3. By giving a practical value to those diplomas, such as would be evinced by a reduction of premiums to intending pupils holding such diplomas, and by attaching weight to the possession of a diploma when choosing among candidates for employment.

4. By granting distinct privileges, in connexion with the professional institutes, to all holders of recognised diplomas.

We here repeat the resolutions already quoted in order that all the formal resolutions may be found together:—

For the purposes of discussion, technical education should be deemed to exclude the manual instruction in arts and manufactures which is given in the workshop.

That the term "technical education" is understood by the sub-committee to mean general instruction in those sciences, the principles of which are applicable to various employments of life.

That technical instruction, as defined above, should not, as a rule, be given in separate professional institutions, but in institutions established for general education.

That, with a view to the development of a system of scientific education, it is desirable that schools be established having for their main object the teaching of science as a mental discipline. These science schools should prepare some youths for the higher courses of a college, and other less ambitious pupils for their professional pupillage.

That the subject of secondary instruction having been reported upon ably and deliberately by the Schools Inquiry Commission, the committee do not feel it necessary to enter into the details of this subject, while they desire emphatically to express their opinion of the necessity for the introduction of scientific teaching in all secondary schools.

That it is desirable that the higher scientific instruction should be tested by public examination, and that the proficiency of persons who pass these examinations should be certified by diploma.

That the preparation for the businesses considered by the committee is not sufficient until due scientific instruction has been followed by practical pupillage in efficient works.

The committee recommend employers of labour and others in the habit of taking pupils, apprentices, and clerks, to give the preference as far as possible, to those adducing evidence of the possession of adequate instruction in the sciences applicable respectively to their professions or occupations.

Your committee have reserved for separate consideration the technical education of those who are producers of works of fine or decorative art, or directors of art manufactures, understanding by that last term manufactures in which beauty or ornament is one of the chief objects aimed at.

It is necessary to bear in mind that for the production of works of an aesthetic character, scientific principles occupy a subordinate position, while a knowledge of the details of execution is desirable for those who design or guide the work of others. Moreover, it must be borne in mind that the taste of those to whom works of beauty appeal, is far more fluctuating than the demand for productions in which utility is alone considered.

Your committee are of opinion that one of the first conditions of progress is the cultivation of artistic knowledge and taste in all classes of society.

With this object in view, no less than with a view to the technical education of the art-workman, provision should be made for the teaching of drawing in all schools, primary and secondary, as a branch of general education, in order to train the eye and hand, and in order to cultivate habits of observation. It is essential that drawing should be part of the regular school course, and not an extra lesson; and, further, that it should be taught intelligently, not from mere copies, but from real objects.

The art-workman needs, in addition to a power of free-hand drawing, an acquaintance with geometrical drawing, in order that he may be able to execute work correctly, in accordance with the designs of the artist who directs him.

For artists, designers, and directors of art manufactures, the education should be a liberal one, in order that they may understand the feelings of those on whom they desire to make an impression. Their education should also be, to some extent, scientific, in order that they may have a knowledge of the properties of the materials they employ, and be able to adapt those materials to the structure of the objects produced, and those objects to the uses for which they are intended.

The recommendation already made with reference to other professions, namely, that the period of pupillage, or the earlier stages of practice, should be preceded by a special attention to those branches of knowledge which have a direct relation to their art, applies to the technical education of those who are concerned with artistic work. In this case that knowledge

should include not only scientific principles, but also a history of the various forms in which, prior to any scientific theory, some of the noblest conceptions have found their expression in works of art.

It is therefore desirable, both for the artist workmen and for those engaged in the highest branches of art, that opportunity should be given by access to museums and to evening classes, for the study both of the theory and history of art.

Your Committee are of opinion that the Universities may render great service to the technical education of those engaged in artistic pursuits, by the recognition of art as an element in general education, and by professional lectures. Some steps in this direction have been taken, by the regulations attaching importance to drawing in the Local Examinations; but your Committee would gladly see the practice carried further, and applied to the higher stages of academical education. They cannot doubt that the study of works of ancient and modern art would have a tendency, in connexion with literature, to diffuse culture throughout the nation, and to raise the standard of technical education.

SCIENCE OF COLOUR.*

ON a subject so attractive as colour, upon which of late so much has been written that is valuable, and excites the wish for more, and so much merely repeated from questionable authority, and apparently serving no useful purpose in art, it is a pleasure to meet with something original, in which thought and labour have not been spared, and the truth of Nature alone is sought.

The book before us is a work of much research, and seems to promise useful results. To give an idea of the contents, we will touch upon some of the more salient points in the order in which they present themselves.

In the chapter on "The Prismatic Colours and their continuous Combinations," the colours of the pure spectrum are described as "seen at once to constitute three conspicuous bands," red, green, and blue, though really changing gradually from one into another; the colours produced by combining parcels of the prismatic rays are thus detailed:—

"The strongest red and green and blue are obtained by throwing together all the rays in which these colours respectively predominate, and excluding the rest. The strongest yellow is produced by combining the red and green rays, and excluding the blue; the strongest sea-green by combining the green and blue rays, and excluding the red; the strongest pink by combining the red and blue rays, and excluding the green. When part only of the third band is excluded, the resulting colour is brighter but paler, until when all are included the pure white of the solar light is obtained."

After mentioning some neat experiments to prove these results, and showing that the colours of all natural objects whatsoever are combinations of those of the prismatic rays, the following striking proposition is laid down:—

"In every case the best colours are produced by rays which belong to some one continuous portion of the spectrum, beginning either at the one extremity or at the other, or at some intermediate point; or (in the case of crimson, pink, and purple) by two such portions, one at one end and the other at the other, all thrown together in their full intensity, while the rest of the rays are totally extinguished."

It follows from this that—

"The best natural colours are inferior to those which may be produced by artificial combinations of the prismatic rays, since there is no substance which transmits, without diminution, all the rays of any one portion of the spectrum, and totally absorbs or extinguishes all the rest."

Such being the case, it is very interesting to learn that, by one simple experiment, we may produce at once "not only the prismatic colours in their greatest possible purity, merging into darkness, but also the colours of all possible parcels of continuous prismatic rays, forming an ensemble of the loveliest colours the eyes can behold." This is done by obtaining the spectrum of an angular space of white upon a black ground, in conjunction with a similar space of black on a white ground; and the effect is elucidated by an explanation and scheme of the colours of the resulting spectrum, accompanying a diagram of the angular spaces. Such a spectrum may be used, our author suggests, "as a natural standard or exemplar of colours, producible with perfect truth in every place under

* Principles of the Science of Colour, concisely stated, to aid and promote their useful application in the decorative arts. By William Benson, architect. (Chapman & Hall.)

the sun, and universally applicable, for every colour in nature must be some shade of a colour included in it."

The next chapter recommends some further experiments with the prism, as novel in their application as the last, by which the prismatic colours, and their various combinations, may be seen in juxtaposition with their complementary colours. We are inclined to think that these experiments, simple and almost obvious as they are, constitute one of the most useful parts of the work. It is usual to suppose that red and green, yellow and purple, blue and orange, are complementary to each other; but here we see, by Nature's unerring pencil, that red is complementary to the sum of the blue and green rays, which our author designates sea-green; yellow to blue; green to pink. The experiments referred to are merely to look through the prism at a band of white upon a black ground, continuous with a band of black upon white; and at an edge of white against black continuous with an edge of black against white. It seems impossible for the most strenuous advocate of the conventional lists of complementary colours, met with in almost all treatises on colour, to deny that material corrections are required in the common doctrine on this essential point.

Another interesting use of these experiments is the exhibition of complementary colours equally luminous; and the distinction between a perfect complementary and a colour complementary only in hue, the former exhibiting in general the strongest possible contrasts.

The utility of such experiments with the prism, when properly understood, in educating the eye to a direct appreciation of colour, is obvious. They need, however, more precise directions how to use the prism, which is rather difficult for a learner to compass without instruction.

We may next notice some remarks on "intermediate colours," or those which lie in a direct gradation between two given colours. The mixture of pigments does not in general give true results. Rotation has been practised, but is not convenient. About a century ago Lambert, a German philosopher, used the simple and beautiful method of reflecting one of the colours by a slip of polished glass upon that part of the glass through which the other colour was seen. Here we have Lambert's method recommended and illustrated with an easy mode of finding that position of the eye in which equal proportions of the two colours are combined. It is needless to show how useful to artists, as well as to learners, such simple means of testing the correctness of gradations and contrasts of colour may be. Applying the glass to the coloured diagram accompanying the description, some common delusions are at once dispelled. A neutral grey, for instance, instead of green, is seen to be intermediate between blue and yellow; and olive green, the shade of yellow, intermediate between red and green.

In the chapter on the primary and secondary colours, the view maintained by Professor Maxwell in the "Transactions of the Royal Society for 1860" is advocated. Mr. Maxwell's experiments on the prismatic colours have never excited amongst practical men the attention they deserve. They consisted of most careful and trustworthy observations, by which he distinctly proved that certain red, green, and blue rays of the solar spectrum so far excelled their intermediate rays in depth of colour, that by merely mixing them the colours of these intermediate rays could be produced in their proper depth; from which, of course, the natural deduction is, that red, green, and blue

"Are simple elementary or primary sensations of colour, and that the hues of all the intervening prismatic colours are compound, caused by some two of these sensations being excited at once in excess of the third. For nothing can be more probable than that each simple sensation is produced with greatest power by rays of some particular period of undulation, and with less and less power, the greater the difference of the period; and if so, it may well be supposed that those prismatic rays which have the greatest depth of colour, that is, the red, green, and blue rays, are those by which the simple sensations are severally most strongly excited, each in equal excess, or very nearly so, over the other two sensations."

We need hardly say that this question of the simple sensations of colour lies at the root of all correct theory and rules of practice. With respect to the theory that they are red, yellow, and blue, now almost universally taught, both in our country and on the Continent, Mr. Benson

roundly asserts (in his preface) that it is "un-supported by a single rational experiment;" and in page 14, that

"That theory is entirely subverted, not only by the researches above mentioned on the prismatic colours, but by all scientific experiments on the mixture of colours, which show that red and green, yellow and purple, and blue and orange, are not complementary to each other."

We commend this question to the special consideration of those who direct the instruction given in the schools of design in the theory and practice of colour. If any reasons can be stated against the new, and in support of the hitherto accepted doctrine, let them be stated; but if the new doctrine be true, we cannot be too prompt in accepting it. The truth of Nature must be superior to groundless theory, as a foundation for all rules of practice.

We cannot leave this part of the subject without noticing another novelty, which strikes us as true and useful,—the doctrine of the double brightness of the full secondary colours. Hitherto the brilliant colours which Mr. Benson designates pink and sea-green have been almost neglected; in this work they both class with yellow, as the true secondaries, all of which ought to be as bright as the whole of the rays of their two respective components can make them. Why should the secondary formed by adding red to blue be the darkest of colours? There are bright strong colours of this hue in some flowers, as in the petunia, and it glows with matchless beauty in the solution of permanganate of potash, though we cannot, perhaps, imitate it well by pigments. As for sea-green, we cannot wonder at its being overlooked, since it very rarely occurs in nature, and there seems to be no pigment but the fading verdigris that represents it well; but this is no reason why it should be omitted in the theory of colour.

Mr. Benson groups together the three primaries and the three secondaries, together with black and white, as the eight principal colours. The double coloured diagram, showing the relations of these principal colours by the supposed addition of the primaries upon black, and by their supposed subtraction from white, each in three partly overlapping circles, deserves notice. It would be a good test of the relative merits of the two theories of primary and complementary colours, in an aesthetic point of view, to compare other diagrams formed on the like plan, with red, yellow, and blue for the primaries, and green, purple, and orange for their complementary secondaries.

The observations made in chap. vi. on the qualities of colour, the definition of richness or strength of hue, the distinctions between the depth, the clearness, the darkness, and the brightness of colours, the reasons why some colours may excel in depth and others in clearness, and the attempt to vindicate their comparative merits in these respects, will be found worthy the study of all who delight in colour. But here again we are led into doctrine which is entirely opposed to the theory introduced by the ingenious Field concerning chromatic equivalents. Mr. Benson thinks the results he alludes to

"May lead to rules concerning the proportions in which colours may neutralize each other more reliable than those which Field so hastily laid down from his experiments on the superposition of coloured glasses or solutions, the results of which he totally misunderstood, since the thicknesses of the coloured substances upon which he experimented, indicated anything rather than the quantities of the respective colours in the transmitted light."

Field, in his "Chromatography," maintained that the full red, yellow, and blue neutralised each other in the proportions of five red, three yellow, and eight blue. Mr. Hay, in the third edition of his "Laws of Harmonious Colouring" (1836), said that Field has proved in the most satisfactory manner that yellow, red, and blue are as three, five, and eight. In his beautiful work called "The Nomenclature of Colours" (1846), he gives a different estimate of the relative powers of the best pigments, for he asserts—

"It will be found that taking the purest powdered pigments that art can produce, and mixing them in the proportions of one yellow, two red, three blue, of equal intensity, a cool grey, such as is produced by mixture of black and white, will be the result."

Now, by using the slip of glass as recommended in this work, it is easy to see that the colours of our most powerful yellow and blue pigments, as King's yellow and Cobalt blue, neutralise each other in about equal proportions without any red; so, also, do those of our deepest and clearest, as French blue and lemon yellow. How can these facts be reconciled with the con-

clusion of Field or Hay? Can the latter be supported by any experiments more trustworthy than the mixture of pigments, or the superposition of coloured transparencies, the fallacy of which is now universally understood? Why continue to repeat a doctrine that is contrary to fact, and can only puzzle or mislead? We commend this matter, also, to the consideration of the Department of Science and Art.

The description and use of what Mr. Benson has called "the natural system of colours" is perhaps the most striking and attractive part of the work. Hitherto no scheme has been used which would find a place for all possible combinations of three primary sensations of colour, so that all direct gradations may be represented by straight lines; but, by the aid of the simple geometrical figure of a cube, this is perfectly effected, and the value of the idea is immediately evident in the facility it affords for conceiving and forming all sorts of gradations and contrasts, and harmonious arrangements of colour. The construction of the colour-cube is thus described (and the method may, of course, be applied to any three primary colours we may choose to adopt):—

"A point must be taken to represent zero, or black, the absence of all light, and three lines drawn from it at right angles with each other, in which and in all parallel co-ordinates red, green, and blue respectively must be supposed to increase in intensity from nothing upwards. Those intensities of red, green, and blue which together constitute white must be supposed to be equal, and will be represented by equal distances in the three rectangular directions. The outer extremities of such three equal lines will therefore be the places of full red, full green, and full blue, in some given intensity of white, and the lines themselves will contain the gradations from black up to those three colours. If, then, the cube of which the same lines would form three edges, be completed, it will obviously contain a place for every possible combination of red, green, and blue, from black, in which all three are not, up to white, in which all three are of full intensity; and the number of distinct combinations would, of course, be the cube of whatever number of steps are taken from black up to a full primary, both included.

The corner of the cube opposite to black would be full white; the corners opposite to red, green, and blue would be sea-green, pink, and yellow. The central point would be a neutral gray. The three sides which adjoin to the corner of black would respectively contain all those colours in which there is no red, no green, and no blue; while the opposite three which adjoin to the corner of white would contain all those which have full red, full green, and full blue. Thus the six sides may be distinguished by the primary which is absent, or fully present in each; and the twelve edges, being lines of which each is common to two sides, by the two primaries, of which each contains nothing or all.

The three diameters terminating in the middles of the opposite sides are designated primary axes, "because in them there is a change of one primary only." The six terminating in the middle of the opposite edges are called secondary axes, "because there is in them an equal change in two primaries, either in the same or in contrary directions." The four joining the opposite corners are in like manner termed tertiary axes, as having an equal change in all three primaries, "either all in the same direction, or two in the same, and the third in the contrary direction."

In every plane section of the cube the colours must vary according to simple laws of gradation in every direction, forming some peculiar natural harmony of colour. But those only which are perpendicular to the thirteen axes above mentioned are represented in colours, taking only one colour between each pair of the principal colours, which makes twenty-seven in all. In this way the same twenty-seven colours are arranged in thirteen different ways, grouped in each in a variety of natural harmonies of colour, the effect of which is very striking, notwithstanding the admitted imperfection in hue and inequality in strength of the pigments used.

In the first coloured plate, for example, we have nine groups, of nine colours each (being the sections perpendicular to the primary axes). The best idea of the nature of these compositions will be given, perhaps, by detailing the colours of the first set:—

Colours containing full Red.

Yellow.	Light Yellow.	White.
Yellow-red.	Light Red.	Light Pink.
Red.	Pink-red.	Pink.

Colours containing half the full Red.

Yellow-green.	Light Green.	Light Sea-green.
Dark Yellow.	Gray.	Light Blue.
Dark Red.	Dark Pink.	Pink-blue.

Colours containing no Red.

Green.	Sea-green Green.	Sea-green.
Dark Green.	Dark Sea-green.	Sea-green Blue.
Black.	Dark Blue.	Blue.

It will be seen that, in each set, the perfect

* The different kinds of homogeneous light, or prismatic rays, are distinguished by the length of the ethereal undulations or waves, in which, according to the now accepted undulatory theory, all light consists.

complementaries are found at equal distances in opposite directions from the central grey; also that the central colour in each group gives the general tone of the group.

In the remaining coloured plates there are six more groups of nine colours; four of seven; twenty of six; and the same number of three; all distinguished by their peculiar harmonies; some complementary to each other, and some more nearly related. But the great point of the system is, that it is suggestive of endless variations. Not only may the sections themselves be varied, but they may be wholly or partially combined symmetrically in endlessly varied ways, to aid which four plates are given, indicating numerous natural ways of combining the single groups. We look for a striking effect on all sorts of colour designs, when the principle here introduced becomes known; for it is not unlikely that, in this idea of sections of the colour-cube, we have a key to the infinite natural harmonies of colour.

It should be added, that the coloured plates and diagrams have been coloured by hand, the number of the different colours, and the manner in which they are arranged, probably rendering the application of printing difficult. This is to be regretted. In the choice of pigments (a list of which is given), the object seems to have been to take the best of each colour compatible with permanence, and to avoid mixtures as much as possible.

As supply naturally follows demand, one good result to be hoped for from an advance in the science of colour, is the further improvement of pigments. Of late years, some admirable pigments have been introduced, several of which are need with great advantage in this book; but there is room for more, especially for one capable of powerfully absorbing the red, and reflecting the blue and the green rays. The chemist who discovers a permanent pigment of this kind will confer a boon upon art. The deficiency mars the beauty of those harmonies in which the full sea-green ought to enter.

In the remainder of the work there are several points on which we should like to dwell, but space compels us to close. The chapter on the colour modifications of colours (under which treat Mr. Benson treats in a comprehensive and accurate manner of the effects known as "accidental colours," and "simultaneous and successive contrast") deserves particular notice; also that on the harmony of colours, in which many subjects for interesting discussion are compressed, and some new considerations advanced. The treatise concludes with a notice of those two distinct peculiarities of vision, "dichromism" and "defective colour-vision," neither of which is uncommon, though many persons affected by them are quite ignorant of the cause of the perplexity they feel about colours.

TERRA COTTA.*

THE first employment of burnt clay was probably for articles of domestic use; and the knowledge obtained in making water-bottles would soon lead to its use for the making of bricks, tiles, and other articles. The monuments of Nineveh and Babylon contain bricks with inscriptions more neatly made and of larger size than those in present use. Many of the bricks found by Mr. Layard were enamelled. The Egyptians made small figures of terra-cotta covered with inscriptions, and having an enamel supposed to be silicate of copper. The finest terra-cottas were probably executed about 400 years B.C., and the examples of this period, which are in the British Museum, testify to the durability of well-burnt clay. Probably some of the friezes, with mouldings and bas-reliefs, in the Museum, are of much earlier date. Pliny, in his thirty-fifth book, gives a long chapter to the art of pottery, and mentions the names of many great sculptors who wrought statues in clay, and also the cities famous for pottery.

The knowledge of every description of pottery possessed by the Romans spread with their conquests, and Germany, Spain, Gaul, and Britain retain fine examples of brickwork and tile and mosaic floors. From the remains of Roman potteries met with in England there can be little doubt that pottery was a most important manufacture here some sixteen centuries past. From Peterborough westward, along the valley of the

Nene, remains of Roman potteries extend for several miles. At Castor, in Northamptonshire, a kiln and a quantity of potter's tools were discovered, also moulded arch and hypocaust bricks.

The people of Lombardy and other states in Italy, mentioned by Pliny as famous for pottery, seem always to have preserved the knowledge of making terra-cotta for architectural purposes; and it is now in North Italy we find the most beautiful architectural terra-cottas. The elaborate terra-cotta enrichments of the new gallery at Milan, called the "Galleria Vittorio Emanuele," have been well executed by Boni, of Milan, from the designs of Signor Mengoni, architect.

The enamelled terra-cottas of Lucca della Robbia, in the fifteenth century, aided the introduction of the new style of ware called *Raffaello*, which was brought to great perfection about the sixteenth century at Pesaro, Urbino, Gubbio, Faenza, and Castle Durante. In the sixteenth century, Bernard Palissy painted tiles for walls and floors, and coated them with a thick enamel. Pottery was made at Majorca by the Moors about the twelfth century; and the Moors, who became for a time masters of Spain, spread the knowledge of making ornamental and enamelled tiles; probably the monks, who were the great conservators of the arts during several centuries, owed their knowledge of making encaustic tiles to the Moors. It is said that the Pisans introduced Moorish tiles for church decoration about the twelfth century, at which time the making of terra-cotta began to revive for architectural work in Italy.

From the time of the downfall of Roman power in England until about the thirteenth century, there are few evidences of brick being used in important buildings in England, except such bricks as were taken from the ruins of Roman works, as at St. Alban's Abbey and other places; and it does not appear that brick became again a favourite material for public works in this country until about the fourteenth or fifteenth century. The brickwork of Little Wenham Hall, Suffolk, is one of the earliest specimens: it is supposed to have been built about 1260.

The introduction of the Tudor style gave an impetus to the use of brick, moulded brick, and terra-cotta ornaments. During the fifteenth and sixteenth centuries many large mansions were erected in England of brick, having moulded brick cornices and terra-cotta ornaments. It is said that Trevigi and Holbein introduced moulded bricks and terra-cotta towards the end of the Tudor period.

During the seventeenth and eighteenth centuries many choice pieces of brickwork were executed, and in many parts of London mouldings and cornices of this date still exist. Towards the close of the seventeenth century, the stoneware potteries of Staffordshire began to be established; and about the middle of the eighteenth century plaster of Paris moulds began to be used by the Staffordshire manufacturers, and Wedgwood began his career in the making of terra-cotta vases and other wares. About 1750 the manufacture of stoneware was making progress at Lambeth; and about 1790 works were established at this place for making terra-cotta architectural details, statues, and vases, by a lady of the name of Coade. These works occupied a large space of ground in Pedlars' Acre, Lambeth, near to the wharf of Messrs. Eastwoods. They were first known as Coade's, then Coade & Sealey's, then Croggon's, and lastly as Routledge & Lucas's. They were closed, on the retirement of Routledge & Lucas from them, about twenty years since, and the moulds, models, implements, &c., were sold by Messrs. Rusworth & Jarvis.

The enterprise and good taste exhibited at these works were of the greatest value to the plastic arts. It is said Flaxman was employed on some of the models for these works, but it is certain that Bacon, Rossi, Bubb, Panzetta, and other leading sculptors who ranked high in the profession at the commencement of the present century, were employed at Coade's. The terra-cotta made at Coade's was of a warm stone colour, and its durability can be tested by very numerous specimens spread over England. The bas-relief representing the death of Nelson, at Greenwich Hospital, was executed by Bacon at Coade's. The frieze, the capitals, the trophies, and statues in the older part of Buckingham Palace were made there, and although the stonework on all sides shows great signs of decay, and the portion last built has been painted several

times, the terra-cotta Corinthian capitals are as sharp as when they left the kiln.

Croggon, successor to Coade, had a showroom on the north side of the New-road, a little eastward to Tottenham-court-road, and erected a terra-cotta front, part of which may still be seen with the paint which was put upon it after he retired, and leaving it fresh and clean.

About the commencement of the present century other manufacturers began to establish themselves in competition with Coade, among whom was Van Spangen, a Dutchman, who established the firm of Van Spangen, Powell, & Co., at Bow, about 1820. Van Spangen made ornamental moulded panels, keystones, rustic quoins, statues, tomb-stones, &c. His works were broken up about forty years since, and a large number of his models and moulds were purchased by the late Mr. Felix Austen, of the New-road, who was then commencing the use of Portland cement (first patented by Aspdin & Beverley, of Wakefield), combined with broken stone, ponded tile, and coarse sand, for forming what he termed artificial stone.

Also, about this time, Rossi and Bubb, who had been employed at Coade's works, began to manufacture terra-cotta for themselves. Rossi executed the large statues, the antifixes, the architect's enrichments, and the capitals for St. Pancras Church, New-road. Bubb executed the bas-relief in front of the Opera-house in the Haymarket, and many of the statues which ornament the terraces in Regent's Park. Mr. Bubb was marble mason, of University-street, Brown, the marble mason, of University-street, took his premises and kiln, and it is perhaps still in existence. Brown made a few terra-cotta articles, but soon abandoned the business.

About 1815, Charles Carter, of Dean-street, Oxford-street, who was connected with Parker & Wyatt, the first makers of what is called Roman cement, made a few architectural ornaments in terra-cotta, and also red incised tiles, and inlaid them with Roman cement to work with stone incised quarries inlaid with Roman cement. When Carter retired from his business, many of his things fell into the hands of Parker & Wyatt, and it was from seeing these suggestions of Carter's as to floor and wall tiles, that led Blasfield (who had become connected with the house of Parker & Wyatt) to inlay tiles with cement, and to make his first experiments in mosaic pavements, and this led to an acquaintance between him and Herbert Minton, and was the main origin of the sort of mosaic pavement, or Minton's tiles, which, beginning with him, are now so commonly manufactured and used.

In 1836, Sir Frederick Fowke, of Leicester, made some very good terra-cotta vases, which were spoken of in a Parliamentary report of this period.

In 1839, Blasfield employed Bubb to make experiments at Canford, for Sir John Guest, on Lord de Manley's clays, for making terra-cotta for use in building model cottages, and a small quantity of moulded bricks, tiles, and ornaments were made at that place, from sketches made by my father, and worked out in his office by myself. Bubb's health failing, Blasfield gave up the attempt to establish works in Dorsetshire, but continued to employ Bubb, who modelled a statue of Pomona for him for the late Sir William Middleton, of Shrubland Park, Norfolk.

About 1845, Herbert Minton executed copies of the Medici and Borgese vases, in buff terra-cotta with a thin glaze, from moulds furnished by Blasfield. Messrs. Cubitt, the builders, erected a kiln at their works in Gray's Inn-road about this date, to make architectural terra-cotta.

After the breaking up of Coade's works by Routledge & Lucas, several makers of terra-cotta sprang up. Moulded bricks were made at Glasgow, Tunstall, Ewell, Ludlow, at Worcester, and other places. Mr. Fulham, of Broxbourne, also began to make architectural works, and Mr. Blanchard, at Lambeth, who made specimens for the Exhibition of 1851, as did Messrs. Donlon, of Lambeth, and several other persons. The Earl of Leicester also made about this time some moulded bricks, chimney-shafts, and other architectural pieces, from drawings by Mr. Bodger, formerly in Mr. Pennefather's office.

Blanchard has executed nearly the whole of the architectural terra-cotta work for the new buildings at the South Kensington Museum, and numerous other large works.

Blasfield began to make terra-cotta at Mill Wall in 1848, and at Stamford in 1858. Previous to 1848, he made terra-cottas occasionally by

* By Mr. C. Barry. From paper mentioned in our last.

way of experiment, as in 1839 when he employed Bubb, but did not enter fully into the merits of the subject until about twenty years since.

When the governors of Dulwich College entrusted the works of their new college to me, without interference as to style or material (but only that inevitable trammel as to cost to which architects must perform submit) I felt that my old dream of long ago might be realized, and I have endeavoured to produce a building almost wholly in terra-cotta of varied colours, and striven to embody therein something of the stateliness, and at the same time elegance and fauoy in details of these old specimens. As a maiden essay, of course it is full of defects and shortcomings, to which no one is more alive than myself, but if it should help to lead others of my professional brethren with larger opportunities and richer experience to draw upon, to carry on the employment of terra-cotta in England, it will have served as useful a purpose as I could have hoped.

Terra-cotta, as my audience know, is a term usually applied to artistic works made of course clay or a coarser material than that used for fine earthenware or porcelain; it is generally of red or buff colour, but can have introduced into it by chemical materials other colours, and architects will readily appreciate at once the opportunity thus afforded of decorating in colour their works, in accordance with their own taste, with a material that shall endure as long as the fabric itself, with which their names are to be identified. As terra-cotta also admits of being glazed, a further opportunity for architectural decoration is presented for use.

The materials used are the clays of Cornwall, Dorset, and Northamptonshire—Lynn sand ground glass—China-stone—felspar and flint—also broken terra-cotta or burnt ware, pulverised. For very light porous articles fossil bone is used with terra-cotta. The variation of colour in white, buff, and red terra-cottas is due to the clays; other colours, such as black, grey, green, blue, &c., are obtained by the admixture of mineral colours with clays and other substances forming the body of the ware.

The whole of the clay and other materials are reduced by grinding them to powder of necessary fineness to suit the size and description of ware intended to be made. For fine ware, it is necessary to, what is termed, slip or wash these bodies together and evaporate a part of the water by means of a slip kiln. For large coarse ware, it is sufficient to mix the proper quantity of each substance together in powder, and after adding a given quantity of water, knead or pug it in a mill; and, to insure thoroughly blending all the bodies in the clayey paste, the operation of pugging should be repeated at least twice. Great care should be taken in blending clays, so that they are thoroughly mixed, or from unequal contraction in the clays the ware may crack.

The "body" or terra-cotta clay is better for being laid by for some days after it leaves the slip kiln, or the mill, before it is used. After the clay is prepared by the mill or by the slip kiln, it should be well beaten with an iron bar, and "wedged." The latter process consists of cutting a large lump of clay, many times asunder with a wire, and then throwing or slapping down the piece out on to the lump of clay from which it was taken off. This operation of wedging properly performed removes the air from the clay.

Clay thus prepared can be used by a sculptor for modelling a statue, or by a mason for running a moulding with a template. When the statue stiffens, it may be cut asunder with a wire and hollowed out; the parts can then be luted together, and the statue gradually finished and dried. After the statue is dry, the sculptor may dress it with the chisel, and correct any faults which have arisen in the drying. A moulding run by a template may be made solid if not much thicker than a brick; or it may be on its under side hollowed out; or it may be run on a saddle. The moulding can be mired and cut into lengths, and squared at the ends. When the moulding is quite dry, it may be rubbed with a piece of grit stone, and finally finished by a mason. The statue and the moulding may then be placed in a kiln and burnt, with very little chance of warping or twisting.

Bassi reliefs of large size may be modelled by a sculptor on a wooden ground, and treated in this way with perfect safety. The large bassi reliefs for the Wedgwood Institute are modelled in clay, sent in a frame of wood, with a cover, from Stamford to the schools at Kensington, and re-

turned complete from the modellers to be burnt at Stamford.

When the same form of design has to be repeated more than once or twice, it is desirable for economy, to make a model, and from that a plaster mould, and impress the clay into the plaster mould, the size of the object determining the thickness of the clay. For architectural work, the smaller the pieces, or the nearer the pieces approach to the size of a large brick, the more economical will be the work. At the same time there is no practical difficulty or objection to using terra-cotta in large pieces. These are then made hollow for the purpose of insuring equal hardness and contraction throughout, and if used, as at Dulwich, bonded into the walls as stone would be, they are filled at the work with fragments of terra-cotta in Roman cement. Although this has been done in this case, I am not at all sure that it is essential, as the transverse strength, even of the hollow blocks forming projections of cornices, strings, and the like, is very great, and I believe sufficient.

When moulds are used, and the clay has remained in them, say, for a piece of cornice equal to a cubic foot, about one hour, the mould may be removed; the plaster being porous, will have absorbed in this time a part of the water from the clay. The piece is then allowed to get tolerably hard and stiff, and the seams of the mould are removed. If the work is to be relieved, a modeller or mason will now undercut the work. It must be carefully watched in drying, so that all parts gradually dry at the same time, or it will crack or twist. The destruction of terra-cotta is far greater in drying than burning. Ornamental work that warps in drying is generally worthless; plain work, if it warps only, and does not crack, may be dressed and rubbed by a mason before it is burnt, and brought to a true surface.

The contraction in drying is about $\frac{1}{8}$ in. to $\frac{1}{4}$ in. to the foot, and about $\frac{1}{8}$ in. to $\frac{1}{2}$ in. in burning, or a total of $\frac{1}{4}$ in. to $1\frac{1}{2}$ in. to the foot. The fineness of the body and the colour of the clay has much to do with the contraction.

Terra-cotta of large size should be well protected from the violent action of the fire in the process of burning, and to effect this for large ware it is better entirely to muffle the inside of the kiln. A little more coal is consumed in a kiln having a muffle lining of brickwork 3 in. thick throughout, but the ware is more uniformly burnt, and it is never discoloured by the sulphur from the coals. Mr. Blashfield has, I understand, patented such a kiln.

To thoroughly burn a kiln containing some 25 tons of hollow terra-cotta ware $1\frac{1}{2}$ in. to 2 in. thick, will consume 20 tons of coal. To burn 20 tons of terra-cotta tiles thoroughly, the tiles being 12 in. by 12 in. by 2 in. thick, and packed closely in the kiln, will take 20 tons of coal,—weight of coal for weight of terra-cotta tiles when burnt. The tiles being subject to a pressure of 25 tons when moist, the particles are brought close together, and the fire does not so readily get through the body as it does through hand-pressed work.

Besides the above described risk in drying, there is also a risk in burning and cooling; first, from the muffle lining of the kiln sometimes giving way and exposing the ware to the violence of the flames from the furnace-holes, or from the kiln drawing in cold air from chinks and cracks in the process of cooling.

Having now described in general terms the mode of manufacture adopted, which, I should say, is taken from the practice of Mr. Blashfield, of Stamford, who has contracted for all the work at Dulwich College, and at whose factory and modelling-shops I have therefore been a frequent visitor, I would wish to point out some of the advantages which recommend terra-cotta as a building material to architects, in addition to its economy, of which I shall speak presently. Foremost among its advantages is the facility it affords to architects to see actually full size any of the more ornamental portions of their design, inasmuch as the material actually built in is the same as that modelled. There is no necessity, as in the case where stone is used for such purposes, to make a model in clay, then two casts in plaster—one in teglio and one in the round—with all the necessary imperfections which attend so mechanical a process; and then, when the model is thus produced, to take the chance of a mason (who is not the artist whose mind was embodied in the original model) being able to reproduce in a non-plastic material the design and delicacies of such model. In terra-cotta clay, on the other hand, the actual work

which is afterwards to be burnt and take its place in the building is the model itself, and bears the impress at once of the mind of the designer and the skill and knowledge of the modelling artist. It can be studied, improved, or modified, and, when quite satisfactory, burnt; and I would submit that a far better reflex of the personality of the architect will thus be found in a building than can ordinarily be the case. Again, except when there is much repetition, no moulds are of course used, so that bassi reliefs, enriched panels, friezes, sculpture of animals, foliage, or figures made in terra-cotta, and used in a building, cannot be copied; they are and must remain the sole originals, and thus have a greater value to the artist or architectural student than when it is possible to find the same composition placed in the different buildings in, perhaps, totally different positions and circumstances from those in respect of which it was originally designed.

Next, I would point out the opportunity it gives for brilliant effects of light and shade by the facility of what in masonry would be undercutting, but in terra-cotta is the application of separately modelled pieces of the material superimposed over the recessed parts while all are in a plastic state, and then the whole being burnt together into one homogeneous mass. I need not enlarge on the enormous economy in proportion to effect produced that this gives over work in stone.

Again, there is the opportunity of heightening the effect of a design by the use of terra-cotta blocks of delicately varied harmonious tints. These most easily available for building purposes are buff, of various shades, from gold colour to nearly brown; a light neutral tint, or grey; and any tint of red, from the plainest to the deepest. To these may be added many other colours produced by chemical materials mixed with the clay, but, of course, somewhat increasing its cost. Add to the above the facility for enamelling or glazing the surface, thus heightening the colour of any particular parts, and it will be seen that a chance is given to the architect who desires and will take the trouble to design in colour, which is not possible with other materials, unless at a fabulous cost, and even then, as when marbles are used, retaining their effect for only a few years.

Next, there is its indestructibility and freedom from decay by the action of the weather, whereas in England, and especially in the metropolis or other large towns, the effect of the weather and the acid gases the atmosphere contains soon disintegrates any soft stones, and a little later has a like effect even on hard ones, or marble, producing laminated surfaces, mouldering edges, and discoloration. With terra-cotta the reverse is the case. The acid gases in the air have no effect; the deposited dirt or soot washes off with the first heavy shower, and the work comes out again as pure and distinct as at the first. If it be said that this is perhaps not always desirable, and that a certain amount of decay adds to the picturesque effect of a building, I think it may fairly be replied that, if so, it is rather an evidence of the carelessness or defects of the design, if it be improved by such adventitious aids, the greater or less extent of the effect of which must be quite uncertain, dependent on local circumstances, and no creation at any rate of the architect's mind, whereas his knowledge that as in form so in colour any creation of his fancy will be handed down unchanged for centuries as it comes from him, will tend more than any stimulus to that tender carefulness of design which all architects ought to possess and foster, which will give them credit, and delight the taste of those who come after them.

WESTMINSTER ABBEY AND ST. MARGARET'S CHURCH.

ALLUSIONS having been frequently made to this not unsightly church, recommending its removal, in order to clear the view of Henry VII.'s Chapel, it may not be amiss to direct attention to the other side of the Abbey, which is crowded in, and concealed by, lofty walls and buildings, clustered together in the most incongruous manner. At the present moment there are in the city several churches under process of demolition, because while the resident population has dwindled away, the sites were wanted for business, or for the clearance of thoroughfares; but the *favours* for demolition ought not to be encouraged, unless in cases

of public expediency or necessity; and it must be also taken into account, that this important space bordering the Houses of Parliament and the Abbey which has been so lately adorned at great expense, would be again thrown into confusion for another year at least.

A glance at the confused and blinded condition of the extensive Abbey precincts on the southward and most ancient side, will at once disclose the necessity of opening out these inexplicable labyrinths of confusion.

The works now in progress upon the Chapter-house, that most venerable monument of art, demonstrate the necessity for clearances on this now unknown side, to show off the majesty of the cathedral. The interior of this ancient octagonal adjunct to the Abbey has a span of 60 ft. Seven flying buttresses have been reconstructed; some of which had been built in as partial walls to private houses,—one in Poets' corner, and others connected with the crazy and hideous old red brick houses and offices of the canons.

When it is considered that the enclosed precincts of the abbey, including its schools, refectories, cloisters, and adjuncts, represent an area of eleven acres, and that the space (humorously called the Dean's-garden alone (surrounded by buildings) contains over two acres—the whole enclosed by lofty walls 3 ft. in thickness; that a narrow way (College-street) bounds it in nearly a direct line from Victoria-street to the Victoria Tower, and the river bank; and that all the adjacent property, including the wide reach of Tothill-fields, belongs to the Dean and Chapter, the wonder is that the spirit of an improving age has not formed a grand thoroughfare to Millbank and Palace-yard; thus opening out the glories of the Abbey, and conferring a value upon hoarded and muffled spaces dedicated now to cloisters and canons' lodges, as formerly to the chambering and *pious* exercises of cowed priests and friars.

Soon after the first dawn of Christianity in these islands, so early as the sixth century, a monastery took station here, and authenticated history names Orthright as the first Canon, A.D. 604. Doubtless they had chapels, refectories, and dormitories; but the oldest foundations, as skillfully traced by Mr. Scott (who, in his researches after architectural evidences, actually found concealed under planks, masonry, and rubbish, the original accounts of disbursements on the chapter-house, cloisters, halls, &c.), were those erected in the reign of Henry III., between 1245 and 1269; and although a church had been built by Edward the Confessor, who reigned from 1042 to 1066, but little can be traced of those primitive foundations save that within the outer circle of the chapter-house an additional wall, 5 ft. thick, reduces the size of the crypt or basement story to the extent of 10 ft. in the diameter, and this was decidedly the original foundation.

Some of the most ancient and beautiful of the cloisters and cellars are ascribed to Abbot Littleton, but it is doubtful, from the mixed character of style, whether these were not founded in earlier times, and built over and transformed by him between the years 1376 and 1386.

It is clear that the nave of the Abbey was partly rebuilt under a commission from Henry V. A.D. 1413, issued to Whittington, the celebrated Lord Mayor, and Richard Harowden, the abbot; and in succeeding reigns, additions and renovations were occasionally superadded; the minor restorations having been effected by Sir Christopher Wren, after the Great Fire of London in 1666, and whilst St. Paul's Cathedral was in process of construction; so that there is an involvement of many styles throughout the structure.

As our great national fane, venerable for its antiquity, consecrated for over 1,000 years by the devotion of kings, prelates, and successive generations, this grand pile ought to be thrown open and disencumbered of the paltry lanes and mean tenements of its southern vicinage. The motley abodes of six canons and of the dean, raised in shapeless masses of red brick upon the cloisters and arches of primitive days, ought to be cleared away, and those cloisters, arches, gateways, and vaults transferred to the care of the architect who is now so ably conserving the remains of the chapter-house.

There is ample space along the dean's garden, with frontage to Great College-street, for the erection of six canons' mansions and a deanery; there is room to widen the street by 20 ft., and

to leave an open garden in the interval towards the Abbey, leaving the cloisters and other remnants of antiquity to be suitably rooted in—introducing plantation, verdure, and open aspect where such treasures are now sealed up.

What can be seen of the chapter-house when renovated? or of the perfect south side of the Abbey without such clearance? But there are other points to be considered,—the completion of the grand plan of *alcantours* for the Houses of Parliament. This can yet be secured by opening out from Victoria-street a nearly straight line southward, through College-street to the river bank, thus forming a noble and more direct route, clear of Dean's-yard, to Victoria-tower.

Thus a fine causeway might be secured from the West-End and the Victoria Station to the House of Lords, commencing at Strutton Ground, on an angle of frontage as yet unoccupied; in continuation, along the north side of Old Pye-street (a wretched remnant of squalid paper domiciles); thence cutting across three or four equally valueless tenements, and slick into College-street, at back of the school.

The modernization and laying out of College-street, the new arrangement of college and of canons' houses, the conservation of the Broad Sanctuary, and all the hallowed precincts, are of course left to the pious care of the Dean and Chapter.

As in all cases of improved thoroughfares in good parts of town or city, the new and more suitable houses would help to pay; but the utilisation of valuable space and the modern adaptation of valuable sites to better uses, must result in dignifying a long-neglected quarter of the town which, in its present condition, is a blot on the House of Peers and a discredit to the metropolis.

QUESTIONS AND REPLIES IN THE HOUSE OF COMMONS.

New Law Courts.—Mr. Alderman Lawrence asked the First Commissioner of Works whether notices would be served during the autumn on the owners of houses in Holywell-street, and also on the owners of houses in the line of a new street from the Strand to Lincoln's-inn-fields, in order that a Bill might be brought in during the next session of Parliament, to provide approaches to the site of the New Courts of Justice by the removal of Holywell-street and the formation of a new street from the Strand to Lincoln's-inn-fields. In reply Lord John Manners said the commission had made no recommendations for the purchase of that property for the purpose of making an entrance to the New Law Courts. However desirable such a proceeding might be as a metropolitan improvement, her Majesty's Government had no intention to bring in a Bill to carry the suggestion into effect. The Alderman then asked whether it was the intention of her Majesty's Government to give notices for the purpose of securing any approach to the New Law Courts: to which Lord J. Manners replied that the subject was under consideration.

Park-lane.—Mr. Gregory wished to know from the hon. member for Bath whether the Board of Works were going to pull down the public-houses on the eastern side of Park-lane, since the proposal to widen the lane through Hamilton-place had been rejected. In reply, Mr. Tite said that the proposals to pass through the Park and to relieve the traffic by widening Hamilton-place had both been proposed, discussed, and rejected within the last few years. It was proposed in 1836 to pull down Gloucester House, and to find the means required in the proceeds of the coal duties; but the Bills, introduced in 1866 and 1867, were ultimately withdrawn. This year another Bill was introduced, with the approval of the Government, but the proposal to pull down Gloucester House was unanimously rejected by the committee. They were thus again thrown back. The suggested pulling down of the public-houses was under consideration, as was also a fresh proposal to widen Hamilton-place, and he hoped to be able next session to bring in a Bill on the subject.

Regent's Park.—In reply to Mr. H. Lewis, the First Commissioner of Works, Lord J. Manners, said the works in the enclosure of Regent's Park were completed, and the water would be introduced almost immediately. The reason of the delay was the recent discovery of a defect in a drain, and the water could not be let in until the defect was remedied, which was now being done. It was not intended to cover the bottom of the lake with cement.

Mr. Canning's Statue.—Lord Stratheden inquired what steps it was proposed to take with a view to replace on a fitting site the statue of the late Mr. Canning. He advocated a site a little in the rear of the original position of the statue. Such arrangement, he added, would be satisfactory to the late statesman's family. The Earl of Malmesbury said he was most anxious to place the statue in a suitable position, but it was very difficult to please every one. The present site had been selected in obedience to the wish of the House of Commons, and no remonstrances against it had been received from the family of Mr. Canning. Lord Stratford de Redcliffe said he would prefer the site suggested by Lord Stratheden. He regretted that the Lord Privy Seal could not hold out any hopes of removal.

The Embassy-House at Therapia.—Mr. Monk asked the Secretary to the Treasury whether he would lay upon the table of the House the estimate, founded upon the plan of Colonel Gordon, which was selected by her Majesty's Government for the new Embassy-house at Therapia; and whether the contract had been entered into for the erection of that house. Mr. Selator-Booth was unable to lay upon the table the estimates and plans referred to, because, although the estimate would not exceed 10,000*l.*, the plan had been materially altered. Colonel Gordon had left Constantinople, and the gentleman now in charge of the building was the British Consul at Constantinople. He believed the interests of economy would be best consulted by leaving the matter in his hands. Everything had been done to insure that the work should be carried out economically.

THE POST-OFFICE AND THE TELEGRAPHS.

The select committee on this bill have agreed to the following special report:—

"Your committee have considered the several matters which they were specially instructed to inquire into, and are of opinion,—1. That it is not desirable that the transmission of messages for the public should become a legal monopoly in the Post-offices. 2. That it should be left to the discretion of the Postmaster-general, with the consent of the Treasury, to make special agreements for the transmission of certain classes of messages at reduced rates; but that any such special agreement should be laid upon the table of the House of Commons as soon as conveniently may be. 3. That security should be taken for insuring the secrecy of messages transmitted through the Post-offices, by making the violation of such secrecy punishable as a misdemeanour. 4. That the special circumstances at present attending the working of those submarine cables which the Postmaster-general may acquire, make it desirable that provision should be made for the working of them by leasing the same, in the first instance, to a company or companies; copies of any such lease to be laid before Parliament; but it may ultimately be found expedient that the Post-offices should itself work such cables."

The select committee also report that they have considered the bill and taken evidence thereon, which they have agreed to report to the House; and they have also gone through the bill and made amendments thereunto.

The committee resolved, that persons in the employment of companies, and not engaged by Government under the new regulations, should receive compensation if they had had an engagement of seven years, and are in receipt of a salary of 75*l.* In the clause referring to newspaper contracts, words were inserted including clubs, exchanges, and news-rooms. No newspaper is to have priority in reception of news or favour in rates.

The committee scheduled agreements between the Postmaster-general and the following companies:—The Great Western, the South-Western, the London, Chatham, and Dover, the South-Eastern, the North-Eastern, the Bristol and Exeter, the North British, and the Caledonian Railway; and between the following telegraph companies:—The Submarine, Reuter's, the Atlantic and Anglo-American, and the Universal Private Telegraph (Limited). This concluded the labours of the committee.

THE LATE MR. CLEPHAN, ARCHITECT, STOCKTON.—We hear with regret of the death of Mr. William Clephan, architect, Stockton. He had won the respect of a large circle of friends, and his death will be more especially felt by the members of the mechanics' institute, with which he had been connected since its organization. He took a great interest in horticulture and the fine arts.

IMPROVEMENTS IN CAMBRIDGE AND CAMBRIDGESHIRE.

The chapel of St. John's College, according to the local *Chronicle*, will be completed and opened in May next. The decorators, Messrs. Clayton & Bell, of London, are by their hand hard at work; the marble shafts are all fixed, and so are the open doors. The carving is nearly finished. The floor is not yet laid, and the windows are not yet filled in with stained glass. Mr. Scott's design is being carried out by the contractors, Messrs. Jackson & Shaw, and their representatives. Messrs. Clayton & Bell are also decorating the college-hall.

Master of Trinity College Second Court will be ready for the occupants of the seventy rooms in October. The rooms, which are all engaged, are in a very forward state, and are being fitted up. The doors are stained (oak), the walls covered with paper; the staircases will be lighted with gas, and the water supplied by the Waterworks Company. Each set of rooms consists of keeping and bed room, with gyp-room, the latter fitted up with every convenience. The contractors for the building are Messrs. Smith & Co., and the works are being superintended by Mr. J. Nicholls, with the aid of Mr. Rencher (clerk) and other assistants.

At Cains College, the alteration is of an extensive character. The college authorities have resolved upon building an entirely new court, the architect engaged being Mr. Waterhouse, from whose designs Messrs. Trollope & Son are working and making rapid progress, with the aid of their clerk, Mr. Tit. The style of architecture is the French Jacobean, with Castleton-ashlar stone and Ancaster dressings. The building will be three stories high, consisting of about sixty sets of rooms, which will be lofty, well ventilated, and suitably fitted up. The height of the court will be 55 ft., and the extent in Trinity-street 210 ft. The main entrance will be from King's-parade, under a tower, 106 ft. in height. Over the gateway will be figures, representing the founders of the college. To carry out this extensive alteration part of the Fellows' garden will have to be taken in, but the gates of "Honour" and "Humility" will be retained. In addition to the building of the new court, the contractors are engaged to almost rebuild the chapel, which is to have two towers. The interior is to undergo extensive alterations, including the creation of an organ-gallery, new screen, new communion-table, and the repaving of the floor. The chapel will be heated with hot water. Under the rooms of the new court will be wine-cellar for the use of the Master and Fellows. The whole will cost something over 20,000l.

In the town there are a new assembly and other rooms at the Guildhall, and a new Corn Exchange is spoken of. The "felt want" now demanding attention, according to our authority the *Chronicle*, is the improvement of the river Cam, its present condition being a hindrance to the University in their aquatic exercises.

In the county there are not many improvements. It is in contemplation, however, to build a middle-class county school. At the Ely militia depot there are to be built twelve houses for sergeants and an hospital for the men. The gas inspectors, on the part of the parish of Cottenham, have advertised for tenders for lighting the streets, roads, &c., of Cottenham with gas.

PRIZE MEETING OF THE WEST-LONDON SCHOOL OF ART.

The annual prize-meeting of this school was held in the theatre of the Geological Museum, Jermyn-street, on Saturday evening last. The chair was occupied by Mr. Beresford Hopo, M.P., the president of the school. The theatre was crowded. This is essentially an artisan school, and is teaching more than a fourth of the entire number of artisans (1,750) taught in the whole of the ten London schools.

The President expressed his deep regret that the drawings of the successful students could not be there exhibited; he said such an exhibition would have redounded to the credit of this school, which he described as the young and vigorous child of the South Kensington establishment, which he termed the "old hen." He said he had in his possession a statement of what this school had done, and, comparing its work to the work done by older establishments; but he should refrain from quoting these figures, as

they might seem to create an antagonism between these art classes, and he was desirous that the whole of the classes throughout the country should pull together. The importance of the work done by the West-London classes was shown by the fact that in 1867 there were 455 students, of whom 67 were draughtsmen and designers, 45 decorators, &c., 41 wood, stone, and ivory carvers, 9 modellers, 27 glass painters, 11 papier-mâché workers, 18 goldsmiths, &c., 23 engravers and diesinkers, 16 metal workers, 21 cabinetmakers, 31 upholsterers, 9 musical instrument makers, 43 carpenters and joiners, 11 machinists, 4 masons, 18 salesmen and clerks, and 23 teachers, with 35 miscellaneous. Remarking that he did not much like papier-mâché, as being often an imitation work, he went on to say that there were here a vast number of persons who were evidently studying art in order to advance them in their daily labour; while, at the same time, there was a lessening of others, such as clerks and salesmen, who were evidently studying art for art's own sake, and for the advancement of their own moral and intellectual nature. Art, he said, had become a necessity of the day; and even if we went to a tavern to take our food, we found, in place of the rough "forms" of hygone times, a mahogany and polished chairs to sit upon, in place of the rough "forms" of hygone times. He alluded to the ornamented railway refreshment rooms as another instance of the advance of refinement. Then he took the example of the general apartments and the furniture placed in them, and said that the cultivation of art gave the people a taste in the choice of their carpets and other household furniture, and this art-taste, too, could be exercised by women in their choice of bonnets, dresses, and even in the putting on of the crinoline. In passing, he congratulated those of the gentler sex present upon the discarding of the latter article from their costume; but he deprecated, amid some laughter, the "bathing-dress style" of attire now adopted by the sex. He proceeded to say that, in whatever they adorned or disfigured themselves, they were exercising a good taste or bad taste. It was of no use people describing themselves as "good plain people," and saying they left taste to painters and others connected with art, for they could not be "good plain people" without all turning Quakers; and, besides, there was a closer connexion between the cultivation of an art-taste and the advancement of the moral qualities than many people were ready to acknowledge. He urged that producers generally were now working up to a higher art-taste than they used a generation ago,—a result he looked upon as coming from those great Exhibitions which were now voted "a bore," but had really done this work in making the consumer look for a better class of articles, and encouraging the producer to supply them.

The prizes having been distributed by the chairman,

Mr. Ruskin said he had been struck by the youth of those who had gained prizes. They had all the world before them where to choose. With the immense advantages now before them, they might look forward, not only to honour, but to founding a school. They should recollect that if they were told to deny themselves, to do everything that was unpleasant, and to go through all sorts of hard exercise, the end of it was to please themselves and other people; for, unless their works of art were enjoyed by themselves, they would never be enjoyed by anybody else. The great object that workers in art ought to have in view was to make their work faultless. In fact, they had no business to have it anything else but faultless. All they did they should do earnestly. The president's expression of regret that he had not a third hand with which to shake in giving triple prizes, reminded him of Prudentia with three heads, looking every way. The old states were very difficult to draw, but they meant a good deal, and he thought this virtue of prudence was not enough insisted upon in our lectures on morality or art. He sometimes found he had done a great deal of mischief by what he had said and written, and he did not know that he had done more mischief than by those speeches and writings for which he had been most flattered, because he found that they led the students always to dwell too much upon what was exciting in art. The student should recollect that

all excellence in art was based on drawing. He ought to get a mastery of pure outline. Referring to the number of salesmen who had joined the school, Mr. Ruskin said he supposed salesmen were men concerned generally in the sale of decorative works who ought to know what they should recommend to the public, but it struck him that, with respect to that, there was rather too much influence at present exercised upon the mind of the public by salesmen, and too little by the artist, and that the artist was rather too much in the power of those who recommended his work. Students in art ought not to be ambitious of obtaining a recommendation of their works in early life; they ought to exercise self-denial in their endeavours to achieve excellence. In the beginning they might have to live on bread and water, but in the end they would live on ambrosia. In conclusion, Mr. Ruskin wished all of the students success, and congratulated them on having an admirable master.

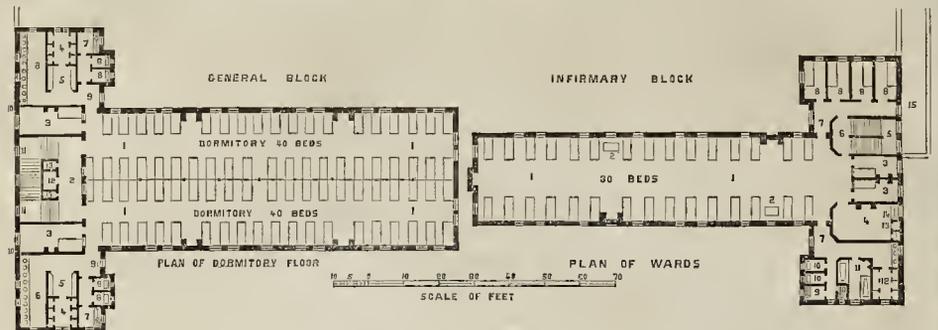

Mr. Digby Wyatt briefly referred to the satisfactory progress of the students of the school, a circumstance not less gratifying to the students themselves than to the masters, who had devoted so much time and attention to its management and control. It was a gratifying feature of the school that the young people who had taken the prizes were all more or less connected with the technical arts of the country. It was this connexion of art with technical industry that was the great want of the present day. A few years ago England was sadly behind some of the countries of Europe. We had made great progress lately, and no more successful combination of the two—the artistic and the practical—could be found than in the beautiful works produced by Mr. Peter Graham, and exhibited by his firm at the great exhibitions in London and Paris. The more his example was followed the more secure would be the industrial position of this country, and the wider-spread would be the roots and branches of its future prosperity and greatness.

Mr. Peter Graham dwelt on the importance, in a commercial point of view, of greater attention to the studies connected with art and industry. England had powerful competitors in every part of the world, and the only way to make that competition successful was to unite as completely as possible the study of art with technical industry. He proposed a vote of thanks to Mr. Hope for his attendance.

This vote was carried unanimously, as also a vote to Mr. Macdonald Clarke, the master, and the other officers of the school.

BUCKS ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY.

The annual excursion of this society has taken place. The members and their friends were conveyed by a Great Western special train to Windsor, at single fares, and on its arrival the Castle was the first point of attraction. Mr. Woodward, the librarian, by desire of her Majesty, met the numerous company in the hall, and, after an introductory address as to date and elevations of the building, conducted them over the older portions of the interior, and the library, explaining every object of interest, more particularly the illuminations, charters, &c. Mr. Parker, of Oxford, then gave an interesting account of the exterior of the Round Tower, the Wolsay and St. George's Chapels. The construction of the latter was then explained, Mr. Parker dwelling more particularly on the beautiful stone vaulting and fan tracery of the nave and choir, the difficulty of the work, and how superior it was to the vaulting of Continental churches he had visited. The deanery was then inspected, then the cloisters, and, lastly, the Wolsay Chapel. The visitors then left for Eton College, where they partook of luncheon, liberally provided by the Rev. Mr. Marriott. They afterwards inspected the college buildings, including the library, where they were welcomed by Dr. Goodford, the provost, who showed and explained some of the most valuable works. Services in the college chapel was held at 3 p.m.; after which Mr. Parker gave a description of the building in its old and restored state. The annual meeting then took place in the college hall, Archdeacon Bickersteth, V.P., in the chair. Many new members joined. Dr. Goodford read a paper giving a history of the college from its foundation. The Rev. Mr. Marriott also read one on Vestments. The company (about eighty) then partook of a repast at the provost's residence.

ASYLUM FOR IMBECILE POOR.

PROPOSED ASYLUM FOR IMBECILE POOR AT LEAVESDEN WOODSIDE, NEAR WATFORD; AND AT CATERHAM, NEAR CROYDON.—MESSRS JOHN GILES & BIVEN, ARCHITECTS.

TECHNICAL EDUCATION FOR ARTISANS.

A MEETING was held at the School-room of St. Gabriel's and St. Saviour's, Mimico, on Friday evening, July 17th, to inaugurate the formation of a school for technical education. The Rev. B. Belcher, M.A., was in the chair.

Letters of apology for absence, but highly approving of the object of the meeting, were read from Mr. J. Stuart Mill, Mr. Godwin, Professor Jenkin, and others. Earl Granville addressed the workmen, and passed a very gratifying opinion on the operatives generally who reported on the Paris Exhibition of 1862, and said he hoped all encouragement would be given to this and kindred societies working for this end. The Amalgamated Carpenters and Joiners of London and Manchester are the pioneers in this movement, and they have every hope that the architectural profession and builders generally will give them their encouragement and support by donations of books, drawings, &c., for self-instruction.

THE ATMOSPHERE AND VENTILATION.

It is a generally received opinion that the ocean of air that surrounds the earth on all sides extends from the surface upwards to a height of about fifty miles, which is equal to one-eighth of the earth's semi-diameter. It is not, however, of uniform density throughout; for barometrical observations prove that one-third of its total quantity is contained within one mile in height from the level of the sea, nearly one-half within two miles, and nearly two-thirds within five miles. If it were everywhere of the same density as at the surface the whole would be contained within this last height; but in that case the physical conditions of the world would be very different from what they are.

The form of the outer surface of the aerial ocean is no doubt spheroidal, like that of the earth, but much flatter, owing to centrifugal force and the great rarefaction produced by the vertical rays of the sun at the equator. The air is an extremely mobile, transparent, and elastic fluid; very dilatible by heat, contractible by cold, compressible by pressure, and expandible by removing pressure. It revolves with the earth, accompanies the earth in its orbit round the sun; and, like all material substances within the influence of the earth's attraction, is obedient to the law of gravity. Hence it exerts pressure on all bodies, and transmits that pressure equally in all directions. Its pressure is equal to 15 lb. on every square inch of surface at the level of the sea,—that being the weight of a column of mercury 1 in. square and 30 in. in height, which the air balances, and by which its pressure is measured. The pressure, however, is variable, owing to variations of temperature, humidity, and elasticity, which causes the column of mercury to vary in height from 31 in. to 28 in. The mean pressure, therefore, is 29½ in., or 14½ lb. per square inch. Water is 13½ times lighter than mercury, consequently the pressure of the air supports a column of water 33½ ft. in height. For this reason water cannot be raised by the common pump, or by the syphon, higher than 33½ ft. Hence the total weight of the air is equal to that of a stratum of mercury 30 in. in height, or of water 33½ ft. in height, covering the whole surface of the earth above the level of the sea. The exact rate of decrease of pressure or density of the air as we ascend is not known; but it has been found to decrease very nearly in geometrical progression as the height above the sea-level increases in arithmetical progression. Thus at the height of 3.42 miles the pressure is 7½ lb. on the square inch, just half what it is at the surface level with the sea; at 6.84 miles it is 3¾ lb., or one-fourth; and so on, the pressure decreasing for each succeeding 3.42 miles one-half what it was at the preceding elevation.

The air grows not only less dense as we ascend, but colder and drier. Its greatest temperature, like its greatest pressure, is at the sea-level; but the temperature gradually diminishes thence nearly at the rate of 1° for every 333.4 ft. At great elevations cold is so intense that frost is perpetual, and moisture falls not as rain, but as snow. For this reason high mountain summits are always capped with snow, and the valleys are filled with glaciers, which gradually gravitate to the plains below, where the warmer air melts them, and the issuing streams form beautiful blue lakes and noble rivers. Thus

the glaciers of the Alps are the springs of the Rhine, the Rhone, and the Danube.

At all places on the earth's surface, and at all heights above it, the atmosphere is composed of 20.80 parts by volume of oxygen, and 79.20 parts of nitrogen, beside four parts in ten thousand of carbonic acid, and also of carburetted hydrogen. It contains besides a small quantity of aqueous vapour, with traces of ammonia, hydrochloric and nitric acids, sulphuretted air is constantly moving, and its temperature and elasticity are always changing, yet there is no appreciable difference in the relative proportions of its essential elements—oxygen and nitrogen. The quantity, however, of aqueous vapour, carbonic acid, and other extraneous substances varies considerably at different places according to circumstances. Common air being 1.000, the specific gravity of oxygen is 1.111, and of nitrogen 0.972. Oxygen, therefore, is heavier and nitrogen lighter than atmospheric air. Oxygen is the most important substance in nature. It constitutes not only one-fifth of the air, but eight-ninths of all the water on the globe, and perhaps about one-third of the whole solid matter of the globe itself. It is the vital principle of animal and vegetable life, and also of fire; indeed, neither animals nor vegetables could exist, nor fire burn, but for a very short time, in air that did not contain a proper proportion of oxygen. It vivifies our bodies, gives redness to the blood, supports the flame of life, and paints the bloom of the rose on the cheek of the fair.

The atmosphere possesses the valuable property of admitting light, and of dispersing and reflecting it in all directions. Were it not for this property, objects out of direct sunshine would be invisible, shadows would be deep black, apartments and places into which the direct rays of the sun did not enter would be in darkness, and the stars would be visible all day. By the reflective power of the air, however, all objects, in whatever position, have light thrown upon them; and they in turn, by reflecting the light they receive, are rendered visible, and produce impressions of their forms and colours on the eyes. The moisture in the air, together with the light of the sun's rays reflected through it, is the cause of the beautiful azure of the heavenly canopy above us, and of the rich emerald of the verdant carpet beneath us. The blue of the sky, as seen from the lower parts of the earth, assumes a deeper hue, approaching to blue-black, the higher we ascend. Hence, from the top of a mountain, the milky-way appears like a silvery flame, and the stars shine with greater brilliancy, and far more numerous, than at lower elevations.

The aqueous vapour in the air is invisible, and is derived from the evaporation of water. It is much lighter than common air, its weight being to that of air as 5 to 8. It is also very elastic, but that varies with the temperature. There is more moisture in the air in summer than in winter, and more in warm than in cold climates. When the air is so completely saturated that evaporation ceases, a fall of the barometer, a fall of the thermometer, and a fall of rain are often associated phenomena. Dew is formed when the objects on which it deposits are cooler than the surrounding air, and so causes a condensation of its moisture. Thus dew contracts on a leaf or a flower, moisture precipitates on a tumbler filled with cold water, and perspiration streams down windows and walls, because the objects are cooler than the air in contact with them, and its moisture is condensed accordingly.

In the absence of rain or dew vegetation is sustained by the moisture it imbibes from the air. Thus in tropical districts, where for months together there is no rain or perceptible dew, many trees and plants preserve their verdure by drawing water from the atmosphere. The quantity of moisture in the air has great influence on the spirits and health of man. When the air is too dry it absorbs moisture from the lungs and skin; and when it is too moist it prevents the evaporation of vapour from the body: hence an excessively dry or moist air is equally injurious to health. The most healthy hygrometric condition of the air is when the dew-point ranges from 10° to 20° below the temperature of the air.

The whole body of the atmosphere is put in motion by excessive heat in the region of the equator, and excessive cold in the regions of the poles. Thus the powerful heat of the vertical rays of the sun round the equator dilates the air, and causes it to ascend to a great height,

whence it divides and flows off, as upper currents, towards the poles; and the intense cold in the polar regions contracts the air, and causes it to descend to the earth, whence it flows off, as lower currents, towards the equator. The currents do not follow the directions of the meridians, but are converted by the rotation of the earth, and the gradual increase of rotatory velocity from the poles to the equator into oblique currents, which cross each other, or the upper ones follow the reverse directions of the lower. By this grand system of ventilation the warm vitiated air engendered on all parts of the earth is drawn into the upper atmosphere where it is purified and dispersed, and returned cold, fresh, and clear to maintain the world as a fit habitation for man.

The atmosphere contains many secrets, mechanical and chemical, electrical and vital: hence it is a vast field for research. Its functions are various and wonderful, beautiful to contemplate, and profitable for meditation. It is the distributor of heat and also of light; it is the great laboratory in which we pass our lives; and it presses on our bodies with a weight of fifteen tons: yet we see and feel it not. By its means light comes to the eyes, sound to the ears, and odour to the nostrils. It draws up from the sea the vapour which descends as snow on the mountain, rain on the land, and dew on the flowers. Its refractive power produces the morning aurora and the evening twilight; tints the clouds and the mountain tops with crimson, purple, and gold; and lifts the disc of the glorious sun above the horizon before he has risen and after he has set. When quiescent it scarcely stirs the lightest leaf, and renders a fluid surface like a mirror; when gently agitated it fans the sun's rays, and wafts the fleets of nations round the world; and when roused to fury it uproots trees, levels buildings, ploughs furrows in the sea, and smites the stoutest ships to pieces as if they were toys.

Four-fifths of the air we breathe are nitrogen, whose chief use appears to be to dilute the oxygen, and restrain its vital energy. The remaining one-fifth is oxygen, more than one-half of which is absorbed by the blood to nourish and sustain the body. The blood sets out from the left side of the heart, circulates through the system, and returns again to the right side every few minutes from birth to death. The outgoing blood is of a bright red colour charged with oxygen imbibed from the lungs by inhalation. In its passage through the system the oxygen, which is life, is given out by the blood to the body; and carbonic acid, which is death, is taken in by the blood from the body. The incoming blood is of a dark purple colour charged with carbonic acid, which, together with all the nitrogen, are exhaled by the lungs. The remaining oxygen is combined with hydrogen, and forms aqueous vapour, which is expired partly by the lungs and partly by the skin. The exhaled air, therefore, is extremely deleterious, and very injurious to health if breathed again. The emanations from the skin are copious, and consist of vapour charged with carbonic, acetic, and phosphoric acids, with muriate of soda and other peculiarly odorous substances. Hence the necessity for frequent ablution and change of clothing, so as to keep the pores of the skin open and in healthy action. We rid ourselves of liquid and solid refuse by drains and otherwise, avoid the dirty and the diseased, object to wear a garment worn by another, remove impurities from our food, and refuse to drink from a cup pressed by the lips of a friend; yet in our dwellings and in our public places of resort we continually draw into our lungs the offensive effluvia emitted from the lungs, skin, and clothes, not only of ourselves and friends, but of the promiscuous crowd.

The temperature of the air we respire is nearly the same as that of the blood, which is 98°; and it is much lighter than common air. Hence it always rises over our heads to the highest part of the rooms, whence it would escape into the external air if an opening into a pipe or a flue were there to enable it to do so; but as there is no such provision, and it cannot get away, it soon loses its levity, descends, and contaminates the whole of the air in the rooms until it becomes so vitiated as to be unfit for respiration. This simple law of ascension of heated or light air like a balloon to an elevation where its density is equal to that of the upper atmosphere points out that we should remove at the ceilings the rarefied air which is constantly rising there from the exhalations of our lungs and skin, and also from the candles,

lamps, and gas which we burn. Thousands of people are shut up by day as well as by night in small rooms without any supply of air or ventilation other than what comes in or goes out at the chinks of doors, windows, and fire-places. The wonder is, not that there are headaches, pale faces, and sickness, but that people can exist at all in such rooms. Those who work in close rooms without ventilation are more prone to consumption than those who work out of doors. The former breathe a foul heated air over and over again; while the latter breathe air more pure, and always changing. Under such conditions deaths from consumption in men are more numerous than in women; and this disease is more prevalent in men and women who work in company in crowded workshops than in those who work singly in their own apartments, because in the former the air is saturated with moisture, is warmer, and more foul and stagnant.

In ill-ventilated workrooms men strip to the skin, to enable them to bear the heat, which is intense, and almost stifling. Continuous breathing of polluted air, both in rooms and in workshops, causes lassitude of mind and body, and a resort to stimulants, resulting in habits of intemperance. Badly ventilated houses produce virulent diseases, which raise the death-rate; yet hundreds of houses are built yearly without any provision for ventilation. The lowest death-rate is 11 per 1,000, and the highest, 45 per 1,000. The lowest is inevitable, and arises from inherent natural diseases; but death-rates from 11 per 1,000 to 45 per 1,000 are referable to zymotic diseases caused by defective sanitary arrangements. The death-rate of the metropolis is 24 per 1,000; but if houses, drains, and sewers were properly ventilated, the drains and sewers trapped, and the sewers made self-cleansing, the people would become more healthy, hardy, and happy, and the death-rate would be reduced probably to 18 per 1,000. We see and feel that the all-bountiful Creator has done for us in ventilating our bodies by the respiratory apparatus of the lungs and the circulation of the blood; and also in ventilating the world by the respiratory apparatus of equatorial heat and polar cold and the circulation of the air: why, therefore, do not we apply the same principles in ventilating our houses, and drains, and sewers? This subject is an extremely important one, and it is to be hoped that it will shortly receive more attention practically than has hitherto been accorded to it. How to do it is known; and it would be done if the Metropolitan Board of Works, and the local boards and vestries, were to take it in hand, not piecemeal, but upon a well-organized system for the whole of the metropolis. Until it is done the poor will become poorer, the parish rates will be made higher, and the death-rate will be increased.

We have much to learn in regard to the constituents and properties of the atmosphere, and in regard to arranging pipes and flues, so as to produce motion in the air, in order to thoroughly ventilate houses. Only few houses, besides large mansions and public buildings, are built with any special appliances for ventilation. We either never consider ventilation as at all necessary, or suppose that so long as there is a door, and a window, and a chimney, nothing more is needed. Every room, however, in which we live, work, and sleep should be provided with means for removing the vitiated air in or near the ceiling, and for admitting fresh atmospheric air near the floor. This is the essential principle of ventilation. Ventilating pipes could be carried from ceilings down to the fire-places, and terminate in the ash-pits close under the fires. The heat of the fires would draw the unwholesome air at the ceilings into the ash-pits, whence it would pass through the fires and up the smoke-flues; and if the ash-pits were closed by doors, the underside of the fires would be supplied with air from the ceilings instead of from the floors. This method, however, would be inoperative in the direction required in summer, or when fires were not burning. The products of combustion from gas-jets could be carried off in the same manner; and also by placing funnels over the gas-jets flush with the ceilings, with pipes leading from them either into the chimneys or into the outer air. But chimney-flues afford the readiest and most practicable method for ventilation. Whether fires are burning or not, there are but few flues in which the draught is not upwards. By some means an upward suction is established, probably by the temperature of the flues being somewhat higher than the external air, or than the rooms; or by the wind passing across their tops aiding

the draught. Be it as it may, a light held at the upper edge of the fire-place or smoke opening is invariably towards the flue. If therefore an inverted funnel be fixed flush with the ceiling, with a pipe leading from it into the chimney, the air at the ceiling would be drawn into the funnel, along the pipe, and up the flue, like the air near the floor passing into the fire-place. By this method a vast number of existing rooms could be easily and cheaply ventilated. This process is somewhat similar to Dr. Arnott's chimney-valve, which communicates with a flue below the ceiling. The hot vitiated air, saturated with moisture, produced by breathing, and by burning candles, lamps, and gas, rises direct to the ceiling, whence it must descend to get into the valve. When, however, it begins to descend, it has lost its levity, and in consequence much of it sinks below the valve, and, mixing with the air in the room, deteriorates it. But by placing a funnel flush with the ceiling, with a pipe leading from it into the chimney, the noxious air passes away at once. Occasional draughts from the flue into the room would be less frequent by the pipe and funnel away from the flue in the centre of the room than by the valve close to the flue. The pipe must not be taken from the funnel into the outer air, as the fire, when there is one, would draw air through the pipe into the room and down from the ceiling into itself, like it draws air through a window when the top sash is pulled down. The funnel could be covered with a perforated ornamental flower screwed to it, the upper side of the flower being clear of the ceiling; or a domelet of perforated zinc could be placed in the funnel convex downwards. This would be much cheaper, and look nearly as well.

It would, however, be far better, while houses are being built, to construct ventilating pipes alongside the flues, or in combination with them. There should also be an arrangement of funnels in the ceilings, with pipes leading into the ventilating pipes. The heat of the flues would rarely draw the air in the ventilating pipes, and so induce upward currents, which would materially assist in drawing the vitiated air out of the rooms and fresh air into them. Pipes have long since entirely superseded brick drains, and why should not pipes supersede brick flues, not only in larger, but in smaller class houses? By a judicious arrangement of pipes for flues and ventilation—round inside for the flues, and square outside of the thickness of the walls, with the intervening spaces for ventilation; or square, with a dividing partition, one part for smoke, and the other for air—much of the room now occupied by the jambs and breasts of chimneys would be saved. Ceilings are usually made horizontal, but they soon become convex by shrinkage. For purposes of ventilation, however, they should be made as concave as possible from the cornices, with the highest point in the middle, where the funnels should be placed. Then the warm vitiated air on arriving at the ceilings would glide upwards to the funnels, and pass through them into the ventilating pipes, and thus a constant interchange of air in the rooms would be established. The outward currents from the ceilings would in most cases produce sufficient inward currents of fresh air through all the present points of ingress without requiring special apertures for its admittance. Still, however, one or more fresh-air openings could be placed at some convenient point in the floor or the skirting opposite the chimney.

No air will produce fire and light but oxygen; and both are extinguished immediately they are deprived of this gas. Respiration and combustion have the same effect,—the one kindles the body, the other the fire; and the one keeps the body, and the other the fire, burning and alive so long as each is supplied with food or fuel. All substances burn with greater brilliancy in pure oxygen than in common air. A flickering taper, or any burning substance, plunged into oxygen bursts into a brilliant flame, and burns with such splendour that the eye can scarcely bear the glare of the light, and the heat is intense. Improper application of air to burning fuel and gas produces imperfect combustion, waste of the carbon and hydrogen, and pollution of the air. Hence the more perfect we can consume coal and gas, the more heat and light we obtain therefrom, the less are the deleterious products from the combustion, and the less waste or loss in a money point of view. Great improvements have been made in stoves of late years, but the best of them are far from perfect. The fire-boxes should be arranged so that the fires can consume the carbon in the fuel without

smoke if possible; then the atmosphere would be less vitiated with the products of combustion; and a greater quantity of heat would be radiated into the apartments with much less consumption of fuel. Gas-burners should also be made to emit the gas from very fine holes, or very fine tubes, arranged close to each other; then the gas-jets issuing from the holes or tubes would be surrounded and fed with oxygen, or completely oxygenized; the united flame would be nearly white, and very brilliant; only a small quantity of sulphur would be evolved; and there would be considerably more light with the same expense of gas. That burner is best and the most economical which consumes the gas, not with a dull yellow flame, but with a brilliant white light.

JOHN PHILLIPS.

CEDAR FOR CABINETS.

The writer of the article on Cedar, in a recent number of the *Builder*, when recommending the wood as a lining for drawers, should not have omitted to caution his readers against employing it where geological specimens are to be stored. The aromatic resin deposits itself upon all descriptions of minerals, and ruins them so far as appearance is concerned. When I was in Rome some years ago, I made a collection of pieces of variously coloured marbles, small portions of the marble veneering on the ancient interior wall-faces, and brought them to England as *souvenirs* of the different buildings. These in the first instance I kept in a large cedar box, made on purpose to hold them. One day I read in the columns of the *Builder* that "geological specimens must on no account be kept in drawers lined with cedar, as the wood deposits a sticky resin," &c. Of course I went at once to look at my marbles, and found them covered with nasty glutinous spots, quite destroying the beauty of such things as the delicate perishable petrified mud from the Falls of Terni, though, no doubt, the gum could be rubbed off from smooth surfaces.

R.

"THE ADULTERATION OF LABOUR."

PRAY do not let the "Adulteration of Labour" pass away. That short passage, and the capital "case in point" immediately preceding it, the account of bad work on the railways, are most valuable for the good of the country's credit. From the wretched rubbish usually put on our doors and windows, in the way of fastenings that will not fasten,—and that make one mentally swear any number of times in a day—to the pier of Chichester Cathedral, and the damaged Manchester cottons, all is rottenness and sham. The disgrace to our country is a thousand times worse than one's own suffering by it.

II.

A MIDDLE-LEVEL SKETCH-BOOK.

THE accompanying outlines are copied from a MS. in the Royal collection in the British Museum, and form a unique example of an artist's sketches in the Middle Ages. They are made in pale colour in the margins of a Chronicle of Geoffrey of Monmouth, of the early part of the fourteenth century, and occupy a middle place between the careful drawings of Willard de Honecourt and the free sketches of Speed in 1610. Although we cannot readily trace any definite identity between the originals and the architectural monuments now existing, they are of extreme value, being of beautiful design and suggestive for modern designs. In London, however, we may, perhaps, trace considerable likeness to the great churches of Westminster Abbey, St. Mary Overy, and old St. Paul's. The other cities illustrated are Cantorbury, Ebrauc. (York), Chichester, Gloucester, Caerleon, and Rome, and the towns of Leicester and Colchester are also represented. The accessories of castles and walls I have omitted, as they are of the conventional type familiar to all conversant with ancient MSS. A cross, a mural ornament, and the head of Edward II. (?) will attract attention from their grace, force, or symmetry. There are also very clever sketches of heraldic shields, with coats of arms, small figures, and a battle piece full of vigour. The architect will at once be able to fix on the Early English triplet, or Early Decorated form of tracery, the double portal, the leaded spires, the crocketed canopy,

the gable with its trigonal widow, and the flattened doorway, and be pleased to see in these the germs of some of those exquisite elevations which modern talent seeks to rival and, as yet, cannot surpass. The seals of the period throw an illustrative light upon these very curious and interesting sketches of an English architect made five centuries ago.

MACKENZIE E. C. WALCOTT, B.D.

** Although interesting, we do not think it necessary to publish the sketches.

CRUSHING WEIGHT: WROUGHT AND CAST IRON.

The apparent contradiction pointed out in the *Builder* for July 18 (p. 534) in the statements made by various authorities as to the relative strength of wrought and cast iron columns is entirely owing to the confounding together of two distinct problems. The pillars experimented on by Mr. Eaton Hodgkinson (see *Phil. Trans.* for 1840 and 1857) had a length of not less than 30 diameters, in which the resistance to crushing does not come into play, the pillars being broken by bending; and it is in these only that wrought-iron bears a greater weight than cast-iron, the formulae being—

$$W = 42 \frac{d^{3.5}}{l^2} = \text{Crushing strength in tons of cast-iron pillar.}$$

$$W = 134 \frac{d^{3.5}}{l^2} = \text{Ditto wrought-iron ditto,}$$

both pillars being solid. If we put $d = 4$ in., and $l = 10$ ft., the cast-iron will break with 126 tons, and the wrought with 194 tons.

When a pillar has its length less than 30 diameters, but more than 10 diameters, it yields partly by bending and partly by crushing; and when the length is less than 10 diameters, its full crushing strength comes into play.

The crushing strength of cast iron is 49 tons per square inch of section, while that of wrought iron is 18 tons; so that for short pillars cast iron is much stronger than wrought.

Hence it is necessary to consider the mode in which the material is to be applied before we can decide whether cast or wrought iron is to be preferred. E. WINDHAM TARN.

The following table from Rankine's "Applied Mechanics," showing that the comparative strength of cast and wrought iron columns varies as the proportion of length to diameter is greater or less, may be of some use to your correspondent "T. M. M." It appears from the table that when the length is about twenty-six and a half times the diameter, the strength per section is equal, in cast and wrought iron; but when the proportion of length to diameter increases, wrought-iron offers the greatest amount of resistance, and cast-iron when the proportion diminishes.

Length	1	1	1	1	1
Diameter	10	20	30.4	30	40
Wrought	84,840	31,706	20,230	27,700	23,480
Cast	84,000	49,000	29,230	24,820	18,000

CHARLES BIRD.

ABOUT A LEAD PIPE.

SIR,—In your last issue, "N. & K." ask for information regarding the cause of a lead pipe (4 in. in diameter, and 6 lb. to the foot) having become in some places almost flat.

The pipe is used to convey water from a cistern on the roof of a mansion to the basement, a height of probably more than 30 ft.; the valve or sluice for cutting off the water is perhaps in the cistern, or somewhere at the top of the pipe. If so, the flattening of the pipe may be at once explained; for if the valve or sluice be closed when water is rushing down the pipe a vacuum will be formed within it, and an unbalanced atmospheric pressure equal to perhaps 14 lb. on every square inch be brought upon the outside; and this often repeated with great suddenness would pretty certainly crush such a pipe.

If the stop-valve be not at or near the top of the pipe my explanation fails, and "N. & K." should give all details of the arrangement. C. H. H.

SIR,—A question was asked by "N. & K." in your impression of the 18th instant, relative to the flattening of a leaden pipe. I have met with the same thing, and it was

supposed by the parties to whom it belonged to have been done wilfully, but on examination I found the following to be the cause.—In this case it was a 4-inch waste, made of lead, 6 lb. to the foot superficial, with a standing pipe and brass washer of the same size, viz. 4-inch, in the cistern. Now, when the cistern was quite full, and the stand lifted for the purpose of discharge, the water sank rapidly until the cistern was about half-empty, when a whirlpool formed just over the orifice in the cistern, the air passing rapidly through into the waste pipe. Now, it does occur sometimes that this whirlpool occurs, while a large portion of the water is still in the tank. Then it does not pass into the pipe so fast as that which is in the pipe passes out. The consequence is a partial vacuum is formed, and the atmospheric pressure on the outside causes the pipe to collapse. I prevented a recurrence of this by simply soldering a small pipe, or an air-pipe (say 3/4 inch) into the waste pipe below the cistern, and carried it over the top of the cistern (elsewhere would do, so that it was above the water line). I applied this ten years ago, and the flattening has not happened since.

I may add that, if the water is discharged from the tank by means of a valve or cock of the same size as the pipe, the sudden closing of the same before the whole of the pipe is empty would cause the damage, and the same remedy would prevent it. E. A. B.

"LAND AND MARINE SURVEYING" AND "ENGINEERING FIELD WORK."

SIR,—We observe in your issue of the 11th instant a letter from Messrs. Atchley & Co. referring to your notice of the above works, and we rely upon your courtesy to allow us also a few lines on the subject.

When Mr. Haskoll brought us the MS. of our book, "Land and Marine Surveying," we knew nothing of the work previously published; and being assured that the new work was entirely original, we considered—and do consider—that gentleman's character quite a sufficient guarantee of the truth of the statement, without troubling ourselves with any examination of his previous works. Since the appearance of Messrs. Atchley's letter we have had an interview with the author, and he reiterates most positively his assurance that every word of our book is original, and that so far from copying from "Engineering Field Work" he never once while writing "Land and Marine Surveying" looked into that volume.

We scarcely think it worth while commenting on Messrs. Atchley's ludicrous doctrine that, a man having once written upon a certain subject, no publisher is justified afterwards in publishing another work by him on the same subject, even after long years of additional experience and observation. Were such a rule to prevail men of scientific attainments and literary skill would often be precluded from laying before the public the results of their sometimes life-long labours, and many of the finest scientific works in our language would never have seen the light. Lockwood & Co.

** With this the correspondence must end.

FREE LABOUR v. TRADES UNIONS.

SIR,—Trades unionists consider that it is right for men of all trades to combine; let them ask themselves the question what the result would be if the farmers throughout the country entered into a powerful combination and (being supported by the importers of corn) doubled the present price of bread.

It is said on all sides that joiners, masons, bricksetters, plasterers, painters, &c. perform only half or two-thirds the work for a day's wages that they formerly did, although their remuneration is now 25 to 30 per cent. higher than previous to the alteration in the corn laws.

Why is there not to be free trade in English labour as well as in corn, cattle, coffee, tea, sugar, rice, &c.?

Were these necessities of life produced under the rules of trade unions, the cost would be so exorbitant that nine-tenths of the world would die of starvation.

It is a matter of little consequence to the public whether the regulations of a shield get, or a foreman's wages; but the present cost of building enhances the rent of every description of dwelling, and thus affects all classes of society.

There are thousands of hoys anxious to become joiners, masons, bricksetters, plasterers, painters, &c.; but the rules of the unions prevent them entering these several callings. The poor rates are thus immensely increased, and many of the working-classes driven (of necessity) to obtain a living by dishonest means. PRO BONO PUBLICO.

CONCRETE BUILDINGS.

SIR,—Can any of your readers, who have practically tested the merits of the new system of building by Portland cement concrete, inform me to what degree a concrete building is sensible to contraction and expansion? A. B.

TO CLEAN STONE.

SIR,—Can any of your readers inform me what will clean and preserve a soft sandstone similar to the stone quarried at Attleborough, Warwickshire? G. J.

LOWER FARES PRACTICABLE.

SIR,—A farthing a ton per mile gives a profit on the conveyance of coals and other minerals, requiring porters, cranes and other machinery, hooking, warehousing, and watching; whereas passengers can preserve themselves to and from the carriage, so compensating for extra carriage-room and insurance. A ton of men, women, and children I reckon twenty, so they cost one-twentieth of fifty farthings each. Approximating gradually from present rates (thereafter, there are surely obtainable increasing profits as each successive reduction becomes established and known. W. W.

THE ARCHÆOLOGY OF FREEMASONRY.

HAVE read a paragraph in your valuable periodical to the effect, that "a Masonic Archæological Society has been established in order to elucidate the antiquities and history of Freemasonry." I should be glad to have some further information relative to the society, the inauguration of which does not surprise me, as I have been aware that recent Masonic investigations have led to the discovery of the lost science of symbolism, by means whereof's rich mine of hitherto occult knowledge has been revealed. W. N. CALWOOD.

WORKMEN AND THE PORTRAIT EXHIBITION.

We have received an earnest request to submit the following appeal:—

"To the Authorities at South Kensington.

On behalf of the class to which I belong, I humbly solicit permission to view the portraits at South Kensington. The charge, 2s. (with catalogue), is a very serious matter to most of us. It means the price of eight dinners, I can assure you.

The slack time is approaching (personally and for my own trade it has set in) when we shall have plenty of leisure on our hands: but the money?

I have an idea that I should like fully to note the contrast as to style, colouring, &c. (*vide Builder*, a week or two ago), between the works of the present century and the supplemental collection.

Neither of the previous collections was seen by most of us for the reason stated above: and the time? Can you give us any facilities as to evening or Saturday? ONLY A TAILOR."

We solicit consideration for this request, and would suggest that the Exhibition should be opened on Saturdays at 2d.

CASES UNDER THE METROPOLITAN BUILDINGS ACT.

Caution to Builders.—On the 17th instant, at Clerkenwell Police Court, Mr. Frederick James Gribble, of Margate-road, Camden Town, appeared in answer to two summonses taken out by Mr. Henry Baker, district surveyor of St. Pancras. First, for erecting three houses in York-road, having wooden overhanging roofs, for which the approval of the Metropolitan Board had not been obtained; and also for omitting to render or parge the outside face of the chimneys, as required by Section 20. The surveyor having proved the case, the defendant was ordered to comply with his requisitions. Secondly, for neglecting to give notice of three other houses, adjoining the last. The defendant argued that, because the houses were exposed to view, and must be seen by the surveyor, the notice was unnecessary. He, the builder, had not attended to the remonstrance of the surveyor, nor had he obeyed the first summons of the magistrate. After a patient hearing, he was convicted in the penalty of 40s., and 42s. costs to the surveyor for loss of time, in addition.

CHURCH-BUILDING NEWS.

Stothdon.—The Church of St. Mary, which has been in a great measure rebuilt, has been re-opened for divine service. The work of restoration included the replacing of the north arcade in an upright position, rebuilding the north wall, and building a new south arcade between the nave and aisle. New roofs have also been put over the nave and chancel. The original heights of these roofs have been restored, the removal of the chancel arch having led to the lowering of the old nave roof. The western gallery has been removed, and the whole of the fittings renewed. The architect, under whose superintendence the works have been carried out, was Mr. Blashill, of London.

Lutterworth.—The whole of the workmen employed in the restoration of Leire Church have been treated to supper at the Hind Hotel, when upwards of 100 sat down in a large booth, specially erected for the occasion. The chair was taken by Captain Richardson, the son of the rector of Leire. Mr. J. Law presided at one table; the vice-chairs were filled by Mr. G. Law and Mr. King. The contractors are Messrs. J. & G. Law and Mr. King. Mr. Smith is the architect; and the other tradesmen connected

with the work are Messrs. Ade, Buswell, and Henley.

Swaffham Prior.—Various improvements have been reported of late in this village, the new reading-room being the most recent example. The principal feature of the parish, the Church of St. Cyriac, has not been neglected. For some weeks past it has been closed for repairs. It is now repaired. The entire building has been cleaned, painted, and repaired. A memorial window to the late Col. Alix has been placed in the south transept by his son, the present proprietor of Swaffham House; who has also presented, in conjunction with Mrs. Roberts, &c., two brass "coronae" for the nave, and a pair of antique "Glastonbury chairs" for the chancel. The vicar has also given a carved oak lectern for the lessons; and the screen and curtains have been removed from the southern transept, as they impeded the view of the new window. The work has been done by Messrs. Adams & Danby, of Swaffham, and Mr. R. Danby, of Brnwell.

Walton.—Within the last ten or twelve years Walton Church has undergone much restoration. The building is dedicated to St. Mary, and is in the Early English style. When it was built some five centuries or more ago a good deal of the cement-stone, so plentiful on that part of the Suffolk coast, was used in its construction, and though this material may be manufactured into an article for cementing together stones of a harder nature, it is not well suited for constructing the walls of a building; exposed to the action of the atmosphere it crumbles away, and hence Walton Church, as years rolled on, became very much dilapidated. Of the tower, there remained only one or two masses of stone a few feet high, and covered with ivy; the west end of the nave was entirely lost, and the chancel and south aisle were in a shabby condition. Some ten years ago the south aisle and vestry were restored, the nave newly fitted with benches, a carved pulpit and reading-desk put up, and new windows were inserted in the north wall of the nave, the cost of the restorations being about 800*l*. Since then the accommodation afforded by the church was found inadequate to the requirements of the parish, and it was determined to enlarge the church by rebuilding the western portion of the nave, which was wholly gone, and at the same time the restoration of the chancel was undertaken. The work was finished in the spring of the present year, but there was no formal re-opening. The restored portion of the nave, as described by the *Suffolk Chronicle*, stands upon the old foundations, but is much more artistic and eighty than the old part of the building; the new walls are faced with flint, and the buttresses have white stone dressings, whilst the old walls are of cement-stone with here and there bricks and stones of a harder nature, and are supported by heavy plain brick buttresses. The roof of the new part of the nave has a higher pitch than that of the more ancient, so that there are now three gradations,—the western portion of the nave, the old nave, and the chancel. There is a three-light west window. In the chancel is a stained-glass east window, put in by Mrs. Boby, Walton Hall, in memory of the late Mr. Boby; the east end has been rebuilt of red brick. Internally there is also a good deal of variety. The chancel is lighted only by the east window. There were formerly two windows in the north wall, but these have been blocked up. The roof of this part of the church is hammer-beam, that in the old part of the nave is plastered with some heavy beams running across, whilst the restored portion of the nave has an open-wagon roof, and that of the aisle is similar. The walls throughout have been touched up; the church is uniformly benched and paved. The cost of the restoration of the nave was about 450*l*, which has been almost entirely raised among the parishioners, who also contributed to the chancel restoration, the roof of that part of the church being restored by Mr. Richards, the lay proprietor of the tithes. Mr. C. Woolnough, Walton, was the contractor. A piece of land a little over a quarter of an acre in extent, adjoining the north side of the old churchyard, has been added to the burial-ground, the total cost, including walling in, being upwards of 200*l*. This addition has just been consecrated.

Liverpool.—The new church of St. Paul, erected on the north shore, Liverpool, the foundation-stone of which was laid a little more than a year since, was consecrated by the Bishop of Chester. The style is Geometric. The architects were Messrs. Calshaw & Sumner. The plan of the church consists of a nave about 70 ft. by 50 ft.,

having side and west galleries, with a wide open chancel 20 ft. deep, separated by the chancel arch, supported upon detached stone shafts, having enriched caps. The sides of the chancel are also divided from small side spaces opening into the nave by arches, thus giving a view of the chancel from all parts of the nave, and side galleries. The principal entrance in the west front is by the large porch 20 ft. by 10 ft., and from this to the nave by two sets of folding doors. The galleries are entered by separate doorways and staircases. The roofs are of open framed principals, resting on the outer walls, but also supported by light iron columns springing from those supporting the galleries. The seats consist of open benches, the whole of the wood-work being stained and varnished. The west front of the church and side porches are constructed of Yorkshire shoddies and Stenton stone dressings, picked bricks with stone dressings being employed for the remainder of the edifice. On the north of the doorway are a hells-tower and a spire rising about 90 ft.

Worcester.—The estimated cost of the proposed restorations of St. Andrew's Church will be about 2,000*l*., and the architect is Mr. W. J. Hopkins. Parishioners have already promised subscriptions to over 300*l*., the entire sum subscribed being now 457*l*., by less than a score of individuals. It may, therefore, be hoped that this ancient church will not be long suffered to remain in its present dilapidated condition. All the sittings will be free and unappropriated. More than a quarter of the amount required can scarcely be hoped to be raised in the parish.

DISSENTING CHURCH-BUILDING NEWS.

Stockport.—The chief stone of the new Baptist chapel in Greet-street has been laid. The edifice has been designed in the Romanesque style. The plan is nearly a square, the extreme external dimensions being 70 ft. by 65*½* ft. There were difficulties in the ground to overcome. The chapel will be built of red brick, the string-courses, bands, and cornices being in the same material. The porch, circular windows, and pinnacles will be in stone from the Hollington Quarries. The dimensions of the chapel will be internally 61 ft. by 53 ft., and 28 ft. to the ceiling. The organ-gallery is separated from the chapel by an arcade resting on columns, with carved capitals of Darley Dale stone. The vestries are placed beneath this gallery and behind the pulpit, separated from the chapel by a wooden screen. They will be contiguous to each other, so that on occasions they may be used as one room by removing the folding partitions. The baptistery will be under the platform, and will be lined with white tiles. The principal entrance to the chapel will be from Greet-street through a triple porch, which will form the principal feature to the front. The whole will be in stone, with clustered columns. Other features of the exterior are the circular windows, which will be filled in with stone tracery of geometrical design, and the pinnacles, which will have columns with sloping stone roofs. As the building is covered by a single-span roof, the turrets break up the extreme width of the gables. Separate access is gained to the vestries and organ-gallery from the front facing the Armory, the stairs being placed in the angle, which has been rounded off and covered with a turret roof. The pews are to be moulded deal, and arranged on the ground-floor in a circular form round the pulpit. The galleries will be on three sides of the chapel, and will have an ornamental iron railing in front. Ventilation will be secured through ornamental centre flowers in the ceiling. The total accommodation will be 1,000. It is proposed to heat the building with Haden's patent apparatus, and the gas-light fittings will be of sun-burners. The architects for the building are Messrs. W. G. Habershon & Pite, of London; and the contractors Messrs. Watkinson, of Ransington, Lincolnshire.

Braintree and Bocking.—The new Wesleyan chapel has been opened for public worship. It is arranged with three rows of open benches in the length, divided by passages on each side, approached from two porches at the end next the high road. At the opposite end is the platform, with a recess arched as high as the ceiling, and a transept extends on either side. At the back is a vestry and class-room, entered from the ground of the minister's house. The roof of the main building is in one span, the principal timbers being wrought and varnished, with a

flat ceiling of plaster half way up the rafters, the inner part of the roof being used for ventilation. A gallery extends across the end opposite the roof. The exterior is faced with red bricks, relieved with black band and arches, the windows and other finishings being of Bath stone of Early English design. A stone arch is gable at the junction of the roads form a porch common to one of the lower entrances and to the staircase to the gallery, which is placed in a tower finished with a spire covered with slates and surmounted by a vane. In the basement is a place for a furnace suitable for warming either by hot water or hot air. The ground story contains 320 sittings, and there are fifty-six in the gallery, besides sixty-four children's. The gallery could be extended along the sides and in the transepts, by which 116 additional sittings may be obtained. The cost of the building, exclusive of the land, has been about 1,400*l*. Mr. Frederick Barnes, of Ipswich, was the architect; and Messrs. Parmenter, of Braintree, were the builders.

Miscellaneous.

TESTIMONIAL.—At the annual dinner given by the firm of R. W. Kennard & Co., of Upper Thames-street, to their employes, the manager of the establishment, Mr. Joseph Crowther, received from the clerks, &c., a testimonial written on vellum, and illuminated by Mr. Leftwich, one who for many years was with him in the establishment. In return, a photographic portrait of Mr. Crowther was presented to each of those who signed the testimonial. Mr. Crowther has been fifty years in the same employment.

"RATTENING" IN LONDON.—Under this title the following letter from Messrs. Bunnett & Co. has been sent us:—Sir,—We have received a threatening notice, of which the following is a copy. We leave it to speak for itself.—Your obedient servants,

BUNNETT & COMPANY (Limited).
New-cross Works, Deptford, Kent, July 20.
"Messrs. Bunnett & Co. (Limited),—Gentlemen,—We have to inform you that a resolution has been passed concerning the system of piecework as most obnoxious to trades unions; and after the ensuing month, should you attempt to deviate from the tenor of this intimation, you must bear the consequences.—Yours respectfully,
From the General Secret Committee, July 15*th*."

CROPS FROM THE LONDON SEWAGE.—At the usual meeting of the Metropolitan Board of Works the chairman said he had received a letter in reference to the effects of sewage manure:—

"Herewith I have the honour to send duplicate specimens of the samples of our crops, which we are exhibiting at the show and garden, &c., at the Crystal Palace. Some of the samples are quite unprecedented. The sample of wheat is grown on a piece of land which bore the same crop last season. The oats, which are perhaps the most extraordinary ever seen, have been produced by the unexhausted manure left on the land by the application of 4,000 tons of sewage per acre last year to a piece of land, from which we got last season seventy-one tons of grass per acre. This is a conclusive refutation to those enemies who pretend that sewage farming exhausts the land."
Some specimens of wheat, barley, oats, potatoes, and strawberries accompanied this letter, and were of extraordinary size and quality.

THE RAILWAY WHISTLE NUISANCE.—The Londoners are beginning to find out that our anticipations as to this growing and insufferable nuisance were correct. The *Athenaeum* says:—

"We trust power will soon be obtained to check the monstrous abuse of the whistles of locomotives, especially at termini. Since the removal into the metropolis of these vast starting-places there is no spot out of hearing of those discordant instruments; and because of them, in the invaded neighbourhood, there is absolutely no silence. Placed in the hands of men who care for little beyond their own practice, almost nothing for the senses or rest of the neighbourhood, they are wantonly abused. Is there, beyond the habit of making the sounds of these things frightful, any reason for their being so dreadfully shrill and painful to the ear? A signal is a signal, we suppose, and as likely to be effective if it were made melodious as it is now, when discordant. Military signals receive attention, although they are given by musical notes, and not by hideous shrieks and terrible screams. As it is, some locomotives signal hoarsely and, comparatively speaking, pleasantly. Why not have two whistles to each engine, one to be heard afar, the other near, and both melodious? As they are now arranged these instruments are made to shriek in ten thousand ears in order that a pointman ten yards off may take warning."

In reckless and never-ceasing disregard of the public comfort we think no metropolitan railway can excel the Great Northern in respect of this truly monstrous nuisance. If the Holloway district was ever inhabited by the monsters of the Saurian order the hideous noises of the present era must closely resemble the acoustic horrors of that dreadful time.

"DUST HOY!"—Reader, did you ever inhale a breeze from a dust-cart when the contents of the basket are tipped over? Eyes, nose, mouth, and clothes suffer. Further trials and annoyances would cease if housekeepers would stamp their dust with a few pails of water the day previous to its removal.—R. T.

THE ALBERT PARK AT MIDDLESBROUGH.—This park is to be opened early next month by Prince Arthur, who has been deputed by the Queen to officiate at the ceremony, in her name. At one time hopes were entertained that the Queen herself, or at all events, the Prince of Wales, would have opened the park. The proceedings will constitute an event in the history of the iron metropolis of the north. Middlesbrough is the first of the northern towns—with the exception of Sunderland—to inaugurate a People's Park on a large scale.

A SUBSTITUTE FOR HAY AND STRAW.—A Country Rectory writes to the *Standard*:—It may not be generally known that the water used (*udora*) which is choking up our rivers and streams in all parts of the country might be turned to good account. It needs only to be led out of the water and dried in the sun. It then becomes sweet and pleasant. My rats eat it, and appears to like it, and it also makes very good litter for the stable. With the respect before us of hay and straw at a high price, these who have a supply of the *udora* near hand would do well to dry a large quantity for the coming winter."

STATUTES AND THE TRANSIT OF ANIMALS.—An influential deputation from the Royal Society for the Prevention of Cruelty to Animals, headed by the Earl of Harrowby, as president, he had an interview with the Duke of Marlborough, and President of the Privy Council, urging on the Government the importance of establishing by law public abattoirs similar to those to be found in the principal cities of Europe; and the necessity for legislative measures for the protection of animals during their transit from place to place by steamboat and railway. The Duke of Marlborough said it was manifest that he would remedy most shortly be provided.

ELECTRO-IRON DEPOSITS.—The *Scientific Review* discusses at considerable length the new scheme of producing, or rather depositing, iron by electricity, which has occupied the attention of French and German experimenters for several months. There is a great desire to keep it a secret; but the process is exposed to be analogous to the electrolytic. The iron so produced is nitrogenous, but pure. It will withstand the action of hydrochloric acid or sulphuric acid in cold, and will, therefore, not rust in the open air. It is of a clear grey colour, and takes a fine finish. With a weak current of a single Daniell cell, iron two millimetre thick is easily deposited in a fortnight.

POLLUTION OF RIVERS.—A case has been heard at Abingdon Assizes, in which Mr. H. P. St. John, of Donnington-grove, was plaintiff, and Messrs. Granville & Plumb, proprietors of the Abingdon Paper-mills, were defendants. The issue for the defendants in this case consented to submit to a verdict for plaintiff for 40s. damages and costs, to give an undertaking not to pollute the water in future, and to close a sluiceway complained of forthwith. The question involved was whether the owners and occupiers of land bordering on a river shall only be benefited by the water that they stream at the rate of the owner or owners of a paper-mill situated on its banks. The trial was one of the most interesting, and therefore heavy damages could not be obtained.

ANNUAL REPORT ON ST. GEORGE'S, HANOVER-SQUARE.—The annual report of the medical officer of health (Dr. Aldis) has been printed. Estimating the population of the parish at 91,500, the gross death-rate for the year ending March 31st was 19.5 per 1,000 living, but deducting the deaths of non-parishioners at St. George's Hospital (300), the death-rate was only 16.7 per 1,000. The rate varies greatly in sub-districts, the richer quarters being very low, and the poorer much higher than the average. In the model lodging-house, Gatliff's-buildings, erected by the Marquis of Westminster, the death-rate was more than 30 per 1,000 in ten months. This is supposed to be attributable to the state of health of the new lodgers in the building was opened, and partly to the unwholesomeness of new buildings, erected on and once marshy.

LINCOLN CATHEDRAL.—The timber gangway which for the last twelve months has formed a temporary bridge between the western towers of this cathedral, has been removed. The eight pinnacles of the western towers have now been renewed. The whole of the works have been carried out without accident to life or limb.

CHELTENHAM SEWAGE IRRIGATION.—A report of the local Sewage and Drainage Committee on the best means of carrying out the principle of irrigation recommended by Mr. Bateman, has been made to the local board. In this report, and basing on an appended report by the borough surveyor, Mr. D. J. Humphris, the committee recommended the conveyance of the sewage from the Hatherley tank to Hayden, where land can be obtained for irrigating purposes, and further on to land at the Barrow with the same view. The estimated cost of the works, exclusive of extension of the sewer to the Barrow, is 7,000*l.*, and inclusive thereof 8,500*l.* The cost of the land at Hayden, if purchased, would be 10,500*l.*, and of fifty acres at the Barrow 4,000*l.*

ESTABLISHMENT FOR NURSES.—At a recent meeting of the governors of the Middlesex Hospital, it was resolved to erect a suitable building in connexion with the hospital as a residence for women to be trained and educated as nurses for the sick in hospitals and private families. It is intended that the building shall afford accommodation for sixty-six pupils, each being provided with a separate apartment. There will be a refectory, laundry, bath-room, and every accommodation for a model building. The sum required to carry out this object is calculated to be about 6,000*l.*, towards which the Marquis of Westminster has contributed the handsome donation of 1,000*l.* Twelve governors gave at the meeting 100 guineas each, and smaller sums, amounting to 300*l.* were also subscribed, making a total of over 2,500*l.* subscribed in a few days towards the promotion of this very important establishment.

OZONE.—This remarkable substance has lately been the subject of numerous researches. It has been shown by Dr. Schar, of Berne, that ozone, as well as substances impregnated with it, will kill animalcules with certainty and rapidity; and, as recent researches seem to place it beyond a doubt that most epidemics, and cholera among the number, are owing to microscopical, great hopes are entertained of its being possible to use ozone in hospitals as a disinfectant; and, perhaps, to extend its use still further. As might have been foreseen, however, from its being a very active form of oxygen, it exercises an irritating action on the respiratory organs, a drawback which must necessarily reduce its application to sanitary purposes within narrow limits, except in a condensed form, such as chemists know the permanganates of alkalis, or Condy's fluid, to be. In this form, indeed, ozone is already largely used in hospitals as a disinfectant, and also internally, as what we may call a sanitary condiment.

COMPETITION FOR A STATUE IN FRANCE.—Never was so great a fiasco experienced by the French as that which has just greeted the competition for the statue of Ingres, to be erected at Montauban, says the Paris correspondent of the *Birmingham Journal*. Thirty-six models had been sent for approval. The sight was hideous. Thirty-six varieties of the same ugliness. Every character of vulgarity had been essayed by the artists. The man was ugly enough in nature, but even his worst enemies could not deny that he was the Belvedere Apollo compared to the majority of these reproductions of himself. The good, honest, unpoetical matter-of-fact painter is in one case threatening the heavens with his mail stick, in another tearing the few hairs which remain upon his bald head in his search after inspiration. He bends his brow to earth, he raises it to the clouds, he pinches his nether lip, he presses his forehead upon his nose. The jury have declined to accept any one of the hideous attempts, and the competition is to be re-opened at a future period. The consequence of this egregious failure has been a deluge of lamentations on the decay of art in France, which bears out the terrible denunciations made by Alexandre Dumas Fils in the preface to the last edition of his works, wherein he declares that under the Second Empire France is beholding her laurels disappear one by one, and that where she has stood first for many generations even in the realms of art, she is being fast consigned to the second place.

INTERNATIONAL TRIALS OF REAPING AND MOWING MACHINES AT BERLIN.—At this contest, one of the largest and most important ever held, and for which more than forty machines by the chief English, American, and Continental makers were entered for competition, after elaborate trials extending over several days, the first and highest prize offered, viz., the prize of 200 thalers and a gold medal, was awarded to Samuelson & Co.'s self-raking reaper; the prize of 50 thalers and a silver medal to Samuelson & Co.'s grass mowing machine; the prize of 50 thalers to Samuelson & Co.'s "Eclipse Reaper." One-half the total money prizes offered and a gold and silver medal were awarded to Samuelson & Co.'s machine.

TRADES ARBITRATION CASE AT LEEDS.—Mr. Rupert Kettle, judge of the County Courts of Worcestershire, who, as our readers are aware, has organized a system of Courts of Arbitration at Wolverhampton and Coventry, has attended at Leeds as arbitrator in a dispute which had arisen between the master carpenters and joiners and their workmen respecting the rates of wages and the hours of labour. The views of both parties were placed before the arbitrator, and the result was that the men are to receive an advance of 3*d.* per hour in their wages, but that the demand for the reduction of the hours of labour was abandoned. It was agreed to appoint a court of arbitration to settle disputes that may arise during the next two years, and Mr. Jowitt was selected as the gentleman who is to be invited as umpire.

MONUMENT TO SIR JAMES BROOKE.—A committee, strengthened by the highest names, has been formed to promote the erection in Westminster Abbey of a monument in honour of the late Rajah of Sarawak, Sir James Brooke. Rajah Brooke sacrificed a considerable fortune to plant a society, governed by humane laws, on the shores of a barbarous island, whose centre has never even yet been explored. He gained solid advantages for England; he practically effected the cession of Labuan, which, as an outpost, an emporium, and a steamer station, is rising in importance every year; he swept the paths of commerce in that part of the world, so long untroubled by piracy; he, virtually, added a bishopric to the episcopate of Great Britain; and through his exertions trade in those waters has marvellously increased.

WATER SUPPLY.—The new waterworks for Carlisle have been completed. The reservoir had to be enlarged one-half, when it was found that the dimensions at first contemplated were insufficient; the embankments had to be extended and strengthened; rockwork required to be excavated, the existence of which had never been anticipated; and various other unforeseen expenses have been found necessary during the progress of the works; so that the contract has been exceeded to the extent of 2,000*l.* or 3,000*l.*, and altogether, instead of some 5,000*l.* or 6,000*l.*, a sum of 10,000*l.* has been added to the cost of the undertaking.—Owing to the present dry weather, the inhabitants of Keswick are to be put upon short allowance of water. The mountain rivulets are, in many cases dry; and the rivers Derwent and Greta are fast becoming mere brooks.

BLACKPOOL.—The new Assembly and Concert Rooms at Blackpool, erected by a limited liability company composed principally of Manchester gentlemen, have just been opened. The building occupies a site at the junction of Talbot-road and Clifton-street. It stands upon a raised terrace of triangular form, the apex of the triangle, fronting the sea, being crowned with an octagonal tower. At the base of the triangle is an opulent arcade, in which shops are situated, and from which visitors enter the Assembly Room by the principal staircase. The principal room (omitting the orchestra) is 74 ft. long by 38 ft. wide, and has galleries on two sides and at the lower end. The ceiling is lofty and panelled; and is furnished with three large domes, from which gas-lights are suspended. The stage (in the construction of which provision has been made for scenery, so as to afford facilities for theatrical performances) is commodious. From the terrace in Talbot-road is a staircase, to be used principally as a means of access to the reading-room, which is 36 ft. in diameter. In immediate contiguity are billiard-rooms, photographic-rooms, &c. From the last-mentioned staircase access is also gained to the galleries of the Assembly Room, and the body of the hall. The entire cost of the building is about 9,000*l.*

NEW CHURCH IN DINAN.—The foundation-stone of the English Church at Dinan, in Brittany, will be laid on the 28th instant. This will be the first Anglican church ever built in Brittany.

CHURCH BELLS DESTROYED BY FIRE.—Brydhill Church, Maidenhead, took fire the other day, and before the flames could be extinguished two bells were melted, and two others fell from their positions on to the lower arch of the tower. The damage done is estimated at 500l. or 600l.

THE OLD LOUVRE.—We mentioned some time ago the discovery of the foundations of the donjon tower of the ancient Louvre. To record the plan of the tower, it has been laid in black and white asphalt, except where the old building lies beneath the pavement of the present court, in which case granite has been used to reposit the foundation of the old building.

EXTENSIVE FIRES.—Park Wood, near Sheffield, has been fired wilfully by boys, and another plantation, near Hollow Meadows, in the same part of the country, has been accidentally fired, and many trees destroyed. At Retford there have been alarming fires in corn-fields; and near Wrexham, the surface of a whole mountain, called Yrondeg, has been burning for a week or more.

"MAREZZO MARELE."—M. Gnelton, concerned in the production of this material, is anxious it should be known that "the nature of the manufacture by which these marble imitations are produced, so far from being a simple result, represents the labour of many years' incessant study of the mineralogical formation of the finest marbles that have come under his observation."

STATUES FOR THE THAMES EMBANKMENT.—The new Thames Embankment being regarded as an excellent site for statues and drinking-fountains and similar architectural ornamentations, it is intended to remove several statues now inappropriately placed, and locate them along the range of the grand river esplanade. Noble's statue of Sir James Ostrum is to be placed, we hear, on the embankment, near the Houses of Parliament. It will probably be followed by a statue of Sir James Brooks. We hope our advice as to trees to shade the embankment walks will not be forgotten.

ROYAL ITALIAN OPERA.—"Il Domino Nero," the first Italian version of Anber's sparkling and well-known "Domino Noir," was produced on Tuesday evening last, Madame Lemmens-Sherrington sustaining the part of the heroine, M. Nardin that of Horace, and Signor Ciampi *Giù Ferris*. The latter sang the "Deo gratias" so well that a repetition was insisted on. Madame Sherrington was agreeable throughout, though towards the close of the opera the work of the season made itself obvious. Signors Neri-Baraldi and Tagliacico and Mlle. Locatelli contributed to a fairly effective ensemble.

RAILWAYS AND THE VALUE OF LAND.—The increased value given to land by railways is illustrated by Mr. Watkin, M.P., who, as chairman of the South-Eastern Company, states that at Hastings a piece of land for which, a few years ago, nobody would give 1,000l., is now worth 30,000l.; that, at Redhill, a piece of land which the company bought for 36l. the acre, has been sold at 1,867l. the acre; and that a park (Brickley) near another station, and containing 700 acres, which fetched no more than 50,000l. a few years ago, has since been sold for 120,000l., and could not now be had for less than 300,000l. In short, through these influences, land at first-class stations has risen in value from 200 to 1,000 per cent.

TEMPLAR'S SASH-FASTENER.—A large proportion of the sash-fasteners used are mere rubbish, soon breaking or otherwise getting out of order. Even when fairly made they have some inherent defects, to meet which Templar's Sash-fastener has been patented. The inventor claims for it, and with some justice, the following advantages:—It is self-fastening; a servant, in closing the window, involuntarily fastens it also; it allows the window to be a little open, if wished, and still fast,—a very valuable quality; it cannot be opened with a knife from the outside, like ordinary fasteners; the dropping of the top sash does not interfere with the action of this fastener as it does with others; and it effectually prevents rattling with the wind. We may add that it is simple, and that there is no spring to rust or to get out of order.

CO-OPERATIVE HOMES AND SANITARY PROGRESS IN ITALY.—At Genoa a large building is being erected on the co-operative principle, by working men, for the residence of fifty-four of their families. English co-operators are backward in this associated home movement, the object of which is to obtain comfort and economy in bed and board. At the laying of the first stone of the building for the Genoa community, Professor Cabella delivered an address on the dignity and virtue of labour, showing how, by prudence, even the poor man can build his own house, and expressing noble aspirations after perpetual improvement. Signor Cabella's address has been translated by Mr. Henry Roberts, F.S.A., whose pioneering efforts to improve the dwellings of the labouring classes, which commenced in England in 1844, have had a wide-spread influence in many foreign countries. When at Genoa, in 1856, Mr. Roberts was told by its chief magistrate that the municipality there had been put to an expense of 500,000l. sterling during the recent attack of cholera, mainly in relieving those of the population who live in narrow streets and filthy dwellings; and he added—"I can now, from experience, confirm what is stated in the publications you formerly gave me, as to the heavy expense which may be incurred in consequence of a defective sanitary state." The corporation, or municipality, has recently, at their own cost, converted a large pile of old buildings into convenient and healthy dwellings for working people.

TENDERS.

For Haddenham Gas Works, as per advertisement. Mr. David Oldfield, engineer to the Company:—

Table with 2 columns: Contractor Name and Amount. Includes Chandler & Son (£512 0 0), Porter & Co. (439 0 0), and others.

CLERK of WORKS is open to a RE-ENGAGEMENT, or as General Foreman, or to take charge. Is thoroughly efficient and energetic, a good draughtsman, and well up in both work. Carpenter and joiner by trade. Age 35. Testimonials first-class.—Address, F. 20, William-street, High-street, King-lane, N.E.

TO BUILDERS. A WELL-EDUCATED YOUTH, 18 years of age (son of a surveyor), desires an ENGAGEMENT, as a draughtsman, or as a draughtsman. Is a good penman, and can do trace and tint drawings neatly.—Address, ALPHA, Stamford-street, S.E.

TO ARCHITECTS. A GENTLEMAN, of some years' experience, requires a RE-ENGAGEMENT as JUNIOR ASSISTANT.—Address, ARCHITECT, Post-office, Finsbury.

A THOROUGHLY experienced Builder (Joiner by trade) is open to an ENGAGEMENT as GENERAL FOREMAN or CLERK of WORKS. First-class references. Town or country, or to a boat.—Address, F. P. Post-office, Newham, Gloucestershire.

TO BUILDERS, ARCHITECTS, AND OTHERS. A CARPENTER and JOINER, aged 35, married, WANTS an ENGAGEMENT at the BRANCH OFFICE of ASSISTANT or Superintendent on a Gentleman's Estate. See out and measure work, prepare plans, thoroughly conversant with all the details of a building. Is a first-class penman.—Address, J. 125, Wall-ditch-street, Wolverhampton, N.E.

A RESPECTABLE YOUNG MAN, 23 years, requires an ENGAGEMENT as CLERK, or as a draughtsman, or as a draughtsman. Is a first-class penman, and is a first-class draughtsman. Good references.—Address, A. B. 3, W. Cottages, Kensington-road, S.E.

The Builder.

VOL. XXVI.—No. 1330.

Memorials of Old London and Old London Life.*

THE Corporation of London has just made a delightful gift to the public. It has placed the early archives of the City of London in the hands of Mr. H. T. Riley for selection, translation, and publication of all passages that give any presentment of London in the thirteenth, fourteenth, and fifteenth centuries, or any details of London life in those times; and in so doing this august body has made the public free, as it were, for ever, of some of its choicest possessions. The Corporation has opened the City gates, and invited the public into old London, the London of the Plantagenets; of Wat Tyler and Walworth; of Geoffrey Chaucer; the London of Queen Eleanor, of Queen Isabel, of Queen Philippa; of the Fair Maid of Kent; the London of Dick Whittington, paved with gold, in truth, if not literally.

Let us enter gratefully, observantly, correspondingly. It is the reign of Edward I. Each city gate is kept by two sergeants, "skilful men and fluent of speech," who carefully note, all day, who passes in and out, so that no harm shall befall the City. At the ringing of curfew every gate is shut and secured: all the taverns, too, for the sale of wine and ale are closed at this signal; and no one is allowed to go about the streets or ways after this hour. The skilful sergeants betake themselves to their lodgings, which are either within the gates or close by; and then into the silent and deserted streets turn six of the most "competent" men of every ward to watch and guard their district throughout the hours of the night. All the boats on the river are moored on the City side at night; the sergeants of Billingsgate and Queen Hythe take note of the name of every one of them; and each of these officers has a boat of his own, and provides four men to guard the river by night, on both sides of the bridge. You can hear the lapping of the water, as though the black shadows upon it are sighing to be free; for no one is allowed to cross the Thames by night.

But when we enter it is noon. There are little boxes, or stands, in the streets for the sale of wares, piles of timber lie here and there, and pigs stray about; but these inconveniences are not to be endured after "Monday next," so we will not dwell upon them. Here is a knot of men at work clearing the water-course of Wall-

brook; and close by them an alderman is passing, accompanied by two of the best men in his ward, on a house-to-house visitation and survey of the hostries, or hostels, in his ward, so that he may be informed of the exact number, quality, and calling of every person in his division of the City, of twelve years of age and upwards. In sight, at the same time, is a female wearing a hood and cape furred with minever, who regards, somewhat contemptuously, a woman of a lower grade, who has also draped herself in a similar garment; and she is evidently determining to move heaven and earth in her aldermanic circle to get an enactment made that regratresses, or women who sell wares by retail, and servants should be limited to the use of lamb-skin and rabbit-skin decorations for their hoods. There is a little crowd opposite the church of St. Martin. We peep between the elbows or over the heads of the throng, and see that "one Matilda, wife of Henry le Coffeur," coming from West Chepe, has fallen upon the pavement and broken her arm. The little crowd declares that she is drunk, hut, nevertheless, she is carried tenderly to her husband's house to languish and die. The men who carry her and the mixed group that accompany them talk of other accidents that have recently occurred as they go. They tell how, on the Eve of St. John, a man was found lying drowned in the Foss under the City wall, near the Tower, Portaoken, and his coat of russet picked up on the ground close by, and suggest that he went to bathe there without knowing how deep the water was, and sank never to rise. No one knows his name, or whence he came. Adam Schot's case is called to mind. He was the servant of Ponce de More, and climbing up a pear-tree in the garden of one Laurence, in the parish of St. Michael, Paternoster Chirche, for the purpose of gathering pears, a branch broke beneath his weight, and, falling to the ground, his body was almost hurst asunder. He died three days afterwards, and the pear-tree was appraised at five shillings; and Ponce de More and the next-door neighbours on both sides were attached by sureties. Then they tell how John de Haucroete was burnt to death a few nights before, through taking a lighted candle with him to his straw bed, and falling asleep before he extinguished it; how Henry de Flegge was drowned when he took his horse to water in the dock of the ward of Castle Baynard; how John Fretard was killed by John le Clerk when playing together at "tiles," by an accidental blow on the side of his head; and how other deaths had occurred by misadventure all within a few weeks. As the little sympathising procession turns into the ward of Anterkin de Auvergne, where Henry le Coffeur lives, we lose sight of it. There is another crowd before the doors of the Church of St. Paul. Let us see what is the matter here. One Walter Bacun has taken sanctuary within the church. The corner of our Lord the King, William le Mazelinor, accompanied by the warden of the city of London, John le Breton, John de Banquette, Baroncin, and other trustworthy persons, has come to demand the reason why he has done so. The refugee confronts the magistrates. He is a forlorn, repentant parish priest, who confesses that he has stolen sixteen silver dishes that belong to Sir Baroncin. Passing from the curiosity of this scene of humiliation into the streets, we note the stations, or stands, for stalls, clustering round the high cross of Chepe and the broken cross, all kept by women, the pent-houses, haut-paces, and signs. Some of the pent-houses are so low and project so much as to obstruct the roadway for people on horseback; the haut-paces, or roofs built on pillars, have their disadvantages too, for the spaces below them serve as harbourage for idle persons; and we feel that both inventions will have to be swept away. Here is the house of Roger Brewere. It is known as the "Maiden en la Hoop" (the Maiden in the

Hoop). Here is the tenement known as "Horseshed," and "Sarazineshed," that Peter Fanelore and two others bestowed upon the chantry in the chapel of St. Mary, near the Guildhall. Here is a hostel with the sign of a lion on a hoop. In Estchepe there is the "Belle on the Hoop" (made famous not long after this as the hostel where William Frenkyssabe passed himself off as the son of the Earl of Ormond upon John Tylneye, of the county of Norfolk, and induced him to part with "divers lands" and other good things upon the understanding that his little daughter Katherine, then seven years of age, should some day be his countess; for which magnificent lie the said William was put in the pillory for three hours, with a whetstone hanging from his neck, and then cast into Newgate until he could satisfy the deluded John). We observe among the signs less graceful combinations with the hoop than the maiden and the hells. Here is "Le-Walsheman sur le Hooppe;" and here are the "Kay sur le Hooppe" and the "Sterre on the Hooppe." In Chepe we recognise the seedlings of future high-storied piles in the selds, or silds, warehouses, or hazaars, which are used for the stowage of goods, and sometimes as centres for the sale of particular wares. They are let out in rooms furnished with ammiries and chests scoured with locks, as well as in shops, to different merchants. This large seld in Westcheape, in the Mercery, belongs to the Lady Roisia of Coventre. Ten melters, or chandlers, have selds in Chepe; and they are much disturbed because they have all received notice to remove the merchandize touching their trade from them, and provide themselves with premises elsewhere. This is the Spicery. In Fryday-strete stands the tanners' seld, where the tanners transact all their business. Foreign tanners coming to sell their hides pay one penny for every ten sold; and a pretty clamour the owner, Adam Lovelyn, is making, because he has heard one of his trade has been selling hides in secret at his hostel; and another has presumed to sell some in the street, instead of in the seld, whereby he is twopence short. In the ward of Brade-strete a knot of men are looking anxiously at an elm growing by London-wall, near Bishopesgate, and prophesying that it is too old and dry to last long, and that if it be not taken down it will be the worse for the shops of Roger Poyntel opposite.

Mr. Riley has not confined his pen to the extracts from the Edwardian archives that show us these things. In a careful and elaborate introduction, he draws attention to arrays of facts that could only have been made by one who has been over the whole field, and systematically groped his gleanings. The topography of old London he traces. He has gathered together mention of all the old gates, streets, lanes, and wards, so that we are able to see somewhat of the localities of the homes whence the citizens flocked to Westminster, to see the coronation of Edward I., and his brave and tender queen, Alianor. He has grouped the surnames in classes, adding to those derived from trades many that have escaped other collectors. Among names from trades are Henry the Wympler, wimple-maker; William the Oynter, melter of grease, or chandler; Andrew the Horsmonger; John the Marberer, sculptor perhaps; Simon the Fannere; Richard the Fruter; Geoffrey the Brochere, spit-maker. Then we read of oystermongers, knyfsmyths, malemongers, sellers of mails or travelling bags, chalicers, otemongers, bredmongesters, and other old names for trades we should scarcely recognise in their early guise but for the translator's identification. There were some people called "peters," who brought fish to the City, and were ordered to stand in Chepe with their fish, and nowhere else. Again Mr. Riley points out that Saxon Christian names had disappeared from the face of the City with

* Memorials of London and London Life in the Thirteenth, Fourteenth, and Fifteenth Centuries. Being a series of extracts, local, social, and political, from the early archives of the City of London, A.D. 1276-1419. Selected, translated, and edited by Henry Thomas Riley, M.A. of Corpus Christi College, Cambridge; and of the Inner Temple, Barrister-at-Law. Published by order of the Corporation of London, under the superintendence of the Library Committee. London: Longmans, Green, & Co. 1885.

but very few exceptions, although three centuries had not elapsed since the Conquest; the king upon the throne bore the almost solitary Saxon name that had survived through the interval. He says, "The name most in favour with the London population was undoubtedly that of John, and probably those of William and Thomas held the second and third places. In the list of the first common council chosen for the City, A.D. 1347, 133 in number, we find thirty-four members with that name, seventeen called 'William,' fifteen 'Thomas,' ten 'Richard,' eight 'Robert,' and eight 'Henry'; in the whole list not one Edward or Edmund, or other Saxon or Christian name, Radulf (or Ralph) excepted, is to be found." Among the women-folk Johanna, or Joan, was the favourite name, and Cristina the next in approval. Only the rich took upon themselves to call their daughters Mary. While this familiar appellation was thus esteemed, Isabel, Matilda, Juliana, Alison (Alice), Lucy, Petronilla, then rendered Pernel and Farnel, Agnes, Idonia, and Avice were common. In the nine treasured volumes consulted by our author only Godiyeva (Godiva) recalled to him that a race of fair Saxon women had ever lived on the soil. He has found several clues that lead to fresh information concerning the three names, either of which would have made any city famous, and all of which belong to London and these old times, Chaucer, Walworth, and Whittington.

Chaucer was the French term then in use for shoemaker. This name is mentioned nearly a score of times in the old City books, beginning with Stephen, a chancer, who was a surety for William de Clay, in 1281, including Richard le Chancer, vintner, identified as the father of our early poet, and ending with Thomas Chaucer, chief butler to Henry IV. and coroner *ex officio* in 1403, one of the two sons of Geoffery Chaucer. And besides these glimpses of the poet and his ancestors, there is the copy of a lease granted by the mayor, aldermen, and commonalty of London to the immortal Geoffrey, of "the whole of the dwelling-house above the gate of Algate, with the rooms built over, and a certain cellar beneath, the same gate, on the south side of that gate, and the appurtenances thereof," for life, in which the poet undertakes to occupy it himself, and keep it in repair "for the whole life of him." The mayor makes a reservation of right to enter the said rooms in time of defence of the city, and to order and dispose of them as may be deemed expedient at that time. This was in "the forty-eighth year of the reign of King Edward, after the Conquest the Third." The name of Walworth does not occur till an entry is made, in 1365, that the subsequently famous Sir William was elected alderman of Bridge Ward. "He had been," says our authority, "apprentice and probably manager of the business of John Lovekyn, stock fishmonger, and until then had to all appearance taken no part in City matters." In 1370 he was sheriff, at which time the City was in great excitement, expecting an attack from a multitude of armed men then in certain galleys lying off the Foreland of Tenet (the North Foreland), and forty men-at-arms and sixty archers kept watch at night between the Tower of London and Byllyngegate; which watch, by agreement, was kept by the Drapers and Tailors on Tuesdays, the Mercers and Apothecaries on Wednesdays, the Fishmongers and Butchers on Thursdays, the Pelterers and Vintners on Fridays, the Goldsmiths and Sadlers on Saturdays, the Ironmongers, Armourers, and Cutlers on Sundays, and the Sawyers, Spurrers, Bowyers, and Girdlers on Mondays, much to the homedamned discomfort, doubtless, of every tradesman's house in the City. There is an entry, dated 1374, of the fact that William Walworth was then elected Mayor. As a temporary enactment was made disallowing aldermen from serving two years in succession, he was superseded in 1377 and re-elected in 1378; again superseded in 1379 and re-elected in 1380. William Walworth does not seem to have spent his days in peace. In the month of June in the third year after the accession of the young king with whom his name was ever afterwards to be associated, one Alice, wife of Robert Godrich, came to his house, in the parish of St. Michael, Crooked-lane, and there "did horribly raise the hue and cry upon the said William," declaring he was a thief, and had unjustly disinherited her of 20*l.* value of land yearly and cast her husband into prison. He prosecuted her for this slander; but when he heard she was sentenced to the pillory, called the "tbeve," there to stand for an hour with a whetstone hung from her neck, as well as to pay him forty

pounds for the damage done by her slander, his indignation was succeeded by mercy, and mercy by pity. He presented himself before the Court, "begging and entreating the Mayor and Aldermen that the punishment of the pillory might be remitted to the same Alice; upon which, at his request, such punishment of the pillory was remitted. And as to the sum of money so adjudged to the said William, he asked that payment thereof might be put in respite, during the good behaviour of the same Alice, and that she might be released from prison, and accordingly at such request she was released." All the more sunny and pleasant did Crooked-lane look that June evening as the brave William wended his way homewards after his forgiveness and intercession, we may be sure; and mite was the tongue that had reviled him, we may be sure too. There is an account of the part he played in the insurrection of Wat Tyler in the June of the following year, which was written, says the City scribe, that this most wondrous and hitherto unheard-of prodigy that ever happened in the City of London might not be unknown to those to come. There are some facts in it that have not been given in other accounts. When the king rode out from the Tower to "Mileende," to meet the countless companies of Commons from Kent and Essex, the Princess Johanna, his mother, accompanied him in a chariot, besides the knights, squires, and citizens on horseback usually mentioned. And after "the most renowned man" had killed "Walter Tyler," in Smithfield, this account says that he so defended himself that "he departed from thence unhurt and rode on with our Lord the King and his people towards a field near to the spring that is called Whitewelleheche; in which place, while the whole of the infuriated multitude in warlike manner was making ready against our lord the king and his people, refusing to treat of peace except on condition that they should first have the head of the said mayor, the mayor himself, who had gone into the City at the instance of our lord the king, in the space of half an hour sent and led forth therefrom so great a force of citizen warriors in aid of his lord the king, that the whole multitude of madmen was surrounded and hemmed in, and not one of them would have escaped if our lord the king had not commanded them to be gone." The first mention of the mayor after he was knighted on the field, on this occasion, beneath the king's standard, occurs within a month in a grant of lease to build a hantpas, or halpase, to Sir Robert Knolles and Constance his wife. The mayor, aldermen, and commonalty of London gave the said Messire Robert and "Custance" his wife leave to make a hantpas, 14 ft. high, extending from the west side of their house to another one belonging to them on the east of it, for which privilege they were to give the chamberlain of the Guildhall a red rose, every year, at the feast of St. John, and in witness whereof the common seal of the City was set to the letters patent, Messire William Walworthe, knight, being then mayor. This Sir Robert was one of the brave knights who figure upon the pages of Froissart.

