent colours, but they are rather occasions for their appearance than the cause of it. (4.) There are only two pure colours, blue and yellow; red may be regarded as a property of both of them. There are two mixed colours, green and purple; the rest are gradations of these colours, and are not pure. (5.) Colourless light cannot be produced out of coloured lights, nor white from coloured pigments. (6.) The colours which appear to us arise solely out of a modification of the light. The colours are excited in the light, not developed out of the light. These views he afterwards extended and explained, but very slightly modified. In Goethe's opinion, yellow was light seen through a thickened medium; blue was darkness seen through an illuminated medium; all other colours were derived from these two. The theory of the *Farbenlehre* has not yet received the recognition which Goethe anticipated for it. In his own day he had some adherents,—the most distinguished perhaps was the philosopher Hegel, whose views, however, of natural philosophy have caused many inquirers to recoil from his theory of metaphysics. Goethe complained that no physicist believed in him, and as that is still true in an age which has been devoted more than any other to physical inquiries, we may conclude that the principle upon which his theories are based is radically wrong.

The year 1809, in which *Die Wahlverwandtschaften* was written, was for Goethe the beginning of a new era. He was then fresher and brighter than he had been for ten years before. He had lived through a troubled period of oppressive sorrow. The death of Schiller, the violation of his beloved Weimar, the deaths of the duchess Amalia and of his mother, his own bodily and mental sufferings, had given a tone of sadness to his poetry. As if to put the finishing stroke to the efforts of his life, he married the mother of his children, arranged and published his collected works, and completed his theory of colours. The unfinished drama of *Pandora* is a symbol of this time. The part which is completed refers only to past experiences of sadness; the continuation was to have lifted the curtain of future hope.

It was natural at the beginning of a new course of life that Goethe should write an account of his past existence. The study of his collected poems made it apparent to him how necessary it was to furnish a key by which they might be understood. These various causes led to the composition of *Dichtung und Wahrheit* (Poetry and Truth), an autobiographical history of the poet's life from his birth till his settlement at Weimar. This work is the cause of much embarrassment to the poet's biographers. Where it ought to be the most trustworthy source of information, it is most misleading. It is probable that Goethe intended it to be an accurate and circumstantial account of his life. But the inner life of an individual is more clear to him than the outer. The stages of our self-development are better remembered than the exact circumstances which produced them, still less than the order of time in which they followed each other. Goethe took pains to ascertain facts which he had forgotten. But he was so conscious that imagination would play a large part in the composition that in the title he gave poetry the precedence before truth. The indefatigable industry of German investigation has laid open before us every detail of the poet's life and every phase of his feeling. *Dichtung und Wahrheit*, if it has lost its rank as a history, still keeps its place as a classic. The simple loving delineation of the childhood of genius is as fresh as ever, and is of more universal interest from being less particular. The first five books of this autobiography appeared in 1811, the next five in 1812, the third instalment at Easter 1814, and the conclusion after Goethe's death. The period during which this was his principal work witnessed the greatest political event of the first half of our century, the rising of the German people against the power of Napoleon. In this Goethe took no share, and with it he apparently felt little sympathy. He made no impassioned orations to his countrymen like Fichte; he wrote no inspiring lays like Körner. The ballads which he composed in 1813 are harmless enough,—*Der wandelnde Glocke*, *Der getreue Eckhart*, *Der Todtentanz*. He saw Stein and Arndt at Dresden in 1813, but disappointed them by his impassive manner. He said to Körner's father at the same time, "Yes, shake your chains! The man is too great for you. You will not break them, but only drive them deeper into your flesh." The reasons for this apparent coldness are perhaps more simple than they appear at first sight. Goethe was a man of thought rather than of action. Although a fair portion of his long life was given to the practical business of his adopted country, his heart was always in speculation or artistic production. While inspecting mines he was spinning theories of geological formation; while working for the war commission he gladly ran away to the castle of Dornburg to bury himself amongst his deserted papers. The pressure of court business at Weimar drove him to the solitude of Italy. In the defiles of the Argonne, and in the trenches before Mainz, he was scheming and arranging his theory of colours. A bombardment was valued by him less as an attack upon the enemy than as a series of interesting experiments in optics. Added to this natural indifference to the details of human affairs was his belief in the predominance of force, and in the necessary evolution of the history of the world. Napoleon was to him the greatest living depository of power. Nations, whether conquered or victorious, separated or united, obeyed a common law against which individual will strove in vain. Goethe was thus incapacitated for politics, both by his qualities and his defects. This habit of abstract contemplation grew upon him in later life. Those who condemn him on this ground should remember that he hailed in no grudging spirit the formation of a united Germany, and that his works have been the most potent agency in making all Germans feel that they are one. Few would wish to exchange the self-conflict of *Faust*, or even the wayward wanderings of *Meister*, for the hectic extravagance of Körner or the unsubstantial rhetoric of Posa.

It was hardly to be expected that at the age of sixty-five Goethe should strike out new lines of poetical activity. However, in the *West-östliche Divan*, he made the first attempt to transplant Eastern poetry to a German soil, and set an example which has been followed by Heine and Mirza Schaffy. In 1811 he first became acquainted with the works of Hafiz in Hammer's translation. At a time when North and South and West were splitting in sunder, when thrones were breaking up and empires trembling, he sought a willing refuge in the restoring fountain of the Eastern poet. The book *Timur* has an obvious reference to the expedition of Napoleon in Russia, but the large majority of the poems are amatory, and are addressed to an imaginary Suleika, whose name is given to one of the books. Once more in his old age Goethe came under the sovereignty of a woman. She was Marianne von Willemer, the newly married wife of a Frankfort banker, Jacob von Willemer, who was an old friend of Goethe's and of his brother-in-law Schlosser. Goethe made her acquaintance in a journey which he took in the Rhine country with Sulpiz Boiserée, who had succeeded in interesting Goethe in early German art, a subject to which he was himself devoted. The correspondence between Goethe and Marianne was published in 1877. It extends almost to the day of his death, and includes letters from Eckermann giving an account of his last moments. Not only were most of the *Divan* poems addressed to Suleika, but several of those included in the collection are by Marianne herself, and will bear comparison with those of Goethe. In these poems the Oriental form is not very strictly observed. The fondness of the Orientals for the repetition of single rhymes is not attended to, and if sometimes remembered is soon forgotten. Their Eastern colour depends rather on the suggestion of Eastern scenery and the introduction of Eastern names. This, however, gives the poet a greater licence to levity, to fatalism, and to passion than would have been possible in poems of a purely German character.

The last twelve years of Goethe's life, when he had passed his seventieth birthday, were occupied by his criticisms on the literature of foreign countries, by the *Wanderjahre*, and the second part of *Faust*. He was the literary dictator of Germany and of Europe. He took but little interest in the direction in which the younger German school was moving, and was driven to turn his eyes abroad. He conceived an intense admiration for Byron, which was increased by his early death. Byron appears as Euphorion in the second part of *Faust*. He also recognized the greatness of Scott, and was one of the first to send a greeting to the Italian Mazzini. He conceived the idea of a world-literature transcending the narrow limits of race and country, which should unite all nations in harmony of feeling and aspiration. German writers claim that his design has been realized, and the literature of every age and country can be studied in a tongue which Goethe had made rich, flexible, and serviceable for the purpose. The *Wanderjahre*, although it contains some of Goethe's most beautiful conceptions, The Flight into Egypt, The Description of the Pedagogic Province, The Parable of the Three Reverences, is yet an ill-assorted collection of all kinds of writings, old and new. Its author never succeeded in giving it form or coherency, and his later style, beautiful as it is, becomes in these years vague and abstract. Still without this work we should not be acquainted with the full richness and power of his mind.

The second part of *Faust* has been a battlefield of controversy since its publication, and demands fuller attention. Its fate may be compared with that of the latest works of Beethoven. For a long time it was regarded as impossible to understand, and as not worth understanding, the production of a great artist whose faculties had been impaired by age. By degrees it has, by careful labour, become intelligible to us, and the conviction is growing that it is the deepest and most important work of the author's life. Its composition cannot be called an after-thought. There is no doubt that the poet finished at the age of eighty the plan which he had conceived sixty years before. The work in its entirety may be described as the first part of *Faust* "writ large." This is a picture of the macrocosm of society as that was of the microcosm of the individual. The parallelism between the two dramas is not perfect, but it reveals itself more and more clearly to a patient study. Some points of this similarity have been well expressed by Rosenkranz (quoted by Bayard Taylor) :—"Both parts are symmetrical in their structure. The first moves with deliberate swiftness from heaven through the world to hell; the second returns therefrom through the world to heaven. Between the two lies the emancipation of Faust from the torment of his conscious guilt, lies his Lethe, his assimilation of the past. In regard to substance, the first part begins religiously, becomes metaphysical, and terminates ethically; the second part begins ethically, becomes æsthetic, and terminates religiously. In one, love and knowledge are confronted with each other; in the other, practical activity and art, the ideal of the beautiful. In regard to form, the first part advances from the hymnal shout to monologue and dialogue; the second part from monologue and dialogue to the dithyrambic, closing with the hymn, which here glorifies not alone the Lord and His uncomprehended lofty works, but the human in the process of its union with the divine, through redemption and atonement." The first act, with its varied scenes of country, castle, garden, galleries, and halls, answers to the two prologues of the first part; the second act introduces us again to Faust's study and his familiar Wagner. The classical Walpurgis Night has its prototype in the first part. The third act is devoted to Helena, who is the heroine of the second part as Gretchen is of the first. The marriage of Faust and Helena typifies the union of the classical and romantic schools, and their child is Euphorion, who is symbolical of Byron. In the fourth act Faust is raised instead of being degraded by his union with Helena. He wishes for a sphere of beneficent activity, and obtains it by war. The fifth act is devoted to the complete regeneration of the soul of Faust. Even the sight of all that he has accomplished does not satisfy him. It is not until he is blind to outward objects that one moment of divine rapture reveals to him the continuance of his work in coming generations, and convinces him that he has not lived in vain. In this one moment of supreme happiness he dies. The struggle for the possession of Faust's soul, indicated in the first part, is fully elaborated in the second. Mephistopheles is shown to have worked out the good in spite of himself, and Margaret appears transfigured as the revelation to man of the divine love.

With the completion of Faust, Goethe felt that the work of his life was accomplished. He still continued to work with regularity. He ordered and arranged his writings, he laboured at his *Tages- und Jahresheften*, an autobiographical journal of his life. He bated not one jot of heart or hope, and took the liveliest interest in every movement of literature and science. When the news of the July Revolution of 1830 reached Weimar, Goethe was excited beyond his wont, not on account of the triumph of liberal principles, but because the controversy between Cuvier and Geoffrey St Hilaire had been decided in favour of the latter. Still he had much to darken his latter days. His old friends were falling fast around him. His wife had died, in 1816, after a union of thirty years. He felt her loss bitterly. The duchess Amalia had died eight years before, not long after the death of his own mother. He now had to undergo bitterer experiences when he was less able to bear them. Frau von Stein, with whom he had renewed his friendship if not his love, died in January 1827; and in June 1828 he lost the companion of his youth, the grand-duke Karl August, who died suddenly, away from Weimar, on his return from a journey. Goethe received the news with outward calmness, but said forebodingly, "Now it is all over," and went to mourn and labour at the castle of Dornburg, where everything reminded him of the days of their early friendship. The duchess Louise survived her husband till February 1830. When Goethe died in 1832 none of the old Weimar set were left except Knebel, who lived two years longer. A greater blow than these was the death of his only son, whom, in spite of his moral weakness, his father deeply loved. He died at Rome in October 1830, and is buried close by the pyramid of Caius Cestius, where Goethe himself once desired to be laid. We have a full account of the last nine years of Goethe's life from the writings of Eckermann, who became his secretary in 1823, lived with him till his death, and has noted down his conversations and his habits with the minuteness and fidelity of a Boswell.

We must pass on to the closing scene. On Thursday, March 15, 1832, he spent his last cheerful and happy day. He was visited by the grand-duchess and other friends. He awoke the next morning with a chill. From this he gradually recovered, and on Monday was so much better that he designed to begin his regular work on the next day. But in the middle of the night he woke up with a deathly coldness, which extended from his hands over his body, and which it took many hours to subdue. It then appeared that the lungs were attacked, and that there was no hope of his recovery. Goethe did not anticipate death. He sat fully clothed in his arm-chair, made attempts to reach his study, spoke confidently of his recovery, and of the walks he would take in the fine April days. His daughter-in-law Ottilie tended him faithfully. On the morning of the 22d his strength gradually left him. He sat slumbering in his arm-chair holding Ottilie's hand. Her name was constantly on his lips. His mind occasionally wandered, at one time to his beloved Schiller, at another to a fair female head with black curls, some passion of his youth. His last words were an order to his servant to open the second shutter to let in more light. After this he traced with his forefinger letters in the air. At half-past eleven in the day he drew himself, without any sign of pain, into the left corner of his arm-chair, and went so peacefully to sleep that it was long before the watchers knew that his spirit was really gone. He is buried in the grand-ducal vault, where the bones of Schiller are also laid.

Goethe differs from all other great writers, except perhaps Milton, in this respect, that his works cannot be understood without a knowledge of his life, and that his life is in itself a work of art, greater than any work which it created. This renders a long and circumstantial biography a necessity to all who would study the poet seriously. At the same time he is so great that we are even now scarcely sufficiently removed from him to be able to form a correct judgment of his place in literary history. He is not only the greatest poet of Germany; he is one of the greatest poets of all ages. Posterity must decide his exact precedence in that small and chosen company which contains the names of Homer, Dante, and Shakespeare. He was the apostle of self-culture. Always striving after objective truth, and sometimes attaining to it, he exhibited to the world every phase of his plastic mind in turn, and taught both by precept and example the husbandry of the soul. The charge of selfishness so often brought against him cannot be maintained. His nature responded to every influence of passing emotion. Like a delicate harp, it was silent if not touched, and yet gave its music to every wooing of the wilful wind. The charge of unsympathetic coldness roused the deep indignation of those who knew him best. He learned by sad experience that the lesson of life is to renounce. Rather than cavil at his statuesque repose, we should learn to admire the self-conflict and self-command which moulded the exuberance of his impulsive nature into monumental symmetry and proportion. His autobiography has done him wrong. It is the story not of his life, but of his recollections. He needs no defence, nothing but sympathetic study. As Homer concentrated in himself the spirit of antiquity, Dante of the Middle Ages, and Shakespeare of the Renaissance, so Goethe is the representative of the modern spirit, the prophet of mankind under new circumstances and new conditions, the appointed teacher of ages yet unborn.

Bibliography.—A complete bibliography of Goethe literature would fill a very large space. We must content ourselves with an indication of the principal sources from which a knowledge of his life may be derived. The most important source of all is his own works. The *Dichtung und Wahrheit*, the *Italienische Reise*, the *Campagne am Rhein*, and the *Tages- und Jahresheften* have an especial autobiographical value. Next to these come the poems, and lastly the letters. Many of these are lost for ever, many remain unpublished. For the first period of his life *Der Junge Goethe*, in three volumes, published by Hirzel, with an introduction by Michael Bernays, is indispensable. It contains his letters and poems in chronological order. A commentary on this work by Wilhelm Scherer, entitled *Aus Goethes Frühzeit* was published in 1879. Otto Jahn published *Goethes Briefe an seiner Leipziger Freunde*. Schöll and A. Hober have collected the letters of the Strasburg period. Goethe's correspondence with Schiller and with Zelter was published during his lifetime. Besides these we have his letters to Herder, Merck, Kestner and Lotte, Lavater, Knebel, Countess Stolberg, Jacobi, Karl August, and Frau von Stein. Lately have appeared his letters to Marianne von Willemer, and some of those addressed to J. G. Schlosser. We are without his letters to Behrisch, Lerse, and Zimmermann; and we have only a few of those addressed to Horn and Sophie La Roche. Goethe's real letters to Bettina von Arnim are in the main unpublished; those which bear the name have been largely falsified, but have a substratum of truth. We have also a few volumes of Goethe's scientific correspondence, published by his descendants. Help to the understanding of his poetry is given by the letters of Wieland, Caroline Flachsland, and his Weimar friends. The letters addressed to him by Frau von Stein exist, but have not been made public. The first life of Goethe was published by Döring in 1828, of which a second enlarged edition appeared after the poet's death in 1833. Then followed Viehoff in 4 volumes, 1847–1853. The best life of Goethe is that of Schäfer, which appeared first in 1851, and the third edition of which dates from 1877. It is contained in two volumes of moderate size, and is written with scarcely a superfluous word. The account of Goethe and Schiller by Karl Goedeke in his *Grundriss der Deutschen Dichtung* is admirable, and so is the little book *Goethes Leben und Schriften*, published by him in 1874 The life of Goethe has been popularized in England by G. H. Lewes, in a work which is as much read in German as in English. A complete biography of Goethe cannot be written until the archives of the Goethe Haus at Weimar are thrown open for consultation. The knowledge of Goethe's works in England is due as much as anything else to the writings of Thomas Carlyle. The commentaries on Goethe's works are endless in number. The most active labourer in this field has been H. Düntze, who has left no side of Goethe's activity and no period of his life unexplored. We must also mention the brilliant lectures on Goethe by Hermann Grimm (Berlin, 1877), and the excellent sketch of his life and works published by W. Hayward in 1878. The following works deserve particular mention:—

Aus Goethes Knabenzeit 1757-59, *Mittheilungen aus einem Originalmanuscript der Frankfurter Stadtbibliothek*, erläutert und herausgegeben von Dr H. Weismann, Frankfurt, 1846; *Briefe an J. H. Merck von Goethe, Herder, Wieland, und andern bedeutenden Zeitgenossen*, hrsg. von K. Wagner, Darmstadt, 1835; *Briefe aus dem Freundeskreise von Goethe, Herder, Höpfner, und Merck*, hrsg. von Dr K. Wagner, Leipsic, 1847; *Briefe Goethes an Frau von Stein aus den Jahren* 1776–1826, hrsg. durch A. Schöll, 3 vols., Weimar, 1848–1851; *Briefe Goethes an die Gräfin Auguste zu Stollberg*, Leipsic, 1839; *Briefe Goethes an Lavater, aus den Jahren* 1774–83, hrsg. von Heinr. Herzel, Leipsic, 1833; *Briefe Goethes an Leipziger Freunde*, hrsg. von O. Jahn, Leipsic, 1849; *Briefe Goethes in den Jahren* 1768 1832, hrsg. von H. Döring, Leipsic, 1836; *Briefwechsel d. Groszherzogs Karl August v. Sachsen-Weimar-Eisenach mit Goethe in den Jahren von* 1775 *bis* 1828, 2 vols., Weimar and Leipsic, 1863; *Briefwechsel zwischen Goethe u. F. H. Jacobi*, hrsg. v. Max Jacobi, Leipsic, 1847; *Briefwechsel zwischen Goethe und Zelter in den Jahren* 1796–1832, hrsg. von Fr. W. Riemer, 8 parts, Berlin, 1833–34–36; *Briefwechsel zwischen Goethe u. Marianne von Willemer (Suleika)*, hrsg. mit Lebensnachrichten, &c., von Th. Creizenach, Stuttgart, 1877; H. Döring, *Goethes Leben*, Weimar, 1828, 2d ed., Jena, 1833; and Goedeke, *Goethes Leben u. Schriften*, Stuttgart, 1874, *Goethes Sammlungen*, 3 parts, Jena, Leipsic, 1848, 1849; Dr Karl Mendelssohn-Bartholdy, *Goethe u. Felix Mendelssohn Bartholdy*, Leipsic, 1871; *Neue Mittheilungen aus Johann Wolfgang von Goethes handschriftlichem Nachlasse*, 8 parts, Leipsic, 1874–76; Dr J. W. Schäfer, *Goethes Leben*, 2 vols., 8th ed., Leipsic, 1877; H. Viehoff, *Goethes Leben*, 3 parts, Stuttgart, 1847–49; Franz Wegele, *Goethe als Historiker*, 1876; Zellenck, *Die Beziehungen Göthes zu Spinoza*, 1878; Edmund Hoefer, *Goethe und Charlotte von Stein*, Stuttgardt, 1878; *Briefe Goethes an Sophie la Roche und Bettina Brentano*, hrsg. von C. Loeper, Berlin, 1879 (a most valuable little book); Graf Ferdinand von Dürkheim, *Lilis Bild geschichtlich entworfen*, 1879; C A. H. Burkhardt, *Goethe und der Componist Ph. Chr. Kayser*, Leipsic, 1879; Vinc. Prökl, *Goethe in Eger*, Vienna, 1879. (O. B.)

GOETZ, HERMANN (1840–1876), a musical composer, presents one of those instances, too frequent in the history of art, of success long sought for, and cut short by death when achieved at last. He was born at Königsburg in Prussia in 1840, and began his regular musical studies at the comparatively advanced age of seventeen. He entered the music-school of Professor Stern at Berlin, and studied composition chiefly under Ulrich and Hans von Bülow. In 1863 he was appointed organist at Winterthur in Switzerland, where he lived in obscurity for a number of years, occupying himself with composition during his leisure hours. One of his works was an opera, *The Taming of the Shrew*, the libretto skilfully adapted from Shakespeare's play. After much delay it was produced at Mannheim (October 1874), and its success was as instantaneous as it has up to the present proved lasting. It rapidly made the round of the great German theatres, and spread its composer's fame over all the land. But Goetz did not live to enjoy this happy result for long. In December 1876 he died at Zurich from overwork. A second opera, *Francesca da Rimini*, on which he was engaged at the time of his death, remained a fragment; but it has since been finished according to his directions by a friend, and was performed for the first time at Mannheim a few months after the composer's death. Besides his dramatic work, Goetz also wrote various compositions for chamber-music, of which a trio (Op. 1) and a quintet (Op. 16) have been given with great success at the London Monday Popular Concerts. Still more important is the *Symphony in F*, on which the composer's great reputation in England is mainly founded. As a composer of comic opera Goetz lacks the sprightliness and artistic *savoir faire* so rarely found amongst Germanic nations. His was essentially a serious nature, and passion and pathos were to him more congenial than humour. The more serious sides of the subject are therefore insisted upon more successfully than Katherine's ravings and Petruchio's eccentricities. There are, however, very graceful passages, *e.g.*, the singing lesson Bianca receives from her disguised lover. Goetz's style, although influenced by Wagner and other masters, shows signs of a distinct individuality The design of his music is essentially of a polyphonous character, and the working out and interweaving of his themes betray the musician of high scholarship. But breadth and beautiful flow of melody also were his, as is seen in the symphony, and perhaps still more in the quintet for pianoforte and strings above referred to. The most important of Goetz's posthumous works are a setting of the 137th Psalm for soprano solo, chorus, and orchestra, a "Spring" overture (Op. 15), and a pianoforte sonata for four hands (Op. 17).

GOG (גּוֹג) occurs in two passages of Scripture (Ezek. xxxviii.–xxxix., and Rev. xx.) as the name of a great anti-theocratic power destined to manifest itself in the world immediately before the final dispensation is ushered in. In the later passage, Gog and Magog are spoken of as co-ordinate; in the earlier, Gog is given as the name of the person or people, and Magog as that of the land of its origin. Notwithstanding this discrepancy, it is obvious that the passages are intimately related, and that both depend upon Gen. x. 2, where, however, Magog alone is mentioned. Here he is the second son of Japhet, and, on the assumption that a geographical order underlies these ethnographical tables, his locality is to be sought between Gomer and Madai or Media. According to Josephus, who is followed by Jerome, the Scythians were primarily intended by this designation; and this opinion has been almost universally accepted in modern times. The name Σκύθαι, it is to be observed, however, is often but a vague word for any or all of the numerous and but partially known tribes of the north; and any attempt to assign a more definite locality to Magog can only be very hesitatingly made. According to some, the Maiotes about the Palus Mæotis are meant; according to others, the Massagetæ; according to Kiepert, the inhabitants of the northern and eastern parts of Armenia. In Ezekiel, Gog is regarded as a terrible ruler in the extreme north, being prince of Rosh, Mesech, and Tubal, as well as governor in the land of Magog, and having the support of Persia, Ethiopia, and Phut, as well as of Gomer and the house of Togarmah. It may be considered as certain that the imagery employed in this prophetic description was suggested by the Scythian invasion which about the time of Isaiah had devastated Asia (Herod. i. 103 ff.). As might have been expected from the prominence given to that description in the Old Testament, Gog figures largely in Jewish and Mahometan as well as Christian eschatology. In the district of Astrakhan a legend is still to be met with, to the effect that Gog and Magog were two great races, which Alexander the Great subdued and banished to the inmost recesses of the Caucasus, where they are meanwhile kept in by the terror of twelve trumpets blown by the winds, but whence they are destined ultimately to make their escape and destroy the world. The legends that attach themselves to the effigies of Gog and Magog which are at present to be seen in Guild Hall, London, are only remotely connected, if at all, with the statements of Scripture. According to the *Recuyell des Histoires de Troye*, Gog and Magog were the survivors of a race of giants descended from the thirty-three wicked daughters of Diocletian; after their brethren had been slain by Brute and his companions, Gog and Magog were brought to London (Troy-novant), and compelled to officiate as porters at the gate of the royal palace. It is known that effigies similar to the present existed in London as early as the time of Henry V.; but it is uncertain at what date this legend first began to attach to them. According to Geoffrey of Monmouth (*Chronicles*, i. 16), Goëmot or Goëmagot (either corrupted from or corrupted into "Gog and Magog") was a giant who, along with his brother Corineus, tyrannized in the western horn of England until slain by foreign invaders.

GOGO, or GHOGHÁ, a town in Ahmadábád district, Bombay, 193 miles north-west of Bombay. About three-quarters of a mile east of the town is an excellent anchorage, in some measure sheltered by the island of Perim, which lies still further east. The natives of this are reckoned the best sailors in India; and ships touching here may procure water and supplies, or repair damages. It is a safe refuge during the south-west monsoon, or for vessels that have parted from their anchors in the Surat roads, the bottom being an entire bed of mud, three-quarters of a mile from the shore, and the water always smooth. Gogo has of late years lost its commercial importance. Its rival, Bhaunagar, is 8 miles nearer to the cotton districts. North of the town is a black salt marsh, extending to the Bhaunagar creek. On the other sides is undulating cultivated land, sloping to the range of hills 12 miles off. South of the town there is another salt marsh. The land in the neighbourhood is inundated at high spring tides, which renders it necessary to bring fresh water from a distance of 4 or 5 miles. The average annual value of the exports for five years ending 1871–72 was £56,227 and of the imports £103,083. Population (1872), 9571.

GOGOL, NIKOLAI VASILIEVICH (1809–1852), was born in the province of Poltava, in South Russia, March 31, 1809. Educated at the Niejin gymnasium, he there started a manuscript periodical, "The Star," and wrote several pieces including a tragedy, *The Brigands*. Having completed his course at Niejin, he went in 1829 to St Petersburg, where he tried the stage but failed. Next year he obtained a clerkship in the department of appanages, but he soon gave it up. In literature, however, he found his true vocation. In 1829 he published anonymously a poem called *Italy*, and, under the pseudonym of V. Alof, an idyll, *Hans Kuchel Garten*, which he had written while still at Niejin. The idyll was so ridiculed by a reviewer that its author bought up all the copies he could secure, and burnt them in a room which he hired for the purpose at an inn. Gogol then fell back upon South Russian popular literature, and especially the tales of Cossackdom on which his boyish fancy had been nursed, his father having occupied the post of "regimental secretary," one of the honorary officials in the Zaporogian Cossack forces. In 1830 he published in a periodical the first of the stories which appeared next year under the title of *Evenings in a Farm near Dikanka: by Rudy Panko*. This work, containing a series of attractive pictures of that Little-Russian life which lends itself to romance more readily than does the monotony of "Great-Russian" existence, immediately obtained a great success,—its light and colour, its freshness and originality, being hailed with enthusiasm by the principal writers of the day in Russia. Whereupon Gogol planned, not only a history of Little-Russia, but also one of the Middle Ages, to be completed in eight or nine volumes. This plan he did not carry out, though it led to his being appointed to a professorship in the university of St Petersburg, a post in which he met with small success, and which he resigned in 1835. Meanwhile he had published his *Arabesques*, a collection of essays and stories; his *Taras Bulba*, the chief of the *Cossack Tales* translated into English by George Tolstoy; and a number of novelettes, which mark his transition from the romantic to the realistic school of fiction, such as the admirable sketch of the tranquil life led in a quiet country house by two kindly specimens of *Old-world Gentlefolks*, or the description of the petty miseries endured by an ill-paid clerk in a Government office, the great object of whose life is to secure the "cloak" from which his story takes its name. To the same period belongs his celebrated comedy, the *Revizor*, or Government Inspector. His aim in writing it was to drag into light "all that was bad in Russia," and to hold it up to contempt. And he succeeded in rendering contemptible and ludicrous the official life of Russia, the corruption universally prevailing throughout the civil service, the alternate arrogance and servility of men in office. The plot of the comedy is very simple. A traveller who arrives with an empty purse at a provincial town is taken for an inspector whose arrival is awaited with fear, and he receives all the attentions and bribes which are meant to propitiate the dreaded investigator of abuses. The play appeared on the stage in the spring of 1836, and achieved a full success, in spite of the opposition attempted by the official classes whose malpractices it exposed. The aim which Gogol had in view when writing the *Revizor* he afterwards fully attained in his great novel, *Mertvuiya Dushi*, or Dead Souls, the first part of which appeared in 1842. The hero of the story is an adventurer who goes about Russia making fictitious purchases of "dead souls," *i.e.*, of serfs who have died since the last census, with the view of pledging his imaginary property to Government. But his adventures are merely an excuse for drawing a series of pictures, of an unfavourable kind, of Russian provincial life, and of introducing on the scene a number of types of Russian society. Of the force and truth with which these delineations are executed the universal consent of Russian critics in their favour may be taken as a measure. From the French version of the story a general idea of its merits may be formed, and some knowledge of its plot and its principal characters may be gathered from the English adaptation published in 1854, as an original work, under the title of *Home Life in Russia.* But no one seems to be able fully to appreciate Gogol's merits as a humorist, who is not intimate with the language in which he wrote as well as with the society which he depicted. In 1836 Gogol for the first time went abroad. Subsequently he spent a considerable amount of time out of Russia, chiefly in Italy, where much of his *Dead Souls* was written. His residence there, especially at Rome, made a deep impression on his mind, which, during his later years, turned towards mysticism. The last works which he published, his *Confession* and *Correspondence with Friends,* offer a painful contrast to the light, bright, vigorous, realistic, humorous writings which had gained and have retained for him his immense popularity in his native land. Asceticism and mystical exaltation had told upon his nervous system, and its feeble condition showed itself in his literary compositions. In 1848 he made a pilgrimage to Jerusalem, and on his return settled down at Moscow, where he died, March 3, 1852, not having quite completed his forty-third year.

GOITO, a large village of Italy, in the province of Mantua and district of Volta, situated on the right bank of the Mincio, about 14 miles from Castiglione, on the highway between Brescia and Mantua. Its position has made it figure from time to time in the records of Italian warfare. In 1701 it was taken by the allies, in 1706 by the prince of Hesse, and in 1796 by the French. It was the scene of a severe conflict between the French and the Austrians in 1814; and in 1848 it saw the defeat of the Austrians by the Piedmontese. The population of the commune in 1871 was 5274.

GOITRE (from *guttur*, the throat; synonyms, Bronchocele, Derbyshire Neck), a term in medicine applied to a swelling in the front of the neck caused by an enlargement of the thyroid gland. This structure, which lies between the skin and anterior surface of the windpipe, and in health is not large enough to give rise to any external prominence, is liable to occasional variations in size, more especially in females, a temporary enlargement of the gland being not uncommon at the catamenial periods, as well as during pregnancy. In the disease now under consideration, however, the swelling is well marked, and is not only unsightly, but may by its growth occasion much discomfort, and even give rise to serious symptoms from its encroachment on the windpipe and other important parts in the neck. The size to which goitrons growths may attain is extraordinary, Alibert recording cases of goitre where the tumour not only enormously enlarged the neck but hung down over the breast, or even reached as low as the middle of the thigh.

In districts where the disease prevails the goitre usually appears in early life, often from the eighth to the twelfth year. Its growth is at first slow, but after several years of comparative quiescence a somewhat sudden increase is a not unfrequent occurrence. In the earlier stages of the disease the condition of the gland is simply an enlargement of its constituent parts, which retain their normal soft consistence; but in the course of time other changes supervene, and it may become the seat of cystic formations, or acquire hardness from increase of connective tissue or calcareous deposits. Occasionally the enlargement of the gland is uniform, but more commonly one of the lobes, generally the right, is the larger. In some rare instances the disease has been noticed to be limited almost entirely to the isthmus which connects the two lobes of the gland. The growth is unattended with pain, and is not inconsistent with a fair measure of health.

Goitre is a marked example of an endemic disease. There are few parts of the world where it is not found prevailing in certain localities, these being for the most part valleys and elevated plains in mountainous districts. The wide distribution of this disease has naturally led to extensive inquiry and to abundant speculation as to its origin. It is unnecessary to mention the numerous theories which have been advanced on the subject. Many of these have already been referred to under CRETINISM (*q.v.*). The most generally accepted view among physicians is that which ascribes the malady to the use of drinking water impregnated with the salts of lime and magnesia, in which ingredients the water of goitrous districts would appear always to abound. This theory alone, however, is inadequate, as is evident from the often-observed fact that in localities not far removed from those in which goitre prevails, and where the water is of the same chemical composition, the disease may be entirely unknown. Hence among the best authorities the tendency now is to regard goitre as the result of a combination of causes, among which local telluric or malarial influences concur in an important manner with those of the drinking water in developing the disease. It is noteworthy that goitre can often be cured by removal from the district where it prevails, as also that it is apt to be acquired by previously healthy persons who settle in goitrous localities; and it is only in such places that the disease exhibits any hereditary tendencies.

In the treatment of goitre the first step is the removal, if possible, of the patient from the affected locality, and attention to general hygienic rules. The employment of burnt sponge as a cure for goitre was in general use until Dr Coindet of Geneva showed that its acknowledged virtues were in all probability due to the iodine which it contained, and proposed as a substitute this latter agent in a pure state. Dr Coindet's views were amply borne out, and iodine and its preparations have been universally adopted as the most potent remedy in this disease, and have superseded all other medicines. Small and gradually increased doses of the drug, either in the form of iodide of potassium or what is known as Lugol's solution appear to be the best methods of administration. The external application of iodine to the goitre, in the form of liniment or ointment, is of scarcely less value than its internal employment, and would seem to be sometimes capable of effecting a cure alone, as is evident from the method of treatment adopted with singular success in India and originally proposed by the late Major Holmes. This consists in applying to the goitre, by means of a spatula, an ointment of biniodide of mercury for about ten minutes soon after sunrise, and placing the patient with his goitre exposed to rays of the sun for six or seven hours. Blistering of the surface generally follows, a second application of the ointment is made, and the patient sent home. This is often found sufficient to effect the cure, but the treatment can, if necessary, be repeated.

The name "Exophthalmic Goitre" is applied to another form of the enlargement of the thyroid gland, differing entirely in its pathological connexions from that above described. In this affection the bronchocele is but one of three phenomena, which together constitute the typical characteristics of the disease, viz., palpitation of the heart and great vessels, enlargement of the thyroid gland, and protrusion of the eyeballs. This group of symptoms is generally known by the names of Graves's disease or Von Basedow's disease, in reference to the physicians by whom the malady was originally recognized and described. Although occasionally observed in men, this affection occurs much more commonly in females and in comparatively early life. It is generally preceded by ill health in some form, more particularly impoverishment of blood, and nervous or hysterical disorders, and is occasionally seen in cases of organic heart-disease. It has sometimes been suddenly developed as the effect of fright or violent mental emotion. The first of the symptoms to appear is usually the palpitation of the heart which is aggravated by the slightest exertion, and may be so severe as not only to shake the whole frame but even to be audible at some distance from the patient. An uncomfortable sensation of throbbing is felt throughout the body, and many of the larger blood-vessels are seen to pulsate strongly like the heart. The enlargement of the thyroid gland generally comes on gradually, and rarely increases to any great size, thus differing from true goitre, as originally noticed by Dr Graves. The enlarged gland is of soft consistence, and communicates a thrill to touch from its dilated and pulsating blood-vessels.

Accompanying the goitre a remarkable change is observed in the appearance of the eyes, which attact attention by their promiuence and the startled expression thus given to the countenance. In extreme cases the eyes protrude from their sockets to such a degree that the eyelids cannot be closed, and injury may thus arise to the constantly exposed eyeballs. Apart from such risk, however, the vision is rarely affected in this disease. Much difference of opinion prevails as to the immediate cause of the protrusion of the eyes, but it is generally ascribed to the increase of the fatty tissue and distension of the blood-vessels of the orbits. It occasionally happens that in undoubted cases of the disease one or other of the three above-named phenomena is absent, generally either the goitre or the exophthalmos. The palpitation of the heart is the most constant symptom. Sleeplessness, irritability, disorders of digestion, diarrhœa, and uterine derangements are common accompaniments.

The pathology of exophthalmic goitre is still somewhat uncertain, but there are strong reasons to believe that it is essentially a nervous ailment, and that the symptoms depend on a morbid state of the sympathetic nerve in the neck, which is well known to play an important part in the vaso-motor functions—that is, in controlling the action of the heart and regulating the calibre of the blood-vessels. In numerous instances of exophthalmic goitre a diseased state of this nerve has been found *post mortem*, although it must be admitted that in some cases no morbid change could be detected. The experiments of Bernard, Brown-Sequard, Schiff, and others upon the functions of the sympathetic nerve lend strong support to this view of the pathology of the disease. Exophthalmic goitre is not directly a fatal malady, but, on the other hand, complete recovery is a less frequent result than partial improvement, the patient continuing to suffer from chronic ill-health. The disturbed condition of the heart's action leads in some instances to permanent disease of that organ in the form of dilatation of its cavities. In the treatment of exophthalmic goitre the most successful results have been attained by the use of digitalis, which has the effect of giving tone to the heart and contracting the dilated blood-vessels. The tincture of digitalis, in doses of 5 to 10 drops twice or thrice daily, is perhaps the best form of administration. Where anæmia is present iron is indicated, and may be combined with the digitalis, although in some cases it is found to be unsuitable. In allaying the palpitation benefit is said to have frequently followed the application of ice to the cardiac region as well as to the thyroid gland. Iodine, which is so valuable in cases of true goitre, is generally admitted to be of no service in this disease, and is rather held to be injurious. (J. O. A.)

GOLCONDA, a fortress and ruined city, situated in the Nizám's Dominions, 7 miles west of Hyderabad city. In former times Golconda was a large and powerful kingdom of the Deccan, which arose on the downfall of the Báhmani dynasty, but was subdued by Aurungzebe in 1687, and annexed to the dominions of the Delhi empire. The fortress of Golconda, situated on a rocky ridge of granite, is extensive, and contains many enclosures. It is strong and in good repair, but is commanded by the summits of the enormous and massive mausolea of the ancient kings about 600 yards distant. These buildings, which are now the chief characteristics of the place, form a vast group, situated in an arid, rocky desert. They have suffered considerably from the ravages of time, but more from the hand of man, and nothing but the great solidity of their walls has preserved them from utter ruin. These tombs were erected at a great expense, some of them being said to have cost as much as £150,000. Golconda fort is now used as the nizám's treasury, and also as the state prison. The diamonds of Golconda have obtained great celebrity throughout the world; but they were merely cut and polished here, being generally found at Partial, near the south-eastern frontier of the nizám's territory.

GOLD

THE colour, lustre, and power of resisting oxidation, which this metal possesses, have caused it to be valued from the earliest ages. Allusions to gold are frequent in the Old Testament, and the refining of the precious metals by cupellation seems to have been a favourite illustration with the Jewish poets.[1] Jewellery and vessels found in Egyptian tombs afford evidence of the perfection attained in working gold at a period earlier than the government of Joseph,[2] and drawings on tombs of about this epoch clearly indicate the method of conducting the operations of washing, fusing, and weighing the metal. Excavations in Etruria have brought to light beautiful ornaments of gold, enriched with minute grains of the metal, the workmanship of which was unrivalled until Castellani studied and revived the methods employed by Etruscan artists.[3] The Greeks were familiar with natural alloys of silver and gold named *electrum*, rough nuggets of which were frequently stamped, and formed the earliest coins in Lydia.[4] The colour of this electrum is pale yellow to yellowish white, and it contains from 20 to 40 per cent. of silver.

[3] *Archæological Journal*, 1861, p. 365.
[4] "Notes on the Ancient Electrum Coins," by Barclay V. Head, *Numismatic Chronicle*, part iv., 1875, p. 245.

With regard to the history of the metallurgy of gold, it may be mentioned that, according to Pliny, mercury was employed in his time both as a means of separating the precious metals and for the purposes of gilding. Vitruvius also gives a detailed account of the means of recovering gold, by amalgamation, from cloth into which it had been woven.

Properties.—Gold is the only metal of a yellow *colour*, which is, however, notably affected by small quantities of other metals; thus the tint is sensibly lowered by small quantities of silver, and heightened by copper. The surface colour of particles of gold is often apparently reddened by translucent films of brown iron ore. It is nearly as soft as lead. The *hardness* varies, however, with the composition. Crystallized specimens from Oregon and Fraser River, containing respectively 835 and 910 parts of gold in 1000, are slightly harder than calc spar but sensibly softer than fluor spar, or much harder than the pure metal. When pure, gold is the most *malleable* of all metals. One grain may be beaten into leaves which cover a surface of 56 square inches, and are only $\frac{1}{282000}$th of an inch thick. Faraday has shown that the thickness of gold leaves may be still further reduced by floating them on a dilute solution of cyanide of potassium. When very thin, leaf gold appears yellow by reflected and green by transmitted light. If, however, certain gold films are heated, the light transmitted is ruby red; the pressure of a hard substance on the film so changes its state of aggregation that green light is again transmitted.[1] The metal is extremely *ductile*; a single grain may be drawn into a wire 500 feet in length, and an ounce of gold covering a silver wire is capable of being extended more than 1300 miles. Gold can readily be welded cold, and thus the finely divided metal, in the state in which it is precipitated from solution, may be compressed between dies into discs or medals. According to G. Rose,[2] the *specific gravity* of gold in the finely divided state in which it is precipitated from solution by oxalic acid is 19·49. The specific gravity of cast gold varies from 18·29 to 19·37, and by compression[3] between dies the specific gravity may be raised from 19·37 to 19·41; by annealing, however, the previous density is to some extent recovered, as it then is found to be 19·40. Its *atomic weight* is variously given as follows:—196·67 (Berzelius), 196·3 (Levol), 196·5 (Wurtz), 196·0 (Watts). The number adopted in this work (CHEMISTRY, vol. v. p. 528) is 196·2. Different observers have given the following temperatures as its *melting point*:—1425° C. (Daniell), 1200° C. (Pouillet), 1380° C. (Guyton de Morveau). Riemsdijk,[4] after comparing the several results, concludes that it may be considered to be 1240° C. The *electric conductivity* is given by Matthiessen as 73·99 at 15·1° C., pure silver being 100; this depends greatly on its degree of purity,—the presence of a few thousandths of silver lowering its conductivity by 10 per cent. The *specific resistance* of the metal in electromagnetic measure, according to the centimetre-gramme-second system of units, is 2154. Its *conductivity for heat* is 53·2 (Wiedemann and Franz), pure silver being 100. Its *specific heat* is 0·324 (Regnault). Its *coefficient of expansion* for each degree between 0° and 100° C. is 0·000014661, or for gold which has been annealed 0·000015136 (Laplace and Lavoisier). The *specific magnetism* of the metal is 3·47 (Becquerel). Details as to its *tenacity* and *rigidity* are given in the article ELASTICITY. With regard to its *volatility*, Gasto Claveus[5] states that he placed an ounce of pure gold in an earthen vessel in that part of a glass-house where the glass is kept constantly melted, and retained it in a state of fusion for two months without the loss of the smallest portion of its weight. Kunkel describes a similar experiment, which was attended with the same result. Homberg,[6] however, observed that when a small portion of gold is kept at a violent heat, part of it is volatilized. Both Macquer and Lavoisier showed that when gold is strongly heated, fumes arise which gild a piece of silver held in them. Its volatility has also been studied by Elsher, and, in the presence of other metals by Napier.[7] Hellot affirms that when an alloy of 7 parts of zinc and 1 part of gold is heated in air, the whole of the gold rises in the fumes of oxide of zinc which are produced. Gold is dissipated by sending a powerful charge of electricity through it when in the form of leaf or thin wire. In the gold *spectrum* Huggins has observed twenty-three lines, and the wave lengths of the three most important of these are 5231, 5835, and 6276 respectively. Some preliminary observations on the spectrum of the vapour at the temperature of the oxy-hydrogen flame, made by Lockyer and Roberts,[8] showed that there was a distinct absorption both at the blue and at the red end.

The solvents for gold are given in the article CHEMISTRY, vol. v. p. 529. It may be added that finely-divided gold dissolves when heated with strong sulphuric acid and a little nitric acid. Dilution with water, however, precipitates the metal as a violet or brown powder from the solution so obtained. Gold is also attacked when strong sulphuric acid is submitted to electrolysis with a gold positive pole.[9] W. Skey has shown[10] that in substances which contain small quantities of gold, the precious metal may be removed by the solvent action of a tincture of iodine or bromine in water. Filter paper soaked with the clear solution is burnt, and the presence of gold is indicated by the colour of the ash.

Occlusion of Gas by Gold.—Graham has shown[11] that gold is capable of occluding 0·48 of its volume of hydrogen, and 0·20 of its volume of nitrogen. Varrentrapp has also pointed out that "cornets" from the assay of gold may retain gas if they are not strongly heated. Artificial crystals of gold may be formed when the molten metal is slowly cooled.

Occurrence and Distribution.—Gold is found in nature chiefly in the metallic state, or as native gold, and less frequently in combination with tellurium, lead, and silver, forming a peculiar group of minerals confined to a few localities in Europe and America. These are the only certain examples of natural combinations of the metal,—the minute although economically valuable quantity often found in pyrites and other sulphides being probably only present in mechanical suspension, although for practical purposes it may be spoken of as combined. The native metal occurs tolerably frequently in crystals belonging to the cubic system, the octahedron being the commonest form, but other and complex combinations have been observed. Owing to the softness of the metal, large crystals are rarely well defined, the points being commonly rounded. In the irregular crystalline aggregates branching and moss-like forms are most common, and in Transylvania thin plates or sheets with diagonal structures are characteristic. These have recently been shown by Vom Rath to be repeated combinations of distorted tetrahexahedra. During the preparation of a mass of pure gold in the Mint at London, some fine crystals which appear to be aggregations of octahedra were obtained; and dendritic crystals of gold,

prepared artificially, have been described by Chester. It is possible also to obtain gold in crystals by heating its amalgam; according to Knaffl, an amalgam of 1 part of gold with 20 parts of mercury is maintained at a temperature of 80° C. for eight days. It is then heated to 80° C. with nitric acid of specific gravity 1·35, when dull crystals will be left, which become brilliant when more strongly heated. More characteristic, however, than the crystallized are the irregular forms, which, when large, are known as "nuggets" or "pepites," and when in pieces below $\frac{1}{4}$ to $\frac{1}{2}$ ounce weight as gold dust, the larger sizes being distinguished as coarse or nuggety gold, and the smaller as gold dust proper. Except the larger nuggets, which may be more or less angular, or at times even masses of crystals, with or without associated quartz or other rock, gold is generally found bean-shaped or in some other flattened form, the smallest particles being scales of scarcely appreciable thickness, which, from their small bulk as compared with their surface, subside very slowly when suspended in water, and are therefore readily carried away by a rapid current. These form the "float gold" of the miner. The physical properties of native gold are generally similar to that of the melted metal and its alloys as described above. The composition varies considerably in different localities, as shown in the following table:—

Of the minerals containing gold the most important are sylvanite or graphic tellurium, of composition (AgAu) Te_2, with 24 to 26 per cent.; calaverite, $AuTe_2$, with 42 per cent.; and nagyagite or foliate tellurium, of a complex and rather indefinite composition, with 5 to 9 per cent. of gold. These are confined to a few localities, the oldest and best known being those of Nagyag and Ofenbanya in Transylvania; but latterly they have been found in some quantity at Red Cloud, Colorado, and in Calaveras county, California—the nearly pure telluride of gold, calaverite, being confined to these places.

The minerals of the second class, usually spoken of as auriferous, or containing gold in sensible quantity, though not to a sufficient amount to form an essential in the chemical formulæ, or even in many instances to be found in the quantities ordinarily operated upon in analyses, are comparatively numerous, including many of the metallic sulphides. Prominent among these are galena and iron pyrites,—the former, according to the observations of Percy and Smith, being almost invariably gold-bearing to an extent that can be recognized in operating upon a pound weight of the lead smelted from it, the proportion increasing to some extent with the amount of silver.[1] The second is of greater practical importance, being in some districts exceedingly rich, and, next to the native metal, is the most prolific source of gold. Magnetic pyrites, copper pyrites, zinc blende, and arsenical pyrites are other and less important examples,—the last constituting the gold ore formerly worked in Silesia. A native gold amalgam is found as a rarity in California, and bismuth from South America is sometimes rich in gold. Native arsenic and antimony are also very frequently found to contain gold and silver.

The association and distribution of gold may be considered under two different heads, namely, as it occurs in mineral veins, and in alluvial or other superficial deposits which are derived from the waste of the former. As regards the first, it is chiefly found in quartz veins or reefs traversing slaty or crystalline rocks, usually talcose or chloritic schists, either alone, or in association with iron, copper, magnetic and arsenical pyrites, galena, specular iron ore, and silver ores, and more rarely with sulphide of molybdenum, tungstate of calcium, bismuth, and tellurium minerals. Another more exceptional association, that with bismuth in calcite from Queensland, was described by the late Mr Daintree. In Hungary, the Urals, and northern Peru, silicates and carbonates of manganese are not uncommonly found in the gold and silver bearing veins. In the second or alluvial class of deposits the associated minerals are chiefly those of great density and hardness, such as platinum, osmiridum, and other metals of the platinum group, tinstone, chromic, magnetic, and brown iron ores, diamond, ruby, and sapphire, zircon, topaz, garnet, &c., which represent the more durable original constituents of the rocks whose disintegration has furnished the detritus. Native lead and zinc have also been reported among such minerals, but their authenticity is somewhat doubtful.

The distribution of gold-bearing deposits is world-wide; although the relative importance of different localities is very different, their geological range is also very extensive. In Europe the principal groups of veins are in slaty or crystalline schists, whose age, when it can be determined, is usually Palæozoic, Silurian, Devonian, or Carboniferous, and less commonly in volcanic formations of Tertiary age. The alluvial deposits, being more extensive, are less intimately connected with any particular series of rocks. Few of either are, however, of much importance as compared with the more productive deposits of America and Australia. In the United Kingdom gold-bearing quartz veins were worked during the Roman occupation at Ogofau, near Llanpumpsant, in Carmarthenshire; and in the year 1863 as much as 5300 oz. was produced from similar veins in Lower Silurian slates at Vigra and Clogau mines, near Dolgelly. In 1875 the mine was reopened, and in 1878 it produced 720 oz. Tetradymite, native bismuth, and several other characteristic associates of gold were also found in small quantity. In Cornwall small pieces of native gold have at intervals been found in alluvial or stream tin works; and similar but more important finds have been made in the granite district of Wicklow, and more recently at Helmsdale, in Sutherlandshire. The largest nugget of British origin weighs under 3 oz.

On the continent of Europe the great rivers originating in the crystalline rocks of the Alpine region, such as the Rhine and Danube, are slightly auriferous in their alluvial deposits in several places; but the proportion of gold is extraordinarily minute, so that the working is only carried on by gipsies, or by the local peasantry at irregular intervals, the return for the labour expended being very small. The same remark applies to the Rhone and its

[1] *Phil. Mag.*, vii., 1854, p. 126.

affluents, and the rivers of the central granitic mass of France. In the Austrian Alps the gold quartz mines at the Rathausberg, near Gastein, at a height of about 9000 feet above the sea-level, and at Zell, in Tyrol, are of interest historically as having developed the system of amalgamation in mills, although they are economically of small importance at present. On the Italian side, in the Valanzasca and Val Toppa above Lago Maggiore, a group known as the Pestarena mines have yielded from 2000 to 3000 ounces annually for several years past; and more recently a discovery of great interest of a highly auriferous copper ore has been made at Ollomont in the Val d'Aosta. In Hungary the gold-bearing veins of Schemnitz occur in greenstones and trachytes of Tertiary age, the most powerful example, the *Spitaler-gang*, being filled with a mixture of quartz and brown iron ore known as zinnopal, and containing gold associated with silver ores, galena, and pyrites In Transylvania, at Nagyag, the gold-bearing tellurium minerals previously noticed are found in small veins traversing greenstone trachyte. These are often very thin, as low as $\frac{1}{8}$th to $\frac{1}{10}$th of an inch, but each is carefully traced out, the rock being impregnated with gold and silver to a certain depth on each side. At Vörospatak, another Transylvanian locality, gold with a very large proportion of silver and associated with gypsum is worked in veins traversing a Tertiary sandstone, being almost the only known instance of such a mode of occurrence.

The Russian empire has the largest gold production among the countries of the Old World, most of the produce, however, being derived from its Asiatic territories. The more important localities are situated on the eastern slope of the Ural chain, extending in a nearly north and south line for more than 600 miles from 51° to 60° N. lat. The chief centres are Miask (55° N.), Kamensk (56° 30' N.), Berezovsk (57° N.), Nijne Tagilsk (58° N.), and Bogoslowsk (60° N.), the known deposits, which include both veins and alluvial mines, extending for about one degree farther north. The geological age of the Ural veins is not very well defined—strata of the Silurian, Devonian, and Carboniferous periods, which form regular parallel alternations on the European slope, being present on the Asiatic side, but in much disturbed and contorted positions, in association with plutonic rocks, diorite, diabase, and granite, with which the gold veins are intimately connected. The latter are therefore of post-Carboniferous and probably of Permian date. At Berezovsk the mines cover an area of about 25 square miles, mainly composed of talcose, chloritic, and clay slates, vertical or sloping at high angles, and penetrated by dykes of beresite, a fine grained rock made up of quartz and white mica with some felspar and pyrites, the latter usually transformed into brown iron ore. These dykes, which have a general north-and-south direction are vertical, and are from 20 to 70 feet and upwards in thickness, are traversed perpendicularly to their direction by veins of quartz from the thinnest string to a maximum of $3\frac{1}{2}$ or 4 feet thick, in which gold is associated with brown iron ore or ochres, resulting from the decomposition of pyrites. The workings being essentially shallow, none of the associated sulphides, galena, disulphide of copper, &c., have as yet been found, as a rule, to be gold-bearing. The valuable parts of the veins are almost entirely restricted to the beresite dykes. The richest of the Ural mines are those of Smolensk, near Miask, and Ouspensk, near the village of Katchkar, in 52° N. The alluvial deposits which, though called sands, are but very slightly sandy clays, extend to the north beyond the inhabited regions, and to the south into the Cossack and Bashkir countries. The most valuable diggings are in the district of Miask, where the largest nuggets have been found, and in the Katchkar, which are remarkable for the great number of gems, pink topazes, emeralds, &c., found in connexion with the gold. Magnetite, quartz, and platinum are very common in all the Ural gold sands; less common are hematite, titaniferous and chromic iron, pyrites, garnet, and, least of all, zircon, kyanite, and diamond. These alluvial deposits are of later Tertiary age, some of them containing traces of prehistoric human work; others are post-Pliocene, with the remains of the mammoth, tichorrhine, rhinoceros, and other mammalian fossils. Somewhat similar conditions prevail in the alluvial gold region of the Altai. Besides the veins and alluvial deposits, the Ural rocks, such as serpentine, diorite, beresite, agrairite, &c., are at times auriferous.

The gold deposits of the Caucasus, though immortalized in the tradition of Jason and the Argonants, are now entirely abandoned, the last attempt at working them having been suspended in 1875.

In India gold is obtained in small quantities by native gold washers in various parts of the highlands of southern Bengal, and more recently quartz veins and alluvial deposits of considerable promise have been discovered in the district of Wynaad, in the southern part of the Madras presidency.

On the Atlantic slopes of North America the chief gold-bearing localities are on the Chaudière river, near Quebec, and in Nova Scotia. In both instances the quartz veins worked are contained in slates belonging to the Quebec group of the Lower Silurian period, those of the latter province being specially remarkable for their quasi-stratified character, as they penetrate the slates at a very low angle of inclination, and have been folded and corrugated together with the containing rocks by subsequent disturbances. Other deposits of old geological periods are found in Tennessee and North Carolina.

On the Pacific side of America gold is found under very different conditions, and on a much larger scale than on the Atlantic side. The whole distance from Mexico to Alaska may be said to be more or less auriferous, the most extensive deposits being in the great north-and-south valley of the Sacramento, which runs parallel to the coast, between the so-called Coast Mountains and the Sierra Nevada, the latter being distinguished further to the north in the Cascade range. Others of less extent are known in the Klamath, Columbia, and Fraser river basins; they extend in the last two far back into the interior, to the region between the Cascade range and the Rocky Mountains. In many of these valleys alluvial deposits are developed to an extent unparalleled elsewhere, the river channels being bordered by banks or benches of gravel and sand, rising in terraces to considerable heights on the flanks of the hills. For example, at the Methow a tributary of the Columbia, there are sixteen lines of such terraces, the highest about 1200 feet above the river; and at Colville, on the Columbia, traces of old terraces, much degraded by frost and rain, are seen at 1500 feet above the river. These gravels, which are of Pliocene and more recent origin, are in many places, though very unequally, auriferous, the richest points being found in the bars or shingle banks of the river after the summer floods, and in the channels of the smaller tributary streams, where the poorer material has been partially enriched by a process of natural washing. The most extensive, or rather the best known because most completely explored, deposits of this class are those of the Upper Sacramento valley, in California (see vol. iv. p. 701).[1] Others of considerable importance are worked in the Cariboo district on the Upper Fraser river, yielding very coarse gold. Another discovery of a singular character, the produce being a regular gold gravel, was made some years back at Salmon river in Oregon, but the deposit, though exceedingly rich, was soon exhausted. Gold-

[1] See also Whitney, *On the Auriferous Gravels of the Sierra Nevada*, Cambridge, U.S., 1879

bearing quartz veins are also common over a large part of California, notably in Grass Valley (vol. iv. p. 702), in strata that are supposed to be of Triassic age, the associated minerals being iron and arsenical pyrites, galena, &c. In Calaveras county, tellurium ores like that of Transylvania are characteristic of the gold veins. In the adjacent States of Nevada and Colorado, gold is so intimately associated with silver ores that it is for the most part only obtained from the ultimate process of refining the reduced silver. The same remark applies to the most of the mines of Mexico, and on the south-west coast of America, in Peru, Bolivia, and Chili. See SILVER.

Very rich gold quartz has been brought from Carabaya on Lake Titicaca; and recently considerable deposits both alluvial and in veins have been opened at Caratal in Venezuela and at St Elie in French Guiana, which are interesting as proving the actual existence of Raleigh's Eldorado.

In Brazil the principal gold mines are upon veins in clay slate, and a peculiar class of rocks known as Jacotinga or Itabirite, and which are mixtures of quartz, chlorite, and specular iron ore, the latter often occurring in large mirror-like crystals several inches across. The gold occurs almost entirely in pyritic minerals, being most abundant in ordinary iron pyrites, and less so in magnetic and arsenical pyrites, free gold being rarely seen. See BRAZIL, vol. iv. p. 224.

In Africa the chief gold-bearing localities are on the west coast—gold dust derived from alluvial washings forming an article of export from many of the trading stations along the Guinea coast. Latterly, alluvial deposits have been worked in the mountains of Transvaal, in the Leydenburg district (25° S. lat., 31° E. long.), producing coarse nuggetty gold in masses up to 11 lb weight, and in a few cases gold-bearing quartz has been found in veins in talcose schist and quartzite, closely associated with eruptive masses of diorite. The age of these rocks is considered by Dunn[1] to be Silurian or Devonian, and the observed phenomena to be similar to those generally observed in Australia. The upper valley of the Nile produces a little gold in Abyssinia and Nubia, the latter being the land of gold of the old Egyptians. Very extensive ancient mines have been described by Linant Bey in the district known as Attaki or Allaki on the Red Sea, situated about 120 miles back from Ras Elba, the headland midway between Berenice and Sauwakin. These are probably the same mines that were described by Diodorus Siculus, and one of the oldest topographical documents known, a map or itinerary of the route to them from the Nile, is preserved at Turin. In the reign of Setee I., of the 19th dynasty, wells were opened along this route, in order that the mines, that were then of very great antiquity, might be reopened.[2] Similar ancient gold mines have recently been discovered by Burton in the land of Midian, on the east coast of the Gulf of Akaba.

The gold districts of Australia cover a very considerable area, extending from the east side of the continent for about 20° of latitude (18° to 38° S.), the more important deposits being those of Victoria in the south. The principal districts are in Victoria,—Ballarat, Castlemaine, and Sandhurst, lying west and north from Melbourne, and Beechworth near the Murray river to the north-east. In New South Wales the gold fields are scattered over the entire length of the colony from north to south, the more important districts lying between the 32d and 36th parallels of S. lat. on the western side of the Australian cordillera, on the upper tributaries of the Macquarie and Lachlan rivers, the centre being about the town of Bathurst. This is known as the western district. Another group, known as the northern district, is on the eastern side of the mountains near the Queensland boundary, in 29° S., Rocky River being the principal locality; while the southern district includes Braidwood, Adelaide, Tumbarumba, and other localities near the Murray river. In Queensland the chief localities are, commencing on the south, Gympie and Kilkevan near Maryborough, 26° S. lat.; a group extending about 50 miles north and south of Rockhampton, in 24° 30′ S. lat., all near the coast; Eastern River, Hurley, and Peak Downs, about 300 miles inland on the 23d parallel; and Clomenny and Gilbert on a stream running into the Gulf of Carpentaria, besides numerous others. In all those localities two principal kinds of deposits are observed, namely, auriferous quartz veins traversing slates of Silurian and Devonian age, which are in intimate relation with masses of diorite and other eruptive rocks; and gold-bearing drifts of Miocene or even newer Tertiary date, derived from the degradation of the older strata. According to Daintree,[3] no auriferous vein of any kind has been found in any Secondary or Tertiary strata, or in the igneous rocks erupted through any such newer formations; and as a result of his experience the same observer gives the following as the modes of occurrence of gold in Australia:—(1) In pyritic diorites and felstones in Queensland, and their alluvial drifts; (2) in pyritic granites in New South Wales; (3) in drifts from auriferous serpentine in Queensland, also in the two northern colonies; (4) in more or less regular veins with quartz and calcspar in the preceding rocks; (5) in quartz and other veins in Devonian and Upper Silurian strata in proximity to similar igneous rocks, which is the general character of the Victoria quartz veins; (6) in veins of metamorphic rocks of unknown age in Queensland; and (7) in quartz veins in Lower Silurian strata, without any apparent connexion with igneous masses. The latter occur only in Victoria, and are of comparatively minor importance. In the northern territory of South Australia, alluvial gold mining has recently been developed to a considerable extent in the neighbourhood of Port Darwin in the Gulf of Carpentaria, the export being from 2000 to 3000 oz. monthly.

Statistics.—There are no means of stating exactly the total gold produce of the world for any particular year, as in many of the larger producing countries no systematic returns are obtained, and in others where such returns are collected their publication is often delayed for a considerable time. The following figures, mostly derived from a recent statistical work, A. Soetbeer, *Edelmetall-Produktion*, 1879, with some additions from late official sources, will give some idea of the relative importance of the different countries. Previous to 1837 the first place was held by Russia, and the estimated average annual yield from all sources was, in the decennial period 1841–50, 1,760,500 ounces.

The contributions of the different countries are as follows:—

		oz.		oz.		oz.
United States	1876,	2,050,000[4]				
Russia	1876,	1,072,920	1877,	1,281,260		
New South Wales	1876,	126,789	1877,	97,582		
Victoria	1876,	963,760	1877,	809,653	1878,	758,039
Queensland	1876,	410,330	1877,	468,418		
New Zealand	1876,	322,016	1877,	371,685	1878,	311,438
Venezuela					1878,	150.000
New Granada	1876,	112,500				
Africa	1875,	110,100				
Mexico	1875,	65,950				
Bolivia	1875,	64,300				
Austria-Hungary	1876,	61,214

[3] *Quarterly Journal of the Geological Society*, vol. xxxiv. p. 435.

[4] The two principal mines, on the Comstock lode, the Consolidated Virginia and California, produced, apart from silver, gold of the value in United States currency as follows:—

	1876.	1877.	1878.
Consolidated Virginia	$7,378,145	$6,270,000	$3,770,000
California	6 618,641	9,386,745	5,553,400

Since 1851 the yield has been very largely increased by the discovery of the Australian and Californian sources, the annual averages being—

In 1851–1855	6,350,180	ounces
,, 1856–1860	6,624,850	,,
,, 1861–1866	5,951,770	,,
,, 1866–1870	6,169,660	,,
,, 1871–1875	5,487,400	,,

Proportion of Gold in Deposits.—A rich gold-bearing deposit is quantitatively very different from one to which the same term is applied when containing ores of other metals. In the latter the useful material must as a rule form a considerable proportion—one or more parts in a hundred—of the mass; while in the former, owing to the superior value of the product, it rarely attains as much as 1 per cent., and is generally very much less, the amount of gold contained in easily worked alluvial deposits being often extremely small. For example, the yield of the Siberian gold washings ranges from 12 grains to 1 dwt. 12 grains per ton;[1] while in the lodes, which are more difficult and expensive to work, the proportion is about 8 dwts. per ton. In the alluvial washings of California it is estimated at about two shillings worth, equal to about $\frac{1}{40}$th of an ounce, per ton of gravel. In Australia the alluvial ground worked in the colony of Victoria in 1878 is returned as averaging 25 grains (1 dwt. 1 gr.) per ton, or about double the above quantity.

In vein mining, which is more difficult and costly, a larger yield is necessary, but probably 5 dwts., or about £1 in value per ton, will in most places represent paying quantities from quartz containing free gold, *i.e.*, not associated with pyrites. The proportional yield and quantities of the different kinds of auriferous materials treated in the colony of Victoria during the last three months of 1878 were—

	Tons.	Yield per ton. oz.	dwt	gr.
Alluvial sand "washdirt"	173·379	1	1	59·6
Cement (gravel) requiring crushing	5871	...	4	21·4
Quartz	222 775	...	9	21
Quartz tailings	11·139	...	1	18
Pyrites and blanketing (ore collected on blanket tables)	1·599	2	6	13·7

In the less tractable minerals, such as arsenical pyrites occurring in the lower portions of the veins, as much as $1\frac{1}{2}$ to 3 oz. may be required for profitable working. When associated with the ores of other metals, such as silver, lead, and copper, the extraction of the gold is in most cases an incidental and final operation in their metallurgical treatment, and may therefore be best considered in the articles on these metals.

Mining.—The various deposits of gold may be divided into two classes—"veins" and "placers." The vein mining of gold does not greatly differ from that of similar deposits of metals. It will only be necessary to refer here to certain details of the extraction of gold in such cases. In the placer or alluvial deposits, the precious metal is found usually in a water-worn condition imbedded in earthy matter, and the method of working all such deposits is based on the disintegration of the earthy matter by the action of a stream of water, which washes away the lighter portions and leaves the denser gold. In alluvial deposits the richest ground is usually found in contact with the "bed rock"; and, when the overlying cover of gravel is very thick, or, as sometimes happens, when the older gravel is covered with a flow of basalt, regular mining by shafts and levels, as in what are known as tunnel-claims, may be required to reach the auriferous ground. In the early days of gold washing in California and Australia, when rich alluvial deposits were common at the surface, the most simple appliances sufficed; the most characteristic being the "pan," a circular dish of sheet-iron with sloping sides about 13 or 14 inches in diameter. The pan, about two-thirds filled with the "pay dirt" to be washed, is held in the stream or in a hole filled with water. The miner, after separating the larger stones by hand, imparts a gyratory motion to the pan by a combination of shaking and twisting movements which it is impossible to describe exactly, so as to keep its contents suspended in the stream of water, which carries away the bulk of the lighter material, leaving a black residue consisting of magnetic iron ore and other heavy minerals, together with any gold which may originally have been present in the mass. The washing is repeated until enough of the enriched sand is collected, when the gold is finally recovered by careful washing or "panning out" in a smaller pan. In Mexico and South America, instead of the pan, a wooden dish or trough, variously shaped in different districts, and known as "batea," is used.

The "cradle," a simple appliance for treating somewhat larger quantities, varies in length from 3 feet 6 inches to 7 feet, but the shorter length is that usually adopted. Its nature will be evident from fig. 1, in which *a* is a movable hopper with a perforated bottom of sheet-iron in which the "pay dirt" is placed. Water is poured on the dirt, and the rocking motion imparted to the cradle causes the finer particles to pass through the holes in the hopper on to the screen *b*, which is of canvas, and thence to the base of the cradle, where the auriferous particles accumulate on the transverse bars of wood *c*, called "riffles." Washing by the cradle, which is now but little used except in preliminary workings, is tedious and expensive.

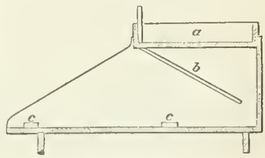

Fig. 1.—Cradle.

The "tom" is a sort of cradle with an extended sluice placed on an incline of about 1 foot in 12. The upper end contains a perforated riddle plate which is placed directly over the riffle box, and under certain circumstances mercury may be placed behind the riffles. Copper plates amalgamated with mercury are also used when the gold is very fine, and even in some instances amalgamated silver coins have been used for the same purpose. Sometimes the stuff is disintegrated with water in a "puddling machine," which is used, especially in Australia, when the earthy matters are tenacious and water scarce. The machine frequently resembles a brickmaker's wash-mill, and is worked by horse or steam power.

In workings on a larger scale, where the supply of water is abundant, as in California, sluices are generally employed. They are shallow troughs about 12 feet long, about 16 to 20 inches wide, and 1 foot in depth. The troughs taper slightly so that they can be joined in series, the total length often reaching several hundred feet. The incline of the sluice varies with the conformation of the ground and the tenacity of the stuff to be washed, from 1 in 16 to 1 in 8.

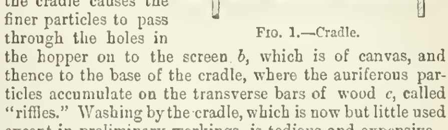

Fig. 2.—Sluice.

Fig. 2 represents one of the simplest forms of sluice as

[1] 1 dwt. per ton corresponds to 1 part in 653,333 by weight, and about 1 in 5 or 6 millions by volume.

used in river diggings in the north-west of America. A rectangular trough of boards, whose dimensions depend chiefly on the size of the planks available, is set up on the higher part of the ground at one side of the claim to be worked, upon trestles or piers of rough stone-work, at such an inclination that the stream may carry off all but the largest stones, which are kept back by a grating of boards about 2 inches apart at *a*. The gravel, which in this particular instance is from 12 to 16 feet thick, and with an average breadth to the river of 25 to 30 feet, is dug by hand and thrown in at the upper end, the stones kept back being removed at intervals by two men with four-pronged steel forks. The floor of the sluice is laid with riffles made of strips of wood 2 inches square laid parallel to the direction of the current (as at *b*. and in cross section at *c*), and at other points *d* with boards having transverse notches filled with mercury. These were known originally as Hungarian riffles. The bottom of the working, which is below the drainage level of the valley, is kept dry by a Chinese bucket pump *e*, attached to a rough undershot wheel driven by the current in the sluice. The sluice boxes are made in lengths, and united together spigot and faucet fashion, so that they may easily be removed and re-erected as the different parts of the claim are progressively exhausted.

In the larger and more permanent erections used in hydraulic mining, the upper ends of the sluices are often cut in rock or lined with stone blocks, the grating stopping the larger stones being known as a "grizzly." In order to save very fine and especially rusty particles of gold, so-called "under-current sluices" are used; these are shallow wooden tanks, 50 square yards and upwards in area, which are placed somewhat below the main sluice, and communicate with it above and below, the entry being protected by a grating so that only the finer material is admitted. These are paved with stone blocks or lined with mercury riffles, so that from the greatly reduced velocity of flow, due to the sudden increase of surface, the finer particles of gold may collect. In order to save finely-divided gold, amalgamated copper plates are sometimes placed in a nearly level position, at a considerable distance from the head of the sluice, the gold which is retained in it being removed from time to time. Sluices are often made double, and they are usually cleaned up,—that is, the deposit rich in gold is removed from them,—once a week. The gold is then recovered by "panning."

The application of a jet of water to the removal of auriferous gravels by the so-called hydraulic system of mining has already been noticed at vol. iv. p 701.[1] This method has for the most part been confined to the country of its invention, California, and the western territories of America, where the conditions favourable for its use are more fully developed than elsewhere,—notably the presence of thick banks of gravel that cannot be utilized by other methods, and abundance of water, even though considerable work may be required at times to make it available. The general conditions to be observed in such workings may be briefly stated as follows:—(1) The whole of the auriferous gravel, down to the "bed rock," must be removed,—that is, no selection of rich or poor parts is possible; (2) this must be accomplished by the aid of water alone, or at times by water supplemented by gunpowder; (3) the conglomerate must be mechanically disintegrated without interrupting the whole system; (4) the gold must be saved without interrupting the continuous flow of water; and (5) arrangements must be made for disposing of the vast masses of impoverished gravel.

[1] Much valuable information on this subject will also be found in the *Fifth Annual Report of the United States Commissioners of Mining Statistics*, Washington, 1873, p. 390.

The general appearance of an hydraulic gold working is seen in fig. 3, the water being brought from a ditch on the high ground, and through a line of pipes to the distributing box, whence the branch pipes supplying the

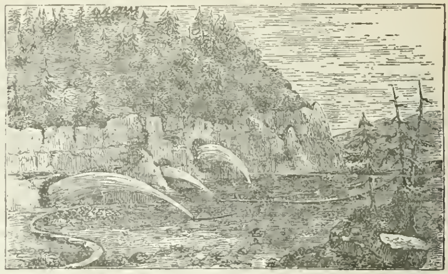

Fig. 3.—Hydraulic Gold Working.

three jets diverge. The stream issues through a nozzle resembling that of a fire engine (fig. 4), which is movable in a horizontal plane around the vertical axis *a*, and in a vertical plane on the spherical joint and centre *b*. so that the direction of the jet may be varied through considerable angles by simply moving a handle. The material of the bank, being loosened by the cutting action of the

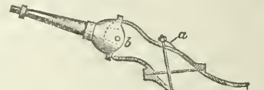

Fig. 4.

water, crumbles into holes, or "caves in," and the superincumbent mass, often with large trees and stones, falls into the lower ground. The stream, laden with stones and gravel, passes into the sluices, where the gold is recovered in the manner already described. Under the most advantageous conditions the loss of gold may be estimated at 15 or 20 per cent., the amount recovered representing a value of about two shillings per ton of gravel treated. The loss of mercury is about the same, from 5 to 6 cwt. being in constant use per mile of sluice. About 1 cwt. is added daily in at least two charges. The average half-yearly consumption is estimated at about one hundred flasks of 74 lb each, after allowing for the amount recovered in clearing up and distillation of the amalgam. The latter operation is performed at intervals of seven or fourteen days in the upper lengths of the sluice, and half-yearly in the lower parts.

The dressing or mechanical preparation of vein stuff containing gold is generally similar to that of other ores, except that the precious metal should be removed from the waste substances as quickly as possible, even although other minerals of value that are subsequently recovered may be present. This is usually done by amalgamation with mercury. In all cases the quartz or other vein stuff must be reduced to a very fine powder as a preliminary to further operations. This may be done in several ways, *e.g.*, either (1) by the Mexican crusher or *arrastra*, in which the grinding is effected upon a bed of stone, over which heavy blocks of stone attached to cross arms are dragged by the rotation of the arms about a central spindle, motion being furnished by mules or other power, or (2) by the Chilian mill or *trapiche*, also known as the edge-runner, where the grinding stones roll upon the floor, at the same time turning about a central upright,—contrivances which are mainly used for the preparation of silver ores; but by far the largest proportion of the gold quartz of California and Australia is reduced by (3) the stamp mill, which is similar in principle to that used in Europe for the preparation of tin and other ores, but has received special modification in many details Fig. C represents the ordinary Californian pattern of a stamp mill. The stamp is a cylindrical iron pestle faced with a chilled cast-iron shoe, removable so that it can be renewed when necessary, attached to a round iron rod or lifter, the whole weighing from 600 to 800 lb. The lift is effected by cams acting on the under surface of tappets *a*, and formed by cylindrical boxes keyed on to the stems of the lifter about one-fourth of their length from the top. As, however, the cams, unlike those of European stamp mills, are placed to one side of the stamp, the latter is not only lifted but turned partly round on its own axis, whereby the shoes are worn down uniformly. The bed or mortar A is of cast-iron. The height of lift may be between 8 and 10 inches, and the number of blows from 30 to 90 per minute. The stuff, previously broken to about 2 inch lumps in a Blake's rock-breaker, is fed in through the aperture *n* at the back of the "battery box," a constant supply of water being given from the channel *k*, and mercury in a finely divided state is added at frequent intervals. The discharge of the comminuted material takes place through the aperture *d*, which is covered by a thin steel plate perforated with numerous

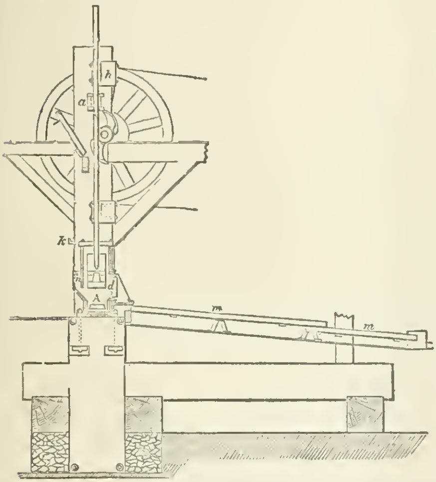

Fig 5.—Stamp Mill.

slits about $\frac{1}{50}$th inch broad and $\frac{1}{10}$th to $\frac{1}{8}$th inch long, a certain volume being discharged at every blow and carried forward by the flushing water over the apron or table in front, *m*, covered by copper plates filled with mercury. Similar plates are often used to catch any particles of gold that may be thrown back, while the main operation is so conducted that the bulk of the gold may be reduced to the state of amalgam by bringing the two metals into intimate contact under the stamp head, and remain in the battery. The tables in front are laid at an incline of about 8 degrees, and are about 13 feet long; they collect from 10 to 15 per cent. of the whole gold; a further quantity is recovered by leading the sands through a gutter about 16 inches broad and 120 feet long, also lined with amalgamated copper plates, after the pyritic and other heavy minerals have been separated by depositing in catch pits and other similar contrivances.

When the ore does not contain any considerable amount of free gold, mercury is not, as a rule, used in the battery. The pulverized stuff is received upon blanket tables or sluices. These are inclined boards covered with coarse woolen cloth or sacking. The heavier particles become entangled in the fibres of the cloth, while the lighter deposits are carried forward by the current. At intervals of a quarter to half an hour the surface of the blanket is completely covered, when it is removed, and its contents are washed off in a tub of water and reserved for further treatment. This consists of amalgamation, in a contrivance analogous to the Hungarian mill subsequently described, and subsequent treatment in pan amalgamators somewhat similar to the *arrastra* in character, but with grinding surfaces of iron instead of stone.

At Schemnitz, in Hungary, quartz vein stuff containing a little gold, partly free and partly associated with pyrites and galena, is, after stamping in mills similar to those described above, but without rotating stamps, passed

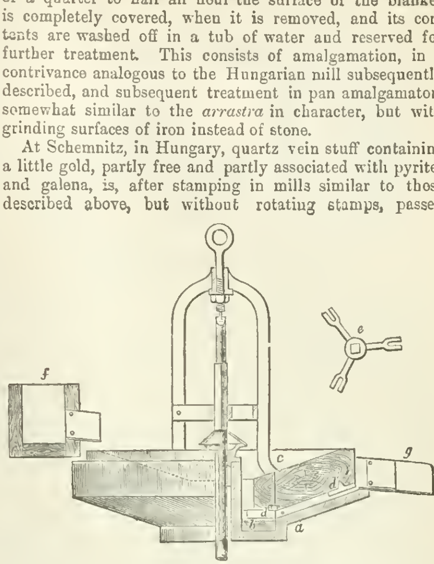

Fig. 6.—Hungarian Mill.

through the so-called Hungarian gold mill, fig. 6. This consists of a cast-iron pan *a*, having a shallow cylindrical bottom *b*, holding 50 lb. of mercury, in which a wooden runner *c*, nearly of the same shape as the inside of the pan, and armed below with several projecting blades, is made to revolve by gearing wheels placed either above, or, as in the figure, below. The connexion of the runner with the driving shaft is effected by the three-armed crutch shown in plan at *e*, which sits on the square part of the shaft. By means of set screws analogous to those of a flour mill, the runner is adjusted at such a height that the knives just clear the surface of the mercury. The stuff from the stamps arrive by the gutter *f*, and, falling through the hole in the middle of the runner, is distributed over the mercury, when the gold subsides in virtue of its superior density, while the quartz and lighter materials are guided by the blades to the circumference and are discharged at *g*, usually into a second similar mill, and sometimes to a third, placed at lower levels, and subsequently pass over blanket tables. The most advantageous speed is from 12 to 14 revolutions per minute. The action of this so-called mill is really more nearly analogous to that of a centrifugal pump, as no grinding action takes place in it. The amalgam is cleaned out about once a month. The average amount of gold collected from 50 tons of stuff stamped, is about 6 oz. in the mills, and in the subsequent dressing processes 1 lb of auriferous silver and 10 cwt. of lead. According to Rittinger, mercury that has been purified by distillation acts much more rapidly upon gold than such as has been saturated with the metal without losing its fluidity, although the amount that can be so dissolved is very small.

There are various forms of pan amalgamators of which space will not permit a description to be given. It may be stated, however, that experience of the great variety of pans that have from time to time been devised has led to the adoption of the more simple forms, in which the grinding is effected between horizontal flat surfaces instead of curved or conical bottoms, and in the pans now usually employed these flat grinding surfaces form an annular floor round a central cone through which a vertical shaft passes. The Knox pan, fig. 7, may be considered to be fairly typical. It is of cast-iron, 4 feet in diameter and 14 inches deep. It has a false bottom to form a hollow annular space through which steam can be introduced. The centre of the yoke *d* attached to the muller *m*, is keyed to a vertical wrought-iron shaft S, 2 inches in diameter, which can be brought in connexion with the driving gear G. The blocks *r*, *r* are of wood. In working the pan 100 ℔ of skimmings are introduced, and water added until the pulp will just adhere to a stick. After three hours grinding the pulp is heated with steam. About 5 ℔ of mercury are added for every charge, together with a cupful of equal parts of saltpetre and sal ammoniac. After three hours further working, water with a little caustic lime is added, and the pulp is discharged first through an upper and then through a lower hole.

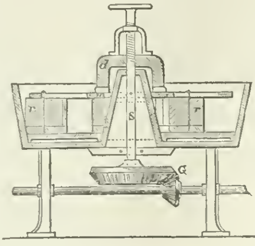

Fig. 7.—Knox Pan.

One of the greatest difficulties in the treatment of gold by amalgamation, and more particularly in the treatment of pyrites, arises from the so-called sickening or flouring of the mercury; that is, the particles, losing their bright metallic surfaces, are no longer capable of coalescing with or taking up other metals. Of the numerous remedies proposed the most efficacious is perhaps sodium amalgam. It appears that amalgamation is often impeded by the tarnish found on the surface of the gold when it is associated with sulphur, arsenic, bismuth, antimony, or tellurium. Wurtz[1] in America (1864) and Crookes in England (1865) made independently the discovery that, by the addition of a small quantity of sodium to the mercury, the operation is much facilitated. It is also stated that sodium prevents both the "sickening" and the "flouring" of the mercury which is produced by certain associated minerals. Cosmo Newberry has investigated with much care the action of certain metals in impeding amalgamation.[2] Wurtz recommends two amalgams, one containing 2 and the other 4 per cent. of sodium, and in practice 1 per cent. or less of these is added to the mercury in the amalgamator. Crookes employs three kinds, which he calls A, B, and C amalgams; each contains 3 per cent. of mercury, but the B variety has, in addition to the sodium, 20 per cent. of zinc, and C is mixed with 10 per cent. of zinc and 10 per cent. of tin. The addition of cyanide of potassium has been suggested to assist the amalgamation and to prevent "flouring," but Skey[3] has shown that its use is attended with loss of gold.

Separation of Gold from the Amalgam.—The amalgam is first pressed in wetted canvas or buckskin in order to remove excess of mercury. According to Rittinger, mercury will dissolve from 0·05 to 0·08 per cent. of native gold of standard 650 to 850 without loss of fluidity, the solubility of the gold increasing with its fineness; and until the point of saturation is reached, no separation of solid amalgam is possible. Lumps of the solid amalgam, about 2 inches in diameter, are introduced into an iron vessel lined with a paste of fire-clay and wood ashes, and provided with an iron tube that dips below the surface of water. The distillation is then effected by heating, care being taken that the retort does not become visibly red in daylight. The amalgam yields about 30 to 40 per cent. of gold. In California the amalgam is retorted in cast-iron pans placed in cast-iron cylinders 11 inches in diameter, 4 feet 6 inches long, supported on brick work. The bullion left in the retorts is then melted in black-lead crucibles, with the addition of small quantities of suitable fluxes.

The extraction of gold from auriferous minerals by fusion, except as an incident in their treatment for other metals, is very rarely practised. It was at one time proposed to treat the concentrated black iron obtained in the Ural gold washings, which consists chiefly of magnetite, as an iron ore, by smelting it with charcoal for auriferous pig-iron, the latter metal possessing the property of dissolving gold in considerable quantity. By subsequent treatment with sulphuric acid the gold could be recovered. Experiments on this point were made by Anossow in 1835, but they have never been followed in practice.

Gold in galena or other lead ores is invariably recovered in the refining or treatment of the lead and silver obtained. Pyritic ores containing copper are treated by methods analogous to those of the copper smelter. This is extensively done. In Colorado the pyritic ores containing gold and silver in association with copper are smelted in reverberatory furnaces for regulus, which, when desilverized by Ziervogel's method, leaves a residue containing 20 or 30 ounces of gold per ton. This is smelted with rich gold ores, notably those containing tellurium for white metal or regulus; and by a following process of partial reduction analogous to that of selecting in copper smelting, "bottoms" of impure copper are obtained in which practically all the gold is concentrated. By continuing the treatment of these in the ordinary way of refining, poling, and granulating, all the foreign matters other than gold, copper, and silver are removed, and, by exposing the granulated metal to a high oxidizing heat for a considerable time, the copper may be completely oxidized while the precious metals are unaltered. Subsequent treatment with sulphuric acid renders the copper soluble in water as sulphate, and the final residue contains only gold and silver, which is parted or refined in the ordinary way. This method of separating gold from copper, by converting the latter into oxide and sulphate, is also used at Oker in the Harz.

Chlorination Process.—Plattner suggested that the residues from certain mines at Reichenstein, in Silesia, should be treated with chlorine after the arsenical products had been extracted by roasting. The process, which depends upon the fact that chlorine acts rapidly upon gold, but does not attack ferric oxide, is now adopted in Grass Valley, California, where the waste minerals, principally pyrites from tailings, have been worked for a considerable time by amalgamation. The roasting is conducted at a low temperature in some form of reverberatory furnace. Salt is added in the roasting to convert all the metals present, except iron, into chlorides. The auric chloride is, however, decomposed at the elevated temperature into finely-divided metallic gold, which is then readily attacked by the chlorine gas. The roasted mineral, slightly moistened, is next introduced into a wooden vat, pitched inside, and furnished with a double bottom, as is shown in fig. 8. Chlorine

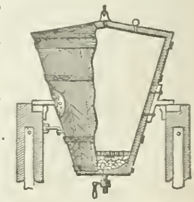

Fig. 8.

is led from a suitable generator beneath the false bottom, and rises through the moistened ore, resting on a bed of broken quartz below the false bottom, converting the gold into a soluble chloride, which is afterwards removed by washing with water. The precious metal is then precipitated as metallic gold by sulphate of iron. The process has been greatly improved in America by Küstel, Deetken, and Hoffmann; with proper care it is a very perfect one, and yields 97 per cent. of the gold originally present in the ore. It is stated not to cost more in California than 50s. a ton. Any silver originally present in the ore is of course converted into chloride of silver and remains with the residue, from which it may be extracted by the solvent action of brine or by amalgamation.

Refining or Parting Gold from other Metals.—Strabo states[1] that in his time a process was employed for refining and purifying gold in large quantities by cementing or burning it with an aluminous earth, which, by destroying the silver, left the gold in a state of purity. Pliny shows that for this purpose the gold was placed on the fire in an earthen vessel with treble its weight of salt, and that it was afterwards again exposed to the fire with two parts of salt and one of argillaceous rock, which, in the presence of moisture, effected the decomposition of the salt; by this means the silver became converted into chloride. In a similar process still practised in New Granada the granulated argentiferous gold is mixed with one part of common salt and two parts of brick dust. In the presence of moisture, effected by the passage of aqueous vapour through the porous pots in which the mixture is heated, the salt acts on the brick dust, producing silicate of soda, and the evolution of hydrochloric acid affords a source of chlorine for the silver. The chloride of silver formed fuses readily and drops off, exposing a fresh surface of the alloy to the action of the gas.

Various methods for separating gold from silver or other alloys appear to have been in use from ancient times. Among these may be mentioned prolonged oxidation by exposure to air, and treatment with sulphur, sulphide of antimony, and corrosive sublimate. In the Harz, 2 ounces of the granulated alloy of gold and silver were mixed and heated with 1 ounce of sulphur, litharge being added to separate the gold remaining in the sulphide of silver.

Parting by Nitric Acid, the old process of refining, is now practised in England by only one firm, although in some refineries both the nitric acid and the sulphuric acid processes are combined, the alloy being first treated with nitric acid. It used to be called "quartation," from the fact that 4 parts of the alloy best suited for the operation of refining contain 3 parts of silver and 1 of gold. The operation may be conducted in vessels of glass or platinum, and each pound of granulated metal is treated with a pound and a quarter of nitric acid of specific gravity 1·32. It is the method employed in the assay of gold (see ASSAYING).

Refining by Sulphuric Acid is the process usually adopted for separating gold from silver on the large scale. It appears to have been proposed in France by Dizé at the beginning of the present century. It was actually in use in France in 1820, and was introduced into the Mint refinery, London, by Mr Mathison in 1829.[2] It is based upon the facts that concentrated hot sulphuric acid converts silver and copper into soluble sulphates without attacking the gold, the sulphate of silver being subsequently reduced to the metallic state by copper plates with the formation of sulphate of copper.

About 80 ℔ of the granulated alloy are boiled for three or four hours in a platinum vessel (fig. 9) with 2·5 times its weight of sulphuric acid of specific gravity 1·84. The sulphurous acids which arise are partially condensed before being allowed to pass into the air. When the acid has

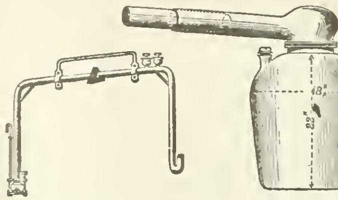

FIG. 9.—Refinery Siphon and Alembic.

ceased to act on the metal, a small quantity of sulphuric acid of specific gravity 1·53 is added, and, after a second boiling, the contents of the vessel are allowed to settle. The supernatant liquid is then withdrawn from the gold, which falls to the bottom of the vessel, and is diluted until its density is 1·21 or 1·26. The silver is usually precipitated from solution by copper plates, but sometimes iron is used, and the silver is roughly dried and compressed by an hydraulic press before it is melted into ingots. The gold, which is often again treated with sulphuric acid, is then washed and melted into ingots that contain from 997 to 998 parts of gold in 1000. The operation of parting may be conducted in iron or platinum vessels; the use of the former was advocated by M. Tocchi, and they are still extensively employed. Magnificent vessels of platinum have, however, been made in England by Messrs Johnson, Matthey, & Co. The alloys best suited for the operation contain from 800 to 950 of silver and 50 to 200 of copper and gold, but the proportion of gold must not exceed 200 parts in 1000. Refiners obtain alloys in suitable proportions by mixing together auriferous silver and argentiferous gold, the proportions of the respective metals having been previously indicated by assay. By such an arrangement, silver which contains but the 0·0004 part of gold, or 2·25 grains in the troy pound, may be profitably treated.

Cost of Refining.—The charge to the public for refining depends in a great measure on the amount of metal to be operated upon and its richness. In England, however, it may be considered to be about 1d. per ounce for the silver and 4d. per ounce for gold. In France the charge is about 90 cents to 1 franc 25 cents for a kilogramme of silver.

The Lower Harz smelting works produce annually from 50 to 55 cwts. of test silver of an average fineness of 950 silver and 50 gold per 1000; the proportion of the latter metal is, however, variable, being lowest (3 per 1000) in the silver obtained from clean lead ores, and highest (10 per 1000) in that separated from argentiferous copper ores,—that from the mixed copper and lead ores being of intermediate richness. The silver, in quantities of 25 kilogrammes, is refined upon small tests in a muffle, and when sufficiently purified is granulated by ladling it into water, whereby thin flattened granules suitable for dissolving are obtained.

The parting vessels (fig. 10) are of porcelain which, to protect them against fracture by irregular heating, are covered with wire netting and plastered over with a mixture of clay and smithy scales. They are mounted in a frame and set loose in an iron pot with a hemispherical bottom, which is heated by a fire from below; the pot also serves to catch the contents of the porcelain vessel if the latter should be accidentally broken. The cover is perforated by a hole in the centre for the passage of a lead pipe to carry off the sulphurous acid fumes,

[1] Fabbroni, *Ann. Chim.*, t. lxxii. p. 25.
[2] *Report on the Royal Mint*, 1837, Appendix, p. 59.

and a smaller one at one side through which acid may be introduced. These, as well as other connexions on the pipes carrying off the vapours, are secured by water-joints. The charge of about 200 ounces (6·25 kilogrammes) of granulated silver is treated with twice its weight of sulphuric acid marking 66° Baumé, and, by careful firing, is dissolved in six hours. The proper management of the heat is of importance, as neglect in the conduct of the operation may easily lead to a breakage of the pot. When the charge is completely dissolved the liquid is allowed to settle for some time, and is then poured off into a lead pan, where the silver sulphate solidifies. This, when redissolved by an addition of water and careful warming, is treated with strips of copper, the separation of the silver being facilitated by agitating the liquid. When the latter is found to be completely free from silver the heating is stopped, and the contents of the pan are allowed to settle for eighteen hours, when the copper solution is drawn off by a siphon and sent to the vitriol crystallizers. In the precipitation of 100 kilogrammes of silver about 30 kilogrammes of sheet-copper are expended.

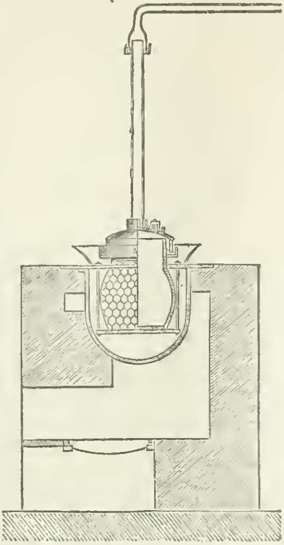

Fig. 10.

The precipitated silver is washed with water in a copper vessel upon a linen filter until the reaction of copper in the washings ceases, and then moulded in cylindrical blocks by screw pressure, to express the residual water. These when fire-dried are melted in black-lead pots, holding 75 lb, with the addition of a little soda nitre.

The parted gold remaining in the porcelain pot, though already sensibly finer than is usual when iron parting vessels are used, still contains silver, and is therefore boiled once more with sulphuric acid of 66° Baumé. Afterwards it is washed with water until silver can be no longer detected in the washings, when it is transferred to a porcelain dish and dried. When a quantity of about 10 lb of gold has been accumulated, it is mixed with a little borax glass, melted in a black-lead pot, and cast. The resulting bars average $\frac{985}{1000}$ fine.

Refining by Chlorine Gas.—F. Bowyer Miller[1] devised in 1867 the following method for separating silver from gold. The process, which is the one now adopted in the Australian mints,[2] consists in converting the silver into chloride by the passage of a stream of chlorine gas through the molten alloy. Clay crucibles are employed after having been saturated with a strong solution of borax and allowed to dry. The chlorine is introduced through the gold by a clay pipe passing to the bottom of the crucible, and connected with the chlorine generator in which the necessary pressure is obtained by a pressure tube 8 feet high. The chloride of silver is easily poured off from the surface of the molten metal, and by carefully fusing with a little carbonate of soda, the small amount of gold it retains is separated and falls to the bottom of the crucible. The gold operated upon contains from 3 to 12 per cent. of silver, and the average fineness of the refined gold is 994. The operation is now conducted on a considerable scale in Australia, and in the years 1871 and 1872 no less than 1,100,000 ounces of gold were refined by its aid in Sydney alone. The absolute loss of gold does not exceed 14 parts in 100,000.

Toughening Brittle Gold.—It will be seen from p. 751 that minute traces of certain metals, which do not exceed the $\frac{1}{1920}$th part of the mass, render gold brittle and unfit for coinage. Miller showed that the removal of the deleterious metals might be effected by converting them into volatile chlorides by a stream of chlorine gas. The process was introduced into the English mint by Roberts,[3] who successfully treated over 40,000 ounces of brittle gold with but trifling loss of precious metal. Wagner has suggested[4] that bromine may replace chlorine in Miller's process. Brittle gold may also be toughened by throwing a small quantity of corrosive sublimate on to the surface of the molten metal, but this method is wasteful, and the fumes evolved are deleterious. The late Mr Warington[5] proposed to toughen brittle gold by the addition of about 10 per cent. of black oxide of copper. The process is efficacious, but the crucibles become much corroded and even perforated; the standard fineness of the gold is, moreover, lowered by such copper as is reduced to the metallic state. If gold is but slightly brittle, it may be toughened by pouring it in a thin stream through atmospheric air into a crucible lined with borax, or by the addition of a small quantity of chloride of copper.

Preparation of Pure Gold.—Chemically pure gold may be prepared by several methods. The metal, either in the form of powder or "cornets" from the purest gold that can be obtained, is dissolved in nitro-hydrochloric acid. The excess of acid is driven off, alcohol and chloride of potassium added to precipitate platinum, and the chloride of gold is then dissolved in pure distilled water, the solution being diluted until each gallon does not contain more than half an ounce of the precious metal. The solution is allowed to stand for several weeks, and the supernatant liquid is carefully removed by a siphon from any chloride of silver that may have fallen to the bottom of the vessel. The gold may then be precipitated by a stream of carefully washed sulphurous anhydride, or by the addition of oxalic acid, formic acid, or ferrous sulphate. The spongy gold is washed with dilute hydrochloric acid, distilled water, ammonia water, and again with distilled water, after which it is melted in a clay crucible with a little bisulphate of potash and borax, and poured into a stone mould. Roberts[6] prepared by this method 70 ounces of gold of which the average purity was 999·96, the precipitant being oxalic acid. Gold precipitated by oxalic acid from an acid solution containing copper is always contaminated with cupric oxalate. E. Purgotti[7] has, however, shown that by heating the solution with the addition of potash, a soluble double oxalate of copper and potash is formed, and the gold is left in the pure state.

Alloys of Gold.—The most important alloys are those with silver and copper. Those used for coinage at the present day contain from 800 parts of gold in 1000, the standard of the Norwegian 2-kroner

piece, to 986·6, that of the Austrian reichsducaten, the alloying metal being mainly copper. In England, when gold coins were first introduced by Henry III., in 1257, they were of pure gold. Edward III., in 1345, was the first to use a standard 994·8, and in 1526 Henry VIII. issued crowns of the double rose of the standard 916·6 for concurrent issue with sovereigns, and other coins of the original standard 994·8. In 1544 the standard for all gold coins was reduced to 916·6, and again in 1546 to 833·4, the lowest point ever reached in England. Mary restored the old standard 994·8. Elizabeth directed that coins of both standards, 916·6 and 994·8, should be issued, and the latter was employed at intervals until 1640. Since then the lower standard, 916·6, has been solely used, and, as is shown by the following extract from the Coinage Act of 1870, 33 Vic. c. 10, is the one now in use :—

Denomination of Coin.	Standard Weight.		Least Current Weight.		Standard Fineness.	Remedy Allowance.		
	Imperial Weight. Grains.	Metric Weight. Grams.	Imperial Weight. Grains.	Metric Weight. Grams.		Weight per piece. Imperial Grains.	Weight per piece. Metric Grams.	Millesimal Fineness.

In America and in those countries which have formed the "Latin Convention," the standard of gold coin is 900, with a "remedy" of $\pm\frac{2}{1000}$. M. Peligot suggested[1] that by employing a triple alloy containing 58·1 per cent. of gold, 36·1 of copper, and 5·8 of zinc, a coin might be produced which, while being of the value of 25 francs, would have the decimal weight of 10 grammes. The alloy is perfectly malleable and of good colour. In England the following standards are used for plate and jewellery, 375, 500, 625, 750, and 916·6, the alloying metal being silver and copper in varying proportions. In France three alloys of the following standards are used for jewellery, 920, 840, and 750. A greenish alloy used by goldsmiths contains 70 per cent. of silver and 30 per cent. of gold. "Blue gold" is stated to contain 75 per cent. of gold and 25 per cent. of iron. The Japanese use for ornament an alloy of gold and silver, the standard of which varies from 350 to 500, the colour of the precious metal being developed by "pickling" in a mixture of plum-juice, vinegar, and sulphate of copper. They may be said to possess a series of bronzes, in which gold and silver replace tin and zinc, all these alloys being characterized by patina having a wonderful range of tint. The common alloy, Shi-ya-ku-Do, contains 70 per cent. of copper and 30 per cent. of gold ; when exposed to air it becomes coated with a fine black patina, and is much used in Japan for sword ornaments. Gold wire may be drawn of any quality, but it is usual to add 5 to 9 dwts. of copper to the pound.[2]

The "solders" used for red gold contain 1 part of copper and 5 of gold ; for light gold, 1 part of copper, 1 of silver, and 4 of gold.

Alloys of Gold and Silver.—Electrum, the natural alloy of gold and silver, has already been described, p. 740. Matthiessen observed that the density of those alloys, the composition of which varies from $AuAg_6$ to Au_6Ag, is greater than that calculated from the densities of the constituent metals. These alloys are harder, more fusible, and more sonorous than pure gold. The alloys of the formulæ $AuAg$, $AuAg_2$, $AuAg_4$, and $AuAg_{20}$ are perfectly homogeneous, and have been studied by Levol.[3] Hatchett has shown,[4] by a series of careful experiments, that certain metals, even when present in such small quantities as the $\frac{1}{1920}$th part of the mass, render standard gold brittle and unfit for rolling. These metals are bismuth, lead, antimony, arsenic, and zinc.

Gold and Zinc.—With regard to the latter metal, it may be remarked that, although its presence in small quantities renders gold brittle, it may be added to gold in larger quantities without destroying the ductility of the precious metal, for, as has been already stated, Peligot proved that a triple alloy of gold, copper, and zinc, which contains 5·8 per cent. of the last-named, is perfectly ductile. The alloy of 11 parts gold and 1 part of zinc is, however, stated to be brittle.

Gold and Tin.—Alchorne[5] showed that gold alloyed with $\frac{1}{37}$th part of tin is sufficiently ductile to be rolled and stamped into coin, provided the metal is not annealed at a high temperature. The alloys of tin and gold are hard and brittle, and the combination of the metals is attended with contraction ; thus the alloy $SnAu$ has a density 14·243, instead of 14·828 indicated by calculation. Matthiessen and Bose[6] obtained large crystals of the alloy Au_2Sn_5, having the colour of tin, which changed to a bronze tint by oxidation.

Gold and Iron.—Hatchett found that the alloy of 11 parts gold and 1 part of iron is easily rolled without annealing. In these proportions the density of the alloy is less than the mean of its constituent metals.

Gold and Palladium.—These metals are stated to alloy in all proportions. According to Chenevix,[7] the alloy composed of equal parts of the two metals is grey, is less ductile than its constituent metals, and has the specific gravity 11·08. The alloy of 4 parts of gold and 1 part of palladium is white, hard, and ductile. Graham has shown[8] that a wire of palladium alloyed with from 24 to 25 parts of gold does not exhibit the remarkable retraction which, in pure palladium, attends its loss of occluded hydrogen.

Gold and Platinum.—Clarke states that the alloy of equal parts of the two metals is ductile, and has almost the colour of gold.

Gold and Rhodium.—Gold alloyed with $\frac{1}{4}$th or $\frac{1}{5}$th of rhodium is, according to Wollaston, very ductile, infusible, and of the colour of gold.

Gold and Iridium.—Small quantities of iridium do not destroy the ductility of gold, but this is probably because the metal is only disseminated through the mass, and not alloyed, as it falls to the bottom of the crucible in which the gold is fused.

Gold and Nickel.—Eleven parts of gold and 1 of nickel yield an alloy resembling brass.

Gold and Cobalt.—Eleven parts of gold and 1 of cobalt form a brittle alloy of a dull yellow colour.

Assay of Gold.—It may be well to supplement the information given in the article ASSAYING with some additional details as to the assay of gold bullion, as practised in the Royal Mint, and of gold ores. The assay of bullion consists of six operations:—

(1.) The sample of metal taken for assay is flattened, and an assistant adjusts a portion of it to an exact weight by cutting or filing. This weight varies with different operators from 5 to 16 grains. The assayer then completes the adjustment on a more sensitive balance. The prepared assay piece is wrapped in lead foil, together with a certain amount of pure silver, which is generally equal to $2\frac{1}{2}$ times the amount of gold assumed to be present. In the case of standard gold, the weight of lead employed is to the weight of the alloy taken for assay as 8 to 1, and the ratio of the weight of lead to the weight of copper present is 100:1. Much diversity of opinion exists as to the amount of lead that should be employed. The proportions recommended by D'Arcet[9] are considerably less than those advocated by Kandelhardt ;[10] and it may be stated, with regard to the silver, that the last mentioned authority and Chaudet recommend the proportion of 1 of gold to $2\frac{1}{2}$ of silver, but Pettenkofer states that the proportion need not exceed 1 to $1\frac{1}{2}$, provided that the subsequent boiling in nitric acid is sufficiently prolonged. The amount of gold lost in cupellation has been shown by Rossler to increase with the amount of lead used, and to decrease as the amount of silver is increased.[11]

(2.) The necessary number of cupels are arranged on the bottom of the muffle (fig. 2, ASSAYING), and the packets containing the silver and gold are transferred from a numbered wooden range to corresponding cupels. The furnace operations are then performed as is described in ASSAYING (p. 727), and the result is that each cupel contains a button of silver and gold.

(3.) The button *a* (fig. 11) is flattened by striking it with a hammer on a polished anvil, first in the centre, and then on the edge, a third blow being given on the opposite edge which elongates the metal. After annealing in an iron tray, the flattened buttons *b* are reduced by laminating rolls to the thickness of a visiting card *c*. They are again annealed and rolled into a spiral or cornet *d*.