Dick Whittington was a London citizen when Walworth thus distinguished himself. The first mention of his name occurs in 1379, in a list of contributors to a City loan. His fortune was then, we presume, but in the course of being made, as he lent but five marks, as did about four-fifths of the subscribers; whereas the Mayor, John Phillipot, lent 10*l.*, and William Walworth 5*l.* We next catch sight of him in the City streets, as one of the eight common councilmen for Coleman-street Ward. Nine years after his loan of five marks he is named as surety to the chamberlain for the sum of 10*l.* towards the cost of defending the City. By this time he figures as one of the twenty-four most substantial commoners in the City. In 1393 he was chosen alderman of Broad-street Ward; and the mayor selected him for sheriff in the same year. When Adam Banne went the way of all flesh during his mayoralty, the king decreed, with the assent and advice of his council, that his well-beloved Richard Whityngtone should be mayor and escheator until the accustomed day of the next election; and when that day came, he was, by common consent, elected mayor for the following year, 1398. We may trace out some of the business that occupied his thoughts and filled his remembrance. In this year of office new ordinances were made for the leather-sellers full of restrictions; John Sewall was imprisoned in the goal of Newgate for saying to Richard Hawtin, in the church of St. Martin-le-Grand, that there had

been neither peace nor love in England since the king reigned; new ordinances were made for the hurers, who had then fallen into the habit of sending "their apprentices and journey-men, as well children of tender age as others, down to the water of Thames and other exposed places, and amid horrible tempests, frosts, and snows, to the very great scandal of the good folks of the said trade," to scour "capes" or "tunes," and were no longer to be permitted to do any "scouring" out of their own houses, nor to work on any feast-day or upon the "Eve of an Eve," nor on any Saturday after the last peal of vespers; and a mart was opened for the sale of broad-cloth on the site of the present Bankruptcy Court and Guildhall Buildings, for which ordinances were also made. A thrill of horror went through the City on the murder of one of its wealthy citizens, who was treacherously slain at Wimbchester, as set down in a valuation of the precious stones and plate found in his shop on Cornhill, appraised at 600*l.* 3*s.* 6*d.* In 1406 Richard was again elected mayor. The details of this election are given with great minuteness, the selection being attributed to divine inspiration, and a mass of the Holy Spirit for the guidance of elections in future years was ordered to be performed annually in the chapel of the Guildhall. In 1411, Richard Whityngtone, citizen and mercer of London, granted a piece of land for the rebuilding of the church of St. Michael, then "too small, frail, and ruinously," and his liberality did not save him from detractors. As in the case of William Walworth, the tongue that said the bitterest things against him most openly was that of a woman. His slanders were Johanna Hert, who came before the mayor, recorder, and sheriffs, and declared that she had often defamed Richard, saying he owed her very large sums of money, and detained goods and jewels of hers to the value of many thousand marks, all of which statements were false, the fact being that the accounts between them were strictly balanced, and if any difference remained she owed more to the same Richard than he owed to her. Whether she was sentenced to the pillory, like the mad-speeched Alice Godrich, does not appear, as the record abruptly ends with the declaration of her falsehood. There was another king upon the throne, when the famous voices of the bells came true, and Whittington was thirce Lord Mayor of London. Henry V. had captured Harfleur, and had fought the battle of Agincourt; the building of the new Guildhall had progressed; various improvements had been made in the City; the halpases at St. Martin-le-grand removed, the little postern in the City wall newly built up, the City moor laid out in gardens, the banks of the fosse at Walbroke piled, the watercourse at Oystergate diverted and put into better condition, and several other steps made in sanitary matters. By this time an order was in force which forbade the granting of the dwelling-houses above the City gates to any persons in consequence of the damage the gates, walls, and fosses sustained when they were occupied. The Plantagenet writings the Corporation has placed before us show us that these old days were busy times. The people were not always in holiday dress, hanging out gay draperies from their windows as demonstrations of joy, attending mass, feasting, or waiting about in great crowds to see triumphal returns of princes from foreign victories. The hutchers and fish-curers seem to have been always filling the kennels with blood and filth, the brewers always drawing water from the pipes of the public conduits for their brewing, the hurers always scouring in the streets, the strumpets industriously aping the dress and especially the furs of honest women, the cap-makers never proof against the temptation to make caps contrary to the mode stipulated and often doomed to see them burnt in Cheaps in consequence; the men in most other trades, too, prone to break the stringent rules and sure to be pilloried or otherwise punished for so doing; for enactments relating to these offences have been repeated over and over again at intervals. There seem, too, to have been a longing and determination to extend the hours of business which were always being jealously reduced to a minimum; frequent attempts to buy and sell in other places besides those arbitrarily appointed; a natural taste for giving bad measure and short lengths, and adulteration, that was always being weeded out, an inkling after Sunday trading, first indulged in by the barbers of London, but severely reproved by the Archbishop of Canterbury; an intention

to sell putrid fish, flesh, and fowl that was rigorously punished as often as detected; and an irrepressible craving to curse and slander the aldermen, which sometimes, in a fainter degree, extended to the mayor; a desire to strip and bathe in the fosses that was not allowed to be gratified; a habit of throwing dirty water from the windows instead of bringing it down to the ground below and putting it into the kennel; some drunkenness; a little child-stealing; but among the most substantial reputable people an abhorrence of all wrong-doing; for there are references to all these things. For the rest, the citizens seem to have come and gone, concentered and dispersed as incessantly then as they do now. This pervading presentment of active life, industry, swift passing to and fro, laying up of treasures and parting with them, is artistically and truthfully indicated in the following passage by Mr. Riley:—

"So far as the details of middle-class and low life, in those times, passed within the walls of a city, are concerned, hardly a feature perhaps can be suggested that in these pages is not, in some way or other, incidentally brought under notice. Among the more prominent may be mentioned,—the rules and usages of various trades and crafts, surgery being included in the latter, and the province mainly of the barbers; inventories of personal property of every description, from jewelry and plate down to pots and pans, kettles and old clothes; the stocks of the City shops; the tackle of shipping; the munitions of war; the roofings of houses; the supply of fuel; the regulations of the markets; the fees of the clergy; the times for curfew; setting the watch; the dangers of the night; the rates of wages; the tricks of trade; the devices for protection then as stark-nad, to all appearance, on the side of the master, as it is now on the side of the man; the importance of scotchmen and professions of the magicians; the arts and frands of the mendicants, swindlers, and sharpers, with as large a per-centage of whom the streets of London were probably then beset as they are at the present day."

Everywhere it is not so much the great ones of the land that we see before us as the mass of the people. When King Edward sends word of his victory over the Scots at Falkeld, it is not the most knightly monarch we see so plainly as the citizens who receive the intelligence, and give 20s. to the tired messenger. When Queen Isabel sends word of the birth of her first son at Windsor, it is not the proud young royal mother we see so well as the civic circle who rejoiced upon the occasion, carolling, and passing through the City with a great glare of torches and blare of trumpets, and who on the Wednesday following gave John du Phalaise, the queen's tailor, who brought the letter, ten pounds sterling, and a cup of silver, weighing 32 ounces, which present the same John sent back on the Thursday, deeming it too small. We do not see so much of the Black Prince, notwithstanding there is a somewhat specious letter from him shown us, as we do of the excited crowd that went out to greet him on his return from France. In the same way we are impressed more with the procession of the mayor and citizens to Westminster, on foot, to return thanks in the glorious abbey, after the battle of Agincourt, rather than with the fact that the queen was there too rejoicing. The "Memorials" are of the people and for the people. Often is the prince indebted to the people in these pages. Four times the royal jewels were sent to the City as security for large loans; and several times munificent presents were bought by the City magnates and presented to royalty. A present to the Black Prince consisted of hundredweights of silver plate, of which the inventory is given. Doubtless the princes were brave soldiers, mighty leaders, and magnificent representatives of authority. So were the citizens brave, mighty, and magnificent, too; and the corporation, especially, a grand, dignified, just-dealing, generous body.

He is a specification of one of the timber houses built in the reign of Edward II. 2 Edward II. A.D. 1308. Letter-book c., fol. xvi. (Latin):—

"Simon de Cantebury, carpenter, came before the Mayor and Aldermen on the Saturday next after the Feast of St. Martin, Bishop [11th November], in the second year of the reign of King Edward, son of King Edward, and acknowledged that he would make, at his own proper charges, down to the lord, for William de Hanl-tone, peltier, before the Feast of Easter then next ensuing, a hall and a room with a chimney, and one larder between the said hall and room; and one solar [parlour, or upper room] over the room and larder; also one oriole [probably bay-window] at the end of the hall, beyond the high bench, and one step with an oriole [porch?] from the ground to the door of the hall aforesaid; also one oriole at the end of the hall, beyond the high bench, and one step with an oriole [porch?] from the ground to the door of the hall aforesaid; also one stable [space left for dimensions which are not given], in length, between the said hall and the old kitchen, of 12 ft. in width, with a solar above such stable, and a garret above the solar aforesaid; and at one end of such stable there is to be a kitchen with a chimney, and there is to be an oriole between the said hall and the old

chamber, 8 ft. in width. And if he shall not do so then he admits, &c.

And the said William de Hanl-tone acknowledged that he was bound to pay to Simon before mentioned, for the work aforesaid, the sum of 8l. 6s. 4d. sterling, half a hundred of best-tempered markes shillings, fur for a woman's hood, valne five shillings, and fur for a robe of him, the said Simon, &c."

Did the honest Simon's true-love, or dame, look with favour upon the fur for her hood thus bargained for, and with kindness upon the donor, who gave his labour, skill, and timber for it? And was Dame Hanl-tone content with her summer-parlour, her new kitchen and cool larder? Was the view from the bay-windows that which charmed or vexed her? Could she see the processions of the mayor, aldermen, and commonalty from them? Did she see the messenger ride away with a present from the City of a thousand marks for the king, in aid of his war in Scotland? Did she hear the proclamation that the tailors should not scour furs in Chepe? Or see William de Croton in the pillory, for pretending to be one of the City sergeants, and stopping the carts of Richolda & Mabel, bakeresses, of Stratford, and exacting 10d. from them by this false pretence? Could she see the people bathing in the fosses of the Tower, or in the other fosses near the Tower, or in the Thames, and was she as vexed with them as the king was, and declare she would have them put to death, as he did?

Here is the agreement of Adam le Plasterer for plastering the hall of John de Bretagne, Earl of Richmond, grandson of Henry III., dated A.D. 1317:—

"Know all men that I, Adam le Plasterer, citizen of London, am held bound and obligated to Sir John de Bretagne, Earl of Richmond, to find plaster of Paris, at my own proper charges, good and sufficient, without default, proper for the hall of the said earl; and also that I will competently, at my own proper charges, plaster and complete the said hall, and will repair the walls of the same with the said plaster, well and befittingly within and without; as also the towels, to the summit, in such manner as befits the repair of the hall aforesaid; and this I will do for 24 pounds sterling, which our Lord the said Earl has paid to me beforehand. Faithfully to perform the which work within eight weeks from the day of the Holy Trinity next ensuing; I do bind myself and all my goods, moveable and immovable, nandy, my lands, houses, and tenements, within the city of London being, to distress on any of my bailiff of our Lord the King, &c., into whose handssoever the same may have come, for enforcing observance of all and singular the premises. In testimony whereof, &c. Given at London, on the Thursday next, before the feast of Pentecost, in the 10th year of the reign of King Edward, son of King Edward."

Did Adam get his prepaid task accomplished in time? Did the earl's mother, the Lady Beatrix, busy herself and maidens with tapestry to cover the newly plastered walls of the principal rooms? Or did the earl purchase for his renovated hall the piece of cloth eight ells long and six ells wide, which Aleyse Darcy embroidered, with divers works in gold and silk, after she had finished one of a similar description for the Earl of Lincoln, as described in the transcript of a quit claim about this time?

Reluctantly, we confine ourselves to one more extract. Mr. Riley has drawn attention to an acknowledgment which contains a distinct allusion to the materials used for varnish-painting upon canvas, more than a century before the time of John Van Eyck, who is often accredited with its invention.

"On Friday, the Eve of St. Botolph [17 June], in the 12th year of the reign of King Edward [the First], Nicholas Boun, painter, acknowledged that he was bound to Hugh Motun [the City chamberlain], in the sum of 20 shillings, for clothe [a green colour], vermilion and canvas, varnish and verdigis; the same to be paid to the same Hugh or his certain attorney, 10 shillings at the Feast of St. Bartholomew [24 August], and 10 shillings at the Feast of St. Michael [29 Sept.], without further delay."

Throughout the volume, Mr. Riley has translated *mestera* and *mestier* trade and craft, in preference to "mystery." He states that as these words are derived from the Latin *ministerium*, a serving to, and are not in any way connected with *mysterium*, a secret, this rendering is less likely to mislead the purely English reader than the use of the old-fashioned word "mystery" or "mistry."

We have referred to the new works at the Guildhall. There are three memoranda relating to them. From these we gather that the building now standing, which is situated a little to the west of the former structure, was commenced in the majority of Thomas Knolles, A.D. 1410, and that three years afterwards the funds were exhausted; upon which a council was held in the upper chamber of the Guildhall, and various fees and fines allotted for the support of the work for the next six years. Every apprentice, male and female, on entrance, was to pay 2s. 6d., and 3s. 4d. more at the close of the apprenticeship; for every deed that was enrolled an extra

fee was to be charged for the good of the work; every will, every letter patent, was to pay a fee over and above the usual charge; several fines and amercements were also appointed to be set apart for this purpose; and a 100 marks sterling out of the revenues of London Bridge were to be given for six years towards the prosecution of the works. This was in the year in which Henry IV. was succeeded by Henry V. The next entry was made in the first year of the reign of the last-mentioned monarch, setting forth that the two carts belonging to Henry Cook, carter, were not to be taken by the sheriffs for any other work, as they were engaged upon the service of the new work at the Guildhall. The last notice of this building is dated in the seventh year of the same king, when an enactment was made that the duty for scavage, or showing of goods, should be applied to the funds; and that Thomas Pike should contribute to the new work three years' arrears due from him. When Edward III. was re-building Westminster Palace so many workmen and labourers withdrew from his works that he issued a proclamation that no one was to employ them under penalty of being sent to the Tower; but no difficulty with the men is recorded to have taken place here. This smooth-sailing was, perhaps, due to the observance of certain articles drawn up by the trade, which we are about to notice.

About three years after the "strike" at Westminster the Corporation took the masons in hand. Solid, hard-headed, slow-thinking men they were, not particular about such trifles as the way their names were spelt, or whether they had any surnames at all; though not clumsy; very precise over the way they did their work, and determined that no one should do it in any other fashion. The mason hewers set themselves against the light masons and setters, and their disputes seem to have been very frequent and tiresome, when the mayor undertook to investigate their case. He attributed their discontents to the fact that their trade was not regulated "by the government of folks of their trade," and agreed to receive twelve of their representatives, who should draw up a code of articles by which, for the future, it should be ordered and ruled. Six masons on behalf of the hewers, and six on behalf of the light masons and setters attended this conference. The regulations, which were drawn up in Norman-French, were briefly these:—Every man might work in any branch of the trade if skillful at it; "good-folks" were to be chosen and sworn to see that no mason undertook work that he was not able to do, under penalty of fine and expulsion. No one was to take work in gross (wholesale or by contract) if he had not ability to complete it in a proper manner. He who did undertake such work in gross was to take with him to the employer six, or four, ancient men of the trade to testify that he was able to perform it, and take upon themselves the responsibility of finishing it if he should prove unable to do so. No one was to set an apprentice or journeyman to work, except in presence of his master, before he was perfectly instructed. No one was to take an apprentice for less than seven years. The masters that were chosen to superintend the trade were to oversee that those who worked by the day took for their hire what their work was worth, and asked no outrageous pay. If any objected to be ruled by these persons his name was to be reported to the mayor, who, with the consent of the aldermen and sheriffs, would imprison or otherwise punish him, "that so other rebels may take example by him, to be ruled by the good folks of their trade;" and, finally, no one was to take the apprentice or journeyman of another, to his prejudice or damage, until the expiration of their term, under penalty of half a mark for each conviction.

We close this recording volume in the same mood as that in which these Edwardian masons must have left the conference, much gratified with the wide courtesy and wise consideration of the corporation.

IMPROVEMENT OF PARK-LANE.—In reply to Mr. Labouchere, in the Commons, Colonel Hogg has intimated that the Metropolitan Board of Works have referred the subject of widening Park-lane to their surveyor, and they hope to be able, provided the expense is not too great, to carry out as far as possible the recommendations of the committee of the House on the subject.

RESERVOIRS AND WATER SUPPLY.

IN a former number of our journal* we proposed to revert to the subject of the collecting and storage of water on a large and comprehensive scale, in sound and well-constructed reservoirs, so that the future water supply of our largely increasing population might be placed on a sure and permanent basis, and that we should not continue on the present short-sighted system working just as it were from hand to month, as appears so self-evident to all those who have observed and investigated the subject; and the present moment seems to us the proper time for drawing public attention more particularly to this important question, so the shortness and inefficient character of the supply are being felt in many of our populous places and these difficulties will continue to arise unless we have the spirit, the enterprise, and determination to grapple with the subject, and to place it at once on a broader, more general, and permanent basis.

As we are just now investigating the subject matter of the water supply of towns and the pollution of rivers by means of royal commissions, the time is very opportune for pressing this momentous question home,—momentous as far as the wants and necessities of our towns and rural populations are concerned, as in the present day, with all our boasted advantages of superior culture and civilization, we lack many of the conveniences and sanitary provisions which ancient leading nations had placed for the advantage of their populations, and ours scarcely merit the appellations so freely bestowed in laudation of the enterprise, the pioneering principle, and the prestige of the Anglo-Saxon.

The necessity for a thorough investigation into the system of the general water supply of the country is now beginning to force itself upon public attention, as every year application is being made to Parliament to extend and amend Acts for the water supply of our large and populous towns, attended with the heavy expenses usual on such occasions, and the session now just ending has had many such applications, which an earlier comprehensive, preliminary, and exhaustive inquiry would have rendered unnecessary, and thus much of this further expenditure would have been saved.

In the absence of railway speculations, and the utter want of spirit or confidence in the money market, complete panic, chaos, and prostration have fallen on those enterprising individuals who usually profit so largely by the various schemes which the ease or gullibility of John Bull enabled them to float upon the capitalists of the country in the shape of "limited liability," and this collapse may turn their speculative theories into more actual channels, and water supply works and similar works may take the place of railways. The manner in which the information was obtained from the provinces by the Water Supply Commission relative to the present or future water supply of the respective localities does not appear to have been very good, and the information obtained will doubtless turn out to be one-sided and *ex parte*: the usual plan appears to be to summon the local surveyor or engineer, and two or three other officials, through which channels of information it is supposed will be elicited pure and unadulterated streams of knowledge bearing upon the sanitary state and conditions of the respective towns they represent, and the principle of calling opposing parties has not been entertained, so that the Commission could separate the wheat from the chaff, and thus from the happy medium draw their well-considered conclusions.

We dare say that when the report appears the town authorities will not have omitted the opportunity to paint everything *couleur de rose*, as was the wont to do provisionally in 1845, until the indefatigable Chadwick, followed up by the "Health of Towns Commission" and the *Builder*, rooted out and exposed the barbarous abominations of our towns, which so astonished and shocked the nation at large, and which educated and prepared them for that large measure of sanitary reform which culminated in the Public Health and other cleansing and purifying Acts. The necessity of an ample supply of water in all seasons to every place is now considered to be so generally necessary, that few will venture to dispute the point when argued publicly or on public grounds; and yet it frequently happens there are found water com-

panies, and even Boards of Health, who act precisely on the contrary principle, and who endeavour to reduce or stint the supply, and place difficulties in the way of the public obtaining it, even where that necessary life exists in comparative abundance. Their main object appears to be, to see how small a quantity of water will supply a population, or how great a pecuniary benefit may be derived from water eked and doled out as if the drops of water were veritable bits of money, to be applied upon the closest and most niggardly scale, and to the fewest possible individuals, forgetting that the leading, vital, and ruling principles of the present day are free trade, low fares on railways, low rates of water supply, and other sanitary arrangements compatible with the utmost efficiency of the works and the public benefit.

Having prefaced our remarks on reservoirs with these few general observations, we will now proceed to introduce the question of site and other subject matter incidental to the proper construction of such works.

The Site.—Great care and judgment are necessary in the selection of a site for a reservoir. The first point to be considered is the situation; that is, if the locality is convenient and suitable in all respects for the proposed works, and has a sufficient extent of area of gathering-ground draining towards it, to keep it at all times well and regularly supplied with water; and this capability of supply must be ascertained by a series of meteorological observations on the rainfall, by gauging from time to time the various streams that intersect the drainage area, and by careful measurements and calculations of the extent of the area and the average amount of the water produced by the rainfall, springs, &c., during a lengthened period of time, and particularly during dry seasons.

This very necessary information is not at all times sufficiently sought after and attended to. The sites frequently selected are in deep and narrow valleys, generally high above the summit level of the district to be supplied, so as to enable the water to flow by its own gravitation to the houses of the consumers; and reservoirs are generally formed by throwing an earthen dam or one of masonry across the narrowest part of the valley, so as to impound the water in the readiest, most secure, and efficient way.

The object to be obtained in this case is to collect the largest volume of water, and at the same time to present the smallest area of evaporating surface, and at the least amount of cost for the construction of the works.

The injurious action of the atmosphere on still and shallow water has induced the construction of reservoirs with great depths of water, and with necessarily deep embankments to hold it up. These afford the least possible space for the action of the atmosphere, either for evaporation or for impurities, and this has led to the making of many reservoirs of large capacity as regards depth, the embankments of which have been carried up, it appears, in many cases to the very verge of, if not beyond the limit of safety, and requiring the utmost skill, experience, and judgment of the engineer in their construction.

Another point to be considered is as to the desirability of the situation. The stratum over the area of the proposed reservoir should be a close, clayey, retentive earth, so as to require as little puddle lining as possible, and also a sound and impermeable foundation is required for the seat of the embankment, to carry the weight of the superincumbent earth forming it, and one that is free from any faults, springs, soaks, &c., not liable to slip from any peculiarity of the geological formation or dip of the strata, from compressibility, or any other cause.

And this, of course, leads us to the absolute necessity of a strict and thorough geological survey of the strata of earth over the whole area of the proposed reservoir, and more particularly of the seat of the embankment; and boring, therefore, must be resorted to, carefully made, and strictly examined, and the results thoroughly investigated and tested.

We have had so many reservoirs fail, as we presume, from a neglect of these very necessary preliminary inquiries, this essential elementary knowledge, that the wonder is that it should have escaped the critical investigation of those discerning men from whom the design of the works emanated. And it may not be considered invidious if we enumerate a few of those works where failures of more or less magnitude have taken place, in some places attended with most serious consequences, as critical allusions end

investigations of failures are often attended with advantages to future works. The places alluded to are Manchester, Bradford, Oldham, Sheffield, Dublin, and some other places of lesser note and importance.

The Design.—A suitable and efficient site having been secured, another important question is the design, as it is equally important as the selection of a sound and watertight stratum; the shaping of the structure, and apportioning the respective parts so that they shall be more than fully equal to the pressures and strains that may be brought to bear, are important elements to be considered, and to make ample allowances for.

The section of a dam-head should depend entirely upon the depth and weight of water it has to hold up and sustain; that is, supposing all other conditions of site, foundations, strata, &c., are perfect and unobjectionable; and to resist that weight of water resting against the banks there must be more than an equivalent weight of earth to resist or counterbalance it.

For instance, the vertical pressure of water on the bottom of a reservoir per square foot is equal to 62.5 lb. multiplied by the depth of water, and this for 100 ft. deep is equal to 62,500 lb. per square foot of the surface.

But the horizontal pressure against the dam-head is equal to 31.25 lb. multiplied by the square of the depth of water, and this for 100 ft. would be 322,500 lb., and this pressure continues to increase as the square of the depth.

And to sustain and resist this pressure a bank must consist of a weight of earth equal to at least double the weight of water, and the fore-bank, or the part in front of the puddle should be of sufficient strength alone to resist the fluid pressure. The water is supposed to be coincident with the top of the embankment, and this strength is necessary, as in case of the contraction of the clay of the puddle there would be a separation of the clay from the earth, and therefore the fore-bank alone would have to sustain the presence of the fluid.

Having cursorily examined this part of the question we will now proceed to view the principle as carried out in practice, and for this purpose will select one of the most successful works of the late Mr. Telford, viz., the Rotten Park Reservoir, belonging to the Birmingham Canal Navigation.

The dam-head is 50 ft. deep (depth of water 45 ft.); width of top bank, 20 ft.; base, 270 ft.; inner slope, 3 to 1; outer slope, 2 to 1; puddle, 15 ft. at base, 6 ft. at top. So, if we apply a rough rule, the width of the top of the embankment is two-fifths of the depth, and with the given slopes making the base about 5½ times more than the depth. If we apply the rule above mentioned to this embankment, multiply 31.25 by the square of the depth, and the horizontal pressure is 63,281 lb., while the weight of the embankment in front of the puddle would be 486,400 lb., and the weight of water resting upon it 196,840 lb., or considerably less than one-half of the weight of the bank.

Now, if we apply this rule to the Bradfield Reservoir by way of elucidation as we proceed, which was of the following dimensions: depth of bank, 95 ft.; width of top bank, 12 ft.; base, 500 ft.; slopes, 2½ to 1; the weight of the bank to resist pressure was 1,241,600 lb.; weight of water pressing against the fore slopes, calculated as before mentioned, 638,270 lb.; horizontal pressure of water, 282,031 lb.

So the weight of the Bradfield embankment was less than double the pressure of water resting upon it, while the Rotten Park Reservoir was considerably in excess of that quantity; and this, coupled with the loose, porous character of the earth composing the bank, which permitted the water to soak into and penetrate it, by which means the equilibrium was destroyed, and it absolutely failed from sheer inability to support and resist the hydraulic pressure to which it was subject; while, on the other hand, the Rotten Park Reservoir bank was firmly and solidly constructed of good terraced clay, which did not permit any infiltration or soaking of any kind.

The top width of the Bradfield bank should have been 40 ft. wide; base, 510 ft. The same fatality attended the Biherry Reservoir, which proved itself of insufficient strength. Its dimensions were as follows: bank, 96 ft. deep; width of top bank, 16 ft.; base, 496 ft.; and if we apply the same rule, it would be found that the top width of the bank should have been 38 ft.; the base, 518 ft., instead of the former dimensions. And if these dam-heads had been con-

* See p. 562, ante.

structed of the dimensions given, of proper material, and in a substantial and workmanlike manner, the melancholy catastrophe at those places would not have occurred; the public would have spared the heartrending shock, and the profession the obloquy that inevitably falls upon all, as well as those personally concerned.

It is always good policy in designing and laying out engineering works, particularly when water has to be dealt with, to err on the side of safety: one had better spend a little extra money, and place the strength of the works beyond the possibility of failure, than to calculate, theoretically and experimentally, upon so fine a principle of probabilities, that the slightest additional weight or accident will turn the scale against you. Hughes, in the "Treatise on Water-works," states that at the compensation reservoir at Longendale, the embankment is 27 ft. wide at top, and, as the water is 90 ft. deep, it is too narrow to support so vast a weight of water, and should have been at least 36 ft. wide. On the other hand, at the Round Wood reservoir, Dublin, laid out by another eminent engineer, the depth of the dam-head is 60 ft., width of top bank 30 ft., and this might have been safely reduced to 24 ft., and is as much in excess of proper width as the other is deficient. Nevertheless, at Round Wood there have been leakage and failures, and these probably arose from some oversight in not thoroughly examining the geological strata of the base of the dam, or the area which is covered by the water of the reservoir, but it has not been exposed to land slips, as was the case at Longendale, and which occasioned at one time much anxiety and expense, so much so as to require a conference of engineers to elucidate the mystery, and to point out a remedy. If we direct our attention to the various hydraulic works or tables that are published, they afford us very little trustworthy or correct data to govern us in the construction of such works. Moleworth, in his tables, gives the following formula for dam-heads:—

Width at top in high dams, 7 ft. to 29 ft.
 Width at top in low dams = the height.
 Breast slopes 3 to 1, and 2 to 1.
 Height above surface of water, 3 ft. 6 in.

For masonry dams the formula is as follows:—

Width at bottom = height \times 0.7
 Width at middle = do. \times 0.5
 Width at top = do. \times 0.3

And those arbitrary dimensions are given without reference to the height of the dam, the depth of water, or other trustworthy data.

The "Engineer and Contractor's Pocket-book" gives the vertical pressure of water on the bottom of the reservoir (62.5 by the depth), and the horizontal pressure against the dam (31.25 by square of the depth); and it is further stated that it is usual to make the embankments at top from 15 ft. to 30 ft. wide, the latter dimension would be about the width for a reservoir 60 ft. deep, the inside slopes to be 3 to 1, outside 2 to 1, and the top of the dam to be from 5 ft. to 10 ft. above top water. It further states, usually but not always, a puddle wall is made in the centre of the embankment to within 5 ft. or 3 ft. of the top, which should be from 5 ft. to 8 ft. wide at the top of the puddle, and slope down with a hatter of 2½ in. per foot vertical. For dams executed in masonry, the thickness at bottom should be 7.10ths of the height, 6.10ths at mean height, and 3.10ths at top; and although they are very particular in giving the exact proportions in dams of masonry, yet in dams of earthwork no defined theory appears to them applicable, otherwise than a general mathematical one. This information is derived from the "Aide-Mémoire," where it first appeared.

Cressy, in his "Encyclopædia of Engineering," touches very lightly and generally on the subject; and in "Telford's Memorandum-Book" a formula is given for calculating the pressure on the whole side or bank of a reservoir or tank say 18 ft. long and 6 ft. deep.

Thus 2.3rds of 6 (being the centre of pressure) is 4: then 4 \times 62.5 = 250 lb., being the mean pressure on each square foot of the plane, and the length 18 \times 6 = 108 square feet \times again by 250 = 27,000 lb., the pressure against the whole area.

But after giving us the pressure of water against the embankment, he gives us no formula for an earthen embankment to support and resist the pressure; and the divergence of practice, and different opinions of professional men, render the question difficult to comprehend and to thoroughly understand.

Hughes, on Water-works, who gives us some details of water-works construction and the dimensions of a few reservoir works, mentions two or three of this country, but affords but little information on that subject, and such that cannot be of much service to the practical man.

Dwyer, on Hydraulics, affords us no information as to the construction of earthen dams; but at page 177 he gives us a formula to calculate the pressure of water, which is follows: Multiply the sectional area by half the altitude, and by 62½, the product is the pressure in pounds. But without giving us any definite proportions for dams, he observes all gates, sluices, banks, &c., should be strengthened in proportion to their section. The centre of pressure being at one-third the altitude of the dam, to this point the additional support should be applied to enable them to withstand the hydrostatic pressure.

In Beadmore's very useful tables there are no allusions made to either earthen or masonry dams; and although much of what appears there is very good and trustworthy in other respects, still it appears to us incomplete without this necessary information.

Jamieson (or rather, say, Turnbull) in his "Mechanics of Fluids," p. 151, gives formulae for computing the strength of earthen embankments to reservoirs, in which he goes very much into detail, and it is very complicated and prolix, and would occupy too much of our space for us to transcribe it, and we must content ourselves by drawing attention and referring to it.

But although in the above works we find little information to assist the practical man, we find some good sound knowledge in a little work of West's Series, by Mr. Wiggins, F.G.S., on "Sea Embankments." He says, "The weight of embankments is of the utmost importance, first, to counterbalance the weight of the sea-water against it, that weight being augmented by the winds, &c., to a considerable extent."

This condition of weight is so important that, in some cases of light material, the safety of the banks depends on it, and a bank must be rendered weighty in proportion, either by enlarging its bulk or by more weighty material, or stone laid on the lighter material. The force of sea-water pressing against a bank will be in the compound ratio of its depth and its velocity. Every attempt to reduce these to calculation will be in some degree negatory, because one may at times greatly exceed the other; but they often act in combination, and the bank must therefore be superior to their greatest united force.

The weight of sea-water is 64½ lb. per cubic foot, and the weight of earth about 1½ ton per cubic yard, or 125 lb. to the cubic foot. We may, therefore, safely take the weight of the materials usually employed in sea banks to be nearly equal to double the actual weight of the quiescent water they have to sustain, because the resisting power of the dead weight of earth and stony matter is greatly augmented by its cohesion, and by the weight of water which rests upon the surface, which also tends to its support.

But this difference of weight in favour of earthy matter is not considered in practice sufficient for absolute security, and accordingly it is usual to increase the substance and weight of the bank by additions to its thickness at the apex, so as to raise it to nearly double the utmost weight that can be brought to bear upon it, and to place this additional substance in the strongest form. The same natural laws that govern a sea bank act also to a certain extent on reservoir banks, except that sea-water is slightly heavier than pure water, and the action of the wind much is greater.

In India, where they have carried out some very extensive reservoir works, they have a very simple practical formula which they use for heavy embankments, which is as follows:—Multiply the extreme depth of the dam-head by five, and that added to the width of the top bank gives the base. For instance, if an embankment were 55 ft. deep, that multiplied by 5 = 425 ft. + 30 ft., width of top bank, equal to 455 ft. base. The front slopes 1 to 1 or 1 to 1½, and 2 or 3 to 1 in the rear. The earth that usually composed it was clayey and generally adhesive earth. In this case there is an arbitrary width of top given, but that we have endeavoured to show should be regulated by the depth of the reservoir and the weight and pressure of water upon the bank, and the slopes we think should be reversed.

Workmanship.—But let a reservoir be ever so

skilfully and well designed and laid out, and the site however carefully selected, it amounts to very little, and is almost labour in vain, if the works are not properly executed and put together, of good and suitable materials and workmanship, and the whole substantially constructed and formed.

The seat of the dam-head is also an important subject for consideration. It should not be laid on sloping ground, but formed on level places or benchings, and connected with water-tight strata; in the same way up the sloping sides of a valley, it should be benched in and well connected with the strata after the whole of the soil has been stripped off. In forming and raising the banks it should be laid on in lifts or courses of not less than 1 ft., or exceeding 3 ft. in thickness, over the whole width of the base of the embankment, inclining a little from the outer side towards the puddle-wall or centre, and each layer should be properly spread and thoroughly consolidated either by means of rammage or by cutting over it with three-wheeled carts, or other means. Embankments either formed of barrows or tramways are always liable to be loose, porous, and unconsolidated, and require the utmost attention in laying the earth on, or mechanical means must be adopted to render it solid and compact, as also time allowed for the earthwork to find a solid basis from its own insistent weight and gravity. No large stones should be used in the structure of the banks, and large lumps of earth, clay, &c., should be broken up, so that every part may become firm and compact.

No deep or heavy embankment ought to be completed at once; it ought to be formed and raised in a series of stages, and he left a time exposed to the action of the weather, for a winter at least, as embankments hurriedly and loosely put together sink more or less for several years after construction, of which we have full evidence in the large number of railway and canal embankments that have sunk and required raising, during the canal and railway era, and from which cause many serious accidents have occurred.

As a case in point we may mention a serious accident that recently took place on a Cambrian railway, by which means a locomotive engine and train of carriages were precipitated into a river, attended with loss of life; and this was occasioned by a loose and unconsolidated embankment, one that had recently been constructed and put hurriedly and loosely together, as is too generally the case in such works. The streams where the accident occurred are in that district where the Severn takes its rise, and had been recently very much swollen from heavy rains, and this was improperly dammed up by a railway bridge of insufficient water-way to take the accumulated water; the consequence was, the mass of water rising against the embankment soaked into and penetrated it so much, that with its great body and weight it upset and made a breach in it to effect a passage, and by this means the flood was reduced.

As this district was well known to be subject to floods, care should have been taken to have put in a bridge of sufficient capacity in the waterway, and the embankment ought to have been constructed in such a manner as to resist the weight and pressure of the accumulated waters,—in fact, as carefully and substantially as a well-constructed reservoir embankment ought to be.

Where railway embankments are exposed to the action of water precisely the same system is required in construction, consolidation, and protection (except the puddle), as a reservoir embankment; and when the constructors fail to carry out that principle, then we shall be likely to hear of serious catastrophes similar to that which took place on the Cambrian Railway.

The puddle wall, composed of well-tempered clay and other ingredients, is also another indispensable adjunct to reservoir works; but upon the strength of this there is some difference of opinion. Telford, Walker, and other old, and most of our present hydraulic engineers, prefer using it in the centre of the embankment, but in many of the modern works they are not made of that thickness, strength, and consistency as were formerly adopted. Telford's puddle wall at the Rotten Park Reservoir for a 50-ft. bank was 15 ft. thick at the base, tapering up to 6 ft. at the top; while the Bradfield Reservoir puddle wall was 4 ft. thick at the top, increasing 1½ in. in thickness for every foot of depth, making the thickness

of the puddle 15 ft. 10 in. at the base for an embankment 93 ft. deep; this, like the bank itself, was considerably too thin and weak, which was proved to the satisfaction of every unprejudiced observer.

The puddle of the Bilberry Reservoir was also 16 ft. thick at the base only, tapering to 8 ft. at the top, with a depth of bank equal to 96 ft.; and this also proved its inherent weakness, and is another striking instance of defective work.

It is also of the first importance that the puddle wall should be thoroughly connected with a water-tight stratum under the seat of the bank: in the instance of Bradfield it is said the engineer sank to a depth of 60 ft. below the seat of the bank to secure that object, but they appeared to be so much troubled with springs, requiring a powerful steam-engine to keep down the water, that it is probable no good and efficient connection was formed with the water-tight strata.

There is also a difference of opinion amongst engineers as to the best and most proper method of constructing reservoir embankments. Some advocate the construction of them without the central wall of puddled clay, and their plan is to carry up the bank in lifts or layers of retentive clay or alluvial earth, carefully put together. On the other hand, and on the contrary, many still consider the puddle-wall an essential element in their perfect and water-tight construction.

Mr. Thom, of Glasgow, appears to have been one of the first to adopt the former practice; and this, we believe, is much adopted in the North, and may be termed, *par excellence*, the Scottish system.

The method of executing the works is as follows:—The embankments are constructed usually with slopes of 3 to 1, and the ground is excavated for the seat of the bank until they reach a firm and water-tight stratum, and upon this is formed the bank, spread in alternate layers of puddled peat or alluvial earth; and generally these layers are mixed and beaten well with wooden dumpers until they are thoroughly consolidated and firmly united together. The inner slopes are then covered with puddle, made of tempered clay mixed with small gravel or furnace cinders, so as to prevent the possibility of rats or other vermin from penetrating into the embankment, and thus causing it to leak.

In contradistinction, and by way of comparison, we may mention one made on the principle of the old canal engineers, and by a worthy lieutenant of Telford; and although it is of a somewhat lighter system of construction than previously laid down in this paper, yet the work was so carefully executed, and of such sound and durable materials, that it has stood remarkably well, and is an enduring monument of engineering skill.

The reservoir we allude to is situated at Harleston, Cheshire, and belongs to the Ellesmere and Chester system of canals. The embankment is of the following dimensions: 40 ft. deep, 10 ft. wide at top, and 210 ft. at the base; inner slope, 3 to 1; outer slope, 2 to 1. Puddle-wall, 10 ft. thick at base, tapering to 4 ft. at the top. The inner slope of this bank was lined 4 ft. thick of clay, laid on in courses 12 in. thick. The lumps of clay were carefully chopped small, and afterwards soundly panned, so as to form a compact and water-tight covering.

The embankment itself was chiefly composed of clay (the celebrated Cheshire clay—not the most trustworthy material), laid on in regular lifts or layers, of not more than 4 ft. 6 in. in thickness, and these lifts were continued all over the length and breadth of the embankment, and each lift was completed before another was commenced.

All large lumps of clay or other earth were carefully chopped and broken, and afterwards thoroughly panned and made as solid as possible, which was a work of considerable labour and expense; but it was attended with marked advantage, as it formed a perfectly solid bank, requiring little or no repair since its construction, which took place in the year 1830.

Although this embankment, like many more of the reservoir works attached to our canal system, has been attended with signal success, notwithstanding the thickness of the lifts, we think the lifts of greater thickness than desirable to form compact and solid banks, or for the deep embankments of the reservoirs of our modern waterworks; we consider lifts of 2 ft. or 3 ft. in thickness ample for the purpose, to ensure sound, water-tight, and durable work; indeed,

the lifts cannot be too thin, if we are to consider only the thorough consolidation of the bank; but as less than the depth above mentioned would be attended with inconvenience in conducting the work, and considerable additional expense, it would add materially and unnecessarily, we think, to the otherwise very costly character of modern water-works.

We dare say it will be remembered that on the occasion of the serious calamity that occurred at Bradfield, near Sheffield, exception was taken not only to the design of the new Sheffield Reservoir embankments, but also to the manner of constructing them. The lifts, or layers, were from 6 ft. to 9 ft. in thickness, and the whole earthwork was being constructed and put together as loosely and carelessly as it was possible to do it, tipped from tram wagons, and brought into the bank with tramways,—in fact, similar to the modern system of making railway embankments.

And that system even for railways is very faulty and open to grave objection, as is well known to railway engineers and contractors, and also to directors; for railway embankments hurriedly and carelessly put together continue settling and sinking some years after construction, and are often the cause of serious and calamitous accidents, with their attendant costly consequences to the shareholders. But in reservoir works, such loosely-constructed and hurried works are exceedingly risky, and doubly disastrous, as water in its action, contrary to the rolling stock of railways, presses every way, incidentally permeates, and will certainly find a vent or weak place, if any exist; and if a failure take place, its consequences are not confined to its immediate locality, as with a railway, but, like the Bradfield devastation, sweeps everything before it for miles, the inundations and overwhelming torrent topples over houses and bridges, roots up immense trees, and carries onward in its headlong career a becomhomb of precious lives, with all their imperfections on their heads, to eternity.

SURREY ARCHEOLOGICAL SOCIETY.

THE annual excursion of the members of this Archeological Society has taken place. Dorking was the rendezvous for starting. About 170 members and friends assembled to celebrate the society's popular "outing." The first place selected for a visit was Milton Court. The building is in the Elizabethan style of architecture, and the chief item of attraction is the grand staircase. Mr. Charles explained the points of interest connected with the building. On leaving Milton the company were next conducted to Wootton Church, where the duty of describing the various points of interest was undertaken by the Rev. E. Evelyn, the Rector, in the absence of Mr. Bailey, who was prevented from reading a paper on the subject. Upon leaving the church the Rev. Mr. Evelyn kindly invited the company to partake of luncheon at the rectory.

"Oakwood Chapel" was the next place mentioned in the programme, but to go there, owing to the distance, was found impracticable, and the excursionists next enjoyed a delightful drive through a magnificently wooded country to Anstiebury Camp, near Leith Hill. Mr. W. Pocock "did the descriptive." The company next took conveyance back to Dorking to visit the museum at Pippbrook House, the residence of Major Burt. Leaving Pippbrook House, the party visited the new church in Dorking Church, and wended their way to Soudes Place Farm, where they were entertained at the expense of Mr. George Cubitt, M.P. Unfortunately, a prior engagement in Ireland prevented Mr. Cubitt being present. About twenty new members were proposed and declared elected.

ANTIQUITIES OF ARYSSINIA.—The German traveller Rohlfis has arrived at Bremen on his return from Alysinnia, where he filled the office of interpreter to the English expeditionary corps. After the taking of Magdala he went alone to Lallibala, the holy city of the country, which has not been visited by any of the Europeans for more than three centuries (?). He found there nice Christian churches of the primitive Byzantine style of architecture, all monoliths, that is to say, each hollowed out of one enormous block of stone, and richly ornamented. In afterwards passing by Axum he discovered that the last of the obelisks still standing in that place is in a state of almost complete ruin.

ON FOREIGN ARTISTS EMPLOYED IN ENGLAND DURING THE SIXTEENTH CENTURY, AND THEIR INFLUENCE ON BRITISH ART.

THE paper on this subject, read by Mr. Digby Wyatt, at the Institute of Architects, and printed, for the most part in our columns,* gave rise to a discussion at another meeting of the Institute, which was carried on with ability and useful results. We confine ourselves in noticing it to the observations of three or four of the speakers who touched principles.

Mr. E. C. Robins read the following remarks on the paper:—It is with great diffidence that I venture to express very hastily the thoughts to which my perusal of Mr. Wyatt's paper has given rise. There is something especially refreshing and invigorating in the unhesitating adhesion of such a man as Mr. Wyatt to principles not now particularly popular. One is carried back to the days of one's pupillage, when the absolute divinity of Grecian architecture was a leading article of professional faith, and the Roman art of the Augustan age its only rival for supremacy. Mr. Wyatt boldly appears, not as the apologist, but as the champion of the much-abused Renaissance style of art, and the recorder of the histories of those men to whom he says we owe "the rapid formation of the great English School of Architects, to whom we are indebted for the creation of the so-called Elizabethan, and who kept alive the flame of that lamp of symmetry and comeliness of structure which ultimately, through Jones and Wren, shed its rays far and wide, not through England only, but to every land and clime in which such noble and right royal architecture as theirs will and must be cherished as long as arts may flourish and mankind endure." The foreign source of the stream of art thus overflowing this country is indicated in the title of the paper; still Mr. Wyatt is at some pains to show the national character of this new development of the arts here. He gives it as his opinion that English Gothic art was in its decrepitude, that Renaissance was in its prime, and that the result of their association was "the birth of an entirely new phase of art," culminating in the triumphant ascendancy of foreign ideas, and the revival and permanent establishment of classicality. The philosophical remarks at the opening of the paper and dispersed throughout it do not appear to be the logical consequence of reasoning upon the facts, but rather the statement of the premises of an argument attempted to be supported by facts, but which the facts collected fail to sustain, and in many cases seem to contradict. Thus, English Gothic art is stated to be in its decrepitude at a time when Beauchamp Chapel, Eton College Chapel, St. George's Chapel, Windsor, Bath Abbey, Henry VIII's Chapel, and King's College, Cambridge, were the embodiments of the "technical, æsthetic, and phonetic" condition of the arts of this country; buildings which Mr. Wyatt acknowledges "were of remarkable merit in technical execution, as well as in grace and beauty of design," and he does not point to any subsequent works of equal extent at all comparable with them. The Wars of the Roses sufficiently account for the decline in some of the industrial arts, in sculpture, painting, and jewelry; but they do not seem to have retarded the conception and execution of the great works before mentioned; and the decrepitude of English Gothic art would not seem to have existed until premature old age resulted from the neglect of it by Church and State. And who was accountable for this but Henry VIII. himself, who introduced foreign elements of design against the will of his people, which led to the popular rising described by Mr. Wyatt, which was put down by brute force only, but which still found vent in the ballads of the time? This prince, instead of nourishing native art, patronized foreigners of all descriptions, and the native art force, having reached such a culminating point of excellence as evidenced by the buildings referred to—which, admitting all their faults, have nothing like them in the world—was crushed out of it by disappointment and discredit, and want of encouragement from either churchmen or statesmen. And from that time to the present foreign fashions have been preferred to native work.

* With the development of the principles of the Reformation, men naturally refused to put

new wine into old bottles," says Mr. Wyatt; "and the country, beginning with Royalty, and proceeding through the chief nobles and successive Ministers of State, ripened for that inoculation of novelty from abroad which, as we shall have occasion to see, rapidly supplanted the old systems of progress by spontaneous internal national combustion."

What is it a thing for which we have any reason to be congratulated that the "inoculation of novelty from abroad should supplant the old systems of progress?" Does Mr. Wyatt doubt that those principles were sound and true? Was not the distinctive character of the arts as they existed in this country at the period, its national glory, as the exponent of its individuality and the outcome of the religious aspirations of its people? Did it not possess the charm of native beauty, in common with other distinct styles of art, the intrinsic worth of which are just in the same proportion that they were the expression of the necessities of the originators, their earnest craving to worthily represent their ideal of beauty or magnificence, their desire to exhibit their fear of the gods, honour to the king, and respect to themselves? Is it not illogical to assert that such inoculation by force from without was the result of "spontaneous internal national combustion?" Surely it was not the love of the profane arts introduced by foreigners that made them flourish; they never were popular till generations of apathy had passed; it was owing to the patronage of the influential few—the King and his Court. Was not the Elizabethan style provoked by the lingering love of the people for its own forms of art and its determination to engraft upon the foreign taste all of English feeling that it could?—a final protest against the imputation of decrepitude. *The life of art was not in the importations from abroad; what of life remained was indigenous to the soil.* The absurd incongruities of Non-such Palace found no popular sympathy, any more than the Brighton Pavilion. And once let loose by the wiser policy and purer taste of the Cardinal, the native arts revolved in the pleasures of Hampton Court, of which old Skelton sings:—

"The Kynge's Court
Should have the excellence;
But Hampton Court
Hath the pre-eminence."

English art died no natural death, was suffered to reach no decrepitude, but was tortured and finally strangled by that same egotistical prince whom Mr. Wyatt delights to honour—who sacrificed so many other "graces" to his lust. But Mr. Wyatt does not seem to see the caustic wit that suggested the plucking of the "hoole personage" of Henry VII. on the curling locks of the capital of an Ionic column. Again, is it fair to the spirit of the reformed religion to say that the new wine was put into new bottles because the old were not trustworthy, when in fact it was enshrined in those very forms of art dedicated to the special service of the still unreformed religion? Rather, was it not indicative of the incongruities of the age, whereby the suppression of bigotry was made the business of an impure prince? Yet Mr. Wyatt would rattle the spurious title of "Defender of the Faith," and add the equally well-deserved title of "Regenerator of the Arts." Whatever the genius of the foreign artists, however great their technical skill in the details of the arts of sculpture and painting and industries of the period, there was no heart, no love, no noble ideal. The old Church had corrupted itself and was despised; the new was made despicable by its supporters, was wounded in the house of its friends; and the result was that no religious aspirations inspired the age, either here or abroad, and forms of art naturally partook of the learning of the schools, "Renaissance" intellectualism, as Mr. Matthew Arnold writes it,—and heathen mythology was the accepted storehouse of symbolism; a state of things well reflected in the pages of Ruskin, who says in his fourth Edinburgh Lecture:—

"The world has had a trinity of ages,—the classical age, extending to the fall of the Roman empire; the mediæval age, extending to the close of the fifteenth century; the modern age, thenceforward to our own times; a change taking place about the time of Raffaele in the spirit of Roman Catholics and Protestants both, a change which consisted in the denial of their religious belief as heretofore expressed in the outward things of life. Thus, before the revival of classic art the very furniture of the king's house was made to confess his Christianity; it may be imperfect and impure Christianity, but,

such as it might be, it was all that men had then to live and die by; and there was not a pane of glass in their windows nor a pallet by their bedside that did not profess and proclaim it. Since that period the decoration has consisted of Cupids and Graces, Floras, Dianas, Jupiters, Junos, &c., as if we were horn heathens; so that the great broad fact which distinguishes modern art from mediæval is this,—that all ancient art was religious, and all modern art profane."

"Freedom and hope," says Fergusson, in his "True Principles of Beauty in Art," "are the first two principles of greatness in art as in everything else; and servility and despair of doing better than has been done before must cramp the noblest genius and hide the highest aim."

It has been well said that if there is one word by which an artist or critic may be tested—a single term in which all truth in art and all virtue in action might be summed up, in which we could find all the essence of a mind or the purpose of a life,—it should be the term Ideal. The reception of this term in all its consequences, or, on the other hand, its utter rejection, at once determines what an artist is in his ends and aims. To have no ideal is to have nothing to strive for or hope after. The ideal should be the end and aim of the fine arts, as distinct from engineering. It was Coleridge who said that a "picture was an intermediate something between a thought and a thing." The thought and the thing stand respectively for the outward world of matter and the inner world of mind. The thing or object is received and taken from visible nature into the inner mind of the artist, and there, being elaborated and combined with his individual idiosyncrasy of thought and feeling, comes forth a second time into actual existence under the new and created form of art. The primary, the raw material is nature; the forming, however, is mind; and the ultimate product, art. Nature enters into the mind a fact, a reality, and issues forth a picture, a poem, an idealty. To the nature around him the artist adds his own nature.

"And thus it is that native air
Mind informs with visions fair."

"Within the pale
We stand, and in that form and face
Behold
What mind can make where Nature's self
would fail."

In an estimate of the conditions under which the "creation of an entirely new phase of art" is possible, why does Mr. Wyatt ignore the effect of the absence of any noble ideal in the influence of foreign artists on British art? All true development is from within and thence without, inward enlightenment expressing itself in outward form; and all true and noble art is an outward and visible sign of an inward and spiritual gift or grace. Take the life of Torregiano, "the first great Italian master upon whom the king most fortunately alighted," says Mr. Wyatt, and consider for a moment what great development of art in its highest range may be expected from the mental laboratory of one who begins life by breaking the nose of Michelangelo (whom he always hated, says Vasari, because he was superior to himself), who was afterwards employed by Pope Alexander at the Vatican, but whom he speedily left for the army because the pay and spoil attracted him. Disappointed of the promotion he coveted, he returned to his art, which for itself he had no love, and worked in bronze and in marble such things as his sordid mind could conceive and his facile fingers embody. It needed little purity of soul to please the voluptuous Harry: so he was invited to England, lured by the better pay; but here this ill-conditioned man, the pioneer of the mercenary artists who followed him for the same good pay, was soon obliged to leave for Spain, where he got into trouble for smashing a figure of the Virgin, for whose purity he can have had no reverence, no heart to portray; and art can have consequently suffered little loss by the demolition. Yet it is to such a man and to such men that the students of the nineteenth century are hidden as to a festival of good things. But I believe it to be as true to-day as twenty years ago when Fergusson intoned it:—

"One of the most fundamental rules of art is that sordid minds cannot express elevation, the impure cannot express purity, or the vulgar mind elegance; if we want lofty, pure, and elegant art we must go to minds where those feelings exist; for all arts are the reflex of the individual of the nation practising them, and the improvement must come from within, either from more sedulous cultivation of purity and the higher emotions, or by a

more honest and straightforward mode of expression than has hitherto been adopted. On the other hand, we may feel perfectly certain that all that is bad in the individual or the nation will come out in their art, however much they may attempt to disguise it by foreign costumes or phrases borrowed from those who were artists not only in form but in spirit. Art must come from the heart, and can only come from there."

We do not want artists to give us a picture of what nature is only (*that* Torregiano and others like him may do), but what they *think* of nature (and who cares for the thoughts of such a man as he?). The mere copying of nature is not the ultimate end of art. Man has to infuse something of himself into the picture or building. It is the artist or me; acting on the Not me. We do not want a dwarfed and caricatured naturalism, but an inspired literalism. What seems most required to effect a revivification of the arts at any period of their decline is inspiration, besides that which may be learnt at schools; and this is often the fruit of honest labour and of pure thought.*

I hope I have made clear the points on which I am chiefly disappointed in Mr. Wyatt's otherwise remarkable paper, which opens a new page in the history of art. At the same time let me say that I greatly sympathise with Mr. Wyatt's cosmopolitanism, and would desire to steer clear, as he has done, of the error of those whose preconceived preference for some particular style or phase of art, blinds them to the beauty of others; but I should wish to avoid latinidarianism. To more accurately define my meaning, I cannot do better than quote, in conclusion, the following contrast between Grecian and Gothic art, sent to me in a letter from my friend the Rev. G. B. Porteous, who thus sums up their powers and limitations:—

"In sculpture one sees nothing so fine as the Greek resembler. It is a shame that the idolator should have stood nearer to nature and have wrestled more triumphantly with her veiled angel than the sculptors of any Christian age. The only Christian sculpture of profound merit is to be found in the general style and execution of the noble cathedral. Here, indeed, is something which, in uniting beauty and perfection, stands far above the graceful temple of the Greek or the more massive structure of the Egyptian, and is calculated by its general effect to lead the soul into states where the imprisoned loveliness within the soul itself can burst its fetters and execute the behest of the Divine Original. In classical civilization among the Greeks we had linear architecture than has ever been seen since. The sons of Hællas, a national incarnation of intellect, the grand avatars of genius, the light-bringers of the world, were real architects; as real as unreligious man could be. Let their archaic sculpture give the first response; and next, is not their architecture clear, finished, and faultless? Is not the symbolic character of Greek architecture a reflection of well-defined ideas, though of miserably dormant affections? Is not the very completeness of Grecian architecture symbolical of a mind habituated to ideas well formed, which it effectually grasps, while yet ignorant of those aspirations which ascend heavenward to the unlimited vastitude of the infinite and the eternal, of which a Gothic cathedral is so hefting and so magnificent an expression? The Parthenon is thought manifested in marble; York-Minster is faith reflected in stone. One is the product of intellect; the other is the offspring of the moral sentiments. The first is an idea; the last is a prayer. Artists designed the former, but saints must have conceived the latter."

Professor Donaldson.—If I understand Mr. Digby Wyatt's paper aright, and the intention with which he has written it, I should say that it was not to justify the introduction of a new style of art, nor to condemn the old one, which really seemed to have exhausted itself; but merely to follow out and to give us the history of the artistic training of the mind, which eventually produced the invention or adoption of a new style of art altogether. I think Mr. Wyatt was quite justified in saying that Gothic art at that time was in a state of decadence, because, if we only look at the exterior of Henry VII.'s Chapel, we must own that there was then great degradation of taste; and there is no one who has studied Gothic or Mediæval art but must acknowledge that, at that time, it was not worthy of continuing its career. There is a difference when we consider the vaulting of the chapel itself, because that was rather the scientific work of the mason than the artistic combination of the architect. The structural skill with which the vaulting is arranged is such as to surpass almost any previous combination of a like nature; and, in point of art, there is exquisite beauty. But the exterior of Henry VII.'s Chapel altogether certainly shows that art had arrived at a very low ebb in point of taste. We are much indebted to Mr. Wyatt for going through the analytical study of the development of the new style of art in this country, following it through all its phases, and pointing out to whom we may attribute the introduction of

* The recognition, appreciation, and interpenetration of the "true styles." Surely it is the union of strength and beauty, not the association of decrepitude and pedantry to which we should look for the "birth of an entirely new phase of art."

this new style, and the various steps by which we arrived at its transition in the sixteenth century. Now, we must recollect what had led to this. The whole of the Continent had been in commotion for a century previously, not merely politically, but in a certain artistic and literary sense, in consequence of the Greeks having been driven out of Constantinople and having taken refuge in Italy. The study of classic literature was revived through them, and began to resume its great dimensions and proportions, for it had been altogether lost. When it was reverted to again, it naturally induced the study of architecture and of sculpture of the Classic period, and of pictorial representations, few only, however, of which then remained, as in the Baths of Titus; and it was this that led the Italian mind into a new train of ideas, weary with the incongruous buildings of the pseudo-Gothic stamp in that country. These were most barbaric productions—mixtures of all kinds of sentiment borrowed from the North, and from Germany especially; the incongruous remnants of old buildings, put together as chance might direct, and without any rule of art; producing masses of buildings of a certain imposing size, with occasional graceful chance-combinations, but, as works of art, incomplete;—I say, dissatisfied with this state of things, the Italians wanted to have some fixed laws of art which should do away with these incongruities and these jarring principles of design, which should elevate art upon the same principles as classic literature, based on coherent forms and well-understood principles. Such was the case upon the Continent, the Italian mind being then very vigorous and powerful; in fact, I may say the Italians at that period were the first nation in the world,—in Europe certainly. They were brilliant in their imagination, eloquent with all the burning emphasis of a most impassioned language; they were enthusiastic in all they undertook, regardless of personal consequences; imbued with a deep love of the arts, pictorial and musical; they were inspired, for they had a natural rich store of invention and originality of ideas, not without deep and erudite investigation of the secrets of nature and the more obvious beauties of the animal and vegetable world; devoting their lives to the pursuits they followed. Such were the people who took the lead throughout all Europe, and, therefore, all Europe naturally followed them. The other European peoples were not endowed to the same extent with the same qualities; they were not possessed of the like rare faculties, and, therefore, feeling the influence of such superior minds, they instinctively yielded to their impulse. Now, England could not stand alone: she must be actuated by like feelings; and, naturally enough, she followed in the wake. We know the intimate relations which existed between Francis I. and Henry VIII. and the influence which the French king had in those days upon ours, and of which the interview on the Field of Cloth between the two monarchs at Calais is a proof. It appears to me, therefore, that it was impossible—altogether impossible—for England to remain behind the nations of the Continent, retaining its Medieval propensities and preferences; but it was obliged to adopt the new taste prevalent throughout Europe. Now it is the investigation of that, and of the process of the teaching of the English mind for the introduction of that new class of art which Mr. Digby Wyatt has sought to bring before us. We know that in our universities Erasmus, Bucer, and other intelligent foreigners were induced to come here to teach the classic languages and the philosophy of the Continent. In like manner, for the promotion of art Holbein was brought over with the able artists who have been mentioned by Mr. Wyatt in his paper, and whose various works have been described to us with so much discrimination as to their relative merits. I think, therefore, that it is extremely instructive to us that our friend should have pursued the subject so far, and should have investigated what was hitherto to a certain degree quite a mystery and an unknown subject, I believe, to nearly all of us—at least, I myself was not aware of the minute history of the art of that period. We knew that Holbein came over here and influenced the arts of this country; and in regard to architecture, we have an instance near us, at Hampton Court, of the graceful architecture he had introduced. We know he erected a gateway at Whitehall; but how these and other pictorial influences came to bear upon architecture we could hardly see or understand. Now, it was alluding to the power of the Italian mind; and our attention

has been drawn by Mr. Wyatt to the circumstance that Leonardo da Vinci, Holbein, and Albrecht Dürer had impressed upon the men of the period the necessity of the study of mathematics and of the mastery of drawing the human figure. These were the two grand elements upon which all art should be founded, and they were themselves very eminent in possessing these great acquirements. There was this misfortune, however, that painters did not satisfy themselves with being painters; sculptors were not content with being sculptors; nor were architects always satisfied with being architects alone; but they mixed up and practised other arts, as we know by the productions of the various artists alluded to by Mr. Wyatt in his paper. That was a misfortune. I think that architecture particularly has suffered by the innovations introduced by painters and sculptors; and in this respect it seems to me no greater injury was ever done to our art than by Michelangelo himself and by Bernini. They destroyed the purity of taste, introducing capricious varieties and all sorts of distortions and contortions in architecture, by which it was degraded materially. It is only men like Alberti, Vignola, Palladio, and others, purely architects, who have vindicated architecture as an art independently of all others. We can perceive, with respect to our buildings of the early period of the reformation of art, that they were very much influenced by not being undertaken by architects alone, but by painters. We see at Fontainebleau that the Italians, who came there not as architects but as painters, introduced every caprice they could think of, and produced a great medley; and although some good picturesque groupings were realized, to say that it is good architecture is not the fact.

Now, I hope Mr. Wyatt will pardon me if I attempt to follow out the architecture of that period, in illustration of our subject, by one particular instance, and that is in a building at Liveden, Northamptonshire, of which there is a plan and perspective view on the wall, taken by myself years ago. I will read an extract from a letter from Mr. Selby, a gentleman who lives in the neighbourhood,—that is, at Pilton, near Oundle, in Northamptonshire, and is well acquainted with the traditional history of that building.

"The building was erected, or perhaps I should say commenced, by Sir Thomas Fresham, who was knighted by Queen Elizabeth at Kenilworth Castle in his eighteenth year. This gentleman, who appears to have travelled in Italy, and to have been an architect of very great taste, built several other houses, &c., in the county of Northampton, viz., the Hall at Rushon, and a triangular entrance lodge, a beautiful work (both these are near to Rothwell). The house now belongs to Clarke Thornhill, esq. He also placed a rich screen in the church of Geddington. Another specimen of his skill, the market-house, the one then just spoken of (Rothwell), is still remaining but abjectly neglected. There is a print of this in Baker's 'County History.' It was commenced in 1577, and appears to have been taken down and rebuilt in an open space near the church. It is two stories high, and to each story there is an order, the lower one being Doric with an inscription in the frieze, and the upper one Ionic with panels containing coats of arms on shields. There are semicircular openings below, and above are the usual Elizabethan windows with mullions and transoms at mid height. It was preserved from total destruction by purchase from the surplus of a fund raised in 1827 by a few individuals." (Baker.) "Liveden itself," Mr. Selby continues to say, "was most likely never finished with a roof, although the naked floors were laid and continued in the building, then going to ruin, until the Parliamentary wars, when they were cut up by Major Butler, who had the command of some troops on that side, and conveyed to Oundle and re-used, as stated by Bridges in his history of the county."

Now this Liveden, gentlemen, as you see, is in the form of a Greek cross, and it has central pavilions at the end of the arms. There is a kind of podium base, and the sur-base is quite a Gothic moulding. The die of the podium consists of a range of panels with niches in them, and occasional apertures for windows; then above that rises a Doric order, not of columns but of plain walls, but there is a frieze and cornice with triglyphs constituting the first order; then above that is, I suppose, an Ionic cornice, the frieze of which bears an inscription, some of the letters of which still remain and may be seen upon the view exhibited on the wall. The detail of the podium is also shown in a small sketch which I took at the time I visited it. Now my informant goes on to say—

"Old Liveden was another fine mansion of the family of Fresham, and stood about one-third of a mile from what is called locally the 'new build.' There were two very handsome gateways to the old house. One was long since removed (destroyed) and the other was removed about ten years since and re-erected at Farmingwood's Hall (Lord Lytton's seat). There is a fair copper-plate engraving of the 'old build,' as it is called, in a work styled 'The Antiquarian Itinerary,' published from 1815 to 1818, in the seventh volume. It is there spoken of under the title of 'leaden old Beal,' which with the whole of the letter-press descriptions of it is a tissue of error. There

is no account of the Livedens in Baker's 'County History,' as all this side of the county unfortunately escaped his attention, whilst his power and means remained."

So far Mr. Selby.

I wish to call your attention to this as a beautiful instance of the Renaissance, quite equal to anything to be found in France and Italy. If we had some artists, or if the Government would take up the work, as is done in France, and send competent draughtsmen through the country, and instead of making a collection of higgledy-piggledy bric-a-brac things, like many authors put together in their hooks; if the pure only were to be chosen, then we should find that this country produced fine works of art, and that that period was one which might be imitated in its spirit with great success at the present time. It is very desirable for us that art should be vindicated from the great trash, which has been published as indicative of that period. My own idea is this, that as we had then but few competent architects and artists, the builders or masses who were employed made designs, which they had not the capacity properly to conceive; they made buildings of a certain size with particular feelings and sentiments of Renaissance, but they were carried out without true taste; and it is under the obloquy of these buildings that we now suffer as to the reputation of that style. I would also call attention in that period to the sepulchral monuments, such quantities of which exist even in the churches of the metropolis. There are some beautiful compositions of this kind in Westminster Abbey, and also in the church of St. Saviour, Southwark, and Ashbourne, in Staffordshire; but throughout the whole country you will find monuments in the churches of exquisite design, great simplicity of taste, and beauty of invention. Immense sums of money were expended upon them, both in regard to the materials of which they were composed, the alabaster and various marbles that were employed, and to the workmanship. Certainly they are very fine productions, and ought not to be allowed to pass away, nor to be so unknown generally as they are at present.

Professor Kerr.—I think we have scarcely recognised as we ought to do the remarks of Mr. Robins, which seem to me to afford a very good illustration of a bad kind of criticism, very common now-a-days. An accomplished gentleman, like Mr. Digby Wyatt, comes before us and reads a communication, which, like himself, is brimful of knowledge; and another gentleman takes leave to criticise it in what is, I hope I may say, without being at all offensive, the least elevated style of criticism that can be adopted in such circumstances. The first question submitted to us by Mr. Robins was whether Mr. Digby Wyatt had not said something disrespectful of Gothic architecture. This is the invariable opening cry raised by a certain sort of persons now-a-days whenever any subject of high-class critical bearing is mooted. Having thus begun, Mr. Robins next proceeded to deal with the critical question on its merits, and again he adopted the ordinary manner of the moment—that is to say, he took the fashionable sentimental view of the question. I may be permitted to say that I am certainly surprised to find a gentleman of Mr. Robins's practical and sensible position in the profession quoting such a writer as Mr. Ruskin against the arguments of Mr. Wyatt. What we have had so often laid before us we have had repeated once more to-night—that in the Middle Ages architecture flourished in consequence of the enthusiastic sentimentality in the people at large. I, for one, never could see anything but the greatest absurdity in such an idea. I believe that the merits of Gothic architecture, often great and often small, were in those old times altogether unconnected with such sentimentality in any shape. There may have been something of the kind amongst some of the clergy, and there may have been an enthusiastic religious feeling, more or less general, amongst some of the laity, according to occasional circumstances; but as for there being anything like a continuous romanticism in the heart of the people at large, of such a kind and of such intensity as to exhibit itself in the details of architectural design, I can only say that I think there cannot by any possibility be a greater fallacy prepropounded, or anything more subversive of the true principles of artistic criticism. I am anxious that Mr. Robins should not think that I am opposing him too severely, but it is seldom that we have this particular argument of his laid before us in a way so favourable for its refutation. Having, then, fallaciously appealed to our sense of re-

spect for Gothic architecture through our supposed veneration for the imaginary sentimentalism of the Middle Ages, Mr. Robins next proceeded to exhibit another kind of error, which is too prevalent at the present time. He introduced as the great cause of architectural change an individual ruler in the State. Now, no such individual ruler has ever in the history of architecture, as a matter of fact, exercised any such influence in a practical way. In the present instance he assumes that King Henry VIII. was the individual cause of a certain change of architectural style; and then, to prove the character of that change, he holds up to us the character of the king in his private capacity! King Henry VIII. married six wives; but if, instead of six, the number had been sixty, such a circumstance can have had no influence upon architecture. On the contrary, if this king exercised any influence at all upon art, it would be in the capacity of one who was a most accomplished and learned man. Indeed, in this view of the case he was a man who did a great deal for this country, a man whose true position in the intellectual progress of England, as apart from his errors of private life, is now beginning to be more rationally recognised. Certainly, as regards literature and the arts, he was one of the most accomplished men in Europe; and as such we may not doubt believe that he took a certain amount of interest in what was then the subject of accomplishment and learning—namely, the spread of the new school of intellect, which took its rise in Italy as the cradle of the modern world. Mr. Digby Wyatt and Professor Donaldson have taken much higher ground than Mr. Robins. They come before us to illustrate a very important period of architectural history in this country, and they do it by means of the resources of learning, by the elaborate collection of facts, and by the deduction of sensible conclusions.

Mr. Wyatt, in replying ultimately, said although Mr. Robins has been ably dealt with by Professor Kerr, I yet feel that a few words are requisite from me, as the author of the paper imputed. In the first place, it is to be clearly understood that because I may commend one style, and point out certain particular excellencies in it, I am not an advocate of one set of principles only, or that I recognize truth, justice, and excellence in one form only either of "faith" or "works." It is in the nature of the estimate of cosmopolitan principles that a true artist should be read. He must show himself as well as enthusiastic and poetical. It is perfectly true, on the one hand, that one of the highest forms of art is the ideal; but because that is so it is no reason why we are to insist upon the limitation of the types of forms of all art to those conventional types which transcend what is natural, can fully embody the ideal. When we look at the beautiful productions of Gothic architecture, painting, and sculpture, they frequently inspire that sort of sentiment which reflects very often pure devotional feelings. At the same time, because we admire that, are we to say that no country is to go on in the study of anatomical, geometrical, or mathematical laws, and their application to the establishment of other types of art? To do so would be to neglect adding all the graces that science may bring to art altogether. It is one of the strongest points in all successful art to observe the essentially practical and technical basis upon which the artist must build, and by means of his command over which he can alone clothe his conceptions with fitting form. It frequently occurs that a great artist sets up the type of a certain form of pure heauty. It is admired, repeated, and adopted as the vernacular production of his contemporaries, who, while aiming at perfection, involuntarily modify it. By this common spontaneous system of progress those who, to a blunted sense in the enjoyment of it; and the type gradually becomes effete. So it is that decrepitude often affects styles which, beginning in purity, are not, as it were, fed on or refreshed by change resulting from the association of fresh external elements with those upon which the great artist first created his ideal type. In my paper I took great care to distinguish between the falling-off in the fifteenth century in the art portion of architecture and its technical part. I stated that there was never a period in Gothic architecture when the technical branches of masonry, in vaulting and interpenetration especially, attained to greater excellence. There were first-rate masons in every part of the land. The concep-

tion of a building like King's College, Cambridge, was one of the grandest in all the country; but I doubt whether any good judge of art, comparing a bay of its length with a corresponding bay from Lincoln, Salisbury, or Westminster, would not at once realise how great a falling-off had taken place in the sense of proportion, and the just conception of a general harmony of parts. Who, examining carefully the sections of the mouldings, the forms of the different complements which make up the whole architecture of Henry VIII.'s chapel, would be found to say that they are one-half as good as corresponding features taken from good models even of Middle Pointed work? Hence I say, and I think with propriety, that had the fifteenth-century system gone on, by spontaneous combustion alone, its "decrepitude" would have merged into "senility." Change, with consequent novelty, by an unerring cycle of revolving wants and supplies, was absolutely demanded in this country to enable it to keep pace with contemporary revolutions abroad; and had that change and novelty been arbitrarily withheld, I believe it would have been certainly fatal to national art. In its earliest architecture, after the creation of the First Pointed style, we recognise the greatest ideal excellence in England. In the reigns of the first two Edwards you find the parts, though still graceful, beginning to assume a certain amount of rigidity, and departing from the excellence which characterised the Early English work. Then you go on to the greater mannerism of the Perpendicular styles; so that, instead of following a ratio of progress, the onward march is in a scale of regular and uninterrupted declension. I feel, therefore, that I am perfectly justified in saying that, under the "Wars of the Roses," architecture was in a fair state of decrepitude, because it had fallen, step by step, from earlier excellence to actual feebleness. That is clearly shown by the falling-off in the spiritual forms of old religions art, with little but mannerism to take its place—by the want of power to draw the human figure or to understand perspective, and the deficiency in knowledge of classical literature; in fact, the country had been declining in intelligence and intellectual activity—a certain advance in the forms of poetical expression being perhaps excepted—for at least a century. There had been a long series of wars, and the whole land was in a feeble and exhausted state; and unless we had had Henry VIII. with an active, full-blooded, strong constitution, young and with a fresh set of sympathies, I believe the country would have gone on dropping and dropping, and, as far as architecture was concerned, would have come almost to a state of annihilation. If we had remained in ignorance of such men as Michelangelo, Titian, Leonardo da Vinci, Raffaele, whose power no critic has been able to impugn satisfactorily, I think that we should in point of art have developed downwards till we had reached insignificance. I consider, therefore, that we are greatly indebted to Henry VIII. for what he did in this respect, and indeed in many others. There is one other point in which a little confusion of ideas seemed to prevail in Mr. Robins's mind. He appears to think that beautiful productions in art must necessarily be the productions of men of beautiful lives. That is entirely a mistake. Whoever is acquainted with the literature of the Greeks, or the Renaissance, or the Medieval literature, will find that at the very time the concretions, which we call embodiments of heauty, were given to the world, the men by whom they were produced were frequently given up to indulgence of vices and evil passions, and even refinements of sin and crime were rife. It cannot, therefore, be said that one period, whatever its art may have been, was much more virtuous than another. The great distinction I believe to be this, that generally speaking the individual may be what he likes; it is general voluptuousness in a country which is apt to produce degeneration in art. You may go as far as that, but to go further is, I think, unsound. In conclusion, allow me to thank you for the patience with which you have listened to me, and believe me that in collecting these materials my object has been solely to put certain facts together and to lay them before you, without claiming merits for reformers simply because they were modifiers of pre-existing conditions of art. It is for you to make such deductions from the facts I lay before you as you may see fit. Believe me I desire to do injustice to no style of art nor set of artists, be they Goths or be they Greeks.

NEW WORKS OF THE BOARD OF WORKS.

THE Thames Embankment footway, between Westminster Bridge and the Temple, was formally opened on Thursday morning, the 30th of July. The members of the Board and their visitors afterwards proceeded to Abbey Mill, and inspected the pumping-station which has been erected there. Sir John Thwaites (chairman of the Board), Earl Grosvenor, Lord John Manners, the Hon. W. Cowper, Mr. W. Tite, M.P., Mr. Alderman Lawrence, Mr. Ayrton, M.P., Mr. Bazalgette (the engineer), and many others were present. We confine ourselves for the moment to a few particulars officially furnished. The paved footway next the river, from Westminster Bridge to the Temple on the northern embankment, together with the Westminster Steam-boat Pier, opened on Thursday, is to be 20 ft. wide, with approaches to Villiers-street, Wellington-street, and Essex-street, Strand. The roadway will be 100 ft. wide, including both footpaths, but it is not to be formed until after the Metropolitan District Railway Company shall have completed their railway, which will for a considerable length pass under the new road. The embankment road will be formed by a new street which is about to be continued from Blackfriars Bridge to the Mansion House.

About 37 acres of land have been reclaimed from the mud-banks of the river by the embankment, and will be laid out in approaches, ornamental grounds and gardens, as soon as the railway works have sufficiently advanced to admit of the execution of such works. It is expected that the embankment and railway will be completed within a year from the present time.

As to the Abley Mills pumping station, all the sewage on the south side of the Thames, and the sewage of a portion of the north side have to be lifted, and for this purpose there are four pumping stations, two on each side of the river. Of those on the south side one is situated at Deptford Creek of 500 nominal horse-power, and the other at the Crossness outfall, also of 500 nominal horse-power; the latter was opened by the Prince of Wales in April, 1865.

Of those on the north side, the largest and most important is the Abbey Mills Station, near to Bow, in the north-east district of London. It is of 1,140 nominal horse-power.

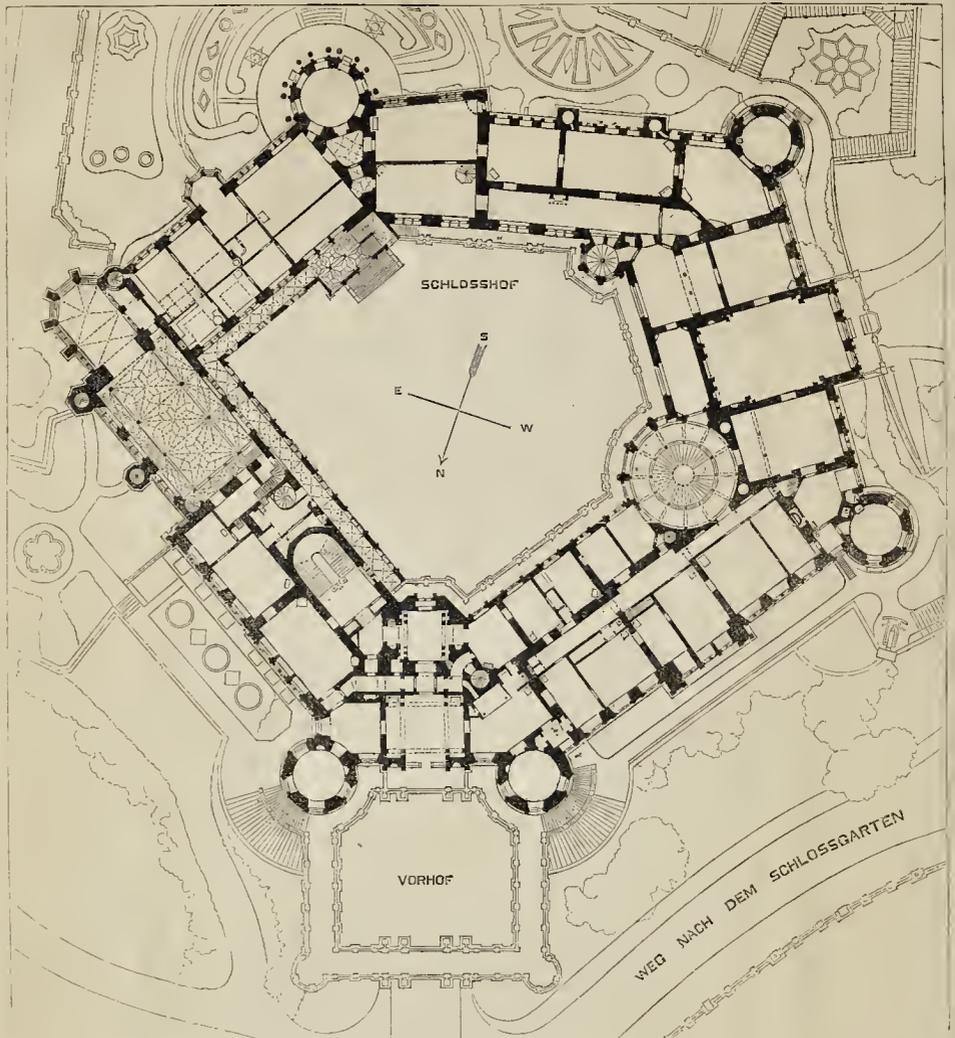

The Abley Mills pumps will lift the sewage of Acton, Hammersmith, Fulham, Shepherd's Bush, Kensington, Brompton, Pimlico, Westminster, the City, Whitechapel, Stepney, Mile-end, Wapping, Limehouse, Bow, and Poplar, representing an area of 25 square miles, a height of 30 ft. from the low-level to the high-level sewers, whence it will flow on by the side of the high-level gravitating sewers to the northern or Barking outfall, and thus it is there are no pumps at the northern as at the southern outfall.

This station covers an area of seven acres divided into two portions by the northern outfall sewer, which passes diagonally across it on an embankment raised about 17 ft. above the surface.

On the south-west side of the embankment stand the engine and boiler-houses and chimney-shafts, together with the coal stores and wharf for landing coals and other materials from Abbey Creek. On the north-east side of the embankment are the cottages for the workmen employed on the works, and a reservoir for storage of water to supply the boilers, and condensing water for the engines.

The engine and boiler-houses form one building, the engine-house being arranged on a plan in the shape of a cross, and the boiler-houses forming two wings extending north-west and south-east of the north-eastern arm of the cross. The extreme dimensions of the building taken across two of the arms is 142 ft. 6 in., the width of each arm being 47 ft. 6 in., the width of the two boiler-houses measures 100 ft. in length by 62 ft. in width; and there is a workshop situated between the two measuring 49 ft. 6 in. by 33 ft. The engine-house consists of four stories in height, two of which are below and two above the surface of the ground, the height of the two lower stories being 38 ft., and that of the two above ground measured from the engine-room floor to the apex of the roof being 62 ft.

At the intersection of the four arms of the cross the building is covered by a cupola of an ornamental character, rising to a height of 110 ft. from the engine-room floor, and at each of the internal angles of the cross rises a turret, in

THE CASTLE OF MECKLENBURG SCHWERIN.—Plan of Ground Floor.

which is formed a circular staircase giving access to the several floors of the building.

The boiler-houses are of one story above the finished ground level, the boilers and stoking-floor being below that level, the total height from stoke-hole floor to apex of roof being 33 ft. The workshop between the two boiler-houses is a few feet higher, the roof being a curb roof, and that of the boiler-houses a ridge-and-farrow roof.

The style of building adopted is mixed, and the decoration consists of coloured bricks, encaustic tiles, and stone dressings, carved work being introduced at the caps of piers and columns.

The drum of the dome, which is octagonal on plan, is supported by four wrought-iron ribs, springing from the walls of the cross at their intersection, the angles of the pyramidal roof below the drum running into and intersecting four of the eight sides of the drum. Immediately above the point of intersection the octagon is reduced by a splay, from which rises the lantern, also octagonal, each side being pierced with a large light, flanked by columns support-

ing arches over the lights. Above this story rises the slated roof, which is high-pitched, and is enriched at about mid-height by an ornamental cresting, and surmounted at its apex with a lofty vane.

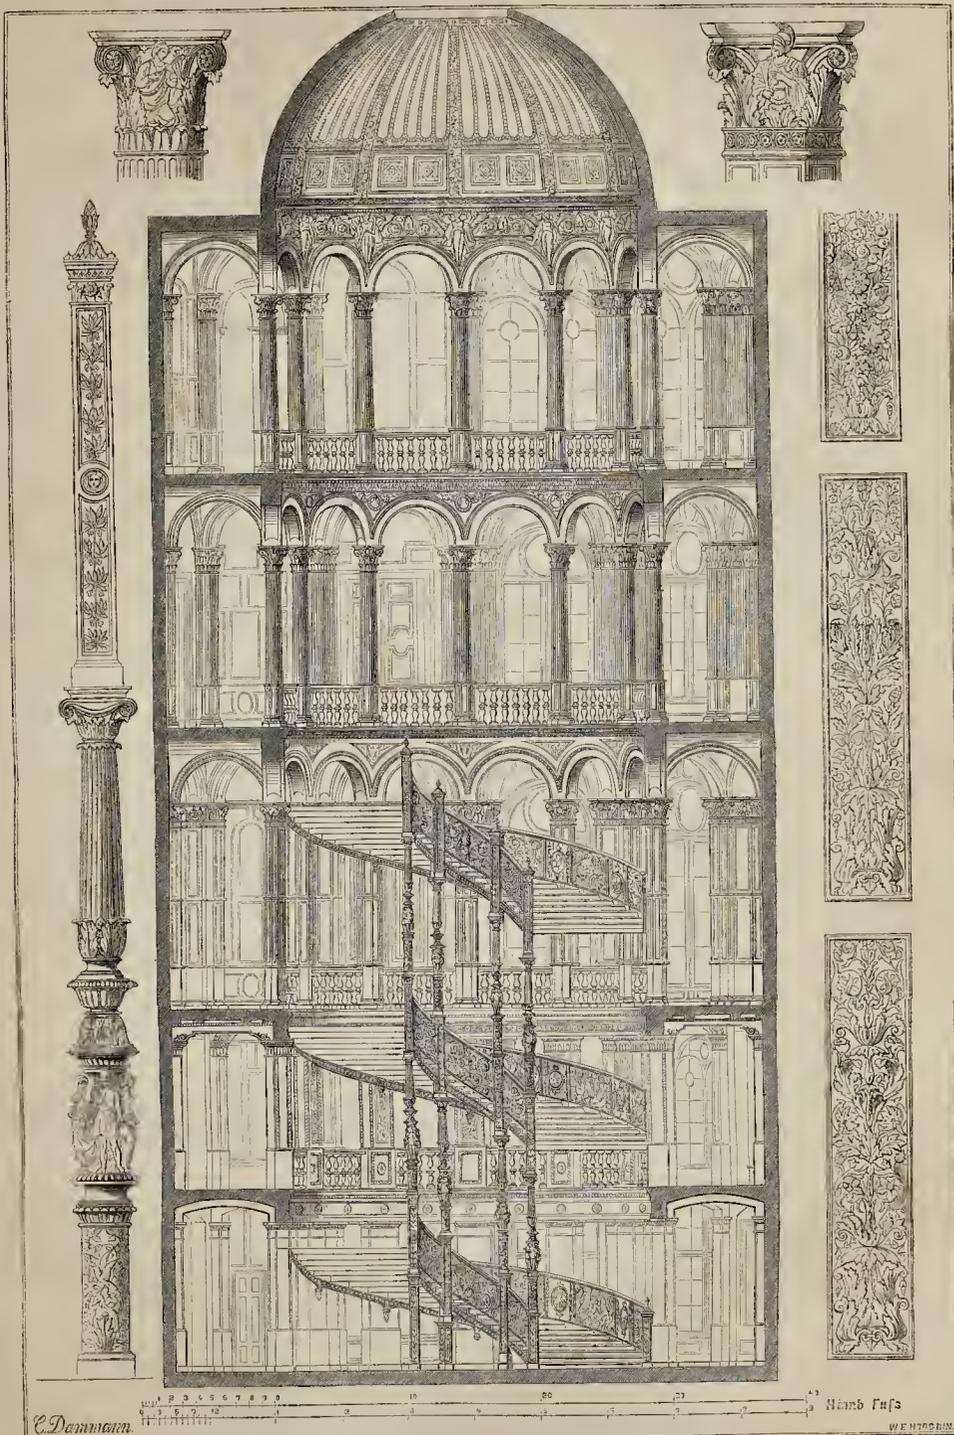

The chimney shafts, of which there are two, one on each side of the engine-house, are 209 ft. in height from the finished surface, and 8 ft. internal diameter throughout. They are externally octagonal on plan, rising from a square battered base. They correspond in style with the main building, and are similarly enriched with coloured bricks and stone dressings, and are capped at the top by an ornamental cast-iron roof, pierced with openings for the egress of the smoke. The foundations of brickwork and concrete extend to a depth of 35 ft. below the finished surface.

The engines are eight in number, each of 142-horse power, and are arranged in pairs, each arm of the building containing one pair, placed parallel to each other lengthwise of the arms, having the fly-wheels at the entrance end, and the cylinders at the inner end of the arm, so that the eight steam cylinders are arranged symmetrically

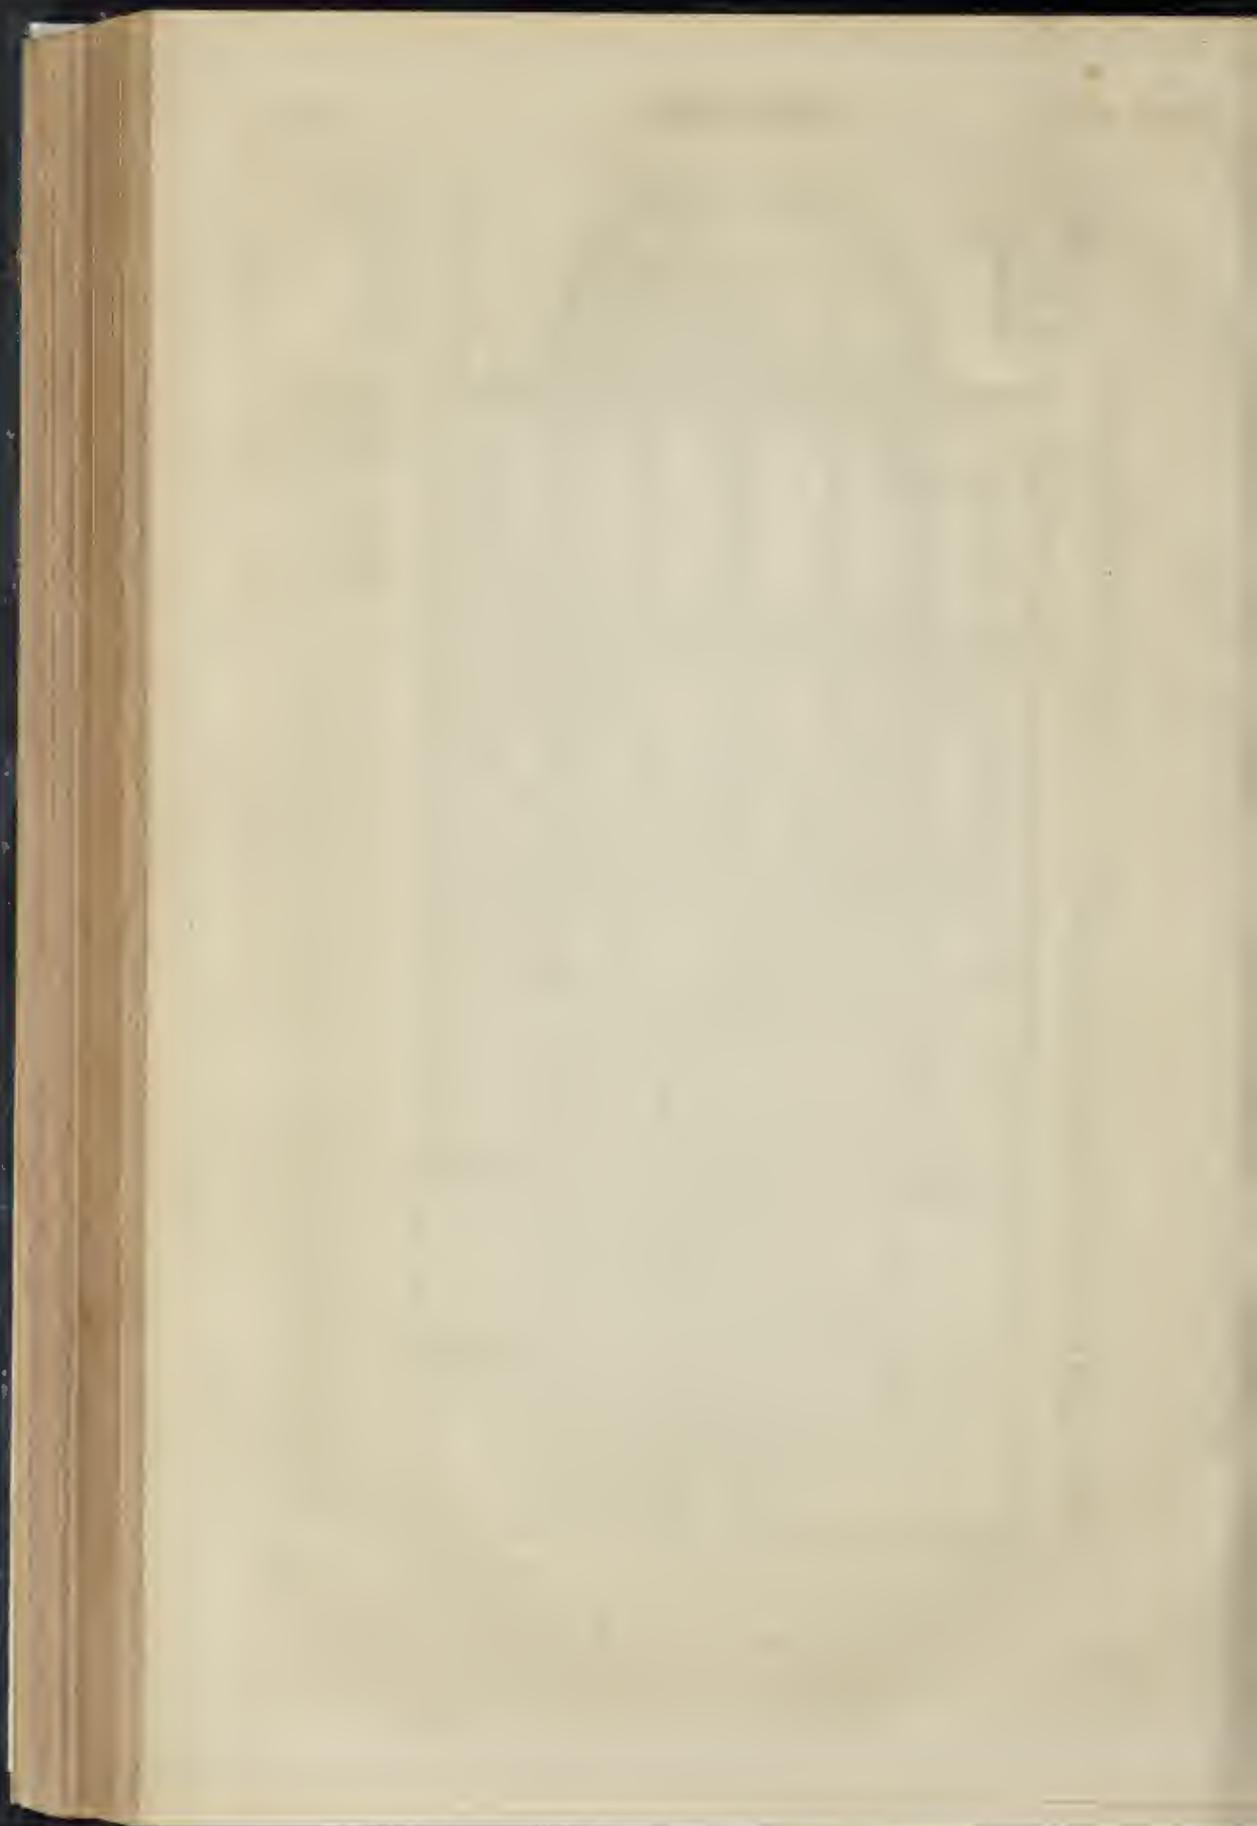

round the centre of the building under the dome.

The reservoir for the storage and purification of the water for the use of the boilers and for condensing purposes is situated on the opposite side of the embankment of the Northern Outfall Sewer. It is constructed mainly of concrete, is 18½ ft. in depth, and covers an area of about one acre, which is divided into three compartments, each compartment being used in turn as a settling pond, and containing about one million gallons; there are inlet pipes to bring water from the creek, and outlet pipes to convey the water to the supplementary reservoir under the engine-room and above the pump-well, from which it is taken direct to the boilers and to the cold-water cisterns around the condensers.

The cottages for the workmen are eight in number, arranged in pairs, each containing five rooms, and are fitted with every reasonable convenience; the house for the superintendent of the works, and which is situated on the other side of the Outfall Sewer, and near the entrance to the works, is more commodious, and fitted up in better style.

THE CASTLE OF MECKLENBURG SCHWERIN: THE GRAND STAIRCASE.—HERR WILLEBRAND, ARCHITECT.

THE CASTLE OF MECKLENBURG SCHWERIN, NORTH GERMANY.

In the account we gave with a view of the recently completed ducal residence of Mecklenburg Schwerin, at the commencement of our present volume,* we promised an illustration of the principal staircase which leads from the ground floor to the state floor. This we now publish, also a plan of the edifice, showing arrangement of the rooms. The steps are of polished black Belgian marble, each in one piece. They rest for about an inch one on the other, and at both ends on cast-iron pillars. These cast-iron pillars are supported in the centre of the stairs by six cast-iron candelabra columns with square pedestals, standing one above another. The outer ring of these pillars rests on cast-iron shelves, which are attached to the sandstone pillars of the gallery, rising one above another. The railings are of cast-iron, the filigree ornaments being of cast zinc. The pillars rising, in the design, through all the floors, are square in the ground-floor and entresol, octagonal in the main floor, and round in the state floor and fourth floor, and are worked in all parts with their ornaments, arches, and cornices of Saxon sandstone, the natural colour of the stone being visible. The balustrades between these pillars and columns of the gallery are of polished dark-red marble; the cornices on the same again of sandstone. The iron ribs of the staircase candelabra-pillars, railings, and filigree ornaments are gilt in all visible parts. The ceilings of the galleries are vaulted and tinted, the floors are laid out in variously-coloured marbles. The walls in the galleries are stuccoed, have the sandstone colour, and are divided into squares by coloured lines. The pillars with their capitals, in the galleries as well as the main cornice under the cupola, are executed in stucco; the cupola itself vaulted with white stone, is painted partly in grey and partly in various colours. The staircase receives light during the day partly from above, but mostly through the windows on each gallery looking towards the yard. At night it is lighted with gas in gilt chandeliers.

NEW SEWERAGE WORKS AT HASTINGS.

The completion of the main intercepting sewer of the new drainage works at Hastings, was celebrated by a dinner to the contractor, Mr. John Howell, given at the Queen's Hotel, on Monday last. Virtually this completion, so far as it goes, may be taken as that of the sewerage of the whole borough; as St. Leonard's proper, the western wing of the frontage, has had its similar system at work for some months past. The *modus operandi* adopted by both places may be described as the *tank system*, the whole of the sewage being conducted by a main intercepting drain to a deposit tank, whence it is discharged at such period of the tide as is favourable to carrying it clear away from the town.

At St. Leonard's this is at high water, when the set of the tide is *westward*. At Hastings, the discharge at low water leaves the flowing tide some four or five hours to carry the outpourings to the *eastward*, where it meets the outflow of the River Rother, and is dispersed to sea.

The intercepting sewer of the Hastings system extends from the Archway (the western extremity of the Local Board district) to Ecclesbourne, where the whole of the sewage of the district (with the exception of a very small portion which is drained into the St. Leonard's sewers) is discharged into the sea from the tank by gravitation, at low water. The point of discharge is about 800 ft. into the sea, and opposite Ecclesbourne Valley. The original sewer remains from the Archway to the centre of Warrior-square, and at the latter point, where there has hitherto been one of those obnoxious outlets into the sea, the new intercepting sewer commences. From that spot to the Albert Memorial the size of the sewer is 4 ft. by 2 ft. 9 in., egg shape, and has a fall of about 7 ft. per mile. From the Albert Memorial the sewer passes along Wellington-place, through Castle-street, along Pelham-place and East-parade, to the Bourne, the size up to that point being 5 ft. by 3 ft. 6 in., also egg shape. There are four branch sewers from George-street, &c., 2 ft. 6 in. by 1 ft. 8 in., egg

shape, with self-acting tide flaps complete. From the Bourne to the East Groyne the size of the sewer is 5 ft. 6 in. by 4 ft. egg shape. The fall from the Albert Memorial to the East Groyne is 4 ft. per mile, and the water of the natural streams running through Warrior-square and Priory is used for flushing power, so as to prevent any deposit in the sewer. The new tank which has been constructed near the East Groyne as a receptacle for the sewage, will contain about 1,500,000 gallons, and previously to the scheme being adopted it was ascertained that the greatest gurgings of sewage, in dry weather, taken at the three outlets, did not exceed 600,000 gallons in twelve hours, leaving 900,000 gallons for slight rains. The bottom of the tank is about 5 ft. 6 in. above low water at neap tides, and 2 ft. 6 in. below the invert of the sewer. From the tank a 4-ft. cast-iron pipe runs out to the point already mentioned, 800 ft. into the sea, with a fall of from 8 ft. to 10 ft. per mile. This will discharge 1,000,000 gallons per hour, and therefore the tank, when full, can be discharged in one hour and a half.

As a matter of fact, the whole contents of the tank, with thirty-six hours' sewage (in very dry weather), was discharged on Monday in the presence of several of the principal inhabitants and representatives of the press, in about an hour. As all the offensive outlets which have so long been allowed to pollute the bathing of this favourite watering-place and induce illness, are now stopped, its visitors may depend on clean bathing in a pure sea.

The works connected with the scheme have been carried out by Mr. John Howell, assisted by his attentive and judicious foreman, Mr. H. Butler, many years with Myers & Co. The amount of contract (which did not include the new groyne) was 25,640l. There were five other tenders for the work, the highest (from a London firm) being 49,850l., and the lowest (from Mr. A. H. Fernandez, of Tunbridge Wells), being 26,639l. The only part of the work which is not quite complete is the fixing of some few of the 4-ft. cast-iron pipes, by which the sewage is discharged from the tank. These pipes can only be fixed at the lowest tides, but the small portion of the work that remains in hand is now being completed with all possible speed, and its being unfinished has no injurious effect on the working of the scheme. Hastings has undoubtedly set an example which other towns would do well to follow. The importance of the undertaking cannot be over-estimated, and highly beneficial results may reasonably be expected to follow the large outlay which has been incurred. The proposal for celebrating the completion of the work by a public demonstration originated with Mr. Curling Hope, of Robertson-street, who, with a commendable degree of public spirit, brought the subject before some of his fellow-townsmen, and, with their co-operation, took judicious steps for carrying it out. The arrangements were made quite independently of any action on the part of the authorities of the town, and may be considered a compliment to the contractor and a testimony on the part of influential inhabitants that they fully approve of the mode in which the work has been carried out.

We need scarcely tell our readers that we view the works at Hastings as, after all, only preparatory, not final. The sewage must be utilised, not emptied into the sea.

MUSEUMS OF TRADE AND INDUSTRY.

The subject of Museums of Trade and Industry was discussed at a meeting convened by the Public Museums and Free Libraries Association, in the Assembly-room of the Metropolitan Club, 20, Piccadilly, on Thursday, July 23rd. Mr. John Holms, D.L., presided.

The proceedings commenced with the reading of a paper by Mr. W. H. Ablett, formerly of Coventry and Macclesfield. They all had heard, he said, a good deal of the subject of technical education lately, and while some even disagreed as to the precise meaning of the terms, they could not have failed to notice the absence of practical suggestions, and the want of unanimity that prevailed on the subject. He appeared before them to advocate a definite plan in aid of technical education, to form its supplement, and be the connecting link between theory and practical application in manufactures, in the founding of museums of trade patterns and industrial examples. This

was with him no new subject, born of the exigencies of the hour. For seven years past he had pointed out its necessity having seen many of our textile manufactures (which alone he progressed to understand) slowly but surely displaced by foreign productions, owing to the want of a little extra knowledge on the part of our workmen. Persons with only a superficial knowledge of manufactures were struck with the great lack of invention and power to stimulate improvements, combined with an awkward unwillingness to depart from old-fashioned methods, that characterised not alone the managers of factories, but also the masters in many branches of English manufactures. That Englishmen were inventive, no one could deny; and that much ingenuity and mechanical skill was often manifested by entirely uneducated workmen, was equally plain. In every manufacturing town throughout the kingdom there lay scattered about, amongst the working population, examples of attempts at something new in the shape of inventions or improvements, which were never brought under the observation of those who could practically apply them, from the simple fact that there was no system through which those attempts could come to the knowledge of the interested, excepting by chance or at rare intervals. Industrial Exhibitions amongst the workmen gave ample proof of the manufacturing ingenuity of the working population; but such exhibitions could exercise no beneficial influence upon manufacturing education, so to speak, and only served to show at times in a grotesque manner the singular misdirection the chances of life cast a man's lot in, as compared with the course whither his real bent or inclination would seem to lead him. He did not for a moment deny that in some branches of trade we still excelled foreign producers. An Englishman would ordinarily do far more work, and bring a more continuous and indomitable energy to a given task, than would a foreigner. But it was not there the weakness lay; it was to be found in defective knowledge of matters of taste and arrangement, and absence of that quickness of apprehension and that fertility of expedient, that were brought into active life only by education, and continuously sustained by daily observation. Who that recollected that we were the nation that produced such men as Shakspeare, Bacon, Milton, and Newton in the realms of thought and imagination, down to our modern school of practical engineers, could consider that we must be necessarily behind the rest of the world? What was now wanted was the wider diffusion of intelligence in the constantly recurring operations of every-day life, by which not only might the skill and talent of the workman be increased, but the mind of the workman become enlarged as to the object and application of his work, its comparative excellence or defects, &c. No means to this end existed other than those chance opportunities that failure sometimes developed; but if such museums as were advocated were established, the germ of a good thought might be perfected instead of dying away, and ideas would be suggested by other objects so as to form a complete whole of what otherwise would remain, perhaps, unutilized; not only would the eye be educated in matters of taste, but trade knowledge of almost every description could be gathered from this comparatively simple and inexpensive expedient, out of which further advantages would naturally spring. We had already to our hands all the outward machinery of a complete system. We had a science and art department, established for the art-education of the people, at South Kensington, in connexion with which the first collection of patterns and examples might well be formed to serve as a model for those provincial towns that would be disposed to adopt the plan. The standard of manufacturing skill and design would speedily be raised by such collections. They would have an influence upon taste, and positively assist a man in the commercial pursuit by which he gained a livelihood, enabling him to see what methods of production were pursued in this and other countries; how an article was started in a loom, or how an object of metal was cast,—placing him, in short, in a position to compete in the markets of the world. Of course, the details and minutiae of these museums must be left to local or municipal management, and one would, perhaps, differ very widely from another. He would suggest, however, the adoption of some arrangement, under which a working man who had produced an invention or a new pattern could exhibit it, with his name and address

* See pp. 9 to 11, ante.

attached, with a view to arousing the emulative spirit of the working classes, and to gather together in one focus the latent intelligence of a district. Masters could then often find ingenious workmen, and the workmen, too, find masters who would take up and successfully work their inventions. The general idea of a museum was that it enshrined the past; and, as time rolled on, the collection that would accumulate would show, in a very interesting manner, the yearly progress of manufacturing and inventive skill. But it was not in that light that it would become most valuable, but in teaching men the practical business of their every-day lives, giving to each workman an idea, and perhaps eliciting one from him, which another workman would amplify. Working men must be specially interested in such a plan. Most valuable inventions and improvements were made by them, but the advantages reaped from these were often enjoyed exclusively by others. Failing to get any one to take up an invention, a workman might exhibit it in the local museum; and the publicity thus given would furnish a positive title to remuneration, which few manufacturers would have the courage to refuse, did they adopt it without due acknowledgment. Hitherto, England had competed solely with the Continent, and America was at one time one of our largest customers for goods. Latterly, the high duties there imposed acted almost as a prohibition against British importations, and an immense impetus had been given to native manufactures. Let America get into full swing, and the active ingenuity of their skillful people become fully developed, backed farther by her boundless resources in minerals, cotton, agricultural produce, and coal—the latter alone exceeding by thirty times our own—and we would have another powerful competitor, whose exertions we yet scarcely felt, although the interesting statistical report sent by the Birmingham Chamber of Commerce to Lord Robert Montagu, exhibited our trans-Atlantic rivals as extensive manufacturers and exporters of such goods as wood-handled spades and shovels, hoes, axes, coopers' tools, nails, pumps, agricultural implements, sewing-machines, revolving pistols and breech-loading muskets, clocks, gas-fittings, weighing-machines, machines for domestic purposes, and a great number of what were termed "American notions." To meet these contingencies it was plain that we must call up all our own labour-power, and educate it purposely to the general advantage of the commonweal.

From the elements within us, the capital and energy of our merchants and traders, the indomitable perseverance and endurance of our artisans, who were naturally industrious and skilful, there was room to build up a grander and finer England in the future than ever existed in the past. There seemed to be something in the peculiar character of Englishmen that they never did their best until some strong opposition was brought to bear upon them; then the combative and persevering spirit of the nation was brought out, and great improvement often followed after a temporary collapse. Thus, upon first going to war with a foreign nation, we had often experienced a reverse, which, instead of acting as a discouragement, seemed to infuse new fire and spirit, with stern determination to conquer, into our management and councils; so that the check received in the first place ultimately proved to be a fortunate spur and incentive, leading to ultimate triumph. The plan of establishing Trade Museums would have a very wide application, for there was not a single branch of industry throughout the country that would not be considerably benefited by its adoption. Even in the mining districts, a museum would be desirable. The classification of the various ores, enveloped by the beautiful stalactites that abound, would form a very interesting collection, to which might be added models of machinery, and of all appliances used in mining. In the seaport towns, boats, anchors, cordage, sails, models of vessels, and marine engines, might be well represented; and these would become in time depositories of curiosities brought from abroad,—though this was the least useful aspect in which to regard the subject, unless they considered the great probability that useful fibres would be brought with other specimens, opening out new branches of industry.

While the mere workmen's Industrial Exhibitions, however worthy of encouragement on certain grounds, could have no abiding influence upon routine manufactures, and, on the other hand, the International Exhibitions were con-

sidered by many persons to have out-grown their just proportions, the proper determination and level of these expedients seemed to be indicated in the resolving of these efforts into final and permanent museums of trade and industry, to be established in all manufacturing centres, which would afford opportunities for the study and observation of the best examples of the kind of manufacture suitable to each district, and furnish an aid to technical education that could not by other means be obtained; as every clever manufacturing expedient in practical working would here be displayed, and could be readily utilized; in short, the museums would form the best descriptive supplement to technical instruction which it would be possible to devise, and if generally established throughout the kingdom would serve to mark an epoch in English manufacturing greatness.

THE PREVENTION OF DISEASES.

The tenth annual report of the medical officer of the Privy Council is, like its predecessors, a document of great interest. The volume is of considerable size, and includes a series of miscellaneous inquiries and reports, one being specially devoted to the geographical distribution and ethnological relations of consumption.

In regard to vaccination we learn that a new system of visitation, inspection of districts, and grants for successful operations, has been in force during the year.

The "occasional inquiries" of the Privy Council this year have extended to the outbreaks of fever at Winterton, Terling, and Guildford. All these were cases such as have again and again been reported on as "illustrations of excremental poisoning." "This filthiest chapter in the history of our pestilences," says Mr. Simon, "is one which I would gladly consider myself excused from re-opening on the present occasion." At Winterton there was disgraceful neglect, though the town four years previously had adopted the Local Government Act. At Guildford the water-supply was poisoned by sewage. At Terling the epidemic was due to conditions of local filth which existed under definite legal responsibility. The nuisance authority of the place (the Board of Guardians of the Witham Union) had grossly neglected its duty. In the space of two months a larger proportion of the population were killed by the filth-fever than ought to have died from all causes in two years. Mr. Simon suggests that if each person who suffered under these circumstances could recover his compensation from the rates, the local authorities would perhaps learn in a sharp practical way that sanitary neglect is a mistaken parsimony. So, too, he hints that, as regards commercial water-companies and the like, certain sorts of malfeasance should involve liability to pay pecuniary damages to injured persons. He thinks that in this point of view the sanitary rights of the public are but very imperfectly secured, and that explicit legislation in the matter is greatly to be desired.

NEW BUILDINGS IN KEIGHLEY, YORKSHIRE.

Mechanics' Institute and School of Art.

The erection of a large building, for the joint accommodation of the Mechanics' Institute and School of Art, has just been commenced at Keighley.

On the ground or principal floor the Institute will have its more important rooms; consisting of reading-room (at the south-west angle of the building), 33 ft. by 20 ft.; conversation-room, 28 ft. by 18 ft.; library, 33 ft. by 18 ft.; also patents room, pence bank, and secretary's office. The lecture-hall—a large apartment, 87 ft. by 44 ft., and with a wagon-headed and panelled and hoarded ceiling—will be common both to the Institute and School of Art, and will seat about 700 people.

On the upper floor the school of art will be located, and will have an exhibition-room, 46 ft. by 22 ft.; mechanical room, 28 ft. by 18 ft.; painting-room, 30 ft. by 18 ft.; modelling room, 33 ft. by 20 ft.; casting room, master's room, and retiring-rooms and lavatories for each sex. The lighting of the painting-room will be to the north, and of the exhibition-room from the top. From the landing of the principal staircase leading up to this flat or story a gallery opens out into the lecture-

hall before mentioned, giving accommodation for about 100 persons.

The whole of the basement story (which, from the nature of the site, will be clear of the ground on all sides) is occupied by a range of classrooms, ten in number, and some of them of very large size; also by a tea-room, 50 ft. by 18 ft., and a residence for the hall-keeper. Separate entrances to this story are provided on the plans.

The building is so arranged that the Mechanics' Institute, the school of art, and the lecture-hall may be in operation at the same time, and yet not interfere with each other.

Externally the building will be in the Gothic style, built of stone, and with ashlar quoins and dressings.

The principal entrance will be under a tower (rising to the height of nearly 100 ft.).

The contracts for the erection have been chiefly taken by Keighley contractors, and the estimated cost with the land is about 12,000l. The architects are Messrs. Lockwood & Mawson.

Baths and Washhouses.

The erection of baths and washhouses for the township has just been commenced by the Board of Health, under the same architects. The accommodation provided will consist of a central office, with separate entrances and waiting-rooms on either side of the baths; two men's tepid swimming-baths (first and second class), each 60 ft. by 30 ft., with open-framed timber roofs and top lights; four first and nine second class men's slipper baths. On the upper floor and approached from either entrance (so as to be used by either sex on different days), will be a suite of Turkish baths, with a first and second class tepidarium, frigidarium, and caldarium complete to each.

The washhouse will comprise thirty double wash-tubs, each supplied with steam and hot and cold water, and with drying closets, and all requisite appliances to correspond. An engine and chimney, and a suitable residence for the attendant in charge, will complete the arrangements.

The building is Gothic in style, and the large inside baths will be treated to correspond. The contractors are wholly Keighley men; and the cost, exclusive of the ground, will be about 7,000l.

THE GUILDHALL, LONDON.

We described some weeks ago the window, executed by Messrs. Clayton & Bell, which has been set up in the Guildhall by the operatives of Lancashire. We may repeat that the window is divided vertically by two main mullions into three sections, the central division being subdivided into five lights, the sides into two each. The copulet division on the north side contains figures of Lancastrian worthies, and in the similar division on the south side are introduced worthies of the City. The subject of the lower tier of the central portion of the window is illustrative of the rebuilding of the City by Alfred the Great, that of the upper tier being devoted to the subject of the grant of the charter to the City of London by William I. In both cases the figures of the kings occupy the central light, the figure of the Conqueror being shown in the act of presenting the charter, which has been reproduced in the glass from the original in possession of the corporation. The two figures in the side division on the north side are full-length portraits of Sir Richard Whittington and Sir Thomas Gresham; those on the south side being of John of Gaunt (Duke of Lancaster) and Sir Thomas Stanley. Whittington, by the way, holds a skull instead of his better known insignium, a cat. At the base of the window runs the following inscription:—

"The grateful memorial of the operatives of Lancashire and the cotton manufacturing districts to the Mansion House Relief Committee, who, as saviours of a world's benevolence, distributed to them more than 500,000l. during the cotton famine, 1862-5, namely, William Cabitt, Lord Mayor, William James Richmond Cotton, Charles Barber, William Morley, John Armitage, G. Howes, Francis Lyett, and Simeon Dillencroft; with Lord Mayors William Anderson Rose, William Lawrence, Warren Stormes Hale; and Joseph Gibbs, Secretary."

The window has a certain tameness. The figures of the worthies in the side divisions are larger than those of the kings in the central groups; and the feet of many of the figures are outrageously large. Nevertheless, it is a very handsome and interesting work. The ugly glass in the west window should be removed at once; its vulgarity is now more than ever apparent.

The costly work, upon which the Corporation of London have been engaged for nearly five years, in Guildhall, is now approaching completion. From first to last in that time the Court of Common Council will have expended upwards of 50,000l. upon the undertaking, the finishing stroke to which is being given by the erection of a carved oak screen, and a dais at the eastern end of the hall, at a cost, included in that sum, of 2,400l. The subject of the restoration was first mooted in the Common Council in July, 1862, on a recommendation, which was adopted, of the City Lands Committee that the then roof of the Guildhall, which was flat and unsightly, and to which we had often objected, should be replaced by an open roof, in accordance with the original architecture of the hall. In May, 1865, in addition to grants previously made, the Court voted 1,200l. for the erection of a lantern and spire to the roof, and authorised the additional expenditure of 4,800l. odd in rebuilding four of the turrets of the hall and two of the pinnacles, and 3,080l. in restoring and repairing the internal stonework of the tracery under the windows. The Minstrels' Gallery, constructed of oak at the western end of the building, has cost 1,200l.; and the construction of staircases in the turrets to afford access to it 250l. The necessary works for lighting and warming the building have cost upwards of 2,430l. The repairing of the hall and other incidental works have involved an outlay of 1,358l. odd, and the lowering the monuments of Nelson, Wellington, Beekford, Pitt, and Chatham, which had become necessary, about 470l. The contractors from the first have been Messrs. Myers, and the works have been executed from designs by Mr. Horaco Jones, the City architect.

THE PALMERSTON MEMORIALS AT ROMSEY.

THESE memorials have now been inaugurated. The day was kept as a holiday in the town. Earl Granville and other members of both Houses of Parliament were present, but neither Lord Russell nor Mr. Gladstone was there. The statue occupies the exact centre of the market-place. A solid bed of concrete forms the resting-place for the statue. In digging out for the concrete some of the brickwork was discovered which, nearly fifty years ago, formed part of the then town-hall and market-house. On the concrete a few rows of bricks are laid, and on these a large piece of granite rests, surmounted by another piece, somewhat smaller. Both these pieces are rough at the sides. Next comes a flat piece of polished marble, bevelled at the sides. On this is a shaft of the same material, equally highly polished. On the front of this shaft, facing the Hundred, is merely the word,—

"PALMERSTON."

And on the opposite side are the words,—

"Born, 1784;
Died, 1865."

This is all the inscription the statue bears. The shaft is surmounted by another piece of scolloped marble, which gives the pedestal a complete appearance. The figure is a bronze one, about 9 ft. high, and has been cast from the precast gun-metal that could be found, by Messrs. Prince & Co. of Southwark, from a mould prepared by Mr. Noble. The right hand is slightly extended and open to a considerable extent. The countenance or likeness is considered to be good.

The triplet of lancets, also erected as a memorial of the statesman, in the west end of the Abbey Church, is of great size, the centre light being 39 ft. by 5 ft. 7 in., and the two side lights 36 ft. 6 in. by 4 ft. 2 in. each. The window has been designed by Messrs. Clayton & Bell, to exemplify the idea of Government descending from heaven to earth. In the upper portion of the three windows is a representation of the highest idea of rule—the Lord Jesus Christ sitting on the throne of glory, surrounded by adoring saints and angels. Below are three subjects from the New Testament, showing acts of power and teaching; namely, our Lord feeding 5,000, the Sermon on the Mount, and the Tribute Money. Below these, again, are three subjects from the Old Testament, illustrative of power and government; namely, Joseph distributing Corn in Egypt, the Judgment of Solomon, and Daniel as ruler. In the lower tier are figures showing allegorically three modes of action in which an

earthly ruler may beneficially exercise his power:—1. In preserving peace and plenty; 2. In making war in defence of his country and of a right cause; 3. In breaking fetters and liberating captives; and at the bottom are the heraldic bearings of Lord Palmerston, and the following inscription:—"In memory of Viscount Palmerston: obit 1865." Beneath each of the Scripture subjects is a descriptive Latin text. In an arched dividing the subjects horizontally are demi-figures of patriarchs, prophets, kings, apostles, and saints.

HEALTH OF GUILDFORD, SURREY.

A RESIDENT in Guildford writes to us,—It is reported here that the fever has broken out very badly at Guildford again. It will be recollected that Mr. Buchanan was sent down from the Privy Council Office to investigate the probable cause of the last outbreak, and which was considered to be caused by the quality of the water supplied to the town, and remedial measures were supposed to have been taken.

I do not know what they will call the cause of the outbreak now. Can it be the great heat, evaporating the sewage which for ages has been saturating the soil and the underlying chalk.

Guildford is not drained. The sewage runs into cesspools, and probably filters through them to a considerable extent. There is a drain runs down some of the streets to take the rainfall from the street gullies, and I have heard some house-drains have been connected to it. There are a good many cellars in some parts of Guildford, and if they are not well ventilated and drained it does not improve the sanitary condition of the place, especially if the soil around the cellar be saturated with sewage.

I think it is likely there may be another official inquiry as to the cause of the outbreak. I do not think fever has ever been absent from the village of Compton, near Guildford, since June, 1867; and no doubt defective sanitary arrangements are the cause. At Dunstable, Beds, it is usual to turn the night-soil and sewage into the cesspools, and dig a fresh one every time the old one gets filled up,—consequently low fever is very prevalent in the town.

NEITHER LIGHT NOR SOUND EXCEPT TO EYES AND EARS.

HAVING read your review of Mr. Benson's "Principles of the Science of Colour," which I soon hope to have the pleasure of reading, I am still impressed with the belief that considerable misconception regarding the theory of colour arises from not pushing our present advanced physical and physiological theories of light and sound to their ultimate conclusions, or it would be perceived that all differences in musical notes and colours are fundamentally due to quantitative or proportional differences. The proximate cause of every colour, according to received theory, is, externally to the sentient being, an undulation of a certain length and velocity, nothing more,—just as the cause of a musical sound in the ear is proximately a certain mechanical vibration of the air. Notes and colours are the effects of these, on, and modified by, living organs; there is neither light nor sound independently of eyes and ears: if there be, we have yet to find the true theories of music and colour, for vibrations would clearly not then be the proximate causes they are now considered: the vulgar error lies in supposing colour to inhere in the vibrations themselves, and that it has the same objective existence that it appears to sense. No received physical theory does this. Vibrating force, then, is the real and sole primary of colour, and it is its variations which fundamentally produce all differences of colour: fundamentally these are differences of degree only, and not of kind. Primarys, secondarys, and tertiarys are verbal distinctions given to the phenomena produced by these mechanical vibrations in us. We do not say that these verbal distinctions are needless, so long as it is remembered that no colour is radically different from another, but that the difference is only a difference of measure.

On the subject of compensation, it appears to me that the largest generalization is the best, for fortunately every colour sensation can be tested, and its true compensation be found, by experimenting with the eye. But the old error creeps in here, and the compensating colours

are discoursed upon in treatises, as if they had objective existence.

The great law of compensation which pervades nature is this:—Let

$$0, 1, 2, 3, 4, 5, 6, 7-8-9, 10, 11, 12, 13, 14, 15, 16,$$

represent the limits of a scale of variation, then we have these compensating pairs, starting from the mean or central eight 9 : 7, 10 : 6, 11 : 5, 12 : 4, 13 : 3, 14 : 2, 15 : 1, 16 : 0; the sum and the mean of every pair being the same. The law may be expressed more intelligibly thus:—Any aberration from a mean state must be compensated by a corresponding one of an equal but opposite kind, which shall re-establish the mean or balanced state.

I believe that colour is the result of a disturbance of the mean state of solar vibration by the prism, or other means.

W. CAVE THOMAS.

THE GREAT PYRAMID AND LINCOLN'S-INN-FIELDS.

IT is commonly reported that the area of Lincoln's-inn-fields is the same as that of the base of the Great Pyramid of Giza; but until Colonel Vyse dug down to the base of that most ancient of structures and found the casing stones, no very accurate account of its dimensions could be given, and, consequently, no very accurate comparison could be made between its area and that of Lincoln's-inn-fields.

I enclose the dimensions of the exterior of the Great Pyramid as measured by the engineer Perring, for Colonel Vyse, with an outline in red ink of the figure of Lincoln's-inn-fields, and a scale of feet as given in the "Plan of the parishes Bloomsbury and St. Giles-in-the-fields, surveyed by J. G. Mair, esq., M.R.I.B.A." Drawn to the same scale, in black ink, is an outline of the base of the Great Pyramid of Giza, of which the superficial area is 583,696 ft., and of Lincoln's-inn-fields 511,116 ft., which leaves an excess in favour of the Pyramid of Giza of 72,580 ft.

If one side of the base of the Great Pyramid of Giza be placed against the wall of the houses on the north side of Lincoln's-inn-fields, the corner touching the garden wall of Lincoln's-inn on the east side of the area; the opposite line of the base of the pyramid will exceed the Fields by a parallelogram containing 72,580 superficial feet; no insignificant property when the new law courts are built.

Present base of Great Pyramid of Giza	736 ft.	Former base, &c.	764 ft.
Height	459 ft. 9 in.		480 ft. 9 in.
Diagonal	668 ft. 3 in.		611 ft.

You will perceive by these measures that about 10 ft. of the crust of the pyramid have been removed from each face, and this work of demolition is still going on; for a rude kind of vase, for pounding the indigo plant in, is made of blocks about 3 ft. high and 2 ft. wide by an Arab mason, whose shop used to be, at the time of the Prussian mission, on the south side of the monument.

JOSEPH BONOMI.

THE BELLS OF THE CHURCH OF ST. MARTIN-IN-THE-FIELDS.

THE steeple of St. Martin's Church is furnished with a fine peal of twelve bells in the key D, the weight of the tenor being 32 cwt. There is also a Priest's bell in the steeple.

The bells are severally inscribed as follows:—

1. Cast by A. R. 1753.
2. E. Hart and W. Chapman, churchwardens. T. R. 1770.
3. Cast by A. R. 1753.
4. [Glory to God in the highest], and on earth peace. 1725.
5. Peace on earth, and good will towards men. 1735.
6. Abraham Rudhall cast: all of us. 1725.
7. Prosperity to all England. 1725.
8. Peace and good neighbourhood. 1725.
9. Prosperity to the parish of St. Martin-in-the-Fields. 1725.
10. Fear God and honour the King. 1725.
11. John Walker and John Sawyer, churchwardens. 1725.
12. Rev. R. Pearson, D.D. vicar. Walter Turner and W. House, churchwardens. 1733. Priest's Bell. A. R. 1725.

The old church, which was taken down in 1720, had a peal of six bells. The present edifice, by Gibbs, was consecrated on the 24th of October, 1726, and according to an item in the account of Mr. Walter Turner, church-

avail themselves of in the town, such as the noble institute, the Fine Arts Gallery, & other admirable centres of education, which are the principal means of lifting men from the degrading position of serfs, and making them members of the highest and most respected members of society. And not only themselves would be benefited thereby, but it would be the means of keeping their children in that state of ignorance which the selfish and sordid-minded aristocracy would like to see. The builders do not let the public know that we do not object to the stone being scabbled out to skeleton moulds at the quarry. The wages are lower in those districts, and they get less done in the same time, so that it is a great loss to the employer. The old custom of our trade to work the stone at the building affords more time for it to become seasoned, and enables the architect or clerk of the works to better judge of the quality of the material, and to guard against all rents and abakes, which could not be so well detected after being worked at the quarries and exposed to the atmosphere and dirt in its transit to the building. In the end, our worked stone will prove the most economical and advantageous to the public."

The "Rattening" Case in London.—In reference to this case the *Forcaster Herald* says,—

"Mr. Potter took upon himself the responsibility of stating that trades societies do not object to piecework; that the societies name the minimum price of labour; and further, that the mere fact of a man being a member of a workman, Mr. Gladstone will not see that Mr. Potter and the delegates were deceiving him. The men themselves are now openly denouncing piecework, and threatening their employers with the horrors of the rattening system unless they accept a labour tariff dictated by only one party to a contract supposed to be entered into for the production of mutual advantages to all concerned. Mr. Potter informed the committee that payment by piece was impracticable in some trades and he may be right, but in most trades it is the fair system, we might almost say the only fair system. But it is not because payment by piece may be impracticable in some trades that the societies actually look; if not, why do they denounce the piecework system? Skilled workmen have a right to be consulted before such a system is adopted. How can mere men, who are not the masters for which an employer of labour has a right to look? Do candidates for admission to trade societies undergo an examination, or submit their names to a committee of experienced workmen, before they are admitted? We limited a number of his trade society without reference to his respect, upon his furnishing proof that he has served as an able worker under the system, or fulfilled certain requirements in which time and the payment of subscription were spread all over the workmanlike capacity."

Let us hope that these cases of "rattening" will be repudiated by the majority of the trade societies, and that philosophers and philanthropists will be left to carry out their good intentions, and so unite the interests of capital and labour that all remembrance of disputes between employers and employed may be lost in complete restoration of mutual goodwill and mutual confidence.

THE PROPOSED LAW COURTS.

A FORMAL protest against the injustice of the award as to the appointment of the architect of the proposed Law Courts has been forwarded by Mr. E. M. Barry to the Treasury, requesting our attention to it. Mr. Barry says,— "It seems to me that the question of a just or unjust termination of so important a competition possesses an interest and involves a warning to the profession at large, less than to myself." We think so too, as we have already said, and should feel surprised but for past experiences that the profession as a body have not uttered a strong protest against the decision that has been arrived at. If Mr. Street had been treated as Mr. Barry has been treated, we should say precisely the same thing. The strongest evidence was borne to the correctness of our views by the late Lord Haverwall, who signed the conditions as Lord Chancellor, under whose auspices they were used thus signed to the competitors, and whose authority respecting them cannot therefore be disputed. His Lordship stated—

"It was due from him to Mr. Barry to say that he was perfectly right in representing that the instructions given to him were to attend almost exclusively to matters of general accommodation, convenience, and arrangement, and was due to Mr. Barry to remind their lordships of the confidence given to all questions of internal arrangement. It was also due to Mr. Barry to say that Mr. Street should be the architect of the National Gallery, and that Mr. Barry ought to construct the Courts of Law."

Mr. Barry in his protest says,— "The conditions provide, (1), that the architect who all acquit himself the best shall be appointed; they point out, (2), that, in deciding who is the best, 'utility is to be the chief consideration; and that the arrangements shall be considered paramount, convenience, and arrangement, and they further provide, (3), that the decision on these points shall be left to the judges appointed by the Government to be a final."

With reference to any claims of other competitors, and the remarks on my prejudice, contained in Mr. Street's recent memorandum, I think it right to remark emphatically that such claims and remarks are based entirely on departmental reports by committees and others who were not the judges, but only some of their professional advisers, and that I rest my claims on the decision arrived at by the judges themselves, with the opinions of all their advisers before them, that "Mr. Barry's design is the best in regard to plans, and the distribution of the interior." This decision we were promised should be final, and it is not necessary for me to defend it. I may, however, quote, as illustrating it, the separate report of Messrs. Shaw and Ewbank assigning to me a preference under forty-one heads against three in favour of Mr. Street, and including in the former every one of those points which the competitors were told were of vital importance, such as light, air, quiet, access, staircases, general arrangement, &c. This report in no way supercedes, though it serves to explain, the decision of the judges, by showing in detail the views entertained by the two professional judges who may be supposed to have special qualifications.

Few non-professional persons can have a just idea of the amount of time, labour, and anxious study I have found it necessary to bestow on this work, so as to provide conveniently and satisfactorily for the vast extent of accommodation required, the printed details of which extend over eighty-three foolscap pages, and include sixty-six schedules, with twenty-four cuts, and more than 1,000 rooms.

I did not hesitate to incur the anxious labour of this competition to the detriment of my private engagements, because I relied implicitly on her Majesty's Government to carry out strictly and equitably the promise which they had made in order to obtain my designs, and because I felt sure that they would recognise the moral claims as well as the legal rights of the competitors. It did not occur to me as possible that the Government could allow me to so devote myself, and, after having received from me all I had to give (viz. my designs), and being thus in possession of all the advantages of the contract between us, would declare that they do not on their part consider themselves bound to keep their engagements, on the faith of which my designs were furnished, but hold themselves free to disregard the decision of the judges, who they promised should be final, and to make any appointment they may think proper as if the conditions had never been written and issued under the auspices of a Royal Commission, with the signature of the Lord Chancellor (Lord Cranworth), formally attached to them."

The course which has been taken is not only highly injurious and unfair to Mr. Barry, but is calculated to have a most prejudicial effect on the public interest; for it is difficult to see how, in the event of future competitions, it will be possible for architects again to repose confidence in the just and equitable adherence of the Government to the conditions prescribed by themselves, and agreed to by the competitors as a contract between the two parties. Is it yet too late to obtain justice?

HARBOURS AND DOCKYARDS.

MEMORANDA by Lieutenant-Colonel Clarke, R.E., director of works, have been issued among the Parliamentary papers, explanatory of vote 11 of the navy estimates. From these memoranda we make a few extracts, first remarking that the votes asked for Deptford, Woolwich, and Sheerness Dockyards are, looking to the proposed eventual suppression of those establishments, limited to such sums as are requisite for the maintenance of the existing structures, and for the effective and economic completion of the current work on the building, repair, and fitting of ships, until the new works at Chatham are sufficiently advanced to admit of those services being undertaken at that yard:—

Chatham Extension.

My estimate of January, 1868, for the execution of the works approved by Parliament in connection with the extension of Chatham Dockyard, amounted to 1,750,000*l.*, to be reduced in proportion as convicts are more or less employed. The further experience we have had in dealing (as we have been doing) with a treacherous and uncertain soil, leads me to hope that it is correct. Up to this date 540,000*l.* have been expended, of which 265,000*l.* have been paid for the supply of plant and material for the employment during the last year of from 700 to 1,100 convicts, whose labours are supplemented and led by from 250 to 350 free artificers and labourers.

Portsmouth Extension.

The Admiralty did not obtain final possession of the site for this work till 1856, and the first contract was let from April 1st, 1857, the necessary preliminary work of making a new boundary wall having been done in the interim. Arrangements for the yield of not less than 20,000,000 bricks a year by convict labour have also been made, and that number will this year be produced. Five hundred and seventy convicts are employed in brickmaking; the remainder, being artificers, are occupied in preparing plant, and in making and repairing tools, &c. Their labour has been supplemented by twenty steam-engines, applied to brick machines, pile-engines, mills, lifts, &c.

Devonport and Keyham.

At Devonport and Keyham the proposed expenditure this year is confined to what is required for additional machinery and the current charges for the efficient working and maintenance of the establishment.

Haulbovins.

The Irish Government, since November, 1867, having increased the number of boats from 275 to 460 men, with 100 free artificers and labourers, these works are now making better progress. Tenders have been invited, and are under consideration, for the construction by contract of the eastern wall and embankment. The expenditure so

far incurred amounts to 26,000*l.* (including 500*l.* for the purchase of Rat Island, which was private property), of which 7,000*l.* have been repaid, as usual travellers, steam pile engines, pumps, &c., and 13,000*l.* for timber and material, 5,000*l.* for the wages of free mechanics, and 1,000*l.* for superintendence. Workshops, stone-cutting sheds, and covered travellers have been erected, and the requisite rails laid down. By a timber viaduct, 3,500 ft. in length, I have connected Haubovine with Spike Island, to avoid the difficulties and danger of bringing the prisoners to the works in boats.

Portland.

For Portland harbour, which may now be regarded as the head-quarters of the Channel fleet, and which will probably become, in time of war, the point of departure and rendezvous for our fleet when taking the sea against an enemy, rapid and most efficient coaling arrangements are wanted, and a sum in the current year amounting to 2,000*l.* has been taken for commencing them.

Marine Barracks.

The extension of and sanitary improvement to the several marine barracks, which have of late years required large votes, are now approaching completion, and the sum asked for this year is limited to 15,000*l.*, the principal item being 3,000*l.* towards the erection of quarters for married marine soldiers, and 6,000*l.* towards the additional accommodation for officers and men at Plymouth.

Gibraltar.

At Gibraltar convicts only are employed, and the sum taken is limited to the amount sufficient to provide plant and a small number of free artificers for the further progress of the mole on the east side of the Naval Harbour. A mole has also been proposed on the north side, but the details have not yet been prepared.

CASES UNDER BUILDING ACT.

Clerkenwell Police Court.—On Friday, the 24th instant, Mr. Albert N. Bryett, builder, of 116, St. James-road, Holloway, attended at this court to answer a complaint preferred against him by Mr. John Turner, district surveyor of the eastern division of Islington, for erecting a building at the rear of No. 36, Grove-road, without first having given two days' notice to him, as required by the 38th section of the Metropolitan Building Act.

This case had been adjourned on two previous occasions, to enable the defendant to receive a reply from the Metropolitan Board of Works, to a complaint he had filed in reference to the proceedings taken by the district surveyor in respect to the said building.

Mr. Joseph E. Turner appeared for the district surveyor, and Mr. Hickette for the defendant. It appeared that on the 23rd of April, 1867, notice was given by Mr. Bryett, of his intention to erect six houses, shops, and additions in the Grove-road. The size of each of the proposed buildings given in the notice was equivalent to an area of 540 superficial feet. In November last the roof of the house, No. 36, Grove-road, was covered in, and the building as then carried out, was found to contain an area of 586 superficial feet. In the month of January last the district surveyor had occasion to visit the premises, when the house was occupied, and an oven had been erected by another builder; and on the 27th of April, 1868, he discovered the building in question began at the rear of the house, and for which he required notice, which had not been given. The sections relied upon by the solicitor for the district surveyor, were the 9th, 27th, 38th, 40th, 41st, &c.

On the part of the defendant, it was contended that works were going on from time to time on this and the other houses included in the original notice, and that even at the present time all the houses were more or less finished, and that the building in question was simply a coal cellar, of about 7 ft. high, and was included in the description of additions contained in the original notice of the houses. He also contended that although this house was "covered in" at the time stated, yet as the remaining houses, for which notice had been given, were not in such a forward state, this house could not be considered to be completely finished, and that according to one of the interpretation clauses of the Act, the term "area" of a building was not to include "attached buildings" the height of which did not exceed the height of the ground story.

The magistrate (Mr. Barker) decided that as the house was proved to have been covered in at the time stated, and taking into consideration that the area given in the notice for the houses was considerably exceeded, although the other houses might not have been completed at the same time as No. 36, Grove-road, yet to be in all respects and purposes each house, although included in one notice, must be considered as a separate building; the rules of the Act applied to each individually, and the work complained of having been commenced after the roof of the house No. 36, Grove-road, had been covered in, notice should have been given to the district surveyor. He should, therefore, impose a nominal penalty of 5*l.*, and award 2*l.* 2s. costs.

Mr. Ricketts stated he was instructed to ask for a case, which was granted.

The district surveyor's solicitor informed the magistrate that the decision of the Metropolitan Board of Works on the complaint made by Mr. Bryett was in accordance with his (the magistrate's) decision.

THE PROPOSED NEW MECHANICS' INSTITUTE AT BRADFORD.

The contract by which the Corporation of Bradford dispose of 1,000 yards of land at the corner of Bowling-green and Tyrell-street, at the price of 12*l.* 10s. per yard, for the erection of a new building in place of the present Mechanics' Institute, has been completed. Messrs. Andrews, Son, & Pepper, architects, Bradford, have been selected to prepare the designs.

MONUMENTAL.

In the House of Commons, Mr. Roebuck, after making some remarks very eulogistic of the late Lord Brougham, asked the Premier whether it was the intention of the Government to erect a monument in Westminster Abbey to the memory of that illustrious man. Sir G. Bowyer said he hoped that his lordship's remains would be brought from Canaan and deposited in the abbey. Other members spoke, including Mr. Gladstone, and Mr. Disraeli said that the Government were considering the best means of doing honour to the memory both of Lord Brougham and of Professor Faraday, and explained that the delay had been occasioned by the lamentable decline in this country of the sculptor's art.—It has been determined by the subscribers to the original fund for the memorial of the late Lord Holland in Westminster Abbey to devote the sum remaining, which amounts to about 2,600*l.*, to the erection of a statue of his lordship on a site offered by Lady Holland on the south side of Holland Park, adjoining the Kensington-road.

FROM SCOTLAND.

Edinburgh.—The foundation-stone of the first Established Church which has been built in Edinburgh since the Disruption in 1843, has just been laid. The edifice, named the West Coates Church, is intended to supply a want which the increase of population in the western part of the city has created, and its provision is the result of public subscriptions. There are already two Free Churches in the district—the Roseburn Church, built some time ago at a cost of 4,000*l.*; and Free St. George's in Stafford-street. The estimated cost of the structure is 7,500*l.* Of this sum rather less than 2,000*l.* only remain to be collected, the public subscriptions amounting already to 3,000*l.*, and a donation of 2,500*l.* being contributed by Donaldson's Hospital, for accommodation to be afforded in the church for the inmates of that institution. The site of the church is on a piece of ground belonging to Heriot's Hospital, adjoining the east corner of the Donaldson's Hospital ground, but separated from it by a road leading to the proposed fencing ground, and by a belt of plantation. The edifice is being built according to plans by Mr. Bryce, architect. It is of freestone, in the later style of Pointed Gothic, and to some extent will be cruciform in plan. The centre portion or nave is allotted to the general congregation; and the two aisles, with the galleries in the aisles, are to be appropriated by the inmates of Donaldson's Hospital. The church will be entered from the Coatbridge road, and exit doors from the galleries will be provided on either side for the general congregation. The entrances to the transepts are provided for by octagon turrets with staircases. Towards the front the structure is gabled; and there will be a spire and tower rising to the height of 130 ft. The tower is in three stories, the first story being lighted by a traceried window, and the upper stories by triplet lancet windows. The spire is pierced by two stories of spire-light windows, and is surmounted by an ornamented finial and vane. The roof is in a single span, framed with main complets. The seats are not to be enclosed with doors, but are to have open bench ends, and they will be wider than the seats usually are in Presbyterian churches. The pulpit is to be placed at the north gable, and behind it will be a vestry and other accommodation. The pulpit and platform in front of it will be panelled, as will also a portion of the wall behind. This north wall will be lighted by a rose window immediately above the pulpit, and by two side windows. The church will accommodate 900 persons; and the estimate of the total cost of the building already given includes all outside work.

Perth.—A grand Masonic demonstration has taken place at Perth, upon the occasion of laying the foundation-stone of Messrs. John Shields & Company's new power-loom weaving factory. The buildings, now in course of erection, are situated on the property of the Earl of Kinnoull, at Balhousie, a short distance to the north of the Perth Cavalry Barracks. When completed, the factory buildings will cover upwards of five acres of ground, and contain 400 looms, as also refreshment and reading rooms for the workers, and the usual necessary adjuncts to so large an establishment. The total cost of the erection of the factory will be about 20,000*l.*

Dumfries.—The foundation-stone of a new United Presbyterian Church has been laid at Waterbeck, near Keithbridge, Dumfries. The church, which will accommodate 331 sitters, will be in the Early English Gothic style, and will be formed of nave and transepts. The site is a short distance to the north-east of the present church. A manse is also in course of erection. The sites and the whole of the stone required for the buildings have been given free of charge. The cost besides is estimated at 1,868*l.*

CHURCH-BUILDING NEWS.

Hale, near Farnham.—Hale Church, built about twenty years ago, in the Norman style, and which had a north aisle added to it in 1861, has recently been again enlarged by the prolongation of the chancel, and by a chancel aisle. A western porch has likewise been built. Messrs. Goddard & Son, of Farnham, were the builders; and Mr. Ferrey, the architect.

Ashwell, Herts.—St. Mary's Church has been re-opened. The successive efforts at restoration made during the incumbency of the present rector have been directed towards beautifying the interior without destroying the original Gothic character of the building, and these are now completed; though a large expenditure is necessary to repair and arrest the ravages of time upon the work done by the Freemasons of the thirteenth century. Soon after the appointment of the present incumbent, the Rev. H. W. Hodgson, he set to work to restore the chancel, and this was effected for 330*l.* Subsequently the rector's father (Mr. C. Hodgson) restored the south porch at a cost of 120*l.*, hoping that this might lead to some more extensive improvements. The churchwarden (the late Mr. John Sale) about the same time paved the whole of the nave with York stone, and not long ago a painted window was placed at the east end of the south aisle by Mr. C. Tilling, to the memory of his wife. During the past year still further alterations have been made. Supported by his parishioners and other friends, the rector has been enabled to place an organ in the church, at a cost of about 400*l.* Under the advice of Mr. Shilcock, of Hitchin, architect, they removed all the old pews, substituting open seats, which have been made by Mr. Seymour, of Hitchin. The expenditure for this and some extras is estimated at 400*l.* In addition to this Mrs. Hodgson has presented the parish with a stone reredos, the centre panel of which contains a sculptured representation of the Lord's Supper, from the painting of Leonardo da Vinci; the design was furnished by Mr. A. Asplint, architect; and the stonework was executed by Mr. James Chapman, Lambeth-road. The cost was 80*l.*

Tunstall.—The new cemetery, which has been prepared for the town of Tunstall, or rather the Episcopal portion of it, has been consecrated by the Bishop of Gibraltar. It is on the slope of a hill on the west side of the town, and close to some large ironworks in the valley below. The cemetery is enclosed at present by a light iron fence, and has been laid out by Mr. Matthews, of Milton, from designs prepared by Mr. R. Dain, architect, Burslem, the walks and drainage being done by Messrs. Smith, Hanley and Newcastle. The extent of the cemetery is about seven acres, the land having been purchased from Messrs. Williamson and Mrs. Clive, at a cost of between 3,000*l.* and 4,000*l.* The chapels are not to be erected until time has been allowed for the subsidence of the ground from mining operations. About half the ground has been set apart for the burial of persons according to the rites of the Church of England.

Lichfield.—The foundation-stone of a memorial church to the Right Rev. John Lonsdale, D.D., late Bishop of Lichfield, is to be laid in the cathedral city, by the Right Hon. the Earl of Lichfield, the lord-lieutenant of the county of Stafford, assisted by the Right Worshipful G. S. Tindor, D.G.P.M., and the principal grand lodge of Freemasons of Staffordshire. After the ceremony there will be a public luncheon at the Guildhall, under the presidency of the Earl of Lichfield.

Iveggill.—The newly-erected church at Iveggill has been consecrated by the Bishop of Carlisle. The church is called Christ Church, and has been built at the sole expense of the Rev. A. E. Hutton, of Stockdalewath, the incumbent of the chapelry, from the designs of Mr. R. J. Withers, of London, who superintended the work. It is a

small edifice, and outwardly presents few attractive architectural features. It has, however, the advantage of being very pleasantly situated. The church, which is Geometric, and capable of holding 116 persons, consists of a nave, a chancel, south porch, vestry, and heating chambers underneath, and at the west end rises a bell spirelet of white shaw stone pierced by three louvres. The interior is decorated with windows in the nave and chancel are filled with stained glass, by Mr. A. O'Comer, of London. The east window has three lights, and is filled with a representation of the Last Supper, the small round lights above are delineated angels adoring, and the lamb and flag. The lower part of each panel is filled with traces. The two west windows, both of which have two lights, contain pictures of the Evangelists—the four major Prophets, Isaiah, Jeremiah, Ezekiel, and Daniel. The reredos is of oak, nine panelled compartments. Six contain zinc panels, illuminated, the Ten Commandments. These are the workmanship of Mr. Creighton and Mr. Scott, of Carlisle. The pulpit and font are of stone. These, as well as the general details of the church, have been executed from designs furnished by the architect. The contractors for the building of the church were Messrs. Robert Hope and George Little, of Dumfries. The church is faced with white shaw stone, but is chiefly built of Iveggill stone from the quarries of Mr. Thomas Nelson, of Penrith, who gave the stone not only for the church, but also for the parsonage-house now in course of erection near the edifice.

Montgomery.—The works in the parish church which have been in progress during the last four or five months, are now nearly complete. They include the restoration of the Perpendicular west window, which was in a very dilapidated and dangerous state. The whole of the stone work has been removed and replaced by new work, exact facsimile of the original, and filled with cathedral tinted glass. In addition to this, the roof timbers of the nave, which are of oak, had been cleansed of the coat of colour with which they were covered, and scraped and oiled. The roof is of open work, both in the west end of the nave, and in the chancel, with a wagon roof in the east end or intervening portion of the nave, the intersections of the woodwork of the latter having coloured bosses, which have been restored and recoloured. The red sandstone quoins of the windows of the nave, the north transept, and the Lymore Chapel, and the stonework of the west door, have been scraped, repointed, and restored. The Earl of Powis has alone borne the expense attendant on the works in the interior of the Lymore Chapel, including the removal and underbuilding, and restoration of the pillars and arches, which separate it from the nave. The exterior of the chapel has also recently been restored at the cost of his lordship. In cleansing the interior of the walls of this chapel, from the whitewash with which they were covered, curious old painting was discovered, representing the Resurrection; and it is still exposed. This chapel, which contains a piscina and sun-dial, has a gable window, the only existing remains of its former use as such are two very old runcumbent male figures in armour, but without record of either name or date, and a monument to Sir Richard Herbert, and his wife, the parents of Lord Herbert, of Chirbury, and George Herbert, the poet and divine. The whole of the works have been carried out by Mr. Morgan, of Llandinam, under the superintendence of Mr. Edward Haycock, junior, of Shrewsbury, who Lord Powis had previously employed in the restoration of the exterior of the Lymore Chapel.

Hungerford.—The foundation-stone of a chapel of ease to the parent church of Hungerford has been laid at Eddington. The site, an elevated one, on the east side of the turnpike road leading to Hungerford and Newtown, had been presented by Mr. W. Honeywood, of Chilton Lodge. Mr. Thomas Woolbridge was the contractor. The edifice is erected in the Gothic style of architecture from the design of Mr. A. W. Blomfield, of London, the material being coloured bricks with Bath stone dressing. The length of the building is 84 ft., and the width 37 ft., and it consists of chancel, nave, and south aisle, the latter being divided by stone pillars, with carved capitals and brick arches. There are open benches of stained deal, affording accommodation for 250 persons, but on an arrangement with chairs, the building would comfortably contain a congregation of nearly 350. The east window is painted the subject being "The Ascension;" it was inserted as a memorial of the late Mr. Mitchell

In the chancel are other windows of painted glass, whilst the body of the church is lighted by seven windows with mullions and tracery. The main roof is open-work, and plain; that of the chancel, however, is decorated with emblems of the Passion. In the chancel are stalls for the clergy and the choir, and the flooring consists of Minton's tiles.

Books Received.

On Aniline and its Derivatives. By M. RIEMANN, P.D., &c. With an appendix. Revised and edited by WILLIAM CROOKES, F.R.S., &c. London: Longmans, Green, & Co. 1868.

This is a practical treatise on the manufacture of aniline and aniline colours. It relates entirely to the actual state of the manufacture as adopted on a commercial scale, and to the apparatus in use in manufactories. Such being the case, and although the book is a valuable and interesting one to chemists and manufacturers, it scarcely admits of quotation here, curious and interesting to all though the subject of the beautiful colours and dyes got from coal tar be. The appendix contains the report on the colouring matters derived from coal tar, shown at the French Exhibition, 1867, by Dr. A. W. Hofmann, F.R.S. There is also a useful index to the volume.

Miscellaneous.

MONMOUTH WORKHOUSE COMPETITION.—Strong statements are made, even by one of the guardians, impugning the decision in this competition. Some of the competitors, we are told, have sent in a claim for compensation.

MOULDERS AND THEIR REGULATIONS.—At the Barnsley County Court, George Holden, a moulder at the Thorncliffe Iron Works, sought to recover the sum of 3*l.* 2*s.* 1*d.* from Messrs. Newton & Chambers. It appeared that the amount claimed had been stopped by the defendants on the plaintiff's wages, in consequence of his casting some 18-in. pipes over a given weight. The plaintiff contended that it was not usual to deduct anything from pipes of that size; whilst, on the other hand, the manager produced the books to show that it had been a rule at the works for forty years. The judge gave a verdict for 17*s.*, which was admitted.

THE SEWERAGE AND WATER SUPPLY OF GIBRALTAR.—The works of the main outfall are finished, and the house drainage is being begun. The works for conveying the water from the "Inundation" into the town are making rapid progress. During the operation of driving a tunnel from the Landport ditch towards the inundation, fresh water has been encountered in abundance soaking through from numerous springs. An estimate of the amount of these soakages, both in the tunnel and in another open cutting connected with the same works, has been made, and it is found to yield 1,436 gallons per hour. If it should prove that this stream is continuous, the great problem of the water supply of Gibraltar will be solved, and incalculable advantages must accrue to the whole community. All theories of the geological conditions of the Rock, according to the local *Chronicle*, seem to point to the existence of a large system of internal watersheds.

THE LATE MR. HASSALL, SCULPTOR.—Richard Hassall was born on his father's farm, near Leek. He inclined more to art than agriculture; and at the age of twenty-five entered the Macclesfield School of Art, where he made progress, gained medals and ultimately became an art pupil teacher. Leaving the school at thirty, for two years he devoted himself to wood-carving, stone-cutting, and sculpture. Macclesfield had a poor appreciation for such business, and insufficient patronage drove him nearly to the verge of despair. Two years and a half ago, the head designer and sculptor of the South Kensington Museum died—a man of great ability—and Mr. Hassall was sent for to strengthen the staff there; where he gained the esteem of all who knew him, and his productions were considered of great promise. Last week he died, just as he might have hoped to make this mark. Another designer and modeller (of South Kensington), Mr. Gibbons, was unfortunately drowned a few days ago.

A RECEIPT FOR YOUR LETTERS.—M. Replovsky, deacon of the Russian church at Stutgard, has presented to the Post-office of administration of St. Petersburg a letter-box, organized in such a way that the person who deposits a letter in it receives immediately a ticket showing the year, month, and day of the act. A commission appointed to examine the invention has found it perfectly practical and well suited for the object proposed.

MEMORIAL OF TALFOURD.—A memorial tablet, executed on British plate-glass of large dimensions, has been placed in the Philanthropic Lodge, No. 9, in the town of Reading, to the memory of the late Judge Noon Talfourd, who was a great supporter of the institution. The memorial consists of the arms, crest, and motto of the deceased judge, within an elaborate border. The work is the production of Mr. Thomas Mills, of London, who has just filled the east, west, and south chancel windows, for the church of Pitchcott, near Aylesbury, with stained glass. From the same factory were lately shipped fourteen stained-glass windows, for the church of the Holy Trinity, Port Elizabeth, Cape Town, consisting of figures, emblems, and geometrical patterns, in the style of the fourteenth century.

ARCHITECTS AND THE "ROYAL ENGINEERS."—A few young men are wanted to serve in H.M.'s Royal Engineers, and so bills are stuck about Devonport, showing to what trades they must have been brought up. The bill ends thus:—

- "Men of the following trades are required in limited numbers only, such as, —
 - Shoemakers, height, 5*ft.* 6*in.*
 - Filters ditto.
 - Surveyors ditto.
 - Clerks ditto.
 - Architects ditto.
 - Painters ditto.
- Rates of pay, from 5*s.* 6*d.* to 7*s.* 6*d.* per diem, according to grade and qualifications of trade."

This is rather good news for the rising generation of architects. They now know, and it is not the first time it has been announced in a similar way, that such of them as measure not less than 5*ft.* 6*in.* may get, in her Majesty's service, from 3*s.* 6*d.* to 7*s.* 6*d.* per day, according to qualifications; provided always that there are not too many of them striving for the post. This is certainly encouraging.

PRESERVATION OF BUTCHERS' MEAT.—It seems that Dr. Dewar's patented process for preserving fresh meat, by means of sulphurous acid, was successfully tried in Abyssinia. At a public meeting, not long since, in Sydney, resolutions were passed to raise 9,000*l.* or 10,000*l.* in order to aid a projector in his first experiment for the supply of the English market with Australian meat; and there is said to be every prospect of 300 tons of beef and mutton being soon despatched. We are told that a gentleman in Sydney has discovered a ready and harmless means of freezing the meat. Gases liquefied by pressure absorb an immense quantity of heat, or create an intense cold, when released from this condition. Such gases are introduced between the outer and inner cases of a double cylinder, and (by their release, we presume) the temperature of the inner cylinder can thus be reduced to 100° below zero. Within the inner cylinder the meat is packed, and therefore it never comes in contact with the gas at all. In twelve hours, it is said, 100 tons of meat may thus be completely frozen.

SANITARY REPORT ON MARYLEBONE.—The monthly report of Dr. J. Whitmore, the medical officer of health for the parish of Marylebone, has been issued. As compared with the death-rate of June last year, we find in the present return an increase of 2-3 per 1,000, and which is mainly attributed to the increased mortality from diarrhoea. The sickness returns also give 1,217 new cases of this disease, whilst in the same month last year they were only 645. The unusual prevalence of diarrhoea at the present time is attributed, first, to high temperature; secondly, to rapid decomposition of animal and vegetable matter consequent thereon; thirdly, to sleeping in overcrowded and ill-ventilated rooms under such a temperature; fourthly, to an unusual quantity of mutton fruit; and, lastly, to utter disregard of all care in diet and personal cleanliness among the poor population. To these causes the extraordinary dryness of the season ought especially to have been added, as rain is requisite to wash away the decomposing matter of a hot season. The shameful state of the dustbins of some of the better class of houses is adverted to.

WIMBLEDON LOCAL BOARD.—The Wimbledon Local Board have elected Mr. Chas. Bird, C.E., to the office of surveyor, vice Mr. Bryceson, who has resigned.

WATER.—Sir: During this hot weather pumps in and about London are besieged for the cool refreshing water in the wells. I would caution people not to drink this water, for I have no doubt that sewage percolates into the wells from adjoining sewers and drains. The gravel beds through which the sewage passes may remove the mechanical, but certainly not the chemical impurities. Some years ago people were seized with cholera from drinking water from wells and cisterns polluted with sewage. Housekeepers should also thoroughly wash out and clean the house-cisterns, which generally contain a muddily deposit from the water supply. People are often seized with diarrhoea from drinking water drawn from foul cisterns.—J. P.

CURIOS DISCOVERY OF A FIRE.—The inmates of Barlow Hall, near Selby, a large old-fashioned house, were recently aroused from their slumbers by the discharge of firearms, evidently inside the house. The master of the house, a Mr. Bailey, and his servants at once proceeded downstairs, when they found the kitchen in flames. An alarm was given, and the neighbours rendering every assistance, the fire was confined to that portion of the house. On an examination being made it was found that a hearth in the chimney had been ignited, probably the evening before, and the fire had communicated with other portions of the house, including a closet containing three loaded guns. These were discharged on becoming heated; hence the discovery of the fire.

IMPROVEMENT OF WORKINGTON HARBOUR.—In accordance with a plan prepared by Mr. Rendall, engineer, the trustees of the harbour of Workington, with the consent of Lord Lonsdale, have commenced a work which has long been greatly needed, namely, the improvement of the entrance channel to their harbour. For a great length of time, owing to the accumulation of gravel on the south side, the channel has been so narrow as to render its navigation dangerous, and during storms almost impossible. The old pier is to be extended 60*ft.* The extension of John's Pier is not at present contemplated, but in order to arrest the travelling heath, three groins are to be put up to the west ward of John's Pier. Workmen are also engaged at low water in deepening the entrance to the Lonsdale Dock.

THE NEW LAW COURTS.—In reply to Mr. Alderman Lawrence, the Chancellor of the Exchequer has stated that the plans of the New Law Courts will be settled by the Treasury, with the consent of the Commissioners. With regard to the funds, the Act of Parliament provides that 200,000*l.* he voted in consideration of the surrender by the Government of the buildings by the side of Westminster Hall now occupied by the Law Courts; 1,000,000*l.* were to be contributed from the surplus interest fund of the Suitors' Fee Fund; and the rest was to come out of a fund to be provided by fees paid by suitors, other than those in the Court of Chancery, extending over a period of fifty years. He could not say whether the contracts would be submitted to Parliament, as the final plans had not yet been decided on.

TWENTY-ONE HOUSES BURNT DOWN.—A couple of very destructive fires took place in Devonshire on Saturday and Sunday, part of two remote villages being razed to the ground. The disaster was in each case owing to the ignition of thatched roofs, which in the excessively dry weather are very inflammable. At Colyton ten houses were burnt down, most of the furniture being destroyed; none of it insured. At Collympton eleven houses fell a prey to the flames, which were increased by a large quantity of oils and spirits lodged in the house where the conflagration broke out. The tinder-like roofs of a whole row of houses were in a blaze at once, and the fire brigade had no chance of extinguishing the flames. Water was obtained from the town lake, but it proved inadequate to the occasion. There was no time to save the furniture, and in one or two instances the inmates barely escaped with their lives. There had not been so great a fire in Collympton since the disastrous calamity of twenty-five years ago, when, also in the month of July, 151 houses were destroyed, the fire originating in a flash of lightning. How the fire on Saturday and Sunday originated is a mystery. The total damage caused is estimated at 5,000*l.*

SOCIETY OF GRAY'S INN.—The whole of the property of the Honourable Society of Gray's Inn is now undergoing an external repair, under the new surveyor, Mr. Lewis H. Isaacs. The contractors for the works are Messrs. J. Simpson & Son.

LONGTON COTTAGE HOSPITAL.—This hospital has been inaugurated. It has been built at a cost of between 600L and 700L, about 130L of which have been contributed by the working classes. Numerous gifts of furniture and other necessaries for a hospital have been made, and the institution will now soon be in complete working order. The new building is erected near the mission schools at Mount Pleasant. It has a very neat exterior, whilst inside its appearance is cheerful and comfortable. Besides eleven bedrooms on the first-floor, there are, on the ground-floor, the sick wards, surgery, bathrooms, and outhouses, and other accommodation, which will be further developed according to the requirements of the town. At present accommodation is provided for four men, four women, and a number of children, and the patients will be attended by skilled nurses, and the best medical skill in Longton.

TENDERS.

For the erection of residence and warehouse, Belvedere-road, Lambeth, for Messrs. Bartram, Thomas, & Front. Mr. Lucy W. Hidge, architect:— Adams & Sons £1,758 0 0 Newman & Mann 1,696 0 0 King & Sons 1,530 0 0 Scrivener & White 1,511 0 0 Front 839 0 0 For the erection of a workhouse and outbuildings, &c., at Llanerchymedd, for the guardians of the Anglesey Union. Mr. R. G. Thomas, architect:— Griffiths £2,234 10 0 Chester (accepted) 1,925 0 0 For the erection of the County Court and offices, Cheltenham. Mr. T. C. Sorby, architect:— Billings & Sons (accepted) £3,340 0 0 For building a house in Newton-road, Paversham, for Mr. T. Gillett. Mr. B. Adkins, architect:— Creed £1,412 0 0 Brattle & Shoobridge 1,326 0 0 Epps 1,223 0 0 Austin 1,193 0 0 Solihull 1,139 0 0 Shrubsole (accepted) 1,039 0 0 For house at Caterham. Mr. P. Webb, architect:— Wells £3,095 0 0 Colls & Son 2,564 0 0 Ward 2,354 0 0 Foster 2,373 0 0 Turner 2,549 0 0 Sharpington & Cole 2,493 0 0 Regis 2,489 0 0 For villa residences at Walton-on-Thames. ADVERTISEMENTS.

KELLY'S PRACTICAL BUILDERS' PRICE-BOOK; or, safe Guide to the Valuation of all kinds of ARTICLES WORKED; with the Modern Practice of Measuring, and the present of the New Building Act for Regulating the Construction of Buildings. Revised and Corrected by New Calculations upon the recent Valuation of Materials and Labour. Arranged by an Architect of eminence, assisted by several experienced Measuring Surveyors, illustrated and exemplified by direct Measurements and numerous Woodcuts. Royal 8vo. price 5s. neatly bound. London: Published by T. KELLY, Paternoster-row; G. PINXIN & Co. 10, BURLINGTON-COURSE; and may be had of all Booksellers. Or whom may be had, see Editions in Quarto, of the following Works:—

1. PETER NICHOLSON'S PRACTICAL CARPENTRY, JOINERY, and CABINET MAKING. Revised by TREDGOLD; being a complete and accurate Treatise upon the Principles of Working, managed on Geometrical and Mechanical Principles. Ten Parts 2s. 6d. or 10 boards, 30s. containing upwards of 120 steel plates, and numerous Woodcut Diagrams.

2. PETER NICHOLSON'S PRACTICAL MASONRY, BRICKLAYING, and PLASTERING (revised by TREDGOLD); being a complete and accurate Treatise upon the Principles of Lining for Stone-cutting, for the Use of Workmen; the Formation of Mortar, Cement, and Plaster; the Use of various Materials, &c. &c.; and a Description of the various Materials employed. Ten Parts 2s. 6d. or 10 boards, 30s. containing upwards of Ninety Steel Plates, and numerous Woodcuts.

3. TREDGOLD and NICHOLSON'S Theoretical and Practical Treatise on the FIVE ORDERS of ARCHITECTURE; containing plain and simple Rules for Drawing and Executing them in the purest style, including an Historical Account of the Rise and Progress of the Art. Illustrated by the Hand of One Hundred Steel Engravings, executed by Artists of first-rate talent, including numerous Diagrams. Ten Parts 2s. 6d. or 10 boards, 30s.

4. CHARLES BUTTLE, M.A. ARCHITECTURE, containing Plans, Elevations, Sections, Perspective Views, and Details, for the Erection of Churches, and other Buildings for public Use, engraved on steel, with Directions for Building, and the estimated cost of each edifice. Twelve Parts 2s. 6d. or 10 boards, 30s.

5. DESIGNS FOR PUBLIC BUILDINGS, consisting of Plans, Elevations, Sections, Perspective Views and Details of Churches, Chapels, Schools, Almshouses, Gas Works, Markets, and other Buildings for public Use. By S. H. BROOKS, Architect. Beautifully engraved on steel. Ten Parts 2s. 6d. or 10 boards, 30s.

6. THE HOUSE DECORATOR and PAINTER. PRICED GUIDE, containing a Series of Designs for Decorating Apartments with taste, and suited to the various Styles of Architecture. By H. W. & A. BROWNELL, House Decorators to Her Majesty. Ten Parts 2s. 6d. or 10 boards, 30s.

7. THE HOUSE PAINTER, or DECORATOR'S COMPANION, containing a complete and accurate Treatise on the Art of Colouring, the Laws of Harmonious Colouring, the Manufacture of Fine Pigments, Oils, Varnishes, &c. By W. HIGGINS, Esq. Accompanied by actual Specimens of Hand-brush Graining and Marking. Ten Parts 2s. 6d. or 10 boards, 30s.

THE ENGINEERS' and MECHANICS' ENCYCLOPEDIA; a new and enlarged Edition, embracing Practical Illustrations of the Machinery and Processes employed in the Manufacture of Manufactures of the British Empire. Illustrated by upwards of 2000 Wood Engravings. By LUKE BEBBER, Civil Engineer. In 10 vols. 10s. 6d. This work has been developed many of the important facts since the first publication in 1855. It includes the most recent and valuable information for the use of the Encyclopedist. The Inventors of the Editor; for, as the value of each was tested by experiment, a description was accordingly prepared, and the Editor has endeavoured to give in the revision of each one, this edition has now become systematically embodied; so that it may be received as fully and as completely extensive "the state of the Art of Engineering and Mechanism, adapted to the wants of the "practical Men." In two large 8vo. vols. cloth, letter, price 10s.

PROFESSIONAL PAPERS ON INDIAN ENGINEERING.

Edited by Major J. G. MEDLEY, R.E. Assoc. Inst. C.E. And Published under the sanction of the Hon. the Secretary of State for India. Each Quarterly Number contains 16 pages, with several Illustrations. Specimens can be seen at Messrs. SMITH, ELDER, & CO.'S, 65, Cornhill, London, where subscribers' names will be received, and the price of the work (containing 16 Numbers) is 10s. 6d. each, now ready. Price of either, 3s. 6d. neatly bound in cloth.

THE AGRICULTURAL GAZETTE OF THE STATE OF THE CROPS THROUGHOUT THE COUNTRY.

Order of any Newsvendor, A King's Copy sent for Six Months Office for Advertisement, 21, Wellington-street, Strand, W.C.

ILLUSTRATED LECTURES, by the Rev. J. L. THE EXPLORATION OF PALESTINE.—This Lecture, and its numerous large original Illustrations, have the express sanction of the authorities of the "Palestine Exploration Fund."

2. HERALDRY, Historical and Popular. By the Rev. J. B. BOUTELL, Esq. (who has undertaken to conduct his brother's lecture arrangement), 14, The Villas, Epsom, Kent.

On Wednesday next, in One Volume, 8vo. with about 240 Illustrations, engraved on steel and copper, cloth, 10s. 6d.

LATHES and TURNING, Simple, Automatic, and Ornamental.

By HENRY NORTHOTT, London: LONDON: W. & A. GILBERT, CO. LONDON: 10, PATERNOSTER-R.

Just published, 8vo. cloth, with Illustrations, in School of Art. The principles governing the projection of Shadows, as shown in perspective representation, are explained in a Treatise upon the Art of Shadows, together with that of Sections, Chapters in twenty lessons; illustrated by numerous Woodcut Diagrams. London: CHAPMAN & HALL, 15, Pall Mall.

SCIOGRAPHY; or, RADIAL PROJECTION OF SHADOWS.

By R. CAMPBELL PUCKETT, Ph. D. Head Master of the Bath School of Art.

The principles governing the projection of Shadows, as shown in perspective representation, are explained in a Treatise upon the Art of Shadows, together with that of Sections, Chapters in twenty lessons; illustrated by numerous Woodcut Diagrams. London: CHAPMAN & HALL, 15, Pall Mall.

NICHOLAS LAKE, ARCHITECT and CONSULTING SURVEYOR.

A Bill of quantities accurately prepared; works measured; up-builders' accounts estimated. Railway compensation claims arranged. OFFICES, 1, ADELPHI PLACE, LONDON-WRIGG, E.C.

A SURVEYOR, of many years' standing.

would be happy to make ARRANGEMENTS with Architects & take out Quantities, &c.—X. S. Coadwin-street, Regent-street, W.C.

The Builder.

VOL. XXVI.—No. 1331.

The Future Architectural Rank of London among European Cities.

MILITARY reasons avowedly and properly guide the conduct of the general. The physician acknowledges no rules for his prescriptions that are not derived from his knowledge of therapeutics. The lawyer, the financier, the man of any special science, is bound by technical rule. The architect must all to take his proper position as one of the directing influences of society so long as it is the habit of the day to settle architectural questions by any other than architectural reasons.

A very important instance of the truth of this view is now attracting public attention. The subject of the site of the new Law Courts has been twice brought before the House of Commons. In the discussions that have occurred, and in the more lengthened and detailed argument on the subject that is offered to the readers of the public journals, the prime question, the architectural one, has been treated as a matter of minor importance. Convenience, not of the public, but of certain owners of property; economy, which is not true but only apparent; and, above all, the dislike entertained by nine people out of ten to getting out of a groove, however casual may be the causes which placed them in it, have been allowed to exercise as much or more influence as the prime consideration of obtaining the best architectural site for a noble public building on which we are preparing to expend millions of money in the hope of its endurance for centuries.

In all architectural works worthy of the name, the choice of site is the primary consideration. For the most part the exigencies of civilization limit the architect in this respect. The position of military structures is generally indicated by Nature herself. The pass to be commanded, or the wide extent of champaign to be dominated, at once determined the feudal builder where to fix the tower of his *château*. Around these natural fortalices the humbler tenements of the peasant grouped themselves for protection. Paths originally selected by cattle, either from their easy slope or from some of those capricious causes that mock the subsequent inquirer, become crooked but well-worn roads. Subsequent fences add permanence to these vagaries of rustic stratigraphy. Cottages and houses rank themselves in the line of the hedge; until at length a purposeless and unintelligible maze, such as the ground-plan of the city of Norwich, confounds the engineer and drives the architect to despair.

Our great cathedral builders for the most part had a start in time over the casual tenements which slowly became consolidated into streets. A fair close surrounded the prin-

cipal structure. The future density of city habitations was unforeseen when such edifices as Gloucester Cathedral, Chester Cathedral, or York Minster, arose as the visible centres of the Christian worship of the surrounding country. The noble towers and happy position of York still enable that cathedral to impress the imagination, even of the traveller who flies by in the railway-train, with a sense of grandeur and of beauty. But if we compare the case where a collegiate or abbey church of imposing dimensions stands in a neighbourhood as yet free from the fury of building, with those in which the mass of population has circined the ecclesiastical globe with a dense array of crowding houses, we shall obtain a better idea of the care of the great church builders in selecting the locality for their work than we may be ordinarily apt to take. Sometimes, indeed, in the troublous times of civil war, the need of security led to the abandonment of the original site, as in the case of Sarum. St. Alban's Abbey, Ripon Minster, Ely Cathedral, Malvern and Tewkesbury Abbeys, may be pointed to as instances of the manner in which the grand form of the church, in the idea and purpose of the architect, stood out, dominant and impressive, towering as far above the humbler roofs of the subservient citizens as the inflexible dogma which it symbolized did above the feeble and uninformed groping of private judgment.

Sometimes the absolute magnitude of the building was such as to crush all competition. Such is the case with St. Peter's. Sometimes a happy chance has led to the selection of an unrivalled site, in an architectural point of view, in despite of economical or political considerations. Such was the case with some of the magnificent ecclesiastico-palatial structures on which the Portuguese kings lavished their enormous wealth. Such was the case with the unrivalled Superga, a church and conventual quadrangle on a lofty hill overlooking Turin, but from which, in certain states of the clear Italian atmosphere, the Duomo of Milan can be distinctly seen. The Duke of Savoy, reconnoitering from this elevated point the lines in which the French army lay round the gallant little ducal capital of Turin, made a vow to build a church on that identical spot, in honour of the Virgin, if victory attended the battle on which he then and there decided. The lover of architecture has reason to rejoice at the defeat of the French king. The somewhat coarse and rough masonry of the Superga is no drawback to the effect of the noble perspective.

The dense and squalid mass of the London of the Stuart kings,—that London in which the Oriental plague had established its power,—was happily swept from the soil by the Great Fire of 1666. To that destructive agent we owe the churches of Wren, the width and comparative convenience of the streets that we are now finding too narrow for our traffic, and that noble cathedral which has the defect of wanting space from which to be seen.

If to the genius of Wren, and to the happy fatality of conflagration, we owe the chief architectural beauty of seventeenth-century London, of a London that will soon be almost as much a thing of the past as ancient and historic Paris already is, we may attribute the stately magnificence which is promised, not indistinctly, for the future, in no small degree, to the impulse given to civilization by a rude Northumbrian labourer, who, at nineteen years of age, could neither write nor read. The patient, resolute, inspired toil of George Stephenson originated that practical union of the rail and the locomotive engine which first linked the suburbs of London with Liverpool, with Bristol, with Falmouth, with Newcastle, and with Edinburgh, and which then, spanning the Thames, burrowing under Islington, and finally marching boldly through the very "City" itself, has enforced

the adoption of a new style of metropolitan architecture.

It is true that in the nineteenth, as well as in the seventeenth century, London owes much to the destroyer. The fire that consumed the old House of Parliament not only made room for the Palace of Westminster, but rendered it necessary seriously to consider the subject. We cannot but feel, notwithstanding the argument that a loftier palace would have tended to dwarf the Abbey, that it is a subject of irremediable regret that Sir C. Barry's beautiful structure was not based at least 8 or 10 ft. above the present level. But this regret, even if ill founded, should be a powerful reason for a careful and adequate consideration of the all-important question of site for our future public edifices.

The great stimulus that was given to the art and practice of the builder by the construction of our railways has had an influence on our street architecture which has been as great indirectly as directly. Those who remember what were our public works forty years ago, our canal bridges, our wooden slip roofs, our hotel, or, rather, tavern accommodation for the stage-coach traveller, may well hold that the Thames Embankment would have been untouched but for the pioneering of the school of Stephenson and of Brunel. Pestilence again threatened the city from the insufferable manner in which we had polluted our noble stream. We were thus driven to lay out four or five millions on drainage works, which, incomplete and temporary as they must remain so long as the estuary is made the ultimate receptacle for the wasted chemical wealth which the land demands, have yet enabled a few straggling salmon to make their way above the bridges. As the Thames again becomes practicable as a water thoroughfare, and as we are devoting such large sums to the purification of the water, and to the removal of the fecular mud banks, the question of the elevations that are to rise within the embankment walls assumes primary importance. The architectural rank of London among European capitals will principally depend on the use we make of the building sites adjacent to the Thames Embankment.

We have now resolved on an architectural development of our public buildings of great magnitude. Four several works, each of primary importance, have been confided to as many distinguished architects. Having provided a palace for our Legislature, we are about to complete the palatial accommodation for our administration. Our disgraceful want of a gallery in which our great pictorial wealth may receive the first requisite for its due use, a place in which it can be seen, is about to be remedied. The aesthetic purposes to which South Kensington is devoted are to receive further pecuniary support. The formation of a national home for the archeological and architectural relics now committed to the cellars of Bloomsbury cannot be long delayed; and we have already expended more than three-quarters of a million sterling in clearing away a rookery that surrounded the ancient City boundary near the Temple, with the purpose of providing a site for worthy Courts of Justice.

To these five admitted requirements a sixth must be added, in the shape of a natural history museum. The state of our galleries of stuffed animals in the British Museum is humiliating to the naturalist, who is aware how far we are, in this important educational respect, in arrears of even secondary capitals on the Continent. It is, in our opinion, indubitable that the requirements of the library, or rather libraries proper of the British Museum, with the addition of the print-room, and, possibly, or perhaps temporarily, of the Geological Museum, a less expansive educational department than that demanded for organic forms, will require the whole available space in Bloomsbury. The localities of the Government

Offices, and of the educational show-rooms and museums, may be left without present question. It remains to consider, on the one hand, the use to make of the finest architectural site in London, and on the other the architectural requirements of the Courts of Law, the National Galleries for paintings, for sculpture, and for annual exhibitions, and the Archaeological Galleries.

Into the determination of a question of this magnitude extraneous arguments should not be allowed to enter. The convenience of site is one of the elements of architectural fitness; but this convenience is that of the general public, not that of any small section of the inhabitants of London. To allow the fact that the owners of the tumble-down pigeon-house that now let at such fabulous rents in the neighbourhood of Lincoln's Inn have a vested interest in keeping the Courts of Justice in an inferior locality, would be at once disgraceful and absurd. The chamber of counsel must be near to the Courts of Law, although the most eminent men have long contrived to appear, or at least to be paid for their appearance, at the same hour at Westminster and at Guildhall. The question of convenience to the bar is neither more nor less than the question which presents itself to every householder when he thinks of moving; not less, that is to say, in one sense, but actually less, inasmuch as the removal of the furniture of a single room is more easy than that of the furniture of a house. The barrister will have to remove his library to new chambers, as he does, perhaps, every five years, without any motive of greatly increased convenience, and his interest in the locality of the Law Courts is at an end.

As to the solicitors, they are, as it is, scattered all over London. A certain number of respectable firms colonise Lincoln's-inn-fields. These gentlemen consult counsel at their chambers. They may now diversify their walks from Stone-buildings to King's Bench-walk. To say that it would be any inconvenience to them to have the bar grouped in convenient chambers near the courts in which they practise is not for a moment to be urged. There remains, then, the sole fact, that if the Law Courts are fixed a quarter of a mile to the south of Carey-street, the rent of a few sets of ill-built chambers may be lowered.

We are by no means asserting that the obtained site for the Law Courts should be given up, and that a site should be obtained for them next the Thames Embankment. There are many and grave difficulties in the way: it must involve a large extra expenditure and considerable delay. It must not be supposed, as some writers on the subject appear to have done, that there is a site on the Thames Embankment ready to hand. This is an entire mistake. There is a frontage, and little more: the site must be bought, and would have to include all the houses between King's College and the Temple, one way, and between the Strand and the river the other. All we ask is, that the question should be fairly inquired into. Will the game be worth the candle? Are the advantages of the site sufficient to outweigh the objections? And in making this inquiry it must not be forgotten that to render the already obtained site sufficient, and to provide fitting frontages and proper accesses, more land to the west and to the north must be purchased.

Convenience of access on either side, by street, by river, by underground railway, will certainly be commended by the river site; and for architectural magnificence neither the Sainte Chapelle, the Institut, nor the completed Louvre of the Second Empire, would boast a nobler site, by the comparatively feeble tide of the Seine, than that which is obtainable by the banks of the Thames. To all persons interested in the dignity and in the prospects of architecture in this country the subject is one of primary interest.

It is to undervalue questions of this nature to consider them as of interest to the architect and to the man of taste alone; still more inappropriate is it to attempt to solve them without attributing due weight to aesthetic considerations. Persons are not, for the most part, more highly respected by their neighbours than they are by themselves. The stately magnificence of a capital city is one of the elements of national prestige, and therefore of national power and influence. The architectural beauty of Paris is not the least of the claims of the French nation to rank their capital as the metropolis of civilisation. An unusual combination of circumstances now allows us to do for London, if not

what Augustus did for Rome, yet at all events more than it often falls to the lot of any single sovereign to see effected in a populous capital. We have fresh and noble sites freely offered to the architect in the very centre of population. We have buildings of the first magnitude and importance to erect, and the erection of which has been resolved on. In a time of peace the nation is prepared to pay adequately for the construction of the courts of justice, of administration, of art, and of education. Commercial public works, of a magnitude unrivalled since the days of imperial Rome, if not since those of the proudest Egyptian dynasty, are educating our workmen, from the lowest to the highest, to a style of craftsmanship entirely unknown in this country at the commencement of the present century. Private wealth, under the stimulus already given to good taste, is replacing the dead walls and unmeaning windows of the Georgian style of street building, the poorest and least picturesque that was ever common in any civilised nation, by not altogether unsuccessful efforts to create a *Victorian* London. To what ever part of the metropolis we turn we find efforts, or designs, for improvement. If in the character and in the site of the buildings which must crown and characterise the whole structural renovation of the era we fail to be guided by true architectural reason, if we allow private interest, uneducated dabbling with artistic and scientific questions, or peddling crochets, to decide or to interfere with the decision, we shall do an injury to our children as well as to ourselves. It is to be hoped that the opportunity for making the architectural aspect of London worthy of the capital of the richest nation in the world, and worthy of the most populous city of Europe, will not be lost or misused. Such occasions as the present once last never recur.

THE ARCHEOLOGICAL INSTITUTE AT LANCASTER.

On the 28th ult., the annual meeting of the Royal Archaeological Institute of Great Britain and Ireland commenced at Lancaster. The Mayor (Mr. T. Storey) and Corporation of Lancaster presented an address to the president and members of the Institute, in which they expressed their congratulation on the meeting being held in the capital of the County Palatine.

Lord Talbot de Malahide, in responding, said it had always appeared to him that of all the public bodies of this country upon whom it was incumbent to show its regard for the preservation of ancient monuments, there was none upon whom that duty devolved more than on ancient corporations. Although there were glaring exceptions, yet the majority of these bodies seemed impressed with their responsibility in this matter. At one time, in the frenzy of the moment, several ancient corporations disposed of many of their most curious heirlooms, merely for the paltry sum which the molten metal would afford them. He believed many of them had been ashamed of what they had done, and in some instances they had done their best to restore, by imitation, the monuments of which they had lost the originals. He trusted that nothing of that sort had been done in Lancaster. His lordship then went on to say that it was essential to appoint a president for the year, and that he had much pleasure in resigning his office in favour of his friend Colonel the Right Hon. Wilson-Patten, M.P.

The newly-installed President then addressed the meeting, and some other speeches followed.

A pleasant week was spent; but Archeology played second fiddle to Pic-nic. The papers were few, and certainly not all of striking merit. Amongst those read on Wednesday was one by Dr. H. Barber on—

Pre-Historic Remains of Furness.

He commenced by remarking that the evidences of the ossific caverns were amongst those which carry man farthest back into the regions of time. The traces of man's existence in this country at very early periods, when Europe was passing through the "fluvial drift" period of the world's geological history, was shown in the reliquary caves, such as are met with at Capeshead and Kirkhead. He then proceeded to give a description of the Kirkhead cave, and the very interesting remains which had been discovered in it. The Capeshead cave is of larger dimensions in a limestone rock, which projects at the

point where the estuary of the Leven opens out upon the Ulverstone Sands. The cave was much disturbed during the formation of the "Over-sands" railway, several yards of the rock at the entrance having been blasted away. The Duke of Devonshire caused the cave to be cleared to a great extent, but nothing of importance was discovered, the work, unfortunately for the interests of archeological science, not having been conducted under the direction and immediate supervision of any one accustomed to such an undertaking. The floor of the cave consists of fine decomposed granite sand, about two or three feet deep, and sufficient evidences of human habitation had been discovered to lead us to hope that at no very distant time the cave will be systematically and thoroughly examined. Other caves are to be found in the neighbourhood of the village of Sculles, in Low Furness, one of which, at Sculles Hings, has been described by Mr. Cloze. Several hut circles, or camps, are to be seen in this district, the principal one being that known as the "Stone-wall," at Urswick, but of their original design and use we are unable to form more than an imaginative conjecture. Other encampments of a similar nature are to be seen at Foulda, on the Holme-bath estate; at Birkirigg; at Colensh, near Grizebeck; the Beacon, near Nettleslack, &c. The paper then treated upon the "sepulchral circles," which differ slightly from the hut circle in having the circle of stones, or walls of earth of which they are constructed, unbroken, while in the hut circle there is a sort of entrance to the circle, generally on the east side. One of these circles exists at Birlugs, and is known by the name of the "Druidical Temple," which, however, is evidently a misnomer. Other sepulchral circles are also to be met with at Knappath, on Kirby Moor, and a remarkable one at Swineshead.

The Chairman (Lord Talbot) gave an short account of some pre-historic remains found in Spain, which bore a close analogy to similar things found in this country.

On Wednesday evening a discussion was raised touching the

Value of the Form of the Arch.

in setting dates, on a paper read by the Rev. J. S. Petit, on "Carmel Priory Church," a building recently restored. The rev. gentleman exhibited some water-colour drawings of the church and its architectural details, and described the features of the building, which presented a singular mixture of the Norman and Early English style. Arches placed opposite to each other were found to be one Norman, with round heads, and the other Pointed; and yet, from their position, they must have been raised at or about the same time. The capricious employment of the round and pointed arch was, Mr. Petit observed, one of the remarkable features of the building. The tower also presented an unique feature in the church, there being a second tower within the first, surrounded by a wall, and supported by pillars so slender as to appear highly dangerous. The whole church was regarded by the rev. lecturer as a good but perplexing example of Gothic architecture. The priory was founded in 1188.

The Chairman (Mr. J. H. Parker) desired to call attention to the fact that they must not consider the form of the arch as a guide to the age of a building. That form was commonly a matter of convenience. People were too apt to think, if they found a round-headed arch, it must be one of the twelfth century, and that, if it was Pointed, it must be of the thirteenth century. Now, he could show them round-headed doorways of all periods, where it was convenient to make them. The form of the arch was, in fact, no guide to the date. They must look to the moulding and tracery.

Mr. E. Sharpe protested against the chairman's dictum as to the form of the arch being no guide to the date of the building. It was true, he said, that they might find exceptions: they knew that one swallow did not make a summer; but unquestionably for the first thousand years of the Christian era the round arch was used, and for the last thousand years the pointed arch was used. That was the general guide to go by; but there was a period intervening when the round arch had to give way to the pointed, and this transitional period was interesting as being the grave of the early form, the Romanesque, and the cradle of the later, the Gothic. This transitional period was one to which he had paid particular attention. He had visited more buildings of that period, per-

haps, than any other individual, with the object to determine, if possible, the question why the circular arch was abandoned, and the pointed arch introduced, and he had come to this conclusion—that the cause of the change was that the circular arch had a certain amount of weakness, which he explained as arising from the imperfect wedge-shape of the stones used in the round arch. The builders saw this tendency to weakness, and so they put a point to the top of the arch. They found in France, and indeed all over continental Europe, that the pointed arch was used invariably in the early buildings of the Transitional period on the main arches of a building—he would call these the arches of construction; but the arches of decoration—the doorways and arcades—were circular. For the first twenty-two years of the Transitional period—which lasted only about forty-five years—the arches of construction were pointed, and the arches of decoration were circular; he would guarantee this on his reputation as an archaeologist. It was not desirable that they should ignore that fact, but they should publish it for the benefit of all students. At the end of the Transitional period there was some confusion, and an apparent inclination to return to the old style; but up to the middle of the twelfth century the buildings were constructed according to the fashion of the Normans; after that period new ideas arose.

Thursday was the first great excursion-day, and included Furness Abbey and Piel Castle. At

Piel Castle,

Mr. Parker having collected his audience together within the walls of the inner bailey, offered a few remarks on the building, which he said was built in the reign of Edward III., about the middle of the fourteenth century, by the abbot of Furness. There were two baileys or courts, the outer one for the protection of the castle, and the inner for the use of the inhabitants. The Chapel was on the second floor of the keep. It was, however, merely a sacrum, a small space sufficient for the accommodation of a priest and an altar, the congregation being assembled in an adjoining apartment, which was used for secular purposes at other times, and which was separated by a screen capable of withdrawal. The main building was divided into two long chambers, which were again subdivided. In answer to Lord Talbot de Malahide, Mr. Parker said there were no doubt three stories to the building, and in many of these castles the upper chambers were the chief apartments. Porticulis grooves were found at the entrance. This, Mr. Parker maintained, was a very ancient system of fortification, for it had been found in use at Pompeii, in the walls of Rome, and in the Etruscan cities. He denied that this kind of fortification was Saracenic, but said it had been adopted by the Saracens with modifications, though existing much earlier than the time of the Saracens. Our mediæval castles were copies of castles of the third and fourth centuries, and they were copies of still earlier originals.

On

Furness Abbey

Mr. Sharpe discoursed. The first part of Mr. Sharpe's address was devoted to the progress of Gothic architecture generally, the steps of such progress being likened by him to the blended colours of the prismatic spectrum, the dark background of the celestial phenomena representing the gloomy period of heathen darkness, which, as the light of Christianity dawned, became illuminated with the various colours of the spectrum. Mr. Sharpe proceeded to apply his general principles to the history of the abbey amidst whose remains his hearers were assembled. He mentioned the historical fact of the early Cistercians having broken away from the parent institution in France, for the desirable purpose of amending the laxity that had crept into the practices of the old Benedictine foundations, which fact, Mr. Sharpe observed, was really the first act of that remedial course which terminated in the great Reformation of the time of Henry VIII. and his immediate successors. With the settled purpose of establishing a system of more practical piety, the Cistercians multiplied their foundations by hundreds, and this abbey at Furness was not the least magnificent of the wonderful fabrics whose devotion had from time to time erected. Mr. Sharpe said he had visited nearly all the abbays of the order on the Continent, and he found invariably that one common rule prevailed, and that rule was the adoption of

an improved style of architecture, from which all florid ornamentation likely to lead to superstitions or idolatrous practices was to be excluded. What gave the lecture the chief local interest was the fact mentioned by Mr. Sharpe of his attendance at that spot in 1850, when the Archeological Institute was last at Lancaster, and of his then having conceived the idea that the remains of important portions of the abbey lay buried beneath the soil of the adjacent field or orchard, and of his having suggested excavations, which the liberality of the Duke of Devonshire carried into effect through Mr. Ramsden, the result being the discovery of the vast hospitiu which constituted so important a portion of the abbey.

At the *déjeuner* which followed the visit, the Duke of Devonshire, replying to his "health," said if it was a privilege to be the owner of so venerable a ruin as that which they had just visited, he felt it was a privilege by no means exempt from duties and responsibilities. He considered it imperatively binding on him that he should hand down to those who followed him this memorial of the past unimpaired. He considered it to be his duty to take every precaution that he could against the ravages of time, and those dilapidations and decays to which such ruins were exposed, as well as against those injuries which might inadvertently be caused by visitors. He said "inadvertently" because he felt certain that no person would inflict wilful injury on such memorials of the past. Amongst the thousands who visited the abbey every year he felt proud that they were so well able to appreciate the architectural glories as well as the historical associations of the place as to refrain from injuring it.

On Friday Mr. Parker gave some brief particulars of his recent investigations in Rome, of which we have published a fuller account. Mr. Parker said that a great deal more had been done in the work lately than had ever been done before, and he proceeded to give a rapid sketch of the discoveries that had been made by the Government of Rome, by private individuals, and by archaeologists themselves. Among these was a discovery made by the Pontifical Government on the banks of the Tiber, namely, the original marble wharf in the lower part of the port of Rome, where the marble was landed. Excavations made here had been followed by great success. They found steps leading down to the water, which, instead of being level, were sloping, taking a zig-zag form up the cliff. They were paved with tiles of the Roman Empire. A little trick had been played, however, in reference to these tiles, of which he as an archaeologist complained. Some of the tiles had been broken or lost, and had been replaced with others from elsewhere. This was certainly managed very ingeniously; but he (Mr. Parker) would rather such tricks were not attempted. He had detected the attempt by discovering the real date of the substituted tiles. The whole was in excellent preservation, and tended to show that there must have been an inundation of the Tiber, perhaps twenty or thirty years after its construction, which hurried the landing-place, and that the marble wharf had been moved to the site of the then salt wharf, which had in its turn been moved higher up. He put the date at the first century of the Christian era. An enormous number—200 or 300—large marble slabs were found, so that the discovery was a profitable one in a pecuniary point of view. They had been carried to the Vatican for security. The Tiber was subject to great fluctuations. Notwithstanding the state of their polity, the Romans were still going on with their excavations, and were making fresh discoveries every day. In making a new street at the foot of the Quirinal, they came across a fine mosaic pavement, and made out a plan of a portion of a palace, but could not go far on account of gardens intervening. Then, in making another road on the banks of the Tiber, they hit on the line of an old subterranean road, of which the Romans were rather fond. Then, in making the new fortifications in the Aventine, they came on a house of the first century; but they would not allow him to examine it, although he saw enough to satisfy him of its date. Mr. Parker then proceeded in detail to describe the discoveries that had been made under the direction of the Archeological Association. These included the tracing out of the walls of the city of Rome, which was as distinct from Rome as the city of London was from London. They made the spaces inclosed smaller than it used to be considered. He had received every assist-

ance from the Romans themselves, and the only bit of Rome from which he had been excluded was under the care of the agent of the French Government.

The week was wound up with an excursion to objects of antiquarian interest north of Lancaster, viz., Borwick Hall, Levens Hall, Sizergh Hall, and Kendal. Leaving Lancaster by train, they proceeded to Borwick Hall, a fine old building in the Elizabethan style, about ten miles off. It is supposed to have been built in 1551, and, within three-quarters of a mile from it, there are the remains of a Roman dock, from which it is inferred that the sea, although now many miles distant, flowed within a mile of the hall during the occupation of this country by the Romans. It is now the property of the Martin family, of Capenrway, and is only partially occupied. It contains, in addition to a fine wainscoted hall and a guard-room, an oratory, and a confessional, of which the railings are still in existence. The principal bed-room is that in which Charles II. slept, in August, 1651, when on his way with his army to Worcester. The soldiers, to the number of 10,000, encamped in a meadow below the house. James II. also once rested here on his way to Scotland. Leaving Borwick, the excursionists proceeded to Milnthorpe by train, and from thence by carriage to Levens Hall, the seat of the Hon. Lady Howard. This interesting old building, with its gabled roofs and square-headed windows, is a picturesque mansion of Elizabeth's time, and in the fine hall there are some decided features characteristic of that period. There is abundant evidence that the hall once formed one of the towers with which the border country was so thickly studded. The next place visited was Sizergh Hall, about four miles from Kendal. It has for a long series of years been in the possession of the Strickland family, and Mrs. Strickland was present to receive the visitors. It contains a chamber which is said to have been for some time occupied by Catherine Parr. The general features of the architecture are Elizabethan. At Kendal a paper by Mr. Crowther on the church was read. The church is now and has been for the last twenty years under restoration. Mr. Crowther, in his paper, observed that it possessed the peculiarity of having four aisles co-extensive with the nave and chancel. The entire length, east and west, was 140 ft., and the width 103 ft., including an area exceeded by few parish churches in the kingdom. It was built in the fifteenth century, ranging from about 1440 to the close of the century. The foundation of an earlier structure on the same site had been found. This church appeared to have been of the Early English period. As far as the details could be ascertained, they had been copied in the restorations which commenced in 1850. In the eastern column of the south arcade of the chancel was an arched recess which had been supposed to be a piscina, but research had been made, and no outlet for water could be discovered, and no drain beneath. Mr. Crowther, therefore, came to the conclusion that it was not a piscina but a credence table. It had been restored.

Other excursions were made and meetings held on Monday and Tuesday following. We would not omit to mention that a clock was presented to the Rev. E. Hill as an acknowledgment of the service he had rendered to the members in arranging their excursions for a great number of years, a very poor testimonial, by the way, for the long given aid. Mr. Beresford Hope presented the gift with humour and feeling.

THE ARTISANS' DWELLINGS ACT.

Amongst the measures which received the Royal Assent on the last day of the session, was the Bill introduced by Mr. Torrens, one of the members for Finsbury, having for its object to provide better dwellings for artisans and labourers. The following correct analysis of its contents will, no doubt, be welcome to our readers.

The object of the Act, as set forth in the preamble, is "to make provision for taking down or improving dwellings occupied by working men and their families which are unfit for human habitation, and for the building and maintenance of better dwellings for such persons instead thereof." The Act states the places in which it is to be put in force, and provides that no place is to be included the population of which, according to the census for the time being

in force, is less than 10,000. The Act extends to Ireland and Scotland.

If in any place to which the Act applies there is no officer of health, the local authority, with the approval of the Secretary of State, is to appoint such an officer forthwith, and pay him a salary out of the local rate. The power of removal is, subject to the same approval, vested in the same authority. If this officer find any premises in a state dangerous to health, so as to be unfit for human habitation, he is to report the fact to the local authority. This report is to be in writing, and is to be referred to a surveyor or engineer, who shall examine and report the cause of the evil, and point out the remedy; stating whether the evil can be remedied by structural alterations, or whether the building or any part ought to be demolished. The local authority is to give copies of both reports to the owner of the property, with notice of a time and place for the consideration thereof. The owner may attend and state his objections, if any, to the reports, or either of them, including an objection that the works ought to be done at the expense of some other person, or at the public expense. The local authority shall make an order in writing, subject to appeal. If the order be one overruling the objections, the local authority, if deemed necessary, shall cause to be prepared a plan and specification of the works and an estimate of the cost. The clerk of the local authority is to give notice to the owner that the plan and estimate are ready, and the owner may inspect and transcribe same without charge. The owner may state objections to plan or estimate within three weeks, and is to attend at a time and place fixed by the local authority, to sustain such objections; and if he show that his objection is good, the plan or estimate shall be amended. An appeal from the local authority lies to Quarter Sessions, but the appellant must give notice in writing of appeal within one month after the making of the order appealed from. He must state in writing the grounds of the appeal, and enter into security to try the appeal and to abide by the order of the court appealed to, paying such costs as may be awarded. If there be not time for the notice mentioned above, the appeal is to be made to the following quarter sessions. At the hearing at quarter sessions the grounds of appeal are to be strictly confined to those set forth in the notice. The Court may, at the request of either party, state a case for the opinion of a superior court. No work is to be done under any order pending the prosecution of any appeal. If the point on which the owner relies be that he is not responsible for the state of the premises, he must give notice of his appeal, and of the grounds thereof, to the person or parish alleged by him to be liable, and such person or parish may appear and be heard against their alleged liability. If the local authority shall decide that such other person, or such parish, is liable, they shall send copies of the reports to such person or parish, and shall appoint a time for hearing such parties. When all the parties are before them they shall make such order as they deem just, and the order shall be subject to appeal, as in the case stated above.

Whenever four or more householders living in or near to any street shall, in writing, represent to the officer of health, that in or near that street any premises are in a state dangerous to health, so as to be unfit for human habitation, he is bound to inspect the premises and report thereon; but even if no such representation be made, he is not excused from inspecting the premises and reporting thereon. If the local authority shall refuse or shall neglect for three months to take any steps to put the Act in force, the householders who signed the representation may address the secretary of state, who may compel the local authority to proceed. When the order of the local authority is served on the owner, he must, within three months (or, in case of appeal, within one month after the appeal shall have been heard and decided upon) signify to the local authority whether he is willing to execute the required works, and where two or more shall so signify, then the right of effecting the works shall be given to the person whose ownership is earliest in title. Notice by the local authority shall be served on the owner or an inmate of his place of residence or of business, if such place of residence or of business be within the district of such local authority; otherwise notice may be sent in a registered letter, addressed to the owner, wherever he may reside or have his place of business. If the owner's residence or place of business cannot be found the

notice may be left, addressed to the owner, with some occupier, or, if there be not an occupier, the notice may be put up on some conspicuous part of the premises. The owner on whom the local authority shall have imposed, in the first instance, the duty of executing the work shall commence such work within two months from receiving the order, and shall proceed diligently to complete the same in conformity with the specification to the satisfaction of the surveyor or engineer appointed by the local authority. If he should fail to do so, then the owner next in order shall be required to execute the said works, and, in case of his default, the remaining owners in their order. If all make default, then the local authority may order the premises to be shut up or demolished, or may execute the work in conformity with the specification. In this last case the expenses, with 4 per cent. interest, are to be charged as a charge having priority over all other incumbrances, the local authority being invested with all the powers conferred by law upon mortgagees.

If the requirements of the order involve the total demolition of the premises, the owner shall within three months after service of the order proceed to take down and remove the premises, and if he fail to do so, the local authority shall take them down, sell the materials, and, after deducting the expense, pay over the balance, if any, to the owner. If the premises be at the time subject to any tenancy from year to year, or for a year or any less term, the local authority is to give notice to every tenant, stating the time at which such tenancy shall be terminated. Nothing in the Act is to prejudice the rights of any owner respecting the breach of any covenant made with him by a tenant; so that if an owner be obliged under this Act to take possession in order to comply with an order, his entry shall not affect his right to avail himself of any breach which may have occurred prior to his taking possession. If the order be that the premises only require improvement, the owner (including the owner of the first estate of inheritance), may take down the premises; but in such case (and also in the event of the owner desiring to retain the site), no house injurious to health shall be erected on any part of the site. If such a house be erected, the local authority may order the owner to abate or alter it, and in case of disobedience may do so at the owner's expense. If there be two or more owners, one of them may apply to two justices should the others neglect or refuse to join in obeying an order, and the justices may empower such one of the owners to take possession of the premises, and do all such works as may be necessary in conformity with the order which may have been made. When an owner has completed required works, he shall be entitled, on producing accounts and vouchers, to an order, charging the premises with an annuity at the rate of 6*l.* for every 100*l.* expended, payable for thirty years. Such a charging order is to have precedence over all incumbrances except quitrents, tithe-rent charges, and charges created by the advance of public money, and shall be recoverable as if it were a rent charge under deed. Clauses (in the details of which we need not enter, as they contain legal technicalities) are inserted, providing for the registration and assignment of such charges.

All expenses incurred by the local authority in carrying out the Act, shall be defrayed by them out of a special local rate, not exceeding 2*d.* in the pound, in any one year. The Public Works Loan Commissioners are empowered to lend, and the local authority may borrow from them, such sums as may be required for the purposes of the Act, but the amount of each loan must be sanctioned by the Lords of the Treasury. Notices to a local authority to be deemed lawfully served if delivered to the clerk of such local authority, or left at his office with some person employed there by him. Notices by any local authority are to be signed by the clerk of such local authority. If any person obstruct the officer of health, or other person acting under this statute, the offender shall forfeit a sum not exceeding twenty pounds. If the occupier prevent the owner, or if the owner or occupier prevent the officer of health, or his workmen, from carrying into effect the provisions of the Act after due notice given, a justice of the peace may make an order requiring such person so obstructing to permit the officer of health, or the local authority, or authorized workmen, to do all things requisite for carrying the Act into effect; and if, at the expiration of ten days after the service of such order, the occupier or owner shall

fail to comply with it, every person so offending shall, for every day during which the failure continues, forfeit a sum not exceeding twenty pounds. During non-compliance by the occupier the owner, unless assenting, is not to be liable to any fine. A local authority may appear before a judge by the clerk, and a company or body corporate by any member of their Board of management. The concluding portion of the Act points out the statutes under which the penalties may be recovered, the verbal alterations to be made for the purpose of adapting the Act to Scotland or to Ireland, and also regulates the jurisdiction of magistrates. Respecting this last point, it will be enough here to observe that powers vested in "two justices" may be exercised in the City of London by the Lord Mayor or any alderman; in the metropolis outside the city by a metropolitan police magistrate; and throughout England by a stipendiary magistrate sitting at a police-court or other duly appointed place.

Schedules are attached to the Act, pointing out the places to which it refers, the description of the local authority, and the source from which the local rate is to be levied. Forms are also added of the orders and notices to be adopted in carrying the Act into operation.

THE PUBLIC HEALTH AND THE WATER SUPPLIES.

"SWEET are the uses of adversity." So wrote the immortal bard, and so is it. If all were calm and sunshine, should we not sink into the lethargy of luxury and indolent ease? As storms purify and cool the heated, stifling air, so the trials of adversity brace up the energies and speed the currents of action in the truly noble. Difficulties, trials, and obstructions are the truest tests of heroism. Not less national than individual is the application of this principle. The Crimean war, for instance, found us unprepared, unnerved, unarmoured for the fight; and not until some sad reverses had roused the spirit of the brave, did the full force of his nationality show itself. The lion had slept, and had received some ugly blows ere he was fairly awakened and had put on his strength. Sweet were the uses of adversity in the Cotton Famine also. The bare fact was this:—300,000 persons were without work, without bread; for what were the few loaves and fishes of charity (freely provided as they were),—what were they "amongst so many?" There was a problem to be solved, and out of that difficulty there arose the most wonderful and practical organization of diversified yet unified labour which this country has ever seen; solving the problem for future time how the calamity of a labour panic may be turned into a blessing. Like the otherwise destructive mountain torrent, curbed and directed in its downward course, is held in restraint, and bid to work for man, so the dangerous force of an unemployed population was guided and controlled until it expended itself in public works, which are a monument of perseverance under difficulties, a triumph of perseverance under difficulties, a triumph of the force of discipline and wise direction, and are and will be a blessing to thousands who have not yet seen their first day. All honour to the gallant hero of Magdala and to his officers and men, who in a strange land made a way for themselves under unexampled natural impediments, and thundered at the door of the barbaric chief, bidding him, in the name of England, let his captives free. Honour also to that more peaceful general who arrayed an army of workers and directed their endeavours in besieging the citadels of dirt and the ramparts of disease, who every where aiding, encouraging, reviewing, and cheering up the drooping spirits of his troops, taught them to earn a solid victory over unexampled impediments. Sweet indeed were the uses of that adversity. Thousands of homes were saved from ruin, and blessed with the reward of honest labour, instead of the pauper's dole. Towns and villages, which filth and neglect had so overgrown that nothing in the way of ordinary effort could have coped with it, or ever have worked up the sad arrears of years of neglect; but the army of workers came down upon them, and a transformation so substantial, so satisfactory, ensued that none but those who shared in the campaign can really estimate the blessings of that calamity, the sweet uses of that adversity. What barriers of red tape and formalism were broken down; what inequalities were levelled; what fosses of exclusiveness were

filled up; what bridges of human sympathy were built; what channels of love and charity were opened up, none can ever tell. To the heroes who generalised the forces and fought the battle of our Lancashire adversity he honour: peaceful laurels will ever deck the brows of those true patriots, whether it be the general who organized the noble earl who presided, or the artisan who toiled. Again the sweet uses of adversity do not less appear when we are periodically awakened by the dread sound of "cholera." It is the trumpet-tongued messenger bidding us arise, set our house in order, and look up our weapons of defence.

The unprecedented heat and drought at present experienced are calculated to produce most disastrous ravages upon the public health. There are very few towns in Lancashire or Yorkshire where the water supply is not a source of anxious inquiry, affording in many cases good grounds for serious alarm. Already the drought has shut up many works, and thrown numbers of people out of employment; the farmers are at their wits' end for needful supplies, and cattle are suffering greatly and have died in numbers. In rural places especially, domestic supplies are most stinted in quantity and doubtful in quality; poor persons having to be up at daybreak to travel far distances and to wait sometimes for hours for the small dribble at the well or roadside trough. So King Cholera finds us wanting our best weapon of defence. The want of a proper supply of water is telling week by week upon the public health. Then, again, the condition of the rivers through and near the manufacturing towns is positively indescribable; there are no words in our present vocabulary which can convey, in many cases, the true idea of their pestilential state. In quantity a minimum, in filthiness a maximum; these streams (bath) heated by manufacturing processes, under a tropical sun, receiving as they do, for the most part, the filth, liquid and solid, of a million inhabitants, they are more like deadly, slimy, giant snakes wriggling their slow and tortuous courses through the towns they infest, or besmearing the landscape with their muddy trail, and emitting such odours as man cannot live in. Once fair and free, the banks of the "speckled trout," these streams gladdened the village and the town, and gave a freshness to the lawn of the mansion and a sunbeam of rainbow colour as they dashed over the mill-wheel. Now they bear in their courses the curse of man's disobedience in sinning against nature. We are learning in this our strait the value of pure water; we may have to feel this even more keenly yet. Nevertheless, the uses of this adversity will be "sweet" if it lead to an earnest searching into the whole question of our water supply and our rivers pollution. To increase the impoundage of the floods of wet seasons so as to provide more amply for every want, whether domestic, sanitary, or trade (and this last has now become of vast importance in the districts of Lancashire and Yorkshire), and to learn the true value of our servant water, who, after doing all the good he can for us, and receiving even our abuse and filth in return, will, if we let him, fertilize our fields and renew his own purity, brightness, and freshness in the very effort itself, coming out of his many labours and services for the benefit of man, like an angel of goodness again to flow on to bless and bless again, ever renewing his youth and freshness as the sun.

Practically our towns are too limited in their water supply to meet contingencies: we must have more, more. The supply has not increased in an equal ratio to the demand; the requirements of civilized life are very different from those of twenty years ago. For our personal comfort we must have our bath; he who cannot afford this luxury will have his "tub" and his sponge: the good housewife is more prodigal of water; she is more profuse in her washing and swilling, her rubbing and scrubbing. Our garden must be watered; we cannot do without the now accepted convenience of the W.C., and this last is a great drain upon our water supply, and a fertile source of abuse and waste. The appliances of modern times have altogether altered the state of things. The India-rubber hose and the high-pressure, for instance, enable the plentiful washing of windows, watering of gardens, washing of carriages, courts, and yards, &c., without labour, where formerly the bucket and the can had to be carried, and did duty much less easily, far less efficiently. Then, again, on sanitary and public grounds. We must have our parks and pleasure-grounds, with artificial lakes and fountains; our baths, washhouses, and

lavatories. We must have an ample supply for flushing sewers, street watering, drinking fountains, extinguishing fires, and what not. How needful now the flushing of sewers and the plentiful watering of streets, both which are impossible at the very time they are most needed. Last, not least, come the requirements of trade, vital necessity, to be kept moving. The streams which once sufficed to furnish the motive power, or to supply the needful wants of trade, are now, for the most part, inadequate or inappropriate,—inadequate from their small quantity, inappropriate by reason of their contamination. For most of the extensive manufacturing factories recently erected new and independent supplies have to be found, and not a few resort to the water companies and pay by meter. The quantities thus supplied for trade purposes alone in such places as Leeds, Manchester, Bradford, Halifax, Sheffield, and like places is astonishing, and in times of severe drought, as at present, the companies are in a strait, and have to resort to every expedient to maintain the trade supply; for when that fails, as it has done now in many places, the works must stand, workpeople are thrown out of employment, and the company's revenue is seriously impaired. There is, therefore, a temptation to continue the supply for trade purposes to such a point as to jeopardise the domestic and sanitary wants. In a vital necessity like water there ought not to be this hair-splitting,—this fine adjustment of wants and supplies,—this too frequent trying to see how little we can exist upon. It ought to be dealt out with no niggardly hand, even superfluous and waste itself (though all waste is to be condemned); yet in the case of water even the waste itself is not all loss, as the quantity expended goes to flush the sewers and to dilute the streams, overcharged, as they mostly are, with foul matter.

The reports from all parts of the country confirm the statements herein made. Hundreds of men and horses are employed in bringing water from all available sources. One town in Lancashire has had its only reservoir dry for a month past, and the inhabitants have to do as they can. At daybreak, in many places, there are thronging and pushing, and even contests of an unpleasant nature, for preference of access to the coveted drop; and a policeman at one point is stationed to secure fair-play amongst the struggling throng. At Bradford, Yorkshire, a large portion of the borough is without supply. Many of the Lancashire reservoirs present nearly a dry bed, and the little water yet remaining in them is shallow, exposed to intense heat, apt to wash up muddy deposits which are now exposed and dry. Cattle and sheep have suffered greatly, and even the salmon now are giving in. The River Ribble, justly famed for its salmon, is much polluted with sewage, and its volume is now so reduced that, I am informed, many salmon have died; others, exhausted and "weary of life," have committed suicide by lying in the shoals and allowing themselves to be captured at leisure. These are the victims of pollution and drought. Thus our food supply is reduced.

But the consideration of the subject in all its bearings, ever so briefly, would lead me beyond reasonable limits in your valuable space; I conclude, therefore, with a few general remarks, just as they rise uppermost to the mind.

In dealing with future water supplies there must be no narrow and limited view; more comprehensive areas must be embraced, and groups of towns must be included in one scheme. The watersheds of entire districts must be conserved, and more equal distribution secured for present and prospective wants. There are needed some equitable clauses to prevent the strong robbing the weak, so that when powerful companies or corporations pounce upon watersheds, distant, perhaps, twenty miles, they shall be compelled to make more ample and effectual provision for present and future wants of those whose district they invade; and should Conservancy Boards be formed (as, indeed, they ought to be), no Water Bill should pass until such Board has reported upon it in all its details.

But how can the companies increase their storage, expand their works, double the supply, and do all this, seeing that with their present works, conducted with the utmost economy, they cannot realize, on the average, more than say 6 per cent. upon their invested capital? The remedy is this: the charges for supply of water must be increased, and I do not think there would be found one dissentient out of every fifty consumers. The persons most likely to feel the pressure would be the operative class; but as

present prices for water supply of cottages are not more on the average than about 2d. per week, even if these charges were increased one-third, or 33 per cent., it would not be any perceptible burden even to the poorest, and yet in the aggregate it would amount to an immense sum.

Other classes of dwellings might be charged proportionately, and I should not doubt that that there would be, upon reflection, a ready acquiescence, and an acknowledgment that the water was well worth all that was charged. In the case of corporations, of course, any leakage in the water-rate would come out of the general pockets: so it is as broad as it is long. In either case the article consumed must be paid for, and no article is so well worth its value as water, particularly if it be good.

The charges for trade might remain as they are, on the graduated scales, as, if the quantity were forthcoming, the increased consumption which would result would amply repay the companies.

We must have more water, and we must pay for it a fair, nay, a remunerative price, so as to induce and encourage the investment of capital in its collection and storage. There is abundance of water in the country for every want: all we require is, reservoirs to put it into. We want more big bottles, out of which, in the droughty time of hay-making and harvest, we may draw abundance to satisfy every "thirsty soul."

As to our rivers pollution, it will take a long time to convince the public of the folly and waste of the present system. There is no panacea for it: every place has its peculiar circumstances and special conditions, but the time is not very far distant when there will be no more need to prohibit the throwing of sewage into rivers than there is now to renew the special clauses which not long ago were necessary to prevent gas companies from throwing, stealthily, their gas tar into adjacent streams; whereas this same tar is now in its crude state worth about 2l. per ton, and in its varied manipulations furnishes the daintiest tints for the robe of the most fashionable belle. The study of the utilization of waste products reveals wonders. How much longer shall the torrent flood destroy and the barren drought desolate? How much longer shall the hungry earth lie agape for the refuse of our cities, and our once bright rivers be turned into cesspools? How long this will continue we know not. But this we do believe that a future generation will, from very necessity, learn to store and utilize every scrap of waste, every gallon of fertilizing liquid, turning that which is our present adversity to sweet and beneficial uses,—our present difficulty into a triumph.

JOSEPH BRIELEY.

THE REAL AND THE IDEAL OF ARCHITECTURE.*

THOSE of us who have adopted architecture as a profession from a sense of its power on our imagination, can remember, as I can aver, the changed impressions on our minds produced by first acquaintance with the practical business of preparing designs for execution, a descent, as it were, from poetry to prose, the reaction from which is in many cases a slow process, but which must be attained ere freedom of design can be accomplished; and the counteraction to which should be constantly encouraged in the student by exercise in abstract design, apart from the mere practical work by which he acquires his technical education. The real in architecture must, to the architect, include, with their external forms, not only all that belongs to the special uses of his buildings, but their consequent necessary modes of construction, and the materials requisite or available for that end; and great is the difficulty of preserving amid these matters of practical and mechanical import, the due impression of his artistic aim, and of securing with full attention to the former all that truly bears on the last, which seems constantly in danger of being overborne and drowned among the varied details of mere physical requirements. I wish to be understood as in no degree holding that the ideal can be severed from the real in any works of true architecture, but I use the terms in their common, popularly received sense; and taken thus, the real of our art must of necessity present itself very differently to at least the three

* From a paper by Mr. H. P. Horner, read before the Manchester Architectural Association.

classes I have hinted at, more specifically—the architect, the proprietor, and the public.

To the architect the technical and constructive elements of practical design must be ever present as the tools or instruments by which he must accomplish what his imagination has conceived. There must be always a tendency in this constructive element of his work, to jar more or less with that exercise of the ideal powers of the mind, so essential to be kept in constant and living exercise if true architecture is to be the result of the artist's labour: and to prevent injury from this source to that province of mental exercise, on which I shall enlarge hereafter, the architect should, I think, aim from the first at the adoption of such a constructive system as shall, throughout his works, have a constant reference to the final effect which he desires them to produce. There are, of course, numerous obstacles meeting the imaginative designer in his endeavours to pursue such a system;—the kind of materials at his command; requirements of economy general or special; the restrictions of local or general enactments; and the habit of mind too often induced, either by early education or later practice (the latter fostered by the modern demands for rapid production), of pursuing a routine method both in the choice and use of the materials. Much care and self-management are needful to save the architect from getting into a species of "bathos" of design through these but too fully experienced causes; and the simple manner in which some constructive difficulties can be overcome by modern appliances of an engineering rather than architectural character, affords a too frequent temptation to adopt the easy and ready, as distinguished from the truly artistic, in architectural construction. I would not be thought of as opposed to the due application of such contrivances in metallic construction as modern engineering has brought into use, but there are valid objections to certain modes of applying them in connexion with architectural art which should not, and, by the true artist, cannot be ignored. It will not be denied that an essential characteristic of good architecture is that self-sustaining repose which results from the appreciation, by the designer, of the appearance as well as the reality of balanced gravitation. Arched construction, duly abuted, gives the highest combination, doubtless, of the actual and apparent in this respect; but where trabeate style or construction is adopted, short bearings, massive proportions, and an excess even in real and apparent overplus of material strength, are essential for producing this effect of architectural repose. Now, to this same effect, the use of extended bearings gained by the application of iron, is distinctly opposed, and the more so, the more studiously the actual means of support are masked or concealed. The mere knowledge that iron or other tenacious metal can alone render such bearings safe, leads even the least practised critic to the conclusion that in such cases it must be present, and the concealment causes in this, as in all other such cases, a feeling of dissatisfaction, and of a certain littleness, not to say meanness of treatment. Far better would it be boldly and openly to declare the presence of your sustaining metal, whether of strongly braced cast-iron, or lighter and simpler wrought; and so showing it, to make its necessary form conducive to your architectural effect, and its surfaces the recipients of suitable decoration.

Thus much for an example combining an illustration of my meaning in respect of material, economical, and habitual impediments to pure and true treatment of architectural design, to which, had I time and space, I might add instances of the manner in which personal tastes and preferences on the part of clients, oppose themselves to the free exercise of his art by the architect whose skill is called into exercise on their behalf. I must, however, myself economise my materials, and now briefly touch on the realistic aspect of architecture as it concerns those personally interested in it as owners or proprietors, whether in a public or private sense of those terms.

Unfortunately for both architecture and architects, a large proportion of those for whose comfort, enjoyment, or advantage the art is to be called into exercise, care little, and really understand less of what is meant by the term architecture, and confound it either with mere building of the commonest utilitarian kind, or with the mere surface decoration which stucco or paint can cheaply and rapidly add to the surface of such work. By clients such as these, though often requiring structures of a scale and

class which should demand full exercise of an architect's power of design, the merely useful is alone seen as their own aim, and in so far, and in so far only, as the works produced suit their needs in respect of accommodation in space and convenience in communication, do they believe that architectural art is present; and vainly bestowed, inasmuch as the inmates are contented, are all the nice studies of vista, effect, proportion, and succession of parts, which the anxious architect has lavished on the, perhaps, costly edifice which is to be coupled with his name and skill in art while its parts shall hold together. The merely everyday uses of common life are the real of architecture to such possessors of its examples, and their unappreciative acquiescence in its simple fitness falls cold on the senses of the lowly estimatèd, though perhaps, highly-paid artist.

I hold it vain to attempt the task of defining how much instinctive feeling, association, or education may have to do, individually or generally, with the acknowledged power of architecture on the human mind; and I proceed to express, weakly and imperfectly it must be, my own view of what through all these channels carries this force of ideal impression deep into thousands of differently disposed and variously cultivated minds.

This source of the power of architecture as an art of imagination rests I am convinced in its consonance with those laws of effect, infinite in the variety of their results, which the Creator has impressed on the material universe, and specifically for us on the surface of the globe which we inhabit.

Form, light (with its complement, shade), and colour are the material sources of all those enchanting landscapes with which this world can gladden the eye of him who seeks such pure enjoyment. Form, light, and colour give architecture, as I have said, place and power among the arts. Contrast, proportion, and gradation in form,—like in the mountain, the headland, the islet, and the cathedral,—arrest the eye and interest the mind. Why, we can scarcely tell, but so it is, and often with overwhelming force. Light, shadow, half light, reflexion, alike mark out, define, and enrich the broken cliff, the waving forest, the palace front, and the village spire; and colour no less, in its endless harmonies, gives life and vividness alike to natural and architectural objects.

The limits within which this strong and close analogy between nature and architecture can be said to prevail must vary as widely as can the objects of architectural production; and the actual ideal may range from rustic simplicity, comfort, elegance, through the whole scale of the beautiful, the grand, the magnificent, and the sublime.

In each class of the architect's works, under these many forms of the ideal, must the degree in which the elements of form, light, and colour contribute to his effects, vary, and interchange; and seldom as it falls to the lot of any of us to have the opportunity of achieving what can be placed in the category of the grand or the sublime, yet such opportunities do, at long intervals, occur for our profession; and happy may that man esteem himself in his generation who leaves behind him on the surface of this troubled globe something which is hailed by his fellow-beings as a gem in the midst of its monotony, and as calculated to call that least olivated, yet, perhaps most essentially characteristic element of his high place in creation,—his imagination,—into full and happy exercise, raising him for the moment above the common-place interests of speeding time, and leading him, even through a material source, to recognise his alliance with that which is surely superior to time in its essence, though doomed to perish with it in its substance.

I class architecture most nearly with music among the arts in respect of its directly elevating power upon the human mind; and it will be frequently found that the intellect most awake to the power of the one is sensitive also to the other; though I think observation will prove that insensibility to architectural impressions is a less common defect than indifference to those of music, the latter arising apparently from a not infrequent absolute deficiency in the organization, I mean of brain rather than of ear, concerned in conveying these impressions to the mind. Architecture is in its associations of wider interest to the greater portion of mankind than the art of music; but though many professing the latter art will be found skilled in its execution and even clever in its technical

arrangements, without any feeling, or very little, for its higher forms of imaginative power, I hardly think you could find indifference to grand effects in architecture in any one who could enter into, and lose himself for the time in the "disembodied" flow of a fugue of Bach's, the sublime transitions and cadences of a chorus by Handel, or the pathetic and heart-scorching strains of one of Beethoven's great symphonies.

I dare not permit myself to pursue this captivating theme of the analogies of the arts, but I feel sure that scope exists for the production of a work of immense interest to any one who would devote time to illustrate the connexion of the arts as Mrs. Somerville has forced of the sciences, and Mr. Grove of physical forces.

Briefly to notice some of the forms of the ideal I have enumerated, I should say that, in respect to that essential element of an Englishman's home,—that untranslatable word of his social vocabulary, *comfort*,—the architect, who must in many cases have this ideal most frequently of all proposed to him in his practice, will find that gentle play of light and shade, and a very restricted and chastened use of sober colour, with little dependence on the higher and stronger effects of architectural form will best assist him in securing its effect. The structures to which the epithet mostly applies are not large in scale, and all strong and forcible effects of form produced on a small scale an impression of movement and unrest which does by no means attach to the same when applied to buildings on a great scale.

Elegance or grace,—the characteristic which attaches strictly to structures connected with the lighter scenes of human life and its intellectual recreations,—would be in a measure wearisome, if markedly pervading the whole domestic range of a dwelling-house, however finished in style; but in the detached concert-room, the saloon, the theatre for the most part; yes, and the ball-room,—externally and internally,—this may be sought and secured. Greater play of form in small masses, less contrast by effect of light and shadow, and more and livelier employment of colour, will be found, I think, to conduce to this end; and, in contrast with the quieter effects of comfort and home feeling, the application of this style of effect may often prove most happy and artistically useful as applied to the parts of domestic or, as in the club-house, of less private buildings, which are to be devoted to such uses as I have alluded to.

Beauty, the next step below the grand, is surely not a result to be obtained in architecture without the expenditure of long and anxious study in design, and no less anxious experiment in respect of detail. Independence of scale is a characteristic of this high and captivating character of art, and, though applicable to a great extent even to large structures of certain classes, yet in those of moderate scale it seems best to commend itself to our love and admiration. Here, form, in some of its most reconcile relations,—chiaroscuro in its most subtle effects, and every variety of harmonious colouring,—may, according to the varying circumstances of the design, be called to his aid by the architect as means to secure his end.

Form,—effective rather by gradation and proportion than by contrast,—and effect of light, rather diffused than concentrated, seem appropriate to impressions of architectural beauty; while, in the use of colour, let the artist beware that only as applied to beautiful forms can this be otherwise than at least semi-barbarous; and let him look at and take warning by the alas! too many examples in modern English structures, where, in the desire to fall in with a prevalent but passing fashion, the architect has marred a perhaps otherwise meritorious design by the use of strongly-contrasted and even coarse colour, applied in hard and graceless forms, and sometimes with a force of crude opposition sufficient to overbear and destroy all that the really architectural features of his work had to offer of beauty or of grace.

Grandeur of effect, unlike beauty, must, as the term implies, enlist large scale among its constituent elements. Here, strong contrasts and hold gradations of form find place, forcible and concentrated effects of light and shade, while colour again falls into comparative abeyance, and where employed must be made strictly ancillary to the bolder effects dependant on form and chiaroscuro, as in deepening the effect of purposely-shadowed parts of a design by its retiring shades of purple or violet, or bringing into prominence what it is sought to press out

the eye by distinct but yet mellow tints of a warmer character, and pointedly by the studied use of gold in an unburnished form of etching. But here must be avoided, save in the smallest measure, the use of the primaries,—red, yellow, or blue,—or their negative and positive neutrals,—black and white.

Buildings of much grandeur of general effect, both of ancient and modern erection, might be cited, which, through injudicious application of a so-called hold—but really coarse—style of coloured decoration, applied sometimes under the misused term of “restoration,” have been robbed of their dignity; and if raised by their innate power of form and chiaroscuro above the danger of becoming vulgar, have been at least brought so near to the common-place that their admirers would be happy to see them thrown back almost into their former state of neglect, rather than made to flaunt in plumage foreign to their real character and true effect.

Feeble and trivial treatment of colour, however, in connexion with such structures, such as rather comes, in fact, within the range of the “elegant” in coloured decoration, is scarcely less out of place than the coarseness I would denounce; and hence arises the necessity of the most careful and repeated trials of parts, and not very small parts either, of such added decoration before it is decided to apply it in any fixed form to the whole. It is singular how slight a variation of tint will, when applied on a great scale, entirely alter (and perhaps mar) an interior effect. I have always admired the carefully chosen tint of thin dead wash which is used for the large surfaces of the interior of York Minster. It is such as to give a pearly grey hue to the further portions, while moderately and happily warm immediately under the eye. Pardon me for descending on the merits of white-wash for the nonce, but I am speaking of a building in which form is the pre-eminent element of effect. Once, when I was in the cathedral, I found the north transept alone completely re-coloured, but the work there beginning again *de novo*. On inquiry I found that, on the application of the colour in the transept, and its drying down to its normal tone, it was found that too large a proportion of yellow, though very little, had been used in mixing the huge quantity of colour required for the whole interior, and on the discovery of this, which was palpable when attention was directed to it, the whole was destroyed, and a new tint prepared which resembled the old aerial effect, while comparative vulgarity in a measure at least must have attended the use of the slightly warmer tint.

Our cathedrals and great churches come strictly within the range of this characteristic of grandeur in their good examples; and here I would say a word as to the effect of stained glass, either old or of modern application.

Little of the old, but far too much of the modern, is of a crudity in colour tending rather to lower than to enhance the architecture it is associated with, and this from three principal causes: one, ignorance or indifference to the character of stained glass in decoration, viz., its due fitness of treatment as distinguished from picture-making or relief by shadow, a treatment demanded for its true effect as for that of fresco, but even in greater measure; secondly, the neglect of the principle of dealing almost entirely with secondary and tertiary tints and hues, rather than with primary colours; and, lastly,—alas!—by the descent of this style of work from an art, as which it was treated but a few years back by Willement, Pugin, and a few more, to the level of a mere trade, in which dealing takes place by the square foot, and wearisome repetitions of gaudy medallions, and ill-drawn and ludicrously anatomized saints and prophets appear in all parts of the kingdom, garnished with glaring borders by the foot lineal, and solid masses of blue and red glass, one would think, by the cube.

NEW LAW COURTS.—In reply to Lord Denman, in the House of Lords, the Lord Chancellor stated that the Commissioners under the Courts of Justice Building Act had not as yet recommended any definite plan to the Government, and therefore the Lords of the Treasury had not as yet adopted or approved of any contract in relation to the building. The Commissioners, however, had agreed upon a draft-letter to the Treasury, which was to accompany sketches of certain floor plans that had been approved of.

THE MEYRICK COLLECTION.

We were in hopes that the remarkable educational museum of armour and other works made by the late Sir Samuel Meyrick, and left by him in Goodrich Court, Hereford, would be obtained for the nation, but this now seems doubtful. An offer was made to the present owner to purchase it for a foreign country, and there seemed a probability of its leaving the country. At the instance, we believe, of the Department of Art Mr. Planché reported on it, advising the purchase; and afterwards Mr. Vaux, of the British Museum, did the same thing. The Government, however, declined to move in the matter. We must express a strong hope that something may yet be done to render the collection available for public instruction and recreation.

IPSWICH FINE ARTS AND INDUSTRIAL EXHIBITION.

An Industrial and Fine Arts Exhibition has been opened at Ipswich, in the new Assembly Rooms. The upper room is occupied by pictures, sculpture, and other art-works, and curiosities; and the lower room is devoted to machinery and industrial works generally, including a great variety of models, a model organ, coffin conductor, aquaria, fine things in sewing machines, horizontal steam engine, &c., forming a varied and entertaining collection. The committee of the Working Men's College have been active organizers of this exhibition. That *souvenir* of the event might be preserved a private subscription has been entered into for the purpose of raising a small fund for the purchase of medals (both silver and bronze). The competition has been circumscribed, and we believe the rule pursued was that the author, artist, or manufacturer of any particular work intimating his intention of exhibiting for competition, was allowed to do so.

The judges in the art department were Mr. Cochrane, of the Norwich School of Art, and Mr. W. P. Ribbins, for woodwork, Mr. H. Brinsmead and Mr. H. Singleton; for iron goods, Mr. J. Hammond and Mr. J. Hawes; and miscellaneous, Mr. T. S. Gowing, Mr. B. Rix, and Mr. J. R. Ridley.

The exhibition was formally opened on Thursday in last week. At two o'clock, the mayor (Mr. J. P. Cobbold), the deputy-mayor (Mr. E. C. Ransome), the magistrates, aldermen, members of the town council, attended by the town servants, the principal (Dr. Christian) and members of the council of the Working Men's College, the exhibitors, and other inhabitants of the town assembled in the Sessions Court at the Town-hall, and thence walked in procession to the Assembly-rooms, and opened the exhibition.

THE WALWORTH-COMMON ESTATE COMPETITION PLANS.

We are requested to insert the following communication addressed to the guardians of the poor of the parish of St. Mary Newington, Surrey:—

“London, August 3, 1868.

Gentlemen,—With reference to the following advertisement, which appeared in the *Builder* of April 4, 1868, viz.:—

“To Surveyors and Architects.—Walworth Common Estates.—The Guardians of the Poor of the Parish of St. Mary Newington, Surrey, are desirous of receiving Plans for laying out the above estate, of about 45 acres, in new roads and streets, for the erection of private houses and shops. Premiums for the best plans will be given as follows:—For the first, 100 guineas; second, 75 guineas; third, 50 guineas.—Further particulars and copy of instructions may be seen at the clerk's office, as under, between ten and four. The plans must be sent in to me on or before the 1st day of June next.—By order,
JOSEPH BURGESS, Clerk.
Vestry Hall, Walworth, March 26, 1868;”

We the undersigned competitors beg to state, that having sent in plans and designs for laying out the above estate, in accordance with such advertisement, in the manner required by the printed instructions issued to us, we do hereby strongly protest against the decision lately arrived at by you, on the grounds of its being both inconsistent with the spirit of your advertisement and printed instructions, and most unjust to us. We complain that you have awarded premiums (especially the two first) for plans which are not in accordance with those

printed instructions, and also do not comprise the sanitary arrangements which are required by the Metropolitan Building Act, whilst many of the rejected plans have fully complied with the instructions, and are in accordance with the Act. We are also not satisfied with the third premium awarded.

We therefore respectfully call upon you to appoint a professional gentleman of high standing and character to act as arbitrator, and decide upon the merits of all the plans sent in; and we further suggest that we may be allowed separately to explain our plans and designs before such professional man, and we shall then be perfectly satisfied with his decision. Awaiting your reply,

- We are, gentlemen,
Your obedient servants,
H. M. BURTON, 14, Spring-gardens.
THOMAS EDWARD KNIGHTLEY, 106, Cannon-street, E.C.
BANISTER FLETCHER, 7, Guilford-street, Russell-square.
FREDERICK A. KLEIN, C.E., 110, Cannon-street, E.C.
LEE & WALTON, 6, Great College-street, Westminster.
ARTHUR C. PAIN, C.E., 7, Parliament-street, S.W.
A. A. FREEMAN, 25, St. Aubyn's-road, Upper Norwood.
THOMAS JEWELL, 2, Cottage-green, Camberwell.
RICHARD HOPTON, 2, Stanstead-road, Forest-hill.
WM. H. RAWLINGS, 1, Welton-terrace, Palace-road, Upper Norwood.
A. G. HENNELL, 22, Southampton-buildings, Chancery-lane.
WARD & USILL, 10, King-street, Soho.
W. B. MOFFATT, King-street, Whitehall.”

*** We have before us a large number of letters, many of them not from competitors, to the effect of the above protest. We trust the guardians may even yet find themselves able to do justice to those who trusted to their honour. The selections are manifestly not in accordance with the Instructions.*

HUMEWOOD, COUNTY WICKLOW, IRELAND.

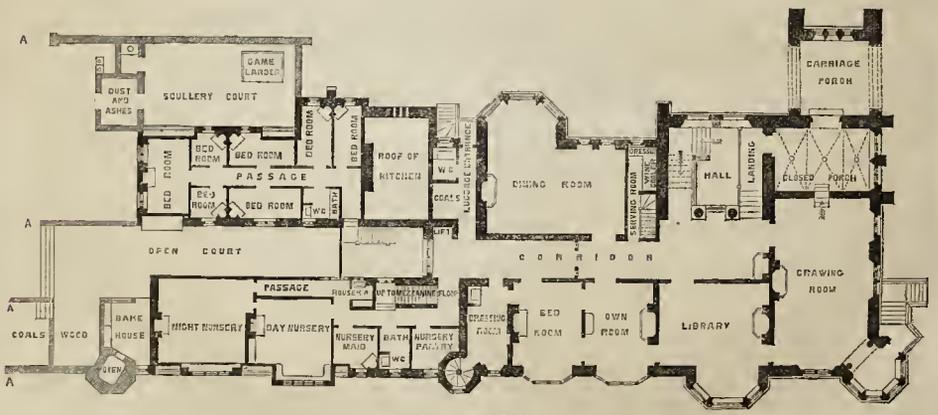

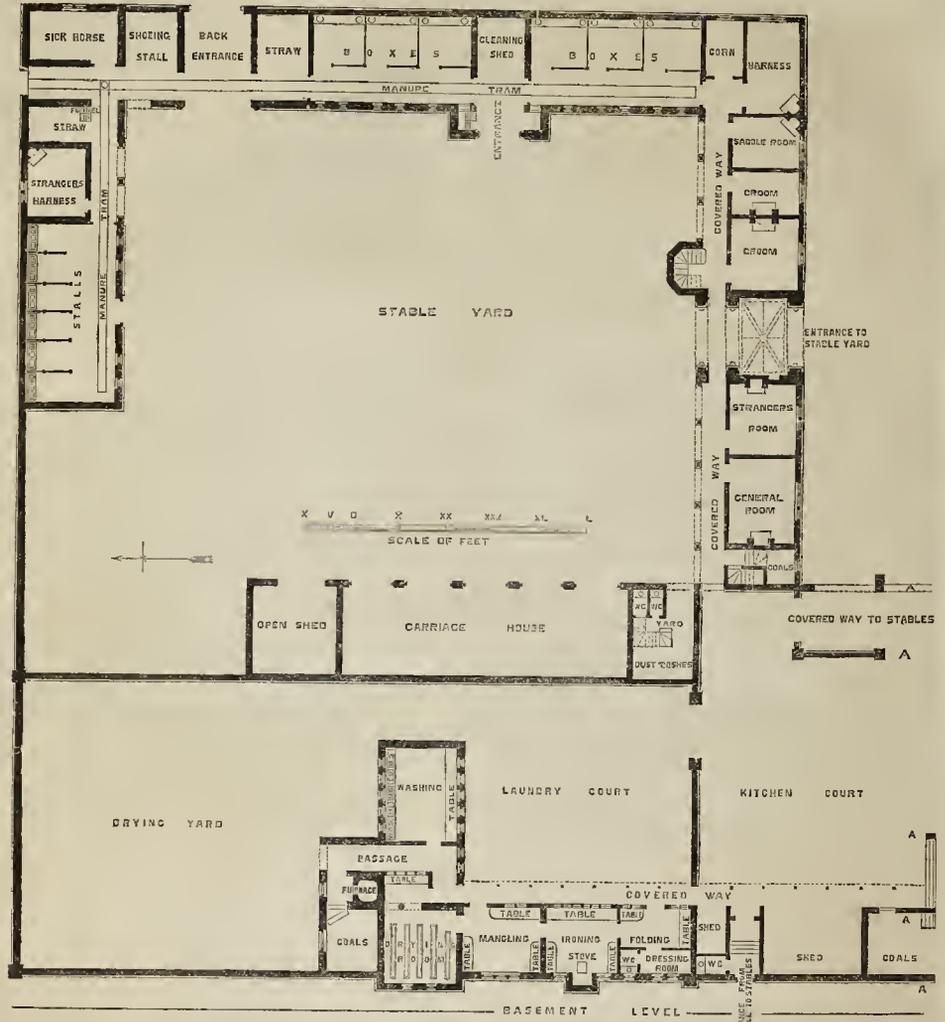

ILLUSTRATIONS are given in our present number of a mansion in the course of erection at Hume-wood, Ireland, for Mr. W. W. Fitzwilliam Dick, M.P. for the county of Wicklow. It stands in a commanding position, well surrounded with rich woods and mountain scenery.

The walls are entirely of granite, and the roofs are covered with tiles. The kitchen offices are in the basement, a few feet below the ground level, giving considerable elevation to the ground floor, which is approached by a stone staircase from a vaulted hall about 40 ft. in height. This hall forms the base of the tower.

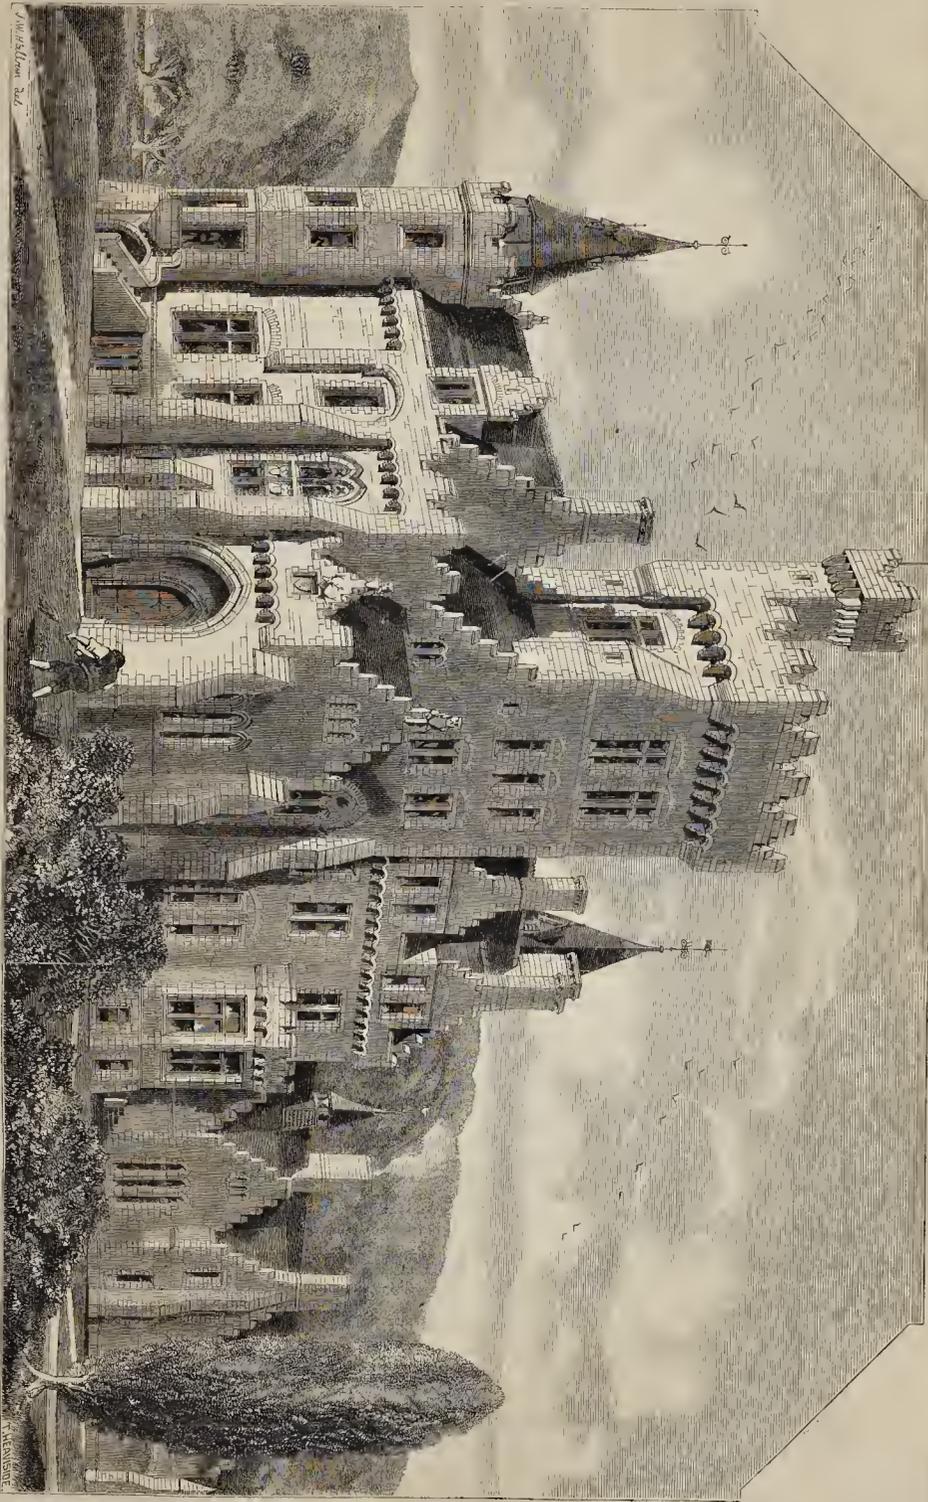

The fittings of the interior are being constructed of various coloured woods, the staircase being in oak. Provision is made in various ways for defensive purposes, if necessary. The house being intended chiefly for a short summer residence, provision has been made for a system of warming and ventilation throughout during the time that it will be unoccupied. The whole of the basement is vaulted in brick. The ceilings and floors over the dining-room, drawing-room, &c., are supported by massive oak beams, and finished with cornices of wood. The kitchen is open to the roof, and well separated from the habitable part of the house. There is a lift for coals and luggage from the bottom to the top of the house, and dinner is to be served by a traversing wagon, passing up the stairs to the serving-room. The windows of the hall and staircase and the upper portions of those of the living-rooms will be filled with stained glass, containing the armorial bearings, &c., of the family. Mr. Dick having a fine folio illustrating the heraldic history of the family from the earliest times.

The contract is being carried out by Mr. Kimberley, of Banbury, from designs by Mr. William White, F.S.A.

* We have received, but too late for present consideration, communications from the authors of the plans to which the first and the third premiums have been awarded.

GROUND PLAN
HUMEWOOD, WICKLOW.

HUMEWOOD COUNTY WICKLOW IRELAND.—MR. W. WHITE, ARCHITECT.

PRIZES AT THE "ECOLE CENTRALE D'ARCHITECTURE."

LAST November we published an account of the opening for the winter session of the Paris Ecole Centrale d'Architecture, which took place under the presidency of Mr. Henry Cole, C.B., who delivered an address to the students, and concluded by putting at their disposal a prize, to be awarded, upon the votes of the students themselves, to the student who could make the best drawing of the human figure. The first election was recently taken place, and it may be interesting to our readers to see the following account of the award made by the students, which we were enabled to give from the official announcement.

"Ecole Centrale d'Architecture.

Report of the Election for the 'Prix Cole.' The students of the first class assembled in the amphitheatre of the school on Thursday, the 14th of June, 1868, at five o'clock, and proceeded to the election of a holder of the 'Prix Cole.' There were twenty-four voters present. The scrutineers were composed of the commissioners, and M. H. Gautier was nominated the president. It declared that, in conformity with precedents, the elected candidate must at least poll half the total votes plus one.

Upon the first scrutiny the votes were recorded thus:—

M. Charbonnier	11 votes.
M. Rzetkowski	5 "
M. Hillard	3 "
M. Sauvestre	2 "
M. Vaudin	2 plus one.

No candidate having polled half the votes plus one, a fresh poll took place between MM. Charbonnier and Rzetkowski, each to poll as many votes as possible. A fresh roll showed that twenty-three voters were present.

The result of this last poll was as follows:—

M. Rzetkowski	12 votes.
M. Charbonnier	10 plus one.

The award of the 'Prix Cole' was accordingly made to M. Rzetkowski, born in 1845, at Julliac (Pyrénées). The director, M. Emile Trelat, expresses in a communication his gratification that, although the majority of the masters' votes were accorded to Mr. Charbonnier, the students, nevertheless, acted nobly and independently by electing Rzetkowski.

these there were 12 cwt. and 4 cwt. respectively, and with them are used common earth, charcoal, coke, blood, and other ingredients in small quantities. After being mixed with water they are pumped gradually into the sewage as it flows to a large tank in which the settling takes place. The sediment is afterwards taken up and poured into the flowing sewage five or six times over, and still proves effectual as a precipitator, and acts much more rapidly than the lime process at present in use. The result, we are assured, is, that over 80 per cent. of the ammonia in the sewage is extracted, and a manure produced which is worth fully 3l. 10s. a ton, while the water flowing off is clear and apparently thoroughly purified.

TRADES UNIONS AND STRIKES.

At the half-yearly meeting of the Birmingham Chamber of Commerce, a report was read, in which it was said, in relation to "Trades Unions and Strikes"—

"It is impossible to deny the right of working men to combine for their own just interest. The part of wisdom is to do all that can be done by persuasion and enlightenment to induce trades unions to keep their action within the limits of fairness and justice, as the only conduct that can be permanently successful. Your council considered that the stonemasons' strike in this town, which began in April last, and unfortunately still continues, was a proper occasion to try if any good could be done towards effecting a settlement between employers and their workmen by conciliation. In order to offer a Board of Conciliation that should be as unexceptionable as possible to the workmen as well as the masters, your council arranged with the trades council of this town, that three deputies from their body should join with three members of your council in offering themselves as a joint committee of conciliation between the parties in difference. The stonemasons on strike and the master builders were invited each to send three deputies to meet this joint committee in the council-room of your chamber. This offer was readily accepted. Some meetings were held, your council regret to say without success hitherto; but as these meetings may possibly be renewed, your council abstain from further statement. This attempt was the more readily made by your council from the hope that it might open up the way to some permanent council of conciliation, to which employers and their workmen might apply in their differences, before resorting to actual hostility."

The threatened "Rattening" in London.—We are written to by Mr. W. Allan, the general secretary of the Amalgamated Society of Engineers, disclaiming all connexion on the part of his society, with secret committees, or with the anonymous letter sent to Messrs. Bunnett, and others, threatening "consequences" if they allow piecework in their business.

ELECTRIC SAFETY LOCK.

MM. DUBÉ and LEMAIRE, Paris, two young mechanics, have invented a new system of safety-lock. The key of the proprietor can open the lock without ringing the bells (placed in the apartment, anywhere about the house, or at any distant locality); but if a false key be introduced, a "jimmy," or any piece of metal, the bells are set going as long as the piece is applied. This is effected by the disposal of the several tumblers with regard to a small lever which completes the battery circuit when elevated. When all the tumblers are lifted simultaneously, as by the master key, the lever is not raised and no alarm is given; but if one, or two, or three be lifted, the alarm lever is raised and the ringing takes place. If the burglar, knowing the mechanism of the lock, try to force the lock plate by any of the usual burglars' instruments, as soon as the metal is attempted to be wedged in the ringing commences.

The safety-lock can be applied to all doors or fastenings without distinction. The acting agent of alarm is a feeble current of electricity produced by a small battery of two elements. The pile used is that of Leclanché (small model), with peroxide of manganese and a single liquid, which does not require touching for several months, and then even a little water is all that is necessary to replace that lost by evaporation.

The master-key is protected by an insulating substance, so that when introduced it establishes no contact, nor does it raise the alarm lever when the tumblers are lifted. Now, supposing a burglar to have a dozen or so isolated keys, he could introduce any one of them silently, but on his attempting to turn it, the alarm would be continuously given and put an end to his experiments, so that he could not try one key after another.

THE SCIENCE OF COLOUR.

I HAVE read with much interest and very considerable surprise, your notice of the work of Mr. Benson on the science of colour.

I have endeavoured to procure the work, but Messrs. Chapman & Hall say they have it not, therefore I can only reason upon what is communicated in your article.

The author, as the reviewer remarks, roundly asserts that all our present theories on the laws of harmony of colour are entirely wrong; consequently that Newton, Brewster, Giète, Field, and Chovrenil are all quite mistaken, and that their old theories must be replaced by Mr. Benson's "Natural System of Colours."

I have read through this article very carefully, and more than once, but I fail to discover any reasons or arguments proving these assertions. I do not perceive why red, green, and blue should be considered the simple elementary or primary sensations of colour. I think a theory very defective which ignores yellow except when combined with blue as green. Does the author really mean that blue, red, and yellow are not the primaries? We are accustomed to call them so because they cannot be compounded of other colours. But he maintains that this system is a delusion, and is "unsupported by a single rational experiment," adding that "that theory is entirely subverted, not only by his researches on prismatic colours, but by all scientific experiments on the mixture of colours, which show that red and green, yellow and purple, and blue and orange, are not complementary to each other."

This is a subject so well known and so easily to be experimented on that I cannot understand how the author can venture to dispute it. It appears to me that he has been carried away by enthusiasm at the result of his experiments with the prism, to make assertions which a careful consideration of the facts cannot justify.

Most brilliant, interesting, and beautiful are combinations of colour brought into play by the use of a good prism; but they are swayed by a variety of subtle influences of shade, light, form, and colour.

I take a sheet of note-paper, and, looking at it through the prism, the top edge is fringed with scarlet red shading to pure yellow; then follows the pure white of the paper, and at the bottom edge is violet shading upwards to clear blue. Taking another piece of paper, and holding it near the first sheet, I bring the violet ray at the bottom edge against the scarlet ray on the first sheet, and the scarlet becomes soft rosy pink. On the centre of the white paper I place a black object; on this the violet and blue rays radiate at top, and the red and yellow at bottom, thus reversing the previous colours. Again, I turn the prism on a grass-plate (alas! it is very dry); the colouring is that of a brilliant opal, yellow predominating with light pencillings of blue, green, and red. Where the grass abuts on a pavement there is a well-defined fringe of deep yellow, then red, violet, blue, and blue-green, each a distinct ribbon of colour; then there is an interval of white, and again belts of yellow, pure rose-colour, and violet-blue. I instance these experiments to show how various are the combinations given by the prism, and that there is nothing in them upstating the theory that red, yellow, and blue are the primary colours, or that green, purple, and orange are their complementaries.

No definite proportion can be fixed for the due mixture of manufactured colours to form neutral grey, that must always be regulated by the tints of the actual colours, and also their chemical composition; but taking light chrome, carmine red, and good light ultramarine blue, I have found that the average proportion of three, five, and eight will form a good grey.

I have no doubt that the work of Mr. Benson will give very instructive suggestions on the various harmonies of colours; but when he declares that all our present received theories are decidedly wrong, he must bring stronger proof to convince us.

I quite agree with you that it is pleasant to meet with something original in which thought and labour have not been spared; but asserting that the truth of nature must be superior to groundless theory, is simply a phrase: it does not prove that theory to be groundless. I am not aware that sea-green and rosy-pink have been overlooked in combinations of colours, or that those colours should have a special influence on the theory. I offer these remarks for consideration.

JOHN G. CRACE.

UTILIZATION OF SEWAGE.

A SERIES of experiments with the contents of a Leicester sewage have been going on at the works in the Abbey Meadow, conducted by Mr. S. Sills and Mr. G. Wigner, of London. The process is that which has been already tried at Tottenham, and the results are those described in *Engineering* of the 3rd ult.—

"The experiments at Tottenham, which were conducted by Mr. Wigner, were commenced in a tank holding 5,000 gallons. The necessary quantity of chemicals, dissolved in about 6 gallons of water, having been put in, the tank was filled with sewage; the pump caused sufficient agitation to mix the ingredients thoroughly. The sewage (a dry black sample) was immediately decolorized, and in ten minutes a sample drawn from a tap nearly at the bottom of the tank was so clear that filtering seemed to be almost unnecessary. 4,700 gallons of this water were run off, and the tank filled again without removing the filament. This also was completely clarified in less than ten minutes. The tank having been filled and precipitated eight times, the trial was so far deemed satisfactory, and the water having been drained closely off, the residue amounted to about 200 gallons of thick black mud, with 100 gallons of water. This was dried in the open air, and the residue was about 8 cwt. of manure much resembling a sample of artificial manure in appearance, and containing 2-37 per cent. of ammonia. The analysis of the water shows it to be little more organic impurity than in the Tottenham water supply, and far less than in the river Lea at Tottenham. 86 lb. of the new compound, dissolved in 69 gallons of water, were used to precipitate this quantity (nearly 100 gallons) of sewage. The cost is estimated at 18s. 10d. per 100,000 gallons.

A larger tank, holding 36,000 gallons, was next prepared, and the sewage allowed to flow in by gravitation at the rate of about 1,600 gallons per minute, the sediment being in at the same time from two small tubs. Fifteen minutes after the tank was filled the mud had subsided, the water was clear, free from odour, and almost tasteless. The greater portion of the impurity remaining in this water was common salt."

At the Leicester works the process has been conducted on a much larger scale, and Mr. Wigner considers with even greater success. Monday 1,728,000 gallons of sewage were dealt with, the precipitating compound being added in the quantity of a little over a ton, the bulk of which was chiefly clay and alum. Of

THE ART AND SCIENCE DEPARTMENT.

As a means of stimulating a branch of industry especially available for the employment of educated females, the Lords of the Committee of Council on Education offer prizes for fans painted by female students in any school of art connected with the Science and Art Department, viz.—One prize of 5*l.*; two prizes of 3*l.* each, 6*l.*; three prizes of 2*l.* each, 6*l.*; five prizes of 1*l.* each, 5*l.* The decoration is limited to foliage, or flowers, or those conjoined with landscape vignettes.

With regard to the Whitworth Scholarships, it may be useful if we say that competitors in the schools and night-classes, for the Whitworth 100*l.* Scholarships will be required to produce a certificate of having passed in the ability to draw outlines like the annexed either enlarged or reduced in size from a copy. The examinations are held at any school of art or night-class in the United Kingdom during the month of May, 1868, or, if specially required, in a science school.

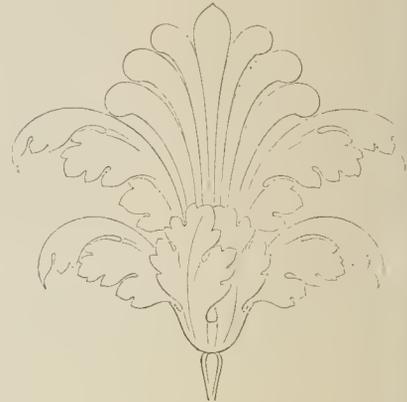

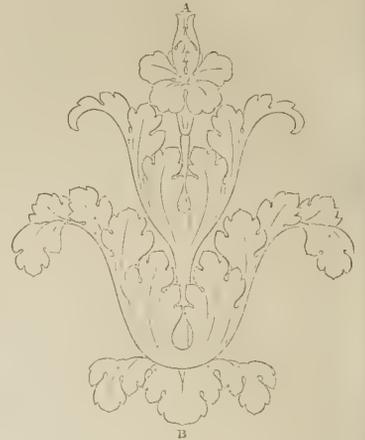

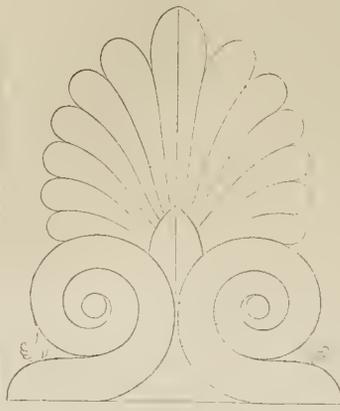

The fifteenth annual report of the Department states that the system of science and art instruction has reached 10,230 individuals in science, and 105,529 individuals in art. The students at the school of naval architecture numbered 41, at the school of mines 13 regular and 102 occasional, and at the college of chemistry 121. At the evening lectures there was a total attendance of 2,207. The total number of persons who have received direct instruction as students, or by means of lectures, in connexion with the Science and Art Department, is about 123,500, being an increase of over 10,000 in 1866. The attendance at the museums and collections under the superintendence of the department in London, Dublin, and Edinburgh has been 1,305,374, showing a total increase of 152,374, or 13.2 per cent. on the numbers of the preceding year, which were 1,153,091. The expenditure of the Department during the financial year 1866-7, exclusive of the cost of the geological survey, was 152,856*l.* 18*s.* 1*d.*, while in 1867-8 it was 179,950*l.* 6*s.* 1*d.*, showing an increase of 27,093*l.* 8*s.*

The committee say,—“We can confidently report that at no period since the establishment of the Department has its influence in promoting the knowledge of science and art, especially among the industrial classes, been so widely extended or its beneficial results so marked as during the past year.”

Our correspondents on the subject of the National Portrait Exhibition will doubtless have noticed that the collection may now be seen free on Mondays, Tuesdays, and Saturdays, and for 6*d.* each person on Wednesdays, Thursdays, and Fridays. The exhibition will close on the 22nd, before which such of our readers as have not seen it should make a point of visiting the gallery.

SHEFFIELD ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY.

The fourth excursion of the members of this society has taken place. Starting from the School of Art, a large party of ladies and gentlemen drove by way of Dronfield and Chesterfield to Hardwick, arriving there about one o'clock. After partaking of luncheon, the party proceeded first to examine the Old Hall, now in ruins. Mr. Haslam, the under steward of his Grace the Duke of Devonshire, acting as guide, explained the different parts of the building, and pointed out objects particularly worthy of notice. From the Old Hall the party repaired to the present mansion, where, by permission of his grace, who is patron of the society, they visited more than is usually shown to

FREEHAND DRAWING EXERCISES.

visitors. After admiring the prospect from the roof, the party were entertained with refreshments before leaving the Hall. After being conducted by Mr. Haslam through the gardens and stable buildings, the party repaired to the inn, where an interesting account of the Old Hall was read on the lawn by Mr. W. White, jun. After tea, the party returned to Sheffield.

PROVINCIAL NEWS.

Ely.—A scheme is on foot to erect in Ely a public building which shall contain a museum, library, and large room for lectures, meetings, concerts, &c. A site has been obtained adjoining the Shire-hall; and a design of the intended building prepared by Mr. Freeman, of Ely. The expense is estimated at about 1,600*l.* Already 650*l.* of the required sum have been obtained.

Epworth.—A large public room has long been wanted at Epworth. The tectotals determined to erect a building to be made available for lectures and other public purposes, and have succeeded. The committee purchased a site in High-street, in the centre of the town, and only a short distance from the Market-place. The foundation stone, or rather the two corner stones, had just been laid.

Bradford.—A sum of 12,000*l.* is to be raised for a new mechanics' institute building, and to convert the institute into a people's college for Bradford.

Masham Hall.—This hall, the residence of

Mr. James Cookson, standing on a picturesque bend of the Tees, near Darlington, has been recently entirely remodelled and greatly enlarged. As altered it presents an Elizabethan group, the central portion being three stories in height, with bay windows carried the entire height, and crowned with a cornice and open parapet, griffins, &c. Attached are conservatories and stabling, dairy, &c. The principal feature in the interior is the main staircase, which is executed entirely in wainscot oak, and lighted from the ceiling. The ceiling is panelled, and the ribs are moulded and relieved with foliage, the intersections of the ribs being marked by carved pendants. The works have been carried out by Messrs. Shaftoe & Barry, contractors, of York, Mr. G. Crathorne acting as clerk of works; and the architect is Mr. John Ross, of Darlington.

SIDMOUTH.

THERE has been a marked difference in the temperature of London and that of South Devon during the last month. Thus, while the temperature of London was 93°, that of Sidmouth was only 76°, or 17° less. The highest and lowest minimum readings were 66° and 54° respectively.* There was generally sufficient wind through the day to prevent lassitude, and the mornings and evenings were delightfully cooled by the sea and

* The air along the south coast is kept cool in summer and warm in winter by the nearly equable temperature of the adjacent sea, which is continually receiving warmth from the gulf stream.

and frozes, and the heavy dews. Great as this advantage has been to Sidmouth, it is as nothing compared to the remarkable absence of sickness and disease, the town never having been more healthy. This may be partly attributable to the drainage works executed some time ago, and described in the *Builder* on the 4th of April last. A stained glass window, by Ward & Hughes, as recently been placed in the parish church to the memory of Miss Bacon, granddaughter of John Bacon, the sculptor, who carved the heads of the key stones in front of Somerset House, under Sir W. Chambers. He also executed other carved work about the same building, and good work of some of it is. The west window, by the same artists, was erected by her Majesty to the memory of her father, the late Duke of Kent, who died here January 23rd, 1820.

WORK IN THE HOT WEATHER.

It would be well were contractors, builders, and their great employers of labour, to be considerate to their men in so sultry and dry a season as the extraordinary one now in progress. They might obtain the same amount of labour, and indeed more, by allowing them to drop work during the hottest heat of the day, working early and late to make it up. The men would be thankful, and a masters would have more or better work done. Sunstroke has been unusually prevalent this season, both in this and in other countries, and working in the sun is dangerous. We have seen a very good practice adopted by gardeners and others to protect their heads,—namely, the wearing in their hats or caps of a large moist cloth, such as of flannel or calico. A moistened handkerchief, however, may do. The Indian practice of wrapping the hat over with a white cloth, we observe, is being adopted by bus drivers and conductors. While we are having something not far short of the dry and sultry of an Indian summer, it seems that in India they are making a trial of the moist and pleasant summer of England.

THE THAMES EMBANKMENT.

"A LONDONER" writes,—I have just had the pleasure of a walk along the northern Thames embankment. I observed that between Westminster and Hingerford Bridges a high wall of brick and stone is being erected, to divide the embankment roadway from the surplus land at the shore. I was under the impression that the formation of ornamental gardens was contemplated on this surplus land, and, if so, a high enclosure wall cannot be necessary. What pity that so much rubbish should have been brought on to the embankment, which will have to be taken away in the formation of the roadway.

FRIGHTFUL ACCIDENT AT A MANCHESTER MUSIC-HALL.

On Friday night in last week a large Society assembled in Lang's Music-hall, Manchester, and during the entertainment an alarm fire was raised. A fearful panic ensued, and the crush which followed twenty-four lives were lost, and thirteen other persons were more or less seriously injured. The building, whose proper title is the Trafford Arms, is in the occupation of Mr. D. R. Davies. The principal portion consists of a theatre, with pit, orchestra, and two galleries. At the time the tragedy named a performance was in progress to the benefit of a Mr. & Mrs. Clifford, dentists. The amusement of the moment was a sack race on the stage, to see which a number of men and boys in the pit stood upon the front benches. The benches creaked as if giving way; several men caught hold of a gas-pendant to save themselves from falling, and the pendant broke off their hands. The smell of the escaping gas was so strong that some one cried "Fire," and instantly the firemen in every part of the house rushed to extinguish the fire. The firemen were not only two staircases on either side of the stage, but in a mad effort to escape. Mr. Clifford was carried to them from the stage that there was a cause for alarm, but no one heeded him. A crush upon the staircases was such as to break the iron balustrades and the ironed stairs themselves, and the victims of the false alarm fell in heaps to the bottom,

while some jumped through the windows. As quickly as possible help was rendered in removing the dead and dying in cabs to the Royal Infirmary. There it was ascertained that the number of the killed was twenty-three, all men, most of them young, and that eleven men and two women were injured. The injuries were for the most part internal. There ought to be a general and stringent law passed to enforce the provision of sufficient means of exit from every place of public resort. On this we have often insisted, and the case which has now occurred only adds one more to scores of such cases which show the necessity for legislation on the subject. The widest possible means of egress, with doors opening outwards, ought to be compulsory.

BEHAVIOUR IN A PANIC.