(4.) These cornets are then treated with nitric acid of specific gravity 1·2, either separately in parting flasks, or together in cups

of platinum, which are introduced into a suitable vessel of platinum, an arrangement by which it will be evident much time may be saved. The boiling is then continued for fifteen or twenty minutes, when the cornets are washed with distilled water, and treated with nitric acid of specific gravity 1·3, and in this the cornets remain for about the same period, after which they are again washed in distilled water and dried.

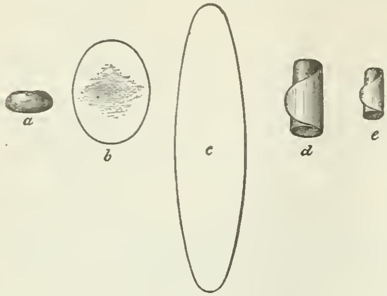

Fig. 11.

(5.) The cornets are annealed, separately, in little clay crucibles, or in the platinum cups in which they have been boiled, by heating them to bright redness. They then diminish considerably in bulk as *e* (fig 11), and are of a pure yellow colour.

(6.) The cornets are then weighed in comparison with "check assays" made on pure gold. These "checks" are necessary, as the accuracy of the result of an assay is liable to be affected either by retention of silver or copper, or by loss of gold by volatilization in the muffle, solution in the acid, or retention in the cupel. The weight of gold, therefore, indicated by the balance, may be either less or greater than the amount originally present in the alloy. The correction to be applied to a gold assay will be evident from the following formula :[1]—

Let 1000 be the weight of alloy originally taken ;

p the weight of the piece of gold finally obtained ;

x the actual amount of gold in the alloy expressed in thousandths ;

a the weight of gold (supposed to be absolutely pure) taken as a check, which approximately equals x ;

b the loss or gain in weight experienced by a during the process of assay, expressed in thousandths ;

k the variation of "check gold" from absolute purity, expressed in thousandths ;

then the actual amount of fine gold in the check-piece $= a\left(1 - \frac{k}{1000}\right)$, and x the corrected weight of the assay will $= p - \frac{a\,k}{1000} \pm b$; b being added or subtracted according as it is a loss or gain.

If a be assumed to be equal to x this equation becomes

$$x = \frac{p \pm b}{1 + \frac{k}{1000}}.$$

Example.—Let $p = 901{\cdot}1$ thousandths.

$a = 920{\cdot}0$,,

$b = 0{\cdot}3$,, gain in weight.

$k = 0{\cdot}1$,,

Then by the first formula—

$$x = 901{\cdot}1 - \frac{920 + 0{\cdot}1}{1000} - 0{\cdot}3;$$

For, as b is a gain in weight, it must be deducted, hence

$$x = 901{\cdot}1 - 0{\cdot}092 - 0{\cdot}3$$
$$= 900{\cdot}708.$$

And by the second formula—

$$x = \frac{901{\cdot}1 - 0{\cdot}3}{1 + \frac{0{\cdot}1}{1000}}$$
$$= 900{\cdot}708$$

Assay of Gold Ores.—500 grains of the finely powdered sample, which must be taken with the greatest care and accuracy, is passed through a sieve of fine wire gauze with at least 80 meshes to the linear inch. Any residue there may be of flattened particles of gold is set aside for subsequent treatment, usually by direct cupellation. Assay of the ore by *fusion with litharge* is best suited to ores which do not contain much iron pyrites. For auriferous quartz 500 grains of the ore are fused with 500 grains of red lead, 300 grains of sodic carbonate, 20 grains of powdered charcoal, and 250 grains of borax. The mixture is introduced into a clay crucible, which it should half fill, and is fused in an air furnace. The button of reduced lead may be removed, either by pouring the contents of the crucible into a mould, or by breaking the crucible when cold. If the ore contains much iron pyrites, or is of the nature of "sweep," the name given to carbonaceous residues which accumulate in mints and goldsmiths' shops, it will be necessary to roast it in a shallow fire-clay dish placed in a muffle. In the case of pyrites containing about 7 dwts. to the ton, the operation would be conducted on about 1000 grains. The roasted ore is then fused with about the same mixture of fluxes as has been given for quartz.

Assay by Scorification.—Scorification resembles cupellation, but the oxide of lead produced in the operation, instead of sinking into a porous cup, is held in a flat saucer of fire-clay, and dissolves the earthy constituents of the ore, leaving the precious metal to pass into another portion of lead which remains in the metallic state. About 200 grains of the roasted ore are placed in the scorifier, intimately mixed with 500 grains of granulated and 50 grains of borax lead ; 500 grains of lead are then distributed over the surface of the mixture ; the contents of the scorifier are fused in a muffle ; air is admitted to oxidize the greater portion of the lead ; and, at the conclusion of the operation, the litharge should be perfectly fluid and cover the molten lead. The slag may be freed from particles of precious metal by the addition at the conclusion of the operation of a small quantity of powdered anthracite, which reduces a portion of the litharge to metallic globules, which fall through the slag and unite with the lead button. The gold is then separated by cupellation, and the silver with which it is nearly always associated is removed by parting in nitric acid.

Assay by means of the Spectroscope.—Lockyer and Roberts[2] state, as the result of a careful spectroscopic investigation of the alloys of gold and copper, that it is possible to distinguish between alloys of these metals which only differ in proportion by $\frac{1}{10000}$th part. Their experiments have been repeated in America by A. E. Outerbridge.[3] (W. C. R.—H. B.)

It will be convenient to give here, in connexion with the article Gold, rather than in their proper alphabetical place, the articles Goldbeating and Gold Lace.

GOLDBEATING. The art of goldbeating is of great antiquity, being referred to by Homer; and Pliny states that one ounce of gold was extended to 750 leaves, each leaf being four fingers square, which is three times the thickness of the ordinary leaf gold of the present time. In all probability the art originated among Oriental communities, where the working of gold and the use of gold ornaments have been distinguishing characteristics from the most remote periods; and in India goldbeating is still carried on as a craft involving many mysteries and great difficulties. On the coffins of the Theban mummies specimens of original leaf-gilding are met with, where the gold is in so thin a state that it resembles modern gilding. The Incas of Peru do not appear to have been able to reduce gold further than to plates which could be nailed for ornamentation on the walls of their temples. In England goldbeating was confined to London until within the present entury. It was introduced into Scotland and the United States within that period, and it is now practised in most towns of any considerable size ; but so far as concerns Great Britain it is principally centred in London. One grain of gold has been beaten out to the extent of 75 square inches, and the same weight of silver to 98 square inches. Taking a cubic inch of gold at 4900 grains, this gold-leaf is the 367,650th part of an inch in thickness, or about 1200 times thinner than ordinary printing paper. The silver, though spread over a larger surface, was thicker, owing to the difference in its specific gravity ; but, calculated by weight, silver is the most malleable metal with which we are acquainted, in that respect considerably exceeding gold. This experiment does not, however, determine the extent of the malleability of either metal, as the means employed to test it were found to fail before there was any appearance of the malleability of the metals

[1] *Fourth Annual Report of the Deputy-Master of the Mint*, 1873, p. 42.

[2] *Phil. Trans.*, 1874, vol. clxiv. p. 495.

[3] *Journal of the Franklin Institute*, 1874.

being exhausted. In practice the average degree of tenuity to which the gold is reduced is not nearly so great as the example above quoted. A "book of gold" containing 25 leaves measuring each $3\frac{1}{4}$ inches, equal to an area of 264 square inches, generally weighs from 4 to 5 grains.

The gold used by the goldbeater is variously alloyed, according to the variety of colour required. Fine gold is commonly supposed to be incapable of being reduced to thin leaves. This, however, is not the case, although its use for ordinary purposes is undesirable on account of its greater cost. It also adheres on one part of a leaf touching another, thus causing a waste of labour by the leaves being spoiled; but for work exposed to the weather it is much preferable, as it is more durable, and does not tarnish or change colour. The external gilding on many public buildings, such, *e.g.*, as the Albert Memorial in Hyde Park, London, is done with pure gold. The following is a list of the principal classes of leaf recognized and ordinarily prepared by British beaters, with the proportions of alloy per ounce they contain.

Name of Leaf	Proportion of Gold.	Proportion of Silver.	Proportion of Copper.
	Grains.	Grains	Grains.
Red	456-460	...	20-24
Pale red	464	...	16
Extra deep	456	12	12
Deep	444	24	12
Citron	440	30	10
Yellow	408	72	...
Pale yellow	384	96	...
Lemon	360	120	...
Green or pale	312	168	...
White	240	240	...

The process of goldbeating is thus conducted. The gold, having been alloyed according to the colour desired, is melted in a crucible, at a higher temperature than is simply necessary to fuse it, as its malleability is improved by exposure to a greater heat; sudden cooling does not interfere with its malleable properties, gold differing in this respect from some other metals. It is then cast into an ingot, and flattened, by rolling between a pair of powerful smooth steel rollers, into a ribbon of $1\frac{1}{2}$ inch wide and 10 feet in length to the ounce. After being flattened it is annealed and cut into pieces of about $6\frac{1}{4}$ grs. each, or about 75 per ounce, and placed between the leaves of a "cutch," which is about half an inch thick and $3\frac{1}{2}$ inches square, containing about 180 leaves of a tough paper manufactured in France. Formerly fine vellum was used for this purpose, and generally still it is interleaved in the proportion of about one of vellum to six of paper. The cutch is beaten on for about 20 minutes with a 17-pound hammer, which rebounds by the elasticity of the skin, and saves the labour of lifting, by which the gold is spread to the size of the cutch; each leaf is then taken out, and cut into four pieces, and put between the skins of a "shoder," $4\frac{1}{2}$ inches square and $\frac{3}{4}$ths of an inch thick, containing about 720 skins, which have been worn out in the finishing or "mould" process. The shoder requires about two hours' beating upon with a 9-pound hammer. As the gold will spread unequally, the shoder is beaten upon after the larger leaves have reached the edges. The effect of this is that the margins of larger leaves come out of the edges in a state of dust. This allows time for the smaller leaves to reach the full size of the shoder, thus producing a general evenness of size in the leaves. Each leaf is again cut into four pieces, and placed between the leaves of a "mould," composed of about 950 of the finest gold-beaters' skins, five inches square and three-quarters of an inch thick, the contents of one shoder filling three moulds. The material has now reached the last and most difficult stage of the process; and on the fineness of the skin and judgment of the workman the perfection and thinness of the leaf of gold depend. During the first hour the hammer is allowed to fall principally upon the centre of the mould. This causes gaping cracks upon the edges of the leaves, the sides of which readily coalesce and unite without leaving any trace of the union after being beaten upon. At the second hour, when the gold is about the 150,000th part of an inch in thickness, it for the first time permits the transmission of the rays of light. In pure gold, or gold but slightly alloyed, the green rays are transmitted; and in gold highly alloyed with silver, the pale violet rays pass. The mould requires in all about four hours' beating with a 7-pound hammer, when the ordinary thinness for the gold leaf of commerce will be reached. A single ounce of gold will at this stage be extended to $75 \times 4 \times 4 = 1200$ leaves, which will trim to squares of about $3\frac{1}{4}$ inches each. The finished leaf is then taken out of the mould, and the rough edges are trimmed off by slips of the ratan fixed in parallel grooves of an instrument called a waggon, the leaf being laid upon a leathern cushion for that purpose. The sizes to which British leaf is cut are 3, $3\frac{1}{8}$, $3\frac{1}{4}$, $3\frac{3}{8}$, and $3\frac{1}{2}$ inches. The leaves thus prepared are placed into "books" capable of holding 25 leaves each, which have been rubbed over with red ochre to prevent the gold clinging to the paper. The leaf is used for gilding picture-frames, and for other ornamental purposes. See GILDING.

The fine membrane called goldbeaters' skin, used for making up the shoder and mould, is the outer coat of the cæcum or blind gut of the ox. It is stripped off in lengths about 25 or 30 inches, and freed from fat by dipping in a potash solution and scraping with a blunt knife. It is afterwards stretched on a frame; two membranes are glued together, treated with a solution of aromatic substances or camphor in isinglass, and subsequently coated with white of egg. Finally they are cut into squares of 5 or $5\frac{1}{2}$ inches; and to make up a mould of 950 pieces the gut of about 380 oxen is required, about $2\frac{1}{2}$ skins being got from each animal. A skin will endure about 200 beatings in the mould, after which it is fit for use in the shoder alone.

The dryness of the cutch, shoder, and mould is a matter of extreme delicacy. They require to be hot-pressed every time they are used, although they may be used daily, to remove the moisture which they acquire from the atmosphere, except in extremely frosty weather, when they acquire so little moisture that then a difficulty arises from their over-dryness, whereby the brilliancy of the gold is diminished, and it spreads very slowly under the hammer. On the contrary, if the cutch or shoder be damp, the gold will become that which is technically termed hollow or sieve-like; that is, it is pierced with innumerable microscopical holes; and in the moulds in its more attenuated state it will become reduced to a pulverulent state. This condition is more readily produced in alloyed golds than in fine gold. It is necessary that each skin of the mould should be rubbed over with calcined gypsum (the fibrinated variety) each time the mould may be used, in order to prevent the adhesion of the gold to the surface of the skin in beating. Dentist gold is gold leaf carried no further than the cutch stage, and should be perfectly pure gold.

By the above process also silver is beaten, but not so thin, the inferior value of the metal not rendering it commercially desirable to bestow so much labour upon it. Copper, tin, zinc, palladium, lead, cadmium, platinum, and aluminium can be beaten into thin leaves, but not to the same extent as gold or silver.

GOLD AND SILVER LACE. Under this heading a general account may be given of the use of the precious metals in textiles of all descriptions into which they enter. That these metals were used largely in the sumptuous textiles of the earliest periods of civilization there is abundant testimony; and to this day, in the Oriental centres whence a knowledge and the use of fabrics inwoven, ornamented, and embroidered with gold and silver first spread, the passion for such brilliant and costly textiles is still most strongly and generally prevalent. The earliest mention of the use of gold in a woven fabric occurs in the description of the ephod made for Aaron (Exod. xxxix. 2, 3)—"And he made the ephod of gold, blue, and purple, and scarlet, and fine twined linen. And they did beat the gold into thin plates, and cut it into wires (strips), to work it in the blue, and in the purple, and in the scarlet, and in the fine linen, with cunning work." In both the *Iliad* and the *Odyssey* distinct allusion is frequently made to inwoven and embroidered golden textiles. Many circumstances point to the conclusion that the art of weaving and embroidering with gold and silver originated in India, where it is still principally prosecuted, and that from one great city to another the practice travelled westward,—Babylon, Tarsus, Baghdad, Damascus, the islands of Cyprus and Sicily, Constantinople and Venice, all in the process of time becoming famous centres of these much prized manufactures. Alexander the Great found Indian kings and princes arrayed in robes of gold and purple; and the Persian monarch Darius, we are told, wore a war mantle of cloth of gold, on which were figured two golden hawks as if pecking at each other. There is reason, according to Josephus, to believe that the "royal apparel" worn by Herod on the day of his death (Acts xii. 21) was a tissue of silver. Agrippina, the wife of the emperor Claudius, had a robe woven entirely of gold, and from that period downwards royal personages and high ecclesiastical dignitaries used cloth and tissues of gold and silver for their state and ceremonial robes, as well as for costly hangings and decorations. In England, at different periods, various names were applied to cloths of gold, as ciclatoun, tartarium, naques or nac, baudekin or baldachin, Cyprus damask, and twssewys or tissue. The thin flimsy paper known as tissue paper, is so called because it originally was placed between the folds of gold "tissue" to prevent the contiguous surfaces from fraying each other. At what time the drawing of gold wire for the preparation of these textiles was first practised is not accurately known. The art was probably introduced and applied in different localities at widely different dates, but down till mediæval times the method graphically described in the Pentateuch continued to be practised with both gold and silver.

Fabrics woven with gold and silver continue to be used on the largest scale to this day in India; and there the preparation of the varieties of wire, and the working of the various forms of lace, brocade, and embroidery, is at once an important and peculiar art. The basis of all modern fabrics of this kind is wire, the "gold wire" of the manufacturer being in all cases silver gilt wire, and silver wire being, of course, composed of pure silver. In India the wire is drawn by means of simple draw-plates, with rude and simple appliances, from rounded bars of silver, or gold-plated silver, as the case may be. The wire is flattened into the strip or ribbon-like form it generally assumes by passing it, fourteen or fifteen strands simultaneously, over a fine, smooth, round-topped anvil, and beating it as it passes with a heavy hammer having a slightly convex surface. From wire so flattened there is made in India *soniri*, a tissue or cloth of gold, the web or warp being composed entirely of golden strips, and *ruperi*, a similar tissue of silver. Gold lace is also made on a warp of thick yellow silk with a weft of flat wire, and in the case of ribbons the warp or web is composed of the metal. The flattened wires are twisted around orange (in the case of silver, white) coloured silk thread, so as completely to cover the thread and present the appearance of a continuous wire; and in this form it is chiefly employed for weaving into the rich brocades known as kincobs or kinkhábs. Wires flattened, or partially flattened, are also twisted into exceedingly fine spirals, and in this form they are the basis of numerous ornamental applications. Such spirals drawn out till they present a waved appearance, and in that state flattened, are much used for rich heavy embroideries termed karchobs. Spangles for embroideries, &c., are made from spirals of comparatively stout wire, by cutting them down ring by ring, laying each C-like ring on an anvil, and by a smart blow with a hammer flattening it out into a thin round disk with a slit extending from the centre to one edge. Fine spirals are also used for general embroidery purposes. The demand for various kinds of loom-woven and embroidered gold and silver work in India is immense; and the variety of textiles so ornamented is also very great. "Gold and silver," says Dr Birdwood in his *Handbook to the British-Indian Section, Paris Exhibition*, 1878, "are worked into the decoration of all the more costly loom-made garments and Indian piece goods, either on the borders only, or in stripes throughout, or in diapered figures. The gold-bordered loom embroideries are made chiefly at Sattara, and the gold or silver striped at Tanjore; the gold figured *mashrus* at Tanjore, Trichinopoly, and Hyderabad in the Deccan; and the highly ornamented gold-figured silks and gold and silver tissues principally at Ahmedabad, Benares, Murshedabad, and Trichinopoly."

Among the Western communities the demand for gold and silver lace and embroideries arises chiefly in connexion with naval and military uniforms, court costumes, public and private liveries, ecclesiastical robes and draperies, theatrical dresses, and the badges and insignia of various orders. To a limited extent there is a trade in gold wire and lace to India and China. The metallic basis of the various fabrics is wire round and flattened, the wire being of three kinds—1st, gold wire, which is invariably silver gilt wire; 2d, copper gilt wire, used for common liveries and theatrical purposes; and 3d, silver wire. These wires are drawn by the ordinary processes, and the flattening, when done, is accomplished by passing the wire between a pair of revolving rollers of fine polished steel. The various qualities of wire are prepared and used in precisely the same way as in India,—round wire, flat wire, thread made of flat gold wire twisted round orange-coloured silk or cotton, known in the trade as "orris," fine spirals and spangles, all being in use in the West as in the East. The lace is woven in the same manner as ribbons, and there are very numerous varieties in richness, pattern, and quality. Cloth of gold, and brocades rich in gold and silver, are woven for ecclesiastical vestments and draperies.

The proportions of gold and silver in the gold thread for the lace trade varies, but in all cases the proportion of gold is exceedingly small. An ordinary gold lace wire is drawn from a bar containing 90 parts of silver and 7 of copper, coated with 3 parts of gold. On an average each ounce troy of a bar so plated is drawn into 1500 yards of wire; and therefore about 16 grains of gold cover a mile of wire. It is estimated that about 250,000 ounces of gold wire are made annually in Great Britain, of which about 20 per cent. is used for the headings of calico, muslin, &c., and the remainder is worked up in the gold lace trade.

GOLDAST, Melchior Haiminsfeld (1576–1635), an historical writer and collector whose works did great service to the study of the older documents of Germany, was born, January 6, 1576 (or 1578), of poor Protestant parents, near Bischofzell in Thurgau. His university career at Ingoldstadt and Altdorf was cut short by his poverty; but at length, in 1603, after he had spent some time at St Gall and Geneva, partly supported by the learned and benevolent jurist Bartholomeus Schobinger, he obtained the post of secretary to Henry, duke of Bouillon, and with him he went to Heidelberg and Frankfort-on-the-Main. But Goldast, though able and laborious, had fallen into an unsettled way of life, and in 1604 we find him in the service of the Baron Hohensax—then the possessor of that unique manuscript of old German poems which now forms one of the treasures of the National Library at Paris, and which Goldast was the first to make partially accessible by the press. Before long he was back in Switzerland, and by 1606 he was again in Frankfort living by his pen, and finding his efforts to obtain a regular post frustrated by Lipsius and Scioppius, whom he had offended by his outspokenness. In 1611 he was appointed councillor at the court of Saxe-Weimar; in 1615 he entered the service of the count of Schaumburg at Bückeburg, and in 1625 returned to Frankfort. As the transport of his books from Bückeburg to Frankfort was attended with danger, owing to the warlike operations then on foot, he entrusted them to the town of Bremen, and they now form part of the municipal library. Appointed in 1627 councillor to the emperor and to the elector of Treves, Goldast soon after passed into the service of the landgrave of Hesse-Darmstadt, who raised him to be chancellor of the university of Giessen. He died at Giessen in the beginning of 1635. Nothing perhaps proves the value of Goldast's labours better than the fact that, in consideration of the service he has rendered, the modern historical and philological investigator is willing to condone the almost unpardonable sin of direct literary forgery of which he has been accused and convicted.

Among his more important works are his *Paræneticorum veterum* (Lille, 1604), which contained the *Kunig Tyro von Schottland*, the *Winsbeken*, and the *Winsbekin*; *Rerum Alamannicarum Scriptores*, Frankf. 1606, 3 vols., new ed. by Senckenberg, *ibid.* 1730; *Monarchia S. Romani imperii*, Frankf. 1621; *Commentarii de regno Bohemiæ*, Hanover, 1627, new ed. by H. Schmink, Frankf. 1719. He edited the works of Pirkheimer and De Thou; and a volume of correspondence, *Virorum Cll. ad Goldastum epistolæ*, was published in 1688. See Senckenberg's *Goldasti Memoria*, prefixed to *Rer. Alamann. Scrip.*, 1730; Bayle's *Dictionary*; and Von Raumer, *Geschichte der germanischen Philologie*, Munich, 1870.

GOLDBERG, a town in the Prussian province of Silesia, capital of a circle in the government district of Liegnitz, is situated 14 miles S.W. of that town, on the Katzbach, an affluent of the Oder. The principal buildings are an old church dating from the beginning of the 13th century, the Schwabe-Priesemuth institution, completed in 1876, for the board and education of orphans, and the gymnasium, which in the 17th century enjoyed great prosperity, and numbered Wallenstein among its pupils. The chief manufactures are woollen cloth, flannel, gloves, stockings, leather, and beer, and there is a considerable trade in corn and fruit. Goldberg owes its origin and name to a gold mine in the neighbourhood, which, however, has been wholly abandoned since the time of the Hussite wars. Population (1875), 6492.

The town suffered heavily from the Tartars in 1241, from the plague in 1334, from the Hussites in 1428, and from the Saxon, imperial, and Swedish forces during the Thirty Years' War. On 27th May 1813 a battle took place near it between the French under Macdonald and the rear guard of the Russians under Wittgenstein; and on the 23d August of the same year a skirmish, in which Macdonald suffered defeat from the Prussians under Blücher.

GOLD COAST, a British colony in Western Africa reconstituted on the 24th of July 1876 by a royal charter which defines it as consisting of two settlements—(1) the Gold Coast proper, comprising "all places, settlements, and territories which may at any time belong to us in Western Africa, between the fifth degree of west longitude and the second degree of east longitude; and (2) the settlement of Lagos, similarly comprising all possessions between the second and fifth degrees of east longitude." The charter appoints a governor, establishes a legislative and an executive council, and authorizes the appointment of judges and other legal officers, &c. Both the Gold Coast colony and Lagos had previously been administered by lieutenant-governors dependent on the governor of Sierra Leone; and the two divisions are still sufficiently distinct to require separate treatment.

By Bosman, the Dutch factor at Elmina in the beginning of the 18th century, the Gold Coast is said to extend "about 60 miles, beginning with the Gold River, 3 miles west of Assini, or 12 miles above Axim, and ending with the village Ponni, 7 or 8 miles east of Acra."[1] In modern times, Cape Apollonia (2° 35′ W. long.) being accepted as the western boundary, and the mouth of the Volta river (0° 41′ 2″ E. long.) as the eastern, the whole coast measures about 225 miles, and this is divided into two sections, the windward or western and the leaward or eastern, the boundary between the two being the Secoom river (0° 3′ 2″ W. long.). Beginning at the west, the first places on the coast that deserve to be mentioned are Grand Bassam and Assini, both French settlements up to 1870. The mouth of the river Assini forms the outlet of a series of lagoons, the eastmost of which is fed by a considerable river—the Tanno or Tando. About 55 miles eastward from this point are the Four Hills or Hummocks of Apollonia, where the English formerly had a fort; and about 20 miles from Apollonia is the mouth of the Ankobne. Three miles further and we come to Axim, the site of an old Dutch fort built near the mouth of the Axim river; and other 20 miles and we reach Great Friedrichsburg, founded by the Brandenburg Company. Rounding Cape Three Points (2° 7′ W. long.), whose vicinity is marked by a line of breakers nearly 2½ miles long, the first place of importance that we find is Akodah or Aquidah, and 10 miles beyond Akodah lies the better known Dixcove or Dick's Cove. From Dixcove Pompendi is distant 10 miles, and other 12 or 13 miles brings us to Secondee, which is only 8 or 9 miles from the mouth of the Busum (or Sacred) Prah. With the exception of the Volta this is the largest river of the Gold Coast; it is on one of its sub-tributaries that Coomassee is situated. At the mouth of the Beyah, 19 or 20 miles eastward, stands Elmina, or in the native language Edenâ, one of the most important posts of European settlement, with a native population of some 10,000 (see ELMINA). Eight miles east of Elmina is Cape Coast Castle, which was the capital of the British territory until 1876. Anamaboe, 10 miles distant, is a town of some 4000 or 5000 inhabitants, with a free port and a good landing-place; and about 38 miles further on we come to Winnebah, which up till 1812 was the seat of an English fort. About 11 miles eastward there is another abandoned fort at Barrocoe; and at Barrocoe we are only 23 miles from Acra or Accra (in Tshi Nkran), the present capital of the Gold Coast colony. It was selected instead of Cape Coast Castle on account of its comparatively healthy position. In the words of Dr A. F. Elliot, it is the healthiest station on the west coast of Africa, being surrounded for miles by fresh undulating ground, and backed at the distance of a day's journey, or about 30 miles, by a range of hills where Europeans can recruit. A sanitary station has been fixed at Akropong, 1800 feet above the sea-level, where the Basel missionaries have their headquarters. About 2 miles east of Acra is the old Danish fort of Christiansborg. There is no station of much importance except Tassi, Ponce, and Great Ningo or Ningua, in the 60 miles between Acra and the Volta. The Volta, otherwise known as the Firaw, the Shilao, or the Amu, is a large river, the course of which has been only partially explored, but which may be expected to furnish a means of opening up the interior. In December 1875, M. M. J. Bonnat, journeying partly by water and partly by land, proceeded as far as Salaha or Paraha, a commercial town of some 18,000 inhabitants. He reports that the Labelle rapids, though 25 feet high, can be ascended by steamers during the rains in September and October, because at that season the river rises 50 feet. The lower part of the course is of difficult navigation in the dry season owing to the shallows. Addah, on the right bank of the river near its mouth; Quittah, the seat of a British fort; and Jellah Coffi, a trading port, are the principal places on the coast between the Volta and Flouhow, which lies at the eastmost extremity of the Volta lagoon. According to the ordinary divisions we enter the Slave Coast when we proceed east of the Volta.

[1] See *Nauwkeurige Beschryving van de Guinese Goud-Tand-en Slave Kust*, Amsterdam, 1709 (frequently translated).

Such are the chief points of interest along the Gold Coast, but there is a considerable range of territory extending from 20 to 60 miles inland, which belongs to the colonial protectorate; and about this a few words are necessary. The western portion of the protectorate is occupied by the woody hill country of Fanti, which stretches northwards towards Ashantee. From the mouth of the Secoom a fine range varying in height from 1200 to 1500 or 1600 feet stretches N.N.E., and divides the eastern portion into two halves. Between the mountains and the sea there are large stretches of prairie land, in which the grass grows to a height of 10 or 12 feet.

The inhabitants of the Gold Coast may be divided into two great classes—the Tshi or Chee, a black type, and the Acra, a red type. The Fantis and Ashantis, both belonging to the former class, have already been described in ASHANTEE. The Akems live in a thick forest region, and maintain existence by hunting, gold-digging, and the gathering of wood snails. The capital of their country is Kyebi.[1] The Aquapems are extensively engaged in agriculture and in trade, both with the other tribes and with Europeans. The Ga or Acra, a clever race, greatly modified by contact with European culture, are to be found in all the towns of the West African coast as artisans and sailors. They are employed by the interior tribes as middle men and interpreters. On the right bank of the Volta are the Adangme[2] or Adampe, distinguished by strength and rudeness. The Crobos live in little villages in the midst of the palm tree woods which grow round about the Croboberg, an eminence about 1000 feet high.

The Tshi or Chee language[3] belongs to the great prefix-pronominal group. It comprises many dialects, which may, however, be reduced to two classes or types.[4] Akan dialects are spoken in Assini, Amanahia (Apollonia), Awini, Ahanta, Wasaw, Tshuforo (Juffer or Tufel), and Denkyera in the west, and in Aseo, Akem, and Aquapem in the east, as well as in the different parts of Ashantee. Fante dialects are spoken, not only in Fanti proper, but in Afutu or the country round Cape Coast, in Abora, Agymako, Akomfi, Gomoa, and Agona. The difference between the two types is not very great; a Fanti, for example, can converse without much difficulty with a native of Aquapem or Ashantee, his language being in fact a deteriorated form of the same original. Akem is considered the finest and purest of all the Akan dialects. The Aquapem, which is based on the Akem but has imbibed Fanti influences, has been made the book-language by the Basel missionaries. About a million people in all, it is estimated, speak dialects of the Tshi. The south-eastern corner of the Gold Coast is occupied by another language known as the Ga or Acra, which comprises the Ga proper and the Adangme and Crobo dialects. Ga proper is spoken by about 40,000 people, including the inhabitants of Ga and Kinkã (*i.e.*, Dutch and British Acra, in Tshi, Nkran, and Kankau), Osu (*i.e.*, Christiansborg), La, Tessi, Ningua, and numerous inland villages. It has been reduced to writing by the missionaries. The Adangme and Crobo dialects are spoken by about 80,000 people. They differ very considerably from Ga proper, but books printed in Ga can be used by both the Crobo and Adangme natives. Another language known as Guan is used in parts of Aquapem and in Anum beyond the Volta; but not much is known either about it or the Obutu tongue spoken in a few towns in Agona, Gomoa, and Akomfi. The dialects of the Ahanta country have still to be investigated.[5]

Mahometanism and Christianity are both making themselves felt to some extent among the natives of the Gold Coast. A Danish mission was started at Christiansborg about 1736 by Protten and Huckoff, the Moravian brethren. In 1835 the Wesleyan mission began its labours among the Fanti. The Basel missionaries had made a start in 1828, but it was not till 1835 that they were fairly settled at Akropong, the capital of Aquapem. They now have stations also at Kyebi, at Kukurantimy, at Abune, at Abokoli, at Addah, and at Acra, and the leaders of the English expedition against the Ashantees speak very highly of their labours.

The climate of the Gold Coast is notoriously unhealthy. At Cape Coast Castle the thermometer ranges from 72° to 85° or 90°, and the amount of moisture in the atmosphere is very great. Not only are the coasts in many places lined with swamps and lagoons, but, according to Dr Gordon, the very basis rock of the country—a granite in which iron ore and hornblende are present—gives off under the influence of the air and the rain large quantities of sulphuretted hydrogen gas. The native towns are populous and dirty, and to add to the evil it was, until the prohibition of the British authorities (at Elmina by Colonel Festing, and at Cape Coast by Governor Strahan), the custom to bury the dead in the floors of the houses. Intermittent fevers, remittent fevers (the so-called coast fever is of this class), and dysentery are the diseases most to be dreaded by the European. "The native inhabitants," says Marcus Allen, "appear to enjoy tolerable health and to live to an average age; but in the rainy season it is not uncommon to find them suffering from pleuritis and pneumonia, rheumatic attacks, bronchitis, and catarrh."

Though the precious dust to which the Gold Coast owes its name is no longer obtained in any considerable quantities by the rude methods of collection employed by the natives, there is abundant proof that the whole region is more or less auriferous, and it is possible that European energy and skill might make it again a real gold coast. In some parts of the country—in the neighbourhood of the Volta, for example—the surface of the ground is broken by innumerable small pits dug by the native miners.[6] At present the value of the territory is mainly due to the profusion of vegetable products supplied by the rich alluvial soil. Of the timber trees which abound in the vast stretches of forest, the best known are several species of the genus *bombax* (silk cotton tree, &c.), from which canoes and wooden wares are manufactured, and the odoom used for building and cabinet-work. The cocoa-nut and the palm oil are common along the coast, and the bread-fruit tree has been introduced with success at Napoleon. Indian corn, yams, cassava, sweet potatoes, tiger-nuts, ground-nuts (*Arachis hypogœa*), Guinea corn (*Sorghum vulgare*), Guinea grains (*Amomum grana-paradisi*), the egg-plant (*Solanum ovigerum*), bennie seed, oranges, limes, shaddocks, pine apples, ginger, and indigo are some of the many objects of cultivation. Nor must the kola nut be forgotten (*Sterculia acuminata*), variously styled cclat, khola, and in older writers gura or gouroo; for it is the favourite substitute in Western Africa for the betel nut, and forms an important article of export. Both tobacco and cotton are indigenous, but neither is cultivated by the natives. Coffee and tobacco are grown by the missionaries at Akropong.

The exports are mainly gold dust, palm oil, and palm kernels; and the imports, in exchange, dry goods from the United Kingdom, and tobacco and spirits from America. In 1875 and 1876 the exports were respectively of the value of £327,012 and £465,268, and the corresponding imports amounted to £364,672 and £446,088. The revenue of the Gold Coast, mainly derived from customs duties, was £67,368 in 1875, and £64,788 in 1876; the corresponding expenditures were £67,368 for 1875, and £93,944 for 1876. There is no public debt.

The jurisdiction of England on the Gold Coast was defined by the bond of the 6th of March 1844, an agreement with the native chiefs by which Her Majesty receives the right of trying criminals and repressing human sacrifices, pannyaring, &c. The limits of the protectorate inland were not very rigidly defined. The purchase of the Danish forts in 1851, and of the Dutch forts and territory in 1871, led to the consolidation of the British power along the coast; and the Ashantee war of 1873-74 resulted in the extension of the area of British influence towards the interior. By the royal ordinances of December 1874 the selling, buying, or dealing in slaves was declared unlawful, and no person can any longer be put in pawn for debt; but those who were actually slaves at that date are left in the same state, except where cruelty can be proved against the masters.

Stanford, *Map of the Gold Coast*, &c., 1873.

GOLDEN BULL (Latin, BULLA AUREA) is, in general, the designation of any charter decorated with a golden seal or *bulla*, either from the intrinsic importance of its contents, or from the rank and dignity of the bestower or the recipient. The custom of thus giving distinction to certain documents is said to be of Byzantine origin, though if this be the case it is somewhat strange that the word employed as an equivalent for golden bull in Byzantine Greek should be the hybrid χρυσόβουλλον (*cf.* Codinus Curopalates, ὁ μέγας λογοθέτης διατάττει τὰ παρὰ τοῦ βασιλέως ἀποστελλόμενα προστάγματα καὶ χρυσόβουλλα πρός τε Ῥῆγας, Σούλτανας, καὶ τοπάρχους; and Anna Comnena, *Alexiad*, lib. iii., διὰ χρυσοβουλλίου λόγου; lib. viii., χρυσόβουλλον λόγον). In Germany a Golden Bull is mentioned under the reign of Henry I. in *Chronica Cassin.*, ii. 31, and the oldest German example, if it be genuine, dates from 983. At first the golden seal was formed after the type of a solid coin, but at a later date, while the golden surface presented to the eye was greatly increased, the seal was really composed of two thin metal plates filled in with wax. The number of golden bulls issued by the imperial chancery must have been very large; the town of Frankfort, for example, still preserves no fewer than eight. But the name has become practically restricted to a few documents of unusual political importance, the golden bull of the Empire, the golden bull of Brabant, the golden bull of Hungary, and the golden bull of Milan—and of these the first is undoubtedly *the* golden bull *par excellence*.

It was drawn up under the direction of the emperor Charles IV., and it was formally ratified in 1356,—the first twenty-three chapters by the diet of Nuremberg (10th January), and the remaining seven by the diet of Metz (25th December). The actual redaction has been assigned to Bartolus de Saxoferrato, to Rudolf of Friedberg the imperial secretary, and even to the emperor himself; but there is no distinct authority for any of the three hypotheses as opposed to the others. A brief statement of the general purpose of its enactments has already been given at page 495 of the present volume. The exordium is a strangely rhetorical lamentation over the miseries of division, and more especially of a kingdom divided against itself; and the body of the document gives a survey of the duties, privileges, and relations of the various dignitaries of the empire, the emperor, the electors ecclesiastical and secular, the electoral plenipotentiaries, and the officers of the court. As might almost be expected, a large place is given to rules of ceremony and etiquette. At first the document was known simply as the Lex Carolina; but by and by the name of the Book with the Golden Bull came into use, and the present elliptical title was sufficiently established by 1417 to be officially employed in a charter by King Sigismund. The original autograph was committed to the care of the electoral prince of Mainz, as chancellor-in-chief of the empire, and it was preserved in the imperial archives at Mainz till 1789. Official transcripts were probably furnished to each of the seven electors at the time of the promulgation, and before long many of the other members of the empire secured copies for themselves. The transcript which belonged to the elector of Treves is preserved in the state archives at Stuttgart, that of the elector of Cologne in the court library at Darmstadt, and that of the elector of Bohemia in the imperial archives at Vienna. Berlin, Munich, and Dresden also boast the possession of an electoral transcript; and the town of Kitzingen has a contemporary copy in its municipal archives. There appears, however, to be good reason to doubt the genuineness of most of these so-called original transcripts. But perhaps the best known example is that of Frankfort-on-the-Main, which was procured from the imperial chancery in 1366, and is adorned with a golden seal like the original. Not only was it regularly quoted as the indubitable authority in regard to the election of the emperors in Frankfort itself, but it was from time to time officially consulted by members of the empire.

The manuscript consists of 43 leaves of parchment of medium quality, each measuring about 10½ inches in height by 7½ in breadth. The seal is of the plate and wax type. On the obverse appears a figure of the emperor seated on his throne, with the sceptre in his right hand and the globe in his left; a shield, with the crowned imperial eagle, occupies the space on the one side of the throne, and a corresponding shield, with the crowned Bohemian lion with two tails, occupies the space on the other side; and round the margin runs the legend, *Karolus quartus divina favente clementia, Romanorum imperator semper Augustus et Boemiæ rex*. On the reverse is a castle, with the words *Aurea Roma* on the gate, and the circumscription reads, *Roma caput Mundi Regit orbis frena rotundi*. The original Latin text of the bull was printed at Nuremberg by Creussner in 1474, and a second edition by Kobergen appeared at the same place in 1477. Since that time it has been frequently reprinted from various manuscripts and collections. Goldastus gave the Palatine text, compared with those of Bohemia and Frankfort, in his *Collectio Constitutionum Imperialium*, tom. i. Another is to be found in Onuphrius Panvinius, *De Comitiis Imperii*, and as an appendix to Cujacius, *De feudis*; and a third, of unknown history, is prefixed to the *Codex Recessuum Imperii*, printed at Mainz in 1599, and again in 1615. The Frankfort text appeared in 1742—*Aurea Bulla secundum exemplar originale Frankfurtense*—from the pen of Wolfgang Ch. Multz. German translations, none of which, however, had any official authority, were published at Nuremberg, 1474(?); at Venice, Johannus Jenson, 1476; and at Strasburg, Joh. Preussen, 1485. Among the earlier commentators of the document are Buxtorf, Dominicus Arumæus, Martinus Rumelius, H. Caninius, G. T. Dietrich, Ostermann, Speidelius, and Limnæus (*In Auream bullam*, Strasburg, 1662). The student will find a good account of the older literature of the subject in Biener, *Commentarii de origine et progressu legum Germanicarum*, 1787 (vol. ii.); and, besides the important work of Ohlenschlager, *Neue Erläuterungen der Guldener Bulla*, Frankfort and Leipsic, 1766, he may consult H. G. Thülemarius, *De bulla aurea argentea*, &c., Heidelberg, 1682 (which gives the Frankfort text of the bull of Charles IV., a golden bull of Andronicus of Constantinople, the Bulla Brabantina, and the capitulation of Maximilian II.); Pütters, *Staatsverfassung des deutschen Reichs*, Gottingen, 1788; Pfister, *Geschichte der Deutschen*, Hamburg, 1831 (vol. iii.); and Stobbe, *Gesch. der Deutschen Rechtsquellen*, Brunswick, 1860. A learned article on "Goldene Bulle," by H. Brandes, will be found in Ersch and Gruber's *Encyclopädie*, 1861.

GOLDEN-EYE, a name indiscriminately given in many parts of Britain to two very distinct species of Ducks, from the rich yellow colour of their irides. The commonest of them—the *Anas fuligula* of Linnæus and *Fuligula cristata* of most modern ornithologists—is, however, usually called by English writers the Tufted Duck, while "Golden-eye" is reserved in books for the *A. clangula* and *A. glaucion* of Linnæus, who did not know that the birds he so named were but examples of the same species, differing only in age or sex; and to this day many fowlers perpetuate a like mistake, deeming the "Morillon," which is the female or young male, distinct from the "Golden-eye" or "Rattle-wings" (as from its noisy flight they oftener call it), which is the adult male. This species belongs to the group known as Diving Ducks, and is the type of the very well-marked genus *Clangula* of later systematists, which, among other differences, has the posterior end of the sternum prolonged so as to extend considerably over, and, we may not unreasonably suppose, protect the belly—a character possessed in a still greater degree by the Mergansers (*Merginæ*), while the males also exhibit in the extraordinarily developed bony labyrinth of their trachea and its midway enlargement another resemblance to the members of the same Subfamily. The Golden-eye, *C. glaucion* of modern writers, has its home in the northern parts of both hemispheres, whence in winter it migrates southward; but as it is one of the Ducks that constantly resorts to hollow trees for the purpose of breeding it hardly transcends the limit of the Arctic forests on either continent. So well known is this habit to the people of the northern districts of Scandinavia, that they very commonly devise artificial nest-boxes for its accommodation and their own profit. Hollow logs of wood are prepared, the top and bottom closed, and a hole cut in the side. These are affixed to the trunks of living trees in suitable places, at a convenient distance from the ground, and, being readily occupied by the birds in the breeding-season, are regularly robbed, first of the numerous eggs, and finally of the down they contain, by those who have set them up.

The adult male Golden-eye is a very beautiful bird, mostly black above, but with the head, which is slightly crested, reflecting rich green lights, a large oval white patch under each eye, and elongated white scapulars; the lower parts are wholly white and the feet bright orange, except the webs, which are dusky. In the female and young male, dark brown replaces the black, the cheek-spots are indistinct, and the elongated white scapulars wanting. The Golden-eye of North America has been by some authors deemed to differ, and has been named *C. americana*, but apparently on insufficient grounds. That country, however, has, in common with Iceland, a very distinct species, *C. islandica*, often called Barrow's Duck, which is but a rare straggler to the continent of Europe, and never, so far as known, to Britain. In Iceland and Greenland it is the only habitual representative of the genus, and it occurs from thence to the Rocky Mountains. In breeding-habits it differs from the commoner species, not placing its eggs in tree-holes; but how far this difference is voluntary may be doubted, for in the countries it frequents trees are wanting. It is a larger and stouter bird, and in the male the white cheek-patches take a more crescentic form, while the head is glossed with purple rather than green, and the white scapulars are not elongated. The New World also possesses a third and still more beautiful species of the genus in *C. albeola*, known in books as the Buffel-headed Duck, and to American fowlers as the "Spirit-Duck" and "Butter-ball"—the former name being applied from its rapidity in diving, and the latter from its exceeding fatness in autumn. This is of small size, but the lustre of the feathers in the male is most brilliant, exhibiting a deep plum-coloured gloss on the head. It breeds in trees, and is supposed to have occurred more than once in Britain. (A. N.)

GOLDEN FLEECE. See ARGONAUTS.

GOLDEN LEGEND. See VORAGINE, JACOBUS DE.

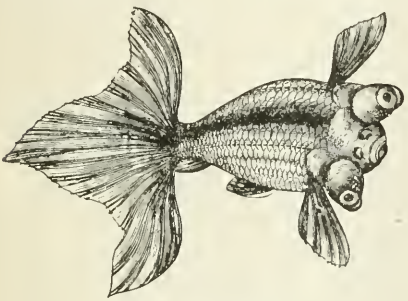
GOLDEN ROSE (rosa aurea), an ornament, made of wrought gold and set with gems, which is blessed by the pope on the fourth (Lætare) Sunday of Lent, and usually afterwards sent as a mark of special favour to some distinguished individual, church, or civil community. The ceremonies which at present accompany the consecration of a golden rose are of a somewhat elaborate character, and are explained by liturgists as designed to make it specially emblematic of Christ and of the Christian graces. Some difficulty is experienced in tracing them to their ultimate origin; but the custom of blessing and sending some symbol of the kind seems to be as old at least as the time of Gregory the Great, with whom it was a frequent practice to send persons whom he wished to flatter a few particles filed from "Peter's chains," and set in keys or crosses of gold (Greg., *Op.* ii. 648, 711, 796, 1031, ed. 1705). This practice continued to be observed for several centuries; thus we find Gregory VII., in 1079, writing to Alphonso of Castile, "Ex more sanctorum misimus vobis claviculam auream in qua de catenis beati Petri benedictio continetur" (Mansi, *Conc. Gen.*, xii. 460). The first mention of the "golden rose," as such, is said to occur in the 11th century; and an allusion to it is certainly made in the Chronicle of William of Newburgh (1197). Pope Urban V., who sent a golden rose to Joanna of Naples in 1366, is alleged to have been the first to determine that the consecration should be annually observed. Among the very numerous recipients of this honour have been Henry VIII. of England, the famous Gonsalvo de Cordova, and, in more recent times, Napoleon III. of France and Isabella II. of Spain. The gift of the golden rose used almost invariably to accompany the coronation of the king of the Romans. If in any particular year no one is considered worthy of the rose, it is laid up in the Vatican.

GOLDFINCH (German *Goldfink*[1]), the *Fringilla carduelis* of Linnæus and the *Carduelis elegans* of later authors, an extremely well-known bird found over the greater parts of Europe and North Africa, and eastwards to Persia and Turkestan. Its gay plumage is matched by its sprightly nature; and together they make it one of the most favourite cage-birds among all classes. As a songster it is indeed surpassed by many other species, but its docility and ready attachment to its master or mistress makes up for any defect in its vocal powers. In some parts of England the trade in Goldfinches is very considerable. In 1860 Mr Hussey reported (*Zool.*, p. 7144) the average annual captures near Worthing to exceed 11,000 dozens—nearly all being cock-birds; and a witness before a Committee of the House of Commons in 1873 stated that, when a boy, he could take forty dozens in a morning near Brighton. In these districts and others the number has of late years become much reduced, owing doubtless in part to the fatal practice of catching the birds just before or during the breeding-season; but perhaps the strongest cause of their growing scarcity throughout the kingdom is the constant breaking-up of waste lands, and the extirpation of weeds (particularly of the Order *Compositæ*) essential to the improved system of agriculture; for in many parts of Scotland, East Lothian for instance, where Goldfinches were once as plentiful as Sparrows, they are now only rare stragglers, and yet there they have not been thinned by netting. Though Goldfinches may occasionally be observed in the coldest weather, incomparably the largest number leave Britain in autumn, returning in spring, and resorting to our gardens and orchards to breed, when the lively song of the cock, and the bright yellow wings of both sexes, quickly attract the notice of even the unobservant. The nest is a beautifully neat structure, often placed at no great height from the ground, but generally so well hidden by the leafy bough on which it is built as not to be easily found, until, the young being hatched, the constant visits of the parents reveal its site. When the broods leave the nest they move into the more open country, and frequenting pastures, commons, heaths, and downs, assemble in large flocks towards the end of summer. Eastward of the range of the present species its place is taken by its congener *C. caniceps*, which is easily recognized by wanting the black hood and white ear-coverts of our own bird. Its home seems to be in Central Asia, but it moves southward in winter, being common at that season in Cashmere, and is not unfrequently brought for sale to Calcutta. The position of the genus *Carduelis* in the family *Fringillidæ*

[1] The more common German name, however, is *Distelfink* (Thistle-Finch) or *Stieglitz*.

is not very clear. Structurally it would seem to have some relation to the Siskins (*Chrysomitris*), though the members of the two groups have very different habits, and perhaps its nearest kinship lies with the Hawfinches (*Coccothraustes*). See FINCH, vol. ix. p. 191. (A. N.)

GOLDFISH (*Carassius auratus*). In China and the warmer parts of Japan a fish extremely similar to the Crucian carp of Europe is of very common occurrence in ponds and other still waters. In the wild state its colours do not differ from those of a Crucian carp, and like that fish it is tenacious of life and easily domesticated. Albinos seem to be rather common; and as in other fishes (for instance, the tench, carp, eel, flounder), the colour of most of these albinos is a bright orange or golden yellow; occasionally even this shade of colour is lost, the fish being more or less pure white or silvery. The Chinese have domesticated these albinos for a long time, and by careful selection have succeeded in propagating all those strange varieties, and even monstrosities, which appear in every domestic animal. In some individuals the dorsal fin is only half its normal length, in others entirely absent; in others the anal fin has a double spine; in others all the fins are of nearly double the usual length. The snout is frequently



Goldfish (*Carassius auratus*).

malformed, giving the head of the fish an appearance similar to that of a bull-dog. The variety most highly prized at present has an extremely short snout, eyes which almost wholly project beyond the orbit, no dorsal fin, and a very long three- or four-lobed caudal fin (Telescope-fish). The gold-fish is now distributed over nearly all the civilized parts of the world. It was first brought to England in the year 1691, but was very scarce till 1728, when it was imported in great numbers from Holland, where the fish had already become domesticated. It will not thrive in rivers; in large ponds it readily reverts to the coloration of the original wild stock. It flourishes best in small tanks and ponds, in which the water is constantly changing and does not freeze; in such localities, and with a full supply of food, which consists of crumbs of bread, bran, worms, small crustaceans, and insects, it attains to a length of from 6 to 12 inches, breeding readily, sometimes at different times of the same year.

GOLD HILL, a town of Storey county, Nevada, United States, is situated at the head of a precipitous ravine of the Nevada mountains, 1 mile S. of Virginia city, and 328 E. from San Francisco by rail. The name was derived from a small hill connected with the famous Comstock lode, and containing rich golden ore. Some of the most valuable mines of this lode are within the limits of the town, the average yield being about two million dollars monthly in gold and silver. Though there are some quartz mills within the town, the greater part of the ore is conveyed to the mills on Carson river. There is a fine hall in connexion with the miners' union, and another has been erected by the Oddfellows and Freemasons. The Methodists, Episcopalians, and Roman Catholics are the principal denominations of the town. Gold Hill obtains its water supply in conjunction with Virginia from the summit of the Sierra Nevada, 25 miles distant. The population in 1860 was 638, and in 1870 4311. Since then it has been rapidly increasing, and must have more than trebled its numbers.

GOLDINGEN, in Lettish KULDIGA, a district town of the Russian province of Courland, in 50° 58′ N. lat. and 11° 58′ E. long., 85 miles W.N.W. of Mittau, on the left bank of the Windau, which forms a beautiful waterfall—the Rummel—in the neighbourhood. On the Schlossberg or Castlehill are a few remains of the foundations of what in the end of the 18th century was the most magnificent ruin in Courland, and in the 17th century had been the palatial residence of the dukes. The town is beautifully built; and it possesses a Lutheran church dating from 1606, and a Catholic church five years older, a hospital and two almshouses, two benevolent societies, founded respectively in 1836 and 1839, and a society of rural economy. Brush-making is the only local industry of much importance. In 1861 the population was 5475 (2764 males), of whom the greater proportion were Lutherans, 1551 being Jews, 360 Roman Catholics, and 290 members of the Greek Church; but according to the *St Petersburg Calendar* for 1878 it has diminished to 4758. The castle of Goldingen was founded in 1249 by Dietrich of Gröningen, and in 1347 the town received its first charter of privileges from Goswin von Gerike, master of the Teutonic order. It has been a district town since 1795.

GOLD LACE. See under GOLD, p. 753.

GOLDONI, CARLO (1707–1793), the most illustrious of the Italian comedy-writers, and the real founder of modern Italian comedy. His life is known to us from his *Mémoires*, which, though they do not reveal a great thinker, are of great value as faithfully representing the Italian society, especially the Venetian society of the 18th century. Goldoni was born at Venice in 1707, in a fine house near St Thomas's church. His father Giulio was a native of Modena. The first playthings of the future writer were puppets which he made dance; the first books he read were plays,—among others, the comedies of the Florentine Cicognini. Later he received a still stronger impression from the *Mandragora* of Macchiavelli. At eight years old he had tried to sketch a play. His father, meanwhile, had taken his degree in medicine at Rome and fixed himself at Perugia, where he made his son join him; but, having soon quarrelled with his colleagues in medicine, he departed for Chioggia, leaving his son to the care of a philosopher, Professor Caldini of Rimini. The young Goldoni soon grew tired of his life at Rimini, and ran away with a Venetian company of players. He began to study law at Venice, then went to continue the same pursuit at Pavia, but at that time he was studying the Greek and Latin comic poets much more and much better than books about law. "I have read over again," he writes in his *Mémoires*, "the Greek and Latin poets, and I have told to myself that I should like to imitate them in their style, their plots, their precision; but I would not be satisfied unless I succeeded in giving more interest to my works, happier issues to my plots, better drawn characters, and more genuine comedy." For a satire entitled *Il Colosso*, which attacked the honour of several families of Pavia, he was driven from that town, and went first to study with the jurisconsult Morelli at Udine, then to take his degree in law at Modena. After having worked some time as clerk in the chanceries of Chioggia and Feltre, his father being dead, he went to Venice, to exercise there his profession as a lawyer. But the wish to write for the stage was always strong in him, and he tried to do so; he made, however, a mistake in his choice, and began with a tragedy, *Amalasunta*, which was represented at Milan and proved a failure. In 1734 he wrote another tragedy, *Belisario*, which though not much better, chanced nevertheless to please the public. This first success encouraged him to write other tragedies, some of which were well received; but the author himself saw clearly that he had not yet found his proper sphere, and that a radical dramatic reform was absolutely necessary for the stage. He wished to create a characteristic comedy in Italy, to follow the example of Molière, and to delineate the realities of social life in as natural a manner as possible. His first essay of this kind was *Momolo Cortesan* (Momolo the Courtier), written in the Venetian dialect, and based on his own experience. Other plays followed—some interesting from their subject, others from the characters; the best of that period are—*Le trentadue Disgrazie d'Arlecchino, La Notte critica, La Bancarotta, La Donna di Garbo.* Having, while consul of Genoa at Venice, been cheated by a captain of Ragusa, he founded on this his play *L'Impostore.* At Leghorn he made the acquaintance of the comedian Medebac, and followed him to Venice, with his company, for which he began to write his best plays. Once he promised to write sixteen comedies in a year, and kept his word; among the sixteen are some of his very best, such as *Il Caffè, Il Bugiardo, La Pamela.* When he left the company of Medebac, he passed over to that maintained by the patrician Vendramin, continuing to write with the greatest facility. In 1761 he was called to Paris, and before leaving Venice he wrote *Una delle ultime Sere di Carnevale* (One of the Last Nights of Carnival), an allegorical comedy in which he said good-bye to his country. At the end of the representation of this play, the theatre resounded with applause, and with shouts expressive of good wishes. Goldoni, at this proof of public sympathy, wept as a child. At Paris, during two years, he wrote comedies for the Italian actors; then he taught Italian to the royal princesses; and for the wedding of Louis XVI. and of Marie Antoinette he wrote in French one of his best comedies, *Le Bourru Bienfaisant*, which was a great success. When he retired from Paris to Versailles, the king made him a gift of 6000 francs, and fixed on him an annual pension of 1200 francs. It was at Versailles he wrote his *Memoirs*, which occupied him till he reached his eightieth year. The Revolution deprived him all at once of his modest pension, and reduced him to extreme misery; he dragged on his unfortunate existence till 1793, and died on the 6th of February. The day after, on the proposal of André Chénier, the Convention agreed to give the pension back to the poet; and as he had already died, a reduced allowance was granted to his widow.

The best comedies of Goldoni are—*La Donna di Garbo, La Bottega di Caffè, Pamela nubile, Le Baruffe chiozzotte, I Rusteghi, Todero Brontolon, Gli Innamorati, Il Ventaglio, Il Bugiardo, La Casa Nova, Il Burbero benefico, La Locandiera.* See P. G. Molmenti, *Carlo Goldoni*, Venice, 1875.

GOLDSCHMIDT, Hermann (1802–1866), a German painter and astronomer, was the son of a Jewish merchant, and was born at Frankfort on the 17th June 1802. He for ten years assisted his father in his business; but, his love of art having been awakened while journeying in Holland, he in 1832 began the study of painting at Munich under Cornelius and Schnorr, and in 1836 established himself at Paris, where he painted a number of pictures of more than average merit, among which may be mentioned the Cumæan Sibyl, 1844; an Offering to Venus, 1845; a View of Rome, 1849; the Death of Romeo and Juliet, 1857; and several Alpine landscapes. In 1847 he began to devote his attention to astronomy; and from 1852 to 1861 he discovered fourteen asteroids between Mars and Jupiter, on which account he received the grand astronomical prize from the Academy of Sciences. His observations of the protuberances on the sun, made during the total eclipse on the 10th July 1860, are included in the work of Mädler on the eclipse, published in 1861. Goldschmidt died at Fontainebleau, 26th August 1866.

GOLDSMITH, Oliver (1728–1774), one of the most pleasing English writers of the 18th century. He was of a Protestant and Saxon family which had been long settled in Ireland, and which had, like most other Protestant and Saxon families, been, in troubled times, harassed and put in fear by the native population. His father, Charles Goldsmith, studied in the reign of Queen Anne at the diocesan school of Elphin, became attached to the daughter of the schoolmaster, married her, took orders, and settled at a place called Pallas, in the county of Longford. There he with difficulty supported his wife and children on what he could earn, partly as a curate and partly as a farmer.

At Pallas Oliver Goldsmith was born in November 1728. That spot was then, for all practical purposes, almost as remote from the busy and splendid capital in which his later years were passed as any clearing in Upper Canada or any sheep walk in Australasia now is. Even at this day those enthusiasts who venture to make a pilgrimage to the birthplace of the poet are forced to perform the latter part of their journey on foot. The hamlet lies far from any high road, on a dreary plain which, in wet weather, is often a lake. The lanes would break any jaunting car to pieces; and there are ruts and sloughs through which the most strongly built wheels cannot be dragged.

While Oliver was still a child his father was presented to a living worth about £200 a year, in the county of West Meath. The family accordingly quitted their cottage in the wilderness for a spacious house on a frequented road, near the village of Lissoy. Here the boy was taught his letters by a maid-servant, and was sent in his seventh year to a village school kept by an old quartermaster on half-pay, who professed to teach nothing but reading, writing, and arithmetic, but who had an inexhaustible fund of stories about ghosts, banshees, and fairies, about the great Rapparee chiefs, Baldearg O'Donnell and galloping Hogan, and about the exploits of Peterborough and Stanhope, the surprise of Monjuich, and the glorious disaster of Brihuega. This man must have been of the Protestant religion; but he was of the aboriginal race, and not only spoke the Irish language, but could pour forth unpremeditated Irish verses. Oliver early became, and through life continued to be, a passionate admirer of the Irish music, and especially of the compositions of Carolan, some of the last notes of whose harp he heard. It ought to be added that Oliver, though by birth one of the Englishry, and though connected by numerous ties with the Established Church, never showed the least sign of that contemptuous antipathy with which, in his days, the ruling minority in Ireland too generally regarded the subject majority. So far indeed was he from sharing in the opinions and feelings of the caste to which he belonged that he conceived an aversion to the Glorious and Immortal Memory, and, even when George III. was on the throne, maintained that nothing but the restoration of the banished dynasty could save the country.

From the humble academy kept by the old soldier Goldsmith was removed in his ninth year. He went to several grammar-schools, and acquired some knowledge of the ancient languages. His life at this time seems to have been far from happy. He had, as appears from the admirable portrait of him at Knowle, features harsh even to ugliness. The small-pox had set its mark on him with more than usual severity. His stature was small, and his limbs ill put together. Among boys little tenderness is shown to personal defects; and the ridicule excited by poor Oliver's appearance was heightened by a peculiar simplicity and a disposition to blunder which he retained to the last. He became the common butt of boys and masters, was pointed at as a fright in the play-ground, and flogged as a dunce in the school-room. When he had risen to eminence, those who had once derided him ransacked their memory for the events of his early years, and recited repartees and couplets which had dropped from him, and which, though little noticed at the time, were supposed, a quarter of a century later, to indicate the powers which produced the *Vicar of Wakefield* and the *Deserted Village.*

In his seventeenth year Oliver went up to Trinity College, Dublin, as a sizar. The sizars paid nothing for food and tuition, and very little for lodging; but they had to perform some menial services from which they have long been relieved. They swept the court, they carried up the dinner to the fellows' table, and changed the plates and poured out the ale of the rulers of the society. Goldsmith was quartered, not alone, in a garret, on the window of which his name, scrawled by himself, is still read with interest. From such garrets many men of less parts than his have made their way to the woolsack or to the episcopal bench. But Goldsmith, while he suffered all the humiliations, threw away all the advantages of his situation. He neglected the studies of the place, stood low at the examinations, was turned down to the bottom of his class for playing the buffoon in the lecture-room, was severely reprimanded for pumping on a constable, and was caned by a brutal tutor for giving a ball in the attic story of the college to some gay youths and damsels from the city.

While Oliver was leading at Dublin a life divided between squalid distress and squalid dissipation, his father died, leaving a mere pittance The youth obtained his bachelor's degree, and left the university. During some time the humble dwelling to which his widowed mother had retired was his home. He was now in his twenty-first year; it was necessary that he should do something; and his education seemed to have fitted him to do nothing but to dress himself in gaudy colours, of which he was as fond as a magpie, to take a hand at cards, to sing Irish airs, to play the flute, to angle in summer, and to tell ghost stories by the fire in winter. He tried five or six professions in turn without success. He applied for ordination; but, as he applied in scarlet clothes, he was speedily turned out of the episcopal palace. He then became tutor in an opulent family, but soon quitted his situation in consequence of a dispute about play. Then he determined to emigrate to America. His relations, with much satisfaction, saw him set out for Cork on a good horse, with £30 in his pocket. But in six weeks he came back on a miserable hack, without a penny, and informed his mother that the ship in which he had taken his passage, having got a fair wind while he was at a party of pleasure, had sailed without him. Then he resolved to study the law. A generous kinsman advanced £50. With this sum Goldsmith went to Dublin, was enticed into a gaming house, and lost every shilling. He then thought of medicine. A small purse was made up; and in his twenty-fourth year he was sent to Edinburgh. At Edinburgh he passed eighteen months in nominal attendance on lectures, and picked up some superficial information about chemistry and natural history. Thence he went to Leyden, still pretending to study physic. He left that celebrated university, the third university at which he had resided, in his twenty-seventh year, without a degree, with the merest smattering of medical knowledge, and with no property but his clothes and his flute. His flute, however, proved a useful friend. He rambled on foot through Flanders, France, and Switzerland, playing tunes which everywhere set the peasantry dancing, and which often procured for him a supper and a bed. He wandered as far as Italy. His musical performances, indeed, were not to the taste of the Italians; but he contrived to live on the alms which he obtained at the gates of convents. It should, however, be observed that the stories which he told about this part of his life ought to be received with great caution; for strict veracity was never one of his virtues; and a man who is ordinarily inaccurate in narration is likely to be more than ordinarily inaccurate when he talks about his own travels. Goldsmith indeed was so regardless of truth as to assert in print that he was present at a most interesting conversation between Voltaire and Fontenelle, and that this conversation took place at Paris. Now it is certain that Voltaire never was within a hundred leagues of Paris during the whole time which Goldsmith passed on the Continent.

In 1756 the wanderer landed at Dover, without a shilling, without a friend, and without a calling. He had indeed, if his own unsupported evidence may be trusted, obtained from the university of Padua a doctor's degree; but this dignity proved utterly useless to him. In England his flute was not in request; there were no convents; and he was forced to have recourse to a series of desperate expedients. He turned strolling player; but his face and figure were ill suited to the boards even of the humblest theatre. He pounded drugs and ran about London with phials for charitable chemists. He joined a swarm of beggars, which made its nest in Axe Yard. He was for a time usher of a school, and felt the miseries and humiliations of this situation so keenly that he thought it a promotion to be permitted to earn his bread as a bookseller's hack; but he soon found the new yoke more galling than the old one, and was glad to become an usher again. He obtained a medical appointment in the service of the East India Company; but the appointment was speedily revoked. Why it was revoked we are not told. The subject was one on which he never liked to talk. It is probable that he was incompetent to perform the duties of the place. Then he presented himself at Surgeon's Hall for examination, as mate to a naval hospital. Even to so humble a post he was found unequal. By this time the schoolmaster whom he had served for a morsel of food and the third part of a bed was no more. Nothing remained but to return to the lowest drudgery of literature. Goldsmith took a garret in a miserable court, to which he had to climb from the brink of Fleet Ditch by a dizzy ladder of flagstones called Breakneck Steps. The court and the ascent have long disappeared, but old Londoners well remember both. Here, at thirty, the unlucky adventurer sat down to toil like a galley slave.

In the succeeding six years he sent to the press some things which have survived, and many which have perished. He produced articles for reviews, magazines, and newspapers; children's books, which, bound in gilt paper and adorned with hideous woodcuts, appeared in the window of the once far famed shop at the corner of Saint Paul's Churchyard; *An Inquiry into the State of Polite Learning in Europe*, which, though of little or no value, is still reprinted among his works; a *Life of Beau Nash*, which is not reprinted, though it well deserves to be so; a superficial and incorrect, but very readable, *History of England*, in a series of letters purporting to be addressed by a nobleman to his son; and some very lively and amusing *Sketches of London Society*, in a series of letters purporting to be addressed by a Chinese traveller to his friends. All these works were anonymous; but some of them were well known to be Goldsmith's; and he gradually rose in the estimation of the booksellers for whom he drudged. He was, indeed, emphatically a popular writer. For accurate research or grave disquisition he was not well qualified by nature or by education. He knew nothing accurately; his reading had been desultory; nor had he meditated deeply on what he had read. He had seen much of the world; but he had noticed and retained little more of what he had seen than some grotesque incidents and characters which had happened to strike his fancy. But, though his mind was very scantily stored with materials, he used what materials he had in such a way as to produce a wonderful effect. There have been many greater writers; but perhaps no writer was ever more uniformly agreeable. His style was always pure and easy, and, on proper occasions, pointed and energetic. His narratives were always amusing, his descriptions always picturesque, his humour rich and joyous, yet not without an occasional tinge of amiable sadness. About everything that he wrote, serious or sportive, there was a certain natural grace and decorum, hardly to be expected from a man a great part of whose life had been passed among thieves and beggars, street-walkers and merryandrews, in those squalid dens which are the reproach of great capitals.

As his name gradually became known, the circle of his acquaintance widened. He was introduced to Johnson, who was then considered as the first of living English writers; to Reynolds, the first of English painters; and to Burke, who had not yet entered parliament, but had distinguished himself greatly by his writings and by the eloquence of his conversation. With these eminent men Goldsmith became intimate. In 1763 he was one of the nine original members of that celebrated fraternity which has sometimes been called the Literary Club, but which has always disclaimed that epithet, and still glories in the simple name of the Club.

By this time Goldsmith had quitted his miserable dwelling at the top of Breakneck Steps, and had taken chambers in the more civilized region of the Inns of Court. But he was still often reduced to pitiable shifts. Towards the close of 1764 his rent was so long in arrear that his landlady one morning called in the help of a sheriff's officer. The debtor, in great perplexity, despatched a messenger to Johnson; and Johnson, always friendly, though often surly, sent back the messenger with a guinea, and promised to follow speedily. He came, and found that Goldsmith had changed the guinea, and was railing at the landlady over a bottle of Madeira. Johnson put the cork into the bottle, and entreated his friend to consider calmly how money was to be procured. Goldsmith said that he had a novel ready for the press. Johnson glanced at the manuscript, saw that there were good things in it, took it to a bookseller, sold it for £60, and soon returned with the money. The rent was paid; and the sheriff's officer withdrew. According to one story, Goldsmith gave his landlady a sharp reprimand for her treatment of him; according to another, he insisted on her joining him in a bowl of punch. Both stories are probably true. The novel which was thus ushered into the world was the *Vicar of Wakefield*.

But before the *Vicar of Wakefield* appeared in print, came the great crisis of Goldsmith's literary life. In Christmas week 1764 he published a poem, entitled the *Traveller*. It was the first work to which he had put his name, and it at once raised him to the rank of a legitimate English classic. The opinion of the most skilful critics was that nothing finer had appeared in verse since the fourth book of the *Dunciad*. In one respect the *Traveller* differs from all Goldsmith's other writings. In general his designs were bad, and his execution good. In the *Traveller*, the execution, though deserving of much praise, is far inferior to the design. No philosophical poem, ancient or modern, has a plan so noble and at the same time so simple. An English wanderer, seated on a crag among the Alps, near the point where three great countries meet, looks down on the boundless prospect, reviews his long pilgrimage, recalls the varieties of scenery, of climate, of government, of religion, of national character, which he has observed, and comes to the conclusion, just or unjust, that our happiness depends little on political institutions, and much on the temper and regulation of our own minds.

While the fourth edition of the *Traveller* was on the counters of the booksellers, the *Vicar of Wakefield* appeared, and rapidly obtained a popularity which has lasted down to our own time, and which is likely to last as long as our language. The fable is indeed one of the worst that ever was constructed. It wants, not merely that probability which ought to be found in a tale of common English life, but that consistency which ought to be found even in the wildest fiction about witches, giants, and fairies. But the earlier chapters have all the sweetness of pastoral poetry, together with all the vivacity of comedy. Moses and his spectacles, the vicar and his monogamy, the sharper and his cosmogony, the squire proving from Aristotle that relatives are related, Olivia preparing herself for the arduous task of converting a rakish lover by studying the controversy between Robinson Crusoe and Friday, the great ladies with their scandal about Sir Tomkyn's amours and Dr Burdock's verses, and Mr Burchell with his "Fudge," have caused as much harmless mirth as has ever been caused by matter packed into so small a number of pages. The latter part of the tale is unworthy of the beginning. As we approach the catastrophe, the absurdities lie thicker and thicker, and the gleams of pleasantry become rarer and rarer.

The success which had attended Goldsmith as a novelist emboldened him to try his fortune as a dramatist. He wrote the *Goodnatured Man*, a piece which had a worse fate than it deserved. Garrick refused to produce it at Drury Lane. It was acted at Covent Garden in 1768, but was coldly received. The author, however, cleared by his benefit nights, and by the sale of the copyright, no less than £500, five times as much as he had made by the *Traveller* and the *Vicar of Wakefield* together. The plot of the *Goodnatured Man* is, like almost all Goldsmith's plots, very ill constructed. But some passages are exquisitely ludicrous,—much more ludicrous indeed than suited the taste of the town at that time. A canting, mawkish play, entitled *False Delicacy*, had just had an immense run. Sentimentality was all the mode. During some years, more tears were shed at comedies than at tragedies; and a pleasantry which moved the audience to anything more than a grave smile was reprobated as low. It is not strange, therefore, that the very best scene in the *Goodnatured Man*, that in which Miss Richland finds her lover attended by the bailiff and the bailiff's follower in full court dresses, should have been mercilessly hissed, and should have been omitted after the first night.

In 1770 appeared the *Deserted Village*. In mere diction and versification this celebrated poem is fully equal, perhaps superior, to the *Traveller*; and it is generally preferred to the *Traveller* by that large class of readers who think, with Bayes in the *Rehearsal*, that the only use of a plan is to bring in fine things. More discerning judges, however, while they admire the beauty of the details, are shocked by one unpardonable fault which pervades the whole. The fault which we mean is not that theory about wealth and luxury which has so often been censured by political economists. The theory is indeed false; but the poem, considered merely as a poem, is not necessarily the worse on that account. The finest poem in the Latin language,—indeed, the finest didactic poem in any language,—was written in defence of the silliest and meanest of all systems of natural and moral philosophy. A poet may easily be pardoned for reasoning ill; but he cannot be pardoned for describing ill, for observing the world in which he lives so carelessly that his portraits bear no resemblance to the originals, for exhibiting as copies from real life monstrous combinations of things which never were and never could be found together. What would be thought of a painter who should mix August and January in one landscape, who should introduce a frozen river into a harvest scene? Would it be a sufficient defence of such a picture to say that every part was exquisitely coloured, that the green hedges, the apple-trees loaded with fruit, the waggons reeling under the yellow sheaves, and the sun-burned reapers wiping their foreheads were very fine, and that the ice and the boys sliding were also very fine? To such a picture the *Deserted Village* bears a great resemblance. It is made up of incongruous parts. The village in its happy days is a true English village. The village in its decay is an Irish village. The felicity and the misery which Goldsmith has brought close together belong to two different countries, and to two different stages in the progress of society. He had assuredly never seen in his native island such a rural paradise, such a seat of plenty, content, and tranquillity, as his Auburn. He had assuredly never seen in England all the inhabitants of such a paradise turned out of their homes in one day, and forced to emigrate in a body to America. The hamlet he had probably seen in Kent; the ejectment he had probably seen in Munster; but by joining the two, he has produced something which never was and never will be seen in any part of the world.

In 1773 Goldsmith tried his chance at Covent Garden with a second play, *She Stoops to Conquer.* The manager was, not without great difficulty, induced to bring this piece out. The sentimental comedy still reigned, and Goldsmith's comedies were not sentimental. The *Goodnatured Man* had been too funny to succeed; yet the mirth of the *Goodnatured Man* was sober when compared with the rich drollery of *She Stoops to Conquer*, which is, in truth, an incomparable farce in five acts. On this occasion, however, genius triumphed. Pit, boxes, and galleries were in a constant roar of laughter. If any bigoted admirer of Kelly and Cumberland ventured to hiss or groan, he was speedily silenced by a general cry of "turn him out," or "throw him over." Two generations have since confirmed the verdict which was pronounced on that night.

While Goldsmith was writing the *Deserted Village* and *She Stoops to Conquer*, he was employed on works of a very different kind,—works from which he derived little reputation but much profit. He compiled for the use of schools a *History of Rome*, by which he made £300; a *History of England*, by which he made £600; a *History of Greece*, for which he received £250; a *Natural History*, for which the booksellers covenanted to pay him 800 guineas. These works he produced without any elaborate research, by merely selecting, abridging, and translating into his own clear, pure, and flowing language, what he found in books well known to the world, but too bulky or too dry for boys and girls. He committed some strange blunders, for he knew nothing with accuracy. Thus, in his *History of England*, he tells us that Naseby is in Yorkshire; nor did he correct this mistake when the book was reprinted. He was very nearly hoaxed into putting into the *History of Greece* an account of a battle between Alexander the Great and Montezuma. In his *Animated Nature* he relates, with faith and with perfect gravity, all the most absurd lies which he could find in books of travels about gigantic Patagonians, monkeys that preach sermons, nightingales that repeat long conversations. "If he can tell a horse from a cow," said Johnson, "that is the extent of his knowledge of zoology." How little Goldsmith was qualified to write about the physical sciences is sufficiently proved by two anecdotes. He on one occasion denied that the sun is longer in the northern than in the southern signs. It was vain to cite the authority of Maupertuis. "Maupertuis!" he cried, "I understand those matters better than Maupertuis." On another occasion he, in defiance of the evidence of his own senses, maintained obstinately, and even angrily, that he chewed his dinner by moving his upper jaw.

Yet, ignorant as Goldsmith was, few writers have done more to make the first steps in the laborious road to knowledge easy and pleasant. His compilations are widely distinguished from the compilations of ordinary bookmakers. He was a great, perhaps an unequalled, master of the arts of selection and condensation. In these respects his histories of Rome and of England, and still more his own abridgments of these histories, well deserved to be studied. In general nothing is less attractive than an epitome; but the epitomes of Goldsmith, even when most concise, are always amusing; and to read them is considered by intelligent children not as a task but as a pleasure.

Goldsmith might now be considered as a prosperous man. He had the means of living in comfort, and even in what to one who had so often slept in barns and on bulks must have been luxury. His fame was great and was constantly rising. He lived in what was intellectually far the best society of the kingdom, in a society in which no talent or accomplishment was wanting, and in which the art of conversation was cultivated with splendid success. There probably were never four talkers more admirable in four different ways than Johnson, Burke, Beauclerk, and Garrick; and Goldsmith was on terms of intimacy with all the four. He aspired to share in their colloquial renown, but never was ambition more unfortunate. It may seem strange that a man who wrote with so much perspicuity, vivacity, and grace should have been, whenever he took a part in conversation, an empty, noisy, blundering rattle. But on this point the evidence is overwhelming. So extraordinary was the contrast between Goldsmith's published works and the silly things which he said, that Horace Walpole described him as an inspired idiot. "Noll," said Garrick, "wrote like an angel, and talked like poor Poll." Chamier declared that it was a hard exercise of faith to believe that so foolish a chatterer could have really written the *Traveller.* Even Boswell could say, with contemptuous compassion, that he liked very well to hear honest Goldsmith run on. "Yes, sir," said Johnson, "but he should not like to hear himself." Minds differ as rivers differ. There are transparent and sparkling rivers from which it is delightful to drink as they flow; to such rivers the minds of such men as Burke and Johnson may be compared. But there are rivers of which the water when first drawn is turbid and noisome, but becomes pellucid as crystal and delicious to the taste, if it be suffered to stand till it has deposited a sediment; and such a river is a type of the mind of Goldsmith. His first thoughts on every subject were confused even to absurdity, but they required only a little time to work themselves clear. When he wrote they had that time, and therefore his readers pronounced him a man of genius; but when he talked he talked nonsense, and made himself the laughing-stock of his hearers. He was painfully sensible of his inferiority in conversation; he felt every failure keenly; yet he had not sufficient judgment and self-command to hold his tongue. His animal spirits and vanity were always impelling him to try to do the one thing which he could not do. After every attempt he felt that he had exposed himself, and writhed with shame and vexation; yet the next moment he began again.

His associates seem to have regarded him with kindness, which, in spite of their admiration of his writings, was not unmixed with contempt. In truth, there was in his character much to love, but very little to respect. His heart was soft even to weakness: he was so generous that he quite forgot to be just; he forgave injuries so readily that he might be said to invite them, and was so liberal to beggars that he had nothing left for his tailor and his butcher. He was vain, sensual, frivolous, profuse, improvident. One vice of a darker shade was imputed to him, envy. But there is not the least reason to believe that this bad passion, though it sometimes made him wince and utter fretful exclamations, ever impelled him to injure by wicked arts the reputation of any of his rivals. The truth probably is that he was not more envious, but merely less prudent, than his neighbours. His heart was on his lips. All those small jealousies, which are but too common among men of letters, but which a man of letters who is also a man of the world does his best to conceal, Goldsmith avowed with the simplicity of a child. When he was envious, instead of affecting indifference, instead of damning with faint praise, instead of doing injuries slily and in the dark, he told everybody that he was envious. "Do not, pray, do not, talk of Johnson in such terms," he said to Boswell; "you harrow up my very soul." George Steevens and Cumberland were men far too cunning to say such a thing. They would have echoed the praises of the man whom they envied, and then have sent to the newspapers anonymous libels upon him. Both what was good and what was bad in Goldsmith's character was to his associates a perfect security that he would never commit such villainy. He was neither ill-natured enough, nor long-headed enough, to be guilty of any malicious act which required contrivance and disguise.

Goldsmith has sometimes been represented as a man of genius, cruelly treated by the world, and doomed to struggle with difficulties, which at last broke his heart. But no representation can be more remote from the truth. He did, indeed, go through much sharp misery before he had done anything considerable in literature. But after his name had appeared on the title-page of the *Traveller*, he had none but himself to blame for his distresses. His average income, during the last seven years of his life, certainly exceeded £400 a year, and £400 a year ranked, among the incomes of that day, at least as high as £800 a year would rank at present. A single man living in the Temple, with £400 a year, might then be called opulent. Not one in ten of the young gentlemen of good families who were studying the law there had so much. But all the wealth which Lord Clive had brought from Bengal, and Sir Lawrence Dundas from Germany, joined together, would not have sufficed for Goldsmith. He spent twice as much as he had. He wore fine clothes, gave dinners of several courses, paid court to venal beauties. He had also, it should be remembered, to the honour of his heart, though not of his head, a guinea, or five, or ten, according to the state of his purse, ready for any tale of distress, true or false. But it was not in dress or feasting, in promiscuous amours or promiscuous charities, that his chief expense lay. He had been from boyhood a gambler, and at once the most sanguine and the most unskilful of gamblers. For a time he put off the day of inevitable ruin by temporary expedients. He obtained advances from booksellers, by promising to execute works which he never began. But at length this source of supply failed. He owed more than £2000; and he saw no hope of extrication from his embarrassments. His spirits and health gave way. He was attacked by a nervous fever, which he thought himself competent to treat. It would have been happy for him if his medical skill had been appreciated as justly by himself as by others. Nothwithstanding the degree which he pretended to have received at Padua, he could procure no patients. "I do not practise," he once said; "I make it a rule to prescribe only for my friends." "Pray, dear Doctor," said Beauclerk, "alter your rule; and prescribe only for your enemies." Goldsmith now, in spite of this excellent advice, prescribed for himself. The remedy aggravated the malady. The sick man was induced to call in real physicians; and they at one time imagined that they had cured the disease. Still his weakness and restlessness continued. He could get no sleep. He could take no food. "You are worse," said one of his medical attendants, "than you should be from the degree of fever which you have. Is your mind at ease?" "No; it is not," were the last recorded words of Oliver Goldsmith. He died on the 3d of April 1774, in his forty-sixth year. He was laid in the churchyard of the Temple; but the spot was not marked by any inscription, and is now forgotten. The coffin was followed by Burke and Reynolds. Both these great men were sincere mourners. Burke, when he heard of Goldsmith's death, had burst into a flood of tears. Reynolds had been so much moved by the news that he had flung aside his brush and palette for the day.

A short time after Goldsmith's death, a little poem appeared, which will, as long as our language lasts, associate the names of his two illustrious friends with his own. It has already been mentioned that he sometimes felt keenly the sarcasm which his wild blundering talk brought upon him. He was, not long before his last illness, provoked into retaliating. He wisely betook himself to his pen; and at that weapon he proved himself a match for all his assailants together. Within a small compass he drew with a singularly easy and vigorous pencil the characters of nine or ten of his intimate associates. Though this little work did not receive his last touches, it must always be regarded as a masterpiece. It is impossible, however, not to wish that four or five likenesses which have no interest for posterity were wanting to that noble gallery, and that their places were supplied by sketches of Johnson and Gibbon, as happy and vivid as the sketches of Burke and Garrick.

Some of Goldsmith's friends and admirers honoured him with a cenotaph in Westminster Abbey. Nollekens was the sculptor, and Johnson wrote the inscription. It is much to be lamented that Johnson did not leave to posterity a more durable and a more valuable memorial of his friend. A life of Goldsmith would have been an inestimable addition to the Lives of the Poets. No man appreciated Goldsmith's writings more justly than Johnson; no man was better acquainted with Goldsmith's character and habits; and no man was more competent to delineate with truth and spirit the peculiarities of a mind in which great powers were found in company with great weaknesses. But the list of poets to whose works Johnson was requested by the booksellers to furnish prefaces ended with Lyttelton, who died in 1773. The line seems to have been drawn expressly for the purpose of excluding the person whose portrait would have most fitly closed the series. Goldsmith, however, has been fortunate in his biographers. Within a few years his life was written by Mr Prior (1836), by Mr Washington Irving (1849), and by Mr Forster (1848; 2d ed., 1854). The diligence of Mr Prior deserves great praise; the style of Mr Washington Irving is always pleasing; but the highest place must, in justice, be assigned to the eminently interesting work of Mr Forster. (M.)

GOLDSTÜCKER, Theodor (1821–1872), an eminent Sanskrit scholar, was born of Jewish parents at Königsberg on the 18th of January 1821, and, after passing through a prolonged course of study at the gymnasium, entered the university in 1836, where he attended the lectures of Lobeck, Rosenkranz, and Von Bohlen, under the last of whom he began the study of Sanskrit. In 1838 he removed to Bonn, where he heard W. von Schlegel, Lassen, and

Freytag; and after graduating at Königsberg in 1840, he proceeded to Paris, where he heard the lectures and enjoyed the friendship of Burnouf, and where in 1842 he edited a German translation of the *Prabodha Chandrodaya.* From 1846 to 1850 he resided at Berlin, where his talents and scholarship were recognized by A. von Humboldt; in the latter year he was induced, for the further prosecution of his Sanskrit researches, to remove to London, where in 1851 he was appointed professor of Sanskrit in University College. He now began to devote himself to the execution of a new Sanskrit dictionary, of which the first instalment appeared in 1856. In 1861 he published an important monograph, entitled *Panini: his Place in Literature*; and from 1866 he was one of the chief promoters of the Sanskrit Text Society, which had been founded in that year; he was also an active member of the Philological Society, and of other learned bodies. His literary productiveness was not, however, proportionate to the extent and accuracy of his reading; he had "allowed his learning to stifle his creative faculty," and a morbid dread of the risk of making inaccurate or defective statements made him unduly reluctant to communicate to the world the results of his laborious collecting and collating. The dictionary, —so copious as almost to deserve the name of a cyclopædia of Indian archæology,—was never advanced further than to about the middle of the first letter (1864); and whatever else he may have written was published anonymously in various periodicals and works of reference. He died on the 6th of March 1872.

GOLF (in its older forms GOFF, GOUFF, or GOWFF, the last of which gives the genuine old pronunciation) is an amusement so peculiar to Scotland and so prevalent there that—unless curling may be held to dispute the place with it—it may be called, *par excellence*, the national game. There seems little doubt the word is derived from the German *kolbe*, a club—in Dutch, *kolf*,—which last is nearly in sound identical, and might give inference for the game of a Dutch origin.[1]

Golf may be practised on any good stretch of meadow-land, where the grass is not too rank; but the ground best suited for the purpose is a reach of undulating down-country, such as is common on the seaboard,—sandy in soil, and as such covered with a short crisp turf, occasionally broken up by sandholes or "bunkers," and provided, in addition, with a fair supply of gorse or whin. These "bunkers" and whins constitute the main "hazards" of the game, in the avoidance of which skill in it is specially shown; and without a fair provision of them, no golfing "links" or "green" can be held to approach the ideal standard. Small holes, of about 4 inches diameter, are punched in the turf at distances indefinitely variable, but ranging from about 100 to 400 or 500 yards; and from one of these holes into the next in order, a ball of gutta percha of about $1\frac{3}{4}$ oz. weight has to be driven with implements (clubs) of some variety, devised for the purpose. Their variety is determined by this, that while, in starting from the hole, the ball may be *teed* (*i.e.*, placed where the player chooses, with a little pinch of sand under it called a *tee*), it must in every other case be played strictly from its place as it chances to lie,—in sand, whin, or elsewhere,—a different club being necessary in each particular difficulty. These clubs may generally be defined as shafts of wood, with so called *heads* of wood or iron attached.[2] Starting from the one hole, it is the immediate aim of the player to drive his ball as far towards the next as he can. Having got within some moderate distance of it, he proceeds to make his "approach shot," carefully selecting the appropriate implement. When he has reached the "putting green,"—a smooth space carefully chosen for the purpose,—he essays to put (or putt) his ball into the hole; and generally, if he does it in two strokes, he may be held skilful or fortunate. The player who holes his ball in the smallest number of strokes is, as matter of course, winner of the hole. The "approach" and the "putting" are by far the most difficult, critical, and important parts of the game; though no one who is not fairly competent in his driving also is ever in the least likely to take rank as a first-class player. The maximum length of a good driving stroke for a first-class player, not favoured by any exceptional circumstances, may perhaps fairly be stated as something over 180 yards, and under 200. For further details as to the mode and order of playing, the reader is referred to the set of "rules" appended to this article.

The game, in description as above, may not seem very lively or entertaining; and it is to be admitted that, seen for the first time, more especially if played by bungling or indifferent performers, it does not look of much promise. No game, however, stirs a keener enthusiasm in its votaries; and very few people who have ever fairly committed themselves to serious practice of it will be found to deny its extreme fascination. It is a manly and eminently healthful recreation, pursued as it is mostly amid the fresh sea-breezes; while, as exercise, it has this peculiar merit, that, according to pace, it may be made easy or smart at pleasure, and thus equally adapts itself to the overflowing exuberance of youth, the matured and tempered strength of manhood, and the gentler decays of age.

It is uncertain at what date golf was introduced into Scotland, but in 1457 the popularity of the game had already become so great as seriously to interfere with the more important pursuit of archery, and cause the rulers of the realm to sound a note of alarm. In March of that year, it is recorded that the Scottish parliament "decreted and ordained that wapinshawingis be halden be the lordis and baronis spirituale and temporale, four times in the zeir; and that the fute-ball and *golf be utterly cryit doun, and nocht usit*; and that the bowe-merkis be maid at ilk paroche kirk a pair of buttis, and *schuttin be usit ilk Sunday.*" It does not appear, however, that to this patriotic decree of their parliament the people paid much attention; and fourteen years afterwards, in May 1471, it was judged necessary to pass another Act "anent wapenshawings," and for opposing "our auld enimies of England." But it seems to have been pretty much as before; *schuttin* was no more *usit*, nor golf the less steadily played because of these decrees of parliament; and accordingly in 1491 a final and evidently angry fulmination is issued on the general subject, with pains and penalties annexed. It runs thus—"Futeball and Golfe forbidden. Item, it is statut and ordainit that in na place of the realme there be usit futeball, *golfe, or uther sik unprofitabill sportis*, but for the commoun gude of the realme, and defence thereof, *that bowis and schuttin be hanted*, and bow-markis maid therefor, ordainit in ilk parochin under the pain of fourtie shillinges, to be raisit be the schireffe and baillies foresaid," &c. This, be it noted, is an edict of James IV.; and it is not a little curious presently to find the monarch himself breaking his own behest, and setting an ill example to his commons, by practice of this "unprofitabill sport," as is shown by various entries in the accounts of the Lord High Treasurer of Scotland (1503–6).

About a century later, the game again appears on the surface of history, and it is quite as popular as before. In the year 1592, the Town Council of Edinburgh "ordanis proclamation to be maid

[1] From an enactment of James VI. (then James I. of England), bearing date 1618, we find that a considerable importation of golf balls at that time took place from Holland, and as thereby "na small quantitie of gold and silver is transported zierly out of his Hienes' kingdome of Scoteland" (see letter of his Majesty from Salisbury, 5th Aug. 1618), he issues a royal prohibition, at once as a wise economy of the national monies, and a protection to native industry in the article. From this it might almost seem that the game was at that date still known and practised in Holland, though it has long since entirely disappeared there.

[2] A complete set of them may number about a dozen:—a driving club, a long, a middle, and a short "spoon" (so called from the face of the club being spooned, or bevelled, to lift a bad-lying ball), and a "putter" (the use of which is explained below) are the clubs formed wholly of wood, while of iron there are—a heavy and a light "iron," a driving and a lifting "cleek," possibly also a "putting" cleek, finally a "niblick," constructed to pick a ball out of some such hole as no other iron can reach.

threw this burgh that, seeing the Sabboth day being the Lordis day, it becumis every Christiane to delicat himselff to the service of God, thairfore commanding in our soverane lord's name, and in name of the provost and baillies, that na inhabitants of the samyn be seen at ony pastymes within or without the toun, *upoun the Sabboth day, sic as golfe, &c.*"[1] The following year the edict was reannounced, but with the modification that the prohibition was "in tyme of sermons."

Golf has from old times been known in Scotland as "The *Royal and Ancient* Game of Goff." Though no doubt Scottish monarchs handled the club before him, James IV. is the first who figures formally in the golfing record. James V. was also very partial to the game distinctively known as "royal"; and there is some scrap of evidence to show that his daughter, the unhappy Mary Stuart, was, in some sort of feminine way, a *golfer*. It was alleged by her enemies that, as showing her shameless indifference to the fate of her husband, a very few days after his murder, she "was seen playing *golf* and pallmall in the fields beside Seton."[2] That her son, James VI. (afterwards James I. of England), was a golfer tradition confidently asserts, though the evidence which connects him with the personal practice of the game is slight. Of the interest he took in it we have evidence in his Act—already alluded to—"anent *golfe ballis*," prohibiting their importation, except under certain restrictions. Charles I. (as his brother Prince Henry had been[3]) was devotedly attached to the game. Whilst engaged in it on the links of Leith, in 1642, the news reached him of the Irish rebellion of that year. He had not the equanimity to finish his match, but returned precipitately and in much agitation to Holyrood.[4] Long afterwards, while prisoner to the Scots army at Newcastle, before being given up to the tender mercies of the English Parliament, he found his favourite diversion in "the royal game." "The King was nowhere treated with more honour than at Newcastle, as he himself confessed, both he and his train having liberty to go abroad and play at goff in the Shield Field, without the walls."[5] Of his son, Charles II., as a golfer, nothing whatever is ascertained, but his brother, James II., was a known devotee.[6] After the Restoration, James, then duke of York, was sent to Edinburgh in 1681–2 as commissioner of the king to parliament, and an historical monument of his prowess as a golfer remains there to this day in the "Golfer's Land," as it is still called, 77 Canongate. The duke having been challenged by two English noblemen of his suite, or *entourage*, to play a match against them, for a very large stake, along with any Scotch ally he might select, judiciously chose as his partner one "Johne Patersone," a shoemaker—a local *crack* of the day, it is to be presumed. The duke and the said Johne won easily, and half of the large stake the duke made over to his humble coadjutor, who therewith built himself the house mentioned above. With the Revolution royal patronage entirely ceased, to be renewed only in comparatively recent times. In 1834 William IV. became patron of the St Andrews Golf Club (St Andrews, the ancient ecclesiastical metropolis of Scotland, being now, as of old, the most famous seat of the game), and to approve of its being styled in time coming "The *Royal and Ancient* Golf Club of St Andrews." In 1837, as further proof of royal favour, he presented to it a magnificent gold medal, which "should be challenged and played for annually;" and in 1838 the queen dowager, duchess of St Andrews, became patroness of the club, and presented to it a handsome gold medal—"The Royal Adelaide,"—as a mark of her approbation, with a request that it should be worn by the captain, as president, on all public occasions. In June 1863 the prince of Wales signified his desire to become patron of the club, and in the following September was elected captain by acclamation. The engagements of the prince did not admit of his coming in person to undertake the duties of the office, but his brother Prince Leopold, having in 1876 done the club the honour to become its captain, twice visited the ancient city in that capacity. Prince Leopold is himself a keen player, and under his superintendence a green has been laid out in Windsor-park. The ancient game of golf has thus fairly now again become as "royal" as ever it was in its old historic periods.

The later fortunes of the game have been uneventful. While always keeping its hold on the affections of the people, it might readily be shown, that over Scotland generally its tide, till nearly within our own time, was rather an ebbing than a flowing one. While it remained a favourite pastime with some of the aristocracy and gentry who always had a sufficient following where—as instance, in Edinburgh—the due facilities admitted, the general enthusiasm for the sport which lives for us in the old records had certainly disappeared, and over various isolated greens, where playing was at one time constant, it had virtually and sometimes absolutely died out. Its increased popularity within recent years has no doubt been largely due to those general causes which have led to a keener interest in almost every form of out-door amusement, but it is also in some measure to be attributed to greatly extended railway facilities, and to the introduction some thirty years ago of the cheap and durable gutta percha ball to replace the old missile.[7]

It remains to give some little account of the more noted golf clubs and golfing grounds. The most famous of golf clubs, to which primacy is by common consent accorded, is that of the city of St Andrews, instituted in 1754. For various reasons this club has always been of much more than merely local celebrity. Its membership is far more numerous than that of any other; nearly all golfers of note belong to it; and to its spring and autumn meetings they flock from every part of the kingdom. To be winner of a medal at St Andrews is thus the highest honour to which the ambition of the golfer can aspire. A "round," as it is termed, of the links is very nearly four miles; and, extent and quality considered, the green is on the whole unrivalled by any other in Scotland. Of greens in Fife of minor importance, those of Elie and Leven may be noted. Next in importance to "The Royal and Ancient Golf Club of St Andrews" ranks "The Honourable the Edinburgh Company of Golfers," who play over Musselburgh green, one of fair but scarcely supreme quality. The first of its regular series of minutes bears date 1744, and is signed by Lord President Duncan Forbes of Culloden, but the club itself is beyond question very much older. Of other Edinburgh golf clubs may be noted "The Bruntsfield," founded in the year 1760, and the "Edinburgh Burgess," the minute books of which are preserved since the year 1773, though it claims to have date of origin 1735. In East Lothian, besides the good old green of North Berwick, there are of late years two others,—Gullane and Luffness,—and on all three excellent golfing sport is to be had. At the ancient city of Perth, though the ground is but indifferently adapted for it, the old Scottish game has continuously been maintained, and still flourishes. So also in Forfarshire, at the historic green of Montrose, to which in our own time have been added those of Monifeith and Carnoustie, which, from their proximity to Dundee, naturally attract many players; and all three may be ranked as greens of fair quality. At Aberdeen, till very lately, the game had quite died out, but it has now been with more or less of vigour resumed. At Stirling likewise it was extinct, but is now again fairly alive, though under conditions of ground, as at Perth, not quite satisfactory. At Glasgow also, where on the old "Glasgow Green" the game was habitually played, it had lapsed into disuse and even oblivion; but within the last ten years the general resuscitation has reached it, and a spirited club now exists there. If the ground is by no means what might be wished, the Glasgow golfer, by a very easy railway run, can reach the green of Prestwick, near Ayr. The "Prestwick Club" is, by comparison, of recent origin, having been organized mainly by the last earl of Eglintoun, and one or two gentlemen in the neighbourhood, interested like himself in the game. Except for limitation in extent, making it impossible that a large "field" should be accommodated without confusion and even danger, such is the excellence of the ground that, as a "sporting" green, to test play, that of Prestwick is held by competent judges perhaps to surpass all others. A second links has recently been opened at Prestwick, and another at Troon, on the same coast.

The oldest golf club in the kingdom is not improbably that of Blackheath, near London. The old records of the club were unfortunately destroyed by fire at Greenwich, where they were kept, and 1766 is thus the earliest date for which there is documentary evidence. Tradition places the origin of this club so far back as 1608, when King James, with his Scotch following, brought the game south into England. Recently another London club has been started, whose ground of play is at Wimbledon. Neither green is of great merit, but both are much prized and frequented by golfers in and near London. In 1864, at Bideford, in Devonshire, a golfing green was laid out by the well-known Tom Morris of St Andrews, and a club was duly instituted, which has since continued to flourish. This links is one of the finest and most extensive anywhere to be found, and despite the disadvantage of remoteness and difficulty of access, the meetings of the club attract players from all quarters, and are commonly most successful. More lately an excellent green was opened at Hoylake, near Liverpool, and the club here has also prospered greatly. At Crookham in Berkshire, and Alnwick in Northumberland, the game is regularly played; and at the universities of Oxford and Cambridge rival golf clubs have within the last few years been formed. In brief, the game has now thoroughly taken root in England; from year to year it is rapidly spreading, and many fine English players have already passed into the front rank.

In nearly all the British colonies the game has naturalized itself. Golf clubs of old standing exist at Calcutta and Bombay, and more casually over India a good deal of play is to be met with. Wherever Scots congregate in any numbers a golf club is pretty sure to spring up. In Canada and the United States, as in

[7] The old ball was, roughly, a circlet of leather, stitched together in sections, and stuffed as hard as a stone with feathers. It was about twice the price of the present ball, and almost incomparably less durable.

Australia and New Zealand, many clubs may be found flourishing; and, oddly enough, at Pau in the Pyrenees, a golf club has long existed. An export of clubs and balls to all these golfing dependencies has long formed, and still forms, an important item of the manufacture.

We must not quit the subject without making note of one pleasing innovation. Some six or eight years ago, the ladies took to the game, and since have diligently prosecuted it in large numbers, some attaining no mean proficiency. They have hitherto confined themselves to the "short game," as it is termed, or putting; and where a separate piece of ground has been assigned them, as at St Andrews, North Berwick, and elsewhere, the "Ladies' Links" form a pretty and charming adjunct to the main green.

We append the more important rules of the game, as played by "The Royal and Ancient Golf Club of St Andrews," which, though it has no claim to give law to other clubs, may be accepted as, on the whole, the best authority on the subject:—

I. *Mode and Order of Playing the Game.*—The game of golf is played by two persons, or by four (two of a side), playing alternately. It may also be played by three or more persons, each playing his own ball. The game commences by each party playing off a ball from a place called the *tee*, near the first hole. In a match of four, those who are opposed to each other, and to play off, shall be named at starting, and shall continue so during the match. The person entitled to play off first shall be named by the parties themselves: and although the courtesy of starting is generally granted to old captains of the club, or members, it may be settled by lot or toss of a coin. The hole is won by the party holing at fewest strokes, and the reckoning of the game is made by the terms *odds* and *like*, *one more*, *two more*, &c. The party gaining the hole is to lead, unless his opponent has won the previous match, in which case the latter leads off, and is entitled to claim his privilege, and to recall his opponent's stroke should he play out of order. One round of the links, or 18 holes, is reckoned a match, unless otherwise stipulated. If, in a double match, one person shall play twice in succession, he loses the hole.

II. *Place of Teeing.*—The ball must be teed not nearer the hole than eight, nor further than twelve club lengths, except where special ground has been marked by the conservator of the links, which shall be considered the "teeing ground," and the balls shall be teed within and not in advance of such marks. After the balls are struck off, the ball farthest from the hole to which the parties are playing must be played first. When two parties meet on the putting green, the party first there may claim the privilege of holing out, and any party coming up must wait till the other party has played out the hole, and on no account play their balls up lest they should annoy the parties who are putting. No player may play his teed ball till the party in front have played their second strokes.

III. *Changing the Balls.*—The balls struck off from the tee must not be changed, touched, or moved before the hole is played out (except in striking, and the cases provided for by Rules VIII., XVIII., and XIX.); and if the parties are at a loss to know the one ball from the other, neither shall be lifted till both parties agree.

IV. *Lifting of Break-Clubs*, &c.—All loose impediments within a club length of the ball may be removed on or off the course, when the ball lies on grass (see Rules VI. and XII.) When a ball lies in a bunker, sand, or any other hazard, there shall be no impression made, nor sand or other obstacle removed by the club, or otherwise, either on or off the green, before striking at the ball. When a ball lies within a club length of a washing-tub, the tub may be removed, and when on clothes the ball may be lifted and dropped behind them.

V. *Entitled to see the Ball.*—When a ball is completely covered with fog, bent, whins, &c., so much thereof shall be set aside as that the player shall merely have a view of his ball before he plays, whether in a line with the hole or otherwise. A ball stuck fast in wet ground or sand may be taken out and replaced loosely in the hole it has made.

VI. *Clearing the Putting Green.*—All loose impediments, of whatever kind, may be lifted on the putting green or table-land on which the hole is placed (excepting as declared in Rule IV.), which is considered not to exceed twenty yards from the hole. Nothing can be lifted either on the course or putting green, if it is to move the ball out of its position.

VII. *Lifting Balls.*—When, on any part of the course, or off it, or in a bunker, the balls lie within six inches of each other, the ball nearest the hole must be lifted till the other is played, and then placed as nearly as possible in its original position—the six inches to be measured from the surface of the balls. In a three-ball match, the ball in any degree interposing between the player and the hole on the putting green, must be played out.

VIII. *Ball in Water, or in the Burn, and Place of Re-teeing.*—If the ball is in water, the player may take it out, change the ball if he pleases tee it, and play from behind the hazard, losing a stroke. If the ball lies in any position in the burn across the first hole, the player may take it out, tee it on the line where it entered the burn, on the opposite side from the hole to which he is playing, and lose a stroke; or he may play it where it lies, without a penalty. However, should a ball be driven into the Eden at the high hole, or the sea at the first hole, the ball must be placed a club-length in front of either sea or river, the player or party losing a stroke. In playing for a medal, a ball driven into the Eden may be treated as a lost ball.

IX. *Rubs of the Green.*—Whatever happens to a ball by accident, such as striking any person, or being touched with the foot by a third party, or by the fore cady, must be reckoned a rub of the green, and submitted to. If, however, the player's ball strike his opponent, or his opponent's cady or clubs, the opponent loses the hole; or if he strikes himself or his partner, or their cadies or clubs, or if he strikes the ball a second time while in the act of playing, the player loses the hole. If the player touch the ball with his foot, or any part of his body, or with anything except his club, or if he with his club displace the ball in preparing to strike, he loses a stroke; and if one party strikes his opponent's ball with his club, foot, or otherwise, that party loses the hole. But if he plays it inadvertently, thinking it his own, and the opponent also plays the wrong ball, it is then too late to claim the penalty, and the hole must be played out with the balls thus changed. If, however, the mistake occurs from wrong information given by one party to the other, the penalty cannot be claimed; and the mistake, if discovered before the other party has played, must be rectified by replacing the ball as nearly as possible where it lay. If the player's ball be played away by mistake, or lifted by a third party, then the player must drop a ball as near the spot as possible, without any penalty. Whatever happens to a ball on a medal day, such as a player striking his cady, or himself, or his clubs, or moving the ball with his foot or club, or his cady doing so, or the player striking it twice before it stops motion, the player in such cases shall lose one stroke only as the penalty.

X. *Ball Lost.*—If a ball is lost, the player (or his partner, in a double match) returns to the spot, as near as possible, where the ball was struck, tees another ball, and loses both the distance and a stroke. If the original ball is found before the party has struck the other ball, the first shall continue the one to be played.

XI. *Club Breaking.*—If, in striking, the club breaks, it is nevertheless counted to be a stroke, if the part of the club remaining in the player's hand either strike the ground or pass the ball.

XII. *Holing out the Ball.*—In holing, no mark shall be placed, or line drawn, to direct the ball to the hole; the ball must be played fairly and honestly for the hole, and not on your opponent's ball not being in the way to the hole; nor, although lying in the way to the hole, is the player entitled to play with any strength upon it that might injure his opponent's position, or greater than is necessary honestly to send your own ball the distance of the hole. Either party may smooth sand lying around the hole, but this must be done lightly and without pressure, or beating down with the feet, club, or otherwise. If, in holing out, the ball rests upon the flag-stick in the hole, the player shall be entitled to have the stick removed, and if the ball falls in, it shall be considered as holed out; but either party is entitled to have the flag-stick removed when approaching the hole.

XIII. *Unplaying Balls.*—In *Match* playing every ball must be played, wherever it lies, or the hole be given up, excepting when it lies on clothes, in water, or in the bed of the burn (see Rules IV. and VIII.), or in any of the holes, or short holes, made for golfing, in which latter case it may be lifted, dropped behind the hazard, and played without losing a stroke. In *Medal* playing a ball may, under a penalty of two strokes, be lifted out of a difficulty of any description, and teed behind the hazard, and if in any of the golfing holes, it may be lifted, dropped, and played, without a penalty. In all cases where a ball is to be dropped, the party doing so shall front the hole to which he is playing, standing close on the hazard, and drop the ball behind him from his head.

XV. *Asking Advice.*—A player must not ask advice about the game, by word, look, or gesture, from any one except his own cady, his partner's cady, or his partner.

XVIII. *Balls Splitting.*—If a ball shall split into two or more pieces, a fresh ball shall be put down where the largest portion of the ball lies; and if a ball is cracked the player may change it on intimating his intention of doing so to his opponent.

XIX. *Breach of Rules.*—Where no penalty for the infringement of a rule is specially mentioned, the loss of the hole shall be understood to be the penalty.

Golf which, as we have seen, has a history of some interest, has also a literature (copious in verse and prose), and a somewhat amusing anecdotage. In *Golf, a Royal and Ancient Game*, a work issued in 1875 by Mr Robert Clark of Edinburgh, a well-known and accomplished adept, a very careful collection will be found of everything connected with the game which in this form deserves preservation. Through the ready kindness of the author this admirable compendium has been available, and free use has been made of it, in the preparation of this article. (P. P. A.)

GOLGOTHA. See JERUSALEM.

GOLIUS, JACOBUS (1596–1667), Orientalist, was born at the Hague in 1596, and studied at Leyden, where in Oriental languages he was the most distinguished pupil of Erpenius. In 1622 he accompanied the Dutch embassy to Morocco, and on his return he was chosen to succeed Erpenius (1624). In the following year he set out on a Syrian and Arabian tour from which he did not return until 1629. The remainder of his life was spent at Leyden where from that date he held the chair of mathematics as well as that of Arabic until his death, which occurred on September 28th, 1667.

His most important work is the *Lexicon Arabico-Latinum*, fol., Leyden 1653, which, based on the *Sihah* of Al-Jauhari, has only recently been superseded by the corresponding work of Freytag. Among his earlier publications may be mentioned editions of various Arabic texts (*Proverbia quædam Alis, imperatoris Muslemici, et Carmen Tograi, poetæ doctissimi, necnon dissertatio quædam Aben Synæ*, 1629; and *Ahmedis Arabsiadæ vitæ et rerum gestarum Timuri, qui vulgo Tamerlanes dicitur, historia*, 1636). In 1656 he published a new edition, with considerable additions, of the *Grammatica Arabica* of Erpenius. After his death, there was found among his papers a *Dictionarium Persico-Latinum* which was published, with additions, by Edmund Castell in his *Lexicon Heptaglotton* (1669). Golius also edited, translated, and annotated the astronomical treatise of Alfragan (*Muhammedis, filii Ketiri Ferganensis, qui vulgo Alfraganus dicitur, Elementa Astronomica Arabice et Latine*, 1669).

GOLLNOW, a town in the Prussian province of Pomerania, government district of Stettin, is situated on the right bank of the Ilna, 14 miles N.N.E. of Stettin, with which it has communication by steamer. It possesses two suburbs, and has manufactures of linen and woollen goods, copper wares, ribbons, paper, and tobacco. Gollnow was founded in 1190, was raised to the rank of a town by Barnim I. in 1268, and in 1314 received Lübeck rights. It was formerly a Hanse town, and came into the possession of Prussia in 1720. The population in 1876 was 7913.

GÖLNITZ, or GÖLLNITZ (GOLNICZBÁNYA), a mining town of Hungary, on a river of the same name, in the county of Szepes (Zips), about 18 miles south-west of Eperies, 48° 51′ N. lat., 20° 59′ E. long. In the vicinity are iron and copper mines, which, with the forges, and the nail and wire factories, &c., afford employment to most of the inhabitants. It is the seat of a mining council and tribunal, has Roman Catholic and Protestant churches, post and telegraph offices, and a high school. In 1870 the population amounted to 5205, composed of Magyars, Slavs, and Germans. Gölnitz was formerly a royal free town; its chief importance now is as a mining centre.

GOLOVNIN, VASILY MIKHAILOVICH (1776–1831), a Russian vice-admiral, was born April 20, 1776, in the village of Gulynki, in the province of Ryazan, and received his education at the Cronstadt naval school. From 1801 to 1806 he served as a volunteer in the English navy. In 1807 he was commissioned by the Russian Government to survey the coasts of Kamchatka and of Russian America, including also the Kurile Islands. Golovnin sailed round the Cape of Good Hope, and on October 5, 1809, arrived in Kamchatka. In 1810, whilst attempting to survey the coast of the island of Kunashir, he was seized by the Japanese, and was retained by them as a prisoner until October 13, 1813, when he was liberated, and in the following year he returned to St Petersburg. Soon after this the Government planned another expedition, which had for its object the circumnavigation of the globe by a Russian ship, and Golovnin was appointed to the command. He started from St Petersburg on the 7th September 1817, sailed round Cape Horn, and arrived in Kamchatka in the following May. He returned to Europe by way of the Cape of Good Hope, and landed at St Petersburg, September 17, 1819. He died July 12, 1831.

Golovnin published several works, of which the following are the most important:—*Journey to Kamchatka*, 2 vols., 1819; *Journey round the World*, 2 vols., 1822; and *Narrative of my Captivity in Japan*, 2 vols., 1816. The last has been translated into French, German, and English. A complete edition of his works was published at St Petersburg, 1864, in five volumes, with maps and charts, and a biography of the author by N. Grech.

GOLTZ, BOGUMIL (1801–1870), humorist and satirist, was born of a German family settled at Warsaw, March 20, 1801. At the age of seven he was taken by some friends to Königsberg, and after studying at the gymnasium was placed under the care of a country clergyman near Marienwerder. He next went to the gymnasium of Marienwerder, and finally returned to Königsberg. In 1817 he began to learn practical farming on an estate near Thorn; but the strong desire which he felt for scientific culture led him, five years later, to the university of Breslau. There he at first entered upon the study of theology, but he did not pursue it, selecting instead philosophy and philology. The next year he bought an estate near Thorn, married the daughter of a Prussian officer, and applied himself to the duties of a farmer. He did not succeed; and after other equally unsuccessful experiments in the same line in Poland and Prussia, he retired in 1830 to the small town of Gollub, and devoted himself to literary studies. Sixteen years of meditative seclusion passed away; and then, having taken up his abode at Thorn, he gave to the world the first fruits of his studies and reflexions in the charming poetic *Buch der Kindheit* (1847), in which he delineates the incidents and impressions of his own childhood with a tender feeling like that of Jean Paul. The dates which he gives in this narrative are inconsistent with those which he furnished for the memoir in Brockhaus's *Conversations-Lexikon*; and a chronological difficulty is thus created which perhaps it may not be possible to solve.

The *Buch der Kindheit* was speedily followed by a satirical and polemical epistle against Ronge and the friends of enlightenment, which he entitled *Deutsche Entartung in der lichtfreundlichen und modernen Lebensart*. For the purpose of enlarging his experience of men, and of amassing stores of material for his art as humorist and reformer of human life and society, he undertook a course of extensive travels, visiting Germany, France, England, Italy, and Egypt. In 1850 he published *Das Menschendaseyn in seinen weltewigen Zügen and Zeichen*. This was followed by another poetically conceived work on his own early life, entitled *Ein Jugendleben: Biographisches Idyll aus Westpreussen* (1852), and by *Ein Kleinstädter in Aegypten* (1853). In his next work, *Der Mensch und die Leute* (1858), he especially displays his peculiar powers in profound and acute sketches of various races of men. It is a book of enduring value. His *Die Deutschen*, consisting of a series of studies on the history and peculiarities of the genius of the Germans, appeared in 1860. His other works are *Zur charakteristik und Naturgeschichte der Frauen* (1859), *Typen der Gesellschaft* (1860), *Die Bildung und die Gebildeten* (1864), *Vorlesungen* (1869), and *Die Weltklugheit und die Lebensweisheit mit ihren correspondirenden Studien* (1869). Goltz is a follower of Jean Paul, and has many of the characteristics of his master; but he takes a lower place as literary artist, wanting Jean Paul's creative imagination. He died at Thorn, November 11, 1870.

An interesting essay on Goltz was contributed by the poet, Rudolf Gottschall, to *Unsere Zeit*, new series, 1871.

GOLTZIUS, HENDRIK (1558–1617), a Dutch painter and engraver, was born in 1558 at Mülebrecht, in the duchy of Juliers. After studying painting on glass for some years under his father, he was taught the use of the burin by Dirk Volkertsz Coornhert, a Dutch engraver of mediocre attainment, whom he soon surpassed, but who retained his services for his own advantage. He was also employed by Philip

Galle to engrave a set of prints of the history of Lucretia. At the age of twenty-one he married a widow somewhat advanced in years, whose money enabled him to establish at Haarlem an independent business; but his unpleasant relations with her so affected his health that he found it advisable in 1590 to make a tour through Germany to Italy, where he acquired an intense admiration for the works of Michelangelo, which led him to surpass that master in the grotesqueness and extravagance of his designs. He returned to Haarlem considerably improved in health, and laboured there at his art till his death, January 1, 1617. Goltzius ought not to be judged chiefly by the works he valued most, his eccentric imitations of Michelangelo. His portraits, though mostly miniatures, are master-pieces of their kind, both on account of their exquisite finish, and as fine studies of individual character. Of his larger heads, the life-size portrait of himself is probably the most striking example. His "master-pieces," so called from their being attempts to imitate the style of the old masters, have perhaps been overpraised. In his command of the burin Goltzius is not surpassed even by Dürer; but his technical skill is often unequally aided by higher artistic qualities. Even, however, his eccentricities and extravagances are greatly counterbalanced by the beauty and freedom of his execution. He began painting at the age of forty-two, but none of his works in this branch of art—some of which are in the imperial collection at Vienna—display any special excellences. He also executed a few pieces in chiaroscuro. His prints amount to more than 300 plates, and are fully described in Bartsch's *Peintre-graveur*, and Weigel's supplement to the same work.

GOMARUS, Francis (1563-1641), professor of theology at Leyden, was born at Bruges on the 30th January 1563. His parents, having embraced the principles of the Reformation, emigrated to the Palatinate in 1578, in order to enjoy freedom to profess their new faith, and they sent their son to be educated at Strasburg under John Sturmius. He remained there three years and then went to Neustadt, whither the professors of Heidelberg had been driven by the elector-palatine because they were not Lutherans. He did not stay long at Neustadt, but crossed to England towards the end of the year 1582, and entered first the university of Oxford, where he attended the lectures of John Raynold, and then the university of Cambridge, where he attended those of William Whitaker. At Cambridge he received his bachelor's degree in June 1584, and thence proceeded to Heidelberg, where the faculty had been by this time re-established, and continued his studies there for two years more. He was called to be minister of a Reformed church in Frankfort in 1587, and laboured there till the congregation was dispersed by the persecution of the year 1593. In 1594 he was appointed professor of theology at Leyden, and before going thither received from the university of Heidelberg the degree of doctor. He taught quietly at Leyden till 1603, when Arminius came to be one of his colleagues in the theological faculty, and began to teach Pelagian doctrines and to create a new party in the university. Gomarus immediately set himself earnestly to oppose these views, in his classes at college, and wherever he found opportunity. He became the leader of the opponents of Arminius, who from that circumstance came to be known as Gomarists. He engaged twice in personal disputation with Arminius in the assembly of the estates of Holland in 1608, and was one of five Gomarists who met five Arminians or Remonstrants in the same assembly in the following year. On the death of Arminius shortly after this time, Vorstius, who sympathized with his views, was appointed to succeed him, in spite of the keen opposition of Gomarus and his friends; and Gomarus took his defeat so ill that, rather than have such a man for his colleague, he resigned his post, and went to Middleburg in 1611, where he became minister of a congregation and gave public lectures. From this place he was called to a chair of theology at Saumur, where he remained four years, and then accepted a call as professor of theology and Hebrew to Gröningen, where he stayed till his death on 11th January 1641. He took a leading part in the synod of Dort, assembled in 1618 to judge of the doctrines of Arminius. He was a man of ability, enthusiasm, and learning, a considerable Oriental scholar, and also a keen controversialist. He took part in the translation of the Old Testament into Dutch in 1633, and after his death a book by him called the *Lyra Davidis* was published, which sought to explain the principles of Hebrew metre, and which created some controversy at the time, having been opposed by Louis Capel. His works were collected and published in one volume folio, in Amsterdam in 1645.

GOMBROON, another name for Bender-Abbasi (*q.v.*).

GOMER, the eldest son of Japhet (Gen. x. 2), and an ally of Gog (Ezek. xxxviii. 6), has usually, since Calmet's time, been identified with those Cimmerii who, originally inhabiting the districts to the N.E. and N. of the Black Sea and Sea of Azoff, at an early period began to penetrate as far as to Asia Minor, and in the 7th century B.C. overran Lydia, though without leaving permanent traces of their presence. This identification, however, is to be met with in none of the older writers. Josephus understands the Galatians of northern Phrygia to be intended; and Gimmeri or Gamir was, in the language of the ancient Armenians, a usual designation for their neighbours the Cappadocians (see Dillmann on Gen. x. 2; whose authority is Kephalion, in the Armenian version of the *Chronica* of Eusebius, ed. Aucher). It is not impossible that an intimate ethnological connexion between the Cappadocians of Kephalion and the Cimmerians of Homer may ultimately be established; but meanwhile it is important to observe that the three sons of Gomer, as named in Gen. x. 2, admit of a tolerably definite localization. Ashkenaz, who has sometimes been identified with the Germans, is almost certainly the same as the Ascanians, a very ancient tribe of northern Phrygia (*cf.* Strabo, xii. 4, 5, *sqq.*, and note the juxtaposition in Jer. li. 27). Riphath has nothing to do with the Rhipæan mountains, with the Carpathians, or with Niphates, but, as Josephus has pointed out, is to be identified with Paphlagonia; as Bochart has shown, the name probably survives in Ῥήβας, the designation of a river in Bithynia, and in Ῥηβαντία, a district situated on the Thracian Bosphorus. Although Togarmah is by Josephus interpreted as equivalent to Phrygia, there is a considerable amount of ancient testimony in favour of its identification with Armenia. It is possible that the same root is actually at the basis of the two words; at all events the connexion is assumed in the account which the Armenians themselves give of their legendary history.

GONDA, a district of Oudh, lying between 26° 46′ and 27° 50′ N. lat., and between 81° 35′ and 82° 48′ E. long., bounded on the N. by the lower range of the Himálayas, on the E. by Basti district, on the S. by Fyzabad and Bara Banki, and on the W. by Bharaich, and having an area of 2824 square miles.

Gonda presents the aspect of a vast plain with very slight undulations, studded with groves of mango trees. The surface consists of a rich alluvial deposit which is naturally divided into three great belts known as the *tarái* or swampy tract, the *uparhár* or uplands, and the *tarhár* or wet lowlands, all three being marvellously fertile. Several rivers flow through the district, but only two, the Gogra and Rápti, are of any commercial importance, the first being navigable throughout the year, and the latter during the rainy season. The country is dotted over with small lakes, the water of which is largely used for irrigation. The *feræ naturæ* consist of tigers, leopards, bears, wolves, and deer. Large game birds are plentiful.

This district has no particular history of its own; what ancient history it has is included in that of Oudh. On the outbreak of the mutiny, the rájá of Gonda, after honourably escorting the Government treasure to Fyzabad, joined the rebels. His estates, along with those of the ráni of Tulsipur, were confiscated, and conferred as rewards upon the mahárájás of Balrámpur and Sháhganj, who had remained loyal. The census of 1869 disclosed a population of 1,166,515 (602,862 males, and 563,653 females)—Hindus, 1,049,397; Mahometans, 117,070; Christians—European, Eurasian, and native—48. Five towns contain a population exceeding 5000, namely, Gonda, Balrámpur, Colonelganz, Nawabganj, and Utraula. Rice; wheat, and barley are the chief products of the district. The area under cultivation is 993,858 acres. The exports are rice and food grains; the imports, cotton, European piece goods, and salt. The administration is under a deputy commissioner, aided by two European assistants. The total revenue (1875–76) amounted to £135,509; the expenditure to £15,810. The police force (1873) consisted of 484 officers and men, maintained at a cost of £6655. Education is still in its infancy. In 1875–76 there were 116 schools under Government inspection, attended by 5879 pupils. Fever is prevalent throughout the district. The other principal diseases are scurvy, cholera, diarrhœa, and goitre. The average rainfall during the eleven years 1865–1875 was 42·0 inches. The average yearly temperature is 77·5° Fahr., the highest recorded being 106°, the lowest 48°.

GONDA, the chief town and administrative headquarters of Gonda district, in 27° 8′ N. lat. and 82° 1′ E. long. The site on which the town now stands was originally a jungle, in the centre of which was a cattle fold (Gontha or Gothán), in which the cattle were enclosed at night as a protection against wild beasts, and from this the town derived its name. The place was formerly celebrated for the manufacture of shields; now it is neither of commercial nor of religious importance. The town contains a civil station, dispensary, school, literary institute, courthouse, and jail. Population, 13,722.

GONDAR, properly GUENDAR, a town of Abyssinia, formerly the capital of the Amharic kingdom, is situated on a basaltic ridge in the country of Dembea, about 21 miles N.E. of Lake Tsana or Tana, a splendid view of which is obtained from the castle. According to Rüppell, its latitude is 12° 35′ N. and its longitude 37° 31′ 57″ E., and it lies 7460 feet above the level of the sea. Two streams, the Angreb on the east side and the Gaha or Kaha on the west, flow down from the ridge, and meeting below the town pass onwards to the lake. In the Gaha the Christian inhabitants of Gondar are accustomed to bathe in vast disorderly crowds on the feast of St John the Baptist (10th September), and again in a more decent manner on the anniversary of the Saviour's birth. The town is divided into several districts separated from each other by wood and field,—one being the Abun-Bed or bishop's quarter, another the Etchege-Bed or quarter of the prior or chief of the monks, while a third takes its name from the Debra Birhan or Church of the Light, and a fourth from the Gemp or castle. This was at one time a splendid pile, designed on the plan of a mediæval stronghold; and the solidity of its masonry, the beauty of its ornamentations, and the general effect of its arrangement stand in striking contrast to the mean and monotonous houses of the town, which are all erected after the cylindro-conical type. It was built in the 16th century for King Socinius by the Portuguese adventurers, who employed Indian workmen in its erection. At some distance there is another palace built at a later date for Ras Michael, which affords no bad imitation of the Portuguese style. Upwards of forty churches, all in the circular Abyssinian style, are said to exist in the town and immediate vicinity; of these the most important is the Quisquam or Flight into Egypt, erected by Mintwab Muntwar, the empress mother of Yasu the Great and Yasu the Little. The painting of the interior was probably executed by the Venetian artists mentioned by Bruce. The city was founded in the 15th century by emperor Fasilidas, or A'lem-Seged; it has been frequently sacked, and in 1868 it was laid in ruins by Theodorus, who did not spare either the castle or the churches. The population, estimated by Bruce at 10,000 families, has been brought to a very low ebb by the political distractions of the country. In 1853 Heuglin thought the inhabitants might number from 5000 to 6000, and in 1861–62 he raised the figure to from 6000 to 7000. About 2000 of the number are Mahometans, and there is a considerable settlement of Jews (Falasha). Cotton cloth, gold and silver ornaments, copper wares, fancy articles in bone and ivory, excellent saddles, and shoes are among the products of the local industry. The shoes are made almost exclusively for the clergy, as the ordinary Abyssinians either go barefoot or wear sandals. See especially Rüppell, *Reise in Abyssinien*, Frankfort-on-the-Main, 1838–40; Heuglin, *Reise nach Abessinien*, Jena, 1868; Lejean, *Voyage en Abyssinie*, Paris, 1872; and Raffray, *Afrique Occidentale*, Paris, 1876. Views of the castle are given by Heuglin and Raffray.

GONDOKORO. See ISMAILIA.

GONDWÁNA, a tract of country in Central India, extending from the 19th to the 25th degree of N. lat., deriving its name from the aboriginal tribe of *Gonds*, who form the predominant element in the population. The tract may be considered as comprising part of the British territory of Ságor and Nerbudda, with the districts of Singraulí, Chotá Nágpur, and Sirguja, the petty native states on the S.W. frontier of Bengal, the Cuttack Mahals, and the northern portion of Nágpur. It is estimated to be 400 miles in length by 280 in average breadth. Gondwána, in its most extensive sense, includes all that part of India within the above-mentioned boundaries which remained unconquered by the Mahometans up to the reign of Aurungzebe. But Gondwána proper is limited to four districts, named Mándla, Chhatísgarh, Nágpur, and Chándal, and it stretches south along the east side of the Wardha and Godávari, to within 100 miles of the mouth of the latter. The greater part of this province is a mountainous, unhealthy, and ill-watered country, covered with jungle, and thinly inhabited; and to its poverty and other bad qualities its independence may be ascribed. A continued chain of moderately elevated hills extends from the southern frontier of Bengal almost to the Godávari, and by these the eastern was formerly separated from the western portion of the Nágpur dominions. This province contains the sources of the Nerbudda and the Son, and is bounded by the Wardha and Godávari; but a want of water is still the general defect, the streams by which it is intersected, namely, the Mahánadi, Kárun, Hatus, and Siláir, being inconsiderable, and not navigable within its limits. The Gonds, or the hill tribes who took refuge in the mountains and fastnesses from the invaders of the country, are the original inhabitants of the country, and, till recently, retained all their primeval habits of barbarism. They have now adopted a form of Hinduism, but they retain many of their ancient customs, and abstain from no flesh except that of the ox, cow, and bull. According to the census of 1872 they numbered 2,041,276, or nearly 25 per cent. of the entire population of the Central Provinces. The more fertile tracts of Gondwána were subdued at an early period by the Marhattás, who claimed as paramount over the whole. The inhabitants were rendered nominally tributary; but it was found impossible to collect any revenue from them without military force, so that, in fact, the collection of the revenue was like a plundering expedition, the cost of which always exceeded the profit.

During the war against the Pindáris in 1818, when the British troops invaded the territories of Appa Sáhib, the rájá of Nágpur, their operations were greatly facilitated by the insurrection of the hill tribes, who occupied the passes into the Nágpur territories. For a long series of years it was the policy of the rájá of this territory, a descendant of Sivají, to interfere as little as possible with the neighbouring powers. At length, in 1803, Raghojí Bhonslá was induced, in an evil hour for himself, to depart from this system of neutrality, and to join Sindhia in a confederacy against the British. He was soon reduced, however, by the defeats which the confederates sustained at Assaye and Argaum, to sue for peace, as the price of which he ceded a large portion of his dominions to the conquerors, namely, the province of Orissa. After the death of this rájá, the throne, contested by various competitors, was at last secured by Appa Sáhib, his nephew, who, in the war against the Pindáris, joined the coalition against the British power, and was involved in ruin along with his other allies. A treaty of peace was concluded with him, which he violated; and he was finally deposed in 1818, and the grandson of the late rájá put in his stead. The latter prince, after a reign of 35 years, died without issue in 1853; the dynasty thus became extinct, and the kingdom of Nágpur was incorporated with the British empire, and now forms the chief commissionership of the Central Provinces.

GONG (Chinese, *gong-gong* or *tam-tam*), a sonorous or musical instrument of Chinese origin and manufacture, made in the form of a broad thin disc with a deep rim. Gongs vary in diameter from about 20 to 40 inches, and they are made of bronze containing a maximum of 22 parts of tin to 78 of copper; but in many cases the proportion of tin is considerably less. Such an alloy, when cast and allowed to cool slowly, is excessively brittle, but it can be tempered and annealed in a peculiar manner. If suddenly cooled from a cherry-red heat, the alloy becomes so soft that it can be hammered and worked on the lathe, and afterwards it may be hardened by re-heating and cooling it slowly. In these properties, it will be observed, the alloy behaves in a manner exactly opposite to steel, and the Chinese avail themselves of the known peculiarities for preparing the thin sheets of which gongs are made. They cool their castings of bronze in water, and after hammering out the alloy in the soft state, the finished gongs are hardened by heating them to a cherry red, and allowing them to cool slowly. The gong is beaten with a round, hard, leather-covered pad, fitted on a short stick or handle. It emits a peculiarly sonorous sound, its complex vibrations bursting into a wave-like succession of tones, sometimes shrill, sometimes deep. In China and Japan it is used in religious ceremonies, state processions, marriages, and other festivals; and it is said that the Chinese can modify its tone variously by particular ways of striking the disc. Among Western communities it is only employed as a substitute for a dinner bell or a general household signal.

GÓNGORA Y ARGOTE, LUIS DE (1561–1627), Spanish lyric poet, was born at Cordova, on the 11th of July 1561. His father, Don Francisco de Argote, was corregidor of that city; and his mother, Doña Leonora de Góngora, was descended from an ancient and noble family of Navarre. Having been sent, at the age of fifteen, as a student of civil and canon law to the university of Salamanca, he soon took a prominent place among his fellow-students; but the great talent which he exhibited did not point in the direction either of legal or of diplomatic employments. Leaving the university some years afterwards (the exact date is unknown) without a degree, but already with a considerable literary reputation, he returned to Cordova, where he had succeeded to a moderate property, and where he was able to associate on terms of intimacy and equality with the best society of the city and province. Lope de Vega, writing about 1593, speaks of him as surrounded there by a literary society, and acknowledged as its chief. In 1604, when past his fortieth year, he took the tonsure, and accepted a prebendal stall in the cathedral of Cordova,—steps which have usually been attributed to worldly or sordid motives, but which really cannot be regarded as unnatural or unbecoming in a man circumstanced as he was. From this time he began to spend a portion of each year at the seat of the court, first at Valladolid and afterwards at Madrid, where as Pellicer, his contemporary, remarks, he "noted everything and pecked at everything with his satirical pen." His circle of literary and other distinguished admirers was now greatly enlarged; but the acknowledgment which the court accorded to his singular genius was both slight and tardy. Ultimately indeed, through the influence of the duke of Lerma and the marquis of Siete Iglesias, he obtained an appointment as honorary chaplain to Philip III., but even this slight honour he was not permitted long to wear. A severe illness, which had seriously impaired his memory, compelled his retirement to Cordova, where, after a period of deep seclusion, he peacefully breathed his last on the 23d of May 1627. An edition of his poems was published almost immediately after his death by Juan Lopez de Vicuña; but the frequently reprinted edition by Hozes did not appear till 1633. The collection consists of numerous sonnets, heroical, amorous, satirical, humorous, elegiac, and "miscellaneous," of various odes, ballads, songs for the guitar, of a few uncompleted comedies, and of certain larger poems, such as the *Soledades* ("Solitary Musings") and the *Polifemo*, which hardly admit of classification. They all exhibit that learned and polished elaboration of style (estilo culto) with which the name of Góngora is inseparably associated; but if, since the days of Lopa de Vega, they have been justly censured for their affected Latinisms, unnatural transpositions, strained metaphors, and frequent obscurity, it must never be forgotten that their author was a man of genius,—a fact cordially acknowledged by those of his contemporaries who were most capable of judging, and indeed a fact capable of direct verification by any one who chooses to take the trouble of reading him even in an imperfect translation. It was only in the hands of those who served themselves heirs to Góngora's style, without inheriting his genius, that "cultismo" became really laughable; but it is manifestly unjust to charge the memory of the master with the follies of his weaker disciples.

A series of *Lecciones Solemnes*, or expository lectures on the *Polifemo*, *Soledades*, *Panegirico*, and *Piramo y Tisbe* was published by Pellicer in 1630; an *Ilustracion y Defensa de la Fábula de Piramo y Tisbe*, by Salazar Mardones, followed in 1636; there is also a commentary on the entire works by Salcedo Coronel (1636–48). A good edition of the works of the "Andalucian Pindar" (as Góngora is designated by Pellicer) is that of Brussels (1659). The admirable labours of Churton (*Gongora, an Historical and Critical Essay on the Times of Philip III. and IV. of Spain, with Translations*, 1862) have made this obscure author easily accessible to the English reader.

GONIOMETER. Strictly speaking this name is applicable to any instrument, such as a mural circle, a theodolite, and so on, used for measuring an angle; it is in reality, however, applied exclusively to instruments used for measuring the angles between the faces of crystals. The oldest instrument of the kind was invented by Carangeot, and consisted simply of a pair of rulers jointed together and fitted with a graduated circle for measuring the angle between their edges. A carpenter uses a somewhat similar instrument, not, it is true, for measuring, but for transferring angles. The application of the principle of reflexion by Wollaston in 1809 converted the goniometer into an instrument of precision. His form, with a vertical divided circle, is still much used. The principle of reflexion is briefly this. The crystal is mounted so that it can be rotated about an axis parallel to the edge in which its two faces meet. It is first placed so that a ray of light coming in some fixed direction (say, along the axis of a collimator), when reflected from one face, passes in another fixed direction (say, along the axis of a telescope). The crystal is then turned till the ray reflected from the other face passes in the same direction as before. The angle through which the crystal has been turned is either $180° + 2A$ or $180° - 2A$, where A is the angle between the faces. The introduction of the fixed mirror by Degen and Lang, and of the horizontal circle with collimators, brought the instrument into its most modern form. Babinet, Malus, Mitscherlich, Haidinger, Von Lang, and others have contributed towards perfecting the instrument. Recently Professor W. H. Miller (*Phil. Mag.*, 1876) has described a new form of goniometer. In the paper quoted some useful details concerning the use of the instrument will be found. For further instructions how to use the goniometer the reader may refer to Phillips's *Mineralogy*, or Groth's *Physikalische Krystallographie*, Abth. iii. The modern goniometer has so much in common with the spectrometer that it is unnecessary to describe it in detail here. See SPECTROSCOPE.

GONSALVO. See GONZALO.

GONZAGA, or GONZUGUE, an old princely family of Italy, which traces its origin to the emperor Lothair, but first came into notice in the 11th century, after the overthrow of the imperial power in Italy, where they for some time disputed the sovereignty of Mantua with the Bonacosse. The long dispute was ended by the murder of Passerino de Bonacossi in 1328, after which the Gonzaga retained possession of Mantua for four centuries. Their claims were in 1354 confirmed to Ludovico I. (1267–1360) by Louis the Bavarian, who nominated him imperial vicar, and gave him also the sovereignty of Reggio and other towns. Petrino, youngest son of Ludovico, founded the countship of Novellara, which became extinct in 1728. The elder branch of the family was continued by Guido and his son Ludovico II., who, on his death in 1382, was succeeded by his brother Francesco. He was followed in 1407 by his son Giovanni Francesco (1394–1444), on whom, for his services in the Italian wars, the emperor Sigismund in 1433 bestowed the title of marquis. Ludovico III. (1414–1478), son of the preceding, surnamed, for what reason is not quite certain, the Turk, retained a body of troops which he granted on hire to neighbouring princes. The younger sons of this Ludovico, Giovanni Francesco and Rudolpho, founded the dukedoms of Gabioneta and Castiglione respectively, which were confiscated in 1692. The elder branch of the family was continued by Frederick I. (1439–1484), whose son, Giovanni Francesco II. (1466–1519), was in 1494 appointed to the supreme command of the united Italian army against Charles VIII. of France, and on the 6th of July of the following year gained the victory of Fornovo, and took prisoner the bastard of Bourbon. His son, Frederick II. (1500–1540), received in 1530 the title of duke from Charles V., and in 1536 the principality of Montferrat. A younger son, Ferdinand, was the founder of the Guastella branch of the family, which became extinct in 1746. Of the succeeding members of the elder branch, the only notable one was Vincenzo I. (1562–1612), to whom the Admirable Crichton was tutor, and by whom he was murdered from jealousy in 1582. This branch became extinct in 1627 through the death of Vincenzo II., sixth successor of Frederick II. The nearest heir was Carlo I., duke of Nevers, who was recognized by the Mantuans, but his claims were contested by Ferdinand II. of Guastella, who had the support of the emperor Ferdinand II. In the war which followed, the duke of Nevers obtained the assistance of Louis XIII. of France, but in 1630 Mantua was captured and pillaged by the imperial troops, and the duke was forced to retire to the States of the Church. In 1631 a treaty was, however, concluded between France and the emperor, by which the duke, on making submission, was reinvested with the duchies of Mantua and Montferrat. Anna, a daughter of Carlo I., became wife of Edward, elector-palatine of the Rhine, and after playing a distinguished part at the French court, died at Paris in 1684, leaving behind her a volume of interesting *Memoirs* (London and Paris, 1686). Carlo died in 1639, and was succeeded by his grandson Carlo III., who, on his death in 1665, was succeeded by his son Carlo IV. This duke married in 1670 Anna Isabella, eldest daughter of Ferdinand duke of Guastella; and on the death of Ferdinand in 1679, he endeavoured to obtain possession of that duchy, but was compelled to relinquish his claims to Vincenzo, a cousin-german of the deceased duke. He took part on the side of France in the Spanish succession war, and received a French garrison into Mantua. After the defeat of the French he was placed under the ban by the emperor Joseph I., whereupon Victor Amadeus of Savoy conquered Montferrat, and Austria, in agreement with France whom Carlo had offended, took possession of Mantua. On his death without issue in 1708, the dynasty of the Gonzagas of Mantua became extinct.

GONZAGA, THOMAZ ANTONIO (1744–1809), "the Portuguese Petrarch," perhaps better known as DIRCEU, was born at Oporto in 1744, and received his early education there and at Bahia, where his father, after having held various judicial appointments, became a member of the supreme court in 1759. Having completed his law studies at the university of Coimbra, which he attended from 1763 to 1768, Gonzaga in the latter year returned to Brazil, and after having acted for some years as juiz de fora or local magistrate at Beja and elsewhere he ultimately was appointed a judge (ouvidor) at Villa-Rica in the province of Minas, where he highly distinguished himself it is said both by his administrative ability and by the many excellences of his private character. He appears before this time to have developed some talent for versification, and his literary tastes soon brought him into intimate association with Claudio Manoel, Alvarenga Peixoto, and other writers of the so-called Minas school; but the love which makes the poet did not, in his own opinion at least, come upon him until he had made the acquaintance (about 1788) of D. Maria Joaquina Dorothea de Seixas, the "Marilia de Dirceu" to whom all his extant poems relate. He had just been nominated a member of the supreme court of Bahia, and was on the eve of his marriage, when discovery was made of the treasonable plot of Minas, and he was arrested on suspicion of having been implicated in it. On merely circumstantial evidence, and that of a very inconclusive kind, he was condemned, 18th April 1792, to banishment for life to Pedras de Angoche, a sentence which was afterwards commuted to one of ten years' exile at Mozambique. Here he made some effort to practise as an advocate, but he never recovered from the wearing-out depression into which he had been thrown by his cruel lot; an attack of nervous fever undermined his health, and after years of an ever-deepening melancholy, which occasionally alternated with fits of acute mania, he died in 1809.

His collection of poems, entitled *Marilia de Dirceu*, consists of two parts. In the first of these, the charms of Marilia and his own happiness in the love he bears to her are his endlessly varied theme. The second, written during his imprisonment, is full of laments over his terrible fate, protestations of his innocence, and many fine expressions of the support and comfort he still finds in the remembrance of his love. Almost everywhere these "lyras" plainly enough betray a conscious imitation of Petrarch or other models; but they also exhibit an imaginative charm, a naturalness and delicacy of feeling, a harmoniousness of diction, and a gracefulness of versification which, in the unanimous opinion of competent critics, entitle them to rank among the best love lyrics in the language. In Brazil their popularity, perhaps aided by feelings of sympathy for their unfortunate author, has from the first been very great. The editions are very numerous, the best probably being that of J. M. P. da Sylva which is accompanied with an historical and biographical introduction (1845). A critical notice, along with selections from the poems of Gonzaga, will be found in Wolf's *Brésil Littéraire* (1863). They have been translated into French by Monglave and Chalas (1825), into Spanish by Vedia, and into Italian by Ruscalla.

GONZALO DE BERCEO, mystic and didactic poet, and one of the earliest names in Castilian literature, was parish priest at Berceo, near San Domingo de la Calzada, in the province of Burgos, and lived, it is believed, during the first sixty years of the 13th century. His works, which are reprinted in the *Poesias Castellanas Anteriores al Siglo XV.* of Sanchez, amount to upwards of 13,000 lines of verse, chiefly in rhymed quatrains. The subjects chosen for treatment are the Lives of San Domingo de Silos, Santa Oria, and San Millan; the Sacrifice of the Mass; the Miracles, Glories, and Pains of the Blessed Virgin; the Signs of the Day of Judgment; and the Martyrdom of San Lorenzo. Apart from the interest which attaches to them in the eyes of the literary and ecclesiastical archæologist, they have little to attract the modern reader. The monotony of their "sermo pedestris" is but seldom relieved by any touches of poetical genius; in some places, however, as Ticknor remarks, there is a simple-hearted piety that is very attractive, and in others a power in story-telling that is very striking. The poem on the Miracles of the Virgin, which is the largest, is also the most curious; but that upon the Signs of the Last Day is often very solemn, while the Mourning of Mary at the Cross breathes such a childlike spirit of gentle, faithful, credulous devotion as enables one to realize with some vividness many of the best characteristics of the religious life of the time.

See Ticknor, *History of Spanish Literature*; and Carus, *Darstellung der Spanischen Literatur* (1846); also Dunham's *History of Spain and Portugal*, vol. iv. (1832).

GONZALO FERNANDEZ Y AGUILAR (1453–1515), commonly known as Gonsalvo de Cordova, El Gran Capitan ("The Great Captain"), was born at Montilla on the 16th of March 1453, and in his fifteenth year was presented to Queen Isabella at Segovia, where his manly beauty, his graceful manners, and his soldierly accomplishments speedily made him conspicuous in the court. He first saw active military service in Portugal under Alonzo de Cardenas, and gained special praise for his conduct on the battlefield of Albuera in 1479. In the protracted Moorish war begun in 1481, he served with distinction in various capacities, and was finally employed to conduct the peace negotiations with Abdallah. For his efficient services in this business he was rewarded with a pension and a grant out of the conquered territory (1492). When, in consequence of the advance of Charles VIII. into Italy, a Spanish expedition was decided upon in 1495, Gonzalo was selected for the chief command; and although at Seminara near Reggio, through the interference of the friendly Ferdinand of Naples, he lost the battle (it was the only occasion on which he ever was defeated), he gained in reputation both for prudence and for bravery. In spite of his subsequent successes in Lower Calabria, the campaign of this year closed with indecisive results; but in the opening of the following season, he still further increased his fame by his brilliant surprise and capture of Laino, and by his junction with the Neapolitan forces before Atella, after an arduous march through hostile territory. It is most commonly, and with most probability, said to have been on this occasion that he received the honourable title of El Gran Capitan, by which the Spaniards still delight to designate him. The conquest of Calabria having been thus rapidly achieved, he, at the pope's invitation, proceeded to clear Ostia of the French garrison by which it had been held, and shortly afterwards entered Rome itself, where he was greeted by the populace as "deliverer of the city." The object of his expedition, the total expulsion of the French from Neapolitan territory, having been fully attained, he, in August 1498, returned to Spain, where he was received with the utmost enthusiasm by all classes, the king publicly declaring that the reduction of Naples, and the humiliation inflicted on the French, reflected more lustre on his crown than the conquest of Granada. After having, early in 1500, efficiently co-operated with Tendilla in putting down the Moorish insurrection in the Alpujarras, Gonzalo, in May of the same year, took command of an armada designed to operate on the coast of Sicily and in the Levant, and generally to uphold the influence of Spain. In conjunction with the Venetian admiral he stormed St George in Cephalonia, in January 1501; and soon afterwards returning to Sicily, commenced operations against Frederick in accordance with the treaty concluded between France and Spain for the partition of Naples. The whole of Calabria was occupied in less than a month, with the exception of Tarento, which did not surrender until March 1502. On the outbreak of hostilities between France and Spain in July of the same year, Gonzalo was compelled to fall back upon Barletta, whence, after having sustained a memorable siege of nearly ten months, he sallied in April 1503, and coming upon the French troops at Cerignola, inflicted on them a disastrous defeat, which at once made him master of the city of Naples and of the greater part of the kingdom. A subsequent victory at the bridge of Garigliano (29th December 1503) gave him Gaeta, and terminated the war. For more than three years he continued to act with popularity and efficiency at Naples as Ferdinand's viceroy; but the jealousy and distrust of that somewhat narrow-minded monarch led to his recall in 1507, and to his subsequent retirement from court shortly afterwards. The remainder of his days were passed on his estate at Loja, where, in the midst of preparations for a voyage to Flanders, he was seized with a fever, of which he died, 2d December 1515.

The life of "the great captain" has been rather a favourite subject with literary men, having been treated by Giovio in his *Vitæ Illustrium Virorum*, and by Quintana in his *Españoles Célebres*, as well as by Florian (*Gonsalve de Cordoue, ou Grenade Reconquise*, 1791), Duponcet (*Histoire de Gonsalve de Cordoue*, 1714), and an anonymous author, sometimes supposed to be Pulgar (*Crónica del Gran Capitan*, 1584). A skilful and judicious use of all these sources has been made by Prescott in his *History of the Reign of Ferdinand and Isabella*, where the purity, generosity, and loyalty of the private character of Gonzalo, as well as the coolness, sobriety, and energy of his military genius, are very fully and vividly illustrated.

GOOD, JOHN MASON (1764–1827), a writer on medical, religious, and classical subjects, was born May 25, 1764, at Epping, Essex, where his father, the Rev. Peter Good, was Independent minister. After receiving his education in the seminary conducted by his father, he was, at about the age of fifteen, apprenticed to a surgeon-apothecary at Gosport. In 1783 he went to London to prosecute his medical studies, and in the autumn of 1784 he commenced practice as a surgeon at Sudbury in Suffolk. Through an obligation rendered to a friend he, in 1792, got into pecuniary embarrassment, and, with a view to surmount his difficulties, he removed in 1793 to London, where he entered into partnership with a surgeon and apothecary who enjoyed an extensive practice. In November of the same year he was admitted a member of the college of surgeons. On account of disagreements with his colleague, the partnership was soon afterwards dissolved, and to increase his income he now devoted more of his attention to literary pursuits. Besides contributing both in prose and poetry to the *Analytical* and *Critical Reviews*, and the *British* and *Monthly Magazines*, and other periodicals, he is the author of a large number of works relating chiefly to medical and religious subjects. In 1794 he became a member of the British Pharmaceutical Society, and in that connexion, and especially by the publication of his work, *A History of Medicine*, he did much to effect a greatly needed reform in the profession of the apothecary. In 1820 he took the diploma of M.D. at Marischal College, Aberdeen. He died, January 2, 1827. Dr Good was not only well versed in classical literature, but was acquainted with the principal European languages, and also with Persian, Arabic, and Hebrew. His prose works display wide erudition and considerable intellectual vigour, and contain much interesting and curious information; but their style is dull and tedious, and they are now very generally forgotten. His poetry never rises above pleasant and well-versified commonplace.

The following are his principal writings:—*Maria*, an elegiac ode, 1786; *Diseases of Prisons and Poorhouses*, 1795; *History of Medicine*, 1795; *Parish Workhouses*, 1798; *Song of Songs, translated from the Hebrew, with notes critical and explanatory*, 1803; *Triumph of Britain, an Ode*, 1803; *Memoirs of the Life and Writings of Alex. Geddes, LL.D.*, 1803; *The Nature of Things: a Didactic Poem, translated from the Latin of Titus Lucretius Carus, with the original text and notes philological and explanatory*, 1805–7, 2 vols. 4to, which is still of considerable value for its parallel passages and quotations both from European and Asiatic languages; *Oration on the Structure and Physiology of Plants*, 1808; *Essay on Medical Technology*, 1810; *The Book of Job literally translated*, &c., 1812; *The Study of Medicine*, 1822, 4 vols. 8vo, 3d ed. in 1832, edited by Dr Samuel Cooper; and *The Book of Nature*, 1826, 3 vols. See *Memoirs* by Olinthus Gregory, LL.D., 1828, and a biographical sketch in the *Gentleman's Magazine* for March 1827. His *Thoughts for all Seasons, in Prose and Verse*, was published, with a short biographical sketch, in 1860.

GOOD FRIDAY, the usual English name for the day observed throughout a great part of Christendom as the anniversary of the passion and death of Christ. In the Greek Church it has been or is known as *πάσχα* [*σταυρώσιμον*], *παρασκευή*, *παρασκευή μεγάλη* or *ἁγία*, *σωτηρία* or *τὰ σωτήρια*, *ἡμέρα τοῦ σταυροῦ*, while among the Latins the names of most frequent occurrence are Pascha Crucis, Dies Dominicæ Passionis, Parasceve, Feria Sexta Paschæ, Feria Sexta Major in Hierusalem, Dies Absolutionis. It was called Long Friday by the Anglo-Saxons[1] and Danes; in Germany it is sometimes designated Stiller Freitag (compare Greek, *ἑβδομὰς ἄπρακτος*; Latin, hebdomas inofficiosa, non laboriosa), but more commonly Charfreitag. The etymology of this last name has been much disputed, but there seems now to be little doubt that it is derived from the Old High German *chara*, meaning suffering or mourning.

The origin of the custom of a yearly commemoration of the crucifixion is involved in some obscurity. It may be regarded as certain, indeed, that among Jewish Christians it almost imperceptibly grew out of the old habit of annually celebrating the Passover on the 14th of Nisan, and of observing the "days of unleavened bread," from the 15th to the 21st of that month. In the Gentile churches, on the other hand, it seems to be well established that originally no yearly cycle of festivals was known at all. The weekly observance of the dies dominica, however, became universal at a very early date; and the practice of giving special prominence to Easter Sunday (the first Sunday after the 14th of Nisan), as well as that of keeping a previous fast of considerable rigour, though of indeterminate duration, had established itself in Egypt and in the Western churches at least by the middle of the 2d century. The accounts which have been transmitted by Eusebius, Socrates, and Epiphanius of the paschal controversies, which began to be agitated about 160 A.D., are obscure on many points—so obscure, indeed, as to suggest doubts whether these historians had altogether comprehended the questions under discussion. So much, however, is clear, that Occidental feeling had even then begun to take great offence at the prevailing Eastern practice. In Asia Minor, Syria, and Mesopotamia, the 14th and 16th of Nisan were specially observed, altogether irrespective of the day of the week, and for this apostolic sanction was urged by Polycarp; but Anicetus of Rome, with great earnestness, though still with deference, pleaded immemorial usage for the custom of observing a Friday and Saturday fast followed by an Easter Sunday feast. As the Western churches gained in influence, the practice of tolerance became increasingly difficult; already in 190 A.D. we find Victor of Rome insisting on the conformity of Polycrates of Ephesus, and proclaiming the contumacious Asiatics to be out of communion (*ἀκοινωνήτους*). To secure uniformity in this matter was one of the objects for which the council of Nice was convened in 325; no canon, however, was framed by the fathers there assembled, but it was recommended in a circular letter that Easter (*πάσχα*) should invariably be observed on a Sunday, and that the passion should, with equal regularity, be commemorated on Friday. Considerable progress towards the compulsory establishment of a uniform paschal usage was made in the years immediately following; thus, by a canon of the council of Antioch (341), the followers of the Oriental use were laid under severe ecclesiastical censures; in the decrees of that of Laodicea (361) the ominous word *αἵρεσις* is heard (*αἵρεσις τῶν τεσσαρες καιδεκατιτῶν*); while in the Theodosian Code (xvi. 5, 9; 6, 6; 10, 24), the Quartodecimans are formally ranked among the other heretics whose error is to be visited with civil pains and penalties.

From the earliest period of its observance, the day was marked by a specially rigorous fast, and also, on the whole, by a tendency to greater simplicity in the public services of the church. Prior to the 4th century there is no evidence of non-celebration of the eucharist on Good Friday; but after that date the prohibition of communion became common. In Spain, indeed, it became customary to close the churches altogether as a sign of mourning; but this practice was condemned by the council of Toledo (633). In the Romish Church the Good Friday ritual at present observed is marked by many special features, most of which can be traced back to a date at least prior to the close of the 8th century (see the Ordo Romanus in Muratori's *Liturg. Rom. Vet.*). The altar and officiating clergy are draped in black, this being the only day on which that colour is permitted. Instead of the epistle, sundry passages from Hosea, Habakkuk, Exodus, and the Psalms are read. The gospel for the day consists of the history of the passion as recorded by St John. The reading of this is followed by bidding prayers for the peace and unity of the church, for the pope, the clergy, all ranks and conditions of men, the sovereign, for catechumens, the sick and afflicted, heretics and schismatics, Jews and heathen. Then follows the "adoration of the cross" (a ceremony said to date back to near the time of Helena's "invention of the cross"); the hymns *Pange Lingua* and *Vexilla Regis* are sung, and the reserved host brought out and partaken of by the priest. In many Roman Catholic countries, as, for example, in Spain, it is usual with the faithful to spend much time in the churches in meditation on the "seven last words" of the Saviour; no carriages are driven through the streets; the bells and organs are silent; and in every possible way it is sought to deepen the impression of a profound and universal grief. In the Greek Church also the Good Friday fast is excessively strict; as in the Roman Church, the passion history is read and the cross adored; towards evening a dramatic representation of the entombment takes place, amid open demonstrations of contempt for Judas and the Jews. In Lutheran churches the organ is silent on this day; and altar, font, and pulpit are draped in black, as indeed throughout Holy Week. In the Church of England the history of the passion from the gospel according to John is also read; the collects for the day are based upon the bidding prayers which are found in the Ordo Romanus.

GOODRICH, SAMUEL GRISWOLD (1793–1860), an American author better known under the pseudonym of Peter Parley, was the son of a Congregational minister, and was born at Ridgefield, Connecticut, August 19, 1793. In

[1] See Johnson's *Collection of Ecclesiastical Laws* (vol. i., anno 957): "Housel ought not to be hallowed on Long Friday, because Christ suffered for us on that day."

1814 he commenced business as a publisher in Hartford. He visited Europe in 1823–4, and on his return to America removed to Boston, where from 1828 to 1842 he published an illustrated journal, the *Token*, to which he was a frequent contributor both in prose and verse. A selection from these contributions was published in 1841 under the title *Sketches from a Student's Window*. In the same year he established *Merry's Museum*, which he continued to edit till 1854. In 1827 he commenced, under the name of "Peter Parley," his series of books for the young, which, embracing geography, biography, history, science, and miscellaneous tales, numbered in 1857 as many as 170 volumes, of which about 7,000,000 had been sold, and 300,000 were being sold annually. In 1858 he published *Recollections of a Lifetime*, which contains a list both of the works of which he was the author and of the spurious works published under his name. By his writings and publications he amassed a large fortune. In 1838 he was chosen a member of the senate of Massachusetts, and in 1851 he was appointed consul to Paris, where he remained till 1855, taking advantage of his stay to have several of his works translated into French. After his return to America he published, in 1859, *History of the Animal Kingdom*. He died at New York, May 9, 1860.

GOODSIR, JOHN (1814–1867), anatomist, born at Anstruther, Fife, March 20, 1814, was the son of Dr John Goodsir, and grandson of Dr John Goodsir of Largo. He was educated at the burgh and grammar schools of his native place, and at the university of St. Andrews. He served an apprenticeship for a short time to Mr Nasmyth, the eminent dentist, but the higher studies of medicine and surgery were more to his liking, and, under the fascinating impulsion of the lectures of Dr Knox, anatomy, descriptive, surgical, and pathological, became his hobby,—the work of Carus giving the first impetus to his investigations in developmental anatomy. From his mother he had imbibed a love of art, and his sketches and casts and methodical demonstrations were the admiration of his fellow students. In Dr Knox's rooms he made the acquaintance of Edward Forbes, the naturalist. Goodsir also worked under Mr Syme, Professor Christison, Dr John Macintosh, Professor Robert Jameson, Dr Thomas Hope, and Dr Graham. His earliest scientific paper was on the snail,—a novel, elaborate, and highly illustrated treatise. In 1835 he became a licentiate of the Royal College of Surgeons, Edinburgh. After aiding Mr Nasmyth, he joined his father in practice at Anstruther. Three years later he communicated to the British Association a paper on the pulps and sacs of the human teeth, his researches on the whole process of dentition being at this time distinguished by their completeness. He had already commenced the formation of a natural history museum, which attracted many visitors,—the habits of animals, from the polype to the ape, possessing an irresistible charm for him. The results of his studies in natural history were laid before the Society of St Andrews, at the request of whose president, Sir D. Brewster, he furnished an account of *cilia*, reading to the society in 1840 his views on the cephalic termination of the sympathetic nerve. The ichthyolites of the Concerres quarry had not escaped him; and we find him now foreshowing his diversified knowledge in essays on the eye of the cephalopodous mollusks, in descriptions of his dredging expeditions with Edward Forbes, and in his lectures at Cupar on the conditions of health. On the nomination of Forbes, he was in 1838 elected to the famous coterie called the "Universal Brotherhood of the Friends of Truth," which comprised artists, scholars, naturalists, and others whose relationship became a potent influence in science. Goodsir was a noble example of the brotherhood, which sought to bind man to man in ties of home and friendship, love and good will. Goodsir and Forbes worked together at marine zoology, but human anatomy, pathology, and morphology formed Goodsir's chief study. The connexion of these two men was illustrated in a paper read at the British Association in 1840 on *Pelonaia*, and further researches on the British *Ciliograda*. In that year Goodsir became a member of the Wernerian Society, contributing several papers, some jointly with Forbes. Professor Jameson was the president, which may account for the greater part of Goodsir's studies in comparative anatomy from 1840 to 1847 being imparted to its members. In 1841 he joined the Edinburgh Botanical Society, holding the office of secretary from 1842–48, when he was chosen vice-president. In 1840–42 ulcers and abscesses and continued fever, in cases of which he advocated the depletive system, occupied his attention. He had associated himself with the Royal Medical Society in 1833, and was in 1841–42 elected the senior president, at the same time becoming president of the Anatomical and Physiological Societies, to which he submitted his studies on the structure of the liver and kidneys. A member of the Royal Physical Society in 1841, he read his papers on the development of the skeleton in the series of invertebrate animals; in 1849 he was elected president, remaining in office till 1852. His own estimate of his work at this period was represented to the Royal College of Surgeons of Edinburgh on his candidature for the post of conservator of the museum. He stated that he had practised every department of preparation and conservation, that he had considerable experience in modelling in clay, plaster, and wax, and in the use of microscope and pencil, and that his own collection of preparations in human, comparative, and morbid anatomy exceeded 400 examples. He succeeded Macgillivray in April 1841, giving lectures on the subjects illustrated by the museum. Goodsir rested no small part of his reputation on his knowledge of the anatomy of tissues. In his lectures in the theatre of the college in 1842–43 he evidenced the largeness of his observation of cell-life, both physiologically and pathologically, advocating the importance of the cell as a centre of nutrition, and pointing out that the organism is subdivided into a number of departments. Virchow recognized his indebtedness to these discoveries by dedicating his *Cellular Pathologie* to Goodsir, as "one of the earliest and most acute observers of cell-life." In 1843 Goodsir obtained the post of curator in the university of Edinburgh; the following year he was appointed demonstrator of anatomy to Professor Monro, and in 1845 curator of the entire museum. He elucidated about this time much that had been obscure in digestion, in parasitic formation and in the secreting structures. He fully confirmed the supposition that cells are the structures which perform the process of secretion, and that the functions of nutrition and secretion are essentially alike in their nature. His views on the nucleated cell as the great agent in absorption, nutrition, and secretion are established data in the science of physiology. In 1846 Goodsir was elected to the anatomical chair in the university of Edinburgh, his highest ambition being thus satisfied. The same year the Royal Society of London enrolled him as a fellow. All his energies were now devoted to the perfection of the science of anatomy; and his system of teaching was regarded as the best that ever regulated the anatomical department of any British university or medical school.

Human myology was his strong point; no one had laboured harder at the dissecting-table; and he strongly emphasized the necessity of practice as a means of research. He believed that anatomy, physiology, and pathology could never be properly advanced without daily consideration and treatment of disease. In 1848 he became a fellow of the Royal College of Surgeons, and in the same year he joined the Highland and Agricultural Society, acting as chairman of the veterinary department, and advising on strictly agricultural matters. In 1847 he delivered a series of systematic lectures on the comparative anatomy of the invertebrata; and, about this period, as member of an æsthetic club, he wrote papers on the natural principles of beauty, the æsthetics of the ugly, of smell, the approbation or disapprobation of sounds, and other refinements. Owing to the failing health of Professor Jameson, Goodsir was induced to deliver the course of lectures on natural history during the summer of 1853. It was mainly zoological, and included the psychological conditions of man as compared with the brute, and the highest exercise of the human faculties—perception, logic, and science. These lectures are among the *memorabilia* of the university; but the infinite amount of thought and exertion which they cost broke the health of the lecturer. Goodsir, nevertheless, persisted in work till 1853, when the necessity for rest urged itself with painful force. A sojourn on the Continent, though it refreshed, could not rid him of incipient paralysis, the common penalty for overtaxing powers. The death of Forbes in 1854 was a sore trial to Goodsir, and though other friends were numerous, the firm attachment of this man could not be replaced. Goodsir persevered in his labours, writing in 1855 on organic electricity, in 1856 on morphological subjects, and afterwards on the structure of organized forms,—his speculations in the latter domain giving birth to his theory of a triangle as the mathematical figure upon which nature had built up both the organic and inorganic worlds. The fundamental principle of form he conceived to exist within the province of crystallography, and to be discernible by a close study of the laws of that science. As he believed that every cell had a parent cell, or "a mother," so he argued there was an umbilicus or centre in everything. He regarded man as simply a conglomerate of cells, rising up, maturing, and decaying. He saw in the growth and form and finished structure of man a tetrahedron,—man, a physical being and a form divine, but a crystal in his structural entity and arrangement. Goodsir hoped to complete the triangle theory of formation and law as the greatest of his works. In his lectures on the skull and brain he held the doctrine that symmetry of brain had more to do with the higher faculties than bulk or form. Goodsir was still working out these higher studies when death ended his labours. He expired at Wardie, near Edinburgh, on the 6th of March 1867, in the same cottage in which his friend Edward Forbes died. Goodsir's anatomical lectures are remarkable for their solid basis of fact; and no one in Britain took so wide a field for survey, or marshalled so many facts for anatomical tabulation and synthesis.

See *Anatomical Memoirs of John Goodsir, F.R.S., edited by W. Turner, M.B., with Memoir by H. Lonsdale, M.D.*, Edinb. 1868, 2 vols., in which Goodsir's lectures, addresses, and writings are epitomized; *Proceedings of the Roy. Soc. of Lond.*, vol. iv., 1868; *Transactions of the Botanical Soc. Edin.*, 1868, vol. ix. (T. N.)

GOODWIN, Thomas (1600–1679), a prominent English divine of the later Puritan period, was born at Rollesby, Norfolk, on the 5th of October 1600, and a little before the completion of his thirteenth year was enrolled a student of Christ's College, Cambridge, where in 1616 he proceeded to the degree of B.A. In 1619 he removed to St Catherine's Hall, and there in 1620 he was chosen fellow. In 1625 he was licensed a preacher of the university; and three years afterwards he became lecturer of Trinity Church, to the vicarage of which he was presented by the king in 1632. Harassed by the interferences of his bishop, who was a zealous adherent of Laud, he resigned all his preferments and left the university in 1634. He then seems to have lived for some time in London, where in 1638 he married the daughter of an alderman; but, in the following year, he found it expedient to withdraw to Holland, and for some time was pastor of a small congregation of English merchants and refugees at Arnheim. Returning to London soon after Laud's impeachment by the Long Parliament, he ministered for some years to an Independent congregation in the parish of St Dunstan's-in-the-East, and rapidly rose to considerable eminence as a preacher; in 1643 he was chosen a member of the Westminster Assembly, and at once identified himself with the Congregational party, generally referred to in contemporary documents as "the dissenting brethren." He frequently preached by appointment before the Commons, and in January 1650 his talents and learning were rewarded by the House with the presidentship of Magdalen College, Oxford, a post which he held until the period of the Restoration. He rose into high favour with the Protector, and ultimately became somewhat prominent among his more intimate advisers. From 1660 until his death, which occurred on the 23d of February 1679, he lived in London, and devoted himself exclusively to theological study and to the pastoral charge of a small congregation which his piety and intellectual abilities had attached to him.

The works published by Goodwin during his lifetime consist chiefly of sermons printed by order of the House of Commons; but he was also associated with Nye and others in the preparation of the *Apologeticall Narration* (1643). His collected writings, which include expositions of considerable portions of the Epistle to the Ephesians and of the Apocalypse, were published in five folio volumes between 1681 and 1704, and have recently been reprinted in twelve 8vo volumes (Edin. 1861–66). Characterized by great yet one-sided reading, remarkable at once for the depth and for the narrowness of their observation and spiritual experience, often admirably thorough in their workmanship, yet in style prolix to a degree that, by modern readers at least, is sometimes found to be almost intolerable,—they fairly exemplify both the merits and the defects of the special school of religious thought to which they belong. Calamy's estimate of Goodwin's qualities may be quoted as both friendly and just. "He was a considerable scholar and an eminent divine, and had a very happy faculty in descanting upon Scripture so as to bring forth surprising remarks, which yet generally tended to illustration." A memoir, derived from his own papers, by his son is prefixed to the fifth volume of his collected works; as a "patriarch and Atlas of Independency" he is also noticed by Wood in the *Athenæ Oxonienses*. A somewhat amusing sketch, from Addison's point of view, of the Puritan president of Magdalen's is to be met with in No. 494 of the *Spectator*.

GOOJERAT. See Gujarat.

GOOLE, a market town and river-port of England, West Riding of Yorkshire, is situated on the right bank of the Ouse, 25 miles W. of Hull, on the Hull and Doncaster Railway, and at the eastern terminus of the Wakefield, Pontefract, and Goole branch of the Lancashire and Yorkshire Railway. About a mile north of Goole the Ouse is crossed by a railway swing bridge, worked by hydraulic power. Until it was made a bonding port in 1829, Goole was an obscure hamlet; but since the erection shortly afterwards of commodious docks, it has steadily advanced in prosperity. The harbour, 250 feet long and 200 wide, communicates by gates with the wet docks, which consist of the ship dock 700 feet by 200, with a depth of 18 feet, the railway dock 600 feet by 200, and the steamship dock 900 feet by 150. The town is well built, and possesses a fine modern parish church in the Perpendicular style, a Roman Catholic chapel in the Early English style, a neat custom-house, a market hall, a handsome courthouse, a union poorhouse, public, free, and national schools, and extensive warehouses for grain and other goods. The number of British ships that entered the port in 1877 was 1686, with a tonnage of 298,150; of foreign ships 62, with a tonnage of 16,399. The number of British ships that cleared was 2642, with a tonnage of 342,727; of foreign ships 64, with a tonnage of 17,038. There is regular steam communication with London and the principal Continental ports. The chief exports are coal, woollen goods, and machinery; and the chief imports, butter, fruit, indigo, logwood, timber, and wool. The industries include the manufacture of alum, sugar, ropes, and agricultural instruments, and iron-founding. Shipbuilding is also carried on, and there is a large dry dock, and a patent slip for repairing vessels. The population in 1871 was 7680.

GOOSANDER. See MERGANSER.

GOOSE (Anglo-Saxon, *Gôs*), the general English name for a considerable number of birds, belonging to the Family *Anatidæ* of modern ornithologists, which are mostly larger than Ducks and less than Swans. Technically the word Goose is reserved for the female, the male being called Gander (Anglo-Saxon, *Gandra*).

The most important species of Goose, and the type of the genus *Anser*, is undoubtedly that which is the origin of our well-known domestic race, the *Anser ferus* or *A. cinereus* of most naturalists, commonly called in English the Grey or Grey Lag[1] Goose, a bird of exceedingly wide range in the Old World, apparently breeding where suitable localities are to be found in most European countries from Lapland to Spain and Bulgaria. Eastwards it extends to China, but does not seem to be known in Japan. It is the only species indigenous to the British Islands, and in former days bred abundantly in the English Fen-country, where the young were caught in large numbers and kept in a more or less reclaimed condition with the vast flocks of tame-bred Geese that at one time formed so valuable a property to the dwellers in and around the Fens. It is impossible to determine when the wild Grey Lag Goose ceased from breeding in England, but it certainly did so towards the end of the last century, for Daniell mentions (*Rural Sports*, iii. p. 242) his having obtained two broods in one season. In Scotland this Goose continues to breed sparingly in several parts of the Highlands and in certain of the Hebrides, the nests being generally placed in long heather, and the eggs seldom exceeding five or six in number. It is most likely the birds reared here that are from time to time obtained in England, for at the present day the Grey Lag Goose, though once so numerous, is, and for many years has been, the rarest species of those that habitually resort to the British Islands. The domestication of this species, as Mr Darwin remarks (*Animals and Plants under Domestication*, i. p. 287), is doubtless of very ancient date, and yet scarcely any other animal that has been tamed for so long a period, and bred so largely in captivity, has varied so little. It has increased greatly in size and fecundity, but almost the only change in plumage is that tame Geese lose the browner and darker tints of the wild bird, and are invariably more or less marked with white—being often indeed wholly of that colour.[2] The most generally recognized breeds of domestic Geese are those to which the distinctive names of Emden and Toulouse are applied; but a singular breed, said to have come from Sebastopol, was introduced into Western Europe about the year 1856. In this the scapulars are elongated, curled, and spirally twisted, having their shaft transparent, and so thin that it often splits into fine filaments, which, remaining free for an inch or more, often coalesce again.[3]

The other British species of typical Geese are the Bean-Goose (*A. segetum*), the Pink-footed (*A. brachyrhynchus*), and the White-fronted (*A. albifrons*). On the continent of Europe, but not yet recognized as occurring in Britain, is a small form of the last (*A. erythropus*) which is known to breed in Lapland. All these, for the sake of discrimination, may be divided into *two* groups—(1) those having the "nail" at the tip of the bill white, or of a very pale flesh colour, and (2) those in which this "nail" is black. To the former belong the Grey Lag Goose, as well as *A. albifrons* and *A. erythropus*, and to the latter the other two. *A. albifrons* and *A. erythropus*, which hardly differ but in size,—the last being not much bigger than a Mallard (*Anas boschas*),—may be readily distinguished from the Grey Lag Goose by their bright orange bill and legs, and their mouse-coloured upper wing-coverts, to say nothing of their very conspicuous white face and the broad black bars which cross the belly, though the two last characters are occasionally observable to some extent in the Grey Lag Goose, which has the bill and legs flesh-coloured, and the upper wing-coverts of a bluish-grey. Of the second group, with the black "nail," *A. segetum* has the bill long, black at the base and orange in the middle; the feet are also orange, and the upper wing-coverts mouse-coloured, as in *A. albifrons* and *A. erythropus*, while *A. brachyrhynchus* has the bill short, bright pink in the middle, and the feet also pink, the upper wing-coverts being nearly of the same bluish-grey as in the Grey Lag Goose. Eastern Asia possesses in *A. grandis* a third species of this group, which chiefly differs from *A. segetum* in its larger size. In North America there is only one species of typical Goose, and that belongs to the white-"nailed" group. It very nearly resembles *A. albifrons*, but is larger, and has been described as distinct under the name of *A. gambeli*. Central Asia and India possess in the Bar-headed Goose (*A. indicus*) a bird easily distinguished from any of the foregoing by the character implied by its English name; but it is certainly somewhat abnormal, and, indeed, under the name of *Eulabia*, has been separated from the genus *Anser*, which has no other member indigenous to the Indian Region, nor any at all to the Ethiopian, Australian, or Neotropical Regions.

But the New World possesses by far the greatest wealth of Anserine forms. Beside others, presently to be mentioned, its northern portions are the home of all the species of Snow-Geese belonging to the genus *Chen*. It is true that two of these are reported as having appeared, and that not unfrequently, in Europe and Asia; but they possibly have been but stragglers from America. The first of these is *C. hyperboreus*, the Snow-Goose proper, a bird of large size, and when adult of a pure white, except the primaries, which are black. This has long been deemed a visitor to the Old World, and sometimes in considerable numbers, but the later discovery of a smaller form, *C. albatus*, scarcely

[1] The meaning and derivation of this word *Lag* had long been a puzzle until Prof. Skeat suggested (*Ibis*, 1870, p. 301) that it signified late, last, or slow, as in *laggard*, a loiterer, *lagman*, the last man, *lagteeth*, the posterior molar or "wisdom" teeth (as the last to appear), and *lagclock*, a clock that is behind time. Thus the Grey Lag Goose is the Grey Goose which in England when the name was given was not migratory but *lagged* behind the other wild species at the season when they betook themselves to their northern breeding-quarters. In connexion with this word, however, must be noticed the curious fact mentioned by the late Mr Rowley (*Orn. Miscell.*, iii. p. 213), that to this day the flocks of tame Geese in Lincolnshire are urged on by their drivers with the cry of "Lag'em, Lag'em."

[2] From the times of the Romans white Geese have been held in great estimation, and hence, doubtless, they have been preferred as breeding stock, but the practice of plucking Geese alive, continued for so many centuries, has not improbably also helped to perpetuate this variation, for it is well known to many bird-keepers that a white feather is often produced in place of one of the natural colour that has been pulled out.

[3] Want of space forbids our entering on the breeding of tame Geese, which was formerly so largely practised in some English counties, especially Norfolk and Lincoln. It was no uncommon thing for a man to keep a stock of a thousand, each of which might be reckoned to rear on an average seven Goslings. The flocks were regularly taken to pasture and water, just as sheep are, and the man who tended them was called the Gooseherd, corrupted into Gozzerd. The birds were plucked five times in the year, and in autumn the flocks were driven to London or other large markets. They travelled at the rate of about a mile an hour, and would get over nearly ten miles in the day. For further particulars the reader may be referred to Pennant's *British Zoology*; Montagu's *Ornithological Dictionary*; Latham's *General History of Birds* and Rowley's *Ornithological Miscellany* (iii. pp. 206–215), where some account also may be found of the Goose-fatting at Strasburg, which, since the reconquest of Alsace, has been transferred to the south of France.

differing except in size, throws some doubt on the older records, especially since examples which have recently been obtained in the British Islands undoubtedly belong to this lesser bird, and it would be satisfactory to have the occurrence in the Old World of the true *C. hyperboreus* placed on a surer footing. So nearly allied to the species last named as to have been often confounded with it, is the Blue-winged Goose, *C. cœrulescens*, which is said never to attain a snowy plumage. Then we have a very small species, long ago described as distinct by Hearne, the Arctic traveller, but until 1861 discredited by ornithologists. Its distinctness has now been fully recognized, and it has received, somewhat unjustly, the name of *C. rossi*. Its face is adorned with numerous papillæ, whence it has been removed by Mr Elliot to a separate genus, *Exanthemops*, and for the same reason it has, for more than a century, been known to the European residents in the fur countries as the "Horned Wavey"—the last word being a rendering of a native name, *Wawa*, which signifies Goose. Finally, there appears to belong to this section, though it has been frequently referred to another (*Chloephaga*), and has also been made the type of a distinct genus (*Philacte*), the beautiful Painted Goose, *C. canagica*, which is almost peculiar to the Aleutian Islands, though straying to the continent in winter, and may be recognized by the white edging of its remiges.

The southern portions of the New World are inhabited by about half a dozen species of Geese, akin to the foregoing, but separated as the genus *Chloephaga*. The most noticeable of them are the Rock or Kelp Goose, *C. antarctica*, and the Upland Goose, *C. magellanica*. In both of these the sexes are totally unlike in colour, the male being nearly white, while the female is of a mottled brown, but in others a greater similarity obtains.[1] Very nearly allied to the birds of this group, if indeed that can be justifiably separated, comes one which belongs to the northern hemisphere, and is common to the Old World as well as the New. It contains the Geese which have received the common names of Bernacles or Brents,[2] and the scientific appellations of *Bernicla* and *Branta*—for the use of either of which much may be said by nomenclaturists. All the species of this section are distinguished by their general dark sooty colour, relieved in some by white of greater or less purity, and by way of distinction from the members of the genus *Anser*, which are known as Grey Geese, are frequently called by fowlers Black Geese. Of these, the best known both in Europe and North America is the Brent-Goose—the *Anas bernicla* of Linnæus, and the *B. torquata* of many modern writers—a truly marine bird, seldom (in Europe at least) quitting salt-water, and coming southward in vast flocks towards autumn, frequenting bays and estuaries on our coasts, where it lives chiefly on sea-grass (*Zostera maritima*). It is known to breed in Spitsbergen and in Greenland. A form which is by some ornithologists deemed a good species, and called by them *B. nigricans*, occurs chiefly on the Pacific coast of North America. In it the black of the neck, which in the common Brent terminates just above the breast, extends over most of the lower parts. The true Bernacle-Goose,[3] the *B. leucopsis* of most authors, is but a casual visitor to North America, but is said to breed in Iceland, and occasionally in Norway. Its usual *incunabula*, however, still form one of the puzzles of the ornithologist, and the difficulty is not lessened by the fact that it will breed freely in semi-captivity, while the Brent-Goose will not. From the latter the Bernacle-Goose is easily distinguished by its larger size and white cheeks. Hutchins's Goose (*B. Hutchinsi*) seems to be its true representative in the New World. In this the face is dark, but a white crescentic or triangular patch extends from the throat on either side upwards behind the eye. Almost exactly similar in coloration to the last, but greatly superior in size, and possessing 18 rectrices, while all the foregoing have but 16, is the common wild Goose of America, *B. canadensis*, which, for some two centuries or more, has been introduced into Europe, where it propagates so freely that it has been included by nearly all the ornithologists of this quarter of the globe, as a member of its fauna. An allied form, by some deemed a species, is *B. leucopareia*, which ranges over the western part of North America, and, though having 18 rectrices, is distinguished by a white collar round the lower part of the neck. The most diverse species of this group of Geese are the beautiful *B. ruficollis*, a native of North-eastern Asia, which occasionally strays to Western Europe, and has been obtained more than once in Britain, and that which is peculiar to the Hawaian archipelago, *B. sandvicensis*.

The largest living Goose is that called the Chinese, Guinea, or Swan-Goose, *Cygnopsis cygnoides*, and it seems to be the stock whence the domestic Geese of several Eastern countries have sprung. It may not unfrequently be seen in English farmyards, and it is found to cross readily with our common tame Goose, the offspring being fertile, and Blyth has said that these crosses are very abundant in India. The true home of the species is in Eastern Siberia or Mongolia. It is distinguished by its upright bearing, which has been well rendered by Bewick's excellent figure. The Ganders of the reclaimed form are distinguished by the knob at the base of the bill, but the evidence of many observers shows that this is not found in the wild race. Of this bird there is a perfectly white breed.

We have next to mention a very curious form, *Cereopsis novæ-hollandiæ*, which is peculiar to Australia, and appears to be a more terrestrial type of Goose than any other now existing. Its short, decurved bill and green cere give it a very peculiar expression, and its almost uniform grey plumage, bearing rounded black spots, is also remarkable. It bears captivity well, breeding in confinement, and may be seen in many parks and gardens. It appears to have been formerly very abundant in many parts of Australia, from which it has of late been exterminated. Some of its peculiarities seem to have been still more exaggerated in a bird that is wholly extinct, the *Cnemiornis calcitrans* of New Zealand, the remains of which were described in full by Professor Owen in 1873 (*Trans. Zool. Society*, ix. p. 253). Among the first portions of this singular bird that were found were the *tibiæ*, presenting an extraordinary development of the *patella*, which, united with the shank-bone, gave rise to the generic name applied. For some time the affinity of the owner of this wonderful structure was in doubt, but all hesitation was dispelled by the discovery of a nearly perfect skeleton, now in the British Museum, which proved the bird to be a Goose, of great size, and unable, from the shortness of its wings, to fly.

[1] See Sclater and Salvin, *Proc. Zool. Society*, 1876, pp. 361–369.

[2] The etymology of these two words is exceedingly obscure, and no useful purpose could be attained by discussing it here, especially as any disquisition upon it must needs be long. Suffice it to say that the ordinary spelling Bernicle seems to be wrong, if we may judge from the analogy of the French *Bernache*. In both words the *e* should be sounded as *a*.

[3] The old fable, perhaps still believed by the uneducated in some parts of the world, of Bernacle-Geese being produced from the Bernacles (*Lepadidæ*) that grow on timber exposed to salt-water, is not more absurd than many that in darker ages had a great hold of the popular mind, and far less contemptible than the conceited spirit in which many modern zoologists and botanists often treat it. They should remember that the doctrine of spontaneous generation has still many adherents, and that seems to be hardly less extravagant than the notion of birds growing from "worms," as they were then called. The mistake of our forefathers is of course evident, but that is no reason for deriding their innocent ignorance as some of our contemporaries are fond of doing.

In correlation with this loss of power may also be noted the dwindling of the keel of the sternum. Generally, however, its osteological characters point to an affinity to *Cereopsis*, as was noticed by Dr Hector (*Trans. New Zeal. Institute*, vi. pp. 76–84), who first determined its Anserine character.

Birds of the genera *Chenalopex* (the Egyptian and Orinoco Geese), *Plectropterus*, *Sarcidiornis*, *Chlamydochen*, and some others, are commonly called Geese. To the writer it seems uncertain whether they should be grouped with the *Anserinæ*. The males of all appear to have that curious enlargement at the junction of the bronchial tubes and the trachea which is so characteristic of the Ducks or *Anatinæ*. As much may be said for the genus *Nettapus*, but want of space precludes further consideration of the subject here. (A. N.)

GOOSEBERRY, *Ribes grossularia*, a well-known fruit-bush of northern and central Europe, usually placed in the same genus of the natural order to which it gives name as the closely allied currants, but by some made the type of a small sub-genus, *Grossularia*, the members of which differ from the true currants chiefly in their spinous stems, and in their flowers growing on short footstalks, solitary, or two or three together, instead of in racemes.

The wild gooseberry is a small, straggling bush, nearly resembling the cultivated plant,—the branches being thickly set with sharp spines, standing out singly or in diverging tufts of two or three from the bases of the short spurs or lateral leaf shoots, on which the bell-shaped flowers are produced, singly or in pairs, from the groups of rounded, deeply-crenated 3 or 5-lobed leaves. The fruit is smaller than in the garden kinds, but is often of good flavour; it is generally hairy, but in one variety smooth, constituting the *R. uva-crispa* of writers; the colour is usually green, but plants are occasionally met with having deep purple berries. The gooseberry is indigenous to the central parts of Europe and western Asia, growing naturally in alpine thickets and rocky woods in the lower country, from France eastward, perhaps as far as the Himalaya. In Britain it is often found in copses and hedgerows and about old ruins, but has been so long a plant of cultivation that it is difficult to decide upon its claim to a place in the native flora of the island. Common as it is now on some of the lower slopes of the Alps of Piedmont and Savoy, it is uncertain whether the Romans were acquainted with the gooseberry, though it may possibly be alluded to in a vague passage of Pliny: the hot summers of Italy, in ancient times as at present, would be unfavourable to its cultivation. Abundant in Germany and France, it does not appear to have been much grown there in the Middle Ages, though the wild fruit was held in some esteem medicinally for the cooling properties of its acid juice in fevers; while the old English name, *Fea-berry*, still surviving in some provincial dialects, indicates that it was similarly valued in Britain, where it was planted in gardens at a comparatively early period. Turner describes the gooseberry in his *Herball*, written about the middle of the 16th century, and a few years later it is mentioned in one of Tusser's quaint rhymes as an ordinary object of garden culture. Improved varieties were probably first raised by the skilful gardeners of Holland, whose name for the fruit, *Kruisbezie*, may have been easily corrupted into the present English vernacular word.[1] Towards the end of the last century the gooseberry became a favourite object of cottage-horticulture, especially in Lancashire, where the working cotton-spinners have raised numerous varieties from seed, their efforts having been chiefly directed to increasing the size of the fruit. Of the many hundred sorts enumerated in recent horticultural works, few perhaps equal in flavour some of the older denizens of the fruit-garden, such as the "old rough red" and "hairy amber." The climate of the British Islands seems peculiarly adapted to bring the gooseberry to perfection, and it may be grown successfully even in the most northern parts of Scotland; indeed, the flavour of the fruit is said to improve with increasing latitude. In Norway even, the bush flourishes, in gardens on the west coast, nearly up to the Arctic circle, and it is found wild as far north as 63°. The dry summers of the French and German plains are less suited to it, though it is grown in some hilly districts with tolerable success. The gooseberry in the south of England will grow well in cool situations, and may be sometimes seen in gardens near London flourishing under the partial shade of apple trees; but in the north it needs full exposure to the sun to bring the fruit to perfection. It will succeed in almost any soil, but prefers a rich loam or black alluvium, and, though naturally a plant of rather dry places, will do well in moist land, if drained.

The varieties are most easily propagated by cuttings planted in the autumn, which root rapidly, and in a few years form good fruit-bearing bushes. Much difference of opinion prevails regarding the mode of pruning this valuable shrub; it is probable that in different situations it may require varying treatment. The fruit being borne on the lateral spurs, and on the shoots of the last year, it is the usual practice to shorten the side branches in the winter, before the buds begin to expand; some reduce the longer leading shoots at the same time, while others prefer to nip off the ends of these in the summer while they are still succulent. When large fruit is desired, plenty of manure should be supplied to the roots, and the greater portion of the berries picked off while still small. Burbidge states that the gooseberry may be with advantage grafted or budded on stocks of some other species of *Ribes*, *R. aureum*, the ornamental golden currant of the flower garden, answering well for the purpose. The giant gooseberries of the Lancashire "fanciers" are obtained by the careful culture of varieties specially raised with this object, the growth being encouraged by abundant manuring, and the removal of all but a very few berries from each plant. Single gooseberries of nearly 2 ounces in weight have been occasionally exhibited; but the produce of such fanciful horticulture is generally insipid. The bushes at times suffer much from the ravages of the caterpillar of the gooseberry or magpie moth, *Abraxas grossulariata*, which often strip the branches of leaves in the early summer, if not destroyed before the mischief is accomplished. The most effectual way of getting rid of this pretty but destructive insect is to look over each bush carefully, and pick off the larvæ by hand; when larger they may be shaken off by striking the branches, but by that time the harm is generally done—the eggs are laid on the leaves of the previous season. Equally annoying in some years is the smaller larva of the V-moth, *Halias vanaria*, which often appears in great numbers, and is not so readily removed. The gooseberry is sometimes attacked by the grub of a fly, *Nematus ribesii*, of which several broods appear in the course of the spring and summer, and are very destructive. The grubs bury themselves in the ground to pass into the pupal state; the first brood of flies, hatched just as the bushes are coming into leaf in the spring, lay their eggs on the lower side of the leaves, where the small greenish larvæ soon after emerge. For the destruction of the first broods it has been recommended to syringe the bushes with tar-water; perhaps a very weak solution of carbolic acid might prove more effective. The powdered root of white hellebore is said to destroy both this grub and the caterpillars

[1] The Scotch *grossart*, originally *grosel*, evidently from the French *groseille*, may have the same ultimate origin; the usual derivation from *grossus*, a green fig, seems far-fetched. The rough wild fruit is called by the Germans *krausbeere*.

of the gooseberry and V-moth; infusion of foxglove, and tobacco-water, are likewise tried by some growers. If the fallen leaves are carefully removed from the ground in the autumn and burnt, and the surface of the soil turned over with the fork or spade, most eggs and chrysalids will be destroyed.

The gooseberry was introduced into the United States by the early settlers, and in some parts of New England large quantities of the green fruit are produced and sold for culinary use in the towns; but the excessive heat of the American summer is not adapted for the healthy maturation of the berries, especially of the English varieties. Perhaps if some of these, or those raised in the country, could be crossed with one of the indigenous species, kinds might be obtained better fitted for American conditions of culture, although the gooseberry does not readily hybridize. The bushes are apt to be infested by a minute fly, known as the gooseberry midge, *Cecidomyia grossulariæ*, which lays its eggs in the green fruit, in which the larvæ are hatched, causing the berries to turn purple and fall prematurely. According to Mr Fitch, the midge attacks the wild native species as well as the cultivated gooseberry.

The gooseberry, when ripe, yields a fine wine by the fermentation of the juice with water and sugar, the resulting sparkling liquor retaining much of the flavour of the fruit. By similarly treating the juice of the green fruit, picked just before it ripens, an effervescing wine is produced, nearly resembling some kinds of champagne, and, when skilfully prepared, far superior to much of the liquor sold under that name. Brandy has been made from ripe gooseberries by distillation; by exposing the juice with sugar to the acetous fermentation a good vinegar may be obtained. The gooseberry, when perfectly ripe, contains a large quantity of sugar, most abundant in the red and amber varieties; in the former it amounts to from 6 to upwards of 8 per cent. The acidity of the fruit is chiefly due to malic acid.

Several other species of the sub-genus produce edible fruit, though none have as yet been brought under economic culture. Among them may be noticed *R. oxyacanthoides* and *R. cynosbati*, abundant in Canada and the northern parts of the United States, and *R. gracile*, common along the Alleghany range. The group is a widely distributed one, species occurring to the west of the Rocky Mountains, and in Siberia and Japan, while one is said to have been found by recent explorers on the lofty Kilimanjaro, near the lake-sources of the Nile. (C. P. J.)

GOPHER (*Testudo gopher*, Bartr.), the only living representative on the North American continent of the *Testudinidæ* or family of land tortoises, where it occurs in the south-eastern parts of the United States, from Florida in the south to the river Savannah in the north. Its carapace, which is oblong and remarkably compressed, measures from 13 to 14 inches in extreme length, the shields which cover it being grooved, and of a yellow-brown colour. The gopher abounds chiefly in the forests, but occasionally visits the open plains, where it does great damage, especially to the potato crops, on which it feeds. It is a nocturnal animal, remaining concealed by day in its deep burrow, and coming forth at night to feed. Its strength in proportion to its size is said to be enormous, it being able, according to Dumeril and Bibron, to move along comfortably bearing a man on its back. The flesh of the gopher or mungofa, as it is also called, is considered excellent eating.

GÖPPINGEN, a town of Würtemberg, circle of the Danube, on the right bank of the Fils, 22 miles E.S.E. of Stuttgart. It possesses an old castle erected by Duke Christopher in the 16th century, two evangelical churches, a Roman Catholic chapel, a synagogue, a real school, a classical school, and an advanced school. The manufactures include linen and woollen cloth, leather, glue. paper, machines, and toys Three miles north of the town are the ruins of the old castle of Hohenstaufen, with the Barbarossa chapel, containing, besides other adornments, an old fresco of Frederick Barbarossa dating probably from the 16th century. Göppingen originally belonged to the house of Hohenstaufen, and at a later period came into the possession of the counts of Würtemberg. It was surrounded by walls in 1129. The population in 1875 was 9532.

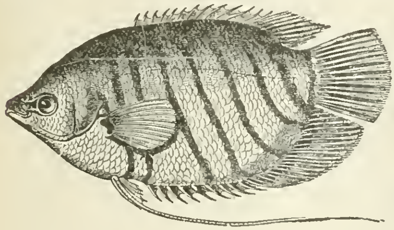
GORAKHPUR, a district of the North-Western Provinces, India, between 26° 50′ 15″ and 27° 28′ 48″ N. lat., and between 83° 7′ and 84° 29′ E. long., bounded on the N. by the territory of Nepál, on the E. by Champáran and Sáran, on the S. by the Gogra river, and on the W. by Basti and Fyzabad, with an area of 4578 square miles. The district lies immediately south of the lower Himálayan slopes, but forms itself a portion of the great alluvial plain. Only a few sandhills break the monotony of its level surface, which is, however, intersected by numerous rivers studded with lakes and marshes. In the north and centre dense forests abound, and the whole country has a verdant appearance. The principal rivers are the Rápti, the Gogra, the great and little Gandak, the Kuána, the Rolim, the Ami, and the Gunghi. The tiger is found in the north, and many other wild animals abound throughout the district. The lakes are well stocked with fish.

The population, which in 1853 numbered 1,816,390, had risen to 2,019,361 in 1872, a great increase in so short a period; of these, 1,819,445 or 90·1 per cent. are Hindus, 199,372 Mussulmans, and 533 Christians. The district contains a total cultivated area of 2621 square miles, with 897 square miles available for cultivation, most of which is now under forest. The chief products are cotton, rice, *bájra*, *joár*, *moth*, and other food-stuffs. The commerce of Gorakhpur is confined to the above products. The means of communication are still imperfect. Two good metalled roads run through the district, one from Gorakhpur to Benares *via* Barhalganj, the other to Basti and Fyzabad. The total revenue in 1876 was £227,738. The police force in 1875 numbered 755 officers and men. In 1875 there were 435 schools, with 13,525 pupils. The district is not subject to very intense heat, from which it is secured by its vicinity to the hills and the moisture of its soil. Dust-storms are rare, and cool breezes from the south, rushing down the gorges of the Himálayas, succeed each short interval of warm weather. The climate is, however, relaxing. The southern and eastern portions are as healthy as most parts of the province, but the *tárai* and forest-tracts are still subject to malaria. The average rainfall from 1860 to 1871 was 45·8 inches; the maximum was 60 inches in 1861, and the minimum 25 inches in 1868. The mean monthly temperature in the shade was 77° in 1870, and 76° in 1871. The death rate in 1875 was 40·092, or 19·85 per thousand of the population.

Gautama Buddha, the founder of the religion bearing his name, died within the district of Gorakhpur. It thus became the headquarters of the new creed, and was one of the first tracts to receive it. The country from the beginning of the 6th century was the scene of a continuous struggle between the Bhars and their Aryan antagonists, the Rahtors. About 900 the Domhatáre or military Bráhmans appeared, and expelled the Rahtors from the town of Gorakhpur, but they also were soon driven back by other invaders. During the 15th and 16th centuries, after the district had been desolated by incessant war, the descendants of the various conquerors held parts of the territory, and each seems to have lived quite isolated, as no bridges or roads attest any intercourse with each other. Towards the end of the 16th century, Mussulmans occupied Gorakhpur town, but they interfered very little with the district, and allowed it to be controlled by the native rájás. In the middle of the 18th century a formidable foe, the Banjáras from the west, kept the district in a state of terror, and so weakened the power of the rájás that they could not resist the fiscal exactions of the Oudh officials, who plundered and ravaged the country to a great extent. The district formed part of the territory ceded by Oudh to the British under the treaty of 1801. During the mutiny it was lost for a short time, but under the friendly Gurkhás the rebels were driven out, and the whole district once more passed under British rule.

GORAKHPUR, a municipal city, and the administrative headquarters of Gorakhpur district, North-Western Provinces, in 26° 44′ 8″ N. lat., and 83° 23′ 44″ E. long., on the river Rápti, near the centre of the district. It was founded about 1400, on the site of a more ancient city. It is the headquarters of a civil and sessions judge, with the usual administrative offices, and has a considerable trade in grain and timber sent down the Rápti to the Gogra and the Ganges. The municipal revenue in 1875-76 was £4771. Population (1872), 51,117.

GORAMY, or GOURAMY (*Osphronemus olfax*), is reputed to be one of the best-flavoured freshwater fishes in the East Indian archipelago. Its original home is Java, Sumatra, Borneo, and several other East Indian islands, but thence it has been transported to and acclimatized in Penang, Malacca, Mauritius, and even Cayenne. Being



Goramy.

an almost omnivorous fish and tenacious of life, it seems to recommend itself particularly for acclimatization in other tropical countries; and specimens kept in captivity become as tame as carps. It attains the size of a large turbot. Its shape is flat and short, the body covered with large scales; the dorsal and anal fins are provided with numerous spines, and the ventral fins produced into long filaments.

GORCUM, or GORKUM (Dutch, *Gorinchem*), a town of the Netherlands, chief town of a circle in the province of South Holland, 22 miles E.S.E. of Rotterdam, on the right bank of the Merve or Merwede, at the influx of the Linge, by which it is intersected. It is surrounded by walls, and has an old town-house adorned with fine old paintings, a prison, a custom-house, barracks, an arsenal, and a military hospital. The old church of St Vincent contains the monuments of the lords of Arkel. The charitable and benevolent institutions are numerous, and there is also a library and several learned associations. Gorcum possesses a good harbour, and carries on a considerable trade in grain, hemp, cheese, potatoes, and fish, although it is still destitute of railway communication. The population in 1876 was 9301.

The earliest notice of Gorcum is in a document of John I., duke of Brabant (in the close of the 13th century), granting the town's folk free trade throughout his duchy. The history in the 15th century is closely connected with that of the countship of Arkel. It was within its walls that William, the last lord of Arkel, perished in 1417, on the capture of the town by the Kabeljaus; and it was the burghers of Gorcum who in 1573 laid the castle of Arkel in ruins. In 1572, when the town was taken by William de la March, he put to death 19 priests and friars, who have a place in the Romish calendar as the Martyrs of Gorcum. The place defended itself successfully against the French in 1672, but was taken by the Prussians in 1785, by the French in 1795, and by the allies in 1814.

GORDIANUS, or GORDIAN, the name of three Roman emperors. The first, Marcus Antonius Africanus Gordianus, the wealthiest of the Romans, was descended on the father's side from the Gracchi, on the mother's from Trajan, while his wife was the granddaughter of Antoninus Pius. While he gained unbounded popularity by his magnificent games and shows, his prudent and retired life did not alarm the tyranny of Caracalla. Alexander Severus called him to the dangerous honours of government in Africa, and during his proconsulship there occurred the usurpation of Maximin. The universal discontent roused by the oppressive rule of Maximin culminated in a revolt in Africa in 238, and Gordian reluctantly yielded to the popular clamour and assumed the purple. His son was associated with him in the dignity. The senate confirmed the choice of the Africans, and most of the provinces gladly sided with the new emperors; but, even while their cause was so successful abroad, they had fallen before the sudden inroad of Capellianus, who commanded Mauretania in the interest of Maximin. They had reigned only 36 days. Both the Gordians had deserved by their amiable character their high reputation; they were men of great accomplishments, fond of literature, and voluminous authors; but they were rather intellectual voluptuaries than able statesmen or powerful rulers. Having embraced the cause of Gordian, the senate was obliged to continue the revolt against Maximin, and appointed Maximus and Balbinus, two of its noblest and most esteemed members, as joint emperors. At their inauguration a sedition arose, and the popular outcry for a Gordian was appeased by the association of M. Antonius Gordianus Pius, nephew of the younger and grandson of the elder Gordian, a boy of thirteen. Maximin forthwith invaded Italy, but was murdered by his own troops while besieging Aquileia; and a revolt of the prætorian guards, to which Maximus and Balbinus fell victims, left Gordian sole emperor. For some years he was under the control of his mother's eunuchs, till happily Misitheus, his teacher of rhetoric, whose daughter he married, roused him to free himself from the ignoble tyranny. Misitheus was appointed prefect of the prætorian guards, and wielded ably the supreme power that now belonged to him. When the Persians invaded Mesopotamia, the young emperor at his persuasion opened, for the last time recorded in history, the temple of Janus, and marched in person to the East. Misitheus proved a skilful and prudent general; but his sudden death under strong suspicions of poisoning was the end of Gordian's prosperity. Discontent and seditions, fostered by Philip, who had succeeded Misitheus, arose in the camp, and Gordian was slain by the mutinous soldiers (244). A monument near the confluence of the Euphrates and Aboras marked the scene.

GORDIUM, an ancient town of Bithynia, was situated not far from the river Sangarius, but the site has not been exactly ascertained, though M. Lejean believes that it may be identified with ruins which he observed in the vicinity of the village Emret. It was undoubtedly a place of high antiquity, and though Strabo describes it as a village, it afterwards increased in size, and, under the name of Juliopolis, which it received in the reign of Augustus, it continued to flourish to the time of Justinian at least. According to the legend, Gordium was founded by a certain Gordius, who had been called to the throne by the Phrygians in obedience to an oracle of Zeus commanding them to select the first person that rode into the agora in a car. The king afterwards dedicated his car to the god, and another oracle declared that whoever succeeded in untying the strangely entwined knot of the yoke should reign over all Asia. Alexander the Great, according to the well-known story, overcame the difficulty of the Gordian knot by a stroke of his sword.

See Kiepert, *Beiträge zur inschriftlichen Topographie Klein-Asiens*, 1863; Lejean, in *Bull. de la Soc. de Géogr.*, Paris, 1869.

GORDON, ALEXANDER, the "Sandy Gordon" of Scott's *Antiquary*, is believed to have been a native of Aberdeen, and a graduate of either King's or Marischal College, but of his parentage and early history nothing is known. When still a young man he is said to have travelled abroad, probably in the capacity of tutor. He must, however, have returned to Scotland previous to 1726, when, betaking himself to antiquarian pursuits, he made the acquaintance of, among others, Roger Gale, the first vice-president of the Society of Antiquaries. In the year just mentioned appeared the *Itinerarium Septentrionale*, his greatest and best known work. He was already the friend of Sir John Clerk, of Penicuick, better known as Baron Clerk, from his having been appointed one of the Barons of the Exchequer; and the Baron and Roger Gale are the "two gentlemen, the honour of their age and country," whose letters were published, without their consent it appears, as an appendix to the *Itinerarium*. Subsequently Gordon was appointed secretary to the Society for the Encouragement of Learning, with an annual salary of £50. Resigning this post he succeeded Dr Stukeley as secretary to the Society of Antiquaries, and also acted for a short time as secretary to the Egyptian Club, an association composed of gentlemen who had visited Egypt. In 1741 he accompanied Governor Glen to South Carolina. No explanation has yet been given of the reasons which led to this step, or of the relations between the old "Roman" antiquary and his new patron. A hint, but nothing more, is afforded by the fact that in the list of subscribers to the *Itinerarium* we find the name of "James Glen of Longcroft, Esq." Through the influence probably of his friend, Gordon, besides receiving a grant of land in Carolina, was appointed registrar of the province, and justice of the peace, and filled several other offices. From his will, still in existence, dated 22d August 1754, we learn that he had a son Alexander and a daughter Frances, to whom he bequeathed most of his property, among which were portraits of himself and of friends painted by his own hand.

Some additional particulars regarding Gordon and his works may be got from a communication to the Society of Antiquaries of Scotland by Professor Daniel Wilson, LL.D., Toronto, printed in the *Proceedings*, with Additional Notes and an Appendix of Original Letters by the late Dr David Laing (*Proc. Soc. of Antiq. of Scot.*, vol. x. pp. 363-382).

GORDON, Lord George, (1751-1793), third and youngest son of Cosmo George, duke of Gordon, was born in London 26th December 1751. After completing his education at Eton, he entered the navy, where he rose to the rank of lieutenant; but on account of a disagreement regarding promotion with Lord Sandwith, then at the head of the admiralty, he resigned his commission shortly before the commencement of the American war. In 1774 he entered parliament as member for the small borough of Luggershall, and possessing some wit, great ease of address, and the confidence arising from sincere conviction, he advocated his individual notions on any subject with great volubility and with something of the eagerness of monomania. After supporting the ministry for some time, he began to attack both ministry and opposition with such ceaseless pertinacity that it became a common saying that "there were three parties in parliament, the ministry, the opposition, and Lord George Gordon." He vehemently opposed the passing of the Acts for the removal of the Roman Catholic disabilities, and took a leading part in organizing the Protestant associations of Scotland and England. Of both associations he was chosen president, and on June 2d 1780 he headed the mob which marched in procession from St George's Fields to the Houses of Parliament in order to present the monster petition against the Acts. After the mob reached Westminster a terrific riot ensued, which continued several days, during which the city was virtually at their mercy. At first indeed they dispersed after threatening to make a forcible entry into the House of Commons, but reassembled soon afterwards and destroyed several Roman Catholic chapels, pillaged the private dwellings of many Roman Catholics, set fire to Newgate and broke open all the other prisons, attacked the Bank of England and several other public buildings, and continued the work of violence and conflagration until the interference of the military, by whom no fewer than 450 persons were killed and wounded before the riots were quelled. For his share in instigating the riots Lord Gordon was apprehended on a charge of high treason; but, mainly through the skilful and eloquent defence of Erskine, he was acquitted on the ground that he had no treasonable intentions. In 1786 he was excommunicated by the archbishop of Canterbury for refusing to bear witness in an ecclesiastical suit; and in 1787 he was convicted of libelling the queen of France, the French ambassador, and the administration of justice in England. He was, however, permitted to withdraw from the court without bail, and made his escape to Holland; but on account of representations from the court of Versailles he was commanded to quit that country, and, returning to England, was apprehended, and in January 1788 was sentenced to five years' imprisonment in Newgate, where, after refusing to grant the guarantees required as a condition of his obtaining his liberty at the conclusion of his original term of imprisonment, he died of delirious fever November 1, 1793. Some time before his apprehension he had become a convert to Judaism, and had undergone the initiatory rite. A serious defence of most of his eccentricities is undertaken in *The Life of Lord George Gordon, with a Philosophical Review of his Political Conduct*, by Robert Watson, M.D., London, 1795.

GORDON, Sir John Watson (1788-1864), Scottish painter, was the eldest son of Captain Watson, R.N., a cadet of the family of Watson of Overmains, in the county of Berwick. He was born in Edinburgh in 1788, and, it being his father's desire that he should enter the army, was educated specially with a view to his joining the Royal Engineers. As drawing was even at that period considered a not inappropriate accomplishment for the scientific service, he was, while waiting for his commission, entered as a student in the Government school of design, then as now under the management of the Board of Manufactures. With the opportunity, his natural taste for art quickly developed itself, and his industry and progress were such that his father was persuaded to allow him to adopt it as his profession. Captain Watson was himself a skilful draughtsman, and his brother George Watson, afterwards president of the Scottish Academy, stood high as a portrait painter, second only to Sir Henry Raeburn, who also was a friend of the family. Between the studios of his uncle and his friend, John Watson seems to have thought he had every necessary assistance a young artist required, and neither then or at a future period showed any desire for foreign study; his art consequently is more purely of native growth than that of any of his contemporaries. In the year 1808 he sent to the exhibition of the Lyceum in Nicolson Street a subject from the *Lay of the Last Minstrel*, and continued for some years to exhibit fancy subjects; but, although freely and sweetly painted, they were altogether without the force and character which in his own proper walk stamped his portrait pictures as the works of a master. After the death of Sir Henry Raeburn in 1823, he succeeded to much of his practice; and as there were at that time in Edinburgh four artists of the name of Watson, all of them portrait painters, he assumed in 1826 the name of Gordon, by which he is best known. Mixing a good deal in literary and scientific society, he painted most of the notabilities who lived in or visited the northern metropolis during his career; one of the earliest of his famous sitters was Sir Walter Scott, who sat for a first portrait in 1820. Then came J. G. Lockhart in 1821; Professor Wilson, 1822 and 1850, two portraits; Sir Archibald Alison, 1839; Dr Chalmers, 1844; a little later De Quincey; and Sir David Brewster, 1864, being the last picture he painted. Among his most important works may be mentioned the earl of Dalhousie, 1833, now in the Archers' Hall, Edinburgh; Sir Alexander Hope, 1835, in the county buildings, Linlithgow; Lord President Hope, in the Parliament House; and Dr Chalmers, 1844. These are all full lengths, and were exhibited in London, where they attracted great attention (the Chalmers portrait was purchased some years later by Sir Robert Peel, and is now in the Peel Gallery); they belong to his middle period, and are distinguished by great sweetness in execution, and, unlike his later works, are generally rich in colour. The full length of Dr Brunton, 1844, and Dr Lee, the principal of the university, 1846, both in the staircase of the College Library, mark a modification of his style, which ultimately resolved itself into extreme simplicity, both of colour and treatment.

During the last twenty years of his life he painted many distinguished Englishmen who came to Edinburgh to sit to him. And it is significant of the position he held in the esteem of artists themselves that David Cox, the landscape painter, on being presented with his portrait, subscribed for by many friends, chose to go to Edinburgh to have it executed by Watson Gordon, although he neither knew the painter personally nor had ever before visited the country. Among the portraits painted during this period, in what may be termed his third style, are De Quincey, the opium eater, in the National Portrait Gallery, London; General Sir Thomas Macdougall Brisbane, in the Royal Society; the prince of Wales, Lord Macaulay, Sir M. Packington, Lord Murray, Lord Cockburn, Lord Rutherford, and Sir John Shaw Lefevre, in the Scottish National Gallery, and a host of others, for latterly he not only possessed great facility of brush but was industrious to a fault. These latter pictures are mostly clear and grey, sometimes showing little or no positive colour, the flesh itself being very grey, and the handling extremely masterly, though never obtruding its cleverness. He was very successful in rendering acute observant character, and there is a look of mobility of feature, in repose it is true, but suggesting that the eye could twinkle and the lips relax. As an example of his last style, showing pearly flesh painting freely handled, yet highly finished, the head of Sir John Shaw Lefevre will hold its own in any school.

John Watson Gordon was one of the earlier members of the Royal Scottish Academy, and was elected its president in 1850; he was at the same time appointed limner to her majesty for Scotland, and received the honour of knighthood. Since 1841 he had been an associate of the Royal Academy, and in 1851 he was elected a Royal Academician. Sir John continued to paint with little if any diminution of power until within a very few weeks of his death, which occurred on the 1st of June 1864.

GORDON, Patrick (1635-1699), of Auchleuchries, a Russian general, was descended from a Scotch family of Aberdeenshire, who possessed the small estate of Auchleuchries, and were connected with the house of Haddo. He was born in 1635, and after completing his education at the parish schools of Cruden and Ellon, entered, in his fifteenth year, the Jesuit college at Braunsberg, Prussia; but, as "his humour could not endure such a still and strict way of living," he soon resolved to return home. He changed his mind, however, before re-embarking, and after journeying on foot in several parts of Germany, ultimately, in 1655, enlisted at Hamburg in the Swedish service. In the course of the next five years he served alternately with the Poles and Swedes as he was taken prisoner by either. In 1661, after changing his resolution more than once, he took service in the Russian army under Alexis I, and in 1666 he was sent on a special mission to England. After his return he distinguished himself in several wars against the Turks and Tartars in southern Russia, and in recognition of his services he in 1678 was made major-general, in 1679 was appointed to the chief command at Kieff, and in 1683 was made lieutenant-general. He visited England in 1686, and, after his return to Russia, he in 1687 and 1689 took part as quartermaster-general in the expeditions against the Crim Tartars in the Crimea. On the breaking out of the revolution in Moscow in the latter year, Gordon with the troops he commanded virtually decided events in favour of the czar Peter I., and against the czarina Sophia. He was therefore during the remainder of his life in high favour with the czar, who confided to him the command of his capital during his absence from Russia, employed him in organizing his army according to the European system, and latterly raised him to the rank of general-in-chief. He died November 29, 1699. The czar, who had visited him frequently during his illness, was with him when he died, and with his own hands closed his eyes.

General Gordon left behind him a diary of his life, written in English. Several of those parts of the diary connected with the military history of Russia were at an early period translated into German—then the literary language of St Petersburg—but never printed, although made use of for various other works. A complete German translation, by Prince M. A. Kolenski and Mr M. C. Powell, was published, the first volume at Moscow in 1849, the second at St Petersburg in 1851, and the third at St Petersburg in 1853; and *Passages from the Diary of General Patrick Gordon of Auchleuchries, 1635-1699*, was printed, under the editorship of Joseph Robertson, for the Spalding Club, Aberdeen, 1859.