SIR,—In a panic at a theatre, church, meeting hall, or in any place where numbers of people are assembled, what is the best course to pursue? Others have written to the newspapers making their suggestions, will you kindly allow me to make mine? When you find yourself in a crowd, on a staircase or elsewhere, the great thing is to do what very few would think of doing, namely, to *push back*. The space in front is full, gain a second or so by pushing back, and those in front will escape, then those behind can come on. In the Grand Stand at Goodwood, during the races are kept boards (about 3 ft. by 2 ft.), mounted on poles, on which boards are painted in large characters the words, "A Surgeon wanted." If an accident happens to a jockey, or if any person is taken ill, men are at once sent round in the crowd within the enclosure, with these boards held on high, and a surgeon is immediately found. Now, would it not be a good thing to have boards of a similar character in our theatres, &c., for use in emergencies, on which boards should be largely printed, "*Do not push forward, but push back!*" Those who could not see the boards might have the same words conveyed to them by means of a common sea speaking-trumpet.

W.

THE LAW COURT'S COMPETITION.

SIR,—I am no lawyer, or I should be able to answer the question which I wish to put. In this country it is our boast that all men are equal before the law,—that the rights of individuals are sacred as against the Government, as well as against any other assailants,—and that contracts, if not respected, can be enforced. The fair and temperate letter of Mr. Barry leads me therefore to inquire whether he cannot obtain either a *mandamus* for his own appointment as architect to the Courts of Law, under terms, or an injunction against the employment of any other architect.

The question of the departure by the Government from its own conditions is one of too much importance to professional men to be left to the decision of administrative caprice. Where there is a wrong, we are taught to believe, an Englishman has a remedy.

F. R. C.

DECORATIONS.

SIR,—Might it not prove a source of much improvement to young men in the several Schools of Art, to give them as a subject for prizes to form decorative designs for the ornamentation of the halls and the several parts of the rooms in which they are engaged, as the ceilings, &c., or even designs for rooms generally? Even as regards the walls of schools, those most proficient might be employed in decorating the several parts of the rooms. This would give them a facility and freedom in drawing, colours, &c., even to designing furniture, &c.

A SUBSCRIBER.

FELLING TREES.

SIR,—Will you or any of your correspondents inform me whether any machine has been invented for felling trees, which would obviate "Heart-shake," and where such is procurable? I shall feel much indebted to you for this information.

R. V. STONEY.

Calcutta.

THE LAST OF AN OLD MANSION.

SIR,—Some years ago you published some notices of mine on the antiquities of Beaumaris and its neighbourhood. One of them in a very short time will be lost, and before it disappears I would suggest that it would be worth while for some one to have detailed drawings and good photographs made of it. I refer to the old town mansion of the Bulkeley family, till lately divided into several small tenements, but now in the last stage of dilapidation, and about to be taken down. It is of the latest style of Gothic,—early timber, partly of stone,—and may have been built early in the sixteenth century. There are Elizabethan additions, and some of the ornamental plaster-work of this period is very good and elaborate in design. It contains a fine hall, with a cone over the door, an arched oak roof, beneath which, at the level of the collar-beam, a very elaborate ceiling with pendants has been added. A minstrel's gallery and screen remain at the lower end of the hall, but filled in with lath and plaster. At the upper end of the hall is a large drawing-room, with a good ceiling, with houses, &c. The hall and drawing-room are sixteenth century. In the roof is a gallery containing a fine fireplace, on which colour and gilding are still to be traced.

I have in vain tried to get the local photographers to take some views of the place; and it would be a matter of great regret if the remnant of this once fine building (which seems scarcely known to antiquaries) were allowed to be removed without some memorial of its details having been preserved. Even as a matter of profit, photographs ought to sell well among the visitors of the place and of the neighbouring watering-places; as Llandudno, &c.

E. W. COX.

A CAMBRIDGE THOUGHT.

Fair are the laws by Camus, reverend stream,
Whose waters quiver'd in the hindling ray
As o'er the cycloid arch we took our way
Where those tall lines invite the countess' dream;
Nor less it pleased in thoughtful mood to stray
Through cloister'd courts, or where the summer glow
Lit up the fading grace of Inigo,
Or own the Tudor fan's majestic array.
Yet seem these antique halls and quiet trees
Things of the Past, while Fancy on the breeze
Brings sounds that ill consort with learned ease—
Lead calls the Age, the trumpet sings to stride,
The leaders beckon, all the plain is ripe,
With hosts that onward press to brighter, stronger life.
H. H. S.

GREENOCK DOCKS.

SIR,—On the 31st of March last competition plans were to be sent in for the above docks. I duly sent in the plans under a motto, in accordance with the instructions, but have heard nothing of the result, although I have looked carefully through your weekly numbers. If the trustees are going to Parliament for further powers, it is time they selected some plans as the basis of their operations; and if they are not, it is full time that the competitors were informed of the result of their labours.

C. E.

LEAD PIPES AND AIR.

SIR,—The question of the flattening of lead pipes can be resolved as your last correspondent mentioned. A current of water, through even a horizontal pipe, with only 18 in. of head, is sufficient to draw in air to such an amount that, by a small pipe fixed at right angles to the flow-tube, and an india-rubber tube, M. Bourdon, known as an inventor of barometers and gauges, works the models of his new engine by vacuum so produced. I spent some hours with him a few days ago, and he assured me that, although he had patented the system in 1857, still it was always a wonder to him how it acted. The horizontal tube he uses is about a foot long, a little trumpet-mouthed, and playing into a waste trough, and the tube to which he attaches the elastic conductor of the vacuum is about 2 1/2 in. long at right angles, as I said above. However, I think the flattening of water-pipes, say of 4 in. diameter, must be gradual, as the pressure is not very great, even for an atmosphere of 34 ft.; but lead is soft, and the continual bearing of the burden will cause it to yield. If holes are bored with small air-pipes, at intervals near the bottom of the pipe, say 6 or 8 ft. from the ground, the exhaust will be prevented. If the air-holes are too near the top, the water will run over, unless the diameter of the pipe be so great as to make it a blowing-machine as used in many country districts.

DAN PARS.

REPUTIATION OF A CONTRACT.

In a case tried at the Lancaster Summer Assizes, Holden and Another v. Maguire, Mr. Holker, Q.C., and Mr. Edwards appeared for the plaintiff, and Mr. Quain, Q.C., and Mr. Gurn, M.P., for the defendant. The plaintiffs, Messrs. Holden & Clegg, were builders, carrying on business at Accrington, and the defendant, Mr. Maguire, a Roman Catholic priest, also residing at Accrington, and the action arose out of a contract entered into by him with the plaintiffs to build a Roman Catholic chapel. The plaintiffs tendered for the erection of the chapel, and sent in their tender, which amounted to £6,336. Some delay took place, the defendant then being desirous to build a presbytery, and was anxious to have the contract taken by the same party that obtained the contract to build the chapel, and the plaintiffs agreed to build the presbytery at the same schedule of prices they had tendered for the chapel. On the 26th January, 1867, the plaintiffs tendered to erect the presbytery for the sum of £1,000, the time for receiving the tenders having been enlarged. Their tender was accepted, and on the 5th of February, 1867, they wrote to Mr. Maguire to know if one of the architects was there, as they had kept Mr. Ellis (a workman well skilled in Gothic work, whom they had engaged upon the suggestion of Mr. Maguire) waiting to commence the work. The plaintiffs not only engaged Mr. Ellis, but they

built a workshop, erected a steam-engine and boiler, and had all in readiness to commence work, when another delay took place in consequence of the title to the land proving defective, and they were told that they must not proceed with the work till the question was settled and other land procured. Land was procured on the 12th of February. The plaintiffs wrote to Messrs. Wilson & Nichols, the architects, who, in reply, sent word that they must wait. They did wait, but to no effect. On the 20th May, Mr. Wilson came over, and the plaintiffs were introduced to him as the contractors for the work, and then for the first time Mr. Wilson said something about bondsmen. They at first objected, as nothing of the kind had been previously hinted at, but eventually they gave the names of persons willing to become bondsmen, and with those names Mr. Maguire expressed himself satisfied. On the 6th of June Mr. Wilson sent a letter to the plaintiffs, expressing his doubt as to their capability to perform the work, and the result was that he took away the contract from them and gave it to another person.

Upon the suggestion of Mr. Quain, it was agreed to limit the inquiry to the question whether there was a contract or not.

During the examination of the witnesses it transpired that after the tenders had been sent to Mr. Bell, an architect, they were opened by the defendant, who at once accepted that of the plaintiffs, and desired Mr. Bell to inform the plaintiffs, and to signify to the other parties, the fact that the contract had been disposed of, in order that he might not be troubled with any further inquiries.

The jury, without any hesitation, gave a verdict for the plaintiffs, the amount of damage to be settled by reference.

CHURCH-BUILDING NEWS.

York.—Until within about a year ago the Church of St. Michael, Spurrergate, in this city, contained high square pews, covered with green baize. The edifice was also damp and dirty, and was principally lighted by windows on the south-east side. These features were considered sufficiently objectionable to induce the parishioners, at a meeting held in the vestry, to pass a resolution substituting for the pews referred to stalls of a modern pattern, at an estimated cost of about 350*l*. The work has been carried out under the superintendence of Messrs. Atkinson, architects. The contractors were Mr. Dennison, for the pulpit, reading-desk, and reposing; Mr. Dodsworth, for wood-staining; and Mr. Keswick, for the masonry. After the improvements had been commenced an offer was made to rebuild the north-west wall, and to place in it two windows,—an offer which was of course readily accepted by the parishioners for the sake of the great improvement that would be effected. The whole of the old pews in the church were removed, and the floor relaid with concrete. The dampness has consequently been got rid of, and the whole of the interior of the building has undergone a thorough cleaning. The expense of rebuilding the north-west wall, and inserting the four-light windows therein, will be borne by the sheriff (Mr. J. Day, Junr.), Mr. Edward Day, Mr. Wood, of Spurrergate, and Mr. Sanderson, of Low Ousegate. These windows (which have been supplied by Messrs. Hodgson, of York) are filled in with cathedral quarries and ornamental stained lead borders. The two middle compartments in each contain subjects in stained glass. They are memorial windows. In the one is a representation of the offerings of the wise men after the birth of Christ, and in the other the descent from the cross. The two compartments in the other window, to the memory of Mr. Edward Day, are occupied with figures of Martha and Christ. The cost of the wall and windows has been 190*l*. The church will now accommodate about 400 persons.

Birmingham.—The new Church of St. Nicolae, to which has been appropriated a district taken from the parish of St. Stephen, has been consecrated by the Bishop of Worcester. The total cost of the building has been about 3,500*l*. Of this sum the Ryland Trustees gave 2,000*l*.; the representatives of the late Mr. H. Elkington, 1,000*l*.; Mr. F. Elkington, the site (700 square yards of very suitable land), besides 500*l*. for a parsonage; and the Church Building Society a grant of 150*l*. The total length of the edifice is 105 ft., and the total breadth 57 ft., measuring from the outside of the walls. The church consists of a nave, two aisles, chancel, organ-chapel, and vestry. As the church is closely surrounded on three sides by buildings, a lofty clerestory has been placed over the nave arches, by which means abundance of light is obtained in every part of the interior. The design of the church is studiously plain: very little which can be called "ornament" is to be seen in any part of it; but effect has been gained by the general proportion of the parts, and particularly by the unusual height of the whole building. The whole of the sittings in the church are free. There are no galleries. The number of sittings is 600. The architects were Messrs. Martin &

Chamberlain; and the contractors, Messrs. Wehl, of Hockley.

Banbury.—The Banbury people have just declined an offer of 1,000*l*. from the vicar's father, and 500*l*. from Mr. Hunt, a local brewer, towards rebuilding the chancel and improving the organ of the parish church, fearing, we suppose, that they should be called upon to find the remainder of the total sum required.

Bletchley (Bucks).—The old parish church of Bletchley, which has been restored under the direction of Mr. W. White, has been re-opened for divine service. Nearly the whole of the stonework had been repaired in brickwork and cement, involving the renewal of the greater portion of it. The chancel is chorally arranged with return stalls in carved oak, and there is a canopy reared behind the altar.

Brighouse.—The foundation-stone of a new church has been laid at Brighouse, by the Venerable Archdeacon Musgrave, of Halifax, who laid the foundation-stone of the existing church thirty-eight years ago. The new church is to be in the Gothic style of architecture, will accommodate 500 persons, and cost about 3,500*l*. Messrs. Mallinson & Berker, of Halifax, are the architects.

Liverpool.—The foundation-stone of a new church, to be called St. Nathaniel's Church, for the Windsor district, Toxteth Park, has been laid. The site of the church has been chosen in Oliver-street, occupying a central position in the midst of a dense population. The cost of the edifice complete will be about 3,600*l*., accommodation being provided for about 750. The contractor for the works, which will be completed by March next year, is Mr. William Murphy, the architect being Mr. David Walker, of Liverpool.

Lichfield.—The Lonsdale Memorial Church, the chief stone of which was recently laid, as already announced, is intended to take the place of the old body of St. Mary's, which was in a sadly dilapidated state, and which was far from being in unison with the tower and spire, built some dozen years ago to the memory of the Rev. H. G. Lonsdale, another member of the Lonsdale family, and which still remains, to form a part of the new structure. The style is to be Gothic, of the Geometrical Decorated variety, and the building will comprise a nave, north and south aisles, a chancel, an organ-loft on one side, and a vestry on the other, and a Diocesan chapel over a vault belonging to the family. The materials to be used in the erection, both inside and out, will be polished stone. An east window, with seven lights, is to be constructed, as a memorial of the late bishop, and there will be six windows in each aisle, the two at the east end being four-light and the others three. It will contain a polished stone circular pulpit, a reredos of Devonshire marble, and the chancel-stalls, altar-rails, reading-desk and lectern, pillar-caps, and other parts of the building will be carved. The roof will be of timber and open, and the building will be fitted up with Haden's warming apparatus. The architect is Mr. J. W. Fowler, of Louth, late of Lichfield; and the builders are Messrs. Crutchlow & Ward, Uttoxeter. The clerk of the works is Mr. Matthewson, Lichfield. The cost will be about 8,000*l*.

DISSENTING CHURCH-BUILDING NEWS.

Norwich.—The memorial end corner stones of a new Mission Chapel for the Wesleyan Methodists have been laid in Ber-street. The chapel, which is to accommodate about 400 people, is to be built of white brick, with schoolrooms under Mr. Adams, of St. Stephen's, is the contractor, Mr. Boardman the architect.

Normanton.—The chief stone of a new Wesleyan chapel has been laid here. The site of the projected chapel is in Woodhouse-lane, in the centre of the new town of Normanton. The building will be of red bricks, with white brick arches, strings, and cornices, also stone dressings. The inside dimensions are 42 ft. long by 33 ft. wide, and the edifice is capable of seating 200 persons. A vestry, 12 ft. by 12 ft., is attached at the rear. The roof inside will show the framing, which will be wrought, stained, and varnished, and externally it will be covered with blue slates. The interior, pews, benches, communion platform, reading-desk, and other fittings, will be of red deal, stained and varnished. The building, the front of which faces the high road, stands back from the line of road about 13 ft. A dwarf brick wall, stone coping, and ornamental iron railings

and gates will enclose the site. Mr. William Watson, of Wakefield, is the architect, and the contract has been taken for the whole of the works by Mr. Henry Gibson, of Normanton builder, for 473*l*. 10*s*.

Wickham.—The foundation stone of a Wesleyan chapel at Wickham has been laid. The site is a little to the west of the village. The chapel, including vestry, will be 45 ft. long by 28 ft. wide, and will have an open roof, the timbers being varnished. The style of architecture is plain Gothic. Seats will be provided for 200 and the total cost is estimated at 500*l*. The plan and specifications have been furnished gratuitously by Mr. Thomas Merch, of Blaydon Bank and were designed by Mr. J. E. S. Vardy, architect, Newcastle. The contractors are—For the mason, plaster, and slate work, Mr. William Nicholson, Leadgate; for the joiner work, Mr. R. Smith, Winton; and for the painting and glazier work, Mr. C. Robson, Winton.

Ormskirk.—The foundation stone of a chapel and schools in connexion with the Wesleyan Methodist hall, has been laid at Burscough Bridge, near Ormskirk. The building is to be cruciform, but the nave only will be used for the congregation, the transeps and chancel being appropriated as schools, and for the purposes of festivities until the congregation require the entire building for their use. The nave will measure 46 ft. by 36 ft., the transeps, 42 ft. 6 in. by 18 ft., and the chancel, 16 ft. by 8 ft. The entire cost of the building will be about 950*l*. The architect is Mr. Thomas Bridge, jun., and the builder Mr. Thomas Bridge, sen.

Tunstall.—The present Wesleyan chapel at Goldenhill, erected in 1822, and subsequently enlarged, being found inconvenient and too small for the rapidly-increasing population, the Wesleyans have for some time past been contemplating the erection of new and more commodious premises. This object is now being accomplished. A suitable plot of land centrally situated in High-street, the main thoroughfare, has been selected, and the premises will include school and chapel. The building will be erected from the plans and designs of Mr. Roberts, of Trentham, the contractor being Mr. John Grosvenor, of Bradley-green. The plans include a school underneath the chapel, which will be 5 ft. above the level of the road, and approached by steps. It will be a plain structure, the front being of red brick, with stone dressings. The interior of the chapel will be 63 ft. by 45 ft., and the height to the ceiling will be 30 ft. The schoolroom will be of the same length and width, the height from the ground-floor to the ceiling being 13 ft. The seats in the chapel will be open, and the woodwork stained and varnished. The singers' gallery will be at the back of the pulpit over the vestries. The cost is expected to be about 2,200*l*., including the price of the land.

Buttershaw (Bradford).—The foundation-stone of a new Congregational Church for this place has been laid, by the Mayor of Bradford. The site of the building is close to the Bradford and Halifax road, on the north side, on rising ground which is becoming thickly populated, and overlooking a vast tract of country. Buttershaw is a thriving hamlet adjoining Shelf. The architect of the new chapel is Mr. J. P. Pritchett, of Darlington. The building will consist of a Gothic nave and choir, with accommodation for 450 people on the ground-floor and in an end gallery, and there will be provision left for the erection of side galleries, so as to increase the accommodation to 600. There will be a tower and spire rising to a height of 90 ft., and a large central doorway with three-light window over; at the sides there will be single-light windows. Internally, the seats will be all open, with low, slanting backs, of wood stained oak colour. The roof will be open, with curved braces. The windows will be cathedral stained, of tinted glass in lead panes. The passages and vestibule will be laid with mosaic tiles. The chapel will be lighted with star-light, and heated with Haden's heating apparatus.

Bunbury.—The memorial stones of a new Wesleyan chapel have been laid. The plans of Mr. J. B. Bottle, of Great Yarmouth, architect, were adopted; and Mr. Livesley, of Tarpoley, builder, has undertaken the building, the contract for which is 825*l*., and the extras may increase that to 900*l*. or upwards. The new chapel will be 70 ft. long by 33 ft. wide, with a clear space of 6 ft. around it, and a good frontage to the Spurstow road at the end of Lower Bunbury. The materials used in the construction will be red and white brick, with stone facings,

the gabled front having buttresses with carved stone capitals, and a narthex, or porch, with window on either side. In the gable will be a circular window, improved by oblique arcade above, and the apex of the front will be surmounted by an iron finial. In the interior the open seats will be of Baltic timber, stained and varnished, and will afford accommodation for about 250 persons, while there will be a school and vestry, and out-office in the rear.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Richmond (Yorkshire).—The new Church of Sainte Joseph and Francis Xavier, has been opened for divine service. It stands on the site of the old Catholic school, near the end of the town. It is Early Decorated. The plan shows nave, aisles, and chancel. There is one lateral porch, and to the front is a large porch or atrium, such as existed in certain well-known churches in Yorkshire,ountains, Ryland, &c. A bell-turret rises at the end of this atrium, giving access to an organ-gallery within the church. The capitals of the columns supporting the arches of the nave are all sculptured. The roofs are of framed timbers, that of the nave being arched. Three windows terminate the chancel or apse, one of which is filled with stained glass. Below these windows is the high altar, all carved in Caen stone, with marble columns. The chancel is paved with a mosaic pavement, and separated from the nave by a communion-rail of metal. At either termination of the aisles are chapels, which will be appropriately fitted up. Confessionals in one aisle, and the baptistery in the other, with a commodious sacristy, complete the plan. It is intended to erect convenient schools beyond the church, of simple character, but in keeping with the latter. The Priory of our Lady was begun some years ago, but is only now being completed by the erection of its most important feature—the chapel—and an extensive wing. All the works have been erected and carried out from the plans of Mr. George Goldie, architect, with local materials, and by local contractors. Mr. Naylor has executed the carpenter's and joiner's work of the church; Mr. Smith has done the stonework; and Mr. Garbutt has undertaken the whole of the convent work. For the sculpture, stained glass, tile, &c., the services of Messrs. East, of London; Wallace, of Newcastle; Law, of Broseley, &c., have been employed. We understand that about 3,000*l.* is its cost, inclusive of fittings. It will afford seated accommodation for 500 persons, exclusive of the organ-gallery and standing room.

Books Received.

Fraser's Magazine for August contains a paper "Trade Unionism in the City and Mayfair," in which trade unions are defended, though certain abuses are admitted. "Good or bad," however, says the writer, "they do only what is done by every mercantile firm, every joint stock company, every political club, every religious sect, every church, and every family. If they had not condemned, so does society too; and the choice lies between—not unionism and non-unionism, but—nonism and the most extreme form of socialism." If the non-nionist cannot compete with the unionist, he says, he must get out of the way. Inns of Court, the medical faculty, and such like bodies are addressed as unions of quite as exclusive and tyrannical a nature as trade unions, although they do not operate as broadheads or rattensers.—Broadway for August completes the first volume, and shows that this new international is getting on successfully. It contains a paper "The American Literati at Home," in which we have some particulars of Longfellow's home in Cambridge, Massachusetts. Broadway is about to appear in a new series, at a shilling monthly instead of sixpence.—Cassell's Popular Educator, new edition, revised, has reached its 10th part.—Part 3rd of Bourne's "Examples of Modern Steam, Air, and Gas Engines" of the most recent and approved Types" (Longmans), of which we lately spoke, has now been issued.—The Quarterly includes a paper on "Indian railways," which should have the effect of crossing the confidence in them already shown by the public as means of investment. A

Life of Garrick and a paper on Proverbs in the same part are very amusing reading.—*Hanover Square*, a magazine of copyright music, edited by Lindsey Sloper (Ashdown & Parry), is now in its tenth number, which contains two pieces for the piano-forte, a song by F. Stanfield (the words by Shakspere), and a charming ballad by Virginia Gabriel.—Several single pieces of music have reached us. We select for mention "The Rock-brook Galop," by E. Hill (Lamborn Cook, Addison & Co.). This is a capital dance-tune, original, spirited, and with time well marked. If this be the production of a very young composer, as we understand it is, we shall see more of the notes of E. Hill, and find them readily exchangeable for cash.

Miscellanea.

BRITISH MUSEUM.—A scandal in the coin department of the British Museum is being talked of, and one of the officers of that department, bearing a well-known name, has lost his appointment, we hear.

NEWSPAPER PRESS FUND.—The half-yearly meeting of this fund has been held at the office, 24, Cecil-street, Strand.—Mr. C. L. Grunneisen in the chair. The report, which was adopted, stated that the committee regarded the progress of the institution as highly assuring. In their last report they spoke with confidence of a large prospective increase in the number of members: this anticipation has been realized by an accession of 30 new members, showing in the aggregate an enrolment of 240; of whom 162 are resident in London, and the remaining 78 in the country. The grants during the past year amounted to 165*l.* The annual dinner, which took place at Willie's Rooms on the 6th of June, was in all respects a signal success. The donations amounted to 1,010*l.* 19*s.* The investments, balance at the bankers', and donations receivable, exclusive of the annual income from members' subscriptions, amounted to 4,744*l.* on the 30th of June.

LAYING THE FOUNDATION STONE OF THE NEW ISLINGTON WORKHOUSE.—On Saturday afternoon last, the ceremony of laying the foundation-stone of the new Islington Workhouse at Holloway took place. The proceedings were of a private character. The site selected is opposite the West London Union Workhouse, and commands a fine view of the surrounding country. The inmates will be classified, and the building is to be fitted throughout with every modern appliance to promote the comfort of the inmates. The edifice will present an extensive front, and although rather more useful than ornamental, it will be relieved by the employment of bands of variegated brick. A cupola will crown the structure. The wings of the building will be need— one as a Board-room, and the other as a casual ward. The whole will be erected from the designs of Mr. R. H. Burden, by Messrs. Nutt & Co. Mr. Alfred M. Lewis is the clerk of the works. It will be capable of accommodating 1,000 persons, and its cost will be about 76,000*l.*

BIRMINGHAM SCHOOL OF ART.—The following students of the Birmingham School of Art have been successful in the examinations held by the Science and Art Department in May last, in the following subjects; amongst others:—

- | | |
|-----------------------------|------------------------------|
| Engineering Drawing: | |
| L. Avis, 1st class. | R. Holliday, 2nd class. |
| A. W. Brown, 1st class. | T. Phipps, 2nd class. |
| W. G. Causser, 1st class. | A. Reading, 2nd class. |
| T. Cox, 1st class. | J. P. Waldron, 2nd class. |
| J. Ellis, 1st class. | G. W. Whitehouse, 2nd class. |
| G. Glydon, 1st class. | W. Bushnell, 3rd class. |
| T. Gray, 1st class. | F. Evans, 3rd class. |
| H. Lewis, 1st class. | J. Fellowes, 3rd class. |
| C. E. Petford, 1st class. | J. Hill, 3rd class. |
| W. H. Robins, 1st class. | R. Morgan, 3rd class. |
| W. D. Sibleford, 1st class. | F. Shaw, 3rd class. |
| A. Betton, 2nd class. | W. Stocks, 3rd class. |
| H. C. Buckley, 2nd class. | W. H. Brookes, 4th class. |
| H. Butler, 2nd class. | E. Baker, 5th class. |
| G. E. Evans, 2nd class. | |
| D. Forbes, 2nd class. | |

- | | |
|---------------------------|---------------------------|
| Building Construction: | |
| W. G. Causser, 1st class. | W. Davis, 2nd class. |
| J. D. Dunn, 1st class. | T. Gray, 2nd class. |
| C. E. Petford, 1st class. | T. Phipps, 2nd class. |
| A. Reading, 1st class. | J. T. Waldron, 2nd class. |
| W. H. Robins, 1st class. | R. Baskin, 3rd class. |
| A. Betton, 2nd class. | J. Thorneloe, 3rd class. |
| H. C. Buckley, 2nd class. | W. J. Trigg, 3rd class. |
| T. Cox, 2nd class. | J. Dainty, 5th class. |

Prizes are awarded to all who pass in the 1st, 2nd, and 3rd Classes.

DISTRICT SURVEYORSHIPS.—At an examination held by the Institute of British Architects on Thursday and Friday last, the following gentlemen were nominated for certificates of competency:—Mr. Arthur Allom, Mr. R. C. James, and Mr. L. W. Ridge.

THE PUBLIC PARKS.—At the request of Mr. Alderman Lawrence, in the Commons, the First Commissioner of Works has promised that, for the convenience of foreigners and other visitors to London, he will cause at each of the park-gates the name of the gate to be written legibly and conspicuously.

WESTMINSTER ABBEY AND WORKING MEN.—The Dean of Westminster conducted a party of working men over the abbey, and afterwards entertained them at tea at the Deanery, on Friday. The visit was organized in accordance with a suggestion made by Dr. Stanley, on the part of the Working Men's Club and Institute Union, a society of which he is one of the vice-presidents.

THE FIRE IN FINSBURY.—Great damage to adjoining premises has been done by the fire in two timber-yards in Paul-street, Finsbury. It appears that no fewer than eighteen houses were more or less injured. There is something very absurd in the fact that so much care is taken by the Building Act that no pieces of timber in the building of any one of these or other houses shall come within 4 in. of the face of the wall; while, adjoining closely to their walls, there may be a whole timber-yard, with timber piled up against the walls themselves.

THE OXFORD CITY SURVEYOR.—On the appointment, from amongst seventy-one candidates, of Mr. T. C. Clarke, assistant engineer of the borough of Portsmouth, to the surveyorship of the city of Oxford, the Portsmouth town council passed a resolution to the effect "that a testimonial under the common seal be given to Mr. Clarke, expressing the high sense this Board entertains of his ability, zeal, and industry, as evinced by him in the performance of his duties, and particularly in respect of the main drainage works, which have been carried out during the three years and a half for which he held his appointment, and for some months of which he had sole charge."

HARRISON'S IMPROVED PARALLEL RULER.—The parallel ruler patented by Mr. Harrison will be found useful. The first idea of the inventor was merely to give a facility for ruling parallel lines at known distance apart, the width of the opening being regulated by lines drawn on the ruler, and this it does. There are different scales for this purpose at the four pivots of the cross-bars. The ruler is also marked so as to set out angle of any number of degrees by ruling along the ruler and along the cross-bar. The angle subtended at the eye by distant objects might by this also be roughly estimated. Cross-hatching or diaper would be readily drawn at any required angle, and probably in making perspective drawings the instrument would be found advantageous. In the business of a lithographic draughtsman it will be found useful, as well as by wood-engravers and brass-plate engravers. This ruler is to be obtained of Messrs. Reeves & Sons, Cheapside.

CHURCHYARDS AS RECREATION GROUNDS.—A crowded meeting has been held at St. John's Vestry-hall, Horselydown, to discuss the propriety of throwing open the parish churchyards as recreation-grounds. The rector (Rev. T. H. Tarlton) explained that he had been stupidly misrepresented when it had been reported in some local paper that he thought the churchyard a good place for old people to smoke their pipes in. What he desired to see was a place with pleasant walks, green turf, flower-beds, and flowering shrubs, to afford grateful retirement occasionally from the noise and bustle of daily toil to hardworking folk; a place where children might be sent to breathe fresh air exempt from the dangers of the street traffic. Mr. Fielding promised a cart-load of chrysanthemums and pompones; Mr. Hart proffered to keep and stock one flower-bed; Mr. Slee two ornamental garden-chairs, the churchwardens four more, and other gentlemen two more. It was resolved to open the churchyard as soon as possible, to gradually adorn it, without needless, or indeed any, desecration; to keep it for the express use an hour or so daily of the inmates of the workhouse at its side, and appoint two custodians to prevent histerious or needlessly behaviour.

DREAFFUL ACCIDENT ON A FRENCH RACE-COURSE.—A terrible accident occurred lately at Amiens races. One of the stands fell, roof and all. About fifty people came to the ground with the *debris*. Two persons were killed on the spot, and there were other casualties.

ESSEX ARCHEOLOGICAL SOCIETY.—The annual general meeting of this society has been held at Brentwood, an excursion in that neighbourhood having been arranged by the council, including the inspection of East Horndon Church, Little Warley Hall and Church, and the ancient Chapel of St. Thomas of Canterbury, Brentwood.

FALL OF A CORNICE.—Last week a serious accident occurred to five men who were engaged on a scaffold in forming a cornice round a new block of houses building in the fields between the Notting-hill station and the Harrow-road, Paddington. The weight of the material caused the work of the cornice to give way, which, in its fall, broke away the scaffold and precipitated the men from the height of 40 ft. to the ground. The sufferers, all of whom were seriously injured, were conveyed to St. Mary's Hospital.

PECKHAM-RYE.—The *South London Press* states that the manorial rights over Peckham-rye, Goose-green, and Nunehead-common, have this week been bought by the parish of Camberwell for 1,000*l*. Chairs for public accommodation will at once be placed on the grounds, and the inhabitants are now considering the propriety of asking for a few flowers; but seeing that the vestry contains members who advocate cutting down a fine grove of trees elsewhere, because in winter the drippings from their branches keep the road damp, they are by no means certain of getting them.

ATTACK ON A FOREMAN.—In the Clerkenwell Police-court, Richard Reilly, a labourer, was brought up on a warrant, and charged before Mr. Barker with committing a violent assault on Henry Skoins, a foreman of bricklayers at the Imperial Gas Works, York-road, King's-cross. Skoins complained to the defendant and the gang of labourers of which he formed part of their not doing work enough, and the defendant hit him twice with the hod. After that the defendant hit him on the breast, and followed this up by striking him on the face with his fist, and kicked him on the knee. The complainant said he had been ill, and spitting blood ever since. Mr. Barker ordered the defendant to pay a fine of 2*l*. 10*s*. or in default one month's imprisonment with hard labour in the House of Correction.

PANIC ON THE BRIGHTON WEST PIER.—There has been a fortunate escape here from a calamity equal to that at Manchester. The West Pier was crowded with about 5,000 people, and a large proportion of them were on the outer "head" listening to the band. A squall of wind caused the head to sway and vibrate a little, when a knot of women took the alarm, and raised the cry that the pier was falling. The great body of the promenaders at once rushed for the shore, and the stamping and running caused the structure to sway in a really alarming way. Fortunately, the pier-master at the first indication of alarm, threw all the gates open, and thus the immense crowd escaped with scant, if any, hurt, except to wearing apparel. The secretary to the pier company states that the pier is quite secure. It provides for deflection as itself a security.

STREET TRAMWAYS FOR LIVERPOOL.—The first Act of Parliament, authorising the construction of street tramways on a scale sufficient to test their adaptability for the omnibus traffic of large cities and towns, has received the royal assent. The Act empowers the company to lay down and work a line of tramway running from north to south of the borough of Liverpool, passing through crowded and in some instances narrow streets, with a loop line in the centre of the town, enabling carriages using the tramway to reach the Exchange. The Act now passed was the third introduced for the purpose in three successive sessions. The two previous bills were thrown out through the opposition of the omnibus proprietors, aided by the London and North-Western Railway, which for some occult reason employed the funds of the shareholders to prevent an improvement in the internal traffic of Liverpool. We hope the company will lose no time in getting their system at work, as improved omnibus accommodation and the relief of our crowded streets, especially in London, are now matters of great moment.

FEVER AT SYDENHAM.—We hear of a very prevalent fever in the older parts of Sydenham, where the drainage and water supply call for attention. This should be inquired into at once.

THE ATLANTIC CABLES.—The announcement that the Atlantic cable of 1866 has failed will be received with general regret. The fact has been notified to the Secretary of the Stock Exchange by Sir R. Glass, chairman of the Anglo-American Telegraph Company. The second cable still maintains the communication between the American continent and Europe.

ASH, AND MOUNTAIN ASH.—It has recently been remarked that the specimen blocks of ash and mountain ash exhibited in the collection of British woods at the Agricultural Show, Leicester, showed a marked distinction in character. The so-called "mountain" ash is no ash at all, nor in the remotest way allied to the ash tribe. As the "mountain-ash" or "rowan-tree" belongs to the rose family, it is a matter of small surprise that it differs in character from the ash.—W. G. S.

PROPOSED NEW INFIRMARY FOR KIDDERMINSTER. It has been resolved at a meeting of the subscribers to the Kidderminster Infirmary, to endeavour to procure funds for the erection of a new building for twenty to twenty-four beds for the Infirmary, which Mr. Baker, the borough architect, estimates will cost 3,500*l*. Mr. I. Brinton promised 500*l*.; the Bishop of Worcester, 100*l*.; and the Rev. G. D. Boyle, 50*l*. A resolution was agreed to empowering the committee to select a suitable site, to collect subscriptions, and to report to a future meeting.

COTTAGE HOSPITAL AT NEWMARKET.—Dr. Gray, of Newmarket, is calling the attention of the public of this town and neighbourhood to the advisability of establishing a cottage hospital, urging that Newmarket is a place peculiarly in need of such an establishment, the nearest hospitals being fourteen and thirteen miles distant, being at Bury St. Edmund's and Cambridge, whilst the town is surrounded by numerous populous villages, to which such an institution would prove an inestimable blessing. It is suggested that a public meeting be called to consider the matter.

TECHNICAL EDUCATION.—An evening class for working men, in connection with the Science and Art Department, for the study of practical, plain, and solid geometry, mechanical and machine drawing, and building construction, was established at the commencement of last winter, at St. John's Schools, Waterloo-road, the teachers being Mr. C. F. Dorrell, Mr. W. Busbridge, and Mr. S. Annis, all holding certificates from the Science and Art Department. About twenty-five students speedily joined the class, and of this number nineteen presented themselves as candidates at the examinations held under the direction of the Science and Art Department in the month of May last. The results of the examinations may be regarded as successful.

VENETIAN GLASS.—As the art of glass-making was introduced into modern Europe by the Venetians, Mr. Herries, her Majesty's Secretary of Embassy and Legation at Florence, in his report just issued, has furnished some statistics relating to the production of Venetian glass. He states that, besides discovering the art of rendering glass colourless by means of manganese, the Venetians also enjoyed the monopoly of mirrors, the silvering of which was a secret long kept from other countries. These mirrors, however, have now lost their reputation, as foreign competitors produce larger plates. Glass beads are still made in considerable quantities for exportation. Venetian enamels have always been famous, and among the peculiar productions of Venice may be reckoned the beautiful composition called aventurine, the secret of which is said to be in the possession of a single manufacturer. The great glass-works are at Murano, one of the islands of the Lagoon. The number of persons employed in glass-making at Murano and Venice is 5,000, of whom one-third are men and two-thirds women and children. The annual cost of the substances employed in the manufacture is estimated at 7,000,000*fr*. In the East there is a constant demand for beads and other articles known as "conterie." There are six glass-works in Turin, three in Genoa, five in Milan, thirteen in Florence, eleven in Naples, and twenty in Venice. These fifty-eight works produce articles of the annual value of 10,276,725*fr*.

ABYSSINIAN PHOTOGRAPHS.—Lord Napier, Magdala, favoured Mr. John Watkins, of Parliament-street, with sittings for a variety of photographs on Tuesday last. Consul Cameron, who is slowly recovering from his serious illness caused by his long imprisonment, has also sent Mr. Watkins; thus completing the artist's set of portraits of the whole of the rescued Abyssinian captives, with that of their gallé deliverer.

INSTITUTION OF MECHANICAL ENGINEERS. The annual meeting of the members of the society has been held at Leeds, in the Philosophical Hall. The chair was occupied by Mr. Joshua Whitworth. There was a numerous attendance of members. Mr. Thomas Greenwood (Messrs. Greenwood & Badley, machinists, Leeds) read the first paper, which was on "The Box Cartridge." A short discussion ensued on the paper. Mr. John Fernie, of Leeds, then read paper "On the Application of Machinery to Cutting." A discussion followed. Subsequently it was announced that the proprietors of the West Yorkshire Coal and Iron Company's works would be glad to see the members of the society and show them not only the coal-cutting machines at work, but also the shale oil works and brickmaking machinery on the same estate.

TENDERS.

For villa residence, coach-house, and stabling at Loughton Park, for Mr. Joseph Rooks. Mr. A. Bridgman, architect:—

Bennett	£2,330 0 0
Johnson	1,235 0 0
Kempson	1,250 0 0
Past	1,150 0 0
Pavitt (accepted)	1,050 0 0

For a pair of semi-detached villas at Croydon, Surrey, for Mr. J. C. Shackleton. Mr. George Low, architect. Quantities furnished by Mr. Fred. Johnson:—

Case	£2,515 0 0
Colls & Son	2,368 0 0
Palmer	2,345 0 0
Becton (accepted)	2,045 0 0

For new factory, Glengall Wharf, Old Kent-road. Mr. V. Buckland, architect:—

W. Lloyd	£5,340 0 0
Browne & Robinson	7,920 0 0
Colls	7,870 0 0
Myers & Sons	7,980 0 0
Lawrence & Sons	8,482 0 0
King & Son	6,456 0 0

For the erection of the Portmadoc British School boys', girls', and infant schools, two classrooms, teachers' residence. Grates not included. Mr. Owen M. Roberts, architect:—

W. Lloyd	£1,283 0 0
Jones & Co.	1,280 0 0
Griffith	1,252 0 0
Jones & Roberts	1,168 0 0
Robert Lloyd	1,115 0 0
Roberts & Williams (accepted)	1,100 0 0
Davies & Son	1,100 0 0

For alterations, repairs, &c., to the Hackney-road Wesleyan Chapel. Mr. John Tarring, architect:—

Diana & Sons	£593 0 0
Selman	591 0 0
Hill & Sons	545 0 0
Saunders	530 0 0
Hall	457 0 0
Blumcrin	444 0 0

For alterations to shop in Black Lion-street, Brighton, for Messrs. Holders. Quantities supplied by Messrs. H. Lansdown & Co. Messrs. Gaulty & Gibbins, architects:—

Parsons	£712 0 0
Chappell	681 0 0
Cheesman & Co. (accepted)	688 0 0

For the erection of seven houses, Fulham. Mr. D. Lake, architect:—

Pitts	£1,030 0 0
Henshaw	3,915 0 0
King & Sons	3,850 0 0
Mann	3,842 0 0
Thorn	3,620 0 0
White	3,454 0 0
Sharp	3,050 0 0
Wills	2,989 0 0

For fishing Nos. 2, 3, 4, and 5, Kidbrooke Park estate Blackheath. Mr. J. Waicheord, architect:—

Fletcher & Gay	£4,055 0 0
Boston	3,800 0 0
Sparrow	3,900 0 0
Emery & Co.	3,000 0 0
Wilsou	2,970 0 0
Gunn	2,820 0 0
Turner	2,179 0 0
Johnson	2,070 0 0
Pett	1,855 0 0
Merritt & Ashby	1,720 0 0
Wise	1,570 0 0
Reeve	1,610 0 0
Eastman & Cockerell	1,425 0 0

For repairing houses Nos. 9 to 16, Northampton-row and 7, Exmouth-street, Clerkenwell, for Mr. W. A. Higgin. Mr. W. Smith, architect:—

Crab & Vaughan	£289 0 0
Fletcher & Gaughy	430 0 0

The Builder.

VOL. XXVI.—No. 1332.

British Archaeological Association in Cirencester.

CIRENCESTER calls for archaeological investigation, and in it the British Archaeological Association have commenced their congress under very agreeable auspices, and with fair hopes that good may result from their meeting. The Association includes a number of staunch, hard-working antiquaries, who go out on these occasions, making no great pretence, but determined to do all in their power to get and give information. The President for the present congress is the Earl Bathurst,

who opened the week on Monday, the 10th, with an address, as he observed, to the unlearned, desiring to incite fresh minds to give attention to the subject. This Association, the President said, was formed in 1843 to investigate the customs and arts of our forefathers; and when the Association commenced its labours there were scarcely any local museums in the country, and the British Museum had then no particular place assigned for the custody of national relics. Speaking in the county of Gloucester, he could not, while on this subject, pass over the name of a distinguished local antiquary, Samuel Lysons, who was born at Rodmaston, not far from Cirencester. He was keeper of the archives of the Tower of London, and he wrote first on the antiquities of the county of Gloucester, and secondly on the Roman remains found at Kenchester: he was also one of the editors of *Magna Britannica*, and by his deep research and personal labours did much in the cause. He (Lord Bathurst) knew him personally in early life. The town of Cirencester, in which they were assembled, was the *Corinium* of the Romans. It was a very general thoroughfare, with roads branching out in different directions; and was no doubt a great military station. Four great Roman roads met at Cirencester,—1. the Fosse; 2. Akeman-street; 3. Apin-street; 4. Ermine-street. These roads would be described in detail in papers to be read on the subject of ancient *Corinium*; but, in addition to these roads, they had other antiquities of the Roman era. There was an elliptical area called the bull-ring, evidently the remains of an amphitheatre, and the Roman burial-place was situated in the suburbs of Cirencester—Watermoor. They had now in that town a museum built by the late Lord Bathurst, in which a variety of antiquities had been deposited. Quite lately a curious acrostic had been found, which had been placed in the museum. Amongst the most interesting relics which time had spared were the tessellated pavements. One of these was descriptive of Orpheus charming the birds and beasts. This was at the Barton Farm. Another was found in digging a drain in Dyer-street, and this was deposited in the museum. A vast number of coins, chiefly of the reign of Constantine, had also been dug up;

and, although a collection of coins might appear to be uninteresting to many, yet they had Addison for an authority that coins told a story much quicker than books, and Pope had adopted the same view. Proceeding to topics of more recent date, the President went on to say that, in the opinion of the townsmen, the abbey church of that town held as high a position in Cirencester as did St. Peter's in Rome. He would not anticipate the details which would be given in describing it by others, but, after a few passing words on the study of architecture, he noticed that one of the places to be visited was Malmesbury Abbey, a grand ruin. Another was Fairford Church, renowned for its painted glass. This glass was captured in a ship that was bound for Rome, by Captain Tame, who built the church purposely for it. The newly-discovered villa of Chedworth was a discovery particularly interesting, not only by reason of its romantic situation, but because it gave them an insight into the mode of country life of the ancient Roman nobleman. In conclusion, the President said that, although archaeology did not possess the all-absorbing interest of the turf and the chase, it had an interest of its own, and did not tend to ruin. And surely the student who pored over ancient remains of Greece and Rome, or visited the edifices which the piety of his ancestors had raised in honour of his Creator, could not be said to pass his time unprofitably.

It would be easy of course to show the speaker that archaeologists are never better pleased than when engaged on the turf, investigating earthworks, in full chase of a promising church seen across country, or thoroughly engaged in the examination of a ruin.

At the conclusion of the address Mr. Godwin, as the senior vice-president present, expressed the gratification which he and his brother members felt at visiting Cirencester. It was impossible to come to Cirencester, or "Cisester," as it was locally called, without receiving instruction: it was full of associations and full of remains. The Roman pavements there showed such a remarkable degree of excellence as to make us not only envious of the work, but ashamed of some of our own. The amount of art displayed in them was remarkable, and the endurance of the work was more so. Here were pavements which, after having done their work centuries ago, were as perfect as when they were first made, while many of the modern pavements in this country were already destroyed. They were making attempts to turn art into this and similar channels, and he hoped they would eventually succeed. The speaker referred to the valuable results which had been attained through the means of archaeological associations, and congratulated Cirencester on having long possessed individuals,—Mr. Buckman, Mr. Newmarch, Mr. Mullins, and others,—who kept alive an interest in the antiquities of the town.

Mr. Canon Powell (once perpetual curate, but now, by recent Act of Parliament, vicar of Cirencester) then invited the members to follow him to the well-known south porch of the parish church, and concerning which Leland writes,— "One Alice Aveling, aunt to Bishop Rathal by the mother side, gave an hundredth markes to the building of the right goodly porch of the paroch church, and Rathal's mother and others contributid to the performance of it."

In 1671 Bishop Nicholson sealed his grant of this "vice" (parvise?) for public uses. Mr. Powell gave some particulars, and a discussion ensued on the often opened question of its use, and as to what a parvise really is. There is no doubt that the term "parvise" (*paradisus*) belongs to an open space in front or near a church; at Chichester we have still the "paradise," and in France the open space near a church is constantly called the *parvis* still. Nevertheless, it is equally certain that the term

has been locally applied to the room often found over the church-porch. Indeed, the "paradise" chamber is not uncommon in old buildings.

Canon Powell then led his audience into the church, and gave a very full description of it; Mr. Niblett, M.A., supplementing it, and Mr. Planché directing attention to the brasses. The church, dedicated to St. John, is among the finest Perpendicular churches in the kingdom. The building extended over a long series of years, and is yet carried out consistently in one uniform style. Over the great window in the tower is a shield of the royal arms, in which the arms of France are borne in a way which has been disused since the reign of Henry IV., thus establishing that the tower is not of later date than 1416, while there is documentary evidence that the nave was not finished till the time of John Blake, the last abbot, and the south porch was the last portion of the fabric. The plan is a chancel with north aisle and north chapel, nave and aisles, with western tower and south porch. The nave is 75 ft. long, divided into six bays, and is 74 ft. wide across the aisles. Of the five chapels, that of St. Catherine is the most curious. It is on the north side, between the chancel and St. Mary's Chapel. The date, 1503, is to be seen on the roof. Over a niche in the south wall is a mural painting of the martyrdom of St. Catherine. The walls of St. Mary's Chapel were also once covered with wall-paintings, portions of which have come to light. One was a representation of Purgatory. In the Trinity Chapel are some fine brasses. Three represent William Prelate and his two wives, the former in plate-armour. The date is 1462.

A transition column on the south side of the church, partly built into the later work, stands on what seems to be the base of a Roman column (the mouldings very good), the front portion of which, being exposed, was cut into a fresh form by the twelfth-century men, to suit the column they were then erecting.

There was a dinner in the evening, at which Lord Bathurst presided genially. Mr. Newmarch, in proposing the health of "The Vice-Presidents," made some references to the signs of certain public-houses in Cirencester. One was "Bishop Blaize," who was the patron of the wool trade of the town, Cirencester being formerly the great mart of the district around. The derivation of this sign had been attributed to many causes. It had been supposed to be the "Bishop ablaze," perhaps a martyr; and, a hush being a Gloucestershire sign for a house of entertainment, it had been supposed to mean a "bush ablaze," or a "burning bush." There was another public-house which, when he was a boy, he remembered was called the "General Wolf," and which referred to the time when Wolf was quartered in the town onlisting recruits. It was not generally known that Hogarth once resided in Cirencester, and he (the speaker) had a painting by Hogarth, which was a panel in the Ram Inn there.

Mr. Thomas Wright, M.A., and another vice-president, invited.

Mr. Gordon Hills, in proposing "The Local Committee," acknowledged the kind co-operation and assistance that had been afforded by that body. With regard to the Abbey Church, which they had visited that afternoon, and where the exigences of time and dinner did not permit them to linger so long as they could have wished, it was a glorious church; but what a far more glorious abbey must once have stood on nearly the same site! William of Worcester had given them the dimensions of both edifices, and they could portray with considerable accuracy the size of the old abbey; and if they compared the dimensions of the old Abbey Church with the parish church they would see the superiority of the former church. It was only by looking back in that way, and thinking of what had been, and reproducing it in the mind, that they could

understand of what importance the town was in former days.

Sir S. Cary, Mr. Bowly, and other gentlemen spoke, Mr. G. R. Wright closing the proceedings with humorous thanks for the "health" of "The Ladies," his *syven-sisters*.

On Tuesday morning an early meeting was held in the Assembly-room, to hear

Mr. T. C. Brown, of Cirencester, read a paper on "The Ancient Plan of the Roman City Corinium," illustrated by a map showing the particular sites to be afterwards visited. Mr. Brown said he believed it to be the *Corinium Dobonorum*. As Roman history was silent respecting this ancient city, he suggested that it took its name from the camp on the river, *i.e.*, the river Churn, which runs by Cirencester, and "ceastre," easily rendered "Cirencester." They might believe it was a British town belonging to the Dobuni, and hence called *Corinium Dobonorum*. The city proper was surrounded by a wall of stone (the stonework had been found repeatedly, but was now covered with soil), having a ditch without. He was sorry to say that ancient and modern Vandals had destroyed many parts of the wall. The area within the wall, including the modern town, was about 400 acres. It was a perfect flat—an expanded portion of the valley of the Churn, which runs from the seven springs on the upper Cotswolds, and formed the head of the Thames. Some 3 ft. or 4 ft. under the soil was a deep gravel bed, in which constantly flowed an underground river. In this gravel bed the Romans dug wells, which they walled with cut stone, and which formed the hulk of the wells of the modern town. In deepening a well of his own, a portion of a Roman pitcher was found built into the wall. There was a good example of the Roman well at Mr. Brewin's Roman villa. No sooner did the Romans occupy this site than they began to fortify it by a wall, and then built common houses for the soldiers, better ones for the centurions, and villas for the officers. The streets of the modern town, they might presume, were the streets of the Roman city. They accorded with the Roman town in being narrow, in having those curious centres formed by three ways meeting, and in crooked arrangements that promoted defence. Without these streets, villas were built, as shown by the tessellated pavements discovered, and when first opened the warm-air baths were seen. The greatness of the Roman city might be judged of, not only by the largeness of the area within the walls, but also by its connexion with the great Roman roads—one to Gloucester, another to Bath, a third to Stow and the north, another to Newbury and the south coast. Throughout all this area, and without the walls, Roman remains were found whenever the ground was opened; coins in all parts, from Claudius, A.D. 42, to Valentinian, A.D. 424; millstones of black basalt from a town on the Rhine, others of conglomerate from the now red sandstone of the Forest of Dean; Samian and other pottery, bricks and concrete specimens of all of which they would find in the museum. Having pointed out the sites where these were found, Mr. Brown mentioned that the level of the present soil within the Roman walls was raised 4 ft. to 6 ft. Whence was this addition derived? In the suburbs of the city now called the Querns was the place of quarries. There the Romans dug stone, and of the rubbish formed an amphitheatre.

Mr. Godwin (in the chair), when inviting discussion, suggested that a systematic reconnoitring of researches, under the superintendence of a committee, should be undertaken. As to the raised level, it might be partly accounted for by the fall of roofs of the Roman houses and other *edifices*.

Mr. W. H. Black did not consider this to be the Corinium of Ptolemy. He believed it was of later date, and, after duly weighing the matter, he thought North Cerney, which was also on the Churn, was the locality of Corinium. Nothing was more likely than that after the first conquest certain situations became of more importance than others first settled. A number of military roads converged here; but these military roads were the youngest instead of the oldest roads in existence, except the modern roads made by Act of Parliament. The military roads sprung from the roads of Julius Cæsar, having a perfect beginning and ending. He thought there could be no doubt that this was a Roman city of respectable antiquity, but that it could not be identified with the Roman Corinium. The great roads converging here would necessitate the rise of a city which might have

become a Corinium of later times, but not the Corinium of Ptolemy. He had no desire to disparage the antiquity of the place, but, after all, truth was truth, and that was what they wished to arrive at.

Everything said by Mr. Black on a question of this kind is entitled to the fullest consideration, but to substantiate his position some stronger arguments will be necessary than those that were then brought forward.

The Rev. Prebendary Scarth and Mr. Thomas Wright, who spoke in the course of the discussion, were not prepared to accept Mr. Black's views. With reference to the raising of the soil, it was mentioned that at Uricinium (Wroster) there were 8 ft. or 10 ft. of earth; in the old city, at Bath, 16 ft.; and in another place, only 2 ft. This the speaker accounted for by supposing that in the more thinly populated places the accumulation would not be so great as in those more thickly populated. At Gloucester a horse-shoe had been found at a depth of 12 ft.

The party then proceeded to the pavement at the Barton, Oakley Park, under the guidance of Mr. John Bravender; and afterwards to St. John's Hospital in Gloucester-street, by the bridge across the fields to Hospital-gate, Abbey-grounds; then by Golden Farm-road, along the Roman wall to Watermoor; then to some remains in the nursery, and to Mr. Brewin's pavement in Queru's-lane. It was shown that the pavement at the Barton was suffering considerably from damp, and Mr. Gordon Hills, Mr. Godwin, and others having offered suggestions for its preservation, Lord Bathurst said he would not fail to avail himself of what had been said. The pavement at the Barton has Orpheus in the central circle, with a circle of birds around it, and then an outer circle of hearts. It is figured in Messrs. Buckman & Newnarch's "Illustrations of the Remains of Roman Art in Cirencester," but the engraving gives no idea of the harmony of colour and elegance of pose observable in the original.

The visitors were entertained by the president with luncheon, two or three hearty speeches being made; and then they went to examine the bull-ring, or so-called Roman amphitheatre, when a discussion ensued to which we shall recur. They also went to the Querns. The term Querns has been thought by some to owe its derivation to the fact that there were here quarries, locally called Quarns or Quarns; but others find it in the *quairns*, or burial places on the spot. Skeletons and ancient coffins have been found there. It is an interesting circumstance that the exceptionally dry weather has made evident here within the last few days, for the first time in the memory of man, that the foundations of a nearly square building, some 36 ft. square, are below the turf. The foundations are distinctly marked by the dryness of the turf above, and ought to be staked out on the surface, so that the knowledge might be preserved. Prebendary Scarth thought it not unlikely that the building here indicated was for the burning of bodies.

The two portions of composite capitals put together and standing in the abbey grounds have always been described as having formed part of one building. We can scarcely view the two pieces as of the same period. The lower part, acanthus leaves, is of purer design than the upper part, which includes a boldly-sculptured head on each of the four faces. The diameter of the top of the column to which the lower part belonged was 2 ft., indicating a structure of considerable importance. We should prefer to see the two pieces separately preserved, as together they form a disproportioned capital, and do injustice to the Roman. We may see from the upper part the licence the Romans allowed themselves in their capitals. Many of the best remains in Cirencester were discovered in the tract of ground known as the Leanea. A visit was paid to the museum, where Professor Church gave a description of the system of arrangement, and a general account of its contents, the greater part of which were local and mostly Roman. He described a process of his own for preserving iron antiquities and frescoes from decay. It consists of holding the iron articles in solid paraffin (paraffin candles), and painting the frescoes with the same material.

Mr. Roberts congratulated the town on the especial value of the museum by reason of its being purely of local antiquities. He also referred to the two Roman tiles which are impressed with the letters I. H. S., and about which there had been considerable discussion in London. Now that he had seen the tiles, he had no hesita-

tion in saying they had, in his opinion, no reference to Christianity, as had been believed by many. He also pointed to two bases of Roman columns which had mouldings, though on a smaller scale, nearly identical with that now in Cirencester Church, proving conclusively the Roman origin of the latter.

In the evening papers were read. Mr. Roberts decanted "On the places visited during the day," it being a customary proceeding to narrate the principal incidents, in order to give an opportunity for renewing, under more convenient circumstances, discussions of interest which the economy of time had caused to be cut short in the field. After this Mr. Dillon Croker read an account of the "Cotswold and its Popular Customs." The most interesting part of this paper was the history and reminiscences of the Dover sports. It appears from the "Annalia Dubrensis," a very rare collection of commendatory verses upon "the yearly celebration of Mr. Robert Dover's Olympic games upon Cotswold Hills (London, 1636)," that these sports, as common in the Middle Ages, consisted of wrestling, leaping, pitching the bar, handling the pike, dancing of women, hunting, and coursing. In this book there is a portrait of Dover on horseback, dressed in a suit of the fashion in vogue in the time of James I, and a dedication of the complimentary poems by his friend Matthew Wallhance, for whom they were printed by Robert Raworth. Amongst the contributors of these laudatory lays were Michael Drayton and Ben Jonson. The games continued until about three years ago, when the benches introduced into them by the railway labourers on the line then in construction caused an end to be put to them.

The chief contribution was a paper by Mr. W. P. Holt, on the remarkable Painted Glass in Fairford Church, and the connexion with it of Albert Durer. Mr. Niblett, M.A., followed with some supplementary remarks pointing out specialties in the Fairford windows. He said he had spent four weeks in examining the details, and had been unable to discover any monogram. The nearest approach to one was the letter A on the sword of an Amalekita.

The Rev. Mr. Joyce, as the representative of his father-in-law, the Vicar of Fairford, explained that the vicar had done everything he could to preserve the windows. As to Mr. Holt's theory of the authorship of the windows, he (Mr. Joyce) had taken a great deal of trouble in examining the works of Durer, and though he was aware there was a general likeness, he was unable to satisfy his mind that these windows were Durer's. If they were, they must have been executed at a very early age. If Mr. Holt could convince them that these were the work of Albert Durer, the Archaeological Association at Cirencester would have made a great conquest in art.

Mr. Holt's paper is so interesting, and the issue involved so important, that we print it in full, and with this must end for the present our account of what the British Archaeological Association are doing in Cirencester.

THE PAINTED GLASS IN FAIRFORD CHURCH, AND ALBERT DURER.*

In introducing to notice the painted glass windows in Fairford Church I do not purpose entering into any detail upon either the antiquity, progress, or decadence of that particular branch of art, but to occupy the time allotted me in closely keeping to the subject under consideration, and thereby endeavor to create, and maintain, throughout my observations, that interest which the importance of the subject unquestionably demands.

As an abstract fact, it is singularly disappointing that such wonderful productions should have hitherto remained without a historian, whereby their influence on art has necessarily been rendered nugatory, and they have been permitted to remain utterly unrecognized.

Whence can this apathy to such glorious works have arisen? How is the neglectful silence of 370 years to be accounted for? Whatever the reason, the fact remains that in the second half of the nineteenth century, when every talented work of art is discussed or criticised with the utmost minuteness, the treasures of Fairford Church still remain in obscurity, and, for any practical advantage hitherto derived from them, might almost as well have never existed.

* By Mr. Henry F. Holt.

With this preliminary reproach, which I feel too just to be either repressed or concealed, I will now attempt to deal with the subject.

Before, however, entering on any point connected with the authorship or merits of the windows of Fairford Church, which will be the subject of an excursion, at which I hope to have the honour of usurping, for the nonce, the functions of the highly respected and painstaking orator of the church, Mr. W. Beale, and playing showman for the day, it will be well, for the benefit of those present who may be unacquainted with the windows, to shortly describe them.

The windows are twenty-eight in number, the majority being divided into several compartments.

The subjects are taken from the Old and New Testaments and the Apocryphal Gospel, and are all, with two exceptions, to be found in the "Biblia Patrum," in the "Speculum Humane Salvationis," two of the best known early repertoires of popular Scripture historical records.

The subjects from the Old Testament are but four, comprising—

1. The Temptation of Eve.
2. The Lord appearing to Moses in a fiery bush whilst he was keeping the flock of Jethro.
3. The double sign vouchsafed to Gideon, and
4. The Queen of Sheba's visit to King Solomon.

The subjects from the Apocryphal Gospel and the New Testament include the principal events in the life of the Virgin and of her Divine Son, and represent—

1. The Meeting of Joachim and Anne at the Golden Gate.
2. The Birth of the Virgin.
3. The Presentation of the Virgin.
4. The Marriage of the Virgin.
5. The Annunciation.
6. The Nativity.
7. The Adoration of the Magi.
8. The Purification of the Virgin, and Presentation of the Infant Jesus in the Temple.
9. The Flight into Egypt, with the Massacre of the Innocents in the distance.
10. Christ disputing with the Doctors in the Temple.
11. The Assumption of the Virgin.

These are succeeded by—

12. Christ's Entry into Jerusalem.
13. Christ in the Garden of Olives.
14. Pilate washing his Hands.
15. The Scourging of Christ.
16. Christ bearing His Cross.
17. The Crucifixion—between two malefactors.
18. The Descent from the Cross.
19. The Entombment.
20. The Heavenly Host vanquishing the Evil Spirits.
21. The Descent of Christ into Limbo.
22. Christ appearing to the Virgin after His Resurrection.
23. The Transfiguration of our Lord.
24. Christ appearing to Mary Magdalen, Mary the Mother of James, and Salome, in the Garden—and in the background the three holy women, and the Angel at the Sepulchre.
25. Christ and His Disciples at Emmaus.
26. Christ appearing to His Disciples.
27. The Ascension of Thomas.
28. The Miraculous Draught of Fishes.
29. The Ascension.
30. The Descent of the Holy Ghost.

Then follow—

31. The Twelve Apostles, and
32. The Four Primitive Fathers of the Church.

Above them are—

33. The Twelve Protectors of the Church, surmounted by Angels.

Opposite them are—

34. The Four Evangelists, and
35. The Twelve Prophets.

Above whom are—

36. Twelve Persecutors of the Church, surmounted by twelve evils.
37. A large window in the west represents, in its architectural grandeur, the Last Judgment.

On either side of this is a window, both much damaged, and comprising (*inter alia*)—

38. David sitting in judgment on the Amalekite for slaying Saul, and ordering his servant to kill him.
39. Two figures of old men.
40. Sampson slaying the Lion.
41. The Judgment of Solomon.
42. Sampson slaying the Philistines, &c., &c.

In the higher lights are small figures en grisaille, comprising the Virgin and Child, Prophets, Saints, Angels (most of them bearing emblems of the Passion); and in two windows are ostrich feathers, with the "Ich Dien," from the cognizance of the Prince of Wales.

The subject of these windows is otherwise interesting, and for us in particular exceedingly important.

The artistic interest of the windows is twofold. There is first their intrinsic merit as pictures, for they belong to the period and style of glass-painting in which the mere decorative effect of coloured glass was, if not subordinated,

reconciled to its capability of conveying noble design. There is next their interest in connexion with the history of the great artist Albert Durer, of Nuremberg, to whom I believe they may safely be ascribed, and a most important record of whose artistic life and development, if I am correct in my ascription of them to him, they occupy and explain.

But the special importance of calling the attention of the British Archaeological Association to them at this moment arises from a mortal danger to which they are exposed, and from which I trust and believe we may hope to rescue them. I mean the imminent peril, the deadly risk, of restoration.

When those of you who do not know these windows come to see them, you will, I think, understand the grounds of artistic merit and art history on which I claim for them the most respectful attention. You will, I believe, find them, in spite of damage and decay, one of the most—if I trusted my own impression I should say the most—interesting series of painted windows in England of the later style, in which considerations of design as well as colour occupied the glass-painter's thoughts.

On the point of art history I think I shall be able to satisfy you that the early and quasi-traditional ascription of them to Albert Durer is borne out to demonstration by internal evidence, and if so, that they supply a gap in his late history, and explain some points of keen controversy and material interest in the earlier stage of his career.

Lastly—on the point of danger—of the imminent need that if these windows are to be preserved some steps should be taken to make their value known, with the view of preserving them from the sad fate of ignorant and incompetent restoration, I shall be able to satisfy you only too completely when, on our visit to Fairford Church, I show you a certain head of our Saviour, two particular prophets, and, alas! more grievous by far, the whole upper part of a west window, representing the heavenly section of the Last Judgment, the ruin of which may be measured by comparison with the lower half, still, happily safe from the tender mercies of the restorer; but, as the worthy parish clerk lately informed me with much satisfaction, likely very shortly to pass through that fiery ordeal, a worse condemnation, as I think ocular demonstration will satisfy you, than any of the condemned are represented as undergoing in the picture. The only place I should propose for such restorers would certainly be in the very hottest corners of the Fairford Inferno.

The earliest mention in print of these windows ascribes them to "Albert Durell, an eminent Italian master." At a later date better-informed describers jumped to the conclusion that Albert Durell must have been Albert Durer. But, strange to say, when this was first printed in 1778, and repeated more than once by compilers and copyists in the next ten years, the ascription was boob-pooled by Bigland in 1791, and since has not been re-advertised. Even Winston, the latest and highest authority on glass-painting, who gives considerable attention and high praise to the windows, nowhere so much as hints at the artist. I appear here, therefore, in the character of a new and independent claimant on behalf of Durer, and as the first who has subjected the windows to thorough examination and detailed comparison with Durer's works in justification of the claim. The study of Durer's life and labours has been the occupation of my leisure for ten years past, and I may, therefore, without vanity, claim to be specially qualified for such an inquiry, and able to give it a more exact importance in connexion with the painter's development than has been hitherto thought of. If I am right in my conclusions, these windows are a conspicuous and sole surviving record of a class of labours which occupied Durer in his transition from artistic youth to manhood, and must have been the preparation for that passage from his work as a wood designer and wood engraver, or *formschneider* to his later and greater labours as a painter, in the years between 1494—when he came back from his apprenticeship tour and married—and 1506, when we have his first grand picture, the "Fête de Rosaire," painted at Venice, and now at Pègne. In the interval his sole hitherto recorded works are the series of the Apocalypse on wood, the Adam and Eve, and a few other copper-plate engravings, and some half-dozen pictures, of which four were portraits. Before this time we know of him first as the goldsmith's clever and hard-working

son, next as apprentice to Michael Wohlgenmuth, whom I maintain to have been no painter, but a "formschneider," which business only Albert Durer practised under him, working principally for the great Nuremberg printer and publisher, his own godfather, Antony Koberger. Under Wohlgenmuth he wrought as a paid apprentice for three years. Then came his "wanderschaft," during which he never left the empire, but confined his peregrinations to a circle of towns and cities, of which Colmar was the furthest removed from Nuremberg, during which time he seems to have worked merely—as far as we know—as a "formschneider." At the conclusion of his "wanderschaft" he returned to Nuremberg, a youth of twenty-three, married Agnes Frey, a fair maiden of fifteen, with a decent dot of 900 gulden, and settled down to work for himself and family as a "formschneider" in the town where he had served his apprenticeship. From that time until he visited Venice in 1506, by the kindly help of Bilibald Pirckheimer, the celebrated patrician of Nuremberg, who lent him money for his journey and subsistence abroad, he was working at Nuremberg; but the list of his recognised works is altogether insufficient to account for his time during the interval at the end of which he bursts upon us as a great painter. My belief is that during this period he was training his mind, hand, and eye to large compositions in colour, mainly by the medium of glass-painting; and that in the Fairford windows we have the only extant remains of his mastery in that art. Not only had his authorship of these windows—once apparently a tradition—dropped into oblivion, but the place of this kind of work in the history of his art and life has never been ascertained or insisted upon, and in this respect I venture to claim originality as well as interest for my present statement.

Everybody who knows anything of art history knows that Nuremberg was one of the great seats of German glass-painting in the early part of the sixteenth century; but a preliminary question which will suggest itself to most minds is, Do we know from independent sources of Albert Durer as a glass-painter? I answer, "Yes." We have a series of twenty windows in the Church of the Temple at Paris, described by Lenoir in his well-known work on glass-painting, representing much the same subjects as those of Fairford, but unhappily destroyed during the Revolution. There are, in addition, windows described also by Lenoir at Passy, which probably have shared the same fate. There was a famous series occupying the windows of the monastery church at Hirschau, in Upper Bavaria, representing the principal events in the lives of the Virgin and the Saviour, which, from their description, must have been very much the same as the Fairford windows, but destroyed by the French in the wars of the Palatinate in 1655. This evidence is sufficient to support the attribution I now contend for. But it is remarkable that, either owing to the destruction of these continental examples, or to ignorance of Durer's biographers, the fact of his occupation in this way, which, from the dimensions of even the works I have mentioned, must have covered several years, has never been even referred to.

The fact that Albert Durer did paint glass being established by independent testimony, wholly irrespective of the Fairford windows, how do I connect those windows with him?

First, tradition associates his name with them.

Next, the history of the rehinding of the church is consistent with the fact.

Thirdly, the internal evidence deducible from comparison of the Fairford windows with Albert Durer's own youthful work is, as I maintain, and hope to satisfy you, absolutely conclusive,—if any such conclusiveness be obtainable from internal evidence.

First, the name of Albert Durell appears in the first printed account of the windows by Sir Robert Atkyns, in 1712.

It is said that an account of the pictures was engrossed on a vellum roll and deposited in the church chest. That roll had long been lost when Atkyns wrote, but a copy on paper was supposed to exist—a something probably drawn up by the then parish clerk for his own use. Any so-called imprint of or extract from this imaginary paper copy, however, is untrustworthy, from errors of description; and if it ever existed it had long before its disappearance become grossly corrupt.

But, secondly, the facts of the rebuilding of the church, and the legend associated with it, are eminently consistent with the ascription to Durer.

recognise the style of Durer from works admitted by all to be his, and bearing his familiar monogram.

To me, that monogram needs not to be inscribed anywhere on that noble range of windows in Fairford Church. The painter has left on them the still more conclusive mark of his great mind and master hand. Not a square inch of the original work still remaining in its significance and its earnestness, its beauty of sentiment or its brilliancy of colour, but I read written on it, as if in his own asymmetric characters, "ALBRECHT DURER."

RAILWAY FARES AND MANAGEMENT.

At present the newspapers are filled with letters complaining of the conduct of the railway companies south of the Thames, in raising the fares of the passenger traffic. A case of grievance is clearly made out, and it becomes a public question of no slight importance. If anything could show the desirability of Government interference it is a case like this. We are continually discussing the necessity for making better provision for the people in the shape of dwellings and lodgings, and certainly one means will be that of encouraging suburban residences; but these will depend almost entirely upon the facilities of access. What encouragement is there for persons to employ their capital in building, or for clerks and other classes of employes to move into residences upon our lines of railway, if at any time, without notice and for no apparent or sufficient reason, the fares are to be raised 50 per cent.? The fares are operating seriously upon building operations and upon the selling and letting of property.

The question is a very serious one, and ought to be taken up by the shareholders of the three companies, whose managers have brought upon them so much odium within the last three months. Upon them the loss will eventually fall. The whole case as affects these companies is a very simple one. There has been immense extravagance and waste arising from a senseless competition; there have been other sources of waste, and the consequences are that they are unable to pay a sufficient dividend, and maintain the working of the lines. They attempt by raising the fares to make good some of this loss, losing sight of the fact that they are breaking faith with those who have been induced to reside within reach of their lines. There is no good reason why they should not be at liberty to revise their fares at any time, but many reasons why they should not advance them upon mere caprice, and beyond the fair average charged by other lines. If they have lost money by foolish and profitless speculations they must bear the loss, and not expect the public to recoup, and in such a contest the public will in the long run have the best of it. In the meantime much angry feeling is elicited, and much inconvenience sustained by large numbers of persons of restricted means.

But the case is even worse than this. We know that there has been a rivalry between the Brighton and the South-Eastern, and one folly arising out of it was the construction of the line by the South-Eastern from New Beckenham to Addiscombe, a line that has never paid one half of its working expenses, and is less likely now to do so than ever. There has also been a rivalry between the South-Eastern and the London, Chatham, and Dover. The lines do not work in unison, and thus the passengers by the Mid Kent are subjected to great annoyance. This state of things has existed for some time, and at last the companies sought for parliamentary powers to amalgamate. Provisional arrangements were concluded, and they at once made an advance upon the fares, but the South-Eastern did not make any alteration so as to improve their service. The public, seeing this, took the question up, and made such representations to Lord Redesdale that the company, hopeless of carrying it, withdrew the bill. It is said that Mr. Watkin has expressed his determination to serve the public out. Such a determination is something worse than folly, for it perpetrates the injustice of punishing those who took no part in the opposition, for the faults of those who did. It is bad diplomacy, because it renders the feelings of the opposition more inveterate. The opposition arose from men who had no personal feeling towards Mr. Watkin, and who did not know him. It would have been easier for them to put up with the loss and the inconvenience, but they took it up on public grounds.

The question, then, occurs, whether it is right to place in the power of men capable of harbouring such petty resentments such immense interests as those involved in the management of our great railways. The interests of the shareholders may be left to themselves, but there are thousands of the public who are affected by it. The matter is much too grave a one to be trifled with, or dismissed by official haughtiness or contempt. It will be for the interests of all concerned that the question between the companies and the public be discussed in a calm and business-like spirit. It is to be hoped that at the next meeting of the shareholders of the South-Eastern, which takes place on the 27th, Mr. Watkin, with the concurrence of the Board of Directors, will offer such explanations as will carry with them the assurance that the case of the passengers will be looked into and redressed.

Having destroyed thousands of the dwellings of the poor within metropolitan bounds, and induced many builders to erect new ones on the skirts of their railways, and persons of restricted means to remove to these suburban dwellings, some of the more eager of the railway managers having thus entrapped their prey, think to benefit their interests by raising the fares. There never was a more foolish delusion. One would have thought that the history of the penny postage, the gas movement, and the more enlightened tactics of trade suggested by these movements, would have convinced these railway directors that it is by lowering prices within certain extensive limits, and not by raising them, that most money is made; but no general experience can make any impression on some boards until they specially try the experiment anew for themselves; and this some of the metropolitan railway directors are now doing. The mischief is, however, that they can only play this trick once and away, because they will thus check suburban building speculations so completely that a return to cheaper fares will be of no avail in restoring confidence so long as the railways continue under that sort of management which has already proved itself to be utterly incompetent. As we have said, however, perhaps it is all for the best, since it may hasten the revolution in railway affairs which is pending.

LETTERS BY SIR DAVID WILKIE.

IN connexion with some notes on Wilkie, by the late John Burnet, recently given in our pages, the following hitherto unpublished letters from Wilkie to the late Mr. Raimbach, the engraver, will be found interesting.

Raimbach lived at 10, Warren-street, Fitzroy-square.

Wilkie painted Raimbach's portrait unknown to him. On the 1st of January, 1819, he sent it to him as a new year's present.

" Kensington, December 2, 1819.
* * * * *
Haydon has been telling me, on the authority of a gentleman he met with at Mr. Hamilton's, who had just arrived from Florence, that Chantrey had really met with a most wonderful adventure. He was attacked between Rome and Naples by banditti, who carried him to the mountains (and they say blindfolded him). They offered him his ransom for a hundred guineas, which he paid by a cheque on his bankers at Rome; and on being assured that his bankers had paid it into their banker's hands in Rome, they set him at liberty. He told them he was a statuary; but it is supposed that was greatly in his favour, for a statuary in Italy is considered a very poor fellow. Haydon says nothing was mentioned about Jackson, and on my relating the story yesterday at the Royal Academy, I found this circumstance rather confirmed the truth of it, for one of the members told me that by the last accounts from Jackson, he was at Florence, and had parted from Chantrey. Haydon says I may depend upon the truth of it. * * * * *

DAVID WILKIE."

" Kensington, September 6th, 1820.
MY DEAR SIR,—The destination of my picture ('Reading a Will') is, I am happy to say, settled for the present. His Majesty (George IV.) has signified his pleasure that Mr. Brook Taylor should not urge the relinquishment of the picture unless the King of Bavaria should upon an inspection not find the work so good as the description of it led him to expect." This, of

course, sets me entirely at liberty to deliver it over to the Bavarian Minister.

As I wish to be prepared on the delivery of the picture with some definite request respecting the engraving of it, your advice will be of use, in order that some plan may be suggested to suit the circumstances of the case, and at the same time render the engraving of it practicable. The picture is still with me. * * * * *

DAVID WILKIE."

" Kensington, May 10th, 1822.

* * * * * My request to have a railing round my picture ('Reading the Gazette of the Battle of Waterloo') met with some shilly-shallying kind of opposition [from Royal Academy*] until the grievance should be more apparent. I went, however, to town yesterday, and from what I saw determined on writing to Sir Thomas Lawrence, and declared the picture to be in imminent danger; upon which a council is not only called, but Sir Thomas went himself to the Royal Academy this morning before eight o'clock and had the railing put up. The council will meet, I suppose, to approve to-morrow morning.

DAVID WILKIE."

" Rome, Posto Restante,

January 10th, 1826.

MY DEAR SIR,—After parting from you in Paris, we proceeded day by day with the Veturino, jogging on slowly towards the south-east frontier,—a journey monotonous, but not without adventures. A quarrel took place between two Frenchmen one night at supper with us, which next morning after we started cost one of them his life. On the eleventh day, we descended in the Canton de Vaud, in presence of the Alps, and entered Geneva. Here, meeting my friend Popffer, introduction and hospitality were not wanting, and we passed four days most agreeably in true native Geneva society: the good Audeoud alone I was not permitted to see; a violent fever had lately attacked his weak and mutilated frame, and, though better, could see no one, and those acquainted with him forbade even the leaving a card as too exciting for him.

We parted from Lawrence at Vevey, proceeded up the Valais, and crossed by that wonder of wonders the route of Mount Simplicon, whence in a short space we found ourselves in the gay and classical scenes of Italy, with all the associations of its former greatness and present interesting decay before us. Art being my object, as it would be yours, the "Last Supper," of Leonardo da Vinci, drew my attention at Milan. Time, however, with this has been even more unparing than is his work. A shadow only remains of this once great work, and that so faint that even the substance of the original paint has become a question,—whether fresco, tempera, or oil; but to show the immortality of mind, when such a thing is to be found in a picture, over the frail material with which it is embodied, this masterpiece in its very ruin has been revived in the admirable engraving of Morghen, and seems yet destined to enjoy a wide posthumous existence, long after the walls of the Dominican refectory have crumbled into dust.

From Milan, by Pavia, we passed to Genoa, a splendid city without, but loathsome within, where a few, and but a few, pictures rewarded the search; thence by the coast of the Mediterranean, along the tops of the Apennines, to Pisa, where the falling tower and the Campo Santo court attention, the latter presenting upon its walls a series of the early efforts before painting reached its maturity, evincing at once the lowness of its infancy with the high and spiritual aim which even from that it attained its growth. From thence we passed to Leghorn, to see my brother's partner, and on to Florence.

Here Phillips and Hilton soon joined me, from Venice, and our conjoined researches from gallery to palazzo, and from chiesa to convent, among the early, the matured, and the latter masters, found full occupation for a month. One object with me here, though defeated, was to see and converse with the venerable Raphael Morghen. His *bottega*, for such his studio partly is, is a resort of many travellers, who buy at first hand impressions of his works, which, numerous and exhausted as the plates must be, he still sells, in tolerable, though grey, condition; and, besides this continuing source of wealth, is said to be a man of considerable substance.

From Florence, our next resting-place was to be the Imperial City itself, and six days by Veturino was to bring us in sight. We chose the unfrequented road through Siena, celebrated for

* Mr. Raimbach's insertion.

the purest Tuscan, as Lochabar is for the purest Gaelic,—I suppose from its inaccessibility to strangers. Here, through wildness, desolation, and volcanic sterility, over barren hills and fetid valleys, the climate cold and wintry, reversing all that Claude has painted or that poets have described, we drove along; and at last, passing the extended and swelling, but pestiferous Campagna, we entered Rome, where, putting up, fatigued as we were, we hurried over intricate streets and muddy Tiber, and before twilight found ourselves in the expansive interior of St. Peter's, where even the most extravagant of our expectations were realised. I felt now, that after my fatigues, after all the sorrow and sickness with which I have been afflicted, a great event was now accomplished,—I was now in Rome, and one of the brightest dreams of my youth come to pass.

The labours of Michelangelo and Raffaele have since been the chief objects of my study. By far the most intellectual, they make other works appear limited; and though high in all that is great, are still an example, and a noble example, too, of bow the accessories of a work may be treated with most advantage. No style can be so pure as to be above learning from them, nor so low and humble as not to gain even in its own way by their contemplation. They have that without which the Venus and the Apollo would lose their value, and with which the mean forms of Ostade and Rembrandt become instructive and sublime,—namely, expression and sentiment. To some of the younger artists here, however, I find they are a stumbling-block,—things to be admired, but not to be imitated, and less to be copied than any flat, empty piece of Venetian colouring that comes in their way. The effect of these works upon the unlearned public at large deserves attention. Fresco, when old, gets dull and dry, and cannot be repaired or refreshed like oil; their impression, therefore, upon the common eye is not striking, and many people acknowledge this who, show them a new print from Raffaele or Michelangelo, would be delighted. Vividness is perhaps necessary to make any work generally impressive, and suppose these, fresh as they were at first, and as I have seen some recent frescoes, I believe they would be the most beautiful things imaginable,—popular, beyond a doubt, as it is upon record they were so.

In modern art, Rome is the school for all other countries, though opposite styles are here to be found suited to each. In painting, the Italians and French are alike followers of David. The English students, excepting Lane, whose picture has not yet been seen by human eye, are chiefly occupied with subjects of Roman costumes; but the Germans, for devotedness more like a sect than a school, have attracted much attention by their novel experiment of copying the masters and precursors of Raffaele—not Raffaele himself—in hopes that passing over the same course, they will arrive at his excellence. They have also revived the art of fresco, which, as they manage it better than they do oil, proves it at least as easy; and though their system scarcely admits of originality, it yet has so much of expression, and discards so much of what is meretricious, that I wish their feeling were infused a little into ourselves. Their names are Shnor, Feght, Schadow, and Overbeck. Shnor takes the lead, has married a Catholic, and changed his religion, to feel more devoutly the scriptural subjects of his art. But it is sculpture here that is the great object of attention and encouragement. The number of these artists multiply by every day's further knowledge of Rome: the chisel and mallet are heard in every corner. Amidst such competition great talents have, and are still, rising. True it is, that seeing at all hands statues and groups arising with almost flawless form and in pure Greek taste, one's notions of the difficulty of imitating the antique itself, is somewhat diminished; but knowledge of the figure and correct form will not of itself make high art. Canova had much more than this or he never would have impressed as he has done. He added grace and intelligence; and although his taste, adored as it was, is passing away, and Thorwaldsen, with more severity, more style, but with less expression, has risen in his place, a blank is still left: draperies prevail over flesh, and flesh over feature, and sculpture will, like painting, become mere decoration, if the expression of the inward man does not occupy some share of its attention. With objects passing around one, with all the

antique remains and local associations of this enduring place, you may believe that time does not hang heavily. The English society, too, are so numerous, and at such a distance from England lay so completely aside their national reserve, that as a stranger I never felt more at home, and having full leisure and no immediate care or anxiety, and with strength and even the appearance of health, and most excellent spirits, I may say the present is a time of most satisfactory enjoyment. Yet still I have not much to boast of: time is left to do everything with my complaint; I have given up medicine, and would almost give up the doctors too, for any good they can do; still I am not worse than I was when I left you in Paris.

My sister has informed me you had been to Kensington after your return from France, and she stated, much to my satisfaction, your having dined with the Baron Gerard at his villa at Auteuil, in company of our worthy president, &c. &c. I wished you should see the Baron, assured as I was you would be well received. I think such a party must have been gratifying to you. As we are now old friends, may I state a suggestion upon this?—namely, considering that it is not every artist that is so qualified for general society as you are, should you not in London go more into society than you do? Some people feel this as a duty to their profession: it would relieve and not hurt your studies, and might, as you could improve it, be of service to your family. This is taking a liberty with you, but it arises from my respect for qualities to which I look up, more than any other feeling, and rest in mental is as necessary as in bodily occupations.

And now, my dear sir, give my kindest regards to Mrs. Raimbach, and to all the young people, not forgetting little David: they will recollect, I doubt not, our meeting in the Louvre; and as at such a distance one likes to hear of our friends and what they are doing, may I ask you to favour me with a letter to tell me all the news;—how the published plate goes on, how you proceed with your more serious labours, and what you think can be done next to carry on the war. My own large plate of the will, from the little I have heard from Burnet, appears to have told. I only now subjoin the following little commission, referring somewhat to business, and subscribe myself, dear sir, yours very truly,

DAVID WILKIE."

"Kensington, April 6, 1822.

* * * * * The Duke of Wellington called a week ago, with some friends, to see my picture, 'Gazette of Waterloo.' He requested to see all my engravings; accordingly I brought him and his party into the parlour, and they all seemed much amused and pleased with them.

During the last week I have let in my neighbours to see my picture, of whom 362 have seen it; my house, in consequence, has been like a cryed fair.

DAVID WILKIE."

"Kensington, Nov. 28, 1823.

* * * * * The letter of M. Andeod, which you have been so kind as to transcribe for me, I have perused with great interest, and feel highly flattered, as you will no doubt feel also with me, at the announcement of the handsome compliment conferred upon us by the Society of Arts at Geneva. When the diplomas, of which M. Andeod says he had got charge, with the official letter from the secretary to you, shall arrive, it will then be proper for us to return our formal acknowledgments to the society. But, in the mean time, should you think it proper to write to M. Andeod, do oblige me by presenting my best regards to him, with my acknowledgments for the honour I have received, which, whatever may be the opinion the members of the society may be pleased to entertain of the works he submitted to them, could not have been conferred upon an entire stranger unless with the assistance of his very favourable recommendation. I hope to have the pleasure of seeing you before long, to confer about this very handsome testimony in favour of our joint labours, when we shall consider in what way our acknowledgments are to be made.

DAVID WILKIE."

ART-UNION OF LONDON.—The pictures selected by the prizeholders,—the names of the chief of them we have already given,—will now be found in the gallery of the Institute of Painters in Water Colour, Pall-mall. The exhibition will remain open until the 29th inst.

ST. MARY AND ST. NICOLAS COLLEGE, LANCING.

On the 28th of July the first stone of the new chapel, the ultimate cost of which will not be far short of 200,000*l.*, was laid by the bishop of the diocese, with great ceremonial, and the new dining-hall of the college was opened, after being many years in course of erection, under Mr. Slater and Mr. R. Herbert Carpenter.

The college, as already completed, comprises dormitory, school-rooms, library, and masters' houses, forming three sides of a quadrangle, about 150 ft. square, with cloisters all round it. The new hall joins the greater part of the fourth side, and the ante-hall and offices join the northern end of it. The chapel stands at right angles to the hall, forming the north side of a still larger quadrangle, of which the fellows' and provost's house will form the south side. The eastern side of this quadrangle is open, and the college being on the slope of the Downs, the view from this point extends over the sea from Beabey Head to the Isle of Wight. Besides these two quads, the southern wing of an upper or western quadrangle is now completed.

It is intended to build the chapel on a very large and magnificent scale, to serve as a place of worship for the three great Sussex schools on all grand gatherings of the college.

The plan consists of an apsidal choir, 170 ft. long (inside) and 30 ft. wide, with an ante-chapel of the same width, and 45 ft. long, north and south aisles, north-western and north-eastern towers, and a great campanile at the south-west angle, 350 ft. high. The whole length is divided into twelve bays (including the ante-chapel), with a five-sided apse. The arcades have clustered columns. Above this is a triforium stage, of richly-moulded lancet arches on clustered piers. This triforium is continued round the apse, and pierced as windows. The clerestory has large two-light windows, and the whole length is groined. The height from the choir floor to the underside of the groining will be 87 ft. The aisles have two-light windows, and are also groined. The flying buttresses on the south side are double, a cloister extending along the southern wall of the aisle. In the pinnacles of the lower rank are a series of niches. The upper pinnacles are more severe in type. The general composition of the buttresses is followed for those of the apse, which are of great projection, as the ground falls nearly 30 ft. from west to east. The total height of the apse to the ridge of the roof will be about 150 ft. On each side of the apse is a tower, of the same size as the width of the aisle. The clerestory composition is continued round the three sides, thus forming an open lantern. The upper part of the towers above the choir parapets has richly-carved niches and figures, and a short spire and pinnacles above. An apse is formed at the east end of each aisle, opening out of the east side of the tower. These will form the chapels of St. Mary and St. Nicolas.

The great entrance is at the west end, from a cloister communicating with the secular buildings. This cloister is of three stories, the upper one ranging in height with the triforium stage, the middle stage being used as mainment rooms, &c. A great rose-window will complete the west front.

The south-west tower will be about 350 ft. in height. The belfry stage has on each face two windows, of two lancet-lights in each, with richly-clustered monials. Octagonal turrets run up at each angle, and are terminated with rich pinnacles. The height to the top of the parapet of the square portion of the tower will be about 200 ft. Above this point it becomes octagonal, with large pedimented windows on each face, surmounted by a low spire of stone. The octagon is intended to serve as a chapel of St. Nicolas, and will have in it a powerful light, supplied by the Trinity House,—for the great height of this tower will cause it to be one of the most prominent objects on the south coast.

Beneath the chapel will be a crypt 20 ft. high, divided into three spans in the width of the choir, until the ascent to the altar begins, when the crypt below will rise to 30 ft., and be vaulted in one span to form a chapel. The foundation already put in exceeds 20 ft. in depth, the solid chalk being at that depth below the surface. The stone laid forms a portion of a jamb of one of the arches of the north aisle of the crypt.

The choir will have stalls for about 450 persons, the ante-chapel and aisles being intended to be used only at great gatherings. The

altar is raised from the choir floor by four flights of steps.

The whole will be faced inside and outside with stone, and groined with chalk, and the roofs covered with lead.

The ball is built of flint, with Caen stone dressings. There is a lower and an upper hall. It is divided into eleven bays by massive buttresses; the upper, or ball proper (the lower being used as a breakfast-room), is lighted by two traceried windows in each bay. A richly-moulded cornice extends the whole length of the outside and inside. On this are built great dormers of stone, of a Burgundian type. They are of two lights, with traceried heads, with rich buttresses, and pinnacles on each side, and surmounted by acute crocketed gables, and filled in with sunk tracery. There are five dormers on the east side, and four on the west, the other buildings abutting against the hall here. The dimensions of the hall are 101 ft. long (inside), 28 ft. wide, and 70 ft. high, or nearly 100 ft., including the lower hall. The roof has great arched and moulded ribs, with curved wind braces. The ante-hall has a gallery over it, opening into the ball by three arches, resting on polished red granite columns. The ante-hall and gallery are 40 ft. by 28 ft., and of nearly the same height as the hall. A lofty lantern of oak, partly covered with lead, with a shingle spire, is erected in the centre of the roof of the hall.

The dais is raised two steps above the general floor. The wall behind the high table is panelled with oak to a height of 18 ft. The panels are in three heights, with carved bands between, with a richly carved and bracketed cove and cornice above. In each of the square divisions of the cove between the brackets are traceried panels with shields. In front of the paneling are figures, 4 ft. high, of the patrons, SS. Mary and Nicolas. This portion of the work is executed by Mr. Forsyth.

The hall is approached by a fine staircase of stone, groined over, divided into three double bays, resting on clustered columns. These and the ribs are of stone, the filling-in of chalk. The northern end is lighted by two great traceried windows. The same staircase is continued down to form the grand approach to the chapel cloisters. A great oriel light is the ante-hall on the south side, richly panelled and carved. The fellows' common-room, serving-rooms, and stairs open out on the north side.

The whole of the windows are intended to be filled with glass by Messrs. Clayton & Bell, some of which are immediately to be inserted.

TRADE TROUBLES AND THE COURT OF CHANCERY.

A WEEK memorable in the annals of trades unions, by the attempt of some secret conspirators to overawe masters into the abandonment of piecework, has been made more remarkable by the judgment of Vice-Chancellor Malins, that the Courts of Equity are under the duty of considering whether, in any given case, they will stop trades unionists from intercepting the labour of their brother workmen. Considering the two operations as contemporary movements of opposite camps, the first thought does not suggest that they look much in the order of conciliation; but as the darkest hour of the night is the nearest to the morning, and the worst stage of the fever must be that which begins the cure, it is just possible that the extremes thus made for us may give that commencement of reconciliation which in so many trades seems almost the only alternative between us and the confiscation, on one side of our industry, and on the other of our capital.

A short time ago nothing was less foreseen on either side than that the formidable machinery of the Court of Chancery would be brought in to play a part in these trade troubles of ours. It was a resource that did not enter into the estimates of either party to the campaign. But the *fait* is now *accompli*, and we may be sure that the step, once taken, will not be retraced. The Court of Chancery is celebrated as having never let slip a good opportunity of extending its jurisdiction, or, having once extended it, of relinquishing its hold. It exists, indeed, less by law than by this tendency in its institution; and, having once assumed the province of protecting property in reference to whatever labour may be open to its competition, it is not likely

to fail of obtaining a predominating control over all the proceedings by which certain sections of workmen seek to limit the industrial operations of their neighbours. "If it shall be held," said the Vice-Chancellor, "that these proceedings are illegal, and if it be found that the court has jurisdiction to restrain them, I believe it will be found to be one of the most beneficial jurisdictions this court has ever exercised." In other words, the justification of the interference is measured by its beneficence. When the illegality is not statutory, or requires speedier treatment than the common law affords, the remedy becomes an affair of equity. This was the original basis of all the jurisdiction of the Court of Chancery, and under the changing circumstances of society it is held to have new causes of interference wherever there are equal grounds of injury to sustain an application.

The importance of the new resource lies exactly in that crushing potency which, in the interest of poverty, society has always tended to deprecate in these courts. We may reasonably enough complain that a machine of a thousand horse-power is set in motion to crush a butterfly or a wasp; but the fact remains that the butterfly or wasp is crushed. Once grant that the extent of injury suffered by an employer entitles him to the assistance of the court, it follows that there can be no means left of resisting the power. It is a maxim that the hardness of any individual case must not stop the operation of law, and the sure rule that would reach any workman visited by an injunction would be considered only the just punishment of the wrong which had provoked it.

But, as in Samson's "devonver" was found "food," and in his "strong" was found "sweetness," this new chapter, so full of unpleasant menace in the history of our trade organisations, has also its side of hopefulness and promise. In the proportion in which the new machinery will be crushing to workmen must it be expensive to employers; and the many arguments that already exist for conciliation may thus acquire the aid of another—the strongest—from the arsenal of the opposition. It may be found, as with nations, that the expense of the war will be the best security for peace. In proportion as the consequences are discovered to be growing every day more serious, all parties may be disposed to recoil from the causes which provoke them.

It is certain that all our other agencies have been singularly infelicitous in helping us to the required commutation. As when "chaos umpire sat," they have only "more embroiled the fray." Up to this time, as far as we have been able to reach a conclusion, even the influence of our remedy of remedies—the trades unions themselves—has been no better than the disease. It would be mere prejudice to say that they have not at times usefully interfered in the relations between men and employers; but the question is not whether they have done good, but how much, and at what expense? We want the estimate of the wrong side of their influence. We know where we are as to the amount of employment and the extent of our industrial resources. Can any one tell us how much work has not been done through them,—how much realized convenience and commodity have been lost through them,—how much individual comfort and public ornament have been missed through them,—how much additional groundwork new action and new enterprise has been sacrificed for ever through them? Can figures set out the unfavourable difference they have made in England alone in the aggregate of received wages during the last quarter of a century? Above all, is it possible to estimate in money, or, indeed, in any form that shall realize the truth, the extent of their influence on the progress of good workmanship,—the development of whatever is solid, original, enterprising, and artistic in the industrial genius of the trades?

We can only reach our best inference by using as our measure the difference between an industry working free and an industry working in fetters. It is easy to see that for our ingenuity and genius to work under less than the utmost freedom consistent with fair play and order is to confiscate a corresponding proportion of our resources and productiveness. The natural and irresistible tendency of all the men who form these private corporations is to subordinate the requirements of the trade to the convenience of a limited number of traders, and to insist on working other men's establishments for their own advantage under regulations that have little or nothing to do with public good, private

justice, or the development of art and industry. When a large manufactory is brought under their dictation, the true principle of management and the true principle of development are gone at the same instant. The laws of nature will, of course, still work; but, instead of being aided, they are weakened, crossed, circumscribed, checked, stunted, circumscribed, and crippled. Jealousy, apprehension, restraint, and limitation are of the essence of the mob empire that is forced over them; and there can be no harmony possible except on the basis of rules which, never more than questionably good and partially applicable, introduce a tyranny exactly where freedom is most required. The wages are kept up under certain inflexible conditions that confiscate progress in the future and shut out all equity and liberality of arrangements in the present; and it is twenty to one if the dictators permit any inequality of remuneration according to inequality of skill or industry, or tolerate any work or mode of payment suited to the emergencies of a changing business, or suffer any kind of employment varying with the requirements of an extended enterprise, or allow any expansion of industry that is not in keeping with their own individual interests or convenience.

The pretext of things is often one, the reason another; and we can only understand a *rationalis* in trades unions by looking upon them as the successors of those trade guilds of India and Egypt which formed part of the police system necessary to jealous and tyrannical governments. Workmen were made slaves to one another under drivers of their own choice. The chiefs checked the masters to please the men, and sacrificed the men to please the masters, and there was everywhere the subordination under responsible leaders dear to the heart of despotism. The check may be important still to those not vitally interested in the prosperity of the trades. It may give even some useful sacrifices for social order; but we must still object to sacrifice to it everything which guarantees that development of industrial enterprise and genius which ought to be making this the most brilliant in the epochs of human advancement.

NEW LAMP LATELY ERECTED IN HOLBORN.

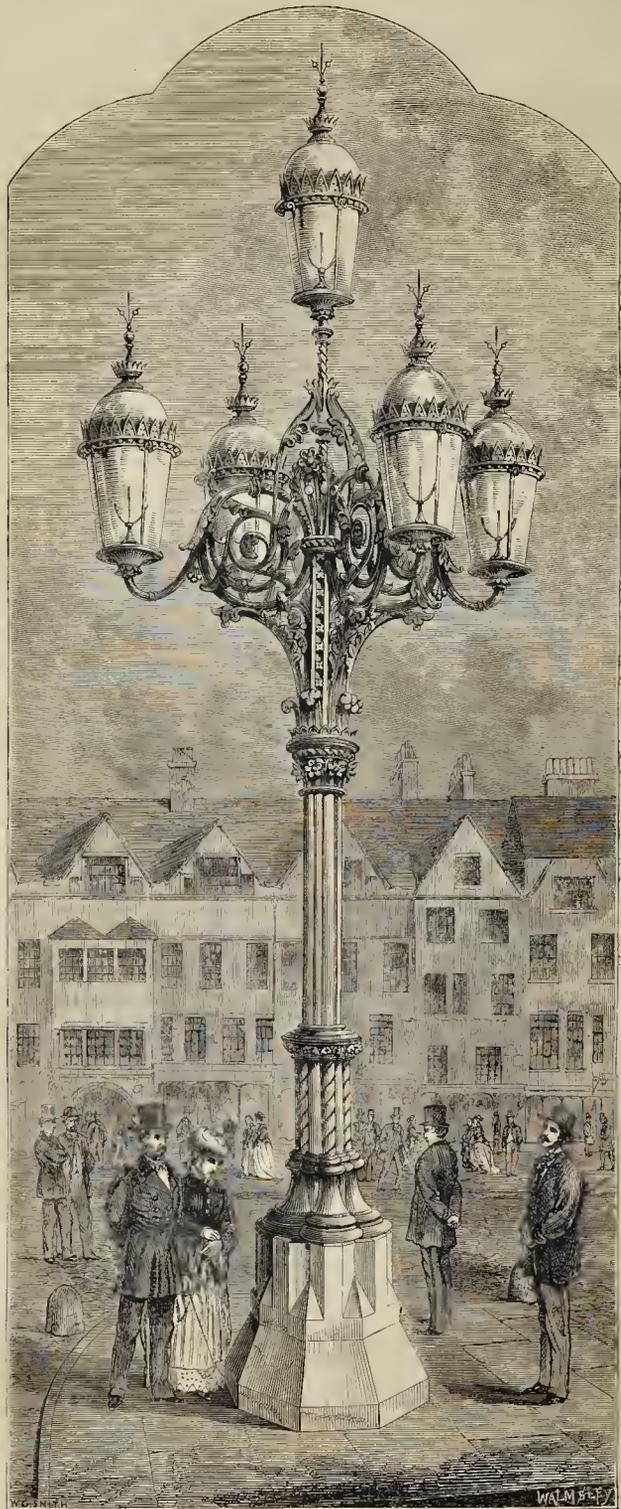

THE lamp which has just been erected by the Metropolitan Board of Works in Holborn, near Gray's-inn-lane, on the site of the old Middle-row (lately removed by the Metropolitan Board of Works), has an octagonal base, and four engaged shafts with moulded bases and moulded and foliated caps, forming a sarbaso, from which rises a central column of shafts banded together, with a foliated and crested cap, out of which spring enriched scroll arms or brackets for four lamps; a fifth and centre lamp rises from the junction of the brackets, by a continuation of the centre column. Flowers and leaves spring from the junctions of the brackets with the centre shaft. Each lamp has four burners, with reflectors, arranged in a novel manner, and has ornamental castings and finials.

The principal dimensions are as follows, viz.:—Height from pavement to top of finial of upper lamp, 24 ft.; to centre of lower lamps, 16 ft.; diameter of base, 3 ft. 2 in.; diameter, lower shaft, 10½ in.; diameter, central column, 7 in.; distance from centre to centre of lower lamps, 6 ft. 9 in.; diameter of lamps, 1 ft. 7 in.; height of lamps, 2 ft. 6 in.

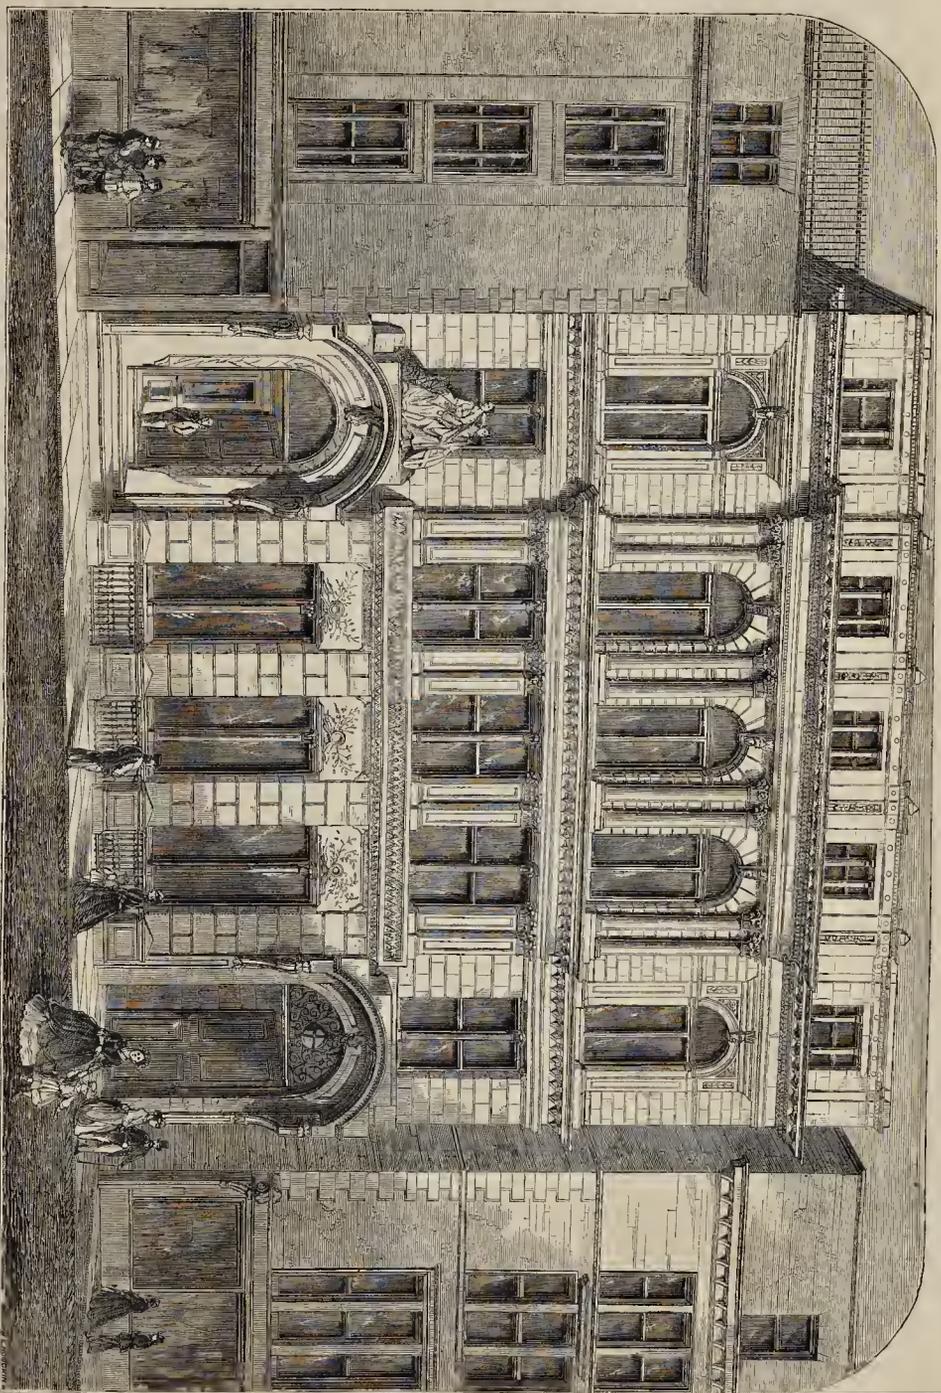

The lamp stands on a paved "sanctuary," oval in form, with guard-posts, with granite spurstones, &c.

The whole of the work, with the exception of the paving, has been executed in cast iron, by Messrs. Walter Macfarlane & Co., from the designs of Mr. Charles H. Driver, architect, at a cost (for the lamp alone) of 99l.

INTERNATIONAL WORKING MEN'S CONGRESS AT BRUSSELS.—There is to be a congress of the International Working Men's Association at Brussels on the 6th September. The subjects to be discussed include the following:—Reduction of the hours of labour; the influence of machinery in the hands of capitalists; landed property; education of the working classes; credit institutions; social emancipation by means of co-operation, &c.

IRON LAMP, RECENTLY SET UP IN HOLBORN.—DESIGNED BY MR. CHAS. H. DRIVER.

OFFICES OF THE LONDON DOCK COMPANY, LEADENHALL STREET, LONDON.—MR. E. N. CHILTON, ARCHITECT.

NEW OFFICES FOR THE LONDON DOCK COMPANY.

Our engraving shows the entrance front of the new offices which have been recently erected for the London Dock Company in Leadenhall-street: the material is stone. Mr. E. N. Clifton was the architect, and Messrs. Brass & Co. were the builders.

KENT ARCHÆOLOGICAL SOCIETY.

ONE of the most successful annual gatherings that the Kent Archæological Society has had since its formation ten years ago was lately inaugurated in Canterbury. Occasion was taken by the Dean to direct attention to an arrangement come to some years ago, whereby it was proposed to fill the niches outside the main entrance to the cathedral with statues of celebrities; and from a circular he has issued it seems that thirty-one out of fifty-six figures contemplated have been erected; and that, in addition to these, the Queen has lately signified her intention of presenting the figures of herself and the Prince Consort.

The preliminary meeting took place, by permission of the Dean and Chapter, in the new chapel and library. This apartment has only been just completed by the builders, Messrs. Besken & Godden, of Canterbury. Earl Amherst, president of the society, occupied the chair, and amongst the company were Lord Fitzwalter, Sir Walter James, Sir Walter Stirling, the Dean of Canterbury, Archdeacon Harrison, Canons Blakesley, Robertson, and Stone, &c., besides about 100 ladies.

The Rev. Canon Robertson read the report of the committee of management, which was adopted, and various new members were elected.

The President then called upon Professor Willis to give a lecture on the ancient masonry of Christ Church, which in olden times surrounded the cathedral. The professor commenced by saying that in 1845 he had made very extensive researches in connexion with the Cathedral of Canterbury, and had been allowed every liberty by the dean and chapter of those residing in the precincts, to investigate every portion of it, take measurements, prepare plans, &c., perhaps beyond that ever before extended to any other individual. He mentioned that the subject of his discourse would be published in the forthcoming volume of the society, and that several of the plans he now used for the purposes of explanation were lithographic proofs prepared for the work. Speaking directly upon the subject, Professor Willis said he had been enabled to satisfactorily decide on the uses of many buildings which hitherto, on less complete investigation, had been assigned to purposes for which they were not intended.

For instance, what was called the baptistry was in fact the great tower to which water was introduced from the north side, and from which the various lavatories of the monks were supplied. By reference to that remarkable and interesting work, "The Rites of Durham," which was written by one of the monks, and which contained a minute description of the whole routine of their daily lives, the whole plan was rendered plain and comprehensible. There were the carefully-contrived passages by which the holy fathers could pass to their diurnal and nocturnal services in the cathedral dryshod, carpets and wood-flooring being unknown in those times; there were "the studious cloisters" where the more educated pored over ancient manuscripts, or instructed the novices; or where the less instructed could think over their past faults and repent their "Ave Marias" and "Pater noster."

For these purposes the south alley of the cloisters was always inclosed, while the other three sides were generally left open. In his researches he had been able to make out quite distinctly the four hostels which were always provided for guests in large houses of this kind. The one for the ecclesiastics was at the east end of the cathedral, and near it, on the north side, that of the nobles, both being close to the more holy parts of the monastic pile. The question-hall for the middle classes, the merchants, and well-to-do was at a considerable distance; while that of the pauper class was close by the entrance, and as far off as possible, not only from the holier portions of the building, but from the other classes of society. The ecclesiastics and nobles were all under the care of the prior in this case, or the abbot at

other places; while the middle class and poor had each officers appointed respectively to take care of them. Professor Willis then, by means of drawings, laid before the audience, explained all the details of the ground-plan which he had prepared, and proposed to accompany the members over the cathedral close, and point out the particular localities of the building he had described.

Thanks were voted to Professor Willis, and the numerous party then accompanied him around the cathedral, and listened to a disquisition in elucidation of the lecture previously delivered.

In the afternoon the members of the society and their friends, to the number of about 200, dined in the Music-hall, St. Margaret-street.

The proceedings terminated shortly afterwards, and the archæologists reassembled at the Deanery, where they were regaled by the hospitality of the Dean and Mrs. Alford. A party was then formed, under the direction of Mr. G. Faussett, the hon. sec., who conducted them over the cathedral by moonlight. As the archæologists were grouped in the nave, and were admiring the effects of light and shade, the choir sang the anthem of Handel, "There were Shepherds," and the "Hallelujah."

On Friday morning, after divine service at the cathedral, a large party met at St. Augustine's College, over which they were conducted by the Rev. the Warden, who pointed out all the portions of the building that belonged to the ancient abbey before the present college was founded by Mr. Beresford Hope, M.P. The party then went to the ancient church of St. Martin, founded by Queen Bertha or Ethelburga, the wife of Ethelbert, King of Kent. Next they proceeded, under the direction of Alderman Brent, F.R.A.S., by way of the Dane John, along the city walls, and by the ancient mound, to the ruins of the Norman castle, near the gasworks; thence to the Hospital for Poor Priests, now the police-station, and thence across the river to the refectory of the Grey Friars, built over another branch of the Stour; and to Eastbridge Hospital, on King's Bridge. After evening service at the cathedral the party was conducted over the edifice by the Dean, the inspection having special reference to the visit of Erasmus.

TRUSTS FOR EDUCATIONAL PURPOSES IN LONDON.

THE Schools Inquiry Commission have published their tenth volume. This relates to the London division, which comprises the cities of London and Westminster, and parts of the counties of Middlesex, Surrey, and Kent, within the metropolitan district as defined by the Registrar-General. The population was computed in the Census of 1861 at 2,503,989. From the introductory summary we get the following facts:—

The total number of endowed grammar schools included in the metropolitan division, exclusive of the Charter House, Merchant Taylors', St. Paul's, and Westminster Schools, which were reported on by the Nine Schools Commissioners of 1861, is 24. To these may be added the foundation of St. Lawrence, Jewry, which is applied in the form of exhibitions only.

Among these twenty-five foundations are three which support schools having each an upper and lower department. These are Christ's Hospital, St. Olave's Southwark, and Dulwich College, on each of which specific recommendations by the commissioners will be found in the fifth chapter of their report.

The aggregate gross income of these foundations, some of which are applicable in part to other purposes besides the support of the schools, has been already computed in vol. i. at 97,708*l.* per annum.

The net annual income, after payment of all charges on account of repairs, rates, taxes, and insurance in connexion with the property and school-buildings, is estimated at 55,189*l.*, besides 1,089*l.* for exhibitions.

The greater part of the income is derived from the foundation of Christ's Hospital, whose net income from endowment is 42,000*l.* per annum, leaving 13,189*l.*, or, including exhibitions, 14,278*l.*, for the aggregate income of the remaining foundations.

In the case of one foundation at least (Dulwich) the prospective increase in the revenue is so great that no safe estimate can be formed of its future income.

Of these 25 schools, besides Christ's Hospital

and the foundation of St. Lawrence, Jewry, some are classical, with 1,417 scholars; nine are semi-classical, with 1,159 scholars; four are non-classical, with 577 scholars; two are elementary, with 88 scholars; one is in abeyance; and the other two are united with other primary schools.

The net annual income of the four schools already named, which were reported on by the Nine Schools Commissioners, is about 19,000*l.*, besides above 7,000*l.* for exhibitions.

The net annual income of endowments applied to the secondary instruction of girls (exclusive of Christ's Hospital) appears to be about 2,000*l.*

Hence the aggregate net income of the endowments for secondary education in the metropolis may be set down at 84,000*l.* per annum.

There is also a large number of endowments connected with the primary instruction of the poor. Ten of these foundations have gross incomes of 1,000*l.* a year each and upwards. They are the Royal Asylum of St. Anne's Society (1,377*l.*), Lady Holles' School (1,377*l.*), Reeve's School (1,164*l.*), the Grey Coat Hospital (2,736*l.*), Emmannel Hospital (3,118*l.*), Bancroft's Hospital (4,589*l.*), Raine's School (1,321*l.*), Aske's Hospital (4,800*l.*), Newcomen's School (1,656*l.*), Rean's Schools (1,000*l.*). Thirteen others have gross incomes between 500*l.* and 1,000*l.* each. Our information is not so complete as to enable us to form a very precise estimate of the net annual income of these charities; but their gross annual income amounts to about 45,000*l.* A large proportion of this is applied in the form of clothing and maintenance of boys and girls, and part also for other non-educational purposes, as almshouses.

After every allowance has been made, it may safely be affirmed that the net income of the trusts for educational purposes in London (including 42,000*l.* belonging to Christ's Hospital) exceeds 100,000*l.* per annum.

MIDDLESBROUGH PARK.

THE new park at Middlesbrough has been opened by Prince Arthur. It is to be called the Albert Park, in memory of the late Prince Consort, who was of same nationality as the donor. It comprises upwards of seventy-two acres of land, purchased about two years ago by Mr. Bolckow, with the view of presenting it to the inhabitants of his adopted town as a place of rational and healthful recreation. It is about half a mile from the southern extremity of the town, and has already been planted by its donor and other gentlemen residing in the neighbourhood. The walks are well planned and laid out, and there is an avenue of Wellingtonias in the park. There are two large pieces of ornamental water, one covering nearly four acres at the eastern extremity, the other covering an area of one acre near the western entrance. A cricket-ground has been laid out, and a bowling-green has also been constructed. There is a circular piece of ground in the centre of the park which is reserved for statuary, and on three sides of the park laid it is to be appropriated to the erection of villa residences.

FROM PARIS.

THE remains of the fire which took place in the eastern pavilion of the Halles Centrales on the 10th ult. have not yet been cleared away. The burned substances, such as meat, grease, hutter, eggs, cheese, &c., under No. 12 Pavilion, exhaled such a pestilential odour that the workmen employed in removing the *débris* had to stop work until some barrels of disinfecting substance, furnished by the Compagnie Richer (Vidanges), had been applied. On inquiring of the inhabitants living on the spot, most of whom have some dealings at the Halles, we ascertain that there is no building so well supplied with water as that portion of the Halles, especially in the pavilion neighbouring to that of the fire,—viz., the fish-market, where there is an enormous tank for live fish, which supplies three horse-fountains incessantly during working hours. Now, they inform us that, when the first alarm was given, the *pompiers* arrived; but they had not the key of the water, as the keeper had gone home. When the key was fetched it was too late. The heat must have been equal to that of a Bunsen's blow-pipe when the iron-work gave way.

Cast and wrought iron are very unsafe mate-

rials to depend upon for constructions in which extremely inflammable hydrocarbonaceous substances are stored. The only really fireproof building seems to be one constructed of thick walls and arched refractory bricks like a blast furnace. As to avoid storing highly inflammable materials, it is impossible; for the world must be supplied with butter, oils, bacon, spirits, &c.; but the evil can be much lessened, in case of fire, if these substances are kept in a number of separate fire-brick arched casements, so that they might burn out without injuring the contents of the neighbouring arches. Wrought-iron shows weakness and loses its tenacity at a common red heat: it does not melt, but it cracks and faints away; steel refiners melt readily, as also do cast supports at a white heat.

On the 22nd ult., at half-past three p.m., another fire, of a more destructive character, took place in an oil-cloth factory, situated in the Rue du Transit, between the Vaugirard Station and the Tonr Malakoff. Six houses were also destroyed. The burning oils and essence flowed in a stream, like lava, for 1,600 ft., setting fire to everything in its course, and causing, while it blazed as high as the first story, an immense cloud of smoke, which appeared to cover half Paris, and was perceived from the Boulevard des Capucines. The stream caught hold of a lamp-post, melted the gas-pipe (of lead), and set fire to the gas. It was turned into a quarry, and put out with sand just as it was about to leap into the main sewer, in which are placed the gas-mains! In the whole experience of the fire staff in Paris they never met with such a cataclysm.

Excavations are being made in front of the New Opera at the corners of the Rue de la Paix, the Rue de Réanmur and the Avenue Napoléon, the new street leading to the Théâtre Français at the Palais Royal, for the magnificent hotels to match those which border the Opera.

All the façades of the Place Vendôme are being scraped clean. Our readers are aware that this place was built after Mansard's designs. Completed in 1701, it was then called the Place des Conquêtes, and contained an equestrian statue of Louis XV. in the centre. When, in 1792, this latter was destroyed, the square was called La Place des Piques (rather symbolically). The present column, constructed with 1,200 bronze guns taken from enemies, was completed in 1810, under the directions of the architects Lepère and Gondin.

The scaffolding and hoarding which covered the new Vandeville Theatre, at the corner of the Boulevard des Capucines and the Rue de la Chaussée d'Antin, have been removed nearly completely; the new building is tastefully decorated with appropriate statues, garlands, medallions, and other ornaments, and bears the name of VAUDEVILLE, in large gold letters on a slab of marble. It is a rotunde building, and seems to be well suited to the site.

An experiment of great interest, in a topographical point of view, has just been made by M. Tournachon, the photographer, better known by the name of Nadar, with the captive balloon at the Hippodrome. At a height of 300 metres (984 ft.) he succeeded, in spite of the rotatory motion of the aërostat, in obtaining several photographic proofs, successively taken, representing most accurately the panorama of Paris. This is an important step in a strategic as well as in a geodesic point of view.

The western façade of the Palais de Justice has been completed; much remains to be done for the general group in the shape of demolitions of the old structures of the Préfecture and the formation of a well-planted esplanade on the site of the Place Dauphine, opposite Henry IV.'s statue. On the quay, the conciergerie towers, of trite memory, have been pointed and consolidated: how the new law courts will be dovetailed into these venerable relics we do not know, but we can only express a hope that the latter will be carefully preserved.

The new organ at Notre Dame, by Cavallé. Coll, with 6,000 pipes (Leeds has 6,150) is worked by six pairs of pumps, giving an enormous reserve of compressed air of 1,000 cubic feet. The filling of the church, upwards of 405 ft. long, with the majestic and sometimes awe-striking sound, making the whole mass tremble in the deep tones, requires the aid of a mechanical force which would, perhaps, be more in its place in an iron foundry. Still, the control, by electricity, is such that no unpleasant jarring meets the ear, especially with a good organist.

From the official reports we learn that the latter

expropriation juries gave the following awards for the value of land in Paris:—1st arrondissement (Palais Royal), 500f. the square metre; 2nd arr. (Bourse), 500f.; 3rd arr. (Temple), 260f.; 4th arr. (Hôtel de Ville), 295f.; 5th arr. (Panthéon), 183f. 33c.; 6th arr. (Luxembourg), 147f. 50c.; 7th arr. (Palais-Bourbon), 300f.; 8th arr. (Elysée), 224f.; 9th arr. (Opéra), 470f.; 10th arr. (Enclous St. Laurent), 387f. 50c.; 11th arr. (Popincourt), 124f. 30c.; 12th arr. (Neuilly), 35f.; 13th arr. (Gobelins), 52f. 55c.; 14th arr. (Observatoire), 88f. 37c.; 15th arr. (Vaugirard), 46f. 42c.; 16th arr. (Passy), 46f. 85c.; 17th arr. (Batignolles-Monceau), 87f. 50c.; 18th arr. (La Chapelle), 60f. 63c.; 19th arr. (Buttes-Chaumont), 39f. 60c.; 20th arr. (Mémilmontant), 28f. 40c.

ST. PAUL'S, OLD BRENTFORD.

THE new church of St. Paul, Old Brentford, the first stone of which was laid by the Princess Mary of Teck, was consecrated by the Bishop of London on the 30th ultimo. The church is a structure in the Decorated style, and consists of nave, north and south aisles, chancel, organ chamber, south porch, and vestry, and is fitted with everything requisite for the proper celebration of divine service. The tower and spire will occupy a position on the south-west angle of the nave; it is at present only carried up about 20 ft., but will ultimately have an elevation of about 140 ft. The church is faced externally with Kentish ragstone, with Bath stone dressings, the interior being of brick, worked in pattern. The piers and arches to nave, windows, strings, corbels, and other internal details are of Bath stone. The carving, of which there is a considerable quantity, is chiefly naturalistic. The east wall is decorated with a costly retables, the gift of two ladies, formed partly of Caen stone, various coloured marbles, and alabaster. The choir stalls, priest desks, sedilia, and lectern are of wainscot. The pulpit is partly of stone, the upper portion being of alabaster, with green serpentine polished shafts, and carved wainscot panels. The lighting is by Hart, being by cones suspended over nave arches, two handsome brass standards being placed within the altar rails. The chancel is paved with Minton's tiles, and the passages in nave and aisles with red and black Staffordshire tiles. A recessed arch on south side of chancel, fitted with white marble slab, will be used as a credence table. The altar rail is of brass on ornamental scroll standards, and is fitted with a telescopeslide. The carving throughout, and the various fittings, such as pulpit, desks, choir stalls, &c., have been executed from the architect's designs by Mr. Anstey, of St. John's-wood. Mr. Nye, of Ealing, was the contractor for the works; Mr. Farmer, the clerk of works. The church will accommodate about 700 persons on the ground floor; and the cost, exclusive of tower and spire and special gifts, will be about 6,000l. Messrs. Francis are the architects.

WHITCHURCH CHURCH, HANTS.

THIS church has recently been re-opened, the greater portion of it (the tower only excepted) having been rebuilt on an enlarged scale. The old church consisted of a nave, with north and south lean-to aisles, south porch, chancel, and a west tower. That part of the building pulled down was in a dilapidated and neglected condition, most hideously galled and, and damp, in consequence of the floor level being much lower than the external ground. The only objects of any architectural interest about it were the north nave arches (of the Perpendicular period); those also on the south side (of Early English date), and a massive tie-beam oak roof (which was, however, concealed by a flat whitewashed ceiling). Externally the tower possessed no feature whatever of beauty, being rough, stuccoed over, with quasi-Italian doorway and belfry windows. It has now been heightened, strengthened by buttresses, and surmounted by a lofty spire, covered with cleft oak shingles (characteristic of the district). The new church comprises a nave of same span as the old one, but one bay longer. The ancient columns and arches have been rebuilt in the same position as before, and the roof cleared of whitewash, and opened out. There are north and south span roof aisles, a well-proportioned chancel, and an open south porch constructed of oak. A vestry has been

built, which will contain an interesting library of theological works, left to the parish by a former benefactor. A remarkable feature, the tower is the internal ringers' stair, placed the north-west angle. It is of oak, octagonal in plan, excellently carved, and moulded with coupled lights and perforated tracery. It was appear to be early fifteenth-century work, remarkable sepulchral monument (somewhat like an Italian "cippus"), thought to be of Sixton date, was found imbedded in the wall of the north aisle. It slightly resembles headstone, having a semicircular top, is situated on both sides, and has a Latin inscription on it. Two recumbent monumental effigies (seventeenth century), elaborately coloured, belonging to the Brook family, stood in the former chancel, and have been preserved from injury. The walls of the new church are built of brick with Bath stone quoins and dressings. The roof is covered with local tiles. The church is present seated with chairs, but open benches, accommodate about 600 persons (when sufficient funds are forthcoming), are to be introduced. The chancel has a panelled roof, with mouldings and carvings, and carved paterae. The pulpits, carved of Bath stone, with foliated panels and cornice, is placed on a low base of the grey Bath stone from the old building. Among the principal contributors to the rebuilding have been Mr. Melville Portal, Dr. Hempstead, &c. The cost has been a little under 3,000l., and the works have been carried out by Messrs. Goddard & Son, of Farnham, builders, from the design of the architect, Mr. Ferrey, F.S.A.

RAILWAY MATTERS.

THE traffic receipts of railways in the United Kingdom amounted, for the week ending July 20, on 13,287 miles, to 820,696l., and for the corresponding week of last year, on 12,998 miles, to 809,533l., showing an increase of 289 million and of 11,163l.

It appears from a report of Mr. Juland Danvers lately published, that the length of railways open in India was increased during the last year by 3,943 miles by the completion of 319 miles. There are 1,665 miles now in course of construction, and various proposals for extending the railway system are under consideration. Materials to the amount of 333,239 tons have been sent out from this country, at a cost of 3,827,420l. The whole expenditure in this country during the year was about 4,000,000l. In India it was about 3,000,000l. Upwards of 9,000,000l. have been added to the capital of the railways, making the whole amount that has been raised up to the 31st of March last 76,579,000l., of which 75,071,600l. have been expended. The gross receipts for the year ending the 30th June, 1867, were 4,875,112l. as compared with 4,537,235l. of the previous year. The working expenses were 2,537,812l. and 2,225,495l. respectively. The net receipts in 1867 were 2,337,300l. and 2,304,534l. in 1866. In 1867 the number of passengers was 13,746,354, of whom 13,074,980 were third class. In 1866 the total number was 12,867,000.

THE NEW DOCK AT BOULOGNE.

THE floating dock at Boulogne has been opened to all descriptions of shipping, if towed by the steam-tug attached to it, since the last instance. It will take some months before the accessories of the dock are completely finished. At the inauguration the presence of the Emperor is expected. The floating dock at Boulogne was commenced in 1859, and has thus been ten years in course of completion. The total cost has been a little under 300,000l.

The basin now opened for shipping occupies a superficies of more than 17 acres, with a quay-wall frontage of 3,600 ft., and a superficial quay space of over 240,000 square feet for the stowage of goods. It is of irregular shape, and about 1,300 ft. in greatest length and 630 ft. in greatest breadth. It is excavated to a uniform depth of about 30 ft. below high-water spring tides, and is intended to contain a depth of from 20 ft. to 25 ft. of water. It is entered directly from the Channel between the piers of Boulogne Harbour, making ingress and egress easy at all times through a lock with two sets of gates, so constructed as to admit the largest vessels, but generally intended to act as a half-tide basin, and to accommodate several vessels of medium

tonnage at a time. The lock or half-tide basin is 325 ft. in length and 68 ft. in breadth, with a depth over the sill of the gates of 29 ft. at high-water spring tides, and 23 ft. at high-water neap tides.

The opening of this new dock marks an important improvement in the facilities presented to navigation by the harbours on the north coast of France. Rails in connexion with the station of the *Chemin de fer du Nord* run along the margin of the basin, enabling vessels to discharge direct into the railway wagons without transshipment; and it is intended before the close of the year to provide cranes and all the most improved appliances to facilitate the loading and unloading of vessels.

ST. PANCRAS NEW RELIEF OFFICES.

THE new relief office and dispensary, the first erected under the provisions of the new Act, and the first of a series of four intended to be erected in the parish of St. Pancras, are situated in the midst of a poor population in Compton-place, one of a series of courts enclosed by the houses in Compton-street, Hunter-street, and Leighton-street. The rooms are all on the ground-floor. The site is of the form of the letter L, the long arm of which has a double series of rooms, and the short arm a single series, chiefly occupied by the porter's apartments. Immediately opposite the principal entrance and hall is the general waiting-room, the superficial area of which is upwards of 600 square feet, lit by continuous lantern skylights in the open roof. The glazed side panels of the lanterns are hung on pivots, and are made to simultaneously open and close for ventilation. It is heated by a large open fire-stove surrounded by warm-air chambers, through which the fresh air is made to pass. At the north end of the room are exit doors leading to separate men's and women's latrines, &c., and to the fuel stores.

On the east side are a series of doors admitting to the committee-room and to the doctors' consulting-rooms. At the south end is the entrance to the dispensary and relieving officer's room, bread-room, &c. Adjoining the dispensary, and entered only from it, is a drug-room fitted with small range, sink, and shelves. Adjoining the relief office, and entered only from it, is a store-room, constructed so as to answer the purpose of a strong room also. Separate conveniences are provided for the officers and porters. The passage leading to the porters' rooms forms an exit from the relief-office without necessitating a return to the waiting-room or entrance-hall. All the rooms are very lofty, being open to the roof, and the underside of the rafters ceiled. The side walls are 12 ft. in height from the floor. All the fireplaces are fitted with Welch's patent ventilating stoves, which admit of fresh air from without being passed through the warm-air chamber at the back of each into the rooms through hit-or-miss ventilators over the chimney-pieces.

The contract was taken by Messrs. Scrivener & White, at the sum of 1,341l. Mr. E. C. Rohins was the architect.

THE SCIENCE OF COLOUR.

SIR,—I am glad that Mr. Crace's remarks were made without book. He will find that I by no means assert that "all our present theories on the laws of the harmony of colour are entirely wrong," and that I advance nothing contrary to Newton. It is the list usually given of primary and secondary colours which I maintain to be erroneous, as all trustworthy experiments prove it to be. Several of these I have mentioned in my treatise,—as, for instance, the following two:—

I. Lay a narrow stripe of paper, part white, and part covered with the brightest yellow pigment, in the sunshine, across a dark cavity: the prismatic spectrum of the yellow part will contain the same red and green as appear in the spectrum of the white part.

II. Lay a circular spot of the brightest cobalt blue on a neutral grey ground, at a little distance from a similar spot of the brightest king's yellow: hold a slip of clean polished glass vertically in the middle, so as to reflect the yellow spot from that part of the glass through which the blue is seen. Thus we obtain different mixtures of the coloured lights given out by the two spots, and

as the eye is moved higher and higher the resulting colour passes from blue to yellow through grey, but never shows the least tendency towards green.

These and many other experiments prove that if red and blue are primary colours, yellow is a secondary colour, and complementary to blue. The doctrine that there are three primary colours, and that those three are red, green, and blue, is supported by the accurate experiments of Professor Maxwell, detailed in the *Philosophical Transactions* for 1860. I have never heard of any experiments in support of the red, yellow, and blue theory, other than those of the mixture of pigments, or superposition of coloured glasses, the untrustworthiness of which is evident, because those substances are coloured only by virtue of their destroying light; and, being all more or less transparent, they must, in overlying, interfere with each other's proper colours.

I hope that when Mr. Crace has had the opportunity of trying some experiments calculated to give true results, he will see that the new doctrine is not without experimental support, and will do me the justice of saying so. I have not the least doubt that the correction of our principles will be of essential service in the use of all rules for beautiful and harmonious compositions of colour.

W. BENSON.

SIR,—According to Mr. Benson's work on the "Science of Colour," which you noticed a week or two since, yellow, if I understand rightly, is no longer to be classed as a primary colour, and green is to be considered as a primary in its stead. Now, as you say, "if the new doctrine be true, we cannot be too prompt in accepting it;" but before doing so we really must be told what yellow is. By the theory of Mr. Benson it appears to be literally "nowhere." We find it classed under "colours containing full red," but what if it contained no red, as it often does? for if it contained red it would be orange. What is that colour which will turn blue into green?—is it a primary or a secondary? If it is a secondary or compound colour, of what is it composed? We are told by Mr. Benson that "the strongest yellow is produced by combining the red and the green rays, and excluding the blue;" but without blue we could have no green, and the yellow ray would remain.

With Mr. Crace, I must say that I was considerably surprised with this new theory. I have tried the prism, as Mr. Crace mentions, upon a sheet of note-paper, and I find it precisely as he describes it. The yellow ray is distinctly visible at the top of the paper, and there is no green to be seen, which appears to be due to the white paper separating the yellow and blue rays, the red and yellow being at the top, and the blue and a tinge of red at the bottom, and when the black object is introduced in the centre the colours are reversed. But green is formed immediately upon allowing the yellow to approach the blue ray. Let us see how other greens are formed in nature. How is sky green formed? Sky green is to be seen on a fine evening, just before sunset, in the clear sky near the horizon, and it is one of the most lovely and delicate greens which can be conceived. It is formed by seeing the blue sky through the yellow rays of the setting sun. The sky itself is not more green than it has been all day; it is simply the medium through which it is seen making it, to our vision, appear green.