GORE, Mrs Catherine Grace (1799-1861), an exceedingly prolific English novelist, was born in 1799 at East Retford, Nottinghamshire, and was the daughter of Mr Moody, a wine-merchant. In 1823 she was married to Captain Charles Gore; and, in the same year, she published her first work, *Theresa Marchmont, or the Maid of Honour.* Then followed, in rapid succession, the *Lettre de Cachet* and *The Reign of Terror* (1827), *Hungarian Tales, Manners of the Day* (1830), *Mothers and Daughters* (1831), and *The Fair of May Fair* (1832). At this point the critics began to say that Mrs Gore had written enough; and she accordingly went to France to extend her range of observation, and did not publish till 1836, when her next novel, entitled *Mrs Armytage*, appeared. Every succeeding year saw several volumes from her pen; and in 1839 *The Cabinet Minister*, *Preferment*, and *The Courtier of the Days of Charles II.* were issued from the press. But in 1841 Mrs Gore fairly eclipsed her other novels by the publication of *Cecil, or the Adventures of a Coxcomb*, which produced a great sensation. This year also appeared *Greville, or a Season in Paris.* Then followed, in 1842, *Ormington, or Cecil a Peer*, *Fascination*, and *The Ambassador's Wife*; and in 1843 Mrs Gore produced another masterpiece, entitled *The Banker's Wife.* She continued to write, with unfailing fertility of invention, till her death in January 1861. Mrs Gore also published some dramas and translations from the French; but it is as a fashionable novelist that she is remembered. Her life was one of extraordinary literary industry, as may be inferred from the fact that she is the author of more than seventy distinct works. Among her best novels are *Cecil, or the Adventures of a Coxcomb*, *Greville*, and *The Banker's Wife*. *Cecil* gives extremely vivid sketches of London fashionable life, and is full of happy epigrammatic touches. It displays great knowledge of London clubs, for which Mrs Gore was indebted to Mr Beckford, the author of *Vathek*. The narrative is varied by occasional glimpses of Continental life. *Greville* is marked by faithful pictures of English country life, and of the ease and grace of French society. *The Banker's Wife* is distinguished for masterly studies of character, especially in the persons of Mr Hamlyn, the cold calculating money-maker, and his warm-hearted country neighbour, Colonel Hamilton.

Mrs Gore's works are characterized by great cleverness in invention, lively satire, shrewd insight into character, and keen observation of life. They are exceedingly deficient in feeling; and the lover of fiction passes a pleasant hou-or two over her novels, not much excited by the triumphs, or vexed by the sufferings of her characters. Sometimes her novels weary the reader; but this does not arise from any failing in her style, which is always clear, animated, and full of point, nor from lack of inventiveness, but from the endless repetitions involved in writing so many books on a subject of such comparatively limited range as fashionable life. Mrs Gore's novels have not only achieved an immense temporary popularity, but possess genuine historic value as eminently readable, and on the whole faithful, pictures of the life and pursuits of the English upper classes.

GOREE (in French *Gorée*, and in the native tongue *Bir* or *Berr*, that is, a belly, in allusion to its shape), a small island off the west coast of Africa, belonging to the French colony of the Senegal. It lies immediately to the south of Cape Verd, and, according to the *Annuaire du Sénégal* for 1878, in 14° 39′ 55″ N. lat. and 12° 16′ 40″ W. long. The distance from the mainland in one direction is about 8 miles, and in another from 3 to 4. Though little more than a barren rock, Goree is of importance as a commercial and military post, and all the more as it has the advantage of a milder climate than the neighbouring mainland. The greater part of its area is occupied by the town, which was constituted a commune in 1872, and placed under the government of a municipal council of 14 members. The streets are narrow, and the houses, built for the most part of dark red stone, are flat-roofed. Among the principal buildings are the castle of St Michael, which occupies the rocky eminence in the south of the island, the governor's residence, the hospital, and the barracks. The summit of the rock within the citadel is levelled to an esplanade, and in the centre is a deep Artesian well, the only source in the otherwise arid island, which is dependent on its rain-water tanks for its ordinary supplies. Goree is a free port, and forms a convenient centre for the distribution of European goods. It is regularly visited by the vessels of the British and African Steam Navigation Company. The harbour is formed in a small sandy bay on the north-east side of the island. Telegraphic communication with St Louis dates from 1862. A chamber of commerce was established in 1870, and a sanitary commission in 1874. The town was reported in 1878 to have a population of 3243, and the arrondissement of Gorée-Dakar, of which it is the administrative centre, had a total population of 61,394. Dakar is a new settlement on the mainland, with a port constructed since 1857 for the vessels of the Messageries Maritimes; but with the exception of the public buildings the town has still to be built. Goree owes its name to the Dutch, who took possession of it in the beginning of the 17th century, and called it Goeree or Goedereede, in memory of the island on their own coast now united with Overflakkee. It was taken from them in 1663 by the English under Commodore Holmes, but recovered in the following year by De Ruyter. They were finally expelled, in 1677, by the French under Admiral D'Estrées, whose conquest was confirmed in 1678 by the peace of Nymwegen. In 1758 the island was captured for the English by Commodore Keppel, but a few years afterwards it was restored to France. With the exception of a few months in 1804, when the island was held by the French, the English were again in possession from 1800, when it was seized by Sir Charles Hamilton, till the peace of 1814.

GORGIAS of Leontini, in Sicily, a rhetorician and sophist of whose personal history nothing is known beyond the facts that in 427, when already a comparatively old man, he was sent by his fellow-citizens at the head of an embassy to ask Athenian protection against the aggression of the Syracusans; that he then settled in Athens, and supported himself by the practice of oratory and by teaching rhetoric; and that he ended his days at Larissa, in Thessaly. His birth and death may be approximately dated respectively at 483 and 375 B.C. He was the author of a lost work *On Nature or the Non-existent* (περὶ τοῦ μὴ ὄντος ἢ περὶ φύσεως), the substance of which may be gathered from the writings of Sextus Empiricus, and also from the treatise (ascribed to Theophrastus) *De Melisso, Xenophane, Gorgia*. His philosophical opinions may be summed up in three propositions, which stand in direct relation to the teachings of the Eleatic school. He held (1) that there is nothing which has any real existence; (2) that, even if anything did really exist, it could not be known; and (3) that, supposing real existence to be knowable, the knowledge would be incommunicable. On the first point his argument was that a real existence must either have come into being or have been eternal. But the first alternative would require it to have been produced, either from the existent or from the non-existent; the second alternative would require us to identify it with the infinite, but the infinite exists nowhere (for that would involve the absurdity of its existing either within itself or within something else), but what exists nowhere is nothing. In support of the second proposition he argued that, if existence could be known, then thought would be existence, and the non-existent would be unthinkable and error would be impossible. The third point for which he argued was the inadequacy of language to convey ideas, and the impossibility of the idea being the same in different minds. In natural philosophy, his opinions, so far as these are known, appear to have been similar to those of Empedocles. See the monograph, *De Gorgia Leontino Commentatio*, by Foss, 1828.

GORGON, γοργώ, according to Hesychius, is a word akin to γοργός, which means terrible, lively, rapid. Sophocles (fr. 167) calls the sea-nymphs γοργίδες and γοργάδες is quoted as a title of the daughters of Oceanus. Now it is a well-established fact that the sea was at one time the sea of air and its nymphs the clouds. Hence we may infer that words from this stem are employed in the sense of quick-moving as epithets of the clouds.

The various forms in which the Gorgon appears in Greek mythology originate probably from the rapidly gathering terrible thunder-cloud. When the cloud covered the heaven and hid the sun, a primitive race, whose thoughts and words were few and simple, said that the sun was united in marriage to the cloud. From this union sprang the lightning and the thunder. Now the sun, in its different aspects and relations, was conceived in different ways, which developed, as thought unfolded itself, into distinct deities; and, as connected with clouds, rain, and the fertility that springs therefrom, he is the original of the Vedic Savitar and Tvashtar and of the Greek Poseidon. Accordingly (Hes., *Theog.*, 273 ff.) Poseidon on a meadow (*i.e.*, the heaven, thus often in mythology) begat from the Gorgon Medusa Chrysaor and Pegasus. Chrysaor, Gold-sword, is obviously the lightning; and Pegasus, who bears the thunder and lightning for Zeus (*ibid.* 286), was probably at first simply the thunder. Gorgo and Erinys are merely tribal or local varieties of the same conception; Gorgo is specially Attic, Erinys Minyan. A similar legend occurs about children of Erinys and Poseidon (Paus., viii. 37). Hence Æschylus (*Cho.*, 1048) compares the Erinyes to Gorgons.

Gorgo is always the impersonation of the atmospheric terrors, and is conceived in connexion with the deities that are armed with thunder and lightning—Zeus and Athene. With Athene in particular is the connexion very close, and some facts of ritual and nomenclature almost suggest an original identity of the two. Palæphatus says that Athene was worshipped in the island of Cerne under the name Gorgo; Sophocles (*Al.*, 450) calls her γοργῶπις; and Plutarch (*Arat.*, 32) says that her wooden statue at Pallene, if brought out of the temple, destroyed human life (compare the description of the birth of Athene in Pindar, *Ol.*, vii. 65 ff., which strongly suggests the phenomena of the thunderstorm). Here we have preserved to us a relic from the very earliest thought among the Indo-European race. When a phenomenon in the heavens attracted their attention, they naturally spoke of it as of an animated being. The storm appeared to act out its own natural course, to live its own life. But afterwards the phenomenon was conceived with reference to human needs: beneficent and hostile deities worked in nature; a hostile power denies to men what a friendly power after a conflict grants. Among the Greeks this opposition appears in the antithesis of Olympian and older or Chthonian gods. The goddess who ruled the storm for man was set in opposition to the actual thundercloud—Athene to Gorgo (see GRACES). Accordingly the usual Greek account is that the γοργόνειον or γοργείη κεφαλή, a terror-striking countenance, is fixed in the middle of the ægis of Zeus. Zeus gives the ægis (*Iliad*, v. 736 ff., comp. Æsch., *Eum.*, 825) to Athene, the goddess of the air. The Gorgoneion is always said to have been won in battle, viz., in the conflict of the beneficent gods against the older nature-powers, who would scorch the earth with heat and deny the needed rain. Zeus then assuming the ægis (the shield of the storm-cloud) overthrows the Titans or the Giants in the aerial battle; the rain descends, and a clearer and cooler sky succeeds. Or in other accounts the whole array of gods engages in the battle; Athene then appears naturally as γοργοφόνη, *i.e.*, she clears the atmosphere, her own special domain, from the terrible cloud, which she keeps on her shield threatening death to all her foes. The Attic tradition was that the Gorgon was a monster produced by Earth to aid her distressed sons the Giants, and was slain by Pallas (Eur., *Ion*, 1002). In Homer Gorgo appears also in connexion with Apollo, Agamemnon, Hector, and Persephone,—a connexion which might be justified by an examination into the mythological ideas that underlie these names.

Later accounts, beginning from Hesiod (*Theog.*, *l.c.*), mention three Gorgons; but Medusa alone inherits the character and history of the older Gorgo, while two sisters are added to make up the sacred number, in analogy with the Moiræ, Grææ, Erinyes, &c. The Argive story has established itself in all later literature as the standard account of the Gorgons. Perseus, the light-giving hero, aided by Athene and the other gods, goes to the abode of the Gorgons beside Oceanus far away in the dark West, and cuts off the head of Medusa. Then from the streaming neck sprang Chrysaor and Pegasus, her two sons by Poseidon. This head, which, like the lightning, had the power of turning into stone all that looked on it, was given to Athene, who placed it in her shield. According to another account, Perseus buried the head in the Agora of Argos. Beside it was buried his daughter Gorgophone, who is obviously a mere impersonation of the old epithet of the Gorgon-slaying goddess.

These ideas of sun and storm give only the starting point for the myths; the history of their further growth involves the whole subsequent history of the nation. Just as in Germany, after Christianity was introduced, many old myths and customs lived on applied to Christ and his apostles instead of the old gods, so must the Greek myths as we know them bear traces of the historical vicissitudes of the race. Hence Böttiger (*Kunst-Myth.*, i. 369) has possibly some ground for referring the Perseus tale to the extinction of Phœnician human sacrifices by the Greeks.

The gradual development in art from the old hideous and terrible representation of the Medusa head to the calm repose of a beautiful dead face is described in detail by Müller, ***History of Ancient Art***, and *Denkmäler der Alten Kunst.* See also Rosenberg, *Die Erinyen.*

GORI, in Georgia, an ancient fortress, is now the chief town of a district of the same name in the government of Tiflis, and a station on the Poti-Tiflis railroad. It is built at the foot of an isolated hill crowned by the old fortifications, in a luxuriantly fertile plain on the left bank of the Kour, at the junction of the Bleejah'va and Medjoura, 48 miles west of Tiflis. The population, about 5000, is almost exclusively Armenian, engaged in commerce. The women are noted for their beauty. This town, at one time celebrated for its silk and cotton stuffs, is now famous for corn, reputed the best in Georgia; the wine is also esteemed, 5200 acres being laid out in vineyards. The climate is excellent, delightfully cool in summer, owing to the refreshing breezes from the mountains of the great Caucasian range, which, however, are at times disagreeably felt in winter. Gori was founded (1123) by David II., "the Restorer," for the Armenians who fled their country on the Persian invasion. The earliest remains of the fortress are Byzantine, but it was thoroughly restored in 1634–58, during the reign of Rustam, and destroyed by Nadir Shah. Besides the Armenian and Georgian churches, and some good schools, there is a church constructed in the 17th century by Capuchin missionaries from Rome. Gori was the birthplace (1773) of Stephàn Peshanegishvyly, a distinguished and popular poet. Eight miles from Gori is the remarkable rock-cut town of Ouplytz-tzykhè, consisting of several large dwellings having their interiors ornamented with mouldings, imitation beams, and designs sculptured in relief, and innumerable smaller habitations, the majority being divided into chambers with doorways, openings for light, and sundry provisions for domestic comfort. The whole have been hewn out of the solid rock, the groups being separated by streets, where steps for facilitating communication and grooves for water courses are cut. This "Fortress of Ouplytz" was projected and completed, according to the annals of Georgia, by Ouphlis, an immediate descendant of Noah (see GEORGIA). It was a fortress in the time of Alexander of Macedon, and an inhabited city in the reign of Bagrat III. (980–1014).

GORILLA. See APE, vol. ii. p. 148.

GÖRITZ. See GÖRZ.

GÖRLITZ, a town in the Prussian province of Silesia, capital of a circle in the government district of Liegnitz, is situated on the left bank of the Neisse, and at the junction point of several railways, 55 miles east of Dresden. The Neisse at this point is crossed by a railway bridge half a mile long and 120 feet high, with 32 arches. The town is the seat of a provincial office, a circle court, and a chamber of commerce. It is surrounded by beautiful walks and fine gardens, and although its old walls and towers have now been demolished, many of its ancient buildings remain to form a picturesque contrast with the signs of modern industry. From the hill called Landskrone, about 1500 feet high, an extensive prospect is obtained of the surrounding country. The principal buildings are the fine church of St Peter and St Paul, dating from the 15th century, with a famous organ and a very heavy bell; the church of Our Lady erected about the end of the 15th century, and possessing a fine portal and choir in pierced work; the Catholic church, founded in 1853, in the Roman style of architecture, with beautiful glass windows and oil-paintings; the town house, containing the arms of King Matthias of Hungary, and having at its entrance a fine flight of steps; the old bastion, named Kaisertrutz, now used as a guardhouse and armoury; the gymnasium buildings in the Gothic style erected in 1851; the fine new middle school, the real school, the provincial trade school, the theatre, and the barracks. Near the town is the chapel of the Holy Cross, in connexion with which there is a model of the Holy Grave at Jerusalem. In the public park there is a bust of Schiller and a monument to Alexander von Humboldt; and a monument has also been erected in the town in commemoration of the war of 1870–71. In connexion with the National History Society there is a valuable museum, and the Scientific Institute possesses a large library and a rich collection of antiquities, coins, and articles of vertu. Görlitz, next to Breslau, is the largest and most flourishing commercial town of Silesia. Besides cloth, which forms its staple article, it has manufactories of various linen and woollen wares, machines, railway waggons, sago, tobacco, leather, chemicals, and tiles.

Görlitz existed as a village from a very early period, and at the beginning of the 12th century it was made a borough by Duke Sobieslaus I. of Bohemia. It was then known as Drebenau, but on being rebuilt after its destruction by fire in 1131 it received the name of Zgorzelice (burnt town). About the end of the 12th century it was strongly fortified, and in 1346 it joined the league of the six towns. It was several times besieged and taken during the Thirty Years' War, and it also suffered considerably in the Seven Years' War. In the battle which took place near it between the Austrians and Prussians, 7th September 1757, Winterfield, the general of Frederick the Great, was slain. In 1815 the town, with the greater part of Upper Lusatia, came into the possession of Prussia. The population in 1831 was only about 8000, but in 1849 it had increased to 19,032, and in 1875 it was 45,310.

GÖRRES, JOSEPH JOHANN (1776–1848), a distinguished controversialist and writer on religious, political, and scientific subjects, was born January 25, 1776, at Coblentz. His father was a man of moderate means, who sent his son, after he had passed through the usual elementary school, to a Latin college under the direction of the Roman Catholic clergy. The sympathies of the young Görres were from the first strongly with the Revolution, and the dissoluteness and irreligion of the French exiles in the Rhineland confirmed him in his hatred of princes. He harangued the revolutionary clubs, and in his first political tract, called *Universal Peace, an Ideal*, he insisted on the unity of interests which should ally all civilized states to one another. He then commenced a republican journal called *Das Rothe Blatt*, and afterwards *Rübezahl*, in which he strongly condemned the administration of the Rhenish provinces by France.

After the peace of Campo Formio (1797) there was some hope that the Rhenish provinces would be constituted into an independent republic. In 1799 the provinces sent an embassy, of which Görres was a member, to Paris to put their case before the directory. The embassy reached Paris on the 20th of November 1799; two days before this Napoleon had assumed the supreme direction of affairs. After much delay the embassy was received by him; but the only answer they obtained was "that they might rely on perfect justice, and that the French Government would never lose sight of their wants." Görres on his return published a tract called *Results of my Mission to Paris*, in which he reviewed the history of the French Revolution. During the thirteen years of Napoleon's dominion Görres lived a retired life, devoting himself chiefly to art or science. In 1801 he married Catherine de Lassaulx, and those of Görres's admirers who claim him as a radical have laid great stress on the fact that this lady was a free-thinker. He published *Aphorisms* on art and physiology—fanciful but suggestive. He was for some years teacher at a secondary school in Coblentz, and in 1806 moved to Heidelberg, where he lectured at the university. He sought, with Brentano, Arnim, and others, to stir up the old national spirit by the republication of some of the old Teutonic ballads, but fruitlessly. He returned to Coblentz in 1808, and again found occupation as a teacher in a secondary school, supported by civic funds. He now studied Persian, and in two years produced a really valuable translation of part of the *Shahnamah*, the epic of Firdousi.

It was in the year 1810 that he seems to have conceived the notion of arousing the people to efforts by means of the press; and after the battle of Leipsic, in the year 1814, he set his paper going. It bore the name of a paper which had been a mere echo of Prussia, the *Rheinischer Merkur*. The intense earnestness of the paper, the bold outspokenness of its hostility to Napoleon, and its fiery eloquence secured for it almost instantly a position and influence unique in the history of German newspapers. Blücher read it every day; Gentz, the brothers Grimm, Varnhagen von Ense, were all loud in praise of it; Stein used it as an instrument to move the public in the direction he desired, and continually sent it information of his plans; Napoleon himself called it *la cinquième puissance*. The ideal it insisted on was a united Germany, with a representative government, but under an emperor after the fashion of other days,—for Görres now abandoned his early advocacy of republicanism. When Napoleon was at Elba, Görres wrote an imaginary proclamation issued by him to the people, the intense irony of which was so well veiled that many Frenchmen mistook it for an original utterance of the emperor. He inveighed bitterly against the second peace of Paris (1815), declaring that Alsace and Lorraine should have been demanded back from France.

Stein was glad enough to use the *Merkur* at the time of the meeting of the congress of Vienna as a vehicle for giving expression to his hopes. But Hardenberg, in May 1815, warned Görres to remember that he was not to arouse hostility against France, but only against Bonaparte. There was also in the *Merkur* an antipathy to Prussia, a continual expression of the desire that an Austrian prince should assume the imperial title, and also a tendency to pronounced liberalism,—all of which made it most distasteful to Hardenberg, and to his master King Frederick William III. Görres disregarded warnings sent to him by the censorship and continued the paper in all its fierceness. Accordingly it was suppressed early in 1816, at the instance of the Prussian Government; and soon after Görres was dismissed from his post as teacher at Coblentz. From this time his writings were his sole means of support, and he became a most diligent political pamphleteer. He was not himself a member of the *Tugendbund*, but he watched that society with deep interest, and believed, as did all the patriots of his time, that the clubs of students, or *Burschenschaften*, were calculated to restore the pristine greatness of Germany. The agitation continued, and finally Kotzebue's denunciation of young Germany led to his assassination. In the wild excitement which followed, the reactionary decrees of Carlsbad were framed, and these were the subject of Görres's celebrated pamphlet *Deutschland und die Revolution*. In this work he reviewed the circumstances which had led to the murder of Kotzebue, and, while expressing all possible horror at the deed itself, he urged that it was impossible and undesirable to repress the free utterance of public opinion by reactionary measures. The success of the work was very marked, despite its ponderous style. It was suppressed by the Prussian Government, and orders were issued for the arrest of Görres and the seizure of his papers. He escaped to Strasburg, and thence went to Switzerland. Two more political tracts, *Europa und die Revolution* (1821), and *In Sachen der Rhein Provinzen und in eigener Angelegenheit* (1822), also deserve mention.

In Görres's pamphlet *Die Heilige Allianz und die Völker auf dem Congress von Verona* he asserted that the princes had met together to crush the liberties of the people, and that the people must look elsewhere for help. The "elsewhere" was to Rome; and from this time Görres became a vehement Ultramontane writer. He was summoned to Munich by King Louis of Bavaria, and there his writings enjoyed very great popularity. His *Christliche Mystik* gave a series of biographies of the saints, together with an exposition of Roman Catholic mysticism. But his most celebrated Ultramontane work was a polemical one. Its occasion was the deposition and imprisonment by the Prussian Government of the archbishop Clement Wenceslaus, in consequence of the refusal of that prelate to sanction in certain instances the marriages of Protestants and Roman Catholics. Görres in his *Athanasius* fiercely upheld the power of the church, although the liberals of later date who have claimed Görres as one of their own school deny that he ever insisted on the absolute supremacy of Rome. *Athanasius* went through several editions, and originated a long and bitter controversy. In the *Historisch-politische Blätter*, a Munich journal, Görres and his son Guido continually upheld the claims of the church. Görres received from the king the order of merit for his services. He was terribly disturbed when the king sunk under the dominion of Lola Montez, and he died July 29, 1848.

See A. Denk, *Joseph von Görres*, 1870; J. J. Sepp, *Görres und seine Zeitgenossen*, 1877. A complete edition of Görres's works was published at Munich in 1854. (L. A. M.)

GORTSCHAKOFF (GORCHAKOV), a noble Russian family, descended from Michael Vsevolodovich, prince of Chernigoff, who, in 1246, was assassinated by the Mongols. The following are the most distinguished members of this family. PETR DIMITRIEVICH (1790–1868) served under Kamensky and Kutuzoff in the campaign against Turkey, and afterwards against France in 1813–1814. In 1820 he suppressed an insurrection in the Caucasus, for which service he was raised to the rank of major-general. In 1828–29 he fought under Wittgenstein against the Turks, occupied Aidos, and signed the treaty of peace at Adrianople. In 1839 he was made governor of eastern Siberia, and in 1851 retired into private life. When the Crimean war broke out he offered his services to the emperor Nicholas, by whom he was appointed general of the 6th army corps in the Crimea. At the battles of Alma and Inkerman he commanded the left wing of the Russian army. In 1855 he retired, and died at Moscow, March 18, 1868. MIKHAIL DIMITRIEVICH (1792–1861), brother of the preceding, was born in 1792. In 1807 he entered the Russian army, in 1810 he took part in the campaigns against Persia, and in 1812–1815 against France. During the Russo-Turkish war of 1828–29, he directed the operations of the sieges of Silistria and Shumla. After being appointed, in 1830, general of artillery, he was present in the campaigns in Poland, and was wounded at the battle of Grochow, February 25, 1831. He also distinguished himself at the battle of Ostrolenka and at the taking of Warsaw. For these services he was promoted to the rank of lieutenant-general. In 1846 he was nominated military governor of Warsaw. In 1849 he commanded the Russian artillery against the Hungarians, and in 1852 he visited London as a representative of the Russian army at the funeral of the duke of Wellington. Upon Russia declaring war against Turkey in 1853, he was appointed commander-in-chief of the troops, numbering in all some 60,000 men, which occupied Moldavia and Wallachia. On the 23d March 1854 he crossed the Danube and besieged Silistria, but was superseded in April by Prince Paskievich, who, however, resigned on the 8th of June, when Gortschakoff resumed the command. In July the siege of Silistria was raised, and the Russian armies recrossed the Danube; in August they withdrew to Russia. In 1855 he was appointed commander-in-chief of the Russian forces in the Crimea in place of Prince Mentshikoff. Gortschakoff's defence of Sebastopol, and final retreat to the northern part of the town, which he continued to defend till peace was signed in Paris, were conducted with skill and energy. In 1856 he was appointed governor-general of Poland. He died at Warsaw on the 30th May 1861.

GORTYNA, or GORTYN, an important ancient city on the southern side of the island of Crete. It stood on the banks of the small river Lethæus (Mitropolipotamo), at a short distance from the sea, with which it communicated by means of its two harbours, Metallum and Lebena. It had temples of Apollo Pythius, Artemis, and Zeus. Near the town was the famous fountain of Sauros, inclosed by fruit-bearing poplars; and not far from this was another spring, overhung by an evergreen plane-tree which in popular belief marked the scene of the amours of Jupiter and Europa. Gortyna was, next to Cnossus, the largest and most powerful city of Crete. The two cities combined to subdue the rest of the island; but when they had gained their object, they quarrelled with each other, and the history of both towns is from this time little more than a record of their feuds. Neither plays a conspicuous part in the history of Greece. Under the Romans Gortyna became the metropolis of the island. Some ruins may still be traced at the modern village of Hagii Deka.

GÖRZ, with GRADISCA, is one of the crown-lands of the Austrian monarchy, between 45° 36′ 3″ and 46° 27″ N. lat., and bounded N. by Carinthia, E. by Carniola, Istria, and the Triestine territory, S. by the Triestine territory and the Adriatic, and W. by Italy. On all sides, except towards the south-west where it unites with the Friulian lowland, it is surrounded by mountains, and four-sixths at least of its area of 1140 square miles is occupied by mountains and hills. From the ridge of the Julian Alps, which rise in an almost unbroken line to a height of 6000 or 7000 feet, the country descends in successive terraces towards the sea, and may roughly be divided into the upper highlands, the lower highlands, the hilly district, and the lowlands. The highest summit is the Terglou, 9370 feet, in the north-west. Geologically the country is a great limestone district, comprising limestone of many different formations, Rhætian, Jurassic, Neocomian, and Nummulitic; and the strata have evidently undergone a series of powerful disturbances. The hydrography is sufficiently peculiar, a considerable proportion of the circulation of the waters taking place by under ground channels. The limits of the country coincide in the main with that of the basin of the Isonzo, which rises in the extreme north at a height of 2650 feet, and pursues a strange zigzag course for a distance of 78 miles before it reaches the Adriatic. At Görz the Isonzo is still 138 feet above the sea, and it is navigable only in its lowest section, where it takes the name of the Sdobba. Its tributaries, of which the most important are the Idria, the Torre, and the Wippach, are little more than mountain streams. Of special interest not only in itself but for the frequent allusions to it in classical literature is the Timavus or Timavo. In ancient times it appears, according to the well-known description of Virgil (*Æn.*, i. 244) to have rushed from the mountain by nine separate mouths and with much noise and commotion, but at present it usually issues from only three mouths and flows quiet and still. It is strange enough, however, to see the river coming out full formed from the rock, and capable at its very source of bearing vessels on its bosom. According to a probable hypothesis it is a continuation of the river Reka which is lost in a cleft of the rock in the south-east of the country near S. Canziano. The coast-line of Görz and Gradisca, though extending for 25 miles, presents no harbour of much importance. It is fringed by alluvial deposits and lagoons which are for the most part of very modern formation for as late as the 4th or 5th centuries Aquileia was a great seaport. The harbour of Grado is the only one accessible to the larger kind of coasting craft. A large part of the country formerly covered with forest has been recklessly cleared, but the Tarnova plateau is still a fine wooded district with an area of about 35 or 40 square miles. The red beech is the predominant and in some parts almost the exclusive tree, but it is being displaced by the fir and the pine. A number of pits in the plateau are full of ice all the year round, and yield about 16,000 cwts. annually for the consumption of the neighbouring countries. More than a fifth of the area of the country is pasture-land, and less than a twenty-fourth is under the plough.

The vine is largely cultivated, being not only planted in regular vineyards but introduced in long lines through the ordinary fields and carried up the hills in terraces locally called ronchi. Wheat, maize, buck-wheat, and potatoes are the usual crops. Silk growing is largely carried on, especially in the lowlands, and furnishes the material for the most extensive industry of the country. There are about 2000 workers in silk, and the produce is worth upwards of £200,000, while the cotton manufacture, which is next in importance, employs about 1000, and produces £100,000. Leather, linen, paper, and soap are manufactured on a smaller scale. The trade of the country is of very little importance. Görz and Gradisca, according to the constitution of 1861, have a diet consisting of six representatives of the landed proprietors, seven representatives of the towns and industrial interests, and eight representatives of the rural communes. The elector for the landed interest must pay 100 florins (about £10) of land-tax in the Italian circle, and 50 florins (about £5) in the Slovenian circle. Two representatives are sent to the imperial council. The political administration is in the hands of the lieutenant of the coast-lands, which include not only Görz and Gradisca but also Trieste and Istria. Roman Catholicism is the exclusive religion, the only Protestant community being in the town of Görz, and the Jews numbering only some 400. Ethnographically the population must contain much more various elements, but in 1857, out of a total of 196,276 inhabitants, 130,748 were registered as Slovenians, 47,841 as Friulians, 15,134 as Italians, and only 2150 as Germans.

Görz first appears distinctly in history about the close of the 10th century, as part of a district bestowed by the emperor Otto III. on John, patriarch of Aquileia. In the 11th century it became the seat of the Eppenstein family, who frequently bore the title of counts of Gorizia; and in the beginning of the 12th century the countship passed from them to the Lurngan family which continued to exist till the year 1500, and acquired possessions in Tyrol, Carinthia, Friuli, and Styria. In the course of the 13th and 14th centuries the counts often appear as protectors (*Schirmvogt* or *Advocatus*) of the church of Aquileia and as captains-general of Friulia. When the Venetians took possession of Friulia they gave Count Henry the title of hereditary marshal as a compensation for his loss of office. The right of coining was exercised by the counts from the 13th century. On the death of Count Leonhard (12th April 1500) the fief reverted to the house of Hapsburg.

GÖRZ, GÖRTZ, or GÖRIZ (Italian, *Gorizia*; Modern Latin, *Goritia*), the chief town of the crown-land, is beautifully situated in the fruitful valley of the Isonzo, 25 miles N.N.W. of Trieste by railway. It is the seat of an archbishop, of a circle court, and of a head tax-office. The principal buildings are the cathedral, the former Jesuit church and college now converted into barracks, the convents of the brothers and sisters of mercy, of the Franciscans, of the Capuchins, and of the Ursulines, the municipal buildings, the theatre, the house of the bishop, and the old castle of the former counts of Tyrol and Görz now converted into a prison. Among the educational establishments are a central episcopal seminary, a gymnasium, an upper real-school, a deaf and dumb institute, and an agricultural school. The industries include cotton and silk weaving, sugar refining, brewing, the manufacture of leather, and the making of rosoglio. There is also a considerable trade in wooden work, fruit, and wine. On account of its mild climate the town is coming to be much resorted to by invalids in winter. Charles X., the exiled king of France, died at Görz 6th November 1836. The population of the town in 1869 was 16,659.

Besides the great monograph of K. von Czörnig, *Das Land Görz und Gradisca*, Vienna, 1873 and 1874, see Siegmund, *Südliche Klimatische Kurorte*, Vienna, 1875; Coronini, *Fastorum Goritiensium lib.* i., Vienna, 1769, and *L'Antica moneta Goriziana*, Görz, 1785; Schweizer, *Abrégé de l'histoire des comtes de Gorice*, Trieste, 1859; Carlo Morelli of Schönfeld, *Istoria della Contea di Gorizia*, Görz, 1855-56; Della-Bona, *Sunto istorico di Gorizia e di Gradisca*, Görz, 1853; Siebert, *Görz, Stadt und Land.*

GOS-HAWK, *i.e.*, Goose-Hawk, the *Astur palumbarius* of ornithologists, and the largest of the short-winged Hawks used in Falconry. Its English name, however, has possibly been transferred to this species from one of the long-winged Hawks, or true Falcons, since there is no tradition of the Gos-Hawk, now so called, having ever been used in Europe to take Geese or other large and powerful birds. The genus *Astur* may be readily distinguished from *Falco* by the smooth edges of its beak, its short wings (not reaching beyond about the middle of the tail), and its long legs and toes—though these last are stout and comparatively shorter than in the Sparrow-Hawks (*Accipiter*). In plumage the Gos-Hawk has a general resemblance to the Peregrine Falcon (see FALCON, vol. ix. p. 2), and it undergoes a corresponding change as it advances from youth to maturity—the young being longitudinally streaked beneath, while the adults are transversely barred. The irides, however, are always yellow, or in old birds orange, while those of the Falcons are dark brown. The sexes differ greatly in size. There can be little doubt that the Gos-Hawk, now-a-days very rare in Britain, was once common in England, and even towards the end of the last century Thornton obtained a nestling in Scotland, while Irish Gos-Hawks were of old highly celebrated. Being strictly a woodland-bird, its disappearance may be safely connected with the disappearance of our ancient forests, though its destructiveness to Poultry and Pigeons has doubtless contributed to its present scarcity. In many parts of the continent of Europe it still abounds. It ranges eastward to China, and is much valued in India (see FALCONRY, vol. ix. p. 11). In North America it is represented by a very nearly allied species, *A. atricapillus*, chiefly distinguished by the closer barring of the breast. Three or four examples corresponding with this form have been obtained in Britain. A good many other species of *Astur* (some of them passing into *Accipiter*) are found in various parts of the world, but the only one that need here be mentioned is the *A. novæ-hollandiæ* of Australia, which is remarkable for its dimorphism—one form possessing the normal dark-coloured plumage of the genus, and the other being perfectly white, with crimson irides. It must be stated, however, that some writers hold these two forms to be distinct species, and call the dark-coloured one *A. cinereus* or *A. raii.* (A. N.)

GOSHEN (גֹּשֶׁן), or the land of Goshen, a territory of Egypt in which the Israelites were settled from Jacob's immigration to the Exodus. In the Septuagint the equivalent is usually the land Gesem (Γεσέμ), but in Gen. xlv. 10 "the land Gesem of Arabia," Arabia being here either the Arabian nome (Ἀραβίας νομός) or the extreme east of Lower Egypt. According to Dr Brugsch the Arabian name was the 20th of Lower Egypt in the older division known to us, the 32d in the later, the alteration in the number being due to a new division under the Ptolemies (*Dict. Géogr.*, List following preface). The Egyptian name of the nome was Supt, and the capital was Kesem, probably Kosem, also called Kesem-Abot, Kesem of the East (Arabia), equivalent to the Gesem of the Septuagint, preserved in the classical Phacusa (Pa-Kesem), and the modern Fakoos, where mounds mark the site of the ancient town (*cf* Brugsch, *Ib.*, 876–7, 1049–50). The etymology is doubtful; probably the name is like many others in the same part of Egypt of Semitic origin, as another land of Goshen, with a capital city of the same name, is mentioned in southern Palestine. It is therefore certain that the land of Goshen was around the town of Phacusa. The site of this town lies within the easternmost part of Lower Egypt, under 20 miles in a direct line south of Sán, the site of Tanis. These conditions suit those of the Biblical narrative. It is obvious that Goshen was a pastoral country, that it was suited for a Shemite settlement, and was in the Shemite part of Lower Egypt, its north-eastern portion. It was near the seat of government in that part of the country, which at this time was Tanis-Rameses, which town, or another of the same name, was the starting-point at the Exodus. In one place (Gen. xlvii. 11) the "land of Rameses" occurs where we should expect "the land of Goshen." We are not sufficiently acquainted with the administrative divisions at this early time to be able to explain this. It may, however, be conjectured that if the Rameses of the Exodus journey was the same as Tanis-Rameses, the archaic Tanite nome may have included the land of Goshen.

GOSLAR, a town in the district of Hildesheim, Prussia, province of Hanover, is situated on the Gose, an affluent of the Ocker, at the foot of the Harz, 24 miles S.E. of Hildesheim. It is surrounded by walls, and has a very antique appearance. Among the noteworthy buildings are the market church, in the Romantic style, restored since its partial destruction by fire in 1844, and containing the town archives, and a library in which are some of Luther's manuscripts; the old town-house, possessing many interesting antiquities; the Kaiserworth, with the statues of the German emperors; the Kaiserhaus, founded by Henry III. in 1050, and along with the adjoining Ulrich's chapel restored in 1873 at the cost of the Prussian Government; the small chapel, which is all that remains since 1820 of the old cathedral founded by Henry III. in 1040, containing among other antiquarian relics of the cathedral an old altar supposed to be that of the idol Krodo which formerly stood on the top of the Burgberg near Neustadt-Harzburg; the church of the monastery of Neuwerk, in the Roman style, with wall paintings of considerable merit; and the house of the bakers' guild, the birthplace of Marshal Maurice of Saxony. There are four Evangelical churches, one Catholic church, a synagogue, a real school of the first order, a higher girls' school, and a number of small foundations. The population are chiefly occupied in connexion with the sulphur, copper, silver, and other mines in the neighbourhood. The town has also been long noted for its beer, and possesses some small manufactures, and a considerable trade in fruit. The population in 1875 was 9838.

Goslar was founded by Henry the Fowler about 920, and when in the time of Otto the Great the mineral treasures in the neighbourhood were discovered it increased rapidly in prosperity. It was frequently the seat of German diets, and the residence of the emperor. About 1350 it joined the Hanseatic League. It was unsuccessfully besieged in 1625, during the Thirty Years' War, but was taken by the Swedes in 1632, and nearly destroyed by fire. Additional conflagrations in 1728 and 1780 gave a severe blow to its ancient prosperity. It was a free town till 1802, when it came into possession of Prussia. In 1807 it was joined to Westphalia, in 1816 to Hanover, and in 1866 it was, along with Hanover, reunited to Prussia.

GOSLICKI, WAWRZYNIEC (1533–1607), a learned Pole, better known under his Latinized name of Laurentius Grimalius Goslicius, was born about 1533. After having studied first at Cracow and afterwards at Padua, he entered the church, and was successively appointed bishop of Kaminietz and of Posen. Goslicki, although an ecclesiastic, was an active man of business, was held in high estimation by his contemporaries, and was frequently engaged in political affairs. It was chiefly through his influence, and through the letter he wrote to the pope against the Jesuits, that they were prevented from establishing their schools at Cracow. He was also a strenuous advocate of religious toleration in Poland. He died October 31, 1607.

His principal work is *De optimo senatore*, &c. (Venice, 1568). There are two English translations published respectively under the titles *A commonwealth of good counsaile*, &c. (1607), and *The Accomplished Senator, done into English by Mr Oldisworth* (1733).

GOSPELS

SYNOPTICAL GOSPELS.

OF the four canonical Gospels[1] (*god*, God or good; *spell*, discourse or tidings, *cf.* εὐαγγέλιον) the first three (differing from the fourth) agree in narrating nearly the same events in somewhat similar language, and are hence called synoptical (σύν, together; ὄψις, view). It will be advantageous to begin with the treatment of these, as to their origin, date, and objects, so far as can be determined from (1) internal evidence and (2) external evidence.

Internal Evidence.

In discussing the internal evidence, it will be convenient to speak, first, of those portions of the synoptic narrative which are found in three Gospels; then of those which are found in only two; and, lastly, of those which are found in only one.

The Triple Tradition.—Few are aware of the very small extent to which independent narrators of the same events use the same words. A comparison of a few specimens of independent narratives (of such events, for example, as the attempt to assassinate King Humbert, or the recent death of the Prince Imperial) would show that the narratives often contain scarcely two or three consecutive words in common, and rarely or never a whole clause of five or six words. The same statement applies to narratives of discourses of any length reported from memory, and not from notes taken at the moment. Now it is well known that in many parts of the first three Gospels the same words and phrases are curiously interlaced, in such a way as to suggest that the writers have borrowed either from each other or from some common source. For example, in describing the healing of the sick (Mat. viii. 16; Mk. i. 32; Lu. iv. 40), Matthew begins thus: ὀψίας δὲ γενομένης; Mark, ὀψίας δὲ γενομένης ὅτε ἔδυσεν ὁ ἥλιος; Luke, δύνοντος δὲ τοῦ ἡλίου. From this and many similar passages it might seem natural to infer that Mark borrowed one of these expressions from Matthew and the other from Luke, and that the narrative of Mark is little more than a combination of passages from Matthew and Luke. This is an inference which has actually been drawn by many critics both before and since De Wette; but at present it finds comparatively little support among competent investigators. However, the oscillations of New Testament criticism have been so numerous that it may be of use to indicate a method by which the originality of Mark may be established on an immovable basis. That Mark (at all events in many parts) contains the original document or tradition from which Matthew and Luke have borrowed can be proved to demonstration by a necessary inference from the following specimen of narrative common to the three writers.[2]

Originality of Mark.

[1] For Apocryphal Gospels, see APOCRYPHA, vol. ii. p. 184.

42 λ·έ·γ·ε·ι αὐτοῖς ὁ· Ἰ·η·σ·ο·ῦ·ς· Οὐδέ·π·ο·τ·ε ἀνέγνωτε ἐ·ν τα·ῖ·ς γραφ·α·ῖ·ς· Λίθον ὃν ἀπεδοκίμασαν οἱ οἰκοδομοῦντες, οὗτος ἐγενήθη εἰς κεφαλὴν γωνίας· παρὰ Κυρίου ἐγένετο αὕτη, καὶ ἔστιν θαυμαστὴ ἐν ὀφθαλμοῖς ἡμῶν; 43 δ·ι·ὰ τ·ο·ῦ·τ·ο λ·έ·γ·ω ὑ·μ·ῖ·ν ὅ·τ·ι ἀ·ρ·θ·ή·σ·ε·τ·α·ι ἀ·φ' ὑ·μ·ῶ·ν ἡ·β·α·σ·ι·λ·ε·ί·α τ·ο·ῦ Θ·ε·ο·ῦ κ·α·ὶ δ·ο·θ·ή·σ·ε·τ·α·ι ἔ·θ·ν·ε·ι π·ο·ι·ο·ῦ·ν·τ·ι τ·ο·ὺ·ς κ·α·ρ·π·ο·ὺ·ς α·ὐ·τ·ῆ·ς.	17 ὁ· δ·ὲ ἐ·μ·β·λ·έ·ψ·α·ς αὐτοῖς ε·ἶ·π·ε·ν· Τ·ί ο·ὖ·ν ἐ·σ·τ·ὶ·ν τὸ· γ·ε·γρα·μ·μ·έ·ν·ο·ν τ·ο·ῦ·τ·ο· Λίθον ὃν ἀπεδοκίμασαν οἱ οἰκοδομοῦντες, οὗτος ἐγενήθη εἰς κεφαλὴν γωνίας;	10 Οὐδ·ὲ τὴ·ν γραφ·ὴ·ν τ·α·ύ·τ·η·ν ἀνέγνωτε, Λίθον ὃν ἀπεδοκίμασαν οἱ οἰκοδομοῦντες, οὗτος ἐγενήθη εἰς κεφαλὴν γωνίας· 11 παρὰ Κυρίου ἐγένετο αὕτη καὶ ἔστιν θαυμαστὴ ἐν ὀφθαλμοῖς ἡμῶν;
44 Κ·α·ὶ ὁ πεσὼν ἐπ·ὶ τὸν λίθον τ·ο·ῦ·τ·ο·ν συνθλασθήσεται· ἐφ' ὃν δ' ἂν πέσῃ, λικμήσει αὐτόν.	18 π·ᾶ·ς ὁ πεσὼν ἐπ' ἐ·κ·ε·ῖ·ν·ο·ν τὸν λίθον συνθλασθήσεται· ἐφ' ὃν δ' ἂν πέσῃ, λικμήσει αὐτόν.	

It will be observed in the foregoing extracts[1] that (up to verse 11 of Mark), besides the matter common to all three writers, Mark and Luke have a good deal of additional matter in common (ἤρξατο, the dat. term. (καιρ)ῷ, ἵνα ἀπὸ, ἐξαπέστειλαν αὐτὸν κενόν, κἀκεῖνον, καὶ ἠτίμασαν, ἀγαπητόν, πρός, ἡμῶν, ἐλεύσεται καί, τοὺς γεωργούς); Mark and Matthew have also much additional matter in common (**καὶ περιέθηκεν φραγμὸν καὶ ὤρυξεν (ὑπο)λήν(ιον) καὶ ᾠκοδόμησεν πύργον, καὶ λαβόντες, πάλιν ἀπέστειλεν, ἄλλ(ον), ἀπέκτειναν, πρὸς αὐτοὺς λέγων, ἑαυτ(οὺς), εἶπ(ο)ν, δεῦτε, λαβόντες, παρὰ κυρίου ἐγένετο αὕτη καὶ ἔστιν θαυμαστὴ ἐν ὀφθαλμοῖς ἡμῶν**; but, in striking contrast, Matthew and Luke have no additional matter in common, except that in verse 3 of Mark they insert *οἱ γεωργοί* for clearness; in verse 7 they insert *ἰδόντες*; and in verse 9 they insert *οὖν*. Are these facts compatible with the theory that Mark compounded his narrative out of Matthew and Luke?

We may begin by dismissing the three trifling words which Matthew and Luke agree in adding to the Triple Tradition (by which we mean the matter common to the three Gospels), as being words that any early editor of Mark might naturally insert. The insertion of the subject in verse 3, for clearness, requires no comment. The *οὖν* in verse 9 softens an abruptness which (however characteristic of Mark) would naturally repel readers and editors. Again, in verse 7 the omission of some phrase to denote that the husbandmen saw the son approaching before they formed their plan, is so abrupt that *ἰδόντες* or *θεασάμενοι* has been actually supplied in Mark by several manuscripts and versions (possibly, of course, influenced by Matthew and Luke), and might naturally be supplied by still earlier editors. Having therefore accounted for these words, we are led to this result, that, from Mk. xii. 1 to Mk. xii. 11, Matthew and Luke contain nothing in common which is not also found in a slightly modified edition of Mark.[2] This being the case, it can be proved by *reductio ad absurdum* that Mark did not copy from Matthew and Luke. For suppose that he did so copy, it follows that he must not only have constructed a narrative based upon two others, borrowing here a piece from Matthew and here a piece from Luke, but that he must have deliberately determined to insert, and must have adapted his narrative so as to insert, every word that was common to Matthew and Luke. The difficulty of doing this is enormous, and will be patent to any one who will try to perform a similar literary feat himself. To embody the whole of even one document in a narrative of one's own, without copying it *verbatim*, and to do this in a free and natural manner, requires no little care. But to take two documents, to put them side by side and analyse their common matter, and then to write a narrative, graphic, abrupt, and in all respects the opposite of artificial, which shall contain every phrase and word that is common to both—this would be a *tour de force* even for a skilful literary forger of these days, and may be dismissed as an impossibility for the writer of the Second Gospel.

For example, Mark might have begun his narrative, Καὶ ἔλεγεν αὐτοῖς, omitting *παραβολήν*; he might have borrowed *οἰκοδεσπότης* from Matthew and have dropped *ἄνθρωπος*; he might have borrowed *πέμψαι* from Luke (ver. 11) instead of *ἀπέστειλε*. Had he done these things (all natural enough), we should have at once had, as additional "common matter" for Matthew and Luke, *παραβολήν*, *ἄνθρωπος*, and *ἀπέστειλεν*, and all in the space of three verses, and "common matter" proportionally in the rest of the narrative. We may assume, therefore, that Mark did not copy Matthew and Luke in this passage, nor in other passages where a similar phenomenon occurs. But it occurs throughout by far the greater part of Mark's narrative. We may, therefore, regard it as absolutely certain that by far the greater part of Mark is not borrowed from Matthew and Luke, and that the duality of phrase, which is undoubtedly a characteristic of Mark, must be explained by other causes. (For other passages where Matthew and Luke have little or no additional matter in common, compare more especially the passages parallel to Mk. ii. 13–17; iii. 1–6; v. 1–39; x. 17–31; xi. 1–10; xii. 13–27; xiii. 1–19; xiv 1–16; xv. 1–11.)

Evidence of an original source.

The question remains, Were Matthew and Luke entirely dependent upon Mark for that part of their narrative which covers the same ground as Mark? It would not be difficult, from a comparison of the three columns above, to make it probable that both Matthew and Luke did not borrow from the complete Mark as we have it. For though each of the three additions *οὖν*, *ἰδόντες*, *οἱ γεωργοί*, is in itself natural enough, yet the hypothesis that Matthew and Luke independently adopted precisely these and no other additions is most improbable. From a comparison of many such passages the improbability of the borrowing hypothesis might be increased. But as the process of proof could not be complete, and would certainly be long, it will be better to bring forward some short passages which are wholly irreconcilable with the hypothesis of deliberate borrowing, and which point to an original source, either written or oral, round which the three narratives play. Those passages will be most convincing where there are traces that some original tradition has been differently understood by the different writers.

(α) One natural error in interpreting a terse tradition (perhaps translated from Aramaic into Greek) would be to supply different subjects to the same verbs, as in the following important passages, which variously describe the message of the angel or angels to the women at the tomb of Jesus:—

(1) Matt. xxviii. 7, προάγει ὑμᾶς εἰς τὴν Γαλιλαίαν· ἐκεῖ αὐτὸν ὄψεσθε· ἰδού, εἶπον ὑμῖν—"behold, *I* have told you."

(2) Mk. xvi. 7, **προάγει ὑμᾶς εἰς τὴν Γαλιλαίαν· ἐκεῖ αὐτὸν ὄψεσθε, καθὼς εἶπεν ὑμῖν**—"as *He* told you."

On the other hand, Luke, who records several appearances of the Lord to the disciples in or near Jerusalem, and who does not take the Galilean view of the resurrection, finds the words εἰς τὴν Γ. out of place in his narrative. Yet his memory or knowledge of the common tradition is too strong to allow him to omit all mention of Galilee, and he therefore inserts it, but differently.

(3) Lu. xxiv. 6, μνήσθητε ὡς ἐλάλησεν ὑμῖν ἔτι ὢν ἐν τῇ Γαλιλαίᾳ—"remember how He spake unto you *while He was* still *in* Galilee."

(β) (1) Matt. iii. 5, **ἐξεπορεύετο πρὸς αὐτὸν . . . πᾶσα ἡ περίχωρος τοῦ Ἰορδάνου.**

(2) Mk. i. 5 (agreeing here with Matthew), **ἐξεπορεύετο πρὸς αὐτὸν . . . πᾶσα ἡ Ἰουδαία χώρα.**

(3) Lu. iii. 3, ἦλθεν εἰς πᾶσαν τὴν περίχωρον τοῦ Ἰορδάνου.

(γ) In some cases the confusion is so important as seriously to affect the context, as in—

(1) Matt. xix. 16. Διδάσκαλε, τί ἀγαθὸν ποιήσω—which is

[1] The ordinary type on page 790 exhibits the words and phrases common to all three writers, which we will henceforth call the "Triple Tradition"; the underlined type that which is common to each pair (in addition to the matter common to the three); and the spaced type that which each writer has peculiar to himself alone. The black type in the first column represents that which (in addition to the matter common to the three) is common to Matthew and Mark; in the second column it represents that which is common to Luke and Matthew; in the third column, that which is common to Mark and Luke. It follows that the same words which are found as underlined type in the first, second, and third columns will be found as small black type in the second, third, and first columns respectively.

[2] The verse added in Matt. xxi. 44 is omitted by Tischendorf, and is perhaps not part of the text of Matthew. But, if genuine, it is a reference to the "winnowing-stone" in Daniel ii. 44, 45, which might naturally be added by some early editor of the original tradition, and might readily be adopted into the subsequent editions of it, which are known to us as the Gospels according to Matthew and Luke.

followed (in the correct text) by "Why askest thou me about the good?"

(2) Mk. x. 17, Διδάσκαλε ἀγαθέ, τί ποιήσω—which is followed by "Why callest thou me good?"

(3) Luke (xviii. 18) agrees with Mark: Διδάσκαλε ἀγαθέ, τί ποιήσας. Note that a scribe has endeavoured to combine the two traditions by inserting ἀγαθέ in Matt. xix. 16.

In the following the confusions are between only two narratives :—

(δ) (1) Mk. iv. 19, αἱ μέριμναι . . . εἰσπορευόμεναι συνπνίγουσι —"cares, *going into the heart*, choke (the word)."

(2) Lu. viii. 14, ὑπὸ μεριμνῶν . . . πορευόμενοι συνπνίγονται —"(the men) *going their way* (or *gradually*, as in LXX.), are choked by cares, or under the influence of cares."

(ε) In the following, Matthew and Mark concur in attributing "desire" and "fear;" but Matthew attributes the "desire" to Herod, Mark to Herodias; again, Matthew makes the object of the "fear" to be the "crowd," Mark "John the Baptist."

(1) Matt. xiv. 5, Καὶ θέλων αὐτὸν ἀποκτεῖναι ἐφοβήθη τὸν ὄχλον.

(2) Mk. vi. 19, Ἡ δὲ Ἡρωδιὰς . . . ἤθελεν αὐτὸν ἀποκτεῖναι, καὶ οὐκ ἠδύνατο· ὁ γὰρ Ἡρώδης ἐφοβεῖτο τὸν Ἰωάννην.

(ζ) In a record of dialogue, the phrases, "said he," "answered they," would naturally vary (as they do, Matthew, Mark, and Luke having peculiarities in this respect), and they might sometimes be omitted, with the important result of transmuting a statement of fact (Mark) into an utterance of Jesus (Matthew), thus :—

(1) Matt. xxvi. 2, Οἴδατε ὅτι μετὰ δύο ἡμέρας τὸ πάσχα γίνεται.

(2) Mk. xiv. 1, Ἦν δὲ τὸ πάσχα καὶ τὰ ἄζυμα μετὰ δύο ἡμέρας.[1]

(η) The following is another case of difference in the grammatical subject of the verb; the resemblance will appear demonstrative proof of confusion to those who compare the context, and who also remember that ἀκολουθεῖν is used habitually of others following Jesus, but not of Jesus following others.

(1) Matt. ix. 19, Καὶ ἐγερθεὶς ὁ Ἰησοῦς ἠκολούθει αὐτῷ.

(2) Mk. v. 24, Καὶ ἀπῆλθεν μετ' αὐτοῦ, καὶ ἠκολούθει αὐτῷ ὄχλος πολύς.

(θ) In the following there is a curious confusion from the omission of some words by Luke, so that what is the apodosis in Matthew becomes the protasis in Luke :—

(1) Matt. xii. 26, Καὶ εἰ ὁ Σατανᾶς [τὸν Σατανᾶν ἐκβάλλει], ἐφ' ἑαυτὸν ἐμερίσθη· πῶς [οὖν] σταθήσεται ἡ βασιλεία αὐτοῦ;

(2) Lu. xi. 18, εἰ δὲ καὶ ὁ Σατανᾶς ἐφ' ἑαυτὸν διεμερίσθη, πῶς σταθήσεται ἡ βασιλεία αὐτοῦ;

(ι) The following suggests that some Aramaic word meaning to "question" and to "try" or "tempt" may have been diversely rendered by—

(1) Matt. xii. 10, Καὶ ἐπηρώτησαν αὐτόν, λέγοντες εἰ ἔξεστι θεραπεύειν.

(2) Lu. vi. 7, Παρετηροῦντο δὲ αὐτὸν εἰ θεραπεύει.

(κ) (1) Matt. xxvii. 49, Οἱ δὲ λοίποι ἔλεγον, Ἄφες, ἴδωμεν εἰ ἔρχεται Ἠλίας σώσων αὐτόν.

(2) Mk. xv. 36, λέγων, Ἄφετε, ἴδωμεν εἰ ἔρχεται Ἠλίας καθελεῖν αὐτόν.

Here (1) in Matthew the bystanders address the man who brings the drink to Jesus; but (2) in Mark the man addresses the bystanders. In (1) the meaning is "desist from giving the drink;" in (2) it appears to be "desist from mocking." But in any case, the meaning differs in Matthew and Mark.

Many other instances might be given (*e.g.*, Mat. xiv. 2; Mk. vi. 16; Lu. ix. 9: Mk. ix. 5; Lu. ix. 34); but we will conclude with one in which two traditional versions of a saying of our Lord, blended into one by Mark, appear to have caused a confusion: (*a*) "Every sin and blasphemy shall be remitted to *men*, but blasphemy against the Spirit shall not be remitted;" (*b*) "Whosoever speaketh a word against the *Son of Man*, it shall be remitted to him; but whosoever speaketh against the Holy Spirit, it shall not be remitted to him." Matthew gives both these versions, Luke one of them (with slight variations). But Mark, combining the former part of the first version with the latter part of the second, so as to omit the phrase "Son of Man," and yet feeling that some mention of "Son of Man" was made in the tradition, substitutes for "men" "sons of men," a phrase that is not found elsewhere in the whole of the Gospels :—

(λ) (1) Matt. xii. 31, 32, (*a*) [διὰ τοῦτο λέγω ὑμῖν, πᾶσα ἁμαρτία καὶ βλασφημία ἀφεθήσεται τοῖς ἀνθρώπαις, ἡ δὲ τοῦ πνεύματος βλασφημία οὐκ ἀφεθήσεται καὶ] (*b*) ὃς ἐὰν εἴπῃ λόγον κατὰ ταῦ υἱαῦ τοῦ ἀνθρώπαυ, ἀφεθήσεται αὐτῷ, ὃς δ' ἂν εἴπῃ κατὰ τοῦ πνεύματος τοῦ ἁγίου οὐκ ἀφεθήσεται αὐτῷ οὔτε ἐν τούτῳ τῷ αἰῶνι οὔτε ἐν τῷ μέλλοντι.

(2) Lu. xii. 10 (using εἰς for κατὰ, ἐρεῖ for ἂν εἴπῃ, and borrowing from (*a*) the word βλασφημεῖν), (*b*) καὶ πᾶς ὃς ἐρεῖ λόγαν εἰς τὸν υἱὸν τοῦ ἀνθρώπου ἀφεθήσεται αὐτῷ, τῷ δὲ εἰς τὸ ἅγιον πνεῦμα βλασφημήσαντι οὐκ ἀφεθήσεται.

(3) Mk. iii. 28, 29 (probably transposing υἱὸς, and using the dative instead of κατὰ or εἰς), (*a*) λέγω ὑμῖν ὅτι πάντα ἀφεθήσεται τοῖς υἱαῖς τῶν ἀνθρώπων τὰ ἁμαρτήματα καὶ αἱ βλασφημίαι ὅσα ἐὰν βλασφημήσωσι; (*b*) ὃς δ' ἂν βλασφημήσῃ εἰς τὸ πνεῦμα τὸ ἅγιον οὐκ ἔχει ἄφεσιν εἰς τὸν αἰῶνα.

Even those who may reject this explanation of the ἅπαξ λεγόμενον in Mark will probably feel that this passage, and all those previously quoted, point to some original tradition (whether written or oral) upon which our three synoptic Gospels are based. These then are the results to which (so far) we are led :—(1) Mark certainly did not borrow from Matthew and Luke; (2) Matthew and Luke, though clearly influenced by some form of Mark, yet probably borrowed, not from Mark, but from some original tradition upon which Mark also is based.

The Nature of the Triple Tradition.—What was the original tradition upon which our three synoptic Gospels are based? Was it Aramaic or Greek? oral or written? single or manifold? Did the earliest of our synoptists receive it fresh from its first source, or after it had passed through many recensions? Few or none of these questions (to some of which reference will be made hereafter) can be answered with absolute certainty; but it is evident that, if Matthew, Mark, and Luke are all based upon an earlier original tradition, then those words and phrases which are common to Matthew, Mark, and Luke (to which we have given the name of the Triple Tradition) must have a peculiar weight, as approximating to the original tradition itself. If it be found that these scattered words and phrases make up of themselves an almost continuous narrative, we may fairly suppose that we are approximating very closely indeed to the original tradition. We shall not expect to find a perfectly continuous narrative. On the contrary, a perfectly continuous narrative, identical in Matthew, Mark, and Luke, would imply, not a floating early variable tradition, but a document simply copied by the authors of our Gospels.

An early tradition, circulated perhaps in various churches, in Antioch, in Rome, in Ephesus, in Corinth, before being embodied in a document, will naturally have been modified, supplemented, and sometimes (as above) confused. More especially in certain unimportant and constantly recurring words and phrases we may expect variations. The words "said," "answered," "went," "journeyed," "asked," "questioned," "tempted," "refused," "rebuked," &c., may naturally be expected to differ in the three versions. But greater differences will soon arise. One version will lay greater stress on the details of miracles; another on the relations between Jesus and John the Baptist; another on the law; another on the forgiveness of sins; and this varying emphasis will produce certain modifications of the original tradition. Again, in the early times of the church, the Greek of slaves and freedmen may pass without offence; but in later times an editor of the Gospel, writing for readers of higher rank and better education, will

[1] Here, as elsewhere in this article, it has not been thought necessary to mention by name those critics whose statements are traversed. For a brief summary of the history of recent criticism on the Gospels, see the end of this article.

substitute less uncouth words for the original barbarisms. Thus, from varying causes, the different versions of the tradition will deviate; and when we come to compare three of them together, and to write down the words common to the three, we shall no longer find the original continuous tradition. Gaps in the sense will occur every now and then, owing to the omission of some necessary word. On the other hand, although the literary cement (so to speak) which fills up the interstices between the words and deeds of the Lord may naturally vary, we may expect that the words of the Lord Himself will be more carefully preserved, and more identically reported by all three synoptists, so that they will give a more continuous sense, and will enable us to approximate to the original tradition. Let us now take the Gospel of Mark, and set down, from the first two chapters of it, all such words as it contains in common with Matthew and Luke, merely adding in italics such words as may enable the reader to perceive the structure of each sentence; and let us see whether the words thus collected show any traces of a continuous narrative;—[1]

"Esaias | the prophet: ‖ the voice of one crying in the wilderness. Prepare the way of the Lord, make His paths straight. | John | in the wilderness preaching | repen(t). | All | wen(t) forth | *to be* baptiz(ed) by him. ‖ There cometh one stronger than I | whose shoe-latchet [Mat. shoes] | I am not worthy to loose [Mat. bear]. | I baptiz(e) you with water, He | shall baptize you with the Holy Spirit. ‖ Jesu(s) *was* bapti(zed). ‖ The heaven[2] | and the Spirit, as a dove, descend(ing) on Him. And a voic(e) from | heaven | My beloved Son, in Thee [Mat. whom] I am well pleased. | The Spirit *drives Him*; | in the wildern(ess) forty days tempt(ed) by [Satan; Lu. devil]. ‖ *He came* into Galilee. ‖ Com(eth) into the house of Simon [Mat. Peter]. | Stepmother *sick of* a fever. ‖ And the feve(r) left her; | she ministered to the(m). ‖ He heale(d). ‖ He preache(d) in the synagogu(es) of Galil(ee). ‖ *There came* a leper | saying to Hi(m), If Thou wilt, Thou canst make me clean. And stretching forth His hand, He touched him | I will, be thou clean. And immediately *there departed* from him the leprosy. ‖ And *He said* to him, Tel(l) no one, but | show thyself to the priest, and offer *that which* Moses ordained as a testimony to them." Chap. ii. "‖ And they brin(g) Hi(m) a paralyti(c). ‖ And seeing their faith, ‖ *He said*, Thy sins are forgive(n). | The scribes *said*, This man blasphem(eth). ‖ Jesus said to the(m), | Why *reason ye* in your hearts? Which is easier, to say | Thy sins are forgive(n), or to say, Ris(e) | and walk. But that ye may know that the Son of Man hath power on earth to forgive sins, He *saith* to the paralyti(c), | Rise, take thy *bed*, | *go* to thy house. And | having taken it up, he went. ‖ And they glorifi(ed) God. And *He saw* one sitting at the receipt of custom, and *said* to him, Follow Me, | and arising he followe(d) Him. | And he *feasted* Him in his house, and man(y) publican(s) | were feast(ing). ‖ And the Pharisee(s) sai(d) to His disciple(s), W(hy) eat with publicans and sinners? | H(e) | *said* to them, They that are strong [Lu. healthy] have no need of a physician, but they that are sick. I cam(e) not to call the righteous but sinners. | The disciples of John | *say* to Hi(m): | *The disciples of John* and *of the* Pharisee(s) fas(t), but Thin(e) *do not*. Jesus said to the(m), Ca(n) the son(s) of the bride-chamber *fast*? | The bridegroom is with them. ‖ But the days shall come when the bridegroom shall be taken from them. Then shall they fast. | No one put*teth* on a | patch upon an ol(d) garmen(t). No on(e) putte(th) new wine into old bottles. Else, it will burs(t) the bottle(s), and the *wine* will peris(h) and the bottles also. But new wine into new bottles, ‖ *On the* Sabbath, *they were* going through corn-fields; His disciples plucke(d) the wheat-ears. | The Pharisee(s) *said*, *They* are doin(g) on the Sabbat(h) that which is not lawful. *He said* to the(m), Have ye not read *what* David did when he was an hungered, and they that were with him? how he went into the house of God, | and ate the shewbread, whic(h) it is not law(ful) to eat, save for the priest(s)? ‖ The Son of Man is Lord of the Sabbath."

Few will have any difficulty in following the above narrative which represents the Triple Tradition of the synoptists. It will be generally admitted that, so far as it extends, it omits little of importance; and its continuity will commend it as likely to be, if not the original tradition, at all events a closer approximation to it than we are likely to find elsewhere. It therefore becomes an important business to consider the scope and variations of the Triple Tradition,—where it is full and ample, where it is meagre, where it begins and where it ends.

The commencement of the Triple Tradition has been given in the specimen quoted above. It begins with the proclamation made by John the Baptist, of the advent of the Stronger One. Describing (Mk. iii.) the cure of the withered hand, the choice of the Twelve, the discourse on blasphemy against the Holy Spirit, and the answer to the question, "Who is My mother and My brethren?" it passes (chap. iv.) to the parables of the sower and the mustard seed, which it gives very fully; the rebuking of the wind and the exorcism of the legion (Mk. v.) are given as follows;—

Mk. iv. 35. "*Let us* go *across* to the other side. *They took* Hi(m) | *in* a boat. ‖ They wak(e) Hi(m) say(ing), We perish: and He, arising, rebuked the win(d). ‖ And there was a calm. *He said* to them, | Your faith! ‖ They said, *Who* is this that even the wind obey(eth) Him?" Mk. v. 1. "And they *came* across into the land of the [Gadarenes, Gerasenes, or Gergesenes]. There met Him | *one* [Mat. two] in the ‖ tombs ‖ crying, | What is there *between me* and Thee, Thou Son of God? ‖ Torment *me not*. ‖ And he [Mat. they] besought Him . . . into . . . ‖ And He . . . them, | goin(g) forth, they come to (or into) the swine, and the herd rushed down the steep place into the sea [Lu. lake] and [were choked, Mat. perished]. | Those that were feeding them | fled and brought word into the city. ‖ They came ‖ Jesus. ‖ And | *they besought* Him *to depart* from | them."

This is given as a specimen of those passages where the narrative is not so continuous, and where there is some appearance of confusion. The evidence of confusion is confirmed (1) by the fact that a word is used here (δαίμων) to denote "spirit" or "demon," which is not found once elsewhere in the whole of the Gospels, nor, indeed, anywhere in the New Testament (except in the Apocalypse twice), whereas δαιμόνιον is used forty-five times, and πνεῦμα twenty-seven times in the three Gospels alone; (2) by the difference of the names for the locality, Gadara, Gerasa, Gergesa; (3) by the fact that Matthew speaks of two demoniacs instead of one.[3]

The restoring to life of the daughter of a ruler (Mk. and Lu., ruler of a synagogue) is next thus briefly related: "*He came* into the house. | *She* is not dead, but sleepeth. And they mocked Him. ‖ Having taken *her* by the hand | Arise." Then follow (chap. vi.) the mission of the twelve, Herod's conjecture about the new prophet, and the feeding of the five thousand, which runs thus (Mk. vi. 44):—

[1] A gap in the narrative of Mark is signified by |, a longer gap by ‖. Bracketed parts of words signify that the word occurs in the three Gospels, but in different forms.

[2] Here Mark uses a strong word, meaning "cleaving" or "rending"; Matthew and Luke prefer the more usual word, meaning "opening." Hence the gap.

[3] It has been suggested (Abbott, *Through Nature to Christ*, p. 447) that this extremely difficult narrative may have arisen from a misunderstanding of the phenomena of possession. Compare the story in the *Evangelium Infantiæ Arabicum* (a Gospel which shows special traces of Mark's influence) in which (chap. xi.) it is said of a certain demoniac that "demons, in the shape of crows and serpents, began to go forth, fleeing from out his mouth." But it is perhaps more likely that the variation in the name of the place points to some misunderstanding as to the origin of the story. The name Gadara, גדרה, sometimes means a "sheepfold"; and *gâdâr*, though not a Syriac word, is yet given in the Syriac lexicons as Hebrew for "flock." Again, the correct reading in Mark is probably "Gerasene," not "Gadarene"; and the word גרש means "to cast out." Lastly, the third reading, "Gergesa," supported by Origen, is expressly said by that author (*Comm. in Ev. Joann.*, vi. 24) to mean "παροικία ἐκβεβληκότων," "the district of those who cast out"; and he suggests that the name was probably prophetical, referring to our Lord's expulsion from the district (ἐπώνυμος οὖσα τάχα προφητικῶς). Now, when a narrative of an event reported to have occurred at a certain place contains three different names of the place, and when each of the three names is adapted to the event, such a triple adaptation is obviously likely to be not a mere casual coincidence, but rather a convergence pointing to some misunderstanding or non-historical nucleus as the centre and origin of the narrative. What the misunderstanding was may be a matter of conjecture, but that there was some misunderstanding is a probability approaching to certainty.

"Send *them* away, that *they may go* into villages. | Give ye them to eat. | *We have* five loaves and two fishes. || Having taken the five loaves and the two fishes, looking up to heaven, He blessed, and having broke(n) them, *He gave them* to the disciples. And they all ate and were filled. | And they to(ok) up twelve bask(ets) of fragments. They were | five thousand men."

The walking on the waves is much more briefly recorded (Mk. vi. 46–51). "*He went* to the mountain. | *It was* late. || *They see Him* walking on the sea. || It is I; be not afraid." Then follows a blank, in which Matthew and Mark generally agree, while Luke is altogether wanting; and, after this, the famous confession of Peter, followed closely by the transfiguration.

Mk. viii. 27. "He aske(d) them, | saying, | Whom | do they say that *I* am? They answered, | John the Baptist; | others Elias; but *others* a prophe(t). | He *said*, But whom do ye say that I am? Peter | answering *said*, Chris(t). *Tell* no one. *He said* that *He* must needs | suffer many things | from the elders and chief priests and scribes, and be slain, and after three days [or, on the third day] He must be raised up [Mk. ἀναστῆναι, Lu. and Mat. ἐγερθῆναι.] || *If* any one wishes *to come* after Me, let him deny himself, and take up his cross and follow Me. For whosoever wishes to save his life shall lose it, but whosoever los(eth) his life for My sake *shall save it*. For what is a man profit(ed), to gai(n) the whole world, *and* be lost? || The Son of Man *shall come* in glory, with the angels." || Mk. ix. "I say unto you, There are some of those stand(ing) *here* who shall not taste death till they see th(e) kingdo(m). | After six [Lu. eight] day(s) he take(th) | Peter and James and John | into a mountain. || His garment(s) *become* white. || And there appear(ed) Elias and Moses speak(ing) with *Him*. | Peter *said to* Jesu(s), It is good for us to be here; let us mak(e) three tabernacles, one for thee, and one for Moses, and one for Elias. || A cloud overshadow(ed) the(m), and there *was* a voice from the cloud, This is My Son: hear Him. | *They saw* Jesus alone."

From Mark ix. 14 to x. 16 there is a break in the common tradition, which here records little except three or four sayings of the Lord.

"O faithless generation, how long shall I be with you?" "The Son of Man is to be betrayed into the hands of men." "Whosoever receiveth a child in My name receiveth Me." "*If any one* cause one of these little ones to stumble, *a mill-stone* round his neck, and *let him be cast into* the se(a)." "Salt *is good*, but if the salt *lose its savour*, wherewith shall it be salted?" "Suffer the children; forbid them not; for of such is the kingdom."

In contrast to this discontinuity, Mark x. 17–52 gives a continuous tradition about the rich young man, the promise of reward to the disciples, the predictions of betrayal, and the healing of the blind man near Jericho. The entry into Jerusalem and the purification of the temple (xi. 1–17) are also fairly continuous. The disputes in the temple touching the baptism of John (xi. 27–33), the wicked husbandmen (xii. 1–12), and the tribute-money (xii. 13–17) are very continuous. A brief denunciation of the Pharisees, who love the first seats in synagogues and at feasts, is found in Mark xii. 38–40. The Triple Tradition then touches on the second coming of Jesus. Luke has here omitted many important passages which are recorded by Matthew and Mark alone, and which will be given hereafter (see p. 795). Here we will set down nothing but the common tradition, marking Luke's omissions.

Mk. xiii. 1. "And || He said, || Not a stone shall be left on stone, which shall not be cast down. || *They asked* Him, || When shall these things be? And what *is* the sign? He *answered*, Take heed lest *any* deceiv(e) you. Many shall come in My name saying, I am He. || *When* ye hea(r) of wars, be not *alarmed* [Lu. substitutes the usual LXX. word πτοηθῆτε for the LXX. ἅπαξ λεγόμενον, θροεῖσθε, which is in Mat. and Mk.]. *These things* must needs come to pass, but the end is not yet. Nation shall rise against nation, and kingdom against kingdom. There shall be earthquakes in places, *there shall be* famines. || They shall deliver you to . . . for a witness . . . || And ye shall be hated by all men for My name's sake, *but he that* remain(eth) *shall be saved*. When ye see | desolat(ion), then let them that are in Judæa flee *to* the mountains. || He that is on the house-top let him not descend, | and he that is in the field let him not turn back.[1] || But woe to them that are with child, and to them that give suck in those days." [Here Luke leaves a blank in which Matthew and Mark predict "false Christs" and "the darkening of the sun."] "And the powers of (or *in*) the heavens shall be shaken. And then shall they see the Son of Man coming *in* the cloud(s) with great power and glory. || From the fig-tree ye know that the summer *is* near So also ye, when ye see these things. || Heaven and earth shall pass away; but My words shall never pass away."

In Matthew and Mark there follows the avowal that "of that day or hour none knoweth, not even the angels in heaven, nor even the Son, but only the Father." But Luke omits this. The Triple Tradition passes to the betrayal of Jesus. The traitor's compact (Mk. xiv. 10, 11) and the visit to the city to eat the Passover are briefly narrated. From this point the Triple Tradition becomes more and more scanty, till it leaves us at last little more than a few disconnected sayings of Jesus.

Mk. xiv. 21. "The Son of Man *goeth* indeed, as it is *written*; *but* woe to that man by whom He is to be betrayed. || Having taken bread, He brake it, and ga(ve) it. | This is My body. And *taking* the cup, This *is* My blood of *the* testamen(t), that is shed . . . || I say unto you, I will never drink of the fruit of the vine until the kingdom. || And | they wen(t) forth to the Mount of Olives. || I say unto thee, *Before* the cock crow, thou shalt deny Me thrice. || He pray(ed), If *it be possible* . . . || He sai(d), Fath(er), *take* this cup from Me; || *yet not as I* wil(l), but *as Thou wilt*. || And *having* foun(d) them *sleeping*, *He said*, Pray, that ye enter not into temptation. || While He was still speaking, *came* Judas, | one of the twelve, | *and* a multitud(e) *with* him. || *He* kiss(ed) Him. || One *smote* [Mk. ἔπαισε, for which Mat. and Lu. substitute the more appropriate and common word ἐπάταξε] the servant of the high priest, and cut off his ea(r). | Jesus said, As against a thief have ye com(e) out with swords and staves? I *was* daily | in the temple; *and* ye *took Me* not. || They led *Him* to th(e) high pries(t). || Peter followe(d) afar off | and sat in | the hall. Art thou the Son of God [Mk. the Blessed]? || Thou shalt see the Son of Man seated on the right hand of the Power. || What need have we yet of witnesses? || They sai(d) unto Him, Prophesy. || A maid-servan(t) *spake unto* Pete(r). || But he denied, saying, I do not know *Him*. || Verily *thou art one of them*, for . . . || And Peter remembered, Before the cock crow, thou shalt deny Me thrice, and he wep(t)."

Mk. xv. "*They led Him to* Pilat(e). || He aske(d) Him, | Art Thou the King of the Jews? He *said* to him, Thou sayest || . . . Barabbas . . . || Cruci(fy) *Him*. Why, what evil hath He done? | Crucif(y) Him. | Pilate released *Barabbas*, and delivered over Jesus. || And they le(a)d Him away. || *They made* Simon a Cyrenian *carry* the cross. || *They came to* the place of the Skull. || They divide(d) His garments and cast lots. || *There was written up*, The King of the Jews. || On the right hand and on the left . . . || He saved others; let *Him* save (Him)self. || About the sixt(h) hou(r) there was darkness over the earth until the ninth hour. || Jesus *with* a loud voice *emitted* His breath. || And the women | who in [or from] Galilee had followed Him behel(d) [Mk. and Mat. θεωρεῖν, Lu. ὁρᾶν, reserving θεωρεῖν for v. 55] these things from afar. || Joseph of Arimathæa | cam(e) to Pilate and begged the body of Jesus, || and wound [Mk. ἐνείλησεν; Mat. and Lu. ἐνετύλιξεν] it in linen | and laid it in a tomb."

At this point the tradition not only becomes discontinuous, but also shows marks of confusion. The tradition appears to have been that the women "beheld," or came to "behold" (another tradition added at "dawn"), and came to the tomb; but what "dawn" is meant, and what was the object of their beholding, is left uncertain.

(1) Matt. xxvii. 61; xxviii. 1. "There were there Mary Magdalene and the other Mary sitting over against the tomb. Late in the Sabbath, at the hour of dawning (τῇ ἐπιφωσκούσῃ), before the first day of the week, came Mary Magdalene and Mary to behold (θεωρῆσαι) the tomb (τάφον)."[2]

(2) Mk. xv. 47; xvi. 1. "Mary Magdalene and Mary the mother of Joses beheld (ἐθεώρουν) where He was laid (τεθειται). When the Sabbath was passed, Mary Magdalene and Mary the mother of James and Salome brought spices that they might come and anoint Him."

(3) Lu. xxiii. 54. "And the Sabbath was dawning (ἐπέφωσκε); and having followed Him (to the grave), the women who had come with Him from Galilee beheld (ἐθεάσαντο) the tomb, and how His body was *laid* (τέθειται), and returning they brought spices."

---

[1] This passage is found in Matthew and Mark here, but in Luke elsewhere (xvii. 32).

[2] It may be observed that the same Syriac word is used to denote evening as well as morning twilight. See Gildemeister, *De Evangeliis in Arabicum e simplici Syriaca translatis*. Bonn, 1865, p. 20.

The only remaining words of the tradition are: " . . . the first day of the week . . . roll(ed) away [*i.e.*, the stone at the opening of the tomb] . . . He is not here; He is risen . . . Galilee . . . *they fled* from the tomb." Matthew and Mark continue for a few lines a narrative based upon some common tradition; but even here there occurs the confusion mentioned above—Mark, "as *He* told you;" Matthew, "behold, *I* told you;" and the narrative of Mark ends at xvi. 9. The remaining verses of Mark are an appendix added by some later editor; and henceforth the narratives of Matthew and Luke—having lost Mark—present no further traces of agreement.

To sum up the contents of the common tradition, it omits the genealogies, miraculous incarnation, and the picturesque details of the infancy; it lays emphasis on the relations between John the Baptist and Jesus; it contains none of the parables except the sower, the mustard seed, and the wicked husbandmen, and few of the long discourses of Jesus, except an abridged prediction of the second coming. The disputes between Jesus and the Pharisees about the Sabbath, about fasting, about exorcism, about the baptism of John, and the tribute, and Christ the Son of David, and the dialogue with the Sadducees about the resurrection, are very fully given; and so also is the dialogue with the rich young man. Indeed it is a collection of dialogues and anecdotes rather than a set treatise of doctrine or biography. The sayings of Jesus recorded in it are short, pithy, and abrupt,[1] and many of them are polemical. Only now and then do we find a sentence which goes down deep below all polemics, and reveals a deep-laid spiritual plan. But putting such sentences together we perceive that the Triple Tradition describes a prophet wholly different from any that had before appeared in Israel; a prophet who not only (like Isaiah) protested against sabbaths and purifications as ends in themselves, but who also preached the Fatherhood of God in a manner entirely peculiar to Himself, and who set aside the Mosaic law of divorce (Mk. x. 2–11). He also instructed His disciples to enter into the kingdom as little children (x. 15), and seems to have attached a certain symbolic mystery to childhood as representing Himself (ix. 37). He taught His disciples further to devote their lives to Him, and to ignore all life apart from Him (viii. 34), ("to confess Christ, to deny themselves"). From the first He claims the power of forgiving sins (ii. 7); and, as soon as one of His disciples confessed Him to be the Messiah, He prepared for death, predicting that He should die, but rise again. Then, after prophesying the fall of the temple, and great distress in all nations, He predicted a final triumph for His disciples; and after bequeathing Himself, His body and His blood, as at a funeral feast, as His final legacy to His disciples, He was arrested and put to death.

Several miracles of healing are recorded, and, in addition to these, the exorcism of the Gadarene (in which, however, great confusion is apparent), the stilling of the storm, the feeding of the five thousand, and the transfiguration. From the beginning of the discourse on the second coming, Luke diverges more and more from Matthew and Mark. After the death of Jesus, Matthew and Mark continue to agree in words and phrases, but a little confusion is apparent; and the tradition suddenly terminates without any record of the appearance of Jesus to His disciples. However we may regret this, it is perhaps what may be naturally expected on the hypothesis that we have before us an early tradition originated at a time when the numerous manifestations of Jesus after His death were still attested by living witnesses; when as yet it had been found impossible to reduce the experiences and impressions of those who had seen Him—impressions necessarily variable and transient, blended with fear and with an excitement bordering on ecstasy—to a consistent and historical shape; and when it had not yet been found necessary to define and harden the narrative so as to adapt it for the purpose of meeting doubts and objections.

The Additions common to Matthew and Mark.—The additions to the Triple Tradition which are found in Matthew and Mark, but not in Luke, are the following:—

(1) The description of John the Baptist (Mat. iii. 4; Mk. i. 6); (2) the ministering of the angels (Mat. iv. 11; Mk. i. 13); (3) the calling of the fishermen (Mat. iv. 18–22; Mk. i. 14–20); (4) the murmuring of His friends at Nazareth (Mat. xiii. 53–57; Mk. vi. 1–4); (5) the influence of Herodias in procuring John's execution (Mat. xiv. 8–13; Mk. vi. 25–29); (6) the walking on the water (Mat. xiv. 22–28; Mk. vi. 45–51); (7) the disputes with the scribes from Jerusalem (Mat. xv. 1–20; Mk. vii. 1–23); (8) the story of the Syro-Phœnician woman, which is narrated by Matthew and Mark in widely divergent language, but with an almost identical conclusion (Mat. xv. 21–28; Mk. vii. 24–30); (9) the feeding of the four thousand (Mat. xv. 32–38; Mk. viii. 1–9), and the comparison between this miracle and that of the five thousand (Mat. xvi. 5–12; Mk. viii. 14–21); (10) the saying of Jesus that Elias had already come (Mat. xvii. 12; Mk. ix. 13); (11) the discussion of the enactments of Moses concerning divorce (Mat. xix. 4–8; Mk. x. 2–9); (12) the saying (but Luke inserts it elsewhere) that "many that are first shall be last" (Mat. xix. 30; Mk. x. 31); (13) the petition of the sons of Zebedee for the chief places (Mat. xx. 20–28; Mk. x. 35–45); (14) the withering of the fig-tree (Mat. xxi. 18–22; Mk. xi. 13, 14, 20); (15) the introductory question of the lawyer, "Which is the great commandment" (Mat. xxii. 36; Mk. xii. 28); (16) in the discourse on the last day, Luke omits reference to the "consummation," συντέλεια (Mat.), συντελεῖσθαι (Mk.); "these things are the beginning of troubles;" "the abomination of desolation," &c.; "he that readeth let him understand;" "pray that your flight may not be in winter;" "(tribulation) such as was not from the beginning till now, nor ever shall be;" the expression about the "shortening" of the days "for the elects' sake;" "He shall send His angels, and gather together the elect;" "of this hour the Son knoweth not;" (17) later on, Luke omits the anointing of Jesus "for His burial" (Mat. xxvi. 6–13; Mk. xiv. 3–9); (18) "I will smite the Shepherd," &c., and "I will go before you into Galilee" (Mat. xxvi. 31, 32; Mk. xiv. 27, 28); (19) the compact of Judas with the priests that a kiss should be the signal (Mat. xxvi. 48; Mk. xiv. 44); (20) the false witness about "destroying the temple in three days" (Mat. xxvi. 59, 62; Mk. xiv. 55–60); (21) the taunt "Thou that destroyest the temple" (Mat. xxvii. 40; Mk. xv. 29); (22) the utterance of Jesus, "My God, My God, why hast Thou forsaken Me?" with the consequent misunderstanding of the bystanders (Mat. xxvii. 46–49; Mk. xv. 34–36); (23) the utterance of the angel (or angels) at the tomb, "He goeth before you into Galilee: there shall ye see Him" (Mat. xxviii. 7; Mk. xvi. 7).

In considering these passages it is natural to ask whether any reason (besides ignorance of them) can be alleged why Luke should have omitted them. It is scarcely possible to fail to see design in some of these omissions,—for example, in those which relate to John the Baptist and Elias (1), (5), and (10). The author of the Acts of the Apostles is by general consent admitted to be identical with the author of the Third Gospel. Now remembering that Luke in the Acts (xix. 3) informs us that, many years after the death of Jesus, there were in Ephesus several disciples who were baptized with the baptism of John, and knew nothing of the Holy Spirit, we may well understand that the author of the Acts finds it necessary, when writing a gospel, to put in as clear a light as possible the subordination of John to Jesus. Accordingly, in place of the graphic description of the austere food and garb of the prophet, he gives (iii. 10–14) a description of his teaching, as containing the elements of a simple and almost commonplace morality, intended merely to prepare the way for a higher teaching, and he adds an express negative from the prophet in answer to those who doubted whether John were the Messiah. Repeatedly does Luke deviate from the common tradition of Matthew and Mark on the subject of

[1] *Cf.* Justin, *Apol. I.* (Kirchhofer, p. 89), βραχεῖς τε καὶ σύντομοι παρ' αὐτοῦ λόγοι γεγόνασι.

Elias; and in each case the object is apparent. Only a close inspection of a harmony of the Gospels will make this clear; but three or four passages may be mentioned which point in this direction. Luke has already (i. 17) declared that John will go before Jesus "in the spirit and power" of Elias, but he cautiously avoids committing himself to the tradition (Mk. ix. 13; Mat. xvii. 13) that John was Elias. The belief in an actual transmigration of souls he will allow the multitude to entertain (ix. 8, 19), but not Herod: for whereas in Mark (vi. 16) Herod says, "Whom I beheaded, viz., John, this man (οὗτος, corr. text), is risen from the dead," Luke, by a slight transposition of the traditional words, converts the proposition into a question: "John I beheaded; but who is this man?" And, further, in order to prepare the way for the interview between Herod and the Lord—which he purposes to describe at the end of his Gospel (xxiii. 8, 9), and to refer to in his continuation of the Gospel (Acts iv. 27)—he adds the words, "And he (Herod) was desirous to see Him." Again Mark (ix. 6) tells us that Peter "not knowing *what to answer*," proposed to build three tabernacles for Jesus, Moses, and Elias; but Luke reads (ix. 33), "not knowing *what he said*," as if to caution the reader against supposing that Elias or Moses could be seriously placed on the same level as Jesus. For the same reason he omits the irreverent misunderstanding of the bystander who supposed that Jesus in his last moments called for Elias, and even the utterance itself (Mat. xxvii. 49; Mk. xv. 36).

Luke's omissions. With reference to many of the other omissions it will be noticed that Luke seems to have before him somewhat different versions of the narratives, which different versions he inserts elsewhere. For example, he gives a version of the calling of the apostle-fishermen, which adds a miraculous draught of fishes, thereby approximating to the narrative in the Fourth Gospel (xxi. 6–11). Again Luke places the murmuring of the Nazarenes much earlier, in the fore-front of the ministry of Jesus, as was very natural, and gives an entirely different version of it. The ministry of the angels after the temptation he omits; but he alone records the ministry of the angel (xxii. 43) when Jesus was tempted in Gethsemane, for which temptation he carefully prepares the way by saying (iv. 13) that the devil departed from Jesus only "for a season." As regards the anointing "for the burial," it is probable we have a different version of it in his story of the woman that was "a sinner" (vii. 37). The reasons for the omission of the feeding of the four thousand and the withering of the fig-tree are not so obvious. The omission could hardly have been dictated by any desire to minimize the supernatural (seeing that Luke contains many miracles peculiar to himself, and that he does not shrink from giving in full detail the exorcism of the Gadarene). It is possible that he omitted the former as being too similar to the feeding of the five thousand to require to be repeated; and if he regarded it (as the author of the Fourth Gospel does) as having a sacramental meaning, one story of the kind may have seemed sufficient. If the story of the withered fig-tree was regarded by him in the same way (rather as emblematic than as historical), then it may have been replaced in his narrative by the story of the barren fig-tree (peculiar to Luke), to which the master came seeking fruit and finding none. It is also noticeable that the moral (on the power of faith) deduced from the withering of the fig tree in Matthew and Mark is contained in Luke, but in a different form. In Matthew and Mark it runs: "If ye say to this *mountain*, Be raised up and cast into the sea;" whereas in Luke (xvii. 6) it is, "Ye might have said to this *sycamine tree*, Be rooted up and planted in the sea." This perhaps slightly confirms the supposition that Luke regarded the narrative of the fig-tree rather as a parable than as a fact. But it is important to bear in mind that we have little more than the evidence of conjecture to explain some of Luke's omissions. For example, the story of the walking on the waves, as told by Matthew and Mark, represents the disciples as being alarmed by the thought that the apparition of the Lord was only a spirit (φάντασμα); unless Luke considered that the ground of this narrative was occupied by his account of a similar fear when the disciples beheld the Lord after the resurrection, it is hard to suggest any reason for its omission. This class of omissions may be terminated with that numbered (19) above—the compact of Judas concerning the signal. It is obvious here that Luke has another version of the tradition in his mind. He alone of the three records the words of Jesus, "Betrayest thou the Son of Man with a kiss," thereby making it unnecessary to explain (with Matthew and Mark) that the kiss was a signal fixed by the traitor.

Another class of passages may possibly have been omitted as being not of interest to the Gentile world, or as being liable to misunderstanding or perversion. The story of the Syro-Phœnician woman perhaps appeared to the editor of the Gentile Gospel to exhibit Jesus in too harsh a light; the application to Jesus of the prophecy "I will smite the Shepherd," appeared more liable to misunderstanding than "He was reckoned with transgressors" (not found in Mark's genuine text); the discussion of the law of divorce and of the regulations touching uncleanness, and the part played by Herodias in the execution of the Baptist, may have seemed to lack interest for readers outside Palestine. In the discourse on the second coming it would be natural for an editor of the tradition writing after the siege of Jerusalem to substitute "encircled by armies" for the "abomination of desolation"—a phrase that would perplex a Gentile reader, and also to modify some of the hyperbolic and emblematic expressions. Lastly, the mention of the "false witness" concerning the destruction of the temple, and the raising up of a new temple in three days, may have begun to present a difficulty in times when the temple actually had been destroyed, and when the Lord Jesus Himself had come to be regarded as the new temple not made with hands. Although therefore Luke does not go so far as the author of the Fourth Gospel (who exhibits Jesus as actually predicting the destruction of the temple and as promising to raise it up in three days), yet he not only omits the "false witness," but also the allusion to it contained in the taunts addressed to Jesus on the cross, "Thou that destroyest the temple and raisest it again in three days, save Thyself" (Mat. xxvii. 40; Mk. xv. 29).

The above explanation of Luke's omissions may only partially commend itself to the reader; but few will fail to see that there is at least some method and motive in most of them. It is a matter of certainty that in the Triple Tradition many of Luke's omissions and modifications of phrases and words are not accidental but editorial: it is but natural therefore to suppose (especially when reasons can easily be assigned) that editorial reasons may also explain omissions and modifications of narratives and discourses. Of course it is not maintained that Luke, or any individual editor, made these changes on his own responsibility. Many of them are probably the result of a "Gentile use" which had gradually sprung up in certain churches, and which was not created but adopted and expressed by the author of the Third Gospel. Consequently we are not obliged to suppose that the omissions resulted from ignorance. The very fact that it is easy to supply motives and reasons for the omission of these narratives increases their credibility, by diminishing the probability that they were late traditions unknown to the author of the Third Gospel. The passages omitted are generally in the style of the common tradition, and they contain incidents of a similar kind to the incidents of the common tradition. It only remains to add that (except in the story of the Syro-Phœnician woman, and, in a lesser degree, in the question of the lawyer about the great commandment) Matthew and Mark closely agree whenever Luke separates himself from them. This is also found frequently to be the case in the Triple Tradition.[1] In the midst of very similar context, if Mark is identical, or nearly so, with Matthew, in the expression of some action, it will be found that Luke often suddenly diverges, or makes some omission. Thus—

(1) Mat. xxi. 12. *Καὶ εἰσῆλθεν Ἰησοῦς εἰς τὸ ἱερὸν καὶ ἐξέβαλε πάντας τοὺς πωλοῦντας καὶ ἀγοράζοντας ἐν τῷ ἱερῷ, καὶ τὰς τραπέζας τῶν κολλυβιστῶν κατέστρεψε, καὶ τὰς καθέδρας τῶν πωλούντων τὰς περιστεράς.*

(2) Mk. xi. 15. *Καὶ εἰσελθὼν εἰς τὸ ἱερόν, ἤρξατο ἐκβάλλειν τοὺς πωλοῦντας καὶ τοὺς ἀγοράζοντας ἐν τῷ ἱερῷ· καὶ τὰς τραπέζας τῶν κολλυβιστῶν, καὶ τὰς καθέδρας τῶν πωλούντων τὰς περιστερὰς κατέστρεψε.*

(3) Lu. xix. 45. *Καὶ εἰσελθὼν εἰς τὸ ἱερόν, ἤρξατο ἐκβάλλειν τοὺς πωλοῦντας*, omitting the rest.

So, in the midst of the story of the rich young man, where Matthew and Mark have *ἀπῆλθε λυπούμενος, ἦν γὰρ ἔχων κτήματα πολλά*, Luke, suddenly diverging, has *περίλυπος ἐγενήθη· ἦν γὰρ πλούσιος σφόδρα* (Mk. x. 22; Mat. xix. 22; Lu. xviii. 23). Sometimes the divergence appears to arise from literary motives, and especially from the dislike of repetition (Lu. iv. 32; Mat. vii. 29; Mk. i. 22); but in other cases it cannot be so explained:—Lu. v. 29, 30; Mat. ix. 10, 11; Mk. ii. 15, 16: Lu. v. 33, 34; Mat. ix. 14, 15; Mk. ii. 18, 19 (see also, in a parable, Lu. v. 36; Mat. ix. 16; Mk. ii. 21): Lu. vi. 11; Mat. xii. 14; Mk. iii. 6: Lu. viii. 13; Mat. xiii. 21; Mk. iv. 17: Lu. viii. 44; Mat. ix. 21; Mk. v. 29. In some of these cases the agreement between Matthew and Mark is so close as to suggest that both writers may have used some common document (not oral tradition) which contained little more than certain words of the Lord in a scanty framework of narrative. But this common matter adds little to our knowledge of Christ. The most important narrative in it is the story of the Syro-Phœnician, showing how Jesus, as it were, acknowledged in the woman's persistent faith a divine revelation, extending His gospel even to the heathen. And this narrative is written in language so divergent as to indicate not a document but an oral tradition.

itions ark Luke. *The Additions of Mark and Luke.*—Additions of any length are very few:—

(1) An exorcism of an unclean spirit (Mk. i. 21–25; Lu. iv. 31-35); (2) the account of Jesus retiring to a solitary place, when He declares that He must carry the gospel elsewhere (Mk. i. 35–39; Lu. iv. 42–44); (3) the saying of John the son of Zebedee, "Master, we saw one casting out devils in Thy name, and we forbade him," and the reply of Jesus (Mk. ix. 38–40; Lu. ix. 49, 50); (4) the short denunciation of the Pharisees that devour widows' houses (Mk. xii. 38–40; Lu. xx. 46, 47); (5) the story of the widow's mite (Mk. xii. 41–44; Lu. xxi. 1–4). Shorter similarities are- (6) a mention of Jesus as being in retirement (Mk. i. 45; Lu. v. 16), and (7) a mention of "Tyre and Sidon" as places to which the fame of Jesus had spread (Mk. iii. 8; Lu. vi. 17). There is a close verbal agreement between Mark and Luke in the exorcism of the "legion" (a name that does not occur in Mark); in the raising of the daughter of Jairus; and in the stilling of the storm. But gradually as Matthew approximates to Mark, Luke deviates from Mark. There is a return to similarity in the preparation for the Passover (Mk. xiv. 12–16; Lu. xxii. 7–13); but from this point Luke deviates more and more, and, with the exception of two words (*στάσις* and *φόνος*) in the incident of Barabbas, and of a somewhat closer approximation in the incident of Joseph of Arimathæa, it may be almost said that Luke has henceforth nothing in common with Mark, except what is found in the Triple Tradition.

[1] In the words of the Lord the three Gospels are often closely similar, but seldom in the deeds.

Most of the incidents common to Mark and Luke are so few and so simple that their omission by Matthew requires no explanation. It is possible that the names Jairus and Legion did not exist in the earliest tradition, as it presented itself to Matthew; the "authority" which Mark illustrates (compare i. 22 with i. 27) by exorcism, Matthew applies (and perhaps justly) rather to our Lord's method of teaching (vii. 28, 29); but it is difficult to suppose that any other cause than ignorance could have caused the omission of the saying of Jesus concerning the widow's mite. It is certain that, in some at least of these passages, Mark represents the earlier, and Luke a modified tradition. Luke (see below, p. 806), writing with a literary purpose, has softened many early irregularities, which in Mark retain their original harshness. For example, the ungrammatical *οἱ κατέσθοντες* (Mk. xii. 40) is altered (Tischendorf and Tregelles, *pace* Lachmann) into *οἳ κατεσθίουσι* (Lu. xx. 47); and instead of *θελόντων* before *ἀσπασμούς* (Mk. xii. 38) Luke inserts *φιλούντων* (Lu. xx. 46). In the story of the widow also, Luke, disapproving of the epithet "beggar" (*πτωχή*) applied to the poor widow, substitutes the more respectable *πενιχρά*, yet with a natural but inconsistent reverence declines to cancel the same epithet (*πτωχή*) when (Lu. xxi. 3) it occurs in the words of the Lord. The rarer and less correct (ambiguous also when followed by the feminine *αὐτῆς*) *ὑστερήσεως* (Mk. xii. 44) is altered into *ὑστερήματος* (Lu. xxi. 4); and, lastly, the lengthy duality of Mark, "as many things as she had; all her livelihood" (which looks as if it had arisen from combining two different renderings of the same Aramaic original), is condensed by Luke (who takes one part of one rendering, and another part of the other) into "all the livelihood that she had." It is probable that not only in these but in all passages common to Mark and Luke alone, wherever Mark and Luke differ, Mark represents an earlier, and Luke a later version of the original. And generally it may be said that Luke follows the tradition of Mark most faithfully when it deals with Galilee, and least when it deals with Jerusalem.

Additions common to Matthew and Luke.—These introduce an altogether new element into the tradition. Additions common to Matthew and Luke. Hitherto the Triple Tradition of Matthew, Mark, and Luke (as well as the double tradition of Matthew and Mark, and of Luke and Mark) has consisted mostly of short "words of the Lord," set in a framework of short narratives, and very seldom agreeing exactly for more than seven or eight consecutive words. But we now come upon "words of the Lord" in Matthew and Luke, some of which agree exactly for several sentences. What was the origin of this close agreement? In order to gain some view of the data for solving this problem, we must briefly consider the principal passages common to Matthew and Luke alone.

The temptation (Mat. iv. 1–10; Lu. iv. 1–12) and the healing of the centurion's servant (Mat. viii. 1–13; Lu. vii. 1–10) are the principal narratives of *fact* common to Matthew and Luke alone. They resemble the narratives of the Triple Tradition in agreeing so far as concerns the words of Jesus, and of those who address Him, much more than in the general narrative. In the narrative of *facts*, the story of the centurion in Luke differs altogether from that in Matthew; in the temptation, the difference is less. Dismissing these, we pass to the "words of the Lord." As Luke's avowed object was to write "in order," we will adhere to his arrangement in our enumeration.

(1) Mat. iii. 8–10; Lu. iii. 8, 9. "Generation of vipers," &c.; this agrees *verbatim*, except that Luke has *ἄρξησθε*, where Matthew has *δόξητε*.

(2) After a break in which (Mk. intervening) Matthew and Luke have no more than a general agreement with Mark and one another, we come to another passage describing the purifying of the threshing-floor with fire unquenchable (Mat. iii. 12 ; Lu. iii. 17) ; the two agree *verbatim.*

(3) Mat. v., vi., vii. ; Lu. vi. Here are some scattered sayings of the Sermon on the Mount, such as, "Blessed are the poor," "the hungry," &c. In these the agreement is not *verbatim.* The only passage that agrees almost *verbatim* is that about the mote and the beam.[1]

(4) Mat. xii. 35 ; Lu. vi. 45. "The good man out of the good treasure of his heart," &c., nearly *verbatim,* but curiously transposed to suit the differing context.

(5) Mat. xi. 2–11 ; Lu. vii. 19–28. John the Baptist sends two of his disciples to say, "Art thou He that is to come?" With the exception that Luke (*a*) introduces some cures wrought by our Lord, for the special purpose of convincing John's disciples, and (*b*) avoids the repetition of ἐν μαλακοῖς ἱματίοις by using ἐν ἱματισμῷ ἐνδόξῳ, this passage shows an agreement almost *verbatim.*

(6) Mat. xi. 16–19 ; Lu. vii. 31–35. "We have piped unto you, and ye have not danced," &c., almost *verbatim,* except that Matthew has ἐκόψασθε, Luke ἐκλαύσατε.

(7) Mat. (*a*) ix. 37, 38, and (*b*) x. 16 ; Lu. (*a*) x. 2, and (*b*) x. 3. (*a*) "The harvest truly is great," &c. ; (*b*) "I send you as sheep among wolves." The agreement, though not *verbatim,* is considerable. But note (*a*) that Matthew takes the prayer for the increase of the labourers, as a preface to the choice of the twelve, while Luke places it after the choice of the twelve, and uses it as a preface to the choice of the seventy, an incident which he alone records ; (*b*) Luke applies to the seventy the warning against danger which Matthew applies to the twelve.

(8) Mat. xi. 21–25 ; Lu. x. 12–15. "Woe unto thee, Chorazin ;" almost *verbatim,* except that where Matthew has καταβήσει, "thou shalt come down," Luke has (if the reading be correct) καταβιβασθήσει, "thou shalt be brought down."

(9) In Matthew no interval occurs between the last and the following passage ; but in Luke intervenes (x. 17–20) the return of the seventy, and a mention of a vision in which Satan was seen falling from heaven, together with the imparting of a power to tread on serpents (compare the late appendix to Mark's Gospel, xvi. 18) ; then comes Mat. xi. 25–28 ; Lu. x. 21–22, "I thank thee, Father, Lord of heaven and earth," &c. There is but a trifling exception to the agreement. Note also that Luke apparently considers the two sayings which are continuous in Matthew to have been discontinuous, for between vers. 21 and 22 he inserts (so Lachmann, Tischendorf, and Tregelles) "and turning to His disciples, He said."

(10) Mat. xiii. 16, 17 ; Lu. x. 23, 24. "Blessed are the eyes," &c. ; here, again Luke inserts his usual note of a discontinuous saying by inserting "and turning to His disciples, He said privately." Matthew ἐπεθύμησαν, Luke ἠθέλησαν ; Matthew δίκαιοι, Luke βασιλεῖς. Otherwise *verbatim.*

(11) Mat. vi. 10–13 ; Lu. xi. 2–4. The Lord's Prayer. Here, where (if anywhere) we should expect identity, there is considerable difference. Luke, after Πάτερ, omits (*a*) ἡμῶν ὁ ἐν τοῖς οὐρανοῖς, and (*b*) γενηθήτω τὸ θέλημά σου, ὡς ἐν οὐρανῷ καὶ ἐπὶ τῆς γῆς. Further, Luke substitutes (*c*) δίδου for δός ; (*d*) τὸ καθ' ἡμέραν for σήμερον ; (*e*) τὰς ἁμαρτίας for τὰ ὀφειλήματα ; (*f*) ἀφίομεν for ἀφήκαμεν ; (*g*) πάντι τῷ ὀφείλοντι for τοῖς ὀφειλέταις ἡμῶν ; and he also (*h*) omits the clause ἀλλὰ ῥῦσαι ἡμᾶς ἀπὸ τοῦ πονηροῦ.

If any words of the Lord have been handed down by oral tradition, the Lord's Prayer would seem necessarily to have been thus handed down, and from the earliest times. Internal evidence also leaves little doubt that here oral tradition, and not a document, is the origin, and that Luke represents the original most closely in his omissions, though not in his changes. If the Lord's Prayer had been early committed to writing, and had contained Matthew's additional clauses, it is inconceivable that Luke should have omitted them. The same tendency which led a later generation to insert (and us in modern times to retain) the interpretation, "For thine is the kingdom, the power, and the glory," &c., would no doubt in the earliest times favour the insertion, rather than the rejection, of any appropriate clauses that had once gained a footing in the prayer. The abruptness of the simple Πάτερ, which is distasteful to us, as implying too great familiarity, would naturally commend to the early church Matthew's (*a*) insertion. Matthew's second insertion (*b*) is no less natural. It, or something much like it, is found in 1 Mac. iii. 60, "Whatsoever be His will in heaven, so let Him (or will He) do" (ὡς δ' ἂν ᾖ θέλημα ἐν οὐρανῷ, οὕτως ποιήσει) ; moreover, Luke himself assigns very similar words to our Lord Himself, xxii. 42 (μὴ τὸ θέλημά μου ἀλλὰ τὸ σὸν γινέσθω), and to the friends of St Paul (Acts xxi. 14). The fact that our Lord Himself used this prayer may have seemed sufficient cause in the earliest times, and especially to Matthew, who is in the habit of massing together doctrine of a certain kind, as in the Sermon on the Mount, for inserting it in the Lord's Prayer. (*c*) Luke's change of the aor. imperative into a present implies a desire to represent a continuous and not an isolated action; and (*d*) the change of σήμερον into καθ' ἡμέραν is explicable by the same motive. The word ἐπιούσιος, common both to Matthew and Luke, and not found elsewhere in the whole of Greek literature, seems to indicate that a Greek tradition, and not an Aramaic tradition, of this prayer, was the basis of both Matthew's and Luke's version. It is probably derived from ἡ ἐπιοῦσα (Prov. xxvii. 1, οὐ γὰρ οἶδας τι τέξεται ἡ ἐπιοῦσα (יום), "Thou knowest not what the day will bring"), and, probably (though this is disputed), means "for the immediate future, the *instant.*"[1] This meaning is consistent both with Matthew's σήμερον and with Luke's τὸ καθ' ἡμέραν. Luke's next three changes, (*d*), (*e*), and (*f*), substitute the more intelligible word "sin" for the less intelligible "debt," and the more intelligible present "we forgive" for the less intelligible past "we forgave ;" and increase the emphasis by adding "every one (that is our debtor)." In all these cases Matthew's seems to be the earlier form ; for it is more likely that the comparatively difficult version of Matthew should have been altered into the comparatively easy version of Luke than *vice versa.* Besides, the retention of the metaphorical ὀφείλοντι by Luke, in the second clause, indicates that the metaphor of "debt," appeared in the original (*g*). Matthew's insertion of the clause "deliver us from the evil" may naturally have arisen from the reluctance to end a prayer with a negative petition, "lead us not into temptation." The inserted clause resembles many passages in the Psalms (xvii. 49, LXX. ; A.V. xviii. 48, ἀπὸ ἀνδρὸς ἀδίκου ῥύσῃ με), and early commended itself to the church (2 Tim. iv. 18). In any case, there is no reason why Luke should omit such a clause, if it were known to him; and there are many reasons why such a clause should be introduced (even though it were not in the original), and why, when introduced, it should be speedily accepted. To sum up the inferences from this most important passage : the variations (and the nature of the passage) indicate a source oral and not documentary, Greek and not Aramaic ; Matthew appears to have massed together a number of prayers taught by, or perhaps used by, the Lord Jesus, while Luke seems to have adhered to an earlier form, which, however, has received late modification for the purposes of daily use. Though, however, we may follow Luke here, as more closely approximating to the original form of the prayer, it does not result that on this account we must commit ourselves to the statement that the Lord's Prayer was actually given at the exact time, and in the exact manner, which Luke describes. Just as Matthew supplies grouping, so Luke supplies motives and occasions. Often it may be more probable that the grouping and continuity of Matthew may be closer to the historical fact than the attempt at orderly arrangement, and at assignment of motive and cause and time, which characterizes Luke. Instances of this will be given hereafter.

(12) Mat. vii. 7–12 ; Lu. xi. 34–36. "Ask, and it shall be given unto you," &c. Luke prefaces this by a parable peculiar to himself, and of a peculiar type,—the argument being that if an indolent man grants requests, influenced by mere importunity, much more will the perfectly good God listen to earnest prayer. There is no reason, in the style or thought of this and similar parables, for supposing that we have the exact words of Jesus. Luke inserts in the part common to him and Matthew a clause about an "egg and scorpion ;" and where Matthew has "good

---

[1] It is noteworthy that, whereas Matthew explains "poor" or "hungry" spiritually, "Blessed are the poor *in spirit*; . . . Blessed are they that hunger and thirst *after righteousness,*" Luke, on the other hand, gives these sayings without Matthew's explanations, "Blessed are ye poor ; blessed are ye that hunger now." It is possible that Luke lays greater stress than any of the other evangelists on the sin of covetousness (see the parables of Lazarus and Dives, the "rich fool," the narrative of the "would-be heir," &c. ; and note also the evident gratification with which the author of this Gospel records in the Acts (iv. 32) the communism of the early church in Jerusalem) ; and this might predispose us to attribute Luke's rejection of the spiritual modification of these words to doctrinal grounds. But it must be borne in mind that the tendency in the history of the Gospels is everywhere to accretion and addition, rather than to rejection, so that shorter forms are generally more likely to be genuine than longer forms. Moreover, elsewhere Luke (xiv. 26) retains a stronger form of the words of Jesus, "If any man man *hate* not his father and mother," while Matthew (x. 37) has a weaker one. On the whole, therefore, it is more probable that Luke, in omitting the words, "after righteousness," &c., represents the letter of the original words of Jesus more closely than Matthew (as perhaps also in the Lord's Prayer, see below), however much the latter may better represent the spirit of them.

[1] There appears to be a reference to the manna which (Exod. xvi. 4) the people of Israel were to gather from day to day. So Philo, *Alleg.*, iii. 57, "Let the soul therefore collect the food of the day for the day (τὸ τῆς ἡμέρας εἰς ἡμέραν)"

things" Luke has "the Holy Spirit." With these exceptions, the agreement is nearly *verbatim*.

(13) Mat. vi. 22-23; Lu. xi. 9-13. "The light of the body is the eye." Similar in the first part; but varies (seemingly through confusion) towards the end.

(14) Mat. xii. 30, 43-45; Lu. xi. 23-26. "He that is not with Me is against Me, and he that gathereth not with Me scattereth," followed by "When the unclean spirit goeth forth from the man," &c., nearly *verbatim*, but apparently better placed by Matthew than by Luke, who has transposed the passage into the neighbourhood of the discourse on Beelzebub, moved possibly by the superficial resemblance of subject ("unclean spirit" and "Beelzebub"), not perhaps perceiving that it is the climax of a condemnation of "this evil generation," which last words (Mat. xii. 45) Luke omits.

(15) Mat. xii. 41, 42; Lu. xi. 31, 32. "The queen of the south shall rise up," &c. The queen of the south is placed by Luke before, by Matthew after, the "men of Nineveh;" and in one of the clauses (very curiously, but perhaps with a desire to bring out the antithesis between the "women" and the "men") Luke substitutes "the men of this generation" for "this generation," and "them" for "it." Otherwise the agreement is almost *verbatim*.

(16) Mat. xxiii. 23-39; Lu. xi. 37-52. A denunciation of those who tithed mint and anise, yet were the true children of the murderers of the prophets. Matthew makes this a part of a long and public denunciation of the Pharisees, in Jerusalem; Luke places it early, and as an utterance in the house of a Pharisee, his host. It is certainly remarkable that here, and nowhere else, a Pharisee is addressed in the singular number, "Thou blind Pharisee" (Mat. xxiii. 26). The "Pharisee" is clearly generic; but if the use of the singular were misunderstood, it might originate a tradition that the speech was delivered to a single Pharisee, in whose house Jesus was dining; and though Luke does not insert the "Pharisee," he may have been influenced by this traditional misunderstanding. Internal evidence is here strongly for Matthew's, and against Luke's place and time. Luke has probably been led to place this discourse at the table of a Pharisee, by the metaphor of the "cup and platter." But the metaphor suits Matthew's version equally well; and it is in defiance at once of good taste and probability, to attribute to Jesus such a denunciation of a host at his own table, and to place it so early in our Lord's ministry. The use (Lu. xi. 39) of ὁ Κύριος (see below, 22) makes it probable that this is a late tradition; and, if it is rejected, there falls with it an accusation brought against Jesus, of neglecting the decencies of life, by coming to a repast with unwashed hands. The agreement is here by no means *verbatim*; and, besides other differences, Matthew has τὸ ἐντὸς καθάρισον, where Luke has τὰ ἐνόντα δότε ἐλεημοσύνην (a change, as in the Lord's Prayer, from the metaphorical to the real). The original and Judæan expression σοφοὺς καὶ γραμματεῖς Luke alters into the Christian ἀποστόλους; he also omits the somewhat difficult σταυρώσετε. It is especially noteworthy that, whereas in Matthew Jesus says, "Wherefore, behold *I* send unto *you* prophets," &c., in Luke Jesus says, "Wherefore, also *the Wisdom of God said*, I will send unto *them* prophets," &c. Here Luke probably represents the earlier form, although the explanation may be doubtful. It is possible that the book containing the "words of the Lord," from which Matthew and Luke borrowed this saying, gave to Jesus the name of "the Wisdom of God" (*cf.* 1 Cor. i. 24, "Christ the Wisdom of God"); and that this title was retained by Luke, but applied, not to Jesus, but to the divine providence. Matthew adds to Zachariah the words "son of Barachiah;" Luke omits them. Here again Luke probably represents the earlier tradition. The Zachariah here mentioned was the son of Jehoiada. But Matthew, whose manner it is to lay especial stress upon all matters connected with the prophets (Schenkel's *Bibel-Lexicon*, "Sacharja"), having in his mind either Zechariah, the son of Jeberechiah (Is. viii. 2), or Zechariah the prophet, the son of Berechiah (Zech. i. 1), inserted the erroneous words. The agreement here is by no means *verbatim*. Matthew makes the utterance continuous, but Luke (xi. 45), introducing a remonstrance from a "lawyer," turns the denunciation from the Pharisees to the "lawyers."

(17) Mat. x. 28-31; Lu. xii. 4-8. "Fear not them which kill the body," &c. Instead of Matthew's "shall fall to the earth without your father," Luke has the more general phrase, "is forgotten in the presence of God." In other parts of the passage there is considerable dissimilarity.

(18) Mat. x. 32, 33; Lu. xii. 8, 9. "Whosoever shall confess me before men," &c. Not *verbatim*. Besides other differences, instead of Matthew's ἔμπροσθεν τοῦ πατρός μου, Luke has ἔμπροσθεν or ἐνώπιον τῶν ἀγγέλων τοῦ Θεοῦ twice. This expression occurs in another passage peculiar to Luke (xv. 10), and nowhere else.

(19) Mat. vi. 25-34; Lu. xii. 22-34. "Wherefore I say unto you, Take no thought," &c. This is the second passage (see above, Mat. xxiii. 34; Lu. xi. 49) common to Matthew and Luke, introduced by "wherefore," though the context is different. Matthew (vi. 25) introduces the passage by a single sentence, to the effect that no one can serve two masters, God and mammon. Luke, on the other hand, after narrating the refusal of Jesus to become a "judge or a divider," and after describing in language and thought peculiar to himself (for to Luke alone belong the parables of soliloquy) the death of the rich fool, continues thus: "And He said unto His disciples, *Therefore* I say unto you, Take no thought," &c. The comparison of this passage is most useful as illustrating the difference between Matthew's and Luke's handling of their subject matter, and also as throwing light on the object (and perhaps on the origin) of many of the parables peculiar to Luke. They seem intended as tales to prepare the way for some famous saying of the Lord as the conclusion and moral. The agreement in language here is not *verbatim*. Besides other differences, Luke changes the πετεινὰ τοῦ οὐρανοῦ into κόρακας, moved perhaps by the memory of the ravens, for whom God "provideth food" (Job xxxviii. 41; Ps. cxlvii. 9). But Luke's καὶ μὴ μετεωρίζεσθε, instead of ἤ τί περιβαλώμεθα, suggests some difference of original text, or some different rendering of the same original rather than a mere alteration.

(20) Mat. vi. 19-21; Lu. xii. 33, 34. "Lay not up for yourselves treasure," &c. There is little exact similarity of language here, except in the last sentence.

(21) Mat. xxiv. 42-51; Lu. xii. 39-46. "But know this, that if the goodman of the house had known," &c. In Matthew this sentence comes towards the end of a long discourse on the second coming, uttered in Jerusalem; in Luke it is spoken in Galilee, and it is preceded by a passage peculiar to Luke, and reminding one of the Epistles: "Let your loins be girded about, and your lights burning," &c. With the exception of Matthew εἴασε. Luke ἀφῆκε (probably the original word), the passages agree almost *verbatim*.

(22) Mat. xxiv. 45; Lu. xii. 42. "Who then is the faithful and just," &c. Here there is precise agreement, except where Luke has altered the text with an object. Finding this parable, in the book or tradition from which he extracted it, connected with the name of Peter, and desiring to distinguish the "steward" or upper "servant," who is placed over the household, from the common slaves, he (*a*) inserts a question of Peter, "Speakest Thou this parable unto us or even unto all?" (*b*) alters the first δοῦλος ("slave") into οἰκονόμος ("steward"); (*c*) alters οἰκετείας ("household," the true reading of Matthew) into a word with somewhat higher associations, θεραπείας ("suite" or "retinue"); and (*d*) changes συνδούλους ("fellow-slaves") into "the manservants and maid-servants." One or two other changes are also made (μεθύσκεσθαι and τε) to improve the text. Luke's σιτομέτριον and ἀπίστων, for Matthew's τροφὴν and ὑποκριτῶν, might be early variations arising from the varying translation of some Aramaic original. There remains the curious fact that, in introducing this parable, Luke uses the rare Κύριος (used not as a vocative in speech of address, but in narration), instead of Ἰησοῦς: "*The Lord* said unto Peter." This is an almost sure sign of a late addition to the Gospels, often of an interpolation. The word Κύριος is not used once thus in the correct text of Matthew. It is not used once in the genuine Mark; but it is used twice in the short interpolated appendix to Mark (xvi. 19, 20). In Luke it is used about twelve times, always in prefaces or other passages peculiar to Luke, and of these twelve passages three are connected with Peter (xii. 42; xxii. 31; xxii. 61).

(23) Mat. x. 34-36; Lu. xii. 51-55. "Think ye that I came to send peace on earth?" The agreement is not *verbatim*, and suggests two independent translations from an Aramaic original. Instead of Matthew's μάχαιραν, "a sword," Luke has διαμερισμόν, "division." This might either be the divergence of translators (so חרב is translated in the LXX. both μάχαιρα and πόλεμος), or it might be a mannerism of Luke (*cf.* ἐπισιτισμόν, ix. 12; ἱματισμῷ, vii. 25; ix. 29, where Matthew has severally βρώματα, μαλακά, and ἱμάτια).

(24) Mat. v. 25, 26; Lu. xii. 58, 59. "Agree with thine adversary," &c. This passage is not *verbatim* in Matthew and Luke, except in the last sentence. The word ὑπάγειν in Luke (which Luke as a rule systematically alters or omits whenever it is found in the common tradition of Matthew and Luke [see Mk. i. 44; ii. 11; x. 21;[1] xiv. 21]) indicates that therein Luke is following some early tradition: but κατασύρῃ, πράκτωρ, and λεπτόν (Luke's "half-farthing," instead of Matthew's "farthing") seem all later touches added to give graphic variety and climax.

(25) Mat. xiii. 33; Lu. xiii. 21. "The kingdom of heaven is like unto leaven," &c. Nearly *verbatim*.

(26) Mat. viii. 11, 12; Lu. xiii. 28, 29. "Many shall come

---

[1] It is curious that, in the only passage where Luke agrees with Mark in reading ὑπάγετε (Mk. xi. 2; Lu. xix. 30), Matthew differs (xxv. 2), using the word πορεύεσθαι. There may be noted a general tendency of Luke to diverge from Mark, and of Matthew to diverge from Mark, wherever Mark agrees exactly with the narrative (as distinct from the words of the Lord) in Matthew and Luke respectively.

from the east and the west," &c. In Matthew these words are uttered by Jesus as a comment upon the marvellous faith of the centurion. In Luke they follow a parable peculiar to himself. The clause "there shall be weeping and gnashing of teeth" (which, except in this instance, is peculiar to Matthew) is transferred from the end to the beginning; and there are other variations, seemingly purposed. The agreement is far from *verbatim*.

(27) Mat. xxiii. 37-39; Lu. xiii. 34, 35. "Jerusalem, Jerusalem," &c. This is a conspicuous instance of the manner in which Luke has sometimes deviated from the true chronological order. He represents these words to have been uttered in Galilee, when the Pharisees warn Jesus to flee from fear of Herod. But Matthew represents them as having been uttered in Jerusalem, and in the temple. The reason for Luke's transposition is possibly contained in the last words, "Ye shall not see Me till the time come when ye shall say, Blessed is He that cometh in the name of the Lord." Now these very words, "Blessed is He," &c., were uttered by the crowd welcoming Jesus on His entrance into Jerusalem (xix. 39). Luke therefore, regarding the words of Jesus, "Ye shall not see Me," as a prediction necessarily preceding its fulfilment, is bound to place these words before the entry of Jesus into Jerusalem. But all internal evidence is on the side of Matthew's order, and against Luke's. The agreement is very nearly *verbatim*, but Luke (whose arrangement does not require the word) dispenses with the "henceforth" of Matthew.

(28) Mat. xxii. 1-14; Lu. xiv. 15-24. The parable of the wedding feast. These parables differ entirely in language, and somewhat in thought. In Matthew those who are first invited slay the messengers, and are slain by the king; and, among those who are subsequently invited, one is rejected for being without a wedding garment. In Luke the guests are simply discourteous, and the host merely invites others (the poor and the maimed, and then the wanderers in the streets) in the place of the first. Matthew's parable is therefore political, Luke's social. Note, however, that in the parable of the pounds (Mat. talents, xxv.), Luke introduces (xix. 27) the missing political element, whereas Matthew there omits it. Clearly no common document nor even detailed tradition originated these parables. They are rather (as also are the parables of the talents and the pounds) of the nature of sermons or stories based upon short "words of the Lord" as texts. It is obvious that Matthew lays special stress upon the exclusion of the unfit intruder, Luke upon the inclusion of all the world.

(29) Mat. x. 37-39; Lu. xiv. 26, 27. "He that loveth father and mother more than Me," &c. In Matthew these words are addressed by Jesus to the twelve in Galilee; in Luke to the multitude following Him during His journey to Jerusalem. Here Luke seems to have preserved the older (because more difficult) form of the tradition: "Whosoever *hateth not*" (Marcion altered μισεῖ into καταλείπει) "his father, ... yea, his own life also," &c. It seems more probable that this was the original form than that Luke intensified the form by any alteration of his own. There is scarcely any agreement of language between Matthew and Luke here.

(30) Mat. xviii. 12-14; Lu. xv. 4-7. "What man having an hundred sheep," &c. The thought is the same, but there is scarcely any similarity of language; and even the conclusion characteristically differs, Matthew having "it is not the will of *your Father in heaven* that one of these little ones should perish;" Luke having "there is joy *in heaven* over one sinner that repenteth." The contrast between the negative ("not the will") and the positive ("joy"), between the "non-perishing" and the "repenting," is typical of the contrast between the whole of Matthew and the whole of Luke.

(31) Mat. vi. 24; Lu. xvi. 13. "No (servant) can serve two masters," &c. With the exception of "servant" added by Luke for definiteness, this saying is the same *verbatim* in Matthew and Luke.

(32) Mat. xi. 12 and v. 18; Lu. xvi. 16, 17. "The law and the prophets were till John," &c., and "Not one tittle shall pass from the law." There seems little connexion in these sayings as they stand in Luke, and there is very little similarity of language between Matthew and Luke.

(33) Mat. xxiv. 26-28, 37-41; Lu. xvii 23-27, 34-37. These are scattered sayings on the second coming, likening it to the "days of Noah" and to "lightning," and predicting the severance of those who are "at one mill" and "in one bed." Luke, after his manner, introduces a question, "Where, Lord?" to which the reply comes, "Wheresoever the body is, thither will the eagles be gathered together." Matthew, on the other hand, introduces the sentence in the midst of the discourse, "So shall also the coming of the Son of Man be, for wheresoever the body is," &c. The agreement of language is not considerable, except in the last part.

(34) Mat. xxiii. 12; Lu. xviii. 14, and xiv. 11. "Every one that exalteth himself shall be abased," &c. This again furnishes a striking instance of the manner in which Luke utilizes words of the Lord as texts for discourses. The saying is introduced by Matthew in the midst of the discourse against the Pharisees; but it is made by Luke the conclusion and moral of the parable of the publican and the Pharisee, and of the discourse on choosing the lower room.

(35) Mat. xxv. 14-30; Lu. xix. 1-28. The parable of the talents or pounds. There is no similarity of language, except in the dialogue between the idle servant and the master. Luke, after his manner, inserts a question from the bystanders ("And they said to him, Lord, he hath ten pounds"); and Luke here, as Matthew above (28), introduces a political element, making the master a king, and narrating a royal vengeance.

In the consideration of the passages quoted above, one fact strikes us at once, that the Lord's Prayer is not *verbatim* the same in Matthew and Luke. If *this* is not identical, it might be thought that we cannot expect any words of the Lord to be identical. And indeed, as a matter not of hypothesis but of fact, those words which have most strongly appealed to men's hearts, and have been most frequently on their lips, from the earliest times of the church; those sayings which have given the tone to Christian life, which have encouraged martyrs, and stimulated waverers, such as (17), "Fear not them which kill the body;" (18), "Whosoever shall confess," &c.; (29), "He that loveth father or mother more than Me," &c.—all these, though identical as regards thought, and similar as regards words, are nevertheless not exactly similar in Matthew and Luke. The exactly similar passages are of a very different nature: they are for the most part passages of a prophetic or historical rather than a doctrinal character with application to individuals. Some, (1), (2), (5), (6), describe the relations between John the Baptist and Christ; another, (8), calls down woe on Chorazin; another, (9), in language that reminds us of the thoughts, though not of the words, of the Fourth Gospel, thanks God for revealing to babes what He has hidden from the wise and prudent; another, (27), pours forth lamentations over doomed Jerusalem. All these passages, dealing as it were on a large scale with the will of God, as it affects religions and nations rather than as it affects individuals, are better fitted for reading in the services of the church than for being transmitted from mouth to mouth in the family from father to son, or from catechist to catechumen, for personal and individual guidance; and consequently they seem more likely to have been handed down in a book than by means of oral tradition. The same conclusion applies to (21), "But know this, that if the goodman," &c. and to (22), "Who then is the faithful and just steward," &c.—both of which passages agree *verbatim*, and both of which appear to have an ecclesiastical rather than an individual reference, at all events in their primary application. In proportion as a rhetorical passage limits itself to individual application, it seems to have been modified by oral tradition so as to deviate from exact agreement: compare in (3) the "mote and the beam;" also (12), "Ask, and it shall be given unto you;" and (19), "Take no thought for the morrow." The only exception perhaps to this rule is in the denunciation of the Pharisees (16). This passage, being of the historical type, ought (according to our rule) to be identical; but Luke differs from Matthew considerably. Possibly, in the earliest days of the church, and especially in the synagogues of Palestine a few years after the death of Christ, the angry conflicts between the disciples of the Lord and the Pharisees may have frequently reproduced and modified by traditional influences the original form of our Lord's denunciation; so that perhaps this subject comes naturally under the head of traditional doctrine. It must also be remembered that, as Luke approaches the later period of the work of Christ in Judæa, he deviates more and more both from Matthew and from Mark; perhaps because there was a Judæan as well as a Galilean tradition of the life of Jesus, and Luke, in the latter part of his history, depended mainly on the former. These two considerations may explain the deviation of Luke from Matthew in the denunciation of the Pharisees.

That the parables should diverge is natural. Their length and number would prevent them from being remembered, or passed from mouth to mouth, with the same fidelity with which the shorter words of the Lord would be preserved; and as they were probably often repeated by Jesus in varied shapes, no one particular shape of any parable would seem to claim a place in the written document of the words of the Lord, as being of the same importance as the "Woe to Jerusalem," or the other strains of poetic prophecy. The parable of the sower, coming first in order, and being typical of the rest of the parables, and having appended to it an explanation of the motive of the parabolic teaching, would naturally attract attention from the earliest times, and consequently it found a place in the Triple Tradition; but this privilege was accorded to no other parable. There is therefore no ground whatever for inferring from the discrepancy of the language of a parable in Matthew and Luke (*e.g.*, the parable of the lost sheep) that it was not actually uttered by Jesus. The exact similarity of thought and sequence of incident in that parable, as recorded by Matthew and Luke, proves to demonstration that the two records are derived from one source.

The following are our conclusions therefore about the additions to the Triple Tradition made jointly by Matthew and Luke. (1.) Their omission by Mark furnishes no argument for their rejection, inasmuch as Mark also omits the Lord's Prayer, and obviously aims at narrating the acts rather than the sayings of the Lord. (2.) Of the additions, some appear to be based upon common tradition, or on documents modified by tradition,—principally those short trenchant sayings (including the Lord's Prayer) which are of a universal and private application. (3.) Others appear to be based upon a common document; and in these documentary additions (as perhaps to some extent in the rest) Luke seems to have modified the original tradition, in words and phrases, with a view to purity of style and intelligibility, or to remove difficulties. (4.) In chronological order and arrangement Matthew and Luke pursue divergent paths; Matthew's object being to group and mass the teaching of the Lord, while Luke aims at supplying motive, occasion, place, and time for each utterance. It is scarcely possible to doubt that the arrangement of neither is to be implicitly adopted. There is much reason to doubt whether what is called the Sermon on the Mount was actually delivered at one time in the shape in which Matthew presents it; and it is equally questionable whether the lamentation over Jerusalem was delivered in a village of Galilee, and whether the denunciation of the Scribes and Pharisees (as murderers, on whom should be avenged all the innocent blood shed from the beginning of the world) was uttered at the table of a Pharisee. (6.) As regards the parables, we have to depend—in our conjecture as to the degree to which the thoughts of Jesus have been preserved—mainly upon the presence in them of the same spiritual power and insight which are perceptible in His other recognized genuine sayings. But the dissimilarity of the language of the parables in Matthew and Luke (where the thought is the same) gives no ground for denying that parables on the same subjects, and to the same effect, were actually delivered by Him. (7.) Since the hypothesis that Luke borrowed from Matthew is untenable, and since therefore we must suppose that Matthew and Luke borrowed these additions independently from some early document, we may infer that before the times of Matthew and Luke. a document containing words of the Lord had existed long enough, and had acquired authority enough. to induce two editors or writers of Gospels, apparently representing different schools of thought and writing for different churches, to borrow from it independently.

This last conclusion is of the greatest importance; for though the document may be, and almost certainly was, later than the Triple Tradition, yet it would have the advantage of preserving the original utterances of the Lord comparatively unimpaired by traditional transmutations. When to this consideration is added the authoritative nature of the words of the Lord in this document, their direct reference to events, and the extreme improbability that any disciple would have, or could have, invented them,—for which of the apostles or subordinate disciples could have invented the discourse on "the lilies of the field," or the lamentation over Jerusalem, or the speech which likens John to "a reed shaken by the wind," and pronounces him the greatest of the prophets, yet less than the least in the kingdom of God?—we are led to infer that in all probability we have in these additions of Matthew and Luke a very close approximation to some of the noblest and most impressive utterances of Jesus Himself. With the exception of the healing of the son of the centurion, and the narrative of the temptation, the additions common to Matthew and Luke introduce no new supernatural element.

Additions peculiar to Mark

The Additions and Peculiarities of Mark.—It might be expected that when we come to the additions peculiar to each of the three synoptists we should find some increase to the accounts of supernatural events. Now it seems to be a striking proof of the antiquity of the Second Gospel that we find in it no additions of this kind. Not that Mark does not lay stress on what appears to be supernatural; on the contrary, he records acts of instantaneous healing with greater minuteness of detail than any other evangelist (vii. 31–37; viii. 22–26; ix. 14–27); but we find in Mark no mention of our Lord's birth or childhood, and only the barest prediction of His resurrection. As an explanation of the deficiency of information on the resurrection, it has been frequently suggested that the latter part of the Gospel may have been lost; and, less frequently (Weiss, *Marcusevangelium*, p. 511), that the Gospel was deliberately closed with the prediction of the resurrection by the mouth of an angel, because "the manifestations of the risen Saviour belong (according to the earliest notions) no longer to the earthly sphere of the action of Jesus, and therefore do not fall within the province of the Gospel." Few Greek scholars, however, will be induced to believe that the author of the Second Gospel deliberately chose to end a book on the good news of Christ with the words ἐφοβοῦντο γάρ. From a literary point of view the γάρ, and from a moral point of view the ill-omened ἐφοβοῦντο, make it almost incredible that these words represent a deliberate termination assigned by an author to a composition of his own. Others have suggested that the last page of the MS. may have been accidentally destroyed. But this suggestion seems to overlook the consideration that the MS. was in all probability written not for a private library but for use in the church, and that it would immediately be multiplied by copies. Again, we know, from reference to Mat. xxviii. 8 and Lu. xxiv. 9, that the common tradition ceases with the return of the women from the Lord's tomb. But it is precisely at this point that the genuine Mark (xvi. 8) also terminates. Now, that a page should have been torn out containing just that part of Mark which followed after the close of the common tradition would be a most remarkable and unlikely coincidence. It seems far more probable that Mark ends his Gospel here because the common tradition ended here, and because he scrupled to add anything to the notes and traditions which he knew to rest upon a higher authority than his own. If this be the true explanation, it stamps with the seal of a higher authority such traditions as have been preserved to us by so scrupulous an author. We proceed therefore to an investigation of the peculiarities of Mark, with a confidence in him increased rather than diminished by the fact that he has neither the introductions nor the appendices which are found in the rest of the Gospels.

The first thing that strikes us in Mark is his duality. Verbosity we might be tempted to call it at the first sight; but though there is a certain disproportion in the space assigned to detail, duality, and not verbosity, is the better word. It is this duality which gave rise (see above, p. 789) to the erroneous supposition that Mark had borrowed from Matthew and Luke. But it may be shown, by reference to passages where there can be no possibility that Mark borrowed from Matthew and Luke (Mk. ii. 19; iii. 5; iii. 27; iii. 22, 30; v. 3, 5; xii. 44), that this duality is a part of Mark's style. In many cases, *e.g.*, iii. 22, 30 (Βεελζεβοὺλ ἔχει and πνεῦμα ἀκάθαρτον ἔχει), it is almost forced on the reader that the evangelist had before him two versions of one saying, and that in his "anxiety to omit nothing"[1] he inserted both. Whether there be any definite traces of translation in his Gospel will be considered hereafter. But, so far, we merely note that some of Mark's dualities of expression might be explained as double renderings of the same original. Only one parable is peculiar to Mark; it is one that illustrates (iv. 26–29) the spread of the kingdom of God by the quiet, unperceived, and gradual growth of corn. The subdued tone of this (one of the most interesting of all the parables) was perhaps the reason why it was not at first widely known, as it undoubtedly is the reason why modern readers pay it too little attention. Mark also amplifies the story of the Baptist's execution (vi. 20–28), and the graphic story of the exorcism of the "legion." For the rest, the other additions peculiar to Mark consist either of dual expressions and amplifications of detail, or of realistic details which would naturally be subordinated in later times, as likely to be stumbling-blocks. For amplifications which treat of the resistance and ultimate submission of unclean spirits see i. 26, 27; i. 44; iii. 7–12; ix. 14–27; for others which relate to the crowding of people round Jesus, the publicity of His work, and His desire for solitude, see i. 28; i. 35–37; i. 45; ii. 1–4; ii. 15; iii. 10–12; vi. 32–33, &c. The narrative also, from first to last, abounds with expressions as to the manner and look and minute action of Jesus during dialogues or miracles (*cf.* iii. 5; vii. 31–37; viii. 22–26). In many of these additions Aramaic words are given as the very utterances of Jesus, *e.g.*, v. 41, Ταλιθά κοῦμι; vii. 34, Ἐφφαθά; xiv. 36, Ἀββά; sometimes, also, names that are given by no other writer, *e.g.*, Bartimæus, Boanerges, and Dalmanutha.[2] Unquestionably, under ordinary circumstances, this elaboration of unimportant detail[3] (and especially the introduction of names—for instances of which see the Apocryphal Gospels *passim*) is a mark of a late writer and of a composer of fiction rather than history. But all the characteristics of Mark support the belief that in his case they are rather the excrescences and redundancies of one who trusted his memory rather than his judgment, and who preferred to report rather than to select and arrange.

One proof of the early composition of Mark is the rudeness and even vulgarity of his Greek. He uses a great number of words which are expressly forbidden by the grammarians. For example, of Mark's phrase ἐσχάτως ἔχει (Mk. v. 23), Phrynichus says (ed. Lobeck, p. 389), "only the *canaille* use it in this sense;" the same grammarian also warns his readers against κράββατος (Mk. ii. 4, 9, 11, 12). Other words noted by Phrynichus, and used by Mark (some of which are also used by Matthew) but avoided by Luke, are μονόφθαλμος (ix. 47); εὐσχήμων (for πλούσιος, xv. 43); κολλυβισταί (xi. 15); κοράσιον (v. 41); ὁρκίζω (v. 7); ῥάπισμα (xiv. 65); ῥαφίδος (x. 25).[4] Such words as these might naturally find their place in the mongrel Greek of the slaves and freedmen who formed the first congregations of the church in Rome; and they are therefore tokens of a date of composition earlier than that of Matthew and Luke. For it is not conceivable that such terms (some of which would so have jarred upon the ear of an educated Greek as almost to correspond to our "slang") should be substituted in later times for a more tasteful vocabulary; whereas it is easily conceivable, and *a priori* probable, that better Greek should, in the prosperous days of the church, be substituted for worse.

It is a natural characteristic of an unpractised reporter that he lays undue stress on a few vivid expressions and striking words, and that he reproduces or exaggerates anacolutha which, though not objectionable in a speech, are inconvenient in a book, because they tend to obscure or subordinate the subject matter. Many such words are inserted by Mark, and avoided by Matthew or Luke, or by both, *e.g.*, σχιζομένους, i. 10; ἄγναφος, ii. 21; κωμοπόλεις, i. 38; ἄναλον, ix. 50. For irregular constructions see iv. 28 (πλήρης σῖτος, the correct reading); xii. 40, οἱ κατέσθοντες (altered by Luke); v. 23, ἵνα ἐπιθῇς; note also the curious change of construction from ἵνα to the infinitive in iii. 15, as compared with iii. 14. The Latinisms of this Gospel are well known: see xv. 15, τὸ ἱκανὸν ποιῆσαι; vi. 35, ὥρα πολλή; vi. 27, σπεκουλάτωρ; xv. 39, κεντυρίων. The words πραιτώριον (xv. 16), κῆνσος (xii. 14), and φραγελλοῦν (xv. 15) Mark shares with Matthew. Other barbarisms are the use of ὅταν with the indicative, and the use of ὅτι to ask a question (ii. 16; ix. 11; ix. 28), both of which idioms are common in the *Acta Pilati*, and perhaps indicate Latin influence.

A still more cogent proof of the early date of Mark is that this Gospel contains many expressions which would be likely to be stumbling-blocks in the way of weak believers, so that they are omitted in the later Gospels, and would not have been tolerated except in a Gospel of extreme antiquity. For example, the strong expression (vi. 5, 6), "He *was not able* to do there any mighty work;" the statement (i. 32, 34) that *all* the sick were brought to Jesus, but that He healed only *many*, whereas Matthew (viii. 16) says that He healed *all*, and Luke (iv. 40) that He healed *each one* (ἑνὶ ἑκάστῳ);

[1] This is a quotation from Papias preserved by Eusebius (Kirchhofer, p. 123): "For he (Mark) took great care about one matter, viz., to omit nothing of all that (μηδὲν ὧν) he heard." If Papias spoke of our Mark, it would seem that this must refer rather to the words than to the incidents recorded in his very scanty Gospel. It seems to be an apology for the disproportion of the narrative. In writing the narrative just as he took it down in notes (from Peter's discourses) "Mark," says Papias, "committed no error," but simply acted as a faithful reporter. We do not, of course, commit ourselves to the truth of this statement; we merely point out that the hypothesis that Mark's Gospel is a collection of "notes," will explain some of the peculiarities of its style.

[2] Mark's custom of placing the Aramaic original side by side with the Greek translation is perhaps in part suggested by the Palestinian dialect of our Lord's time, in which (especially in certain phrases) Greek and Aramaic were blended together, as in the phrase "my Lord," מרי כירי, which stands for מרי, κύριε. See Lightfoot, *Galat.*, p. 167, for this and other instances. But in Mark the reduplication for the most part is confined to passages expressive of strong emotion.

[3] Take, as an instance, the wounding of the high priest's servant by Peter. Here Mark (xiv. 47) merely records the wound: Matthew (xxvi. 52) adds the reproof addressed by Jesus to Peter; Luke (xxii. 50, 51) adds that it was the "right" ear, and that Jesus healed the man; lastly, the Fourth Gospel, while omitting the healing, retains the "right" ear, and adds that the servant's name was Malchus. In such a case it is impossible to feel certain that the simpler narrative of Mark may not have been modified by later accretions.

[4] Such arguments as that "Hippocrates used ῥαφίς" cannot count for anything against the general feeling of dislike for the word expressed by the dictum of Phrynichus. "ἡ δὲ ῥαφὶς τί ἐστιν οὐκ ἄν τις γνοίη."

the attempt of His mother and brethren to lay hands on Him on the ground that He was insane (iii. 20-21); the imputation of an ambitious petition to James and John, instead of (as Matthew) to their mother (x. 35); the mention of the marvel of Pilate at the speedy death of Jesus, which might have been perverted to support those who denied that Jesus had really died upon the cross (xv. 44); the statement that Jesus only gave power to His apostles to cast out devils (iii. 15, correct text), and not (as Mat. x. 1) to heal diseases; the enumeration of the different stages by which Jesus, at least on one occasion, effected a cure, and the description of the, at first, only partial cure (viii. 24); the statement that the fig-tree, instead of being withered up "immediately" (as Matthew, παραχρῆμα, xxi. 19), was not observed to be withered till after the interval of a day; the bare statement (xvi. 4) that the women found the stone rolled away from the sepulchre (which might have been used to support the statements of those who maintained that the friends or enemies of Jesus had stolen His body), whereas Matthew (xxviii. 2) distinctly meets such an objection by asserting that an angel descended from heaven in the sight of the keepers and rolled away the stone;—these, and probably other expressions, indicate a very early date of composition, and a disposition to record facts as they came, without emphasis or subordination. Mark neither masses similar sayings or deeds, as Matthew does, nor supplies motives and occasions, as Luke does. It is most interesting to note that the words "law," "lawyer," which played so prominent a part in Matthew and Luke, are not to be found at all in Mark's narrative. His business is simply with the life of Christ. Again, whereas Matthew and (in a less degree) Luke are careful to point out that Jesus fulfilled the sayings of the prophets, Mark, on the other hand, though he recognizes in John the Baptist (i. 2) the messenger predicted by the prophets, sees in Jesus a Being too absorbing and interesting as a man to find much time for contemplation of Him as the mere fulfiller of prophecy. In a word, Mark writes of Jesus, not as the destroyer or fulfiller of the law, not as the Messiah predicted by the prophets, not as the refuge of the Gentiles, but rather as a man; subject to anger, and disappointment, and weariness; not knowing all things; not able to do all things; but endowed with strange powers of healing the souls and bodies of men; and carrying out a mysterious plan for the regeneration of the world, through a spirit of childlike obedience to God and brotherly love towards men; lastly, a man who assumed for Himself and for His disciples a power of forgiving sins, and who based all the success of His plans upon His predicted death and resurrection, to be followed by a second coming.

True, Mark's Gospel is disproportioned, inartistic, and uncouth—scarcely, indeed, to be called a book, but rather a collection of graphic anecdotes. Yet it has a unity derived from its naive simplicity and single-mindedness, in recording whatever it records as it was delivered from the earliest sources in its entirety; and possibly in that string of anecdotes the development of Christ's life and work may be traced with not less clearness than in the ampler and more artistic production of Luke.

The Additions and Peculiarities of Matthew.—The principal additions to the common tradition contributed by Matthew alone are the following:—

(1) i. 1-17, the genealogy of Jesus from David; (2) i. 18-25, the annunciation, and the dream of Joseph; (3) ii. 1-12, the adoration of the Magi; (4) ii. 13-23, the massacre of children in Bethlehem and the flight of the parents of Jesus to Egypt, together with their return to Nazareth; (5) iii. 13-17, the reluctance of John to baptize Jesus; (6) iv. 14-16, the fulfilment of the prophecy, "The people that sit in darkness," &c.; (7) v. 5-10, the six beatitudes on the sorrowing, the meek, the merciful, the pure in heart, the peacemakers, the persecuted; (8) v. 17-48, the new law is more exacting than the old law; (9) vi. 1-18, warnings against ostentation in almsgiving, prayer, and fasting; (10) vi. 34, "Sufficient for the day is the evil thereof"; (11) vii. 6, "Give not that which is holy to dogs," &c.; (12) vii. 13, 14, "Broad is the gate," &c.; (13) vii. 22, "In thy name have we cast out devils," &c.; (14) ix. 13 and xii. 7, the saying, "I will have mercy and not sacrifice"; (15) ix. 27-34, the cure of two blind men and of a deaf man;[1] (16) x. 5-8, "Go not into any city of the Samaritans," &c., instructions to the twelve; (17) x. 23, "But when they pursue you in this city, flee unto the other; for verily I say unto you, Ye shall not have gone over the cities of Israel until the Son of Man be come"; (18) x. 25, "The servant is not above his master," &c.; (19) xi. 28-30, "Come unto Me, all ye that are weary," &c.; (20) xii. 17-21, the prophecy of Isaiah, "Behold my servant," &c., is fulfilled in Jesus; (21) xii. 22, 23, the healing of one that was both dumb and blind; (22) xii. 33, "Either make the tree sound and the fruit sound, or," &c.; (23) xii. 36, 37, "Every idle word," &c.; (24) xii. 40, "As Jonas was in the whale's belly," &c.; (25) xiii. 14, 15, the fulfilment of a prophecy of Isaiah in the misunderstanding of Christ's teaching; (26) xiii. 24-30, the enemy and the tares; (27) xiii. 35, the fulfilment of prophecy in Christ's teaching by parables; (28) xiii. 36-43, the interpretation of the parable of the tares; (29) xiii. 44-50, "The kingdom of heaven is like (*a*) a treasure, (*b*) a merchant buying a pearl, (*c*) a net; (30) xiii. 51, 52, Every disciple to bring forth things new and old," &c.; (31) xiv. 28-33, the attempt of Peter to walk upon the waves; (32) xv. 13, "Every plant that My heavenly Father hath not planted shall be rooted up," &c.; (33) xvi. 17-19, the blessing on Peter; (34) xvii. 24-27, the tribute money; (35) xviii. 3, 4, "If ye be not converted and become as little children, ye shall not enter," &c.; (36) xviii. 10, "Their angels do always behold," &c.; (37) xviii. 12-14, the parable of the hundred sheep (given by Luke in similar language); (38) xviii. 15-18, "Tell it to the church," &c., the course of procedure in case of quarrel; (39) xviii. 21, 22, the question of Peter, "How often shall my brother sin against me?" (40) xviii. 23-34, the parable of the unforgiving servant; (41) xix. 10-12, "There are some eunuchs," &c.; (42) xx. 1-15, the labourers in the vineyard; (43) xxi. 5, the fulfilment of the prophecy, "Behold thy King cometh," &c.; (44) xxi. 16, the fulfilment of the prophecy, "Out of the mouth of babes and sucklings," &c.; (45) xxi. 28-32, "I go" and "I go not"; (46) xxi. 43, "The kingdom of God shall be taken from you, and shall be given to a nation that bringeth forth the fruits thereof"; (47) xxii. 1-14, the parable of the despiteful and murderous guests (very dissimilar in Luke); (48) xxiii. 1-3, "The Scribes and Pharisees sit in Moses' seat, &c.; (49) xxiii. 7-12; *ib.* 15-22, "Be not called Rabbi," &c., "He that sweareth by the altar," &c.; (50) xxv. 1-13, the parable of the ten virgins; (51) xxv. 14-28, the parable of the talents; (52) xxv. 31-46, the parable of the sheep and the goats; (53) xxvi. 51-54, "Put up thy sword," and "Thinkest thou not that I cannot now pray to My Father," &c.; (54) xxvii. 3-10, the fulfilment of the prophecy, "And they took the thirty pieces of silver," &c.; (55) xxvii. 19, "Have thou nothing to do with that just man," &c.; (56) xxvii. 24-25, Pilate washing his hands; (57) xxvii. 52, 53, "And many bodies of them that slept arose," &c.; (58) xxvii 62-66, the Jews seal the sepulchre; (59) xxviii. 2-5, the angel rolls the stone from the tomb of Jesus; (60) xxviii. 9-15, the women clasp the feet of the risen Jesus; the soldiers are bribed to say that the disciples stole away the body; (61) xxviii. 16-20, Jesus appears to the eleven disciples on a mountain in Galilee.

The preface (chaps. i. and ii.) reveals a part of the purpose of the whole Gospel, in tracing the genealogy of Jesus, not from David merely, who was under the law, but from Abraham, who was the receiver of the promise (Gal. iii. 16) and the father of the faithful (Gal. iii. 7). Such a genealogy is the fitting preface of a book which aims at exhibiting the law, not as trampled upon but as fulfilled and developed into a higher law of promise, in which all the families of the world were to be blessed (Gen. xii. 3). But by this time also the church required some distinct affirmation concerning the divine origin of Jesus. The gap left in the opening of Mark's Gospel needed to be filled up. The mere earthly pedigree from Abraham was insufficient; nor did it suffice that Jesus should be declared to be spiritually the Son of God. It was necessary that the verity of the spiritual birth of Jesus from the Father should be embodied in a narrative so expressed as to be intelligible to all.

The differences between the prefaces of Matthew and Luke are obvious, and need no stress laid on them, except as illustrations of the freedom which, at this period, was allowed in the handling of the various introductions to the

[1] Possibly these narratives may refer to events also described by Mark; but, as the language presents no similarity, they are placed here.

Gospel tradition. It is obvious, for example, that Luke regards Nazareth as the residence of Joseph and Mary from the first (i. 26 ; ii. 4), whereas Matthew seems to represent them as selecting Nazareth for their new home after the birth of Jesus and the return from Egypt, only because they were afraid to return to their old home in Judæa, thereby fulfilling an ancient prophecy (ii. 23). Throughout his preface, as throughout his version of the Triple Tradition, Matthew always bears in mind that Jesus came to fulfil the prophets as well as the law. The birth from a virgin (i. 25), the birth in Bethlehem (ii. 6), the return from Egypt (ii. 15), the massacre of the children in Bethlehem (ii. 18), and the residence in Nazareth (ii. 23) are all spoken of as the consequences of prophecies. It is scarcely fanciful, also, to see some reference to the infancy of Moses, and the slaughter of the Israelitish children by Pharaoh in the massacre of the children of Bethlehem by Herod.

Passing next to Matthew's version of the Triple Tradition, we note first the prominence given to the law. Instead of giving a chronological account of our Lord's acts and sayings, Matthew prefers to collect a mass of doctrine into one continuous discourse, known from early times as the Sermon on the Mount. This discourse follows almost immediately (iv. 11 ; v. 1.) on the commencement of His public life ; and it contains the new law of the new kingdom. The Sermon on the Mount corresponds to the law given on Mount Sinai, and a thread of contrast runs through the former, comparing in each case that which had been said "of old time" with that which the New Lawgiver prescribed, and showing that in each case the new law, though more gentle, was also more stringent and more exacting than the old. "Depart from Me, ye workers of iniquity" (Lu. xiii. 27) is expressed by Matthew (vii. 23), "Depart from Me, ye that work lawlessness ;" and this word "lawlessness" is found four times in Matthew, and not at all in the rest of the Gospels. Luke recognizes that no jot or tittle is to pass from the law till all be fulfilled ; but nowhere in Luke shall we find the strong language which declares (Mat. v. 19) that he who breaks, or teaches others to break, one of the least of the commandments of the law shall be called least in the kingdom of God.

The genealogy traced from Abraham, and the stress laid on prophecy, as well as the prominence thus given to the law, all suggest that this book was primarily intended for Jewish readers ; and this supposition is confirmed by the whole tenor of the Gospel. Matthew finds less space than Luke for the parables which point to the inclusion of the Gentiles, and more for those which point to the exclusion of the workers of lawlessness and of the unworthy Jews. He alone among the evangelists has the saying, "Many are called but few chosen ;" and the distinction between the "called" (κλητοί) and "chosen" (ἐκλεκτοί) is the more remarkable, because Paul uses the two words almost indifferently, and Luke (though he too has the parable of the unworthy guests) has not ventured to use κλητοί in Matthew's disparaging signification. But Matthew, more than the rest of the evangelists, seems to move in evil days, and amid a race of backsliders, among dogs and swine who are unworthy of the pearls of truth, among the tares sown by the enemy, among fishermen who have to cast back again many of the fish caught in the net of the gospel ; the broad way is ever in his mind, and the multitude of those that go thereby, and the guest without the wedding garment, and the foolish virgins, and the goats as well as the sheep, and those who even "cast out devils" in the name of the Lord, and yet are rejected by Him because they "work lawlessness." Where Luke speaks exultantly of "joy in heaven" over one repentant sinner, Matthew in more negative and sober phrases declares that it is not the will of the Father that one of the little ones should perish ; and as a reason for not being distracted about the future it is alleged that "sufficient for the day is the evil thereof": see above, (10), (11), (12), (13), (28), (29 *c*), (50), (52). It is far-fetched to suppose that these subjects are selected or amplified in antagonism to the doctrine of Paul. The condition of the Jews, their increasing hostility to the Christians, and the wavering or retrogression of many Jewish converts when the hostility became intensified shortly before and during the siege of Jerusalem,—this may well explain one side of Matthew's Gospel ; and the other side (the condemnation of "lawlessness") might find an explanation in a reference to Hellenizing Jews, who (like some of the Corinthians) considered that the new law set them free from all restraint, and who, in casting aside every vestige of nationality, wished to cast aside morality as well. Viewed in the light of the approaching fall of Jerusalem, and the wavering or retrogression of great masses of the nation, the introduction into the Lord's Prayer of the words, "Deliver us from the evil," and the prediction (xxiv. 12) that "by reason of the multiplying of lawlessness the love of many shall wax cold," will seem not only appropriate, but typical of the character of the whole of the First Gospel.

Besides the fulfilments of prophecy mentioned in the preface, Matthew sees several others (6), (25), (43), (44), (54) which are not mentioned in the Triple Tradition, and these applications of prophecy sometimes contain obvious confusions. For example, Matthew sees in our Lord's entry into Jerusalem a fulfilment of the prophecy : "Thy king cometh . . . sitting upon an ass, and a colt the foal of an ass." The repetition seems to denote one animal, after the manner of Hebrew poetry, and only one is mentioned by Mark and Luke ; but Matthew, applying prophecy more closely, speaks of two, and adds (xxi. 7) "they brought the ass and the foal and cast their clothes upon *them*, and he sat upon *them*." Again, in speaking of the "potter's field" (xxvii. 9), he quotes, as from Jeremiah, a prophecy that is really from Zechariah xi. 12 (the word translated "potter" is rendered by Ewald "treasury"; and [though Aquila has πλάστην] the LXX. has χωνευτήριον, "foundry," neither of which renderings will suit Matthew's application). Again, though Luke speaks of the "sign of Jonah," Matthew alone makes Jesus publicly declare that, as Jonah was three days and three nights in the belly of the whale (xii. 40), so He shall be three days and three nights in the heart of the earth ; and such a declaration, exciting no questioning in the disciples, nor wonder in bystanders, appears in the highest degree improbable, and looks like a later application. It will be remembered that Matthew alone has the inaccurate statement that the murdered Zachariah was the son of Barachiah (xxiii. 35) ; and perhaps an inaccuracy resulting from a lapse of memory may explain, not only the use of the name of Jeremiah above, but also the quotation "He shall be called a Nazarene" (ii. 23), which is found in no existing book of prophecy. Similarly (perhaps) Mark, through lapse of memory on the part of those whose tradition he records, quotes (i. 2), as from Isaiah, according to the correct reading (the A. V. reads "prophets"), a prophecy composed of two passages, the first of which is from Malachi, and only the second from Isaiah. It must be remembered that, without the modern means for rapid reference, verification was a much harder task then than now, and much more trust was necessarily given to memory.

Few new miracles are introduced by Matthew into the body of his work (15), (21), (31), (34). Two of these consist of acts of healing ; and two are connected with Peter, viz., Peter's partial success in walking upon the waves, and his (supposed) extraction of a stater from the mouth of a fish. But the words implying the latter miracle have possibly arisen from a misunderstanding ; at all events they leave in the mind "a doubt whether, in this instance, some essential particular may not have been either omitted or left unexplained" (Farrar's *Life of Christ*, vol. ii. p. 46).

In its moral teaching this Gospel lays special stress upon the sin of religious ostentation and hypocrisy. In a strong passage (xii. 33) consistent undissembling wickedness is preferred to dissembled wickedness, and the Pharisees are described at greater length than in any of the other Gospels. Yet this Gospel does not always dwell upon the dark side of Christ's doctrine. It preserves also some of the Lord's most "comfortable" sayings: the blessings upon the meek and merciful; the saying that the angels of the little ones always behold the face of the Father; and above all that saying which is a gospel in itself, "Come unto Me, all ye that labour, and are heavy laden," &c. (xi. 28–30).

In speaking of the date of Matthew's Gospel, so far as it can be determined from internal evidence, we must remember that, if the work be composite, the fact that some of Matthew's additions are clearly late will not show that others may not be early. The saying, for example, that the disciples shall not have gone over the cities of Israel till the Son of Man shall have come (x. 23), seems to be an early and unaltered reminiscence of a saying of Jesus, which was not generally adopted in the tradition because of its recognized difficulty at a later date. It is possible that Matthew may consider the coming of the Son of Man fulfilled primarily in the transfiguration; for whereas in their prefaces to the transfiguration Mark and Luke write, "There are some standing here who shall not taste of death till they see the kingdom of God" (Mark adds "coming in power"), Matthew substitutes for "kingdom of God," &c., "the Son of Man coming in His kingdom." But, whatever may have been Matthew's theory, the difficulty of the utterance in Matt. x. 23 implies its early date. On the other hand, a decidedly late date seems implied in the expression "up to this day," which is twice found—once in the addition xxvii. 8 (the potter's field) and again in xxviii. 15 (the bribing of the guard by the chief priests). Yet these additions appear to be in the style of the writer both of the preface and the appendix, and of the other passages peculiar to Matthew.[1] It would follow that all these passages are of a late date, not added to the tradition till long after the death of Christ. The interval must have been long enough to allow, for example, the "potter's field"—and this argument holds whether the story of the potter's field (xxvii. 8) be historical or not—first, to acquire the name of the Field of Blood, and secondly, to retain that name for so long a period (nearly at least a generation) as to make it possible for a writer to speak of the acquisition of the name as a far distant fact, writing that the name is still borne, even "to this day." The same expression in xxviii. 15,—where it is said that the false charge against the disciples, of stealing the body of Jesus, is commonly reported "unto this day" by "the Jews,"—warrants the same inference; and this inference is corroborated by the remarkable use of "the Jews." The author of the Fourth Gospel, writing at a much later date, habitually speaks of "the Jews" as an alien race, quite separated from the Christians; but this is not in the manner of the synoptistic tradition.

The uncertainty in which Mark left the resurrection of Jesus would naturally seem to later writers to require to be removed; and accordingly we find that Matthew adds to the vision of angels (two instead of one) a manifestation of Jesus Himself. But the whole of this narrative (xxviii. 9–20), though apparently in Matthew's style (*cf.*, for example, the remarkable use of οἱ δέ, without the οἱ μέν, in the sense of "others," in xxviii. 17 with that in xxvi. 67), and though containing internal evidence of being composed long after the events narrated (xxviii. 15), is nevertheless strangely disjointed. Yet its very defects, its disconnectedness, incompleteness, and abruptness, indicate a date earlier than that of the more connected and completer narratives of the Third and Fourth Gospels. Matthew separates from Mark's narrative at the departure of the women from the tomb, having previously given an account (repeated by no other evangelist) of the resurrection from the dead of a great number of "saints," who "went into the holy city and appeared unto many." To Mark's simple statement that the women "found the stone rolled away" Matthew adds a graphic account of a glorious angel visibly descending from heaven, filling the keepers with fear, and rolling the stone away. Then, immediately after the women have departed with the angelic message, to bid the disciples to go to Galilee, Jesus suddenly appears to them. They clasp His feet, while He repeats over again the message that the disciples must go to Galilee there to behold Him. Without any further mention of the place of meeting, the disciples are said to have gone to "*the* mountain, where Jesus made agreement (ἐτάξατο) with them (to meet them)." To avoid this dislocation, there has been suggested the desperate remedy (Weiss, *Matthäusevangelium*, p. 582) of rendering ἐτάξατο, "laid down the law," with reference to the Sermon on the Mount; but the probable solution is that Matthew here extracts and separates from its context some ancient tradition which is obscured through want of its framework.[2] Again Matthew tells us that, upon this mountain, only the eleven were present, and that while some of them worshipped, others "doubted." This statement is of value as evidence that it was acknowledged, even so late as the compilation of Matthew's Gospel, that some at least of the manifestations of Jesus were of such a nature that, while they brought immediate conviction to some beholders, they did not at once convince others, even of His nearest disciples; in other words, the manifestation of Jesus depended upon other considerations than the mere physical sense of sight. But, on the other hand, the statement seems quite inconsistent with the supposition that in previous manifestations in or near Jerusalem Jesus had been recognized and worshipped by all the eleven. The last words of the Gospel represent Jesus as commissioning His disciples to go into all nations, preaching His gospel, and baptizing in the name of the Father, the Son, and the Holy Ghost. The thought con-

[1] Want of space renders it impossible to state the grounds on which it seems probable that Matthew consists only of (1) the Triple Tradition; (2) extracts from a book or tradition of the words of the Lord from which Luke also borrowed; and (3) an introduction, framework, and appendix, all added by one hand; though possibly the introduction and appendix, being borrowed, the former from an Aramaic source, the latter from a Latin source, may show differences of idiom not wholly concealed by the overlying style of the author who works up the materials. A similar use of the particles δέ and καί, and of participles, runs throughout almost all the non-traditional narrative parts of Matthew; and the rhythm of the sentences is very similar. But the linguistic evidence has not as yet been so selected, classified, and concentrated as to obtain any certain results. And until this is done, inferences drawn from isolated phenomena are likely to be very misleading. For example, it has been inferred (Weiss, *Matthäusevangelium*, p. 502) that the use of the form Ἱερουσαλήμ once only in Matthew (xxiii. 37, in a passage almost identical with Lu. xiii. 34, whereas Matthew uses Ἱεροσόλυμα eleven times) proves that Matthew borrowed the passage in which it occurs from an Aramaic source. Now it is true that other reasons make the hypothesis of an Aramaic source for the identical passages in Matthew and Luke extremely probable; but this use of Ἱερουσαλήμ is quite insufficient proof. For a comparison of Paul's use of Ἱεροσόλυμα (Gal. i. 17, 18; ii. 1) and Ἱερουσαλήμ (Gal. iv. 25, 26) will show that the same author might use the one form geographically and the other in a higher style, theologically or rhetorically. And this may possibly be held to explain the use of Ἱερουσαλήμ by Matthew in the highly rhetorical passage in which alone it is found.

[2] In a somewhat similar manner the author of the Second Epistle of Peter speaks of "*the* holy mount" (2 Pet. i. 18), assuming that his readers would understand the definite reference to the mountain of the transfiguration.

tained in these words furnishes a suitable termination to the Gospel; but there is every probability that we have not here the exact words of Jesus Himself. Not to speak of the introduction of the later baptismal formulary, "in the name of the Father, the Son, and the Holy Ghost," the rest of the vocabulary is not found in the words of Jesus as recorded in the Triple Tradition, but is peculiar to Matthew. For example, (1) the word μαθητεύειν (xxviii. 19) is used three times by Matthew, and nowhere else in the New Testament, except once in the Acts; (2) the expression συντελείας τοῦ αἰῶνος (xxviii. 20) is found five times in Matthew, and nowhere else in the New Testament, except once in the Epistle to the Hebrews; and (3) the word τηρεῖν (xxviii. 20), used by Matthew six times, is used once only by Mark, and not at all by Luke.

It is noteworthy that Matthew makes no express mention of the ascension of Jesus. But it is possible that he considers this final manifestation on the mountain-top to have terminated with the ascension; for Matthew, describing the farewell of Jesus, appears to have in his mind the picture, contemplated also by Daniel, of the Son of Man endowed with all power and seated on the clouds of heaven. Compare Daniel vii. 14, "ἐδόθη αὐτῷ ἐξουσία," with Matthew xxviii. 18, "ἐδόθη μοι πᾶσα ἐξουσία." And this perhaps may explain the twice repeated saying of Matthew, that some of the disciples should see the Son of Man coming. The manifestation of Jesus upon the mountain in Galilee, commissioning His disciples to go forth to make disciples of all the world, and claiming all kingdoms for Himself, might well seem a fulfilment of these two prophecies (x. 23; xvi. 28), as well as a fitting close to the book of the Gospel.

Additions peculiar to Luke.

Additions and Peculiarities of Luke.—The principal passages peculiar to Luke are:—

(1) i. 1-4, the dedication to Theophilus; (2) i. 5-25, the vision of Zacharias; (3) i. 26-38, the annunciation; (4) i. 39-45, the meeting of Elisabeth and Mary; (5) i. 46-56, the song of Mary; (6) i. 57-80, the naming of John and the song of Zacharias; (7) ii. 1-7, the journey of Mary to Bethlehem; (8) ii. 8-20, the vision of the shepherds; (9) ii. 21-35, the song of Simeon; (10) ii. 36-40, the prophetess Anna; (11) ii. 41-52, the child Jesus found in the temple; (12) iii. 1, the precise date of the commencement of the public life of Jesus; (13) iii. 5-16 (except vers. 8 and 9), the teaching of John the Baptist; (14) iii. 18-20, Herod imprisons John; (15) iii. 23-38, the genealogy of Jesus from Adam; (16) iv. 13, the devil departs from Jesus "for a season"; (17) iv. 14-30, Jesus preaches at Nazareth; (18) v. 1-11, the miraculous draught of fish and the call of Simon; (19) v. 17, preface to the healing of the paralytic; (20) v. 39, "No one having drunk old wine desireth new," &c.; (21) vi. 12-13, preface to the choice of the apostles; (22) vi. 24-26, "Woe unto you that are rich," &c.; (23) vi. 32-35, "Love your enemies," &c. (in language peculiar to Luke); (24) vii. 1-10, the healing of the centurion's servant (in language peculiar to Luke); (25) vii. 11-17, the raising of the widow's son at Nain; (26) vii. 21, 22, the acts of healing wrought before John's disciples; (27) vii. 36-50, the sinful woman and the parable of the two debtors; (28) viii. 1-3, the names of the women who accompanied Jesus; (29) ix. 51-56, James and John wish to call down fire on the Samaritans; (30) ix. 61, 62, "No one having put his hand to the plough," &c.; (31) x. 1, the appointment of the seventy; (32) x. 17-20, "I beheld Satan as lightning," &c.; (33) x. 25-37, the good Samaritan; (34) x. 38-42, Martha and Mary; (35) xi. 1, "Teach us to pray," &c.; (36) xi. 6-8, the friend persuaded by importunity; (37) xii. 13-21, the rich fool; (38) xi. 21-22, "When the strong man armed," &c.; (39) xi. 27, 28, "Blessed is the womb that bare Thee," &c.; (40) xii. 32, 33, "Fear not, little flock," &c.; (41) xii. 35-38, "Let your loins be girded about," &c.; (42) xii. 47, 48, "But that servant that knew not his lord's will," &c.; (43) xii. 49-50, "I came to send fire on earth," &c.; (44) xii. 54-57, "When ye see a cloud rising," &c.; (45) xiii. 1-9, the Galileans slain by Pilate, and the parable of the fig-tree; (46) xiii. 10-17, the healing of the woman bound by Satan; (47) xiii. 23-27, "Are there few that be saved?" and the answer; (48) xiii. 31-34, "Go tell that fox," &c.; (49) xiv. 1 6, the healing of the dropsical man on the sabbath; (50) xiv. 7-11, "Sit not down in the highest room," &c.; (51) xiv. 12-14, "When thou makest a dinner," &c.; (52) xiv. 15-24, the discourteous guests; (53) xiv. 28-33, "Which of you intending to build a tower," &c., (54) xv. 1 10, the lost sheep (different in Matthew), and the lost piece of silver; (55) xv. 11-32, the prodigal son; (56) xvi. 1-12, the unjust steward; (57) xvi. 14-31, Dives and Lazarus, with preface; (58) xvii. 7-10, the master must be served before the servant; (59) xvii. 11-19, the grateful Samaritan; (60) xvii. 20-22, "The kingdom of God cometh not with observation," &c.; (61) xvii. 28-30, "It shall be as in the days of Lot," &c.; (62) xviii. 1-8, the unjust judge; (63) xviii. 9-14, the Pharisee and the publican; (64) xix. 1-10, Zacchæus; (65) xix. 11-27, the parable of the pounds (different in Matthew); (66) xix. 39-44, "If thou hadst known even thou," &c.; (67) xx. 18, "Whosoever shall fall upon that stone shall be broken,"[1] &c.; (68) xxi. 18, "There shall not an hair of your head perish;" (69) xxi. 23-26, "There shall be great distress in the land," &c.; (70) xxi. 28, "And when these things begin to come to pass, then look up," &c.; (71) xxi. 34-38, "But take heed to yourselves lest at any time your hearts be overcharged with surfeiting," &c.; (72) xxii. 14-16, with parts of 17 and 19, "With desire have I desired to eat this passover with you," &c.; (73) xxii. 31-34, "Simon, Simon, behold Satan hath desired to have you, &c.; (74) xxii. 35-38, "When I sent you without purse," &c.; (75)[2] xxii. 43, 44, the angel strengthening Jesus; (76) xxii. 48, 49, "Betrayest thou the Son of Man with a kiss?" (77) xxii. 51, the healing of the wound of the high priest's servant, (78) xxiii. 5-12, Jesus is sent by Pilate to Herod; (79) xxiii. 13-15, Pilate proposes to release Jesus; (80) xxiii. 27-31, "Daughters of Jerusalem, weep not for Me," &c.; (81) xxiii. 39-43, the penitent thief; (82) xxiii. 48, 49, the crowd beat their breasts and return; (83)[3] xxiv. 12, Peter sees the linen clothes in the open tomb; (84) xxiv. 13-35, the walk to Emmaus; (85) xxiv. 36-49, Jesus appears and eats in the presence of His disciples; (86) xxiv. 50-53, Jesus parts from the disciples near Bethany,[4] and they return to the temple.

Before speaking in detail of the passages peculiar to Luke, it will be convenient to consider his avowed purpose in writing, and some peculiarities of his style. The dedication to Theophilus, a name which is now believed by many to be merely typical of every reader who is so far "loved of God" as to be admitted into the church of Christ, states that the author purposes to write an account "in order," and implies that many previous[5] "attempts" (ἐπεχείρησαν, a word implying impotence; *cf.* Acts ix. 2, 9; xix. 13) at similar compilations had not been "in order"; further it informs us that the object of the treatise was not to tell the reader anything that was new, but rather to give him an ampler knowledge of the certainty of those things which were then and always had been fully believed in the church, even as they had been handed down by those who had been from the beginning eyewitnesses and ministers of the word. Without going so far as to affirm that the word handed down (παρέδοσαν) excludes written tradition (Westcott's *Introduction*, 186, 203), it is at least remarkable that Luke distinguishes between the "eyewitnesses" and those whose attempts he disapproved,—saying that the latter attempted to draw up a "connected narrative," whereas the former merely "handed down" the facts. This amounts almost to a denial on the part of Luke that any "eyewitness" (that is to say, apostle) had up to that time written any narrative (so far as Luke knew) of the life of Christ. It implies also that the words and deeds of the Lord had been recorded by many without arrangement, and that the author purposed to arrange them. The literary and artistic purpose of the author appears in words and phrases, as well as in the conceptions. Writing perhaps principally for readers to whom the Greek of the

[1] But possibly this passage is also found in Matt. xxi. 44.

[2] The genuineness of this passage is doubtful.

[3] The genuineness of this passage is doubtful.

[4] The clause describing the ascension is omitted by Tischendorf.

[5] It is very doubtful whether the aorist tense (ἐπεχείρησαν) necessarily implies (Westcott, *Gospels*, p. 186) that "St Luke speaks of the 'attempts' as of something which had no influence at the present . . . . (*attempted*, not *have attempted*)." In the New Testament the proper distinction between the aorist and perfect cannot always be maintained as it can in classical Greek. For example (Mk. xiv. 9), our A. V. rightly renders ἐποίησεν, "she *hath done* what she could:" and it would seem absurd to say that the aorist ἐποίησεν represented an action "which had no influence at the present," in the face of the following words, "Throughout the whole world this also that she *hath done* (ὃ ἐποίησεν) shall be spoken of for a memorial of her."

original tradition would be in many respects distasteful, he substitutes more classical words for many that are used by Matthew and Mark in the Triple Tradition (see above, p. 796). Even the use of "sea" to denote the Lake of Gennesareth. is objectionable to him, and he always substitutes "lake." The Latinism κοδράντης for farthing (Mat. v. 26; Mk. xii. 42) is altered or omitted by Luke. He prefers πορεύομαι to ὑπάγω. Versed as he is, and as his readers would be, in the metamorphoses of the heathen stories, he shrinks from applying the word "metamorphosed" (Mat. xvii. 2; Mk. ix. 2) to the transfiguration of Jesus, and substitutes (ix. 29) "became different." He dislikes repetitions also, as much as he dislikes low-class words: compare v. 32, 33; vi. 10; viii. 21, 15, with the corresponding passages in Matthew and Mark; and note especially, in the cure of the palsied man (Mat. ix.; Mk. ii; Lu. v.) how Luke not only avoids the word κράββατος, for "bed" (noted by Phrynichus as objectionable, Lobeck, p. 62), but also, to avoid repetition, uses three substitutes in succession,—(v. 18) κλίνης, (v. 19 and 24) κλινιδίῳ, (v. 25) ἐφ' ᾧ (or ὃ) κατέκειτο, where Mark is content to use the objectionable κράββατος four times. When writing in his own style he is fond of long and sonorous words, such as διάδος for δός (Mat. xix. 21; Mk. x. 21; Lu. xviii. 22), διαμερίζομαι, διαγογγύζειν, and the compounds of διά generally; compare also his use of περιποιοῦμαι (xvii. 33, correct text), and of ζωογονεῖν (*ib.*) for σώζειν.

The question of Luke's style is specially important because the striking differences between certain portions of his Gospel which are all, though in very different styles, found in his Gospel alone (occurring neither in the Triple Tradition, nor in the parts which Luke has in common with Matthew or in common with Mark), might naturally induce even a careful student to believe that they are composed by different authors. For example, take as a criterion the use of καί and δέ. In classical Greek, and indeed in almost every Greek except the ultra-Hebraic, the particle δέ is of constant occurrence. The fact that it does not occur more than six or seven times in the whole of the Apocalypse, and not at all in the first book of the Maccabees till chap. iii. 36, would naturally lead us readily to believe that the former was written by a Jew who knew little of Greek literature, and that Jerome was right in saying that the latter is a translation from a Hebrew original. Applying this test to Luke, we find that in the 80 verses of Luke's first chapter, it occurs 16 times, while in the 19 verses of x. 25–42 it occurs 16 times; or in other words, δέ is (proportionately) used more than four times as often in the ninth chapter as in the first. This suggests the inference that Luke's introduction has an Aramaic origin. But if we turn to the Acts we find that in the first chapter, containing 26 verses (or 19 verses of narrative and 7 of a speech), δέ occurs only twice; whereas in the ninth chapter, which contains 43 verses, δέ occurs 35 times. Yet an Aramaic origin has not been thought, by any consensus of competent authorities, necessary or probable for the first chapter in the Acts.

Although, therefore, it is possible that the first two chapters of Luke may be a direct translation from an Aramaic original, yet there is an alternative. The alternative is that Luke, a man of letters and skilled in composition, consciously or unconsciously adapted his style to the subject, feeling that a different style was required on the one hand by the Magnificat and the Nunc Dimittis, and on the other hand by the graceful domestic narrative of the contrast between the sisters Martha and Mary.

This will be made all the more probable if it can be shown that Luke had studied and imitated the LXX., and in particular the Greek Apocrypha. Words not used (or seldom) by Matthew and Mark, but by Luke and the Apocryphal writers, are ἐπίβλεψον, ἀποσπασθέντων, ἐπιβάλλει in the sense of "belonging," ἐπισιτισμός, the use of ὕψιστος for God, στιγμή, ἀντιβάλλειν, εὔθετος, περισπᾶσθαι, καιρὸς ἐπισκοπῆς, δοχή, and λυσιτελεῖ. But far more striking than mere words (for Matthew and Mark might be shown to have some peculiar words in common with the Apocrypha) are the sentences in the Apocrypha which seem to have suggested similar sentences in Luke. For example, compare Luke's story of the rich fool (xii. 19) with the following passage from Sirach (xi. 18): "There is one that gathereth wealth from his overheed and pinching; and this is the lot of his reward. In the hour when he sayeth, I have found rest, and now let me eat of my good things, even then he knoweth not what season shall pass away, and he shall leave these things unto others and shall perish." Again, in the parable of the unjust judge, there is a striking similarity between the words (xviii. 8) "Though he bear long with them (μακροθυμεῖ), I tell you He will avenge them speedily," and (Sirach xxii. 22), "And He will surely not delay; nor will He bear long (μακροθυμήσει) with them"; so also between (i. 42) "Blessed art thou among women," and (Judith xiii. 17) "Blessed art thou, O daughter, by the Most High God, above all the women that are in the earth"; and between (vi. 35) "Love ye your enemics . . . and ye shall be the children of the Highest," and (Sirach iv. 10), "Be as a father unto the fatherless . . . and thou shalt be as the son of the Highest." Occasional similarities of thought and even of words are found between Matthew and Mark and the LXX. Apocrypha; but it cannot be said of either of them, as it can of the Third Gospel, that it is saturated with the LXX. diction. In many cases there is an allusive use of LXX. words. For example, Luke (xxiii. 51), telling us that Joseph of Arimathæa had not "consented to" the wicked decision of the Pharisees against Jesus, uses a word not elsewhere used in the whole of the New Testament. Why? Because the word is used by the LXX. (Exod. xxiii. 1) in a passage expressly prohibiting combinations for false judgment: "Thou shalt not *consent with* (συγκαταθήσῃ) the unjust to become an unjust witness; thou shalt not be with the stronger side to do ill; thou shalt not add thyself with the multitude to shut out judgment." Again, when Luke (xxiii. 49), telling how the "acquaintances" of Jesus stood at a distance from the cross, uses the word "γνωστοί"—not elsewhere found in the synoptists,—there can be little doubt that he has in his mind the passage from the LXX. (Ps. lxxvii. 9), "Thou hast put mine acquaintances (γνωστούς) far from me." Compare also the use of ἐγκαθέτους, only found once in Luke (xx. 20), with the use of the word in the LXX. (twice only) Job xix. 12; xxxi. 9. See also a similarity implied between the aged Abraham and Sarah on the one hand, and Zacharias and Elisabeth on the other, in the similarity between "προβεβηκότες ἡμερῶν" (Gen. xvii. 11) and προβεβηκότες ἐν ταῖς ἡμέραις" (Lu. i. 7).

Our conclusion must be (1) that as Luke has modified the Triple Tradition, and the words of the Lord common to himself and Matthew, by alterations of words and phrases, so and much more has he modified other traditions or documents which he has introduced into his work; and (2) that those portions of the part of the Gospel peculiar to himself which have a more archaic and Judaic rhythm and vocabulary than the rest may be either translations from Aramaic documents, or imitations, conscious or unconscious, of the books of the LXX.,—natural adaptations of the style to the subject, like the language of Shakespeare's *Julius Cæsar* as compared with the less simple and dignified language in his English plays of the same date. It is probable, however, that when the evidence is more thoroughly classified than it has hitherto been, it may at least demonstrate the existence of different documents in Luke, whether translations or not.

Impossible though it is here even to summarize the evidence, we may give the reader a conception of the nature of it. Attention has been called above to the use of the form ὁ Κύριος, "the Lord," in narration, as being an indication of late authorship. But this form occurs several times in the body of Luke's Gospel: namely, in the passages containing the raising of the widow's son at Nain (vii. 13); the appointment of the seventy (x. 1); the rebuke of the Pharisees (xi. 39); the preface to the parable of the faithful and just steward (xii. 42); the healing of the daughter of Abraham bound by Satan (xiii. 15); the parable of the sycamore tree (xvii. 5, 6); the parable of the unjust judge (xviii. 6); the story of Zacchæus (xix. 8); warning to Simon Peter (xxii. 31); Christ's look (xxii. 61); and the verse where it is said that they found not the body of the Lord Jesus (xxiv. 3). Many of the above passages certainly show signs of translation; and when we remember that the Gospel of the Hebrews (see below, p. 818) always uses the form ὁ Κύριος, and never ὁ Ἰησοῦς, we see herein a confirmation of the theory that these passages in Luke are translations from Aramaic. Another testing word is Ἱερουσαλήμ. Luke uses Ἱερουσαλήμ about twenty-six times. Ἱεροσόλυμα only three times (ii. 22; xix. 28:

xxiii. 7). It has been shown above that the latter form is sometimes used geographically by writers who use the former rhetorically or historically; but it is certainly remarkable that in ii. 22 and 41 the two forms should be used, apparently in the same sense, ἀνήγαγον αὐτὸν εἰς Ἱεροσόλυμα and ἐπορεύοντο . . . εἰς Ἱερουσαλήμ. Many other test words might be mentioned, the converging evidence of which, added to the internal evidence of thought (and perhaps corroborated by the evidence of special forms, *e.g.*, ἤλθαν for ἦλθον), may possibly hereafter enable future critics to distinguish with certainty between the different strata of Luke's narrative. But no certainty is possible in the present condition of the evidence. There has been abundant labour but insufficient classification of evidence, and no attempt at all to represent it in a concentrated form.

Passing now to the consideration of Luke's additional subject matter, and reserving the supernatural element to the last, we will speak first of the doctrine. The key-note is struck in the song of Zacharias, and repeated in the first sermon of Jesus in Nazareth. The object of the messenger of Jesus is (i. 77) "to give us knowledge of salvation" by "the remission of sins," by reason of "the tender mercy of our God, whereby the dayspring from on high hath visited us to give light to them that sit in darkness;" and the object of Jesus Himself (iv. 18) is "to preach the gospel to the poor," to "heal the broken-hearted, to preach deliverance to the captives, and recovering of sight to the blind." All through the Gospel (or at least the parts peculiar to Luke) there appears to a greater degree than in the First or Second Gospel the contrast between light and darkness, God and Satan, sin and remission of sins, culminating in the triumph of forgiveness and mercy; so that in the very last words of Jesus to His disciples (xxiv. 47) the proclamation of "repentance and remission of sins" is made the prospect of the future gospel to all nations.

The law of Moses appears at first sight inconsistently magnified, almost in an Ebionitic spirit, throughout the first two introductory chapters of the Gospel, and afterwards put aside. But there is no inconsistency, Paul himself says that the Saviour placed Himself at His birth "under the law," and hence it is that Luke, with an almost anxious elaboration, details the exact fulfilments of the law not only by the parents of Jesus, but also by those of His messenger. Hence also it is that in a single chapter of the introduction the word "law" occurs more often than in all the rest of the Gospel put together. For when Jesus attained to manhood, He was no longer under the bondage of the old law, which had now attained its fulfilment in the new law of the remission of sins through love. Yet the law is not trampled on, but only superseded by development; it was only "until John;" yet not "one tittle" of it can fall (xvi. 16, 17).[1] True to its principle of contrast, this book gives Satan a prominent position. When Satan departs from Jesus, he departs only "for a time" (iv. 13); Satan causes diseases and binds a daughter of Abraham;[2] Satan is beheld by Jesus in a vision cast down from heaven; he enters into Judas (xxii. 3, not mentioned by Matthew or Mark); he demands the Twelve that he may "sift" them; see above (16), (32), (46), (73). But this need not denote (as is thought by Keim) an Ebionitic source; the same recognition of the ἐξουσία τοῦ σκότους appears in the Acts and the Epistles to the Ephesians and Colossians, which no one suspects of Ebionitic tendencies (Lu. xxii. 53; Acts xxvi. 18; Eph. ii. 2; vi. 12; Col. i. 13). Something more than the principle of contrast may, however, be required to explain the sharp demarcation between rich and poor. We do not find in Luke that qualification of the epithet "poor" which Matthew (v. 3) inserts, "the poor in spirit." He enforces the hampering disadvantages of wealth, pronouncing a woe upon them that are rich; gently rebukes the "cumbered" Martha; exhorts the rich to entertain the poor; and dooms the rich fool to a sudden and disappointing death, while Dives is consigned to unalterable torment,—(21), (34), (46), (51), (57). But if this seems to savour of Ebionitic thought, let it be remembered that the principle of contrast is even more systematically applied to illustrate the power of the genuine Pauline faith in the parables of forgiveness. As Lazarus is contrasted with Dives, and the grateful Samaritan with the ungrateful Jewish lepers, and the merciful Samaritan with the heartless priest and Levite, and even the trivial anxieties of Martha with the simple devotion of Mary,—so in the stories of forgiveness, the publican finds his foil in the Pharisee who prays by his side; the woman "which was a sinner," and who "loved much," contrasts with Simon, the churlish host, who loved little; the prodigal younger son with the envious elder son; and the penitent thief on the right with the impenitent thief on the left. All these stories, as well as the tale of Zacchæus, and the lost piece of silver, and the lost sheep (peculiar to Luke in language, though the same subject is found in Matthew), magnify the power of forgiveness, and repentance, and faith, for the most part "without works"—contrasting the instantaneous and complete victories of emotional faith with the inferior results of a long life of ordinary and prudent respectability,—(27), (54), (55), (81), (66), (64).

The universality of the Gospel is more marked in Luke than in Matthew or Mark. The seventy missionaries appear to be emblematic of the preaching of the gospel to the seventy (or seventy-two, see Westcott's *Introduction*, p. 374) nations of the earth. The preference of the Gentiles to the Jews would seem to be indicated at the very outset of the public life of Jesus in the sermon at Nazareth (iv. 16–30), if we could accept this as chronologically and historically accurate. Besides the statement of Jesus in the Triple Tradition, that His kinsmen were those that heard the word of God and did it (Luke prefers this expression to that of Matthew and Mark, "doing the will of God"), Luke gives us another assurance that God's special blessing is reserved, not for the mother of the Saviour, but for those who do the word of God. The inclusiveness of the author breaks down the barrier between Jesus and the Samaritans; the sons of Zebedee are rebuked for desiring to call down fire on a Samaritan village; a just Samaritan shames both priest and Levite; and a grateful Samaritan puts nine Jewish lepers to the blush,—see (31), (17), (39), (29), (33), (59).

In connexion with this, the gentler and more inclusive side of the gospel teaching, it may be mentioned that Luke lays especial stress on the part played by women alike in discerning the providence of God, in ministering to Jesus, and in eliciting some of His most helpful utterances. The songs of Mary and of Elisabeth, and the testimony of the prophetess Anna, are found nowhere but in the Third Gospel; in Luke, for the first time, the mother of the Lord begins to assume a wider province,—she it is, and not Joseph, that ponders in her heart the words of her divine Son, and her sufferings are made the subject of inspired prophecy (ii. 35). Luke alone thinks it worth while to record at some length the names of those women who accompanied Jesus and contributed to His support; he alone knows of the devoted faith of Mary and the domestic anxieties of Martha; he alone records the cure of the afflicted "daughter of Abraham," the truth-eliciting exclamation of the woman who invoked a blessing upon the womb that bare Him, the story of the woman who "loved much," and the parable of the woman rejoicing over the lost piece

[1] Compare the strong language of Luke xvi. 16, and the contrast there between the "law" and the "kingdom," with the similar but much weaker language in Matt. xi. 12, 13, where the contrast is almost lost.

[2] Note that Luke alone in the description of the cure of Simon's mother-in-law (iv 39) tells us that Jesus rebuked the fever.

of silver. Luke alone holds up the fate of Lot's wife as a warning; nor do we find in any other Gospel the touching utterance of Jesus to the weeping "daughters of Jerusalem." The other synoptists concur with Luke in pronouncing a blessing on the man who gives up father or mother or lands or houses for Christ's sake, and the sense of fitness has induced the scribes of several MSS. to insert in Matthew and Mark the word "wife" as well as "mother"; but it has no legitimate place except in the version of Luke. It is true indeed that Luke, so far from giving to women the prominent part assigned to them by Matthew and the interpolated Mark, and even by the Fourth Gospel, in attesting the resurrection of Jesus, carefully places their evidence in the background; but the evidence of impressionable witnesses might naturally be subordinated by a writer (perhaps a physician too) who was collecting the traditions of the church into an historical narrative. In any case, it is noteworthy that the word "woman" occurs in Luke almost as many times as in Matthew and Mark put together.

Probably the most perplexing part of Luke's doctrine is found in the parables of the unjust steward, the unjust judge, and the friend persuaded by importunity. In the last two of these the argument appears to be,—"If an unjust or indolent man can be goaded by importunity into granting requests, much more will assiduous prayer prevail with the Father in heaven;" in the first, "If the fraudulent show forethought in providing for their earthly future, much more should the children of light show forethought for their eternal future." Although it is quite possible that our Lord drew a contrast (with something of irony) between the single-mindedness of earthly ambition and the scattered energies of those whose aim is righteousness, yet it is difficult to believe that He uttered these parables in their present shape, or that they are entirely free from misunderstanding. The last two of these three parables (as they stand) seem at variance with His teaching in prayer, which bids us remember that the Father knoweth what things we need before we ask them; and the right moral to be drawn from the unjust judge would seem to be, "Although the unjust judge may be won by importunity, do not suppose that importunity can prevail with the just Judge." It is to be observed, however, that the language and style of these parables (differing from that of the Triple Tradition) make it somewhat improbable that we have here in Luke's narrative the exact words of Jesus; see (36), (56), (62). As regards the great day and the coming of the Lord, Luke appears to distinguish (more than Matthew and Mark) between the ultimate coming and the fall of Jerusalem, which was to precede it. As Luke distributes the discourses which Matthew connects with the twelve into two parts,—one connected with the twelve and the other with the seventy,—so he distributes the discourse on the coming (which Matthew reports as one continuous discourse uttered at Jerusalem) into two parts,—one uttered at Jerusalem, and dealing principally with the fall of Jerusalem (xxi. 6–38), the other uttered on the way to Jerusalem, and expressed in more general terms (xvii. 20–37). As a preparation for the coming, Luke lays stress on constancy and directness of purpose. No man who puts his hand on the plough must look back (30); better not to begin the tower than leave the tower unfinished (53); remember Lot's wife (61). The coming is spoken of as possible at any moment—suddenly and without observation (60); and the disciples are exhorted to wait as servants for their master, with their loins girded (41 and 42), avoiding surfeit and drunkenness (71). When the master or king returns, ignorant disobedience will be less severely punished than the disobedience of knowledge (42); and those who have not increased the "mina" or pound intrusted to them, will be less severely punished than the rebels (65), who will be slain.

Luke (like Matthew and Mark) predicts a time of trouble; but he sees somewhat clearly, beyond it, the dawn which is to precede the rise of the kingdom. Destruction falls, not by chance, but on all that do not repent (45); all must strive to enter the strait gate (47), for not those that were first called shall enter in (52). Much more clearly than in Matthew and in Mark is the future fall of Jerusalem described, as the result of a *siege* and capture; and the slaughter of the citizens, the scattering of the nation, and trampling down of the city are mentioned, with details for which we vainly look in the first two Gospels (59). It is not concealed that the disciples have much tribulation in store, and that they must use all prudence to protect themselves (74). But a term is set for all these troubles; Luke (omitting the remarkable saying of Matthew and Mark that the Son Himself knoweth not "the hour") declares that the trampling down of Jerusalem will be only till "the times of the Gentiles are fulfilled." Then will come a time of "distress," not, however, now for Israel but for the Gentiles (69); and amidst convulsions of nature the Son of Man will come. In the hope of this coming, the disciples are to lift up their heads (70), remembering that not a hair of their heads will be injured (68). Certainly the comparatively cheerful tone of the discourse on the coming, combined with the joyful and triumphant tone of the first two chapters of Luke's Gospel, indicates an author writing at a time when the fall of Jerusalem was an accepted fact, and the establishment of a new and spiritual Jerusalem recognized as a sufficient consolation,—a time when the church, not yet troubled by systematic persecution or by serious desertion (Keim, *Jesus of Nazara*, Engl. ed., vol. i. p. 96), was still sanguinely looking forward to the moment when the times of the Gentiles should be fulfilled, and the Son of Man should suddenly come.

The supernatural narratives peculiar to Luke, and found in the main body of his treatise, are the miraculous draught of fishes, the raising of the widow's son at Nain, the healing of the woman bound by Satan, the cure of the dropsical man, and the appearance of the angel strengthening Jesus,—(18), (25), (46), (49), (75). The first two suggest to many minds a symbolical interpretation, and raise the question whether they (and possibly some of the other miracles) may be emblematical rather than historical. This question cannot suitably be discussed in these pages; but one or two observations may be made. That Jesus wrought instantaneous cures cannot be contradicted, being proved by the whole texture of the Triple Tradition, as well as by the indirect testimony of Paul. That He also had the power of raising the dead no Jew could well doubt or dispute. Elijah had raised a child from the dead; still more notably Elisha, even when dead himself; some (interpreting the prophet literally) said that Ezekiel (Ez. xxxvii. 7) had done the same. But whatever the inferior prophets had done He who was at once *the* Prophet and Messiah could not fail to do. Still less could heathen converts suppose that Jesus was inferior in power to Æsculapius. It was therefore certain that, whether the traditions and books of the church contained or omitted any record of a raising from the dead, the church would believe from the first that Jesus possessed and employed this power. Different readers will give different weight to the considerations for and against the authenticity of Luke's narrative of the raising of the widow's son. Many will be so far influenced by the extreme beauty of the story (and perhaps by the fact that the custom of early burial among the Jews might reduce this, like the case of Jairus's daughter, to the level of natural though marvellous events) as to believe that in it we have, not legend, but history; but no one who can weigh evidence at all will maintain that the evidence for this miracle is equal to the evidence for the raising of Jairus's daughter. Luke's other principal miracle, the draught of fishes, is also considered by many to have arisen from metaphor misunderstood. It is connected by Luke with the calling of Simon Peter, an incident mentioned both by Matthew and by Mark; yet neither Matthew nor Mark describes or gives the slightest hint of any such miracle in connexion with the calling of Peter. In the next place, the metaphor describing the apostles as fishermen and converts as fish, borrowed from Jeremiah perhaps (xvi. 16), is applied by our Lord both to the apostles, as "fishers of men," and to the preaching of the gospel, which he describes as a "net" catching all sorts of fish, bad and good. As the sea in the Old Testament is regarded as the type of "sin," everything favoured the addition and development of this metaphor. Accordingly Philo (*Creation*) describes fishes as typical of the lowest kind of unenlightened existence; and Clement of Alexandria addresses a hymn to Christ, as the fisher of men catching fishes with the bait of eternal life from the hateful wave of the sea of vices (*The Instructor*, iii. 12). It is of course possible that the developed symbolism which we find in Clement may have been entirely the effect, and in no degree the cause, of the narrative in Luke v. 6; and in any case the full discussion of this question would require more space than the limits of this article allow.

Passing now from the main body of Luke's Gospel, we come to the introduction, which name we may give to the first two chapters, describing the birth and childhood of Jesus, and the birth of His forerunner John, the son of Zacharias. The doctrine of the miraculous incarnation, although distinctly stated in Matthew's Gospel, nevertheless required further confirmation. This doctrine appears to have been spoken of from the earliest time, in language which might give rise to different conclusions, according as it was interpreted literally or metaphorically. For example, in the Apocalypse, "the Man Child who was to rule over all nations with a rod of iron" is said to have been born of a woman who was "clothed with the sun, and the moon under her feet, and upon her head a crown of twelve stars," who, after her son had been "caught up into heaven," fled "into the wilderness where she hath a place prepared of God" (Rev. xii. 1–6). It seems certain that the writer represents by the woman, not the Virgin Mary, but the Church—the Spiritual Israel; and in later times the letter of the Church of Lyons (Euseb., *H.E.*, v. 1) speaks of the "Virgin Mother" as having her children restored to her from the dead (meaning that the church received back, as martyrs, those who had first recanted and then renounced their recantation). Justin Martyr also protests that, even though he should not be able to prove the pre-existence of Jesus, and even though it should appear that He was born man of men, yet it would still be true that He is Christ; "for," adds he, in his dialogue with Trypho (chap. xlviii.; or, ed. Morell, p. 267), "there are some, O my friends, of our race,[1] who confess Him to be Christ, but who declare that He is man of men, to whom I do not assent: nor would very many that have formed the same opinions as I have say as they say, because we have been commanded by Christ Himself not to follow the teachings of men, but the proclamations made by the blessed prophets, and taught by Him." The expression "not very many" (οὐ πλεῖστοι) indicates that (*a*) even in Justin's time (150 A.D.) a large though not very large number of Christians in Samaria or Judæa believed that Christ was the son of Joseph, and that (*b*) a principal part of the evidence for the contrary belief was based upon "the proclamations of the prophets." On the other side, what germs of wild and fanciful doctrine were in the air may be inferred from the Gospel of the Hebrews, which will not allow that Jesus had even a human mother, but speaks of His mother as being the Holy Spirit (Kirchhofer, p. 451, and *cf.* p. 454). In opposition to these divergent but heterodox beliefs, it became increasingly necessary to maintain the doctrine that Jesus was at once a man, born of a human mother, and divine, born of the heavenly Father; and this needed to be reaffirmed now, during the prosperity of the church in a somewhat less apologetic tone than characterized the narrative of Matthew.

When we speak of Luke's "supplying the deficiencies of Matthew," we must not be supposed to mean that Luke had before him, or even knew the existence of, Matthew's Gospel. It has been shown above that he probably knew of no apostolic written narrative (see p. 806 above). Though Matthew's was probably written some years before Luke's Gospel, very many years might elapse before a treatise used in one church or province might be recognized as authoritative beyond its original boundaries. But by "supplying the deficiencies" we mean that the conscience and faith of the church required in Luke's time some further and more vivid embodiment of the spiritual truth involved in the incarnation than was contained in the unsupplemented narrative of Matthew.

For example, it was not a sufficient argument against the Jewish slanderers who asserted that Jesus was born of adultery, to say that Joseph, when purposing to put Mary away, was warned by an angel in a dream to give up his purpose. Something more positive, and in a higher tone, not a dream, but an angelic visitation, was needed to confirm the divine origin of the Son of God. Moreover, in order to set forth still more emphatically the subordination of John the Baptist to the Lord, it was needed that the church should know that the prophet (who himself also had his own birth heralded by angels) was from the first acknowledged by his parents as the mere forerunner and messenger of Him that was to come, to whom, even in his mother's womb, the infant prophet did obeisance. Further, when Jesus was born, it was not enough that wise and learned men from the East should come to worship Him. It was necessary to show that the poor and simple toilers of the earth, typified by night-watching shepherds, were also privileged to behold His glory, and were the first to hear with the ear of faith the divine message of the birth of the Redeemer.

The testimony offered to the divine Son of David by Zacharias, who represents the priestly tribe of Levi, and by Elisabeth, who was one of the daughters of Aaron,[2] and the blessing of Simeon, and of Anna who is said to have been of the distant tribe of Asher,—all this emblematic homage from Israel to its Redeemer would be inadequately replaced by Matthew's brief story of the flight into Egypt; and, although refusing to feed a frivolous curiosity with frivolous legends on the childhood of Jesus, the church would naturally cherish the story which told how the youthful Redeemer, when missed by Mary and Joseph, was found in His Father's house. A narrative of this kind, not vulgar nor colloquial, and yet not too refined or scholastic, but framed both in language

[1] Another reading ὑμετέρων would make Justin refer to Jewish Christians; but the inference would remain unaffected.

[2] The importance attached to the co-operation of Levi with the "Lion of the tribe of Judah" is clearly seen in the very early (before 135 A.D.) apocryphal book entitled *The Testaments of the Twelve Patriarchs* (Sinker, p. 104), in which "Christ is spoken of as coming forth from the two tribes of Judah and Levi, as typical of His twofold office of King and Priest." The symbolism of Origen, as regards Zacharias and Elisabeth is far more fanciful; he sees (*In Evang. Joann.*, ii. 27) in the meanings of Elisabeth ("the oath of my God") and Zacharias ("memory") a reference to the birth of John ("the gift of God"): "ἐκ τῆς περὶ θεοῦ Μνήμης κατὰ τὸν τοῦ Θεοῦ ἡμῶν Ὅρκον τὸν περὶ τοὺς πατέρας" (Luke i. 73).

and in thought on the model of the best Greek Apocrypha, setting forth in the sacred vocabulary of the LXX. the earliest Christian psalms and hymns that had been committed to writing, would be justly felt by all the churches to tend to edification, and would soon find a place in every assembly for Christian worship.

But the resurrection, even more than the incarnation, required amplifications. If Matthew had left gaps in his introduction, still more serious were the deficiencies in his appendix to the traditional gospel. Although Matthew had added something to the mere suggestions of a resurrection contributed by Mark, he had not added enough. More proof was required, tangible proof, if possible. The women, it is true (according to the narrative of Mat. xxviii. 9), had held Jesus by the feet, but the disciples themselves were not recorded to have done so; and, besides, the increasing reverence of the church shrank from the thought that the body of the risen Saviour had been actually touched (Jo. xx. 17), even though He might have offered Himself to the touch of His disciples. As far therefore as the evidence went, it was open to the Jewish sceptic to call the manifestations of the Lord delusions, or at best visions, and to apply to them the words of the angel (Tobit xii. 19): "All those days I did but make myself visible unto you, *and did neither eat nor drink*; but ye beheld a vision." Against so formidable an objection, no proof could better commend itself to a close student of the LXX. (such as Luke assuredly was) than a narrative describing how Jesus ate in the presence of His disciples (xxiv. 43). Again, whereas the conclusion of Matthew's narrative leaves Jesus (except by inference) still on earth, Luke omitting the apologetic details which had now become unnecessary, or even liable to perversion (*e.g.*, the Jewish slander that the Lord's body had been stolen from the sepulchre, and the fact that some of the eleven disciples "doubted" when they saw the Lord, apparently for the last time, upon the mountain), describes how Jesus was not parted from His disciples till He had produced complete conviction in all of them, and had opened their minds to understand the scriptures.

Still, even with these important additions, the appendix of Luke seemed to some, and perhaps to Luke himself, incomplete; and, accordingly, either Luke himself, or some early editor or very early scribes, inserted in the appendix several further additions:—(1) that Peter saw the grave-clothes of Jesus lying in the open tomb (xxiv. 12);[1] (2) that Jesus proved His identity to His disciples by showing them His hands and His feet; (3) that He fed not only on the emblematic "fish" but also on the "honeycomb" (xxiv. 42); and lastly, (4) that He ascended into heaven (xxiv. 51). Perhaps the same hand added, in the account of the agony at Gethsemane, the description of the angel from heaven who appeared strengthening Jesus, and of drops as it were of blood falling from Him to the earth. It is by no means improbable that Luke himself added these passages in a later edition of his own work, as authoritative traditions which had subsequently become known to him; and two or three of them, in somewhat different shapes, will present themselves to us subsequently in the Fourth Gospel.[2]

Language of the Original Tradition.—It is probab that the Jews, and more especially those in Galilee, wc. (like the Welsh in the present day) bilingual; and th question has therefore been raised whether our Lord, in Hi teaching, spoke Greek or Aramaic. If He spoke Greek, then the Aramaic words *Talitha cumi* and *Ephphatha* (Mk. v. 41; vii. 34) must be supposed to be specially addressed to the young and the illiterate, who would best understand the national dialect. But the names Cephas, Boanerges, given by our Lord to His Galilean disciples, and the use of Aramaic in His own prayer ("*Abba*, Father"), and in His last utterance (as recorded by Mat. xxvii. 46; Mk. xv. 34), indicate that both for Himself and for His disciples Aramaic and not Greek was the natural tongue. Although therefore it cannot be denied that Greek, even in Jerusalem (see Acts xvii. 2, indicating that Greek would have been understood, though they preferred "Hebrew)," was generally intelligible, yet the scanty evidence derivable from our Lord's words is that He habitually used Aramaic.

The testimony of Josephus tends in the same direction. He, though a man of education, composed certain books first in his own tongue (pref. to *Wars*, 1). He also tells us that he found it a laborious task to render the history of his country in Greek, "an alien and strange language" (pref. to *Antiqu.*, 2). It is to be presumed that he wrote in Aramaic partly for his countrymen in Judæa; but he adds that it was also for the sake of "Parthians, Babylonians, and remotest Arabians, and those of our nation beyond Euphrates, and the Adiabeni" (pref. to *Wars*, 2). Making every allowance for exaggeration, we are justified in drawing from the fact that Josephus thought it worth while to compose books first in Aramaic the inference that a large number of readers in the East would be more likely to read Aramaic than Greek.[3]

But it has been thought that the use of the LXX. in our Lord's quotations from the Old Testament shows that He spoke Greek. The answer is—(1) Even if all the quotations in the synoptists from the Old Testament exactly agreed with the LXX., the agreement would by no means prove that our Lord used the LXX.; for, in translating Hebrew into Greek, the translator might naturally translate the Hebrew quotations from the Old Testament into the corresponding LXX. version, to which his readers were accustomed. This he might do, even though the LXX. did not quite accurately represent the Hebrew; just as, in translating into English a Latin book, with quotations from the Vulgate, we should naturally use our English version, without considering whether the English exactly represented the Latin. (2) But, in the second place, there is scarcely a single quotation[4] in the Gospels from the Old Testament that exactly agrees with the LXX. when the LXX. differs from the Hebrew; and many of the quotations differ slightly both from the

[1] It is most improbable that this passage has been interpolated in Luke from the Fourth Gospel (xx. 4-7); for the passage in the Fourth Gospel is fuller than in Luke, and the tendency of copyists is rather to amplify than to curtail. Besides, there are traces that Luke and John are both different versions of the same tradition, differently understood.

[2] Unless these additions were made by some authoritative hand, it is not easy to see why they should have been adopted by so many of the best MSS.: no such additions are found in the appendix of Matthew. Again, unless they are additions (not forming a part of the first edition of the Gospel), it is hard to see why any of the best MSS. should omit them, since they would recommend themselves to all readers and copyists.

[3] The statement of Josephus (*Contra Apion.*, i. 9), that "he alone understood (μόνος αὐτὸς συνίην)" the information brought to the Romans by deserters from Jerusalem during the siege, must be regarded as a piece of bombast. For is it credible that a Roman army before a besieged city should have had with it no other interpreter besides one recently captured prisoner? Nevertheless, this exaggeration may be taken as an indication that the lower classes in Jerusalem could not, as a rule, speak Greek; for Josephus assumes this, as a matter of course. Greek, of course, would have been perfectly intelligible to any educated Roman if the deserters had been able to speak it.

[4] An exact illustration may be derived from the Latin translation, by Rufinus, of the *Clementine Recognitions*, in which (Sanday, *Gospels*, p. 161) "the quotations from the gospels have evidently been assimilated to the canonical text which Rufinus himself used."

Hebrew and from the LXX., and even from the same quotations as elsewhere occurring in the New Testament. And this is just what we might expect. A Hellenist, translating a Hebrew document into Greek (in times when reference to books was far more cumbrous, and trust to memory far more common, than with us) would be likely to be guided principally by his memory of the LXX., but partly by the Hebrew before him. Hence would result translations slightly varying both from the Hebrew and from the LXX., and from other translations made by contemporaneous writers. This argument is, of course, unaffected whether the translation was originally made in a document or, as is more probable, in an oral tradition.

Some confirmation of this hypothesis is derived from the fact that, although the first book of Maccabees was without doubt originally written in Hebrew, yet the quotations in it from Scripture are not translations from the Hebrew version. On the contrary, if the quotation in 1 Mac. vii. 17 from Ps. lxxviii. (lxxix.) 2, 3, be compared with the latter passage in the LXX., it will be seen at once that the former, though not identical with the latter (nor with the Hebrew), could not have been written but by a writer familiar with the LXX. version; compare also 1 Mac. ix. 23 with the LXX. version of Ps. xci. (xcii.) 8. A similar inference would seem to be justified by the statement (De Wette, quoted by Roberts, *Discussions on the Gospels*, p. 50) that Josephus uses the LXX. more than the Hebrew text.

The hypothesis of translation. Mistranslation of an Aramaic original may possibly explain in part some of the confusions in the common tradition noted above (p. 791). It cannot of course be denied that *some* of these confusions imply a confusion of Greek, not Hebrew, tradition (*e.g.*, *ἰσάγγελοι*, Lu. xx. 36; *ὡς ἀγγέλοι*, Mat. xxii. 30; Mk. xii. 25); but some of the changes of construction (*e.g.*, *πᾶσα ἡ περίχωρας ἐξεποοεύετο*, Mat. iii. 5 and Lu. iii. 3, *ἦλθεν εἰς πᾶσαν τὴν πεαίχωρον*, Mk. i. 5) are more easily explicable on the hypothesis of translation. Some of the changes of words are also explicable thus, as may be illustrated by the Latin version. Commenting on the text, "Domine, ne in *ira* tua arguas me, nec in *furore* tuo corripias me," Augustine (Ziegler, p. 10) says that in some codices of the Latin translations "ira" stands first, and "furor" second, in others "furor" first and "ira" second. Compare with this Mat. v. 40, *τῷ θέλαντι λαβεῖν χιτῶνα ἄφες αὐτῷ τὸ ἱμάτιον*, and Lu. vi. 29, *ταῦ αἴροντός σαυ τὸ ἱμάτιον μὴ κωλύσῃς τὸν χιτῶνα*, where the phenomena are precisely the same; and note that Mat. (xxvii. 65) has *ἱμάτια*, where Mk. (xiv. 63) has *χιτῶνας*. Of somewhat the same type (perhaps) are the passages Mat. vii. 16, *ἀπὸ ἀκανθῶν σταφυλήν*, and Lu. vi. 44, *ἐκ βάταυ σταφυλήν*.

In the translations from Greek into the early Latin versions of the New Testament, one very common difference is (besides divergent rendering of single words) that one version uses participles where the other uses finite verbs, or relative pronouns where the other uses co-ordinate conjunctions.[1] These same slight differences are found in several sayings of our Lord where they happen to be twice recorded by the same evangelist. Compare (*a*) Lu. viii. 18, *ὃς γὰρ ἂν ἔχῃ*, and Lu. xix. 26, *πάντι τῷ ἔχαντι* (see also Mat. xiii. 12; xxv. 29); (*b*) Lu. viii. 17, *οὐ γάρ ἐστιν κρυπτὸν ὃ οὐ φανερὸν γενήσεται*, and Lu. xii. 2, *οὐδὲν δε συγκεκαλυμμένον ἐστιν ὃ οὐκ ἀποκαλυφθήσεται* (see also Mat. x. 26); (*c*) Mat. x. 39, *ὁ εὑρὼν τὴν ψυχὴν αὐταῦ ἀπαλέσει αὐτὴν, καὶ ὁ ἀπολέσας τὴν ψυχὴν αὐτοῦ ἕνεκεν ἐμοῦ εὑρήσει αὐτήν*, and Mat. xvi. 25, *ὃς γὰρ ἐὰν θέλῃ τὴν ψυχὴν αὐτοῦ σῶσαι ἀπολέσει αὐτὴν, ὃς δ' ἂν ἀπολέσῃ τὴν ψυχὴν αὐταῦ ἕνεκεν ἐμοῦ εὑρήσει αὐτήν* (and *cf.* Lu. ix. 24; xvii. 25); (*d*) Mat. v. 32, *πᾶς ὁ ἀπολύων τὴν γυναῖκα αὐτοῦ*, &c., and Mat. xix. 9, *ὃς ἂν ἀπολύσῃ*, &c. (*e*) In the same two passages there appears to be a confusion between "causeth to commit adultery" and "committeth adultery,"—Mat. v. 32, *παρεκτὸς λόγου πορνείας, ποιεῖ αὐτὴν μοιχευθῆναι*, and Mat. xix. 9, *μὴ ἐπὶ πορνείᾳ . . . . μοιχᾶται*; (*f*) Mat. v. 32, *ὃς ἐὰν ἀπολελυμένην γαμήσῃ*, and Mat. xix. 9, *ὁ ἀπολελυμένην γαμήσας*. These passages, so far as they go, would indicate that the compilers of the First and Third Gospels did not themselves translate from Aramaic originals; for if they had themselves been the translators, it would seem that they would have adopted a uniform rendering in translating the same or very similar words. Limited though the evidence is, it goes to prove that the compilers incorporated in their treatises Greek translations, not all made by themselves, from Aramaic originals.