How is green formed in vegetation? It appears to me to be entirely due to the blue ray in the atmosphere, which apparently forms a blue colouring matter under the outer surface of the leaf, but which is altered by the yellow colour of the sap and the outside covering of the leaf into green. If we, for instance, take a fully-developed ivy-leaf, the upper side is of a dark bluish green, while the under side is of a light yellow green. Cut off a portion of the upper surface with a sharp penknife, and we shall find the colouring matter under is of a darker and still bluer green than the surface, showing that the colouring matter is modified and made yellower by the upper surface or covering, from which it is reasonable to assume that the blue is communicated to the yellow sap by the blue ray of the atmosphere; for the under side, which is less exposed to the light, is far less blue than the upper. The blue also is received by the plant gradually, as the young leaves are always of a yellow green, and they become bluer only by degrees. If the plant is excluded from the light altogether, it loses nearly all its blue and becomes yellow. When the sap ceases to flow

through the leaves, and they decay, as in autumn, the blue is abstracted from them, they become yellow, red, or reddish brown, according to the nature of the original colour or the further brownning influence of the sun. The great fact, however, is, that the blue is gone and the yellow remains. The rays of the summer sun have drawn away the colour imparted by the blue cold ray of spring, until at last, the sun's rays becoming redder and more powerful towards autumn, they will turn the cold blue green of the wheat into the yellow and golden grain of our harvest fields.

This appears to me to show clearly enough that green is a compound colour, and that yellow is a primary.

JAMES K. COLLING.

THE PRISMATIC COLOURS AND HOW TO SEE THEM.

As reference has recently been made in your columns by Mr. Crace and others to the colours produced by the prism, perhaps the following capital method (accidentally found out by me a few weeks ago) of seeing the prismatic colours to perfection may be considered worth a place in the *Builder*. I am not sure that it is entirely new, but it is quite new to me, and may be so to many others.

The usual method of observing prismatic colours is by looking at any object through a prism, or by observing the rays projected by a prism on to a surface; by each method all the prismatic colours are displayed at once in small patches, and it is not easy to observe the exact shades of the primitive colours, because they are interfered with by the secondaries; now, by the following method the rays may be, as it were, separated,—one colour only seen at a time, and that, too, in a large mass.

If, then, instead of looking at the colours through a prism, the prismatic colours be directed, one at a time, from a prism (by a second party) directly into the pupil of the spectator's eye, the effect to the party operated upon is, that he sees the whole apartment in one perfect haze of the colour directed into his eye; as the successive rays are thrown one after the other on to the eye, the effect is most magnificent. It is very dazzling from a small prism when the sunlight is not very strong. I have not tried it with a very large prism in full sunlight, but words are altogether inadequate to describe the splendour of the separate colours of the prism as seen by these means.

W. G. S.

À PROPOS DES BOTTES.

SINCE the railroad to Florence has been established, people of all grades and opinions have visited that famous city, and contemplated the treasures of art in its palaces and churches, while every Englishman returns to his country extolling the beauty of the celebrated statue of the Venus de Mediciis. Notwithstanding this tribute of praise,—this just acknowledgment of the perfection of its proportions, on which the excellence of this celebrated work mainly depends,—the shoemaker is still permitted to inflict on our wives and daughters the narrow misshapen shoe of the last century.

If, Mr. Editor, you regard the subject of sufficient importance in an artistic or sanitary point of view to publish the following dimensions, taken from a very excellent cast of the Venus de Mediciis in the Museum of Sir John Soane, it would enable any lady, in the possession of a foot-ruler and a modicum of arithmetic, to ascertain for herself what should be the exact length and width of the sole of her shoe, and at the same time convince her of the truth of the above statement respecting the narrow, misshapen shoe which the wily shoemaker has hitherto persuaded her to accept.

As the Venus de Mediciis stands, she measures exactly 4 ft. 11 in.; but, as she leans forward, and is poised more on one leg than on the other, 3 in. is calculated, must be added to the 4 ft. 11 in. in estimating her height in the perfectly erect position. This would make her 5 ft. 2 in. in height. Now, as her foot is exactly 9 in. long, it is rather more than one-seventh of her entire height.* The greatest width of her foot is 3 1/2 in., and this would be a mere fraction more than

* Vitruvius says the foot is one-sixth of the entire height of the man; but the finest statues of antiquity make the foot a little more than one-seventh.

one-eighteenth of her entire height. It may, therefore, be confidently asserted that anything less than these dimensions for the sole of the shoe of a woman of 5 ft. 2 in. in height will not only be out of proportion, but that it will occasion discomfort and inconvenience, and that anything much less will produce considerable pain, and ultimate irremediable deformity of the foot. It may also be observed that high heels to boots or shoes will greatly add to the misfortunes the foot is subjected to, by producing ankylosis of the tarsus,—in plain English, a growing together of the bones of the instep, of course not without its concomitant evils.

JOSEPH BONOMI.

KENSINGTON SICK ASYLUM.—PAYMENT TO ARCHITECTS.

SIR,—Has your attention been called to recent proceedings in Middlesex for the erection of sick asylums with respect to the remuneration of their architects? And, also, have you noted what was done in this respect at the last county meeting of Middlesex magistrates, as to a proposed scale for the payment of any architects employed by them on county buildings? With regard to the first, you published (25th July) a plan and description of two such asylums about to be carried out by Mr. Giles; but you do not say a word as to the terms of the competition. Six architects have been asked to send a design for the sick asylum at Kensington, but, feeling how improper the conditions were, and that they are such that no member of the Institute is at liberty (morally, of course, I mean) to accept in the face of the published scale of the Institute, out of the six applied to only two have accepted, Mr. Currey, Mr. Worthington, Mr. Wyatt, and Messrs. Banks & Barry have declined. The Middlesex magistrates propose a yet lower scale. I think something like this:—

5 per cent. first £1,000.
4 " up to £10,000.
2 " after.

No commission at all is to be given for any excess over original estimate: this is to be taken into consideration by the court in October. Meanwhile the matter is serious, and ought to receive attention.

F. R. I. B. A.

THE WALWORTH COMMON ESTATE.

SIR,—I am glad to see that the rebuilding of this estate, consisting of about forty-five acres, in the midst of our vast metropolis, is deservingly attracting some attention.

The plans, as laid out by the various competitors, provides for about three miles of new houses; and it is most important, not only to the rate-payers of St. Mary, Newington, and the inhabitants of the immediate neighbourhood, but also to the public at large, that suitable provision should be made for the health and comfort of those families who will have to occupy, at no distant date, these proposed new streets, which, if intended more especially for the poor, should then more especially be healthy.

The majority of the competing architects for laying out the estate affirm that this provision for health has been disregarded in the plans selected for execution and premiated by the guardians; and that a narrow view of E. S. A., arising from over-crowding the estate with the greatest possible number of miserable dwellings, has blinded a more liberal and broader view of getting a truer value from the land, by allowing a little more breathing-space, and so really securing in the end a greater prosperity.

The subject then suggests, I think, two questions:—

1st. Is it to the true interest of the ratepayers and the inhabitants that either of the three premiated plans, as shown to them, should be carried out in all its integrity?

If not, such plan should be at once rejected.

2nd. Do the premiated plans comply with the instructions issued by the guardians?

The competitors say no; and they ask (apparently with justice) that an arbitrator may be appointed to decide.

He would no doubt commence by rejecting all plans which have not complied with the instructions; and would probably include amongst them those showing a less holding depth than 50 ft.

He would then select the plans with the best

system of streets; and from these he would select such as gave the greatest amount of building frontage together with the greatest average depth; a minimum depth of 50 ft. being taken.

I think, sir, by some such method the best plans would be secured, and all the parties would be satisfied.

A LOOKER ON.

SILICATE PAINT.

SIR,—A short time ago my attention was directed to a letter which appeared in your columns recommending silicate of potash as the basis of a paint or dressing for stones. If your correspondent will kindly inform me how to make a black paint with the silicate, I should be greatly obliged.

PHILIP GRAYSON.

THE THAMES EMBANKMENT.

At the last meeting of the Metropolitan Board of Works the following report of Mr. Bazalgette, engineer of the Board, respecting the Thames Embankment, was read:—

"Engineer's Department, Spring Gardens, S.W., August 5, 1868.—The Thames Embankment, Contract No. 1, between Westminster and Waterloo Bridges, is nearly the whole of the works contained in this contract now completed, these remaining to be done being principally the finishing of the pilings at the top of the piers and the Charing-cross and Waterloo steamboat level of a part of the works, the removal of some piers and the completion of the wall facing the Crown Pier and the Priory Gardens. Approximately, the whole cost of the works executed, including 3,000 ft. of materials upon the ground, amounts in value to about 460,000, of which the sum of 6,000, represents the progress made in the past month. Contract No. 2, between Waterloo Bridge and eastern end of the Temple Gardens. With the exception of the finishing of some of the ornamental carvings, &c., the whole of the works contained in this contract are complete, at a cost approximately of 232,865. Contract No. 3, between Temple Gardens and Blackfriars Bridge. The dam for this work is fast progressing; about one-third of the number of piles are driven, and about 600 feet in length of the foreshore has been dredged down to the clay and properly puddled. The value of these preliminary works is 2,500. At the Westminster steamboat pier the pontoons and the waiting-rooms, and the offices thereon, and the two nearly girder bridges, or gangways for access thereto for the truss and completed ready for the use of the public. Similar works are being prepared at the Charing-cross, the Waterloo, and the Temple piers. With slight exceptions the whole of the main paved footway extending from Westminster Bridge to the Temple pier is completed and open to the public. The paved approaches thereto are being completed from Villiers-street, from the steps of Waterloo Bridge, and from Essex-street. An open deal fence is erected along the entire line of footway, but by a recent declaration of the Works, &c., Committee, this fence will shortly be close boarded, in order the more effectually to protect the several properties abutting upon the embankment."

A report was brought up from the Works and General Purposes Committee, submitting a plan of the proposed arrangements between the Board and the Metropolitan District Railway Company, for the construction of the railway along the line of the embankment, north, and new street to the Mansion House, and recommended that the sanction of the Board, be given to the same. The chairman regretted that they had not been able to open the approaches to the embankment from Villiers-street, from Waterloo Bridge, and from the steamboat pier at the bottom of Essex-street, Strand. This had arisen from the want of material, but the Board would accelerate the work as much as possible, and it was hoped that, in a very short time, the approaches would be open for the use of the public. The Board adjourned for holidays.

THE BUILDERS' BENEVOLENT INSTITUTION.

The twenty-first annual general meeting of the friends and subscribers to the above charity was held on Thursday (30th ult.) at Willis's Rooms, King-street, St. James's, for the purpose of receiving the directors' report for the past year, the election of officers, and other business connected with the institution. Mr. W. R. Rogers (president) officiated in the chair.

The chairman having briefly opened the proceedings, the secretary read the report, which stated that a satisfactory addition had been made to the fund, stock, 1,525l. 13s. 3d. having been purchased for the relief fund, and 107l. 8s. for the building fund. The amount now invested is 11,332l. 19s. 4d. for the relief fund, and 2,936l. 19s. 9d. for the building fund, being a total of 14,272l. 18s. 1d. stock, Three per Cent. Consols.

The directors again venture to solicit the friends and supporters of the charity to increase their kind efforts, and endeavour to obtain amongst their connections additional annual subscribers to enable them at the ensuing elections of pensioners to elect a large number of the unfortunate and deserving applicants.

Four directors, in conveying to the late president William R. Rogers, Esq., their unanimous thanks for his kind and energetic efforts to increase the prosperity of the institution, allude, with great thanks, more especially to his having obtained the large donation of 100l. each from ten firms; and the directors take this opportunity of thanking these gentlemen for their generous and liberal contributions.

The investment of these and all donations to the relief fund in Government securities constitutes a solid foundation for the future of the Builders' Benevolent Institution.

Mr. Joseph Bird expressed his gratification at the very satisfactory report which had been rendered, and moved that it be adopted and printed.

The motion, having been seconded, was unanimously carried.

Mr. George Plucknett proposed that the thanks of the meeting be given to the patrons of the institution, and that the names of the following gentlemen be added to their number, they being the ten firms who gave a donation of 100l. each at the annual dinner in October last:—A. Z. per Mr. Geo. Dines; Mr. William Webster; Mr. John Kell, M.P.; Mr. C. J. Peake; Messrs. Lucas Brothers; Messrs. Laurence Brothers; Messrs. Holland & Hannen; Messrs. Wm. Culbert & Co.; Messrs. George Myers & Sons; and Messrs. George Smith & Co.

Mr. T. Stirling having seconded the resolution, it was

unanimously carried.

Mr. T. Thorn next moved a resolution expressive of thanks to the president (Mr. W. R. Rogers) for his very beneficial services during the past year, and said that they had met together that day for the purpose of receiving the twenty-first annual report. The society had come of age, and he was happy to find that during the last year of his minority it had been presided over by so good a parent. While in his swaddling clothes difficulties occurred, but it was pleasing to know that from birth it gained in strength and beauty. It had been very useful, and had done very essential service, and would do so again.

Mr. Thomas Crooks was happy to second the resolution of a vote of thanks to the president, for never president had done greater good than he had done.

Mr. Bird put the resolution, which was passed with one accord.

Mr. Rogers, in returning thanks, said that, although it was the conclusion of his year of office, he still had the interest of the institution at heart, and he hoped that its benefits would be extended. He thought that there should be no relaxation in endeavours to obtain supporters for the society's interest and welfare.

The various officers were next elected, when complimentary votes were passed, particularly to Mr. Plucknett, the treasurer; and Mr. J. Bird, as hon. secretary to the annual hall, which was an effective source of revenue to the funds. Those gentlemen having replied, and expressed their continued adherence to the institution, Mr. George F. Trollope, on the motion of Mr. Plucknett, was unanimously received as president for the ensuing year.

We must ourselves offer Mr. Rogers a word of hearty praise for the good service he has done the Institution.

Miscellaneous.

TECHNICAL EDUCATION IN GATESHEAD.—In 1867 the artisans of Gateshead entered classes for scientific instruction, conducted at the National Schools, during the winter evenings. About fifty students enrolled their names. A committee was formed, and classes were commenced under the tuition of Mr. James Mac Callum, an engineer in the office of the River Tyne Commissioners. Mr. MacCallum had taken a distinguished degree in the University of Glasgow, and was, on the Rector's application, recognised by the Science and Art Department as a duly qualified instructor in any of the branches of science contemplated by the department. The classes were conducted on Tuesday and Thursday evenings from the beginning of November to the early part of May. At that date Captain Campbell, the Government inspector of science schools, held an examination of twenty-four of the students, who, having made twenty-five attendances and upwards, were willing to present themselves. The results of the examination have been just made public. The subjects of examination were practical, plane, and descriptive geometry; mechanical and machine drawing; building construction; and theoretical mechanics. In the first of these objects three students presented themselves: of whom one obtained a 1st class and two a 3rd class. In the second object twenty-two were examined: of whom four obtained a 2nd class, five a third class, seven a 4th class, two a 5th class, and four failed. In the third subject one obtained a 3rd class and one a 5th class; no failures. In the fourth subject, of the two examined both obtained a 4th class. The successful students are all artisans or apprentices. Of the twenty-five students nineteen were successful. One passed in four subjects, and one in three. Thirteen "Queen's prizes" were adjudged to the students, and six certificates of merit.

DIRECTING POSTS.—The *Chelmsford Chronicle* speaks of a directing post intended to be used where required in the Chelmsford Highway District. It was designed by Mr. Frank Whitmore, the surveyor to the Board. It is made of iron, with fluted column, the inscription being in relief on a green glazed ground, which seldom requires painting. The contractors are Messrs. Whitmore & Binyon, Wickham Market.

CAMBERWELL CHURCH.—The scaffolding fixed round ago to the steeple of St. Giles's, Camberwell, remains there through some parish squabble, and the work is not finished. The builder declines removing it until he is paid. I know that the ropes must be decayed, for it is two years since I first saw the wretched job; hundreds of poles will come rattling down some day, and the church will be poleaxed, and perhaps people also.—T.

MUSCULAR CHRISTIANS.—On Sunday, the 2nd instant, between twelve and one o'clock, the church service at Wiggington, in Bedfordshire, was suddenly interrupted by an old dame rushing into the church, and without ceremony crying out that the clergyman's hedge was on fire, and a neighbouring rick was in danger of being burnt. No sooner was the alarm given than the church was quickly emptied of the male portion of the congregation, who set to work at once to extinguish the fire. Foremost amongst the workers was the clergyman himself, the Rev. Mr. Mason, who wielded a heavy axe and cut a gap in the hedge, which helped to stop the fire. The rick remained uninjured; and after the fire was extinguished the clergyman returned with his flock to the church and finished the service: next day he regaled the whole of the workers.

COMPENSATION CASE.—On the 11th, the case of "The Emanuel Hospital v. the Metropolitan District Railway" was finally disposed of by Mr. H. Toogood, deputy high bailiff of Westminster, and a special jury. The claim was about 2,000l. for a piece of land in the rear of Emanuel Hospital, Victoria-street, which was required for the inner circle of the railway. The Corporation of the City of London were the promoters of the charity, which was founded by Lady Dacre in the reign of Queen Elizabeth, 1594. Besides the support of old men and women, a number of boys and girls were educated, and as "educational purposes" were prominent in the present time, the land was valuable, and could be utilised to a great extent. Mr. Lloyd and Mr. Thrupp were for the City of London; Mr. Hawkins, Q.C., and Mr. Streeten for the railway company. Several surveyors were called for the company, and said the value of the land required was about 8,000l. The evidence on the other side, by equally respectable men, was that the value was from 20,000l. to 22,000l. They differed as to the mode of utilising the property. The jury eventually assessed the value of the land at 10,475l., and they received three guineas each.

SOUTH-WEST LONDON SCIENCE CLASSES.—Amongst the results of the Science Examinations of the Science and Art Department of the Committee of Council on Education, South Kensington Museum, may be named:—*Building Construction.*—Queen's Prize, 1st class.—W. Bailey, J. Coles, W. P. P. Queen's Prize, 2nd class.—J. Bachelot, G. Jackson, W. Lawrence, J. Taylor, W. Wenham, H. White. Queen's Prize, 3rd class.—R. Bailey, F. W. Baller, H. J. Cadwell, C. Carter, J. Chivers, A. Everett, A. Grint, H. Humphreys, V. Jerams, E. Johnson, J. Line, V. Twissell, E. Walters, F. Wilford. Honourable mention.—T. Chivers. Passed.—G. Bird, J. Jordan, R. Young. *Mechanical Drawing.*—Queen's Prize, 2nd class.—W. Bailey, C. Humphrey, James Line, G. Thwaites, W. Wenham. Queen's Prize, 3rd class.—C. Carter, G. Jackson, V. Jerams, E. Johnson, W. Lawrence, W. P. P. Taylor, W. Walker, F. Wilford. Honourable mention.—R. Bailey, F. Baller, G. Bird, J. Watkins, T. Schofield, E. Walters, A. White, R. Young. Passed.—Alg. Chapman, A. Chapman, J. Chivers, J. Chivers, A. Everett, H. Jordan, T. Jones, W. Twissell, Theodore Winks. *Local Prizes (Chelsea).*—Sir C. Wentworth Dilke's Prizes.—1st class, value 5l.; 2nd prize, value 3l.; 3rd prize, value 2l.; 4th prize, value 1l.; 5th prize, value 10s. each. G. Jackson, W. Wenham, W. Evans, C. Carter and F. Wilford, W. Allee and T. Jones.

A MILLENNIUM IN HUNGARY.—The Hungarians propose to erect a colossal obelisk on one of their vast plains, in order to commemorate the thousandth anniversary of the foundation of the kingdom of Hungary. Some prefer a national pantheon on the mountain which overlooks their capital.

THE BROKEN ATLANTIC CABLE.—The tests seem to show that the fault lies at about eighty miles from Newfoundland, in water not exceeding, if it reaches, 100 fathoms in depth, and that the interruption of communication is so complete as to put it almost beyond doubt that the injury has been caused by the grinding of an iceberg. Communication will, it is expected, be restored in less than a month; but meanwhile the other cable is fully equal to the work required of it.

COMPETITION DESIGNS FOR WAREHOUSES AND OFFICES FOR THE LIVERPOOL FINANCIAL ASSOCIATION.—We understand the association have selected the design "Nota bene" for the first premium of 100l., and the design marked with the device of a triple tau within a circle for the second premium of 50l. The former is by a London architect, and the latter is a design sent in jointly by Mr. Brattan, architect, Birkenhead and Liverpool, and Mr. Shakeshaft, Liverpool. There were sixteen competitors.

CHURCH BELLS AND THEIR USES IN HAWAII.—The natives of Kona, Hawaii, have recently raised a new bell upon a tower, which they have erected, attached to one of their churches. The first use which they made of their new bell was to toll forty-eight funeral strokes in honour of the burial of some old conch-shells which had been blown for the past forty-eight years for the purpose of assembling the people to church, and which were buried with due solemnity. In a few years these conch-shells would have ranked among the choicest historical relics of the natives.

INFECTIOUS LODGINGS.—It ought to be generally known by sea-side and other lodging-house keepers that letting lodgings which have been occupied by lodgers afflicted with contagious diseases before the said lodgings have been effectually purified is now an offence punishable by law. The Sanitary Act of 1866 (Vict. 29 and 30, c. 90, secs. 33 and 39) provides that,—

"If any person knowingly lets any house, room, or part of a house, in which any person suffering from any dangerous infectious disorder has been, to any other person, without having such house, room, or part of a house, and all articles therein liable to retain infection, disinfected to the satisfaction of a qualified medical practitioner, as testified by a certificate given by him, such person shall be liable to a penalty not exceeding 20l. For the purposes of this provision the keeper of an inn shall be deemed to let any part of a house to any person admitted as a guest into such inn."

THE CATASTROPHE AT THE VICTORIA MUSIC HALL, MANCHESTER.—A resolution, adopted by the trustees of the Manchester Royal Infirmary, urging the city council to appoint a public officer to examine all places of public amusement, and especially to report in cases where the means of egress are defective, was read at the last meeting of the council by the town clerk. In moving that the matter be referred to the general purposes committee, it was observed that during the last season an alarm of fire was raised at one of Mr. Hall's concerts in the Free Trade Hall, and that in consequence of the alarm Mr. Tozer was directed to report as to the means of egress afforded by the hall in the event of any sudden panic occurring. He did so, and a copy of the report was sent to the directors of the hall; but they had not the courtesy even to acknowledge its receipt, and no other action was taken in consequence. The motion was adopted. The jury at the coroner's inquest in this case pronounced as follows:—

"The jury are unanimously of opinion that the staircase and handrails were quite insufficient for the egress of such large audiences usually assembled there, and that suitable alterations should be at once made for the safety of such as visit this place of amusement, and that the lighting should be so constructed as to prevent the gas being interfered with. The jury further recommended that power be given by Parliament for the appointment of a qualified officer by the corporation to inspect theatres, music-halls, and similar places of public resort, and that no licence be granted for public entertainments to the proprietors or public lessees of such buildings without the production of a certificate from such officer that the means of egress are sufficient for the number of people they profess to accommodate."

The foreman added that the jury wished that young people should only be admitted to such places with greater discretion than appeared to have been displayed in this instance. Verdict, "Accidental death."

TUAM CATHEDRAL.—The restoration of this cathedral is progressing. The Misses Cooper, of Mackree Castle, have presented the entire fittings and stalls for the choir. The carvings were brought by the late Mr. Cooper from abroad, and are considered among the most rare and remarkable specimens of art. Within the cathedral will also be preserved the arch, the celebrated remains of Early Irish architecture, which led into the little chancel of a church built in the twelfth century.

CONSECRATION OF ST. MARY'S, CHARTERHOUSE, GOLDEN-LANE.—On Saturday afternoon the new Church of St. Mary, Charterhouse, Playhouse-yard, Golden-lane, was consecrated by the Bishop of London. The edifice is one of those ordinary church structures which are being erected in the diocese of London in connexion with the Bishop's Fund, in which the very smallest possible space is made available for the very largest number of people who like to come. The church is a very large one, and is placed in the middle of a very dense and destitute part of London. It will accommodate nearly 1,000 people.

DRINKING FOUNTAINS.—It may show how useful such fountains are to state that the number of persons who drank at the fountain erected by the United Kingdom Temperance and General Provident Institution on London-bridge, from seven o'clock in the morning of August 5th to seven o'clock in the morning of August 6th, 1868, was 5,710. The fountain was built by and is now under the care of the Metropolitan Free Drinking Fountains Association.—The Duke of Sutherland has had fixed at the entrance to Trentham Park, Newcastle-under-Lyme, for the use of the public, a commodious drinking fountain, supplied with pure spring water, with three metal cups, so that three persons can be accommodated at the same time. The late Duke ordered the drinking fountain at the porter's lodge to be put up for the use of total abstinents twenty-seven years ago. There is an opinion that this is one of the earliest public drinking fountains for the use of the general public.

THE SOLAR ECLIPSE.—On the 13th instant the eclipse of the sun so much talked of by men of science will take place; and in various parts of the world, where it will be well seen, though not so in this country, parties of astronomers and others will be on the watch for its interesting phenomena. From the favourable position of the earth and moon, this will be a very complete eclipse, as the sun will be at about its greatest distance and its least apparent diameter, while the moon will be at nearly its least distance and its greatest apparent diameter. The red flaming appearances round the black lunar disc will be specially watched. These are believed to be really of the nature of flames, and connected with the sun; but we have an idea that they may be refractions of roseate clouds on the borders of the farther hemisphere of the moon, which may have both air and water—both atmosphere and clouds—on that side, although the centrifugal force of its movement may prevent either from remaining in the hemisphere presented towards us. If there be any depth of atmosphere, however shallow, at the edges of the disc, such a refraction as we have indicated would certainly be possible.

MARGATE.—At a recent general meeting of the corporation a discussion arose upon the state of the harbour, originating from an application to sewer some premises into the King-street drain. The application was strongly opposed by Alderman Price, and also by Mr. Kable, the mayor, and another member, on the ground that the drain deposited in the harbour all the sewage matter, and at low tide this quite poisoned the atmosphere, and had been the cause of visitors leaving the town. By granting the application the council would only increase the nuisance, and still further injure the town. In proof that there were real grounds for the complaint, a letter was subsequently read from Mr. Reers, of the York Hotel, complaining of the nuisance arising from decayed seaweed, &c., lying in the harbour, which, it was said, had made his family ill; and asking the council to take steps to remedy the evil. The council, however, adopted a curious mode of procedure. They determined by a majority of votes to grant the application to sewer into King-street drain, and afterwards instructed the sanitary inspector to take the necessary steps under the advice of the town clerk, against the Pier and Harbour Board to abate the nuisance.

THE RIVERS POLLUTION COMMISSION AND THE LIVERPOOL WATER SUPPLY.—The other day the Commission inquired at Chorley into the pollution of the river Yarrow. A calico print stained his opinion that the pollution of the river was mainly attributable to the impounding of the water of the district by the Liverpool Corporation. Sir William Denison said he was surprised that the Liverpool Corporation had been allowed to have the water; but that, with other matters, should have their attention.

TWICKENHAM ECONOMIC MUSEUM.—A party of workmen, members of the St. James's and Soho Working Men's Club, accompanied by Mr. Dexter, the secretary of the Public Museums and Free Libraries Association, paid a two hours' visit to the Museum of Domestic and Sanitary Economy, at Twickenham, on Saturday afternoon; Mr. Thomas Twining, to whose benevolence the public are indebted for this unique collection, paying the greater portion of the cost of the visit. The same club has just received a gift of more than 480 volumes of valuable books from Captain the Hon. R. W. Grosvenor, M.P.

SUBURBAN VILLAGE AND GENERAL DWELLINGS COMPANY (LIMITED).—An extraordinary general meeting of this company was held at the Cuildhall Tavern, on Monday evening, Mr. C. Palmer, a shareholder, in the chair. The report of the shareholders' committee was read, from which it appeared that the petition to wind up the company had been dismissed, and that through Mr. W. G. Habershon the estate at Longborough-park had been secured, with the addition of a road at the farther end, rendering it as desirable an estate as could be procured for the purposes of the company. Four new directors, viz., Messrs. W. G. Habershon, Basil Wood Smith, J. Faithful Fortescue, and C. J. Cooke were unanimously elected.

OPENING OF KING'S CROSS MARKET.—The new market adjoining to the Great Northern and Midland railways, at King's Cross, has been opened. It stands in the centre of a triangle of ground, at one corner of which is the station of the Great Northern Railway, with a siding to slant the produce of its line into the stores of the market's wholesale department. By this line thousands of tons of fish have hitherto been brought from Grimsby and Hull, and then carted to Billingsgate at an expense of extra carriage, loss, and delay by transit. But now the supplies of fish, meat, vegetables, garden produce, and general provisions will be at once sold wholesale, and offered fresh and undamaged in the adjoining retail department. The gates of the new Midland station are nearly opposite the market entrance, whilst at the other corner of the triangle is the Metropolitan station, with its incessant traffic to almost every part of the city and suburbs. The building has been erected under the direction of Mr. Jethro Robinson, the builder. The roof is so constructed as to admit only the north light, and thus shade and coolness are to be secured. There are to be daily auctions of produce. The entrance at present is from the Old St. Pancras-road, where a large iron foundry used to stand.

A GOOD TIME COMING.—At the close of the ceremony of "capping" the medical graduates of the University of Edinburgh, Sir James Young Simpson delivered an address, in the course of which he said:—"It may be, that the day will yet come when our hygienic condition and laws shall have been changed by State legislation, so as to forbid all communicable diseases from being communicated, and remove all causes of sickness that are removable; when the rapidly-increasing length of human life shall begin to fulfil that ancient prophecy, 'the child shall die an hundred years old;' when there shall have been achieved, too, advances in other walks of life far beyond our present state of progress; when houses shall be built and many other kinds of work performed by machinery, and not by human hands alone; when the crops in these islands shall be increased five or ten fold, and abundance of human food provided for our increased population by our fields being irrigated by that waste organic refuse of our towns which we now recklessly run off into our rivers and seas; when man shall have invented means of calling down rain at will; when he shall have gained cheaper and better motive powers than steam; and when he shall travel from continent to continent by submarine railways, or by flying and ballooning through the air."

TENDERS.

For the construction of sewage tank at Moss Hall, Finchley, N. Mr. Stephen Hoskon, surveyor:—
 Fitch & Caughley 2,417 0 0
 Evans 385 0 0
 Wills 375 0 0
 King & Sons 360 0 0
 Wills 354 0 0
 Faulkner & Cowley 326 0 0
 Goodair 315 0 0
 Bloomfield 298 0 0
 Eglinton & Paucei 268 0 0

For the erection of a public-house, St. Andrew's-road, Hastings. Messrs. Voysey, Jeffery, & Shiller, architects:—
 Vidler 909 0 0
 Longhurst 899 7 6
 Scire 865 0 0
 Parks 865 0 0
 Russell 813 0 0
 Howell 810 0 0
 Bourne (accepted) 783 0 0

For Hither Green-lane, Kent. Messrs. Tilbott & Chamberlain, architects:—
 Pritchard 4,312 10 0
 Pritchard 323 0 0
 Grady 228 10 0

Rebuilding 78, Chesapeake, for Mr. Bradshaw. Mr. F. Johnstone, architect. Quantities supplied:—
 Henshaw £1,428 0 0
 Axford 1,290 0 0
 Kilby 1,284 0 0

Alterations and additions to Frith House, Walton, for Mr. A. Holford. Mr. F. J. Dibble, architect. Quantities supplied by Messrs. Birdseye & Storer:—
 Terrace £3,090 0 0
 Axford & Whillier 2,852 0 0
 Godard & Son 2,727 0 0
 Kilby 2,730 0 0
 Hamblin 2,460 0 0

For additions and repairs to the rectory-house, buildings, and chance of church at Stow-Maries, Essex. Mr. Fredk. P. Walters, architect:—
 Kilby £1,176 0 0
 Gault 1,100 0 0

For the erection of three shops, Hereford-road, Kingsland, for Messrs. Mann, Crossman, & Paulin. Messrs. Hammack & Lambert, architects:—
 Webb (accepted) £1,495 0 0

For alterations to No. 50, Porchester-terrace, Baywater. Messrs. Hammack & Lambert, architects:—
 Rayment & Son (accepted) £3,116 0 0

For vicarage-house, Herthill, near Faversham, Kent. Messrs. Newman & Billing, architects. Quantities not supplied:—
 Whiting £1,445 0 0
 Judgs 1,413 15 0
 Epps 1,250 0 0
 Shrubsole 1,243 7 6

For house, Thatcham, Berks, for Rev. H. Martin. Messrs. Newman & Billing, architects. Quantities not supplied:—
 Elliott £2,645 0 0
 Wells 2,500 0 0
 Alloway (too late) 2,560 0 0
 Wheeler 2,361 0 0

For making roads at Homeward Lodge, for Mr. Wm. Tains:—
 Adams 4,750 0 0
 Drummond (accepted) 745 10 0

Sum offered for pulling down the British Institution, Blackheath:—
 Blount £100 0 0
 Ewins 105 0 0
 Drummond (accepted) 109 0 0

For making roads for Mr. R. Walker, King's Arms-yard:—
 Hales £1,695 10 0
 Drummond 1,995 5 0

The Builder.

VOL. XXVI.—No. 1333.

Railways Strangled and Railways Developed.

PEOPLE say that some kinds of grass spread and flourish all the more for ill-usage. Trampled beneath the hoof, nibbled and bitten to the stump, the hardy plant clings with yet more tenacious grasp to the soil, and sends down its countless rootlets in search of the moisture which may enable it to repair its losses. Even in a season like that of the remarkable July of 1868, when so much of our untrinitrated pasture has been unable to support the usual attacks of hungry cattle, from the effects of the yet fierce rage of the sun, we know that but a few days of steady rain are required in order to reclothe the landscape with verdure.

A vitality like that of the grass of the field attaches to the industrial growth of a great people. This vitality is not the only point in common between natural and political development. The analogy is so close that it can hardly be mere coincidence. A certain degree of freedom and hard usage seems to be as necessary to the sturdy growth of manufacturing and productive enterprise as to that of the vegetable pasture on which so much of our sustenance depends. The process of forcing is alike unsatisfactory in either case. Industry does not thrive under glass. On the contrary, there is ample evidence that the attempt to protect, to direct, and to foster the employment of labour by artificial means only results in unhealthy and unstable development. Remove legislative obstacles, remove prejudice, remove ignorance, and industry only asks to be let alone. Allow the sun to shine and the rain to fall, and the industrial harvest is sure.

In no description of industrial undertaking has the truth of this view become so strikingly evident as in railways. We have had ample illustration of the ill effects of an attempt to force prosperity. It is refreshing to be able to contrast with the long tale of mismanagement and misfortune even a single instance of more prudent conduct. The change that has come over the circumstances of one of the most notoriously unfortunate of English railways, under the care of one able and disinterested controller, is the strongest proof of the immense inherent vitality of the system of locomotive communication that has yet come to light.

Railway chairmen and managers, like financiers on a more imposing scale, are often apt to take to themselves credit for a prosperity with which they have in truth but little to do. The honour which they have, on memorable occasions, claimed or received, may remind us of the remark of Sheridan when the share of the Prince Regent, in the great events of 1814 and 1815, was being discussed: "What he most prides himself on is the late abundant harvest." But the plain straightforward account of the

result of six months of his stewardship which the Marquis of Salisbury has laid before the shareholders of the Great Eastern is not thus to be explained away. The stagnation of enterprise, and the disquiet produced in men's minds by the immense armaments of the military powers, have produced a natural effect on the general receipts of railways. In the week ending August 1st, 1868, the gross receipts of fourteen principal railways show a falling off of more than 1½ per cent. as compared with the corresponding week in the preceding year. And this diminished receipt has been earned by the working of a length of lines exceeding that of the former period by more than 2 per cent. The juxtaposition of these two statements tells heavily against the shareholders. In the face of this general depression, the present management of the Great Eastern has secured an increase of something like 15 per cent. in the net profits of the half-year. Of this large increase, the main part, in the opinion of the noble chairman, was due to a genuine increase of traffic. There had been no increase in the suburban fares to any considerable extent. In some particular instances, where the fares had been disproportionately low, they had been raised; but the wise general principle of the management had been, that residential traffic ought to be respected. Lord Salisbury carefully guarded himself against being thought to refer to any other lines; but the contrast between this prudent and honest conduct, and that which is rapidly emptying the houses on the Sydenham hills, is as marked in its principles as in its results. It is only to the impulse given by a competent head, who looked to the *bona-fide* improvement of an actual property rather than to the profits derivable on the Stock Exchange, that we can attribute the actual state of things. Fifty-two thousand pounds of increased revenue had been earned without a farthing of increased expenditure. Nor was this all. Such had been the care of the officers of the company that, in consequence of the diminution in the number of accidents, there had been an actual decrease in expenditure. No less than fifteen thousand pounds had been saved as compensation for accidents. There had been further a large diminution (5,679*l.* for the half-year) in the *bona-fide* working expenses; and in renewal of working stock, and substitution of new for old iron rails, an expenditure of 17,000*l.* had been incurred and paid out of revenue, which under the prevalent system of "making things pleasant" would have been hung, as an additional charge to "capital," around the neck of the helpless shareholder.

We call particular attention to the saving in the item of compensation. It is, as Lord Salisbury remarks, an unalloyed benefit, and one which relieves the public as completely as it does the shareholders. But why should the contingency of such a charge be left to weigh upon the company? Why should not each company become, as in other departments of commercial enterprise, their own insurers? It is true that vigilant care, good selection of officers, prompt and efficient discipline, and, above all, substantial encouragement for good conduct, form the most desirable elements of insurance against accidents, for which no money can adequately compensate the sufferers. But this is not all. We can conceive of no reason why a company, first taking every proper and possible precaution against accident, should not further secure themselves against any uncertainty of claim in the event of accidents taking place. This sum of 15,000*l.* is not given as the total amount of compensation paid in the preceding half-year, but as the saving effected in this one item in the course of six months. It represents the insurance of 1,800,000 passengers at twopence apiece. Why should not the company combine a definite system of insurance

with their fares? If it pays an independent company to insure passengers, for long and short journeys alike, at the respective charges of threepence, twopence, and a penny, for first, second, and third class passengers, how much better would it pay a company carrying on the traffic of a district to do so on their own behalf! If the additional pence were added to the fares it might be done by so proportioning the risk to the length of the journey as to make the increase almost insensible. But it would probably pay to grant a definite insured compensation without any increase of fares at all. If every passenger was informed, on the face of his ticket, that a certain sum was insured in case of his injury, from causes beyond his own control, while travelling by virtue of that ticket, and that the journey was undertaken on no other condition, the company being no further responsible unless the passenger chose to insure for a higher sum, the great element of legal squabble would be eliminated. On the one hand, the care and vigilance of all the servants of the company would be stimulated by the presence of a definite responsibility, which they ought to have a direct interest in avoiding. On the other hand, the social position, wealth, or public utility of any sufferer of actual injury could no longer be brought forward as an argument that the company should pay to him a heavier fine for personal damage than it could be called on to pay to the poorer or more unfriended individual who shared his misfortune.

We venture to suggest that the chairman, who has shown us so admirably what six months can effect, will take this question of insurance into consideration. If he introduce the system on the Great Eastern, not only will future dividends be swelled, but the shareholders of other lines, and the travellers on other districts, will not be slow to follow the example set by that which was, for so long a time, the most unfortunate of English railways.

We cannot but contrast the good news thus sent from the City Terminus Hotel with the chorus of discontent, anger, and deserved indignation which swells louder and louder from the South-Eastern district. It will, no doubt, be fresh in the memory of our readers that we permitted ourselves to make certain predictions on this subject: of these, we regret to say, every day announces some new accomplishment. It is nearly twelve months* since we pointed out what was required for the proper management of railway policy and railway traffic. To those remarks Lord Salisbury's speech on the 7th of August gives a clear and faithful echo. More recently† we called attention to the effect on the suburban growth of London which the shortsighted and unscrupulous policy of the directors of the South-Eastern system of lines was calculated to produce. The verification of our fears was almost immediate. A rise of fares, which may be called either vindictive or suicidal, was effected the moment that Parliament, against the consistent opposition of Lord Redesdale, had assented to an increase of the maximum rates. This increase has not been merely a return to fares established when there was not the urgent fear of competition which led to a reduction, possibly too great, but it has been a general augmentation to an extent ranging from 20 to 75 per cent., that can only be considered as a breach of faith with residential travellers. As against the public, the South-Eastern directors—we speak not of one line alone, but of the group of lines—have assumed an attitude of open and contemptuous hostility. We do not think that this is their chief blunder. In our opinion their policy cannot pay. Cost of transit to or from the metropolis has become an outlay which is so closely connected with rent that

* See vol. xiv., p. 653. † See p. 501, ante.

the two items of expenditure must be classed and considered together. So much per quarter for rent and taxes, so much for railway ticket, is the cost of a house at Sydenham as compared with one elsewhere. Stability of outlay is a matter of the last importance to persons of limited income. Landlords are prevented, partly by agreement, partly by a due sense of their own interest, from exorbitant and undue increase in the rent they demand. If that portion of the annual expenditure which goes into the coffers of the railway company is made the subject of rash experiment, landlords will be the ultimate, as tenants are the immediate, sufferers. We hear already from the house-agents that the empty houses in this healthy and agreeable suburb are numbered by hundreds. This means the arrest of the builder. Lodgers are making off in swarms, and a desolation which will be felt in the dividends of the ill-managed railway companies seems to be in course of active accomplishment in this ill-used district.

The improved state of affairs in the Eastern Counties, which the Marquis of Salisbury has made public, leads us to supplement the remarks we formerly made on the influence exerted by the management of the different great railway lines on the suburban development of London. There can be no doubt that, in the possession of stations at London Bridge, at Cannon-street, at Ludgate-hill, and at Charing-cross, the South-Eastern lines possess an enormous advantage over all other railways—an advantage which, by their arrangement of up and down lines, they have done their best to neutralise. The access to the Eastern Counties terminus is simply detestable. For residential traffic it is one of the worst of any metropolitan line. What may be the arrangements referred to by Lord Salisbury as pending with reference to metropolitan extension, time will show. But while the liability which has been incurred in this respect has hung like an incubus on the prospects of the Great Eastern, it cannot be doubted that any reasonable mode of bringing the Shoreditch terminus within readier reach of the Bank of England would be an enormous advantage to the traffic of the line. Suburban extension, driven from Surrey and from Kent, would freely take place along the highway into Essex, if the great disadvantage of the starting-point were removed. The Great Eastern is singular in this disadvantage; for although the Great Western has not yet pushed its terminus further than the spot selected by Brunel for his noble station, it is in connexion, though not in what may be called organic connexion, with the heart of London by means of the Metropolitan. Euston-square, not a very central station, was not the first terminus of the London and North-Western; and the residential traffic on this line is at a minimum as compared with that commanded by more accessible termini. Still the London and North-Western has its feeders independent of Euston-square, and from the neighbourhood of Camden Town to Willesden and Kensal-green the railway service is becoming more and more adapted. The terminus of the Eastern Counties line alone remains where it was fixed in 1835, without aid from intercalating lines. This has been, there can be no doubt, a serious injury to the shareholders. The stream of direct traffic is served not inadequately by the Shoreditch station. But the due development of the species of traffic which Mr. Watkin and his friends are doing their best to drive from the lines under their control will never take place on the Eastern line until some better arrangement is made for pouring it into the very heart of the City.

It may be thought that these remarks are of more immediate value to the shareholders on the lines, of which we have thus compared the management and the prospects, than to our general readers. We do not share that opinion. To all those who are interested in building, whether as constructors or architects, the matter is of primary importance. In all that description of building enterprise which is to any extent speculative, even within the most legitimate bounds, the investigation of the circumstances which control the future development of cities and towns is of the highest importance. In the paralysis which has fallen on our engineering enterprise, inquiry as to the proper method of developing the traffic of a district is of no less importance. Sooner or later the engineer will again be at work, to carry out the great necessity of the day, the supply of the readiest means of intercourse between district and district. When the public becomes convinced that, under the

guidance of the most ordinary prudence, it is remunerative to provide for the wants of the future, enterprise will reawaken. While the old spirit of vindictive strife, or of grasping speculation, presides over the councils of a railway system, the shareholders will suffer, the local interests will suffer, and the future development of the country will be, to that extent, checked. While a wise and energetic management develops the true sources of income the reverse will take place. To earn fifty-two thousand pounds more, by an expenditure of nearly six thousand less, is not discounting the future (the usual habit of railway directors), but making amends for the follies of the past by the best use of the present. It is an indication, and something more than an indication, that a prosperity equal to that which we so rashly tampered with in 1845 is yet in store for the railways of this country, if only we do not continue to repel it. The natural increase of the population alone will add ten per cent. to our traffic returns in ten years. But the increase of the travelling tendency of the population has been and will continue to be immensely greater than that of the population itself. There are no signs that this increase is likely to be checked. The falling off that has coincided with so much financial distress has been comparatively small. Every fresh facility that is offered to communication, whether it be a railway through the Alps, a canal through an isthmus, or a cable under the ocean, pours a fresh stream of traffic on the English lines. The ultimate development of the railway system is as yet unapproached. The light branch lines, which the ill-advised standing orders of Parliament as yet prohibit, will be demanded, sooner or later, by the necessity of the case, and by the good sense of the public. It can hardly be thought too sanguine an estimate of the future to anticipate that this natural completion of the railway system will add as much to the actual resources of the country as our 14,000 miles of trunk lines have already allowed us to do. On the one hand, we have the demands of common sense, the results of experience, and the fair prospects of the future; on the other, we have the resistance offered by the ruthless, selfish, gambling spirit which has thrown away so many millions that might have been remuneratively employed. It is important for all practical men to have clear, definite, and accurate ideas on this important subject.

THE THORNEY ISLAND CAMPO SANTO.

The facile pen of the very reverend historian of Westminster Abbey has made to the public, in the columns of the daily press, an appeal on a subject not unfamiliar to our readers. It is not because the project of a Campo Santo, to be constructed at Westminster, in the form of a cloistered enclosure connected with the old conventual buildings, has been indicated in our columns, that we shall be found silent when the official guardian of the Minster, and representative of the mixed abode of the spot, becomes the advocate of the scheme. The idea is not only one worthy of the associations and of the history of the locality, but is to a certain extent a necessary consequence of the architectural movement now actually in progress. With the entire area from the Church of St. Martin and the north side of Trafalgar-square to the Palace of the Legislature rebuilt or rebuilding, it is impossible that the mean and dingy tenements that now squat beneath the shadows of the Victoria Tower should be allowed long to remain as they are, or should be reconstructed under any supervision but such as shall bring the new structures into harmony with the Palace and the Abbey.

The Dean of Westminster speaks of a connexion between the proposed new cloister and Poets'-corner, and refers to the restoration of the chapter-house as affording facilities to the architect for this purpose. It would be interesting to observe how it is proposed to deal with the exigencies of this hallowed spot in a mode at once structurally and aesthetically satisfactory. A difficulty here presents itself to the casual observer. To say the least, the position of the pier which supports one of the new flying buttresses of the chapter-house comes into very inelegant juxtaposition with one of the battresses of the Abbey. A collection of nooks and corners is apparent, with which no small amount of architectural skill is required satisfactorily to deal. It is always easy in such

circumstances to criticise,—easier to do so perhaps, than to suggest improvements; but the present aspect of the buildings is not such as would have satisfied either the founders or the restorers of the Abbey, still less the founders that noble chapel which, if of an inferior style of architecture, is still the very central feature of the spot. Had a cloistered approach from Abingdon-street been designed in connection with the restoration of the chapter-house, means might have been devised for avoiding the inelegance which we can only consider as temporary. To work bit by bit was the plan adopted by the great builders of our cathedrals and minsters, and by this expedient alone we see the presses of the founders and enlargers of the religious edifices enabled to arrive at the imposing grandeur of their completed works. By the partial progress was that of execution rather than of design. In any modification or combination of original work the additions were planned on a well-digested scheme, however slowly the scheme may have been carried out. One high or abbot might build a nave, his successor might raise the transepts, or even, as at Exeter, pier bold arches through the walls of the twin towers when he lengthened the main axis of the building, and then raise a tower to a commanding height, for the adequate support of which the original foundations were laid; but an original design, or a development of the original design in harmony with its idea, has always presided over such serial work, when it has been developed and not patchwork.

In the present state of the restoration of the chapter-house this harmony is by no means visible. We speak with all reserve of the merits of a distinguished architect, when the conception of their *ensemble* is only arrived at from the otherwise unexplained forms that issue from the labours of the mason. Had the flying buttress to which we more particularly allude been situated in a similar position with regard to the chapels of a cathedral in Italy, or in any of the great stone-building countries, to that which it occupies in Westminster, we should have been sure that it was only one of those temporary piers which the masons of those regions rapidly erect, and that, the roof of the chapter-house completed, the thrust of that particular angle would have been met by the imposition of perpendicular weight, or by some other device known to the cunning of such builders as those of Gloucester Cathedral, and that the pier and awkwardly-situated pier would have been removed. As it is, we can only express hope that the plan of the architect is not yet revealed to the bystander, and that it is not intended that the worshipper or the visitor should reach the north-eastern entrance of Poets'-corner by threading a zigzag course between blocks of stonework and receding angles, that would unavoidably become receptacles of nuisances.

The very word of *Campo Santo* carries back the memory to the graceful cloisters at Pisa famous for the fine frescoes of the monks Orcagna. Cloisters are not foreign to Westminster. To the south of the abbey we have the ancient cloistered arcade of the former monks, well worthy of the most reverent and efficient restoration. Across the great line thoroughfare we have an example of a most successful treatment of the same architectural feature. In the cloistered arcade bounding the former Old Palace-yard we have, indeed, effect not contemplated by the architect. The weeping of moisture (probably from concrete above) through the stone voussours of the gutter in question has encrusted them with quaint patterns of the salts of lime or of magnes. The effect at the present time is that of cloud and variegated marble; and the observer who in a vain attempt to obtain some point of view from which the aspect of the Peel statue (recently erected with its back to all comers) would enter the railled courtyard of Westminster Hall may look anything but undesigned beauty that imparted to the otherwise beautiful perspective. Of any comprehensive and successful method of dealing with the requirements of the environment of Westminster Abbey, there can be no doubt that the element of cloistered arcades must form an important feature. We are not now offering a design, or suggesting a finished plan; that the duty of the architects to whom the treatment of the subject may be entrusted. To a cloister suggested by Dean Stanley is to the tower, not to the north, of the Abbey. But it becomes almost daily more evident that

whatever may be the work of the rebuilders, that of the demolisher must be unsparring. The site now in course of clearance and of re-arrangement extends from the Victoria Tower to Leicester-squares. Little by little, with more or less forethought, all mean, paltry, and incongruous building over that area is doomed to destruction.

The point which is, at the present stage of the affair, most important to consider, is that of a wise, comprehensive, provident plan. Details, even details of the first magnitude, may be fixed in year by year, decade after decade, or even century after century. But unless the foreshadowing of the magnificent ensemble which, if England does justice to her history and to her future, will hereafter group around the tombs of our kings, be grasped in time, it is possible that partial work may be so conducted as to stand in the way of the future whole. Such are the statues and drinking-fountains that spring up like mushrooms, each from its own independent stem, without any systematic arrangement or actual unity of idea. Such are the diagonal roads constructed across a spot where either a plain, unbroken area, or a turfed lawn, broken only by chapels, monuments, or other erections in harmony with the same, should stretch from the Abbey to the rear of Great George-street. The great point which we are anxious to urge is the cause of development against cobbling. It is the long-thoughted prevision of the founders of our cathedrals that we are anxious to see substituted for the results of a catch-party act.

This prevision is evinced by Dean Stanley, "The Abbey," he tells us, "is not yet filled." Yet "the space allotted in the Abbey to the graves and monuments of illustrious men is yearly becoming more and more narrow." "We must look forward to the future." The idea, therefore, of providing a spot, not for the entombment, but for the worthy memorial of great men, is one that may be almost called instinctive. Our climate demands vertical shelter for statues. Even the noble material of bronze is surely, if slowly, corroded by exposure in the streets of London. Marble, or stones of any kind, rapidly passes from the state of portraiture to that of scarecrow-ism. St. Paul's is invaded in a manner which we must be pardoned for questioning in more than one instance, and St. Paul's will never rank in the minds of Englishmen as the equivalent of Westminster. We cannot, therefore, regard the question of the Campo Santo of Thorney Island as either a fancy or a crocheted. We look at it as one of those things which, well or ill considered, the future will certainly bring forth. And if such be the case, the time for considering it is the present. We have our hand to the work. Demolition on one part, building on the other, is active and energetic. The nation is feeling after some certain guidance in the matter of taste. Recourse to the services of private members to compel from so inadequate a tribunal as the House of Commons the condemnation of an enormity erected by supplies is altogether unworthy of a civilised people. What would the architectural glories of Italy or of Germany have been if such judges had sat upon the questions of the safety of the Campanils of Pisa or the position of the Horses of the Sea before the palace of the Bourbon kings? Haste, and party feud, and rampant *dilettantism*, are all active in their opposition to the architectural embellishment of London. The present opportunity is unique. We do not urge that it should be hastily or rapidly exhausted. But it is impossible for us to be too careful that it should not be thrown away. With the land area from Trafalgar-square to Westminster so covered as to harmonise with the waterside elevation between the bridges, London will present a nucleus of architectural splendour not unworthy of the Victorian age.

THE FAIRFORD GLASS AND ALBERT DURER.

We ended our notice last week of the doings of the British Archaeological Association in Cirencester with the reading of the paper on the Painted Glass in Fairford Church, by Mr. Holt.* On the following day (the 12th) the places visited included Fairford Church, and we purposely kept separate this portion of the proceedings.

Mr. Holt, in face of the windows, repeated and strengthened his statement at great length. We can give but portions of his statement. He said he believed that Albert Durer received the order from John Tame to execute the windows according to certain dimensions furnished by the architect. He selected his subjects from the Old Testament, the Apocryphal Gospels, and the New Testament. The first window was a representation of the Temptation of Eves. The peculiarity of this picture was essentially that of Durer. Up to the time of Durer nobody,—at least of the German school,—had ever represented the serpent of the peculiar form given to it here. The foliage of overy leaf was finished in a marvellous manner, and the whole of the detail of the subject was worked out with wondrous precision, the greatest care being bestowed upon every portion. Nothing was passed over in a slovenly spirit, but everything appeared as if the artist had thrown his whole soul into the work. As he (Mr. Holt) had stated on the previous evening, he laid claim on behalf of Albert Durer to his being the person who produced the block-books then exhibited. That claim he knew would be most strenuously opposed. The error as to the authorship of that book arose thus. A certain print, known as "St. Christopher," bears date 1423, and the argument was that the state of art displayed in that "St. Christopher" under the date of 1423 showed a decided superiority of intellect and execution when compared with the engravings in the block-book, and hence the date of this block-book must have been 1380 or 1400. In fact, the literati could fix its date at any year from 1380 to 1420. Now, he had had the misfortune to dispute that date, and a great deal of obloquy had been cast upon him in consequence; but believing his objection to be valid, he had the courage to adhere to it, and still did so. He fearlessly declared the date of that "St. Christopher" to be a forgery, and that the print was, in fact, executed by Albert Durer himself, at Colmar, in 1493. The manner in which that forgery was committed was a starting-point which must be well understood. By a stroke of the pencil the clever dealer at Buxheim, where Heinken got the print, added seventy years to the date. By one movement of the hand he converted mcccxciii into mcccxciii. It must be borne in mind that no second copy of the "St. Christopher" was known to exist. He (Mr. Holt) contended that the print was executed by Durer himself at Colmar, at the time he was on a visit to the brothers of Martin Schön, who resided there. In the multitude of representations of St. Christopher there was only this and one other which had two doggerel lines in Latin underneath them; and this engraving was executed upon paper exactly similar to and bearing the same water-mark as that used by Albert Durer in 1493. The only other artist who ever produced a St. Christopher with the Latin lines was a friend of Durer, and copied from Durer's work. The block-books were executed by Albert Durer in 1494 or 1495 at the latest. In almost every instance the block-book was the foundation from which Albert Durer derived his design for these windows. The first subject in the windows was the Temptation of Eve; and the question would arise how far the slightest originality could be claimed for Durer if he executed the windows and not the block-book. Between the window and the block-book there was the smallest conceivable variation in treatment, but in spirit they were identical. One very distinctive ground on which he claimed Durer as the painter of the lights in the window just examined was, that they represented scenes which no other German ever painted until some years after 1500. He was bound to acknowledge that the subject was very differently treated by Durer himself in the year 1510. In the picture of the Birth of the Virgin were some very distinguishing marks of Durer's work. One was to be found in the shape of the bed, the arrangement of the canopy, and the tucking up of the

curtains into the form of chandeliers covered with baize. In that instance he borrowed from Martin Schön, who was the first artist who produced that species of bed with the curtains so looped up. He (Mr. Holt) had made a very careful search at the British Museum, and, through the kindness of Mr. Reed, had every facility offered to him; but nowhere until the time of Martin Schön could he find the same arrangement of the canopy and curtains. In the picture of the Birth of the Saviour, in the next window, the Virgin was a very fine type, marvellously left us, of Albert Durer's work. Those who knew the type which he had adopted for his Virgin would not disagree with him (Mr. Holt) in ascribing the present figure to Albert Durer. One of the attendants was handing to the Virgin the Babs, which was a bambino wrapped up in swaddling clothes, and the mother was in the act of receiving it with her right hand. The type of the dress was essentially that of Nuremberg, and the mode in which the details were treated was peculiar to Durer. He would ask the visitors to lament with him that small portions of the glass belonging to other pictures had been inserted at wrong places for the mere purpose of filling up. The very charming picture of the Presentation of the Virgin was the first known representation of that subject by Albert Durer. In this case the nimbus had been slightly damaged. In one window there was a figure which might represent St. Christopher, but he (Mr. Holt) could not speak positively on the point, because it occupied a different position from that in which St. Christopher was usually placed in Roman Catholic churches; but it was impossible not to identify the figure as one of Albert Durer's. It was in the frontispiece of the "Biblia Panperum," but, as Durer was not apprenticed to the wood-engraving, that book remained without date or place or printer's name, as the publication of engravings by a man who was not entitled by apprenticeship to produce them would, if known, have involved heavy penalties. It was erroneously believed that there were guilds of painters and other trades at Nuremberg at that time; but everything was regulated by the municipal council. The only thing that was free was art; but printing was then a trade. It had not then been emancipated from the provinces of trade, and dignified as a professional art. In the "Marriage of the Virgin" the persons represented were Mary, Joseph, the high priest, and an attendant. The hair of the Virgin was such as no hand but Durer's had ever attempted up to his time. There was scarcely any representation of the Virgin which he did not attempt. The head, in this instance, could belong to no earthly creature but Durer, but there was an instance in which it was made use of in 1510. In the marriage picture there were further touches of the apprenticed goldsmith, namely, in the bend and the finish of the chain. It was in the details that we must look for Albert Durer. It was in the marvellous minutia that this great artist was to be found. When the peculiar condition of the Virgin at the time of her marriage was remembered, those who had an artistic soul could not help being struck by the glorious style of the composition as displayed in the folds of the drapery, and the whole arrangement of the scene. The description of this picture given in the supposed manuscript of Sir Edmund Tams was as follows:—"Next to Joseph and Mary going to be contracted. There is [sic] the contractor and his witnesses to the contract." The Annunciation window was the finest of the series. Martin Schön was the source from which Albert Durer derived his inspiration for that particular window. Martin Schön was Durer's idol. He was a very celebrated painter at Colmar, and he might be said to be the greatest engraver on copper that had lived up to that period. Martin Schön and Albert Durer's father were very old friends; and it did not require a great stretch of the imagination to conceive that as Martin Schön produced his engravings they would somehow find their way to Nuremberg and come into the hands of young Durer. The studies of Albert Durer were founded on the works of Martin Schön, who had treated the Annunciation in a manner similar to that which characterised this window, with the exception that Schön had placed his Virgin in a standing posture. There were further traces of the goldsmith. None but a practised hand could have given due effect to the chain. The hair, again, was such as no hand but his had ever previously produced.

* See p. 598, ante.

NEW ACT ON THE REGULATION OF RAILWAYS.—The Act to amend the law relating to railways (30 and 31 Victoria, cap. 119) has just been printed. There are forty-six sections in the Act. Railway companies are to be liable during transit as carriers. They are when required to furnish particulars of charges for goods. After the 1st of April next communication between the passengers and the company's servants is to be provided under a penalty not exceeding 10*l.* for each case of default. Any passenger who makes use of the means of communication without reasonable and sufficient cause shall be liable for each offence to a penalty not exceeding 5*l.*

Mr. Nihlett called attention to an inscribed tablet at the back of the bed in the painting.

Mr. Holt said that no other artist but Durer used that tablet. He would show it in a dozen instances from the *Nuremberg Chronicle*. In the next painting (the Visit of the Wise Men to Christ) was another type of Durer. There was the first marked nimbus to the Babe. Nobody used that but Durer. He thoroughly believed all he had been stating. Every little detail in those windows could be identified with Durer. There was the Nuremberg treatment of the trees. It was not everybody who had adopted that style, common as it seemed. Some of the Flemish artists adopted it 150 years after Durer's days; but then they were all mad on copying him. He formed the model for imitation, and did to this hour. The next subject was the Adoration. There, again, the goldsmith's work was most elaborately done. All this work was entirely *sui generis*, and its marvellous detail compelled admiration. The costume was the Nuremberg costume of the period. Here, again, was the nimbus of Albert Durer. It was seen a little more pronounced in another picture. The horse's head was a remarkable type of Durer. He was not at that time celebrated for animal painting; but the head bore unmistakable traces of the hand of the master. The Star of Bethlehem was not to be found in the picture. In the Presentation of the Infant Saviour and Purification of the Virgin the characteristic nimbus occurred. It was used by nobody but Durer, and by him only for ten years—between 1490 and 1500. The woman with the doves could not be mistaken by anybody who had studied his works. Neither this nor the treatment of Joseph could be imputed to any one else. The architecture of the Temple and the form of the altar were essentially the composition of Durer, and formed a very fine production. This painting could not be sufficiently admired. It was, perhaps, one of the finest in the church; and here, again, the influence of Martin Schöen was shown. Martin Schöen was the first artist who depicted an angel in the tree pressing down the branches to enable Joseph to gather the fruit. He (Mr. Holt) did not at all object to his words being taken down by any one in the church. No one prior to Martin Schöen had so represented that subject. He was absolutely the first who introduced the angel into the branches of the tree. Albert Durer adopted that idea. The difference between Schöen's engraving of that subject and Durer's representation was that the former made the Virgin and the Child on the donkey, while Durer represented the donkey grazing. He (Mr. Holt) had never seen that mode of treatment by anybody either before or since Durer. The handling of the subject was very remarkable, and again marked the style of Durer. What could be more exquisitely pencilled than the foliage and grass? Every leaf would bear a careful examination through a magnifying glass. The whole production was perfection in painting. The next picture, which was the Assumption of the Virgin, was one of the finest in the church. The Virgin was standing on the moon, which was supported by an angel kneeling. Over her head was a crown borne by two angels, which were of the Durer type, beyond all doubt. The crown was one of those marvellous crowns painted by Durer, and by him alone. This was one of the finest types of the Virgin which he had ever seen, and it was truly unfortunate that the face should have been damaged. The treatment of this subject was Dureresque to the last degree. The figure of the Almighty was German. In the next window (the search for the child Jesus) was a very remarkable nimbus. All the nimbi here employed were of the pattern invented by Albert Durer. The picture contained a curious type of Nuremberg furniture. It was what was called a linen-fold. The composition of that painting he recommended particularly to notice. Every detail reminded one of Durer, and of no one else. This was true also of the figures above and around the painting. Nowhere could there be found any one who represented those figures in the same way, and to no one else could they be attributed. They represented emblems of the Passion. This window was the finest in the church. In the east window there were, as he (Mr. Holt) had stated last night, some distinctive characters, the pure invention of Albert Durer, and which none before him ever attempted, and which no one in painting had ever attempted since. The cross of the Saviour was

made of worked wood, which appeared to have been planed or sawn. The trees on which the malefactors were crucified were of wood in its natural rough state. From the head of the penitent thief there issued a small white body, emblematic of his soul, which was conveyed to the Paradise which the Saviour promised; and on the other side, from the head of the other malefactor, there was issuing a black body, emblematic of the blackness of his sin. These bodies would be scarcely seen or comprehended unless specially pointed out; but, fortunately, we had a drawing by Albert Durer himself, signed in 1514, in which the Saviour was represented as crucified on the worked wood, while the thieves were on the rough wood; and here were a white child, emblematic of purity, and a black child, emblematic of sin, issuing from the heads of the repentant and the unrepentant sinners. Now, considering, as he should strongly contend, that Albert Durer executed these windows somewhere about the year 1500, and that he did not make that drawing until 1514, and that he had never been in England at all, we must conclude one of two things—either that he was a vile plagiarist, or that he was the inventor of these devices. The treatment of the subject in the two cases was identical. The Virgin Mary was represented as being supported by John. The richness of the drapings was essentially Durer's; and one would swear that the horses being Durer's, and nobody else's. Nobody in painting ever indulged in the angles and points, in the folds of the dresses, as did Durer. The angels in this picture were the true type of Albert Durer's work. The whole composition of the picture was so essentially that which was set forth in the drawing which was indisputably Durer's that it would be almost a waste of time to contend against the authenticity of this picture as Durer's production fourteen years before he made the drawing. The nimbi corresponded, and the treatment was the same in both. The more these windows were studied—which he hoped they would be by everybody—the more certainly would the student be convinced that in these pictures Fairford possessed a treasure which all the world might envy; and that there did not exist in all England, except on a very small scale indeed, any other windows to be compared with these as specimens of German art. The moment the existence of these windows became known to the Continent, he would venture to say that Fairford would see in one week more foreign guests than she had ever seen since the time of William the Conqueror. The next window was a very fine one, and really merited all the attention which could be given to it, both for its composition and its execution and completeness. Everything in the picture was of the true Durer type. In the painting of the Transfiguration of our Lord the whole subject was properly treated. The hair exhibited a brilliant little bit of Durer's work. The detail was very nice, and the arrangement of the drapery and the angular folds were such as no other artist whom he (Mr. Holt) could recall had ever ventured upon. These were perfect types of what was met with at the period in the country about Nuremberg. Attention must be called to the representations of St. Dorothy and the Virgin and Child. What could be sweeter little statues than those? It was impossible to imagine anything better executed or more beautiful in taste. In the representation of our Saviour with the disciples on the way to Emmaus there was a head which he (Mr. Holt) need not say was *not* by Albert Durer. Scarcely could he point to a more melancholy instance of the improper interference of restorers than the presence of that head. Could anything be more successful as a type of vulgarity? The cup represented in the next picture was a Nuremberg cup, which anybody acquainted with Nuremberg customs could swear to without hesitation. The furniture here introduced was furniture of the latter part of the fifteenth or the beginning of the sixteenth century. The whole of the costume was as well marked as could be desired. This picture, again, exhibited several unmistakable characteristics of Albert Durer. The small figures at the top were charming. Nobody else ever represented upraised wings in the manner in which Durer depicted them. In the picture of the Draught of Fishes the alterations by other hands were very striking. In one of the new portions the light was represented as on both sides of the figure, while in the original portion by Durer the light fell on one side of the figures, and the other side was in shadow, as it ought to be. In the Descent of the Holy

Ghost the dove was represented with another kind of nimbus, or an aureole. Here again was the characteristic angularity of Albert Durer. This was the last of the pictorial subjects. The next windows contained the figures of the twelve Apostles. They were grand to the last degree—marvels of art and position, exhibiting in the mode in which they were detailed a knowledge of the fundamental principles of art which could not fail to very materially improve the science of painting if the modern school could have the benefit of these pictures. They were real treasures and were needlessly and even cruelly withheld from that admiration to which they were entitled, and the rising generation of artists were being deprived of treasures which they would find invaluable for their contemplation, study, and instruction. In one of the windows was a Prince of Wales's feather, which would dispose of the notion that the paintings were ever intended for the Pope. The upper portion of the large west window consisted of all new glass. In this restoration the church had received a parcel of what he might call the sheerest rubbish in exchange for the genuine article. It had been suggested that the artist who restored the window had simply cleansed the old glass and evident that it to its pristine beauty; but it was restored it all the glass in the upper part of the window was "Brammagen," while that in the lower part was glass of Nuremberg. From that, two opinions could not exist. The artist of Birmingham had, perhaps, done his best, and executed the task entrusted to him to the best of his ability. He (Mr. Holt) did not intend to cast the smallest blame on anybody breathing. On the contrary, he was willing to believe, and did most firmly believe, that those who entrusted the glass to the artist for the purpose of being cleaned really believed that it would be returned to them with increased beauty. Instead of that, they had simply been miserably duped, having had returned to them new glass of 4d. a yard in value; and the real Nuremberg was gone. He could only say that he hoped that not four-and-twenty hours would be allowed to elapse before a special messenger was sent off to Birmingham, to make sure of the recovery of all the old glass. Let them hope and trust that it was not actually destroyed, and that, with money, art and talent might be found to replace a great portion of it. He could hardly imagine that the persons who put in the new glass would break up the old. No doubt they had arranged it, and copied it to the best of their ability; but here was the result. He appealed to the British Archaeological Association to lose no time in announcing to Emper the treasure which existed here, and of which all the world had a right to be proud. They should invite co-operation in all quarters to secure the best talent to restore the pictures with the original glass.

In reply to the Rev. Mr. Joyce, Mr. Holt said that, with the exception of the top row, the upper portion of the west window was all new. The old glass was almost always in small pieces, while the new material was in large pieces. The blue circle was all new, except in small portions at the top. A portion of the window represented St. Michael weighing the good and bad, according to a curious old German legend. He might mention, though it was a bold declaration to make,—but he was sure he was right,—that Albert Durer was the first to treat the subject of the Last Judgment as it was here depicted. In the "Biblia Pauperum" he introduced two swords, one on each side of the Saviour; but in a subsequent representation he removed one of the swords, so as to introduce Mercy as well as Judgment. In the group on the left there was a perfect revelling of ideas. Many mistakes had been made in the explanation of that representation; but, to these, their own shaudry should be a sufficient answer. In the representations of the twelve Apostles there were further specimens of Birmingham work. No doubt the restorers had done their best; but was the result satisfactory? Would it be well to send any more pictures to Birmingham? He believed not. It must be perfectly absurd to expect Fairford to do what was needful in order to restore the original glass and to rearrange the misplaced portions. The task would place too heavy a burden upon the clergy and landed gentlemen of the parish, and hence the movement must be a national one. The question which he wished to bring fairly and broadly before the association was this,—Have we, or have we not, such a monument of art here that no words can be found to express adequately its real value? If we had, let us all be of one mind,

and animated by one spirit, to do honour to the immortal artist who produced it, and to take care that everything possible should be done, and done perfectly, that the whole force of influence of the Archaeological Association might be evinced by the vigour with which they undertook the work.

On examining the west window of the south aisle, the Rev. Mr. Joyce observed a character, having the appearance of an ornamental capital A, located on the blade and near the hilt of an executioner's sword, which formed a figure in the picture. The attention of Mr. Holt was called to this mark.

Mr. Holt said it appeared to be something more than an A. There was a cross stroke at the top, which would form it into the monogram A (A). This recalled to his mind that on the preceding evening Mr. Niblett mentioned that Albert Durer sometimes signed himself Albert Thürer, and hence he might write his initials as A. T.

Mr. Niblett said that it was not unusual to put a letter on the blade of an executioner's sword.

Mr. Holt, in reply, said that it had just been suggested to him by a friend that, in consequence of its being a usual practice to put a character on the sword-blade, Albert Durer might have taken advantage of the custom for the purpose of recording his own initials.

Mr. Roberts, in a brief description of Fairford Church, said that it consisted of a nave with aisles and a chancel with aisles. It was all late, and of a style which he was in the habit of calling "Debased Perpendicular." A great portion had been restored, and therefore it had become to some extent even more debased than it was at the date of its erection. It was said to have been erected in 1498. The Guildhall of the City of London, in the restoration of which he had been concerned, was built in 1499. It happened that this church was a little more debased in the upper part than the Guildhall, but in the lower part it was a little purer. Therefore it was exceedingly probable that 1498 was the date of most of the lower portion of the church. The upper part and outside seemed slightly more debased than the Guildhall. Probably the building was completed in 1500, as two or three years would have been a sufficient time for the holding of the edifice, with the amount of money which John Tame had at his command. The old wall-paintings in the upper part of the nave were of a more exalted character than the style of the edifice, and reminded him very much of paintings of an earlier date. They were of a similar character to those in the chapter-house at Westminster Abbey, which were attributed to foreign artists. That would bear out Mr. Holt's theory that these wall-paintings were produced by the workmen who came over with Albert Durer's glass.

Mr. Niblett said that the date of the founder's tomb, in the chapel at the north, was 1471.

Mr. Roberts, after further examination, stated that the date of 1471, which Mr. Niblett had ascribed to the death of John Tame, referred to the death of his wife. John Tame was described as having died in 1500.

Touching Mr. Holt's supposition that Albert Durer was the author of the woodcuts in the "Biblia Pauperum" and the "Speculum Humanae Salvationis," Mr. H. Noel Humphreys writes as follows:—

"Mr. Holt concentrates his remarks upon the 'Biblia Pauperum' and the 'Speculum Humanae Salvationis' in the following passage:—After stating that he has a final and conclusive argument to adduce, he says that argument is 'the belief that Albert Durer was largely concerned in the designing and engraving on wood of the cuts in the earliest set of German books containing Scriptural designs—viz., the 'hook-books,' comprising the 'Biblia Pauperum,' the 'Speculum Humanae Salvationis,' &c.' Now, it is utterly impossible that Albert Durer should have been engaged either in the designing or cutting of the earliest block-books, inasmuch as they were executed not only before his birth, but in all probability before his father was born. A well-known copy of the first edition of the 'Biblia Pauperum,' still in its original binding, contains a date which clearly proves that the work of the binder was performed between the years 1429 and 1430, and as Albert Durer's father came to settle in Nuremberg as a young adventurer in 1455, he was probably not born in 1425, nor even in 1430. It is to be observed also that the first editions of the famous 'Biblia Pauperum' were printed, on one side of the paper only, with a distemper ink, the impression being produced by rubbing at the back, which at once stamps them as the work of an epoch long anterior to that of Durer. The latest edition of the 'Biblia Pauperum' which I have seen was issued full half a century later. It is printed in printer's ink, after the invention of the printing-press, and bears a printed date—1470. Yet even this edition was printed one year before the birth of Albert Durer, which happened in 1471. The latest date that can possibly be assigned to the first edition of the 'Speculum Humanae

Salvationis' is about 1410, and it was probably produced full ten years earlier. Like the 'Biblia Pauperum,' it is printed on one side of the paper only, sufficiently proving that it belongs to a pretypographic period.

It is unnecessary to add that these works are without any colophon, date, or printer's name, and that the entire character of their illustrations is as distinct as possible from that exhibited in the cuts of the 'Nuremberg Chronicle,' with which they are grouped by Mr. Holt. That work did not appear till 1493, and it is possible that Albert Durer may actually have executed his pretences on some of its illustrations, as ingeniously suggested by Mr. Holt; his master, Wöhlgemuth, having been the chief designer or engraver of the cuts with which that work is so profusely embellished. But neither that circumstance nor the form of the nimbus employed by the artists who were engaged on the 'Nuremberg Chronicle' (which was, in fact, a form in common use) proves anything whatever as to whether or not Albert Durer was the designer or painter of the windows at Fairford."

STONE AND IRON MANUFACTURES ON THE THAMES.

On Friday, the 14th inst., a numerous party of members and associates of the Society of Engineers, under the direction and guidance of Mr. B. Latham, C.E., president of the society, Mr. Perry F. Nursey, auditor, and Mr. Harris, secretary, visited the shops and yards of the Thames Iron Works Company at Millwall, and the Patent Concrete Stone Company's factory at East Greenwich, on the opposite bank of the river.

A remarkable contrast was presented by the state of affairs at the two establishments, and the condition of some of the great works and yards on each side of the river was also suggestive of reflections far from cheerful. At the Thames Iron Works, although a large number of hands are employed—some 800 or upwards—it was sufficiently evident that only a fraction of the work of which the establishment is capable is in course of execution. Rolling of metal to various forms, and forging of various kinds, with divers other manipulative processes, were in active progress, and there is evidence that some little is still doing in shipbuilding on the Thames; but it was melancholy to note that the splendid engine workshops of the company, containing one of the finest assemblages of tools and tool machines in the world, was swept and garnished, toneless and silent. Cheerless, also, it was to note, on both sides of the river, the empty building slips and the smokeless chimneys. Apart from the question of the rate of wages paid to artificers on the Clyde, the Tees, and the Tyne, as compared with the Thames, it may be feared that the differential margin in the price of coal on the southern, as compared with the northern rivers, is fatal to a reasonable hope of a revival, to any great extent, of either iron shipbuilding on the Thames or any other branch of manufacturing industry involving a considerable consumption of the main power-producer—coal. During the last few years the average price of coal delivered in London has advanced fully 3s. per ton, including the best household qualities; and the relative price of

smithery, boiler, or furnace coal is, of course, considerably more. The railways already, it is admitted, carry more coal than is consistent with the safe conduct of their other traffic; and although additional railway-lines to London from the Northern and Midland coalfields may be constructed in the future, it is unlikely that any reduction of rate in the price from such a cause will be made for a good many years to come. To this reason—the comparatively high rate paid for freight or carriage of the heavy raw materials, coal and iron, which are staple articles of consumption in the shipbuilding yards—may be attributed, in a great degree, the languid condition of the Thames works. Hence it is, probably, that the recently-completed works of Messrs. Maudslay & Co., at East Greenwich, can scarcely be said to have commenced business; and hence also, probably, for a cogent reason, the fact that the fine new works of the Messrs. Bessemer Brothers, which have been erected in the same locality, have not commenced business at all, although they appear to have been almost, if not quite, complete for above twelve months. It is satisfactory to turn from these works—Messrs. Maudslay's and Messrs. Bessemer's—to others in their immediate vicinity, which exhibit a more healthy state of activity. On the one hand, the Telegraph Construction Company are shipping the Malia and Alexandria cable, of about 972 miles in length, and expect to get the whole on board by the first week in September. The *Scandera* is now in the river loading, and will take about 800 miles of the main cable. The *Chilton* will follow with the remainder of the cable and the shore ends. Both vessels are chartered and specially fitted by the company with the necessary iron tanks and other appliances.

The works of the Patent Concrete Stone Company are close by, and exhibit in their apparent activity and prosperity a contrast, not only as compared with some of the works in their neighbourhood, but as compared with their own state little more than twelve months ago. Then the works were very palpably new, barely finished, partially occupied, and evidently capable of turning out a much larger amount of work than appeared to be in progress. Now everything is shaken into its proper places, all is working smoothly, and the full resources of the works are in requisition in the execution of the orders in hand. A marvellous change has passed upon the appearance of the spacious yard. At its inner end a considerable space of what was but a short time since a pestilent marsh is converted into a fruitful vegetable and flower garden, containing numerous and varied samples of highly successful culture. Appropriately placed at the end of the buildings where the process of manufacture commences are great piles of sand of various qualities,—beautiful small, sharp shingle from Bristol, brought as ballast; a finer description of sand from Harwich; and a large heap of fine and dazzlingly white "silver sand" from Maidstone. In other parts of the yard are great stores of the other materials used in the manufacture,—piles of flints from Kent, and of a better sort from Dieppe; casks of caustic soda, and of chloride of calcium. At the outer end of the works towards the river, as sent out after passing the finishing process, are great piles of goods, all made to order, including some thousands of massive corbels for the principal cornices of St. Thomas's Hospital, and of balusters for the same buildings. Notably also among the finished work are great numbers of grindstones, of all sizes up to 6 ft. diameter by 14 in. thick, and of rice millstones. In these—the grindstones in particular—the company now do a large business, sending out occasionally 10 and 12 tons weight in a week. As many as 500 stones were recently despatched, in execution of a single order, to the Victorian railways.

The *raisonné* of Mr. Frederick Ransome's process of manufacturing stone has been described in previous numbers of the *Builder*, and need not be here repeated. The successive improvements he has introduced, as the result of much watchful observation, patient labour, and untiring perseverance, have been duly recorded. His earlier practice of hardening the stone by kiln-burning was admittedly defective, and it was not until he elaborated the chemical process of moulding his material with silicate of soda, or flint dissolved in caustic soda, and then saturating the moulded articles in chloride of calcium, that his theory could be accepted as sound. In theory he *did* attain

* In reply to this, Mr. Holt says, amongst other things, "I confess I am neither surprised nor touched by any of your remarks. When he mentions that which he calls 'a well-known copy of the first edition of the 'Biblia Pauperum,' still in its original binding, and which contains a date which clearly proves that the work of the binder was performed between 1429 and 1430,' I reply that one of two things must exist—either the date is false, or a copy of the 'Biblia Pauperum' has been purposely bound in the covers of an old manuscript, so as to give it the appearance of an antiquity which did not really belong to it."

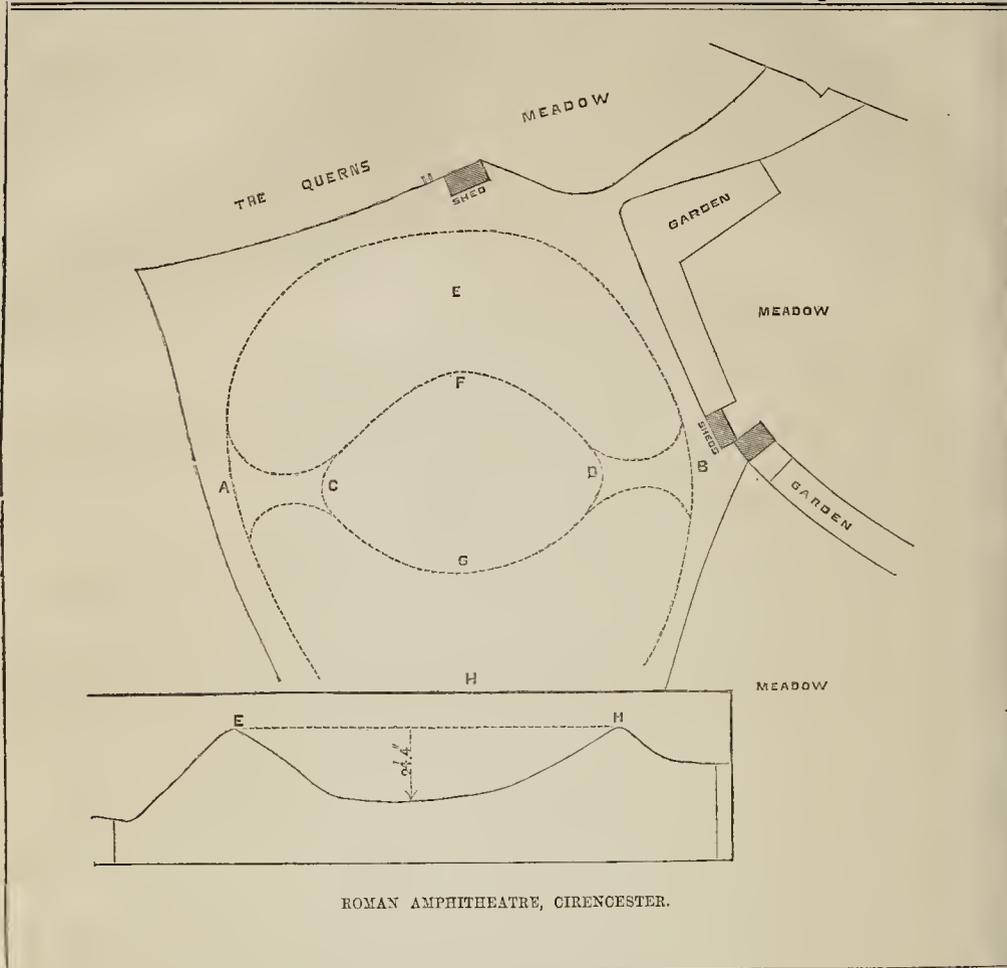

"H. N. H. must forgive me when I state that, as a general rule, I am an utter disbeliever in dates of 'literary or artistic rarities' prior to 1500, and that such incredulity is one of the results of my investigations, wherein the instances I have met with in the falsification of dates are both numerous and startling, satisfying me that however 'ingenious fraud' may be supposed to distinguish itself in the nineteenth century, it was equally remarkable in the fifteenth century, and practised whenever opportunity promised a reward."

Earnestly desiring to avoid unnecessarily occupying your valuable space, I will, instead of now combating in detail the views expressed by 'H. N. H.,' at once proceed to mention those which I believe to be some of the fundamental facts upon which my new theory is based, and upon a satisfactory solution of which must ultimately depend the value or the absurdity of my views.

First, I venture to insist that printing preceded engraving, and, consequently, that no engraving existed prior to 1440—no, not even the 'playing-cards.'

Secondly, as the most perfect justification of my disbelief in earlier dates, I disavow the date upon Lord Spencer's St. Christopher of 1423, so implicitly believed to this moment to be the earliest known woodcut with a date, to be a forgery, and that the true date is 1493. I further say that this forgery was effected by altering the word of the 'sc' into an 'x,' by which simple process seven years was forthwith added to its date; and I also declare that the St. Christopher in question was executed by Albert Durer at Colmar in 1493, on the occasion of his visit to the brothers of Martin Schöen.

Thirdly, I challenge all literature to mention a single instance in which the existence of a copy of the 'Biblia Pauperum' can be proved prior to 1489."

ROMAN AMPHITHEATRE, CIRENCESTER.

perfection at that stage, but it was found that important improvements in practice were still necessary, and these are in course of application. The remarkable novelty and special improvement in Mr. Ransome's process, to which the attention of the visiting engineers was directed, and which we have to record, is the mode adopted for accelerating the action of the chloride of calcium upon the silicate of soda in the interstices of the stone. By the method formerly adopted of external drenching of the pieces as cast, with the chloride, and their subsequent immersion for saturation in a bath filled with the same agent, much time was consumed, especially with the larger castings. The number of orders, and their magnitude, which came in upon the company speedily forced upon the managers the alternatives either to refuse orders, or to increase and quicken, if possible, their means of production. The pressure thus brought to bear has operated admirably in a further improvement of this process; and the latest expedient employed to carry it to the perfection desired is to clear the way for the binding agent—the chloride of calcium—by placing the piece to be acted on in an airtight receiver, immersing it in the bath, applying the air-pump for exhaustion of the air in the interstices of the block, and thus facilitating the rush of the chloride to fill the vacuum which nature allows. The saving of time by this exhaust process, as compared with the ordinary soaking, is as about 40 to 1; the chemical action by the rapid process is also much more complete and satisfactory than by the slower. The

only further improvements in the works that suggested themselves to visitors were their enlargement, and divers mechanical appliances, not essentially, although commercially, of importance, for the more rapid movement and manipulation of the materials employed in the manufacture.

In the elaboration of this invention, Frederick Ransome, like George Stephenson, groped long comparatively in the dark, and laboured hard and meritoriously to get into the light, which he has now done, even to the perfect day. Stephenson had important assistance in the latter part of his career from his well-educated and accomplished son Robert. Mr. Ransome also may be congratulated on having such an efficient co-labourer as his son Ernest, manager of the works, and between them it need not be doubted that all that yet may be necessary to make this invention a complete commercial success will be supplied by father and son, and their staff.

RETURNING WATER FOR THE REGENT'S CANAL.
In consequence of the drought, the Regent's Canal Company have been seriously threatened with a failure of their water supply. Mr. Sykes has been employed by them (in conjunction with Messrs. Easton & Amos) in pumping the water back over their nine lowest locks, employing for the purpose nine large centrifugal pumps, driven by portable steam engines. This is a somewhat novel application of pumping power.

THE ROMAN AMPHITHEATRE AT CIRENCESTER.

We spoke in our last of the discussion that ensued at Cirencester, amongst the members of the British Archaeological Association, touching the correctness of the opinion that what is popularly called the Bull-ring is in truth a Roman amphitheatre; and we have now gathered together the observations that were made on the subject both then and afterwards.

Mr. T. C. Brown, being requested to point out its features, said he would first call their attention to the city within the walls. They would find that the ancient city was buried several feet below the surface. He would ask them how the present level was raised. If they looked onward, they would see numerous quarries, extending far beyond where they stood. From these quarries the structures of the ancient town had been taken, and in course of ages by dilapidations had caused the rise. He suggested that it was the practice of the Romans to have games and other amusements in amphitheatres outside their cities; and he asked, What more likely place to be selected for such a purpose than the waste ground of a quarry? He repudiated the design which was before them being called an accident; it must be clear to everybody who knew what practical quarrying was that it could not happen that one should be left in the form which has presented. He pointed out a gap which he thought might have been an inlet for the beasts and gladiators who were to furnish sport for the assembled people. He had recently made a

section of one of the banks, but found no stones or steps, such as had been found in similar amphitheatres in foreign countries. This, however, did not alter his opinion as to its being an amphitheatre, as he reflected that in this cold climate it would not be comfortable to be sitting on stone seats. He thought, therefore, that the seating must have been of wood, which in the course of centuries had perished.

Mr. Black said he should like to ask two questions before expressing an opinion. First, in examining the structure of these hills, did it appear that the soil was solid or only detached? Secondly, had there ever been a section cut across the arena?

Mr. Brown answered the second question first, that the arena had never to his knowledge been opened, and as to the first question, that the soil consisted of oolitic rock, that there was little loose stuff, although occasionally banks of clay were found. Cuttings in other mounds by Mr. Lawrence had discovered several coins, lacrymæ, pottery, and some stone coffins.

Mr. E. Roberts said he believed it was no amphitheatre at all, but simply an uncalled-for, as it is now called,—throwing the rubbish of the quarry to the nearest convenient spot. There were several other mounds in close proximity, having nearly similar formation, and in this instance, so far as excavations had gone, no evidence of any structure had been discovered.

Mr. Turner said he believed it was a Roman encampment, and nothing more. There were many instances of Roman encampments precisely similar, and he believed that this was one.

The Rev. Prebendary Scarth thought no one who had seen the amphitheatre at Trèves could doubt that what they saw before them was of Roman origin. It was not fair, however, to judge of the amphitheatres in England at Roman stations by those on the Continent. He instanced several Roman stations in this country where there are similar amphitheatres to the present which are not doubted. At Dorchester there was one—the arena elliptical. Silchester the same. At Old Sarum, up hill to Charterhouse and Mendip, ancient Roman stations, perfect as the day when they were abandoned by the Romans, there were amphitheatres similar but smaller. Ilchester in the time of the Foss, amphitheatre smaller but similar. He multiplied instances, and denied that they were natural formations. We might as well say that the barrows on the Wiltshire downs were natural formations.

Mr. Godwin said his opinion should be determined by experiment. Further investigation should take place, and sections should be made. It was quite possible that, although originally a quarry, it might have been adapted to the purposes of an amphitheatre.

Earl Bathurst, being appealed to for permission to do the work, replied that if the congress were generally of opinion that it was desirable to make the excavation he would have no hesitation in allowing it.

The Rev. J. G. Joyce, of Stratfieldsaye, Hants, being asked to speak, said, having had three years' experience in excavating the interesting site at Silchester, he had no doubt in his own mind of this being an amphitheatre, and he felt sure that if they made the proposed excavations they would find some trace of the facing of the seats and the stonework, which would have been placed to prevent the earth falling in. No steps had been found at Silchester.

Mr. Richard Mullings, referring to the term "Bull-ring" said it might not be uninteresting to some persons to know how the amphitheatre came to be designated by its present name. Late in the seventeenth century, or early in the eighteenth century, a society was raised in Cirencester in favour of the Pretender, called the "Jacobite Club" of which club he had now the honour to be a member. Their meetings were held at an inn called the Bull, and there was upon record an entry stating that a sum of money was voted for the purchase of a "bull." That inn was doubtless named in the amphitheatre, which had since been called the "Bull-ring."

Professor Buckman, on another occasion, speaking of the antiquities of Cirencester generally, said there had been some little discussion about the amphitheatre, or "Bull-ring," as it was called. Now, he had made a minute examination some years ago, and had excavated a section. There he had found fragments of pottery and some coins, the date of which he could

not remember, but he had no difficulty in pronouncing it to be really what it was called, an amphitheatre. It was highly probable that it was originally a quarry, from which they obtained stone for the erection of Corinium, but they had doubtless without much difficulty converted it into an amphitheatre.

Since the examination, Messrs. Bravender & Son, surveyors, have kindly enabled us to engrave a plan and section of the amphitheatre, and have favoured us with the following dimensions with reference to it:—

- From A to B, 320 feet.
- From C to D, 200 feet.
- From A to C, 60 feet.
- From D to B, 60 feet.
- From the summit at E to F, 55 feet.
- From F to G, 120 feet.
- From C to the summit at H, 86 feet.

On first examining these remains we were not impressed with the correctness of the generally received opinion: the nature of the ground around, where almost similar mounds abound, the appearances at the two entrances, the asserted absence of any stonework whatever, and our recollections of Dorchester and Silchester rendered us unwilling to accept at once the assertion that we were looking on a Roman amphitheatre. Further examination and consideration have, however, entirely dispelled our doubts, and satisfied us of the correctness of this belief. That stonework has been found there would seem to be proved by a passage from Raddier's "History of Gloucestershire," published in the year 1779. Raddier, who was a native of Cirencester, says,—

"There are two avenues to this area (east and west), and on the north side, also, is another straight approach between two stone walls, lately discovered by people digging for stone."

This statement, however, does more: it shows a striking similarity between this amphitheatre and that discovered at Richborough, and described by Mr. C. Roach Smith in his volume on "The Antiquities of Richborough, Reculver, and Lympne, in Kent." Here, where an oval wall forming the enclosure of the arena was found, there is also, besides two other entrances, an avenue on the north side between two side walls remaining, 9 ft. apart, the intermediate space having been covered with a bard pavement. The dimensions of the arena also agree, the longer diameter measuring, like that at Cirencester, exactly 200 ft.* The shorter diameter at Richborough measures 166 ft. The long diameter at Dorchester is said to be 219 ft. (138 ft. the shorter), and that at Cæreleon 220 ft. The arena at Trèves is 219 ft. the longest way, 155 ft. the other; and that at Tintinnac, figured in Montfaucon's "Antiquité Explicite," tom. iii. p. 2, and quoted by Mr. C. R. Smith, 200 feet by 150 feet.

We must reiterate the desire expressed on the ground that the amphitheatre should be investigated under proper and careful direction.†

WIDE STREETS AND SHADE TREES.

THERE are sites in our city where the plantation of fine trees would not only prove a solace to inhabitants and passengers, but would contribute largely to the architectural aspect of neighboring buildings. In Trafalgar-square a few tubs have been lately placed, with cropped bay shrubs. These bits of formal verdure give universal satisfaction. It is after the old fashion of orange tubs in the Tuileries and in the court of the Palais Royal. How magical would be the effect if only a dozen planes of twenty years' growth were planted,—three at either end, and six ranging in front of the National Gallery! The fountains would look all the better, the buildings none the worse.

Many of the London streets are wider than than those in Paris, where trees are ranged so as to afford rest on seats, and shade to fatigued passengers. Except a few yards of Piccadilly and the Brompton-road (through the crescent), and also on the splendid thoroughfare of the Grand Junction-road (Oxford and Cambridge terraces), we have no timber trees to solace the

* This dimension at Cirencester has been called by Messrs. Buckman & Newmarch 148 ft., but we conclude Messrs. Bravender are correct.

† We have devoted so much space to two of the subjects treated of during the Cirencester congress that we must postpone the continuation of our outline of the whole proceedings until our next issue. We may mention that a good report of the doing of the week, with several of the papers in full, will be found in the *Wilt Standard*.

wayfarer. It may not be amiss to state that, before Piccadilly was widened by a strip from the Green Park, an article in the *Builder* led to the saving of the thirteen trees at present bordering the footway and cab-stand.

And now, as to the grand boulevards of Oxford and Cambridge terraces, which are 172 ft. wide from house to house, the writer would point out to the inhabitants the vast improvement that might be made by removing the iron railings of the inclosures on the sides next the terraces, and the widening of those drift-ways which have scarce room for two carriages to pass, and which have, in the centre of each terrace, an unsightly railed semicircle for teams to turn. All this might be obviated by gravelling a width of 6 ft. or 8 ft. up to the tree range, which might thus be thrown open and kept in decent order at little expense. Along the central route, which is 60 ft. wide and paved on either side, the railings and gates might stand as at present.

In the fine range of Westbourne-terrace, which is 100 ft. wide from area to area railing (the areas counting 20 ft. more from front to front), there are also strips of plantation, with double rows of heavy Portland cement balustrades. This canseway, about half a mile long, might advantageously be treated in the same manner, and planted with shady trees.

Along the Cromwell-road, which is 90 ft. wide, rows of poplars have been planted; but these want the grace of the wide-spreading lime, plane, or sycamore; and, if in continuation, along the Brompton-road (north side) trees were planted where they had been before growing, it would be a great boon to pedestrians, particularly in this portion of the line, which from opposite Brompton Church measures 90 ft. across.

Formerly in forming streets, no regard was shown to alinement: the longest, Oxford-street and Holborn, discovers great divergence of width, the mean of the former being 60 ft. from house to house; Holborn being in some parts 50 ft., in others 100 ft.: the intervals between Gray's and Furnival's Inns measure over 100 ft.

The Strand also discovers great inequalities, being, opposite Holywell range, under 40 ft., and at Somerset House over 100 ft. Again, in Whitehall and Parliament-street, there is a great diversity of width, which, opposite to the Treasury, and across to the railings of Montagu House, measures 134 ft. (exclusive of the grounds, railed in), but the proposed demolitions in Parliament-street will doubtless secure the continuation of suitable latitude to the terminal vista at the Cathedral.

Far from being a default, these varieties of width in great leading thoroughfares are an advantage; and where the style of architecture is varied, give effect and character. Somerset House ought not to form part of a range equally storied up to a continuous sky-line of cornice—that is the fault of Portland-place and numerous Russellian squares, and is no recommendation to the boulevards of new rectilinear Paris.

If the Strand goes on improving in equal ratio to the bye-lanes of the City, it will be, so soon as Holywell-row and the Temple Bar incus are removed, an incomparably fine boulevard; and St. Clement's Danes and the beautiful St. Mary's will lend grace and dignity to the range. It will then only remain to sweep away the unsightly and restrictive iron barrier around St. Paul's, throw open a noble piazza there, give a continuous street on the north side of the Cathedral, and thus make straight the way which the church ought to be the last to obstruct.

As to plantation on the way-side, it might be rash at the present juncture to prescribe planes, lindens, or poplars, although trees bring shade and a healthy atmosphere. Open the straits first, ornamentation will come after.

THE SEWAGE FOR THE SOIL.

THE long undecided question, what to do with our sewage, is gradually resolving itself into a satisfactory solution of the problem.

At Warwick, about two years ago, the corporation received complaints from several land-owners and residents in the district respecting the pollution of the Avon with the town sewage, and proceedings in Chancery were threatened. Instead of embarking in costly and needless litigation, the corporation frankly admitted the evil, asked for time to devise remedial measures, and forthwith vigorously commenced operations. It was decided to take the town sewage out of

the river and apply it to the land, and for this purpose a farm of 109 acres, situated on the Longbridge-road, was rented from Lord Dorner. At a total cost of about 8,000*l.*, the necessary buildings and machinery have been erected, and the flow of the town sewage has now been diverted from the river to the farm. The results of the new system far exceed the expectations of its most sanguine promoters. Although the land had only been irrigated for three weeks, there was already a good crop of rye-grass, 7 in. or 8 in. high; and, notwithstanding the very unfavourable condition of the weather, no inconvenience has been occasioned by any smells arising from the farm. The green and flourishing appearance of the fields contrasted most favourably with the parched condition of the adjoining pastures. It is stated that the governing body have received a very liberal offer from a resident in the town to take the farm for twelve months, at a good rent. The Warwick council, by their energy and prudence, have apparently avoided litigation, and created a new source of revenue, to the easement of the ratepayers at large.

At Rugby, the works connected with the thorough sewerage of the town are now completed, after six months' labour. The work has been carried out by the local board, under the immediate direction of the resident engineer, Mr. Bounney; and in place of the whole sewage of the town being discharged either into the brook or the canal, it is now carried to the Moor Farm, a distance of nearly half a mile from the town, by means of large iron tubes, laid 6 ft. under the surface of the canal (a sufficient depth to drain every cellar in the place), which take all the refuse matter from every street and court into the main culvert. All the drains have an inclination sufficient to clear themselves, but, to do away with the possibility of choking, there are nine or ten points at which the brook can be suddenly turned into them to flush and clean them out.

At Leicester the experiments already noticed by us are believed to prove that a compound has been invented which has only to be well stirred up in the abominable torrents which stream from every large town, in order to precipitate the organic and inorganic matter which the waters hold in solution, without any deterioration of their value as agricultural manure. Hitherto this has been the chief difficulty with inventors and chemists. The cost of solidifying the sewage without ruining it as a manure has rendered every application of it to the soil, except in the immediate neighbourhood of towns, practically impossible. The inventors of this new process, taking the first hint, as it is said, from certain regulations of the Levitical code, mix animal charcoal with blood, clay, and alum, and they have been pumping this "A B C compound," as they call it, into the streams discharged by the culverts of the well-drained town of Leicester. The result is reported as wonderful. The water, as discharged by the culverts, contains 189 grains of organic and inorganic matters in the imperial gallon. After being mixed with the new composition it contains only 57 grains per gallon, of which only 14 grains are organic, the London drinking-water containing as much as 8½ grains of the same. The residuum is then dried by simple evaporation, and on a chemical analysis of its elements, when thus dried, it is said to be worth about 4*l.* per ton. The cost of the composition and of its application for the production of one ton of this dry manure is less than 30*s.*, and the quantity which can thus be produced at Leicester alone would be worth about 17*l.* daily. We offer no opinion.

By the interposition of the Court of Chancery the Banbury authorities have been compelled to prevent their sewage from defiling the river Chorwell. Besides poisoning the river, it killed the fish, injured the cattle, and seriously affected the health and prosperity of the people who lived below the outfall. Perchloride of iron, carbolic acid, and other chemicals failed to prevent the nuisance. At last 135 acres of land were taken on lease, as a sort of disinfecting area, over which the sewage was to pass before entering the stream. The land was levelled and laid out like water meadows, with open trenches. By means of a steam-engine the sewage was pumped into an elevated tank, and thence flowed over the fields by gravitation. Already the results are remarkable. The sewage of a population exceeding 10,000 has been poured over these acres, and it would seem that if the land had not been underlaid in some parts with drain-pipes, very

little of the fluid would have reached the river at all. As it is, the effluent water has been perfectly pure, and during the last six weeks the thirsty soil has absorbed so much of the fluid that scarcely a drop has been left to go into the river. Of course all nuisance is at an end. The sewage, too, thus produces a substantial return. The local board of health pay 4*l.* 10*s.* an acre for the land. On eighteen acres they have grown a crop of oats realising 193*l.* by public auction. On thirty-five acres they have grown Italian rye-grass, producing up to the 12th of July, 379*l.*, being at the rate of 10*l.* 16*s.* 6*d.* per acre, with more crops to follow. The remainder of the farm is mowing grass, and hitherto the proceeds of the several sales (of all kinds) have been close upon 1,000*l.* It does not appear that all the mowing grass has been subject to irrigation, and the difference is very largely in favour of the sewage-grown crops. The Banbury ratepayers, we are told, "begin to feel easy in their minds."

By degrees we are finding out what sewage is capable of doing. In the present season excellent potatoes have been grown in sand transferred from the Maplin and irrigated with London sewage at Barking. While sea-sand may thus be made fruitful, sewage is found equally available for the stiffest clay. Town sewage, it is found, will grow anything from a bed of strawberries to a field of wheat. But it will not improve the fisheries; and, as a nation with a limited area, we cannot afford to take nutriment from the land and cast it into the sea.

PRINCESS'S THEATRE.

MR. GEORGE VINING and Mr. Boucicault together have achieved another great popular success, under the title of "After Dark." Mr. Boucicault writing the piece, and Mr. Vining producing it in the way by which alone it could succeed, and acting in it very finely indeed. Like the "Streets of London," it depends greatly for lengthened popularity on the excellent way in which known sites and buildings, such as the Victoria Station; Blackfriars Bridge, on crutches, with St. Paul's by night; a suburban villa and its lilac-filled garden; and the Underground Railway, are set forth; but the piece is of itself exceedingly interesting, with two or three very powerful situations, and is remarkably well acted throughout. Mr. Walter Lacy, Mr. Dominick Murray, Mr. Montague, and Miss Rose Leclercq are made for their respective parts. Incident succeeds incident with wonderful rapidity, all consecutive and all working to a climax, and the spectator has little time or desire to attempt to criticise till the curtain finally falls. To Mr. F. Lloyd and his assistant, Mr. W. Hann, great praise is due. The painting of "London by Night" is particularly charming, and the passage of a locomotive and train across the stage in the Underground Railway is a marvel of mechanical contrivance. "After Dark" is one of those pieces that all playgoers will feel themselves obliged to see.

FIRES.

This has been an unprecedented season for fires, most of them arising from the extraordinary dryness of the summer. Fields, woods, moors, and even hill and mountain surfaces have been burnt from the slightest causes, such as waste matches, locomotive sparks, &c. Houses, and even towns, have been destroyed by fire. From all parts of the Continent and from America comes the story of forests on fire. The ravages in Russia appear to be most extensive, and the flames were making progress in the direction of St. Petersburg. The trains on the Nicholas Railway ran through a district of 200 versts enveloped in smoke and flame. A fire, on the 28th July, destroyed nearly the entire of the town of Sestrook, in Russia; nearly 800 houses have fallen a prey to the flames. The town of Vytégra, in the government of Olonez, Central Russia, has just narrowly escaped destruction by a fire which broke out in a forest, in the centre of which it is situated. The disaster was caused by some haymakers, who had lighted a fire for cooking in a field, and the grass and timber, being unusually dry from the long drought, burnt with great rapidity. London has not escaped from fires of considerable magnitude. A great fire has occurred in the Borough, in the vicinity

of King-street. It originated in wooden premises occupied partly by a carpenter. After destroying various workshops and stables, it spread to adjoining book warehouses, and dwellings in various courts and alleys running into Chapman's-yard. At one time fifteen houses were on fire. Many poor families have lost everything belonging to them. At London Bridge station a fire has occurred, which at one time threatened disastrous consequences. It originated in the vaults under the platform, where there are oil stores and lamp rooms. Considerable damage was done. The cause is said to have been spontaneous ignition. The Huddersfield goods station of the Lancashire and Yorkshire and Great Northern Railway Companies, at Huddersfield, has been wholly destroyed by fire. The fire originated in a quantity of greasy material in the form of shoddy. The Friars' Goose Chemical Works, Gateshead, the property of the Jarro Chemical Company, have been destroyed. The loss of property is estimated at 100,000*l.*, and 500 persons will be thrown out of employment. Four men were injured by the fall of the roof, and were severely burned besides. Two policemen also were hurt. The fire is believed to have been spontaneous. Extensive fires have taken place at Uxbridge, origin unknown.

Since what we have said was in type other fires have occurred in London,—one in the workhouse of St. George's, Hanover-square, situated in the Fulham-road. The over-heating of a hot-air pipe in the laundry drying-room seems to have set that portion of the premises in flames, and the fire next communicated to the adjoining mangling and ironing rooms. The firemen and salvors were unable to get the fire extinguished until the drying-room was burnt out, and the mangling-room and ironing-rooms severely damaged by fire and water. The infirm ward overhead is also damaged, and the contents as well by fire, water, and removal. The damage was confined to the south wing.

Northumberland House, Strand.—On Wednesday night about one-third of this building was destroyed by fire. Fortunately the historical part of the edifice was not touched. The fire broke out in the hall-room, forming the wing of the mansion on the west side of the garden front, and which was erected about seventy or eighty years ago. A noble *Sèvres* vase, about 3 ft. high, and valued at 10,000*l.*, was broken to pieces; but we are glad to be able to say that the pictures are safe, except being damaged, chiefly by water, not, it is thought, irremediably. Even as to the vase, it may perhaps be restorable.

ACCIDENTS.

The King's-cross Accident.—An inquest has been held on the body of Benjamin Thresher, who was killed at the King's-cross works of the Great Northern Railway through the falling of an iron girder, weighing fourteen or fifteen tons. The accident was caused by the giving way of a crab which was being used to raise the girder. Mr. Cliff, the contractor, and his men, contended that the crab was of a size and calculated strength ample for the work required of it, and that, in fact, it had done heavier work before. The jury were of opinion that it was totally inadequate for the work put upon it, and an adjournment was therefore agreed to for the purpose of obtaining the opinion of Captain Tyler, the Government Inspector of Railways. At a subsequent sitting of the court Captain Tyler's report was read. It stated that one of the teeth of the intermediate wheel of the crab had evidently given way on a previous occasion, and the detached part had been fixed in its place again by an iron stud being put through it and the wheel. This had snapped off when the weight of the girder was put upon it, and the total destruction of the crab and the falling of the girder had followed as natural consequences. The accident would not have occurred but for the flaw. Mr. Cliff said the crab in question must have been part of a new plant he had bought. He never knew of the flaw till after the accident. Brown, the foreman, denied all previous knowledge of the flaw, although the iron stud was very large and very apparent. The jury returned a verdict of accidental death, but appended an opinion "that sufficient care and skill had not been displayed in the supervision and inspection of the machinery."

Fall of a Building at Warrington.—A man was killed and another seriously injured by an

accident which has taken place in Silver-street, Town's-end, Warrington. A number of workmen had been engaged in removing an old building, to clear the site for the erection of a Wesleyan chapel. During a shower the workmen, some five or six in number, sought shelter in the lower portion of the building. Suddenly a crash was heard, and on the neighbours repairing to the spot they found that the floors and roof had fallen in and hurried the workmen. They were extricated without loss of time; but one of them had been killed on the spot, while a second man had sustained very serious injuries.

Scaffold Accident at Wearmouth Bridge.—While the painting of Wearmouth Bridge was being carried on the men worked on scaffolding suspended from the bridge. Whilst at work at the west side, fortunately not over the river, they commenced "skylarking," and suddenly the frail scaffolding of two narrow planks "canted," and they were thrown off. They fell to the ground beneath, a depth of about 25 ft. They were severely shaken, but, fortunately, were not seriously injured.

ROYAL CONVENTION FOR THE EXCHANGE OF WORKS OF ART FOR THE PEOPLE.

DURING the Paris Exhibition a convention was entered into by several princes of the reigning families of Europe, whereby they agreed mutually to assist the museums of Europe in procuring casts and copies of national objects for the promotion of art.

Throughout the world every country possesses fine historical monuments of art of its own, which can easily be reproduced by casts, electrolytes, photographs, and other processes, without the slightest damage to the originals. This is the course of operations suggested:—

1. Each country to form its own commission according to its own views for obtaining such reproductions as it may desire for its own museums.
2. The commissions of each country to correspond with one another, and send information of what reproductions each causes to be made, so that every country, if disposed, may take advantage of the labours of other countries at a moderate cost.
3. Each country to arrange for making exchanges of objects which it desires.

The following princes have already signed the convention:—Albert Edward, Prince of Wales; Alfred, Duke of Edinburgh; Frederick William, Crown Prince of Prussia; Louis, Prince of Hesse; Albert, Prince Royal of Saxony; Prince Napoleon (Jerome); Philippe, Comte de Flandre; the Czarévitch; Nicolas, Duc de Leuchtenberg; Oscar, Prince of Sweden and Norway; Humbert, Prince Royal of Italy; Amadeus, Duke of Aosta; Charles-Louis, Archduke of Austria; Rainer, Archduke of Austria; Frederick, Crown Prince of Denmark.

We view this remarkable convention with the greatest satisfaction; it promises much more than is at first sight obvious; and we are truly glad to be able to regard his Royal Highness the Prince of Wales as the originator and main promoter of so admirable an undertaking.

THE NEW HOTEL AT LIME-STREET STATION, LIVERPOOL.

THE great hotel now in course of construction by Messrs. Haigh & Co., of Liverpool, for the London and North-Western Company, in connexion with their station in Lime-street, will, when completed, be one of the largest establishments of the kind in the country. The style of architecture adopted is of a mixed nature, partaking of the palatial character. The Lime-street façade, which forms the principal elevation, is 298 ft. in length, stretching the entire distance between Gloucester-street and Lord Nelson-street. The unusually high altitude of this, the main elevation, imparts to it a commanding appearance. The height to the top of the main cornice is 81 ft. 9 in., there being five stories from the ground floor to the cornice, above which again there are rooms formed in the roof, lighted by pediment-headed dormers. The elevation is rendered still more striking in its character and proportions by four towers, two being in the centre, immediately over the main entrance to the hotel, and flanked by two other towers at the

north and south sides respectively. The central towers, which are carried up to a considerable height above the main cornice, form the principal feature in the elevation. The height of these two towers from the main cornice to the top of the vane is 76 ft., making their entire height, from the ground floor to the apex, 157 ft., an altitude higher than that of most of the spires of the local churches. At each corner there are pinnacles corbelled out from the main body of the towers. The lower portion of these towers will be set apart as sleeping-rooms; and, there being three flights of this class of apartments, that portion of the building consisting of the central elevation will show eight stories. The two towers at the north and south ends respectively are 61 ft. above the main cornice, their entire altitude being thus 142 ft. above the ground floor of the hotel. They are formed by a high-pitched roof, surmounted by a square platform, the latter being surrounded by ornamental iron railing. The roof of the Lime-street elevation, which rises to a considerable height, is Gothic in character, the apex being surmounted by iron railings, harmonising with those at the top of the north and south towers. The central portion of the structure beneath the towers forms a special feature in the elevation, being much more prominent than those portions on the north and south sides. At each end, under the two outside flanking towers, there is an oriel window, two stories in height, supported on arch carved corbels. The ground-floor windows, facing Lime-street, which are sixteen in number, there being eight on each side of the main central entrance to the hotel, are circular headed, whilst those in the upper stories are divided into bays, with square pilasters and caps, from which spring circular-moulded arches. The main entrance to the hotel from Lime-street is in the centre, immediately under the towers. From this entrance a glass roof, supported by ornamental iron columns, will extend across the footpath of the street to the boundary of the carriage-way.

As regards the interior arrangements of the hotel, our authority, the *Albion*, states that, from the basement to the roof of the building, the architect in his plans appears steadily to have kept in view the utilisation of every yard of space at his disposal. The whole of the culinary and domestic arrangements of the hotel will be conducted in the basement, which has been so planned as amply to provide for the several departments of management. These plans include the kitchens, larders, store-rooms, wine and beer cellars, linen-rooms, luggage-rooms, cooking apparatus, with steam-boilers and other requisites, together with a large ice-house and a great variety of minor apartments. The servants' dormitories, both male and female, will also be in the basement, a portion of which has been specially set apart for this purpose. Passing through the vestibule on the ground-floor, a spacious hall is approached, from which corridors run north and south, communicating with a spacious coffee-room, reading-room, ladies' coffee-room, several dining-rooms, billiard-room, and a number of sitting-rooms. By ascending a grand staircase from the large hall on the ground floor, the private sitting-rooms and bed-rooms in the upper stories are approached. The upper stories consist of upwards of 200 bed-rooms, in addition to a large number of spacious sitting-rooms for private families and others, besides an endless number of bath-rooms, closets, and other conveniences. The upper portion of the hotel will be reached by a hydraulic "lift," the apparatus for working which will be in the basement of the building. The hotel communicates direct with the railway station.

In the construction of the Lime-street façade, as well as those facing Lord Nelson-street and Gloucester-street, a stone resembling that at the municipal offices in Dale-street will be used, whilst the frontage inside the railway station will consist of white brick. Messrs. Haigh & Co., the contractors for the erection of this immense structure, are proceeding with energy. It is only a few months since they commenced the undertaking; and, although the removal of the railway façade in Lime-street formed part of the contract, it has not only been cleared away, but the basement is already in a forward state, the stonework facing Lime-street being above the street-level. Messrs. Haigh have undertaken to complete the building and hand it over to the company in the course of two years. The architect of the hotel is Mr. Alfred Waterhouse.

We may here state that the enormous new roof, the largest in the world, now being constructed over the Lime-street station by Messrs.

George Thomson & Co., contractors (Lieut.-Col. Thomson), is being rapidly carried forward. It consists of a roof of one span, the principals stretching across the station to the extent of 214 ft. of a segmentary span each, is 75 ft. in height from the level of the rails to the apex, and when completed will be 385 ft. in length. It will be supported by eleven principals, 35 ft. apart, above which is the roof itself, which is ornamental and well ventilated. Two of the principals, with the iron framework securing them, have been completed. The roof will be covered with Welch blue slate.

SHOP ARCHITECTURE IN BRADFORD.

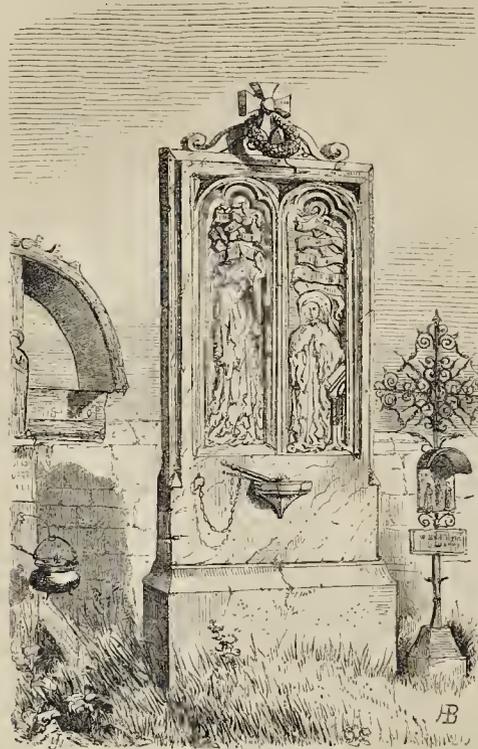

A FILE of buildings to be erected in that portion of Westgate, Bradford, recently widened, extending from Southgate to Godwin-street, has been just commenced. The buildings are intended to be used as a drapery establishment. The style selected is the French Renaissance, and the architects are Messrs. Andrews, Son, & Pepper. The area to be covered is 550 square yards, with a frontage to Westgate, including the angles at Godwin-street and Southgate, of 120 ft., and a frontage of 66 ft. to the latter street. The foundation has been hewn out of the rock. The building will be four stories in height, the top story lighted with dormer windows, and will measure 50 ft. from the ground to the parapet, towers rising at the angles 20 ft. above, and the outline being broken with angle chimney-stacks. The principal feature of the front of hasted work, and built of idle stone, with cleansed moldings) is a decorated window over the central entrance to the premises, crowned with a pediment. The windows of the shop, filled in with plate-glass, will be secured at night with iron revolving shutters. The shop, entered by a wide central doorway in Westgate, is 15 ft. in height. All complaint on the part of customers that they cannot properly see the goods is obviated by the light poured down on the back of the shop from a well-light, 45 ft. high and 13 ft. diameter. An office, placed on the mezzanine floor, will enable the principal to command at a glance a view of the entire ground floor. The building will cost several thousand pounds. Other premises are in course of erection in Godwin-street, but they are plain in design. Alterations are in progress at the corner of Well-street and Market-street, nearly opposite the Midland Station, where a frontage of 117 ft. will be secured to the best thoroughfare in the town, extending from Well-street round the corner into Market-street. The architects mentioned are superintending the work.

ANIMAL FOOD: ITS PRESERVATION AND ITS WASTE.

THE following mode of preserving meat in the hottest weather is given by a correspondent of the *Times*, who has tried it with success with the thermometer at 135°. The meat should be placed in a wooden box on a metal grating about 3 in. from the bottom. Under this grating should be burnt about an inch of sulphur stick as often as a joint is put in, the lid being immediately closed. It is convenient to have a sliding bottom to the box for facility of cleaning when necessary. The meat is perfectly good at the end of a week, and entirely free from unpleasantness of any kind.

This seems essentially to be the same as Dr. Dewar's sulphurous acid process, the fumes of burning sulphur being just that acid.

While saving processes are thus progressing, it is curious to note how waste for want of them proceeds in Australia. At the "boiling-down" establishment of the Messrs. Witter Brothers, at Colmahhah Station, Victoria, the sheep are collected in yards adjoining the wool-scouring shed, killed and taken into the shed attached to the dip, and then skinned and cleaned and hung up on hooks till the vat is ready to receive them. So soon as the vat is to be filled a number of hands are employed in chopping them into three or four pieces, and throwing them in. The vat is 11 ft. high, and holds 300 wethers or 400 ewes, and 1,000 of these are stewed by steam from a 40-horse power engine in forty-eight hours. When the fat has been all extracted it is drawn by taps in the side of the vat into large 500-gallon coolers. The gravy runs from a tap in the bottom of the vat into a reservoir

ANCIENT GRAVESTONE AT MOOSBURG, BAVARIA.

prepared for it, and is afterwards given as food to pigs, who luxuriate on what would be a great blessing for the poor in some of the large and populous cities in the old country. All the bones and shreds of meat that remain are drawn out and carted away to the same omnivorous herd. The bones are made so soft as to break in pieces in hand, the marrow being completely melted out of them. Casks are filled from the coolers, and sent by train to Melbourne.

ANCIENT GRAVESTONE IN CHURCH-YARD AT MOOSBURG, BAVARIA.

THE interesting little town of Moosburg, between Landsht and Munich, contains many objects worthy of notice. The minster is a noble Romanesque building of the very earliest kind. The interior bears a strong resemblance to the oldest portions of St. Alban's Abbey. The choir, which is not earlier than the fifteenth century, contains one of the most magnificent high altars in Germany. The reredos, carved in wood, is 60 ft. high, and adorned with statues varying from 2 ft. 6 in. to 8 ft. in height. The whole is richly painted and gilt, and contains pictures by the elder Holbein. The date of this magnificent work is 1426. There are a splendid set of stalls and several fine fifteenth and sixteenth century monuments. Near the minster is another church containing a singular western gallery, and just outside one of the gates is a small Romanesque church, surrounded by a very old cemetery. Two or three of the gravestones are ancient. The best is the one of which we give a sketch. It is carved out of a slab of red marble. On one side is a representation of the Annunciation,

and on the other an inscription, which is so defaced by time as to be nearly illegible.

The whole of the carving is in very low relief, but the drapery is well represented, though very angular in its folds, as is the case with all late German sculpture. Attached to this monument (and, in fact, to nearly every other in this cemetery) is a *bénitier* for holding holy water, and an *aspergès* brush chained to the gravestone. The upper portion of the monument has been modernised, and it is difficult to guess how it originally terminated. Very probably it had a "rood" and attendant figures.

Ancient churchyard monuments are very rarely to be met with, and we know of few other specimens.

Two or three monumental inscriptions, executed in brick, are let into the walls of the Cemetery of the Holy Blood at Landsht, and there are one or two old tombs in the cemeteries at Nuremberg and Saltzberg.

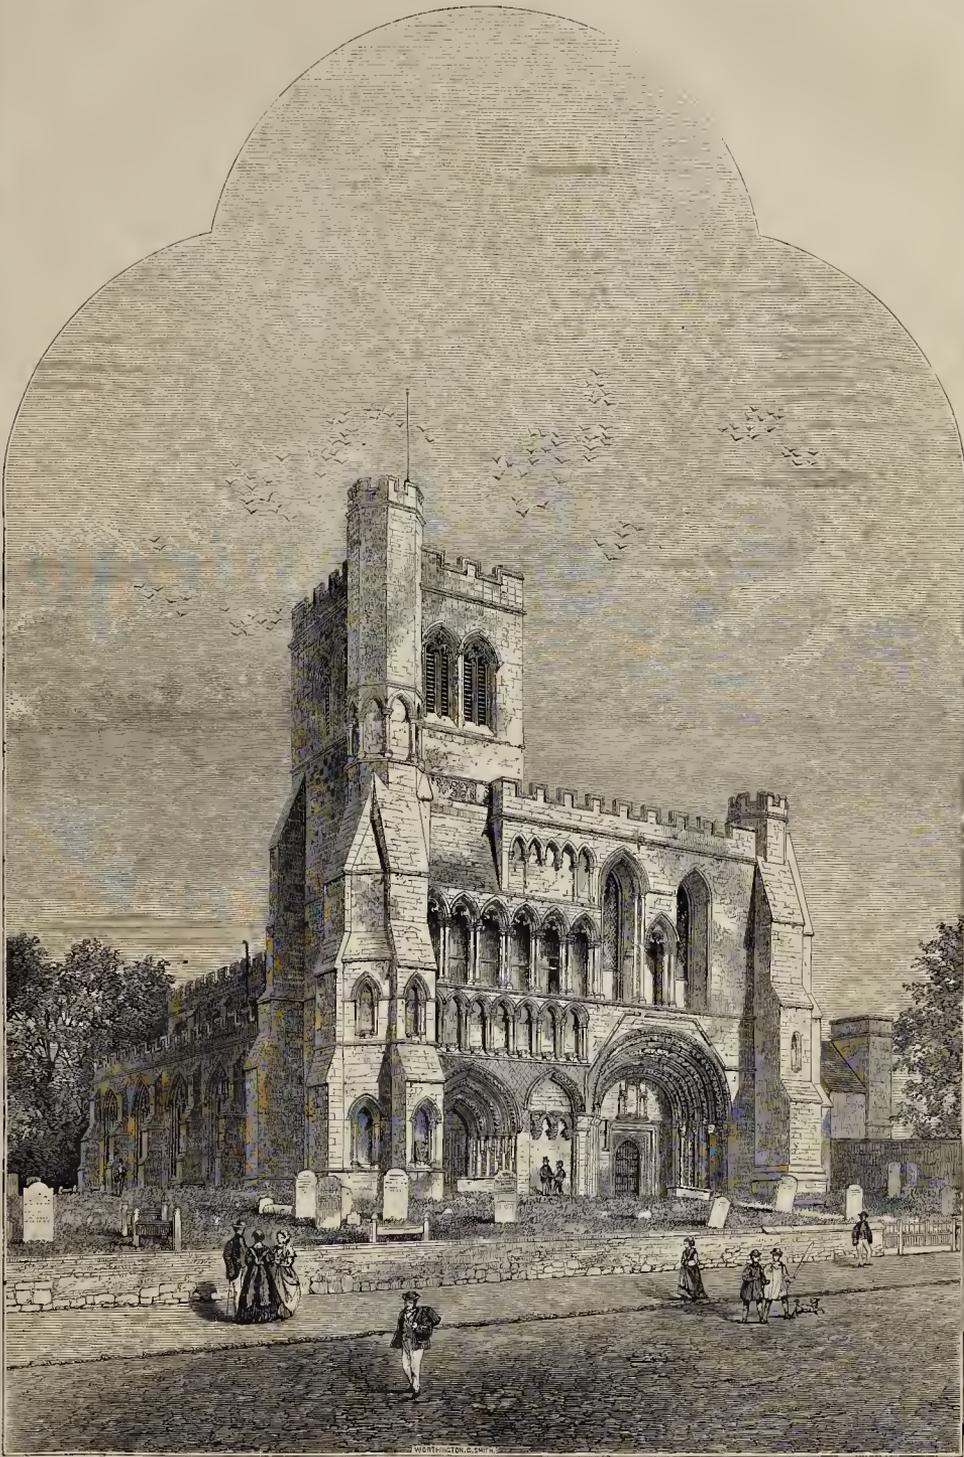

DUNSTABLE: ITS CHURCH AND NEIGHBOURHOOD.

Nor long ago, writing of Woburn and its neighborhood, we spoke of the ancient church at Dunstable and its interesting west front.* This we now illustrate, and would speak of it a little more at length.

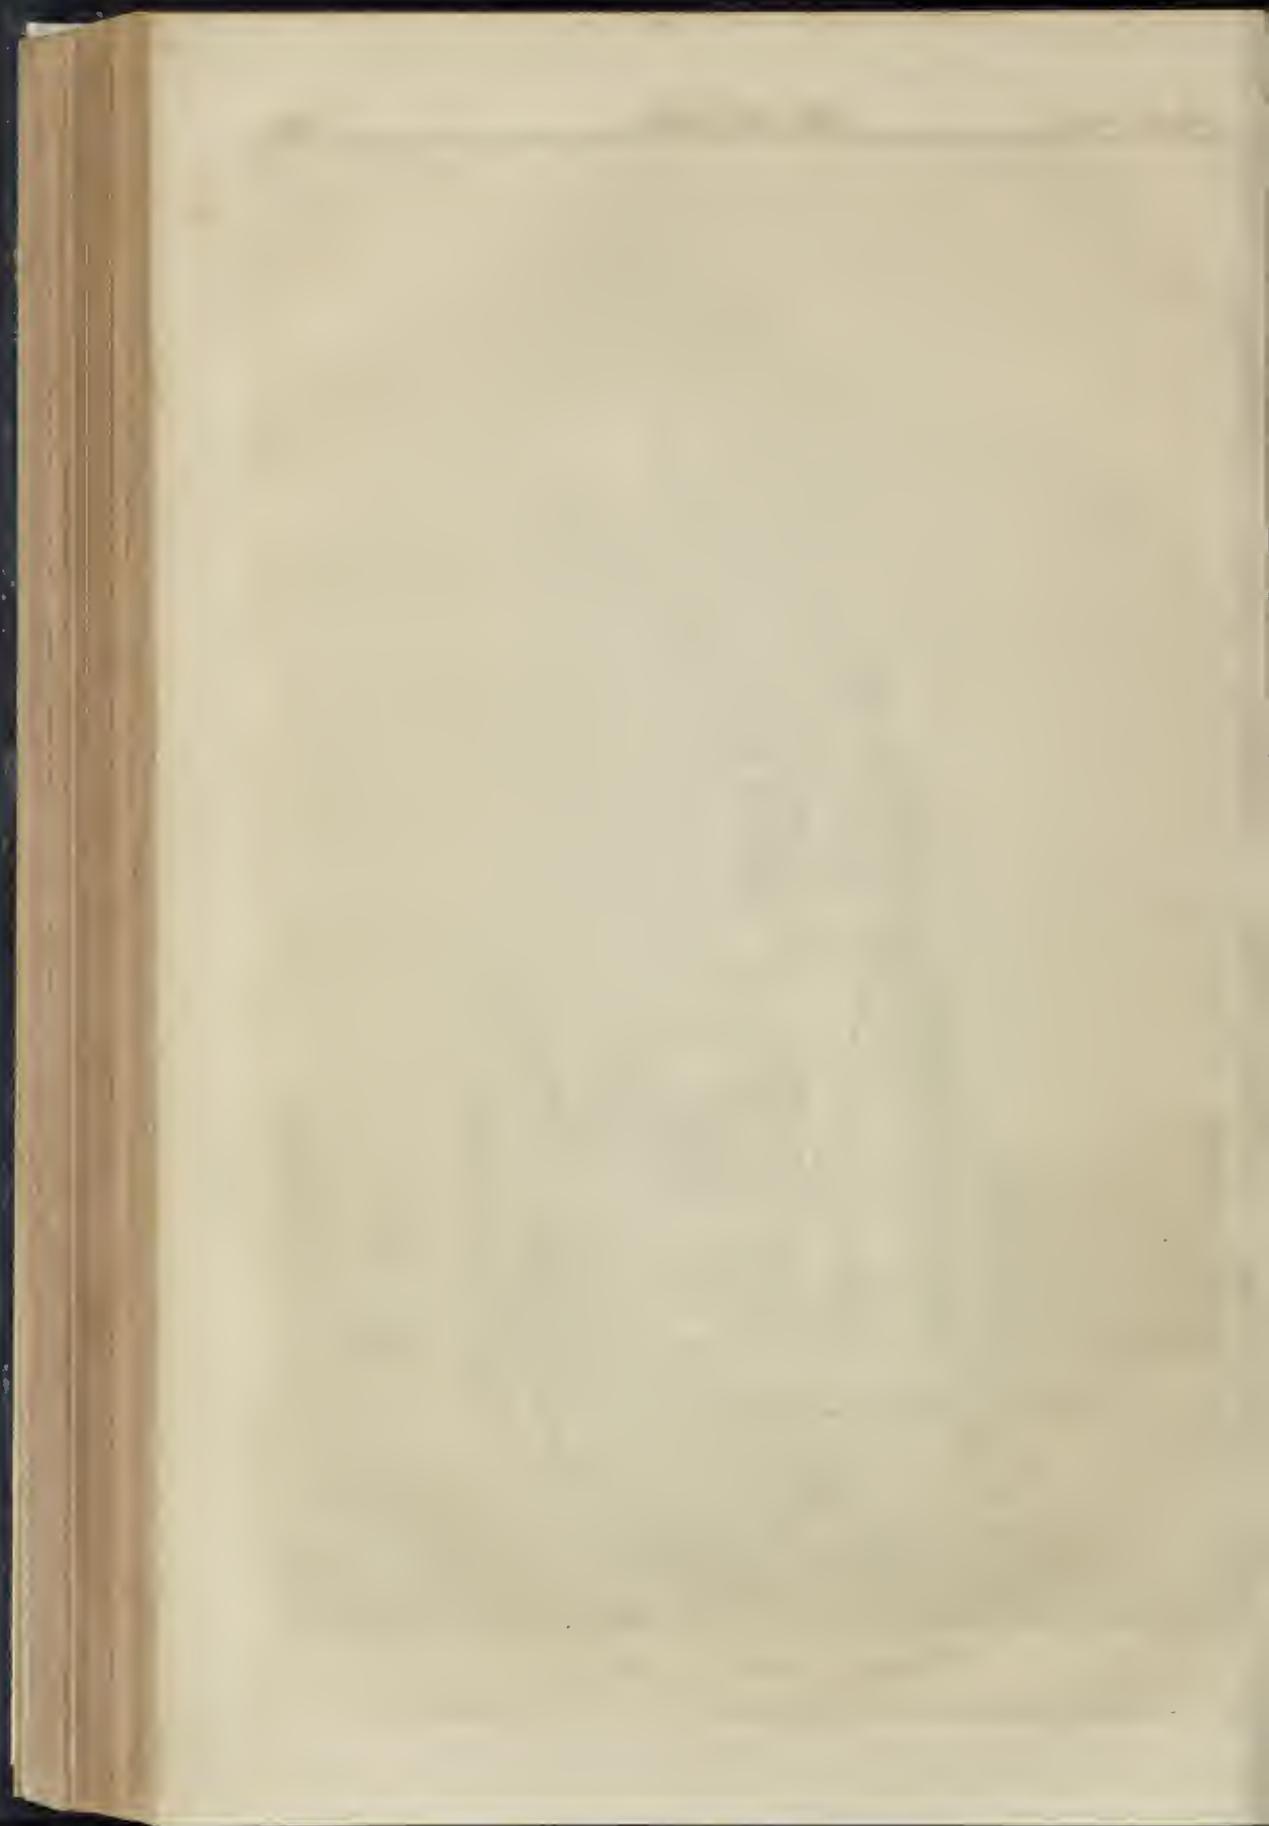

The "Dunstable Chartulary" (Harl. 1885) contains on one leaf the beginning of the celebrated "Annals of Dunstable" down to A.D. 552; it is written in a thirteenth-century

hand, probably the compiler's own. Preserved also among the Cotton MSS. in the British Museum is the continuation or single MS. folio on parchment of the Annals (Annales Prioratus de Dunstaplia), marked Tiberius A. 10: the handwriting is the same to the middle of the year 1210; then various hands are employed: after the year 1221 the entries in each year were probably made during the course of, or at the end of, the year itself. The Annals begin at A.D. 1, and the early entries are very curious, but, of course, are of no historical value: for instance, the first entry is, A.D. 1, "*Adam usque ad Nativitatem Christi*," &c.; and again (after a lapse), A.D. 33, "*Christus crucifixus est octavo Kalendas Aprilis*," &c. Coming to A.D. 606, we have (but always in Latin) "St. Paul's Church in London built;" and A.D. 1074, "Survey of England by William I.," and A.D. 1135, "Dunstable Priory founded." The MS. was very much injured by the fire in the Cotton Library in 1731, but it has been repaired with great care and skill. The earlier portion of the chronicle down to the year 1201, when it becomes original, is very brief. The author of this valuable historical work was Richard de Morins, prior of the monastery from 1202 to his death in 1242. Referring to the chronicle, we have "Richard de Morins made prior of Dunstable, and sent to Rome by the king on July 25, 1203." Under date 1203, we have "The lordship of Houghton given to this priory, and a three days' fair in May." (This fair in the month of May is held in the town to this day.) It is, however, very strange that Richard de Morins (beginning his chronicle in 1210) gives no account of the foundation of the priory, founded as it was in honour of St. Peter for Augustinian canons towards the end of the reign of Henry I. It was

* See p. 385, ante.