The phenomena of the ante-Jerome versions of the New Testament deserve careful consideration in discussing the possible origin of our Greek synoptic tradition from an Aramaic original. In a well-known passage, Jerome (Ziegler, *Die Lateinischen Bibelübersetzungen vor Hieronymus*, p. 12) complains that there were as many texts as copies of the Latin versions ("tot sunt enim exemplaria pœne quot codices"), and the occasionally great variety may be illustrated by comparing an extract from the Codex Bobbiensis (*Jahrbücher d. Literatur*, Vienna, 1847, *ad fin.*) with the Vulgate version of Acts xxvii. 20, 21:—

BOBBIENSIS.	VULGATE.
Neque sole neque stellis *apparentibus per* multos *dies* et hieme et *tempestate* minimia [*sic*] perseverante, *jam* amputabatur *spes omnis* liberandi nos. *Et cum* jam diu sine ciba essent, *tunc stans Paulus in media* ipsorum ait: *Oportuerat quidem* vos obediri credentes mihi non navigare de *Creta* et *lucrari hanc injuriam* et detrimentum.	*Neque* autem *sale neque* sideribus *apparentibus per* plures *dies* et *tempestate* non exigua imminente, *jam* ablata erat *spes omnis* salutis nostræ. *Et cum* multa jejunatio fuisset, *tunc stans Paulus in medio* eorum dixit: *Oportebat quidem*, o viri, audito me, non tollere a *Creta*, *lucri*que facere *injuriam hanc* et jacturam.

It will be seen at once that there is some similarity between the thread common to these two Latin versions and the thread common to many passages in Matthew, Mark, and Luke; though the resemblance between any two of the three synoptists would generally exceed the resemblance of the two passages quoted above. In most cases, however, the ante-Jerome versions (as represented by the Codex Corbeiensis, Brixianus, Vercellensis, and Veronensis) agree much more closely together, even more closely than any two of the synoptists agree together, and a portion more closely than the three synoptists agree. On the whole, taking into consideration the greater influence of differentiating causes in the earliest times of the church than in the times when the ante-Jerome versions were composed, we may fairly conclude that if in these later times so great a variety could occur in the process of translation from Greek, the greater variety found in the common tradition, as given by the three synoptists, might well be partly explained in the same way, as originating in part from varieties of translation from Hebrew. But then the questions arise—(*a*) Were the ante-Jerome versions independent translations from the Greek text? (*b*) Or were they divergent corruptions of one original Latin translation from the Greek text? (*c*) Or were they partly independent, but partly modified by some oral tradition or "ecclesiastical use," which diminished the divergence? On these questions there is not at present a complete agreement. Wiseman maintained that the second (*b*) answer was the right one; but in a recent work (quoted above) Ziegler (p. 123) maintains, with great probability, that the third (*c*) is correct—viz., that the oral catechizing and preaching in the Latin churches modified and assimilated translations otherwise independent. It is extremely probable that the same hypothesis of combined causes—(1) translations from Aramaic documents, (2) influence of oral Greek tradition—may explain much of the agreement and variation in the passages common to the three synoptists.

The difference between the Triple Tradition of Matthew, Mark, and Luke, and the Double Tradition of Matthew and Luke will, at this stage, occur to us as an important feature in our evidence. The widely different phenomena of the Double and the Triple Traditions suggest different origins for the two traditions. Many of the passages common to Matthew and Luke agree together far more closely than even the Latin versions of the Greek Gospels. It would seem to follow that in such cases Matthew and Luke used one and the same Greek document—a translation of some Aramaic original—which document had not undergone much modification by oral tradition before passing into the several treatises of Matthew and Luke. On the other hand, the more varying language of the Triple Tradition, together with the additions and omissions of the three writers, suggests (*a*) independent translations of an Aramaic original; (*b*) occasional resemblances suggested by the general "usus ecclesiasticus"; (*c*) divergences created by the local "usus ecclesiasticus," or by the individual style of the editor or editors.

Date of the Synoptic Writers.—The composite nature of

[1] Compare the Codex Corbeiensis and Brixianus (Migne, *Patrologiæ Curs. Compl.*, vol. xii. p. 197); of which (1) the former has (Mat. ii. 7) "Tunc Herodes, clam *vocatis* Magis diligenter *didicit* ab eis tempus stellæ *quæ* apparuit eis; et *mittens* illos in Bethleem, *dixit* '*Ite et interrogate*,'" &c.; while the latter has (2) Tunc Herodes *occulte vocans* Magos diligenter exquisivit ab eis tempus *quando* apparuit eis stella, et *misit* illos in Bethleem, *dicens* '*Euntes requirite*'" &c.

the synoptic Gospels makes it necessary to distinguish carefully between the date of the compilation of each collective treatise and the date of the composition of the several parts of which that treatise may be composed. The original tradition has been shown to have existed before any of the three synoptics; some common document of the words of the Lord has been shown to have probably existed before Matthew's or Luke's narrative; other documents or traditions might also possibly be shown to exist embedded in each of the synoptists, and the date of each of these parts would be earlier than the date of the whole. Therefore, even if the date of Matthew, or Mark, or Luke could be exactly determined, it would by no means determine the date of the traditions which they contain. It is even possible that a later Gospel may retain in some cases an earlier version of the common tradition of the words of the Lord, as we have seen in the case of Luke's version of the Lord's Prayer (see p. 798 above).

There is no internal evidence for exactly determining the date of any one of the synoptics. The supposed references in Mark to the death of James, the capture of Jerusalem, or any special earthquakes which might determine the date (Renan's *Évangiles*, p. 123), are so shadowy as scarcely to deserve consideration. The reference to the death of Zachariah the son of Baruch, shortly before the capture of Jerusalem (Joseph., *B. J.*, iv. 5, 4), supposed to be found in Mat. xxiii. 35, is still more improbable. Still the marked difference between the detailed prediction (in Lu. xxi. 18–25) of the fall of the city and the scattering of the people, and the more general predictions in corresponding passages in Matthew and Mark, indicates that Luke's description is modified by reminiscences of the siege of Jerusalem; while Matthew's and Mark's accounts are not thus, or at all events not equally, modified. It is an almost certain inference that Luke compiled after 70 A.D. As regards Matthew and Mark inferences cannot be drawn with equal certainty; for of course a compiler may compile at a late date, and yet preserve traditions in their earliest shape; but it is at least a reasonable inference that the compilers of the First and Second Gospels wrote before Luke; and there is a balance of probability in favour of the supposition that they wrote before the fall of Jerusalem.

Coming to more general evidence, we find (see p 791) that (1) Mark, at least in many passages, includes the original tradition from which both Matthew and Luke borrowed; (2) his language, less polished than that of Matthew and Luke, appears more natural for an earlier Gospel in the first and rudest age of the church; (3) Mark's version of the tradition contains many expressions which might naturally be considered "stumbling-blocks," and which, in fact, were rejected or not inserted in the other Gospels; (4) the omission of all account of the manifestations of Jesus after the resurrection indicates a very early date; and though it may be said that this omission arises from the fact that the Second Gospel was accidentally left incomplete, yet this answer will not account for the omission of the genealogies, and of all account of the birth and infancy of Jesus; (5) the interpolated appendix describing the resurrection of Jesus, quoted as it is by Irenæus, shows that even in the time of Irenæus (170 A.D.) the Gospel had been long enough in use to admit of widespread interpolations. All these facts lead to the inference that Mark was compiled earlier than any of the other Gospels, and probably some time before 70 A.D. It is almost impossible to fix any date (worth stating) after which the compilation must have taken place. Those who accept as literally true Mark's accounts of the feeding of the four thousand and five thousand, the walking on the waves, and the exorcism of the Gadarene, may naturally carry back his history to the first years of the Galilean church; and even those who interpret these accounts symbolically are ready to admit that a very short space of time is often quite sufficient, by misunderstanding and accretion, to erect supernatural narratives on a basis of natural and symbolic story. But any approximation to a date *after* which the Gospel was compiled must be deferred till we consider the external evidence.

The narrative of Matthew does not leave us quite so uncertain. The mention of "the Jews," which is so frequent in the Fourth Gospel, is justly regarded as a proof that the author was writing in times when the Christian church was regarded as definitely and antagonistically separated from the Jewish nation. In the synoptists it is the "Pharisees," not the "Jews," who are in conflict with Jesus. But in his account of the resurrection Matthew (xxviii. 15) uses the word in this antagonistic sense. Further, he twice (xxvii. 8; xxviii. 15) uses the expression "even to this day," of events occurring shortly before or after the death of Jesus,—thereby showing that a long interval had occurred between the death of Jesus and the compilation of the narrative. The tone of the Gospel, as compared with Luke, indicates a period when the Jews still existed as a nation, and when the abrogation of the law and the destruction of the temple were not yet accepted as recognized facts; but the number of parables upon the end of the world and the judgment, the tendency to dwell on exclusion rather than inclusion, on the "many" that are shut out rather than on the "few" that are chosen, and the atmosphere of gloom generally characterizing the Gospel, point perhaps to the crisis immediately preceding the siege of Jerusalem. The additions concerning the birth and incarnation may seem to imply a later date; but when we reflect how natural it was that in very early times the church should attach importance to these subjects, the wonder will be, not that these narratives were written so soon, but that they were deferred to so late a period as forty years after our Lord's death. It is also extremely remarkable—and a mark of early date as compared with Luke—that even in this developed form of the Gospel the accounts of manifestation of our Lord after His resurrection should be so scanty, doubtful, and vague.

In Luke the signs of later date abound:—(1) the pre-existence and implied failure of many "attempts" to set forth continuous narratives of the things "surely believed;" (2) the mention of the "tradition" of the eye-witnesses and ministers of the word as past, not as present (παρέδοσαν) (i. 2); (3) the dedication of the Gospel to a man of rank (fictitious or otherwise), who is supposed to have been "catechized" in Christian truth; (4) the attempt at literary style and at improvement of the "usus ecclesiasticus" of the common tradition; (5) the composition of something like the commencement of a Christian hymnology; (6) the development of the genealogy and the higher tone of the narrative of the incarnation; (7) the insertion of many passages mentioning our Lord as ὁ κύριος, not in address, but in narrative; (8) the distinction, more sharply drawn, between the fall of Jerusalem and the final coming; (9) the detailed prediction of the fall of Jerusalem, implying reminiscences of its fulfilment; (10) the very great development of the manifestations of Jesus after the resurrection. The inference from all this evidence would be that Luke was not written till about 80 A D. at earliest. If it could be further demonstrated that Luke used any Greek Apocryphal book (Judith, for example), and if it could be shown that the book in question was written after a certain date (Renan suggests 80 A.D. for the date of the book of Judith), it might be necessary to place Luke much later; but no such demonstration has been hitherto produced

External Evidence.

The composite nature of the synoptic Gospels will affect the inferences we shall draw from early quotations of passages found in them, where the authors of the Gospels are not expressly mentioned. If, for example, we find in Justin a passage (quoted as a saying of the Lord) which is found both in Matthew and Luke, Justin may indeed have quoted it from Matthew or from Luke; but it is also possible that he may have quoted it neither from Matthew nor from Luke, but either (*a*) from the common source whence Matthew and Luke derived the passage, or (*b*) from some other book or tradition, which, like Matthew and Luke, included the passage in its collection or compilation. The same applies to a quotation from the Triple Tradition. It may be quoted from Matthew or from Mark or from Luke; but it is also possible that it may be drawn from none of these, but from the common tradition itself, or from some other treatise based on the Triple Tradition.

Taking the evidence chronologically, we come first to the testimony of Paul, who, in the First Epistle to the Corinthians, says (1 Cor. xi. 23), "I received from the Lord that which also I delivered to you;" and then follows a description of the institution of the Lord's Supper, differing materially from Matthew and Mark, and agreeing in the main with Luke, except that Paul repeats twice the command, "Do this in remembrance of Me." It would seem unreasonable and scarcely reverent to suppose that a special revelation revealed to Paul the exact words of the institution; but comparing the passage with Gal. i. 9, 12, we see that Paul merely says here about this part of his teaching what in Gal. i. 9, 12 he says about the whole of it, viz., that he received it from the Lord and not from man. From Ananias, or from other elders of the church, he may have received the words of oral tradition of the church; but for the meaning and spiritual force of it, and the application of each part of it to the work of redemption, he was indebted, not to the elders of the church in Damascus, but to the revelations given to him in the solitude of Arabia. The words of Paul, therefore, do not exclude (and the facts render probable) the use of oral tradition in this passage. This being so, it may seem remarkable that Paul follows the tradition contained in the latest of the three Gospels. It can hardly be that Luke has here preserved the earliest tradition. The insertion of "new" before "testament" (not inserted in the correct text of Matthew and Mark), and the ampler narrative of Luke indicate a later, not an earlier, shape of the tradition. The word "testament" appears to have been used by our Lord in the ordinary sense of "will" and "testament," indicating that in that funeral feast He was *bequeathing* Himself to His disciples for ever.[1] The insertion of "new," by a sort of play upon the double meaning of the word "testament," introduces the sense of "covenant," and therewith a contrast between the old and the new covenants. But this suggestive thought (highly characteristic of Paul) seems more likely to have been added to the original in process of explanation, than to have been dropped by Matthew and Mark through neglect, or discarded owing to difficulty. The probable solution therefore would seem to be that Luke has embodied, not the earliest tradition, but the later Pauline shape of the tradition. We have here therefore not Paul supporting the tradition of Luke, but Luke (in all probability) borrowing from Paul.[2] The only other passage in which Paul (in the Acts) quotes a saying of Jesus contains (Acts xx. 35) words not found in any of our Gospels, "It is more blessed to give than to receive."

The Second Epistle of Peter (2 Pet. i. 17) contains a reference (apparently) to the transfiguration, of which the writer speaks as an eye-witness. But this testimony, most important if genuine, is almost certainly spurious. The mention of the mount of transfiguration as "the Holy Mount," and of Paul's epistles as "scriptures," would in itself suggest a late date; and Canon Westcott (*Gospels*, p. 175) justly says that "the comparative elaborateness of the description (of the transfiguration) seems to offer an instructive contrast to the simplicity of the earlier Gospel." External evidence is also against the genuineness of this epistle. Up to the times of Clement of Alexandria "no trace has been found" of its existence (Westcott, *Canon*, p. 349); and neither Origen nor Eusebius accepts it as canonical. To obtain a complete idea of the judgment of the church upon the canon, we must combine (Westcott, *Canon*, p. 264) the two canons of the East and West; by doing this "we obtain, *with one exception*, a perfect New Testament without the admixture of any foreign element." That "exception" is the Second Epistle of Peter. The only importance to be attached therefore to the testimony of an epistle thus rejected by the general consent of the early church is that which attaches itself to an early literary fabrication composed so early as to have found a place in our canon. Such a composition (mentioning Paul's letters as "scriptures") cannot have been written before the beginning of the second century; yet we find that, even at that date, the common tradition is quoted most inexactly. The voice from heaven, as given by the author of the spurious epistle, is, Ὁ *υἱός μου ὁ ἀγαπητός μου οὗτός ἐστιν εἰς ὃν ἐγὼ εὐδόκησα·* But in Matthew (xvii. 5) it is *οὗτός ἐστιν ὁ υἱός μου ὁ ἀγαπητὸς ἐν ᾧ εὐδόκησα· ἀκούετε αὐτοῦ.* Mark and Luke differ still more from the Epistle, for they both omit *εὐδόκησα.* The inaccuracy is the more serious because, in describing the baptism of Jesus, Matthew (iii. 17) speaks of a voice from heaven which almost exactly agrees with the words in the Epistle, omitting the words *ἀκούετε αὐτοῦ.* In these circumstances it is impossible to say that the author of this spurious Epistle had Matthew before him. Much more probably he was quoting from memory, or from some document differing from any of our synoptic Gospels.

The next witness is Clement of Rome, whose Epistle to the Corinthians, probably written in or soon after 95 A.D. (Lightfoot's *Clement of Rome*, Appendix, p. 267), contains three passages which may indicate a use of our Gospels. (1) In chap. xiii. he blends together (Sanday, *The Gospels in the Second Century*, p. 921) passages common to Matthew (v. 7; vi. 14; vii. 12; vii. 2), Mark (iv. 24; xi, 25), and Luke (vi. 36, 37, 31, 38, 37) in a terse, antithetical, and uniform style, inserting the words, *Ὡς χρηστεύεσθε οὕτως χρηστευθήσεται ὑμῖν.* Dr Lightfoot has pointed out that the looseness of this quotation does not exceed the looseness with which (chap. 12) the same author quotes the narrative of Rahab, and therefore it is quite possible that here, as there, Clement may be simply quoting from memory with no other documents than Matthew and Luke in his mind; but to many the "roundness, compactness, and balance of style" which Dr Sanday notices in the quotation will make it probable that Clement was quoting, not perhaps from any other document (for else how is it that no trace remains of a documentary version of the word of the Lord so "rounded and compact" in style, and used 95 A.D. by so eminent a man as Clement of Rome in writing to the church of Corinth?), but with some tradition in his memory (which had perhaps served the purpose of preachers, teachers, and catechists in the Roman Church), blending and condensing the versions of Matthew and Luke into a form adapted for the oral instruction of converts. (2) In another passage (chap. xxvi.) Clement combines Mat. xviii. 6 (Mk. ix. 42; Lu. xvii. 1, 2) and Matt. xxvi. 24 (Mk. xiv. 21; Lu. xxii. 22) in a manner which suggests quoting from memory. (3) A third passage (Sanday, p. 70) contains a quotation from Isaiah (xxix. 13) differing from the Hebrew and from the similar LXX. (which is, *ἐγγίζει μοι ὁ λαὸς οὗτος ἐν τῷ στόματι αὐτοῦ, καὶ ἐν τοῖς χείλεσιν αὐτῶν τιμῶσίν με, ἡ δὲ καρδία αὐτῶν πόῤῥω ἀπέχει ἀπ' ἐμοῦ*), and substituting a condensed and antithetical form, *οὗτος ὁ λαὸς τοῖς χείλεσίν με τιμᾷ, ἡ δὲ καρδία αὐτῶν πόῤῥω ἀπέστιν ἀπ' ἐμοῦ*,- which is also found in Matt. xv. 8 and Mk. vii. 6 (except that they read *ἀπέχει* for *ἀπέστιν*). The inference has been drawn that Clement is quoting from our Gospels. But this is not the only passage where quotations from the Old Testament in the New appear to have been influenced by an "ecclesiastical use," arising in some cases from a desire to make the application closer (compare Jo. xix. 37 with the LXX. version of Zech. xii. 10, and note that this version is exactly quoted by Justin, and allusively by the author of the Apocalypse, i. 7), in part from abridgment or other causes (compare Mat. iii. 3; Mk. i. 3; Lu. iii. 4 with Isa. xl. 3). Therefore, even though the citation in Clement exactly coincided with the citation in Mark and Matthew, it would not follow that Clement cited it from them; and as the quotation is not identical, the probability is that it is quoted by Clement, with a slight alteration, from memory of "ecclesiastical use." There is also in chap ii. ("more gladly giving than receiving") an allusion to the saying of Jesus mentioned in Acts xx. 35. Our conclusion is—(*a*) that Clement of Rome, about 95 A.D., is proved to have a knowledge of the several scattered sentences in our common tradition which he quotes as "words of the Lord," but very loosely and freely; (*b*) that his quotation of the Old Testament appears on one occasion to be influenced by Christian "ecclesiastical use"; (*c*) that he uses (but whether as a quotation or not we have no means of determining) some words not found in our Gospels, which words are attributed to Jesus by the author of the Acts of the Apostles.

[1] Similarly it is used in the Epistle to the Hebrews (ix 17), *διαθήκη γὰρ ἐπὶ νεκροῖς βεβαία· ἐπεὶ μήποτε ἰσχύει ὅτε ζῇ ὁ διαθέμενος.* This use of the word is also found in the title of the early apocryphal work, *The Testaments of the Twelve Patriarchs.* It is said by Mr Sinker, in his edition of that work (p. 32), that probably, by the time of the composition of the *Testaments* (*i.e*, before 135 A.D), "the word *διαθήκη* itself [דְּיָתִיקִי] had been taken into Hebrew in the sense of "will" (Buxtorf, *Lex. Rabb.* s.v.). It would seem to follow that long before that date, the word *διαθήκη* was in regular use, in Hebraic Greek, to render the meaning "will" or "testament," although of course it also represents (and very much more frequently, owing to the more frequent repetition of the thought in the New Testament) the meaning "covenant."

[2] If the similarity between Luke xxii. 20 and 1 Cor xi 25 arises from an interpolation in the former, in that case the negative conclusion remains the same, that we have not here Paul supporting the tradition of Luke.

Early in the second century we for the first time meet with a quotation from the addition to the common tradition which are peculiar to Matthew. The Curetonian or shorter version of the epistles of Ignatius (107 or 115 A.D.) uses Matt. x. 16 almost *verbatim*, and possibly refers (Sanday, p. 79) to the star of Matthew (chap. ii.). The Vossian or longer version of the Ignatian epistles (which may be accepted as testimony for about 150 A.D.) contains, besides an ample and somewhat exaggerated reference to the star in Matt. ii., three or four (Westcott, *Canon*, p. 60) short but striking phrases peculiar to Matthew. But none of these passages have marks of quotation, the words of Matthew being in each case embedded in the writer's own words. It is remarkable that the only words of the Lord expressly quoted by Ignatius are words not found in any of our synoptic writers: "And when He came to those about (περὶ) Peter, He said to them, Take, handle Me, and see that I am not a bodiless demon." These words, although they have some likeness (the word ψηλαφήσατε is in both) to Lu. xxiv. 39, are expressly said by Eusebius to be derived from some source unknown to him, and by Jerome to be derived from a Gospel which he had translated (from Hebrew), and which was read in his time by the Nazarenes (Kirchhofer, p. 449); and, according to Origen, the passage occurred in the teaching of Peter. It is, of course, impossible for us, upon this evidence, to determine whether Ignatius quoted from the Nazarene gospel, or from the teaching of Peter, or from some other document or tradition embodied before or after in both those documents. Our conclusion is that, by the middle of the second century, the writer of the Vossian version of the Ignatian epistles was familiar with the Gospel of Matthew, but that he also used other sources (not known to us) when quoting the words of the Lord in support of the material resurrection of Jesus.

In the Epistles of Barnabas (100-125 A.D.) is found (chap. iv.) the first apparent reference (if we except the reference in 2 Pet. iii. 16) to any passage of the New Testament as "written": "Let us beware lest we be found, as it is written, many called, but few chosen," words almost exactly found in Matt. xxii. 14 alone (probably interpolated in Matt. xx. 16). There is also an allusive quotation of the words in Matt. ix. 13; Mk. ii. 17; Lu. v. 32: "I came not to call the righteous, but sinners." The only words expressly assigned to Jesus (chap. vii.) are not found in our Gospels: "Even so, saith He, they that would see Me and touch My kingdom, must take Me, through persecution and suffering." It is most unfortunate that the inexactness of the verifiable quotations in this epistle prevents us from laying much stress upon the author's statement as to the source of those which are unverifiable. For example, in chap. xvi., the author has, "The scripture saith, And it shall come to pass in the last days, that the Lord will deliver up the sheep of His pasture, and their sheepfold and tower to destruction. And it so happened as the Lord had spoken." But we know of no "scripture" containing these words; and the probability is that the author was quoting from memory and erroneously, as when (chap. v.) he combines Isa. iii. 9 and Wisdom ii. 12, as follows: "The *prophet* speaks against Israel, Woe to their soul because they have counselled an evil counsel against themselves, saying, Let us bind the Just One, because He is displeasing to us." Our conclusion is that, if Barnabas is deceived by his memory in attributing one passage to "writing" or "scripture," he may be deceived about another, and that we consequently cannot feel sure that he is quoting Matt. xxii. 14 from a document and not from memory of oral tradition. But (*a*) that the author was acquainted with passages found in Matthew is certain; and (*b*) it is also certain and noteworthy that the only words of the Lord quoted by him are quoted from sources not known to us

Polycarp (born about 69 A.D., died 155 or 156) quotes (chap. ii.) sentences from the Sermon on the Mount, similar to those quoted by Clement above, with the preface, "remembering those things which the Lord said (while) teaching, Judge not," &c. The quotation, like Clement's, is antithetical and compressed, but neither in order nor in words agrees so far with Clement's as to make it in the least degree probable that Polycarp and Clement are quoting from a written version differing from our synoptics. There is also a quotation from Mat. xxvi. 41 and Mk. xiv. 38, and a reference to Mat. vi. 13, "Asking the all-beholding God not to lead us into temptation; even as the Lord said, The spirit indeed is willing, but the flesh is weak." Two other coincidences (chap. v. and vi.) seem to refer to Mat. xx. 28; Mat. ix. 35; Mat. vi. 12, 14; Lu. xi. 4. There are no supposed allusions to apocryphal writings in Polycarp (Westcott, *Canon*, p. 61). It will be seen from what has been said above that there is nothing remarkable in the great variations with which the "Sermon on the Mount" was taught and quoted among the Christians in the first century. Like the "Lord's Prayer," it has not a literary but a practical interest; and being much used in many different churches from the earliest times, it may naturally have assumed many different shapes serviceable for catechists and preachers. This consideration (and the possibilities of variation arising from translation) may easily account for the variation between Clement and Polycarp, without necessitating or justifying, even as a working hypothesis, the supposition that Clement or Polycarp, in quoting the "Sermon on the Mount," quoted from other documents than our existing Gospels.

The "Shepherd" of Hermas, written about 135-40 A.D., "contains no distinct traces of any writing of Old or New Testament" (Sanday, *Gospels*). This is worth bearing in mind, as a warning that the nature of the subject will greatly affect the number of quotations from the scriptures in any early books. The allegorical nature of the "Shepherd," intended more as a stimulating tale than as a polemical or hortatory discourse, dispenses with scriptural illustrations; and in the same way Justin, in his *Second Apology*, refrains from quoting the scriptures, while in his other works he multiplies quotations or references. In appealing to the heathen, Justin "quotes the scriptures only when he must speak of things beyond the range of common history, preferring elsewhere to appeal to external documents such as the enrolment of Quirinus and the Acts of Pilate" (Westcott, *Canon*, p. 110).

Papias, who wrote about 130-140 A.D., composed five books, entitled "Exposition (ἐξηγήσεως) of the Oracles[1] of the Lord." It is (apparently) in an introduction to this work that he speaks (Euseb., iii. 39) of traditions gathered from different sources: "But I will not shrink from placing along with my interpretations (ἑρμηνείαις) as many (traditions) as at any time I learned well, and well stored up in memory from the elders." The noun "interpretations" (ἑρμηνείαις) may receive some light from Papias's own use of the words ἑρμηνευτής and ἑρμηνεύω, as quoted in the same chapter of Eusebius. "Mark," he says, "was the interpreter of Peter (ἑρμηνευτὴς Πέτρου γενόμενος):"[2] again, "Matthew wrote his scriptures (λόγια) in Hebrew, and each man interpreted them (ἡρμήνευσε) as he best could." So Eusebius himself in the preceding chapter tells us that some believe Clement to have "interpreted" (ἑρμηνεῦσαι) Paul's (Hebrew) Epistle to the Hebrews into Greek. Our conclusion would be that the word ἑρμηνείαι may here mean something more than mere "commentary"; it may imply that he, as others had done, wrote an interpretation of the "Logia," accompanied by comments and by supplementary traditions. At all events he does not speak of any one Greek "interpretation" of Matthew as being as yet paramount and authoritative, so as to exclude the necessity of further "interpretations." Of Mark he speaks (in the person of "the elder") almost apologetically, implying that his narrative had been censured for its incompleteness and unpolished style; and he defends it by quoting a tradition from "the elder" (apparently, John the elder) thus:—"Mark, having become Peter's interpreter, wrote down accurately all that he remembered—not, however, in order—both the words and deeds of Christ. For he neither heard the Lord, nor attached himself to Him, but later on, as I said, attached himself to Peter; who used to adapt his lessons to the needs of the occasion, but not as though he were composing a connected treatise of the discourses (λόγων, v. r. λογίων) of the Lord: so that Mark committed no error in writing down some matters just as he remembered them (ἀπεμνημόνευσε). For one object was in his thoughts (ἑνὸς γὰρ ἐποιεῖτο πρόνοιαν)—to make no omissions and no false statements in what he heard."

Much of this exactly applies to our Mark. If we desire to know what is meant by Mark's not writing "in order," we have only to turn to Luke, who made it his object to write "in order," and whose arrangement, chronologically as well as artistically, differs from Mark. It is true that we may be disposed to think Mark's "order" not inferior to Luke's; but the fact is indisputable that Luke attempted to write "in order," and that his "order" differs considerably from that of Mark, who manifests no purpose except the desire to put down what he knew as he remembered it. It has been shown above (see p. 802) that Mark's Gospel is rather a collection of anecdotes than a connected narrative; and of such a collection it would be natural to say that it was not written as an orderly narrative. To the single evidence of Papias, derived from an unknown elder, not much importance can be attached; and it is very doubtful whether the most searching investigations will ever determine with certainty the name of the author or authors of any one of the synoptic Gospels. But at all events, it is only reasonable to admit that the hypothesis of "notes" taken from oral discourses, and serving as the groundwork for the Second Gospel, would explain many of its phenomena. If these oral discourses embodied the early common Greek tradition, it would be easy to see how the First and Third Gospels came to resemble the Second Gospel, although all three Gospels are mutually independent. As regards the First Gospel, it has been shown above that internal evidence is against the theory of a very early authorship; and we

[1] No one word in English will exactly express the word λόγια, which was used both before and after Papias, to mean not merely "sayings" but "Scriptures."—Lightfoot, *Contemporary Review*, Oct. 1875

[2] *Cf.* also Clem. Alex., *Strom.*, vii. 17, 106, where certain heretics appeal to Glaucias τὸν Πέτρου ἑρμηνέα; and Jerome suggests as an explanation of the difference in style between the First and Second Epistle of Peter that the apostle used different *interpreters* (Kirchhofer, p. 276). The point for consideration is, not whether the statements of Papias are correct, but what Papias meant when he spoke of Mark as ἑρμηνευτής, and of himself as writing ἑρμηνείαι.

must add that it exhibits no signs that the portion before the call of Matthew was written from hearsay, and that after the call of Matthew by an eye-witness. But there seems the following strong argument in favour of the tradition of Papias as to the authorship of Matthew: if there was no basis for it, if it was a mere fiction or guess, why not select, as the author, some more distinguished apostle, Peter, John, or James? This argument is neutralized by the following consideration. The apostles (Acts iv. 13) were known in the earliest days to have been unlearned and ignorant men; and although the Holy Spirit gave them power to speak and teach, it was less natural that they should be inspired with power to write and to compose connected treatises. But Matthew being a publican, and necessarily ready with his pen, might naturally be supposed in the post-apostolic generation to be a skilful writer; so that if an early tradition with general apostolic authority was committed to writing, the church would naturally select Matthew the publican and ready writer as the special author of it. Nevertheless, the testimony of Papias is important as attesting the belief (1) in a Hebrew origin for the Logia or the Gospel scriptures, and (2) in an early multiplicity of "interpretations."

The apologetic tone in which Papias introduces the traditions, which he "will not shrink from placing along with the interpretations" of the scriptures, indicates that the written scriptures were gradually subordinating tradition. He nowhere expresses an opinion that the Logia are unauthoritative, but he implies that they require "interpretation," and adds (almost as though it were an idiosyncrasy) that *he* set a great store on supplementary tradition from the sources nearest to the truth,—not only taking pleasure in those who taught the commandments that came from the Lord (who was) the very truth (*i.e.*, the disciples of the Lord), but also questioning any who had "attached themselves to the elders," whom he used to examine closely on the utterances of Andrew, Peter, Philip, Thomas, James, John, Matthew, or any other of the disciples of the Lord, and on the sayings of Aristion and the elder John, the disciples of the Lord.[1]

It must be added that Papias, besides recording the raising of a dead man by Philip, and the drinking of poison without injury by Justus surnamed Barsabas, is said by Eusebius to have narrated several "strange parables and teachings of the Saviour," and other fabulous matters, originating from a literal understanding of figurative expressions. He also published "a story about a woman accused in the presence of the Lord for many sins, which is contained in the Gospel according to the Hebrews" (Euseb., *ib.*) It has been demonstrated by Dr Lightfoot that Eusebius, in treating of the disputed and undisputed writings of the earliest times, adopted one course for the former and another for the latter. (1) As to the disputed books, the *antilegomena*, he pledged himself to "record when any ancient writer employs any book belonging to their class;" but (2) as regards the undisputed canonical books, he only professes to mention them, "when such a writer has something to tell about them" (*τίνα περὶ τῶν ἐνδιαθήκων εἴρηται*) *Contemporary Review*, Jan. 1875. We are not therefore to infer from the silence of Eusebius that Papias did not know or quote the Gospels of Luke and John, but only that he said nothing about them; which of course might arise from either of two causes, either because he did not know of their existence, or because, knowing their existence, he "had nothing to say about them." What bearing this may have on the authorship of the Fourth Gospel we shall see hereafter. But, so far, we see written scriptures still (1) supplanted by oral tradition; (2) freely criticized as inadequate; and (3) accompanied by memoirs of various interpretations from some Hebrew original; though rapidly emerging, if they have not already emerged, to authoritative definiteness.

One fact is of the highest importance. We have seen that Papias was of a curious disposition, discontented with the written records before him, and anxious to supplement them by traditions. He was also, according to Eusebius, a man of no great judgment, fond of recording wonders, and, by his own account, fond of recording novelties. If therefore there had been any other non-canonical Gospel at that time, rivalling our present Gospels, and known to Papias, it seems probable, if not certain, that he would have used such a book; and, if he had done so, Eusebius could not (in the execution of his plan) have failed to mention such a use; but Eusebius makes no mention of the use of any non-canonical gospel by Papias. Even in the narrative of the sinful woman mentioned above, which was found in the Gospel according to the Hebrews, Eusebius expressly avoids saying that he derived the narrative from that Gospel. He merely says that Papias "has published a narrative which is contained in the Gospel according to the Hebrews" (it is probably the narrative interpolated in Jo. viii. 1–11); whereas, almost in the same sentence, he says that Papias "has used testimonies from the First Epistle of John." This negative evidence from the silence of Papias is strongly in favour of our Gospels.

In the works of Justin Martyr (who is supposed to have written Justin Martyr.
his *Apologies* and *Dialogue with Trypho*, 145–147 A.D.; so Hort, quoted by Westcott, *Canon*, p. 98) we find definite and abundant mention of written documents containing the facts of the Gospel narratives, but no assigned names of authors. The Gospel is by him considered as a whole, sometimes called *εὐαγγέλια*, sometimes *εὐαγγέλιον*, but frequently *τὰ ἀπομνημονεύματα τῶν ἀποστόλων*, and once (when he is referring to Mark's Gospel) *τὰ ἀπομνημονεύματα Πέτρου*. Bearing in mind Xenophon's well-known *ἀπομνημονεύματα Σωκράτους*, from which title "the word had already been borrowed by several writers" (Westcott, *Canon*, 108), we might naturally infer that the memoirs were not written by the apostles, but about the apostles or rather about their teaching; and this view is confirmed by what Papias says (above) about Mark, that he *ἀπεμνημόνευσε*, "recorded from memory," the teaching of Peter.[2] This probably was originally the meaning of the title as applied to our Gospels; but it seems to have been understood differently by Justin, as though it meant "written by the apostles." For in describing the descent of the Holy Spirit on Jesus at His baptism he uses the words, "The *apostles* wrote." It might indeed be said that he has in his mind Matthew and John, for John also records

---

[1] Eus., *H. E.*, iii. 39: *Οὐκ ὀκνήσω δέ σοι καὶ ὅσα ποτὲ πάρα τῶν πρεσβυτέρων καλῶς ἔμαθον καὶ καλῶς ἐμνημόνευσα, συντάξαι ταῖς ἑρμηνείαις, διαβεβαιούμενος περὶ αὐτῶν ἀλήθειαν· οὐ γαρ τοῖς τὰ πολλὰ λέγουσιν ἔχαιρον, ὥσπερ οἱ πολλοί, ἀλλὰ τοῖς τἀληθῆ διδάσκουσιν, οὐδὲ τοῖς τὰς ἀλλοτρίας ἐντολὰς μνημονεύουσιν, ἀλλὰ τοῖς τὰς παρὰ τοῦ κυρίου τῇ πίστει δεδομένας καὶ ἀπ' αὐτῆς παραγιγνομένας τῆς ἀληθείας. εἰ δέ που καὶ παρηκολουθηκώς τις τοῖς πρεσβυτέροις ἔλθοι, τοὺς τῶν πρεσβυτέρων ἀνέκρινον λόγους· τί Ἀνδρέας ἢ τί Πέτρος εἶπεν ἢ τί Φίλιππος ἢ τί Θωμᾶς ἢ Ἰάκωβος ἢ τί Ἰωάννης ἢ Ματθαῖος ἤ τις ἕτερος τῶν τοῦ κυρίου μαθητῶν, ἅ τε Ἀριστίων καὶ ὁ πρεσβύτερος Ἰωάννης οἱ τοῦ κυρίου μαθηταὶ λέγουσι.* It is maintained by able scholars (from whom dissent can be expressed only with great diffidence) that the *λέγουσι* indicates that Aristion and John the elder were living, while the *εἶπεν* indicates that Andrew, Peter, John the apostle, Matthew, and all the rest of the apostles were dead at the time "when Papias began his investigations" (Westcott, *Canon*, p 69). Now, John the apostle is supposed to have died at a very advanced age, about 98 A.D., and Papias (Lightfoot, *Contemporary Review*, May 1875) to have been born about 60–70 A.D., and to have written (Westcott, *ut sup*) about 140–150 A.D. We have therefore to suppose on this hypothesis (*a*) that Papias did not "begin his investigations" till he was twenty-eight or thirty-eight years old (*i.e.*, not till seven or seventeen years after he had attained to manhood), although the apostle John was living all that time in his immediate neighbourhood; (*b*) that two personal disciples of Jesus outlived the aged apostle John for a period long enough to enable Papias to conduct a systematic investigation into their traditions during their lifetime. "Improbable" is too mild a word for such a hypothesis. It seems very much more probable that *λέγουσιν* is simply the graphic present used for variety. Papias desires to make a distinction between the *dicta* of the apostles and the less authoritative utterances of Aristion and John the elder, who were not apostles. For this purpose he not only (1) mentions them separately, but also (2) varies the construction, changing *τί* into *ἅ τε*, and (3) *εἶπε* into *λέγει*. A hundred instances might be given from the Gospel of St John alone, where *εἶπε* and *λέγει* are used indifferently and alternately for the mere purpose of variety; see John iv. 9, 10, 11, 13, 15, 17 (*bis*), and the whole of the gospel *passim*. And for the use of *λέγει* in a dependent sentence following an imperf. indic., compare Plato, *Apol.* 21 B., *ἠπόρουν τί ποτε λέγει*, "I was in doubt as to what (the oracle) meant." It is true that Eusebius, though he denies Irenæus's assertion that Papias was a hearer of John the apostle, maintained that Papias heard John the elder. But he appears to have no evidence for this statement except the sentence just quoted, and the fact that Papias set down certain traditions of John the elder, mentioning him by name. His words are: "*Ἀριστίωνος δὲ καὶ τοῦ πρεσβυτέρου Ἰωάννου αὐτήκοον ἑαυτόν φησι γενέσθαι. Ὀνομαστὶ γοῦν πολλάκις αὐτῶν μνημονεύσας ἐν τοῖς αὐτοῦ συγγράμμασι τίθησιν αὐτῶν παραδόσεις.*" This is quite insufficient in face of the great difficulties in such a supposition. The only tradition of an elder quoted by Eusebius from Papias with any words of preface begins thus: "The elder said this also." Such a preface is quite consistent with the supposition that Papias had heard the tradition, not from the elder himself, but from one who had attached himself to the elder (*παρηκολουθηκὼς τῷ πρεσβυτέρῳ*); and the above-quoted sentence of Papias itself better suits such a supposition, for the "cross-examining of those who had attached themselves to the elders" naturally applies to *all* the names that follow, and more especially to John, since he is expressly included in the class of "elders." "I used to cross-examine any that came in my way who had attached themselves to the elders (asking them), what said Andrew, . . . and about the sayings of Aristion and John the elder;" surely the natural inference is that Aristion and John are included in the "elders." If this be so, every difficulty vanishes: Papias, though placed before Polycarp by Eusebius, may have been naturally so placed because he died before the aged Polycarp, so that his work fell in a period preceding Polycarp; but he may have been born about the same time or later, say 80 A.D. In that case the last of the apostles would have passed away before Papias was nineteen; and when Papias began his investigations he would necessarily have to rely on the pupils of the elders, since the elders themselves, whether apostles, as Andrew and Peter, or mere elders, as Aristion and John, had all passed away. If, however, it should appear after all that Papias did hear John the elder, it follows that, when Irenæus described Papias as "the hearer of John," he either (1) meant John the elder, or (2) confused John the elder with John the apostle. In either case most important consequences might follow, bearing upon the authorship of the Fourth Gospel. For it follows that, if here, then on other occasions, when speaking of the authorship of the Fourth Gospel, Irenæus either (1) may have meant John the elder where we at present suppose him to mean John the apostle, or (2) may have confused John the elder with John the apostle.

[2] Clement of Alexandria (Eus., *H. E.*, vi. 14) expressly says that Peter had no part in the composition, and did not even encourage it. There seems to have been an early and not unnatural tendency to depreciate the Second Gospel.

this; but St John's Gospel is not once quoted in the whole of his works and it is inconceivable that, in this latent fashion, he should have referred once to a writing as apostolic, which elsewhere he never quotes. It seems more likely that Justin considered that the ἀπομνημονεύματα Πέτρου were written by Peter, so that the first two Gospels at all events were written by apostles, or else that he considered the First Gospel not to have been written by one apostle, but to have been a joint apostolic production. Elsewhere, in describing the agony of the Lord (Lu. xxii. 44), a passage peculiar to Luke, he seems to have been struck with the inapplicability of his favourite title to a work written by one who was only a follower of the apostles; and instead of his usual formula, he here substitutes "The memoirs which I assert to have been written by the apostles, and by those who attached themselves to them;" but even this more precise description would only hold good of the three Gospels used by Justin, on the supposition that the "Memoirs of Peter" were written not by Mark but by Peter. The subject is important, as showing by what easy stages a work written by a pupil might be supposed (even in the face of direct evidence to the contrary) to be written by the teacher.

For a full discussion of Justin's quotations from the Gospels the reader is referred to Westcott, *On the Canon of the New Testament*, pp. 95–175, and Sanday, *The Gospels in the Second Century*, pp. 88–137. Here it must suffice to state a few general conclusions deduced from an examination of his use of the Old and New Testament.

We must bear in mind then (1) that Justin is writing polemically, and that (especially in his dialogue with the Jew Trypho) a main object with him is to show that "the prophets are fulfilled in Jesus;" to the proof from prophecy he attaches more importance than to any other. (2) He is a most inexact quoter; and though he quotes long passages from the Old Testament accurately, shorter passages are quoted from memory inexactly, while Messianic passages, even when long, are modified (sometimes with a closer return to the Hebrew original) by Christian use and adaptation to Christ. (3) He often inserts words and notions of his own in the passages quoted from the Old Testament: for example, he says that Moses, in order to heal the children of Israel from the plague of serpents, "took brass and made an image of a cross, and set this in the holy tabernacle, and said to the people, Should you look on this image and believe on it, ye shall be saved" (*Canon*, p. 124). (4) He ascribes texts to wrong authors, and quotes the same text in various shapes, not only in different books, but even in the same book and at short intervals (*Ib.* 127). This being the case, we shall naturally be prepared, in approaching the New Testament quotations of Justin, to find many inaccuracies, and some alterations of fact; especially where a slight alteration can render some Old Testament prophecy more applicable to the New Testament narrative.

Reviewing the quotations from the apostolic fathers given above, we shall expect to find in Justin also a great number of the words of the Lord and incidents in the life of Jesus quoted from tradition, which are not found in our Gospels. Clement, we find, has two passages roughly quoted from our Gospels; and one traditional saying quoted in Acts xx. 35. Ignatius (Vossian) uses phrases or sentences from Matthew four times allusively, but quotes a "word of the Lord" found in no Gospel. The author of the Epistle of Barnabas quotes Matthew once, and a non-canonical word of the Lord once. Polycarp is the first apostolic father who, while four or five times quoting or alluding to sayings in our Gospels, quotes no non-canonical passages. Papias "published" a narrative contained in the Gospel according to the Hebrews. If then, in the small modicum of quotation hitherto given, so large a proportion (say a fourth) is non-canonical, how much more non-canonical matter might we naturally expect to find in Justin, who in two works quotes our Gospels 67 times (Sanday, p. 116), and occasionally in long continuous passages? We shall also expect to find in Justin many misquotations of our Gospels, arising from interpolations and corruptions of the text, for "the worst corruptions to which the New Testament has ever been subjected originated within a hundred years after it was composed" (Scrivener, quoted by Sanday, p. 135). A generation after Justin, Irenæus will be found quoting the interpolated appendix of Mark, which the general consent of scholars now recognizes to be spurious; and it has been pointed out that the differences of Justin from the ordinary text are little more than the differences of Codex D from the same text.

Bearing these considerations in mind, we ought to be surprised, not at the large, but at the small amount of extraneous matter which Justin has introduced into the Gospel narrative, and at the comparative accuracy with which he has quoted the Gospels. Treating of the variations of quotation, Dr Westcott has shown that, even where Justin's misquotations are found in other authors, the resemblances are of such a kind as to be easily derivable from some common tradition, or from some early but now obsolete text (*Canon*, pp 148–156). The extraneous matter may readily be explained as arising either from sense of an omission or from the morbid desire to find in each incident of the life of Christ the fulfilment of some prophecy in the Old Testament. If, for example, (1) he speaks of the voice from heaven at the baptism as being, "Thou art My Son, this day have I begotten Thee;" this is explained (apart from the various reading in D, which no doubt arose from the same motive) by a desire to see in the voice a repetition of Ps. ii. 7. (2) If a fire is said to have been kindled in the Jordan at the Lord's baptism, was it not natural that He who came to baptize others with the higher baptism of fire, as well as that of water, should Himself receive the highest baptism; or that the act which was already technically known as φωτισμός, "enlightenment," should be accompanied (in the case of the Lord of Light) by that symbol which was specially characteristic of the divine presence? (3) If Mark recorded that Jesus was a "carpenter" (a fact not then suppressed by the various reading in Mk. vi. 3, owing to such sneers as those of Celsus, Origen, *Cont. Cels.*, v. 34), was it not fitting that the Carpenter, who bade men lay hand on the plough, and take His yoke on them, should have "wrought, when among men, ploughs and yokes"? (4) If he speaks of the Magi as having come "from Arabia," had it not been prophesied, Ps. lxxi. (lxxii.) 10, that "the kings of the Arabians shall bring gifts"? (5) If the foal of the ass on which our Lord entered Jerusalem was said by Justin to have been "bound to a vine," must it not needs have been so, seeing that it was said of Judah (Gen. xlix. 11) that "he bound his foal unto the vine"? (6) Lastly, since Isaiah predicted (xxxiii. 16 in LXX.) that "he shall dwell in a high cave of a strong rock," was it not necessary that the Messiah should not only be born in Bethlehem, but also "in a cave"?

In all these additions there is absolutely nothing to make probable, or even suggest (even though the "fire" at the baptism of Jesus is mentioned in an apocryphal Gospel) that Justin used any other written Gospel than those known to us. These thoughts and others like them were floating in the atmosphere of every Christian church in those days. They were the results naturally developed from that habit of appeal to prophecy which has produced, even in our own canonical Gospels, not inconsiderable effects; and there is nothing in Justin's additions that is not capable of being explained from the same method (developed a little further) as that by which we may explain Matthew's addition about the potter's field, and possibly some of the other passages peculiar to the First and Third Gospels. Nor does the omission of the names Matthew, Mark, and Luke, by Justin, throw any doubt upon the supposition that he used the Gospels called by those names. It is quite possible that the names were given to these Gospels long after their composition. The very title, "The Gospel *according to* Matthew," &c. (not *of*, or *by*, Matthew), indicates that, even at the time when the titles were assigned, the compilers were regarded rather as editors of an old and received tradition than as authors of a new book. It is therefore quite possible that Justin (who mentions John by name as the author of the Apocalypse) may have used the first three Gospels, and yet have been ignorant of the names under which they are now current.

Three most important facts remain to be mentioned. (*a*) Justin tells us that in his days the memoirs of the apostles were read with the books of the prophets in the service of the church. This public reading of the memoirs must have given, if not a complete security, at least a considerable guarantee, against material alterations. The fact that the new traditions were now placed on a level with the ancient and venerable writings or scriptures of the Old Testament was a still more effectual barrier against change. (*b*) Although Justin mentions sayings of our Lord and events in His life not found in our Gospels, yet "he never does so when he proposes to quote the apostolic memoirs" (Westcott, *Canon*, p. 157). (*c*) In describing the fire kindled in the Jordan and the voice from heaven, he not only does not quote the memoirs, but, by implication, distinguishes these statements from other statements immediately following, which are quoted from the memoirs (*Canon*, pp. 158–159).[1]

To conclude, we find that, although Justin knew and used traditions, yet (1) he set a special value on certain writings, which were publicly read in the churches; (2) he believed these to have been written by apostles, or the immediate disciples of apostles, and he repeatedly quotes them under this title; (3) though he does not lay stress on miracles (for miracles would be assumed by the Jew Trypho, accustomed to the miracles of Moses and Elisha, and they would be rather harmful than helpful to his cause in the eyes of educated Greeks and Romans), nor on the longer lessons involved in Christ's parables, yet he covers the greater part of our Gospel history, and much of our Lord's teaching through maxims; this he does to such an extent that it is possible (Sanday, pp. 91–98) to reconstruct from his quotations a fairly connected narrative of the incarnation, birth, teaching, crucifixion, resurrection, and ascension of the Lord; (4) the whole of this narrative (with the exception of the few unimportant incidents mentioned above, and one or two

[1] Perhaps we may also lay some stress on the fact that, in the seven passages in which Justin uses the phrase, "it is written," as applied to the memoirs, he almost always agrees *verbatim* with Matthew or with Luke (*Canon*, p. 130).

traditional sayings of Jesus) is found in Matthew, or Mark, or Luke, or in all three; and there is also a reference to an incident recorded by Mark alone; (5) he never, as from these memoirs, quotes any words, or alleges any incidents not found in our Matthew, Mark, or Luke; (6) he never quotes any rival Gospel, nor alleges any words or facts which make it probable he used a rival Gospel; (7) such non-canonical sayings and facts as he mentions are readily explicable as the results of lapse of memory, general looseness and inaccuracy, extending to the use of the Old as well as the New Testament, and the desire to adapt the facts of the new scriptures to the prophecies of the old. Our conclusion is that the memoirs of the apostles which include so much that is contained in our first three Gospels, and which were continuously read in the services of the church from the time of Justin downwards, cannot have passed into oblivion a few years afterwards, so as to have given place to rival Gospels not known to Justin. They must be identical with the Gospels, to some or all of which testimony is successively borne by Marcion (140 A.D.) in spite of his arbitrary and entirely uncritical excisions; by the heretical Clementine Homilies (160 A.D.?) in spite of occasional use of apocryphal sources; by the Muratorian fragment (170 A.D.); by Athenagoras and Ptolemæus, and the churches of Vienne and Lyons (177 A.D.); till the century closes with the affirmation of Irenæus, who not only uses three synoptical Gospels with the Fourth so fully as to leave no doubt of the identity of his Gospels with ours, but also is so convinced of the essential necessity that there should be four and only four Gospels, that he discerns in the quadriform nature of the cherubim a type of the preordained quadriform nature of the records of the life of Christ.[1]

In the foregoing remarks attention has been mainly directed to definite evidence, whether external or internal. Limits of space, as well as other considerations, prevent the discussion of that more indefinite evidence which might perhaps be called indirect external evidence, and which would treat of the influences amid which the Gospels grew up and by which they were likely to be moulded. For such a discussion it would be necessary that we should place ourselves in the position of a disciple in some early congregation of Jewish or Gentile Christians, and endeavour to realize the influence exerted upon the Christian records—(1) by prophecy; (2) by heathen religions; (3) by Eastern metaphor acting upon Western literalism; (4) by the ritual and language of the Lord's Supper; (5) by the universal predilection for the marvellous; (6) by the fall of Jerusalem. The results thus obtained would be in a great measure conjectural; but, compared step by step with the results deduced above, they would enable the reader to feel additional confidence in conclusions supported by the double confirmation of indirect as well as direct evidence. The best work in English bearing on this subject is probably the translation of Keim's *Jesus of Nazara* (London, 1876–79); and there is also much valuable information in the Appendices to Canon Farrar's *Life of Christ.*

The Gospel of the Hebrews.

[1] As a good deal of stress has been laid upon the apocryphal Gospel of the Hebrews, from which (according to the testimony of Jerome, Kirchhofer, p. 449) Ignatius quoted, it may be well to show that this was later than our Gospels. (1) We have seen above (p. 807) that in the common tradition Ἰησοῦς is habitually employed, and that the use of ὁ Κύριος, "the Lord," in narrative is a sure sign of later origin; but "the Lord" is habitually used in the narrative of the Gospel of the Hebrews (see Kirchhofer, pp. 450, 453, 454). (2) It softens moral difficulties: (*a*) in the story of the rich young man, the Lord says to him, "Behold, many of the brethren, sons of Abraham, are covered with dung and dying for hunger, and thy house is full with many good things, and naught goeth forth at all from thee to them," thereby blunting the point of the young man's rejection; (*b*) after the words "If thy brother shall sin against thee" (*cf.* Matt. xviii. 22), Jesus adds, in the Gospel of the Hebrews, "in word, and if he shall make thee amends" (*Ib.* p. 454) (*in verbo et satis tibi fecerit*): (*c*) the error in Matt. xxiii. 35, "son of Barachiah," is corrected into "filium Jojadæ," Jerome (*Ib.* p. 455). (3) It increases the marvellous element: (*a*) at the baptism of Jesus, "It came to pass when the Lord was come up from the water, the whole fountain of the Holy Spirit came down and rested upon Him, and said to Him, O My Son, in all the prophets I was awaiting Thee, that Thou mightest come, and that I might find rest in Thee; for Thou art My rest, Thou art My first-born Son, who reignest for ever" (*Ib.* p. 454), (*b*) hence the Holy Spirit is called the Mother of the Lord, and it is said by the Lord, "But now My Mother, the Holy Spirit, took Me by one of My hairs, and carried Me away to the Mount Tabor" (*Ib.* p 451); (*c*) after His resurrection, it is added that the Lord ordered a table and bread to be brought, and caused His brother James to break his fast, when James had sworn not to eat bread till he had seen the Lord; in this story James is called "James the Just," a title which in itself is a mark of late composition.

To this note we may add that Celsus, towards the end of the second century, speaks of "the writings of the disciples of Jesus" (*Ib.* p. 330) as the source of his information, and mentions nothing (so far as we know) of any importance that is not found in our Gospels. It is true that Origen (*Cont. Cels.*, ii. 74), in answer to Celsus's boast that he had crushed the Christians with facts taken from their own writings, replies, "But we showed (above) that there has been a great deal of nonsensical blundering, contrary (παρά) to the writings of our Gospels," &c.; but if we refer to what has gone before, we find that Origen is referring (1) to Celsus's unfair inaccuracy, *e.g.*, in saying that Jesus was betrayed, not by one disciple, but by His disciples; (2) to such blunders as the confusion of "Chaldæans" with "Magi;" (3) to his ignorance of the number of the disciples, &c. There is therefore every reason to believe—for if Celsus had attacked any apocryphal narratives as representing the faith of Christ, Origen could not have failed to take advantage of the triumphant rejoinder which such a mistake would have afforded him—that an assailant of Christianity, writing before the end of the second century, knew of no writings of the disciples of Christ upon which he could base any effective attacks against their religion, except our four Gospels.

THE FOURTH GOSPEL.

Authorship.

Evidence from earliest Tradition.—Before considering the subject matter of this Gospel, it will be well to consider the evidence, direct and indirect, bearing on the authorship. The author is not mentioned in the Gospel by name, but only as "the disciple whom Jesus loved" (xxi. 24, 20), "which also leaned on His breast," and to whom Jesus commended His mother from the cross (xix. 26; xiii. 23). The first writer who mentions John as the author in connexion with a passage quoted from our Fourth Gospel is said to be Theophilus, who wrote towards the close of the second century (170–180 A.D.). The Muratorian fragment (170 A.D.) speaks of the apostle as the author of a Gospel, but does not quote from it. But Theophilus quotes Jo. i. 1, as written by John, one of those "inspired by the Spirit" (πνευματοφόρων).[2] It is a natural inference that Theophilus (at so late a date), using the name thus without further definition, meant by "John," the "John" best known to his readers, *i.e.*, John, the son of Zebedee, the apostle. But there is unusually strong evidence to show that John the apostle wrote the Apocalypse, so strong that we may assume the apostolic authorship of that book with more confidence than the authorship of any other book in the New Testament, except some of Paul's epistles. The question therefore arises, how far does the style of the Gospel, which was said by Theophilus (170–180 A.D.) to have been written by John (presumably the apostle), agree with the style of the Apocalypse, which we have so good reason for believing to have been written by the apostle John? If we assume John to have been four or five years younger than his Master, he would be, according to the commonly received date (68 A.D.) of the Apocalypse, about sixty-seven or sixty-eight years of age when he wrote that work. By that age (one would suppose) an author's style would, if ever, have reached its maturity. Even if he were ten years younger than Jesus, so that he was only a little over sixty years of age, yet his style would not be capable of a complete transformation. But when the Gospel is compared with the Apocalypse, instead of similarity, we find an almost complete contrast.[3] The vocabulary, the forms, the idioms, the rhythm, the thought—all is different. That the Apocalypse and the

Early evide of aut ship.

[2] Such at least is the statement of Kirchhofer (p. 153), and it has been reproduced in modern books. But part of the period of Irenæus might precede part of the period of Theophilus; and Irenæus quotes John's Gospel (xx. 31) as from "John the disciple of the Lord," in a passage of his work *Against Heresies* (III. xvi. 5, or ed. Grabe, iii. 18), a passage omitted by Kirchhofer.

[3] It is not necessary, however, to deny that the Gospel exhibits traces of the Apocalyptic doctrine and thought. On the contrary, the impression left by a comparison of the two is, that the Gospel exhibits an attempt to refine and spiritualize some of the more material and concrete expressions of the Apocalypse. From this point of view, we may say that "the Gospel is the spiritual interpretation of the Apocalypse. . . . The active and manifold religious thought of Ephesus furnished the intellectual assistance which was needed to exhibit Christianity as the absolute and historical religion in contrast with Judaism and heathenism" (Westcott, *Introd. to St John*).

Fourth Gospel should have been written by the same author would be, we will not say impossible, but one of the most marvellous literary phenomena ever authenticated. The change in Shakespeare's style, or in the style of Burke, cannot be compared with this; for those changes can be in part explained by the transition from youth to maturity or old age. Here we have to explain how a writer could completely change language, style, and thought, after the age of sixty or sixty-seven years. It is possible, but *a priori* highly improbable.

It has indeed been suggested that this change of language may be explained by the lapse of more than thirty years, during which the author was living in the midst of a Gentile population. This assumes that the Apocalypse was written in 68 A.D., before John had resided in Ephesus, and that he wrote the Gospel at the age of ninety-eight. But (1) the minute knowledge of the Seven Churches (Rev. i. ii. iii.) makes it probable that the writer had resided for some time in their neighbourhood; (2) the composition of such a work as the Fourth Gospel at the age of ninety-eight is in itself unlikely; (3) it is by no means certain that the Apocalypse was written in 68 A.D., and not rather in 78 A.D., simultaneously with the fourth Sibylline Book (and the later the date of the Apocalypse the shorter the interval between it and the Fourth Gospel, and the more improbable becomes the theory of the change of style). An hypothesis based upon three hypotheses, themselves not proved or improbable, requires much evidence before it can be accepted.

There is yet another difficulty in the way of believing that John the apostle is the author: the words of Jesus in the Fourth Gospel (1) differ altogether in style and rhythm from the synoptic tradition of the words of the Lord, and (2) do not differ at all from the author's own remarks and observations. So great is the similarity between the words of the writer and the words which are assigned by him either to our Lord or to John the Baptist that Dr Westcott, commenting on Jo. iii. 10–21, 27–36, says (*Introduction to the Gospels*, p. 292), "It is impossible not to feel that the evangelist is in fact commenting on and explaining the testimony which he records. The comments *seem to begin* respectively at verses 16 and 31." The words italicized (not by Dr Westcott) require little comment. It is obvious that a biographer, who so mixes the words of his characters with observations of his own that a most careful and scholarlike commentator is unable to feel sure where the words of the characters end and the observations of the author "seem to begin," cannot be supposed to be exactly recording, scarcely even to be attempting to record with exactness, the words of the characters themselves. Yet it seems impossible that the "disciple whom Jesus loved" should either remember his Master's words so ill, or else deliberately transmute them into entirely different language of his own. A work of this kind, notwithstanding the presence of historical elements, seems rather to deserve to be called a poem, or a drama, than a biography; and accordingly the same careful commentator who is quoted above declares that "the spirit of parallelism, the instinctive perception of symmetry in thought and expression, which is the essential and informing spirit of Hebrew poetry, runs through the whole record" (*Introd. to the Gospel of St John*). Such a work does not seem likely to have proceeded from one of the sons of Zebedee, a fisherman of the lake district of Galilee, not indeed a poor man, but still not a man of letters nor of any great literary culture.

"The earliest account of the origins of the Gospel is already legendary" (Westcott, *Introduction to the Gospels*, p. 255), as given in the fragment of Muratori (A.D. 170). It is there said that, being requested by his fellow-disciples and bishops to write, John desired them to fast for three days, and then to relate to one another what revelation each had received either for or against the project. The same night it was revealed to Andrew, one of the apostles, that "while all called (the past) to mind (or while all revised,—'cunctis recognoscentibus'), John should write everything *in his own name*." Legendary though this account may be, it curiously agrees with a passage in the Gospel itself which implies that others besides the author were "revising," or otherwise assisting in, the work: "This is the disciple which testifieth of these things and wrote these things: and we know that his testimony is true" (xxi. 24). Yet immediately afterwards—in a sentence which, though omitted by Tischendorf, is supported by the MSS. almost without exception—the singular number is resumed: "I suppose that the world could not contain the books that should be written." This passage certainly seems to indicate some kind of joint authorship or revision, or at all events a desire to convey the impression of joint authorship or revision, such as the Muratorian fragment describes. The theory of joint authorship or revision is confirmed by evidence derivable from the 1st Epistle of John, which is justly regarded (Lightfoot, *Contemp. Rev.*, 1875) as a kind of postscript to the Gospel. It begins (like the Gospel, and unlike the Apocalypse, as also unlike the 2d and 3d Epistles of John) without mention of the author's name, and in the plural number: "That which was from the beginning, which we have heard, which we have seen with our eyes, which we have looked upon, and our hands have handled, declare we unto you, that ye also may have fellowship with us." Yet at the conclusion of the first chapter, as though it were to be understood that the whole was written "in the name of John" ("suo nomine," as the Muratorian fragment has it), the singular number is used, "these things write I unto you" (1 Jo. ii. 1, 7, 12, 13, 14, 21; v. 16).[1] So far therefore as we have gone, the evidence is very decidedly against the supposition that John the apostle was the sole author of the Fourth Gospel. He may have written it (1) through an amanuensis or disciple, who translated his language (and possibly his thoughts also) in the process of expressing them (just as Paul is said by some to have written the Epistle to the Hebrews in Hebrew, and to have had it freely rendered by one of his followers);[2] or (2) it may have been an attempt on the part of a leading teacher of the Johannine school at Ephesus to reproduce the spirit of their Master's teaching after He had been taken from them by death, an attempt of one of the Ephesian elders to reproduce John once again in their church, surrounded by Andrew and Philip and Aristion and the rest of the disciples of the Lord, the former proclaiming and all the rest assenting to "that which they had heard, that which they had seen with their eyes."[3] If during the latter years of his life John was infirm and bedridden, obliged to preach and teach by deputy,[4] it is obvious that the "teaching of John" during the last eight years of his life, when the old man was now past ninety years of age, might be

[1] Of course the "we," whereby the writer identifies himself with his readers (ii. 3 and *passim*), is quite different from the "we" mentioned above.

[2] The statement that Papias "wrote out the Gospel at the dictation of John," quoted by Westcott (*Canon*, p. 76) from an argument prefixed to an MS. of the 9th century, is probably worthless, except as indicating an opinion much earlier than the MS., that John did not himself write the Gospel.

[3] That a similar attempt was made to reproduce, as it were, the authority of Peter by a writer in the 2d century, we have seen above (p. 814) in the account of the Second Epistle of Peter. But the circumstances and prolonged infirmities of the apostle John might make such an attempt far more successful and a far more accurate representation of spiritual truth.

[4] Jerome, *Comm. in Ep. ad Gal.*, vi. 10, quoted in Westcott's *Introd. to St John*.

very different in language, and even somewhat different in thought and substance, from the teaching of the apostle himself; and a spiritual doctrine, taught in the Ephesian church, and based upon three or four traditions affirmed by the aged apostle, such as the tradition of blood and water, might, even in the lifetime of the apostle, become known, within a limited district, as the Gospel according to the apostle John. How different, in language if not in substance, may be a pupil's record of a master's teaching may be perceived from Plato's and Xenophon's records of the teaching of Socrates. But in any case, whatever may be the authorship of the book, it must be admitted to be, so far as we have gone, in the highest degree improbable that John the apostle wrote the Fourth Gospel with his own hand at the age of ninety or nearly a hundred, in the same way in which he wrote the Apocalypse at the age of sixty or seventy or eighty.

Evidence from quotations. Papias.

Evidence from Quotations.—But we pass now to the evidence of the early fathers. Theophilus and Irenæus are the first to quote John by name, but earlier writers, who do not mention his name, quote words contained in the Fourth Gospel. We will take Papias first. He tells us (see above, p. 816) that he used to inquire about the *dicta* of Andrew, Peter, Philip, Thomas, James, John, Matthew, or any other disciples of the Lord, and also about the sayings of Aristion and the elder John, the disciples of the Lord. The order of names is remarkable, and it has been most ingeniously inferred (Lightfoot, *Contemp. Rev.*, Oct. 1875) that John is placed, out of his order of precedence, along with Matthew, because the last two had left written Gospels; moreover the order of the first three, "Andrew, Peter, Philip," quite unlike the synoptic order, is the order in Jo. i. 40–43, which suggests that Papias was aware at all events of the story of the calling of the apostles contained in the first chapter of the Fourth Gospel. We are also told by Eusebius that Papias "used testimonies" from the 1st Epistle of John. This is, of course, no proof that Papias quoted the Epistle with John's name (for quotations of New Testament documents with the name of the author are not common in the earliest writings of the church); but it may be inferred that he regarded the 1st Epistle of John as an authoritative document; and the Epistle is so closely connected with the Gospel that, if the apostle John is proved to be the author of the one, it must follow that he is the author of the other also. But it is important to note that Papias recognized two Johns, both of whom were "disciples of the Lord;" and Eusebius tells us that Papias quoted certain traditions of the non-apostolic John, distinguishing him as "the elder,"—"the elder used to say," &c. Now Irenæus—who speaks highly of Papias, describing him (wrongly) as a "hearer of John" (the apostle),—quotes Papias as one of "the elders who saw John the disciple of the Lord," and who remembered how he (John) had repeated to them certain teachings of the Lord Jesus, to the effect that "the days will come in which vines shall grow, having each 10,000 branches, and in each branch 10,000 twigs, and in each twig 10,000 shoots, and in every shoot 10,000 clusters, and in every cluster 10,000 grapes, and every grape when pressed will give 25 measures of wine. And when any one of the saints shall lay hold of a cluster, another shall cry out, 'I am a better cluster, take me; bless the Lord through me,'" &c. (*Apostolic Fathers*, Clark's trans. p. 443). The question therefore arises, Which John is here meant? It seems certain from the context that Irenæus meant *the* famous John, the apostle: yet he calls him nothing but "disciple," and the tradition imputed to John (though not out of accord perhaps with the imagery of the Apocalypse) is quite unlike anything that we find in the Gospel or 1st Epistle called by John's name. On the other hand, a passage of the Fourth Gospel (xiv. 2) is quoted by Irenæus (*Adv. Hær.*, V. xxxvi. 2) in connexion, not with John the apostle, but with "elders," and possibly as part of the doctrine communicated to Papias by the "elders" ("the context makes it at least highly probable that the passage was quoted from Papias's 'Exposition,'" Westcott, *Introd. to the Gospel of St John*). But, if this be so, *i.e.*, if a passage of the Fourth Gospel was communicated to Papias, not necessarily by John the apostle, but by "elders," then it follows that among the "elders" who communicated it to him may have been John the "elder." Although this is, in great measure, conjectural, yet, even as a possibility, it becomes deserving of attention, when placed in juxtaposition with the certainty mentioned above; (1) it is *possible* that a saying in the Fourth Gospel was communicated to Papias, not by John the apostle but by John the elder; (2) it is *certain* that the only passage quoted from Papias as coming from John (the apostle) is not to be found in the Fourth Gospel and in no way resembles the style or thought of the Fourth Gospel. Again, the 2d and 3d Epistles of John, which have the name of the author inserted, are written, not in the name of John the apostle, but in the name of "the elder," and they were so doubtfully regarded (perhaps on that account) by the church that Eusebius places them among the "impeached (ἀντιλεγόμενα) writings," while Origen speaks of them as only possibly genuine, and Jerome attributes them not to John the apostle but to John the elder. Yet Irenæus quotes this 2d "impeached" Epistle, not as the work of John the elder, but (twice) as the work of "John the disciple of the Lord." Evidently there is here, if not confusion, at least a danger of confusion, and one cause of confusion can be immediately indicated. Papias tells us that both John the apostle and John the elder were "disciples of the Lord." Now, for some reason or other, Irenæus, though he quotes Matthew as "the apostle" (*Adv. Hær.*, III. ix. 1) and a speech of Peter as spoken by "the apostle" (*Ib.* xii. 1), appears not to quote the Fourth Gospel except as written by John "the disciple of the Lord," or simply "John" (*Ib.* xi. 1, 2, 3, 7). It cannot indeed be assumed that Irenæus is here (unconsciously) referring to John the elder, and not to John the apostle. On the contrary, the more probable explanation is, that John the apostle was himself called by preference John "the disciple of the Lord," as being "the disciple whom Jesus loved."[1] Nevertheless it remains an unfortunate fact that Irenæus and Theophilus, who are the first to quote John by name, give us no means of ascertaining whether they refer to John the apostle or John the elder, both of whom are described by Papias as being "disciples of the Lord." In this state of confusion we are naturally led to suspect that possibly the two Johns mentioned by Papias (neither of whom, as we have shown above, was probably known to Papias himself) may have really been one; and this suspicion is confirmed by the testimony of Jerome, who informs us that though two tombs were shown in his time at Ephesus, one as the tomb of John the apostle, and the other as the tomb of John the elder, yet some considered the two persons to be identical; "nonnulli putant duas memorias ejusdem Joannis evangelistæ esse" (Jerome, quoted by Kirchhofer, p. 159). We have not evidence to prove this theory, but neither have we evidence to disprove it; and we must therefore leave the question who was the author of the Fourth Gospel

[1] Compare *Fragments*, iii., "John the disciple of the Lord and the other apostles with whom he was conversant." Hippolytus doubles the title (*Christ and Antichrist*, ch. 36), "Tell me, blessed John, apostle and disciple of the Lord." In speaking of the author of the Apocalypse, Irenæus (*Adv. Hær.*, IV. xx. 11) describes him not only as the "disciple of the Lord" but also as the disciple "upon whom Jesus had leaned at supper."

(so far as the evidence of Papias and Irenæus can help us) unanswered and unanswerable. Indeed it cannot be denied that the probability is that Papias did not know of its existence as an authoritative Gospel written by the son of Zebedee. For, had he known it, would he have had "nothing to say" about its origin, about the contrast between it and the Apocalypse, about the difference between it and the synoptic narrative, and about the interesting account of its composition given in the Muratorian fragment and therefore current before 170 A.D.? That Papias should have "nothing to say" about Luke's Gospel is intelligible, because the dedication to Theophilus speaks for itself; but why he should describe the origin of the First and Second Gospels and pass over the Fourth, where there was so much to describe and where a joint authorship was not only suggested by tradition but also by internal evidence (John xxi. 24), is by no means easy to explain. In the face of this silence we cannot attach much value to the evidence in Papias for the apostolic authorship, derived from the association of John with Matthew in the list of the apostles. Against that evidence, too, such as it is, must be set the fact that the only tradition detailed by Irenæus as coming through Papias from John the disciple of the Lord is one quite unlike the tone of the Fourth Gospel. The latter negative at least neutralizes the first positive; and the scale is thus left unaltered, pressed heavily downwards against the apostolic authorship by the discrepancy of style (when the Gospel is compared with the Apocalypse) and by the external and internal evidence of joint authorship.

Evidence has been drawn from the epistle of Barnabas, the "Shepherd" of Hermas, the Ignatian letters, the epistle of Polycarp to the Philippians, the works of Justin, and the Clementine Homilies, to show that the authors of these writings used the Fourth Gospel (Westcott, *Canon*, *passim*; Sanday, *Gospels in the Second Century*, 273–298); and no candid mind can resist the proof that some of them knew and were influenced by the thoughts of the Fourth Gospel, while some even used its language. But it is by no means certain, indeed it is improbable, that they knew of it as a Gospel; and it is still more improbable that they recognized it as a Gospel written by "the disciple whom Jesus loved." Else, how comes it that Justin quotes Matthew about fifty times and the Fourth Gospel once, or not at all?

Moreover, the apparent quotations of the Fourth Gospel in the apostolic fathers show not so much the use of a document from the first, as rather the influence of the common atmosphere of the Asian churches, the floating tradition of the Ephesian school, gradually merging into a definite document. Barnabas, for example, speaks of "water," with a certain mystery, associating it with the "cross"; as also Justin seems to do, mentioning the cross and baptism in consecutive chapters (lx. lxi.) of his *First Apology*. But the Clementine Homilies, amplifying the mysterious efficacy of water, as being the origin of all things, and the direct recipient of the impulses of the Spirit (ch. xxiv.), give a loose quotation of Jo. iii. 5, which seems adapted for the Clementine context by being blended with the baptismal formulary previously mentioned by the writer in xxviii. 19: "For thus the prophet has sworn to us, saying, Verily I say to you, Unless ye be regenerated by living water into the name of Father, Son, and Holy Spirit, ye shall not enter the kingdom of heaven." It can scarcely be an accident that this same passage is the only passage from the Fourth Gospel quoted in the whole of the works of Justin Martyr. Moreover, in Justin also, as in the Clementine Homilies, it is not so much the Gospel as rather the substance of the Gospel that is given; and this too in a shape not so developed as that which appears in the Fourth Gospel.

It is worth while to sketch the growth of this passage, for the process is a typical one, and will illustrate many other theological developments. The doctrine of the new birth first appears (but only in its germ) in the synoptic Gospels: "Except ye be converted, and become as little children, ye shall not enter the kingdom of heaven" (Mat. xviii. 3: *cf.* Mk. x. 15; Lu. xviii. 17). But Jesus clearly did not mean that His disciples were to become like little children by becoming ignorant, foolish, or helpless; but only that they must trust the Father in heaven, as earthly children trust their earthly parents; in other words, that they must become children of the heavenly Father, and therefore be born again with a heavenly birth. It was therefore a legitimate development of Christ's teaching to remind Christians (1 Pet. i. 3, 23) that they had been "begotten or born again" (ἀναγεννᾶν); and Paul describes his converts as "begotten" (γεννᾶν) by himself in Christ spiritually, distinguishing such a birth from the "birth according to the flesh" (Gal. iv. 23, 29). It was inevitable that the Christians should early associate this spiritual birth with the rite of purification or baptism, with which they would naturally (as John had done) introduce their converts into the church. But further, as soon as the need of this spiritual "begetting" became a part of the teaching of the church, it would have to be protected against the literalism of misrepresenting enemies and of dull unspiritual friends. Jews and Gentiles would argue, "But it is impossible for a man who has once been born to enter a second time into his mother's womb." This argumentative objection would therefore be naturally placed (in the minds of the teachers and catechists of the first century) side by side with the doctrine of Christ. One teacher, treating the subject dramatically, might put the objection into the mouth of an objector in the shape of dialogue; another might state the answer to the objection in his own person. With this explanation we shall at once understand that Justin, though appearing (in the course of an argument upon baptism) to quote the Fourth Gospel once only (whereas he quotes Matthew fifty times), is not really quoting it, but only the floating tradition of the Ephesian elders, when he writes as follows:—

Justin, *Apol. I.*, lxi.	John iii. 3–5.
"For Christ said, Except ye be born again (ἀναγεννᾶν, Peter's word, 1 Pet. i. 3, 23), verily ye shall not enter into the kingdom of heaven. Now, that it is impossible for those who have once been born to re-enter the wombs of those that bare them is evident to all." [Here the quotation terminates, without making any reference to water.]	"Jesus answered and said unto him, Verily, verily, I say unto thee, Except a man (γεννηθῇ ἄνωθεν) be born again (or from above) he cannot see the kingdom of God. Nicodemus saith unto Him, How can a man be born when he is old? Can he enter the second time into his mother's womb, and be born? Jesus answered, verily, verily I say unto thee, Except a man be born of water and the Spirit, he cannot enter into the kingdom of God."[1]

Note here the inexplicable omission—on the hypothesis that it is an omission. We must bear in mind that in the preceding extract Justin is arguing for baptism by *water*. How obvious then to quote the words of Christ Himself, "Except a man be born of *water* and the Spirit," &c. But Justin does no such thing. He gives as a reason for water-baptism the intention that men may not remain "the children of necessity and ignorance," which reason, he says, we have learned from the apostles. He also quotes, suitably enough, the saying of Isaiah, "Wash you, make you clean." Lastly, he quotes a saying of Christ, and omits from it (supposing that he has the Fourth Gospel before him) the very words which tell with greatest force for him, and which indeed make all further argument unnecessary! It is possible, but most improbable, that Justin should quote Matthew fifty times, and a Gospel which he knew to be written by the beloved disciple of the Lord only once; but it is more than improbable—it is inconceivable—that, in this single quotation, he should not only quote inaccurately, but omit the very words that were best adapted to support his argument.

The probability is that Justin's quotation represents one stage, and the Fourth Gospel another stage, of the Christian doctrine of the new birth, and that the Ephesian "usus ecclesiasticus" had not yet come to his knowledge, or, if it had, had not yet superseded the less developed tradition. The stages may be classified as follows: (1) Synoptists. "Except ye become as little children;" (2) Justin, "Except ye be born again;" (3) a third stage is implied in 1 Pet. i. 3, 23, and iii. 21, and it would run thus, "Except a man be born of the Spirit as well as water" (a protest against the Essenistic overvaluing of ablutions, see also *Sibylline Books*, iv. 164–174); (4) the inevitable transition hence was to the form in the Fourth Gospel, "Except a man be born of water and of the Spirit." Here the authority of the Ephesian apostolic school arrested the development, which would else have issued in (5) the Clementine stage, "Except ye be regenerated by living water into the name of Father,

---

1 The argument is not affected even though we adopt in John iii. 3 the reading ἀναγεννηθῇ, which is unquestionably proved by the Latin renderings to have been a very early reading. Whichever be the reading, Justin's omission—as an omission—remains inexplicable.

Son and the Holy Spirit, ye shall not enter the kingdom of heaven." If (6) "living" had subsequently been omitted, the development would have been completed in a sixth and last stage.

Take another case of the apparent use of the Fourth Gospel by Ignatius. "I desire bread of God, heavenly bread, bread of life, which is the flesh of Jesus Christ, ... and I desire drink of God, His blood, which is love imperishable, and ever-abiding life" (*Ep. to the Romans*, ch. vii.). Now here it is true that we have a thought peculiar to the Fourth Gospel. Paul speaks of the "blood" always as sacrificial, the "blood of sprinkling;" and indeed to a Jewish mind, taught to "abstain from blood," the thought of drinking "blood" would be at first extremely repulsive, even as a spiritual metaphor. It is very unlike anything in the Apocalypse, where blood is never "drunk," except by the scarlet woman and the murderers of the saints. But it is an image that must have suggested itself to the church as soon as the Gentiles, unfettered by Jewish associations, began to be imbued with eucharistic thought. Indeed, after the first repugnance had worn away, Jewish thought itself—even Pauline thought, and much more the thought of Jewish Christians trained in the school of Philo—would hasten the adoption of the eucharistic metaphor. For was not the blood "the life," according to Moses? And was not a Christian taught to believe, with Paul, that his individual life was merged and "hid" in Christ's life? Again, it would soon be felt that to speak merely of feeding on Christ's flesh was to present the New Testament in an unsymmetrical and almost maimed aspect. Moses had not only fed his people upon bread from the sky (the manna), but had also given them water to drink from the rock. What had the church to show against this symmetrical display of Mosaic power? It was not enough to say (with Paul) that that same "rock" was really Christ: it was necessary to show that the rock still supplied the faithful with divine drink. And for this purpose, what was more appropriate than the cup of the Lord's blood? Regarded in this way, the metaphor would commend itself speedily even to the Jewish mind. Nay, to the cultivated Alexandrian Jew, it would at once commend itself, as we may perceive from the works of Philo, who uses words so strikingly similar to Christian thought that they might almost seem, to a hasty reader, to have (of themselves) originated the eucharistic miracle of Cana. "Who can pour over the happy soul (which proffers its own reason as the most sacred cup) the holy goblet of true joy, except the cup-bearer of God, the Master of the Feast, the Word?" (*On Dreams*, ii. 38). When such thought as this was floating in the atmosphere of Ephesus and Alexandria, it is impossible to draw from the vague resemblance of the Ignatian passage quoted above any inference that Ignatius was quoting, or even referring to, the Fourth Gospel.

Nor can we infer any quotation of documents from the fact that Polycarp (*Ep. to Philip.*, ch. vii.) mentions Antichrist in language somewhat similar to 1 Jo. iv. 2, 3. "Every one that doth not confess that Jesus Christ hath come in the flesh," writes Polycarp, "is Antichrist; and whoso doth not confess the mystery of the cross is of the devil." The thought indeed is manifestly similar, and the language so far similar as to show that both Polycarp and the author of the epistle lived amid identical traditions of Christian teaching. But the epistle itself testifies that the name "Antichrist," so far from being invented by the author of the epistle, was already current in the church: "Little children, ye have heard that Antichrist shall come." If, therefore, it was a fact that already in Asia there had arisen a sect denying that Christ had come "in the flesh," and that the Ephesian circle of apostles first, and the Ephesian school of elders afterwards, had denounced such a belief as being of Satan and of Antichrist, and if this was taught to the Ephesian catechumens, and preached in the Ephesian pulpits, in a form sanctioned by authoritative teaching and by repeated use, what more is wanting to explain the similarity between the Epistle of John and that of Polycarp?

Again, it is said that Justin (*Dial.*, ch. 88) imitates John (i. 23) in putting the words "The voice of one crying," &c., into the mouth of John the Baptist, instead of placing them as an evangelical comment (as the synoptists do) on the appearance of the Baptist (Mat. iii. 3; Mk. i. 3; Lu. iii. 4). But this inference is unsound, as can be shown by analogy; for Mark uses also as an evangelical comment (i. 2), "I send My messenger before thy face;" but Matthew and Luke place it in the mouth of our Lord (Mat. xi. 10; Lu. vii. 27); and therefore, according to the reasoning above, we must infer that Luke had copied Matthew, or Matthew had copied Luke, in taking the evangelical comment, and inserting it in a discourse of Jesus! How fallacious would be such a deduction! How much more reasonable to suppose that—in accordance with the inevitable tendency thus to take prophecy, as it were, out of the framework, and insert it in the picture—Matthew and Luke have independently adopted a tradition later than Mark, which transposed Mark's evangelistic application of prophecy, and inserted it in the words of the Lord! But if this is the more probable solution in the case of Matthew and Luke, why not also in the case of Justin and John, the circumstances being precisely the same?

But it has been urged that, although Justin cannot be shown to have quoted the Fourth Gospel, yet his acquaintance with the Valentinians (*Dial.* 35)—"who freely used the Fourth Gospel" (Iren., *Adv. Hær.*, I. viii. 5)—"shows that the Fourth Gospel could not have been unknown to him" (Westcott, *Introd. to Gospel of St John*). Justin's words are these: "There are, and there were, many who, coming forward in the name of Jesus, taught both to speak and act blasphemous things, with whom we have nothing in common, since we know them to be atheists. Some are called Marcians, and some Valentinians, and some Basilidians, and some Saturnilians, and others by other names." Now this mere mention of the Valentinians as one of a number of abhorred sects, with whom the writer has nothing in common, scarcely seems to prove any minute acquaintance on the part of Justin with the opinions or books in use among the Valentinians. But even if it be proved, what is the consequence? Surely this, that Justin, knowing the Fourth Gospel to be freely used by a sect which he stigmatizes by name, altogether abstained from using it himself. Irenæus, who uses the Fourth Gospel, accuses the Valentinians of misusing it; Justin, who does not use the Gospel, brings no such accusation. The natural inference is (if any inference at all is to be drawn from such slight premises) that either he did not know of the existence of the Gospel or of its misuse, or that he knew of its existence and use but did not recognize its authority.

Two more instances must conclude the list. It is found that both Justin and John alter the quotations of Zech. xii. 10 from the LXX. version (*ἐπιβλέψονται πρὸς μὲ ἀνθ' ὧν κατωρχήσαντο*) into *ὄψονται εἰς ὃν ἐξεκέντησαν*: "They shall look on Him whom they pierced;" and the Apocalypse (i. 7) also contains the same word in "they also which pierced Him." But this, as we have seen above, especially as it involves a return to the Hebrew text, is perfectly explicable on the same grounds as those which explain prophecies similarly quoted by the synoptists—viz., a common "ecclesiastical use." Still less can anything but floating tradition be inferred from such an allusion as is contained in Polycarp's Epistle to the Philadelphians: "The Spirit, coming from God, is not to be deceived; for it knoweth whence it cometh, and whither it goeth." Here, though the words οἶδεν πόθεν ἔρχεται καὶ ποῦ ὑπάγει (ὑπάγει is a word specially disliked by Luke in his Gospel, and not used by Paul), being identical here and in John iii., do certainly, as Dr Sanday points out (*Gospels*, p. 275), imply "an association of ideas," yet, as the same writer remarks, the thought is different. Polycarp says, "The Spirit knoweth whence it cometh;" John says, "We know not whence the Spirit cometh." This indicates that Polycarp is vaguely alluding to oral and traditional doctrines current in his province (familiar, perhaps, but by no means as yet authoritative), rather than quoting from a Gospel known to be written by one of the foremost of the apostles, the "beloved disciple of the Lord."[1]

But it is urged (1) that Justin has the doctrine of the Christian, as distinguished from the Alexandrian, Logos; (2) that he could not have had originality enough to develop this himself, and therefore (3) he must have borrowed this method of thought from the Fourth Gospel. And the following expressions are quoted: "Jesus Christ is, in the proper sense (ἰδίως), the only Son begotten of God, being His Word (λόγος), and First-born, and Power (Πρωτότοκος καὶ Δύναμις);" "But His Son, who alone is rightly (κυρίως) called Son, who before all created things was with Him and begotten of Him as His Word, when in the beginning He created and ordered all things through Him," &c.; "Now, next in order to the Father and Lord of all, the first Power (who indeed may also be called Son) is the Word, concerning whom we shall relate, in what follows, how being made flesh (σαρκοποιηθεὶς) He became man;" "The Word of God is His Son" (*Apol. I.*, xxiii., xxxii., lxiii.; *Apol. II.*, x., quoted by Sanday, *Gospels*, p. 284; see also Lightfoot's *Colossians*, i. 15).

But it can be shown (1) that all these thoughts were suggested, and many of these expressions actually used, by Philo in Alexandria (40 A.D.), about a hundred years before Justin wrote; (2) that the personification of the Wisdom of God (and Logos means Wisdom as well as Word) in the books of Proverbs and Wisdom rendered it necessary for orthodox Christians, who accepted these books, to identify this personified Wisdom with Christ; (3) that the generally recognized Messianic reference of Ps. lxxxix. 27, ἐγὼ πρωτότοκον θήσομαι αὐτόν, leading to the comment, "I will make King Messiah a First-born," resulted in a recognition of "the First-born" (ὁ Πρωτότοκος, בְּכוֹר) used absolutely, as a title of the Messiah (Lightfoot, *Col.* i. 15); (4) that those elements of the Alexandrian theory of the Logos which are inconsistent with the Christian theory furnish no proof at all that the Christian theory was independent of the Alexandrian. It was inevitable that, when the Christians borrowed, they would adopt what was consistent, and discard what was inconsistent, with the belief in the incarnation of Christ.

There is abundant evidence to prove these propositions. Even before Paul wrote the Epistle to the Colossians, and *a fortiori* before the composition of the Fourth Gospel, that instinct which compels men to set the First Cause of all at a distance from matter had impelled Alexandrian Judaism to adopt the belief that the supreme God did not Himself directly and immediately create the world, or manifest Himself to mankind, but indirectly and mediately, through some medium or mediator. The simplest and subtlest metaphor to express this mediateness was Word—more especially in the Greek language, where Word (Λόγος) might mean reason as well as speech, the word in the thought as well as the word in the sound. Man manifests himself through deeds as well as words; but for the Supreme (with whom to speak is to do) the only necessary manifestation was the Word, the Logos. Dr Lightfoot has shown (Col. i. 16) that Philo sometimes regards the Logos as a merely passive instrument, so that he allows himself to use the simple instrumental dative (ᾧ) to describe the relation of the Word to the Creator (ᾧ καὶ τὸν κόσμον εἰργάζετο), "which mode of speaking is not found in the New Testament;" and elsewhere Philo, even where he uses the prepositional construction (δι' οὗ), expressly likens the world to a house, the Supreme to the builder, and the Logos to the ὄργανον or tool (*Of Cain and his Birth*, ch. xxxv.). Moreover, as a city, while as yet only existing in the conception of the architect, may be said to *be* the reason of the architect, so the world (regarded as perceptible only to the intellect) is said to *be* the Logos or reason of God busying itself in the work of creation (*The World*, vi.). Philo also describes the Logos as "the archetypal model, the idea of ideas." These passages undoubtedly indicate a great gulf between the Christian and Alexandrian Logos. But other passages abound, which Christians could adopt unchanged, applying them to the incarnate Christ; in particular, the passage quoted above (*On Dreams*, ii. 38), where the Word of God is described as "the cup-bearer of God;" and here follow words which would be fraught with eucharistic meaning for a Christian—"the Master of the feast . . . . not differing from the draught itself." Again, the Word is said (*Who is the Heir*, ch. xxxix.) to divide in equal portions among all that are to use it the heavenly food of the soul which Moses calls manna; and the Word is expressly said to be a Person in the following passage (*Questions and Solutions*, 62)—*Question*: "Why is it that He speaks as if of some other god, saying, He made man after the image of God, and not that He made him after His own image?" *Solution*: "Very appropriately and without any falsehood was this oracular sentence uttered by God; for no mortal thing could have been formed on the similitude of the supreme Father of the universe, but only after the pattern of the second Deity, who is the Word of the Supreme Being." Even where Philo describes the Word as the instrument of creation, he speaks of it or Him as "the image (εἰκών) of God" (*On Monarchy*, ii. 5): "The Image of God is the Word by whom all the world was framed (ἐδημιουργεῖτο)." Further, the Word is frequently called by Philo the "First-begotten (πρωτόγονον) Son" and "Eldest Son." The prophecy of Zechariah (vi. 12, according to the LXX.) "Behold a man, the East is his name," which is twice applied by Justin (*Dialogue*, cvi. and cxxi.) to Jesus the Son of God, was applied with curious similarity and difference a hundred years before by Philo, who, although he finds it inappropriate for "a man compounded of body and soul," sees in it a singular appropriateness to "that incorporeal Being who in no respect differs from a divine image. . . . . For the Father of the Universe has caused Him to spring up as the Eldest Son" (*On the Confusion*, &c., 24).[2] Many of the very expressions which are sometimes used to show that the Logos of the Alexandrians was impersonal are found applied to God in the Old Testament, or to Christ in the New. For example, if Philo calls the world the "garment" of the Logos, the Psalmist also (Ps. civ. 2), appealing to the Lord his God, says, "Thou coverest Thyself with light as with a garment;" or if the Logos is described by Philo as the "bond" which holds the world together, so also does Paul describe Christ as the Being in whom "all things cohere" (τὰ πάντα συνέστηκεν, Col. i. 17). Nay, further, he attributes to the Logos that function of "reproving" or "convincing" (ἐλέγχειν) which is so strikingly assigned in the Fourth Gospel to the Spirit of the ascended Christ (Jo. xvi. 8), "And when He come, He will reprove (ἐλέγξει) the world of sin;" compare Philo—who also adds a remark that suggests the thought (Jo. i. 9) of "the Light that lighteth every man"—"As long as the *divine Word* has not come to our soul, all its actions are blameless; but when the priest, conviction (or "reproval," ἔλεγχος), enters our heart like a most pure ray of light, then we see that our actions are liable to blame" (*On the Unchangeableness of God*, 28).

In the face of all these passages (and many others might be quoted) the difficulty would seem to be, at first sight, not to prove that the Alexandrian theory of the Logos was the parent of the Christian theory, but to find any difference between the two. The difference, however, is in reality very great, and very readily explained. Philo looked on the manifestation of God through the Logos as being the old inferior dispensation, while the new dispensation was to be the manifestation of the Supreme as τὸ ὄν, absolute Being. The Logos manifestation of Philo was a manifestation of God through visible creation; the higher manifestation was to be independent of visible objects. The former was the manifestation of "God as man"—*i.e.*, as liable to anger, change, repentance, &c.; it was also (*On the Unchangeableness of God*, xi.) an appeal to fear through rewards and punishments, not strictly true, and not intended for the esoteric sage, but only for the unspiritual multitude. The latter, on the other hand, was the manifestation of God as not man—a fatherly revelation, appealing to love. It followed that Philo not only did not identify his Logos with the Messiah, but would have regarded any such identification with one who had "become flesh" as a degradation. It followed also that, although Philo declared the highest revelation to be a revelation of love, there was really no basis for love at all in it. Of God as τὸ ὄν, Philo could not say that He was good, or holy, or loving, because He was superior to all goodness, holiness, and love: "His existence indeed is a fact which we do comprehend concerning Him; but beyond the fact of His existence we can understand nothing" (*On the Unchangeableness of God*, 13).

[1] The writer is indebted to Dr Hort for the suggestion that the transition may be from (1) "thou knowest not whence He cometh," to (2) "He alone knoweth," &c., and thence, the "alone" being understood, to (3) "He knoweth," &c. Yet, when all due weight is given to this suggestion, it will be difficult to deny that the context of John iii. 8 has little in common with the context in Polycarp, "the Spirit is not to be deceived," and that Polycarp's words indicate rather a vague reminiscence of tradition than a quotation from a Gospel supported by the authority of the apostle John.

[2] Some degree of uncertainty whether to call the Word a person or not appears to be implied in the following passage (*Questions*, 54): "The expression 'one of us' (Gen. iii. 22) indicates a plurality of being unless we are to suppose that God is conversing with his own virtues;" but Philo seems to incline to the personal theory.

Imagine the early Christian teachers and preachers, in the cities which were earliest influenced by Alexandria, brought into contact with the Alexandrian theory of the Logos, or possibly in some cases (as in that of Apollos perhaps) themselves trained up in the Alexandrian theory, and now superadding to it the belief in an incarnate Son of God—and what would be the consequence? Not, surely, that they would cast the Logos theory aside as baseless; for how could they deny that "by the Word of the Lord were the heavens made"? or how cancel the words of Wisdom in the book of Proverbs (viii. 22-30), "The Lord possessed Me in the beginning of His way, before His works of old. . . . When He prepared the heavens I was there. . . . I was by Him as one brought up with Him: and I was daily His delight, rejoicing always before Him"? Paul might possibly eschew the actual use of the word Logos, as savouring of men's philosophy, and alter the πρωτόγονος, "First-begotten," of Philo into πρωτότοκος, "First-born," to prevent the inference[1] derivable from the former title, that the Lord, being First-begotten, was not "Only-begotten;" but how could he, or any Christian who believed Christ to be the Redeemer of all mankind and the Eternal Son of God, do other than adopt the Old Testament theory about the Word of God, and at the same time Philo's language, so far as it was personal, while discarding all that was impersonal? If Christ was not identical with the Word of God and the Wisdom of God, then there seemed to follow the intolerable inference that He must be inferior to it; but if He was identical with it, then the introduction of Philo's felicitous language into Christian thought was simply a matter of time.

The introduction would be a very easy process, requiring nothing but a few omissions of expressions implying passive instrumentality (*e.g.*, the instrumental dative), and the addition of an emphatic protest that the manifestation of the Supreme as Love, even though it were through visible objects,—yes, even though it were through the Word of God becoming "flesh,"—nevertheless constituted not an inferior but a superior revelation, the highest revelation of all. To the Logos theory of Philo, which stated that all men were made in the image of the Word, the Christians could add that, through forgiveness and by faith, fallen mankind was destined also to be raised up and conformed to that Word, so that He was the goal as well as the starting-point, the Ω as well as the A; or, as Paul expresses it, "All things are not only created in Him," but "to Him (εἰς αὐτόν)," Col. i. 16 (Lightfoot). This is accordingly expressed emphatically in the Fourth Gospel. Although "no man hath seen God at any time," yet "the only begotten Son, who is in the bosom of the Father, He hath declared Him" (Jo. i. 18); and again, "Have I been so long with you, and hast thou not known Me, Philip? he that hath seen Me hath seen the Father" (Jo. xiv. 9).

This is the full Christian development of Philo's doctrine, as applied to the "First-born" becoming "flesh." But there is not only no evidence that Justin quotes from any written document exhibiting this development, but rather evidence to the contrary, that his doctrine of the Logos, though affected by the teaching of the Ephesian school, had not yet been imbued with it. For, in speaking of baptism, he calls attention to the fact that, in that rite, God is mentioned *only* by the name of "God the Father and Lord of the Universe; for," he continues, "no man can utter the name of the ineffable God; and if any one dare to say that there is a name he is incurably mad" (*First Apology*, lxi.). Looked at in the light of the context, this word ἄρρητος, "ineffable," implies a conception of the revelation of God through Christ hardly reaching the level of the Ephesian doctrine, which teaches that, though God had never been seen, He had been *declared* by the only begotten Son, so that whoso had seen Him had seen the Father. But it is in harmony with what Justin says soon afterwards (*Ib.* lxiii.), that Jesus is also called "Angel" and "Apostle" (compare also Heb. iii. 1); and it harmonizes well too with the doctrine of Philo, that "no mortal thing could have been framed in the similitude of the supreme Father of the universe, but only after the pattern of the second Deity, who is the Word of the Supreme Being" (*Solutions*, 62).

It appears therefore that, although Justin knew certain traditions embodied in the Fourth Gospel, yet (1) it was not read in the church services of the district in the same way as the "memoirs of the apostles"; (2) he did not use the Gospel as an authoritative document; (3) his teaching exhibits less of development than the teaching of the Fourth Gospel. An inevitable inference follows that, if he knew of the existence of the Fourth Gospel as a document, he did not believe it to be the work of the apostle John.

[1] Paul nowhere uses the word Logos to denote Christ; but he uses the expression ὁ λόγος τοῦ Χριστοῦ in one place (Col. iii. 16) to denote what is more commonly denoted by the Spirit of Christ, the indwelling presence of Christ in the heart manifesting itself in word; *cf.* Lu. xxi. 15, στόμα καὶ σοφίαν.

The general conclusion to which we are thus led by the external evidence of quotations is that, although some of the *doctrine* of the Fourth Gospel, expressed in words similar to the words of the Fourth Gospel, was probably current in the Ephesian church towards the end of the first half of the second century, yet it was not by that time widely used, if at all, as an authoritative document; nor have we proof that it was so used till the times of Irenæus, *i.e.*, towards the end of the second century, by which time the Gospel was authoritatively quoted as a work of John; and those who so quoted it probably meant by "John" John, the son of Zebedee, the apostle.

Internal Evidence.

The Fourth Gospel compared with the Synoptic Narrative.—In estimating the Fourth Gospel as a history, we must necessarily attach a special importance to those portions in it which cover the synoptic ground; for these will afford us the best means of judging how far the facts of the life of Christ, as well as the language of Christ, may have been transmuted by the author. We will therefore first consider those parts of the Fourth Gospel which afford us an opportunity of comparing it with the Gospels of the synoptists.

The first point of comparison is the greater scope of the Fourth Gospel as compared with the other three. It includes all past time in its prologue, and exhibits the incarnation of the divine Word as but one act in the drama of the universe.

Nor is its scope in space narrower than in time. The limited scenery of the synoptic stage—Galilee, Samaria, Judæa,—is (in spirit, though not in letter) exchanged here for "the world." As Philo tells us that the tabernacle figured the universe, and that the robes of the high priest represented (*Moses*, iii. 12) the different parts of the world, so the High Priest of the Fourth Gospel, though speaking or working in a narrow province of Syria, is always regarded as officiating at the altar steps of the universe, and bearing with Him the destinies of humanity. "The world" is continually on His lips; and John the Baptist is made to proclaim, even at the very outset of the Messiah's career, that the Lamb of God will take away the sins, not of "the Jews," but of "the world." It is true that Judaism is not ignored. Prophecy is constantly appealed to, and the motive of the Gospel is undoubtedly to show that Jesus is "the Christ" (xx. 31), as well as to show that He is the Son of God. Yet nowhere in the Fourth Gospel is found any marked distinction between the Gentiles and Samaritans on the one side and the Jews on the other, as if the former must be neglected for a time (Matt. x. 5; Lu. ix. 52), and as if the latter were entitled to priority in the offer of salvation; on the contrary, Christ is described, early in the narrative, as preaching to the Samaritans, and the Samaritan faith (far more general than the isolated case of the Samaritan leper in Luke) serves as a foil to the Jewish unbelief. "The Jews," so far as they are distinguished from others, appear throughout as a nation with whom the writer has no sympathy, as the emblem of rebellious, unspiritual scepticism.[2] Viewing the drama at a greater distance of time than the synoptists, and purposely withdrawing himself to a still more subjectively distant point of view, for the purpose of unity and compression, the author almost

[2] The passages iv. 22; x. 16; xi. 52, though they give a kind of precedence to the Jews, yet treat of the passing of salvation from the Jews to the Gentiles, in the way of climax; and these two or three passages (which occur in dialogue and not in narrative) cannot count for anything against the forty or fifty passages wherein the author, in his own person, speaks of "the Jews" as "murmuring," "seeking to slay Jesus," "taking up stones to stone Him," and always systematically opposing themselves to Jesus.

ignores the minor distinctions of Pharisees, Sadducees, Herodians, scribes, and lawyers, with which the synoptists have made us familiar.[1] Palestine is seen no longer with the distinctions of a neighbouring diversified coast-line, but like a dark mass upon the horizon of the distant East, serving as a foil to the splendour of the rising Sun of Righteousness, which it strives in vain to obscure.

In the miraculous part of our evangelist's narrative especially, there is visible this artistic power of selection and compression. Few miracles are described, not more than eight in all (including the post-resurrection miracle of the draught of fishes), and among these not a single case of exorcism. The element of mere wonder (which comes too prominently forward, at least for a pupil of Philo, in the synoptic miracle on the Gadarene) is carefully subordinated to the symbolical element. It is true that the whole Gospel breathes a supernatural atmosphere. Although the Logos, becoming "flesh" (i. 14), is immediately afterwards called Jesus (i. 17) or the Son (i. 18), and is never henceforth mentioned by the name Logos throughout the whole of the Gospel, yet in reality it is still the Logos, rather than Jesus, that is described in the following pages. The Logos is never (as in Mark) "unable" to work miracles, never liable to "marvel," never "in an agony," never (with the single exception of the scene at the grave of Lazarus in which ἐτάραξεν ἑαυτόν, John xi. 33) "sorrowful and very heavy;" the words ἔλεος, ἐλεεῖν, σπλαγχνίζομαι occur repeatedly in the synoptists, never in the Fourth Gospel; the Logos "knows what is in man," sees Nathaniel "under the fig-tree," discerns from the first that one of the twelve whom He had chosen is "a devil"; when He asks advice from His followers, it is a mere form, merely "to prove them, for He Himself knew what He would do"; there is not in the drama of the Fourth Gospel (as in Mark) any development of thought or plan in the chief actor; the development must be looked for in the drama taken as a whole, and including the creation, the fall, and all the preparation of the world for the coming of the Word as flesh; but the life of Christ on earth is, in the Fourth Gospel, only one act as it were, in which the previous action of the drama is simply carried on and sustained; the whole of the future, His destined "lifting up" His death, His rising in three days, all lie mapped out before the Saviour, so that He walks in a known country and in light, while all around, friends and foes alike, are stumbling or groping in the dark. In this sense, therefore, it is true that the supernatural element is even more prominent in the Fourth Gospel than in the synoptists. But the miracles themselves are subordinated. Though frequent reference is made to the vast number of them (ii. 23; iii. 2; vi. 2; vii. 31; ix. 16; xi. 47; xii. 37; xx. 30), yet, not only are very few described, but even those few are described rather as "emblems" than as "mighty works." It is remarkable that the word σημεῖα ("signs"), which the synoptists almost always use in a bad sense (to denote the "sign from heaven" demanded by the Pharisees, or the "signs" which the false Christs shall work to deceive, if it were possible, even the elect, Mk. xiii. 22), is the very word selected by John to describe the miracles of Jesus; while the word δυνάμεις ("mighty works"), which in the synoptists generally denotes the works of Jesus, is never used in the Fourth Gospel. Partly, no doubt, the author may have felt that miracles were made cheap by excessive enumeration, and that the narrative of a multitude of miracles without apparent motive created a stumbling-block rather than a help to philosophic and educated readers. Especially might this be felt in Ephesus, the home of wizards and wonders and "curious arts" (Acts xix. 19), where even the last-called of the apostles had worked cures and exorcisms past numbering (*ib.* 12). Accordingly the author, though he makes mention of very many miracles, describes none but those which are obviously emblematic. It has been stated above that the 1st Epistle of John was not only written by the author of the Fourth Gospel, but must be considered as a kind of postscript or appendix, commending the Gospel to the church. Remembering, therefore, the important passage in the Epistle (1 Jo. v. 8), which describes the three witnesses on earth as breath (or spirit), water, and blood, and bearing in mind that "blood" in all probability has (among other possible meanings) a reference to the eucharistic wine, we shall not be surprised that the first miracle of all describes the changing of the water into wine. Next is a miracle exemplifying the power of the word of Jesus, where faith is present (iv. 50, and *cf.* iv. 41); then the Messiah manifests (in the cure of the impotent man) the superiority of the ever-flowing fountain of life to the intermittent power of the pool of the law (v. 3); then comes the eucharistic feeding of the five thousand with bread and fishes, wherein "the Lord gave thanks," εὐχαριστήσαντος τοῦ Κυρίου (vi. 23), followed by the walking on the water, which is also appended by Matthew and Mark to the eucharistic miracle, then the opening of the eyes of the blind by Him who was the Light of the world (ix. 5); the raising of Lazarus by Him who was the Resurrection and the Life (xi. 25); and lastly, the miraculous draught of fishes, taken at the command of Him who had sent His apostles to be fishers of men, and to cast the net of the gospel (xxi. 6).

In all these narratives, although the common people are exhibited as wonder-struck, yet the impression left on the reader is that, for the Word of God, such works are matters of course, and only important because of their inner spiritual meaning. Philo says (*Life of Moses*, i. 38) that such miracles as the production of the water from the rock by Moses and the like are the sports (παίγνια) of God, and not so really great or deserving of serious attention as the revolutions of the planets. There is no trace of "sport" in any of the works of the Word of God narrated by the author of the Fourth Gospel; yet both he and Philo agree in looking through the letter of the narrative of every miracle to the spiritual essence contained in it, which alone constitutes the importance of the act. Now Philo, in speaking of the creation of Eve from the rib of Adam, declares at once that the literal meaning is fabulous (μυθῶδες); whereas he treats the emission of the water from the rock as historical, although he suggests, as a first explanation, that possibly there may have been a latent spring in the rock. Yet Philo proceeds to deduce his spiritual inferences as freely from what he deems "fabulous" as from what he deems historical. It is not necessary to assume in the author of the Fourth Gospel precisely the same indifference to the distinction between spiritual and historical narrative; but it appears certain that, in his writings, as in Philo's, the historical is subordinated to the spiritual. Not but that the picturesque incidents of each miracle receive from him due attention; but it seems to be for the most part the picturesqueness resulting from the skill of a graphic teacher, rather than from the memory of an eye-witness. Compare, for example, Mark's with John's account of the feeding of the five thousand. There is less motive, less

[1] It has been ingeniously suggested that a distinction is drawn by the author between the "Jews" in the south and the "multitude" (ὄχλος) in Galilee (Westcott, *Introd. to St John*). But the term ὄχλος is also applied to the mixed multitude of pilgrims in Jerusalem at the Passover (xii. 12, 17, 18, 29, 34); and besides, if the author had intended to deny any such distinction, he could hardly have expressed himself more cogently than in xii. 9, where he adds that this "multitude" was of the "Jews" (ὄχλος πολὺς ἐκ τῶν Ἰουδαίων).

art, about Mark's detail than about John's. John's omissions and additions all point to one object, the desire to heighten the Logos and to subordinate the disciples and the crowd. Mark begins by saying that "Jesus had compassion on the multitude;" but the Logos, knowing beforehand "what He would do," determines His course at once as soon as He "lifts up His eyes" and discerns the multitude. In Mark, the disciples come to Jesus begging Him to send the multitude away; in John, it is Jesus who first "proves" one of the disciples with the question, "Whence shall we buy bread that they may eat?" Then (giving a picturesque variety to the story) Andrew, as well as Philip, and a servant-lad (παιδάριον) are introduced, the latter carrying the *viaticum* of the apostles. The loaves, a new circumstance not found in the synoptists, are of an inferior kind, "barley;" and Andrew bases an expostulation on the smallness of the provision. After the command to "sit down," Mark says that they sat "down on the green grass," an epithet natural enough for a speaker perhaps, but inartistic, because too prominent, in a written narrative. John, on the other hand, turns a defect into an excellence, by judiciously connecting the "grass" with the command to sit down, so as to enhance the forethought of the wise Master of the feast, who made provision for the comfort of His guests in the minutest details: "Jesus said, Make the men sit down. Now there was much grass in the place." Lastly, in the synoptic narrative, the gathering of the fragments is the spontaneous act of the disciples; but in John, the feast ends as it began, with the display of the wisdom of the Master, even in the smallest matters, "Gather up the fragments that remain, that nothing may be lost." It is scarcely possible to deny that, in the symmetrical manner in which the story gathers itself around the Logos as its object and centre, the narrative of the Fourth Gospel is far superior to that of the synoptists, and that many of the additional touches of the former are dictated by what has been happily described by Canon Westcott as "an instinctive perception of symmetry in thought and expression."[1]

The same remark applies to the other miracle which John has in common with Matthew and Mark, viz., the healing of the "nobleman's" son.[2] Every detail of difference in John heightens the dignity of the Saviour. In the synoptic account, Jesus offers to go to the house to heal the youth; in John, no such offer is made, and the nobleman and his companions are accosted with a rebuke, "Except ye see signs and wonders, ye will not believe." In the synoptists, the man is represented as living at Capernaum, and Jesus as entering Capernaum, so that the father sends but a short distance; in John, Jesus is represented as remaining at Cana, while the suppliant father journeys thither in person from Capernaum, a distance of twenty-five miles. In the synoptists, the father sends a message, praying Jesus not to trouble Himself to enter his roof, but to "speak the word only;" in John, the father piteously supplicates the Saviour to "Come down, ere my child die." In the synoptists, it is recorded that Jesus "marvelled"; in the Fourth Gospel, He simply pronounces the authoritative words, "Go thy way, thy son liveth." In the synoptists, Jesus avails Himself of this incident to proclaim, almost as if it were (and probably it was) a development of His work suddenly revealed to Him by His Father, that many of the Gentiles shall be admitted into the kingdom; in the Fourth Gospel, which exhibits no development, these words would necessarily seem out of place, and are omitted. Contrast could scarcely be more complete; and it is not surprising that many commentators, rather than identify such opposites, prefer to suppose that, about the same time in the life of Jesus, two men, both in high positions, had sons at the point of death, in the same place (Capernaum), both of whom petitioned Jesus to heal their children, and both of whom obtained from Him miraculous cure, performed at a distance from the two patients. To some, however, as to the candid author of *The Authorship and Historical Character of the Fourth Gospel*, it will appear more probable that we have the same event, differently described. But those who accept the theory of identity ought to consider how much is involved in it. For the defenders of the difference of the two miracles are undoubtedly justified in drawing a contrast between them in almost every point of spiritual importance (Augustine, *Ev. Joh. Tract.*, 16). If, therefore, the Fourth Gospel is historically accurate, then (on the supposition of the identity of these two narratives) the three synoptic Gospels are historically inaccurate; but if the synoptic narrative is historically accurate, the narrative of the Fourth Gospel must be considered rather a new dramatic version, than an independent historical account; and the same remark will necessarily apply to, and affect our estimate of, all the accounts of miracles in the Fourth Gospel.

Gaining light thus from the comparison of the Fourth Gospel with the synoptists, wherever they occupy common ground, we shall find it useful, before proceeding to the summary of the Fourth Gospel, first to touch on the few remaining points which the fourth has in common with one or more of the three. Luke contains most of these. For example, if we accept the passages Lu. xxiv. 12, xxiv. 40, as being not interpolations, though perhaps additions made by the author to a subsequent edition of his Gospel, it will follow that, in the account of the resurrection, Luke and John agree identically in adopting the traditions (1) that Peter "beheld the linen clothes laid by themselves in the sepulchre;" (2) that the Lord showed His disciples, after His resurrection, His wounded body in token of His identity. In both these cases several minute details are added by John; and this also applies to another important incident which Luke and John have in common, viz., the "entering of Satan" into Judas. Luke records it briefly in two words (xxii. 3), and makes the "entrance" occur some time before the last supper; but John, in a far more powerful scene, reserves the "entrance" for the moment when the "sop" is handed to the traitor by the Saviour, and the disciples seated at the last supper. Here again the incident is the same; but the treatment is very different.

The agony described by Luke (xxii. 44, and, without Luke's additions, in Mat. xxvi. 39 and Mk. xiv. 35, 36), when the Lord prayed that "the cup might pass from Him," and when an "angel" appeared from heaven strengthening Him, may seem, at first sight, to have no counterpart in John. And indeed the synoptic description of the agony in Gethsemane is not adapted for the Fourth Gospel. Inserted in any page of that Gospel it could not fail to jar upon us as being out of harmony with the context. Nevertheless, a remarkable passage in John (xii. 27) appears to bear a striking resemblance to the account in Luke: "Now is My soul troubled." Thus the Saviour

[1] The only points in which this narrative can be illustrated by Philo's remarks (*Alleg.*, iii. 56–8) on the manna are two or perhaps three:—(1) As Philo says that the soul is fed not by earthly food but by "words," so the Gospel says that "words" are the source of life (vi. 63); (2) Philo, speaking of the manna, praises those who seek the food for its own sake and not for ulterior advantage; compare John vi. 26 on the "loaves and fishes;" (3) Philo, speaking of the object of the miracle, quotes Exod. xvi. 4, "that I may prove them;" this may possibly, but not probably, illustrate John vi. 6.

[2] It is here assumed (with Dr Sanday, *Fourth Gospel*, p. 100) that they are the same. The assumption of their difference involves even greater difficulties than the assumption of their identity.

avows a certain conflict in His heart, yet by the very deliberateness (as well as by the publicity) of the avowal takes from it something of the intense and almost passionate humanity of the synoptic narrative. Immediately after these words the Saviour, in the Fourth Gospel, deliberately suggests to Himself the synoptic prayer, and repeats it: "What shall I say? 'Father, save Me from this hour?' But for this cause came I to this hour." At once triumphing over the—from the point of view of the Fourth Gospel—unworthy suggestion, He exclaims, "Father, glorify Thy name." Upon this comes the heaven-sent message, but not (as in Luke) an angel to "strengthen" one "in an agony praying more earnestly;" on the contrary, the voice does but ratify the Saviour's utterance: "I have both glorified it, and will glorify it again." Finally, the author adds, as usual, the babble of the multitude, as a foil to the all-knowing wisdom of the Divine Word: "The people therefore that stood by and heard it said that it thundered; others said, An angel hath spoken to Him." No answer to their doubts and questionings is given by Jesus; but we are left under the impression that the "I" is uttered, neither by thunder nor by any mere angel of God, but by the Father Himself. A soul "troubled"; a prayer to be saved from the trouble; the suppression of that prayer, after more or less of conflict, and the substitution of another prayer in its place; and lastly, a message or messenger (ἄγγελος) from heaven—the facts are much the same both in Luke and in John, yet how different is the treatment of the facts, and what a world of difference in the spiritual result!

Almost the only passage in which John adopts a few consecutive words of the synoptic narrative is the narrative of the anointing (xii. 3–8). There is much less similarity between Peter's confession, as recorded in Jo. vi. 68, and as recorded in Mat. xvi. 16; Mk. viii. 30; Lu. ix. 20; but the narratives appear to refer to the same event, and if so, the comparison between the two is most instructive. In Matthew and Mark the confession of Peter constitutes a turning-point in the life of Jesus; it is the sign which convinces Him that, the seed of a living faith having been sown, His work is now done, and that the hour of His departure is at hand: "From that time forth" (Mat. xvi. 21; Mk. viii. 31) "began Jesus to show unto His disciples how that He must go unto Jerusalem, and suffer," &c.; and accordingly the Lord prepares the disciples with the greatest care, and even tenderness, for the all-important answer to the question which He is to put to them, "Whom say ye that I am?" and when the question is answered, pronounces a fervent blessing on Simon, the son of Jona, but better called Cephas, a rock, whose faithful confession is the token of the laying of the foundation stone of the new temple. If Jesus is to be regarded as a man, "who, though He were a Son, yet learned obedience by the things which He suffered" (Heb. v. 8), then in the whole synoptic narrative of the life of Christ there is not a more important crisis than this. But in the Johannine narrative crises are altogether out of place, where all is pre-ordained; and instead of the tender questioning, the inspired confession, and the fervent blessing, we have simply an almost casual appeal of the Lord to His disciples, "Will ye also depart?" which, when a response has been made by Peter, is followed, not by a blessing, but by sad words conveying the assurance that the Word of God, who chose the twelve, knows all their weakness as well as their strength, and cannot be surprised either by confession or by betrayal: "Jesus answered, Have not I chosen you twelve, and one of you is a devil?" Both in the Fourth Gospel and in the synoptists (Mat. xvi. 23; Mk. ix. 33), immediately after the blessing of Peter, mention is made of "Satan" or "Devil." To bless Peter, and to call him "Satan" immediately afterwards, is consistent with the human Christ described by Mark and Matthew. The difficulty is avoided, in Luke, by omission; but the Fourth Gospel, retaining the traditional mention of the word "Satan," or "Devil," directs it to Judas; upon whom elsewhere the Fourth Gospel (xii. 4–8) concentrates the faults imputed by Matthew (xxvi. 8) not to Judas alone but to all the disciples.

Readers who may think that this last dislocation of the words of Jesus appears somewhat improbable should consider carefully the patent instance which follows. In the synoptic account of the betrayal, Matthew and Mark represent Jesus as awaking the sleeping disciples (at the moment of the arrival of the traitor and his band), with the words, "Rise, let us be going (ἐγείρεσθε, ἄγωμεν). Behold, he that betrayeth Me is at hand" (Mat. xxvi. 46; Mk. xiv. 42). Luke alters this; it is too human for him, seeming to imply flight; and therefore he substitutes a command, in the second person, "Rise up and pray, lest ye enter into temptation" (Lu. xxii. 46). But John, while averse to this change of the traditional words, neutralizes their questionable effect by taking them completely out of their context. Accordingly, he places them between the discourse on peace in ch. xiv. and the discourse on the vine in ch. xv., just at the point when we may suppose the Master with His disciples to be rising from the table, purposing shortly to pass quietly from the lighted upper-room where He had been celebrating the last supper down into the streets of Jerusalem, on His way to Gethsemane. Taken in this context, the words are free from all suspicion of haste or trepidation; on the contrary, they betoken authoritativeness and decision. Rising from the sacred meal, and going forth to welcome "His hour," the Saviour says,—as if with the consciousness that He is the High Priest of the World, going forth to celebrate the sacrifice foreordained before the foundations of the world,—"But that the world may know that I love the Father, and as the Father gave Me commandment, even so I do. Arise, let us go hence (ἐγείρεσθε, ἄγωμεν ἐντεῦθεν)."

The entry into Jerusalem, the crucifixion, and resurrection, are almost the only remaining events common to the Fourth Gospel with the synoptists. The entry is much condensed, and closely connected with the raising of Lazarus (xii. 18); the lengthy account of the sending for the ass is passed over in the words—"Jesus, when He had found a young ass, sat thereon"; and the acclamations of the multitude and the pomp of the procession are all omitted or lightly touched, as if the gleam of popular favour which so impressed the synoptists scarcely deserved the attention it had received from them. It was a mere consequence of the raising of Lazarus: "For this cause the people also met Him, for that they heard that He had done this miracle." Yet in Matthew (xxi. 11), when the city asks "Who is this?" the crowd replies, "This is Jesus, the prophet from Nazareth of Galilee"—making no mention of the wonder which—according to the Fourth Gospel—was the sole cause of the procession.

After this, John omits the purification of the temple, which he has placed earlier, at the first visit of Jesus to Jerusalem (ii. 15),[1] and passes rapidly to the last supper. Here, as is well known, there are great difficulties in recon-

[1] The purification of the temple, placed as Christ's first public act, is as suitable an introduction to the life of Christ in the Fourth Gospel as the sermon in Nazareth is to the life of Christ in the Third Gospel. In Luke (the Gospel of mercy), the proclamation of the "healing of the broken-hearted" to His friends at Nazareth; in John (the Gospel of the Word of God, in which the words ἔλεος, ἐλεεῖν, σπλαγχνίζομαι, so often repeated by the synoptists, are altogether absent), the purifying of the temple of God,—is the most appropriate commencement of the Saviour's public work. Besides, the prophecy of Malachi

ciling the account of the Fourth Gospel with that of the synoptists. In the synoptists the last supper is (apparently) the passover, in which the Lord bequeathes Himself to His disciples as their sacrifice, giving them His body and blood; in John the last supper, so far as he describes it, is merely the last meal shared by the Master and His disciples, at which He washes their feet, and exhorts them to humility, patience, and peace; and it is expressly described as being "before the feast of the passover" (John xiii. 1). Again, in the synoptists, Mark places the crucifixion at the third hour (9 A.M.), and the darkness is made by all the synoptists to last from 12 to 3 P.M.; but John (who is describing in the crucifixion the sacrifice of the passover, the slaughter of the Lamb of God which was to take away the sins of the world) naturally places the crucifixion later, in order that the Lamb may be slain "between the two evenings," as prescribed in the law; and therefore he does not place even the delivery of Pilate's verdict till the sixth hour, *i.e.*, 12 o'clock, and the crucifixion, consequently, later still. The symbolism which prevails in the Fourth Gospel may incline us generally to accept the synoptists' narrative in preference. But there are special reasons why, at a very early date, a slight misunderstanding, among the Gentile churches, of Jewish custom and of the common tradition may have led to an erroneous supposition that the last supper was the passover meal; and the explanation suggested by Canon Westcott (*Introduction to the Study of the Gospels*, p. 344) seems a very reasonable one. In this case, therefore, the Fourth Gospel must have the credit of dissipating an error which had very early crept into the synoptic narrative (namely, the insertion of the words "The first day of unleavened bread," Mat. xxvi. 17; Mk. xiv. 12; Lu. xxii. 7); nor is it at all unlikely that this rectification came from the apostle John himself. But as regards the hour of the crucifixion, it seems more likely that the account of Mark is correct, not only because it leaves more time for the burial before sunset, but also because the later hour implied in the Fourth Gospel appears naturally suggested by the same symbolism which afterwards finds in the wounded body of Christ a fulfilment of the two prophecies, "A bone of Him shall not be broken," and "They shall look on Him whom they pierced."

Passing now to those details of the crucifixion wherein the Fourth Gospel differs from the synoptists, we find in almost each case but one motive—to enhance the majesty of the Saviour. Even in the arrest of Jesus this motive appears. The synoptists tell us that He was arrested by a "crowd" (ὄχλος), servants, sent apparently from the houses of (παρά Mat.; ἀπό Mk.) the chief priests and elders; and as the moon shone at the full, so brightly that the disciples could discern their Master from some distance (a stone's cast), and perceive His agony, as well as hear the words of His prayer in the stillness of the night, they do not think it necessary to make mention of "lights" or "torches." The Fourth Gospel describes how the "cohort" of the citadel of Antonia is called out, together with the servants of the priests, making up in all, if the whole cohort is meant, five or six hundred men; and these approach, not with "swords and clubs" (as Mk.), but with "torches and lights and arms." Jesus goes forward to meet them, and intrepidly declares that He is the person whom they are seeking, upon which they "recoiled and fell to the ground." Nothing of all this is found in the synoptists.

Though John agrees with Luke in the tradition that the servant's ear cut off by Peter was the "right" ear,[1] he entirely omits Luke's narrative of Christ's examination before Herod; but this is in accordance with his fixed purpose—while by no means neglecting graphic and picturesque detail—to ignore all petty local distinctions, and to draw none but large and clear outlines on his canvas. Rome and "the Jews" alone appear round Christ on the stage of his drama; not one of the Herods is so much as once mentioned from the beginning to the end of it. The irony of providence, by which Pilate is made to proclaim that Jesus is "King of the Jews" (xix. 20), reminds us of the similar irony by which Caiaphas, not speaking "of himself" but inspired by God, is forced to publish the suffering of the Saviour (xi. 51); and both passages are quite in the manner of the Fourth Gospel. So also is the very natural application of the prophecy, "And for My raiment did they cast lots," to the seamless tunic of Christ. Remembering what stress is laid by our author's teacher, Philo, on the high priest's garments (*Moses*, 14; *Dreams*, 37), which "represent the universe," we shall readily perceive that while the outer garment of Christ is freely given to the four quarters of the world, the inner seamless tunic (χιτών), that which He wears next to His heart, is not to be rent, representing as it does the regenerated world, "those who receive remission of sins through Him" (*Dialogue* liv.).[2]

Comparison with F Epistle John.

The Motive of the Fourth Gospel illustrated by the First Epistle of John.—It has been said above that the 1st Epistle of John is most closely connected with the Gospel. The connexion is so close, in thought as well as in language, that the former may almost be called a summary of the latter. In the Epistle, even more clearly than in the Gospel, we see the author's habit of dealing rather with elements than with nations or individuals. With the exception of the illustration of "Cain," which he possibly borrowed from Philo (who uses Cain and Abel to denote the earthly and the spiritual principle, *Sacrifices of Cain and Abel*, 1), he prefers to dispense with personal illustrations of principles. He does not, like Paul, speak of Abraham, or Hagar, or Sinai, or Isaac, or Melchisedek, or the Jews, or the Gentiles; but of the world and the flesh, the water, the blood, and the spirit, light and darkness, life and death. In the Epistle, as in the Gospel, we see the rejection of Christ explained, not as a casual outcome of individual caprice or wickedness, but as an inevitable result of the eternal antagonism between light and darkness. In the Epistle, as in the Gospel, the author insists that the new commandment of Christ to "love one another" is really an old commandment which men have had from the beginning: a commandment as old as the promptings of the Light which from the beginning has "lighted every man coming into the world,"—an old commandment only so far made new as it has been brought home to the hearts of men with a quite new intensity by the manifestation of the incarnate Love of God. In the Epistle, as in the Gospel, it is recognized that the antagonism between the world and the spirit, between light and darkness, must go on without truce till one has prevailed; and each man must take one or other side, putting away all hope of compromise. There are two principles, says Philo, contrary to and at variance with one another,—the one represented by the God-loving Abel, the

(iii. 1),—"Ἰδοὺ ἐξαποστέλλω τὸν ἄγγελόν μου, καὶ ἐπιβλέψεται ὁδὸν πρὸ προσώπου μου (John the Baptist), καὶ ἐξαίφνης ἥξει εἰς τὸν ναὸν ἑαυτοῦ κύριος ὃν ὑμεῖς ζητεῖτε,—predicts a "sudden" coming of the Lord into the temple, following on the steps of his "messenger." This prophecy is better fulfilled, if the Lord comes to the temple *Immediately after* the preparation of John the Baptist; and, besides, the "sudden" coming is better fulfilled in the early entry of Jesus (John ii. 14) than by the later entry in the synoptists, which was preceded by a public procession. Thus prophecy, as well as appropriateness, might induce an account of an early purification of the temple.

[1] Note also that the Fourth Gospel is the first to give the servant's name, Malchus. In the same way the *Acta Pilati* for the first time give the names of the two thieves, Dysmas and Gestas.

[2] Only the Fourth Gospel thus distinguishes between the ἱμάτια and the χιτών. But compare Lev. xvi. 4, where the χιτὼν ἡγιασμένος is prescribed as the dress for the high priest on the day of atonement; and see also Philo (*Dreams*, 37); and especially note Philo's remark that this χιτών is "not easily *rent*" (ἀρραγέστερος).

other by the self-loving Cain, which must needs be at variance when born, "for it is impossible for enemies to dwell for ever together." In precisely the same way does our author illustrate the same antagonism by the same personality: "Not as Cain, who was of that wicked one, and slew his brother. And wherefore slew he him? Because his own works were evil and his brother's righteous"; and then, relapsing from the unfamiliar method of personal illustration into his habitual language about principles or elements, he substitutes for Cain the "world," and for Abel the "children of God," and bids his readers "marvel not if the world hate you."

In this continuous strife between light and darkness the victory is to be gained by faith,—but faith supported by witnesses; and we read in the Epistle that the object of our victorious faith is "He that came through (διά) water and blood, Jesus Christ; not with the (ἐν τῷ) water only, but with the water and the blood; and the Spirit is that which beareth witness, because the Spirit is truth; because they that bear witness are three, the spirit (or breath, τὸ πνεῦμα) and the water, and the blood, and the three are united so as to make up the one" (εἰς τὸ ἕν εἰσι) (1 John v. 6–8).

Passing over many differences of interpretation, and asking, What is the meaning of the water and the blood? we turn to the Gospel, and, in the account of the crucifixion, we find (xix. 34) especial stress laid upon the fact that from the side of Jesus "there came out blood and water; and he that hath seen hath born witness (μεμαρτύρηκεν), and his witness (μαρτυρία) is genuine (ἀληθινή), and he knoweth that he saith true, that ye might believe." In what sense is the "blood" here to be understood? As nourishing? or as cleansing? Almost certainly as cleansing; because above, in this very Epistle, the blood of Jesus is described (i. 7) as cleansing us from all sin. Inferring, then, that the blood signifies a superior purifying or baptismal influence, we necessarily infer simultaneously that the water signifies an inferior baptismal influence. Two purifications are mentioned in all the four Gospels, an inferior and preparatory, and a superior and final: the former is the baptism with water, the latter is the baptism with the Holy Spirit, or (as in Lu. iii. 16) with the Holy Spirit and fire (*cf.* also Lu. xii. 49). But the conception of "baptism with fire,"— though it is based on the early history of Israel (Num. xxxi. 23), and appears occasionally in the shape of a "fiery trial" of faith, as well as in the fiery tongues of Pentecost—was soon supplanted by one of two other conceptions, either sprinkling with sacrificial blood, or baptism with the Spirit. This higher purification, or baptism with blood, Jesus brought into the world. He not only came working by means of it (διά with gen., as above in the passage quoted, 1 John v. 6), but also, in a certain sense, in it (ἐν). That is to say, He himself underwent the higher baptism with blood as well as the lower purification with water, which He received from John the Baptist. "Can ye be baptized with the baptism wherewith I shall be baptized?"—He said to the sons of Zebedee (Mk. x. 38). The agony in Gethsemane, which was that baptism, was typified by Luke in an exudation of "sweat, as it were great drops of blood falling down to the ground" (Lu. xxii. 44). But this baptism was scarcely public enough to be a sufficient fulfilment of the prophecy which predicted that "In that day there shall be a fountain opened to the house of David, and to the inhabitants of Jerusalem, for sin and for uncleanness" (Zech. xiii. 1). When it became recognized that the Lord was this "fountain," and that His blood was the cleansing stream, then the piercing of His side and the visible emission of the purifying blood from the wound became an effective and almost necessary type of the spiritual purification, and the type of the blood of sprinkling, suggested perhaps by Luke in his description of the agony, fell into the background, being supplanted by the more natural type of the pierced side.

Such a type would all the more commend itself because, without it, the crucifixion might almost seem incomplete. The mere piercing of the hands and the feet might seem an insufficient fulfilment of the prophecy of the "fountain"; and besides, since crucifixion was generally a lingering death extending over many hours, and since the body of Jesus was taken down on the same day on which it had been attached to the cross (and, according to John, only three or four hours after the commencement of the crucifixion), the record of His death, without the spear wound, might seem to justify the statements of those who maintained that Christ never died at all, and that He was a man only in appearance. Therefore, as a proof of His humanity and of the reality of His death and sufferings, no less than as a fulfilment of the prophecy of the "fountain," it was natural that the latest Gospel should insert, and that the church should readily accept, the witness through blood as well as water, which is so emphatically related by the author of the Gospel, and here appealed to by the author of the Epistle.

But the question remains, What is meant by the connexion of the water and the blood with the breath or spirit —"They that bear witness are three, the breath (or spirit), and the water, and the blood"? Philo may throw light both on the number and on the nature of the witnesses. Only to earthly matters did the rule apply that "in the mouth of *two* witnesses shall every word be established:" heavenly matters required, so Philo teaches, "*three* witnesses" (ἅγιον δὲ πρᾶγμα δοκιμάζεται διὰ τριῶν μαρτύρων, *Posterity of Cain*, 27). He also calls attention to the fact that Moses declares with apparent inconsistency (1) in Leviticus (xvii. 11) that blood is the essence of life, (2) in Genesis (ii. 7) that breath is the essence of life; and he reconciles the two statements by assigning to men two kinds of life: (1) the irrational, which they have in common with beasts, which life has for its seat (ἔλαχε) blood; (2) the rational, which flows from the fountain of reason (λογικῆς πήγης), which has for its seat breath (or spirit), "not (mere) air in motion, but a kind of type and impress of that divine power which Moses calls by a name especially appropriated to it (κυρίῳ ὀνόματι), image (of God)" (*The Worse plotting*, &c., 23). Elsewhere (*Who is the Heir*, 11) he says that blood is the essence of the entire soul, but divine spirit (πνεῦμα θεῖον) the essence of the dominant part of the soul. On the metaphor of the water also Philo throws light. Water and earth, he says, represent the origin, growth, and maturity of the human body; consequently, he tells us, purification by water is that preliminary recognition of one's own nature ("know thyself") which is required from those who aspire to the higher purification. Hence purification by water, he asserts, was appointed by the law as a preparation for the purification by sacrificial blood; and hence the Sacred Word thought meet that the high priest, whenever he purposed to perform the sacrifices ordained by law, should previously sprinkle himself with water and ashes (*Dreams*, 36, 37; *Those who offer Sacrifice*, 1, 2).

If now we could find in the Gospel narrative of the crucifixion some mention also of the breath or spirit, nothing would remain wanting to make up the triple purification and triple witness mentioned in the Epistle, of "the spirit and the water and the blood." Such a mention is probably intended in the willing surrender of the "breath" or "spirit," which is mentioned (xix. 30) in the Fourth Gospel alone [Mk. ἐξέπνευσε. Mat. ἀφῆκε; Luke (xxiii. 46) who comes nearest to John only describes the intention, not the fact, παρατίθεμαι]: "He bowed His head, and gave up His breath" (or spirit). Thus the meaning both in the Gospel and in the Epistle appears to be the same. (1) Jesus took unto Himself not only (*a*) the dead fleshly nature of man, typified by water, but also (*b*) the life and passions of man, typified by blood, and (*c*) that higher life of man (in virtue of which he is described as made in the image of God), typified by the spirit. (2) In these three departments of existence He made three several sacrifices, pouring forth (*d*) water and (*b*) blood from His side, and giving up (*c*) His breath as the last sacrifice of all.[1] (3) Thus these three sacrifices betoken three several purifications:—(*a*) the purification, by water, of the body in baptism; (*b*) the purification of the soul by the death of the lower nature (what Paul calls "the old man"), which partakes in the death of Christ; (*c*) the purified life of the soul rising from the dead through the Spirit, and living with, and in, the risen Saviour. The two latter purifications are two phases of the same (the former implying dying in the blood of Christ, the latter rising again and living in His Spirit); but there is sufficient difference to warrant a distinction. (4) These three purifications go to make up the one perfectly pure and ideal purification and sacrifice for sin, which is the Lamb of God, the Word (εἰς τὸ ἕν εἰσιν).[2]

Stress has been laid upon this important passage in the Epistle because it appears to be a key to much that we shall find in the Gospel. It reveals an exaggerated notion of the importance of baptism with water, against which the author feels compelled to contend; "not by water only, but by water and blood." Somewhat in the same way Paul uses not water but earth (Philo using water and earth) to contrast the natural man, the mere "living soul," with the "lifegiving breath, or spirit" (1 Cor. xv. 45, 47). But that which distinguishes John from Paul is the use of mystical imagery, arranged with a certain numerical symmetry. Sometimes the imagery is dual, when it describes incompleteness, such as the conflict between the world and the children of God, between light and darkness, between God and the devil. But in other cases it is triple: he appeals to three classes, the children, the young men, the fathers; contending against three enemies, the lust of the flesh, the lust of the eyes, the imposture (ἀλαζονεία) of life; and strengthened in their faith by three witnesses on earth, the water, the blood, and the spirit—all of which dimly tends towards that other triple witness which has been inserted in the Epistle by later scribes (v. 7), the Father, the Word, and the Holy Spirit.

If we could be sure that the Second Epistle was from the same pen as the First, then the very great probability that the "elect lady" and the "elect sister" (2 John 1; *ib.* 13) represent two churches might prepare us for similar personifications in the Gospel; yet as this personification is disputed by some, we must not lay much stress on it.[3] Nevertheless we have seen enough of the nature of the Epistle to be prepared (in passing to the larger work by the same author) for a Gospel of types and symbols, a Gospel of selection rather than of continuous narrative, a Gospel in which principles on a large scale rather than individual characters shall be represented, and in which light and darkness, death and life, the word and the world, the water and the spirit, and the spirit and the blood, shall play no inconsiderable part.[4]

Analysis of the Fourth Gospel.

As was to be expected from a writer conversant with the system and thought which, for brevity, we call the school of Philo, the prologue of the Gospel opens with a protest against Philo's doctrine of an impersonal or quasi-impersonal Logos. The Logos or Word is at once declared to be (i. 1), not the mere instrument by which the world was made, but the companion of God, and God; a Light, from the beginning shining in darkness, received by some, to whom power was given to be born of God, but rejected by others who were the children of the flesh. John the Baptist is introduced, in marked distinction from the Word, as a "man;" not the Light, but a witness to the Light; and the Baptist declares at the very outset of the public life of Jesus (i. 16) that, though the law was given by Moses, the gifts of divine grace and truth came through Jesus, and that He, being the only begotten Son in the bosom of the Father, has manifested the invisible God to men. The baptism of Jesus by John is omitted; but John bears witness to the visible descent of the Spirit upon Jesus, adding that it "abode upon Him," and he bears record that his own baptism with water is but to prepare the way for Him who will baptize with the Holy Spirit; and that He on whom the Spirit thus descended is the Son of God, the Lamb of God that is to take away the sins of the world. Here, then, at the very outset, we see the thoughts, and one may almost say the *dramatis personæ*, of the Epistle reintroduced in the Gospel—light and darkness, the word and the world, the law and grace, the Father, the Spirit, and the Son. The three grades of purification are not as yet mentioned; yet there is perhaps a side-reference to them in the three grades of the world, *i.e.*, of impure existence, which are alluded to in the contrast between those who are born "of God" (i. 13) and those who are born (1) of blood, (2) of the will of the flesh, (3) of the will of man.

Calling of the discip[les]

The narrative of the calling of the disciples implies unmistakably that this book is not to follow the common tradition, nor to be a complete narrative, but rather a selection; for it only narrates the calling of six of the twelve, and one of these, Nathanael (significantly described as a man of Cana, where two out of the eight miracles in this Gospel are to take place), is so far from being universally identified with one of the twelve that Augustine excluded him from the number. The earlier names are mentioned in the same order as in Papias (see above, p. 820), and suggest the inference that some of these apostles, or their disciples, dwelling in the neighbourhood of Ephesus, furnished some of the materials of which the Fourth Gospel is composed. Two points are further to be noted in this narrative. (1) In order to enhance the dignity of the central character, the writer causes the inferior characters to revolve around Jesus, conversing with and questioning one another, doubting and erring, before venturing to obtrude themselves upon Him (see, besides this passage, iv. 27; iv. 33, vii. 27, 40–43, xi. 16, xi. 37, xii. 20–22, xiii. 24, xvi. 17; and note how, both in xvi. 19 and in other passages, Jesus, after the manner of a king, takes the initiative in addressing His disciples, instead of their bringing their difficulties to Him unbidden, as they do for the most part in the synoptists).

[1] A somewhat similar compound sacrifice of "blood" and "mind" is described by Philo (*Alleg.*, ii. 15), who represents the High Priest as "having put off the robe of opinion and fancy, and as coming disrobed into (the Holy of Holies) to make an offering of the blood of life (σπεῖσαι τὸ ψυχικὸν αἷμα) and to offer up as incense all his mind to the God of salvation."

[2] No doubt these three sacrifices are also connected, in the author's mind, with the three gifts: (1) the water springing up into everlasting life; (2) the wine of the Lord's blood; (3) the spirit which He breathed into the souls of His disciples.

[3] Dr Lightfoot (Col. iii. 12) accepts the personification in 1 Pet. v. 13 as "probably" intended.

[4] The numerical symmetry that pervades this Gospel is fully recognized by Canon Westcott, who sees "three pairs of ideas" running through the work, and "seven witnesses" corresponding to the seven times repeated "I am" (vi. 35; viii. 12; x. 7; x. 11; xi. 25; xiv. 6; xv. 1), and to the seven "signs" of Christ's ministry on earth, followed by one "sign" of the risen Christ.

(2) The second point is the error of Philip in saying, "We have found Him, of whom Moses in the law, and the prophets, did write, Jesus of Nazareth, the son of Joseph" (i. 45). Philip introduced with this slightly pompous and erroneous statement—in a kind of irony highly characteristic of our evangelist—seems intended as a contrast to the humiliated and wiser Philip of the fourteenth chapter: "Have I been so long time with you, and yet hast thou not known Me, Philip?"

The next chapter (ii.) opens with a "sign," of which the symbolism is obvious.[1] The water changed into wine evidently typifies the substitution of grace for the law. It was a common metaphor among the Jews to express the superiority of the oral tradition to the written law by saying that "the law is water, but the words of the scribes are wine"—a metaphor that exactly recalls the words of Origen about this very sign: "Before Jesus the Scripture was water, but from the time of Jesus it has been made wine for us" (*Comm. in Ev. Joann.*, xiii. 60). A somewhat similar comparison of old wine and new wine had been adopted by Jesus Himself to illustrate the difference between His teaching and the law of Moses. The identity between the purifying blood of Christ's sacrifice and the nourishing blood of His sacrament is understood even by Justin independently of the Fourth Gospel, and would be a natural inference from the Messianic prophecy (Gen. xlix. 11), which identified the cleansing stream that was to purify the robe of the Messiah with the blood of the grape, declaring that He should "wash His robe (*i.e.*, as Justin explains it, His church) in the blood of the grape." Therefore, in changing water into wine, the Messiah is, by His first sign, striking the key-note of all that is to come, indicating the object and nature of His work, viz., the supersession of the law by the gospel, and the introduction of a new spiritual nutriment and purification, which shall at once cleanse and strengthen and gladden the soul—all this to be effected by and in Himself through His blood.[2]

...diction ...rding ...ple. The prediction here made of "the hour" when the "blood of the grape" should stream from His wounded side is at once followed by a second similar prophecy. After leaving Cana for the passover in Jerusalem (where He purifies the temple by expulsion of the money-changers; see above, p. 827), Jesus answers the request of the Jews for a sign with these words, "Destroy this temple, and in three days I will raise it up." It is added that He "spake of the temple of His body."[3] It is interesting to note four different stages of development in the expression of this prediction. The synoptists Matthew and Mark declare that a very similar charge (differing only in "I will destroy" and "I am able to destroy," Mat. xxvi. 61; Mk. xiv. 58) was brought against Jesus by false witnesses; and they give us no hint that the witnesses erred by a simple and natural misunderstanding. Luke, however, who not only wrote after the destruction of Jerusalem (when it would be a common saying that the Lord Jesus had destroyed the temple), but also modified his Gospel in many respects to suit it to the requirements of the changed times, makes no mention of any false accusation. In his subsequent treatise of the Acts he goes a step further; for there the accusation is repeated (Acts vi. 14), and not denied. Now, lastly, the author of the Fourth Gospel adopts the charge as in the main a true one, or at all events as an inevitable misunderstanding in which His disciples, as well as His enemies, participated. At the same time, this prophecy, like the symbol of the wine, prepares the way for Christ's subsequent doctrine (xiv. 23) that every man is a temple of God, and that He Himself is that Temple in the highest sense. This doctrine had been taught even before Paul by Philo, who scouts the thought of preparing for the Supreme a "house of stone or wood," and declares (*Cain and his Birth*, 20) that the invisible soul is the terrestrial habitation of the invisible God. Yet though Philo's language may have influenced the language of the Fourth Gospel in such passages as xiv. 23, it is most certain that this doctrine is a necessary inference from the teaching of Christ Himself, who taught us that the body must be "full of light." There is therefore no essential misrepresentation in this introduction of the Pauline doctrine of Christ the Temple or Church.

[1] It is true that the symbolism of this "sign" is not indicated in the text in the same clear manner in which the symbolism of the feeding of the 5000 is avowed (vi. 32, 33); but there is a clear reference to it in the words (ii. 4) "Mine hour is not yet come," which seem to look forward to the hour when the "blood of the grape" should stream from the wounded side of Jesus. It may be necessary to point out, at the outset of this analysis, that the language of the Gospel may naturally have been affected, not only by the thought and language of Philo, but also by what was called the "Asiatic" style, which was prone to metaphor and symbolism: see Lightfoot's *Galatians*, p. 362, where we find that Polycrates, bishop of Ephesus (born or converted about 130 A.D.) described John (probably metaphorically) as a priest, wearing the πέταλον or high priest's mitre, and speaks of Melito as a "eunuch," meaning merely that Melito devoted himself to Christ ("propter regnum Dei eunuchum"). It is noteworthy in this context, that the Epistle to the Ephesians is the only Epistle that appears to contain an extract from one of those early hymns which, as Pliny says, the Christians used to "sing to Christ as a god," and this hymn, as is natural, deals in metaphor: "Awake thou that sleepest, and arise from the dead, and Christ shall give thee light" (Eph. v. 14). Probably from some such Asiatic metaphor (that "John, though dead, still breathed in the church") arose the tradition, of which mention is made by Augustine, that the earth over the apostle's body still rose and fell with his breath.

[2] This narrative may be abundantly illustrated from Philo. (1) He speaks of "the veritable High Priest," who pours forth a libation of "pure wine, namely *himself*" (*De Somniis*, ii. 27); (2) he connects this High Priest with the Logos by describing the Logos as a priest having for his inheritance the Eternal (τὸν ὄντα), a priest of the most high God (see also *De Somniis*, i. 37); (3) he speaks of this priest (under the type of Melchisedek) as substituting wine for water: "Melchisedek shall bring forward wine instead of water, and give your souls to drink" (*Allegories*, iii. 26)

[3] An inference has been drawn from the words Τεσσεράκοντα καὶ ἓξ ἔτεσιν ᾠκοδομήθη ὁ ναὸς οὗτος (ii. 20), that because the year so indicated would be the same year as that assigned by Luke to our Lord's commencement of His public work, therefore, by their coincidence, the two Gospels mutually support each other. But it seems natural that the writer of this Gospel, an educated Jew, should know both the date of the commencement of the temple and the date as given by Luke of the commencement of our Lord's ministry; and it seems characteristic of the author, by details of this kind (and especially by numbers), to add picturesqueness and realism to his narrative: *cf.* the 200 pence (vi. 7), the 200 cubits (xxi. 8), &c. However, it must not be forgotten that Origen (*Comm. in Ev. Joann.*, x. 22) throughout his long discussion of this passage assumes that the meaning is "in" not "during" forty-six years. And this seems to be the natural translation of the words—"the temple was built *in* forty-six years" (although the dative may be used for duration of time, the aorist hardly permits the English version); and if so, the author is under a mistake in supposing that the temple was completed. Yet from this passage (ii. 20), and from other indications of a knowledge of Jewish customs, Messianic expectations, and the geography of Palestine, it has been inferred that the author was a Palestinian Jew. A stronger argument is the author's preference of the Hebrew rather than the LXX. version of the Old Testament (Canon Westcott quotes vi. 45; xiii. 18; xix. 37), which certainly shows either that he used the Hebrew version himself, or that the Ephesian doctrine was based upon that version. The knowledge of the country does not seem to exceed what might be attained by any Alexandrian Jew who had spent one or two passovers in Jerusalem and had travelled for a short time in Palestine; and the geographical argument has been unduly strained by such suggestions as that a "minute knowledge" of the relative positions of Cana and Capernaum is implied in the expression "He went down" (ii. 12). The same argument would show that the author of the book of Jonah had a "minute knowledge" of the position of Joppa (Jonah i. 3), or that the author of the Acts of the Apostles had a "minute knowledge" of the places from which he or Paul "went down" to Attalia, Troas, or Antioch (xiv. 25; xvi. 8; xviii. 22). Any traveller might know that Capernaum was in the low-lying basin of the Jordan, down on the edge of the sea of Galilee, without having a "minute knowledge" of its position relatively to the inland villages of Galilee.

The whole of the next chapter (iii.) deals with purification by water and the spirit. The learned but timid Nicodemus, "the teacher" of Israel (iii. 10), exhibits the blindness of carnal learning as contrasted with the knowledge that belongs to those who are born of the spirit. A third prediction of "the hour" is expressed through a third figure, the serpent in the wilderness. But this figure introduces a new conception, that of faith, an intense *looking* towards Christ, even as the children of Israel looked on the healing serpent.[1] This thought of faith as sight, illustrated perhaps by the statement that Nicodemus had come by night, introduces a few remarks on a subject hereafter to be more amply treated by the evangelist—the difference between the children of light and the children of darkness (iii. 18-21). In the second section of this chapter the subject of water-purification is taken up again by the Baptist, who contrasts his own inferior purification with the higher purification of the Messiah, and his own decrease with Christ's increase, describing himself (almost in the language of Paul) as "earthly," whereas the Messiah is "from heaven." But the Baptist also introduces the subject of faith; the path of life is through faith in the Son of God: "He that believeth in the Son hath everlasting life" (iii. 22–36).

Particularly to be noted is verse 24 of this chapter, in which it is expressly stated that "John was not yet cast into prison." It will be remembered that the synoptists give no account of the public appearance of Jesus till after the imprisonment of John. It was therefore open to the enemies of the church to maintain that Jesus was but a pupil of the Baptist, and that He did not venture to teach till His master John had been shut up in prison. Much more might this be asserted in Ephesus, where, as we have seen, there were some who were baptized only with the baptism of John, and who knew nothing of the Holy Spirit. On this account probably it is that our author introduces Jesus as working by the side of John, before his imprisonment, and even then inevitably, and against His own will, drawing multitudes from the Baptist to Himself. The apostle John himself is one of the first to leave the Baptist for the Greater Teacher (i. 37); but the Baptist also is made to witness, and to rejoice in, the desertion: "He must increase, but I must decrease." And finally, we are told that the superiority of Jesus over the Baptist had become so manifest that the Pharisees had heard that Jesus made and baptized more disciples than John, and upon this, desiring to avoid this appearance of superiority, Jesus retired to Galilee[2] (iv. 1). It would not be possible more effectively to repel every suggestion of the pupilage of Jesus, or of his subordination—even His temporary subordination—to John the Baptist.[3]

Now follows (ch. iv.) what may be called the foreign section of the Gospel. We noticed that, even in Luke, the Samaritans assume a prominent position, their faith and unconventional goodness being twice contrasted with the carnal formalism of the Pharisees, at one time in a miracle (Lu. xvii. 16), at another time in a parable (Lu. x. 33). We are now to see how the contrast between Samaria and Judæa is handled in the Fourth Gospel in the dialogue on the living water, which might fairly be called, from its subject, as from its scenery, the "Dialogue of the Well." The well is a frequent figure in the books of Philo. To all men, says Philo (*Planting of Noah*, xix.), there is, in common, the desire to find drink; but some seek drink for the body, others for the soul. The seekers after truth are as those who dig wells, and many seekers have dug wells without finding water; and taking the LXX. version of Genesis xxvi. 32, "We have *not* found water," he comments on the well of the oath (Beersheba), which is discovered to be "dry"; and he declares that the dry well illustrates the failure of all human search after knowledge, as compared with the ideal God-given knowledge which is like a gushing spring. Elsewhere (*Dreams*, ii. 2, *et seq.*) he says, even more explicitly, that the well is the emblem of knowledge; that its depth signifies the difficulty of the attainment of knowledge; and that concerning all knowledge the well-diggers have to make but one sad confession, "We can find no water." Moses sits by the well "waiting to see what water God will send forth for his thirsty soul" (*Alleg.*, ii. 4); Israel "sang the song of the well," *i.e.*, sang a song of triumph at the discovery of knowledge (*Dreams*, ii. 4); and the remark of the daughter of Samaria (iv. 11) that "the well (φρέαρ) is deep," followed by the contrast of the "fountain" (πηγή) of water that "leaps up" (iv. 14), at once suggests Philo's contrast between the bond-woman Hagar at "the deep *well*" and Rebecca who nourishes those who come to her with "the *fountain* that never fails" (*Posterity of Cain*, 41). Origen, in the same way, considering Jacob's well to mean the Old Testament, contrasts Samaria leaving her ὑδρία (the old implement of knowledge) with Rebecca at the fountain (*Comm. in Ev. Joann.*, xiii. 10 and 29). The four wells dug by the patriarchs Abraham and Isaac represent (*Dreams*, ii. 3, 4) four departments of knowledge. The fourth and dry well represents the search after the fourth and incomprehensible immaterial element corresponding to the material heaven—a search that is necessarily fruitless. This being Philo's interpretation (and he indignantly protests against any other, as being unworthy of wise men), we shall also see a singular propriety in placing the dialogue on the living water in the neighbourhood of "the parcel of ground that Jacob gave to his son Joseph" (iv. 5); for here also Philo has prescribed a metaphorical interpretation, declaring that "Jacob gave Joseph Shechem, mean-

[1] According to Philo, the brazen serpent represents temperance, the antidote of pleasure; and he who has strength to behold the beauty of temperance, and to "discern God through the serpent" shall live (*Allegories*, ii. 20).

[2] The insertion of the remark that "Jesus himself baptized not, but his disciples," serves two purposes:—(1) to magnify the Messiah: (2) to disparage the mere baptism with water.

[3] It is, of course, possible that here (as in the matter of the last supper) the Fourth Gospel may have preserved some historical traditions concerning the acts of the Lord in Judæa, which have not been preserved in the synoptic record. Nor is it denied that elsewhere, *e.g.*, in the matter of the three passovers, the Fourth Gospel may be historical. There is scarcely evidence enough to admit of absolute demonstration on either side. All that is contended is that, whether historical or not, the incidents recorded in the Fourth Gospel are suggested (1) often by a clearly discernible motive in the mind of the writer contrasting forcibly with the motiveless, simple, inartistic narrative of St Mark; (2) sometimes by a desire to supplement, if not to correct, the previous narratives of the synoptists. The presence of such a motive and desire is not, of course, absolutely inconsistent with historical accuracy; but, the more we consider the synoptic narrative to be objective, and the more we consider the Fourth Gospel to be subjective, the more we shall be disposed to believe that, in proportion as incidents in the latter are suggestible by motives and desires, in that proportion are they likely to be non-historical, especially if they appear to be difficult to harmonize with the earlier narrative of the synoptists. It has been suggested that the lamentation over Jerusalem (Mat xxiii. 37; Lu. xiii. 34), expressed in the words, "How often did I desire to gather together thy children . . . and ye would not," implies many previous visits. These words were no doubt spoken in Jerusalem, where Matthew (not Luke, see p. 800, above) places them; but still, may they not refer to the many occasions in Galilee where the Redeemer, striving to "gather together" the children of Israel, had surely included the "children of Jerusalem" in the scope of his efforts? Even if the words "thy children" are to be taken literally, they may refer to the occasions when the scribes and Pharisees had come down from Jerusalem to test the Messiah, and Jesus had proclaimed the new kingdom to them in vain. Though preaching in Galilee, Jesus was really conflicting with the spirit of Jerusalem, and striving to "gather together the children of Jerusalem." In any case the supposition that ποσάκις refers to previous public visits to Jerusalem results in an incompatibility. For no one maintains that Jesus had made more than two previous public visits to Jerusalem; and it is impossible that "how many times" can mean twice.

ing thereby the bodily things which are the objects of the outward senses" (*Allegories*, iii. 8). But there is also an appropriateness in the use of the name (iv. 5) "Sychar." For whether the name be a corruption of "Shechem" or of "Askar" (Sanday, *Fourth Gospel*, p. 93), in either case the name contains a possible reference to "drunkenness" (Isaiah, xxviii. 1, 7; *Dict. of Bible*, s.v.), and serves as a suitable contrast to the Living Water. The next point for consideration is the "five husbands" of the woman of Samaria. Is there any special meaning in the number "five?" Turning again to Philo, we find, a little after the passage about wells quoted above, the statement that "the number five is appropriate to the *outward sense*" (*Planting*, 32), and that it represents material enjoyment. This is certainly a natural use of the number, if it is to be used emblematically.[1] Further, the number "five" is connected also by Philo, not indeed with "husbands," but with "seducers." Philo (*Allegories*, iii. 88) says that the lawful husband is the mind (νοῦς), the unlawful husband or seducer (φθορεύς) is represented by the five objects of the senses working through the five senses.[2] Immediately before the passage, Philo adopts the more common metaphor of the Old Testament in speaking, not of the mind, but of the Lord Himself, as the Husband, being the Father of the perfect nature, and sowing and begetting happiness in the soul. Samaria is supposed by Justin (*Dial.* lxxviii.) to represent in Isaiah (viii. 4) "sinful and unjust power;" but here it rather typifies sense-wrapped ignorant unbelief. The whole of this imagery seems so well connected and so appropriately transferred from the pages of Philo to the pages of the Fourth Gospel, that one hesitates to accept another explanation (Keim) which would otherwise seem extremely probable—an explanation borrowed from the five religions of the five nations of Samaria (2 Kings xvii. 30–37). In either case, the sixth "husband" may very well refer to Simon Magus, who, as we know from the Acts of the Apostles (Acts viii. 11), had very early in the history of the church "for a long time" held the Samaritans "bound with his enchantments."[3]

Like all the other narratives of our evangelist, this narrative is in the highest degree dramatic. From her previous repellent attitude, the woman of Samaria is led, first into wonder, then into interest, then into conviction of sin (becoming ashamed of her false husbands), and into admiration of the New Prophet; lastly, she receives from the Messiah a draught of that spiritual water which alone can satisfy the longing soul; and in the climax she is brought to the very brink of the eternal fountain—"I that speak unto thee am He."

The journey into Galilee.

The journey into Galilee adds one more to the instances in which the Fourth Gospel corrects the synoptists. The saying that "a prophet is not without honour save in his own country" is stated by the synoptists to have been uttered by Jesus in Galilee (Mat. xiii. 57; Mk. vi. 4; Lu. iv. 24) *after* the unexpected rejection of Him by His countrymen; and Mark adds one of those passages which were early "stumbling-blocks" to the church, viz., that "He was not able to do there any mighty work, . . . and He marvelled because of their unbelief." Not content with Luke's considerable modification of this passage, the author of the Fourth Gospel boldly places this saying of Jesus *before* the visit to Galilee, and assigns it as *a reason for His going thither*: "After two days He departed thence (from Samaria) and went into Galilee; *for* Jesus Himself testified that a prophet hath no honour in his own country" (iv. 44). The motive is obvious: Jesus is desirous of escaping from notoriety. He has found that the Pharisees (iv. 1) are aware of His superiority to John the Baptist, and that His disciples exceed John's in number; and for this very reason He leaves Judæa, and comes to Samaria, a hostile district. Even here, however, He cannot help making converts. But having made them, He leaves them and goes into Galilee, where at least He is sure to find "no honour." Yet even here, adds the author, He *was* honoured; for "the Galileans received Him, having seen all the things that He did at Jerusalem at the feast" (iv. 44). Thus skilfully, after his manner, the author takes those very sayings and traditions which had been turned against Jesus, and, by his delicate handling, uses them to enhance the glory of the Messiah, "who knew what was in man" (ii. 25).

The pool of Bethesda.

Passing over the cure of the nobleman's son, which has been discussed above, we come to the first "sign" wrought on the sabbath (v. 2–9). Once more there is a contrast between the water of the law and the fountain of the Messiah. The rejection of this divine act of mercy, simply because it was wrought on the sabbath, introduces, almost for the first time, the conception of "judgment" or "condemnation." The word "judgment" had been mentioned in the dialogue with Nicodemus, as a necessary result, though not an object, of the coming of the Light, which, by its very presence, distinguishes and "judges" those who love the darkness (iii. 17–21); and now we have an example of the way in which the Light divides all who hold it into two classes—those who love it, and those who hate it. This is in accordance with the spirit of the synoptists, who (Mat xxiii. 13; Mk. xii. 40; Lu. xx. 47) describe Jesus as addressing the sabbatarian sign-hinderer as "hypocrite," and as pronouncing on "hypocrites" greater "judgment" or condemnation (περισσότερον κρῖμα). But that part of the discourse in which Christ describes Himself, in the presence of the multitude, as having received all power to judge and to quicken the dead, does not resemble anything in the synoptic narrative, except the discourse—"All things are delivered unto Me of My Father" (Mat. xi. 27; Lu. x. 22); and that was uttered privately to the disciples, after their return from their mission. It is possible that the author here (as elsewhere) sets down, as a public discourse, some sayings that may have been uttered privately; and the words "that all men should honour the Son, even as they honour the Father," remind us at once of the synoptic saying, "He that receiveth you receiveth Me, and He that receiveth Me receiveth Him that sent Me" (Mk. ix. 37, &c.); which again, in the synoptists, was a private, not a public saying.

The author's fidelity to the spirit rather than to the letter of the words of Jesus appears also in the reference to the quickening and raising from the dead. Jesus had in Matthew (x. 8) bidden His disciples to "raise the dead," and this precept is amplified, in the Fourth Gospel, into "The hour is coming and now is, when the dead shall hear the voice of the Son of God; and they that hear shall live" (v. 25),—a saying that would naturally be inter-

[1] Origen (*Comm. in Ev. Joann.*, xiii. 9) speaks of "the five husbands as corresponding to the *five senses*;" and he says that Samaria is the type of a soul which has once been wedded to the objects of sense, but has recently divorced herself from these and allied herself to a "sixth husband," a false semblance of spiritual truth. If this stood by itself, we might regard it as one of many other specimens of Origen's baseless allegory; but it assumes importance when we find Philo, who wrote long before the composition of this Dialogue of the Well, using nearly the same language as Origen, who wrote after it and (apparently) without any knowledge of Philo's pre-existing metaphor.

[2] Elsewhere (*Migration of Abraham*, 37) he says that the "five daughters" of Salpaad represent the "outward senses." The same thing is represented (*Abraham*, 5) by "the five cities of Sodom."

[3] Yet the "sixth husband' may possibly be illustrated by the contrast which Philo (*Abraham*, 5) draws between the "seventh power," the "power of peace," and the "six powers of turbulence," which consist of "the five senses" and uttered "speech" (ὁ προφορικὸς λόγος) which prates of things that should not be uttered (ἀχαλίνῳ στόματι μυρία τῶν ἡσυχαστέων ἐκλαλῶν): see Rev. xiii. 5.

preted in a purely spiritual sense.[1] No less spiritual is the doctrine here enunciated on faith. As elsewhere in this Gospel (i. 50; iii. 1, 2; iv. 39–41; xx. 29; and, if rightly considered, vi. 26), the author lightly esteems belief based on "mighty works" or wonders. The right faith is that of the Samaritans, who, rising out of the lower wonder-faith, attain to the higher faith which comes from hearing Christ (iv. 42). For to this, and to no other testimony, does Christ, in the Fourth Gospel, make His ultimate appeal. Christ does not indeed despise the testimony of John to Himself, but He does not accept it as a final basis for the true faith (v. 32–34). He appeals to the Scriptures, it is true, but rather as an unerring guide to the true source of faith than as being of themselves able to generate faith in the reader (v. 39). What then is the living final testimony to which He appeals? It is to His "works,"—not the "mighty works," or "wonders," but all "the works (ἔργα) which the Father hath given Me to do," meaning the whole of His life, and including both words and deeds. In other words, the Fourth Gospel appeals to that which we should call the influence of the life of Jesus, but which the evangelist better calls the "Spirit" of Jesus, passing from Jesus to His disciples, and from those disciples to others who had not seen Jesus—as the final testimony, convincing every honest heart, and generating in every conscience that loves the light a belief in Jesus as the true Light. In the synoptists, "faith" is, for the most part, that half physical thrill of trust in the presence of Jesus which enables the limbs of a paralysed man to make the due physical response to the emotional shock consequent on the word "arise," so that in the strength of that shock the paralytic is enabled to shake off the disease of many years; or, at the highest, it is a thrill through the inner being, whereby the soul shakes off the burden of sin. But in the Fourth Gospel faith implies even more than in Paul's Epistles; it is a faculty that tests, transmutes, and develops the recipient soul; it means a trust in Christ, not only as a sacrifice, nor as propitiation, nor as miracle-worker, nor as Son of God, but as source and object of all love, and the be-all and end-all of every human life. If such a Being is best expressed by "Word," then the human receptiveness of such a Being will be best expressed by the metaphor of "hearing." Accordingly the Samaritans believe, not because of miracles, nor because He told the woman "all that ever she did," but because they had enjoyed His presence for two days, and had *heard* Him. "Now we believe, not because of thy saying; for we have *heard* Him ourselves, and know that this is indeed the Christ, the Saviour of the world." Here we have at last a doctrine not borrowed from Philo, a doctrine that constitutes the great difference between Philo's philosophy and the religion of the Fourth Gospel, making the latter a powerful and life-inspiring motive for all classes of men, while the former remains a barren philosophy fit only for meditative hermits. For in Philo, faith, as in the Old Testament (Lightfoot, *Galatians*, pp. 154–162), has a passive meaning—trustworthiness, stability, constancy,—rather than the active meaning of trust, by which the lower nature is raised to the level of the higher; the "dog" to the level of "man" (Bacon, *Essays*, xvi. 79); the man to the level of Christ, and, through Christ, to God (1 Cor. iii. 23). Faith, in Philo, is a prize rather than an effort, a harbour rather than a voyage; it is "the only sure and infallible good, the solace of life, the fulfilment of worthy hopes" (Lightfoot, *Gal.*, p. 158); whereas, in the New Testament, it is the faculty by which one is able to trust in Christ, to love Christ, and to serve Christ—a faculty implying continuous effort, loyal and enthusiastic service, and progressive activity. The nearest approach in Philo to the Pauline and Johannine faith is perhaps in the words that describe it as "the entire amelioration of the soul which leans for support on Him who is the cause of all things, who is able to do all things, and willeth to do those which are most excellent" (*ib.* p. 158); but even this, though the same in theory, is very different in practice from the faith of the New Testament. For—faith being neutral and colourless and taking its colour from its object—how different must needs be even the faith that is based upon the *things* that are "most excellent" from the faith that rises to the Father through such a one as Jesus of Nazareth, concerning whom even the most incredulous must admit that He made peace in man's troubled heart, banished sin from those who trusted in Him, and "constrained" (2 Cor. v. 14) even His bitterest persecutor to join in laying the foundations of His empire.[2]

In the discourse that follows the miracle of the feeding of the five thousand,[3] it is noteworthy that the author speaks of the eucharistic food not as the Lord's body and blood, but as His "flesh" and blood. Most characteristically: for "flesh" is, as in Paul's epistles, a principle, an element, and the author desires to show that the Lord' flesh and blood are the only satisfying element for the human soul. He has before spoken of blood and flesh and man (i. 13) as antagonistic elements to the divine elements; now he wishes to point out the divine elements themselves, and they are the flesh and blood of the Word, who "became flesh" (i. 14, σὰρξ ἐγένετο) for men. Here, as before, we must add that the use of this language—"Whoso eateth My flesh and drinketh My blood"—in a public discourse is quite unlike anything in the synoptists, and though it represents the essence of the teaching of the Lord's supper, somewhat amplified, it can hardly be considered in its chronological, or even perhaps in its artistic place, as a public discourse here. Yet it is necessarily placed here to account for the desertion of many of His followers. In the synoptists the desertion is otherwise explained. There we see Jesus, as He develops the constitution of His Kingdom, alienating, step by step, the Pharisees, Herod, the patriots or Galileans, the followers of John the Baptist, and at last the whole of His countrymen, till He is compelled to flee from Herod to the neighbourhood of Cæsarea Philippi, where, as an exile with no more than twelve other outcast companions, He who had never revealed Himself to be the Messiah finds, upon questioning His disciples, that they have been led by the divine guidance to the sense that He and He alone must needs be their Redeemer; so that the seed of

The con fessio of Pe

[1] Compare Philo, *De Profugis*, 10, "Some that are living are dead; and some that are dead live."

[2] It is a remarkable fact that this evangelist never uses the noun πίστις, which is frequently used by the synoptists, while he uses the verb πιστεύειν about twice as often as it is used by all the synoptists put together. He appears to prefer to contemplate faith, not as in itself a virtue, but rather as a mental act or state taking its quality from its object. Note also that he seems to distinguish between πιστεύειν μοι and πιστεύειν εἰς ἐμέ. The former is generally used in questions and negations (v. 38; viii. 45, 46; x. 38), or else of temporary and progressive trust, *e.g.*, trust in God, in the word of Jesus, or in the Scriptures; all of which are regarded as preparatory acts leading to that final state of trust which can only be obtained by *coming to* Jesus (iv. 50; v. 24; v. 46; v. 47 (*bis*); x. 38). The latter (πιστεύειν εἰς) denotes the final state of fixed trust and repose on Jesus, and it is only once used by the synoptists (Matth. xviii. 6; ? Mk. ix. 42).

[3] Nothing has been said here about the difference of John's chronology from that of the synoptists, because, if the Fourth Gospel is a spiritual rather than an historical composition, it is scarcely to be expected that its chronology should be limited by historical considerations; and, in any case, the subject is too large a one to be discussed here. Canon Westcott remarks (*Gospels*, p. 285) that "a very strong case has been made out by Mr Browne (*Ordo Sæclorum*) for the limitation of the Lord's ministry to a single year. If there were *direct* evidence for the omission of τὸ πάσχα in John vi. 4, his arguments would appear to be convincing." The context suggests that the words τὸ πάσχα may not improbably be an insertion based on a sense of the spiritual meaning of the narrative rather than on history.

faith has at last begun to germinate, and He can now prepare to leave them, because He discerns already the temple of the new kingdom founded upon the inspired confession of Simon Peter. In the Fourth Gospel, on the other hand, the desertion of the disciples is represented as due to another cause, namely, their unspiritual dulness and their inability to understand the doctrines of their Master. Here and there in this discourse appear glimpses of the synoptic utterances,—for example, in the words "No man can come unto Me except My Father draw him" (vi. 44); and in the words "It is the Spirit that quickeneth, the flesh profiteth nothing" (vi. 63), one seems to recognize a version of part of the blessing of Peter, "Blessed art thou Simon, son of Jona, for flesh and blood hath not revealed it unto thee, but My Father which is in heaven." But elsewhere, in the greater part of this discourse, the author departs entirely from the synoptists. In the confession of Peter, a very striking peculiarity is presented. Not only do we find brought out in a very touching manner what may be almost called the despairing faith of the confessing apostle—"Lord, to whom shall we go?"—as though the disciples were driven in desperation to remain with Jesus because, if they deserted Him, they had no hope, no refuge, elsewhere; but we also find Peter avowing the cause of his belief, and it is the same cause as moved the believing Samaritans; it is not the "signs" but the "words" of Jesus—"Thou hast the *words* of eternal life."[1]

Hitherto the Gospel has dealt with the Word as purifying and nourishing; now it has to speak of it as enlightening. The types have hitherto been water (under various aspects), wine, flesh, blood, bread; now we are to read of Jesus as Light. This is the highest or nearly the highest doctrine; for it is another aspect of the doctrine of the Spirit. The two doctrines are closely connected in Philo, who (*Creation of the World*, 8) declares that God assigned a "pre-eminence to the elements of spirit (or breath or air) and light, calling the former the spirit of God because it is the most life-giving element, and God is the cause of life;" and the visible light Philo declares to be the image of the invisible light, which is the image of God. In the short summary of Christ's doctrine set forth to Nicodemus (iii. 3–21), a brief suggestion of the doctrine of the light follows on the doctrine of baptism; now the higher doctrine is to be expanded. But light implies darkness, and therefore the development of the doctrine of light connects itself naturally with the period of conflict between light and darkness, *i.e.*, between the Word and "the Jews,"—a conflict that becomes from this time more and more prominent.

First of all, however, comes a climax of the doctrine of water, and a preparation for the doctrine of light. This section (vii. 2–40) begins with a very distinct indication, differing widely from the synoptic treatment, of the relations between the Lord and his brethren. It is possible that the Ebionite school based their low views of Christ's nature upon traditions derived, or supposed to have been derived, from the Lord's brethren, and that the author is here striking at a particular school of thought. Comparing Mk. iii. 21 with Mk. iii. 31, we see clearly that the mother and brethren of Jesus, alarmed perhaps for His safety, and deceived by false reports about His sanity, desired to place Him under restraint; and Matthew and Luke unite in asserting that the mother as well as the brethren desired to speak to Him, and were rejected. But there is no mention of the mother in the Fourth Gospel as ever doubting or ever alarmed concerning her Son; the brethren alone doubt, and their doubt amounts almost to an antagonistic scepticism. They do not "believe in Him," yet they urge Him to go to "Judæa that the disciples may see the works that Thou doest. *If Thou doest these things*, show Thyself to the world" (vii. 3–5). No reproof could be more severe (from the point of view with which the Fourth Gospel regards the "world") than the reply of Jesus: "The world cannot hate you; but Me it hateth." So imbued are the Lord's brethren in fleshly worldliness, that the world recognizes in them that familiar darkness which it loves, because its works are dark, while it hates the convicting light. It is not surprising, after this, that Mary, who throughout this Gospel is regarded with affectionate reverence, is not committed to the guardianship of these sceptical brethren of the Lord.

The discourse itself is, as has been said, mainly preparatory. After one brief appeal to the conscience as the final test of the truth of His teaching (vii. 17), the conflict is predicted: "Why go ye about to kill Me?" A hint of the synoptic saying "He casteth out devils through Beelzebub" is perhaps contained in the reply of the people, "Thou hast a devil;" but the author deviates from the synoptists, in the justification of the sabbath-cure, not from the "ass" or the "ox" in the pit (Lu. xiv. 5), but from the practice of circumcision on the sabbath (vii. 22, 23). The violent spirit first manifested after the cure of the impotent man (v. 16, 18) now breaks out again, and a direct attempt made by the Pharisees to arrest Him (vii. 32), frustrated by the wonder of His words (vii. 46; and compare xviii. 6), leads Jesus once more to predict that He will soon pass away from them, and finally to conclude the "doctrine of water," by exclaiming in "the last day, the great day of the feast, . . . he that believeth in Me, as the scripture hath said, out of his belly shall flow rivers of living water"[2] (vii. 38). The spiritual climax thus given to the doctrine of water is very striking. The well of living water, before promised to the woman of Samaria, is now not merely to spring up in the believer, as there stated (iv. 14), but it is also to flow forth from Him to others, thus preparing the way for the higher doctrine of the Spirit of fellowship which the author touches on in the next verse: "But this He spake of the Spirit, which they that believe on Him should receive" (vii. 39).

The method of the author is admirably illustrated by the dialogue between the people (vii. 41, 42): "Others said, This is the Christ, But some said, Shall Christ come out of Galilee? Hath not the scripture said that Christ cometh

[1] Although the word used by Peter (ῥῆμα) is not the same as that used by the Samaritans (λόγον), yet a comparison of a great number of passages in which the "word" of Jesus (λόγος μου) is said to be the object of belief, and the source and province of spiritual life (ii. 22; iv. 50; v. 38, the word of God; viii. 31; viii. 37, 43, 51, 52; xii. 48; xiv. 23, 24) seems to show that the name Λόγος itself had some influence in leading the author to insist so frequently upon the "word" rather than "the work" as being the prime cause by which the incarnate Word generated faith in the souls of men In the Fourth Gospel the plural λόγοι is only once used by Jesus of His words (xiv. 24); and there in a passage where (seemingly) it is desired to distinguish the separate from the collective "words:" Ὁ μὴ ἀγαπῶν με τοὺς λόγους μου οὐ τηρεῖ· καὶ ὁ λόγος ὃν ἀκούετε, οὐκ ἔστιν ἐμὸς ἀλλὰ τοῦ πέμψαντός με πατρός. On the other hand, the synoptists frequently represent Jesus as speaking of "my words" and of "the word," but never of "my word." Note also the remarkable passage (xii. 48) where it is said that Jesus does not judge men, but that the word which He has spoken will judge them.

[2] These words have caused perplexity, as not being found in any book of the Old Testament; but they are probably a corrupt reading or reminiscence of the LXX. version of Isa. xliv. 3, 4, "I will give water in the midst of drought to them that walk in a waterless land; I will place My spirit upon thy seed, and My blessings upon thy children—καὶ ἀνατελοῦσιν ὡς ἀνὰ μέσον ὕδατος, &c." The Greek words quoted above were probably separated from their context; ἀνατελοῦσιν was taken transitively and connected with ὑδώρ (ὑδὼρ ἀνατέλλειν, Pind. *Is.*, 6 (5) 111, being a recognized phrase for "to make water gush forth"); and ἀνὰ μέσον was rendered "the middle parts," ἐκ κοιλίας. Such corruptions of the Old Testament are readily paralleled from Barnabas and Justin, although altogether unlike the method of quoting the Scripture assigned to our Lord by the synoptists.

of the seed of David, and out of the town of Bethlehem where David was?" It is a curious instance of the degree to which the dramatic character of the Fourth Gospel has been ignored, that even an acute commentator has inferred from this passage that John "was not aware of the birth at Bethlehem." The fact is that the author uses these and similar errors and blind gropings of the people, the enemies, and even the disciples of the Lord, to enhance the majesty and insight of Him who walks above them all, high in the light of heaven, while they are creeping in the mist around His feet. He does not stop to correct these vulgar errors, for he presupposes that his readers are in the light, and able to see through them all; and it is with a frequency almost betokening enjoyment that he repeats this device over and over again, in every case holding up the error in silence to the contempt or pity of his reader, and delighting to exhibit human folly glorifying the wisdom of God. Instances of this device occur in this very chapter. "Who goeth about to kill Thee?" says the ignorant multitude (vii. 20), at the very time when the arrest of Jesus is being planned by the Pharisees: "Out of Galilee ariseth no prophet," say the learned students of the law (vii. 52), so blinded by their malignity that they cannot even read the books that describe the birthplaces of Elijah and Jonah; "We have found Him of whom Moses in the law, and the prophets, did write, Jesus of Nazareth, the son of Joseph," says Philip, happy in the completeness of his new-fledged knowledge (i. 45), and ignorant that a time will come when he will hear from "the son of Joseph" this humiliating rebuke, "Have I been with you so long, and hast thou not known Me, Philip?"

Passing over the story of the woman taken in adultery as being an interpolation, we are led to that section of the Gospel which treats of the doctrine of light. The mention of the Father and the Son, as being two witnesses, bearing witness to the Son—according to the saying of "your law" that "the testimony of two men is true" (viii. 12–17)—is a subtle use of the words of Scripture, such as we look for vainly in the teaching of Christ as preserved by the synoptists.[1] But the connexion between the light and the truth, and between truth and freedom, and the dialogue that follows upon the genuine children of Abraham, remind us, in part, of the synoptic version of the Baptist's teaching about the children of Abraham (Mat. iii. 8; Lu. iii. 8); in part, of the teaching of St Paul concerning the freedom of "Jerusalem which is above" (Gal. iv. 26; and compare Rom. vi. 16–20).[2]

The climax of hatred and insult of the Jews is most appropriately expressed (viii. 48), "Say we not well that Thou art a Samaritan and hast a devil?" and it is also appropriate to a discourse on "the Light that lighteth every man coming into the world" that the Jews should be informed that even Abraham saw that light and rejoiced. It is probable that both here and in xii. 36 we ought (in spite of the LXX. usage) to translate ἐκρύβη "was hid" (*cf.* Lu. xix. 42; Heb. xi. 23), and that we must suppose the intervention of some supernatural agency in a judicial retribution hiding the Light from the children of darkness who seek to destroy it.

The section on light terminates with an appropriate sign, the opening of the eyes of the blind man, who is sent to wash his eyes in the waters of a pool named Siloam. The evangelist sees a mysterious meaning in the name of the pool. As the Baptist had baptized in Ænon near to Salim, *i.e.*, the "waters" near to and preparing the way for "peace";[3] and the Samaritan woman had boasted of her well of Sychar or drunkenness, and the impotent man had been healed in Bethesda or the "house of mercy," so now the opening of the eyes of the blind man is effected in part by the direct action of the Light of the world, but in part also by the instrumentality of water at a pool named "Sent,"—a word which may apply to an aqueduct, "*missio* aquarum," or to Him whom the Jews expected as the "Sent," *i.e.*, the Messiah. The conclusion of the section on light (ix. 39), "For judgment I am come into this world; that they which see not might see, and that they which see might be made blind," accords with the passage in Matthew and Luke where Christ acknowledges to the Father that it hath seemed good to Him to reveal these things to babes and to hide them from the wise and prudent (Mat. xi. 25; Lu. x. 21); and the climax appropriately introduces the Pharisees, confident in the "lamp of the law," asking, in a tone which suggests the utter impossibility of an affirmative answer, "Are we blind also?" The answer of Jesus distinguishes two kinds of darkness in the soul—the involuntary darkness arising from inexperience of the light, and the voluntary darkness which arises from experience and rejection of the light. His answer explains the sense in which the word "hypocrite" was so often applied to the Pharisees by Jesus in the synoptists. The Pharisees were in darkness, and, like all other men, had received gleams from "the light which lighteth every man," convicting them of their darkness, and leading them to say, "We see not," if they had but been honest. But they persisted in saying, "We see."[4] Therefore, it is said to them, "Your sin remaineth" (ix. 41). These latter words, whether uttered or not by Jesus in the exact shape in which the Fourth Gospel gives them, are undoubtedly true to the spirit of His teaching; and they furnish a suitable end to the discourses on light, bringing prominently forward that "reproving" or "convincing" power of light which is one of the special attributes of that Holy Spirit to whom, step by step, the Fourth Gospel is leading us.

The metaphor of the good shepherd suggests an important difference between the Fourth Gospel and the Gospels of Matthew and Luke, viz., the absence of all allegory and almost all parable in the former. Why did the author, who rejected so many other parabolic subjects, retain only this parable of the shepherd in common with them? The answer may be, partly that it is a parable based upon the teaching of Philo, who distinguishes between mere indulgent "keepers of sheep" and "shepherds," somewhat in the same way in which our parable distinguishes between "hirelings" and shepherds; and he adds that the Supreme Shepherd is God, who orders all His flock of created things through the Logos, His first-born Son (*Plantatio*, &c., 11). In part, perhaps, the author may have

[1] It appears to mean the Son, on the one side, manifesting Himself by ἔργα, and the Father, on the other side, abiding in the heart of the hearer, and influencing the conscience to acknowledge and believe in the Son.

[2] Ver. 35 and 36 seem difficult to connect with ver. 34, "*Whosoever committeth sin is the servant of sin.* And the servant abideth (μένει) not in the house for ever, but the Son abideth ever; if the Son therefore shall make you free, ye shall be free indeed." The italicized words seem to confuse the thought. The argument that seems required is this. "No mere servant, such as Moses, is a safe patron for those slaves who desire the master of the house to enfranchise them; the safe patron is the Son, whose influence in the house is permanent." Just such an argument is found in the Epistle to the Hebrews (iii. 5; viii. 3). "Moses was faithful in all His house as a servant, . . . but Christ as a son over His own house, whose house are we;" and in the same epistle Christ is said to "abide" (μένειν) a priest continually, and to be able (Heb. vii. 24, 25) to save men to the uttermost, because He "abideth" (διὰ τὸ μένειν αὐτὸν εἰς τὸν αἰῶνα). It seems probable, therefore, that some early teaching of the church is here confused by the addition of the italicized words.

[3] Philo (as well as the author of the Epistle to the Hebrews) emphasizes the fact that Melchisedek, the true High Priest, the giver of wine instead of water, is the King of Salim or peace (*Alleg.*, iii. 25).

[4] *Cf.* Philo, *Who is the Heir?* 15, "Look up, so as to convict (ἐλέγχειν) the blind race of common men, which, though seeming to see, is blinded."

felt that the synoptic picture of the shepherd "leaving the ninety and nine sheep in the wilderness" while He seeks the single wanderer, requires at least to be supplemented by the picture of Him who putteth forth His sheep, and is followed by them, so that none of them wander. But a principal reason for introducing this parable at the conclusion of the doctrine of light, and before the narration of the death of Christ, is to prepare the way for that death, by exhibiting the reason for it in a clear light. It is true that Jesus has, before now, predicted that He is to be "lifted up" (iii. 14, viii. 28) and slain (vii. 19, viii. 40); but it needs to be distinctly stated that Jesus will not only be slain, but voluntarily slain; and the motive requires to be expressed. This is explained in the synoptists by saying that He came to give His life as a ransom (λύτρον) for many (Mat. xx. 28; Mk. x. 45). But to whom was this "ransom" to be paid? To God or to the evil one? The question was a difficult one to answer; and the Fourth Gospel avoids, though it does not solve, an insoluble difficulty by substituting a new metaphor for that of ransom: "I am the Good Shepherd. The Good Shepherd giveth His life for the sheep." Then, in a master-piece of delicate spiritual subtlety, while the expression "the Good Shepherd will even be slain by the wolf for the sheep's sake"—which would have introduced all sorts of intricate difficulties—is avoided, the same thing is, by antithesis, indirectly suggested—"But the hireling seeth the wolf coming, and leaveth the sheep, and fleeth." A repetition of this statement leads to a more emphatic reiteration that the Shepherd will lay down His life of His own free will (the essence of sacrifice), "in order that He may take it again" (x. 17)—thus entirely neutralizing the suspicion (so carefully avoided above) that the Good Shepherd may be doomed to succumb to the wolf.[1]

Two points remain to be considered in this chapter (x.). The words, "All that ever came before Me are thieves and robbers," have naturally caused some difficulty; but it is possible that some words, such as "in comparison with Me," are to be understood; and if the meaning was, "all previous redeemers of mankind have been, in comparison with the true Redeemer, self-interested and ambitious," then, such language becomes compatible with the author's point of view; and, even looked at from the synoptic side, it presents little more difficulty than the saying that John the Baptist, though the greatest of the prophets, was less than the least in the kingdom of God.[2] But the second point is of more importance. In defending Himself (x. 35) against the charge of making Himself God, Jesus is made by the author to argue that, if the judges of Israel in the Psalms are addressed as, in a certain sense, divine and gods,—"I have said ye are gods,"—*a fortiori* might He Himself without blasphemy call Himself the Son of God. But, if this argument might be adopted, then it might be urged that the Son of God differed from other sons of God only in degree, or, if in anything else, only in pre-existence, and the special privilege of pre-existence has been already destroyed by the evangelist; for, in the introduction to the healing of the blind man, he has caused the disciples of Jesus to take for granted, and Jesus not to impugn, the doctrine that all men exist before birth: "Master, who did sin, this man or his parents, that he was born blind? Jesus answered, Neither this man nor his parents; but that the works of God should be made manifest in him" (ix. 2, 3). But if all men pre-exist, and if to all men, in a certain sense, may be addressed the title of "God," it would follow that even the Eternal Son of God, by whom the world was made, would be but the eldest among many brethren. It is scarcely possible that the evangelist intended his readers to follow out this train of thought; but it is unquestionable that in spite of the readiness to admit supernatural incidents, the author's habit of referring all phenomena to the action of certain elements—water, spirit, light, darkness, flesh, blood, and the rest—leads him (perhaps unconsciously) into a habit of describing and perhaps even conceiving the life and work of Christ Himself as conforming itself to an unalterable law, which is none the less a law, because it is also a will, the will of our Father. The works that He does are "prepared by the Father." His sheep hear Him; those that are not His sheep do not hear Him. The same thought is expressed, whether the law be regarded as the fixed order of things or as the will of the Father: "No man can come unto Me except the Father which has sent Me draw him."

Again and again He disclaims caprice, and even the exercise of an independent will: "I came down from heaven not to do Mine own will but the will of Him that sent Me" (vi. 38). Though judgment is committed to Him by the Father, yet so rigidly is His power and desire to judge restrained by facts or laws (or by whatever other name the truth may be called), that He solemnly declares that *He* does not really judge, it is the *facts* that judge. "I do not judge," He says (xii. 47), but "the word that I have spoken shall judge him;" and even where He accepts the task of judging, He declares that He judges "as He hears" (v. 30), and "with the Father that sent Him" (viii. 16), *i.e.*, according to truth. The same conception of the work of the Word as being (like the working of the elements) universal, continuous (v. 17), and according to law, is expressed both in the prologue to the Gospel (John i. 1–9), and in the Epistle also, where the writer declares that the commandment which he gives to the church from Christ is "no new commandment," but an old commandment which men had had "from the beginning."

The raising of Lazarus.

We come now to the last of the pre-resurrection "signs" of Jesus—the raising of Lazarus. Even those who maintain the historical accuracy of every detail of this narrative will scarcely deny that its symbolic meaning goes down, and is intended to go down, to an act far deeper and far vaster than the revivification of the brother of Mary and Martha. Remembering the teaching of Paul (1 Cor. xv. 45) that there are two men,—the former the "living soul" or fleshly animal nature (ψυχὴ ζῶσα), the latter the "quickening or life-giving spirit" (πνεῦμα ζωοποιοῦν); the former the first Adam, the latter the second Adam—we see at once in this miracle the second Adam raising up the first Adam from spiritual death, by imparting to him His own life. The very word used by Paul to describe the second Adam (ζωοποιεῖν) is used by our author to describe the prerogative of the Son—"the Son quickeneth (ζωοποιεῖ) whom He will" (v. 21). Other meanings may, no doubt, be conveyed beneath this central incident of the Fourth Gospel; nor is it impossible that the author, before describing how the Saviour laid down His life for mankind, wished to give the best possible proof of the spontaneousness of the action (asseverated above, x. 17, 18) by showing that He was actually the source of life to others. As a preparation for His resurrection on the third day, what could be better than that He should raise from the dead one who had been four days lying in the grave? If, also, a preparation was needed for the doctrine of the Spirit, which is soon to come before

[1] The use of ὑψοῦν ("exalt") to denote what the synoptists (Mat. xx. 19; xxvi. 2; Lu. xxiv. 7) denoted by σταυροῦν ("crucify") is very remarkable. In the synoptists, ὑψοῦν always means "to honour highly" ("every one that *exalteth* himself shall be abased" (Mat. xxiii. 12; Lu. xiv. 11); but, in the Fourth Gospel, Jesus uses it in addressing (viii. 28) His future murderers, "When ye *exalt* (ὑψώσητε) the Son of Man": comp. viii. 40, "Ye seek to slay Me." Strictly speaking, of course, we must say that ὑψοῦν is not the σταυροῦν, but the result of it.

[2] Compare Philo, *Abraham*, 44, where a similar contrast is drawn between the distinctive "kingdoms" of human rulers and the beneficent "kingdom" of the ideal man

us, the resurrection of Lazarus would serve this purpose too. For the Spirit is the source of life (ζωτικώτατον, Philo calls it, *Creation*, 7); and, therefore, just as the doctrine of the living water is preceded by the miracle of the water changed into wine, and the doctrine of bread by the miracle of bread, and the doctrine of the supersession of the intermittent sabbath by the continuous loving activity of the Father and the Son (v. 17) is preceded by the miracle of sabbath-healing vouchsafed to the man to whom the intermittent spring was useless, and the doctrine of the Light of the world is preceded by the miracle of giving light to the blind, so is it natural, and, as it were, proportionate, that the doctrine of the quickening Spirit (*cf.* vi. 63, τὸ πνεῦμά ἐστι τὸ ζωοποιοῦν) should be preceded by some miracle of quickening the dead.[1]

The anointing and the triumphal entry into Jerusalem having been discussed above, we pass to the last discourses (xii. 20 to xvii. 26). The last discourses in the synoptists treat of the second coming of Jesus in the clouds of heaven, and of the day of judgment; the last discourses in the Fourth Gospel treat rather of the continuous and increased presence of Jesus in the hearts of the disciples, of the reproving or judgment of the world by the Holy Spirit, and generally of the function of the Spirit in the church. In other words, the Fourth Gospel exhibits in a spiritualized form that which the synoptists set forth through material imagery. The promise of the future presence of Christ had been expressed by the synoptists in the legacy of His body and blood, which Christ is described as bequeathing to His disciples. The Fourth Gospel, which omits this incident (possibly as being already sufficiently known and receiving sufficient attention), lays more stress on the presence of the Spirit as Christ's substitute. It is important to observe that both the synoptic account of the last supper, and the last discourses in the Fourth Gospel, are founded on one and the same basis of historical fact, viz., that Christ approached death with the expressed conviction that His work would not be frustrated by it, but that He would remain for ever a living power in the hearts of His disciples. There is also, even in the Gospel of St Mark, an intimation that His disciples were to be aided by a "Holy Spirit," which should speak for them before princes and kings: "And when they lead you away, betraying you, take no forethought what ye shall speak, neither rehearse it, but whatsoever shall be given to you in that hour, this speak: for it is not ye that speak, but the *Holy Spirit*" (Mk. xiii. 11). To the same effect Jesus speaks in the parallel passage of Luke (xxi. 14, 15), bidding His disciples not to rehearse their defence (προμελετᾶν ἀπολογηθῆναι), for He will give them "a *mouth* and wisdom," which their adversaries shall not be able to gainsay. Thus, even from our earliest Gospel, it would seem that to those unlettered Galilean peasants, diffident (as Moses had been before them) of the sufficiency of their rhetoric to plead their cause before the bar of the great ones of the earth, a promise had been made of a "mouth" that should plead for them. The Holy Spirit was to be their Advocate. It is not likely that Jesus should have uttered these two expressions (quoted above) and no more, about the Spirit which was to be His substitute. Therefore, if the author of the Fourth Gospel had access to any apostolic sayings and traditions that illustrated the teaching of Christ during the last two or three days before His death, we might naturally expect to find in these traditions something more about the Spirit which was to be the Advocate of the disciples when pleading without their Master before the sanhedrin, and before princes and kings. Accordingly, finding in the last discourses of the Fourth Gospel an ampler doctrine on this subject, we have no ground, *a priori*, for regarding it with suspicion. True, the doctrine is set forth here, as elsewhere, in the peculiar language of the writer, so that we are absolutely certain that we have not the exact words uttered by Jesus; but this need not hinder us from accepting the thoughts as the thoughts of Jesus, if we can throughout trace the synoptic doctrine. In the synoptists Jesus predicts that He will "rise again"; obviously the letter of this prediction, though important, implies a still more important spiritual meaning beneath it. For this prediction would not have been satisfied by any amount of literal fulfilment if Jesus had merely walked from His grave and exhibited Himself alive, by tangible as well as ocular proof, to thousands of curious observers, hostile as well as friendly, unless He had at the same time poured a new influence or influent spirit into the hearts of those to whom He manifested Himself. It is characteristic of our evangelist that he realized (1) that the essence of the resurrection of Christ consists in His spiritual resurrection and intensified presence in the hearts of His disciples; (2) that this resurrection, triumphing over death, and making death the stepping-stone to a more active life, is as much in accordance with law, as is the growth of the corn of wheat which (xii. 24), "except it fall into the ground and die, abideth alone; but if it die, it bringeth forth much fruit." This law—illustrated daily by the increased influence of the dead upon the living, no less than by the fruitful death of the "corn of wheat"—a law so simple and yet so profound, like all the other laws enunciated by Jesus, can hardly have proceeded from any other than from Jesus Himself. The spiritual depth of the doctrine, and the similarity which it bears to the synoptic prediction (in spite of the difference of outward form), furnish strong arguments that, in the last discourses of the Fourth Gospel, we have much of our Lord's own teaching, though modified by the medium through which it is conveyed to us.

The doctrine of the Spirit, regarded not now as the purifying element in conjunction with water, but as the Advocate or Paraclete—being the highest and most esoteric doctrine of all—is reserved for the inner circle of His disciples. First, therefore, it is necessary to bring to an end the doctrine of Jesus to the outside world; and the battle between light and darkness, between Jesus and the Pharisees, ends with a recapitulation and conclusion of the doctrine of light. The Gentile world, appearing on the stage in the person of some inquiring Greeks, stretches out her hand to the Messiah (xii. 20); a voice from heaven attests His glory (xii. 28). The Son of God pronounces the fall of the evil one, and, almost in the same word, His own victorious death (xii. 31, 32). Then the light is hidden from the rebellious nation (xii. 36); the evangelist pronounces against them the sentence of condemnation, that they are blinded because they loved darkness more than light, and the praise of men more than the praise of God; and for the last time the voice of Jesus is heard, as it were from behind a cloud, warning those whom He has left in darkness that in rejecting Him they have rejected the Father also (xii. 37–50).

The esoteric doctrine begins with a parable of action, in which the Lord, by washing the feet of His disciples, teaches them humility. Two classes of heretics seem aimed at in this parable,—those who reject the washing of Jesus, to whom Jesus replies, "If I wash thee not, thou

[1] The complete discussion of this, the crowning "sign" in the Fourth Gospel, is not adapted for these pages. It would require a close examination of Lu. xvi. 20–31, together with Lightfoot's (*Horæ Hebraicæ*) comment on "Lazarus." On this point see also Wunsche, *Neue Beiträge zur Erläuterung der Evangelien*, p. 467; and compare Philo on the meaning of Eliezer (Lazarus) in *Who is the Heir?* 11, 12. The greater part of Origen's commentary on this portion of the Fourth Gospel has unfortunately perished; but some light may be thrown on it by a study of his *Comm. in Ev. Joann.*, xxviii. 5, 6, 9, as well as by Augustine, *In Joann. Evang. Tract.*, 49. The reasons usually alleged for the omission of this "sign" by the synoptists would also require careful consideration.

hast no part with Me;" and those who laid stress on repeated baptisms or purifications, "He that is (wholly) washed (λελουμένος) needeth not save to wash (νίπτειν) his feet." Now Judas, the child of darkness, goes forth from the chamber, and the evangelist seizes the moment to tell us that "it was night" (xiii. 30). Yet in this hour of darkness the hour of glorification is hailed by Jesus; and He conveys to His disciples, not indeed a new testament, but a new commandment, "that ye love one another" (ver. 34). How could this be called a new commandment for those who had been commanded long ago by Jesus to love even their enemies, much more their friends? The answer is found in the context: "As I have loved you, that ye also love one another," the meaning being, that after the death of Jesus, the memory of His love, enhanced in His absence, would spring up as an entirely new power within their hearts, so that "love" would assume a new meaning, and the command to love—though as old as the first influence of the Word, and therefore as the creation of man—would become essentially a new commandment. These words occur almost verbatim in the First Epistle of John (ii. 7), and, from their language, they can hardly be accepted as giving the letter of the words of Jesus; but they go down to the very roots of His teaching. The importance here attached to this new commandment of love leads us to observe that, throughout the whole of these discourses, love, almost as much as the Spirit, occupies the thoughts; and, indeed, in chapters xiii., xiv., xv., and xvii.,[1] the word ἀγαπᾶν occurs 24 times, against 10 times in all the rest of the Gospel. The connexion is obvious: step by step we are being led up to God; and God is love. The doctrine of the Spirit can reveal no higher manifestation of Him than this; and the Spirit itself is a Spirit of love, which will find its home only in the hearts of those that love.

Although Jesus has not expressly predicted His death, yet the warnings of betrayal and departure have troubled the hearts of His disciples. To comfort them Jesus promises that He will return, and be still present with them. But neither is the path of His departure and return, nor is His presence itself—so He warns Thomas and Philip—to be regarded as material. He will (spiritually) be more present with them, when, and because, He will be (materially) absent. Greater works will they do than He has done, because He, abiding with the Father above, will lift up their hearts to heaven—their home henceforth because their treasure, Christ, is there—and will make them one with Himself and with the Father, in will and in power. And here is repeated the saying, also found in the synoptists, that whatsoever the disciples pray for they shall obtain,—joined with the assurance that they shall do greater works (ἔργα) than He Himself does (xiv. 12). Note here that our evangelist brings out more clearly than the synoptists the spiritual meaning of the promise concerning prayer, and makes it evident that, as above, the works (ἔργα) meant are not "miracles" (δυνάμεις),—not the casting of a material mountain into the sea, as might be inferred from a misinterpretation of the synoptists,—but the Messianic "works" of forgiveness and regeneration.

The nature of Christ's future presence in the hearts of His disciples is differently described in different passages. At one time (xiv. 30) He declares that He Himself, together with the Father, will take up His abode in every heart that loves Him; but more often He uses the word used by Mark above, and speaks of a *Spirit* which shall be sent to them by the Father. He applies to the Spirit the very title we have been led to apply to the Spirit as described by Mark—the Advocate (Παράκλητος, or Advocatus). As a paracletus or advocatus was wont to explain the law to Greek or Roman clients, and to put words into their mouths, or rather to be himself their spokesman, so the spiritual Paraclete or Advocate would not only put words into the mouths of the disciples when they stood before the bar of kings (Mk. xiii. 11), but would also teach them all things, and bring to their remembrance all the spiritual laws laid down by their lawgiver Christ (xiv. 26). In one sense, the Spirit is a witness, because He testifies of Christ (xv. 26); but even here He is in reality an advocate, for the testimony is regarded as not uttered by the Spirit directly, but indirectly through the mouths of the inspired disciples who are to be "martyrs" or witnesses (μάρτυρες) for Christ (xv. 27). It was very natural that that aspect of the advocate's work which most impressed the editor of our earliest Gospel should retire into the background when the first brunt of the collision between the church and the world was over; and that gradually the work of the advocate should assume a wider province than that of merely educating the disciples to plead the cause of Christ in the presence of Gentile judges. Hence Paul regards the Spirit as teaching the disciples not so much what to say in their defence before earthly kings as rather in their prayers before the King of Kings: "We know not what we should pray for as we ought: but the Spirit itself maketh intercession for us with groanings which cannot be uttered" (Rom. viii. 26); "The Spirit searcheth all things, yea, the deep things of God, ... which things also we speak, not in the words which man's wisdom teacheth, but which the Holy Spirit teacheth" (1 Cor. ii. 10–13). But this conception, carried a stage further, makes the paraclete an advocate not revealing the laws of the celestial kingdom to the enfranchised citizen of it, nor yet revealing the will of the Father in heaven to the child on earth, but rather pleading the cause of the child before the offended Father; and in this sense Philo seems to use the word when he describes the high priest as clothed in the garb which is typical of the invisible universe, *i.e.*, typical of the Logos or Son of the Supreme Father of the world—because it was necessary for the priest consecrated to the Father of the world that he should have as his paraclete the Son, in order (through Him) to obtain pardon of sins and supply of blessings (*Life of Moses*, 14); and he also introduces Joseph (ch. 40) saying to his brethren, "I forgive you; seek no other *paraclete*," *i.e.*, no one to act between me and you as your advocate; and lastly, in this sense, the First Epistle of John (i. 1, 2) seems to use the word in the passage, "If any man sin, we have an advocate with the Father, Jesus Christ the righteous; and He is the propitiation for our sins."[2] But though our evangelist uses the word in this somewhat lower sense in the Epistle, in the Gospel he nowhere uses it thus. There the Paraclete's function is to be, as in Luke, "a mouth, a wisdom" (Lu. xxi. 15); to be a substitute for the helping presence of Christ (xiv. 16); to teach and remind (xiv. 26); to testify and to aid the disciple to testify (xv. 26); and to convict the world of sin (xvi. 8);—but nowhere to obtain forgiveness of sins from the Father by pleading the cause of the disciples in His presence. It is not an unreasonable inference that the evangelist's different use of this word in the Gospel and the Epistle may have arisen from the fact that in the former he is adhering more closely to the original use of it as handed down by Christ Himself.

Besides describing the work of the Paraclete as a consequence of the departure of the Son to the Father, the discourse touches upon the enmity which the disciples must be prepared to meet, and enforces the necessity of unity

[1] Note the curious break in chapter xvi., where the word ἀγαπᾶν does not occur at all, and φιλεῖν is twice used, xvi. 27.

[2] *Cf.* Schoettgen, vol. ii. p. 659, where it is shown that the Jews adopted the Greek word συνήγορος (not in its classical sense of "prosecutor," but in the sense of "advocate for the defence"), under the form סניגור, and applied it to Michael, who defends Israel from the accusations brought against him in the presence of God.

through love. Only in two points does the thought seem to suggest the influence of Philo; and in both of these Philo is rather corrected than followed. Philo says (*Giants*, 7) that it is impossible that the Spirit of God should remain for ever in the soul (though it may for a time) because of our inseparable connexion with the flesh; he adds (in language which is at least liable to the interpretation of asceticism) that, as Moses fixed his tent outside the camp, so those who would have the Divine Spirit as a permanent tenant of their souls must put off all the things of creation; the safest course being to contemplate God, not even through the uttered word, but without utterance, as absolute, indivisible existence (*ib.* 11, 12); with the mass of mankind the Spirit remains only for a moment, nor would it ever have visited them but to convict (διελέγξαι) them of choosing what is disgraceful instead of what is good (*ib.* 5).[1] The Fourth Gospel emphasizes no less the work of the Spirit in "convicting" (ἐλέγχειν) the world of sin; but it is also careful to say that the gift of the Spirit shall be permanent, "not as the world giveth give I unto you" (xiv. 27), and that the disciples are to remain in Jesus, while nevertheless not taken out of the world (xvii. 15). The Saviour is no more in the world, and the disciples are in the world (xvii. 11); yet He will not pray that they should be removed from the world, but only that they should be delivered from the evil (ver. 15). The discourse concludes with the prayer that all future believers may be knit together into one great body, which shall be in the Father and the Son, while at the same time the Father and the Son are in it (ver. 21, 23); and the last words of all, after innumerable periphrastic metaphors to describe the promised presence of Christ with His disciples, recur at last to the plain expression of His presence, "and I in you"—not greatly differing from the promise in the First Gospel (Mat. xxviii. 20), "I am with you always."[2]

There is doubtless a purpose in this accumulation of obviously inconsistent statements of the local relations between the Father, the Son, the Spirit, and the Church: "I am in the Father, and the Father in Me;" "Ye in Me, and I in you;" "I go unto the Father;" "The Holy Spirit whom the Father will send in My name;" "The Comforter whom I will send unto you from the Father;" "I came forth from the Father, and am come into the world;"—the intention being to prevent the mind of the reader from attaching any importance to mere local relations between the Three Persons, and to force him to form spiritual conceptions instead of local by showing that the most opposite local relations may be simultaneously predicated. Thus contradiction after contradiction leads the reader at last to pierce beneath the literal integuments to the spiritual truth concealed below them; and, aided by the bold analogy (xvii. 21) derived from human unity ("that they all may be one; as Thou, Father, art in Me, and I in Thee, that they also may be one in us"), we are led at last to discern that the unity is not that of place, but of will; and that the bond of unity is not sight working through material presence in material light, but Love working through spiritual sight or the spirit of truth, independently of material presence. And so, after all, the evangelist leads his reader to see that the coming of the Paraclete (like all things else in his Gospel) is according to law; "If I go not away, the Comforter will not come unto you" (xvi. 7); "The Holy Spirit was not yet given, because that Jesus was not yet glorified" (vii. 39). Not until the dead has passed away from us does the "idea of his life" creep into our minds—

"Apparelled in more precious habit,
More moving-delicate and full of life
Than when He lived indeed;"

and the Eternal Word, who subjected Himself to the laws of human nature in birth and life, may be supposed without irreverence to have subjected Himself to, or perhaps rather we should say to have availed Himself of, the same laws of human nature which regulate God's ordinance of death.

The crucifixion having been considered above, we pass to the narrative of the resurrection. Matthew and Mark imply that Jesus manifested Himself to the disciples in Galilee; Luke mentions none but manifestations in Judæa; the Fourth Gospel mentions manifestations in both places. Compared with Matthew and Luke, the Fourth Gospel may be said to handle the subject more familiarly, taking the resurrection, so to speak, more as a matter of course, and representing Jesus as moving in a more human fashion among His disciples after He had risen from the grave, helping them in their fishing, holding long conversations with them, and, in a word, renewing almost without a break the intercourse of the days before the crucifixion. In Matthew, the Christ after death appears once, upon a mountain, doubtfully discerned by some, and emits one final message, sending His disciples to evangelize the world, and promising them His perpetual presence. In Luke the risen Christ "vanishes," causes fear and terror to His disciples, and is supposed to be a "spirit" till He eats food in their presence; finally He is "parted from them." In John, the ascension, though alluded to, is not described; and everything else that might give the manifestation a phantasmal character is studiously kept in the background. No mention is made of the angel who descends (Mat. xxviii. 2) from heaven to roll away the stone from the sepulchre, terrifying the keepers of the grave, and bidding the women "fear not." It is rather assumed that, by His own unaided strength, Christ burst the bars of the grave, and after leisurely laying aside the grave-clothes, and the "napkin in a place by itself" (John xx. 7), went forth to converse with His disciples. It is true that the Fourth Gospel does not attempt to conceal the fact that the manifestations of Jesus were more than once not recognized by His disciples at first; but, in the cases of non-recognition, it is suggested (as in Luke), not that the manifestation was faint or shadowy (as seemingly in Mat. xxviii. 17, "And when they saw Him, they worshipped Him; but some doubted"), but that they mistook Him for a stranger (xx. 14; xxi. 4). That Jesus ate in the presence of His disciples is not stated, nor can it be said to be implied; but His familiar presence at the meal of the disciples (xxi. 13) suggests a real presence almost as effectively as the narrative of the eating of the fish and honeycomb in Luke. Additional conviction is also obtained by taking one of the apostles, Thomas, as a type of resolute scepticism, refusing to believe unless he touches the body of the risen Saviour, and by describing how even such scepticism as this was converted into certainty. Moreover, as the water and the blood were visibly given by Jesus on the cross, so—lest the giving up of the breath on the cross should be a scarcely sufficiently noticeable type of the gift of the holy breath or Spirit—

[1] Comp. Philo, *Quod Deus Immutabilis*, 26: "When the high priest, conviction, like a pure ray of light," flashes on our minds, we realize our pollution; and thus conviction may be said, as it were, to pollute our former imaginary and self-satisfied righteousness.

[2] There is an attractive symmetry in the supposition of Canon Westcott (*Introd. to St John's Gospel*), that these discourses (xiii., xiv., xv.), in which alone is any mention made of "commandments," are intended to be a kind of Sermon in the Chamber, corresponding to the Sermon on the Mount. The Sermon on the Mount sets forth the new law of Christ; the Sermon in the Chamber vivifies the new law with the new Spirit. This supposition exactly corresponds with the "spiritual" (Muratorian fragment) motive of the Gospel; and the esoteric nature of the doctrine is not inconsistent with the statements which are said to be mainly "based on direct knowledge of Papias's book" (Westcott, *Canon*, p. 76), that Papias, "a dear disciple of John," wrote five books entitled "exoterica." For "exoterica" imply "esoterica."

our evangelist records that Jesus breathed on His disciples and said, "Receive ye the holy breath" (or Spirit)—at the same time connecting with this highest gift the highest activity for which a human soul can be inspired by God, the faculty of forgiving sins. It is probable that the Gospel originally ended at xx. 31: "But these are written that ye might believe that Jesus is the Christ the Son of God, and that believing ye might have life through His name." This is a most appropriate termination; and what follows bears every appearance of being an appendix added by the author, describing a miraculous draught of 153 fishes, and a meal of Jesus with seven of the disciples, followed by a dialogue between Jesus and Peter, in which the death of the latter is predicted, and the erroneous tradition that the beloved disciple should not die is shown to be baseless.