DUNSTABLE PRIORY CHURCH: WEST FRONT.

certainly not founded earlier than the middle of 1131, because Robert de Bethune, Bishop of Hereford, who is one of the witnesses to the foundation charter, was consecrated on June 28, 1131. Keeping still to the chronicle, we have, under date A.D. 1207, "Altars dedicated at Dunstable;" under A.D. 1208 mention is made of marriages and chrismings taking place at the church doors, and of a sermon being preached to the people outside the church, the "gans benedictus" and holy water being given to them there, and oil mixed with the chrism at baptism by the Pope's special licence. A.D. 1210, a vision of two Jews announcing the advent of Antichrist, seen by the prior; A.D. 1211, a red rainbow seen; A.D. 1212, miracles at Dunstable; A.D. 1213, the town burnt. During this same year (1213), and on the feast of St. Luke, the church was dedicated by Bishop Hugh II. of Lincoln. Altars in it were dedicated by Robert, Bishop of Lismore, in 1219, and by Hugh, Bishop of Ely, in 1231. In the great storm of June, 1222, which did so much mischief through the country, the roof of the presbytery and two towers of the west front of the church fell. In 1223 St. Mary's Chapel was pulled down in the Canons' Cemetery. It was pulled down in 1324, being then in ruins, and built up again from its foundations. In 1250 the inner gate within the court was built; a new dormitory in 1251, as the old one was in a dangerous state; and a new stable in 1257, on the fall of the old one. In 1273 the body of the church was restored at the cost of the parishioners; new bells were given in 1277; a new body to the bakehouse and brewhouse wall were built in 1282; a clock was placed over the "pulpitum" or choir-screen in 1283. In 1289 the parishioners finished two pinnacles on the north front of the church, and restored the stone roof, then in a ruinous condition, of the north porch. The great cross and many saints' effigies were repainted in 1293. During the plague of 1349 the parishioners gave a new bell, and the prior covered the belfry with lead. The reference to the two towers of the west front is very interesting, as at the present day there remains only the lower portion of the north-west tower. We believe, however, that the architect now engaged directed remains indicating the position of the south-west tower some years ago, an account of which was then published in the *Builder*. At the present day there are no traces whatever of the two pinnacles on the north front. The other references to the roof of presbytery, the Canons' Cemetery, the court, inner gate, dormitory, stables, bakehouse, brewhouse, and many other buildings and ornaments are of interest and value to the architect and antiquary.

Dunstable Church is a fine specimen of Norman and Early English architecture; but three centuries ago the building was cut down in all its parts, and only a portion of the nave was left, of which the triforium was made a clearstory, and it was covered with a florid Tudor roof. The structure, as it now stands, is in many respects perfectly unique, and is made up of Gothic work, ranging from the twelfth to the fifteenth century. It is the principal ecclesiastical building in the county of Bedford. The whole structure appears to have been built upon a very expensive and magnificent plan, and was originally in the form of a cross, with a bell-tower in the centre, supported by four lofty arches, parts of which, belonging to the eastern pillars, still remain. It is said that Henry VIII. intended to have made it a cathedral, and to erect it into a see, of which Dr. Day was to have been the first bishop. Upon the design being abandoned, a considerable part of the priory church was pulled down, and all that remains at present are the nave and two side aisles, a length of about 120 ft. The inside is chiefly Norman, and undoubtedly part of the original structure. Most of the windows are of a later date than the building itself. The east end is crossed by a flat wall, and the two nearest arches on each side form the present choir. A beautiful stone screen of four pointed arches, with clustered columns, ranges over the west door inside.

The west front, of which we give a view, is one of the most singular pieces of work in the country. The great Norman door, with its semi-circular arch and rich sculpture, was at one time a magnificent piece of work: now it is a mere wreck. The outer moldings are zig-zag work; the next, angels and foliage in alternate ovals; the third, beasts' heads and foliage; the fourth, the signs of the zodiac, &c., Pieces and Capricorn no long time ago being still there. The sill

is formed of an old coffin of Purbeck marble. The whole of this work is (or was) undercut in the most remarkable manner, and was in much better condition some fifty or sixty years ago than it now is, if we may believe one of the oldest inhabitants, who recently said to us,—"Ah! sir, you should have seen the door when I was a boy, and old Bob Eggleton was parish clerk. The carving was better then, but sparrows used to build their nests in the carving, and we boys used to go and throw large stones at the ornaments, and shuck the sparrows out." Then we often picked up a bit of a bird's wing or a beast's head carved in stone. As fast as we knocked one lot of sparrows out, they built again in the next ornaments; so we used to go and shuck them out again." This process of "whacking out" appears to have been carried on till there is now hardly a fragment of the original sculpture un mutilated to be seen. At this time the church was infested with jackdaws, starlings, owls, and harts; but their nesting-holes have since been filled up.

The lesser doorway, of Early English work, is in much better condition as regards the enrichments, but is nevertheless in a sad state of decay. The junction of the Norman and Early English work on the west front is very remarkable, and the character of the Norman ornament is almost unique in England. Above these doorways are seven niches for statues; the figures are all gone, but the pedestals remain. Above these is a second tier of open arcading leading to the bell-tower. Perhaps the primary use of this outer gallery was for the priest to ring the sanctus-bell when the Triagium was said, so that all persons, within and without the church, on hearing it might fall down on their knees in reverence of the elevated Host. The niches at the lower part of the north-west tower were formerly filled with statues, portions of which still remain. In the interior are a few tiles and memorial brasses. Of the latter many have been removed from their slabs and totally lost; and, as the original east end of the church has entirely vanished, the most costly and beautiful probably went with the building. In the north aisle is a slab which, though much worn, has undoubted traces of having been ornamented with a brass of great beauty, to the memory of an ecclesiastic. The size of the stone is about 10 ft. by 4 ft. Two other stones, which evidently were placed to commemorate departed priests, are to be seen: the largest is at the west entrance, just within the church; the smallest is placed without the church, near to the belfry-door. It was split some years since by the clapper of a bell, which flew out of the belfry as it was being rung, and fell on the stone. The brasses are both gone. Some years ago we copied the following inscription from a slab in the nave:—

"We now thor art not lost, but sent before
Thy friends all lette thy absence to deplore;
Nor can thy virtues ever be for gotten,
Thought in the grave thy corpse be did and rotten,
For yet t'onged crye to the ward must tell
That as they livest thou dyest, and that was well."

But the following is much more curious:—

"*He William Mulso, sibi quem sociavit Alice,
Mortuore sub dura cancellavit mora generalis.
Ter tres, bis quinos, hac natos fertur habere;
Per sponos binos Deus hi clemens miserere!*"

which may be rendered, "One general fate has enclosed here, under hard marble, William Mulso, and Alice his wife. She is reported to have had three times three and twice five children by two husbands, the Lord being merciful to commiserate." Many other inscriptions are of great interest, most of them dated.

The Priory Church is noted for its bells, and they bear the following inscriptions:—

- 1st Bell. "While thus we join in cheerful round,
May love and loyalty abound."
- 2nd Bell. "Peace and good neighbourhood."
- 3rd Bell. "Music is medicine to the mind."
- 4th Bell. "All ye who join with hands, your hearts unite;
So shall our tuneful tongues combine to
laud the nuptial rite."
- 5th Bell. "Wm. Coles & Wm. Exames, churchwardens,
1775."
- 6th Bell. "Although I am both light and small,
I will be heard above you all."
- 7th Bell. "If you have a judicious ear,
You'll own my voice is sweet and clear."
- 8th Bell. No inscription.
- Sanctus Bell. "*Ave Maria, gratia tibi!*"

Three bells especially deserve notice—1st, "The incumbent induction bell," rung the last time on June 1st, 1844, when the Rev. F. Hose, M.A., the present rector, entered upon the living; 2nd, "The pancake bell," formerly the confessional bell, always rung on Shrove Tuesday; and, 3rd, "The passing bell," which announces the death of townfolk.

A gorgeous ceremonial attended the consecration of the "sanctus bell." First of all, the bell was suspended from a scaffold, having a temporary arch erected near it, adorned with crucifix, candlestick, and pix. Around the bell were boys with white surplices, silver crosses, and elevated lanterns. After the curé had read a long declaration, various prayers were read, and an attendant priest laved the bell with a bunch of myrrh dipped in holy water; a ribbon was then tied round the clapper, the bell was anointed with oil by the curate, and under it various powders of powerful odours were burnt. Making use of the ribbon, the curé struck the bell three times with the clapper, and afterwards a lady, probably Matilda, daughter of Malcolm, King of Scotland, who was the godmother of the bell, if we may so speak, struck it in like manner. The clapper was then wrapped up in a napkin, the inside of the bell again fumigated and anointed, after which the whole party adjourned to celebrate Mass. In 1837 a man in a state of intoxication ascended to the helfry (when the bells were set perpendicularly for ringing), and went recklessly amongst them, the consequence being that one of the bells fell from its upright position, and crushed him to death against the wall.

A large number of interesting coins, in gold and silver, and other antiquities, have been found near the church and in the neighbourhood at different times. Amongst an immense number of Roman and other coins, we may mention one of Augustus Cæsar, B.C. 30; of Tiberius, of Trajan, Vespasian; a quantity of coins of Antoninus and Constantine; of Claudius Cæsar, Otho, Adrian, Commodus; ones of Probus, who reigned six years (rise of Manichean heresy); and many others unknown. Of the English series, a silver coin of Henry I., the founder, discovered between the stones of the old south wall of the church, near the vestry door; a coin of Henry III., three of Edward I., Edward III., Henry VII.; a shilling of Elizabeth; a coin of Charles I., one of the finest and most remarkable of the English series (it is the work of Rawlings, whose initials appear on the wall of the city of Oxford, on the obverse of the coin); a Charles I. shilling; and many others of various dates. An impression of the common seal of the priory, somewhat imperfect, is attached to the acknowledgment of apremacy in 1534, to be seen in the chapter-house at Westminster. It represents St. Peter with his keys, seated, and the legend round him is, "Sigil scolie sci Petri de Dunstaple."

Dunstable has always been noted for its old miracle plays, for its grand tournaments, and for its visits from kings and queens. Hallam, in his "Literature of Europe," says the earliest mention of miracle plays has reference to England. Geoffrey, afterwards Abbot of St. Alban's, finally teaching a school at Dunstable, inaugurated one of these shows on the story of St. Catherine. This was within the first twenty years of the twelfth century. Roscoe thinks there is reason to conjecture that the miracle play acted at Dunstable was in "dumbshoe." Warton, however, in vol. i., "Dessart," says Geoffrey was a Norman, his scholars were the actors, the performance took place in A.D. 1110, and he horrowed the copes from the sacrist of the neighbouring abbey of St. Alban's to dress the characters.

Leaving for the present the more modern history of the church and neighbourhood, we will glance at its most ancient remains. The original inhabitants of the locality upon which Dunstable now stands were a people called Cassii, who spread themselves sparingly over the counties of Beds, Bucks, and Herts, and proved to be no mean combatants with the powers of Rome. In the immediate neighbourhood of Dunstable are large ranges of steep chalky downs, and perhaps there is no part of our land where the relics of the earlier inhabitants can be better studied. Contiguous to the roads by these downs are the evidences of the aboriginal British stations, consisting of simple holes for residences formed in the chalk, with numerous tumuli. On the north-west of Dunstable, and about a mile and a half from the town, is an ancient Roman road, 25 ft. broad, in the most perfect condition. On one part of the downs, close to Dunstable, are five large tumuli, known as the "five knolls," with several circular and oblong excavations. This spot is one of the earliest British stations. Close to these knolls is Parscomb Pit, an immense hollow, whose sides still exhibit many remains of the ancient primeval dwellings. At the bottom is

an earthen platform, supposed to be a work of the Roman period, thrown up for the purpose of exhibiting gladiatorial feasts; the neighbouring hills would afford to thousands of spectators full views of the sports below. A group of primeval dwellings may be seen near the base of a hill on the road to Luton, averaging 8 ft. in diameter and 3 ft. deep. On the south-west side of Dunstable is an enormous earthwork, known as "Maiden-bower," 25,000 ft. in circumference. It consists of a single vallum thrown up from the external surface at an angle of 45°, from 8 ft. to 14 ft. high; and it is not improbable that originally a stockade was planted on its summit, composed of branches of trees intertwined. There are now no remains of a fosse. On the north-west side there is a gradual descent to the meadows below, where are the remains of mounds of earth, encircling the small streams which issue from the base of the chalk downs, and may possibly have been intended for fishponds, or as reservoirs or dams. It seems a natural inference that such small springs would be thus embanked to insure an abundant supply of water for the Cassii and their cattle. About two miles north-west from Dunstable, at Tottenhoe, is a lofty precipitous hill, with a summit of ramparted earthwork. It is in such a commanding position that, if defended by resolute men, it must have been impregnable. It consists of a lofty keep in the centre, with a vallum round its base, and a larger one of irregular form a short distance from it; on the summit of the hill are ridges of masonry placed in layers upon each other without mortar. Two Celtic coins and other antiquities have been found near. Close to Leagrave, three miles from Dunstable, is a fosse very deep and broad, describing a circle of 8,200 ft. This is probably the true site of Lygesburgh, one of the four British towns which fell into the hands of the Saxons A.D. 580. In the immediate neighbourhood traces of a hard-fought battle have been turned up in the shape of pieces of armour, spear-heads, and other weapons and armour, the entire valley, fields, and gravel-pits abounding with human skeletons.

King Henry I. kept the town of Dunstable in his own hands until 1131, when he granted it, with all its rights and privileges, to the Priory of Black Canons, or Augustine Friars, placed at Dunstable by permission of Pope Eugenius III. The king kept Christmas, 1123, with great splendour at his residence near the priory, receiving at that time an embassy from the Earl of Anjou. Henry I. kept Christmas here again in 1132; and his successor, King Stephen, in 1137. In the year 1215 (one year before his death) we find King John at Dunstable; in 1247 Henry III., his queen, Eleanor of Provence, and his family, visited the priory. In 1265 we find Henry III. and his queen, with Cardinal Attahon, again at Dunstable; and once more, in 1267, with Richard, King of Germany. In 1275, and again in 1276, Edward I. visited Dunstable. In the "Annales Prioratus de Dunstaplia" we now find accounts of grand tournaments held here, one in 1279, two in 1280, and another in 1289, all in the reign of Edward I. In 1290 the corpse of Queen Eleanor remained one night at the priory. At the spot where it rested in the market-place was erected one of the series of Eleanor crosses. It stood for 370 years, but there is not a fragment remaining now. The cross was erected the same year (1290) by John de Belle, a native of Battle. In 1293 there was another tournament, and a large bell was set up by the lepers.

In 1341 King Edward III. and his queen were at Dunstable, to be present at another tournament of great splendour, in commemoration of the victory over the French, in which two hundred vessels were taken, and thirty thousand men destroyed. In 1357 we find Henry VI. and Queen Margaret at Dunstable. On May 23, 1553, Archbishop Cranmer here publicly divorced Katherine, the unfortunate queen of Henry VIII., in the Virgin Chapel. Queen Katherine was then residing at Amphill Park, a few miles from Dunstable. In 1572 Queen Elizabeth visited Dunstable, and was entertained with pageants. Our present Queen has also visited the town.

We are indebted for a great deal of the information here produced, regarding the ancient church and neighbourhood of Dunstable, to the Latin reproduction of the "Annales Prioratus de Dunstaplia," by Henry Richard Luard, M.A., and to the "Dunstableologia" of Lamborn, added to our own knowledge of the whole neighbourhood.

Of late years we have visited the town and ad-

joining pastures and woodlands for its natural history and geological treasures, in which it is as rich as in historical antiquities. The butcher-hird or shrike we have often seen. Its curious work in the way of fixing cockchafers and beetles on the spines of hawthorn and other prickly bushes is observable. The kingfisher, too, one of the loveliest of British birds, is not uncommon near some watercourses by the town. Amongst other birds may be mentioned the great barn-owl, golden-crest, the wren, fieldfare, golden plover, bittern, curlew, red-shank, grosbeak, skua-gull, and many others. Of rare and curious plants there is an abundance; some of the neighbouring chalk hills produce the splendid pasque-anemone in profusion; the chalky plantations and hills give birth to a great variety of orchids. Here we have found the bee, the fly, the frog, gnat, butterfly, and birds'-nest orchids; the different species of epipactis, — *orchis mascula*, *maculata*, *ustulata*, *latifolia*, and many others. In Tottenhoe mead grow the grass of Parnassus, the butterwort, and adder's-tongue; at Kensworth, the green hellebore. The fungus tribe is represented by some of the greatest varieties; they may be found by the diligent searcher by the leafy roadsides in October, — one fine scarlet boletus, especially, has been found there, and described elsewhere by Mr. Worthington Smith (*B. rubinus*, W.G.S.), new to science, and which has never been found anywhere else. Of the abundant fossils from the chalk, one at least is quite unique.

The road between Dunstable and Leighton Buzzard is in one part remarkable. Originally the road (which diverges from the old Roman road) went right over the hill, and was so fearfully steep that it was next to impossible to get wagons and coaches over it. Then a road was made to the left of present cutting (less steep), but it is now grass-grown and disused. The road now used has a steep cutting through the solid chalk, perhaps 130 ft. deep, the *débris* being taken northward to fill up the valley and make the road good nearer Hockliffe. The cutting was, one severe winter, filled with drifted snow, and the road stopped for many days; it was at last carted away. Considering that this road was made some half-century ago, before railway times, it must be regarded as a brave undertaking.

From these few remarks it will be seen what historical and natural history riches are possessed by Dunstable. Returning for a moment to the church, the rector, the Rev. Frederick Rose, M.A., writes, — "There is danger of the present contract being suspended for the want of funds to cover the newly-restored internal stonework with the new roof." The external west front cannot be touched, from the same cause, although it is perfectly unique, and "a grammar of architecture in itself." What is now doing will be well done; but it is only a portion of much that ought to be undertaken at once. An appeal has been published to lovers of church architecture, and to those who take an especial interest in maintaining our ancient national edifices, for funds to aid in the restoration now being carried out under the superintendence of Mr. Geo. Somers Clarke. Large sums have been already subscribed by the rector and townsfolk, more than one person having given 200l. for that purpose. Let us hope that the good work will not be stopped for want of a little money to carry on the restoration of such an interesting national monument.

PARLIAMENTARY PAPERS FOR WORKING MEN.

The Working Men's Club and Institute Union have taken steps to obtain copies of important parliamentary papers, as they appear, in order to form a permanent "Parliamentary Library," and to place them at the service of the institutions which it is their object to aid and establish. They particularly desire that artisans who are members of clubs in London should have access to these papers. By the assistance of some members of both Houses of Parliament, they have already collected several documents of this kind, and on every Monday evening their offices will be open from eight to ten P.M., when the member of any London club who is not in arrears with his subscription, may, under certain conditions, borrow any paper, or refer to it at the office. The council of the above society rightly believe that the means of access to important

"Dine Books" will be of great service to all who take an intelligent and an active interest in public affairs. They believe that the discussion and treatment of all public questions would be far more satisfactory, because more accurate, if those taking part in them had the means of ascertaining the facts which can only be found in these reports. It is not creditable that the metropolis should not contain a single library of reference of this kind, and the "Union" have increased their claims to public support by this sensible step. Clubs in the country, subscribing five shillings a year to the circulating library of the society, will be entitled to borrow copies of these publications, as well as thirty volumes of general literature every three months. To form a library of such works as are not generally accessible to working men, and to circulate them to clubs throughout the country, at a mere nominal charge, is an undertaking which the council are very anxious to carry out. Persons may do good by supplying this library with copies of suitable books.

PARTNERSHIPS OF INDUSTRY.

At a recent meeting for discussion held at 150, Strand, under the auspices of the Working Men's Club and Institute Union, the value of industrial partnerships was considered, the question being whether there was evidence that a system of division of profits between master and workmen in a trading concern could be maintained, so as to conduce to the welfare alike of workmen and capitalists. The discussion was opened by Mr. E. Hall, F.S.A., a member of the council of the Union, who has given much attention to the subject in France. Mr. Hall's observations went to show that the question between the trade unionists and others in the previous discussion was left in a most unsatisfactory state, and had not resulted in showing how the great mass of the poor, or lower working class, were to be provided for; but that there were measures of palliation which might end in being remedial, and as to the value of the immediate introduction of which there was ample evidence, such as he had to offer. After a brief reference to arbitration and conciliation, which he distinguished from one another, saying that the value of measures aiming at the former was doubtful, whilst the feasibility of conciliation was completely proven (as by the fact that the majority of cases before the *Conseils des Prud'hommes* were settled not judicially), he spoke of the principle of co-operation between workmen, and contrasted it with that of competition, quoting from a *mémoire* by Blanqui, read in 1816 before the Academy of Moral and political Sciences of the French Institute, and from later expressions of opinion. Considering, however, that co-operative undertakings amongst workmen alone were impracticable in the large majority of cases, because some amount of accumulated saving or capital was necessary at first, he inferred that the chief means of promoting the interests of the working classes, and the consumer with the capitalist also, for some time to come, must be looked for in associations based on the principle of a division of profits between the master and the workmen. The question before them was, — Was there evidence that such associations could be maintained? He was provided with evidence, derived from the existence of one such partnership since the year 1842; and that association was now contributing to the solution, not only of the question that was then prominent, but to that of other questions among the most important of the time. In that trading concern, the house-painting establishment of M. Leclair in Paris, not one of the conditions predicted as operating to the destruction of partnership relations between a master and his workmen had ever troubled the harmony between M. Leclair and his subordinates.* As to management, the point on which it had been predicted that such partnerships must break down, there was no lack of it; whilst M. Leclair, in answer to Mr. Hall, with reference to the assertion that such concerns could not get through periods of commercial disaster, had said he could not imagine why they should do so less successfully than partnerships of the old kind. Whilst there was no lack of management in M. Leclair's case, there was no concealment of the state of the common business and property; and Mr. Hall

* A full account of this establishment, and of the system pursued, was given in the *Builder* some years ago, at a time when the possible value of such partnerships was less generally admitted than it is now.

mentioned another partnership, similar to that of the Maison Leclaire, wherein there was a provision for examination of the books by representatives elected by the workmen. The results in M. Leclaire's establishment were briefly these, as the chief:—1. Entire freedom since 1842 from strikes; 2. A partition of the profits, in two equal parts, between M. Leclaire and an associate of his on the one hand, and the workmen on the other hand; 3. The maintenance of a provident society for cases of sickness and accident, old age, widowhood, and orphanhood; 4. Diminished sickness, from the nature of the house-painter's occupation, by the use of methods that had been tried in this country, following M. Leclaire, but had been here abandoned; 5. Superior execution of the work, and opportunity given to the public to test the execution; 6. Improved demeanour of the workmen, of which there was the highest testimony; and 7. Education of apprentices and others in the craft, with courses of lectures and social réceptions, tending to render permanent the relations, and to secure the advantage of all. There were, however, the speaker urged, more extended results possible from co-operation than were immediately deducible from what had been said of the success of a single trading establishment. In France M. Leclaire looked to one of the most important spheres of co-operation as in connexion with agriculture; and he was already actively engaged in the promotion of one such undertaking in the commune of Herblay, near Paris, of which he was maire.

The meeting was subsequently addressed by Mr. Lloyd Jones, Mr. Charles Hole, Mr. Lilwall, and several workmen, most of the speakers looking forward to a change of the relations between the labourer and the capitalist as inevitable. The discussion will be resumed on the last Thursday in this month.

TREAT TO THE WORKMEN AT THE ABBEY MILLS PUMPING STATION.

FROM Monday to Thursday of the previous week the members of the several vestries and district Boards of the metropolis had visited the Abbey Mills Sewage Pumping Station, on the invitation of the Metropolitan Board of Works. On Friday in last week another class of visitors inspected the works, Mr. Webster, the contractor for them, having invited a number of friends, and also the various classes of his workpeople engaged in rearing the works, their wives and families, to inspect them. The premises having been thrown open to those invited, and the steam-engines and other parts of the works inspected, the company then proceeded to a large tent provided for the purpose, where Mr. Newton, the chairman of the Main Drainage Committee of the Metropolitan Board of Works, and other members of the Board sat down at a cross table at the side of Mr. Webster, the visitors being in front, and the several classes of labourers, excavators, carpenters, bricklayers, masons, painters, &c., being ranged at tables at each side, and provided with a substantial meal. At the conclusion of the repast Mr. Newton remarked that the object of their meeting was to give the workmen engaged on that great work a treat, and also do honour to Mr. Cooper, who was the resident engineer, and the representative of Mr. Bazalgette, who had taken such an important part in carrying out the works. Mr. Webster said it was a proud day for him to see a thousand happy faces around him, some of which he had known for twenty years. He acknowledged the valuable services rendered to him by Messrs. Jennings and Powell, and also Mr. Halkin, the artist. Afterwards the tables were removed, and dancing and singing were enjoyed.

TAYLOR'S BRIDGE COMPETITION, CAMBERWELL.

THERE were forty-two sets of designs sent in, in response to the advertisements offering premiums of 21l. and 10l. 10s. The vestry selected as the four best "Audentes fortuna juvat," estimated cost 2,100l.; "Pontifex" (No. 2), 2,412l.; "Datnr Dignoi," 2,450l.; and "Vox Vectis," 1,496l. After the selection had been thus made, but previous to the motto envelopes being opened, a competitor ("Pontifex") addressed a letter to the chairman of the Purposes Committee on the subject of his estimate, and, not content with signing himself "Pontifex," he

added his official address. On the occasion of the final decision by the vestry it was moved "That 'Pontifex' should be excluded from the competition," or "that he should be placed third in merit." This occasioned a sharp discussion, but on its being shown that there were two "Pontifexes" in competition the motion was withdrawn. The vestry then decided that the designs of "Audentes fortuna juvat" and "Pontifex No. 2" should be the premiated sets, and on the envelopes being opened it was found that the authors were Mr. J. Dredge, 10, Buckingham-street, Strand, and Mr. J. W. Smith, 7, Westminster-chambers, Victoria-street. It was also then seen that Mr. Smith was the "Pontifex" who so narrowly escaped exclusion.

PRIZES TO ART-MASTERS.

THE Lords of the Committee of Council on Education having, by a minute dated the 3rd of January, 1868, offered prizes—viz., one sum of 50l., three sums of 40l., five sums of 30l., ten sums of 20l., and twenty sums of 10l.—to the head-masters of the schools of art in the United Kingdom in which the general amount of work, considered with reference to the number of students under instruction, should be found, after the examinations, to be most satisfactory; and having had the results of the recent examinations laid before them, have awarded the above prizes as follows:—

Chas. D. Hodder, Edinburgh	£50
J. S. Rawle, Nottingham	40
J. P. Bacon, Stoke-on-Trent	40
Edwin Lyne, Dublin	40
D. W. Reimach, Birmingham	30
Edw. R. Taylor, Lincoln	30
W. G. Muckley, Manchester	30
C. M. Clarke, West London	30
Luella Gunn, Bournemouth	30
W. L. Casey, St. Martin's	20
Susan A. Ashworth, Edinburgh	20
Joseph Kennedy, Kidderminster	20
John Sparkes, Lambeth	20
Robert Greenless, Glasgow	20
John Anderson, Coventry	20
Herbert Gilbert, Lancaster	20
Walter Smith, Leeds	20
George Ryles, Westminster	20
S. F. Mills, Spitalfields	20
James Ford, Macclesfield	10
J. S. Groppel, France	10
John N. Smith, Bristol	10
F. M. Black, Kilmarnock	10
W. H. Boucens, Sheffield	10
Samuel Elton, Darlington	10
James Carter, Hanley	10
F. F. Hosford, Llanely	10
William Stewart, Paisley	10
Alexr. Macdonald, Oxford	10
W. H. Stopford, Halifax	10
W. C. Way, Newcastle-on-Tyne	10
John Parler, St. Thomas, Charleston	10
W. J. Baker, Southampton	10
J. B. Birkenmyer, Exeter	10
Robert Cochrane, Norwich	10
Peter Chaudler, Hull	10
W. T. Griffiths, Ipswich	10
John Finnie, Liverpool (South District)	10
R. C. Puckett, Bath	10

ANOTHER "CAMBRIDGE THOUGHT"

Alas! that feet by "seedy Cam" that stray
Should gladly turn to strife's unallotted way!
Alas! that eyes which scan these classic meads
Hail Discord's promise in her scatter'd seeds!
That ears which "neath the lofty Tudor vault"
Drink in high music, still are so at fault!
To deem the trumpet "sings" which shrieks to scorn
Old Wisdom's utterances—vain to warn!
Not such the lore on Cam's still margin taught.
Hear some few truths with long experience fraught,
Old Time old Error for new Truth shall see;
Hard reasoning makes the black seem white—not be;
The man's gray hair is still the worst;
Who feed the bubble, Change—shall feel it burst.

SENIOR BOX SARKEN.

MONUMENTAL.

The Clyde Statue.—A statue of Lord Clyde, erected by public subscription of the citizens of Glasgow, has been publicly unveiled in George-square, in that city, in presence of a large concourse of spectators. Sir James Campbell, on behalf of the statue committee, formally handed over the monument to the city corporation, and the Lord Provost, in a few suitable remarks, accepted the trust. The statue, which has been executed by Foley, occupies a site close by that of Flaxman's Sir John Moore. It represents Lord Clyde in a military nodding, standing erect with left foot advanced. The left hand, grasping a telescope, rests on the stump of a palm-tree, while the right, hanging by the side, holds a sort of velvet cap, encircled with an Indian veil.

Statue of the late King of the Belgians, at Antwerp.—This statue has been inaugurated with great rejoicings. Leopold I. is on horseback, and in the act of saluting. The monument is of bronze, and is the work of Joseph Geefs. The pedestal is of blue stone, the stone of Belgium. Four inscriptions are engraved on it; the first reads thus: "The commerce and population of Antwerp to Leopold, the First King of Independent Belgium. Voted, 1856; erected, 1868."

Monument to Archdeacon Phelps at Reading.—A mural tablet in memory of the late Archdeacon Phelps has just been erected in Grey Friars Church, Reading. The tablet is fixed to the south wall of the nave, and is supported on stone corbels. The general feature is a foliated arch, resting on two dark marble columns, and enclosing a panel of white marble bearing the inscription. The monument is executed in red Mansfield stone, and is designed to harmonise in style and character with the architecture of the church. The tablet was designed by Mr. Woodman, architect, and the work has been executed by Messrs. Wheeler, all of Reading.

THE ELEVATIONS ON THE HOLBORN VIADUCT.

It has been stated in the Times that the utmost freedom and variety are to be allowed in the architecture of the buildings about to be erected on the line of the Holborn Viaduct; there appears to be an impression that this will scarcely turn out to be so practically. A "Lover of Variety," writing to us, says,—"I have felt bound to inquire particularly as to the facts. The conditions (printed) bind the lessee to submit an elevation within two months for the approval of the committee. He is to make any modification that the City architect may direct; and if no elevation is submitted the City architect is to make one, to which the lessee must bind. If one party take a portion only of a block, he is to agree with his neighbours as to the elevation, and the City architect is to approve or direct an elevation of his own to be adopted by all the workmen, so as to secure uniformity. The blocks are very long indeed, as a rule. I am perfectly satisfied that the intention is not to permit variety, as pleasingly depicted in the Times article, but to hedge the matter round with such restrictions as will produce uniformity, and that of the design prepared already. The conditions may be seen by any one at the architect's office, Guildhall. As to their practical operation, there are more than one architect already who could tell you a story."—We shall hope to find that uniformity will be avoided.

THE HOLBORN VIADUCT AND ITS PROGRESS.

SIR,—In July, 1865, tenders were sent in for the City architect, Mr. Horace Jones's, plan for the Holborn Viaduct. The lowest was that of Messrs. Myers, and the work was, under very heavy penalties, to be completed in nine months from the order to commence. Amount of Messrs. Myers's tender, 239,537l.

In May, 1866, tenders were sent in for the engineer to the Commissioners of Sewers, Mr. William Haywood's, design for the Holborn Viaduct. This design did not include the bridge over Farringdon-street (which Mr. Jones's did). The lowest tender was that of Messrs. Hill & Keddell, 99,837l. This tender was accepted, and on Monday, June 4th, 1866, the work was commenced.

The plan of the bridge across Farringdon-street was settled in the Court of Common Council, on December 6th, 1866. Its cost (afterwards ascertained) is to be under 15,000l. The ironwork only of the bridge is to be by Messrs. Cochrane, Grove, & Co., of Woodside Ironworks, near Dudley.

So, sir, we see that the carrying out of Mr. Jones's plan would have cost, in round figures, 240,000l.; the carrying out of Mr. Haywood's, admittedly inferior, will be 115,000l. These are the constructional costs of the two schemes. But Mr. Jones's viaduct would have been finished and open for traffic (and the ground in a relettable state) in the middle of 1866—nine months after commencement. When Mr. Haywood's will be finished Heaven only knows. It has already been twenty-six months in hand.

In a report of Mr. Joseph Cubitt, who was

consulted in the matter by the Improvement Committee, of which Mr. Deputy Fry is chairman, Mr. Cubitt says that "a reasonable time for the completion of the viaduct would be fifteen months from the date of the order to proceed." This report was received by the Improvement Committee on December 19th, 1865.

The great excuse is that the stone for the bridge is not ready. I will make no remark on the unwise selection of an unprocurable stone for a work which required to be done rapidly. But assuredly there is much more of the viaduct besides the bridge to finish.

Nor will I intrude on your space by quoting from the reports which have from time to time been made to the Corporation and to others as to the immense yearly loss which was inflicted on the public by old Holborn-hill when in its integrity, though I have some of the reports before me. Of course the annual loss now is much greater.

Some day I shall be glad to be allowed to describe the street which is to "wander" from Bartlett's-buildings to Ludgate Valley-circus. Gresham-street is crooked enough, but this street—bah!

JASPER.

RAILWAYS AND THE PUBLIC.

THE article in the last number of the *Builder* under the head of "Railway Fares and Management" induces me to address you the accompanying remarks. It is now about four months ago that you were good enough to notice a pamphlet* I had published on the subject, and since then events have occurred which I think render what I then considered advisable (viz., the transferring the whole system of railways in the United Kingdom to the State) now an urgent necessity. Not that the attempt lately made by the southern railways to impose upon their daily customers when once the directors imagined they had fairly caught them in a trap needs the interference of Government, for I fully believe the inhabitants in those districts will be equal to the occasion, and be able to bring the companies to their senses, but that the possible recurrence of such a course would retard, and in fact altogether prevent, the suburban building schemes which were just commencing to effect so much good for London and other over-crowded cities. This would of course recoil upon the shareholders, who would ultimately be ruined; that is their own affair, but the evil done to the community at large by such impolitic, I might almost say dishonest, measures must in future be guarded against by the State.

The only way that this can be effected is, that all the railways should be united under one management. Without this no considerable saving can be made, and the system cannot be developed as it ought to be; no Boards representing different, and in many cases conflicting, interests, can ever be made to work for the public benefit. The interests are national, and the management, to be effective, must be national also.

The scheme I have briefly sketched out in my pamphlet would prove equally advantageous to the shareholders, the travelling public, and the community at large.

RAPHAEL BRANDON.

THE INFLUENCE OF FOREIGN ARTISTS ON BRITISH ART.

YOUR publication of the discussion of this subject at the Institute of Architects, so far as it referred to principles, gives me the opportunity, which I embrace, of replying to some of the remarks of the speakers who followed me.

I think Professor Donaldson correctly states that the leading object which Mr. Wyatt seemed to have in view was this—"To follow out and to give us the history of the artistic training of the mind, which eventually produced the invention or adoption of a new style of art altogether." It did not appear to me that he succeeded in doing so much as this, and in particular that the assertion he made at the outset respecting the "decrepitude" of the Perpendicular period of English architecture, as compared with subsequent efforts, was unwarrantable, and, though unintentionally, yet really a falsification of the facts of the case. So far from this, I ventured to assert, and beg now to repeat, that no sub-

sequent style in England ever attained to such a "vigorous manhood;" at the same time I am, of course, aware that, judged from a purely artistic point of view, the earlier periods of English Gothic architecture were more elegant and refined, but they had their counterparts on the Continent, whereas the Perpendicular style is unique, and is nowhere else to be found.

"It is curious to observe," says Ferguson in his "History of Architecture," "how different the course of events was in France. While Saxon common sense was gradually coming to the surface in this country, and curbing every fancy for which a good economic reason could not be given, the Celtic fancy of our neighbours broke loose in all the playful vagaries of the Flamboyant style."

The glory of this age of art was its independence of all the world, its self-reliance, and carelessness of its own architectural precedents, with all their numberless claims of matchless beauty—its strong and manly persistence in working out its own ideas of beauty of form and colour, and modes of expression and impression. Granting every defect to exist which our more recent culture has alone enabled us to detect growing out of, and incidental to, the technical excellence of its marvellous masonry and carpentry; *individuality* never was more clearly stamped upon the architecture of this country than at that very period which Professor Donaldson and Mr. Wyatt agree to consider the period of its culminating decrepitude.

The recognition of this historical fact was the chief justification of its employment in the new Houses of Parliament. We had nothing else we could equally claim as a national style of art.

Is there any subsequent style that would bear the same archaeological investigation and yield such rich acclimated fruits, while admitting of the introduction of all the science of the nineteenth century? Will Sir Christopher Wren's Abbey towers bear a moment's comparison? and however sublime his reproduction of Italian architecture undoubtedly is in St. Paul's Cathedral, it is *Italian still*, and cannot be said to be more original or vigorous than Sir Charles Barry's reproduction of English architecture in the palace of Westminster, which alone is *English still*. The problem of ecclesiastical Roman art had been already worked out in Italy, while Barry had to secularize Medieval art and adapt it to a building of the most complex character of modern times. Barry resuscitated a neglected but *national "true style"*. Wren produced an English version of an Italian rendering of a Roman prototype. Therefore I still think I am justified in expressing the opinion that as a matter of fact there is no sufficient evidence given that the architecture of the period in question was in a "state of decrepitude" or that the architecture of Jones and Wren has greater claims to be considered as having attained to a "vigorous manhood." The peculiarities of the style, more especially as they affected fenestration, are thus admirably summed up in that truly philosophical and rigidly impartial history Ferguson's before quoted, which peculiarities should have commended it to those who cannot believe in "sentimentality in any shape."

"It may not be quite clear whether William of Wykeham (1368-1404) invented perpendicular tracery; but certain it is that the admiration excited by his works in this style at Winchester, Oxford, and elsewhere gave a death-blow to the Decorated forms previously in fashion. Although every lover of true art must regret the change, there was a great deal to be said in favour of the new style. It was pre-eminently constructive and reasonable. Nothing in a masonic point of view could be better than the straight lines running through from bottom to top of the window, strengthened by tracings where requisite for support, and doubled in the upper division. The ornaments, too, were all appropriate, and, externally at least, the whole harmonised perfectly with the lines of the building. Internally, the architects were more studious to prepare forms suitable by their dimensions and arrangements for the display of painted glass than to spend much thought on the form of the frames themselves. The poetry of tracery was gone, but it was not in this respect that we miss the poetic feeling of earlier days. The mass was gradually taking the guidance of the work out of the hands of the educated classes, and applying the square and the rule to replace the poetic inspirations of enthusiasts and the delicate imaginings by which they were expressed."

What Wren achieved, however, was an example of the faithful following of a *noble ideal* triumphing over the narrowness of the times in which he lived, and the debased state of the arts in this country which had resulted from Henry's introduction of the imitative styles and patronage of foreign artists in the sixteenth century. The Great Fire of London gave the occasion, and enabled Wren to rise to be the greatest architect of his age; and, considering the difficulties he overcame, "right royal" is a happy appellation by which to designate his achievements. Of his works we have good reason to be proud, and

need nothing but his own monument over his tomb to vindicate his power. If Henry had patronised Englishmen, giving them all the means of self-improvement he had himself enjoyed, what might they not have achieved? Instead of this, he ignored their existence, and fostered foreigners, introducing a system of art-larceny as demoralising as it was vain. Till then art had developed for good or ill from one native phase to another. Thereafter it was made a matter of merchandise, and was bought and sold ready made, and borrowed plumes were accounted more valuable than native worth. The power was there, independent thought and technical excellence; it needed only opportunity and time to further develop itself as knowledge increased. Henry was too impatient, and killed the goose to get the golden eggs all at once. The following title of an Act which received the royal assent in the thirty-first year of his reign does not say much for the liberality of his mind—"An Act for abolishing diversity of opinions, &c."

Mr. Wyatt reiterates an apparent truth when he says that "embodiments of beauty were given to the world by men given up to vices and evil passions;" but his statement of an apparent fact is beside my argument. I do not deny that bad men have produced splendid specimens of art; but I affirm that they cannot reach the *highest*. I believe that their works would have been nobler, sublimer, diviner, nearer to nature, and sweeter to observers, had they been executed under higher ideas or ideals, and that no art deserving the epithet of a *new creation* is possible that denies the necessity or ignores the influence of the exercise of the noblest part of our nature, of which it should be the visible expression. But this seems to me so obvious, and is, to a certain extent, admitted by Mr. Wyatt, that I need not add another word in reply to Professor Kerr, who "takes leave to criticise in what is (I hope, I may say, without being at all offensive) not the most elevated style of criticism that can be adopted under the circumstances."

EDWARD C. ROBINS.

A LONDON WANT.

WITH some reason a correspondent, "J. T. D.," writes,—A mania for theatre-building seems to have set in, and capitalists are found willing to speculate largely in this very doubtfully profitable field of enterprise. Meanwhile, those who have the means of supplying something London positively needs, and which fairly managed could scarce fail to pay,—a good hall or several halls for lectures and meetings in the heart of the metropolis and the more dense and demonstrative of the outlying boroughs, such as South-wark and Lambeth and the great East-end,—make no effort in the right direction. Could not you point to the neglect with a view to its being remedied?

THE SCIENCE OF COLOUR.

SINCE I wrote the letter you were good enough to insert in the *Builder* of the 8th inst. I have obtained Mr. Benson's book, which I have read through carefully. It well deserves perusal, being a very interesting work, containing much subject for consideration, and many coloured diagrams, illustrating his natural theory of colour. But though I admire the ingenuity and ability with which this book is composed, I more strongly than ever contest its correctness. I do not believe that blue, green, and red are the primary or fundamental colours of light. I am not convinced by any of the experiments. On the contrary, I cite this strong illustration. If you look through a prism on a page of the coloured diagrams on a black ground, you will perceive a strong reflection of blue above every example. If you look at the same examples on a white ground, you will see a reflection of deep yellow over each. Thus, yellow is to white what blue is to black. How can you ignore yellow and retain blue as a primary?

I lay no claim to a philosophical knowledge of the subject, but I have the opinion that light emanates from electric action; that the positive pole is represented by yellow deepening to orange and red, and the negative by blue intensifying to violet.

As to the experiments made by a piece of plate-glass bringing the reflection of one colour upon another, I consider them most interesting

* "Railways and the Public."

and most inconclusive. It is true that if you reflect the yellow upon the blue you produce a grey tone, but that is probably caused by the opacity of the yellow shading, and not commingling with the blue; a deep blue, on the other hand, seems to have little power when reflected on the yellow, and alters it but slightly.

I will not attempt to enter further on this subject at present, it would take up too much space in your valuable paper; but I have felt bound to respond to the appeal of Mr. Benson in your last number.

JOHN G. CRACE.

SEA-WATER FOR TOWNS.

A CORRESPONDENT—J. F. Wadmore—repeats a suggestion before now made in our pages—

Reading the paper in your last number on the insufficient and defective state of our water supplies, in all places, but chiefly in our large towns and manufacturing districts, reveals a state of things in this our nineteenth century which, with all our luxuries, shows a want of one of the first necessities of our existence.

It has often occurred to me, and must have done so frequently to others, that much of this waste might be saved, and the health of many of our towns greatly improved, by the use of sea-water, where practicable. For instance, baths and washhouses, when used for the purpose of ablution, and in the case of road and street watering, flushing of sewers, and other kindred purposes. There are of course many places where the levels would be an insuperable objection to its adaptation, but in others ordinary hydraulic appliances might be made available for its transit; and a stationary engine-house, at intervals, calculated according to heights and distances would, either with a canal or iron pipes, be all that was necessary to insure an abundant supply.

With respect to the metropolis, it would not be necessary to go further than Herne Bay, and in Liverpool a less distance would suffice; and a reservoir on Shooter's-hill, Hampstead, or other spots, would have sufficient elevation for the supply of the greater portion of our great city.

With regard to the expense, I do not conceive that it would be more than any of our similar works, and might form a fit and proper object for the Metropolitan Board of Works to carry out, seeing that it would be greatly for the common good, and, in a sanitary point of view, of incalculable benefit to all classes, whether rich or poor.

On the walls of the heltry are four tablets, on which are recorded certain exploits of the "College Youths" and "Cumberlands."

The present ringers, who are members of the Cumberland Society, attend for practice every alternate Tuesday evening, the faithful steeple-keeper, Mr. John Cox, being the conductor.

THOMAS WALESBY.

WALWORTH COMMON ESTATE COMPETITION.

SIR,—In your paper of the 8th instant you inserted a letter sent to the guardians by the unsuccessful competitors, protesting against their award, premiums having been given to plans which in several important points did not comply with their printed instructions, and, at the same time, asking them to appoint a professional man to go through the plans and decide on the merits.

Enclosed I send the reply received from the clerk to the Board, and, as it is evident that any further appeal to them on moral or equitable grounds would be utterly useless, the only course left open to us is to take such legal steps to enforce a fair adjustment of our claims as we may be advised.

A. G. HENNELL.

The clerk, in reply, forwards the following:—Resolution: "That the Board have already decided the question, and see no reason to reopen it."

SIR,—No doubt in competitions of this kind one or two competitors will be dissatisfied with the result, and will vent themselves through the columns of a newspaper, and after which the profession cannot shut their eyes to such facts, and competitors complain of a great injustice being done to them, and expose it by every means in their power, and by a formal protest published in many journals calling upon the Board of guardians to do them justice by re-considering their decision, and pointing out to them their mistake, it becomes a very different matter indeed, and the public, as well as the profession, are naturally well looked for a satisfactory explanation.

But what has been the result? The guardians of St. Mary's, Newington, have refused to give these gentlemen any satisfaction beyond telling them "the matter is decided."

I would ask, is this the proper course for a public Board to adopt? and are they at liberty to induce, by advertisement and printed instructions, a number of professional gentlemen to expend two months of their time, and money, in getting up plans for an honest competition, to find that the only two plans out of twenty-two sent in which have not complied with those instructions, are pronounced of inferior merit, are the ones to which the principal premiums are awarded, and then to be told the matter is decided?

Is there no redress for such injustice? Are the rate-payers aware of this fact? and do they agree with the selection made by the guardians (which has been pronounced by every notice I saw the plans to be most outrageous)? I cannot believe it.

E. R.

COLOUR BLINDNESS.

CAN you or any of your correspondents inform me whether there is any remedy for what is termed "colour blindness"? In my case I cannot, with confidence, distinguish some greens from browns or drabs, although when they are all together I can see the difference, but not apart. Is there any artificial means of producing the effect of gas or candle light upon green? If so I could tell a green at once by its bluish hue. I can, without the least difficulty, distinguish every other colour, whether compound or primitive. If you could give me any information on this difficulty you would greatly oblige

A DECORATIVE ARTIST.

THE GRASS IN THE PARKS.

SIR,—I am anxious your useful journal should draw the public attention to the state of the ornamental grass in the parks. Great pains and expense were expended in making the garden in Hyde Park, between the Marble Arch and Stenhope Gate. The grass which makes good a contrast to the flowers when kept green and close, has a very dull brown appearance, not from the great heat, but from the carelessness of those who have the charge of it. When watering the flower borders, the men water the ribbon borders with a watering-pot, treading daily on the same spot. The consequence is that the grass is entirely worn away. There is a long hose used daily on some of the beds—why could it not be used here? On the opposite side of the road, the old reservoir was made a quasi-ornamental garden, with sloping grass sides. To protect this bank, iron railings were placed, but children would make this a playground, and the principal amusement seems to be to run up and down the bank till nearly all the grass has disappeared. Again, the new fountain, erected by a well-intending Censor, has plots of grass at each angle, equally protected by iron railings; but this is tempting to get over; consequently, from the children playing on the plots, the grass has disappeared. Nothing is prettier than a nicely-kept garden; but nothing so invitingly neat as an unscrupled one. If the expense of maintaining these gardens in a proper condition is too great, let them be done away with, and let the flowers and ornamental grass be reduced to such dimensions as funds will allow. A new hobby has sprung up on the south side, which is most carefully tended; but do not let the old love be neglected when, with a little pains, we might get an ornament. Let us not lose on idleness.

AN OLD SUBSCRIBER.

THE PROPOSED MORTUARY, ST. MARY-LEBONE.

THE following is the official description of this establishment, as furnished to the vestry of St. Marylebone by its chief surveyor, Mr. T. Gant Browning:—

"The style of the building is to be very plain Egyptian, 23 ft. long, 18 ft. wide, and 17 ft. high, the walls of brick-work stuccoed, and the floor of stone, covered in by an iron roof, which will have the centre part only filled in with rough glass. The other portion of roof, measuring nearly three-fourths of the whole area, will be covered in with slates, hoarding, and felt.

For the purpose of admitting fresh air to the floor level, there will be a trench the whole length on each side of the building, covered with an iron grating; each trench will have five communications with the external atmosphere by means of air-bricks.

For the escape of vitiated air there will be an opening at least 3 in. wide all round the eaves of the roof, and the upper part will be entirely open, but protected from rain by means of a projecting frame glazed with rough glass, and kept sufficiently high to admit of a very free escape of the impure air which may ascend into the upper part of the roof."

CONSPIRACY AND INTIMIDATION BY MASONS.

THE first sentence on "picketing" has been pronounced on the case of the Sheffield masons, charged by their employer, Mr. James Powell, with conspiracy and intimidation. This was the case tried at the Midland Circuit, in the Crown Court, Leeds, before Mr. Justice Lush, in which John Sheridan, Isaac Morton, John Morton, Henry Hinchcliffe, James Butler, Alfred Staley, Joseph Armstrong, and Daniel Sanderson were indicted for unlawfully conspiring together to injure James Powell in his trade as a mason and builder, by molesting, obstructing, and using threats and intimidation to such workmen as might be willing to be employed, and also with prejudicing, injuring, and oppressing James Powell in his trade, and with detaching certain workmen from continuing to work for him at Sheffield, on the 15th of April, and on other dates. The indictment contained twenty-five counts, varying the statement of the offence.

For the prosecution it was stated that Mr. James Powell had contracted to build a house at Sheffield, and had a quarry about six miles from the site of the building. He found it more convenient to dress the stone at the quarry than to carry it to the building in the rough, and there chip and dress it. On the first day he attempted to carry out this plan two of the defendants, Sheridan and Isaac Morton, came to see him, and informed him that the course that he was pursuing was contrary to their code of rules. He replied that their rules were nothing to him, and he should pursue his own course. Sheridan said there was a builder who had refused to set according to the rules, and he had become a ruined man, and was obliged to leave that part of the country. He added that he did not mean this as an intimidation. The following day Mr. Powell's men struck. He told them that unless they returned to work before the following Monday he should find others to do the work. He then sent to London for workmen, and eight men came. They were to come to work the following morning. They did not come. They had been spoken to, and advised not to work for Mr. Powell, as it was a "black" job. There was a club held at the Dog and Partridge public-house, where the men from London were invited to go, and where they went, and were advised not to work, and persuaded to leave the town, and received a few shillings to enable them to leave. On the road from the lodgings of the London men to the building there were men standing as pickets, and there were often small crowds of men standing about and shouting, "Bah! black sheep!" but these ceased as soon as Mr. Powell looked round. The eight men all left Sheffield without doing any work. Mr. Powell afterwards procured three others from London. They went to work the first day, but the following day they also were persuaded to go. Large placards were posted about the town, which was a "Notice to Stonemasons," advising masons not to work with Mr. Powell, as he had broken one of the rules. Advertisements were also put into two Sheffield newspapers to the same effect.

It appeared that there was a rule of the Masons' Union that piecework should not be done, and the defendants appeared to think that the having the work done at the building instead of at the quarry would be in the nature of piecework.

At the close of the case for the prosecution Mr. Seymour, Q.C., submitted that there was no evidence of a conspiracy to do an unlawful act.

His Lordship said there was a question for the jury if men put themselves in a road and shouted for the purpose of making others think they would be molested: the question for the jury is *quo animo* the act was done. It must be by some threat or intimidation—that is, by some working upon the fears of the party.

Mr. Fitzjames Stephen, Q.C., submitted that there was no evidence of an agreement to do an unlawful act. The presence of the men at the club and the advice they gave Mr. Powell, and so giving him the money, so also was the placard and the advertisements. With respect to shouting on the road, no one was present at the time except Hinchcliffe.

His Lordship still thought the case ought to go to the jury, but he thought there was no evidence of any threat or intimidation to the master. The case would therefore be confined to intimidating or molesting the workmen.

Mr. Seymour, Q.C., having addressed the jury for the defendants.

The Judge summed up the law and the facts with great care, and the jury found three of the men—Armstrong, Hinchcliffe, and Sanderson—guilty of intimidation. On pronouncing sentence, the Judge said,—My learned colleague and myself have considered the circumstances of your case with a view of determining what sentence we ought to pass upon you, and we have come to the conclusion that we cannot deal with you as he (Mr. Baron Bramwell) dealt with the prisoners whom he tried at the Old Bailey some time ago for the same offence. The question of picketing came then for the first time before a criminal court—its legal quality had not previously been declared—and at the close of a long trial the defendants and the other members of the union to which they belonged expressed themselves satisfied that they had com-

THE BELLS OF ST. BRIDE'S, FLEET STREET.

THE beautiful steeple of the Church of St. Bride—or St. Bridget—by Sir Christopher Wren, contains a melodious peal of twelve bells in D, the weight of the largest bell, or tenor, being 28 cwt.

These bells, as intimated in my former paper on the peal at St. Martin's, were cast by Abraham Rudhall, of Gloucester, and they respectively bear the following inscriptions:—

1. Prosperity to all our benefactors. A.R. 1719.
2. Prosperity to all our benefactors. A.R. 1719.
3. Michael Evans, Frel. of Westminster, and Vicar of St. Bride's. 1719.
4. A.R. 1719.
5. John Eocking, Thomas Colborn, Churchwardens. S.K. fecit, 1736.
6. Abraham Page and Phillip Robinson, Common Councilmen. S.K. fecit, 1736.
7. Abraham Rudhall, bell-founder. 1719.
8. Peace and good neighbourhood. God save the Church and Queen.
9. Prosperity to all our benefactors. A.R. 1710.
10. Abraham Rudhall, of Gloucester.
11. Prosperity to England. Mr. John Grainger, Mr. John Hathaway, churchwardens. Mr. Andrew Redgate, Mr. John Jackson.
12. A.R. 1710.

The bells Nos. 3 to 12, forming a peal of ten, were made in 1710, and Nos. 1 and 2, making a peal of twelve, were cast in 1719.

The fifth and sixth bells were re-cast in 1736, by Samuel Knight, of London, founder of the grand peal at St. Saviour's, Southwark.

As I have said, the first and second bells of the present peal of twelve were cast in 1719. I may add that "they were purchased with the joint subscriptions of the 'College Youths' and 'Loudon Scholars,'—afterwards, 'Cumberlands,'—for their own practice, and were kept secured from the use of other ringing societies some time afterwards by means of a chain affixed to each bell."

mitted a breach of the law. Moreover, they saw they could not adopt the practice of picketing, so as to be of any use to themselves, without violating the law, and they therefore gave an assurance that the practice should be discontinued for the future; and upon that ground it was that my learned colleague felt himself justified in discharging them without passing any sentence at all, merely getting them to enter in their own recognisances to appear for judgment when called upon. You (to the defendants) have deliberately, and with knowledge of the case to which I have just been alluding, attempted to practice picketing; and you have done it, according to the finding of the jury, upon which I must act, by means of intimidation and annoyance, and therefore brought yourselves within the criminal law. I can readily believe what was stated by your counsel, that you took legal advice before you so acted, and that you intended to keep yourselves within the limits of the law. But I cannot sympathise with persons who, for the purpose of injuring another, intended to go to the verge of the law, and happen to be betrayed beyond it. I hope this will be a warning to you and others not to enter upon a practice so perilous, because you cannot say how far you may be led beyond the point marked out for yourselves. I feel bound to pass a sentence upon you in order to deter others from following your example, and to teach you and others that the law, while it will protect you to the full in the enjoyment of your rights, will also compel you to respect the rights of others. The sentence upon each of you is, that you be imprisoned for four calendar months.

CASES UNDER METROPOLITAN BUILDING ACT.

NOTICE TO DISTRICT SURVEYOR.

Of the 31st ultimo, at the Clerkenwell Police-court, Mr. Cumber, one of the partners in the firm of Messrs. John Nutt & Co., the contractors for the erection of Lisington new work house, appeared in answer to a complaint preferred against him by Mr. John Turner, the district surveyor of the eastern division of Lisington, under the Metropolitan Building Act, for that he had not given him a proper and sufficient notice, under the 38th section of the said Act, whereby he was unable to carry out the duties of his office in reference to public buildings.

Mr. Joseph Turner, solicitor, in stating the case on behalf of the district surveyor, said that the district surveyor had written to Messrs. Nutt & Co. in reference to the insufficiency of information given in the notice, and requesting them to submit the drawings and plans of the proposed work for his approval, and had also laid the case before the superintending architect of the Metropolitan Board of Works, who had communicated to Messrs. Nutt & Co. that the usual practice of builders was to give the district surveyor, in such cases as this, copies of the plans, &c., and that as they had still failed to supply that information, and the building was in course of erection, he, the district surveyor, therefore deemed it necessary to take these proceedings, and contended that the notice given by Messrs. Nutt was not a sufficient notice, inasmuch as "the area, height, &c., of the proposed building or buildings" were not given, and that consequently it was impossible for the district surveyor to approve of the construction thereof, as required by the 38th section of the Act, which provides that "every public building, including the walls, roofs, floors, galleries, and staircases shall be constructed in such manner as approved by the district surveyor."

The notice given was then put in. Mr. Cumber, on the part of Messrs. Nutt, admitted the insufficiency of the notice, but submitted they could give no further information, as the plans and drawings were not in their hands, and the architect to the building had prohibited any copies being made of them. An adjournment was agreed to, at the suggestion of the magistrate (Mr. Barker), to enable the defendants to supply the necessary information and particulars.

At the adjourned hearing of the case, on the 14th inst., it was stated by the solicitor that some further particulars had been given to the district surveyor of the buildings in course of erection, but that these were not sufficient to enable him to approve or object to the construction of the buildings. Mr. Cumber said Messrs. Nutt had written to the Board of Guardians, acquainting them of these proceedings, and requesting that copies of the plans might be forwarded to the district surveyor, and that the district surveyor had been informed the plans might be inspected at the clerk of the works' office on the ground, and that they had never before been required to furnish such plans, &c.

Mr. Barker expressed his sense of the hardship it was upon Messrs. Nutt to have to supply particulars, &c., which they had not received from the architect, and that he should have arranged by this time to give the information necessary for the district surveyor, and he decided the notice was not sufficient, and imposed a penalty of £5, and 2s. costs.

PROVINCIAL NEWS.

Framlingham (Suffolk).—The people's hall here, which, with its staircase, turret, &c., forms a conspicuous object on entering the town from the railway, has lately been opened. It comprises large hall, reading and committee rooms, and other conveniences. The works have been executed under Mr. Sugden, of Leek, architect, by Mr. Bedwell, of Braddeston, near Wickham Market.

Leek (Staffordshire).—The guardians of the Leek union have decided on the erection of male and female fever and convalescent wards, with nurses' rooms, baths, &c., in connexion with the union workhouse at Leek. The arrangements of the proposed new buildings include such provisions as the experience in hospital construction of late years has shown to be indispensable in such buildings. Mr. Sugden, of Leek, is the architect.

Newham.—The Severn Bank Hotel, Newham, has been opened. The building consists, on the ground floor, of a vestibule hall and corridor, from which access is obtained to a series of rooms devoted to what is called the "service" of the hotel—viz., bar, manager, porter, still-room, larder, china pantry, staircases, &c.; and down a few steps are a spacious kitchen, scullery, cook's pantry, larder, and coal and wood stores, &c. For the visitors there is a coffee-room, 40 ft. by 22 ft., and a commercial and smoking room, with a billiard-room. A balcony runs round the river front, from which are obtained views of the Severn and surrounding scenery. There is a roomy staircase to the first and second floors, and on the first are three large sitting-rooms, each communicating with bedrooms, and four other bedrooms, with bathroom conveniences, housemaids' closet, &c. The next floor contains ten bedrooms. The elevations are executed in red brick, with Bath stone dressings. The grounds are only partially laid out, but it is intended to form terraces. The building is fitted up with hot and cold water on every floor, and gas. The contract for the works was taken by Mr. J. Coleman, of Cheshill, builder. The architect under whose superintendence the works have been carried out is Mr. A. W. Mahery, of Gloucester.

Scarborough.—The commissioners of the piers and harbour of Scarborough have received twenty-three plans from engineers for the proposed extension of the harbour. The following list shows the names of the competitors, with the estimates of cost of their respective schemes: Cabitt, Westminster, 22,000l. and 25,000l.; Cox, Westminster, 5,482l.; Whitaker, Lambeth, 16,000l. and 21,000l.; Shelford & Robinson, Westminster, 16,752l.; Haughton, London, 45,180l. and 19,885l.; A. Scott, London, 14,481l.; Forrest, Westminster, 23,511l.; M. Scott, Westminster, 19,000l. and 25,000l.; Pain, Westminster, 16,972l.; J. E. Dowson, Scarborough, 7,700l. and 18,620l.; Henslow, Lynn, 35,016l.; Wise, London, 25,000l.; Casbourne, West Hartlepool, 11,348l.; West, Boxmoor, 52,416l.; Cooper, Leeds, 30,203l.; Lang, Manchester, 28,000l., 40,000l., and 52,000l.; Donl, Westminster, 30,000l.; J. D. Climie, Scarborough, 15,228l.; J. Austin, Scarborough, 17,135l.; Nisbet, Sunderland, 7,500l. and 9,500l.; W. Climie, Scarborough, 14,460l.; Redman, Westminster, 18,000l. and 24,000l.; Lintock, Liverpool, 14,600l. With but two or three exceptions, the several schemes do not differ very widely as to the proposal in the main, which was to erect a new pier to the west of the present western pier, the latter and the island pier to be removed.

Great Yarmouth.—The Octagonal Tower at the Trinity Works, rising to the height of 75 ft., is now completed, and, from its position at the south end of the town, forms a conspicuous object. The view from the summit is extensive. The contractor was Mr. Bennett, and Mr. Williams superintended the works.

Holywell.—The corner-stone of the new wing of the Girls' Orphanage at Pantasaph, near Holywell, has been laid by Lady Clare Feilding. The new buildings are from the designs of Mr. Edmund Kirby, architect, Liverpool.

CHURCH-BUILDING NEWS.

East Aclam.—The ancient parish church of East Aclam, dedicated to St. John the Baptist, having become very dilapidated through age, was some time ago pulled down and a new edifice has been erected on the same site, and was lately opened for divine worship. In style of architecture the new church is Early English. It consists of a nave and chancel and western tower. The porch is on the south side of the nave, and the vestry is on the north side of the chancel. The roof is high pitched and open timbered, and covered in with grey slates. The nave is fitted up with open seats of deal wood stained and varnished, and they are provided with book boards. The stalls in the chancel are of oak, and so are the pulpit, lectern, and reading-desk, the former standing at the entrance to the chancel on the north side, and the two latter on the opposite side. The altar-rail of oak is supported by iron standards, and underneath the east window is the reredos, which is composed of encaustic tiles of various patterns, and in the centre is a cross. This is the work of Messrs. Maw & Co., of Broseley, in Shropshire. The new structure has cost about 1,250l. The whole of the stone and sand which have been

used in the erection of the new church were gratuitously given by the Crown, from the estate in the parish belonging to the Woods and Forests. The extreme inside length of the church from the east wall of the chancel to the west wall under the tower, is about 80 ft., the width of the nave is 25 ft., and the breadth of the chancel 20 ft.; the height from the floor to the apex of the roof being nearly 40 ft. The windows have all trefoil heads, and are filled in with cathedral glass, and have coloured margins. The east window is of three lights, that in the centre being much larger than the side lights. The west window is of two lights, and those in the side-walls of the chancel and nave are lancets, and also of two lights each. The font, which is of Caen stone, is situated between the porch and the tower on the south side of the nave. The flooring is laid down with coloured tiles.

Womersley.—The ancient church at Womersley, after being closed for twelve months, during which time it has been restored, has been reopened for divine worship. Mr. Crossland, of Leeds, a pupil of Mr. Scott's, has carried out the restoration. The entire flooring has been lowered about a foot, the previously buried bases of the pillars brought to light, and the defaced and almost obliterated capitals restored. The whole interior of the building, which is a mixture of the Norman and Early English styles, and appears to have been built in the thirteenth century, during the transitional period of architecture between the Norman and English, has been so scraped and renovated as to considerably lighten the appearance of the dull and heavy masonry. Various unsightly objects, in the shape of an ugly gallery and high-backed pews, have been removed, the latter being replaced with the more modern open sittings, and re-arranged so as to increase the accommodation of the building,—seats being now provided for about 230 persons. A number of old round Venetian windows in the chancel, south aisle, and transept have also shared a similar fate, and the light is now admitted through some Decorated ones, in which, however, the general style of the architecture of the building is carried out. In addition to this the chancel has been improved by a stained glass window, by Hardman, which has been put in by the Hon. Stanhope Hawke. The subject chosen for illumination is the Resurrection of our Lord, which forms the centre, and on one side is a representation of His appearance to Thomas, and on the other of His appearance to Mary Magdalen. Another stained glass window, by Gibbs, but not yet completed, presented by Lady Louisa Cator, is also to be put in at the opposite end of the church. An organ, costing upwards of 200l., and entirely paid for by the parishioners and their friends, has taken the place of the less pretending harmonium. This has been built by Mr. Brindley, of Sheffield, and is placed in a side chapel. The screen-case is constructed to suit the church, and the front pipes arc decorated.

Weymouth.—St. John's Church has been enlarged. The nave has been prolonged 15 ft., and the transepts extended 6 ft., besides being made double the original width and divided by arcades. The chancel has received an extra length of 9 ft., and a chancel chapel has been added, also a porch facing the Preston road, while on the opposite side have been built vestries for the clergy and choir, and also an organ chamber. The enlargement has secured accommodation for about 320 persons. Mr. Dodson was the contractor. The enlargement has given an opportunity to various benefactors to beautify the church by memorial windows inserted in the chancel and transepts, in addition to the two windows placed in the east and west ends of the edifice, the former by Captain Hawkins, and the latter by the present incumbent. The windows in the north and south sides of the chancel have been bestowed by Mr. W. Thompson. The northern represents the meeting of the Saviour and Mary Magdalen in the garden. The southern portrays the three women going to the sepulchre, after the Lord's resurrection, and being met by the angel, who addresses them, "Why seek ye the living among the dead?" These windows were executed by Messrs. Ward & Hughes, of Solo, the makers also of the western window. Dr. Smith has also placed two windows in the south transept. One of these represents the principal personages of the *Te Deum*. The other window has for its subject the 4th chapter of Revelations—St. John beholding the throne of God in heaven, with the four-and-twenty elders worshipping, and the seven lamps of fire burn-

ing. In the north chancel a stained window symbolises the raising of Lazarus from the dead. The other window remains unfiled, except by rough glass. The last-named stained window was supplied by Lavers & Barrard, of London. The reredos has been backed with Portland stone, and will shortly be illuminated with the commandments, &c. The chancel aisle is distinguished by moulded shafts, the only occurrence of this class of sculpture throughout the church. The choir stalls in the chancel are of plain oak, with carved poppy-leaves at the ends. The organ has been removed to the chamber on the side opposite where it formerly stood. The chancel has been raised 3 ft., and the space within the communion-rails 18 in. A new chancel arch has also been built, with the capitals carved with foliage. The church has been plastered throughout, the roof cleaned, and the pews re-varnished.

Liverpool.—The foundation-stone of a new church, to be called St. Nathaniel's Church, for the Windsor district, Toxteth Park, has been laid. The site of the church has been chosen in Oliver-street, occupying a central position in the midst of a dense population. The site is irregular in shape, being bounded on three of its sides by Pine, Grove, Oliver, and Dinorchen streets, in consequence of which the architect's arrangement of plan has been somewhat restricted. The general form of the building is that of a nave and aisle church, with western tower, chancel transepts, and large circular chancel apse, the whole width of nave. One of the transepts is devoted to children's seats, and the other to the organ-chamber and vestry, &c. The nave and aisles are divided by an arcade of four arches, which support a lofty clearstory. The roof of the church will be constructed in the form of a barrel vault, without tie-beams, and is designed for painted decorations at a future period. The seats, one-half of which are to be free and unappropriated, will be of open benches. The structure is intended to be built entirely of brick, no plaster whatever being used. The tower and slated spire will be carried to a height of 110 ft., and will form a prominent object from the surrounding neighbourhood. The style of the edifice is twelfth-century Gothic, partaking much of the character of the brick erections of Northern Italy, and dependent for effect rather upon proportion and simplicity of detail than ornamentation. The cost of the edifice complete will be about 3,600*l.*, accommodation being provided for about 750. The contractor for the works, which will be completed by March next year, is Mr. William Murphy, the architect being Mr. David Walker, Liverpool.

Hulme.—The foundation-stone of St. Stephen's Church, Gloucester-place, Hulme, has been laid by the Earl of Ellesmere. Since the schools and master's house were built, a parsonage has also been erected on the adjoining plot of ground. The group of buildings is now being completed by the church, which is rising on the site at the corner of Gloucester-place and the City-road. Its plan is simple, consisting of a broad nave of three bays or arches in length; aisles, which are carried on round the west end of the nave; a chancel, the full width of the nave; chancel aisles; organ-chamber; vestries, &c. The roofs of nave and chancel are on the same level, and the point where they meet is marked by a belfry or *flèche*, that will rise to a height of 86 ft. from the ground. The chancel is turned towards the city road. The wall, to a height of about 18 ft., will be unpierced by window, door, or any opening, but will be relieved by a brick arcade. The chancel window is of large dimensions, being about 30 ft. high by 15 ft. wide. The chancel gable will be about three times as high as the two-storied house adjoining. The architects are Messrs. Medland Taylor and Henry Taylor.

Kildale, in Cleveland.—The Church of St. Cuthbert, at Kildale, in Cleveland, has been rebuilt, and re-opened for divine service. The old fabric, now demolished and supplanted by the present structure, was very old and dilapidated. At first it was thought that it might be restored and enlarged, and, as it consisted only of a nave and chancel, that a north aisle might be added, and some portions of the chancel repaired. Mr. G. F. Jones, of York, architect, received instructions to this extent merely, but he found that the walls were so dilapidated, and the structure generally so decayed, that any attempt to patch it up would be a waste of money. Shortly after plans and drawings were prepared for a new edifice the arrangements were completed for the building of the new church, whose style of archi-

ture is that of the Early Geometric. The stone of which it is erected was obtained gratuitously from a quarry on the estate of the second son of Captain Turton, of Larpool Hall, the quarry being about two miles distant from Kildale. The church is built of pitched faced walling and chiselled dressings, and the stone is of a durable character. The church consists of a nave, chancel, and north aisle, the entire inside length from east to west being 81 ft. The nave is 44 ft. long by 19 ft. in width, and the space between the floor and the central part of the roof is 29 ft. The north aisle is the same length as the nave (44 ft.), and its width is 10 ft., the extreme inside breadth of nave and aisle together being 81 ft. The chancel is in length 26 ft., by 15 ft. in width, the height to the apex of the roof being less by 3 ft. than that of the nave—namely, 26 ft. On the north side of the chancel there is an organ chamber and a small robing closet. The tower, which stands at the west end of the nave, is 66 ft. in height to the apex of the slanting roof. The chancel floor is laid down with Maikin & Co.'s encaustic tiles. The floor of the nave consists of dressed flags. The roofs of the chancel, nave, and north aisle are open timbered and hoarded, and they are covered in with Westmoreland slates. The seats in the church are wooden, and of deal wood, stained and varnished, the ends being of pitch pine. The seats in the chancel and at the east end of the north aisle are of oak, and also the pulpit and reading-desk. The east window is of three lights, and Geometric in character. Those in the chancel are cusped lancets, and the lights in the north aisle are also lancets. The windows in the south wall are of three lights, and the whole are filled in with cathedral glass and stained margin, with the exception of the two-light window in the west wall underneath the tower. This window is filled in with stained glass of Early Geometric pattern, and the tracery is a simple quatrefoil, also of Geometric design. The architect, Mr. G. F. Jones, has presented this window. Messrs. Hodgson, of York, have completed the filling in of the windows throughout, and Mr. Cole, of York, has executed the carved work of the church internally and externally. The present structure is larger than its predecessor, but only accommodates about 200 persons. The expense incurred has been about 2,000*l.* The tower of the church has been rebuilt by subscription.

DISSENTING CHURCH-BUILDING NEWS.

Calne (Wilts).—The Free Church here, which has been reared and completed in something less than twelve months, has been opened for divine service. Mr. Stent, of Warminster, was the architect. It stands in the centre of the town, in a somewhat confined situation, in Church-street—the site formerly occupied by the old Bear Inn. The style is Early English. The extreme length of the building inside is 91 ft. (the chancel being 21 ft.), the width 37 ft., and sufficient accommodation is provided for seating a congregation of 420 persons, or more, if required. All the sittings are open, and half of them will be unappropriated—for the use of the poor. The nave terminates with a circular chancel, lighted by six lancet windows, filled in with stained glass of a quiet design; and a tracery west window, of suitable stained glass, modifies the lighting of the church, which, in other respects, is lighted with tinted cathedral glass. The roof throughout is of open wood-work. The entrance is by one doorway in the centre of the frontage, and through a doorway on the north-west angle of the church. Another door at the north end also admits to the building, near the vestry and organ-chamber. The walls are built of native stone, with Box dressings, the interior being faced with Farley stone. The church is heated by Messrs. Haden & Sons' hot-air apparatus; and the stained-glass windows are by Horwood, Brothers, of Frome. Messrs. Light & Smith, of Chippenham, were the contractors; and the whole cost (including the schools in the rear) has been 5,000*l.*

Sheffield.—A new Wesleyan Chapel is about to be built at Ran Moor, Sheffield, from designs by Mr. John D. Webster, architect, Sheffield, which were selected in a limited competition. Accommodation is provided for 300 or more adults, with a gallery for children.

Ross.—The new Congregational Church has been so far completed as to admit of being opened for divine service. The church is erected on a new site in the Gloucester-road, the old

chapel in Kyrle-street having been disposed of. It is erected in the Middle Decorated style of architecture, and consists of a projecting porch-entrance, carried on coupled columns, having foliated and decorated capitals; a lobby in which the stairs to the gallery lie right and left; a nave and two aisles; and an apsidal recess for the pulpit. The lobby is separated from the chapel by a wooden screen of open Gothic work, filled with fluted plate-glass. There are side and end galleries, in the front of which is open geometrical ironwork, with moulded cappings, which will be coloured in maroon and gold, and backed with crimson cloth. The roof, which is of very high pitch, is open arched, boarded and ceiled, octagonal in form, with arched ribs; it is carried on cast-iron pillars from the floor of the chapel, having wrought-iron hammered foliated capitals, and forms five bays in length and three in width. The apse is opposite to the entrance, and contains seven single-light trefoil-headed windows, which are filled with stained glass, the gift of Mr. Walwyn, of Ross. The chapel is lighted on each side by three three-light and one two-light windows 14 ft. high and 6 ft. wide, divided by transoms, and having geometrical tracery of varied designs. At the end fronting the street is a five-light window, 20 ft. high and 10 ft. wide, with geometrical head, and filled with stained glass, by Harwood, of Newport, the gift of the architect. The floor of the chapel is boarded, and the whole of the seats are open benches with sloping backs, and will be stained and varnished, as is also the roof and pulpit. The whole of the ironwork, which is by Cornell, of Cheltenham, and the capitals of the pillars will be similarly coloured to the front of the galleries. The roof is covered with particoloured slates—green and purple—and the gables will be capped with wrought-iron finials decorated in colour and gold. The windows have drip-stone terminations carved. The interior length of the chapel is 60 ft., including the apse and lobby, and is 37 ft. 6 in. wide, clear of the walls. From the floor-line to the wall-plate is 21 ft., and the pitch of the roof is 23 ft., thus giving a total height of 49 ft. On either side of the apse there are minister's and deacons' vestries, the dimensions of the former being 12 ft. by 7 ft., and of the latter 13 ft. by 12 ft. Underneath the chapel are school-room, class-rooms, and ladies' vestry, approached from the street by an open door-way and steps on the south-side of the building. The school-room will accommodate about 250 children, and is 37 ft. 6 in. by 25 ft. The class-rooms are 15 ft. by 12 ft., and the ladies' vestry 11 ft. 6 in. by 12 ft. The height of these rooms on the basement-floor is 12 ft. There are all other conveniences on this floor, including a boiler-room, 10 ft. by 10 ft., in which is placed the warming apparatus, by Bright, of Carmarthen, for heating the chapel in winter. The open space on either side of the porch will be enclosed with iron palisading. The building, which will accommodate about 400 persons, is constructed of local and Forest stone, from the contractor's own quarry, with Bath stone dressings. The contract was 1,600*l.*; but there are certain extras which will bring up the amount to about 1,700*l.* or 1,750*l.* Mr. Durke, of Cinderford, is the contractor; and the architect is Mr. B. Lawrence, of Newport.

STAINED GLASS.

Lincoln Cathedral.—A stained-glass window is in course of erection in this cathedral to the memory of the late Chancellor Bird. The medallions represent God's revelation under three dispensations—Life in Christ, Out of Sin and Death, Through Substitution and Sacrifice. The two circufossils contain representations of St. Peter and St. Paul, and the three large lights, which contain three medallions, are devoted to the following subjects:—The Expulsion from Paradise, the Sacrifice of Abel, the Translation of Enoch, the Tower of Babel, the Sacrifice of Abraham, the Translation of Elijah, the Adoration, Gethsemane, and the Supper at Emmaus. The window, which is the gift of Mr. Samuel Hanson, of London, is the work of a Nuremberg firm.

Loversall Church.—A stained-glass window, which has been purchased by subscription by numerous friends, in memory of the late Mr. Simpson, of Loversall, has just been placed in the chancel of Loversall Church. The window is by Messrs. Ward & Hughes.

Whitechurch Church.—Messrs. Ward & Hughes,

of Soho-square, have recently completed in this old church a window, which has been erected by their surviving children to the memory of the late Mr. and Mrs. Churton. The architecture of the edifice is of the Roman type; and a semicircular-headed window, measuring 22 ft. 6 in. by 8 ft., on the south side, has been filled with painted glass of the sixteenth-century character, treated with large-sized figures, the costumes of which are executed with a view of representing the Biblical period. There are two subjects: that above the gallery is the "Meeting of Jacob and Joseph in Egypt;" the subject below is the "Death-bed of Jacob." The ornamental portion is characteristic, and a jewelled border surrounds the whole.

SCHOOL-BUILDING NEWS.

Chelmsford.—The new London-road Independent Sunday-schools have been opened, in connexion with the New-road chapel. These schools have been erected opposite the Cloisters, by Mr. Cozzett, of Woodham Walter, builder, from designs by Mr. C. Pertwee, of Chelmsford, architect. The building is of white brick, relieved with yellow bands and niches, the window and door-openings having circular heads, and the general character of the architecture being Romanesque. On the ground-floor is a school-room, 70 ft. by 30 ft., capable of accommodating 400 children, and 100 in a gallery at the end. Opening out of this room are five class-rooms for boys, each affording space for twelve to fifteen scholars; also a senior class-room for about twenty persons. At the end of the school-room are two class-rooms for girls, and an infant school-room, 22 ft. by 14 ft., for 100 children; also a kitchen or heating-apparatus room, and other conveniences. A stone staircase at the end of the school-room near the girls' entrance, leads to four girls' class-rooms upstairs, accommodating from twelve to fifteen in each room. All these rooms open direct into the gallery. The large room is 21 ft. high to plate, and about 25 ft. in centre, and has a semi-open roof with arched trusses, the timbers being stained and varnished. All the rooms are lined round 4 ft. in height with dado boarding, and are fitted up with proper seats, benches, and hat-rails. The whole will be heated in winter with warm air, upon the plan of Mr. Allaway, of Manchester, engineer. The class-rooms will be lighted with starlight burners, and the large school-room by three corona gaslights. The stonework has been executed by Mr. Wray, and the painting, &c., by Mr. H. Tanner. The total cost, including purchase of site, has been 2,512l.

Tynemouth.—The chief stone of Tynemouth Priory National Schools has been laid by the Duke of Northumberland. The site is at the north end of the village. Their cost will be 2,000l., and a deficiency of 500l. remains to be raised. The schools are designed by Messrs. Anstin & Johnson, of Newcastle, in the Early Pointed style of architecture. Considerable progress has been made in their erection. The present arrangement of the ground-floor is T-shaped, comprising a large room, 48 ft. by 25 ft., to be used for girls and infants; and, at right angles to this, a boys' school, 51 ft. by 19 ft., with class-rooms, lavatories, &c. It is intended hereafter to erect a room for the girls similar to that of the boys', and so to bring the building into the form of the letter H. The boys' school and class-rooms are lighted by windows with geometrical tracery, and by plain lancets; the large room by lancet windows, with rose windows above them, treated as dormers. A spirelet, containing a bell, will be placed on the roof. The arrangements for heating and ventilation will be complete. The buildings are of local sandstone, with bands of red stone from Penrith. The site contains an area of an acre, and was presented by the Duke of Northumberland. It will be surrounded by appropriate wall and iron railing, and is bounded on three sides by new roads in course of formation on this part of his Grace's estate. The contractors for the several works are Messrs. T. Alexander, mason; J. & W. Lowrey, carpenters; T. Sauderson & Co., slaters; Wilkinson & Co., plasterers; Mather & Armstrong, plumbers; Donkin, ironfounder; and Richardson & Co., painters.

Rattinghope.—The foundation-stone of a new district school has been laid here. Mr. Smalman Smith, of Stonebridge, prepared the plans, and Mr. T. Cooke, builder, of Criffden, is carrying

them out. The building is arranged to accommodate thirty children, and there will be a master's house, with parlour, sitting-room, and three bed-rooms, &c. The whole is built of stone, from the Stiperstones range, and local brick. The bell-turret will be covered with bright red tiles, and the roofs with blue and purple slates. It is proposed to introduce some stained glass into the windows of the school-room, the work of a member of the Scott family. There will be a bronze bell, which will occupy the turret. The cost of the building will be about 400l. At a comparatively short distance from the school a new parsonage-house is to be erected, of which Mr. Smalman Smith is also the architect. It will be built of the materials of the locality, viz., selected Norbury stone, and local brick inside. The walls of the upper floor will be of brick externally, arched with white Staffordshire bricks. The roof will be of tiles. The cost will be about 1,600l.

Louth.—The foundation-stone of the new building for the Grammar School of King Edward VI., Louth, has been laid. The site of the new building, now in course of erection, is at the back of the old school, which is still standing. The school proper is to be built quite back to the boundary-wall of the playground; the old school will then be pulled down, so that there will be a considerable open space in front of the new building, which will front School-house-lane. Several blocks of old buildings, at the corner of School-house-lane and fronting Gospel-gate, have been taken down, and the Bede-houses are being erected where they stood.

Books Received.

A Treatise on Lathes and Turning. By W. H. NORTHCOTT. London: Longmans, Green, & Co. 1868.

The treatise under notice contains a good deal of practical information as to plain turning in all its simpler and less expensive forms, as well as on the more elaborate work of advanced practitioners of the art. The volume is confined to turning as it exists, and does not deal with it historically. Indeed, the author thinks that any historical disquisition on an art which is essentially modern, would be useless; and almost all he says on this subject is that doubtless the modern lathe may have originated in the ancient potter's wheel, and that whether the crude principle were derived from the ancient Greek or the aboriginal savage is a matter of little or no moment to us.

VARIORUM.

"Eleventh Report of the Vestry of the Parish of Chelsea. 1866-7." Printed by Bell, 133, King's-road, Chelsea. 1868. This voluminous report has been printed under the authority of the vestry. The volume comprises upwards of 400 pages octavo; but the report proper fills only about fifty of these pages, all the rest being an Appendix, containing documents of various kinds, statistical tables, correspondence, &c. There is nothing calling here for special remark.

Miscellaneous.

THE CHARTER-HOUSE.—The project for widening Wilderness-row from Goswell-street to St. John-street, involving the use of land appertaining to the Charter-house estate, is about to be carried out.

LYNN DOCK.—The Government have consented to advance the 20,000l. authorised to be raised on debentures in aid of the share-capital of this scheme. The advance is made under the provisions of an Act of Parliament for the promotion of such public works, and on the recommendation of Mr. Kendal, C.E., who has inspected them on behalf of the Admiralty, and reported favourably of them. It is intended (and the contracting parties have agreed) to vary the original design for the dock, by making the slope of the sides steeper, and facing them with concrete blocks, instead of concrete laid on the slopes. The estimated additional cost is 2,200l., and the effect will be to give an additional acre of water area, besides more space for warehouses, &c. The works are making considerable progress.

THE ELECTRIC ORGAN.—The electric organ from Her Majesty's Opera, Drury-lane, is being erected at the Polytechnic Institution, above the proscenium in the great theatre. Messrs. Bryceson have to construct a large and powerful electric organ to suit the requirements of Her Majesty's Opera, Haymarket, now being rebuilt after the fire, and which will be re-opened next season.

ONE RESULT OF HIGH FARES.—On Saturday last Messrs. Richardson, Slade, & Elson entertained the whole of the men in their employ, at Caterham. A long day of fifteen hours was passed in the pleasantest manner, in the pleasantest part of Surrey. Owing to the rise in railway fares, the journey to and fro was made by road, which proved much more agreeable, and was cheaper than the same journey by rail.

DANGEROUS STATE OF A SUSPENSION BRIDGE AT CHESTER.—The suspension bridge across the Dee, and leading to Queen's Park, has been found to be defective, and not safe in its present state. Messrs. Bryan Johnson, engineer, and Richard Davies, city surveyor, have examined it, and they say in their report,—

"The suspension chains are fastened direct to the arching and column heads, and there is no provision made for any movement of the chains which may arise from either expansion and contraction by the weather, or by the swinging motion produced by people passing over it. In consequence of the above omission the upper portions of the columns have gradually given way, and now lean towards the river, while the lower halves of the columns being in contact with the roadway are still upright. We applied a plumb-line to the columns, and found some of them as much as 3½ in. out of the perpendicular, and none less than 2½ in. We recommend that these two points be at once put right, and this can be done without much trouble. We also wish to record our opinion that at no time should a great number of people be allowed on the bridge at the same time."

Mr. Mallison, of Manchester, the owner of the bridge, has been written to, and his earliest attention requested. As this is a bridge much used by the Chester public, meantime the police have instructions to prevent crowding upon it.

RUST'S MATERIAL FOR DECORATIVE PURPOSES.—A company is being formed to bring into use Mr. Jesse Rust's "manufacture of a material for decorative purposes, by melting glass and sand together in a furnace, with the addition of metallic oxides, and moulding the same into the requisite forms." The promoters claim that it is an almost indestructible material, which, while lending itself gracefully to every form of mural ornamentation, provides a substance for mosaic flooring, which must tend to introduce more generally among us that form of pavement. It is stated that the material can be sold 1s. a yard cheaper than coloured clay tiles, and yet produce a profit of 50 per cent. to the manufacturers at even the present working expenses.

"The profit to be made on the polished material will appear from the following figures. The price of a 9-inch boss in polished granite ranges from 22s. to 25s.; in polished marble, from 15s. to 20s. In the patent material a 9-inch boss, as hard as granite, and with all the appearance of marble, can be manufactured at a cost of 6s., which includes the present extravagant item of 3s. for polishing, which charge, in the event of complete works being established, could be reduced to one half. A 9-inch boss therefore of the patent material sold at 12s. 6d. would show the enormous profit of 150 per cent. on the present cost of manufacture."

THE SUSSEX ARCHEOLOGICAL SOCIETY.—This year the Sussex Archeological Society visited Rotherfield and Mayfield. It rained the whole day, and the meeting was by no means so numerous as it would otherwise have been. At Rotherfield Church Mr. Mark Antony Lower read a paper on Rotherfield. Mr. Durrant Cooper pointed out various alterations which had from time to time been made in the edifice; and the company then went to Mayfield, about three miles from Rotherfield. The church was first visited, and afterwards Mayfield Palace. In the great hall of this building Mr. Durrant Cooper read a paper on the "Antiquities and Archeology of Mayfield." It was originally intended to visit and inspect the ancient houses in the town; but the rain ruled it otherwise, and the majority of the party proceeded at once to the school-room, where several relics of antiquity, lent for the occasion, were viewed. The general meeting for business was held in the school-room, and was presided over by the Rev. E. Turner, of Maresfield. Four new members were elected. The dinner took place in the society's marquee, which was erected in the grounds adjoining the parsonage. About 230 tickets had been taken; but very little over half of that number sat down. Umbrellas had to be resorted to for protection even under the canvas of the marquee. Lord Colchester presided.

The Builder.

VOL. XXVI.—No. 1334.

*The Hospitals of the World.**

HERE is little that need now be said to the readers of the *Builder* on the subject of hospital-building; and we might perhaps complain that the advantages derived from our labours by the

author of this last book on hospitals is scarcely admitted as it should be. However, we will let

that pass. The book comprises a recital of the requisites of hospitals in construction and appliances; an inquiry into the best mode of administration of such charitable institutions; a considerable amount of information relating to special hospitals, such as those devoted to convalescents, lying-in patients, incurables, lunatics, consumptive patients, children's hospitals, eye, fever, military, lock, Samaritan, orthopedic hospitals, those in tents, marquee, and huts; notices of hospices and workhouse infirmaries; a chapter on dispensaries; a report upon the plans in continental cities for the relief of patients at their homes; and brief descriptions of about 200 institutions in Europe, Asia, and America. The ground-plans of about fifty hospitals are given.

If we would realize the wide importance of perfection of hospital accommodation, we must bear in mind that 170 deaths out of every 1,000 in London take place in hospitals. It is difficult for the mind to grasp the misery of 12,000 deaths in the metropolitan institutions as the average amount. Yet 12,000 times those in authority in the various hospitals of London give quiet instructions that the cold, stiff form that has then ceased from suffering should be removed, and the bed whence it is taken made up afresh for another patient. In England and Wales, in 853 institutions, where there were 154,602 inmates in 1867, there were 32,437 who closed their eyes for ever in them. The greatest sanitary precautions and most complete sanitary contrivances, doubtless, could not have saved all these lives, but we may take it for granted they would have considerably augmented the crowd of convalescents that went away rejoicing. What these precautions and contrivances should be it is the aim of Dr. Oppert to show; the system of relief, however, occupying scarcely a secondary place in his work. He gives the preference to the pavilion plan. Speaking of the exterior of a hospital, these are our author's views:—

"Whatever," he says, "may be the style of architecture—Gothic, Italian, or mixed—I should not object to a fine clock-tower and an ample porch. The chimneys can need not look ugly, and narrow entrance-doors can be avoided. The architect ought to dispense with arched windows. A little stained glass in the chapel is not very expensive. Simple iron railings may surround the building at some distance, and there need not be an entrance looking like a triumphal arch. The material of which the walls are built should be good bricks, and the architect may avail himself of Portland stone and terra-cotta."

He adopts the arrangements now usually approved. The offices for administration and the sleeping-rooms of officials and nurses should

be separated as much as possible from the wards. He would have no hospital more than two stories high, as the vitiated air ascends. The kitchen should be a separate building, connected with the main building only by a corridor, so that no smell of cooking should pervade the house. The wash-house and the dead-house should be alike detached. The water-supply should be abundant and good. The staircases should be stone, and wide enough to admit of carrying up the patients conveniently. Linnenshoots of earthenware should be provided close to all wards. About thirty beds, or a few more or a few less, he considers the most suitable number in a ward. The basins in lavatories should be of glazed earthenware, and those that are emptied by tilting are preferable to those furnished with plugs. Waterclosets should be everywhere provided instead of latrines. Knobs that are pressed by the finger, to admit hot or cold water into the lavatories, are more desirable than taps. The bath and lavatories he places in one apartment, divided from a ward by a ventilated passage-way, and the sink, urinals, and waterclosets in a corresponding one exactly opposite to it. The headsteads should be iron, painted a cheerful-looking colour, and on castors, except in the surgical wards. They should be of a convenient height, for though a low bedstead is preferable for a patient given to fall out of bed, it is a serious inconvenience to those attending him. Dr. Oppert mentions the case of the surgeons who attended the wounded during the July fights in Brussels, 1830, and who, owing to constantly stooping over the low beds, were hardly able to keep upright when walking. The best mattress is a spring one covered with horsehair at least 2 in. thick. There should be a head-shelf, foot-board, a rope with a hand-grasp, a chair, and a marble-topped side-table to every bed; and a low screen painted a dark green colour at hand to be used when needed. A long table with a marble top should be in the centre of the ward, and a sideboard and a few easy chairs should not be wanting. Gas, with ventilating pipes to carry off the foul air, is the best means of lighting.

With regard to warming, Dr. Oppert's sympathies appear to be with the continental stove rather than with the open chimney and fireplace. The German stove is used in the hospitals of Russia and North Germany. This is formed of clay and claytiles, and, although capable of being made ornamental, is generally found to be anything but beautiful in these buildings, where the cost is a consideration. He says, if large, they interfere with the ventilation, for the air does not circulate in the recesses in which they stand, nor in the space between them and the wall; nevertheless, they seem indispensable in climates north of the 54th degree, as there are no other means for heating the wards so gradually, thoroughly, and retentively. Iron stoves are smaller and less expensive, but the heat is not maintained for so long a time; they are useful, however, where it is an object to obtain heat quickly for a short period. In the Berlin *Charité* hospital the stoves are placed in the wall dividing the wards from the corridors, whereby one stove serves both apartments; but this plan our author opposes, as a waste of surface heat upon the intersecting walls. He speaks well of the remodelled fire-grate made of brick grates in an iron stove, where the air is supplied from behind the grate, and the smoke is directed into a chimney without a register. There is an air-chamber behind this grate communicating with the outer world, whence, after the air is heated, it is carried up a shaft and dispersed in a ward by means of a *louvre*. The expense of these, 30*l.*, is the chief objection. The French calorifères are iron stoves unrounded with brick mantels, whence the hot air in the intermediate space ascends through apertures to the ceiling. In the great Parisian hospital *Lariboisière* the heating and ventilation are combined. There

are two systems in use, both of which work well. On the female side water is heated in a boiler, whence pipes convey it to a reservoir or tank, from which it is conducted to the several floors, and hack again to the boiler. The pipes pass through four stoves on each floor.

"The ventilation is caused by the heat of the reservoir to which all the foul-air channels lead. The reservoir containing several divisions, forms a large surface, from which heat is thrown out. The foul air ascends through the channels formed by these divisions, and ultimately escapes by a chimney. Fresh air continually replaces the impure, being admitted through channels which end in the outer walls, and communicate with the stoves. The following is the second system, the system *Grosvolle-Thomas-Lawrence*. There are four stoves filled with water in each ward; this water is heated by steam pipes from a boiler in the cellar, each pavilion having its own boiler. The ventilation is by forcing in or injecting the air. An air-shaft, higher than the chapel, communicates with a cellar, where a fan is placed. This fan or ventilator has four wings or blades, bent to an angle, and revolves very quickly, viz., 400 times a minute; it is set in motion by steam power. It draws the air from the shaft and forces or injects it into a channel, which takes it to the wards. The air passes through the stoves in the wards, and from their forty-eight apertures and some openings in the flooring it moves up to the ceiling with a considerable force, and replaces the foul air at the ceiling, which finds its way out through apertures near the floor."

Notwithstanding this care and expenditure, *Lariboisière* has nearly the highest death-rate of any of the Parisian hospitals; and, although it is urged that one-third of the patients are tuberculous, and a large proportion hopelessly sick when admitted, it is certain the expectations based on theoretical calculations have not been fulfilled. We believe that operations are less successful where artificial systems of ventilation are in use than where a sweetening of the air is relied upon from the opening of doors and windows.

Without a proper amount of cubic space per patient the best methods of ventilation would not be sufficient. Medical men are frequently pressed by architects to state the amount they consider adequate.

The author of the present book, after giving the composition of pure air, allowing for the carbonic acid exhaling from the lungs and skin, and the watery vapour lost by the body, giving the results of various experiments made by German philosophers, comes to the following conclusion:—

"Taking into consideration all the impurities caused from spittings, bedding, poultices, infusions, bathing, &c., Poncelet thinks the sick require about double the quantity of air that would be considered necessary for healthy people; this would be 30 or 40 cubic metres per bed per hour. But 40 cubic metres will be insufficient when patients suffer from gangrene or typhoid fever, especially when the temperature is high. A much larger supply is then desirable, the amount of which I scarcely can state in figures."

We may add that 60 cubic metres (2,100 ft.) are considered necessary in *Lariboisière*. Our author sums up his tenets concerning ventilation in nine dogmas, to which we refer those employed in hospital construction or management.

We have described and illustrated before now the workhouse infirmary of the *Chorlton Union*. It consists of five oblong blocks or pavilions, 100 ft. apart, connected at the southern end by a long arched corridor, which forms the means of communication. Each pavilion is three stories high; and the ward on each floor is 124 ft. long and 24 ft. wide, and has beds for thirty-two patients. Each ward is approached from the south end by a spacious staircase, and all are alike provided with a nurse's room, 12 ft. by 11 ft.; a scullery, 12 ft. by 10 ft.; a water-closet for the nurses, and a hoist at the south end; and in two small projecting wings, at the north end, with two waterclosets for the patients, a sink for cleansing the bed-pans, a closet for brushes, &c., baths, lavatories, dust-shoot, and foul-linen shoot. The cubic space per patient is 1,350 ft. The height of the wards is 14 ft. 6 in., 14 ft., and 15 ft. There are various contrivances to admit the outer air. The long sides of the walls of the wards have a series of windows, divided into three, facing one another, 4 ft. 8 in. wide, and extending from 2 ft. 9 in. above the floor to the ceiling. We have already illustrated these windows.

* "Hospitals, Infirmaries, and Dispensaries; their Construction, Interior Arrangement, and Management, with Descriptions of existing Institutions, and Remarks on the present System of affording Medical Relief to the Sick Poor." By F. Oppert, M.D., L.R.C.P.L. London: John Churchill & Sons, New Burlington-street, 1867.

There is a *louvre* over the door from the staircase, and a swivel window at the opposite end of the ward, by means of which a current of fresh air can be obtained without opening either door or windows. At various points there are air-shafts running up the walls which discharge themselves above the roof level; as well as a number of small air grids built in the walls close to the ceilings. The floors are provided with hit-and-miss gratings, with galvanized iron horizontal tubes to conduct fresh air to the foot of the beds when required. The windows of the top wards do not reach the ceilings, as the upper floors are partly in the roofs. To compensate for this difference there are large revolving ventilators on the ridges. The lighting is by gas. Three suspended rings of burners, with a funnel-shaped hood, terminating in an iron flue communicating with a shaft in the wall, are placed in each ward. The warming is effected by open fire-brick fireplaces. An iron hood partly closes the upper part of the opening, which is furnished with a hit-and-miss grating, which can be opened when the fires are burning brightly, to admit of a stratum of air being drawn off up the chimney. The drainage is kept outside the building, and in the three principal chimney-stacks of each pavilion a drain-ventilating flue is built unconnected with any other, but placed between two smoke-flues, so that their heat may assist in forming an upward current. Charcoal-boxes are placed on the tops of these drain-ventilating flues to destroy the gases. Dr. Oppert mentions as a defect that the inmates complain of cold, and sometimes catch cold, which fact he attributes to a draught from the top of the windows straight down to the beds.

American hospitals resemble those of England both in construction and administration. The Boston Free Hospital is on the pavilion plan, is two floors high, and affords ample cubic space. At one end of each ward are rooms for the nurse and a separation-room, and at the other the *hata* and waterclosets. The peculiarity of this plan is, that the six pavilions are distributed round a centre, as though they were the arms of a cross, and the connecting corridors are curved, and radiate from the centre. The Hammond Hospital, on the Chesapeake Bay, consists of sixteen pavilions placed in a circle, the centre of which is occupied by the administrative buildings. The Philadelphia temporary hospital was also on the pavilion plan. The wards, some of which contained forty-eight beds, were one story high, and built of wood. 214 temporary hospitals, containing 134,000 beds, were erected in the space of four months in the course of the late war.

Indian hospitals present very different features. The columns of the *Builder* have from time to time furnished descriptions of hospitals in various parts of the world, and some of these are reproduced in the present work. The account of the European hospital in Bombay will be thus familiar to our readers. In East India the native or military hospitals are mere sheds, furnished with mats instead of beds. The patients dress their own food according to the manner prescribed by their religion, contenting themselves with receiving medicine only at the hands of the authorities. In consequence of this arrangement, hospital cookery is lamentably neglected. With but one or two exceptions, states the author, upon the authority of Dr. Gordon, there is not at the present day a cooking range in any regimental hospital. The cooking-place is the ground, and the rice is baked in the oinders. Corresponding with this shortcoming is the fact that one matron is considered able to nurse the invalids of a battalion.

The famous pavilion hospital of Bordeaux, the first built upon the principles laid down by the Paris Academy, is outlined, as is the scarcely less celebrated institution in Brussels. Of the German hospitals he gives no attractive report. They are often of great extent and ancient origin, but the construction is nearly always defective. The corridor system is most in vogue. The Bethanien hospital, Berlin, founded in 1847, is on this plan. So is the Katholisches Krankenhaus. So, too, is the principal portion of the Charité hospital, where 1,400 patients are received. In the Summer Lazarth, a detached block, there are two floors over a cellar or basement, and several of the rooms in the basement are used to live in. There is an anatomical school in connexion with this institution, for which there is every accommodation. The new Charité, Berlin, is built in the form of a horseshoe. The Allgemeine Krankenhaus, Munich, for 500 patients, is an oblong building, having

two central courts, divided from one another by a central block, in which the kitchen and some private wards for patients who pay are situated. In this building the lower wards have stoves, furnished with hollow columns of cast iron, which ascend through the three floors. These columns are covered in the upper wards with glazed tiles, leaving ornamental apertures through which the warmed air passes. Besides this arrangement, there was an elaborate system of channels for foul air leading to the stoves on the ground-floor, and air-towers with air-channels between them and the wards, and other air-channels running through the roof, which branched off with smaller ones, communicating with the space between the iron columns and the tile mantels. But this scheme proved a failure, for the foul air often remained stagnant in the channels, and sometimes came back again into the wards. The apertures have since been closed, and the stoves treated as calorifères. There is a system of ventilation in use at the Anshülfe Krankenhaus, Munich, which Dr. Oppert thus describes:—

“There are calorifères in the wards, composed of an inner stove of cast iron, a brick mantel, and a movable top made of tin; the latter has a large aperture leading to the roof, and a smaller one, which opens from the floor in the usual way. There are foul-air-channels leading to the roof; they end by two apertures in the walls of the wards, an upper and a lower one, and either may be closed by a valve. There is an anemometer placed in each channel, and a permanent indicator shows how the air moves inside, if rapidly or slowly. This is a novel and an economical system, but I doubt if it will be quite satisfactory, because the draft will not be strong enough in the ejection channels. In summer time this is to be improved by a gas-burner, which is lighted in the shaft near the roof.”

The Vienna General Hospital is built round nine square courts, most of which are laid out as gardens, with fountains in them; three thousand patients can be accommodated here in ninety-three wards; and there are four amphitheatres, two dispensaries, three laboratories, two large kitchens, washhouse, several ice-pits, besides the officers' apartments and offices. The floors of the wards are of red brick. There is no artificial ventilation and no water-closets. Unless a recent change has been made, says the author, there are night-stools in the corners of wards, standing behind curtains! No small-pox patients are received. Every patient either pays for himself or is paid for by the municipality or parish. First-class patients pay 4s. 4d.; second, 2s.; third, 10d. per day. Out of every hundred patients who find shelter here, thirteen or fourteen do not recover, despite the gardens and fountains. In the Hospital Rudolph-Stiftung, built by the Emperor of Austria, in commemoration of the birth of his eldest son, a combination of the pavilion and corridor system has been tried. Its construction occupied more than four years. In the centre is a court 180 ft. by 330 ft. laid out as a garden. Around this run two-storied lines of building over ground floors, except on the east side, where the hall is only one story high. From this quadrangle project three pavilions, containing sick-wards, a fourth set apart for the administration and dispensary, and two others fitted up with baths and waterclosets. The pavilions project 84 ft., and are 12½ ft. apart from one another. The cubic space per patient is 1,480 ft. The windows are double and 10 ft. high, two-thirds of this height opening like doors, and the top third is movable, and can be made to incline inwards by a screw and toothed wheel, which fixes both the outer and inner portion at the same time. Dr. Böhm's calorifères are used for heating, and gas, with ventilated globes, is employed for lighting. The Italian hospitals, which are nearly all of Medieval origin, and attended by monks and nuns as nurses, have frequently been convents in the first instance, and are therefore but defective buildings as hospitals. The classification of the patients is very imperfect. The Ospedale di Sta. Maria Nuova, Florence, was founded in 1289, and by the addition of wing after wing is still available. There are about fifty wards in it, and 1,200 patients. At Geneva is another large ancient ospedale, constructed round courts. At Mantua the Austrians have built a hospital, which the author calls notorious for its unhealthiness. The grand hospital at Milan was formerly considered a model. We examined it personally a few years ago, and could not endorse that opinion.

It was opened in the year 1456, and can contain nearly 3,400 patients, but the usual number is under 2,600. It is situated close to a thoroughfare, and a canal runs at its back, the water of which moves a four-mill, used to grind corn for the inmates. The buildings are one story high, except in the centre, where we find two floors. The

buildings stand around square yards, the principal one being much larger than the others. The principal wards form a cross, in the centre of which is a copola, with an altar beneath it, where divine service is performed daily, in sight of the patients. These wards have corridors on both sides, which are not so lofty as the ceilings of the wards, and consequently there is plenty of room for windows above these passages. The height of these wards is between 30 ft. and 50 ft. at the highest point; the ceilings are vaulted, the floors covered with red bricks or flags, this being preferred for coolness. The outside wards are nothing but spacious corridors. The latrines are at one end, and the less said about them the better. There is no warming apparatus, but small portable stoves for charcoal; they are rarely used, the climate being so mild. The windows are used for ventilation. The cubic space for each patient is more than 2,000 ft.

We have to add to this picture of an Italian hospital, in which Medieval devotional intensity pervades everything from the construction to the attendance, that there are six establishments in connexion with this, devoted to special forms of human infirmity, five of which were once convents. Naples has a hospital, called Della Pace, that was originally a palace. It has one ward 300 ft. long and 130 ft. wide, with handsome columns supporting the arched ceiling. The Ospedale San Luigi di Gonzaga, in Turin, built for the dwelling of a nobleman, is in the form of a St. Andrew's cross. There is a chapel in the centre; from this depart four arms, or blocks, two stories high, each of which contains a long ward, with a corridor on each side of it. There are openings in the wall over each bed, through which food and medicines can be passed without entering the ward. Another opening serves for a sink. The latrines have marble seats, and are supplied with water. Six large fires in the cellars are supposed to ventilate the wards at night. All the additional accommodation for the physicians, dispensary, offices, dead-house, &c., are placed in blocks to the right and left of the St. Andrew's cross thus occupied by the wards. This is an interesting example.

The Russian hospitals are palatial in their appearance. They are three and four stories high, and placed in large gardens. The wards are heated for the most part, by Russian stoves, which make the air very dry, though the clay stoves used in North Germany are sometimes seen; and some wards have open fireplaces in addition. The bad corridor plan is most general. A large living-in hospital is on the point of being closed on account of its defects; and as lunatic asylums are in course of re-organization all over the country, we may infer that a future survey of Russian hospitals will be more profitable than any now undertaken would be.

A few particulars of a Swiss hospital must close our notice of Dr. Oppert's book. The Zurich hospital shows the pavilion system in a modified form. The front, consisting of a centre three stories high, and two wings two stories high, is 559 ft. long. The central pavilion contains all the accommodation for the service, administration, and instruction; the females are on one side of this, and the males on the other. There are five wards on each floor in each wing, and between each ward there is a nurse's room; on each floor all these wards and rooms open into one long corridor. The cubic space is ample. The bedsteads are of wood, and placed along the walls, instead of the usual material and disposition. Something like the aroma of Swiss forests and a vision of Swiss lakes and mountains come to us when we read that the windows open on little balconies. There are tile-stoves for warming in the central building, and hot-water pipes in the wings. The last are placed in coils near the walls, and surrounded by perforated plates, have much the appearance of stoves. The doors, which open into the corridor, have casements instead of panels in their lower parts, for the purpose of admitting fresh air when desired, without opening the whole door.

The strong point of Dr. Oppert's book is that a large number of plans are therein brought together; the weak one is, that the bad and good are not sufficiently discriminated.

MEMORIAL PORTRAIT.—The working men of Durham have subscribed for a portrait of the Very Rev. Geo. Waddington, D.D., Dean of Durham, to be placed in the Durham County Hospital, to which the dean has been a great benefactor. The portrait was painted by Mr. Clement Burlison, a Durham artist, and it has been placed in the principal convalescent ward of the hospital. The presentation ceremony has just taken place.

SAVANS IN NORWICH.

THE proceedings of the British Association for the Advancement of Science have been so fully reported, far and wide, that our readers will probably thank us for confining ourselves to brief notices of some few of the papers on subjects oftenest treated of in our journal. The address of Dr. Hooker, the president, was full of brave and thoughtful statements, which have, of course, provoked criticism, and will continue to do so. As an example of the views held by the advanced thinkers of the Congress, we give the peroration of Professor Tyndall's inaugural address as president of the Mathematical and Physical Sciences Section.

Materialism.

"In affirming that the growth of the body is mechanical, and that thought, as exercised by us, has its correlative in the physics of the brain, I think the position of the 'materialist' is stated as far as that position is a tenable one. I think the materialist will be able, finally, to maintain this position against all attacks; but I do not think, as the human mind is at present constituted, that he can pass beyond it. I do not think he is entitled to say that his molecular groupings and his molecular motions explain everything. In reality, they explain nothing. The utmost he can affirm is the association of two classes of phenomena, of whose real bond of union he is in absolute ignorance. The problem of the connexion of body and soul is as insoluble in its modern form as it was in the pre-scientific ages. Phosphorus is known to enter into the composition of the human brain, and a courageous writer has exclaimed, in his trenchant German, 'Ohne Phosphor kein Gedanke.' That may or may not be the case; but even if we knew it to be the case, the knowledge would not lighten our darkness. On both sides of the zone here assigned to the materialist he is equally helpless. If you ask him whence is this 'matter' of which we have been discoursing, who or what divided it into molecules, who or what impressed upon them this necessity of running into organic forms, he has no answer. Science also is mute in reply to these questions. But if the materialist is confounded and science rendered dumb, who else is entitled to answer? To whom has the secret been revealed? Let us lower our heads and acknowledge our ignorance one and all. Perhaps the mystery may resolve itself into knowledge at some future day. The process of things upon this earth has been one of amelioration. It is a long way from the Ignoradon and his contemporaries to the president and members of the British Association; and whether we regard the improvement from the scientific or from the theological point of view, as the result of progressive development or as the result of successive exhibitions of creative energy, neither view entitles us to assume that man's present faculties end the series—that the process of amelioration stops at him. A time may, therefore, come when this ultra-scientific region by which we were now enfolded may offer itself to terrestrial, if not to human investigation. Two-thirds of the rays emitted by the sun fall to arise in the eye the sense of vision. The rays exist, but the visual organ requisite for their translation into light does not exist. And so from this region of darkness and mystery which surrounds us rays may now be darting which require but the development of the proper intellectual organs to translate them into knowledge as far surpassing ours as ours does that of the wallowing reptiles which once held possession of the planet. Meanwhile the mystery is not without its uses. It certainly may be made a power in the human soul; but it is a power which has feeling, not knowledge, for its base. It may be, and will be, and we hope is turned to account, both in steady and strengthening the intellect, and in rescuing man from that listlessness to which, in the struggle for existence, or for precedence in the world, he is continually prone."

The Rev. Canon Girdlestone read a paper on,—

The Condition of the Agricultural Labourer, especially in the West of England.

The Rev. Canon observed that the progress of manufacture, so far from lessening, had rather increased the value of land. Fortunes made in manufactures were generally invested in land, and Great Britain retained, and was likely always to retain, its character as an agricultural country. Landowners occupied the highest positions and enjoyed the greatest social privileges.

Public opinion, the reform of universities and public schools, the facility for foreign travel, and the admixture of the manufacturing classes with the old landed proprietors, had much raised the character and improved the tone of the latter. Still, especially in the West of England, there were many of the old school remaining who resisted all progress. The race of farmers was much improved, but not so much in the West of England as elsewhere. The land was also much improved; a larger area was brought into cultivation, and each acre was made to yield more. In this respect also, in the West of England, there was less improvement than elsewhere. Nowhere had the improvement of the agricultural labourer kept pace with that of the landowner, the farmer, and the land itself. In the West of England the condition of the labourer was very little different, and, in some respects, it was worse than it used to be. Wages were low, while fuel and provisions were dear, and the poor-rate was so administered as to quench every feeling of independence. In the West of England an agricultural labourer had till lately only 7s. or 8s. a week, and now only 8s. or 9s. Unless he was a horsekeeper or a shepherd, he had to pay out of this 1s. to 1s. 6d. a week for house-rent, and provide food, clothing, medical attendance, fuel, and every other necessary for himself, wife, and family. He paid a high rent for potato ground, and fuel he seldom got, except at the cost of many hours of hard work. He had three pints or two quarts of cider a day, and he had a portion of his wages often paid in grist, which when grist was dear was an advantage, but otherwise a loss to him. He was often not allowed to keep a pig or poultry, lest he should steal food for them from his master. He worked nominally ten or ten hours and a half a day, with an hour and a half deducted for meals. He was almost always, however, kept a much longer time than this, and was seldom paid anything for overtime, except by bread and cheese in harvest time. Women got 7d. or 8d. per day for out-door work, with a quart of cider, and boys small sums in proportion. The men breakfasted before they left home on "tea-kettle broth," which consisted of bread and water with a little milk if (which was not often the case) it could be got. For luncheon and dinner, which they took with them, they had coarse bread and a little hard, dry, skim-milk cheese, at 3d. per lb. For supper, on their return home, they had potatoes or cabbage, with a very small slice of bacon sometimes to give a flavour. Butchers' meat they seldom saw, except it was given to them. They were unable to lay by anything, and few comparatively belonged to benefit societies. They were long-lived, but even in their prime feeble, and at the age of 50 they were often crippled with rheumatism, the result of poor living, sour cider, a damp climate, hard work, and anxiety combined. There remained nothing for them but parish pay and the union. There were many exceptions to this general rule, often even in contiguous parishes, owing to the presence of an intelligent resident landowner, or the immediate neighbourhood of a large town, mines, or manufactures. The wages of the agricultural labourer were always higher in the neighbourhood of towns, mines, and manufactures. The condition of the agricultural labourer varied, indeed, greatly in different parts of England; but the fact that in agricultural districts the poor-rate was very high, that there were more marks than signatures in the marriage registers, that recruits from the same districts were seldom able to read or write, that our prisons were filled from the same districts, and the general conviction that agricultural labourers were wholly unfit to be trusted with the franchise, were real and reliable evidences of the low condition of this class of men. That which was really required for the agricultural labourer was, in one word, "independence." At present he was the most dependent of any class of labourers. In order to change this—firstly, good wages were required in proportion to quantity and quality of work, but always, in the case of an able-bodied and industrious man, enough to keep him and his family, with a margin for insurance against old age or sickness; secondly, well drained and ventilated houses, with at least three bedrooms and all other appliances for decency, with a provision also against taking in lodgers, such houses to be in the control of the landowner rather than the farmer; thirdly, greater facilities for education should be afforded; fourthly, all "mops" and hiring-fairs should be abolished, and a good system of registration should be generally adopted and made known through the instrumentality of

the penny papers throughout the country; fifthly, agricultural labourers' unions of a strictly protective character, and well guarded against intimidation, to either employers or fellow-workmen, might be formed with advantage—the whole system of unions was not to be condemned because of outrages committed by a few; sixthly, there should be legislation in favour of the agricultural labourers, especially as regards education, and the administration of the Poor Law by a central board of disinterested officers, instead of by a local board of landowners and farmers. Legislation so far had done less for the agricultural labourers than for any other class, although landowners and farmers had a special pecuniary interest in the improvement of the rural workman. The outspoken language of this paper provoked frequently excited interruptions of dissent.

Mr. F. S. Corrance, M.P., read a paper on

The Social Condition of the Wage Class.

He traced at considerable length the rise of a great wage-paid class, and the industrial transformation of the North of England, and then proceeded to inquire whether the Poor-law legislation for thirty years had been successful. The last thirty years had been a time of peace, of free trade, of unequalled increase of wealth, of unparalleled emigration; but the expenditure in poor relief had increased in 1867 to 6,959,840*l.*, as compared with 6,317,255*l.* in 1834, the population of England and Wales being 21,100,000 in 1867, as compared with 14,322,000 in 1834. Was, then, pauperism extirpated? Had the rates decreased? Were the Poor-laws abolished? He feared that these questions could not be answered in the affirmative. On the contrary, the system had taken firm hold of men's minds, and as a vested interest it claimed its place. It was an important source of patronage and place, and the management charges were daily on the increase, having been 596,162*l.* in 1853, 696,095*l.* in 1863, and 730,704*l.* in 1867, showing an increase in fourteen years of 134,542*l.* Morally speaking, what men had the present system reclaimed? Whom had it made more provident? What encouragement or assistance did it hold out? It acted by repression, it pauperized, it exacted a hard and rigid test. Poor-laws might satisfy a present requirement, but they could not cure pauperism. Taught self-dependence, and with self-interest prescribed as the great rule of life, the working classes set to work according to their light, and applied the doctrine to some remarkable effects. The number of friendly societies had now reached 24,800, with 3,000,000 members, and 20,000,000 of assets in hand. At the close of 1866 the number of depositors in savings banks amounted to 2,149,764, and the deposits to 44,465,806*l.* All these facts seemed to him clearly to indicate the necessity of authority to guide and direct the efforts made, and to protect the weak. All that was ever urged against friendly societies tended to such a point; they were sometimes the speculations of clever knaves, or were conducted for the benefit of a public-house. He considered that medical clubs were a great advance upon the medical assistance afforded by the Poor-law Board. The objects embraced under the co-operative associations were multiple, but they might be divided into at least three classes,—societies for the transfer of goods or merchandise, societies of credit, and societies of production, building societies coming under the latter head. Even in agriculture co-operation had been tried with a fair amount of success. That such a system could or would ever supplant scientific agriculture, aided by machinery, need not be dreamt of. As regards trades unions, considered purely as such, if under a new sense of power and liberty ignorant or half-informed men had acted upon a doctrine which learned men had sanctioned—that of self-interest—it was not to them alone that blame was to be attached. These men were bad economists; they were reckless except of present gain. Their morality was not the morality of the upper classes; but these things did not grow up in a night—they followed as darkness followed light. They would pass away, but the dawn might not be yet. Upon the whole the Poor Law had failed, and an increasing pauperism and a vicious code of social laws were no safe or pleasant features. Was there no gentler code which we could suggest more in accordance with social economy and the Christianity we professed?

Very great interest was excited by these two papers, and the discussions were long and valuable. We may, perhaps, return to them.

The Pecuniary Results of Prison Labour.

On this subject Sir J. Bowring read a paper. He said the objections to making prison labour profitable might be mainly grouped together under four heads: first, that prison discipline should be simply deterrent; secondly, that to teach a convict a trade was to place him in a better position than the honest man outside the prison; thirdly, that prison labour would be put unfairly in competition with honest labour; fourthly, that in agricultural counties the teaching prisoners other trades would lead to a scarcity of agricultural labour and to a rise in wages, to the detriment of the agricultural interest. As regards drunkenness, which was the main source of crime, Sir John characterised it as the great Christian vice, or one which professedly Christian nations exhibited in its most offensive and dangerous form. As regards the argument that prison discipline should be deterrent, the policy of appealing to the hopes as well as to the fears of convicts might be advantageously adopted. Again, in few instances could convict labour be so productive as prison labour, since all social influences and stimuli were wanting while the improved appliances so usefully introduced in manufactories were also not within the reach of the convict. If convicts, too, had been at work in the open market, would they not have brought their competition to bear upon the price of labour and products? After all, convicts were "in-door servants"—who were bound to give their services to those who provided for them. As to the objection that teaching convicts a trade would injuriously affect the agricultural labour market, was the apparent desire to obtain goal birds among the rural peasantry creditable? Was not the elimination of convicts from any occupation or interest an advantage? The economical aspects of the question were, however, of less importance than its moral aspects. A goal might be made a reformatory school, and by beneficent influences faculties might be developed, the existence of which might not be at all suspected. The prisoner ought, indeed, to be made the confederate and not the foe of society, a supporter of the law and not the breaker of it; and prison labour was, he contended, a great influence which might be enlisted to conduce to this result. Sir J. Bowring proceeded to cite statistics to show the excellent results which had followed the introduction of prison labour at Wakefield, Taunton, and elsewhere. The Indian prisons were made more than self-supporting by prison labour, while the re-committals were small. The experience acquired in American prisons was to the same effect. In Massachusetts some of the products of the prisoners carried off prizes at the Paris Exhibition, and purchases were made by the King of Prussia and the Emperor of the French. At Wakefield the earnings of the prisoners in 1867 were 7,384*l.*, and the whole of the trade capital which belonged to the Government, amounting to 10,000*l.*, had been repaid. The average earnings of each prisoner were, in 1864, 4*l.* 12*s.* 6*d.*; in 1867 they were 7*l.* 4*s.* 7*d.*. In the Salford prison the net earnings were 3,369*l.*, being an average of 5*l.* 18*s.* 10*d.* per prisoner. At Bradford, in the five years ending 1857, the profits derived from the results of industrial labour introduced in the county prison by the present governor, since his appointment in April, 1853 (and which had been conducted without any aid from the county-rates) were 985*l.*; in the five years ending 1862, 1,367*l.*; and in the five years ending 1867, 2,506*l.* Including work done in and about the prison, for which no charge was made to the county and other receipts, the total profits on prison labour for the past fifteen years were estimated at 9,618*l.* As regards the Massachusetts prison, the net profits to the state of prison labour in 1867 were 22,345 dollars, while for 1868 it was estimated that the total profit would rise to 25,000 dollars. The re-committals of prisoners in Massachusetts were also relatively moderate.

Mr. J. Wyatt, of Bedford, Sir Willoughby Jones, Mr. Bracebridge, and other gentlemen took part in a short discussion which followed, the general tendency of the opinions expressed being in concurrence with the paper of Sir John Bowring. Sir Willoughby Jones, however, remarked that, as our prisons were at present constructed, the system of reproductive convict labour could only be applied to a limited number of prisoners. In the Norfolk county prison the treadmill was now reserved for strong abeddoed convicts, while the weaker were kept to remunerative occupation.

Science and Abyssinia.

In the course of a paper on the geography of the Abyssinian expedition, Mr. G. R. Markham, the Government geographer of the expedition, said the remarkable passes from the coast to the highlands of Abyssinia have been thoroughly explored, the mountain chains forming the watershed of a vast region have been examined, and the numerous sources of the great fertilising tributaries of the Nile have been accurately surveyed. Besides the observations I have taken, that most zealous and indefatigable of quarter-master-generals, Colonel Phayre, has completed a rough but useful survey of the whole country traversed. Dr. Cooke, notwithstanding severe illness, has done much valuable meteorological work; and the officers of the Indian trigonometrical survey have completed the mapping of the eastern portion of the Abyssinian highlands. But, important as the geographical results of the expedition have been, our science is not the only one that will be enriched by it. Mr. Blandford, who, from his intimate knowledge of the analogous formations in the Deccan, was peculiarly well qualified for the work, has found the geology of this part of Abyssinia to be exceedingly interesting—so interesting that he resolved to be amongst the last to quit Abyssinian soil. He has also added to our knowledge of the zoology of the country, and ascertained the existence of four distinct zones into which the fauna is divided. Mr. Jesse, who was sent out by the Zoological Society, and several officers, have also made large collections of skins, both of birds and mammals. The botany had been already thoroughly worked out by M. Schimper, the Nestor of King Theodore's captives. The country on the line of march also presents many points of antiquarian interest. The ruins of the Greek emporium at Adulis, on the coast, and of Koheito, at the head of the Degana pass, offer a field of research of no common interest to the archaeologist as throwing light on the ancient intercourse between the Axumite kingdom and the Egypt of the Ptolemies. The cave church at Dongola, the curious ruin at Azula, and the famous caverns of Lalibela, illustrate the late period when one of the most ancient Christian churches was established in Abyssinia. Nor can it be said that nothing of antiquarian value was to be obtained worth taking away, when several thousand MS. parchment folios were found in the library of King Theodoros, and a golden chalice, belonging to Sultan Segwed, a king who flourished in the sixteenth century, were amongst the plunder of Msghala. The main objects of the Abyssinian expedition have been gained. The men of science who accompanied the expedition have not returned empty-handed, and there are a few regions on the globe where so much could be found to repay inquiry.

The Broads of East Norfolk.

The title of a paper by Mr. R. B. Grantham, C.E., and had reference to water-supply, storage, and drainage. These broads, or lakes, he said, were not commonly found in the same geological formations in England. As an instance of utilizing the waters of these broads, and also of improving lands affected by them, he referred to the Great Yarmouth Waterworks Company, taking water from Ormesby, Rollesby, and Filby Broad (possessing together an area of from 400 to 500 acres), and supplying the town of Yarmouth and its neighbourhood; and the cases of improvement of land by drainage as carried out at Martham, Somerton, and Winter-ton, and Beccles, and other places about to be constituted drainage districts. To show the origin of the broads, he described the geology of those portions of the country in which they are situated, and from this and certain historical facts he deduced the conclusion that the eastern valleys of Norfolk were formerly branches of a wide estuary, and that the present rivers and broads are the remains of that large body of water. He then proceeded to refer to the valleys of the rivers Bure, Yare, and Waveney, and their tributaries, the combined water-sheds of which extend over parts of Norfolk and Suffolk, and embrace an area of 1,210 square miles, or 774,400 acres. The Bure and the Yare together drain more than half Norfolk, the Waveney only a small portion, but a large part of Suffolk. In Ormesby Broad, on the north side of the Bure, the surface of the water is 2 ft. or 3 ft. above the high water of the Bure at the sluices at the end of Muckfleet. It is said to be 20 ft. deep in some places, which would make its bottom considerably lower than low water in the sea. Pro-

bably the bottoms of many other broads may be below the level of the sea, which may be accounted for by depressions and upheavings of the formation. River-beds are not unfrequently lower than the low water of the sea, and this occurs far up their courses away from the sea. In some cases this may be traced to the force of the currents deepening them, but in the broads there are no currents or other disturbances to cause an excavation of the bottom. The Broad is supplied by streams running into them from minor valleys and springs which rise in the formations, to which they form catchment basins or reservoirs, and are no doubt performing a most important and useful part in the economy of water supply by detaining superabundant quantities of water from storms and continuous wet weather; and they prevent inundations in the lower parts of the country by affording time, where the inclination in the main valley is slight and the velocity naturally slow, for floods to pass off at each successive low tide. With regard to the scour of the river Yare, Mr. Grantham was of opinion that it would be most desirable to deepen the whole of Breydon Water and impound a larger body of back water, and thereby further increase the scour at the bar. Passing to the subject of drainage in connexion with the broads, Mr. Grantham did not recommend their conversion into agricultural land, considering the great importance of keeping them as reservoirs, particularly those of large area, in which the water would continue good and wholesome. The land to be acquired by draining the broads, if that were possible, would amount to 2,500 acres, which is a trifling quantity as compared with that which may be retained round about them, or with the quantities which might be improved in many other parts of the county. The drainage he would recommend was that of the marshes and swamps, which were mostly caused by the broads and the rivers in connexion with them. Most of the lands he had seen in this state would be highly productive and profitable if they could be deprived of the surplus water and so maintained. At the same time he would secure the means of using the water for irrigation, if necessary. This conversion of the marshes into profitable and remunerative land need not interfere with the impounding and storing the water in the broads. By the improvement of so much land a large amount of additional permanent employment would be given to the population, and the healthiness of the localities would be increased. Although large bodies of water might be objected to, he did not consider them so injurious as the miasma arising from the evaporation and exhalation from the decaying of the vegetation of large tracts of marshes, which is the chief cause of fever and ague in the tropics and other similarly circumstanced countries and districts.

We must end, for the present, with a brief notice of what Mr. Jas. Fergusson said

On Buddhist Architecture.

The discourse was delivered at an evening meeting in the Drill-hall, and was listened to with great attention, which is more than can be said of the audiences on some other occasions. His subject being an Indian one, was consequently a subject upon which much ignorance existed in England, and he was enabled to give a great amount of information which had the charm of novelty. He first referred to the foundation of the Buddhist faith by a native prince named Sakya Mune, or Buddha, several centuries before the Christian era. This prince abandoned all his worldly comforts and possessions, chose an ascetic life, and for fifty years lived under trees and taught the doctrines he wished to disseminate, viz. kindness to animals and to all living things, and, above all, brotherly love and kindness to all men. But it was not till 300 years after his death that Asoka made it the State religion, and was said to have converted all India to the faith; and it was still 600 years later that Nagarjuna established ministers and gave Buddhism a clergy, and from that time it spread over Bnrmah, Siam, into China, all over Tibet, and the greater part of Asia. A very remarkable fact, however, was that, although Buddhism was still the religion prevailing over a great part of Asia, there was not now to be found a single Buddhist in India, the land of its birth. Having given an elaborate description of the monuments of Sauchi and Amravati as examples of the structures raised in honour of Buddhist saints, the lecturer went on to refer to the details of the architecture of several periods, the sculpture proving beyond all doubt that tree and

serpent worship, which was the religion of India previous to the introduction of Buddhism, had again gradually crept into the new faith. Tree and serpent worship, he observed, had at some period or other prevailed all over the world, and doubtless the frequent reference to trees and serpents contained in the Holy Scriptures was in some way connected with this practice. Trees and serpents also held a high place in all the mythological fables; and his opinion was, that if this subject were thoroughly looked into they would arrive at an amount of ethnological and religious knowledge now quite unsuspected. All over the steppes of Asia, throughout Scandinavia, and in this country, wherever they found these rude tumuli, they found traces of the same race that erected similar monuments in India; and though he did not say that people came over from India and taught the people of this country to erect Stonehenge, nor that they had any connexion with the people of India, yet there was this great underlying stratum of population, who cropped up in Europe and other parts of the world as well as in Asia, and wherever they came to the surface their monuments were similar in character, and all more or less applied to the same purpose. Originally funereal, they gradually became temples and relic shrines; but they were all monuments of one great people, and all expressed more or less distinctly one idea. He was convinced that when this subject was fully investigated they would have a very interesting picture of a people who were now only known by their rude monuments all over the globe.

SUMMER DIARRHŒA IN LARGE TOWNS.