Three inferences seem probable from this last narrative:—(1) that there had been at Ephesus a tradition (arising perhaps from the extreme old age of John and from some such expression as is recorded in John xxi. 22) that John would not die till the Lord had appeared; (2) that John had died when this account was written (for if he were living and past his ninetieth year, at a time when the church daily expected the coming of the Lord, the Ephesian Christians would not have needed any explanation or softening away of a prediction which would seem to them very likely to be fulfilled); but (3) if John was dead, it must seem that the words "we know" *could* not have been added (as they might be supposed to have been added, according to the Muratorian legend) by Andrew and Philip, who in all probability died before John died; and if John was dead, it must seem that the words *would* not have been added by any elders of Ephesus representing the generation after John; for how could they—who stood on a footing altogether subordinate and inferior in point of reputation, and with no opportunities of information—have ventured to ratify the testimony of the "beloved disciple?"

It is more easy to arrive at negative than at positive results, when evidence is so slight; but it seems probable that the author, attempting to give the spiritual essence of the gospel of Christ, as a gospel of love, and assigning the Ephesian Gospel to the beloved disciple who had presided over the Ephesian church, by way of honour and respect (for the same reasons which induced the author of the 2d Epistle of Peter to assign that Epistle to the leading apostle), and being at the same time conscious that the book (though representing the Ephesian doctrine generally, and in part the traditions of John the apostle, as well as those of Andrew, Philip, Aristion, and John the elder) did not represent the exact words and teaching of the disciple—added the words "We know, &c.," partly as a kind of *imprimatur* of Andrew, Philip, and the rest; partly in order to imply that other traditions besides those of John are set forth in the book; partly to characterize the book as a Gospel of broader basis and greater authority than the less spiritual traditions issuing from non-apostolic authors, which our evangelist desired to correct or supplement. Nor is it in the least unlikely that this Gospel does represent the teaching of Andrew and Philip, and Aristion and John the elder, as well as that of John. If Papias of Hierapolis gathered up the traditions of these apostles and elders, why not also our author, writing in Ephesus perhaps several years before Papias? It is assuredly not for nothing that the name of "Matthew," mentioned in Matthew, Mark, and Luke, is not found in the Fourth Gospel; nor is it without significance that the Gospel begins and ends with an inner apostolic circle. The "twelve" are indeed mentioned, but as in the background. The beloved disciple, Andrew and Peter, Philip and Nathanael,—these, and these only, are mentioned as called by Jesus in the beginning; Peter and Thomas, Nathanael and the sons of Zebedee, and two other disciples (presumably the same list as those above, with the addition of James, the son of Zebedee, and Thomas), are mentioned as alone admitted to the sacred meal which closes the Gospel. This fact marks the whole character of the book; it is esoteric and eclectic, and designedly modifies the impression produced by the tradition previously recorded by the synoptics.

The criticism of the first three Gospels.—For fourteen centuries the church was content to follow Augustine (*De Consensu Evangelistarum*, i. 4) in believing that Mark was "as it were the humble companion (pedissequus) and abridger" of Matthew. Towards the end of the 18th century this dogma was shaken, and two different hypotheses were put forward: (1) that the evangelists had borrowed from one another, either Matthew from Mark, or Mark from Luke, or even (so capricious and baseless were the hypotheses which now started into existence) Matthew and Mark from Luke; (2) that all the three Gospels depended upon an original and common Gospel. The first of these hypotheses may for convenience be called the "borrowing" hypothesis; the second may be called the "traditional" hypothesis. Eichhorn was the first to systematize the "traditional" hypothesis, maintaining (1794) that the original tradition was a written Aramaic Gospel, known to the three synoptists, but afterwards (1804) so far modifying his views as to recognize that the Aramaic tradition had been translated into Greek, and passed through several documentary stages, before it assumed the form preserved in the triple version of our synoptists.

Inside the circle of those who maintained the traditional hypothesis there now arose inner divisions upon the question, which evangelist most closely approximated to the "original" tradition. Eichhorn had assigned (1804) the priority to Matthew, Grätz (1812) to Mark. Moreover, a new form of the hypothesis was shaped out by Schleiermacher (1817), who maintained that our Gospels were composed on the basis of a number of disconnected documents; while Gieseler (1818) showed that it must have been, in any case, oral tradition which served the needs of the earliest disciples,—tradition stereotyped by time, and reduced to some kind of similar pattern before being committed to writing by the synoptists. Still no certain conclusions were arrived at. De Wette (beginning from 1826) assumed a common oral tradition for Matthew and Luke, and treated Mark as an epitomizer. Credner (1836) joined Schleiermacher in tracing our Gospels back to a collection of words of the Lord, which he supposed Matthew to have combined with the oldest Gospel, viz., Mark; similarly Lachmann (1835). Bleek (1862–1866) relapsed into Griesbach's view (1784–1790) that Mark was based on Matthew and Luke.

All these conflicting hypotheses might naturally induce those who had not themselves closely studied the synoptic texts to believe that the truth of the matter was unattainable, and that, in any case, the synoptic narratives (not being the records of eye-witnesses, nor being preserved in unaltered documents written contemporaneously with or soon after the events) must necessarily be untrustworthy. Accordingly, in 1835, Strauss maintained that the whole synoptic narrative was legendary or otherwise untrustworthy. The defenders of the synoptists against Strauss found little consideration, and the hypothesis that Mark contained the original Gospel was discredited by the extravagance of its supporters. In 1846–7 Schwegler and Baur, recurring to the "borrowing hypothesis," issued it in a new form as an "adapting hypothesis." The original Gospel was now supposed to be the Gospel of the Hebrews (see p. 818 above), which was imagined to contain in all its bare truthfulness the Ebionite doctrine of the early church. Matthew combined this original Jewish-minded document with some other document of more liberal sentiments. Luke was at first a Pauline protest against Judaism, but was afterwards supplemented, in a conciliatory spirit, with passages coloured with Ebionitic and Jewish thought; Mark was treated as a neutral and colourless adapter of Matthew and Luke,—"pedissequus et breviator." This was the Tübingen doctrine, sometimes called the "tendency hypothesis," because the adaptations were supposed to proceed from theological "tendencies."

Ewald (beginning from 1849) combated the Tübingen theory, maintaining that (1) there was an original Gospel, perhaps composed by the evangelist Philip; (2) in addition to this, there was a collection of "logia" made by Matthew; (3) and, out of both these documents, or by an author acquainted with these documents, was formed Mark, or, at all events, Mark in its original shape; (4) Matthew contains (1) (2) and (3), together with extracts from a "book of higher history"; (5) three anonymous evangelists revived this narrative, which received its last form at the hands of Luke (see the account of Ewald's theory in Westcott's *Gospels*, p. 203). From this time the compilatory and artistic character of Luke began to be generally recognized; and even the Tübingen school gave up the theory that Mark had adapted Luke. Hilgenfeld, "in a five years' literary struggle with Baur" (see Holtzmann, in Schenkel's *Bibel-Lexicon*, art. "Evangelien"), proved Mark's independence. Köstlin (1853) advocated an original Mark as the groundwork of the synoptists; together with a "Gospel of Peter" as the basis for the parts common to Matthew and Luke. Ritschl (1851), recanting his former opposition, and Meyer (1853) became converted to the belief in an "original Mark." Volkmar (1857) and a number of other theologians took the same view; Weiss (1861) advocated a parity of originality, or rather a common original source, from which Matthew and Mark borrowed equally, while occasionally Matthew borrowed from Mark itself. But the work which most approximates to a proof of the originality of the tradition contained in Mark is Holtzmann's *Die Synoptischen Evangelien*, &c., 1863, from whose summary of the criticism of the first three Gospels (Schenkel's *Bibel-Lexicon*, "Evangelien") these statements are mainly drawn. The author of *Jesus of Nazara*, Dr Keim, of whom, for the sake of that interesting work, we would speak with all respect, was almost alone in defying, in his last work (p. vii. *Aus dem Urchristenthum*, 1878), the "mane-shaking of the Mark lion;" but even he, with qualification (*ib.* p. 30).

The work of Dr Holtzmann last referred to is of great value; and so are Dr Weiss's *Marcusevangelium* (1872) and *Matthäusevangelium* (1876); but it is truly lamentable that nearly a century has passed in the accomplishment of so little. The reason is perhaps to be looked for (1) in the amount of personality which has been introduced into discussions of this kind; (2) in the haste with which theories have been erected upon the basis of single causes; (3) in the general absence of attempt to classify and concentrate evidence; (4) in the failure to recognize the distinction between probabilities and certainties, and the amount of labour necessary to attain certainty; (5) most of all, in the absence of mechanical helps. It is probable that the publication of Bruder's *Concordance* in the middle of this century has done more than all the rest of the hypothesis inventors, from Augustine to Hitzig, to forward the scientific study of the synoptic Gospels; nor could Dr Holtzmann's valuable work have been written but for the humble assistance of Bruder. It is lamentable to think how much industry, ink, and paper, and occasionally intellect as well, might have been saved if there had been in common circulation from the beginning of this century, along with Bruder, a harmony of the Gospels, printed after the manner suggested above (p. 790), from which any one, almost without knowing Greek at all, could have seen at a glance that the "pedissequus" theory of Mark was not for a moment tenable, and that Mark *contains*—by no means, necessarily, *is*—the original tradition from which, at least in some places, Matthew and Luke independently borrowed

There are signs that a similar waste of industry is to be apprehended in the further discussion of the question whether the common tradition is derived from oral or documentary sources. When, for example, we find so able a critic as Dr Holtzmann (Schenkel, "Evangelien," p. 210) laying stress on the irregular form ἀπεκατεστάθη occurring in the same place in all the three synoptists (Mat. xii. 13; Mk. iii. 5; Lu. vi. 10) as a convincing proof that the copying of documents (and not oral tradition) can alone explain so strange a similarity, we naturally suppose that this irregularity is nowhere else found in the Old or New Testament. But so far is this from being the case that the irregular form may be with greater truth said to be the only form current in the Old and New Testament, occurring not only in the three passages above, but also in Mk. viii. 25 (ἀπεκατέστη); in Jerem. xxiii 8; in Exod. iv. 7; in var. interpret. Gen. xxiii. 16 [Trommius quotes 3 (1) Esdr. i. 36 (?33), but Tischendorf reads ἀπέστησεν]; and the only passage in which the regular form is found, Gen. xl. 21, contains a var. lect. ἀπεκατέστησεν, which, no doubt, ought to be inserted in the text. This may serve as an example to show how ultimately circuitous the path must be through these attempted short cuts to certainty. The truth is that the question of oral or documentary sources is not to be settled without a great deal more of labour and of judgment than the subject has hitherto received. For a statement of the oral hypothesis, which is generally adopted by English scholars, the reader is referred to Westcott's *Introduction to the Gospels*, pp. 161–208. It has been pointed out, however, by Dr Sanday (*Academy*, Sept. 21, 1878) that there has been of late an increasing tendency in the three theories—the Tübingen or adaptation theory, the documentary Mark theory, the oral tradition theory—to approximate to each other; so that the tendency theory has given less weight to dogmatic tendencies and more weight to literary considerations. The documentary Mark theory allows the previous influence of tradition, only stipulating for some lost documentary links between the oral tradition and our Mark; while the oral theory approaches to the documentary Mark theory in assuming that the oral Gospel is represented most nearly by our present Mark. Nevertheless, says Dr Sanday, between the two last theories (for the Tübingen theory may be left out of account) "the struggle has yet to come. The division between these is almost national. In Germany no one of any significance as a critic holds the oral theory. In England none of our prominent writers hold anything else. France is divided. Godet ranges himself on the side most popular in England. Réville was an early supporter of a view similar to that which is gaining the ascendency in Germany; and the same is substantially adopted by M. Renan."

It is greatly to be desired that, in this "struggle," the disputants may illustrate the subject in a somewhat ampler manner than has been hitherto common. Different versions of the same original—tales, histories, ballads—transmitted through documentary and oral sources should be compared together; and more especially the phenomena of the ante-Jerome versions of the New Testament should receive the most careful study, before even the ablest commentator should allow himself to use the dogmatic tone which unfortunately characterizes Dr Weiss's *Matthäusevangelium* in deciding against the oral theory. But this is a natural characteristic of an author who sees in a single Ἱερουσαλήμ convincing proof of an Aramaic original (see p. 805 above), and to whom a καὶ ἰδοῦ settles all critical disputes. With this dogmatism the tone of Canon Westcott's remarks on the oral Gospel contrasts advantageously. Nevertheless, it will probably be hereafter found that the phenomena of our present synoptists are due not to one, but to all, of the causes advocated by the various disputants of the 18th century. Tradition, documents, theological tendencies, literary modifications, misunderstanding of metaphorical parable, misunderstanding of eucharistic language, misunderstanding of spiritual language—all these causes will be found to have contributed to produce the present synoptic result; and it will not improbably be found, as Dr Sanday shrewdly suggests, that early documents have been much more modified, and early oral traditions much less modified, than modern associations might have led us to suppose. Future investigations will receive a considerable stimulus and help, as soon as a harmony of the synoptists showing the Triple Tradition as well as the double traditions (pp. 795–800 above) becomes a recognized text-book for all students of the Gospels. It will also be a useful check, if no demonstration of different documents (in Luke, for example) be recognized as sound until it has been tested by application to other authors. For example, the proof from καί, δέ, τε, εἶπε, λέγει, λαλεῖ, Ἱερουσαλήμ, κύριος, ἐνώπιον, εὐθύς, καὶ ἰδοῦ, is by no means to be despised; but it requires expression in a clear picturesque way by the well-known means of curves; and no proof of this kind ought to be accepted until it (or corresponding proof) has been applied,—first (*a*) negatively, to several passages recognized as genuine productions of the same author (Plato, for example), and then (*b*), positively, to several passages, some of which are recognized as genuine, others as spurious. In the first case (*a*) the curves will exhibit no fluctuations; in the second (*b*) the curves will exhibit fluctuations corresponding to the fluctuations in Luke; and this will be a strong and clearly intelligible proof (even to those who know no Greek—for the same illustrative proof might be deduced from the application of the test to *Titus Andronicus* and to *Hamlet*) that the fluctuations of the curves are caused in each case by the incoming of different documentary strata. But perhaps, to do this thoroughly, it would be necessary to do it four or five times over for each of the four or five principal ancient MSS. (nor ought, perhaps, even varieties of spelling, and certainly not varieties of form, such as ἦλθαν, &c., to be neglected, as possibly pointing to the incoming of different documents); and the labour is so great that, even with the avoidance of all broaching of hasty theories and all personalities, a single worker could hardly accomplish it with the devotion of a life,—at least that is the conclusion to which the present writer has been forced after devoting some years to this labour. Yet, in any case, one signal advantage will result from our keeping before ourselves a high standard of demonstration, viz., that, although we may bring forward theories for discussion, we shall draw a very distinct line between what is proved and not proved, and shall shrink with a just horror from short cuts to knowledge.

Criticism of Fourth Gospel.

The Criticism of the Fourth Gospel.—No criticism of a systematic kind, says Dr Holtzmann (Schenkel's *Bibel-Lexicon*), began till the publication of Bretschneider's *Probabilia* (1820), which provoked so much opposition that the author retracted it. The apostolic authorship was supported by Schleiermacher, and by Credner (1836), even while admitting that the Gospel could not be regarded as a purely objective work. Similarly De Wette, after some doubt and hesitation (1837), and Reuss (1840–64) decided for the Johannine authorship,—the former being influenced by a comparison of the Fourth Gospel with the other works of the 2d century. The attack of Strauss, in his *Life of Jesus*, being passed over (as indicating no attempt, or possibly ability, to appreciate the depth of the spiritual doctrine in the Fourth Gospel, in spite of the suggestiveness and occasional accuracy of his method), we come to Baur (1847), who pronounced the Gospel to be a religious ideal poem, composed in the 2d century. A great number of writers accepted this theory; among them, Zeller and Hilgenfeld, and Schenkel and Keim in their lives of Christ, together with Réville (1864) and Scholten. In the meantime an hypothesis of "partial authorship" had been suggested, some (Weisse in 1838, and Freytag in 1861) believing that the discourses, others, as Renan (1863), believing that the historical narratives, were genuine; while some wished to detach the Judæan from the Galilean portion of the Gospel, as being distinct in authorship and origin. Lucke, Ewald, Brückner, and Wittichen, adopting in various forms the view of a divided authorship, recognized in the Gospel a framework of historical fact, but noted also the promisence of the ideal, the want of historical development, and the subjective colouring given by the author to the discourses of Christ—views which find a full expression in Weizsäcker's *Untersuchungen über die evangelische Geschichte* (1864). Canon Westcott, in his *Introduction to the Gospels* (5th ed., 1875), maintains apostolic authorship, which is also in a special treatise (*Authorship and Historical Character of the Fourth Gospel*, 1872) maintained by Dr Sanday. The latter work lays perhaps somewhat too much emphasis on the geographical expressions which are used to prove that the author was a Jew of Palestine. Many of these would appear natural for an Alexandrian Jew who had spent two or three passovers at Jerusalem, and had travelled through the country. Still more doubtful is the canon assumed throughout the treatise, that graphic details, particularities of name, place, &c., imply an eye-witness—the contrary being suggested by the phenomena of the apocryphal Gospels. Nor does Dr Sanday make any attempt to illustrate the Fourth Gospel (except in respect of the Logos doctrine) by the teaching of Philo. Nevertheless the book is eminently candid, and there is no other book in English to compare with it for the light it throws, not only on the Fourth Gospel itself, but also on the history of its criticism. Dr Sanday also recognizes, even more fully than Canon Westcott, the subjective nature of the Gospel, at least so far as to make this admission, that the words of Jesus himself and the words of the evangelist are, in more than one instance, so inextricably intermixed that it is impossible to tell where the former end and the latter begin. In the *Introduction to the Gospel of St John*, published (1879) in the *Speaker's Commentary*, Canon Westcott has greatly amplified the valuable remarks on the Fourth Gospel contained in his *Introduction to the Study of the Gospels*, and states most forcibly the views of those who see in the multiplicity of detail in the Fourth Gospel one among many proofs that the Gospel was composed by an eye-witness of the events which it records. For the doctrine of the Logos Canon Westcott gives the following list:—Gfroerer, *Philo u. d. Jud.-Alex. Theosophie*. 1835; Dachne, *Jud.-Alex. Religions-Philosophie*, 1834; Dorner, *Person of Christ* (Eng. trans.); Jowett's "St Paul and Philo" (*Epistles of St Paul*, § 363 ff.); Heinze, *Die Lehre v. Logos in Griech. Philosophie*, 1872; Siegfried, *Philo von Alexandria*, 1875. Grossmann (*Quæstiones Philoneæ*, 1829) gives a complete summary of the use of the word in Philo. An account of the Logos literature up to 1870 is given by Dr Abbot in his appendix to the article on "The Word" in the American edition of the *Dictionary of the Bible*, and Soulier includes several later works in *La doctrine du Logos chez Philon d'Alexandrie*, Turin, 1876. (E. A. A.)

GOSPORT, a fortified seaport and market town of Hampshire, England, on the western side of Portsmouth harbour, near its mouth, directly opposite and about a mile from Portsmouth, with which it is connected by a floating bridge moved by a steam engine working on two fixed chains. The old fortifications built at the end of last century are now obsolete, and a line of new forts has been erected about two miles from the town, extending from the Solent to the upper part of Portsmouth harbour, with accommodation for two regiments of infantry and a brigade of artillery. Near the town is the royal St Clarence victualling yard, with brewery, cooperage, powder-magazines, biscuit-baking establishment, and storehouses for various kinds of provisions for the royal navy. Adjoining this yard there are large Government powder magazines and a laboratory for making fusees and rockets. Within the old fortifications a fine new barracks has been erected with accommodation for 1100 men, and another barracks with accommodation for 1600 men adjoining it. The principal other buildings are the town-hall and market-place, the church of Holy Trinity, erected in the time of William III., and the magnificent Haslar naval hospital, capable of containing 2000 patients. Gosport has an extensive establishment for the manufacture of anchors and chain cables, and it is also celebrated for its yacht-building and sail-making establishments. The coasting trade is considerable. The town is said to have received its name, Gosport or God's Port, from Bishop Henry de Blois, who put in here for shelter during a severe storm in 1158. It was then only a small fishing village. According to another supposition its original name was Gorse Port, and it was so called from the gorse and furze with which the commons in the neighbourhood were thickly covered. The population in 1871 was 7366.

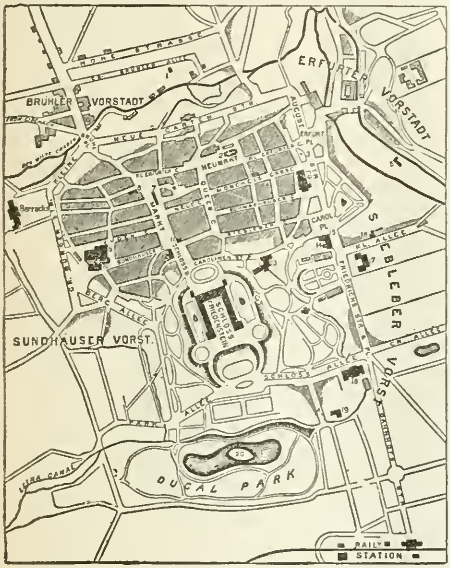
GOSSART, JAN, born at Maubeuge towards the close of the 15th century, is better known to Englishmen by the name of Mabuse than by that of Jenni Gossart, with which he signed some of his pictures, or that of Jennyn van Hennegouwe (Hainault), under which he matriculated in the guild of St Luke, at Antwerp, in 1503. We know nothing of his life before he attained to manhood; but his works at least tell us that he stood in his first period under the influence of artists to whom plastic models were familiar; and this leads to the belief that he spent his youth on the French border rather than on the banks of the Scheldt. In no seat of artistic culture is this feature more conspicuous than at Tournai, Douai, or Valenciennes, and it may be that in one of these cities Mabuse learnt to commingle the study of architecture with the gaudy system of colouring familiar to tinters of stone. Without the subtlety or power of Van der Weyden, he had this much in common with the great master of Tournai and Brussels, that his compositions were usually framed in architectural backgrounds; and this marked characteristic is strongly displayed in the pictures which he executed in the first years of the 16th century. But whilst Mabuse thus early betrays his dependence on the masters of the French frontier, he also confesses admiration for the great painters who first gave lustre to Antwerp; and in the large altar-pieces of Castle Howard and Scawby, he combines in a quaint and not unskilful medley the sentiment of Memling, the bright and decided contrasts of pigment peculiar to coloured reliefs, the cornered and packed drapery familiar to Van der Weyden, and the bold but Socratic cast of face remarkable in the works of Quentin Matsys. At Scawby he illustrates the legend of the count of Toulouse, who parted with his worldly goods to assume the frock of a hermit. At Castle Howard he represents the Adoration of the Kings, and throws together some thirty figures on an architectural background, varied in detail, massive in shape, and fanciful in ornament. He surprises us by pompous costume and flaring contrasts of tone. His figures, like pieces on a chess-board, are often rigid and conventional. The landscape which shows through the colonnades is adorned with towers and steeples in the minute fashion of Van der Weyden. After a residence of a few years at Antwerp, Mabuse took service with Philip, bastard of Philip the Good, at that time Lord of Somerdyk and admiral of Zeeland. One of his pictures had already become celebrated—a Descent from the Cross (50 figures) on the high altar of the monastery of St Michael of Tongerloo. Philip of Burgundy ordered Mabuse to execute a replica for the church of Middleburg; and the value which was then set on the picture is apparent from the fact that Dürer came expressly to Middleburg (1521) to see it. In 1568 the altar-piece perished by fire. But its principal features were preserved in a large arras hanging, recently exhibited at the Archæological Museum of Brussels. In 1508 Margaret of Austria sent Philip of Burgundy to Italy to negotiate for the treaty of Cambrai. On this mission he was accompanied by Mabuse; and by this accident an important revolution was effected in the art of the Netherlands. Mabuse appears to have chiefly studied in Italy the cold and polished works of the Leonardesques. He not only brought home a new style, but he also introduced the fashion of travelling to Italy; and from that time till the age of Rubens and Van Dyck it was considered proper that all Flemish painters should visit the peninsula. The Flemings grafted Italian mannerisms on their own stock; and the cross turned out so unfortunately that for a century Flemish art lost all trace of originality.

In the summer of 1509 Philip returned to the Netherlands, and, retiring to his seat of Suytburg in Zeeland, surrendered himself to the pleasures of planning decorations for his castle and ordering pictures of Mabuse and Jacob of Barbari. Being in constant communication with the court of Margaret of Austria at Malines, he gave the artists in his employ fair chances of promotion. Barbari was made court painter to the regent, whilst Mabuse received less important commissions. Records prove that Mabuse painted a portrait of Leonora of Portugal, and other small pieces, for Charles V. in 1516. But the only signed pictures of this period are the Neptune and Amphitrite of 1516 at Berlin, and the Madonna, with a portrait of Jean Carondelet, of 1517, at the Louvre, in both of which we clearly discern that Vasari only spoke by hearsay of the progress made by Mabuse in "the true method of producing pictures full of nude figures and poesies." It is difficult to find anything more coarse or misshapen than the Amphitrite, unless we except the grotesque and ungainly drayman who figures for Neptune. In later forms of the same subject—the Adam and Eve at Hampton Court, or its feebler replica at Berlin—we observe more nudity, combined with realism of the commonest type. Happily Mabuse was capable of higher efforts. His St Luke painting the portrait of the Virgin in Sanct Veit at Prague, a variety of the same subject in the Belvedere at Vienna, the Madonna of the Baring collection in London, or the numerous repetitions of Christ and the Scoffers (Ghent and Antwerp), all prove that travel had left many of Gossart's fundamental peculiarities unaltered. His figures still retain the character of stone; his architecture is as rich and varied, his tones are as strong as ever. But bright contrasts of gaudy tints are replaced by soberer greys; and a cold haze, the "sfumato" of the Milanese, pervades the surfaces. It is but seldom that these features fail to obtrude. When they least show, the master displays a brilliant palette combined with smooth surface and incisive outlines. In this form the Madonnas of Munich and Vienna (1527), the likeness of a girl weighing gold pieces (Berlin), and the portraits of the children of the king of Denmark at Hampton Court, are fair specimens of his skill.

Philip of Burgundy had been deputed in Italy (1515) to escort Charles V.'s sister, Isabella, to Denmark. She was the affianced bride of Christian II., whose subsequent attempt to unite Denmark and Sweden ended so fatally. Here a favourable opportunity was afforded for introducing Mabuse to the Danish court; and it is possible that the opportunity was not neglected. Yet Mabuse may have become acquainted with the Danish king at a later period. As early as 1523, when Christian came to Belgium, he asked Mabuse to paint the likenesses of his dwarfs. In 1528 he requested the artist to furnish to Jean de Hare the design for Isabella's tomb in the abbey of St Pierre near Ghent. It was no doubt at this time that Mabuse completed the portraits of John, Dorothy, and Christine, children of Christian II., which came into the collection of Henry VIII. No doubt, also, these portraits are identical with those of three children at Hampton Court, which were long known and often copied as likenesses of Prince Arthur, Prince Henry, and Princess Margaret of England. One of the copies at Wilton, inscribed with the forged name of "Hans Holbein, ye father," and the false date of 1495, has often been cited as a proof that Mabuse came to England in the reign of Henry VII.; but the statement, it is clear, rests on no foundation whatever. At the period when these portraits were executed Mabuse lived at Middleburg. But he dwelt at intervals elsewhere. When Philip of Burgundy became bishop of Utrecht, and settled at Duerstede, near Wyck, in 1517, he was accompanied by Mabuse, who helped to decorate the new palace of his master. At Philip's death, in 1524, Mabuse designed and erected his tomb in the church of Wyck. He finally retired to Middleburg, where he took service with Philip's brother, Adolph, lord of Veeren. Van Mander's biography accuses Gossart of habitual drunkenness; yet it describes the splendid appearance of the artist as, dressed in gold brocade, he accompanied Lucas of Leyden on a pleasure trip to Ghent, Malines, and Antwerp in 1527. The works of Mabuse are those of a hardworking and patient artist; the number of his still extant pictures practically demonstrates that he was not a debauchee. The marriage of his daughter with the painter Henry Van der Heyden of Louvain proves that he had a home, and did not live habitually in taverns, as Van Mander suggests. His death at Antwerp, on the 1st of October 1532, is recorded in the portrait engraved by Jerome Cock. (J. A. C.)

GOSSELIES, a town of Belgium, in the arrondissement of Charleroi and province of Hennegau, is picturesquely situated on the Piéton and on the Brussels and Charleroi canal, 8 miles N.W. from Charleroi. There are extensive coal-mines in the neighbourhood, and the town possesses breweries, tanneries, bleachworks, and manufactories of hats, knives, and nails. Here the French gained a victory over the Austrians, 26th June 1794. The population is about 7000.

GOTHA (originally *Gotegewe*, or *Gotawe*, and later *Gotaha*, or *Gothau*), a town of Germany, formerly capital of the old duchy of Gotha, and now, alternately with Coburg, the residence of the duke of Saxe-Coburg. Gotha is situated on a canal of the Leina, and on the Thuringian railway, about 6 miles north of the Thuringian Forest. It consists of the town proper and four suburbs, which are grouped in the shape of a half-moon to the north, west, and east of the hill on which, at the height of 1086 feet, stands the castle of Friedenstein. With the exception of those in the older portion of the town, the streets are handsome and spacious, and the beautiful gardens and promenades between the suburbs and the castle add greatly to the town's attractiveness. On the other side of the castle there is an extensive and finely adorned park. To the north-west of the town the Gulberg hill,—on which there is a public pleasure garden,—and to the south-west the Leeberg hill, rise to a height of over 1300 feet, and afford extensive views of a beautiful panorama. The castle, begun by Ernest the Pious in 1643 and completed in 1654, occupies the site of the old fortress of Grimmenstein. It is a huge square building flanked with two wings, having towers rising to the height of about 140 feet. It contains the ducal coin cabinet, and the ducal library of nearly 200,000 volumes, among which are several rare editions, and about 6900 manuscripts. The picture gallery, the cabinet of engravings, the natural history museum, the Chinese museum, and the cabinet of art, which includes a collection of Egyptian, Etruscan, Roman, and German antiquities, are now included in a new building, completed in 1878, which stands on the southern terrace of the castle. The principal other public buildings are the Margaret church,—with a beautiful portal and a lofty tower,—founded in the 12th century, twice burnt down, and rebuilt in its present form in 1652; the Augustines or Cloister church, with an altar-piece by the painter Jacobs; the theatre; the fire insurance bank and the life insurance bank; the ducal palace, in the Italian villa style, with a winter garden and picture gallery; the buildings of the legislature of the duchy; the hospital; the old town-house, dating from the 11th century; the old dwelling-house of the painter Lucas Cranach, now used as a girls' school; the ducal stable; and the Friedrichsthal palace. The educational establishments include excellent city schools, a gymnasium (founded in 1524, one of the most famous in Germany), a ladies' school of the first order, a training school for teachers and another for female teachers, a free school, a trade school; and a commercial school. Among the other institutions are a lying-in hospital, a surgical and eye hospital, a private lunatic asylum, an orphanage, a reformatory, a magdalen institute, and a school for the board and education of destitute girls. The observatory, erected by Duke Ernest II. in 1787, was in 1857 transferred to a new site in the neighbourhood of the park. Formerly the town obtained its water supply



Plan of Gotha.

13. Mint.
14. Ducal Palace.
15. Telegraph Office.
16. Perthes's Publishing House.
17. Friedrichsthal Palace.
18. Ducal Stables.
19. Observatory.
20. Ducal Burying-Place.

by means of the Leina canal, which was excavated in 1369, but water for drinking purposes has since 1874 been obtained from the Thuringian Forest. Gotha is one of the most active commercial towns of Thuringia, its manufactures including sausages, for which it has a great reputation, porcelain, tobacco, sugar, machinery, mechanical and surgical instruments, musical instruments, shoes, lamps, and toys. There are also a number of nurseries and market gardens. The book trade is represented by about a dozen firms, including that of the great geographical house of Perthes. Population (1875), 22,928.

Gotha existed as a village in the time of Charlemagne. In 930 the Abbot Gotthard of Hersfeld surrounded it with walls. It was known as a town as early as 1109, about which time it came into the possession of the landgraves of Thuringia. On the extinction of that line Gotha came into the possession of the electors of Saxony, and on the division of their estates between Frederick the Soft-hearted and William, it fell to the share of the latter, after whose death it was inherited by the Ernestine line of dukes. After the battle of Mühlberg in 1547, the castle of Grimmenstein was partly destroyed, but it was again restored in 1554. In 1566 the town was taken from Duke John Frederick by August of Saxony. After the death without issue of John Frederick's two sons, it came into the possession of Duke Ernest the Pious, the fourth of the line of the dukes of Gotha; and on the extinction of this line it was, in 1826, united, along with the dukedom, to Coburg.

GOTHENBURG (Swedish, *Göteborg*), the second city and chief commercial town of Sweden, and the capital of a "lan" of the same name, is situated in a low valley surrounded by bare hills, on the south bank and $1\frac{2}{3}$ miles from the mouth of the Götha river, 282 miles W.S.W. of Stockholm by rail (by the Götha Canal 370 miles). Gothenburg is well and regularly built, mostly of stone or brick, with wide and well-paved streets, and in its general appearance much resembles an English town. It consists of two main portions, the town proper and its suburbs,—together $5\frac{1}{4}$ square miles in extent. The first may be described as a semicircle extending south-eastward over a marshy flat from the bank of the Götha as its diameter. This semicircle is crossed by the East and West Harbour Canals and from east to west by the Great Harbour Canal, which divides the town proper into two parts, a north and a south. The canals are enclosed with hewn stone, lined with trees, and crossed by 24 iron bridges. The finest streets of Gothenburg are the North and South Harbour Streets. Gustavus Adolphus's *Torg* (market-place), with a bronze statue of Gustavus Adolphus by Fogelberg, occupies the centre of the town, while the principal market-place is now (since 1849) *Kungstorget* (the king's market-place). The favourite promenades are the Horticultural Society's Park, the King's Park, with Molin's group (the Beltbucklers) and the *Nya Alléen* (new alleys), situated on the south outskirts. Gothenburg has seven Lutheran churches, of which the finest are the cathedral (*Gustavii Domkyrka*), called after Gustavus Adolphus, founded 1633, rebuilt after fires in 1742 and 1815, now a cruciform structure 173 feet high and 194 feet long by 75 feet broad, Haga church, erected in 1856, and the German church, rebuilt 1747–1798; an English Episcopal church (1855); a Catholic chapel; and a synagogue (1855). The other chief buildings are the exchange, in Italian style (1844), with marble statues of Odin by Fogelberg (1855), and of Oscar I. by Molin (1855); the residence house, built by Torstenson after the Thirty Years' War; the town-house, founded 1670, enlarged 1814; the old *kronhus*, where the diet of 1660 was held; the new custom-house (1866); the artillery barracks (1806) for 750 men; the prison (1854); the railway station (1858); the arsenal (1860); the new theatre (1856–59) seated for 1030; and the Sahlgren new hospital (1848–55). Gothenburg is the seat of a bishop and of a provincial governor. It has 34 schools of various kinds, including two Latin schools, a school-teachers' seminary, an extensive *Elementär-läroverk*, founded 1630, rebuilt 1859, with a library of 15,000 vols., a trade institute, the Chalmers' technical school (1869), another technical school (1848), a "real-gymnasium" (1844), and a navigation-school (1862). The museum, founded in 1833, contains collections for natural history, entomology, anatomy, botany, archæology, and ethnography, a picture and sculpture gallery, and a collection of 6000 coins and medals. Gothenburg has numerous benevolent and charitable institutions, mainly supported by the munificence of private citizens. The industries are shipbuilding (carried on in four docks), linen and cotton weaving, brewing, and the manufacture of furniture, machinery, lucifer-matches, paper, sugar, and tobacco. In 1877, 2213 ships of 532,127 tons (Swedish, 1221 of 270,900 tons; British, 267 of 130,219 tons) entered at the port, while 1781 ships of 526,352 tons (British, 264 of 118,236 tons) cleared. The mercantile fleet belonging to Gothenburg consisted on January 1, 1878, of 65 steamships of 21,215 tons, and 156 sailing vessels of 63,913 tons. The exports in 1877 amounted in value to £2,437,200. These included 8,107,326 cubic feet of deals, boards, and battens (6,021,546 cubic feet to England); 6,065,408 cubic feet of pit-props and other timber, besides 7,216,056 pieces of oak and other staves, and laths and carpenters' work valued at £80,083; 90,460 tons of iron and steel (62,480 tons to England); 333,194 quarters of grain, chiefly oats (265,655 quarters to England); also beans and pease, lucifer matches, 2667 head of cattle, and 38,578 cwts. of butter. The imports in the same year amounted to £3,865,000, chiefly made up of cotton (14,540,996 ℔) and cotton yarn (3,608,355 ℔), wool and woollen yarn (3,397,757 ℔), raw sugar (17,289,777 ℔), refined sugar (6,512,919 ℔), coffee (8,239,346 ℔), molasses (4,883,021 ℔), rice (3,246,247 ℔), olive oil (2,443,804 ℔), salt (796,208 cubic feet), coal and coke (246,205 tons), iron rails (32,059 tons), petroleum (13,243,408 ℔), hides (2,346,577 ℔), and paper (712,538 ℔). Under the peculiar licensing system initiated in Gothenburg October 1, 1865, the town authorities contract for three years with a limited company, which takes the whole number of licences for selling *brändin*, and hands over to the town treasury the net proceeds of its trade. These amounted to £40,103 in the year ending October 1, 1876, when the company sold 383,561 gallons of spirits, 178,133 gallons of which were consumed on the public-house premises, and realized a gross profit of £52,850. The licences issued have been reduced from 119 in 1865 to 56 in 1876. All "bars" are closed from 6 P.M. on Saturday to 8 A.M. on Monday, and in the period 1866–76 apprehensions for drunkenness have on the average decreased 22 per cent., though since 1870 there has been a slight increase (in 1876, 2357 persons were fined), usually attributed to the higher rate of wages and the greater efficiency of the police. The population of Gothenburg, including suburbs, was 71,707 in 1877.

Founded by Gustavus Adolphus in 1619, Gothenburg was from the first designed to be fortified, a town of the same name founded on Hisingen (an island 44 square miles in area between the two arms of the Gotha river) having been destroyed by the Danes during the Calmar war. From 1621, when it was first chartered, it steadily increased, though it suffered greatly in the Danish wars of the last half of the 17th and the beginning of the 18th centuries, and from several extensive conflagrations (the last in 1813), which have destroyed important records of its history. The great development of its herring fishery in the latter part of the 18th century gave a new impulse to the city's trade, which was kept up by the influence of the "Continental System," under which Gothenburg became a depôt for the colonial merchandise of England. After the fall of Napoleon it began to decline, but since its closer connexion with the interior of the country by the Götha Canal (opened 1832) and Western Railway it has rapidly advanced both in population and trade. It is expected that the great line now in course of construction through the mining districts will very greatly increase the importance of Gothenburg. Since the demolition of its fortifications in 1807, it has been defended only by the two redoubts of Billingen and Rya Rabbe. Gothenburg was the birthplace of the poet Bengt Lidner, and of two of Sweden's greatest sculptors, Fogelberg and Molin. After the French Revolution Gothenburg was for a time the residence of the Bourbon family.

GOTHIC LANGUAGE. See under GOTHS, p. 852.

GOTHOFRED or GODEFROY, the name of a noble French family, of which many members attained distinction as jurists or historians.

The first whose name is associated with the active study of jurisprudence, at the close of the 16th century, was DENIS GODEFROY (1549–1621). He was born at Paris, and studied law at the universities of Louvain, Cologne, and Heidelberg. Having embraced the Reformed religion, he found Geneva a safer abode than Paris, and became professor of law there. Some years afterwards he obtained a public appointment in one of the districts in the Jura, but was driven from his home by the troops of the duke of Savoy and retired to Basel. Thence he was induced by the offer of a chair of Roman law to go to Strasburg, but soon changed his appointment for one at Altorf, which then possessed a university celebrated for its late professor of law, Donneau. In 1600 the elector palatine appointed him professor of Roman law in Heidelberg, where he spent the greater portion of the remainder of his life, and was placed at the head of the faculty of law. The most flattering offers from several universities failed to induce him to leave his adopted country, but the invasion of the Palatinate by Tilly's troops forced him to take refuge again at Strasburg, where he died in 1621. His most important work is his edition of the *Corpus Juris*. The text given by him was very generally adopted and used in quotation. More than twenty editions of the work were published in various towns of France, Germany, and Holland. Godefroy's other writings are very numerous; but they are for the most part either editions of classical authors or compilations which display great industry and learning, but are of little use to the modern student.

THEODORE GODEFROY (1580–1649), the eldest son of Denis, forsook the religion which his father had adopted, and obtained the office of historiographer of France, as well as several important diplomatic posts. His historical works are very numerous. The character of his labours will be judged from the title of his most elaborate production—*Le Cérémonial de France*. Many of his smaller works are devoted to questions of genealogy.

JACQUES GODEFROY (1587–1652), the younger brother of Theodore, has a real claim to the remembrance of students of the history of Roman law, in his edition of the *Theodosian Code*, at which he laboured for thirty years. It was this code, and not the *Corpus Juris* prepared under the direction of Justinian, which formed the principal, though not the only source from which the lawyers of the various countries which had formed the Western empire drew their knowledge of Roman law, at all events until the revival of the study of law in the 11th century at Bologna. Hence Godefroy's edition was of real value. Jacques Godefroy also completed the difficult and useful task of collecting and arranging those fragments of the *Twelve Tables* which can be discovered, and so an important step was taken towards representing the Roman law in its first definite form. His other works are very numerous, and are principally devoted to the discussion of various points of Roman law. He died in 1652, having served the republic of Geneva both as its principal magistrate and in undertaking important missions to the court of France.

A list of the works of the various members of the family of Godefroy, whose activity extends over a period of nearly 200 years, may be found in the *Biographie Générale*, and fuller particulars of its history in Moreri's *Dictionnaire historique*.

GOTHS. The historical position of the Gothic nation needs to be marked out with special care, both on account of various lax popular uses of the Gothic name, and also on account of much legendary history and many rash ethnological speculations, ancient and modern, which have gathered round the true history of the Gothic people. An ignorant age used the words *Goth* and *Gothic* as vague names of contempt for anything that was thought rude and barbarous. A hardly less ignorant but better disposed age used the word *Gothic* in an equally vague way, but without the same feeling of contempt, for anything which was thought to be mediæval or "romantic," as opposed to "classical." The name came also to be used as a philological or ethnological term; we heard of "Gothic nations," "Gothic languages," &c., meaning "Teutonic" in the widest sense. The name was also, first scornfully, then respectfully, applied to a style of architecture which has some claim to be called Teutonic as opposed to Greek or Roman, but which has nothing whatever to do with the Goths as a nation. Long before this, two European sovereigns who had nothing whatever to do with the national Goths, took the title of King of the Goths out of a mere accidental likeness of names. All these uses of the Gothic name must be carefully distinguished from the history of the true national Goths who play so great a part in Europe from the 3d to the 8th century of our era. The Goths may on many grounds claim the foremost place among the Teutonic nations which had a share in the break-up of the Roman power. They were among the earliest, if not quite the earliest, of the Teutonic nations to establish themselves within the empire, as distinguished from merely ravaging its frontiers. Their history too is closely connected with the geography of the whole empire. Their first historical appearance was in the East; their great historical settlements were made in the West. No Teutonic people fills so great a place in the political and military history of the 4th, 5th, and 6th centuries, and no Teutonic people has left behind it such early remains of a written native literature. The real greatness of the Goths quite accounts for the many vague uses of the Gothic name. Alike in scorn and in honour, the Goths have been, not unreasonably, taken as the representatives of the whole Teutonic race. The wonderful thing is that a people who played so great a part for several ages should have wholly passed away. The Goths have not for many ages existed anywhere as a distinct nation, nor have they given an abiding name to any part of Europe. Franks, Angles, Saxons, Burgundians, Frisians, Thuringians, Lombards, Bavarians, perhaps Vandals, are all visible on the modern map. So several parts of Europe have at different times been known as *Gothia*; but the name was never borne by any large country, and it has nowhere lasted down to modern times.

The chief ancient authority for the early history of the Goths is their national historian Jordanis, who chiefly followed the Gothic history of Cassiodorus the minister of Theodoric, and the lost history of Ablavius. (On the value of Jordanis's writings see Pallmann, *Geschichte der Völkerwanderung*, i. 23.) But he is careless and uncritical, and, like other national historians, is full of mythical elements in the early part. He has to be tested throughout by the contemporary Roman and Greek writers from the 3d century to the 6th. Among these, perhaps the first place is due to Ammianus in the 4th century and to Procopius in the 6th.

The first certain historical appearance of the Goths is in the lands north of the lower Danube in the 3d century of our era. For any earlier account of them we have to go either to mythical stories or to ingenious guesses and inferences. There are a remarkable number of national and legendary names which have more or less of likeness to the name *Goth*, and this likeness has naturally led to an unusual number of theories. The Goths first appear in history in the ancient land of the *Getæ*; and this geographical fact, combined with the likeness of the names, has naturally caused *Getæ* and *Goths* to be looked on as the same people. The identification is as old as our first historical mention of the Goths (Ælius Spartianus, *Ant. Car.*, 10). Claudian always speaks of the Goths as *Getæ*. So does the national historian Jordanis (cap. v.). The identity is mentioned doubtingly by Procopius (*Bell. Vand.*, i. 2; *cf. Bell. Goth.*, v. 4). It is strongly maintained by Jacob Grimm (*Geschichte der Deutschen Sprache*, capp. ix., xviii.), but is rejected by nearly all later writers. A more famous legend, which has derived its chief currency from Jordanis, brings the Goths first of all from Scandinavia (see Gibbon, c. x.; Geijer's *History of Sweden*, c. x.). There is a so-called East and West Gothland in Sweden, but the connexion of these lands with the Goths of Roman history is more than doubtful. Ptolemy (ii. 11, 35) places the Γοῦται in Scandia, and Procopius (*Bell. Goth.*, ii. 15) knew the Γαυτοί among the inhabitants of Thoule; but he clearly did not look on them as Goths (see Zeuss, *Die Deutschen*, 500, 511; Grimm, p. 312). Then there is the god *Geát* (see Kemble's *Saxons in England*, i. 370), and the *Geátas*, who figure in Beowulf, and elsewhere in Old-English writings. The Traveller's Song (34, 115, 177) distinctly distinguishes *Goths* and *Geátas*, and couples the latter with the Swedes. Pliny (*Nat. Hist.*, iv. 11) places *Getæ* and *Gaudæ* together on the lower Danube. His *Gaudæ* may possibly be Goths; if so, they are distinguished from the *Getæ*. Then there are the *Jutes* of Old-English history, the *Guttones*, *Gothones*, *Gothini* (see Latham, *Germania*, Epilegomena xxxviii. *et seqq.*). Pytheas, according to Pliny (*Nat. Hist.*, xxxvii. 7; *cf.* iv. 14) placed the *Guttones* on the south coast of the Baltic (that seems to be his meaning), and rules them to be a German people. This carries the name back to the time of Alexander. Ptolemy also (iii. 5, 20) has Γύθωνες in Sarmatia on the Vistula. Tacitus (*Germania*, 43) distinguishes the German *Gothones* in the same region from the Celtic *Gothini*, whom he places seemingly nearer to the Carpathians. Tacitus moreover not only speaks of the *Gothones* or *Gotones* as a people, but mentions (*Ann.*, ii. 62) a particular man of the nation, Catualda by name, as having restored the independence of his people after it had been overthrown by Maroboduus. With this hint, it is perhaps not too much to infer with Aschbach (*Westgothen*, 2d ed.) and Zeuss (136) that for Βούτονες in Strabo (vii. 1), who are mentioned among the nations subject to Maroboduus, we should read Γούτονες. And there is no doubt that names like *Getæ*, *Gethæ*, *Guddæ*, even *Gothi*, lived on almost to modern times, first as national names, then as names of contempt, in Poland, Lithuania, and Prussia (see Latham, and Zeuss, 672). Latham asserts the identity of the names *Getæ*, *Gothi*, and *Gothones*, but he holds (see especially p. 42 of his Epilegomena) that both *Gothones* and *Getæ* were Lithuanian, and that the Teutonic Goths took the name of the people whom they had conquered. They would, on this view, be Goths only in the sense in which Englishmen are Britons.

On the whole, it seems that there is no trustworthy evidence for a migration of the Goths from Scandinavia, and that the idea was suggested only by the likeness of name between the true Goths and the *Gauts* or *Geátas* of Swedish history. The application of the name *Gothland* to the island *Gotland*, as well as to the continental *Gauthiod*, is a further mistake. Nor does there seem to be any reason for making *Goths* and *Getæ* the same. But the identification of the Goths with the *Gothones*, Γούτονες, *Guttones*, on the south coast of the Baltic (which is accepted by Pallmann and Dahn) has much more to be said for it. *Gothi* and *Gothones* are strictly the same name; the double form is usual in the Latin shapes of Teutonic names. But the whole history of the Goths in their northern seats is summed up in the personal history of Catualda, who, after delivering his people from Maroboduus, was himself overthrown by the Hermunduri. The continuous and certain history of the Gothic nation begins in the Roman Dacia.

The question now comes, Which of the nations which are historically connected with the Goths had any closer connexion with them than that of common Teutonic origin? Setting aside Getæ and other doubtful theories, the real

Gothic name is used by the Greek and Latin writers in a wider and in a narrower sense. We must also bear in mind the vague way in which the ancient writers used national names, and their fondness for using obsolete names. Thus the Goths and other Teutonic nations are spoken of as Scythians and Samaritans. Procopius, in an evidently well-considered passage (*Bell. Vand.*, i. 2), speaks of the Goths as having been formerly called Σαυρομάται καὶ Μελάγχλαινοι, names which come out of Herodotus's description of the regions where the Goths first appear. But he gives it as the definite result of his own observations that Goths,—by this name he always means specially the East-Goths,—Vandals, West-Goths, and Gepidæ (Γήπαιδες, with an evident intention to give the word a Greek meaning) were originally one nation, speaking one Gothic language. The only question is about the Vandals. The Gepidæ are commonly acknowledged as a branch of the Goths, and Jordanis (17) has a legend which implies their kindred. The Taifalæ (Ammianus, xxxi. 19), the Bastarnæ, Peucini, and other tribes are also reckoned among the Gothic races. In other passages Procopius speaks of several other nations, as the Alans, Rogi, and Scirri, as Gothic, but he does not seem to be in the same way pronouncing a definite judgment. Among all these, the historical Goths, who play a part in European history by that name, consist of the East and West Goths, and of the small division called Tetraxitæ. The division into East and West Goths does not appear in the earlier writers, as Ammianus and Zosimus, but we find it both in Procopius and in Jordanis. Instead of East-Goths and West-Goths, we read in Ammianus, Zosimus, and Claudian of *Greuthungi* and *Tervingi.* These seem to be (see Aschbach, 21; Zeuss, 406; Köpke, 103) the strictly national names of the two divisions, which took the names of East and West Goths from their geographical position in the lands which they entered. There is an exact parallel in England, where the national name of the *Gewissas* gives way to the geographical name of *West-Saxons.* Jordanis indeed doubts whether the East-Goths were so called from their eastern position, or from a king Ostrogotha. Strange to say, this Ostrogotha seems to be a real person, and not a mere mythical eponym. Οὐστριγότθος (Procop., *Bell. Goth.*, iv. 27) is an historical person at a later date, and the name is borne in a feminine shape by one of the daughters of Theodoric. The history of the East and West Goths, as far as the empire is concerned, falls naturally into three periods. In the 3d century they are still settled outside the empire, and appear as invaders and ravagers of the Roman territory from outside. After an interval in which they almost sink out of notice, they appear again within the bounds of the empire, in various relations of alliance and enmity, marching to and fro, but not making any lasting settlement. It is not till the 5th century that they begin to form settled powers. During their wandering stage they appear mainly in the Eastern empire. But neither they nor any other Teutonic people founded any permanent settlement within its borders. The historical settlements of the Goths are the short and brilliant dominion of the East-Goths in Italy, and the more lasting dominion of the West-Goths in Gaul and Spain.

After the first vague mention of the Goths under Antoninus Caracalla, they begin to play a distinct part in the reign of Alexander Severus. They were then in Dacia, and received a tribute or subsidy of some kind (Petrus Patricius, 124, ed. Bonn). The next emperor, Maximin, is claimed by Jordanis (15) as himself of Gothic birth, but we may suspect the usual confusion with the *Getæ*. The narrative of Jordanis begins from this point to put on a more historical character, and his account is helped out by various notices in the Augustan History. In the reign of Philip (244–248 A.D.) they passed the Danube and ravaged Mœsia, and in 251 the emperor Decius fell in battle against them (see Zosimus, i. 19 *et seqq.*). From this time they ravaged eastern Europe and western Asia far and wide (251–268). They carried on their warfare by sea, and reached as far east as Trebizond. And it seems to have been now that the first permanent Gothic settlement was made, though not strictly within the lands of the empire. This was in the Tauric Chersonesos or Crim. Here their settlement lasted for many ages, and they became allies rather than subjects of the empire in the reign of Justinian. Within the empire the Gothic inroads met with repulses at several points, especially from the local forces of Athens under the historian Dexippus (Trebellius, Gallienus 13, and the fragment of Dexippus himself). At last, in 269, the Goths suffered a decisive defeat from the emperor Claudius at Naissus in Dardania, which formed an epoch in Gothic history. It answers to the repulse of the Saxons from Britain by the elder Theodosius. The first attempt at Gothic settlement south of the Danube had been premature. It had to be repeated at a later time with greater success.

Further victories over the Goths are attributed to Aurelian. But the chief event of his reign was one which amounted to a legal acknowledgment of Gothic occupation north of the Danube. The Roman legions were withdrawn from Dacia, and the name of Trajan's great conquest was transferred to the land south of the Danube (274). That is, the great river was established as the boundary between the Roman and Gothic dominions. The wisdom of this cession is shown by its being followed by a period of ninety years in which the peace between the Goths and the empire was seldom seriously broken. The chief interruption was during the reign of Constantine, when the Gothic king Araric invaded the empire, and, after some momentary successes, was driven back. In the middle of the 4th century a great power arose under the East-Gothic king Ermanaric (less correctly *Hermanric*; the name is the same as *Eormenric*, in the royal line of Kent), of the house of the Amali, which was reckoned to be the noblest among the Goths. Ermanaric has become a great figure in Teutonic legend, and it is not easy to say how far legend has built upon history, and how far so-called history has drawn from legend. But that Ermanaric was a real man, and the founder of a great dominion, is plain from the few words of Ammianus (xxxi. 3). Yet there is something unsatisfactory in the way in which we read vague accounts of the greatness of his power, with hardly a glimpse of himself personally. The period assigned to his reign is full of stirring events, in which we get a clear conception of much lesser Gothic chiefs, but none of Ermanaric himself. Jordanis (23) claims for him a vast dominion stretching from the Danube to the Baltic, and he is specially emphatic on the subjection of the Slavonic nations to the rule of the Gothic overlord. With regard to the Gothic nations, we can see that the rule of Ermanaric was a mere overlordship. The West-Goths appear as a distinct people, with the power of making war and peace on their own account. But they had no kings; their great chief Athanaric appears only as "judge" (Ammianus, xxvii. 5; xxxi. 3), answering to our *ealdorman* or *heretoga* (*cf.* Jordanis, 26); and along with him are other West-Gothic chiefs, specially his rival Frithigern. We hear of a civil war between these two rivals (Socrates, iv. 33), and it is more certain that Athanaric made war within the Roman border as an ally of the usurper of Procopius in 365, and afterwards made peace with the emperor Valens. By this time Christianity was making swift advances among the Goths. According to the view of some modern writers (Köpke, 123; Pallmann, ii. 63), the outlying Gothic settlement in Crim had been Christian and Catholic from the beginning; but now Christianity in its Arian form began to be gradually accepted by the great mass of the Gothic nation. This was mainly the work of the teaching of Ulfila (see ULFILA), the Gothic apostle and translator of the Scriptures into the Gothic tongue (Sozomen, iv. 24). According to some accounts (Pallmann, i. 71), he had, to avoid persecution, led a Christian colony south of the Danube (348), who settled peaceably at Nicopolis, and are hence known as Mœsogoths (seemingly the *Gothi Minores* of Jordanis, 51). Later, in 370, there was another great persecution, in which Athanaric, the special enemy of everything Roman, appears also as the enemy of the Christians, while Frithigern is their friend (Sozomen, vi. 37; Socrates, iv. 33). The distinction between Christian and heathen Goths remains of political importance for some time. But both East and West Goths had fully embraced Arianism long before the end of the 5th century, while the Goths of Crim seem to have remained Catholic, and received Catholic bishops from Saint John Chrysostom, and afterwards from Justinian.

Towards the end of the reign of Ermanaric several causes joined together to break his great dominion asunder. There were clearly signs of division between East and West Goths, between Christians and heathens, as well as discontents among the subject nations. These causes of division were now strengthened by pressure from without. Now began the first of those movements of the Turanian races into the lands north of the Danube, which have had such an effect on the history of south-eastern Europe down to our own time. The Huns pressed on the new dominion of the Goths, which was already beginning to break in pieces. Ermanaric died at the age, it is said, of 110, by the hands of subject princes stirred to wrath by his cruelties (Jordanis, 24). All thought of a lasting Gothic dominion north of the Danube died with him. With his fall the movements south of that river begin again on a great scale.

From this time the history of the East and West Goths parts asunder, to be joined together again only incidentally and for a season. The great mass of the East-Goths stayed north of the Danube, and passed under the overlordship of the Hun. They do not for the present play any important part in the affairs of the empire. The great mass of the West-Goths crossed the Danube into the Roman provinces, and there played a most important part in various characters of alliance and enmity. The great migration was in 376, when they were allowed to pass as peaceful settlers under their chief Frithigern. His rival Athanaric seems to have tried to maintain his party for a while north of the Danube in defiance of the Huns; but he had presently to follow the example of the great mass of the nation. The peaceful designs of Frithigern were meanwhile thwarted by the ill-treatment which the Goths suffered from the Roman officials, which led first to disputes and then to open war. In 378 the Goths won the great battle of Adrianople, in which the emperor Valens was killed. His successor Theodosius the Great made terms with them in 381, and the mass of the Gothic warriors entered the Roman service as *fœderati*. Many of their chiefs were in high favour; but it seems that the orthodox Theodosius showed more favour to the still remaining heathen party among the Goths than to the larger part of them who had embraced Arian Christianity. Athanaric himself came to Constantinople in 381; he was received with high honours, and had a solemn funeral when he died. His saying is worth recording, as an example of the effect which Roman civilization had on the Teutonic mind. "The emperor," he said, "was a god upon earth, and he who resisted him would have his blood on his own head."

The death of Theodosius in 395 broke up the union between the West-Goths and the empire. Dissensions arose between them and the ministers of Arcadius; the Goths threw off their allegiance, and chose Alaric as their king. This was a restoration alike of national unity and of national independence. The royal title had not been borne by their leaders in the Roman service. Alaric's position is quite different from that of several Goths in the Roman service, who appear as simple rebels (see Köpke, 128). He was of the great West-Gothic house of the Balti (bold), a house second in nobility only to that of the Amali. His whole career was taken up with marchings to and fro within the lands, first of the Eastern, then of the Western empire. The Goths are under him an independent people under a national king; their independence is in no way interfered with if the Gothic king, in a moment of peace, accepts the office and titles of a Roman general. But under Alaric the Goths make no lasting settlement. In the long tale of intrigue and warfare between the Goths and the two imperial courts which fills up this whole time, cessions of territory are offered to the Goths, provinces are occupied by them, but as yet they do not take root anywhere; no Western land as yet becomes *Gothia*. Alaric's designs of settlement seem in his first stage to have still kept east of the Adriatic, in Illyricum, possibly in Greece. Towards the end of his career his eyes seem fixed on Africa (see Köpke, 128).

Greece was the scene of his great campaign in 396, the second Gothic invasion of that country. In this campaign the religious position of the Goths is strongly marked. The Arian appeared as an enemy alike to the pagan majority and the Catholic minority; but he came surrounded by monks, and his chief wrath was directed against the heathen temples (Hertzberg, *Geschichte Griechenlands*, iii. 391). His Italian campaigns fall into two great divisions, that of 402–3, when he was driven back by Stilicho, and that of 408–10, after Stilicho's death. In this second war he thrice besieged Rome (408, 409, 410). The second time it suited a momentary policy to set up a puppet emperor of his own, and even to accept a military commission from him. The third time he sacked the city, the first time since Brennus that Rome had been taken by an army of utter foreigners. The intricate political and military details of these campaigns are of less importance in the history of the Gothic nation than the stage which Alaric's reign marks in the history of that nation. It stands between two periods of settlement within the empire and of service under the empire. Under Alaric there is no settlement, and service is quite secondary and precarious; after his death in 410 the two begin again in new shapes.

Contemporary with the campaigns of Alaric was a barbarian invasion of Italy, which, according to one view, again brings the East and West Goths together. The great mass of the East-Goths, as has been already said, became one of the many nations which were under vassalage to the Huns; but their relation was one merely of vassalage. They remained a distinct people under kings of their own, kings of the house of the Amali and of the kindred of Ermanaric (Jordanis, 48). They had to follow the lead of the Huns in war, but they were also able to carry on wars of their own; and it has been held (see Köpke, 139; Pallmann, ii. 173, 277) that among these separate East-Gothic enterprises we are to place the invasion of Italy in 405 by Radagaisus (whom Pallmann writes Ratlger, and takes him for the chief of the heathen part of the East-Goths). One chronicler, Prosper, makes this invasion preceded by another in 400, in which Alaric and Radagaisus appear as partners. The paganism of Radagaisus is certain. The presence of Goths in his army is certain, but it seems dangerous to infer that his invasion was a national Gothic enterprise.

Under Ataulf, the brother-in-law and successor of Alaric, another era opens, the beginning of enterprises which did in the end lead to the establishment of a settled Gothic monarchy in the West. The position of Ataulf is well marked by the speech put into his mouth by Orosius. He had at one time dreamed of destroying the Roman power, of turning *Romania* into *Gothia*, and putting Ataulf in the stead of Augustus; but he had learned that the world could be governed only by the laws of Rome, and he had determined to use the Gothic arms for the support of the Roman power. And in the confused and contradictory accounts of his actions (for the story in Jordanis cannot be reconciled with the accounts in Olympiodorus and the chroniclers), we can see something of this principle at work throughout. Gaul and Spain were overrun both by barbarian invaders and by rival emperors. The sword of the Goth was to win back the lost lands for Rome. And, amid many shiftings of allegiance, Ataulf seems never to have wholly given up the position of an ally of the empire. His marriage with Placidia, the daughter of the great Theodosius, was taken as the seal of the union between Goth and Roman, and, had their son Theodosius lived, a dynasty might have arisen uniting both claims. But the career of Ataulf was cut short at Barcelona in 415, by his murder at the hands of another faction of the Goths. The reign of Sigeric was momentary. Under Wallia in 418 a more settled state of things was established. The empire received again, as the prize of Gothic victories, the Tarraconensis in Spain, and Novempopulana and the Narbonensis in Gaul. The "second Aquitaine," with the sea-coast from the mouth of the Garonne to the mouth of the Loire, became the West-Gothic kingdom of Toulouse. The dominion of the Goths was now strictly Gaulish; their lasting Spanish dominion does not yet begin.

The reign of the first West-Gothic Theodoric (418–451) shows a shifting state of relations between the Roman and Gothic powers; but, after defeats and successes both ways, the older relation of alliance against common enemies was again established. At last Goth and Roman had to join together against the common enemy of Europe and Christendom, Attila the Hun. But they met Gothic warriors in his army. By the terms of their subjection to the Huns, the East-Goths came to fight for Attila against Christendom at Châlons, just as the Servians came to fight for Bajazet against Christendom at Nicopolis. Theodoric fell in the battle (451). After this momentary meeting, the history of the East and West Goths again separates for a while. The kingdom of Toulouse grew within Gaul at the expense of the empire, and in Spain at the expense of the Suevi. Under Euric (466–488) the West-Gothic power again became largely a Spanish power. The kingdom of Toulouse took in nearly all Gaul south of the Loire and west of the Rhone, with all Spain, except the north-west corner, which was still held by the Suevi. Provence alone remained to the empire. The West-Gothic kings largely adopted Roman manners and culture; but, as they still kept to their original Arian creed, their rule never became thoroughly acceptable to their Catholic subjects. They stood therefore at a great disadvantage when a new and aggressive Catholic power appeared in Gaul through the conversion of the Frank Chlodwig. Toulouse was, as in days long after, the seat of an heretical power, against which the forces of northern Gaul marched as on a crusade. In 507 the West-Gothic king Alaric fell before the Frankish arms at Bouglé, near Poitiers, and his kingdom, as a great power north of the Alps, fell with him. That Spain and a fragment of Gaul still remained to form a West-Gothic kingdom was owing to the intervention of the East-Goths under the rule of the greatest man in Gothic history.

When the Hunnish power broke in pieces on the death of Attila, the East-Goths recovered their full independence. They now entered into relations with the empire, and were settled on lands in Pannonia. During the greater part of the latter half of the 5th century, the East-Goths play in south-eastern Europe nearly the same part which the West-Goths played in the century before. They are seen going to and fro, in every conceivable relation of friendship and enmity with the Eastern Roman power, till, just as the West-Goths had done before them, they pass from the East to the West. They are still ruled by kings of the house of the Amali, and from that house there now steps forward a great figure, famous alike in history and in romance, in the person of Theodoric son of Theodemir. Born about 454, his childhood was spent at Constantinople as a hostage, where he was carefully educated. The former part of his life is taken up with various disputes, intrigues, and wars within the Eastern empire, in which he has as his rival another Theodoric, son of Triarius, and surnamed Strabo. This older but lesser Theodoric seems to have been the chief (not king) of that branch of the East-Goths which had settled within the empire at an earlier time. Theodoric the Great, as he is sometimes distinguished, is sometimes the friend, sometimes the enemy, of the empire. In the former case he is clothed with various Roman titles and offices, as patrician and consul; but in all cases alike he remains the national East-Gothic king. It was in both characters together that he set out in 488, by commission from the emperor Zeno, to recover Italy from Odoacer. By 493 Ravenna was taken; Odoacer was killed by Theodoric's own hand; and the East-Gothic power was fully established over Italy, Sicily, Dalmatia, and the lands to the north of Italy. In this war the history of the East and West Goths begins again to unite, if we may accept the witness of one writer (Anon. Vales. 728) that Theodoric was helped by West-Gothic auxiliaries. The two branches of the nation were soon brought much more closely together, when, through the overthrow of the West-Gothic kingdom of Toulouse, the power of Theodoric was practically extended over a large part of Gaul and over nearly the whole of Spain. A time of confusion followed the fall of Alaric, and, as that prince was the son-in-law of Theodoric, the East-Gothic king stepped in as the guardian of his grandson Amalaric, and preserved for him all his Spanish and a fragment of his Gaulish dominion. Toulouse passed away to the Frank; but the Goth kept Narbonne and its district, the land of Septimania—the land which, as the last part of Gaul held by the Goths, kept the name of *Gothia* for many ages. While Theodoric lived, the West-Gothic kingdom was practically united to his own dominion. He seems also to have claimed a kind of protectorate over the Teutonic powers generally, and indeed to have practically exercised it, except in the case of the Franks.

The East-Gothic dominion was now again as great in extent, and far more splendid, than it could have been in the time of Ermanaric. But it was now of a wholly different character. The dominion of Theodoric was not a barbarian but a civilized power. His twofold position ran through everything. He was at once national king of the Goths, and successor, though without any imperial titles, of the Roman emperors of the West. The two nations, differing in manners, language, and religion, lived side by side on the soil of Italy; each was ruled according to its own law, by the prince who was, in his two separate characters, the common sovereign of both. The picture of Theodoric's rule is drawn for us in the state papers drawn up in his name and in the names of his successors by his Roman minister Cassiodorus. The Goths seem to have been thick on the ground in northern Italy; in the south they formed little more than garrisons. In Theodoric's theory the Goth was the armed protector of the peaceful Roman; the Gothic king had the toil of government, while the Roman consul had the honour. All the forms of the Roman administration went on, and the Roman polity and Roman culture had great influence on the Goths themselves. The rule of the prince over two distinct nations in the same lanc was necessarily despotic; the old Teutonic freedom wa: necessarily lost. Such a system as that which Theodoric established needed a Theodoric to carry it on. It broke in pieces after his death.

On the death of Theodoric (526) the East and West Goths were again separated. The few instances in which they are found acting together after this time are as scattered and incidental as they were before. Amalaric succeeded to the West-Gothic kingdom in Spain and Septimania. Provence was added to the dominion of the new East-Gothic king Athalaric, the grandson of Theodoric through his daughter Amalasontha. The weakness of the East-Gothic position in Italy now showed itself. The long wars of Justinian's reign (535–555) recovered Italy for the empire, and the Gothic name died out on Italian soil. The chance of forming a national state in Italy by the union of Roman and Teutonic elements, such as those which arose in Gaul, in Spain, and in parts of Italy under Lombard rule, was thus lost. The East-Gothic kingdom was destroyed before Goths and Italians had at all mingled together. The war of course made the distinction stronger; under the kings who were chosen for the purposes of the war national Gothic feeling had revived. The Goths were now again, if not a wandering people, yet an armed host, no longer the protectors but the enemies of the Roman people of Italy. The East-Gothic dominion and the East-Gothic name wholly passed away. The nation had followed Theodoric. It is only once or twice after his expedition that we hear of Goths, or even of Gothic leaders, in the eastern provinces. From the soil of Italy the nation passed away almost without a trace, while the next Teutonic conquerors stamped their name on the two ends of the land, one of which keeps it to this day.

The West-Gothic kingdom lasted much longer, and came much nearer to establishing itself as a national power in the lands which it took in. But the difference of race and faith between the Arian Goths and the Catholic Romans of Gaul and Spain influenced the history of the West-Gothic kingdom for a long time. The Arian Goths ruled over Catholic subjects, and were surrounded by Catholic neighbours. The Franks were Catholics from their first conversion; the Suevi became Catholics much earlier than the Goths. The African conquests of Belisarius gave the Goths of Spain, instead of the Arian Vandals, another Catholic neighbour in the form of the restored Roman power. The Catholics everywhere preferred either Roman, Suevian, or Frankish rule to that of the heretical Goths; even the unconquerable mountaineers of Cantabria seem for a while to have received a Frankish governor. In some other mountain districts the Roman inhabitants long maintained their independence, and in 534 a large part of the south of Spain, including the great cities of Cadiz, Cordova, Seville, and New Carthage, was, with the good will of its Roman inhabitants, reunited to the empire, which kept some points on the coast as late as 624. That is to say, the same work which the empire was carrying on in Italy against the East-Goths was at the same moment carried on in Spain against the West-Goths. But in Italy the whole land was for a while won back, and the Gothic power passed away for ever. In Spain the Gothic power outlived the Roman power, but it outlived it only by itself becoming in some measure Roman. The greatest period of the Gothic power as such was in the reign of Leovigild (567–586). He reunited the Gaulish and Spanish parts of the kingdom which had been parted for a moment; he united the Suevian dominion to his own; he overcame some of the independent districts, and won back part of the recovered Roman province in southern Spain. He further established the power of the crown over the Gothic nobles, who were beginning to grow into territorial lords. The next reign, that of his son Recared (586–601), was marked by a change which took away the great hindrance which had thus far stood in the way of any national union between Goths and Romans. The king and the greater part of the Gothic people embraced the Catholic faith. A vast degree of influence now fell into the hands of the Catholic bishops; the two nations began to unite; the Goths were gradually Romanized, and the Gothic language began to go out of use. In short, the Romance nation and the Romance speech of Spain began to be formed. The Goths supplied the Teutonic infusion into the Roman mass. The kingdom, however, still remained a Gothic kingdom. "Gothic," not "Roman" or "Spanish," is its formal title; only a single late instance of the use of the formula "regnum Hispaniæ" is known. In the first half of the 7th century that name became for the first time geographically applicable by the conquest of the still Roman coast of southern Spain. The empire was then engaged in the great struggle with the Avars and Persians, and, now that the Gothic kings were Catholic, the great objection to their rule on the part of the Roman inhabitants was taken away. The Gothic nobility still remained a distinct class, and held, along with the Catholic prelacy, the right of choosing the king. Union with the Catholic Church was accompanied by the introduction of the ecclesiastical ceremony of anointing, a change decidedly favourable to elective rule. The growth of those later ideas which tended again to favour the hereditary doctrine had not time to grow up in Spain before the Mahometan conquest (711). The West-Gothic crown therefore remained elective till the end. The modern Spanish nation is the growth of the long struggle with the Mussulmans; but it has a direct connexion with the West-Gothic kingdom. We see at once that the Goths hold altogether a different place in Spanish memory from that which they hold in Italian memory. In Italy the Goth was but a momentary invader and ruler; the Teutonic element in [taly comes from other sources. In Spain the Goth suplies an important element in the modern nation. And hat element has been neither forgotten nor despised. Part of the unconquered region of northern Spain, the land of Asturia, kept for a while the name of Gothia, as did the Jothic possessions in Gaul and in Crim. The name f the people who played so great a part in all southern Europe, and who actually ruled over so large a part of it, as now wholly passed away; but it is in Spain that its istorical impress is to be looked for.

Of Gothic literature in the Gothic language we nave the Bible of Ulfila, and some other religious writings and fragments (see notice of Gothic Language below). Of Gothic gislation in Latin, we have the edict of Theodoric of the ear 500, lately edited by Bluhme in the *Monumenta Germaniæ Historica*; and the books of *Variæ* of Cassiodorus ay pass as a collection of the state papers of Theodoric and s immediate successors. Among the West-Goths written ws had already been put forth by Euric (466–484). The cond Alaric (484–507) put forth a *Breviarium* of Roman w for his Roman subjects; but the great collection of Westothic laws dates from the later days of the monarchy, ing put forth by King Rekisvinth about 654. This code ve occasion to some well-known comments by Montquieu and Gibbon, and have been discussed by Savigny *eschichte des Römischen Rechts*, ii. 65) and various other iters. They are printed in the old collections of Lindenog and Heineccius. They do not seem to have been yet rinted in the *Monumenta Germaniæ*. Of special Gothic tories, besides that of Jordanis, already so often quoted, re is the Gothic history of Isidor, archbishop of Seville, special source of the history of the West-Gothic kings wn to Siunthala (621–631). But all the Latin and eek writers contemporary with the days of Gothic predominance make their constant contributions. Not for special facts, but for a general estimate, no writer is more instructive than Salvian of Marseilles in the 5th century, whose work *De Gubernatione Dei* is full of passages contrasting the vices of the Romans with the virtues of the barbarians, especially of the Goths. In all such pictures we must allow a good deal for exaggeration both ways, but there must be a ground-work of truth. The chief virtues which the Catholic presbyter praises in the Arian Goths are their chastity, their piety according to their own creed, their tolerance towards the Catholics under their rule, and their general good treatment of their Roman subjects. He even ventures to hope that such good people may be saved, notwithstanding their heresy. All this must have had some ground-work of truth in the 5th century, but it is not very wonderful if the later West-Goths of Spain had a good deal fallen away from the doubtless somewhat ideal picture of Salvian.

Of modern writers dealing specially with Gothic history may be mentioned Manso (*Geschichte des Ost-Gothischen Reiches in Italien*, Breslau, 1824); Aschbach (*Geschichte der Westgothen*, Frankfort, 1827); Köpke (*Die Anfänge des Königsthums bei den Gothen*, Berlin, 1854; Dahn (*Die Könige der Germanen*, Munich and Würzburg, 1861–1871); Pallmann (*Geschichte der Völkerwanderung*, Gotha and Weimar. 1863–1864). It is hard to find any work in English dealing specially with Gothic history, though much may be learned from writers like Gibbon and Milman, who deal with the Goths simply as part of some larger subject. Several chapters in tho third book of Milman's *History of Latin Christianity* are of special importance in this way. (E. A. F.)

Gothic Language.

By this name, which may be taken generally as denoting the idioms of the various divisions of the Gothic nation, is more particularly meant the language exhibited in certain fragments of a translation of the Bible and other minor documents, which, although preserved in manuscripts not dating farther back than perhaps the 5th century, and clearly written in Italy during the rule of the East-Goths, are commonly assumed to have originated among the West-Goths at the time when they were seated in Mœsia, and to be therefore older by at least a century than the manuscripts themselves. It is chiefly due to this assumption that the more distinctive name of *Mœsogothic language* is often used, in England and elsewhere, as well as the simpler *Gothic*. The latter name, however, seems to be more appropriate, in spite of the great probability of the assumption referred to,—since it is, for obvious reasons, utterly impossible to prove that the language of the West-Goths at that time differed from that of the East-Goths, or, even if there was any difference, to show that our manuscripts represent the original forms of the speech of their supposed West-Gothic author. Indeed, according to a fragment of a Gothic calendar preserved in one of the Milan manuscripts, which gives the name of the Gothic people as *Gut-thiuda*[1] (*thiuda*, "people"), the most correct form of the name would be *Gotic*. This spelling at least has obviously greater claim to authenticity than *Gothi*, *Gotthi*, or Γότθοι, and other similar forms most commonly (although not exclusively) used by Latin and Greek writers, whose want of familiarity with the sounds of the Gothic language is often abundantly manifest. From *Gut-thiuda* we may infer with certainty that the Goths called themselves *Gutôs*, the corresponding adjective being *gutisks*.

We have no direct evidence of the character of the Gothic language until the time of the above-mentioned manuscripts but some conclusions regarding a more archaic state of the language may be drawn from a careful examination of the numerous words borrowed from Gothic at a much earlier period by some of the Finnish tribes originally dwelling in the interior of Russia.[2] It may be safely assumed that some at least of these words still retain forms of the Gothic language from as early a period as perhaps the 1st or 2d century B.C. By the same date the Goths, as well as the other Teutonic nations, were no doubt already in possession of the Runic alphabet, an adaptation of a particular form of the Latin characters to their special wants and uses.[3] No traces of this alphabet, however, have been left, except the already mentioned short inscription of the Bucharest ring, a list of the Gothic names of these runes, preserved in a Vienna manuscript of the 9th century,[4] and some letters in Ulfila's Gothic alphabet, which soon supplanted the less convenient Runic characters, and so helped to inaugurate the short literary period of the Gothic language so closely connected with the name of that prelate.

Ulfila, or rather Vulfila (310–380 A.D., see ULFILA), was a man of the most profound learning. He not only invented, as has been said, a new alphabet for his literary purposes, but was also able to preach and to write in Latin and Greek as well as in his native Gothic language, and he is reported to have left behind him a great number of tracts and translations in these three idioms. The principal work of his life, however, was his translation of the Bible, parts of which seem to have reached us in the famous *Codex Argenteus*, now at Upsala, and in several minor fragments at Wolfenbüttel (*Codex Carolinus*) and Milan (*Codices Ambrosiani*, including some leaves now kept at Rome and Turin). In this way we possess the greater part of the gospels, considerable portions of the epistles, and a few fragments of the Old Testament; there is also a fragment of a commentary on St John's gospel, commonly called *Skeireins* (or "explanation"), and the fragment of a calendar which has been already mentioned as containing the original form of the name of the Gothic people.[5] As to the authorship of the last two fragments nothing can be said with certainty; and certain differences in language and manner of translation make it doubtful even whether the fragments of the Old Testament can be traced to the same origin as those of the New. The bulk of the whole, however, may safely be ascribed to Ulfila, for it can hardly be assumed that the same work would have been done twice over in so short a space of time as that lying between the days of Ulfila and the date of our manuscripts. The whole character of the translation too seems to indicate a man of Ulfila's mental power and theological learning. Although it cannot be denied that several alterations of the original have been introduced into our texts at a later time, it is certain both that the author carefully interpreted the Greek text (which was of course the fundamental source of his work), and also that he consulted, and in not a few places followed, the old Latin versions where his own ideas seemed to differ from those of his Greek authorities.[6]

As a specimen of the language, and of Ulfila's mode of translation, we may insert here his version of the Lord's prayer:—

Atta unsar thu in himinam. Weihnai namo thein. Qimai thiudinassus theins. Wairthai wilja theins swe in himina jah ana

[1] The same form of the name seems to occur a second time in th Runic inscription of tha Bucharest ring, *Gut-annôm hailag*, "dedicate to the Goths' treasure." *Cf.* H. F. Massmann, in Pfeiffer's *German* (Vienna, 1857), ii. p. 209 *sq.*; and Ludv. Wimmer, *Aarböger f nordisk Oldkyndighed og Historie* (Copenhagen, 1867), p. 45.

[5] A few Gothic words and names occur among the subscriptions to two Latin charters, one of which is now preserved at Naples; tho other, formerly kept at Arezzo, is now lost.

[6] For fuller particulars see the two principal editions of the Gothic texts by V. d. Gabelentz und Loebe (3 vols., Altenburg and Leipsic, 1843–76), and by E. Bernhardt (Halle, 1875).

airthai. Hlaif unsarana thana sinteinan gif uns himma daga. Jah aflet uns thatei skulans sijaima, swaswe jah weis afletam tham skulam unsaraim. Jah ni briggais uns in fraistubnjai, ak lausis uns af thamma ubilin.

The Gothic language did not very long survive the times of Ulfila. From Mœsia, where it had gained its highest literary culture, it disappeared together with the Goths, when they were driven from these parts by later migrations. In the western portions of Europe, that is, in Italy, France, and Spain, whither it had been carried by the emigrants, the Gothic language seems to have died out even sooner than the Gothic nationality, giving way to the overpowering influence of Latin, and leaving behind it only a few indistinct relics in some proper names and other words that had been received into that victorious language. It was only in a remote spot of the Crimea that it continued to exist until the 16th century, when the last remains of a Gothic people were detected, and a few specimens of their language were gathered by Augerius de Busbeck, a Dutch traveller, who visited the eastern parts of Europe in the years 1554–1564.[1]

It is well known that the literary remains of Gothic are (with the exception, perhaps, of a few Runic inscriptions belonging to the Scandinavian languages) by several centuries the oldest specimens of Teutonic speech, and therefore have a particular value for the student of the history of that family of languages. Notwithstanding this fact, it would be altogether wrong to regard Gothic as the common source of the more modern stages of these idioms. Although very archaic in many of its forms and sounds, it is in these still far removed from the original features of the common language, as it was spoken before any separation of Teutonic tribes had taken place. Most nearly related to it seem to have been the Scandinavian languages, which are now generally assumed to have formed, together with Gothic, the so-called eastern branch[2] of the Teutonic family, while English, Frisian, and Low and High German belonged to a western division. The latter is chiefly marked by the introduction of a considerable number of forms and sounds of a less archaic stamp, while the eastern idioms are found to have adhered more closely to the original forms. Thus, almost the only distinct innovation in the sound-system of the eastern branch is the insertion of a *g* sound into the groups *iuw*, *auw*, *uw* in accented syllables, as in Gothic *triggws*, Old Norse *tryggr*, compared with Old High German and Old Saxon *triuwi*, Old English *treowe*, *trywe*, "true"; or Old Norse *höggva*, to hew, Old High German and Old Saxon *hauwan*, Old English *heawan*. Western Teutonic, on the other hand, is at once discernible by its doubling all single consonants ending a short root-syllable before *y* (*w*, *r*, *l*); thus Old English *theccan*, Old Saxon *thekkian*, Old High German *decken*, to cover (literally "to thatch"), but Gothic *thakjan*, Old Norse *thekja*; or Old English *sellan*, Old Saxon *sellian*, Old High German *sellen*, to sell, but Gothic *saljan*, Old Norse *selja*. As to the inflexional system, the accusative plural of nouns has in Western Teutonic been replaced by the nominative form, as in Old English *dagas*, Old Saxon *dagōs*, Old High German *tagā*, days; Gothic still has *dagōs* for the nominative, and *dagans* for the accusative, the Old Norse forms being *dagar* and *daga* respectively. The same change is found in the adjectives, as Old English and Old Saxon *blinde*, Old High German *blinte*, blind (*cæci*), corresponding to both Gothic *blindai* and *blindans*, Old Norse *blindir* and *blinda*. On the other hand, the formation of the plural of certain neutral substantives by adding an *r*, as in Old English *lombru*, lambs, Old High German *lembir* (still extant in the English plural *children*) is entirely lost in Eastern Teutonic (Gothic *lamba*, Old Norse *lömb*). Another instance of change is to be seen in the loss of the dative case of the reflexive pronoun (Gothic *sis*, Old Norse *sér*) in Western Teutonic, the corresponding forms of the personal pronoun of the 3d person being used instead (Old English *him*, *hire*, &c.) Western Teutonic has also introduced the use of the genitive forms of the same personal pronoun instead of the possessive pronoun (Gothic *seins*, Old Norse *sinn*) when the possessor is denoted by a feminine or a plural (Old English has gone even farther by dropping the possessive pronoun altogether). In the verb, Western Teutonic has replaced the original form of the 2d person singular of the past indicative ending in *-t* (as in Gothic and Old Norse *wast*, *gaft*, thou wert, gavest) by the corresponding form of the subjunctive (Old English *wære*, *geáfe*, Old Saxon and Old High German *wāri*, *gābi*). Western Teutonic has also lost the faculty of deriving passive or intransitive verbs from active verbs or adjectives by adding the syllable *-na-* after the root-syllable, as in Gothic *fullnan*, Old Norse *fullna*, to be filled, as compared with Gothic *fulls*, Old Norse *fullr*, full; or Gothic *fulljan*, Old Norse *fylla*, to fill. Only a very few instances of this formation are left in Western Teutonic, such as Old English *wæcnan*, to awaken [intrans.], or *leornian*, German *lernen*, to learn (*cf.* Old English *weccan*, German *wecken*, to awaken [trans.], and German *lehren*, to teach). As to the vocabulary, we may mention the loss of the verb *dón*, to do, in Gothic and Scandinavian. The most conspicuous peculiarity in the syntax is the frequent use of the dative (or perhaps originally the instrumental case) instead of the accusative in Eastern Teutonic.

Among the Teutonic languages Gothic holds by far the foremost rank as regards the regularity of its sound-system and its inflexions. The vowel system is remarkable for the absence of the short *e* and *o* sounds, except in a few places where *ĕ* and *ŏ* (spelt *ai* and *au*) occur under certain consonantal influences. *Umlaut*, or assimilation of root-vowels to a following *a-*, *i-*, or *u-* sound, is not discernible in Gothic. Thus we find only five short vowels, *a*, (*ai*), *i*, (*au*), *u*; five long vowels *ā*, *ē*, *ī* (spelt *ei*), *ō*, *ū*; and three diphthongs *ai*, *au*, and *iu*. There may have been other distinctions of vowel-qualities besides those expressed in spelling, but we have no means of definitely settling this question; so much, however, can be said, that the long vowels, and especially *ē* and *ō*, probably had the close sounds, since these are often interchanged with *ei* and *u* in our manuscripts. The spelling of the consonantal system is also very simple. Besides *y*, *w*, *r*, *l* and three nasal sounds (the guttural nasal being expressed by *g* after the Greek fashion), we find three voiceless stops, *p*, *t*, *k* (*q* being only a combination of *kw*); three voiced stops, *b*, *d*, *g*; four voiceless spirants, *f*, *s*, *th*, *h*; and only one distinct sign for a voiced spirant, *z*. This system of spelling, however, is obviously insufficient to express all the sounds of the language,—an insufficiency partly due to the fact that the transcription of the Gothic speech-sounds was chiefly an imitation of the Greek graphic system, which, at least in Ulfila's time, had become rather imperfect, inasmuch as different sounds developed out of one sound of an earlier period were still often expressed by the same sign (just as in the English orthography of the present day). It is highly probable, for instance, that the signs of *b*, *d*, *g* of the Gothic alphabet not only expressed the sounds of voiced stop consonants (*mediæ*), but also represented the sounds of voiced spirants, such as English *v* and soft *th*, or North German *g* after a vowel (these values being the only ones left to the Modern Greek signs β, γ, δ). Hence the regular change of *b*, *d* final after a vowel into *f*, *th*, as in *gaf*, I gave, from *giban*, to give; or *bath*, I bade, from *bidjan*, to bid.[3]

Great regularity prevails also in the inflexional system. In the substantival and adjectival declensions the instrumental case has become extinct by an early confusion with the dative (the case commonly called dative being, in fact, a mixture of forms of the original dative and the instrumental and local cases), while in the Western branch of Teutonic it was still in frequent use. At the same time, Gothic is the only Teutonic idiom that has still preserved, in a few cases, the vocative in a form distinct from that of the nominative (*fisks*, fish, for instance, has *fisk* in the voc.). The adjectival declension is remarkable for the retention of special forms of the *i-* and *u-* stems, which in all other Teutonic languages have been transferred to the inflexion of the *ja-* stems. In the pronominal inflexion the instrumental case has been kept distinct in a few instances, such as *thē*, *hvē* (the latter form being the same as English *why*). There are also some relics of the dual number left in the 1st and 2d personal pronouns. As for the verb, Gothic is quite unique in retaining the old formation of the passive voice by means of simple derivation (as in *bairada*, *bairanda*, he is, they are borne, Greek φέρεται, φέρονται), the dual number of the 1st and 2d persons throughout the whole active voice (*bairōs*, *bairats*, we, you two bear, in the indicative, or *bairaiva*, *bairaits* in the subjunctive, or *bēru*, *bēruts*, we, you two bore [ind.], and *bēreiva*, *bēreits* [subj.] along with the plural forms *bairam*, *bairith*, &c.), and the 3d person of the imperative (as *bairadau*, *bairandau*, he, they shall bear, Greek φερέτω, φερόντων). The different verbal classes are of course the same as in the other cognate idioms; but they are kept more completely distinct in Gothic, for it is only there that the reduplication has been preserved intact in the past of the reduplicative verbs, Gothic *haihald*, I held, for instance, corresponding to such shortened forms as Old Norse *helt*, Old English *heold*, Old Saxon *held*, and Old High German *hēlt*, *healt*, *hielt*. Gothic again is the only language that seems to give us a clue to the explanation of the formation of the past in weak verbs. There we find such

[1] See his report and word-lists, reprinted by Massmann, in *Zeitschrift für Deutsches Alterthum*, i. p. 345 *seq.* The words contained in these lists are not all intelligible, and some of them are clearly Slavonic or Iranian origin, but others are decidedly Gothic as regards their form, thus *schlipen*, to sleep; *criten*, to weep; *fyder*, four; the correct Gothic forms being *slēpan*, *grētan*, *fidvōr*.

[2] H. Zimmer, "Ostgermanen und Westgermanen," in *Zeitschrift für Deutsches Alterthum*, xix. p. 393 *sq.*

[3] See W. Weingaertner, *Die Aussprache des Gothischen* (Leipsic, 1858); F. Dietrich, *Ueber die Aussprache des Gothischen* (Marburg, 1862); H. Paul, "Zur Lautverschiebung," in *Beiträge zur Geschichte der Deutschen Sprache und Literatur*, i. 147 *sq.* (Halle, 1874).

plural forms as *hausi-dēdum*, we heard, while in Old Norse we have simple *heyr-ðum*, in Old English *hier-don*, &c. Now, this *-dēdum* would be exactly the corresponding form of the verb *dōn*, to do (lost in Gothic, as mentioned above), so that *hausi-dēdum* must once have meant "we did hear."

Notwithstanding all these instances of great antiquity we must be on our guard against the assumption that Gothic in all its features bears the same archaic stamp. In fact, it often goes farther than the other cognate idioms in dropping short final vowels. There are no traces left of the short vowels originally ending *a-* or *i-* stems in declension; thus, *dags* from *daga-*, day; *haurn* from *horna-*, horn; *gasts* from *gasti-*, guest; *hugs* from *hugi-*, mind; but there are many instances of the preservation of these vowels in the other languages, such as *dagar*, *horna*, *gastir* in Old Scandinavian Runic inscriptions, or *hyge* in Old English, or *hugi* in Old Saxon and Old High German.[1] Even the regularity of the inflexional system is often not archaic, but due to later assimilations of forms originally more distant than in Gothic. The most striking instance of this is perhaps the loss, in the verbal system, of the so-called grammatical change, that is, the transferring of a voiceless spirant into a voiced spirant after a syllable unaccented in the earliest time before the general Teutonic rule of fixing the accent on the root-syllables had come into use.[2] This change (still discernible in such English forms as *I was*, *we were*) was fully developed in all other cognate idioms, as for instance in Old English, *cf. ic wæs, we wǣron*, or *ceosan*, to choose, *ic ceas*, *we curon*, *gecoren*, &c., these forms standing for *wás*, *wēzúm*, &c. Gothic has given up the voiced sound altogether, forming simply *was*, *wēsum*, or *kiusan*, *kaus*, *kusum*, *gakusans*. It is only in some isolated words (such as *fadar* and *brōthar*, corresponding to Sanskrit *pitár* and *bhrā́tar*), and some derivatives that even traces of this fundamental rule are now to be found in the Gothic language. (E. SI.)

GOTTFRIED. Meister Gottfried of Strasburg, the most brilliant German poet of the Middle Ages, flourished about the end of the 12th and beginning of the 13th century. Of his life and position we have no certain information, for he has told us next to nothing about himself, and contemporary records are dubious and confusing. It would seem, however, that he was a man of good birth and position, who filled an important municipal office in his native town of Strasburg. His chief work was written about 1210, and we may confidently place his death between 1210 and 1220. We know from his writings that he was a man of high culture, but it is almost certain that he was not a priest. Of this his occasional sneers at the clergy are perhaps a better proof than the dubious morality of much of his work. Gottfried wrote one great poem, *Tristan und Isolt*. The story is of Celtic origin; it came first from Britain and Ireland, thence was carried to France, and thence to Germany. Few stories have been so often treated or have had so wide an influence upon literature. A very few words will suffice to give Gottfried's version of it. King Mark of Cornwall has a nephew named Tristan, whom he sends to woo vicariously, and bring home as queen of Cornwall, the beautiful Isolt, princess of Ireland. The young man goes on his mission, is successful, and sets out with Isolt on the homeward journey. Before they reach Cornwall, however, they unfortunately drink a love potion which Isolt's mother had intended to be given to her daughter by the king of Cornwall. The consequence of the mistake is that the young people fall madly and hopelessly in love with one another. The wild force of their passion soon causes them to disregard morality and prudence alike, and the bulk of the poem is devoted to an account of the numerous complications which in time arose. Of course the king soon becomes suspicious, and at last his suspicions become certainties. Tristan withdraws to Normandy, and enters into an alliance with a princess of the land, whose very name—Isolt, the white-handed—has a strange charm for him. But he finds that he really cares nothing for this new Isolt; the memory of his old love rises powerfully in his soul; and he gives utterances to his doubts and perplexities in a soliloquy, with which the poem abruptly concludes.

Tristan is thus an unfinished work; still it is a tolerably long one, as it consists of 19,552 short rhymed lines. The style is highly finished. There is an artistic choice of fit words, a frequent use of antithesis and word-play, and a skilful management of the versification. But these are, of course, only side matters. The permanent interest of the poem consists in its representation of human passion, and in the knowledge it shows of the human heart. The plain, rude story, when told by Gottfried, takes a depth and pathos that are hardly its own. All is described, too, with such clear, bright touches, and such vivid force, that the poem seems somehow a tale of our own time. Its morality indeed is not high; but this objection did not probably occur to those who first read it. If we judge it by a purely art standard, we must pronounce it worthy of an important place in the literature of Europe. *Tristan* was not allowed to remain a fragment. Ulrich von Türheim (about 1236) and Heinrich von Freiberg (about 12[illegible]) both wrote continuations and conclusions of the work, which certainly fell far short of the original.

Of Gottfried's other writings, only some lyrics in the ordinary style of the minnesingers remain to us. Two longer poems, entitled *Lobgesang auf die Jungfrau Maria* and *Gedicht von der Armuth*, were long attributed to him, but recent criticism has conclusively proved that they are the work of others. Gottfried's influence on German literature was very great, and a proof of this is the number of poets who treated the same subject after the plan he had laid down. All these, from Hans Sachs (14[illegible]–1576) to Immermann (1796–1840), may fairly be claimed as his followers.

The chief editions of Gottfried's *Tristan* are those of Fr. Heinrich v. d. Hagen (a complete edition, with the continuations, Bresl., 182[illegible]), Groote (Berlin, 1821), Massmann (Leip., 1843), and Bechstein (containing a very able and complete introduction, 2d ed., 2 vols., Leip., 1873). See also the translations into modern German, with continuations, &c., by Herm. Kurz (Stuttg., 1844, 3d ed., 1877), and Karl Simrock (2d ed., Leip., 1875). For what is known of the life of Gottfried see Kurz's "Zum Leben Gottfried von Strassburg" (in the *Augsburg. Allgemeine Zeitung* for 1868, and *Germania*, 15 Jahrgang); and as to the sources of the story, Franck's *Tristan et Isult* (Paris, 1865), and F. Compart, *Die Sagenüberlieferung in den Tristan-Epen Eilharts von Oberge und Gottfrieds von Strassburg* (Güstrow, 1876).

GÖTTINGEN, the chief town of a circle of the same name in the land-drostei of Hildesheim and province of Hanover, Prussia, is pleasantly situated at the foot of the Hainberg in the fertile valley of the Leine, about 67 miles to the south of Hanover, on the Hanover and Cassel railway. It is traversed by the Leine, which separates the Altstadt from the Neustadt and Masch; and it is surrounded by ramparts which are planted with lime trees and form an agreeable promenade. The streets in the older part of the town are for the most part crooked and narrow, but the newer portions are spaciously and regularly built. Apart from the churches and the numerous university buildings, it has few structures of any public importance. There are several thriving industries, including, besides the various branches of the publishing trade, the manufacture of woollen and cotton goods, and of physical and mathematical instruments. The university, the famous Georgia Augusta, founded by George II. in 1734, and opened in 17[illegible], rapidly attained a leading position, and in the year 18[illegible] its students numbered 1547. Political disturbances, in which both professors and students were implicated, lowered the attendance to 860 in 1834; and the expulsion of the famous seven professors (Albrecht, Dahlmann, Ewald, Gervinus, Weber, and the brothers Grimm) in 1837 still

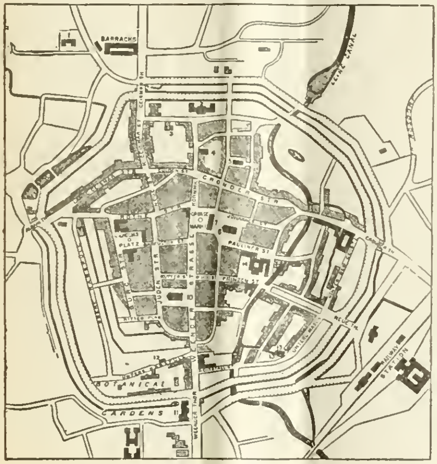
further reduced its prosperity. The events of 1848, on the other hand, told somewhat in its favour; and since the annexation of Hanover in 1866 it has been carefully cherished by the Prussian Government. In the winter session 1877–78, its students numbered 909, and the teaching staff 124,—its numerical strength thus entitling it to rank as the eighth on the list of German universities. The present professoriate includes, among other distinguished names, those of Benfey, Lagarde, Lotze, Ritschl, and Weber. Amongst those who have been teachers within its walls may be mentioned, besides the seven already named, Haller, Gesner, Gatterer, Sprengel, Heyne, Blumenbach, Herbart, Heeren, O. Müller, K. F. Hermann, and Eichhorn.



Plan of Göttingen.

1. Observatory.	5. University Church.	10. St James's Church.
2. Chemical Laboratory.	6. St John's Church.	11. Lecture Rooms.
3. Reading Room.	7. Townhouse.	12. Reformed Church.
4. Catholic Church.	8. Gymnasium.	13. Synagogue.
	9. University.	14. Library and Museum.

Neander, Ewald, and the distinguished chemist Bunsen, it may be added, were natives of Göttingen. The university library contains upwards of 500,000 printed volumes and 5000 manuscripts. There is a good chemical laboratory, as well as adequate zoological, ethnographical, and mineralogical collections, the most remarkable being Blumenbach's famous collection of skulls. The other establishments more or less connected with the university, such as the observatory, botanical garden, and various hospitals, do not call for special notice. The Gesellschaft der Wissenschaften publishes the long-established and well known *Göttingische Gelehrte Anzeigen.* The population in 1875 numbered 17,057.

The earliest mention of a village of Goding or Gutingi occurs in documents of about 950 A.D. The place received municipal rights from the emperor Otho IV. about 1210, and from 1286 to 1463 it was the seat of the princely house of Braunschweig-Göttingen. During this period it held a high place among the towns of the Hanseatic League. In 1531 it joined the Reformation movement, and in the following century it suffered considerably by the Thirty Years' War, having been taken by Tilly in 1626, after a siege of 25 days, and recaptured by the Swedes in 1632. After a century of decay, it was anew brought into importance by the establishment of its university; and a marked increase in its industrial and commercial prosperity has again taken place in recent years.

GOTTSCHALK, or GOTESCHALCUS, surnamed FULGENTIUS, a prominent figure in one of the most important theological controversies of the 9th century, was the son of Berno, a Saxon count, and, having been devoted (oblatus) from infancy by his parents to the monastic life, was trained at the monastery of Fulda, during the abbacy of Hrabanus Maurus, and while Walafridus Strabus was a member of the fraternity. At the approach of manhood he made strenuous efforts to be released from his vows; and he actually succeeded in obtaining from a synod held at Mainz in 829 the necessary dispensation; but through the hostile influence of his abbot this was afterwards cancelled by Louis the Pious, though as a slight mitigation of the harshness of this treatment he was permitted to remove to the monastery of Orbais, in the diocese of Soissons. Here he devoted himself to ardent study of the writings of Augustine, with the result that he became an enthusiastic believer in the doctrine of absolute predestination, in one point going even beyond his master—Gottschalk believing in a predestination to condemnation as well as in a predestination to salvation, while Augustine had contented himself with a doctrine of preterition as complementary to his doctrine of election. While returning from a pilgrimage to Rome in the year 847, Gottschalk, happening to pass a night at a hospice in Friuli, came into contact with Notting, the newly elected bishop of Verona, and expounded to him his peculiar views. The bishop, apparently without saying much at the time, carried word to Hrabanus Maurus, who, meanwhile, had become archbishop of Mainz; the latter lost no time in issuing two letters, one to his informant and another to Count Eberhard of Friuli, in both which he denounced the opinions of Gottschalk with some recklessness and great violence. On the one hand, he accused his adversary of neglecting the distinction between foreknowledge and foreordination; on the other hand, he himself refused to recognize any difference between predestination to punishment and predestination to sin. At a synod held in Mainz in presence of the emperor in 848, Gottschalk presented himself with a written explanation and defence of his views; he was, however, very summarily found guilty of heresy, and handed over to his ecclesiastical superior, Hincmar of Rheims, to be dealt with as his crime might deserve. Having again assumed the defensive in an assembly at Chiersy in 849, he was once more condemned, —on this occasion not only as a heretic, but also as a despiser of authority, and as a disturber of the church's peace, —and sentenced to be whipped severely and rigorously imprisoned (durissimis verberibus castigari et secundum ecclesiasticas regulas ergastulo retrudi). The place selected for his captivity was the monastery of Hautvilliers in the diocese of Rheims, and here he languished throughout the remainder of his life, a period of twenty years, notwithstanding the efforts of influential friends and his own pitiful appeals. Prudentius of Troyes, Wenilo of Sens, and Florus of Lyons successively expressed opinions more or less in favour of his views; nor did Hincmar derive much real aid from the dialectical skill of Erigena, whom he had called in as an authority on the other side. Various synods met, reached widely discrepant opinions on the burning question, and ultimately postponed its settlement to a future council in less troubled times. The summons of Pope Nicholas I., in 863, calling Hincmar to account for his harsh conduct, unfortunately never took effect; and the result was that, after many renewed attempts at conviction and persuasion on the part of Gottschalk—he even proposed to settle the question by ordeal of fire—he was suffered to die unheeded in 868, and, by orders of his inhuman adversary, was buried in unconsecrated ground. It may be added that Gottschalk had attempted to establish a counter charge of heresy against Hincmar, on account of the latter's substitution of "Sancta Deitas" for "Trina Deitas" in a current hymn. This was thought to savour of Sabellianism; but the orthodox archbishop succeeded at once in purging himself from such an imputation of heretical pravity.

The story of Gottschalk has been told with great fulness by Neander and Gieseler. See also Gfrörer's *Untersuchung über Alter, Ursprung, und Zweck der Dekretalen des falschen Isidorus*, 1848.

GOTTSCHED, JOHANN CHRISTOPH (1700–1766), a German author and critic of considerable influence in his own time, was born, 2d February 1700, at Judithenkirch, near Königsberg. He studied philosophy and literature at Königsberg, was appointed professor, first of poetry (1730), afterwards of logic and metaphysics (1734), at Leipsic, filled various other important offices in connexion with the university, and died 12th December 1766. His chief works were a tragedy entitled *Der sterbende Cato* (Leipsic, 1732)—poor enough rubbish, though it had great but short-lived popularity; *Deutsche Schaubühne* (1740–45), a collection of plays, some of which were written by himself, his wife, J. C. Schlegel, and their friends, whilst others were translated from the French classical dramatists; *Nöthiger Vorrath zur Gesichte der deutschen dramatischen Dichtkunst* (1757–1765), intended to contain an account of all previous German plays Though not complete, the last is a very valuable and important work. Besides these, Gottsched wrote a number of educational works, and edited several journals devoted to literary criticism. He was a pedant, but there is no doubt that he did good and lasting service to German literature. When he began to write, the stage was occupied by plays in which extravagant rant did duty for eloquence, coarse vulgarity for wit, and the wildest improbabilities for inventive incident. In the writings of the second Silesian school the utmost extent of absurdity was reached. Gottsched set his face against such productions. He enunciated rules by which the playwright must be bound; he insisted on the observance of the dramatic unities, and pointed to the French drama as the best possible model for the German stage; moreover, his criticism did much to regulate and purify the German language. Unfortunately he went too far. He placed himself in opposition to the Swiss writers Bodmer and Breitinger, who were bringing before the German public several of the great English writers, more especially Milton; he refused to recognize the rising genius of Klopstock and Lessing, and still went on enunciating rules when the time for that was past, and praising mediocre writers as if they had been great geniuses. So it came to pass that his influence speedily declined, and that before his death his name became almost proverbial for pedantic folly. Of all lots his was the hardest, for he outlived his own reputation. His wife, Luise Adelgunde Victorie Kulmus (1713–1762), was his faithful helper in his literary labours, and herself an authoress of reputation. Among other works she translated the *Spectator* (9 vols., 1739–43) and Pope's *Rape of the Lock* (1744, new ed. 1772). After her death her husband edited her *Gedichte*, with a memoir (1763). See Danzel's *Gottsched und seine Zeit*, Leipsic, 1848.

GÖTZ, JOHANN NIKOLAUS (1721–1781), a minor German poet, born at Worms, 9th July 1721, studied theology at Halle (1739–1742), where he became intimate with Gleim and Uz, acted for some years as military chaplain, and afterwards filled various other ecclestiastical offices. He died at Winterberg, 4th November 1781. The writings of Götz consist of a number of short lyrics and several translations, of which the best is a rendering of Anacreon. His original compositions are light, lively, and sparkling, and are animated rather by French wit than by German depth of sentiment. They give easy expression to some unexpected whim or conceit, and, though utterly destitute of depth or force, are yet very pretty specimens of elegant trifling. Of that sort of work it would be difficult to find more favourable examples than *Thamire an die Rosen* and *An eine Romansleserin*. See Götz's collected works, with biography by Ramler (Mannheim, 1785, new ed., 1807); also J. H. Voss, *Briefe über Götz und Ramler* (Mannheim. 1809).

END OF VOLUME TENTH.