We are rather too much in the habit of regarding as inevitable and unavoidable certain violent fluctuations in our national death-rate, looking upon them as the natural result of the season, and the alterations of temperature in our uncertain climate. It is beyond denial that in winter the duration of life of the nation, but more especially of that portion living in large towns, rises and falls in almost unvarying sympathy with the mercury in our thermometers; but we have yet to learn how much the loss of life through the various diseases of the lungs, which ensue directly the temperature falls to the freezing point, may be lessened when the social and sanitary condition of our town populations shall have been raised to a very different standard from that which is now in force. So with the summer season, it is only necessary to point to the present season as a striking example of what may be observed in a series of years, that continued high temperatures and a rainfall far below the average have always produced an excessive mortality in the shape of an epidemic of summer diarrhœa. In cold wet summers there is little or no mortality from this cause. The year 1860 is perhaps the strongest example of such a season, and in that year the deaths from diarrhœa in England and Wales were less by something like 10,000 than the average number.

Summer diarrhœa seldom becomes epidemic in England until the middle or end of July; but this year it appeared in the middle of June, produced without doubt by the excessive and unusual temperature. In London the deaths from diarrhœa rose from 31 in the second week of June, to 66 and 171 in the last two weeks, and had increased to 412 in the last week of July; since which the numbers have declined to 384, 294, and 245, in the three weeks ending Saturday, 15th instant. These numbers are exclusive of a weekly average of 30 deaths in the eight weeks ending 15th instant, which have been referred to cholera and choleraic diarrhœa, many of which are doubtless only severe cases of diarrhœa.

The Registrar General's weekly return has recently published the mortality from diarrhœa in several other large English towns besides London, and it will be interesting to compare the relative fatality of this summer scourge of large towns, in the metropolis and in the provincial towns. For the purpose of comparison we will use the returns for the four weeks ending the 15th instant. The ten towns below are those for which weekly returns of mortality are published, and they are arranged in the order of their annual death-rate per 1,000 from diarrhœa, in the four weeks above mentioned.

	Annual rate per 1,000 in four weeks.
Newcastle upon Tyne	44
Bristol	54
London	57
Bradford	84

	Annual rate per 1,000 in four weeks.
Liverpool	10.8
Manchester and Salford	11.1
Sheffield	11.1
Hull	13.7
Leeds	13.2
Birmingham	16.7

From the above table it will appear that although the prevalence of diarrhœa in London in the past four weeks has raised the deaths by about 300 per week, the mortality from this complaint in proportion to population has been much more excessive in all the large provincial towns, except in Newcastle and Bristol. Although to some extent the fatality of an epidemic may be taken as a test of the general sanitary condition of any community, the above figures, if well considered, will show that some exceptional causes must be found to account for three towns like Hull, Leeds, and Birmingham, whose death-rates have recently been so satisfactory, suffering so severely from this summer diarrhœa.

The experience of cholera epidemics has taught us the first importance of an abundant and pure water supply, and the severe penalties which the absence of this necessary has entailed on different town populations; it is, therefore, natural to consider that the excessive fatality of diarrhœa in a town so generally healthy as Birmingham, at least throws some suspicion upon the quantity and quality of the water supply of that town. This high mortality, moreover, recalls to mind the fact that Birmingham is still without a medical officer of health, who in such a time as the present is especially necessary to organise an effective distribution of preventive medicine, and to secure as far as possible the instruction of the poorer classes in the necessity for prompt attention in the earlier stages of the complaint. Another important duty of a medical officer is to use every possible precaution against the sale of fruit and other perishable articles of food in a condition unfit and poisonous for consumption.

The low death-rate from diarrhœa in Newcastle is in a great measure due to the greatly improved sanitary condition of the town, but has been doubtless considerably influenced by the more moderate temperature which has prevailed in this northerly town. In Bristol and London the sanitary arrangements, although still admitting of improvement, are in a more satisfactory condition than in most other towns, and to this may be attributed the smaller proportional fatality of diarrhœa. The fatal prevalence of all kinds of zymotic disease in both Manchester and Sheffield discloses a sanitary condition which explains the high death-rate from diarrhœa. It is to be hoped that greater sanitary activity, favoured by the recent lower temperature and heavy rains, will go far to reduce the fatality of the epidemic, that the death-rate of 1868 will still remain one of the lowest on record.

The present mortality, however, should stimulate the efforts of all sanitary reformers to devise such precautions as will offer a greater security to our infant-town populations, from this annual scourge of diarrhœa.

THE GIRENCESTER ARCHÆOLOGICAL CONGRESS.

ON the 12th inst., when the Fairfield windows were visited, as already related,* the day's excursions included visits to the churches of Ampney Crucis, Maysey Hampton, and Bibury, Mr. E. Roberts, F.S.A., the hon. sec., undertaking their exposition.

At Ampney Crucis,

the vicar, the Rev. Mr. Brewster, gave an account of the accidental discovery of the head of the cross, and Mr. Pianché stated that the figure in armour was of the date of Henry VI., about 1430-40. Mr. Black considered that the base was originally an engineering landmark of the Romans. Mr. Roberts, in the course of his remarks, said that the interest in Ampney Crucis had hitherto centred in its cross, but that its story, like the history of Gloucestershire, still remained to be told. Since Rudder wrote, now nearly a century since, vast strides have been made in the system of researches, and enormous amounts of materials have been gained. There is no archaeological society in the county, and probably in consequence much has been lost sight of or failed to be recorded; but the more generally

diffused love of antiquities has led to inquiries, and it is desirable that the history of this and other places, scarcely touched on by Rudder and Atkins, should be more fully written. As regards Ampney Crucis, the materials are few.

At the time of Domesday survey the manor of Ampney Crucis was held by the abhey of Tewkesbury, which continued in possession until the dissolution.

Downnemeu and Qnennington appear to have been places visited annually by Edward I.; and each year, except those occupied by his French and Welsh wars, viz., about five years, he remained from three to twenty-nine days. Edward II. also lodged at Downnemeu in 1326, preferring either Gloucester or Cirencester when on his journeys hither.

As regards the cross and church, the work on "The Crosses of Gloucester," by Pooley, has views of it as well as descriptions. The date of the cross appears to be about 1430, and it is particularly interesting from having its upper part nearly perfect. The church has some remains of the Norman period. The chancel arch of that date is well preserved, and the doorway to the rood-loft remains.

Bibury.

The manor of Becheherie, or Bibury, is one of those the history of which commences with "Domesday Book." Mr. Roberts mentioned some curious benefactions recorded.

1. Hugh Westwood gave by will in 1559 for four of the most impotent and poor men of Bibury for maintenance, clothing, and firing, and who are lodged in his almshouse, a rent charge producing 18s.

2. John Smither gave by will, in 1621, 10l. vested in the churchwardens, being borrowed for the use of the church thirty years before, for four widows in Bibury if possible.

3. Thomas Tawney gave by will, in 1676, 50l. (lent to the church in 1754) for the use of the poor.

It appears, therefore, that sums of money were borrowed from parishioners for the use of the church, and remained a rent charge upon the parish.

The church consists of a nave 75 ft. 5 in. by 22 ft. 6 in., being slightly narrower at the west end; a south aisle, about half the length of the nave, and 13 ft. 6 in. wide; and a north aisle the whole length; a chancel 44 ft. by 15 ft., a west tower, and a south porch.

"This church may be appropriately described as an unknown treasure. It has been said repeatedly to have a very curious history if only it could be made out. In the absence of perfect records, we are driven to read its history in its walls. Undoubtedly, then, the foundation was Saxon, and many parts remain to show its size and construction. The nave is large, and the construction shows that the Saxon church was limited to nave and chancel. The latter, however, was not of the same shape or size that it now is, having been shorter, and terminated in an apse. The chancel opening bears every appearance of being the original size. The nave has been lengthened westward from the five arcades inserted in the Saxon walls, on the north side, of Transition or late Norman date; while the arcades on the south side are of a later date.

At the west end on the south side are three lancet windows, one being at a lower level than the others, with a circular or cyclet-hole window over it, splayed inside and out, precisely similar to those discovered at Framingham Earl, in Norfolk, and others which I have before pointed out in that district. I understand that Mr. Scott, who restored this church, considered this window to be Saxon. Now, although there is much of Saxon in this structure, I believe this window to be of the earliest Norman period. It is in a very peculiar position, and appears to me to have lighted a former loft. In the north aisle I must call your attention to the small piers or buttresses which are peculiar to Saxon work though in this instance it varies from the ordinary type, and seems to have been seriously restored. I have made inquiries of Mr. Scott, but I cannot ascertain what was done there. The chancel, as I have said, was lengthened, but still at an early date, the eastern amburies being always an evidence of early times. There are as many as eight amburies altogether, and two piscinas, both with shelves. Five of the amburies have been closed by doors.

Externally there are two carvings, one of Late Saxon scrollwork, and the other of Early Norman; one built into the wall of the chancel

* See pp. 595, 615, and 618, ante.

and, as our member, Mr. Irvine, thinks, marking the end of the Saxon work; the other is at the south doorway."

Richard of Cirencester.

At the evening meeting, Mr. Leviau, M.A., read a paper on "Literary Forgeries," which remarks on Richard of Cirencester, and his writings. After some introductory observations, he referred to numerous notable literary forgeries, commencing with those of Ireland in the beginning of the present century, and including the Byron and Shelley forgeries. He then came to the work alleged to have been written by Richard of Cirencester, but which was a forgery. Richard of Cirencester was a monk of the Benedictine order, who lived between the middle and the end of the fourteenth century, dying at Westminster between 1400 and 1402. The work "De situ Britannia," put forth as emanating from the polished brain of Richard of Cirencester, was proved to have been written by Charles Julius Bertram, a Copenhagen professor. The fabrication had been detected by Mr. Woodward, and by this imposition a number of valuable hooks written on the authority of these fabricated volumes had been vitiated. In these days, said Mr. Leviau, when my lords and honourable gentlemen, with that deep erudition which they individually and collectively possess, sit on parliamentary benches, and after having themselves doubtless mastered all the *arcana* of the most abstruse of the *ologies*, look down serenely like the gods in "Lucretius" upon those less happy mortals who are arranging up the steep paths of learning that lead to their empyreal heights, and are laying down laws with respect to competitive examinations, compulsory education, and the various other methods of torturing which they invent for the purpose of bringing less enlightened folks up to their own intellectual standard, they may perhaps allow an outsider to remind them that oven they themselves, the Civil Service Examiners, the Council Office, the "experts," and the learned societies are not infallible, but that when such base metal as Bertram Cirencester, or Cirencester Bertram, has been allowed for so many years to pass current among us, it may fairly be asked *quis examinabit ipsos examinatores?*

Mr. Gordon Hills mentioned, on the authority of Mr. Freeland, M.P. for Chichester, a remarkable case of historic forgery, or mistranslation, of an Arabic MS.

Mr. Black pointed out at some length his reasons for disbelieving the historical work attributed to Richard of Cirencester. He, with many others, amongst whom was his friend Sir Richard Hoare, were at one time in favour of the work, but no one conversant with the writing of the period at which this was supposed to have been written could for one moment be deceived by it. It was, in his opinion, a base fabrication, which had tended to throw into disrepute the "Antonine Itinerary," which has since been found, in the distances and measurements, to be as correct as Bertram's is incorrect.

On Thursday, the 13th, the Association went by the Roman-road, Akeman-street, to the source of the Thames. Upon this spot, which is known as "Thames Head," seven springs rise; but, in consequence of a pumping-engine situated at a short distance from it, and which supplies the Thames and Severn Canal with water, the basin was at this time quite dry, and had been so for some weeks previous to this visit. Before the construction of the canal a copious stream flowed from this spot. At an evening meeting afterwards, Mr. G. B. Wright read a paper on the origin of the name Thames. The chief place visited during the day was—

Malmesbury Abbey,

where Mr. Gordon Hills gave, in his usual sound clear manner, a full account of the buildings. In the course of his remarks, Mr. Hills directed attention to the fact that three of the flying buttresses on the south side were in a most perilous condition, and said the effect of a wet season or frost upon them might be exceedingly disastrous to the only remaining portion of the ancient fabric. 1,000*l.* spent upon the building now prevent its destruction.

On Friday, the excursion was to Daglingworth, Dunstbourne Rouse, and Elkstone, under the guidance of Mr. Thos. Blashill. Before examining the church at Daglingworth the party were conducted to the ruins of a fifteenth-century building, now partly roofless and partly converted into cottages, and which has been locally considered as the remains of a branch house of the nunnery of Godslow, in

Oxfordshire. It was stated that an architect had even fixed the position of the refectory and some other portions of the monastic edifice. Mr. Blashill showed from extracts from the register of the property belonging to the nunnery, which is deposited in the Bodleian Library, that they held only the advowson of the living, and pointed out the strong presumption that this was the ancient manor-house. There is a large porch, with a handsome archway and angle buttresses. Within the porch is a recess on the right for a staircase, and over it appears to have been an oratory; a window with a recess, like that of a piscina, but without the nasal drain, still remaining on the east-side wall. The porch is near the centre of the southern side of the main building, which measures about 54 ft. by 19 ft., and contains remains of good fireplaces, windows, and doorways, from which the original design might be traced. A deed, of the date of Philip and Mary, which was afterwards produced by Mr. Mullings, proved to be a lease of the manor-house and dovecot, and confirmed the conclusion already arrived at as to its history.

The church of Daglingworth appears in the ordinary catalogues of Anglo-Saxon buildings, and it certainly possesses several of the characteristics usually considered to belong to that early period. Until its enlargement, within the last few years, it consisted of a fifteenth-century tower, a nave, having a crippled semi-circular arch thrown over it between the porch and the western end, and a chancel. The western face of the wall above the arch in the nave had an altar, standing on two small Norman columns, with scalloped capitals, and projecting from the wall at the level of the wall-plate. A rough oak roof, of more recent construction than the trussed rafter roof of the rest of the nave, covers this portion. The walls also are thicker, although they form a straight line on the outer face. Mr. Blashill pointed out that this must have been the ancient tower, with a chapel on the first floor. Much of the ancient work was lost in adding an aisle and vestry on the north side; but all the old angles have what is known as "long and short" work, with a rebate run down at about 6 in. from the angle, clearly defining the timber-like construction. Possibly the plaster with which many early churches were covered stopped against this rebate. There is a narrow semicircular chancel-arch and a narrow south doorway. Each has splayed and square strings, to act as capitals, with a flat bead decoration in the chancel, and a flat plated ornament in the porch doorway. Very small, narrow, round-headed windows, with wide inner splay, did exist throughout the church, one or two of which can be clearly traced, and a small stone, with two semicircular-headed piercings, of pre-Norman character, was clearly made out from a few remains of inverted letters to be part of a Roman altar. Mr. Prebendary Scarth and the Rev. Mr. Joyce having arrived independently at the same reading of the inscription. The masonry generally is decidedly of a better description than is usual even in early Norman work,—so good, indeed, as to throw strong doubts upon the early date put down for the building. There is, however, no doubt as to the extremely early character of some sculptured panels which were found built up in the chancel-arch. They represent Christ seated; the Crucifixion, in which are two Roman soldiers, one having a spear and the other having a sponge upon a reed and a vessel for vinegar; and St. Peter, with the keys. The moustache on the figure of our Lord, the tunic in which he is dressed, the knotted girdle, the large heads of all the figures, and, as Mr. Gordon Hills pointed out, the uncrossed position of the feet in the Crucifixion, all show Saxon workmanship. The visit of the British Archaeological Association is likely to lead to the complete examination and illustration of the architecture of this interesting building.

The Church of Elkstone

is of the class of Norman structure, remains of which exist at Ifley, Kilpeck, Shobdon, Stowley, and other places, and are dated early in the latter half of the twelfth century. In this case the influence of the work at Malmesbury Abbey is clearly visible. There is a good doorway with the beak-head ornament, a rich chancel arch, two vaulted compartments in the chancel, the ribs in the eastern one meeting in four grotesque heads. The east end is square, and over the whole of the chancel is a room which appears to have been much higher in the last century, and is fitted as a dove-cot. The nests are composed

of portions from the old parts of the church; one piece of sculpture with a scalloped ornament appears Roman in character (it is near the Roman road known as Irmin-street, and there are Roman villas in the neighbourhood), but possibly the whole of the fittings of the dove-cot might prove, if carefully examined, to have been added since the Reformation. The eaves of the nave have grotesque corbels, as is usual in these twelfth-century buildings.

The buildings visited, though small, were of interesting character, and, though the day was showery, the view from Birdlip-hill over the vale of the Severn was magnificent. The line of the Irmin-street running straight as an arrow on Gloucester, whose town was a fine feature in the view, the distant view of May-hill, the range of the Malverns, and the rich valley with isolated hills, altogether made up a scene of hearty English in character, but rare even in England.

In the evening amongst the papers read was one by Mr. J. R. Panché, Somerset Herald, on

The Norman Earls of Gloucester,

wherein he argued in favour of the existence of an Earl of Gloucester (a William Fitz-Enstace) previous to Robert the Consul; and, referring to the errors committed and perpetuated by persons who did not sufficiently understand the subjects discussed by them, went on to remark,—“My amiable friend, the late Thomas Haynes Bayly, in one of his pleasant Songs of Society, said

‘It’s pity when charming women
Talk of things which they don’t understand,’

Without, by any means, endorsing this opinion, I do not hesitate to assert that it is a much greater pity when sensible men commit the same impropriety. A right honourable senator, who deservedly enjoys a high reputation for general knowledge and remarkable oratorical powers, not long ago, stated at a public meeting that he believed something useful was to be learnt from the study of every science—except that of heraldry. Here was an undoubtedly sensible man talking of what he did not understand, and it is the more to be lamented because he was unnecessarily giving the weight of his great opinion to a very silly prejudice, which I am happy to say is becoming rapidly destroyed by the proof constantly afforded of the exceeding value of heraldry to the student of our National Antiquities, whether historical, genealogical, or artistic. In conclusion, I must beg you to understand that, while arguing in favour of the existence of a Norman Earl of Gloucester previous to Robert the Consul, I am not hacking up a favourite theory, or interested in anything beyond arriving at the truth. Had my inquiry resulted in an adverse conviction, I should have stated it with equal satisfaction. The great object of such a society as ours, and our strongest claim to your support, is the establishment of facts by the critical examination of statements reported without question by writer after writer until ever becomes so venerable from antiquity and the sanction of apparent authority, that the archaeologist who would destroy it is accused of sacrilege and twitted with being untrue to his order. At the same time it is his duty to respect tradition, which is so frequently founded on fact, however distorted; and carefully to preserve every fragment of local history which is not contradicted by official record or opposed to common sense. Such a fragment I consider Dr. Powell’s note on the Battle of Cardiff; and while by no means insisting on the accuracy of every particular, I venture to think that, disentangled of the obvious misconceptions which have hitherto mystified and disfigured it, the ‘plain unvarnished tale’ is not unworthy of further investigation by the antiquaries of Gloucestershire.”

We are not pretending to mention all that was done and said, and must pass on to the very interesting visit paid to the site of the newly discovered Roman villa at

Chedworth,

where the area of the discoveries was pointed out, and, by the aid of a plan, the situations of the different apartments, bath, hypocaust, &c., were traced by the Rev. Prebendary Scarth, Mr. Grover, and Professor Backman. The villa is situated on the Great Foss-road, about eight miles from Cirencester, and sixteen from Gloucester, on the small river Colne. The buildings form three sides of a square, and the property belongs to the Earl of Eldon, with whose sanction excavations have been made by Mr. J. Farrer, and the site traced out, or the greater part of it. A large quantity of Roman relics have been dis-

covered, all of which, with a few exceptions that have been carried off to London, have been deposited in a museum erected on the spot for their reception. We have before now referred to this villa in connexion with the interesting fact that the Roman remains display *Christian symbols*.

Prebendary Scarth read a paper descriptive of the discovery, and showed that, although much of the villa had been brought to light, the whole had not been disclosed: fresh foundations of walls were being constantly found. There were undoubted proofs that the villa had been destroyed by fire, and the discovery of 257 coins, mostly of the Roman period, enabled them to fix pretty accurately the date of its destruction. No Saxon coins had been found. The position of Chedworth was marked on the map of Roman Britain in *Monumenta Historica*, but it was not mentioned in Horsley's map. Mr. Scarth proceeded to describe the general plan of the villa, which appeared to be divided into two parts, one the residence of the owner, the other allotted to the servants of the farm, which was generally attached to these rural villas. A perfect Roman villa, according to Columella, contained three parts:—1. The villa urbana, or owner's residence. 2. The villa rustica, or residence of the bailiff. 3. The villa fronsaria, or barns or out-houses. The peculiar situation of that at Chedworth had led to its preservation. It was situated on the declivity of a hill, and after destruction had probably been left until the underwood had hid it from view, and gradually covered up the remains. This would account for so much good masonry being left undisturbed. The pavements were very perfect and of a high order of merit, and probably were executed by the same artists who had laid down those found in and around Cirencester. One of these,—viz., that adjoining the principal bath,—had already been drawn and described by Mr. Crover; but there was another in the same line of building equally worthy of note, containing the figures of a dance somewhat resembling our present waltz. The writer went on to describe the finding of the Christian emblems, but we are tempted in lieu of following him to avail ourselves of information furnished some little time ago by the Rev. S. Lysons, who was present when the monogram was discovered. We give it under a separate heading. Suffice it to add, that the British Archaeological Association have spent their week in Cirencester with singularly good effect.

ROMAN REMAINS AT CHEDWORTH.*

To the accident of a lost ferret we are indebted for the discovery of one of the most interesting Roman or Romano-British villas existing in this country. The under-keeper, in thrusting his arm into a rabbit burrow to pull out the recalcitrant animal, at the same time drew out a number of tesserae, which being submitted to the inspection of those who understood such matters were at once pronounced to be of Roman type, indicating the existence of a pavement at that spot. Further search proved the correctness of the suspicion, and fortunately Mr. James Farrer, being a man of scientific pursuits, was not one who would allow the suggestion to remain without further inquiry. It is interesting, not only as revealing to us a work of art of the times when the Romans held sway in this country, but still more so from the historic fragments which may be collected from hence, and which, when pieced in with history and tradition, help to restore a link which was well nigh obliterated, in consequence of the loss of that historic literature which I cannot help thinking we must have once possessed. It is well known that in the second invasion of this island by the Emperor Claudius, the Romans, after a rapid march across the country, advanced with comparatively little opposition on the part of the Britons as far as the county of Gloucester, then inhabited by a people by some historians called the Dobuni, by others called the Dobuni, according as might be the curial perception of the pronunciation of their name by those who recorded it. History also tells us that some of the British princes were favourable, rather than otherwise, to the Romans, and others were soon converted into obedience. History, such as we have it, relates that Arviragus, king of this country, a king whose name is recorded by Juvenal, made terms with the emperor, and was permitted to retain pos-

session of his kingdom; that this king having reigned honourably forty-four years, and having during that time visited Rome, returned to his kingdom, and was eventually buried at Clonchester. At this time Vespasian, father of Titus, the conqueror of Jerusalem, was lieutenant of the emperor in Britain, and to him British historians attribute the foundation of the town of Cirencester, or, rather, its conversion from a British settlement, called Caer Corin, then the capital of the Dobuni, into a Roman fortress, with the Romanised British name of Corinium. Discoveries in that town give reason to believe that there is every probability of the truth of the tradition. Its Roman occupation, its Roman walls are unquestionable, and why should not Vespasian, who Roman history tells us was in Britain at that period, have transformed it from a British settlement into a Roman town? But to return to Arviragus. He is not only said to have been king of this country, but also to have been a Christian, one of the earliest British Christians. Bigland, the county historian, tells us that in this very parish, within a mile of this Roman villa, about the year 1750, the vestiges of a Roman bath were discovered at Listercomb-bottom; there were a spring and other necessary appendages. Most of the bricks of which it was built were legibly marked ARVIRI, describing, probably, says Bigland, by connected initials, the titles of the legion which was stationed here. But, as I cannot discover in these letters any way corresponding with them, and as they do form the very legend upon the coins attributed to Arviragus, I was most anxious, on the discovery of this interesting villa, to ascertain whether any other evidence might be found connecting this place with the traditional British king which might in any way confirm the story of his Christianity.

From our early chroniclers we learn that the Emperor Claudius made friends of some of the British princes, and left them in charge of the governments they had previously held, as the kings of Oude and Delhi, and other rajahs, have been left by our Government in India. This view is confirmed by the Roman historians Tacitus and Xiphilius; and we read in Juvenal that Arviragus was still at his government in the reign of Domitian, in which there is nothing inconsistent, considering the great length attributed to his reign by all the chroniclers. Arviragus then, being king of the Dobuni, of which Corinium (Cirencester) was the capital, one is not surprised to find the bricks discovered at that city also inscribed with the same mark of ARVIRI. Several of these exist in the Cirencester Museum. Whether or not that sovereign had at so early a period exacted a tax on bricks, and had them stamped with his legend, we cannot now say. They must have got their revenue from something, and therefore such a suggestion has nothing impossible or improbable that I am aware of in it. That both the Romans and Britons imposed taxes upon their people is unquestionable. The British coins marked *taxio* have been considered by some writers as signifying that they were used for paying the taxes. The British word *tasg* undoubtedly means a task, an imposition, or tax. I see no reason why we should be more surprised to see the sovereign's name upon these bricks than to see V. R. (our own sovereign's mark) upon any excisable article. The Romans had a tax upon salt, and the Emperor Vespasian, the founder of Cirencester (so says Suetonius), imposed a tax upon wine; a tax upon catables was imposed by Caligula, and why not on bricks? I may remark that the pigs of lead of the Roman times, of which there are several specimens in the British Museum, invariably have the mark of the emperor in whose reign they were moulded. It would be interesting to know whether any bricks of the Roman times with the legend of Arviri are discovered in any other county. Mr. Farrer kindly invited me to visit this place during the progress of the excavations; and at the time when the workmen arrived at the foundation-stone of the principal entrance of the villa, knowing the custom of most nations to inscribe the foundation-stone with some emblem of their faith,—the Egyptians with the Scarabeus, the Jews with the ineffable name, &c.,—I caused the workmen to turn up the stone, when, to my great interest and delight, I discovered the Christian monogram, the two first letters of the name of Christ, evidently marking that the builder of that villa was a Christian. This monogram was precisely of the character of those seen on the coins of the Emperor Augustus

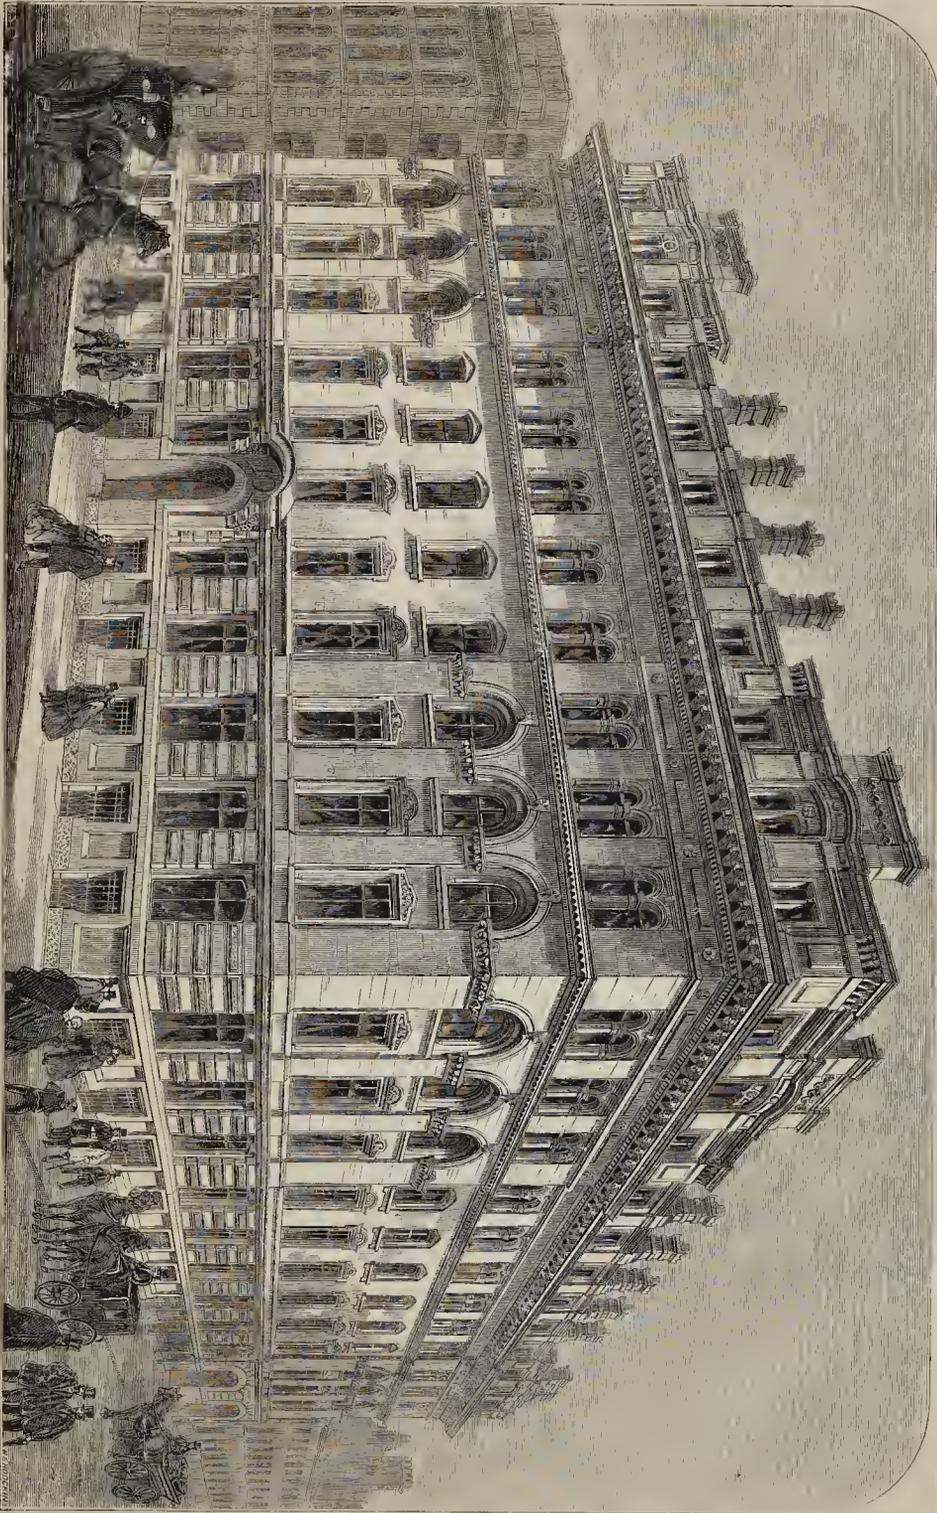

and his brother Decentius, who—Britons by their parentage, as we read in Zonarus—reigned A.D. 350. This type, however, I find on the Christian tombs, in the catacombs of Rome, reaching back to the times of Hadrian, who commenced his reign in 116 A.D., if not indeed, to a remoter period, and is, I believe, as old as the Apostolic times. This was not, however, the only specimen of the monogram: on further research I found no less than four other instances of it. It has been the prevailing opinion that the monogram originated in the time of Constantine the Great, but my own reading, confirmed by Signor Erasmo Pistolesi, on the Vatican at Rome, shows that Constantine only adopted a symbol well known among Christians from the earliest period of Christianity. But the historic chain does not cease here. I received a letter from Mr. Farrer, informing me that a sculptured stone had been found, with letters inscribed on it, requesting me to examine it on my next visit. On having the stone washed, I found the letters PRASIASATA, which is the abbreviation of Prasiatagus, as ARVIRI is of Arviragus. Here we have the name of another British king, known in history as the sovereign of the Iceni, who made his will, dividing his property in favour of the Roman Emperor Nero and his own two daughters. Prasiatagus, Prasiatagus, or Prasiatogus, as his name is variously written, was the husband of the celebrated Boadicea, also called Boudicca, and Bonidicca, and Voadica, according to the phonetic perceptions of the historians who record it. She was the queen who revolted against the Romans for taking rather more than the lion's share under her husband's will.

I think I have read somewhere that Boadicea was daughter of Arviragus, though I cannot find the passage. It is, however, probable that she had something to do with this county, for the coins bearing her legend, "BODOV," according to Akerman, are not found out of the confines of Oxfordshire and Gloucestershire.

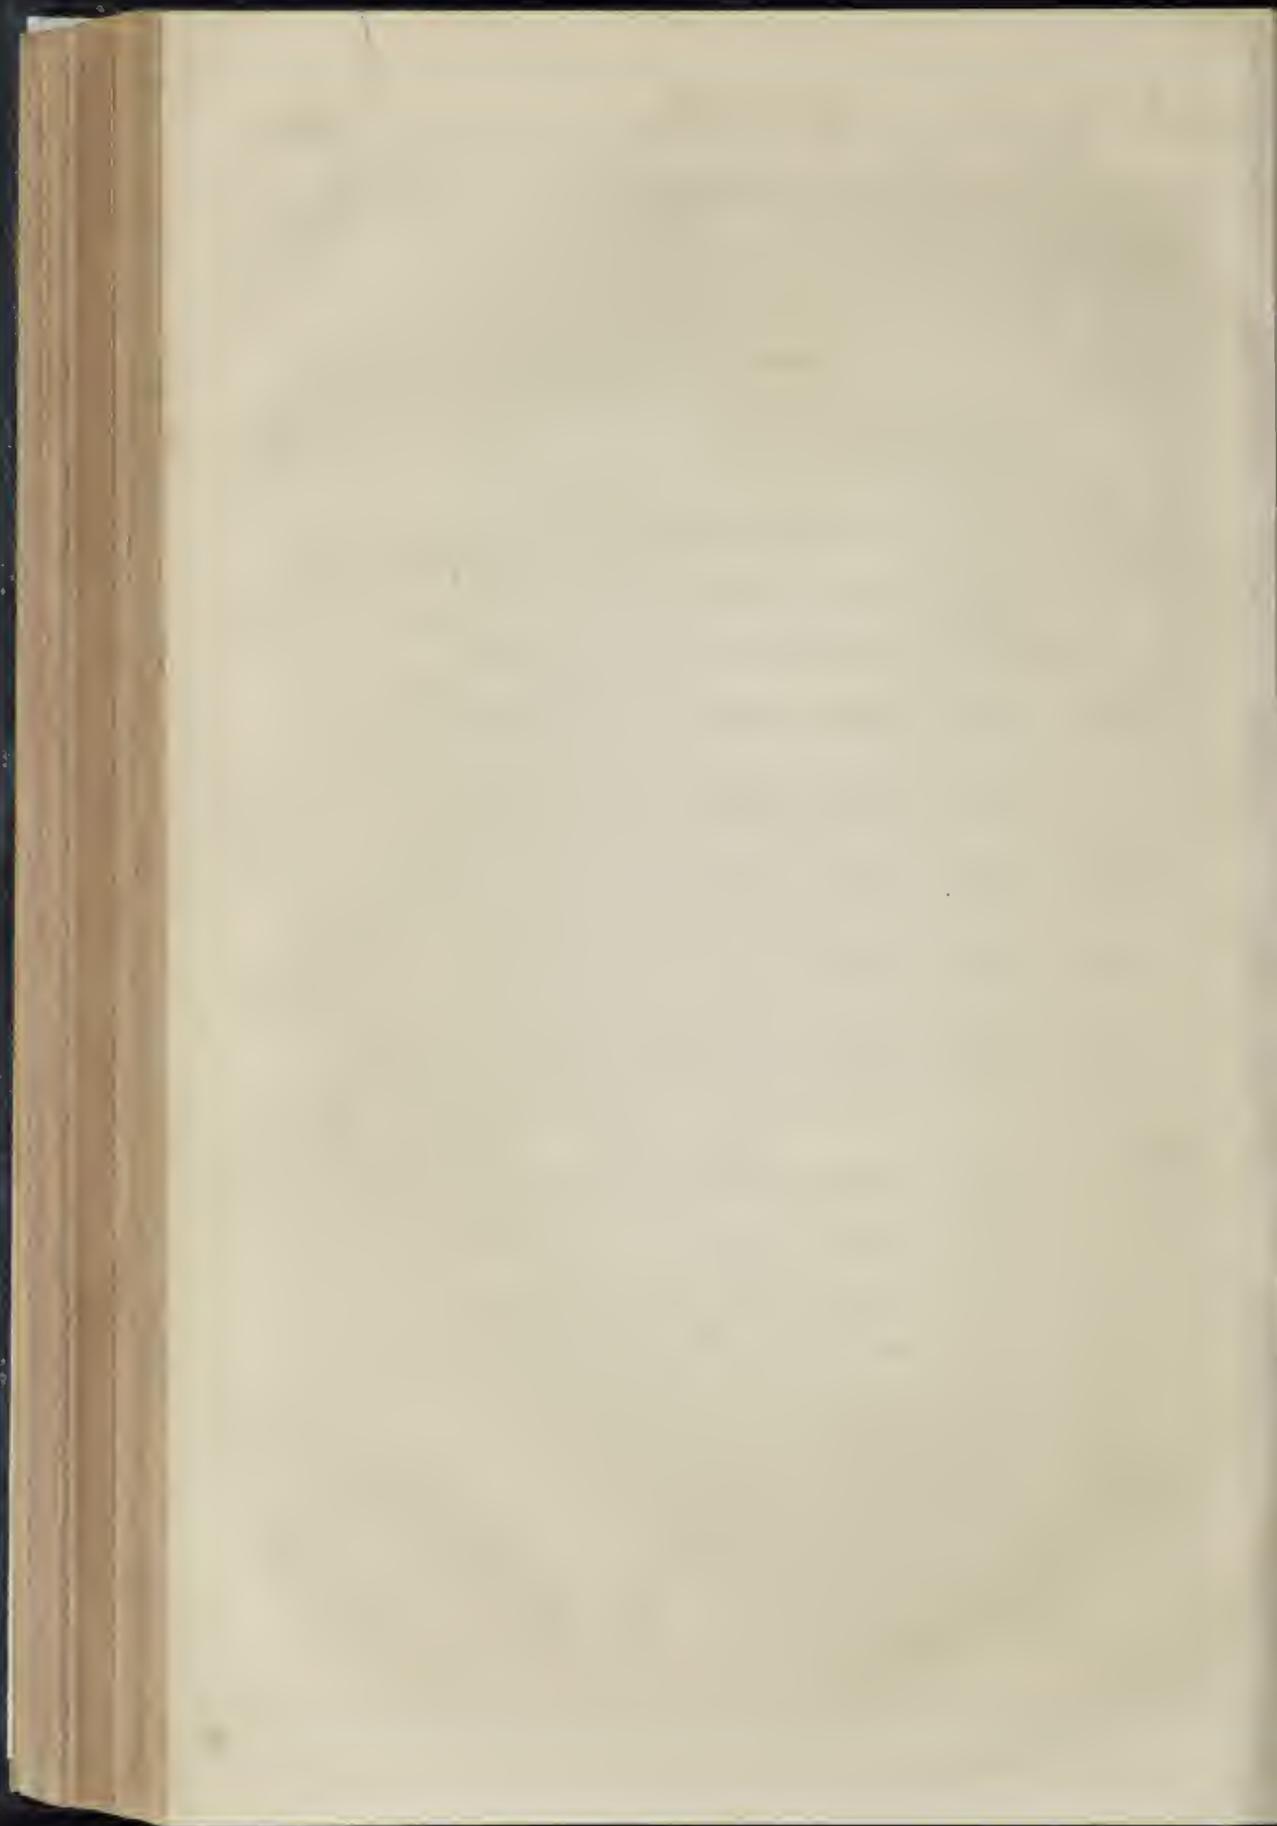

The traces of the early British Christianity, which are so decidedly asserted both by heathen and patriotic writers, have been hitherto but scantily discovered. Yet every year is producing more specimens. I am inclined to think that they have not been sought after, and when found have been overlooked or not understood. In the present instance the probability is that, had I not been present and searching for these evidences, the stones would have been thrown away with the rest of the rubbish and lost. The same monogram is found in mosaic on one of the pavements at Frampton, in Dorsetshire. Nor does it urge against the Christianity of the possessors of these residences that the Christian emblems are found mixed up with those of the heathen gods and goddesses, because no doubt intermarriages between heathen and Christians at that period must have been very frequent. Moreover, during the four hundred years' residence of the Romans in this country there must have been many changes of occupants of these villas, having different religious views. But I have remarked at this villa the singular absence for the most part of heathen emblems.

I have remarked, too, upon the existence of a chamber or building having an apse, presenting every appearance of a baptistery, of an octagonal form, which would scarcely, I think, have served the purpose of a bath, there being already two other bath establishments for the villa in another locality. In the corner of this building was an altar, but I failed to discover any heathen emblems about it. Whether this building was a baptistery is, of course, a matter of considerable question; but, if it was not, what was it? It was scarcely a bath,—it is not deep enough; besides, there are other baths in sufficiency; neither was it a well, for the same reason; nor a reservoir for the supply of the baths, for either of the large baths would exhaust four times as much as this contains; besides, a well or reservoir would not have required so grand a building. And then, what about the altar in the corner of the building, and the space occupied by the apse? This space would give room for the witnesses of the baptismal ceremony, who by standing in that position would face nearly or quite due east. Again, just over the altar are three peculiar niches. These are very remarkable, as possibly suggesting a Tritonian worship. These circumstances, at any rate, deserve much consideration. Whether all these circumstances united together may carry any weight in confirmation of some of the traditions of our early historians is for readers to judge.

* See above.

A MANCHESTER WAREHOUSE (MESSRS. A. GULLIE & CO.'S).—MESSRS. MILLS & MORGENTHAU, ARCHITECTS.

THE SCIENCE OF COLOUR.

I AM not surprised at the hesitation of your correspondents, Mr. Crace and Mr. Colling, in accepting what is to me evidently the only true theory of colour. I started myself with the same prepossession in favour of the doctrine that red, yellow, and blue were the simple or primary sensations of colour, and that their complementaries were green, purple, and orange. I began with endeavours to ascertain by rotation of coloured discs and other means the correct hues of these six important colours, and spent much time to little purpose, for nothing would come according to the theory; red and green would always make a dull yellow or olive green, yellow and purple would make a dull red, orange and blue would make a dull purplish hue, while blue and yellow would always most provokingly produce a neutral grey.

Then, again, I endeavoured to find out what could be the meaning of the doctrine that red, yellow, and blue would neutralise each other in the proportion of 5, 3, and 8, and what was the ground on which it rested; for it seemed natural to suppose that if white was a sensation compounded of those three sensations, then the intensity in which they existed in white ought to be regarded as equal. Having with some difficulty procured a copy of Field's work, my faith in the doctrine was somewhat staggered by finding that the only ground stated was that the thicknesses of certain coloured solutions, which, when superposed, transmitted a neutral light, were proportionate to 5, 3, and 8. Field seems not only to have disregarded a fact which is obvious to the eye, and was lucidly explained by Sir Isaac Newton two centuries ago, in his answer to Hooke, that the colours of solutions and other transparent bodies vary in hue as well as in darkness with the thickness of the bodies that produce them, because these bodies extinguish the differently-coloured rays at different rates, but also to have committed the amazing oversight of enjoining that the quantity of the colour transmitted was some way proportionate to the thickness of the solution. And on no better ground, it seems, this very equivocal doctrine has been ever since accepted by artists almost without examination or question.

I wondered, too, why yellow was the brightest of all colours, since orange and green, which were supposed to contain the red and blue of the full white, in addition to the yellow, ought to be still brighter; and why purple, which contained two primaries combined, must be darker than either of them separately. Is it possible, I thought, that red and blue light produce a mutually darkening effect on each other, and all illumination depends on the yellow? But if so, how is it that white is brighter than yellow?

It would be tedious to mention the absurdities and inconsistencies that naturally arise in following out a false theory. I will only add that after many vain attempts to produce anything like a perfect and harmonious system of colours upon the red, yellow, and blue theory, I was surprised to find a passage in Dr. Thomas Young's lectures maintaining that green, and not yellow, is the simple sensation, and afterwards met with Professor James Clerk Maxwell's account of his experiments, which confirm that opinion by proving distinctly (what, indeed, the unaided eye, when once attention is called to the fact, immediately recognizes) that of all the colours of the prismatic rays which compound the sensation of white, the red, green, and blue are the deepest, or most nearly pure; so much excelling the rest in this respect, that their mixtures are capable of producing all the intermediate colours with the depth they possess in the spectrum. As this doctrine perfectly agrees with all the results I had obtained, both by mixing coloured lights, and by presenting coloured surfaces to the eye in such rapid succession that the sensation excited by one had not faded before that excited by another had been produced, I had now little difficulty in accepting it, especially as it quickly appeared to me to give results far more harmonious and satisfactory to the eye than those deduced from the other doctrine. And as all carefully considered experiments with the prism, both in analysing the colours of pigments (such as that mentioned in my former letter), and in obtaining the colour of combinations of the prismatic rays (such as those tried by Mr. Crace when he viewed white and black spaces through the prism), perfectly agree with the new theory, I make hold to assert that it is impossible for any reasonable

man who knows the facts to withhold his assent from it.

I should like here to call special attention to a very simple and satisfactory experiment, which is perhaps more instructive than any other single experiment, except that of obtaining the spectrum of a brilliant white line. I shall assume that the reader is acquainted with and admits the foundation-doctrine of all that is known about light and colour: I mean Newton's great optical discovery that the white solar light is a mixture of an infinite number of different kinds of rays, all differently refrangible, and all distinguished by the peculiar sensation of colour which they produce in the eye; and that the prismatic spectrum of a line of such light is nothing else but a series of similar lines adjoining each other so as to fill a rectangular space, varying in colour from the red of the least refrangible ray to the violet of the most refrangible ray, through all the series of the prismatic colours, which to all persons of ordinary trichromatic vision at once arrange themselves in three conspicuous bands of red, green, and blue: the orange, yellow, and yellow-green which lie between the best red and green rays, and the mixtures of green and blue which lie between the best green and blue rays, being (in the pure spectrum of a narrow stripe of white) almost lost, on a general view, in the superior strength of those three predominant colours. I will also assume that the reader admits that the several rays, when mingled, each produce their proper effect on the eye, and that the resulting sensation is therefore a compound of the several sensations proper to the component rays. Without these premises no explanation can be given of the phenomena of light and colour, or of the particular experiment I propose to notice here, which is most easily performed in the following way.

Take two rectangular pieces of white paper, with clean edges (half-sheets of note-paper will do); support them over a dark cavity so that they touch at one corner, the right-hand edge of one piece being in a line with the left-hand edge of the other, and the bottom or near edge of one in a line with the top or far edge of the other; and let the paper itself be strongly illuminated. Now, holding a prism parallel with and at a moderate height above the line formed by the top and bottom edges that meet, view the spectra of the two white spaces. A charming assemblage of colours appears, arranged in the following order:—

WHITE,	BLACK,
Pale greenish yellow,	Dark violet blue,
YELLOW,	DUCK,
ORANGE,	Sagegreen-blue,
SCARLET,	SKY-GREEN,
Dark red,	Pale sea-green,
BLACK,	WHITE.

The opposite colours are perfectly complementary to each other, each containing exactly what the other wants to make up the full white of the paper; for if one of the white spaces is pushed laterally so that its spectrum is added on to the spectrum of the other white space, the two instantly neutralise each other, and white alone appears through the prism where the colours appeared before.

But how are these colours produced? Simply by adding together successively larger and larger portions of the pure prismatic rays, beginning at the red end on one side, and less and less portions beginning at the violet end on the other side. For the prism merely displaces rectangular spaces of the different prismatic colours (which without it are all seen together in the white), according to the refrangibility of those coloured rays, and the colours appear in the space between the greatest and least displacement on each side. This will be best seen if we distinguish the several prismatic rays by different letters, as by *a* for the extreme red, *b* for the next red nearer to orange, *c* for the next, and so on, down to *f* for the extreme violet. We can then show the formation of these colours as follows:—

$$\begin{array}{l}
 a + b + c + d + e + f \\
 a + b + c + d + e \\
 a + b + c + d \\
 a + b + c \\
 a + b \\
 a \\
 \text{NIL.}
 \end{array}
 \quad
 \begin{array}{l}
 \text{NIL.} \\
 f \\
 e + f \\
 d + e + f \\
 c + d + e + f \\
 b + c + d + e + f \\
 a + b + c + d + e + f
 \end{array}$$

By producing at the side a simple spectrum from a white stripe in the line of the top and bottom edges which meet, it is easy to see what prismatic rays are combined to form any given colour in either of these two compound spectra; and it will be found, on the one hand, that the

addition of all the green rays to all the red makes the best yellow; and that the further addition of the blue rays converts that yellow to white; and, on the other hand, that the addition of the green rays to the blue makes the best sea-green, which the further addition of the red converts into white.

This single experiment shows conclusively, without a possibility of mistake, the nature of all these colours which are formed by combining the rays of different portions of the spectrum beginning at one end or the other, and also places those which are perfectly complementary in juxtaposition with each other; and it seems impossible to avoid the conclusion that the best yellow is opposite and complementary to the best blue that can be presented to the eye, and the best red or scarlet opposite and complementary to the best sea-green; the colours produced by adding together continuous parcels of the prismatic rays being the best of their kinds that are possible. In like manner, by looking through the prism at a stripe of white (about a quarter of an inch wide) on a black ground, continuous with a similar stripe of black on a white ground, and properly adjusting the distance of the prism, the best possible green may be seen in juxtaposition with its complementary pink.

If any confirmation is asked for as to the truth of these being complementary colours, besides that afforded by such experiments as those mentioned in my former letter, cut out some circles of white card-board, and having painted opposite halves of each with the pigments which best represent them, such as the brightest ecarlet vermilion and verdigris, the brightest cobalt blue and king's yellow, the deepest emerald green and brightest rose madder (the latter should be toned with a slight mixture of cobalt, as it is not usually sufficiently blue), pierce their centres with small pieces of wood, tapered, and set them spinning. If the colours are laid on in proper strength, all the three tetrads will exhibit the same neutral grey.

I am obliged to Mr. Crace for the commendation which he so liberally awards to my treatise in his last letter, and am glad that my attempt to elucidate this inviting subject should be so candidly discussed; but I think that further consideration would lead him to abandon such crude and shadowy views of the nature of light and colours as were maintained by Goëthe in Germany, and by Field and Hay in England, who, with all their merits in other respects, were no philosophers. They are merely delusions which Newton put out of the domain of science two centuries ago, as that marvellous monument of genius, his treatise on optics, conclusively shows. However opaque the substance may be which reflects yellow light, the light itself cannot be opaque; rays of all colours cross in all directions without interference.

The first part of Mr. Colling's letter, in your number for August 15, is, I think, answered by the experiment proposed and explained in this letter, and in my treatise; but he makes one observation which requires remark. He says, "But green is immediately formed by allowing the yellow to approach the blue ray." A little consideration of the nature of the experiment will show that green appears when the white space is so narrow, or is viewed at such a distance, that the red in its spectrum no longer overlaps the green: so that it is, in fact, formed by subtracting the red from the yellow. Hence the green is darker than the yellow was, not lighter, as it would be if produced by adding the blue to the yellow.

I need not enlarge upon the natural phenomena which Mr. Colling next endeavours (though but lamely) to account for on the supposition that yellow and blue make green, and then uses as arguments to prove that doctrine. The colours of the sky, which vary from blue, through pale sea-green, to the glowing hues of sunset, have never, so far as I know, been fully and satisfactorily accounted for. Contrary opinions have been maintained by those most capable of judging. It may, however, be safely said that the sky-green is not formed by seeing blue sky through the yellow ray of the setting sun, since if those rays could possibly constitute a medium which would act like a wash of gamboge over a blue surface, the green they would so produce would be darker than the sky-blue, instead of brighter, as sky-green is. But, in fact, as we find by many direct and unexceptionable experiments that yellow and blue lights thrown together into the eye produce the sensation of white and not of green, the real cause must be other than that suggested by your correspondent.

Mr. Colling seems also under a mistake as to the nature of the colour of the greens of vegetation. Whether dark, as in ivy, or light, as in a blade of fresh grass, if analysed with a prism they are all seen to be yellow-greens, scarcely ever exhibiting even the pure prismatic green, which is of the hue of the pigment called emerald green, much less containing an excess of blue, as he seems to suppose; in fact, a large part of the light they reflect or transmit to the eye is red, and a very small part blue. Of this he may easily convince himself, by comparing the spectra of leaves with the spectrum of white light, by a method similar to that proposed for analysing the colour of king's yellow in my former letter.

The height of the sun makes a considerable difference in the solar spectrum; the atmosphere, or the aqueous vapour in it, absorbing some rays more than others. The extreme violet and red rays can only be seen when the sun is high and bright. Change of season cannot reasonably be supposed to produce any direct effect on the solar light which reaches us, so that the expressions which Mr. Colling uses, "the blue cold ray of spring," and "the sun's rays becoming redder and more powerful in autumn," have, I fear, nothing in nature to justify them. The sun's light, in our latitude, is obviously more powerful in May than in September; and it differs but imperceptibly in colour at midday, all the year round.

The admitted importance of right views on a subject on which such difference of opinion exists, will I hope be a sufficient apology for this long communication.

W. BENSON.

P.S.—I have omitted to notice the circumstance mentioned by Mr. Crace that all the coloured spots on a black ground in my diagrams, when viewed through the prism, exhibit strong traces of blue. All ought to do so, except those which belong to the group of colours containing no blue, and the traces of blue can hardly be said to be strong in these. Scarcely any blue comes from the spots of Indian lake, vermilion, cadmium, and king's yellow; very little from the spots of emerald green and viridian, not more than the red on their opposite side. But very strong traces of green and of red may be noticed on the opposite sides of the king's yellow and cadmium, though somewhat less green in the latter, red and green being essential to the constitution of those colours. Whatever blue is in them arises from the imperfection of the pigments, and from the white superficial reflection. The yellow seen over the coloured spots on the white ground, as may be seen by its being strongest over the black spot.

THE FAIRFORD WINDOWS.

It is proposed to form a committee, with the co-operation of the Vicar of Fairford, and of the inhabitants of the district, for the purpose of making complete and faithful records and illustrations of the Fairford glass, the authorship of which has been ascribed to Albert Durer, and towards conserving what must be considered masterpieces by whomsoever executed.

THE LATE MR. GEORGE ROWDEN BURNELL.

THE death of Mr. George R. Burnell, known as the writer of several scientific works, and which occurred at his residence in Kensington Garden-terrace, on the 23rd of July last, in his fifty-fourth year, should not pass unrecorded. His attainments were numerous. He had an extensive knowledge of languages, and had resided in America, France, and Belgium, besides visiting Spain and Sardinia.

About seven years of his life were spent in France, during which time he was engaged on the Paris and Rouen Railway, and as superintending architect of the Havre Docks. On the cry being raised of "La France pour les Français," in 1815, he returned to England. Though he executed several works both here and abroad, his bent was decidedly literary. He contributed several articles to the *Builder* early in his career, especially on roofs. In 1857 he wrote a rudimentary work on "Limes and Cements;" in 1861, "The Annual Retrospect of Engineering and Architecture." He edited "The Builder's and Contractor's Price-book" and "The Engineer's and Architect's Pocket-book." He was

connected, too, with the *Journal of Gaslighting* for many years, and wrote several papers for the Institution of Civil Engineers, for which he received prizes: he was the author of many articles in Brande's "Dictionary of Science," and in the "Dictionary of Architecture," published by the Architectural Publication Society, especially one on the word "Abattoir."

Mr. Burnell was a relative of Mr. W. Tite, M.P., and at his suggestion was made a member of the Government committee, appointed to inquire as to the preservation of the stone of the Houses of Parliament,—a committee, by the way, that sat long, published a useful report, and never received the slightest acknowledgment of its services.

Mr. Burnell endured previously to his decease a long and painful illness.

WORDS OF WARNING FROM WORTH.

A SUSSEX Antiquary says it is stated that Worth Church, one of the few Saxon buildings remaining to us, is to be restored, and hopes it is in good hands, and will be rightly cared for. Our correspondent continues,— "The ugly gallery, I am told, is to be taken away, and something done to the spire; and the archway of the south transept, which is wider at bottom than at top, is to be made upright! Surely that will not do, will it? Had it not much better be left alone? The south transept, it seems, belongs to Rowfant, and the parish must, under penalty of forfeiture, repair it; which is to be done by substituting open seats. The north transept is to be opened out into the church again."

We participate in the writer's anxious desire that nothing damaging should be done, and shall be glad to learn that the superintendence of the work is in proper hands.

THE EPIDEMIC AT GULDFORD.

SINCE we drew attention to the sanitary condition of Guildford the epidemic has somewhat declined. From June 1st it has attacked more than 400 persons, and there have been twenty-two deaths. Besides the fever, diarrhoea has also been unusually prevalent, and several cases of English cholera have occurred, as well as croup. The fever has attacked all classes, and in some cases it has been rapidly fatal: the chief inspector of the county constabulary died within forty-eight hours of the commencement of the attack. No endeavour has been made by the local authorities to check the progress of the epidemic. The local Board is most blameable for not taking measures even to ascertain the presence, or watch the progress, of so fatal a disease, far less to arrest it in the way prescribed by the Sanitary Act.

METHODIST NEW COLLEGE, BELFAST.

THIS new college has been opened. It is situated on an elevated site at University-road, in the vicinity of the Botanic Gardens. The building is 260 ft. in length from east to west, by 170 ft. from north to south. On the students' side are thirty-two rooms for thirty-six students (nearly all in separate apartments), average size, 16 ft. by 10 ft.; two large class-rooms, 25 ft. by 16 ft. average; a library, 38 ft. by 18 ft. 6 in., and 14 ft. high. On the boys' side are three dormitories, average size 50 ft. by 25 ft., lofty and well lighted, affording accommodation for eighty boys as boarders. Two of these dormitories are so arranged as to give each boy a separate chamber or "cubicle," of convenient size, so as to secure, to a great extent, the privacy and comfort of a separate room. There are three masters' rooms, in immediate connexion with the dormitories. There is a library, or reading-room, for the boys, 36 ft. by 18 ft.; four class-rooms, average size 30 ft. by 18 ft.; school-room, 55 ft. by 27 ft., and 20 ft. high, giving accommodation to 100 day boys, in addition to the boarders. There are common to both departments, a public lecture-hall, 55 ft. by 27 ft.; dining-hall, 50 ft. by 22 ft. There is a separate infirmary, or hospital, distinct from either department. Water-closets, baths, and lavatories, with hot and cold water laid on, are provided for each department. The principal staircases are of stone, and careful provision made against

fire. The corridors and rooms are well warmed and ventilated throughout. There are three residences—for the principal, head master, and theological tutor respectively. The boys' playground is of ample extent, and is to have a large covered space for exercise in wet weather, with gymnastic ranges for the principal kitchen, as well as all the other kitchens throughout the building, are by Flavel, of Leamington. These were specially selected by the building committee from the agents, Messrs. Richard Patterson & Co., Belfast, who held the contracts for the entire cooking apparatus, gas-pipes, and electric bells. The builder was Mr. Henry, of Belfast; and the architect, Mr. Wm. Fogarty, of Dublin.

CESSPOOLS IN RAMSGATE.

A CORRESPONDENT,—Mr. Thomas Hall,—writes thus:—Happening to stay this week at the crowded watering-place Ramsgate, I was thunderstruck at the extraordinary sanitary arrangement, or rather disarrangement, of the town. I was informed that each house is supplied with an immensely large cesspool, which is supposed to be emptied every three years. Over this is placed the water-closet seat, without either trap or water laid on. The one at the house I was staying at had not, I was assured, been emptied for over nine years; and, being constructed as above described, there arose a continual odor I should not like to sniff for long.

THE NEW TRENT BRIDGE.

ON Tuesday morning last the Bridge Committee met at the public offices to receive the tenders, and to determine upon the contracts for the new bridge over the Trent. Tenders were required to be delivered before ten o'clock in the morning, and forty-two by that time were received. The range in the estimates was very considerable, as will be seen from the following list; and many of the first firms in the country were competitors. The works are divided into two contracts; No. 1 being for the general builders' brick and stone work; and No. 2 for the cast and wrought iron work. The names and amounts are as follow:—

No. 1. CONTRACT.

Dennett & Company, Nottingham	£21,650 0 0
Lepish & Knowles, Shipley, Leeds	20,100 0 0
Shaw, Head, & Company, London and	
Stockton	18,388 0 0
Worcester Engine Company, Worcester	18,343 10 0
London Engineering and Iron Ship	
Building Company, Poplar, E.	17,600 0 0
Hewitson & Dargies, Lancaster	15,965 14 10
Henry Jackson, London	15,500 0 0
Benton & Woodiwiss, Derby and Glossop	14,837 0 0
E. V. Ponsoby, Sheffield	13,150 0 0
Charles Verity, Doncaster	12,672 0 0

No. 2. CONTRACT.

E. V. Ponsoby, Sheffield	14,674 0 0
Durlston Belge and Roofing Company	12,600 0 0
Cochrane, Grove, & Company, Dudley	11,687 0 0
Fairbairn Engineering Company, Manchester	11,500 0 0
Thames Ironworks Company, Blackwall	10,900 0 0
Worcester Engine Company	10,679 10 0
Close, Ayre, & Nicholson, York	10,431 0 0
London Engineering and Ship-building	
Company	10,200 0 0
Haywood, Derby	10,000 0 0
Leeds Railway Plant Company	9,545 0 0
Phillips & Company, London	9,500 0 0
Cliff & Company, Bradford	9,465 0 0
Butlerley Company, Alfreton	8,575 0 0
Gusson & Company, Leicester	8,514 0 0
Handyside & Company, Derby	8,294 0 0
North Staffordshire Engineering Co.	8,113 0 0
S. Ruston & Company, Doncaster	8,030 0 0
Benton & Woodiwiss, Derby and Glossop	8,019 11 11
Wm. Richards & Company, Leicester	8,487 0 0
Buller & Pitt, Leeds	5,436 11 0
Shaw, Head, & Company, London and	
Stockton	8,250 0 0
Horsley Company, Tipton	8,200 0 0
Eastwood, Swinburn, & Company, Derby	7,187 0 0
Smedley & Company, Belfast	7,072 8 0

Nos. 1 and 2 CONTRACTS TOGETHER.

Worcester Engine Company	28,852 0 0
E. V. Ponsoby, Sheffield	23,105 0 0
London Engineering Company	27,500 0 0
J. Phillips, Westminster	27,480 0 0
Thomas Bramble, London	27,125 0 0
Shaw, Head, & Company	
Stockton	26,036 0 0
Benton & Woodiwiss, Derby and Glossop	23,366 0 0
Cliff & Company, Bradford	22,938 0 0

After consideration, the Bridge Committee unanimously accepted the tender of Messrs. Benton & Woodiwiss, of Derby and Glossop, for the stone, brick, and other work of Contract No. 1, amounting to 14,837*l.*; and the tender of

Messrs. Andrew Handyside & Co., of Derby, for the ironwork of Contract No. 2, amounting to 9,291*l.*—the total sum being 24,131*l.* The estimates of Mr. Tarbotton, the engineer of the bridge, delivered to the committee for the corresponding works, were as follow:—Contract No. 1, 15,000*l.*; Contract No. 2, 9,500*l.*: total, 24,500*l.*

It will be seen by referring to the list, that the lowest tenders for the two contracts, added together, amounted to 19,744*l.*, and the highest tenders, so added, amounted to 36,564*l.*

RAILWAY MATTERS.

The inhabitants of Plaistow are displeased with the want of early and late trains by the Tilbury and Southwood Railway, and have sent a memorial to the directors on the subject. It is urged that if greater facilities were afforded for reaching the City and returning from it, the vicinity would become more populous, and the railway profits be increased.

A farmer has got a verdict against the Lancashire and Yorkshire Railway Company for 13*l.*, damages for the destruction of a straw-stack by firing from sparks, or rather a live coal, from the funnel of one of their locomotives.

Mr. G. Remington proposes the construction of a railway from the South-Eastern Railway at Appledore to the town of Lydd, a descending gradient of 1 to 70 for 3½ miles to Duogeness, where the level of the railway-tunnel intended to pass under the English Channel would be 240 ft. below the level of low-water spring tides; and from the latter level the line was to rise at the rate of 1 in 3,795 for about 7 miles, then a descending gradient at the rate of 1 in 1,200 for about 8 miles to the centre shaft, and thence another descending gradient of 1 in 3,265 for 11 miles to Cape Grisnez; from this point rising gradients of 1 to 70 and 1 in 81 to join the French railways. The height of the tunnel would be 30 ft. from the soffit of the arch to the centre of the invert, leaving a clear headway of 20 ft. for the trains. The space between the rails and the invert would be occupied by a spacious sewer, running along the central line of the tunnel, and on each side of it two air-tunnels for the purpose of providing ventilation. The width of the tunnel was to be 25 ft. It was proposed to carry the tunnel through the Wealdon formation, consisting of very strong clay, beds of freestone, and freshwater limestone all the way. The estimated cost of the works, allowing 638,000*l.* for contingencies, was 7,000,000*l.* The probable income of the railway was estimated by Mr. Remington at 1,625,900*l.* per annum, the working at 650,360*l.*, and the net profit at 975,540*l.*

FREE LABOUR REGISTRATION SOCIETY.

The Committee of the Free Labour Registration Society have presented their first report. They say that during six months they have provided permanent employment for upwards of 1,000 workmen in various trades, "thus showing an average of more than 150,000*l.* a year, as the wages obtained for members." Bearing in mind the industrial depression under which the country has been and still is suffering, the committee think that this fact will be received with satisfaction. The society and the principles it advocates are, it is stated, making steady progress to the confidence of all classes of operatives. The names, ages, addresses, and references as to character and ability of upwards of 14,000 union workmen have been up to the present time registered in the books of the society. Complaint is made that while workmen have not been slow to avail themselves of the advantages held out by the society, employers of labour have not evinced an equal alacrity. "This," the committee say, "is no doubt partly to be accounted for by the depressed state of the labour market, but it is also in a great measure caused by the unwise practice, now too prevalent, of leaving all arrangements with the men to foremen and others, who are, in many cases, the unscrupulous adherents of trades unions. Conciliation and arbitration being the chief features of this society, it is sought to promote these objects by bringing masters and men more cordially and trustfully face to face." The benefit club is making, on the whole, satisfactory progress; and it is hoped that the time is not far distant when its operations will be very largely

extended. The committee say they believe that one example of a sound society like theirs in full operation will ultimately be of greater use than the exposure of the false grounds of any number of other societies. To the report are appended several letters from employers, speaking in the highest terms of the society's operations, and praising the good character and efficiency of the men sent by them. A London master builder writes (and his letter is a specimen of many others):—"I can testify that your society is working an under-current of good which all employers are feeling the benefit of, though they may not openly acknowledge it, and I do hope they will respond to your appeal and support you liberally."

THE NEW LAW OF COMPENSATIONS.

In the New Regulation of Railways Act an alteration has been made as to the law of compensation for lands purchased or injuriously affected by railways, and which amendment, if adopted, will materially change the practice in "compensation cases." By the 41st section (31st and 32nd of Victoria, cap. 119), it is declared that, whoever, in the case of any lands purchased or taken otherwise than by agreement for the purpose of any public railway, any question of compensation to respect thereof, or any question of compensation in respect of lands injuriously affected by the execution of the works of any public railway, is, under the provision of the Lands Clauses Consolidation Act, 1845, to be settled by the verdict of a jury empanelled and summoned as in that Act mentioned; the company or the party entitled to the compensation may at any time before the issuing by the company to the sheriff as by that Act directed, apply to a judge of any one of the superior Courts of Common Law at Westminster, who shall, if he think fit, make an order for trial of the question in one of the superior courts upon such terms and in such manner as to him seem fit, and the question between the parties to be stated in an issue to be settled in case of difference by the judge, or as he directs; and such issue may be entered for trial and tried accordingly in the same manner as an issue joined in an ordinary action, at such place as the judge directs, and the proceedings to be under the control of the Court as an ordinary action. Furthermore, it is provided that whenever a company is called upon or liable under the Act mentioned to issue its warrant to the sheriff in the case of any disputed compensation, and the company obtains a judge's order, the obtaining of the same and notice thereof to the opposite party is to be a satisfaction of the company's duty in respect of the issue of the warrant. The verdict of the jury and the judgment of the Court upon the issue, as regards costs, &c., to be entitled to the same effect as if the verdict had been obtained before the sheriff on a warrant issued by the company under the recited Act. The provisions as to compensation cases have immediate operation.

A "MIDDLE ROW" IN THE CITY.

Sir,—It took thirty years of agitation to abolish "Middle-row," but they are erecting another in the City at the present time!

Walking down Cheapside the other day, I held another Middle-row in process of formation. Would you allow me, in the *Builder*, to put on record a protest against such a monstrous absurdity. It seems almost incredible that such an idea as leaving twenty or thirty houses between Cheapside, Bucklersbury, the Poultry, and the Mansion House could be seriously entertained; but let everybody go and be convinced of the fact.

Another City matter. Can any individual give a reason why the south side of Newgate-street was not widened instead of the north side? (The improvements at Christ's Hospital, I suppose, did begin it.) Suppose this to have been done, and the ground that lay waste at the west end of Cheapside (it used to be said for the purpose of making an opening into St. Paul's Churchyard from St. Martin's-le-Grand), not built on, then have set the houses back from the Post-office to the first or second lane in Cheapside, and we should have had it and Newgate-street one thoroughfare, with a very slight deviation. ONLY A TAILOR.

A CHALLENGE TO BUILDERS OF CONCRETE HOUSES.

Sir,—I have long taken deep interest in the question of concrete for building, and have been at some considerable trouble to arrive at a fair decision as to its merits. Of the capability of the material I have no doubt; my hesitation rests solely on the economy of construction. Now, to adopt Mr. Tall's motto: "An ounce of fact is worth a ton of theory," I beg through you to place this practical test for those who have faith in the patentee's assertion, that concrete "is only half the cost of brickwork." I require four ordinary six-roomed houses erected. I will find all the materials on the ground at the price named in Mr. Tall's pamphlet, and will agree to pay for the work performed at the highest price he names, viz., 2s. 6d. per yard; further, I will undertake to pay 40 per cent. of the cost of the apparatus for one house, which is estimated at 75*l.*

The party who undertakes the work may or may not contract for the carpentry, as he may prefer.

Should any doubt arise as to the work being properly done, I shall be happy to abide by your decision, for which, of course, I should be pleased to pay. G. C. J.

THE VENUS DE MEDICIS AND "LA BELLE TAILLE RONDE."

All the dimensions of the healthy adult torso of the human body are greater from side to side than from front to back; therefore the epithets "belle" and "ronde" in the above-quoted dictum, as applied to the "taille," waist, are utterly inadmissible. The smallest diameter of the waist, or that from front to back, of the Venus de Medicis is 7½ in.; and the larger diameter is 9½ in.

If now an oval be struck, having for its larger diameter 9½ in., and for its smaller 7½ in., the periphery or circumference of this oval will measure 27 in.; that is, for all practical purposes, three-sevenths of 5 ft. 2 in., the height of the Venus de Medicis in the perfectly erect position. If, therefore, any lady, knowing her height, would take the trouble to divide it into seven equal parts, three of those parts ought to be, according to that universally acknowledged standard of beauty, the exact circumference of her waist or the naturally smallest part of the torso. It may also be confidently asserted, as in the case of the shoe (see *Builder*, August 15th, "Apropos des Bottes"), that anything less than three-sevenths of her height for the circumference of the dress of that part of the body, will not only be out of proportion, but will occasion discomfort and inconvenience, and if much less will produce considerable pain and ultimate irremediable deformity not without its concomitant evils, which are fully described, by competent authorities, under the word "Corset," in the *Penny Cyclopaedia*. JOSEPH BONAMI.

"PARVISE."

Touching the discussion at Cirencester the other day, on the meaning of this term and the use of the building erected on the south side of Cirencester Church,* Mr. Thomas Wright, M.A., writes:—

"On my return I looked up that question of the parvis. *Paravise*, the word in Medieval Latin, is a mere corruption of the Greek word for paradise. It is explained by the Greek lexicographer, Hesychius, as the place in the locality for walking about. It was the place before the Greek temples where the philosophers walked and discoursed. It appears that in the early Greek churches it was usually planted with trees, and hence it gained the name of paradise. In Medieval times all sorts of business was transacted in the parvis. The scholars in the university of Paris sometimes held disputations there, and it was the common place for the consultation of lawyers. I can easily understand how in Cirencester it has been the place of meeting of the municipality to discuss the affairs of the town; and that that worthy lady, Alice Avening, might have thought it a public service to erect a building on the spot to keep the municipal authorities out of the rain. The only difficulty I have with it, is that there appears to be no authority for calling it a parvis (pronounced, of course, rightly, parres, but in English it was probably called parvis). But in the registers read by Mr. Black, which must of course have given the name as known at that time (since which we must suppose such a corruption of parvis must have taken place), it is called the 'vice'; and, as vice meant a novel or winding staircase, it was the word for it. It may be that the name may have arisen from such a staircase having been the original access to the room in which we met and talked,—nothing to do with parlor."

* See p. 507, ante.

SANTARY STATE OF STAFFORD.

We have received from those on whom we can rely statements as to evil and dangerous conditions existing at Stafford, which call for the immediate attention of the authorities. Amongst other things, the drainage is very defective.

Dr. Day, writing on the same subject in a local paper, says,—

"To my mind it is plain that if a balance were struck between the amount that would be required for the drainage of Stafford, and the saving that would be effected by such drainage, in *human life, human sickness, sorrow, and suffering*,—not forgetting the before-mentioned 'poor rates'—a comparatively limited period would be sufficient to clear off any debt it might be found necessary, in the first instance, to incur. I know that there are some persons in the town who comfort themselves with the belief that because the general death-rate of Stafford is a fraction or so below the average death-rate of all England (this being about 23 in the 1,000 per annum), therefore the health of the borough must be good; but surely they do not know, or, if they do know, they ignore, the circumstance of the Registrar-General having expressed the opinion that all death-rates exceeding 16 or 17 in the 1,000 arise from preventable causes,—yet further, they should bear in mind that even if the town be healthy, according to their idea, there can be no good reason why it should not be rendered more healthy, if it be practicable to make it so."

CHURCH POLYCHROMY.

Sir,—On your readers give me any information on Polychromy? Among the hills and vales of Cumberland and Westmoreland there is great room for improvement in church decoration, and very simple means for any such improvement; we cannot raise money for carvings, sculpture, &c., but anything that would be effective, church-like, durable, and easy of execution, as well as cheap, would do much for the bare walls of our churches, especially in chancels, and tend to render what are in appearance little better than barns now, something more like houses of prayer and praise. Your kind insertion of this will be a great favour to many down here.

R. C. H.

DAMP DRIVING THROUGH BRICK WALLS IN EXPOSED SITUATIONS.

Sir,—I have tried a remedy suggested some time ago in the *Builder*, of carefully covering the wall with mottled soap dissolved in water, and, in twenty-four hours after, laying on a coat of alum dissolved on the coating of soap, but I found that the bricks, which were red, obtained a very decided tinge of blue when they had received the first wash of the soap, which was in no way removed when the alum was applied. The unsightly appearance given to the building quite precludes our using this remedy. If any of your readers have in their experience found anything else that will keep damp from driving into or through walls already built, and will inform the profession through your valuable paper, they will, I am sure, confer a great benefit to the public.

UNDESIRABLE.

THE CIRENCESTER AMPHITHEATRE.

Sir,—On looking at the Roman amphitheatre, at Cirencester again, I think the shortest diameter was originally 130 ft., and not 129 ft., which it measures now. The soil has slipped down the slope on both sides a little, and thus rendered the distance across somewhat less than it was when used as an amphitheatre.

This has not occurred with the longest diameter, because there was no bank at the extremities.

JOHN BAYVELDE.

THE GATESHEAD PLATFORM ACCIDENT.

The coroner for Chester Ward of the county of Durham, has held an adjourned inquest, at Gateshead, relative to the death of James Barnet, seventy years of age, formerly an agent, who died on the 11th of August from injuries received on the 11th of June by the fall of the gentlemen's platform at the ceremony of laying the foundation-stone of the new Town-hall.

The coroner, in opening the business, said that it had been proved that the platform did fall; that Mr. Barnet, who was upon it, received injuries, and that he died in consequence. Their inquiry would have reference to the cause of the disaster. They would have to ascertain who drew the plans, who gave the instructions, and who built and who inspected the platform.

Mr. John Johnstone, the architect for the new Town-hall buildings at Gateshead, deposed that on the 3rd of June last he made out to get two platforms erected for persons to view the ceremony of laying the foundation-stone at the request of the Town-hall Sub-committee, which consisted of the Mayor (Mr. R. S. Newall), Mr. Ald. Bigger, Mr. Ald. Johnson, Mr. Redman, and Mr. B. Frazer. After viewing the ground, the sites were arranged, and on Friday, the 5th of June, he called upon Mr. Bell (who had contracted with Mr. Bulman for the joiner work), and told him to prepare the timber and have it sent over to start work on Monday, the 8th. He saw John Mason (Mr. Bell's foreman), and made a sketch on a bench of a plan of how he wanted the platform erected, so as to guide him in selecting the different lengths. On Wednesday, 10th June, he (Mr. Johnstone) had occasion to go to Hexham to assist in the laying of a foundation-stone there; and before he went (on Tuesday evening) he gave particular instructions to Mr. Bell and his foreman (Mr. Mason) that the gentlemen's platform was to be erected in strict accordance with the ladies' platform, adding that the former was to be an elongation of the latter. He also asked Mr. Burnup, clerk of the works, to see to matters generally whilst he was away. On Thursday morning, when he returned from Hexham, he was

astonished to find it had been erected on a different plan from that which he had prescribed, and remonstrated with Mr. Mason on the subject, and the answer which he received was, that the sub-committee had altered it on Wednesday, the 10th (the day that he, Mr. Johnstone, was away), and had given orders through Mr. Burnup, clerk of the works, to that effect. Mr. Burnup had given orders that the gentlemen's platform was to be erected on the plan of an inclined plane, instead of with steps. He told Mr. Mason that he was astonished at so great a change having been made in the plan, and that he could not then be responsible for the work; and further, that he might finish the platform according to the instructions which he had received from the sub-committee, and that he (Mr. Johnstone) could not take any further interest in it, or words to that effect. He considered that the mayor had some practical skill, and that the other gentlemen who acted with him had a knowledge of those matters. He did not examine the platform, and, having every confidence in the builders, allowed two of his own clerks and his stepson to go upon it during the ceremony. His own business caused him to be engaged in another part. He did not give any formal notice to the mayor of declining the responsibility; he did not consider it his duty to do so, as he had never received any notice of the change that was made in his plan either verbally or by letter. The pressure on the platform constructed on an incline would be forward, and the strut springing from the foot of the upright at the back would lose its service, unless there was one placed in the opposite direction, and the joints or uprights in the front of the platform, near the level part, were sufficiently strong. He saw no supports to resist the forward pressure under the open space near the foundation-stone. It would have been sufficient to make a strut with a bell forward to counteract the pressure in that direction. The platform seemed to have given way at the open space, as the wall was displaced upon which it had abutted. On a graduated step and platform the pressure was vertical, but on an incline plane platform it was forward; on the first, only two persons could move; on the last, the entire number of spectators might, by starting in motion, be pressed forward without the loss of resistance. The gentlemen's platform was built to contain about 500 people.

The coroner inquired how many persons were upon the platform when it fell, and Mr. Elliott, the chief constable, who said he was experienced in judging of numbers, replied 250. The point was disputed, others saying 300. The witness being requested to state the number he felt very indignant on finding that his plan had been altered, and that he had been interfered with, but did not express his annoyance or objection to the mayor on Thursday morning when he saw him on the ground. He had full confidence in the practical skill of the mayor and members of the sub-committee, and therefore did not complain to them or the town-clerk. He considered that the other six heads against his, and he must have been in error. Moreover it was (as the coroner had remarked) a disagreeable thing for him to find fault with his employers. He said his plan had been entirely superseded by a plan which gave notice to resign. In that particular case, which referred to the voluntary erection of a temporary platform, for which he was to have no remuneration, and with regard to which he had received formal notice of alteration, he did not think it necessary to give formally notice of being relieved of his responsibility. He did not, however, being requested to state the number of persons he thought that his plan had been altered. There was no bad feeling between himself and the mayor.

Mr. J. Mason, joiner, of Cambridge-street, Newcastle, and foreman to Mr. Geo. Bell, the builder of the Gateshead Town Hall, said he had received instructions from Mr. Burnup, clerk of the works, to construct the gentlemen's platform on the afternoon of Wednesday, the 10th June. He was to make it on an easy slope of 2 ft. 6 in., from back to front, and it was to be dealed or plankd over instead of stepped. Nothing was said about nuts or anything else. Mr. Bell's instructions were with reference to Tuesday night, before he went to Hexham, that they were to erect the gentlemen's on the same principle as the ladies' platform, and draw them out a plank plan to convey the idea. The gentlemen's platform was built in plan to an incline instead of a gallery. The benches were placed across the joints, every other one being fastened with four 6-inch clipped nails; he preferred those which were wrought up, but put the other in as he had his own accord, because he was afraid of the platform going in that direction. He considered the platform on an incline not so strong as the galleries. The benches were in the front of the platform—where it fell—were 4 ft. apart; but the alternate ones were not let into the ground.

A Jurymen: That accounts for the accident.

The coroner: Why were they not let into the ground? Witness: Because of the stones. The alterations caused me to be hurried. Had the platform been constructed on Mr. Johnstone's plan I should not have been so hurried, as the steps for the gallery were all cut.

Mr. William Burnup, clerk of the works, said he did not receive any instructions from Mr. Johnstone, the architect, about the erection of the platform, nor did he interfere in any way with the exception of making known the orders of the sub-committee at two o'clock on Wednesday afternoon.

Mr. Geo. Bell, builder, Westgate-hill, Newcastle, was the sub-contractor under Mr. Bulman, for the erection of the Gateshead New Town-hall, and Mr. Mason was his foreman. He was employed by Mr. Johnstone to erect the ladies' platform, and the instructions he received in relation to that he received with reference to the gentlemen's platform were from Mr. Burnup, at half-past seven on Wednesday night. He told him that the sub-committee had been on the ground and had altered the plan of the gentlemen's platform altogether. He (witness) said "Very well, they know best what they want," and Mr. Burnup replied "If you do not like the alterations, you may say when he comes back," and witness said, "Never mind Mr. Johnstone, you carry the instructions of the sub-committee out." He said they had likewise given instructions to the joiner to alter the ladies' platform. "Well, by all means do it." He believed he asked Mr. Mason if the borough engineer had looked at it, and he replied that he knew nothing of the borough engineer. He said he had asked the borough engineer if he saw, and he thought that he knew something about the matter. He thought, also, that the borough engineer would have inspected the stand of the ladies' platform. He said he had seen the stand of the ladies' platform.

The coroner: If you had not considered some one would have inspected it you would have spoken about the matter? Witness: Yes; I dare say to Mr. Johnstone. The timber used was good. I told Mr. Johnstone that they had altered his plan, and he said, "Who the devil did that?"

The coroner: If a building you were building was altered in your absence by your employers, what plan would you adopt?

Witness: I should ask my employers why they altered it.

The coroner: Would you have gone further?

Witness: That would depend on circumstances. Mr. Johnstone is a very good-tempered fellow, or he would have gone to his employers and said, "I cannot be responsible." I should have done that. They (his employers) should have sent some notice to him about having altered his plans.

The Mayor explained that the borough surveyor (Mr. Borrie) had nothing to do with the Town-hall buildings. Witness then said he considered the step plan the safest, as the people were standing at ease in that case, whilst on an incline, with their toes downwards, they were pressing forward. The people could be more densely packed on an incline than on a stepped platform.

Mr. Robert Stirling Nevill said he was mayor of Gateshead and one of the sub-committees appointed to make arrangements for the laying of the foundation-stone of the Gateshead New Town-hall. He suggested that the level of the platform should be lowered, and that planks should be placed on the slope. The suggestion was thought to be a good one.

The coroner: By whom? The Mayor: The members of the sub-committee, and it (the suggestion) was therefore adopted. No orders were given about uprights, rafters, or struts. The order was to leave out the witness applied for the planks caution it felt. The slope was to be 2 ft. 6 in. instead of 6 ft., as Mr. Johnstone's scheme would have carried out. Mr. Ald. Johnson said to the joiner, "Now, mind you make it four inches mould; make it more than three inches, or you will find it out; but if you make it too weak, every one will have reason to complain." The man said he would attend to it. They made some alterations by way of strengthening the ladies' platform, and he considered it the committee's rather than Mr. Johnstone's.

The coroner: Was the other platform which you altered inspected by the witness? The Mayor: Yes; so far as the altering it into the form of the incline plane was concerned. This was the committee's recommendation. According to engineer's advice, the pressure was allowed on a platform of 100 square feet; the forward thrust is in proportion to the angle of the rise, and by lowering the platform to 2 ft. 6 in. from 6 ft., we lessened the thrust in exactly the same proportion.

Mr. Johnstone stated that the pressure was so great that the coroner dislodged 15 tons of masonry. The coroner said that he need not go through the whole of the evidence, as much of it did not relate to the inquiry. There were many engineering points which would not bear at all upon their verdict. It became them now to inspect the work, and to witness applied to witness caution it felt. He thought that, to get rid of the responsibility on either part, there ought to have been some remark made by one of the members of the sub-committee to Mr. Johnstone that he was to be careful of the pressure.

The Mayor: Yes; so far as the altering it into the form of the incline plane was concerned. This was the committee's recommendation. According to engineer's advice, the pressure was allowed on a platform of 100 square feet; the forward thrust is in proportion to the angle of the rise, and by lowering the platform to 2 ft. 6 in. from 6 ft., we lessened the thrust in exactly the same proportion. Mr. Johnstone stated that the pressure was so great that the coroner dislodged 15 tons of masonry. The coroner said that he need not go through the whole of the evidence, as much of it did not relate to the inquiry. There were many engineering points which would not bear at all upon their verdict. It became them now to inspect the work, and to witness applied to witness caution it felt. He thought that, to get rid of the responsibility on either part, there ought to have been some remark made by one of the members of the sub-committee to Mr. Johnstone that he was to be careful of the pressure. The coroner thought that Mr. Johnstone, for his own sake,—finding that the platform had been altered,—should have made some allusion to it, and he thought it relieved himself of the responsibility. The construction of the platform, however, was allowed to go on without any person inspecting it. Every one had come to the conclusion that there was nothing to support the forward pressure, and that a strut should have been placed in the contrary direction to the one from the foot of the uprights at the back. They had heard all the evidence; and, as many of them were builders, they would thoroughly understand the nature of the work. The man's death was caused by the fall of the platform, and it was for them to say who was to blame.

The jurymen retired, and returned after an absence of one hour and three-quarters with the following verdict:—That James Barnet died on the 11th of August from a fracture of pyramis, caused by injury to his foot by the falling of the platform at Gateshead on the 11th of June last; that the falling of the platform was caused by the want of proper precautions in the construction of the platform; that Mr. Johnstone, the architect, could not give up his responsibility without first naming the fact to the sub-committee when he was on the platform on Thursday; that the sub-committee were equally to blame for altering the plan in the absence of the architect, and their not seeing that the platform was properly inspected.

Every one had come to the conclusion that there was nothing to support the forward pressure, and that a strut should have been placed in the contrary direction to the one from the foot of the uprights at the back. They had heard all the evidence; and, as many of them were builders, they would thoroughly understand the nature of the work. The man's death was caused by the fall of the platform, and it was for them to say who was to blame. Their verdict, however, implied a want of proper inspection.

CHURCH-BUILDING NEWS.

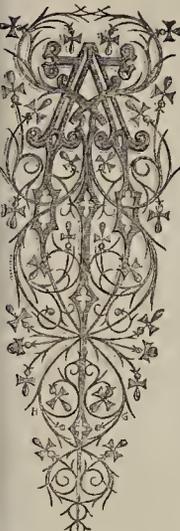

Berden (Essex).—The parish church here has been re-opened after restoration under the direction of the diocesan architect, Mr. Joseph Clarke. The chancel has been almost entirely rebuilt. A considerable quantity of the old stone carving has been preserved. The number of sittings has been largely increased. The whole work has been completed at a cost of nearly 1,900l.

Stockton Heath.—The new church here has been consecrated by the Bishop of Chester. The edifice is in the Geometrical style, from the designs of Mr. E. G. Paley, of Lancaster. It consists at present of a nave and south aisle, both 75 ft. long, and a north transept 16 ft. by 16 ft., with an organ chamber and vestry. The chancel is 32 ft. by 25 ft. The exterior of the walls is of Runcorn stone, the interior of white bricks, of roof and pewing of Baltic timber, the doors of oak. The edifice has eight stained windows, executed by various artists. The large east window, by Messrs. Clayton & Bell, is the gift of Mrs. G. Greenall, of Walton Hall, and illustrates the principal events in the history of our Lord's Passion. The two smaller chancel windows are the gift of Miss Forde, of Stockton Heath Parsonage, and represent the incidents which took place at Bethany, and on the morn-

The Builder.

VOL. XXVI.—No. 1335.

Railway Construction and Feeding.

PERIOD of unusual immunity from accidents to railway travellers has just been terminated by the occurrence of two disasters of almost unprecedented magnitude. The Mont Cenis surface-line has been closed, and partly carried away by a landslide; and the Chester and Holyhead Railway has been the scene of a collision involving an explosion of petroleum, and causing the instant death of at least thirty-three passengers.

The latter accident, which appeals to the English public with that irresistible eloquence which, in our country, always echoes from the tomb, appears in the first instance unaccountable. Part of a luggage train is said to have become detached from the locomotive, and to have run down an incline, on which the Irish mail, rushing up at the rate of forty miles per hour, came into collision with the trucks. Notwithstanding the fact that this part of the line was on a curve, it seems inexplicable that such a collision should have occurred. What could have been the nature of the look-out kept by the engine-driver?

The shock is said to have exploded a quantity of petroleum, placed on one of the trucks at the end of the luggage-train. This statement is probably intelligible in one way. The shock of the collision may have started the vessels containing the inflammable material, and thrown some of the escaping contents into the fire-box of the engine. The combustion of the remainder of the cargo would be inevitable.

We have no wish to dwell on a catastrophe which will tingle in the ears of every one that hears of it, and that is being dissonant at a considerable length before a coroner's jury. It is one of those events which bear on the management of traffic, but which have nothing to do with the construction of a railway. With the *Mont Cenis* slip the case is reversed.

Judging from the imperfect accounts that have yet reached us, it seems that an *éboulement*, or landslide, caused by violent rain, carried away both road and railway, interrupting absolutely the passage of diligences, and allowing only of an interrupted service for the locomotive route (even if that be not now stopped). Several complaints are made that the officials, when the worst of Continental railway servitudes, give no warning to the passengers, such as might allow them to halt at a place where shelter could be found, or to arrange their steps to an unbroken line of

conveyance. But neither this usual French tyranny over unfortunate railway travellers, nor the interruption of the line itself, comes under the head of casualties special to the *Mont Cenis* line. The misfortune has overtaken the road with even more disastrous effect than that produced on the railway. Unless it be asserted that the vibration of the engine has hastened the detachment of the slip (which, if the case, can have only been a question of time), the cause of the displacement has nothing to do with railway locomotion any more than with the old traffic by diligence. It is a danger peculiar to the locality, as might be that arising from a snow-drift or an avalanche, and might beset the pedestrian or equestrian traveller with as much peril as the railway passenger.

The question, therefore, of the applicability of the system introduced by Mr. Fell, or of any other method of surmounting steep gradients, or piercing mountain passes, is only incidentally touched by the occurrence of the *Mont Cenis* slip. All engineers know the peculiar dangers that attend the passage of mountain chains. That which is novel to our experience is the method of so applying tractive force as to enable us to overcome the resistance offered by the power of gravitation to the ascent of lofty heights, while at the same time we adopt the same means for obviating the resistance of friction that have led to the improved travelling of the last third of a century. The resistance offered to going up hill, as far as actual lifting of load is concerned, can be diminished by no human skill: we can only apply adequate power to lift the load. The resistance offered by friction to the passage of the *diligence* or the wagon we have reduced, by the introduction of the surface line, to the 7 lb. or 8 lb. per ton common to the more level lines of railway.

The great object which has to be carried out by the various and successive improvements in internal communication which have taken place since the middle of the eighteenth century may be stated in one word as the diminution of friction. The substitution of a water surface for a land route, in the case of inland navigation,—the prevention of the deep ruts and water-logged holes that rendered our highways all but impassable in winter before the time of MacAdam,—the introduction of steel springs for carriages,—the placing of cast-iron plates to bear the wheels of the small mineral trucks of the tramways,—the iron railway introduced by Stephenson,—the subsequent step of "fishing" the rails,—the application of steel instead of iron,—and the high finish now attained both in locomotives and in some of our carriages,—are all so many steps in the reduction of running friction. Without now analysing this general expression into its constituent elements, it may be considered that a pull of seven or eight pounds weight on a well-ordered railway is more effective than that of a horse, or even of a team, under the ordinary circumstances of the winter road traffic of 1760.

The carter, or the coachman, before the date of Macadam, had indeed the knowledge that a hill was an element of difficulty. Then the opposition to progress arising from bad roads with which he had to contend was such that a gentle ascent, where the road naturally drained itself, was often preferable to a level route, where the drainage was bad. Distance, in barbarous countries, is measured rather by time than by space,—by hours rather than by leagues,—and the general travel-worthiness of a road was regarded as a question of experience, depending on soil, on undulations of the ground, on amount of mending required and lately effected, on the character of the coach-master or of the whip, rather than as a simply scientific matter.

But when once it became evident how much mastery over distance was to be attained by the

use of a rigid support for the wheels of heavily-laden vehicles, more exact views as to the force of locomotion followed as a matter of course. Thus it was constantly present to the mind of George Stephenson, in every step of his career, that while the engineer would almost annihilate friction, he was unable to elude the force of gravitation. Let him produce a road and a carriage by means of which the force of a child would effect far more than that of the finest team on the old mail routes, on a level,—the level was a *sine qua non* condition for the full development of the advantage of the new system. Let the rigid road rise at the rate only of 1 in 300, a rise all but imperceptible to the stage-coachman, and the power required for propulsion must be doubled. In fact, by reducing running friction to a minimum, the difficulty of ascent appeared, relatively, to be raised to a maximum. If friction could have been so far done away with that a wagon could have been propelled by a touch, still the slightest ascent involved the need of a power adequate to lift the load in the air to the exact height attained by the summit of the incline.

With this unquestionable fact clearly in view, it was the object of the engineers of the school of Stephenson to reduce gradients, as they were called, to a minimum, and rather to wait upon nature, by following the circuitous course of a river valley, than to force nature, by the construction of lines made as the crow flies, involving not only heavier earth-works, but also steeper gradients, than those of a valley route.

Of the mechanical truth of the principle always insisted on by Stephenson there can be no question. But locomotion, although dependent on mechanics, is not simply a mechanical question. Locality goes for much. In the actual configuration of the surface of a country certain differences of level exist, and, roughly speaking, have to be accepted and provided for. To surmount an unavoidable hill, even though you have the advantage of running easily down again, is a positive loss of power and source of cost. But to carry a traffic from London to Birmingham it is necessary, sooner or later, to raise the weight carried from the level of the Thames to that of New-street or the Bull Ring. There is no avoiding the actual rise.

Thus in selecting river valleys, in following the courses of canals, in excavating and tunnelling so as to reduce intermediate summits, much may be done to economise tractive power. But no care, and no outlay, will reduce the cost due to the actual difference of level between termini. The cost of working a line may be indefinitely increased, but that power adequate to overcome that further dead weight of gravitation must be produced there can be no doubt at all.

With this question of unavoidable cost of going up-hill, put it in the best manner you can, has often been blended an entirely different consideration. It is that of the application of power. The first circumstance on which the possible speed of railway travelling depends is, that the adhesion of the driving-wheel to the rail is sufficient to allow of the propulsion of the train. When it came to be a question of climbing it was feared that this adhesion would not suffice. It was proposed, and indeed carried out, by Mr. Robert Stephenson, that the inclines of one in seventy-five and one in sixty-six on the extension from Camden Town to Enston-square should be worked by a stationary engine. It was only experience that decided that locomotive power was available, as well as more convenient, over these inclines. At the Lickey incline, near Bromsgrove, another case where the natural features of the country refused to be coerced by the engineer, an incline of one in thirty-two was worked by locomotives from the

very opening of the Birmingham and Gloucester Railway. The past summer has seen the solution of the same problem on the Mont Cenis pass. As far as the application of locomotive power is concerned, it is now certain that inclines of one in forty, one in thirty, and even more, are perfectly manageable. The question, then, reduces itself to one of expense.

Were a group of lines, differing in their gradients, or, at all events, differing in the amounts of actual lifting work that has to be accomplished in the transit of each convoy, to resemble each other in every other element of working cost, it would be possible to ascertain from the accounts, if properly kept, what was the different amount of summit level to be surmounted in each case. From the present state of the returns made to the half-yearly meetings of the various companies, cumbersome and voluminous as many of them are, it is impossible to arrive at any such definite result. But looking forward to the time when uniformity of management, of accounts, and of dividend, shall result from an efficient central control of the railways of the United Kingdom, we are justified in expecting that a direct correspondence between the cost of locomotive power and the character of the grading of a line will be found invariably to exist.

Clear perceptions as to what amount of economy is, and what is not, attainable by the employment of rigid bearing surfaces for roads underlies the solution of that important question as to street railways, and branch or supplementary lines, which is now commencing to attract the attention of the public. To the short-sighted proceedings of the directors of the South-Eastern railways we shall, no doubt, owe an earlier practical insight into this subject than could otherwise have been anticipated.

In fact, we see in almost every part of the country lines of streets forming themselves near and around the stations of our various railways, or parallel to their course. That which most follows is the arrangement of railways, tramways, or anti-friction roads of some kind, parallel to the direction of our streets. When we once distinctly understand what can and what cannot be effected by the reduction of friction, we shall hasten to grasp the advantages which are to be derived from the introduction of street railways. The most remarkable part of the matter is, that we have drawn so little practical inference from the information which we have actually acquired. How long is it since lines of rail have been laid through the docks at Liverpool? How slow and tentative have been the arguments for running decks, of the steamers for Dublin, Galois, Brazil? The saving of time, of expense, of annoyance, of everything worth saving, that arises from a prolongation of a line of rails to the very end of a journey, instead of condemning all descriptions of passengers to a supplementary cab, or omnibus, or carriage, is at least equal to that which is effected by the substitution of a good pier, alongside of which a steamer can moor, and from which the passengers can step on board, for an open and crazy boat.

As the supplement, or rather complement, to the existing system of English railways, the introduction of light branches, and of street rail or tram ways can only be a question of time. What is less certain, but highly important, is, the further question of how far light street railways, worked by horse power, or, perhaps, by light locomotives,—engine and carriages being made of steel, and designed for passenger traffic alone,—may be available to check such a public injustice as that now in course of perpetration by the directors of the South-Eastern lines. Speaking with due reserve, and without any wish to give value to the patent of Mr. A., or to the project of Mr. B., we think that such a check is attainable. The next Parliament would feel, it is probable, compelled to authorise a scheme for which the capital was found by aggrieved residents acting in self-defence. The cost, if we take such experience as is to be gleaned abroad, would not exceed from 3,000, to 4,000, per mile, for the Grindsett and Hammarline, of thirty miles on a 3 ft. 6 in. gauge, was opened in 1864 at a cost, including rolling stock and stations, of 3,000, per mile. We call the attention of those of our friends who are smarting under the recent inflictions of railway penalties to this subject. Mr. Watkin and his brother directors may yet prove to be benefactors to their countrymen, as the means of introducing, in spite of themselves, light suburban passenger railways into the outskirts of the metropolis.

WATER SUPPLY, SEWAGE, IRRIGATION, AND NAVIGATION.

In the pages of the daily papers there have appeared lately articles upon the subjects of water supply, sewage, irrigation, and navigation, from the pens respectively of Sir John Kenzie, C.E., and Mr. W. B. Adams, C.E.; treating very ably of the above important subjects; and, following as they do in the wake of the *Builder*, and of Mr. Bailey Denton, whose arguments they fully corroborate, it is sincerely to be hoped that as we have succeeded in arousing a feeling of strong interest and ardent sympathy in the cause, and have enlisted the services of some shrewd and sound thinkers upon the subject, it will be pursued with energy and determination, until a satisfactory result has been produced alike beneficial to all the very important interests involved. We trust this momentous question may not be allowed to lag or drop again until it has been practically solved, and placed in that clear and unerring light that public opinion may fully understand the question, and thus by these means our future legislators may be educated, trained, and induced to develop a perfect remedy by imperial legislation.

The long period of drought through which we are now passing has extended over an interval of nearly three months (except in a few isolated cases of rainfall, or thunderstorms in a few instances). From Manchester, Halifax, Sheffield, Bradford, and many other places the wail is for water; and even in those places where it was supposed the supply was skillfully arranged and carefully calculated to be full and ample for all times and seasons, the hope has not been verified. This last season has aroused the fears and anxieties of the denizens of our cities and towns, and the population of the country generally, lest a total failure should take place; and it has already produced a disastrous and damaging effect on vegetation, except to one cereal crop, which is fine and superabundant, evidently thriving best in a dry season; and this will serve in some measure to counterbalance the loss to the country in the lamentable failure of other produce. Our barley and oat fields look stunted and thin, and our turnip fields are comparatively bare; so that, doubtless, though we may have a cheap loaf, the price of meat and other necessities of life will be comparatively high, unless the markets of the country are equilibrated by importations of those articles of consumption from other parts.

This extraordinary dry season, with all its serious consequences, ought to arouse the energies and sympathies of our Government, our legislators, and holders, agriculturists, and our town populations generally, to this very important subject—perhaps one of the most important subjects of the day and hour; and that this partial privation of this very necessary element of life in animated nature and the vegetable world may be the means of working a large amount of public good, by directing earnest attention more particularly to it, with the view of enlisting the national sympathies in that direction, leading to a large and comprehensive measure that will prove an effectual remedy to this state of things. It is an admitted fact, and patent to all, that in every part of this country we have at some period of the year copious supplies of rainfall, yielding a superabundance of water to replenish our rivers, brooks, and springs; and we ought, as a matter of right and duty, studying the national welfare, to utilise and economise these blessings so hominously showered down upon us, and to make proper and ample provision in the rainy season, by storing up our surplus water, that will fully and at all times carry us over a dry season, so that neither man nor animals, nor even vegetation should perish for the want of copious supplies of this vital and indispensable element of existence.

In the case of our water-supply we fail to exercise that far-seeing and provident principle which is usually thought to distinguish the race of Anglo-Saxons, and which peculiarity exalts them above the ordinary run of nations; and as our common country becomes more dense and thickly populated, and agriculture is made to yield manifold crops under the pressure of a scientific mode of culture, the rainfall of the country must, as a matter of necessity, be collected and utilised, at any rate, so far as it is required for the proper water-supply of the population, for the purpose of irrigating the land, and to keep open and in proper order our various navigations.

It is perfectly astonishing how rapidly agricultural produce springs up and grows in tropical countries in those periods of the rainy season that are alternately showery and sunshine; the copious down-pour of rain and the heat of the sun between the showers force vegetation so rapidly, that it may almost be said to be seen to grow; and the sowing of the seed, the growth, the maturity, and the gathering of the crop, are a work of only a few weeks, and such crops that would gladden the hearts of our husbandmen; while, on the contrary with us, the various progresses described are spread over the best part of the year, and the result is at all times a matter of speculation, grave anxieties, and doubts.

In those tropical countries where maize forms the staff of life, the yield from cultivation is marvellous, one grain of maize producing from 400 to 800 fold, if the situation be favourable to its growth, and it is well supplied with water, either from rainfall or irrigation. The latter will more than double the crop.

In countries which we have known, maize grows to a height of from 10 ft. to 14 ft., and from the time of sowing the seed to gathering in the harvest there is a period of only about six weeks; it shows plainly and incontestably what an incentive to growth and production a plentiful supply of water is, whether in the shape of continuous showers or irrigation, and with the all-powerful rays of a tropical sun, the earth yields forth her increase in great and surpassing abundance.

But even the production of that useful cereal, maize, is excelled in those countries by another tropical plant called the "plantain," which is wonderfully luxuriant; and next to maize forms the principal food of the people.

The stem is soft, herbageous, 15 ft. or 20 ft. high, with leaves often 6 ft. long and nearly 2 ft. broad. The fruit is about 1 in. in diameter, and 8 in. or 9 in. long, and it grows in clusters. When ripe it is filled with a pulp of a luscious, sweet taste, somewhat resembling ripe apples. Its yield is enormous. From a single acre it is calculated to produce a quantity equal to the crop of 133 acres of wheat, or 44 acres of potatoes.

And these are cases in point of what may be done on a fruitful soil, with plenty of sun, and an ample supply of water for irrigating purposes.

This year we have had a taste of a tropical sun and heat, but we unhappily lack the liquid and invigorating element to render the visitation a blessing, and an advantage to agriculture. Let us picture to ourselves what would have been the result if the rain-falls of last winter had been collected and stored up on the drainage area of all our rivers, and our lands had been laid out scientifically for the purposes of irrigation, the produce of all kinds would have been manifold, splendid, and magnificent, and such only as those who have observed such remarkable circumstances in those highly-favoured lands above mentioned, where the vegetable productions are extraordinary and wonderful, are able to appreciate.

In India and other tropical countries a scarcity of rainfall or a comparatively dry season means a shortness or failure of the crop; and if a copious supply of the vital element is so necessary there to infuse life and vigour into plants, it is equally necessary with us in many seasons, and particularly in this just elapsing, as our agriculturists look tamely but anxiously on while the scorching rays of a powerful sun wither and parch up their precious and costly crops, and they are quite helpless to avert the calamitous result.

Our system of agriculture appears to be open to considerable amendment and improvement, such as are capable of meeting all the requirements and necessities occasioned by the changeable character of the climate. In certain seasons under-drainage is necessary to render the soil dry, and to carry off the surplus water that would otherwise injure vegetation, which, in a dry season, would be of very questionable advantage, if not a positive injury; and in dry seasons we ought to be prepared with a sound, practical system of irrigation, that would supply the deficiency arising from a lack of rainfall; and if the sewage of our towns, which is now to a considerable extent thrown into our rivers and wasted, is not fully equal to supply the necessary amount of the aliment necessary for the food of plants, the rainfall of the district stored up should be resorted to, to support vegetation in a healthy state, and to aid in the increase of the productions of the soil, so essential to the wants of a largely increasing population.

There is one subject to which Sir John Rennie draws particular attention in the case of the River Thames, and that is the deposit of the solid part of the London sewage in the navigable channel of the river at its outfall, and thereby causing an accumulation of mud-banks injurious to the navigation.

This is certainly an evil, but we apprehend it is only of a temporary character, as it cannot be supposed that so large a quantity of valuable manure can be thus so ruthlessly thrown to waste, particularly as its value and the necessity for its use to agriculture is now coming to be understood; but even the deposit there is better than when discharged into the river, as formerly practised, poisoning most barbarously the very atmosphere we breathe. It is rather a difficult matter, no doubt, in the present state of the question, to devise a practicable scheme, and hastily solve the problem to deal satisfactorily with so large a volume of sewage; but the day is surely not far distant, as so many skilful, enterprising, and energetic men are turning their attention to this much-voiced question, when the sewage will be applied to its only legitimate uses as a valuable manure, although many may doubt whether land is always in a condition fit to receive it; that is, when crops are about maturing, when the earth is already saturated with moisture, or under times of frost, as the sewage will never cease to flow, and means must be devised at those times to purify and otherwise utilize it, so as to prevent it further injuring our rivers and brooks. But plans appear to be now the subject of experiment, which may lead to some practical result.

Though there are difficulties attending it, they are such as may be grappled and dealt with, as may be evidenced at many places in the country on a small scale; and although the progress to mature successful plans has been somewhat slow since the question was first mooted, we hope soon to see it brought to an nearly issue in a well-considered and practical measure, alike beneficial to the welfare of our thickly populated cities and towns and the general interest of agriculture. Science is making rapid strides in the improvement of agricultural implements. We now have the aid of all-powerful steam and machinery to assist in gathering in the crops more efficiently and expeditiously than by the old system of manual labour: this harvest, in consequence, we have not heard a complaint made of the scarcity of the soil for the benefit of man. Let us, therefore, at once avail ourselves of her wise and able teachings and endeavour to profit as largely as possible by her grand discoveries.

It is quite idle to suppose, and unworthy of our national character, that the very material of all others that our agriculturists require to replenish and invigorate the soil should be thrown to waste, and thus made to defile the precious water of our rivers, spreading disease and misery through the country instead of life, health, and plenty; material which would at the present time have been the salvation of many crops, and great wealth and happiness to the industrious husbandman, and have absolutely made the difference between abundance, plenty, and cheapness, and shortness, scarcity, and dearth. We ardently hope that so time will be lost in applying a remedy to this anomalous state of things, and removing this foul blot from our national escutcheon.

As the poet says, it is a pleasant contemplation—

"To scatter plenty o'er a smiling land,
And read its history in a nation's eyes."

The area within the rock-bound margin of our little island is so limited, and our population increases so rapidly (notwithstanding the drawbacks of colonial emigration), that it means can be desired to grow more blades of corn on cultivated land, and make our large tracts of wastes and barren sands to blossom like the rose by the means pointed out, it would be a difficult matter to estimate the amount of benefit the nation would derive from it, and those men who aid in any way in solving the difficulty, and triumphing over it, will be as worthy of all honour, and their names will be as rightly inscribed on the tablets of fame as those who devote their lives and talents to adorn the councils of their lives and who dazzle with their lore and eloquence the subject of the navigation of our rivers and canals is also of the greatest importance, and rain-fall should be conserved for the purpose

of aiding the supply of water to them in periods of drought.

In a former article we drew attention to the efforts made by our old canal engineers to supply canals at the early period of their history, as it was then of the utmost importance that those great arteries of the country should be kept open to traffic at all times and seasons, and we give them credit to a considerable extent in having succeeded in doing so; but the abstraction of the water for our town wants from the sources through which they obtained it, has absorbed to some extent their principal sources of supply without affording them an adequate equivalent; and on these grounds we ought to store up our rain-fall in winter and spring, to keep open and in proper action these important channels of communication, as well as to aid in replenishing and renewing the continuous flow of the water in rivers and canals.

As the weather we have had for some months past has been of a tropical character, there is little doubt we shall have a rainy season of some length, and during that period it is to be apprehended we may be visited with epidemic and endemic diseases, as at those times in the tropics a heavy visitation of sickness usually follows the change in the season. Let us, therefore, hope that the authorities of our cities and towns will see that their houses are put in order, so that should these expectations be unhappily realized, we may be in a condition to ward off the evil consequences, or at any rate to mitigate them so far as human care and foresight can accomplish it.

The work will be incomplete so long as they cast a valuable fertilizer of the soil to waste, robbing our lands of their proper natural aliment, defiling the most beautiful objects in our picturesque scenery.

PETROLEUM AND LEGISLATION FOR IT.

The heartrending disaster which occurred at Abergele on Thursday, August 20th, by which thirty-three persons were ushered into eternity, naturally leads us to inquire concerning the nature of the substance which produced such dreadful destruction of human life. Petroleum is met with at Inuiskillin, Canada West, Kenhawa in Virginia, Sootsville, Ky., Oil Creek in Venango Co., Pennsylvania, Duck Creek in Monroe Co., Ohio, and Liverpool, Ohio. It was formerly collected and sold by the Seneca and other Indians, and is hence called Seneca or Genesee oil. It is also found in Burmah. In 1862 about nine millions of gallons of petroleum oil were imported from the United States; of this large quantity nearly half came to England. In 1866 the yield was so large from the States that it was actually in excess of the demand. A district of Scotland west of Edinburgh goes by the name of the "Scottish Petrolia." This consists of oil-bearing shale, and is so valuable that a piece of land before worth 2,000l. is now worth 200,000l. These bleak inland farms have been found to be mines of wealth, and villages will spring into towns.

Petroleum (Greek *πετρα*, a rock, and *λαϊον*, oil) is a mineral substance very like naphtha, composed of a number of hydrocarbons. Geologists consider it to be a product of the bituminous shale, which attains in America enormous extent and thickness; in Michigan a thickness of 4,900 ft. Others regard it as a product of the distillation of subterranean coal-beds, and conceive the cavities of the upper strata serve as receivers to the vast coal retorts below; from such cavities the condensed vapour may be supposed to filter through the soil sometimes to much lower ground than its source, i. e. on the principle of an artesian well. Dr. Mantell says, "It appears probable that petroleum has originated from the coniferous trees whose remains have contributed so largely to the formation of coal; and that the mineral oil is nothing more than the turpentine oil of the pines of former ages: not only the wood, but also large accumulations of the needle-like leaves of the pines, may have contributed to this process. We thus have the satisfaction of obtaining, after the lapse of thousands of years, information as to the intimate compositions of those ancient forests of the period of the great coal-formation, whose comparison with the present vegetation of our globe is a subject of so much interest. The mineral oil may be ranked with amber, succinite, and other similar bodies which occur in the strata. The springs of petroleum do not seem to depend upon combustion,

as has been supposed, but to be simply the effect of subterranean heat. According to the information we now possess, it is not necessary that strata should be of very great depth beneath the surface to acquire a temperature equal to the boiling point of water or mineral oil. In such a position the oil must have suffered a slow distillation, and have found its way to the surface; or have so impregnated a portion of the earth as to form springs or wells."

Mr. Sonstadt says it is scarcely possible to bore deeply anywhere near the Ohio river without striking a source of the oil. Nor, judging by analogy, does there appear to be any likelihood of these wells failing for hundreds of years.

When petroleum is distilled at a low heat benzine is obtained. This is a light and very combustible fluid, too dangerous to be used for illuminating purposes, but very useful for cleaning fabrics from grease spots. The next substance obtained is paraffine (French, from Latin *parum*, little, and *affinis*, allied), so named for its resistance to combine with an alkali. This is also called Belmontine oil, from Belmont, one of Messrs. Price & Co.'s manufactories. A lubricating oil used for machinery is also obtained by further distillation, and also Belmontine, a solid substance of a fine translucent white colour, which makes beautiful-looking candles at a small cost. The stearic acid in these candles possesses a high illuminating power, and thus with a finer wick we get a brighter light than ten of the nearly obsolete "dips" used to give us. Dr. Stearns has shown that paraffine is the best water-proofing agent that we possess.

Petroleum oil is not nearly so dangerous as turpentine oil. It will not explode unless mixed with three or four times its bulk of atmospheric air. Paraffine oil cannot be ignited under a temperature of 140° Fahrenheit.

Petroleum is said to have been used for lamps in Ohio as early as 1819. The first well at Oil Creek, Pennsylvania, was sunk in 1863, and a tax was laid upon the oil in the United States in July, 1864.

The legislation on the subject in England is contained in two Acts, passed in 1862 and 1868; and of these measures the following is a carefully condensed summary.—

The Act of 1862 recites the expediency of providing for the safe-keeping of petroleum and certain products thereof that are dangerous to life and property from their properties of giving off inflammable vapours at low temperatures. The Act provides that petroleum shall include any product thereof that gives off an inflammable vapour at a temperature of less than 100° Fahrenheit. It will be seen below that the Act of 1868 is much wider in its operation, and includes many substances not products of petroleum. Under the Act of 1862, every vessel carrying petroleum, or entering any harbour within the United Kingdom, is to conform to any regulations made by the harbour authorities as to the place at which she is to be moored. Disobedience entails a penalty of 20l. a day. The vessel may be removed to a safe place at the expense of the owner or master. The provision in the Act of 1862 respecting the storage of petroleum has been repealed by the Act of last session. The latter Act provides that, from the 1st of February, 1869, no petroleum shall be kept, otherwise than for private use, within fifty yards of a dwelling-house or of a building in which goods are stored, except in pursuance of a licence given in accordance with the Act of 1862. Conditions which may seem expedient to the local authority may be annexed to any such licence as to the mode of storage, the nature of the goods with which petroleum may be stored, the testing of petroleum, and generally as to its safe-keeping. Petroleum kept in contravention of the law shall be forfeited, and, in addition thereto, the occupier of the place in which such petroleum is kept shall be liable to a penalty not exceeding 20l. per day during the time the petroleum is illegally kept. Under the Act of 1868, the interpretation of the word "petroleum" is extended to mean all rock oil, Rangoon oil, Burmah oil and any product of them, and also any oil made from petroleum, coal, schist, shale, peat, or other bituminous substance and any product of them that gives off an inflammable vapour at a temperature of less than 100° Fahrenheit.

The licences which are referred to above, may be granted in the City of London by the Court of Lord Mayor and Aldermen; in the metropolis outside the City, by the Metropolitan Board of Works; in English and Irish boroughs, by the council; in Scotland, by town councils, or police

commissioners, or county justices of the peace, according to circumstances; in any harbour, by the harbour authority; in places in England or Ireland, not boroughs, by local trustees or improvement commissioners, or by justices assembled in petty sessions. Licences are valid if signed by two or more of the persons constituting the local authority, or executed as other licences are executed by the same authority. They may be granted for a limited time, and there may be conditions annexed as to removal or otherwise, which the local authority thinks necessary for diminishing the risk of damage from explosion or fire. If the licence be refused, or be granted on unsatisfactory conditions, the applicant may demand a certificate of the grounds of refusal, or of attaching such conditions, and he may memorialise the Secretary of State, or (if in Ireland) Lord Lieutenant, who may make inquiry; and, should he think proper, may grant the licence in the manner prayed for. Of all forfeitures and penalties half is to go to the crown and half to the informer, unless such informer be a servant of the person informed against, in which case the informer's half shall be applied in such manner, and to such other purpose as the convicting justices may think fit. Respecting Scotland there is a provision for imprisonment for a period not exceeding three months, if the penalties be not paid. The clause respecting Scotland says nothing about the informer receiving half, but leaves the half which is not for the crown to be disposed of as the magistrates direct. Petroleum may be searched for in the same manner as, under the Gunpowder Act of 1860, gunpowder may be searched for; and all the provisions of the Gunpowder Act relating to searches are to be incorporated with the Petroleum Acts.

In order to protect the public against explosions, it is enacted by the recent statute that, from the 1st February, 1869, no person is to sell, or expose for sale, for use within the United Kingdom, any description of petroleum which gives off an inflammable vapour at a temperature of less than 100° Fahrenheit, unless the bottle or vessel containing such petroleum shall have attached thereto a label with the following words, in legible characters: "Great care must be taken in bringing any light near to the contents of this vessel, as they give off an inflammable vapour at a temperature of less than 100° Fahrenheit's thermometer." Any person acting in contravention of this provision is to be liable for each offence to a penalty of not exceeding 5*l*. Inspectors of weights and measures are empowered by the late Act, at all reasonable times to inspect and test all petroleum kept, offered, or exposed for sale; and if it shall be found under circumstances infringing the law it may be seized, and, upon conviction, forfeited. The inspector is to retain a sample, and the offender is to be liable to a penalty not exceeding 5*l*. If, however, the accused shall claim to have a further test made on his behalf, the magistrate hearing the case shall call before him the public analyst, or, if there be no such officer in the district, some other person having competent chemical knowledge, who shall test the sample and give evidence of the result. The analyst is to be paid a sum not less than 2*s*. 6*d*. nor more than 10*s*. 6*d*., and in case of conviction the offender is to pay the cost of the analysis. All offences under the petroleum Acts may be tried as petty offences, by any magistrate acting under any general or local police Act.

There is a schedule annexed to the new Act containing, in minute scientific detail, instructions as to the mode of testing petroleum in order to find out at what temperature it gives off inflammable vapour.

Paraffine was discovered by Reichenbach, in coal, wood, and tar, in 1830; and Dr. Lyon Playfair directed the attention of Mr. Young, some years ago, to a thick, dark-coloured, oily liquid, oozing from the roof of an old coal-mine in Derbyshire. He found it was a kind of mineral naphtha, purified it, and a factory was established; but as the oil soon ceased it was discontinued. Mr. Young then tried experiments on the coal, from which he considered that the oil must have been distilled, and he found that coal distilled at a low temperature, yielded a considerable amount of gas, and no tar at all, but in their place a large amount of vapour, which could be readily condensed into an oil, &c., into paraffine oil. A factory was established, and the process patented in 1850, at Bathgate, near Edinburgh, which now employs more than 800 men. The crude oil procured by

the first distillation is a thick, dark-coloured liquid, and the first step towards its purification, consists in simple distillation, which, observes Mr. Tegetmeier, is performed in large iron stills, weighing as much as five tons each. In these the oil is distilled, there being left in the still a mass of bright shining hard coke, which is nearly as possible pure carbon. The oil is then mixed with oil of vitriol, and after having been allowed to rest, is distilled again, and separated into four portions, naphtha, paraffine oil, lubricating oil, and solid paraffine.

Colonel Julius Adams, of New York, made experiments on the use of petroleum as fuel in combination with steam, for the heating of steam-boilers. The advantage of the oil as a fuel for marine engines have been thus stated:—

"Rapidly with which steam may be raised, reduced dimensions of boiler and furnace below that required for coal,—the continuous firing effected by feeding the fuel through a pipe into the furnace, thereby preventing the great loss of heat in the furnace every time a fresh supply of coal is thrown on, and the rush of cold air upon the opening of the furnace-doors,—the freedom from smoke, cinder, ash, or refuse of any kind, which in coal reaches from 7 per cent. to 16 per cent. of the whole amount. In the ability to command a forced fire almost instantly, without a forced draught, which under some circumstances at sea, is of vital importance. In dispensing with the numerous class of coal-heavers, stokers, &c., and all the inconvenience of raising clinkers and ash from the furnace-rooms; and, finally, the diminished space occupied in the storage of the fuel."

Experiments were afterwards made at Woolwich, conducted by Mr. Richardson. His report informs us that 1 lb. of oil will evaporate about double the weight of water which 1 lb. of coal, burnt in the ordinary way, would evaporate. If the price of the oil is materially reduced the substance may come into use for engines instead of coal. Mr. Richardson says:—

"The experiments at Woolwich were necessarily commenced with the best and more expensive petroleum. Nothing was known of their properties as fuels; the result has proved that those which contain spirit and burning oil are not so well suited for fuel as those from which they have been extracted; but until a method was arrived at of getting rid of the smoke no others could be used. The smoke was mastered by simply decomposing a little water-vapour, carbonizing and burning the gases. The heavy oils, as they are termed,—those from which the spirit and burning oil have been extracted,—are about the consistency of gas-tar. Their market-price is at present 5*l*. per ton. When we remember that the gas-tar is the same as the heavy oil, only in a more concentrated form, and that it can be obtained in any quantity at 1*s*. per ton, cheapness would be the result of an enlarged manufacture."

Petroleum oil has been used for fuel in a steam fire-engine in Boston, U.S. It does not, like other fuel, clog the exhaust-pipes. In this instance the engine gained 90 per cent. of water-pressure in excess of any other machine on the ground.

A large percentage of petroleum may be distilled from pitch, but the process is expensive, and the smell of the oil so procured very offensive; so that petroleum obtained from it is not likely to come into competition with that which comes up from the ground in a liquid state. The Pitch Lake, in the Island of Trinidad, is one of the most extraordinary phenomena of the volcanic kind in the world. Curiously enough the vegetation around is very rich, and the pitch appears to give a deeper tint of green to the plants. The lake is about a mile and a half in circumference, and except in the wet season a person may walk on the solid pitch for a considerable distance from the edge. It is a hit-and-miss quicksand, and in some places an oily substance oozes up when the foot is put down. A stont pole will disappear, when planted in the asphalt, in the course of a quarter of an hour; so it is as well for persons to take the policeman's advice, and keep "moving on." Natural channels intersect the lake in all directions, filled with the clearest fresh water. Fish have been found in these streams. There is certainly a communication between the lake and the sea, for marked poles have been thrust into the lake and engulphed, and in the course of a few days afterwards they have been picked up on the seashore. Mr. Rowland says it is probable that the Pitch Lake may at any time belie the experience of the inhabitants, and show itself in the terrible shape

of an active discharging volcano, having a crater a mile and a half in circumference, full of the most destructive and ruthless agents it is possible to imagine. There is, in fact, nothing to show that there is not a slumbering volcanic agency which at any time may bring destruction on the island. In Canada the deposits of asphaltum or mineral pitch are called gum-beds. A cubic foot of this, it is said, represents the effusion of 60 to 80 cubic feet of lubricating oil, and from 100 to 120 ft. of illuminating oil. This might perhaps be made available for engines. Some of the best oil-wells in Canada are sunk on or near these gum-beds. Apropos of oil, the *Athenian*, some time ago, stated that at Biren, a Swiss village which tourists will remember when walking up the valley of the Subr, the inhabitants have begun to manufacture oil from chafers. The process was initiated by two men, who having noticed that a chafar looked greasy when squeezed, thought that the grease might be useful for the wheels of their cars. They caught a number of chafers, subjected them to pressure, and obtained a quantity of greasy fluid, which after a few days became clear and yellow, and on trial was found to burn brilliantly, with an agreeable odour. Forthwith there was a general chafar chase after the villagers, of which the results are said to exceed their expectations.

The paraffine oil surpasses every light in brilliancy combined with economy. One gallon of paraffine oil is equal in illuminating power to one gallon and a fourth of the best petroleum oil, or to 26 lb. of wax candles, and to 36 lb. of ordinary tallow candles; so that as Mr. Tegetmeier remarks, one pennyworth of paraffine oil is equivalent in light-producing power to 1 lb. of common candles. Here is therefore another instance out of many in which science has benefited the working classes. In many a cottage, instead of a dirty-looking "dip" giving a poor light, we see a neat lamp fed with this oil at half the cost of the former, with many times its illuminating power. And in all sections of the middle classes the beautiful paraffine candles have taken the place of the commoner sorts. In the matter of light, the progress effected in this generation contrasts most surprisingly with the aggregate of the progress effected in all previous generations put together since the earliest dawn of authentic history. A writer in the *Spectator* a short time ago, drew attention to this fact, pointing out that the lamps and torches which illuminated Belshazzar's feast were probably just as brilliant, and framed out of nearly the same materials as those which shone upon the splendid fêtes of Versailles, when Marie Antoinette presided over them, or those of the Tuileries during the imperial magnificence of the First Napoleon. Pine-wood oil, and perhaps wax, lighted the banquet-halls of the wealthiest nobles, alike in the 18th century before Christ, and in the 18th century after Christ. There was no difference except in finish of workmanship and elegance of design—little if any advance, we mean, in the illuminating power, or in the source whence that power was drawn—between the lamps used in the days of the Pyramids, the days of the Coliseum, and the days of Kensington Palace. Fifty years ago, that is, we burnt the same articles, and got about the same amount of light from them, as we did 5,000 years ago. Now we use gas of which each burner is equal to fifteen or twenty candles; or when we wish for more, we have recourse to the electric light or analogous inventions, which are fifty-fold more brilliant and far-reaching than even the brightest gas.

SAVANS IN NORWICH.

RETURNING to the papers read by Canon Girdlestone and Mr. Corrance on

The Condition of the Agricultural Labourer,

noticed in our account of proceedings by the British Association for Science,* we add some of the observations made during the animated discussions that followed.

Professor Leone Levi said: The subject with which these papers dealt applied to two-thirds of the population of the country, and to some of its largest interests, for he believed that the income of the working classes amounted to 400,000,000*l*., and that of the agricultural labourers might be taken at 60,000,000*l*.. He sympathised with a great deal that had been

* See p. 635, ante.

brought forward by Canon Girdlestone, but at the same time he thought that there were other circumstances than those which had been referred to that ought to be taken into consideration. The labour of the agriculturist was a very healthy one, and the labourers were long-lived, so that they received wages for many years; whereas the working man of Sheffield, although he might get from 2l. to 3l. a week, could not look forward to the enjoyment of those wages for a period of more than twenty years, at the end of which time he left a widow and probably a family. Therefore, if the Sheffield workman received more wages, his position was not thereby improved, because the agricultural labourer continued to live longer and to support his family for a more extended period. Upon a broad view he did not think that wages paid in the country were unfairly low. They were certainly better now than they were some years ago. To his mind it was not by strikes that wages were to be improved. For if labour was suspended there could be no wages, and the result was diminished capital or reduced wealth. Consequently, strikes were rather a hindrance than a stimulus to the progress of wages, although in some isolated cases a temporary improvement might be obtained by resorting to such questionable means. If the individual members of the working classes, instead of studying the improvement of their homes and morals, began to engage in politics and formed societies for defending their political rights, he thought they would rather lose than gain by their efforts. In respect to co-operation, by means of unions, he thought that though these might be a useful medium for those who attained a certain amount of education, it was hardly a system that could be resorted to at the present moment with any great advantage to the working classes. If this country were to keep *pari passu* with other countries, all anxious to make progress, and ready to make the greatest sacrifices in accomplishing that object, it must go forward and not backward in this question of education. Another point was that it was important for the working classes to concede they were responsible to society generally for the manner in which they filled up their time; wasted their opportunities, and lost the chances which were seldom given to them more than once.

A member said he thought it was a discredit to the country that the principal buildings in our towns should be the gaols, workhouses, and lunatic asylums; and he was of opinion that if they were removed into the country, and their inmates set to work in their immediate neighbourhood, it would be a vast improvement on the present system. With regard to the question of co-operation, he instanced the case of Mr. Briggs's colliers, who were allowed a share in the profits of their labour, and stated that the system had been found to work with great success.

Dr. E. Crisp offered a suggestion to the effect that reading-rooms, and places where the agricultural labourers might assemble for purposes of recreation and instruction, should be established for rural districts. He also recommended the adoption of the co-operative principle, as already carried out in the co-operative stores of London and other large towns.

Dr. Farr, thought it was quite right that they should take into account the duration of the agricultural labourer's life, and they ought likewise to consider the expense to which he was put, and the fact that if he were to get into an urban district, although he might receive more wages, the difference in his expenses would probably be such as to render him no better off for the change. It had been said by Mr. Hodgson that there was nothing so fallacious as figures, except facts. The fallacy of facts generally consisted in this, that an exceptional fact was taken and considered as an illustration applicable to the general state of things. He could not help thinking that the facts presented by Canon Girdlestone to some extent belonged to the class of exceptional facts; consequently they could have no general application. He trusted that the consideration of this question would take some really practical and tangible form, and that some resolution might be adopted that would have this effect.

Mr. H. E. Blyth expressed his regret that there should exist in any part of the country a class of men of whom such a picture could be drawn as that which had been placed before the association by Canon Girdlestone. He should not call in question the data from which the rev. canon

had drawn his paper, inasmuch as he had had no opportunity of visiting North Devon, and of finding for himself the actual condition there of the landowners, farmers, and labourers. But he must humbly protest, in the name of the Norfolk men, against the application of such an illustration to the condition of the agricultural labourers of this county. They had not heard that legislation had done anything for the betterment of the people, and that education was defective; but no system had been suggested which was likely to settle the question satisfactorily. Education was undoubtedly a subject deserving of the most serious attention, particularly by those who filled the situation of masters and employers. With regard to the condition of the agricultural labourer in this country, he was sorry to say, from an experience of fifty years as a master, that the labourers did not set so high a value upon character as formerly, and that the masters were more lax than they used to be in considering the character of those whom they engaged. Speaking as a farmer, he regretted to say that the agricultural population was not progressing as it ought to do, either in a social, moral, or economical point of view. But with regard to economy, if the employers spoke of the want of it among the labouring class, could they to those in their own sphere as examples worthy of imitation? The employers ought to endeavour to set an example which the lower classes might be expected to follow. They ought, first of all, to train up those who had to get their living by the sweat of their brow in such a way that they might fulfil their duty in the condition of life in which they were placed, and, ultimately, without or in spite of legislation, emerge therefrom, or improve their present condition.

Mr. C. S. Read, M.P., in a paper on recent improvements in Norfolk farming, afterwards read by him, said on this same subject:—The wages of the agricultural labourer in the last ten years, have been raised by nearly two shillings per week, and it is quite certain the men will not perform the same amount of work on this increased price. This is easily proved by comparing the price of piecework with what it was a few years ago, but as the agricultural labourer has already formed the subject of two separate papers, I will not venture any further remarks on the subject. You, Mr. President, said that, in your opinion, one great reason for the unsatisfactory condition of the labouring population was their ignorance of political economy, and the chief hope you had of any improvement was their being taught the ground-work of this great science. In that I most cordially agree, for I protest against the partial application of scientific theories to agriculture. If hitherto political science has been applied only so far as it favours the consumer. You have exposed our agricultural produce to the competition of the cheap labour of the world, and to successfully hold our own we must have cheap labour too. In my small way I have done what I can to improve the condition of the agricultural labourer, and though I am ignorant of science, I believe my ideas are closely allied to sound political economy. I contend that the price of labour must in a great measure depend on supply and demand. In seasons of great mercantile activity our young labourers migrate by scores and hundreds to the north and to London, without the aid of any registration societies; for our great employers of labour have agents all over the country always looking out for strong active hands. Even our old labourers are not ignorant of the rate of wages paid elsewhere, but they know that high wages invariably mean longer hours, more work, and expensive living. Political economy would also tell the agricultural labourers that the way to raise their condition is not by combining together to do as little work as they can in a day, but to improve the quality of their work, and so earn more wages. I believe that every young agricultural labourer has the means of acquiring the most perfect independence; but he must learn to rely on his own industry, skill, and frugality, and not upon charity, an easy-going master, or the parish, for his support.

A committee was appointed to consider whether any steps should be taken to improve the condition of the agricultural labourer, and to report to the next meeting of the association.

Physical Sciences.

In the Mathematical and Physical Science Section, Colonel Strange read a paper "On the Necessity for State Intervention to Secure the Progress of Physical Science." The author

stated, that knowledge, of whatever kind, was promoted principally in three ways,—viz., by teaching, by education, and by exhibition. Unless the young were instructed, unless the workers advanced beyond what they learnt when young, and unless the world was reminded of what had been done, and of what remained to be achieved, knowledge must languish. The provision, such as it was, which had been made in England to meet these three main requirements had grown up casually with the progress of society, and was not equally complete in all branches of knowledge. In literature extensive provision was made for instruction in our private and public schools and in our universities, while the fine arts were less cared for. They formed as yet no avowed part of general education in England. Neither music, painting, nor sculpture was taught systematically in our schools, nor encouraged warmly in our universities. The provision made in our academies for its extension was meagre in the extreme—from no fault, perhaps, of the professors or the system, but chiefly from the fact that this requirement was provided almost wholly from private, and, therefore, inadequate, resources. Art was better, if not perfectly, provided for; but that our pictures, statues, and music were seldom good was due to our imperfect means of teaching and of extension. The conviction long held by thinkers and workers in science that a knowledge of the products and the phenomena of the material universe should form a large part of the education of its inhabitants seemed at last to have dawned on society generally. It was one of the opinions of the day that scientific was at least of equal value with classic lore, that it must be infused early and freely into the minds of even children, and that it must be recognised in universities as an essential branch of a liberal education, sharing the honours and privileges heretofore too largely absorbed by Greek, Latin, and logic. Colonel Strange proposed the foundation of a national institution expressly for the practical advancement of scientific research apart from education—an institution for workers as distinguished from learners. Such an institution implied a building or buildings planned with a view to modern scientific requirements, of which the chief were ample space, absolute stability, and perfect command of light and temperature. It seemed indispensable that such an institution, being maintained at the public expense, should be as accessible as possible to the scientific public.

Water Power.

Mr. T. Login, C.E., read a paper on "The Abandoning and Transporting Power of Water." After referring to the importance of water as an agent in adapting the world to a condition suitable for the habitation of man, the author observed that the power derivable from water, and the resistance of water to bodies passing through it, had been well investigated; but of the transporting power of water at different velocities very little was known. In illustration of this fact he spoke of the great controversy now going on between Sir Arthur Cotton and Sir Proby Cautley, two of the greatest engineers India had ever produced, with reference to the great Ganges Canal, and observed that on the correct settlement of this dispute great interest depended. Not only was it a subject for the philosopher to study, but for the politician, the philanthropist, and Christian, as the future prosperity of the great continent was bound up in it. Having entered into a minute account of observations taken in India with reference to the slope required to transport the earthy matters held in suspension, and prevent the canals from silting up, he arrived at the following conclusions:—That the transporting power of water must depend to some extent on the nature of the earthy matters to be transported; that water containing large quantities of such matters required greater slope than those containing small quantities, and that without a sufficient slope the earthy matters became deposited on the bed of the stream; that any obstruction in a silt-bearing stream will at once cause a deposit, which, if allowed to accumulate, will eventually cause an alteration in the course of the current; that water containing no such matter would continually deepen its bed had not nature provided that at certain seasons the rivers flowed under both conditions, and so preserved the balance. These observations led to the deduction that the slope of every canal intended for irrigation purposes should depend upon the velocity of the stream, the amount of

earthly matter held in suspension, and the character of such matter.

Professor Rankine observed upon the necessity that existed for greater attention being paid to irrigation in this country. Any one who travelled through the country within the last few weeks must have seen land where vegetation had been dried up, although in many cases there was an abundant supply of water within a few yards, which, however, was not available for want of the means of applying it. He suggested the appointment of a committee to investigate the power of water in transporting matters of different kinds, which distinction had not previously been known to science. Mr. Vignoles agreed in the desirability of irrigation, which was more especially valuable in Italy, Spain, and other countries, but in England he thought there was not uniformly such a scarcity of water as would render necessary any extensive works of the kind.

Patent Monopoly as affecting Progress

was treated of by Mr. Dircks, C.E. The author alluded to early State papers and scientific literature as recording secret and also patented inventions, thus distinguishing two classes of inventions, the former including inventions which two often never come to light, the latter those open to public use. He next distinguished patents as a monopoly in an individual property, —an otherwise secret invention,—one to which the possessor has an inalienable right. Noticing the obnoxious system that prevailed in the reign of Elizabeth, he traced the progress of improvement in the patent laws from James I. to the present period, freely admitting the importance of those reforms, and the possibility of carrying them still further. Regarding the so-called "frivolous patents," he considered they formed a very insignificant portion of the large numbers of patents granted annually, and likewise that it was next to impossible to distinguish between great and small inventions in reference to practical manufacturing operations, very small matters frequently engaging a large amount of labour and capital. Tracing the progress of patents from the one to six obtained annually during several reigns to the 3,000 or 4,000 annually granted at present, he concluded that a case of improvement and encouragement in science and manufactures was thus clearly made out, enumerating at the same time a variety of entirely new and most important chemical and mechanical manufactures, and recording the names of many distinguished patentees whose operations had no better protection than the old, expensive, and very defective patent laws that existed to the end of September, 1852.

A paper by Mr. Bell Galloway "On Inventors and Inventions," was read by the secretary. The author stated that for some years past foreign nations had offered great inducement to inventors and skilled workmen to leave England, and as the result, much of the engineering and other branches of manufacture was now being done in foreign countries. With a view to prevent the continuance of this state of things he suggested the creation of a special fund to develop important and approved inventions, and that the association should ask for the whole of the balance of the money which has arisen from the working of the patent law, now amounting to a million sterling, as the nucleus of a fund for this purpose.

In the discussion which followed, Mr. Drayton well condemned the proposal of the author of the last paper. He denied that the fund accumulated amounted to anything like a million sterling, and said that such a proposal as that of Mr. Galloway would be a most prolific source of jobs, and the people who had to disburse the rewards would be amongst the most abused people to be met with in the country.

Capital and Labour.

Mr. Samuel Brown, in his inaugural address as president of the Economic Science Section, referred to the relation of wages to capital as a subject of vital importance in maintaining the position of this country in its competition abroad as well as with its peace and prosperity at home. He said, the opinion that labour and capital must be in antagonism, each trying to subdue the other to its own terms—an opinion which can only be entertained in ignorance of their relative functions—is becoming gradually undermined; and the earnest efforts of some of the most practical and enlightened employers of labour, aided by the increased intelligence and better feeling produced by conciliation, on the working

classes, have allowed some important experiments to be fairly tried to reconcile the two opposing foes, and to bring them into harmonious working together. A most influential general committee has been formed under the auspices of the National Association for the Promotion of Social Science; and in a meeting at which the Right Hon. W. E. Gladstone presided, the question was debated, and certain general principles laid down for the course of proceeding. But the work to be accomplished is of the most laborious character. It is to be hoped, at any rate, that the clumsy and barbarous system of strikes and lock-outs which destroy both the small savings of the workman and the capital out of which he hopes to increase his wages, and which keep up a perpetual source of irritation and ill-feeling, will be abolished as an insensate and reckless process. Trades unions are contended for by some as useful and effective, if not carried on to the injury of the trade, or to the detriment of the nation, and provided the members pursue their own objects without undue coercion of others. But without coercion and oppression how can they fulfil their objects? The limitation of times of labour, the depression of the sober, industrious, and most skilful workmen to an average level of the more idle and unskilful, the exclusion of apprentices, and the dire effects in other branches of the trade or manufacture in which without wishing to strike themselves, the workmen are dependent on the continued labour of others who will not work, naturally drive capital away into other countries or other trades, and thus leave the infatuated workman with worse prospects of success than when he began the strike. The president suggested as a powerful mode of co-operation, because it appeals more directly to the self-interest of the working classes, industrial partnerships in which the masters and workmen may unite together, by the adoption of which he believed the greater part of the difficulties between labour and production would vanish. The proper rate of honours for labour must, no doubt, depend on the proportion which the labour bears to the other costs of production, and of bringing the article to market. Mr. Brown thus concluded:—"In social science and political economy statistics may be considered the collection of experiments by the results of which we observe the hidden workings of the laws which regulate the social condition of man and his progress in civilization. The growth and decay of population, the freedom of capital and the rights of labour, the duty of voluntary or enforced education, the extent of Government interference in labour or manufactures, the competition of prices, the true principles of commerce, the most effectual means of suppression or prevention of crime, the theory of taxation and national loans, and multitudes of similar questions, are all governed by subtle laws affecting the free will of man, checked and kept in place by similar actions in others, of which we catch a glimpse sometimes by their irregular action in enforced or abnormal conditions, and sometimes by our having discovered and acted in harmony with the natural law which governs them. But as society is perpetually changing, what we have discovered and thought to be truth seems frequently inadequate to account for the new phenomena presented. It is only by extending our observations from the narrow sphere of a single country or a single class to all countries and all classes, by a uniform collection of statistics, as is now being done by all the Governments in Europe, by noting differences as well as analogies, and confessing and correcting errors and comparing the operation of the same causes under various conditions of interference, that we shall throw light on the many involved problems of social and political economy which modern civilization presents.

ABERGAVENNY TOWN-HALL AND MARKETS COMPETITION.—The commissioners met on Friday, 23rd ult., and decided to give the first premium, 50*l.*, to Messrs. Wilson & Wilcox, of Bath; the second, 20*l.*, to Mr. Haddon, of Hereford; and the third, 10*l.*, to the local competitor, Mr. Nevill. There were sixteen competitors. Each of the commissioners was furnished with a tabular paper, upon which were arranged the various requirements of the competition, and as each competitor fulfilled or failed in the particular requirement under consideration there was accorded or not a mark against his name. The work will be commenced at once.

ANTIQUITIES OF CORNWALL.

Early Christian Symbols.

At the recent meeting in Cirencester, Mr. J. W. Grover read some "Observations on Relics of Ancient Cornwall," which carried on the subject opened by the Roman remains at Chedworth,—namely, the occurrence of Christian symbols on works of very early character,—a point of extreme interest. We print the greater portion of Mr. Grover's paper:—

My object, he said, is not to bring before you any new discovery, but rather to draw attention to such points of archaeological interest as occurred very forcibly to me during a few days' stay in Cornwall last year; and I trust those who may have already investigated the subject of early Cornish antiquities will forgive me if I should happen to repeat what they already know; whilst those who have not had the opportunity of looking into the history of that ancient country will feel more interest in doing so, when I say that it clearly exhibits signs of very early Christianity,—of an earlier character, and of a date perhaps as old, if not older, than that which we find marked off in the Roman villa of Chedworth. Indeed, I must say that the general subject of early Christianity in Cornwall, in Roman times, seems to me to help us materially in our contemplation of the marks which are found at Chedworth, and in a very few other parts of Britain, as mentioned in my late paper in the "British Archaeological Journal" on "Pre-Augustine Christianity in Britain." Cornwall is, indeed, a land of mystery; it seems to have been the head-quarters of Druidism in its most advanced state of development. Except Brittany itself, I know no land more rich in all those precious relics of ancient heathenism, which we know by the names of Meni-herion, monoliths, tumuli, karns, circles, &c.,—clearly all of Eastern origin, and such as may still be seen in the valleys of Anti-Lebanon, and amongst the countries of the old Chaldean. When Christianity first dawned upon Cornwall the people were devoted to this Druidism, a religion which seems to have been a singular combination of the worship of many deities with a supreme belief in the *one God*. The Druid adored the sun, moon, and stars, and all the sublime works of nature—rocks, trees, fountains, caves,—to which worship Cornwall was peculiarly conducive. That it was Christian when the Saxon invaded it, is proved by the fact of the inhabitants having purchased permission from the invaders to exercise the Christian religion (*Rudborne Chron.*, lib. 2, chap. 1; also *Hist. Mey. Winton. Angl. Sann.*, 1, 157). That Cornish Christianity, like that of Wales, was of Eastern origin is shown by the Passover having been kept on the same day as that on which the Jews held it, and contrary to the Church of Rome. The Cornish continued independent in matters of religion till A.D. 905; the Saxons then held a synod, whereat sundry provisions were made to recover them from their "errors"—that is, their "refusing to acknowledge the Papal authority." (*Repin. Hist.*, vol. 1, p. 112.) And Usher says (*Hist. Brit. Antiq.*, p. 1152) that they would no more communicate with the Saxons than with Pagans, accounting that of themselves and of the Welsh the only true Christianity. I believe it is generally admitted that the religion of the Nazarene was generally favourably received by the Druids; and it is also known that before its advent they were accustomed to venerate the cross in the form of the tan. One solitary instance of this form remains—in a single upright stone—upon which is an inscription—"Christus hic jacet, Cunoconci filius." Mr. Edward Lhwyd fixes the date of this relic in the fifth or sixth century; Mr. Moyle places it in the fourth or fifth. No reason is given why it should not be even earlier. Druidism was of Eastern origin,—and there seems good reason to suppose that it continued its connexion with the East by some remote channel, probably Africa, throughout the Roman dominion. Could Eastern Christianity have passed along the same channel? The tan cross was an Egyptian emblem, and is called the *crux ansata* the key of the Nile, and was thought to be the emblem of life. St. Anthony, who was an Egyptian saint, is shown with it in the Middle Ages. It was also the all-potent sign of the Knights Templars. Mr. Syer Cuning, in a paper read before the British Archaeological Association, June, 1867, draws attention to the fact of its still being in use among the Celtic nations, and exhibits a specimen obtained from a Kantine peasant in

Ireland, who could give no further account of it than that it was a favourite form among "certain people" in County Cork. Sir J. Gardner Wilkinson has a passage in his "Ancient Egyptians" (Ed. 1854-1-277) so singularly applicable to this Cornish stone that I give it:—"The origin of the tau I cannot precisely determine; but this curious fact is connected with it in later times, that the early Christians of Egypt adopted it in lieu of the cross, which was afterwards substituted for it, prefixing it to inscriptions in the same manner as the cross in later times, and numerous inscriptions headed by the 'tau' are preserved to the present day in early Christian sepulchres at the great Oasis." Plato, who lived four centuries before the Christian era, advocated an idea of the Trinity, and expressed an opinion that the form of the second person of it was stamped upon the universe in the form of a cross (see "Justin Martyr ad Timonem," p. 36). St. Augustine even goes so far as to say that it was by means of the Platonic philosophy that he was enabled properly to understand the doctrine of the Trinity. Certainly the τ cross is an excellent symbol of the mysterious three in one. Montalembert, I believe, and several other authorities of opinion that the earliest cross was that of the τ (tau). Mr. Broughton supposes that this was the shape of the cross upon which our Lord suffered. The Samaritans, long before Christianity, are proved to have used the same figure. Another singular feature connected with this subject is that the Egyptian τ and Δ , which were interchangeable letters, both conveyed the same idea of the Trinity, or three in one equal, the Δ being Δ .

The ancient church of Perranzabuloe, so well known, will soon become a matter of history, for a recent visit shows that exposure is working its rapid annihilation; and not a hand is stretched forth to preserve this interesting memorial of the long-forgotten past. There are, however, several remains of ancient chapels in West Cornwall, which appear to deserve the equal honours of extreme antiquity. One of these is the venerable oratory of St. Gothian on the eastern side of St. Ives Bay, which, from the rudeness and gaunt character of its masonry, belongs clearly to the earliest ages. No cement is used at all, and no mouldings of any sort are found. Around it many skeletons are buried. At Porth Cornow, near St. Levan Church, on its southern coast of the Land's End district, are the ruins of another of these ancient oratories or chapels. Strange to say, this relic of primitive faith stands upon a tumulus, under which a sepulchral urn was found a few years ago. One of the most satisfactory evidences of the very early date of these rude structures is to be found at the stormy promontory of Cape Cornwall, which is called by Borlase the Promontory of Helons, the son of Priam, who is said to have come over with the renowned Brutus. The edifice I allude to is called Parc an Chapel, and resembles Perranzabuloe. Near it, and proving its remote antiquity, was found a small stone bearing the famous monogram, the *Chi Rho*. In the same district another example of this is found at St. Phillack. I attach importance to the presence of this holy seal, which we find also at Chedworth, because several antiquaries have, as usual, endeavoured to disprove the great age of Perranzabuloe, and would assign it to the eleventh or twelfth century. Certainly, as far as it is individually concerned, there is no absolute proof of its being built in one century more than another, but there is universal tradition, and that is backed up by the general appearance and character of the work, which is clearly not Medieval. When to this comes to be added the early Christian seal in close proximity to a similar structure near at hand, the evidence acquires weight. Vestiges of these small rude oratories may be traced in many parts of the Welsh coast, and, as I have before stated, the Cambrian antiquaries give an almost apostolic foundation to many of their churches and monasteries, so much so that one is fain to doubt. Montalembert, in his "Monks of the West," a work which in spite of the heaty of its composition is, in my opinion, very likely to damage the cause of pre-Anglo-Saxon faith—so mightily does the fabled zeal take the place of historical fact—states that Ninian (A.D. 370-94), built a little stone church on the peninsula of Galloway, called Candida Casa, or Whitechapel. He also informs us that modern research has discovered and registered as many as ninety churches, whose origin dates from the times of Columba—as many as fifty-three being still traced in Scotland. These rude relics of

early piety very much resemble the ruins of Perranzabuloe. It would not be fair to quit Cornwall without a further brief notice of those remarkable stone crosses which the traveller meets at every turn, and of which so little to the purpose has really been said by the learned. Who were the pious masons who chiselled them? The Rev. W. W. Haslam, an excellent Cornish antiquarian, attributes them to the early Christian converts of Britain. I think he is right, although it is important to observe that the character of them differs very greatly, some being the work of men in later ages, who improved upon the ideas of their forefathers, and by degrees introduced the figure of the crucified Redeemer. The earliest forms are those of the Greek cross. Perhaps the Tau stone which I have described may be taken to be the very earliest, and marks the Eastern character of the whole. Some of them partake of the lofty taper outline of the Egyptian obelisk, and, like it, are covered with quaint markings and mysterious Eastern devices. The explanation of them appears to me to be this:—The Druid, before his conversion, was wont to erect stone menhir-herion; you see them all over Cornwall. They are but rude prototypes of the stone crosses which succeeded them, and to which the convert transferred his allegiance and his symbolical ideas. This, I think, may be taken as proved by the fact of their being found only in the counties where Druid remains abound, and it was a very natural transition of idea. They abound on the entire western coast, as far north as Angus, where they are very numerous, but of a type later than the Cornish examples. Hallowed relics of the long-forgotten past! how eloquently, yet how silently, do you tell of a rude but pious age! It is very important to remember what Didron says (p. 376) on the subject of the Greek and Latin cross:—"These types were not at first specially confined, the one to the Greek, the other to the Latin church; they were originally common to both countries, and were admitted indifferently by both." Again,—"Still, the most ancient Greek sculptures at Athens, in the Morea, in Macedonia, and in Constantinople, contain crosses with branches of unequal length. That primary type must, therefore, have been known and practised in Greece. As to the second, the cross with equal branches, it is the most commonly adopted by the Greek Church." In Cornwall we have the four forms,—the Greek, the Latin, and the Tau cross, as well as the *Chi Rho*. The two latter symbols are undoubtedly of the Roman period. The two former, very probably, belong to the same age, but not necessarily; one remarkable fact, however, remains to be noticed, and that is, the presence of sculptured figures in tunics, with the arms outstretched, both upon some Latin and Greek crosses: this clearly is the first idea of the crucifix, although according to Didron, p. 250, this emblem was very unusual in the sixth century, and is there mentioned as a novel representation by Gregory of Tours. We are, however, told of a little image which placed itself miraculously upon the cross executed by an artist named Mark, a contemporary of Diocletian era, A.D. 300, which represented not the crucified Saviour, but Emmanuel (see "Labbe Concilium Collectio Maxima," vol. 7, col. 768, second Council of Nice). Images or representations of our Saviour upon the cross were unknown in the early Christian catacombs. I believe it is correctly maintained that to the impure sect of Egyptian Gnostics, we must attribute the early introduction of little images of our Lord. These statues were made of gold or silver, after the heathen pattern of those of Pythagoras, Plato, and Aristotle, who were all honoured with a similar kind of worship,—if we can believe St. Irenaeus and St. Epiphanius. We know that the Emperor Alexander Severus placed amongst his Lares figures of Christ and Abraham opposite those of Orpheus and Apollonius. Everything, says Didron, countenances the opinion that "from the commencement of the third century images of Christ were in circulation among the faithful—at least among those of the lower order—and particularly in Rome, where Gnosticism had made many proselytes;"—and, he might have added, Cornwall. The Rev. W. Haslam attributes these figured crosses to the Roman epoch, and he draws attention to one in the parish of St. Buryan, three miles from the Land's End, situated one mile from Churchtown, in a corner of the road running down to some ancient ruins called the "Sanctuary." He thinks the character of this relic is Byzantine and massive, and resembles the few illustrations which remain of early

crosses at Constantinople. He tells us, moreover, that the human figure was carved on crosses in the time of Constantine, and he quotes a passage from Lactantius in proof,—I think not very conclusively. Gretzer tells us that the crucifix was in use at the time of Tertullian, but where he obtains his authority is not stated. There are some crosses in Cornwall which represent the human figure in a manner which would lead to belief of its having been added at a later period. At the churchyard, Sanceed, is a very ornamental example, about 6 ft. high: on this side it shows a triangular pattern very common in British jewellery and earthenware; on the face is shown a vase, and what appears to me to be the rood. I would name one illustration of perhaps the earliest and primary form of the Greek Cross, as found in Cornwall; it bears the inscription—"Isidocus Vitalis Filius Torrici;" in its execution there is not the least deviation from the Roman capitals, two names of the person buried are also given: this is a feature which marks the Roman character of the work, the cross at the top is within a circle; Borlase is surprised to find it on a piece of Roman work; he therefore assumes without any reason that it must have been cut at a later period. We may, in fact, trace the various forms of the cross; from its stern primitive outline to the many florid examples, which were clearly executed in times verging on the Norman Conquest. The Tau of the Druid being converted into a symbol of Christianity, as used on the Nile; then comes the *Chi Rho* of the times of Constantine and his predecessors, the Greek and Latin forms following on promiscuously through the Middle Ages.

CAIUS GABRIEL CIBBER, OR CIBERT, SCULPTOR.

The father of Colley Cibber was Caius Gabriel Cibber, or Cibert; he was born in the year 1630, and died in the year 1700.

In the marriage register of St. Giles's-in-the-Fields, London, I had the good fortune to discover the following entry, now for the first time in print:—

"L. L. 1670. Nov. 24. Caius Gabriel Cibber, widr-[widow], and Jane Colley, spinster."*

Future historians of the stage, and future writers of lives of actors, will doubtless refer to the columns of the *Builder* for the fact I now bring to light.†

The following extracts are taken from the accounts of the paymaster of the Royal Works at Hampton Court, in King William III.'s reign. The Earl of Portland (William's favourite Bentinck) was superintendent of the works at Hampton Court:—

"Caius Gabriel Cibber, carver, for a great Vauze of white marble, enrich with divers ornaments, with a pedestal of Portland stone, also enrich, 234*l*. More for a great marble Urn, with divers base relieves and figures, 521*l*. 12*s*. In both, 755*l*. 12*s*."—*Works at Hampton Court, 1689—1696*.

"Gabriel Cibber, statuary, for two coats of arms in Portland stone, several statues and figures in metal, and for carriage of the statues and other charges, 530*l*."—*Works at Hampton Court, 1691-4*.

"Gabriel Cibber, statuary, for insculping the reliefs on the tympan of the great frontispiece with iconological figures, and for several journeys of himself and men to look after the performance, 400*l*."—*Works at Hampton Court, April 1st, 1691, to March 31st, 1696*.

I come now to the works at Kensington Palace:—

"Gabriel Cibber, statuary, for four great flower-pots of Portland stone, richly carved,

* Walpole writes—"I can only find that he [the sculptor] was twice married." The register quoted above confirms what Walpole believed to be the case. L. L. has some reference to a marriage by licence.

† The will of the widow of Samuel Cooper, the celebrated miniature painter (died 1672), contains the following entries, now first published:—

"To my nephew and godson, Alexander Pope, my painted china dish, with a silver foot, and a dish set in gold, and after my sister Elizabeth Turner's decease, all my books, pictures, and medals set in gold.

To my cousin John Hoskins, my husband's portrait in crayons, and all my husband's linings that shall be with me at the time of my decease. Also Sir Peter Lilly's picture in oil." [I wonder much where this can be.]

My funeral expenses, and the monument over my grave, not to exceed 50*l*. [Cooper's monument in old St. Pancras Church, London, was crowned by a palette and brushes.]

† This noble vase was removed from Hampton Court to Windsor by King George IV.

1871. 10s.—Works at Kensington Palace, October 1st, 1861, to March 31st, 1866.

The second wife of our sculptor was the daughter of William Colley, Esq., of Glasston, in the county of Rutland, great-grandfather of Sir Anthony Colley.*

At a sale at Sotheby & Wilkinson's, November 27th, 1861, forty-four drawings for sepulchral monuments by Gibber were sold for the insignificant sum of 11. 3s.

The Triton Fountain, at Chatsworth, was made in 1688 by our great statuary.†

PETER CUNNINGHAM.

WORKMEN'S REPORTS ON THE PARIS EXHIBITION.

DURING the continuance of the Paris International Exhibition a few members of the "Working Men's Club and Institute Union" (an ugly title that should be changed as soon as possible), who thought it important that means should be devised for enabling British workmen to visit the Exhibition and manufactories in Paris, at a cost which would enable a large number to enjoy that advantage, formed themselves into a committee to effect this object. A report shows that upwards of 3,200 persons availed themselves of the arrangements thus made; and that, including the delegates who went to Paris under the auspices of the Society of Arts, 700 British artisans were enabled to inspect the principal industrial establishments in that city. To render these visits as useful as possible, the committee announced their intention of giving prizes for reports on the branches of industry which the visitors severally represented. A fund of 45*l.* was raised for this purpose and for the printing of such of the reports as might be found worthy of publication. On the recommendation of Mr. Austen H. Layard, M.P., the Committee of Council on Education made a liberal grant to this prize fund, on the condition that copies of the reports should be distributed gratuitously to a certain number of public institutions.

As might have been expected (considering what was being done by the Society of Arts), the committee did not receive a very large number of papers, and the volume published is a small one.‡ It consists of the following reports:—

1. "Pottery and Porcelain." By Thomas Kirkby, Trentham.
2. "Gold and Silver Work." By P. Rasmussen, London.
3. "Educational Appliances." By Henry Major, Nottingham.
4. "Maps and Educational Appliances." By A. T. Greenwood, Congleton.
5. "Preparation of Leather." By Alfred Heswell, Bermonsey.
6. "Watchmaking." By J. E. Bradshaw.

Appendices.—Report of the Paris Excursion Committee; Conditions of the Prize Competition; Rough Notes and Reminiscences of the Committee's Work.

We quote a paragraph from Mr. Hooper's report on "Cabinet Making." Touching polishing:—

"The process of polishing should have some notice in a report upon wood. The niceness of the grain displayed to so much advantage in screens, where 'feathers' and 'crisps' of every design are produced, would not exhibit half their beauty were it not for the labour and skill of the polisher. But here there is too often the fault of hurry, and what we call 'scumming' the work. Polishing, to stand in wear, should never be hurried. Without entering into the secrets of the trade I may add that it ought to be repeated at certain intervals, so that the grain may be well filled in before it be finished off, or it will soon expose its deficiency in wear. A piece of good work well polished will always show to the best advantage and will increase in beauty and richness by use if properly attended to. Where there is carving, and the fingers of the polisher cannot apply the rubber, a thin coat of

* Lysons's Environs of London (St. George's-in-the-East), ii. 437.

† See the late accomplished Duke of Devonshire's "Handbook of Chatsworth," privately printed by the duke a little before his death. Three days before the duke died I had a note of invitation from Sir Joseph Paxton, written at the request of the duke, that I should arrange and catalogue his portraits at Chatsworth and Hardwick.

‡ "Modern Industries: a Series of Reports on Industry and Manufactures as represented in the Paris Exposition in 1867." By Twelve British Workmen, visiting Paris under the auspices of the Paris Excursion Committee. London: Macmillan & Co., 1868.

varnish can be applied with a brush so as to put a gloss on it, as it protects the wood from dirt and dust which would otherwise so eat into the fine and delicate parts that it could not be removed. Much must in this case depend on the knowledge and skill of the polisher."

The same writer has a lofty notion of the advantages enjoyed by French workmen. He says:—

"I sum up the causes of our decline in trade in this fact, that as workmen we are not encouraged to elevate or improve ourselves, nor are we treated as men who hold responsible positions in the world. We are only 'mechanics' in the common application of the term. No attractions of a rational, refining, elevating nature are generously offered to us. We need look no further for an answer to the question as applied to my own trade, in which so much knowledge and appreciation of art design and skill are necessary, 'where Continental workmen successfully compete with British industry, is it due to superior manipulative skill, or to the adoption of some labour-saving process and more efficient machinery.' It must be evident to every thoughtful observer that their superiority is largely due to their training and education. Higher aspirations are created, better tastes and improved habits are formed. These imbibed in early childhood are afterwards practically exercised from manhood. The workman unites the love of art and the culture of refined taste with the pursuit of his calling in the workshop. This, then, may be said to be the 'more efficient machinery' which is in operation in France, and which I hope to see adopted and brought to bear on us and on our children in liberty loving England. Across the Channel no obstructive or needless restrictions clog the progress of the workman. There every encouragement is given him by the Government, which concerns itself with industry in the workshops, improved dwellings for the people, and healthful recreation at all times and in all places. The ruling powers in France had their truest policy to be to look to the welfare of the working class—the creators and producers of the nation's wealth."

Well-informed or ill-informed as the reporters may be, we fully endorse Mr. Hodgson Pratt's remark that this volume contains evidence of the healthy mental stimulus which the insight into the social and industrial condition of the French people has given to the minds of our artisans.

Mr. Dexter, who has edited it, explains how it was that the guarantors were called upon to pay a certain amount of the cost of the excursions:—

"They thought that, under all the circumstances, they would be fully justified in securing accommodation for 112 men per week for five months; and if that anticipation had been fully realised, and the beds thus paid for in advance had always been occupied, no loss would have accrued. The slight change in the number of excursionists over and above their outlay would have covered all the expenses for advertisements, printing, office, &c. However, the result in point of fact was that, while the committee had to engage a great amount of extra accommodation in August, to the extent sometimes of 20 beds a week, in the two last months of the season a very large number of their 112 beds were every week unoccupied."

Hence the deficiency.

THE TWO BRIDGES.*

"God's blessing on the architects who build
The bridges 'cross deep rivers and abysses,
Else all impassable to human feet." LONGFELLOW.

1848.

I stood in London, on Westminster Bridge,
Old Labeley's camel-bridge, with hump awry:—
A half-burnt palace creeps up on one ridge,
Vast fragrant mud-banks greet the nose and eye,
On either bank what can sad Taste deprecate,
But dreary, doleful roofs, eyesores a hundred,
A minor mass and wretched rookery? *So*
So that, for aces, Seine-bred minds had wonder'd
How sane John Bull could e'er have so insanely
blunder'd.

1868.

Again upon Westminster Bridge I stand,
The unrival'd span of many-bridg'd Page,
A joy of Art for every coming age.
Where, now, a stately path margins the Strand,
And, in the mind's eye, structures may be seen'd,
Fitting such site (all slimy late, and slobbery),
By grateful labour hewn—by genius plan'd.
Doubt not, Art, that interloping jobber
Lay on this golden chance the hand of greed and
robbery!

STONE-WORKING MACHINERY.

Messrs. ROTHEOE & BASTIN are now sending out machinery which has the effect of cheapening very considerably the production of good masonry. We have examined the machines as set up for Messrs. Holland & Hannen, behind the fine houses they are erecting at Grosvenor-gardens, on the Marquis of Westminster's estate. These are three in number, and are respectively for sawing, surfacing, and moulding stone. The saw-machines are each capable of taking in blocks measuring 9 ft. one way, 7 ft. the other, and 4 ft. 6 in. thick, and cutting them into any

* Suggested by the essay in the *Builder*, p. 581, ante, on "The Future Architectural Bank of London among European Cities."

required thicknesses. They are made of wrought iron, and have an arrangement for connecting with saw-tillers and cutters; and they are suspended by suitable chains, links, &c., supported and working into grooved pulleys, fitted with adjustment so as to regulate the speed of the saws according to the quality and character of the stone, also a proper arrangement for removing the frames entirely up out of blocks of stone. The motion of the saw-frames is horizontal.

The planing and moulding machine has two tool-boxes, carrying where necessary four tools, and is so constructed that the tools cut both in and out travel of machine. The planing and moulding, therefore, can be carried on at the same time, either together or separately, and in two or three pieces of stone may be operated upon in one machine. The tool-holders are arranged so as to receive the cutters according to any required design.

The surfacing or rubbing machine consists of a cast-iron bed-frame, having a revolving top of 9 ft. diameter (it may be larger), the metal in which is very carefully selected and prepared. Proper arrangements are made in the framing, so that the upper surface of revolving plate can be easily adjusted. A small crab-winch is fitted to the framing for shifting and removing stones from the table. This seems a particularly useful machine.

The power for driving these machines and a circular-saw rope feeding-bench is supplied by a 12-horse power engine.

The manager of the works where these have been set up (Mr. Pyle) speaks highly of them as the result of his experience, and considers the saving effected fully 60 per cent., as compared with the results of hand-labour. It seems clear that for large operations this machinery may be used with advantage.

SMOKE PREVENTION AT HANLEY.

AN inquiry into the subject of the prevention of smoke, directed by the Secretary of State, has been held at Hanley, in pursuance of a requisition by a large number of the principal inhabitants. The inquiry was held in the townhall, before Mr. R. Rawlinson, C.B. At an adjourned meeting, Mr. McMahon said since the commissioner last sat, the town council had done all that he then suggested. They had appointed a smoke inspector, who had made and recorded a great number of facts respecting the smoke produced in the borough. The council, acting on his report, had served notices upon a number of manufacturers, and in six cases, these notices not having had the desired effect, summonses had been issued. The Act left the decision of cases of this kind entirely in the hands of the magistrates. The commissioner said he was quite prepared to admit that time must be allowed to the town council. Nothing would be required from them which was unreasonable, impracticable, or opposed to common sense. It might take weeks or months to make all the alterations required. He believed that the necessary reform would be one of slow growth, and he hoped the council would proceed in a conciliatory spirit, and that goodwill would be displayed on both sides. The law required the local authority to see that no one carried on his business ignorantly or willfully to the injury of his neighbor, but the law did not require any man to do that which was scientifically impossible. To show what might be done, he mentioned that since Lord Derby's Act came into operation for preventing nuisance from alkali works, and limiting the escape of vapours to 5 per cent., there were some manufacturers who did not allow 1 per cent. to escape, and the average was much less than 5 per cent. After further procedure, including a good deal of evidence on the subject in question, the commissioner said he thought the course taken would be the means of doing good, and had no doubt that in future generations, when the various processes of manufacture had been brought to a degree of perfection which could not yet be claimed for them, people would look back with wonder at the evils and nuisances which had to be endured. He had no doubt that a large proportion of the smoke nuisance might be prevented, and if gentlemen would set to work and do what ought to be done in this matter they would not only set a good example to the country, but would render it unnecessary for the Secretary of State to interfere.

LEICESTERSHIRE ARCHITECTURAL AND
ARCHÆOLOGICAL SOCIETY.

The general annual meeting of this society was held this year at Kegworth. The members and their friends assembled at the Mechanics' Institute, and proceeded thence to the church, at which the Litany was read by the Rev. Jos. Clarke, M.A., rector of the place. After service Mr. M. H. Bloxam descended upon the architectural features of the church.

The inspection having been concluded, the party proceeded to the museum of antiquities and other objects of interest, which were arranged in the school-room of the village. In the afternoon a party visited Kingston Church. At six o'clock a dinner took place at the Flying Horse, at which the Rev. J. Clarke presided.

At half-past seven in the evening a public meeting was held in the Mechanics' Institute, which was completely crowded on the occasion. The chair was occupied by the rector.

The chairman, in opening the proceedings, read a note from the Ven. Archdeacon Fesnon, regretting that he could not be present, on account of the death of the Bishop of Peterborough. He then read a paper, entitled "Memorials of Kegworth."

Mr. Bloxam then proceeded to read a paper, "On some Discoveries made in the Progress of the Restoration of Lutterworth;" and the Rev. E. Tower one entitled "Richard Fowke's Journey to Freestone Shore, illustrative of Social Life amongst the Middle Classes at the Commencement of this Century."

Mr. Thompson not being present, owing to ill-health, a paper announced by him, "On the Objects of the Leicestershire Architectural and Archæological Society," was not given, but in lieu of it Mr. North read a short paper on the same subject.

A vote of thanks was unanimously accorded by the meeting to the society for coming to meet at Kegworth, and a hope was expressed that at no distant date they would come again.

The excursion took place the following day. A good deal of rain had fallen in the night, but the morning proved remarkably fine and the party enjoyed an extremely pleasant drive through a varied country. The next stage was Bunney, and the company successively visited the churches of Wysall, Willoughby, Wymeswold, Rempstone, Costock or Goringstock, East Leake, and West Leake; Mr. Bloxam making occasional remarks as they went along. The party then returned to Kegworth, and there separated.

SCHOOLS OF ART.

The Dorchester School.—The first public meeting for the distribution of prizes in connexion with this school has been held. The meeting was convened at the Shire-hall, and was attended by a large company of the friends and supporters of the institution. The attempt to establish a school for promoting a love and taste for the fine arts in Dorchester has been attended with gratifying success. The chair was occupied by Mr. John Floyer, M.P. for Dorset, and president of the school. The prize drawings were suspended around the hall, and proved a source of interest to the visitors, by whom they were inspected before and after the meeting. The President, in opening the proceedings, spoke in terms of congratulation and encouragement. He said: "We have not achieved, I believe, any very brilliant success, but we have achieved at least as much as we expected, and perhaps almost as much as we could have hoped for. I am informed that the classes have been very fairly attended. That destined especially for operatives has not been so fully attended as we could have wished, but still there has been a tolerable attendance even in that class, and I am informed that the results of their studies and their works are of a very satisfactory description. Mr. Dewar Campbell, the master of the school, said there were very few of the students, possibly none, who fell short of the average; and there were many whose talents raised them above the level of mediocrity. There were some few who might attain to any point of excellence which their ambition proposed to them; but which their perseverance in study must second. In reference to the Government awards, he thought that when the annual report reached them they would find they occu-

pled a very respectable position among the schools of the country.

The Bridport School.—This school is conducted by the same master as the Dorchester school. The second session has been commenced, on which occasion the various works of the most meritorious students were exhibited in the lecture-room of the Literary and Scientific Institute. The prizes were distributed by Mr. T. A. Mitchell, M.P., and the room was filled with not only students, but most of the leading gentry of the town and neighbourhood.

CONGRESS OF GERMAN ARCHITECTS
AND ENGINEERS.

The following is the programme for the fifteenth annual meeting which this year assembles at Hsinburg, as we advised our readers some time ago. August 31st, first *Conversations* in a pavilion specially erected in the centre of the "Alster" Basin. September 1st, Sessions, general and in sections, after which visits to the principal objects of interest in the city; then a steam trip down the Elbe. In the evening a special representation at one of the theatres. September 2nd, Breakfast at the Zoological Gardens; at ten a meeting in the Arta Gallery; at two p.m. inspection of the new mail steamship *Cimbria*, and trip down to Blankenese, where dinner will be provided. In the evening second *conversations*, concert, and fireworks. September 3rd, to Lubeck and back. September 4th, Sessions during the morning and the last *conversations* in the evening. For those who can remain a few days longer, various excursions to Kiel, Heligoland, &c., have been organized.

PROVINCIAL NEWS.

Rochester and Chatham.—The whole of the alterations and improvements ordered by the corporation to be carried out at the Cuildhall having been completed, the building, together with the council-chamber adjoining, have both been re-opened, after being closed for several months. The carved ceiling has been entirely restored, while the whole of the full-length portraits of the ancient city worthies on the walls, including Sir Godfrey Kneller's portrait of King William III., recently valued at 800 guineas, have all been restored. The interior of the hall is lighted by a series of sun-light burners in the centre of the ceiling. The whole of the alterations and improvements have been carried out under the superintendence of Mr. H. Andrews, the corporation surveyor.

Bury.—The laying of the corner-stone of the castle and army of the drill-hall now in course of erection at Bury, for the 8th Lancashire Rifle Volunteers, was made the occasion of great rejoicing in that town. The estimated cost of the whole will amount to between 2,500l. and 3,000l., and up to the present time 1,500l. have been subscribed. The building is erected on the site of the old Bury Castle, and will consist of a large drill-hall, a strong room for the safe custody of arms, a guard-room, an orderly-room, a reading-room and meeting-room for the privates, a non-commissioned officers' room, and a dwelling-house for the drill-instructor. The building will be of brick, with a stone front, in the castellated style. The drill-hall is 108 ft. long by 70 ft. broad, and 20 ft. high. This hall was opened in November last, and since then has been made use of for drilling in. The headquarters have been completed as far as the first story. Messrs. Farrer & Slyam, of Manchester and Bury, are the architects; and Mr. John Hall the builder of the head-quarters.

Newcastle-upon-Tyne.—The new premises of Messrs. George Angus & Co., leather and gutta-percha manufacturers and merchants, situated in Craigher-street West, a new street that promises to add to the architectural features of Newcastle, have been formally opened by the mayor (Mr. H. Angus) in the presence of a large assemblage. Craigher-street West is to take the place of a wretched and dilapidated street known as St. John's-lane, extending from Bigg Market to Westgate-street. This new street constitutes a part of the much-needed improvements projected by the corporation, and it is contemplated by the original designs to prosecute the work of improvement until an almost straight and wide thoroughfare stretches between the Central Railway station on the south-west and

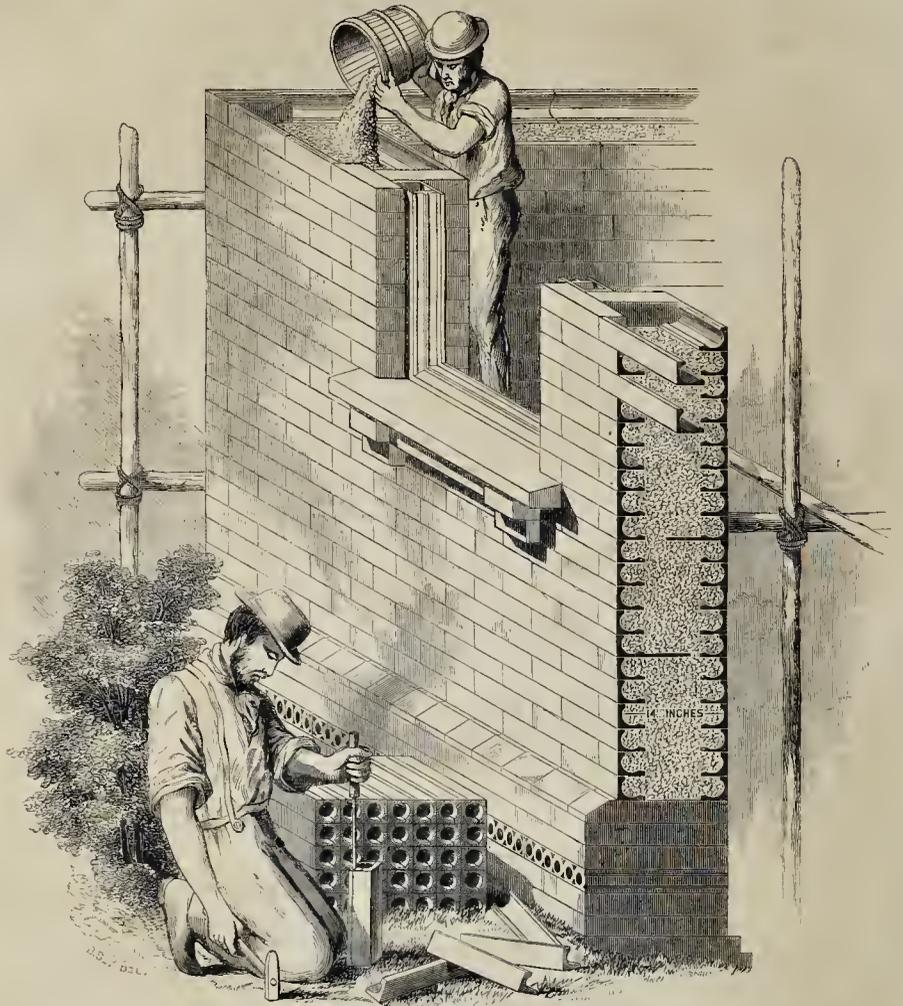

the Grey Monument on the north-east. The work, as a whole, has come to be designated the "St. John's-lane Improvements." The new building for Messrs. Angus & Co., situated on the north-east of the Savings Bank, occupies an area of 3,000 square yards. There are also 600 square yards adjoining, which can be built upon when necessary. It is three stories in height. At the rear are three floors, one above another, each having an area of 90 ft. in length and 45 ft. in width. The upper story will be used as a manufactory, and the other two as warehouses. The front shops will be used for the India-rubber and gutta-percha business of Messrs. Angus & Co., and the upper stories will be let chiefly for office purposes. Not far from the building are large tannery works, formerly belonging to Alderman Sillock, and here the firm are about to erect extensive machinery for the manufacture of hose belts. The façade of the building is about 90 ft. in length. The style of architecture is French Gothic. Over the principal entrance is a carved bull's head—the crest of the firm. The stone of which the building consists was obtained from the Wilsopon and Branton quarries. The architect was Mr. Gibson Kyle; Mr. Curry did the carving; Mr. W. Robson was the builder; Messrs. J. & W. Lowrey had the contract for the carpenter work; the plumber was Mr. Watson, of the High Bridge; Mr. Richardson, Clayton-street, did the painting and decorating; and Mr. Charlton was the plasterer.

FROM SCOTLAND.

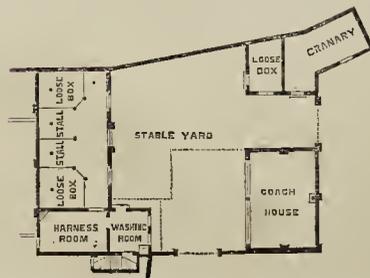

Edinburgh.—The alterations and improvements in the Antiquarian Museum of the Royal Institution, which have been in progress since the opening of the year, are being pushed forward. The floor has been lowered 2 ft. 8 in., to Playfair's original design, and the effect of this alteration, according to the *Scotsman*, is a marked improvement in the appearance of the hall. The joinery work is now finished, and the curator is engaged in re-arranging the collection. The heavy upright cases have all been let down from their old position against the walls by means of pulleys, and are now on the new floor.—The building operations in connexion with the new market in Prince's-street are progressing with rapidity. The bulk of the mason work is now nearly finished, the only remaining portion of the rubble building yet to do being the walls at the south-west end of the area to be occupied by the market. The sbslar coping and pavement, &c., in Prince's-street, probably will not be laid until the early part of next year, as it is desirable that the embankment put in behind the heavy retaining wall should be as much consolidated as possible previously, in order to prevent subsidence. The old building known as Trotter's Warerooms is about to be removed.

Portobello.—The road-steamer has been at work here almost daily. It has run at a high speed over the wet soft sand of the seashore as far as Joppa, and then, wheeling round, returned at a still higher speed. It ran with great ease and perfect steadiness eight and ten miles per hour. The india-rubber wheel-tires run over sand, whether wet and soft or dry and loose, with equal facility, making only the merest trace of a track, scarcely ever so deep as one inch, and generally not exceeding half that depth. This power of running over loose sand is one which, it is believed, will give Mr. Thomson's invention great value in many countries where the roads are often little better than mere tracks covered with sand or earth, and such vehicles, we may add, may yet be the true "ships of the desert," when the camel is set aside as out of date and antiquated, as he looks.

Glasgow.—The foundation stone of a new building in connexion with the Glasgow Industrial Schools now being erected at Mossbank, near Hogganfield, about three miles from the city, has been laid with Masonic ceremonial. The Industrial Schools originated in the Ragged Schools, established some twenty-one years ago. At present there are fully 500 children in the institution. Additional accommodation being required, the directors purchased the farm of Mossbank, consisting of 13 acres, at a cost of 900l. The building is to be of red, white, and black brick, 240 ft. in length, and three stories in height, with a spire, and will contain about one thousand children. The foundation stone was laid by the Earl of Dalhousie, Grand Master Mason of Scotland.

CONCRETE AND FACING BLOCKS: DETAILS OF CONSTRUCTION.

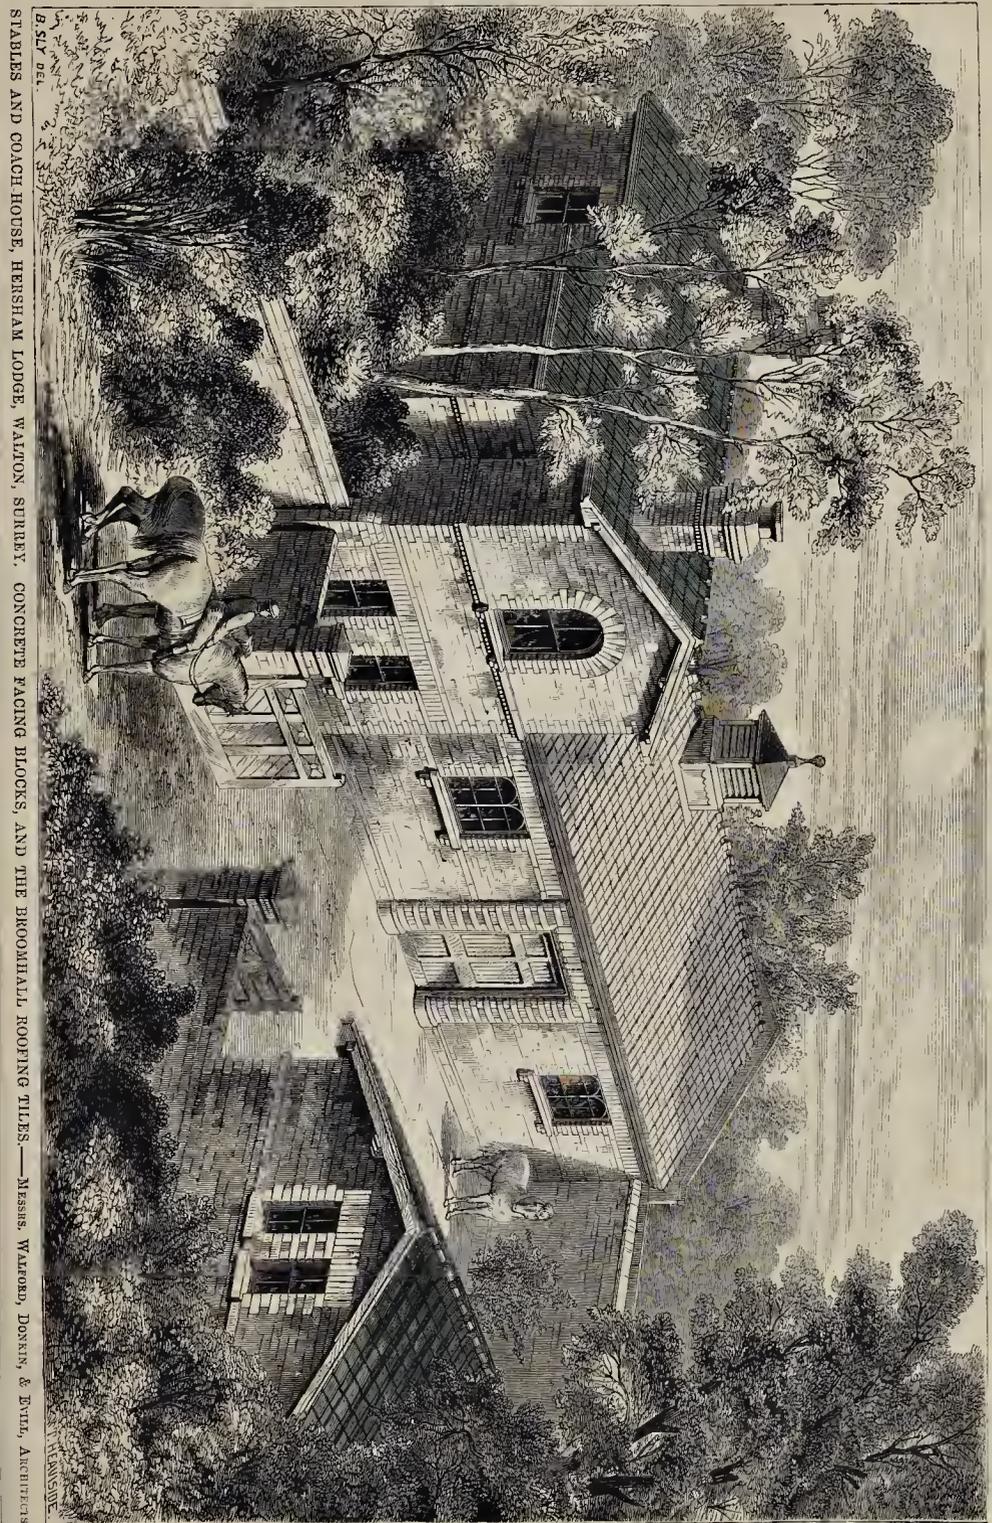

Plan of Stables and Coach-house, Hershams Lodge, Walton.

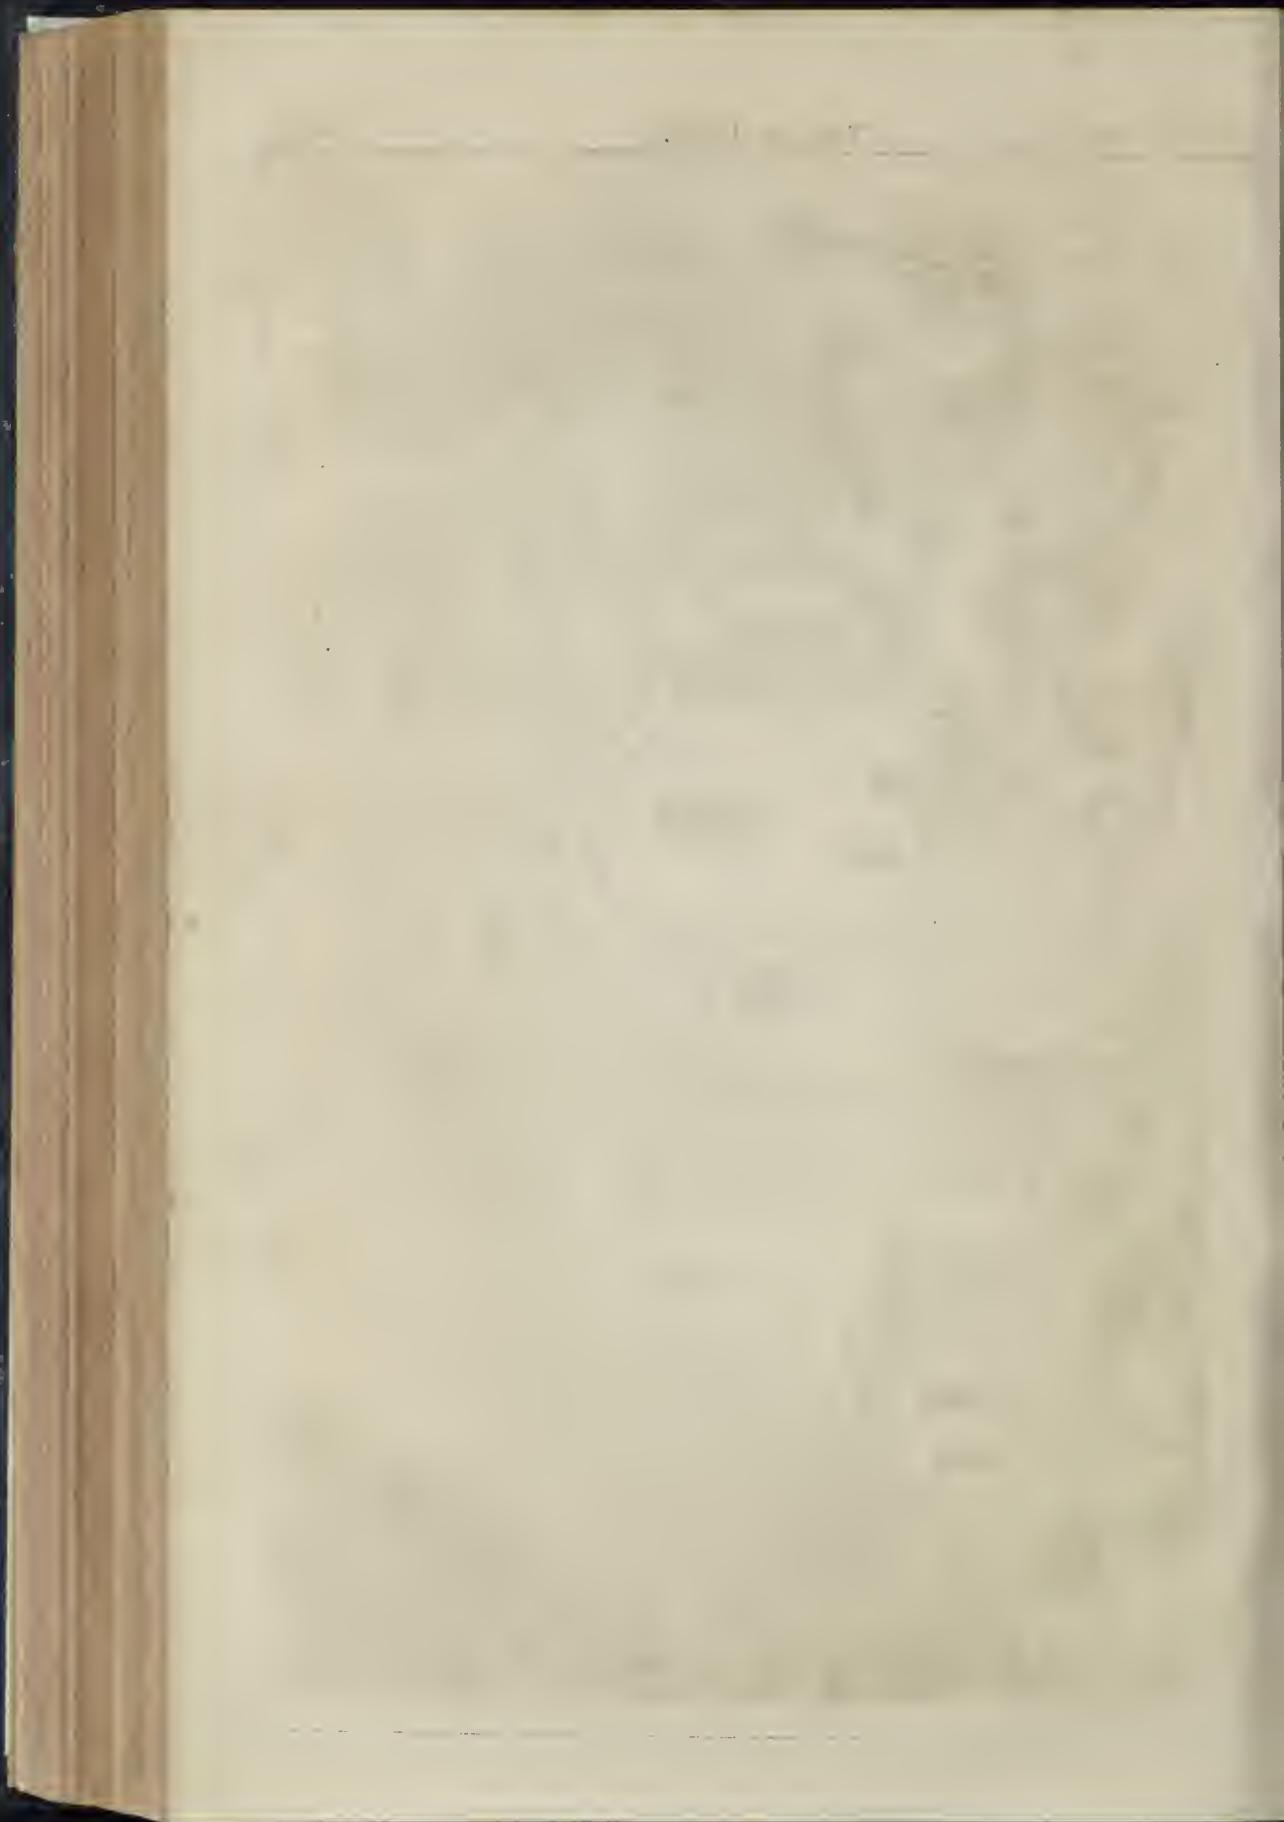

STABLES, WALTON, SURREY.

NEW MODES OF CONSTRUCTION.

MANY ingenious efforts are being made to bring again into use the principles of building in concrete with a view to economy and strength, to some of which modes we have already drawn attention. In our present number we give illustrations of some new stables and outbuildings recently erected at Hershams Lodge, Walton, Surrey, for Mr. B. Barton, upon a plan which seeks to overcome the disadvantage of a rough external surface by the use of a facing block; a detail of the working of which we annex. These angle facings are 12 in. long made in pairs, separable by a blow, and are used as blocks to any thickness of wall; the interspace being filled up by the labourers with concrete, course by course. With lime-concrete it would be necessary to guard against the effects of its expansion in setting. Using cement, the archi-

STABLES AND COACH HOUSE, HERSHAM LODGE, WATTON, SURREY. CONCRETE FACING BLOCKS, AND THE BROOKHALL ROOFING TILES.—MESSRS. WATFORD, DONKIN, & EVILL, ARCHITECTS.
 B. SLY DEL. W. HANSIDE SCULPT.

teets say no inconvenience of this kind was found.

We understand from the architects that the cost is from 8l. 10s. to 9l. 15s. per rod, reduced; according to the facilities of getting gravel or burnt ballast. The thicker the walls the greater the saving.

These blocks were obtained at the Broomhall Tile Company's wharf at 45s. per 1,000. The roof is covered with patent tiles from the same firm.*

A few points in the detail of the building are, perhaps, worthy of notice.

The coach-house doors are fitted with Messrs. Clark's patent revolving shutters in lieu of folding gates; the other external doors are suspended and slide upon a bar against the wall. A ventilator, constructed in wood, with plate-glass louvres and top, provides for lighting as well as ventilating the stable. The internal fittings are all of wrought-iron from the St. Pancras Iron Works, and the building generally is fitted up in a very complete manner.

Messrs. Walford, Donkin, & Evill were the architects; J. Mr. Ingram was the builder. The total cost will be about 1,000l.

COURTS OF CONCILIATION AND ARBITRATION.

The manufacturers and operatives of the Staffordshire potteries have just formed a court of conciliation and arbitration for the settlement of disputes in the pottery trade, consisting of ten employers and ten workmen. The operative members of the court were appointed at a large and enthusiastic meeting of potters at the town-hall, Hanley, at which Mr. J. Ashford Wise, formerly M.P. for Stafford, presided. Mr. Wise said he anticipated the happiest results from the adoption of the principle of conciliation and arbitration. Courts of conciliation, he said, existed in ancient Greece and Rome, and had been in operation since 1808 in France, where there were eighty boards of conciliation and arbitration. In the last few years no less than 174,487 trade disputes had been settled by the lesser court, which consisted of four members, leaving nearly 10,000 for the decision of the larger or Arbitration Board; but when it was found that these 10,000 cases could not be settled by the court of conciliation, 4,589 were withdrawn, and only 5,178 went before the higher tribunal. These courts worked well in Belgium, but had been most successful in Denmark and Norway, where the principle had been applied not only to trade purposes, but to a settlement of differences in private life. Three years before the establishment of these courts there were 25,000 cases for the lawyers, but in the year following their formation there were but 9,000. The time had come for legislation on this question in England, and then submission on one side and dictation on the other must cease.

THE TELEGRAPH ACT.

The statute passed on the day of the prorogation to enable Her Majesty's Postmaster-General to acquire, work, and maintain electric telegraphs, is an important measure. In twenty-four sections the preamble is worked out. The uniform rate, subject to regulation, of messages throughout the United Kingdom, and without regard to distance, is to be not exceeding 1s. for the first twenty words, and not exceeding 3d. for each additional five words, or part of five words. The Postmaster-General is now authorized, with the consent of the Treasury, "out of any moneys which may be from time to time appropriated by Act of Parliament, and put at his disposal for that purpose, to purchase for the purposes of this Act the whole or such parts as he shall think fit of the undertaking of any company." Telegraph companies are empowered to sell their undertaking, under certain conditions specified, with a provision as to the appointments of their servants by the Government, or compensation by way of annuity. The Postmaster-General is to enter into contracts with certain railway companies mentioned in the Act, and very specific directions are given as to such acquisition. The Postmaster-General is to transmit to their desti-

nation all messages of a railway company in any way relating to the business of the company in the United Kingdom free of charge. All matters of difference between the Postmaster-General and railway companies are to be settled by arbitration. There are provisions in the statute to enable the Postmaster to acquire the right of way over canals. It is constituted a misdemeanour in any person having official duties to disclose or to intercept messages. In the schedule annexed to the Act, thirteen agreements with railways and telegraph companies are referred to, subject to the approbation of Parliament; and it declares it to be expedient that agreements should be made with other railways set forth, including the metropolitan districts. Three months' notice is to be given by the Postmaster-General to the companies. By the statute the Postmaster-General, with the approbation of the Treasury, can purchase the undertakings of telegraph companies.

AMERICAN ANTIQUITIES.

We are told of some discoveries recently made by railway surveyors on the banks of the Little Colorado river, in the territory of Arizona; walls of buildings still 8 ft. or 9 ft. high, irrigating canals, and the ruins of a castle, of which the walls are still 30 ft. high. The ruined buildings are of hewn stone. A paper recently read at a meeting of the American Association for the Advancement of Science, held in Chicago, on the "Geological Evidences of Man's Antiquity in the United States," maintained that four American races preceded the red man: first, the mound-builders; second, a race in the territory now called Wisconsin; third, a warlike race in the region south of Lakes Ontario and Erie; and, fourth, a religious people in Mexico. Pottery, arrow-heads, &c., have been found, the writer said, in conjunction with and beneath the mastodon and megatherium. While Dr. Hooker has been drawing public attention to a race who erect dolmens, &c., in India, Mr. Squiers has been photographing ancient dolmens in Peru! The sitting posture in which the dead were anciently placed in Mexico and elsewhere in America, too, is interesting in connexion with the ancient "old world" races who also buried their dead in a sitting posture.

THE REMAINS OF WILLIAM RUFUS IN WINCHESTER CATHEDRAL.

It being very desirable to remove the Rufus sarcophagus from its inconvenient position, between the north and south doors of the choir and near the altar, the dean and chapter resolved to do so if the sarcophagus were found to contain no human remains, as was believed to be the case. It was, therefore, opened, but the almost entire skeleton of a man of about 5 ft. 9 in. in height was found in it; so that in all probability the legend that Cromwell's soldiers abstracted the bones to throw them at the windows is untrue. The authorities, therefore, have resolved to allow the sarcophagus to remain where it is, unless it can be established that its present position is not its original one, as is also believed. Besides the bones, the sarcophagus contained fragments of corroded lead, a few morsels of gold tissue and a turquoise stone, probably the remains of a ring, and a small ivory carving. The tomb had seemingly been rifled of a lead coffin, gold embroidered cloth, &c., but the skeleton is thought to be that of Rufus.

MONUMENTAL.

Statue of Duke of Cumberland in Cavendish-square.—This equestrian statue, which stands upon its stone pedestal in the centre of the enclosure, and which was erected in 1770, has become so dilapidated that it is about to be taken down to be recast.

Tomb in Southampton Cemetery.—A tomb has just been erected in memory of the late Mr. Councillor Bull, from the design of Mr. C. A. Monday, of Southampton, architect. The style is Gothic, of the latter part of thirteenth century. The memorial is arranged for a family tomb. Above the base, the whole of the work except the columns is executed in Portland stone. Above the York stone base is a stone plinth,

relieved by ornamental sinkings in the stone-work; above this, each side of the tomb is divided into four panels, and each end into two panels, by polished granite columns and stone caps and bosses, carved with conventional foliage. These columns, caps, and bosses support a series of intersecting arches. The angles of the tomb have octagonal shafts. The whole is surmounted by a moulded cornice, in which is introduced the tooth ornament. The top stone is in one piece, and over 10 ft. long and 4 ft. wide. The whole of the work was executed in the stone-yard of the firm established by the late Mr. Joseph Bull.

Memorial of Alexander III. of Scotland.—A public meeting has been held in the Town-hall, Burntisland, Fifeshire, for the purpose of considering the propriety of erecting a memorial of Alexander III. Mr. Roger Sinclair Aytoun, M.P., occupied the chair. Mr. George Seton, Advocate, Edinburgh, moved, and it was unanimously resolved:—"That a tablet, Celtic cross, or cairn, be erected to the memory of Alexander III., on the 'King's Rock,' between Burntisland and Kinghorn, being the spot to which the body and horse of the king are believed to have rolled after falling over the cliffs above." A committee was appointed to carry out the object of the meeting. A design, in the form of a Celtic cross, has been prepared for the committee by Mr. M'Glashan, sculptor. Were Scotsmen to erect a series of statues or other memorials of their old kings, as Parliament has done of old English kings at Westminster Palace, good and well; but it seems an odd movement this, to commemorate one of the old Scottish kings who is already better remembered than others who perhaps better deserve remembrance.

Statue of Napoleon I. at Grenoble.—The new statue, on the Place d'Armes, has been inaugurated in the presence of the troops forming the garrison and of an immense concourse of the population. Senator Larrabit, who had arrived expressly from Paris, presided. In the evening there was a grand banquet and fireworks followed.

FROM IRELAND.

Delfist.—The foundation-stone of the new Wesleyan chapel, Coote-hill, has been laid. The site chosen for the new building is about midway on the left down Bridge-street, and opposite the old building. It is an oblong building, 54 ft. in length by 31 ft. in breadth. The architect is Mr. Hallam, of Rockcorry. It is designed to accommodate about 250. It will contain two aisles, without either gallery or pulpit; for the latter there will be a raised dais or platform. The old preaching-house will be converted into a school-house in connexion with the chapel; and it is also in contemplation to build a residence for the minister.

INDIAN AND CELTIC MONUMENTS.

Sir,—In reading a notice of Mr. Fergusson's paper on "Buddhist Architecture" in the *Builder* of the 29th ult., and a paper on "The Tinnevely Pearl Fishery," by Mr. Markham, as well as other papers relating to India, I have observed an identity in sound and meaning of many words both in the Indian and Gaelic or Celtic languages. Mr. Markham in his paper on "The Pearl Fishery of Tinnevely," read before the Society of Arts, says—"The head-quarters of the fishery were then, and indeed, from the days of Ptolemy to the seventeenth century, continued to be, at Choylye, or Coyl, or Sacl, as Barbosa has it, literally 'the temple.'" Here we have the word *choyl*, or *coyl*, almost identical in sound and perfectly identical in meaning with the Gaelic word *kille*, or *kil*, a church or temple, the *f* having the long sound as in *kine*. This word *kille*, or *kil*, forms the prefix to the names of many places in Ireland, Scotland, and Wales. If we give *ch* the soft sound in the word *choyl*, it will sound nearly like *sacl*, as Barbosa has it, which word *sacl* sounds very much like *gael*, by giving *a* its soft sound, or that of *j*; so that the Choylic, Gaelic, Saelic, Keltic, and Celtic people originally meant a temple-going or church-going people. Take, again, the word Brahmin or Brahmane, as the French spell it. The first syllable *Brah* is evidently identical in sound with the Gaelic word *Bragh*, which means ever, or everlasting, and the word *mane* signifies spirit; so that the

* Of these tiles, which cost 5l. 5s. per 1,000, the company say, 185 cover 100 ft. superficial; 2,000 of them weigh about 2 tons. Proper ridge and hip tiles form part of the arrangement.

compound word Brahmin or Brahmane literally means "everlasting spirit."

Mr. Fergusson states in his paper that "he did not say that people came over from India and taught the people of this country to erect Stonehenge, nor that they had any connexion with the people of India; yet there was this great underlying stratum of population, who cropped up in Europe and other parts of the world as well as in Asia, and wherever they came to the surface their monuments were similar in character, and all more or less applied to the same purpose. Originally funeral, they gradually became temples and relic shrines; but they were all monuments of one great people, and all expressed more or less distinctly one idea. He was convinced that when this subject was fully investigated they would have a very interesting picture of a people who were now only known by their rude monuments all over the globe."

The subject here referred to by Mr. Fergusson is certainly a most interesting one for investigation, and may—considering our present and future relations with India—prove most useful and profitable. I am quite convinced that a knowledge of the Gaelic, Celtic, or old Irish language, together with a knowledge of the structure of what are called Druidical altars and temples, will be found to facilitate the investigation. For instance, near Leeds there is a Druidical altar called "Brimham Rocks," the structure of which resembles Stonehenge. Apart from any ideas that may be suggested by the structure of Brimham Rocks, the very name affords evidence of the most convincing kind, that those who placed these Rocks in position held one and the same religion with the Indian worshippers of the god Brimha. This god is not to be confounded with another god worshipped in India called Brahma or Bramha. Brimha, according to Indian theology, is the only eternal, omnipotent, and self-existent god. Having been solitary and alone in the universe, he resolved within himself to create a goddess, who, in the process of time, laid three eggs, from which the three gods Brahma, Vishnu, and Siva were developed. E. NUGENT, C.E.

THE SCIENCE OF COLOUR.

I HAVE read through, several times with care, Mr. Benson's long letter in the last number of the *Builder*, in support of his theory on colour, but I only became more mystified instead of being enlightened. For I am informed that "blue and yellow would always most provokingly produce a neutral grey." (Mr. Benson must have used very bad colours.) That green added to red makes yellow, and that, by adding blue, yellow is converted into white! Really I must confess that I do not understand this; and if Mr. Benson were not an earnest observer, as I have every reason to believe he is, I should be tempted to say that it was simply ridiculous.

In Mr. Benson's own experiment, which he says answers the first part of my letter, although I fail to see how, if his papers are looked at diagonally with the prism, the yellow ray will be brought across the blue at the corner where the papers touch, and a brilliant green is the result; showing, as I said in my former letter, that "green is immediately formed by allowing the yellow to approach the blue ray." Indeed, Mr. Benson himself shows this is the case, when he says "that green appears when the white space is so narrow that the red in its spectrum no longer overlaps the green." Just so; but the yellow which comes next the red overlaps the blue and forms green. This is easily seen by widening the white line until you separate the yellow from the blue, when you have no longer any green.

As to my other illustrations upon the formation of green in nature, Mr. Benson simply shirks them, and falls either to explain or controvert them. He says that, if sky-green were formed as I say it is, it "would be darker than the sky-blue." How does Mr. Benson know that it is not? We cannot see the blue which is beyond except through the yellow medium, therefore we cannot compare the one with the other to know which is lightest or darkest. It is a very simple phenomenon, and very easily accounted for, in the same way that the more homely one may be of bringing a piece of blue paper under the influence of candle-light, when every one will exclaim that the paper is green, and not blue.

Again, I am told that I "am under a mistake as to the nature of the colour of the greens of vegetation." But I beg to say that Mr. Benson wholly misunderstands my illustration, the object of which is simply to show that green is a secondary colour and not a primary. I assert as a fact, that the foliage in the bud, before it is exposed to the atmosphere, is yellow, that it becomes of a greenish blue when it first bursts forth, and that it gradually becomes greener and greener, until it assumes, when fully developed, a dark blue green, all of which is gradually brought about by the chemical addition of blue, in some way, from the atmosphere, added to the normal yellow colour of the plant;—that the leaf again loses the blue, and falls in autumn, as in the case of the willow, yellow; thus illustrating, by the aid of nature, that green is a compound colour formed of blue and yellow; and to deny it Mr. Benson might as well deny that two and two make four. As to the nature of greens, whether they are yellow greens, or that "the light they reflect or transmit to the eye is red," is altogether beside the question. The variety of greens in nature is something positively wonderful.

Respecting the blue, the actinic or chemical ray, which is mostly in excess in spring, the yellow in summer, and the red, or ripening ray in autumn, that requires no observation of mine, as it is now well understood by all botanists, and that the sun's rays differ very perceptibly according to the moisture or dryness of the atmosphere. It is a question whether what we call white light exists at all; probably the term is only comparative, and that we view everything, more or less, through a coloured medium according to circumstances.

JAMES K. COLLING.

CHURCH POLYCHROMY.

YOUR correspondent "R. C. H." evidently wants information as to distemper colouring, for I believe there is no other kind of decoration which can be produced at so little cost. All he would require for this would be, say, for a dado round a chancel, half a pail of whitening (whiting and size), a pail of weak size, a pail of clean water, half a dozen pots, a piece of board, a straight-edge, a few painters' tools and fitches, and the requisite dry-ground colours. He would have his pattern, and should cut his stencils plates out of cartridge-paper and then oil them. To mix the colours he should put a quantity of the whitening into his pot, and make it of a proper consistency to work with by adding clean water; then put in his dry colours. He should try his colours on a board, allowing them to dry before judging of the tints. He will understand one colour may be put over another without the under one showing through. If he wants his colours to be their full depth of tint he must mix them with the size-water only, and the part on which these colours are to be put must be previously distempered white. I should be pleased to contribute a pattern or any further information to "R. C. H.," or any one with the same worthy object in view as that of decorating his church. F. R. M.

LIFE IN LIVERPOOL.

SINCE the publication of my former letter in your journal, the mortality in this town of Liverpool has increased from the then rate of 33.5 to 36.4 per 1,000, and this, too, although the heat of the weather had very sensibly diminished. The deaths have actually exceeded the births by thirty-one-tenth of the whole number nearly. How is this? Compare it with London. In London, in the same period, the deaths, according to the Registrar-General's return, were 24 per 1,000, and the births have exceeded the deaths by more than one-third of the whole number. This comparison is very damaging to Liverpool.

I have endeavoured in my former letter to point out two of the causes of this fearful state of things, and as since then I have suffered severely in my own health and in that of my wife and children, it is with all the greater reason I feel the necessity of some alteration.

The existence of the large number of middens in the town is undoubtedly the cause of a great deal of disease and death. I have endeavoured to ascertain why these places exist, and I am told that there is an overwhelming interest in

the town-council which prevents their conversion into closets. The sanitary reformers were strong enough some time ago to carry a law compelling the builders of all new houses to provide water-closets to them; but all then-existing middens are still emptied by nightmen, and the contents carted into the country for farm manure. And it sometimes happens that the removal to the country does not take place at once. It is always carried out and deposited on the pavement, ready to be put into carts; but the carts do not always come, and the filth remains till the next night, and perhaps till the morning following. I enclose an instance of this. The effect is most sickening. I can account for its continuance only by saying, as I believe, that the great bulk of the people here are excessively ignorant of the first principles of sanitary science.

With regard to the second cause I mentioned, the drinking customs of the inhabitants, I shall quote a few figures. I believe the population of Liverpool is something over half a million. These are supplied with intoxicating drinks from 2,500 licensed houses, or one house to about 200 persons, men, women, and children. To show that these houses are used I shall quote the records of Monday last, 17th inst., which say that there were no fewer than 273 persons in custody, 53 of these charged with felony, and the remainder with assaults and with being drunk and disorderly. And this, recollect, is for Liverpool only, and does not include Birkenhead. Is any comment necessary?

I have heard and read in newspapers that there was free trade in intoxicating liquors in Liverpool,—that licences were granted to any person who had the required accommodation. That, however, is not the case now, though it may have been so formerly. An instance of this has occurred within my own knowledge lately in which the owner of a corner house in a great thoroughfare has had it fitted up in a most expensive manner for the retail spirit, wine, and beer trade. He has been refused a spirit licence, and his house is now open as a wine and beer shop only.

Sir, it appears to me conclusive that a great number of people here die of poison. The system is poisoned by the immoderate use of bad liquor, and they live and sleep in crowded neighbourhoods, where each house has a midden seething and fuming in its rear, giving off poisonous gases, which, acting on the already weakened system, produce some kind of zymotic disease. This again is fed by more liquor taken as a remedy, which goes on till a doctor is called in, who generally finds the disease has reached a stage beyond his control.

And I say crowded neighbourhoods advisedly, for there are districts in Liverpool which beat London hollow in that respect, and which, if the law were properly carried out, would not exist.

There is one other circumstance which appears to me to be at least a proximate cause of mortality. I mean the existence of numerous burial societies.

These societies undertake to pay a certain sum at death, say 6*l.*, on condition that a weekly subscription of, say 2*s.*, be made to them. And they are very considerate, for they will not trouble you to bring them the money, but they employ collectors to call on the members for their twopences, which they do with a regularity which reminds a Londoner of the tallyman; and, indeed, his business partakes somewhat of that character, for he is paid usually by a percentage of some 25 per cent. on what he collects. And as these men pass from house to house, and find one recently come to be inhabited, they call and introduce themselves with, "Would you like to join the ———— Burial Society, sir?" Such a circumstance is within my own experience. And this applies to every member of the family, though only a day old.

Imagine the effect produced by the regular appearance of this collector upon the members of a family, especially if they be poor and ignorant, as is often the case. They would be forcibly reminded of death every time he called. For what reason does he come but that he may receive a small payment which is to secure a large sum to them at the death of one of their number? And it is within my own knowledge that parents whose natural feelings have been blunted by drink, and want, and care, have ceased to provide wholesome sustenance for their children when well, and proper nourishment and nursing when they fell sick, and have come to look upon the death of one of their children as a blessing, as a means whereby their empty pockets may

filed; a means perfectly legal because law seldom reaches them, and they know how to do the same. Is it not notorious that rich and low, children are looked upon as a nuisance; and that, while the rich succeed in preventing them coming into the world, the poor, so skillfully, succeed in sending them out of it otherwise, how is it that 103 children, under five years of age, have died of diarrhoea in one week this town? I would not have it supposed that I object to the principle of life-assurance; and assuredly it should be confined to the breadwinners of the family. Wherever else it is applied, it offers a direct premium on death, which abundant evidence proves is in these days neglected.

E. G.

PROTECTION OF BRICK WALLS FROM RAIN.

A CORRESPONDENT, "M.," writes thus:—"In answer to 'Utilitarian's' letter in your press of the 29th ult., requesting information as to the best method of preventing damp driving through brick walls in exposed situations, I beg to inform him that the best remedy he can have is the patent solution manufactured by Messrs. R. Gay & Co., of Alton, Lancs, which I find answers the purpose admirably, and renders walls quite impervious to moisture, whilst the composition itself is not acted upon by extreme heat or cold."

We know nothing of the merits of this solution, and we leave our usual course in thus venturing it. The writer of the note, however, makes a public appointment, and may be supposed to speak what he knows. The evil in question is so large and universal, the request for a remedy so constant, that we shall be glad to see confirmatory evidence if the solution be tried, so, to know whether or not it is applicable to all walls.

VALUE OF LAND AT MARGATE.

A CORRESPONDENT writes,—"The corporation of Margate bought, on a late occasion, an old town-land property known as 'Pot's Property,' in King-street, with a view to widen the thoroughfare. They gave 600*l.* for the land, some 40 ft. square, inclusive of the two old shops thereon, and have again sold the site by public auction, on condition of the sale being that the purchaser should pull down and clear the existing houses by the 31st December next, and give up a strip of the entire frontage, 8 ft. wide at one end, and 5 ft. wide at the other, for the purpose mentioned. The result of the sale shows that the Town Council estimate the value, and pay for the land they thus obtain for street improvements, at a figure seemingly out of all proportion to the demands of the borough, or to the wealth of the ratepayers.

The case may be stated thus:—The council pay for the entire property 630*l.*, and sell off the required portion for 370*l.*, thus paying for the widening of the street at a cost of 260*l.*, equal to 221 square feet, and so costs about $\frac{1}{2}$ *s.* per acre. Verily, there must be more money than land at Margate.

"A DRUIDICAL RACE IN INDIA."

SIR,—Under this title the attention of the public is drawn, for the first time, as it is imagined, the fact, adduced by Dr. Hooker in his address the British Association at Norwich, that there is a race in India who still practise observances which have been usually attributed in this country to the Druids. In 1864, however, a singular fact of this very kind was first brought to general notice by me in the *Builder*, with allusion to the religious observances of an Indian tribe inhabiting the Sub-Himalayas.

Dr. Hooker, in his address, thus speaks of the mid-like structures which he has seen in India:—"It will no doubt surprise many here to be told that there exists within 300 miles of the British capital of India a tribe of semi-savages who habitually erect dolmens, cromlechs, and other megalithic structures in their portions and very similar in appearance and construction to the so-called Druidical remains of Western Europe; and what is still more curious, though described as figured nearly a quarter of a century ago by Colonel

Yule, the eminent Oriental geographer, they are scarcely alluded to in the modern literature of pre-historic monuments, except by Sir J. Lubbock. In the *Bengal Asiatic Journal* for 1847 will be found Colonel Yule's description of the Khasia people of East Bengal, an Indo-Chinese race. Dr. Thomson and I dwell for some months upon the Khasia people, now eighteen years ago, and found Colonel Yule's account to be correct in all particulars. The undulating eminences of the country, some 3,000 ft. to 6,000 ft. above the level of the sea, are dotted with groups of huge unpolished squared pillars and tabular slabs, supported on three or four rude pillars. In one spot, buried in a sand-grove, we found a nearly complete circle of menhirs, the tallest of which was 30 ft. out of the ground, 6 feet broad, and 2 ft. 8 in. thick; and in front of each was a dolmen or cromlech of proportionately gigantic pieces of rock, while the largest slab hitherto measured is 33 ft. high, 15 ft. broad, and 24 in. thick. Several that we saw had been very recently erected, and we were informed that every year some are put up, but not in the rainy season, which we spent in the country. The method of removing the blocks is by cutting grooves, along which fires are lit, and into which when heated cold water is run, which causes the rock to fissure along the groove; the lever and rope are the only mechanical aids used in transporting and erecting the blocks. The objects of their erection are various,—as sepulchre, a marking spot where public events had occurred, &c. It is a curious fact that the Khasia word for a stone,—"man," as commonly occurs in the names of their villages and places, as that of Man, Manan, Manan, Manan, Manan, of Brittain, Wales, Cornwall, &c.; thus the same signification in Khasia the stone of oath; mamoo, the stone of salt; mamlong, the grassy stone; and just as in Wales men mark the hill of the big stone; and in Brittain a monolith is a standing stone; and a dolmen, a table-stone, &c. The establishment of a British empire among them renders it important that the inquiry into their origin, language, beliefs, customs, &c., should be followed up without delay. This will now be done, thanks to your representations, and I cannot doubt but that it will throw great light upon that obscure and important branch of pre-historic archaeology, the megalithic monuments of Western Europe."

The passage in the *Builder* of 1864, to which I have referred, is as follows:—

"Oracles are even now (or were lately) in full force in the Sub-Himalayas. In the *Asiatic Journal* of Bengal, vol. xviii, p. 239, is a curious account, by Mr. B. H. Hodgson, of an 'incantation,' as he calls it, named the bamboo festival of the Bodos, which was then still actually practised annually, by the Rauts of Sikkim, for the purpose of predicting the prospects of the harvest! In this modern incantation, thirteen priests (a devil's dozen) dance and chant with a monotonous invocation of a few fixed syllables and choruses, another—a creature of the priest,—called the Deeda, in whom the God or the Oracle is to be manifested. Each of the thirteen holds a bamboo pole in his hand. The chant and whirling dance gradually become fast and furious, till, suddenly, all the thirteen poles are concentrated to the one common centre of the circle, into a pavilion form, above the head of the central Deeda, who immediately goes off in what Mr. Hodgson calls an 'ecstatic fit,' but which a little more judiciously of what he was speaking of would have, no doubt, induced him to think was probably a real fit—of entrance-ecstasy, and ebullition of the Oracle—the God-possessed or God-given man, the Deeda,—in the encircled centre, was doubtless consulted by the surrounding priests. Even to the 'pavilion' there is, in all this, something peculiar and impressively Druidical."

The quotation occurs in a letter "On Circular Rock-marks and other Symbols" in the *Builder* of 2nd July, 1864. JOHN E. DOVE.

OVERCROWDING IN NEW YORK.

A RESIDENT thus writes of the dwellings inhabited by the poor in the more unhealthy parts of New York:—

"The ordinary way in which tenement houses in New York are built is as follows: let 25 ft. by 100 ft., and on this are erected two buildings, seven or eight stories high—one at the front of the lot and one at the rear—each 25 ft. by 40 ft., and separated by a court 20 ft. wide. Through each house, in the centre, runs a hall 5 ft. wide, and the space on each side of this, which is 40 ft. by 11 ft., is divided into four rooms, each 10 ft. by 11 ft. The room which fronts the street and the one which looks into the court have windows; the two middle rooms are lighted and ventilated only by the door which opens into the hall. Thus, upon this lot of 25 ft. by 100 ft. are crowded 128 apartments; and in each of these generally dwells a family, although in some cases one family contrives to pay for two rooms, in one of which the cooking, washing, and eating are done, while the other is the sleeping apartment. The rooms are about 7 ft. high, and get fresh air into them or foul air out of them is impossible. It is only in the best of these houses that one family has even one room to itself. In many of them, two and sometimes three families occupy the same room, and occasionally takes 'boarders' besides; so that in a single house of this size 800 men, women, and children eat and sleep. As misery loves company, the greater number of these fearful places are crowded together in the same quarter of the city; and in the same localities are hundreds of slaughter-houses, stables, tanneries, soap factories, and all sorts of similar nuisances, continually poisoning the air with the most noxious vapours. The moral influences of these neighbourhoods are as bad as their material surroundings, and here are the vilest brothels, the lowest shebeens, and the most beastly dance-houses. In the Fourth Ward of New York, a locality where there is a large amount of mercantile and manufacturing business is done, the population is crowded into the worst kind of 'tenement' houses, and an examination made of 200 of these houses, and the amount of air had only about 100 cubic feet of air-space for each individual, when 700 ft. is the least quantity in which a person can exist without detriment to his health. The insalubrious consequences follow. All sorts of zymotic diseases prevail in these quarters; the children die off with fearful rapidity; and the death-rate is often as high as 1 in 20, while in other portions of the city it is as low as 1 in 80. There is one curious fact which I have observed in my wanderings through the quarters of which I have

spoken, I did not find any Scotch people there, and on consulting the police and Board of Health records, I saw that while every other nationality under heaven was to be found in the Fourth and Sixth Wards, there was scarcely a Scotsman there, unless he was conducting some business as an agent. I found one item in my researches giving the census of 59 tenement houses inhabited by 882 families. There were 2 Welsh people, 7 Portuguese, 9 English, 10 Americans, 12 French, 35 Africans, 186 Italians, 189 Poles, 218 Germans, and 812 Irish. And these figures give a pretty good idea of all that part of New York which lies between the Battery and Canal street, and from which the heaviest Democratic majorities are given."

INTERCOLONIAL SOCIETY.

SIR,—A daily contemporary, in a recent leading article, announces "that there had been held, with little parade or ostentation, the first meeting of the above-named society, which is intended to supply a conspicuous want in our colonial system, and that its aims are so eminently useful that the wonder is they were not attained long ago."

In reference to this subject, will you kindly allow me space in your valuable periodical to record that, some five years since, I felt the need of a society having for its object the establishment of an Intercolonial Club-house, in some central position, say the banks of the Thames, where colonists might rendezvous and enjoy a temporary home, which should combine not only dormitories, but a museum for the exhibition of specimens of colonial products, natural and artificial, as well as a repository for records of colonial statistics, books, maps, &c., either for reference or purchase; thus centralizing the vast colonial interests of the empire upon the same principle that now leads to the centralization of the Government departments and of the Courts of Law.

Entertaining these views I committed them to writing, and had printed copies circulated among colonists, including ex-colonial governors, but they were so lukewarm in the matter that I suffered it to drop; the revival, however, of the project under the favourable circumstances narrated is most gratifying. W. N. CHAVRON.

PUBLIC BUILDINGS AND DISTRICT SURVEYORS.

At the Marylebone Police Court, on the 27th ult., Mr. D'Eyncourt was engaged for several hours in hearing a case, the decision of which affects three theatres now erecting in London.

The "Marylebone" theatre in New Church-street, Edgware-road, is now undergoing alterations prior to its being re-opened as the "Royal Alfred." Mr. Peebles, the district surveyor of the northern division of Marylebone, acting under the provisions of the Metropolitan Building Act, visited the premises, and noticing that the builder, Mr. Samuel Simpson, did not carry out the works in accordance as he was required, with the rules laid down in the Act of Parliament, he gave him notice of the alterations and additions which he required to be made. The builder paid no attention, nor did he appeal to the Metropolitan Board, but, according to the district surveyor's evidence, he proceeded with the work with extra speed. Under these circumstances the district surveyor took out a summons against the builder under the Building Act, for that he "did do certain things contrary to certain rules of the said Act; to wit, did construct the floors or corridors leading to the boxes upon the first gallery, and also the floor at back of said gallery, with combustible materials; and did omit to do certain things required to be done by the said Act; to wit, to construct the said floors with stone or other fire-proof material as required by sec. 22."

In the course of a long discussion as to what was meant by the term "corridor," and a reference to dictionaries on the subject, the case was simplified by the defendant stating that he had not obeyed the notice from the district surveyor for several reasons. The following are some of them:—

1st. The theatre was not essentially different from what it had been before the alteration, except that new material was used, the old having become so rotten that it was unlikely that the Lord Chamberlain would re-licence the theatre unless it was removed. The interior arrangements of the former theatre having been approved by the Chamberlain, all that was necessary for him was to get the Chamberlain's licence again. In cross-examination he said that the stage had been shortened, and the auditorium thereby enlarged. Under the new management the theatre would hold about 200 more persons. Mr. D'Eyncourt said he was strongly of opinion that the Lord Chamberlain's licence did not apply to the question as to the materials to be used in the construction of a theatre. Defendant said it did. For instance, if he deposited plans approved of by the district surveyor, but which did not meet with the approval of the Chamberlain, or (the builder) would have to alter those plans before he could get a licence. Mr. D'Eyncourt asked he was shown any section which exempted theatres from the operations of the Metropolitan Building Act. Plaintiff said there was no exemption for theatres.

2d. Defendant said he had built the Queen's and Holborn theatres, and there were surveyors in those theatres, as well as in Marylebone. They had not objected to the mode in which those buildings had been constructed, though it was precisely the same as in the present case. He said also that the Gaiety Theatre, and no difficulty was made by the district surveyor there. Mr. D'Eyncourt observed that one object contemplated by the Act was the safety of the public during fire; and to say that Mr. Peebles ought not to take any notice because two other district surveyors had not thought proper to do so, was no proof that Mr. Peebles was wrong.

3rd. Defendant said the plans were approved of by the officials at the Metropolitan Board who acted on behalf of the superintending architect; but it was contended by plaintiff that this was not an approval by the Metropolitan Board, which was not so.

Mr. D'Eyncourt said he considered this to be a new building, and that it came under the operation of the Building Act. He believed plaintiff had made out his case, and the necessary alterations must be made in accordance with the district surveyor's notice.

CHURCH-BUILDING NEWS.

Barnet.—Trinity Church, Barnet, has been consecrated. It was opened so long ago as the beginning of 1865 under license. The church was erected from the designs of Mr. Ewan Christian, and consists of a nave, north and south aisles, and apsidal chancel, with aisles; the southern aisle, which is used for the organ, has the vestry behind. The walls throughout are of brick with stone dressings. The nave roof is oiled with a harrel vault, with moulded ribs, tie-beams, and king-posts. In the aisles the whole of the timbers are exposed to view, and stained and varnished. The roof of the chancel is similar to that of the nave, both being adapted for decoration. The roofs externally are covered with slate; and the bell-cot, which is constructed of timber in connexion with the chancel arch, is covered with oak shingles, and is surmounted by a vane. The interior is fitted with open benches of stained deal, affording accommodation for about 420 persons. The passages generally are paved with red and black quarry tiles, and the floors of the chancel and communion space are laid with Minton's tiles—the latter being of encaustic patterns. Messrs. Dove, Brothers, were the builders, and the amount paid for their work was 2,996l. 4s. 6d.

Stroud.—The new church at Stroud has been opened for divine service. Various plans for the restoration were, we believe, obtained; and, among others, Mr. Gilbert Scott sent in a design. Ultimately, Messrs. Wilson & Wilcox, of London and Bath, were appointed the architects, and Messrs. Wall & Hook, of Brimscomb, the builders. Under their direction the old church, excepting the tower and spire, was rased to the ground. Of the 7,000l. required when the stone was laid, more than 5,000l. had been promised: the general subscriptions realised about 4,000l., and the remainder came from the Warneford Trustees, the Stroud Peoffees, the Diocesan Society, and the Incorporated Society. Save in regard to the spire, the rebuilding has been complete. The new building is cruciform, and comprises nave, north and south aisles, north and south transepts, chancel, north and south chancel aisles, south porch, and vestry on the south side of the chancel aisle. The tower and spire are at the west end of the nave, and the belfry is divided from the nave by an open iron screen. There are eight bells. The chief entrances are through the south porch and under the tower: there are also entrances on the east side of the north transept and through the vestry. The length of the nave is 77 ft.; its width, 23 ft. 3 in.; and its height from the floor to the wall-plate, 33 ft.; and to the apex of the roof, 43 ft. The north and south aisles are, of course, the same length: the north aisle is 13 ft. 3 in. wide; the south, 16 ft.; and the height is—to the wall-plate, 19 ft.; and to the apex of the roof, 32 ft. The north and south transepts are 22 ft. long and 19 ft. wide; the height of the side walls is 26 ft.; that to the apex of the roof, 42 ft. The length of the chancel is 29 ft.; the breadth, 23 ft. 3 in.; and the height—to the cornice, 26 ft.; and to the apex of the roof, 43 ft. The chancel aisles are 26 ft. long; the width of the north aisle is 15 ft. 3 in.; that of the south, 16 ft.; and the height of the wall is 18 ft.; and that to the apex of the roof, 31 ft. The nave is divided from its aisles by an arcade of five arches on each side. The columns are of blue Bristol Pennant stone, with carved Painswick stone capitals, from which the arches rise. The arches are also executed in Painswick stone, with moulded heads. There are twelve clearstory windows on each side, and they have blue Pennant columns, with moulded and carved caps, to correspond with those of the arcading below. The roof of the nave is of English oak. The whole of the roofs are circular-headed. Underneath the tiles is a layer of Croggon's patent asphalt. The nave aisles are lighted—the north aisle with four two-light windows in the north wall, and one three-light window at the west end; the south with three two-light windows in the south wall, and one three-light window at the west end. The north and south transepts have each a large four-light window in the gables, and also a three-light window in the east and west walls, all with moulded jambs and traceried heads. The north and south chancel aisles are divided from the chancel by two arches on each side, supported by moulded Painswick stone bases, beneath four clustered red Devonshire marble columns for each centre, and two for each respond. From the carved capitals spring the arches, which are deeply moulded, with red

Mansfield stone bands. These aisles have each a three-light window at the east end. Between the nave and the chancel is a moulded and carved arch, springing from carved corbels, on which stand black polished Devonshire marble columns. The east window has five lights, with deeply-moulded jambs and traceried heads. Between the chancel and its aisles, and also between it and the nave, are low Painswick-stone screens. The floor of the chancel is laid with Godwin's figured encaustic tiles; the floors of the nave and aisles and transepts and tower and porch are of Godwin's plain red tiles. The outer walls are faced with Painswick stone ashlar. The walls are built in diagonal-range stonework, pointed with bad mortar. The external dressings are of Bradford-on-Avon stone, obtained from the quarries of Rogers & Rollins. The entrance porch has a deeply-moulded arch, supported by blue Pennant stone columns, supplied by Mr. F. Greenway, of Downend, near Bristol, who also furnished the large columns of the interior arcading. The roofs are covered with Broseley coloured tiles, laid in alternate courses. The material employed throughout is chiefly native stone, and the architecture is Early Gothic, of thirteenth century. Save for those we shall mention presently, the windows are filled with cathedral-glass in tinted patterns. All the internal fittings are of English oak, and have been twice varnished. The oak fittings are open. They will accommodate about 1,200 persons. The painted windows are seven in number. One in the tower, by Ward & Hughes, represents Christ Blessing Little Children, and the cost of it has been collected by children of the town. The chancel-window, by Heaton, Butler, & Bayne, has five large lights, four of them with double subjects, representing the Annunciation, Visit of the Wise Men, the Appearance of the Angels, the Flight into Egypt, the Addressing of the Disciples, the Crucifixion (the large centre light), the Resurrection, the Ascension, and other incidents in the Saviour's life; and the tracery is filled with flowers and emblematical devices. The south chancel-aisle window has three lights, illustrating the Parable of the Talents, by Lavers & Barraud, and given by Mrs. Charles Stanton. The north transept window is given by Mr. Sidney Biddell and family, and chiefly illustrates Christ rewarding the just. In the tracery are angels and praying children hearing scrolls. The south-transept window contains large figures of the Evangelists. The window in the north aisle is given by Mrs. Chnitz, and that in the south aisle by Mrs. Hill, of the Thrupp.

Tickhill.—The Parish Church of Tickhill, after being restored and cleansed, has been re-opened for divine worship. The entire cleansing and restoration of the church was done by Mr. Athron, of Doncaster. The first week's work, which consisted in scraping off a thick enamel of whitewash was performed freely by a number of men in the village, and in three months the work was completed, the whole interior presenting a renovated appearance. Such of the windows and pillars as needed it were restored, and the walls, &c., cleaned and stuccoed. A new reredos, designed by Mr. Goddard, of Lincoln, and constructed of stone, alabaster, and slate, was placed in the chancel. By the liberality of Mr. B. H. Brookshank, the organ, which entirely hid the west window, was rebuilt and removed to the Laughton Chapel. The restoration of this instrument was done by Mr. Menceck, of Doncaster. The front pipes have been decorated by Mr. J. Hawley.

DISSENTING CHURCH-BUILDING NEWS.

Aslbourne, Derbyshire.—The chapel of the Countess of Huntingdon's connexion at this place, is about to be restored and enlarged, and the schools rebuilt. Messrs. Stonier Brothers, of Rochester, have contracted for the works, which are to be carried out under the direction of Mr. Sugden, architect, of Leek.

Barrow-in-Furness.—A Presbyterian church, costing some 1,400l., and calculated to hold 350 persons, has been formally opened. The Messrs. Hay, of Liverpool, were the architects.

Plymouth.—A Presbyterian church has been commenced here, which will accommodate 1,200 persons. The architect, Mr. J. L. Hodge, of Plymouth, has designed the building in the Italian style of architecture, and it will be of limestone, obtained from Pimplete and the West Hoe Quarries, faced with Portland stone. It will be 100 ft. by 55 ft., and about 50 ft. high,

lighted by thirty-seven windows, and there will also be a gallery. The estimated cost is 4,000l. of which one-half has been contributed. Mr. Walter Lethbridge is the contractor, and getting on with the work. The foundation-stone has just been laid.

Brighton.—A new church, unconnected with the Established Church, has been opened here for divine service by Dr. Canning. It is constructed of iron, upon the plans and under the superintendence of Messrs. Hemming, of London, and is said to be, with one exception—that of church at Cheltenham, built by the same firm—the largest iron structure of the kind in the kingdom. It provides for and accommodates a congregation of 1,500 persons; and on the occasion of its opening contrived to include within its walls some 150 more. The church is situated at the west side of Brighton, between the Western-road and the sea, close to Waterloo-street. It is Gothic in its general style and formation, with a central aisle and two side aisles, standing east and west with an eastern chancel, in which is placed the communion-table. It is highly decorated, and recourse has been largely had to both strong colours and gilding. It is thickly carpeted in addition throughout, and the open pews are cushioned in scarlet.

Knighton.—The new Wesleyan Chapel, a Cefinion, in the Knighton circuit, the foundation-stone of which was laid in April, has been dedicated to divine worship. The edifice was built by Mr. Pugh, of Bishop's Castle. It is in the Norman style of architecture.

Whitby.—A new Congregational Church, at West Cliffe, Whitby, has been opened for divine worship. The edifice was designed by Mr. J. P. Pritchett, of Darlington, and is in the Geometrical style. It consists of nave and aisles. Accommodation is provided for 950 adults on the ground floor and galleries in seats which are open and have low slanting backs, all of pitch pine, varnished. The contracts amounted to 3,300l., exclusive of warming apparatus, gas-fittings, and furnishing, which, with professional charges and sundries, will bring up the total to about 4,000l.

SCHOOL-BUILDING NEWS.

Worcester.—The new building for Queen Elizabeth's Grammar School has been formally opened. It is situated in the Tything, to which it presents its chief elevation. An unsightly row of cottages has been removed to make way for the new building. The material is Tewkesbury brick, with Bath stone facings and dressings, and the style is Elizabethan. There are on the west side, facing the street, three three-light square-headed windows, and a large five-light pointed window at the north and south ends. These windows have stone mullions and transoms. Above each window is an ornamental square and circular step gable, with a ventilating slit or opening in each; and the steeply-pitched roof is surmounted in the centre by an octagonal lantern-light or bell-turret, covered with lead, which also acts as a ventilator; a crown and weather-vane on its top. In a niche, canopied, over the central window of the front, is a statue of Queen Elizabeth, designed by Mr. Perkins, the architect, and executed by Mr. Boulton. The statue represents her Majesty crowned and holding the sceptre and orb. The porch by which the school is entered is at the north-west angle, and is composed of variegated bricks and freestone, and over the door is an ornamental gable containing a sculptured shield with the royal arms, and the initials "E.R." (Elizabeth Regina). The floor of the porch is covered with Godwin's encaustic tiles. The great school-room, which is about 11 ft. in height to the apex of the roof, 50 ft. long, and 27 ft. 6 in. wide, has an open roof, hammer-beamed, resting on stone corbels. This room is lined with white bricks, varied with red and black, has a hoarded floor, is warmed by a large open fireplace, and is provided with a clock. At the north end of the school a passage leads into a class-room, also into lavatories, robing-rooms, hat and cloak rooms, water-closets, urinals, &c., the offices of the masters being distinct from those of the boys; and at the rear are coal stores, with two fires courts and playground. The school and grounds are surrounded by a high fence, that of the front towards the street and sides being an ornamental railing, with stone piers. Between the front facade and the facade of the school is a distance of 27 ft., consisting of a gravel walk, with either turf or flower-

border. The entire cost will be about 1,600*l*. The architect was Mr. Perkins, and the builders were Messrs. Collins & Collins, of Tewkesbury.

Darleston.—The first stone of new schools intended to be erected in connexion with the parish church of St. Lawrence, Darleston, has been laid by Mrs. S. Mills, of Darleston House. The design is Gothic. The building will be 130 ft. in length and 68 ft. in width, and designed to accommodate 500 children, and will stand upon 2,040 square yards of land, valued at 306*l*., the gift of Mr. J. A. Dorset, of Woodville, Bromsgrove. It is estimated to cost 2,430*l*. The architect is Mr. A. P. Brevitt, jun., and the builder Mr. J. Wilkes, both of Darleston.

Hurstpierpoint.—The first stone of new parish schools has been laid. The schools, of which Messrs. Goutly & Gibbins are the architects, are to be a Gothic building of red brick, and will comprise boys' and girls' schools, each 46 ft. by 17 ft.; and infant school, 45 ft. by 17 ft.; and a master's house. The building is to cost 1,867*l*. Mr. F. Hollands is the builder employed.

Miscellaneous.

CRANE ACCIDENT IN MANCHESTER.—An accident, unfortunately attended with loss of life, has occurred at the works of Messrs. Bowden & Edwards, builders, Brook-street, Manchester. The owners were fixing a large boiler, weighing 7 tons, by means of two travelling cranes, calculated to move respectively 8 and 4 tons. Fourteen men were engaged in the work; and just as they were putting the boiler in its place, and when it was raised 3 ft. from the ground, the gangtree broke which supported the two cranes, and they both fell, breaking into several pieces. Seven of the men were knocked down and severely injured. One of them died on the way to the infirmary. The larger crane was a new one, but the smaller one had been in use fourteen or fifteen years, and the woodwork was much decayed, which was the cause of the accident.

THE BIRMINGHAM WORKHOUSE SCHOOLS.—The Birmingham guardians are again in a difficulty about the workhouse schools. The Poor Law Board decline to sanction the plans lately adopted, unless with modifications so extensive as greatly to enhance the cost. The guardians will not agree to some of these modifications. Neither do they revert to their original resolution to build completely separate schools, and so leave the workhouse free to its proper inmates, at the same time giving the children the means of escape from the miserable influences of pauper association. All the objections of the Poor Law Board, as the local journal notes, tend in this direction; and perhaps the Poor Law Board may ultimately insist upon the original plans being carried out. It would be cheaper in the end, as well as more beneficial to the children.

A STEEP RAILWAY.—A somewhat strange account of the railway to the summit of Mount Washington, New Hampshire, has reached this country. The station, at the starting-point, is 2,700 ft. above the level of the sea; and the road, when complete, will be two miles and 260 rods long, rising, it is said, in that instance, 3,600 ft. to the Tip-Top House, which is 6,300 ft. above the level of the sea. The average grade of the track is 1,280 ft. to the mile, but in some parts of the line the grade is increased to 1,760 ft. to the mile, or 1 ft. in every 3 ft. On this portion of the road the workmen, notwithstanding the sharp spikes in their shoes to prevent them from falling, could only build 25 ft. per day. The track consists of three rails, the one in the middle being of wrought iron, with cogs or pins corresponding to cogs in the driving-wheel. The train consists of the locomotive with a tender and one passenger-car. The locomotive of 35-horse power is built with its boiler suspended, so that it is always level; it weighs four tons, and pushes the train up before it. The driving-wheel is 18 in. in diameter. There is a similar cog-wheel on the tender, and another on the passenger-car, each strong enough to hold the entire train. Friction rollers, running under the edges of the middle rail, hold the train down upon the track. The ascent from the starting point to the second station, 5,300 ft. above the level of the sea, was accomplished in one hour and twenty minutes, including two stoppages for water. The descent occupied thirty-eight minutes.

ST. STEPHEN'S, WALDBROOK.—We are asked in more than one quarter to call public attention to a contemplated alteration in the position of the organ here, calculated some say, who know exactly what is proposed, to damage materially the effect of the interior as well as of the organ. The *Musical Standard* says the alteration will be a perfectly useless and wanton architectural innovation.

THE NEW CHANNEL DOCKS, BRISTOL.—There has been commenced at Avonmouth an undertaking which, it is hoped, will greatly benefit the trade and add to the prosperity of the city of Bristol; namely, Channel docks, for the accommodation of ocean-going steamers. The present docks are only calculated for vessels of moderate tonnage. The dock and adjoining premises are to occupy 70 acres of land. The dock is to be 1,400 ft. long by 500 ft. wide, and the lake will cover an area of 16 acres. The dock will admit any vessel second to the *Great Eastern*, being 450 ft. in length by 55 ft. in width. The vessels, having taken their berths, will have facilities for discharging their cargoes into warehouses or railway trucks. There is to be a tramway which will connect the docks with the Port and Pier Railway, and an important feature of the undertaking is the Junction Railway, extending from the present line to the three great local railways. Mr. Lawrence has the contract.

CURIOUS IDENTIFICATION OF STOLEN TOOLS.—At the Llanelly Petty Sessions a mason, living at Swansea, was charged by a carpenter, of the Brea, Llanelly, with having stolen some of his tools. Prisoner had in his possession a rule, which was one of the articles named previously as having been stolen. A small brass plate, about three-eighths of an inch wide, was let into the rule which prisoner had in his possession, upon which the owner's name had been engraved. Other articles answering to the description given by the owner were found in the prisoner's possession, except that they were not stamped with his name as described. It was found on examination that names had been scraped or cut out of the various articles, and on the exact places at which prosecutor said they had been stamped. Captain Cross, the magistrate, suggested that if the tools were dipped in boiling water the names would become quite intelligible again. The experiment was tried, and on each article, says our authority, the *Cambrian*, the name of the prosecutor, exactly corresponding with the stamp he produced, became readable. The prisoner was committed for trial. The curious fact here so ingeniously made use of reminds one of the puzzling Chinese mystery of silver plate which shows on one side what is chased or otherwise represented on the other.

ALTERATIONS AT CARLISLE GAOL.—The alterations of Carlisle gaol, in accordance with the requirements of the Prisons Act, are making rapid progress. There are 112 cells for males, arranged in two rows and in three stories. All the doors on each flat open into long corridors, which in the case of the upper stories are narrow galleries, so that the whole building is open from floor to roof with the galleries of the first and second floors projecting on each side. The cells are all flagged and have arched roofs. In the day time each cell is lighted by a square window strongly grated and guarded, and at night it is so illuminated by gas that the lighting apparatus is beyond the control of the prisoner. A cavity is made in the wall near each door, in which the gas-light will be placed. The inner side will be fitted with plate-glass, and on the outer side will be placed a good reflector to throw forward and diffuse the light in the cell. The water supply, like the gas, is also beyond the control of the prisoner. A brass water-nozzle will project into each cell, and at a certain hour, at which the water will be turned on, the gong will sound for washing. The prisoner must then draw his supply. At certain times, too, the supply for drinking will be turned on. In a cupboard will be conveniences, including a utensil upon the earth-closet principle, which has been substituted for the more costly system of water-closets for night use. The cost of water-closets as at first planned in each cell would have been about ten guineas each; whereas the whole of the furniture, under the plan adopted, will not, it is expected, cost more than 2*l*. for each cell. Whether the one be as good as the other is another question. The whole building will be heated with Gil's stoves, and preparations are now being made for laying the flues.

THE ASSOCIATED CARPENTERS AND JOINERS OF SCOTLAND.—The sixth annual demonstration of this association has taken place at Edinburgh, in the Corn Exchange, Grassmarket. When all had assembled the large building was completely filled, upwards of 3,000 being present—the ex-nationists having been joined by about 800 of the trade from Edinburgh and Leith. The addresses were chiefly on the advantages of social gatherings amongst the working classes, and advocated the cause of union, not for the purpose of aggression, but for the maintenance of rights.

DAMAGES FOR POLLUTION OF A STREAM.—In the case, *Scarlsbrick v. Ormskirk Local Board of Health*, the plaintiff, Lady Scarlsbrick, owner of extensive estates in the neighbourhood of Ormskirk, sought to recover damages from the Board of Health of Ormskirk for causing a nuisance by polluting a stream which, running through a portion of the plaintiff's property, communicates with the lake in Scarlsbrick Park. A verdict for 1,000*l*. was taken by consent, to be reduced to the nominal sum of 40*s*. if the nuisance complained of was abated. There were several other terms agreed to.

LAKE DWELLINGS IN SCOTLAND.—Interesting researches have been recently made on the Loch of Forfar. The existence of a crannog or lake dwelling on this lake has long been known, but its thorough examination has only now been made. The causeway was found to consist of a ridge of stones and marl, stretching across to the west end of the loch. On the north side there had been a row of piles, on the top of which were transverse piles, generally about 5 ft. below the surface of the ground. The examination led to the inference that the inhabitants were similar in their modes of life to those who erected the lake-dwellings in Switzerland.

BURIED ALIVE IN LAMBETH.—The Lambeth Waterworks Company have lately opened a trench at Surbiton, for the purpose of laying down a 30-inch service-pipe. Several workmen were engaged, and as they progressed the trench was filled in. The works were carried on under the contract of Messrs. Aird & Son, and the superintendence of an engineer of the water company's selection, and an inspector provided by the contractor. The works had reached Maple road, nearly opposite the Antelope Tavern, when there was a slip of earth, entirely burying a man named Dymond, and partially covering up two others, one of whom was embedded to his middle. Dymond was extricated alive, and taken to the Westminster Hospital, where he afterwards died. The men at work complained amongst themselves that the struts and shoring were insufficient, as it was light earth, the opening having been previously made for a similar purpose. They, however, made no formal complaint. An inquest was held upon Dymond, and the jury found a verdict of "Accidental death," but requested Mr. Trotman, the manager under the contractor, to act with greater care for the future. Mr. Trotman said the request of the jury was almost unnecessary, for great care was taken, but for the future the shoring and timber work should be particularly attended to.

DISCOVERY OF A ROMAN OVEN AT WINTERTON.—An interesting antiquarian discovery has been made in digging for sand, about half a mile west of the Roman road at Winterton, in a field about half a mile east of the Roman tessellated pavements. By the falling of a portion of the side of the pit there was exposed what appears to be a rudely-constructed oven, made by sinking a circular cavity, about 6 ft. deep and 6 ft. diameter at the top, becoming narrower towards the bottom, so as to be, in fact, an inverted cone. From the centre of the floor rises a pillar, 1 ft. 9 in. in height, and widening from 1 ft. diameter at the bottom to 1 ft. 10 in. at the top, which pillar widens suddenly so as to form a sort of mushroom-head, continuous in structure with the clay or mud floor and walls just described. A shallow groove runs all round the inside of the oven, a little above the top of the pillar, and broken pieces of blue Roman pottery are laid across from the pillar to the side of the basin, so as to cover in a sort of circular flue. Over these has been spread a thin coat of clay, similar to the rest of the lining, so that the upper story, so to speak, is a shallow pit, about 3 ft. diameter and 1 1/2 ft. deep. It may be that this was used for baking bread or other cooking operations, and that it was heated by a fire in the flue beneath. This upper part was filled with earth, plaster, broken Roman pottery, &c., and the flue with black ashes and Roman potshards.

FIRES IN LONDON.—Within forty-eight hours last week no fewer than twelve fires took place in the London district. How much longer shall we build houses as if expressly to burn?

CO-OPERATIVE CONGRESS.—At a meeting held at the offices of the Agricultural and Horticultural Association, to determine the time and place for holding a congress of the representatives of co-operative societies, partnerships of industry, trade unions, &c., it was resolved that the meeting shall take place in London, in the early part of February, 1869. Resolutions were passed to the effect that invitations be issued to co-operative societies, at home and abroad, and the friends of the movement generally, and a list of questions for discussions by the congress was drawn up.

EGRESS FROM OVERTURNED RAILWAY-CARRIAGES.—A proposal has been received that there should be openings or hatchways in the roofs of railway-carriages, so that if overturned the passengers could readily get out by opening these hatchways or roof-doors. The difficulty of keeping out rain would be an objection: however watertight such hatchways might be when made, they would be liable to become defective. It is difficult to keep even skylights watertight. Perhaps a lining of elastic indiarubber along the edge of the hatchway pressing on the roof-edge where they met might aid in keeping the whole watertight, the overlapping and all other arrangements being as carefully planned as possible.

BALANCE WEIGHT SIGNALS.—Mr. F. N. Giborne proposes to apply his ship and mine signals to hotels, hospitals, and houses. The principle is simple. The apparatus consists essentially of a balance-chain, working around indented pulleys, each pulley being placed in the centre of a dial, and furnished with an index, the connexion being so made that neither of the pointers can move without all the others adopting a precisely similar course. In the mining signals the dial is lettered "men," "up," "stop," "down," "men," respectively, and whenever either one of the pointers is directed to say "up" the engine-room bell gives the proper signal, and every pointer in the connexion is at the same instant turned to "up" also—in fact, the dials may be lettered to suit any kind of wording that may be considered necessary. As the weights at either end exactly balance each other, the index has no tendency to return to any zero, but remains at whatever point it may be set. The apparatus is self-adjusting, and transmits signals steadily, but little power being required to move it. The pointers and transmitting handles of every communicator and indicator can be quickly adjusted to the centre of a common order by simply turning the outside binding screw, which holds them in position. Any ordinary mechanic can fit it; and the cost price is said to be small, and the fitting inexpensive. Mr. Jerram, of Great Queen-street, Westminster, engineer, has undertaken the introduction of the mining signals.

BRADFORD BYE-LAWS AND TOWN IMPROVEMENTS.—Mr. Dewhurst, one of the borough magistrates of Bradford, is erecting an arched market for the benefit of a district where such a market is needed; and the corporation, who have an interest in putting down all markets but their own, have been attempting to stop the erection of the new market by various dodges, under pretence of the plans being inconsistent with the bye-laws. Six successive plans were prepared by the architects, Messrs. Lockwood & Mawson, but each time the requirements were only extended,—as, for example, in regard to the breadth of the street, and the arched. One bye-law stated that "Every new street, not being a carriage-road, shall be laid out and formed at least 24 ft. wide, and there shall be one entrance, at least, to every such street, of the full width thereof, and open from the ground upwards." As to the breadth of the street, the local Board, in the face of their own bye-law insisted, successively, on 36 ft., and even 42 ft., to which the plans were actually altered. Mr. Dewhurst being advised that "open from the ground" in the bye-law as it stood referred to the entrance and not to the street; and, being prepared with the evidence of various architects and others to the effect that ventilation, drainage, width, &c., were adequately provided for, at last proceeded with his market in defiance of the corporation, who cited him before the local magistrates; but they have just dismissed the case, after full and repeated hearing.

A ROMAN CATHOLIC CHURCH is about to be erected in York-road, Battersea. It is to be of brick, with windows and other dressings of moulded brick, in the style of the thirteenth century. Mr. Charles A. Buckler is the architect, and Mr. B. E. Nightingale is the contractor.

ISLINGTON NEW WORKHOUSE.—At the last meeting of the Islington Board of Guardians, some strange statements were made as to improper materials and proceedings in erecting the new workhouse, and by a series of resolutions the clerk of the works was placed in a wrong position in respect of the architect. The contractors should be either exonerated from the charges made, or requested to walk off the ground at once.

THE COLOSSEUM IN THE REGENT'S PARK.—It would be a matter for regret if the Colosseum were pulled down. Can nothing be done to prevent this? London is greatly in need of large and appropriate halls and meeting-places. It seems a pity to sacrifice a fine building of its kind easily convertible for such a purpose. A correspondent, Mr. Roumien, suggests that it should be made to take the specimens of Architecture and Sculpture of the British Museum, but we are not quite prepared to adopt this suggestion.

TECHNICAL INSTRUCTION FOR WORKMEN.—The Working Men's Club and Institute Union have obtained the authority of the Science and Art Department to engage the services of Mr. J. C. Buckmaster for the purpose of holding a series of meetings at the different workmen's clubs in London, at which he will explain the conditions under which the Department grants aid in the formation of science classes. The first of these meetings was held on the 25th ult., at the club called "The Bedford Institute," for workmen, in Wheeler-street, Spitalfields. Mr. Buckmaster gave a very clear statement of the great facilities afforded by the Department for the establishment of such classes. Those present were evidently not aware of the very small outlay necessary to provide systematic instruction in such subjects as applied mechanics, mathematics, machine-drawing, geometry, chemistry, &c., or of the valuable rewards given for proficiency.

THE MASTERS AND WORKMEN ACT.—An important case under the Masters and Workmen Act of 1867 was heard recently at the county magistrates' office in Liverpool. Messrs. J. G. & Robert Martin, builders, complained by information that two hod-carriers, named Stephen Wood and James Dignan, whom they had employed at 92s. per week, had struck work about one o'clock on Thursday, the 20th August, at some houses in course of erection in Edge-lane, and so brought to a stand the bricklayers engaged in building the houses. The bench ordered the prisoners to pay respectively 8s. and 7s. as their share of the loss thus sustained by their employers, in having to pay men who were standing idle—trade rules not allowing any one but recognised hod-carriers to carry bricks to the "setters"—and to forfeit half their week's wages. The judgment was designated a lenient one for the sake of example, and to show workmen the power of the new Act in compelling them to fulfil their labour contract.

TRAMWAY RAILS.—A report from the Liverpool borough engineer to the Health Committee of the town council, on models of sections of the rails proposed to be laid down by the Tramway Company, has been made. The reporter describes the crescent rail and the corrugated rail. A crescent rail was laid in Castle-street, and remained there nearly two years. This rail was only 3 in. wide, and was not considered to be of the best form to insure safety and prevent obstruction. The corrugated rail was then submitted to the committee. This rail was also only 3 in. wide, and was 'consequently deficient in stability. It was, however, a decided improvement on the crescent rail, and the engineer recommends it on condition that it be broadened to 4 in.; and the top of the groove eased by being rounded, so as to prevent its becoming dangerous to horses. This rail, if thus altered, he considers, would be superior to any yet in use. It is 1 in. wider than that submitted to and approved of by Parliament. The object of the increase in width is to admit of the use of sleepers strong enough for stability and for the security of the rail fastenings, and to be so covered by the rail that the paving may abut closely upon it on each side.

LIVERPOOL SEWAGE UTILIZATION COMPANY.—At the half-yearly meeting, held in the Town-hall, Liverpool, Mr. Robert Nelson, presiding, the report stated that the requisite amount of subscriptions for the work had been paid; that arrangements had been made at Blundellsands, north of Liverpool, for arable and other land on which to apply the sewage; that a contract had been entered into by Mr. English for the supply of steam pumping apparatus capable of lifting 500,000 gallons per day; and that plans had been adopted for the construction of the intercepting sewer. The report was adopted.

TENDERS.

For rebuilding warehouse, Bury-street, St. Mary-axe.
Mr. H. H. Collins, architect.
King & Sons £1,015 0 0
Henshaw 942 0 0
Gaves 850 0 0
Wall & Russell 822 0 0
Stuart & Bennett 670 0 0

For pair of villa residences at Ealing, for Mr. Bowden.
Mr. Marks, architect.

TO CARPENTERS, BUILDERS, &c. A YOUNG MAN, accustomed to the Bench and Jobbing, is in want of EMPLOYMENT. Terms moderate.—Address, J. B. H. Little Clapton-street, Edgware-road.

The Builder.

VOL XXVI.—No. 1336.

Derbyshire.*

GAN assure you," wrote Lord Byron, "there are things in Derbyshire as noble as Greece or Switzerland." And "He that has seen Dovedale has no need to visit the Highlands," said Dr. Johnson, rapturously. There would be no need to indorse these opinions if they related to unknown land, and there must be still less occasion when they are expressed in relation to places the artist's pencil, the engraver's burin, and the pen of the ready writer, have made familiar to every one. We have, moreover, only recently, given our readers a series of "Out and About" sketches of the principal places of interest in Derbyshire.†

But we have now to notice two new guides, one of which sets out to conduct us through four counties, and the other limits our wanderings to a radius of a few miles round Matlock Bath; and in the course of this pleasant task we may have to go over the ground concerning which Byron and Johnson wrote in these glowing terms. We do not intend to follow our Murray through Derbyshire, Notts, Leicester, and Stafford, but rather to walk through the principal seats in the first-mentioned county with the two guides in hand, comparing one with the other.

We take Chatsworth first. Bright and sparkling it rises before us, a white stone palace with chimneys and towers and terraces on a green smooth site of award. This same sward is part of a fine deer park some eleven miles in circumference, and through it, at a little distance before the palace, winds the river Derwent. The first view is so peaceful that it is difficult to realise there could have been a "year of sorrow" here, though we know, in truth, there has been, and more than one. We pass swiftly through the corridor that leads to the great hall, abiding with polished Derbyshire marbles, and thence to the chapel, where are some of the best wood carvings that are never to be forgotten by those who have once seen them. We come to a standstill here, because we wish to ask Mr. Murray why he ascribes these carvings to Grinling Gibbons, without, however, bringing forward any proof that they are his work. In this matter he simply follows Walpole, repeating the paragraph from his "Anecdotes of Painting" that have misled so many. Mr. Hicklin, the author of the more strictly local guide, properly assigns the work to Samuel Watson, who, jointly with Lobb and Davies, was engaged

to execute the ornaments of the state apartments. We cannot reject the testimony of the epitaph in Heonor Church, which would never have claimed the carvings at Chatsworth as the work of Watson if they had been executed by Gibbons:—

"Watson is gone, whose skillful art display'd
To the very life whatever nature made:
View but his wondrous works in Chatsworth Hall,
Which are so gazed at and admired by all.
You'll say 'tis pity he should hide in obscurity,
And nothing said to revive his memory.
My mournful friends, forbear your tears,
For I shall rise when Christ appears."

Honor to whom honour is due. Mr. Hicklin says further:—

"Lord Orford was misinformed when he spoke of Watson as a pupil of Gibbons, who assisted him chiefly at Chatsworth. It appears that he worked under Young, and afterwards on his own account; his price for daywork was 3s. 10d. a day. It is on record that his grandson, Mr. White Watson, of Bakewell, stated that he was a pupil of Mr. Charles Oakley, carrier in the parish of St. Martin-in-the-fields, London. There is some of his work in that portion of the State apartments at Chatsworth, for which he was paid, in 1703, 1744, for ornaments of the great frieze over the doors, cyphers, coronets, &c. He carved also twenty-two heads, for the galleries in the inner court; and for which, and six vases, he was paid 1077. 10s.; in 1704 he was paid 1122. 16s. for similar work."

The auditor's accounts show that some cases of carved work, statues, and pictures came from London during the progress of the works, the carriage of which cost 141. 15s.; but there is no other entry on them that can possibly be construed into any indication that Gibbons was employed. We quote Mr. Hicklin again:—

"The name of Thomas Young, who was certainly during three years the principal carver in wood, is not mentioned by Lord Orford, nor those of Lobb, Davies, or Lanseroun; the latter, or a person of that name, is mentioned as a painter. The slight mention that is made of Watson is erroneous. It is remarkable that no writer, before Lord Orford published his 'Anecdotes of Painting,' ever spoke of the works of Gibbons at Chatsworth. Dr. Leigh, who gave a particular description of Chatsworth in 1770, 3000 after all the principal apartments were finished, speaks of the works of Verrio, but makes no mention of Gibbons; nor does Dr. Kennet, when describing Chatsworth in his 'Memoirs of the Family of Cavendish.' J. Mackay, who published 'A Tour through England' (the result of actual observation) in 1724, quotes Leigh, and makes no mention of Gibbons, which seems to intimate that the carving was not then shown as his work."

Until there is evidence that the auditor has curiously overlooked Gibbons, from the fact, perhaps, that his work may have been included in some contractor's estimate, or that the cases mentioned above actually contained work from his hand, we must conclude that it was the imagination of Lord Orford that brought him to Chatsworth, and transferred to him the credit that is due to Young, Watson, and other members of the same staff. We must add, that Mr. Murray quotes the epitaph on Watson in his notice of Heonor Church.

We turn to Haddon Hall. All is grey and quiet here. There is a river flowing through the meads around, but it is not the same stream that Chatsworth looks upon. It is the Wye. Grey, sad, full of shadows, but sunshiny withal, is the deserted hall of the Vernons. An impression of enchantment pervades the place. The gazer feels, as the guide conducts him from chamber to chamber, that the opening of the next door may usher him into the presence of the company that thronged the place three centuries ago. But there are no footfalls, no voices, no clattering of horses' hoofs in the courts without, no baying of dogs: all is still; although there are the antique pewter-platters looking as though they were only used yesterday. Hanging on the wall, in the first room entered, are huge jackboots, spurs, a leather doublet, a hunting-born, a matchlock, as though their owner were close at hand; and here is the oaken cradle in which once lay and crowded the first Duke of Rutland. Nothing is stirring save the foliage without; nothing altering its outlines but the slow shadows. Mr. Hicklin mentions, on the authority of rumour only, we perceive, that Mrs. Radcliffe frequently spent the night here when writing her "Mysteries of Udolpho," and desirous of intensifying her powers of descriptive romance. Both guides take us through the building in the same way as that pursued by the custodian of the keys. Here are

the low entrance-gates, with their well-worn steps, the oblain's room, and the chapel, with its open timber roof, music-gallery, and long oaken benches. Coming back into the grey courtyard again, we are ushered into the banqueting-hall, where we may see how a great dinner was served and partaken of in the days of yore; see the raised floor where the lord sat, with his principal guests above the salt, while his dependants ranged themselves on either side of the table below the salt; the iron book in the wall to which a man's wrist was tied, while cold water was poured down his sleeve, if he would not conform to the rules of the house; the hatch through which the trenchers were handed; the broad shelf on the half-door or hatch of the kitchen close by, on which the cooks placed their dishes, whence the serving-men could carry them up a sloping passage to the hall, and place them on the table. Further on, opening out of a passage from the banqueting-hall, is the oak-panelled dining-room, some of the knotted carvings of which we figured in these pages, with its chimney-piece inscribed "Died: God and honor the King," and fine oriel; and after ascending the grand staircase we are shown the large, light, empty drawing-room above this, which is hung with tapestry, though otherwise unfurnished; and the long oak-panelled and oak-floored gallery, which extends along the south front of the hall for 109 ft. 9 in., and has a recess, as large as a modern chamber, 15 ft. by 12 ft., in the centre of the south side; whence to the ante-room of the state bedchamber, where behind the tapestry are folding-doors opening on the steps of the upper garden terrace, and then into the chief sleeping-apartment, the walls of which are also covered with tapestry, and in which stands the state-bed, the green velvet curtains of which are believed to have been embroidered by the wife of Sir Robert Mansers, in the reign of Henry VI.

At Hardwick we lose one of our guides. Mr. Murray alone shows us through the great glazed hall the Countess of Shrewsbury built. He says, without much enthusiasm for its Elizabethan character, "it is still habitable, but destitute of all comfort, and very little suited for a dwelling of the present time, though the duke now and then stays here." Walpole has served again for an opinion and description of this wondrous place, and it comes off but poorly under the hands of the new guide. Especially among the very interesting and historically valuable portraits, we missed mention of Holbein's great drawing of Henry VIII. Fuller has said that "an ounce of mirth, with the same degree of grace, will serve God more than a pound of sorrow." In the same spirit we feel an ounce of appreciation in the art-world, with the same degree of discrimination, is of more service than a pound of cool description.

Mr. Murray has introduced into his volume the local sayings and customs of the counties he describes. Some of these are quaint, others humorous; all are curious. Among the sayings we may quote that of the people of Market Harborough. This town has no lands appertaining to it, a circumstance the residents indicate by saying, "A goose will eat all the grass that grows in Harborough Field." The fictitious common in question is also used as a terror for children:—"I'll throw you into Harborough field." At Groby, where the Queen of Edward IV. lived happily as the wife of Sir John Grey, there is a mere of 40 acres extending beyond the old house, called Stewardsbury. There are two sayings relating to this pool. If great improbability is to be expressed, it is common to say, "Then, I'll bathe Groby Pool with pancakes;" and if a death has taken place, that no one regrets, people say "There is many a wet eye in Groby Pool" for it. In the neighbourhood of Belvoir Castle, there is a weather-saying that runs, "If Bever hath a cap, you curls of the

vale look to this." At Sibley there is a legend of a giant who took three tremendous leaps, which resulted in his death. Starting at Mount Sorrel, where he is supposed to have mounted his sorrel-horse, he leapt to a place called Wanlip (one leap). He then leapt a second mile, coming to the earth with so much force as to burst himself and his horse, at a place called Birstall; and after that misfortune, contrived to take a third leap, the spot at which he alighted being his burial-place, Begrave. This tradition is alluded to in the saying, "He leaps like the Bell-giant or Devil of Mount Sorrel." At Lockington, which is at the extreme of the northern angle of the shire, when it is desirable to get rid of any important person, it is common to say, "Put up your pipes, and go to Lockington Wake." At Billesdon, which is a small irregularly-built Leicestershire village, there is a saying, "In and out like Billesdon." Derbyshire has a geographical saying too. Codnor Park, now celebrated for its iron-works, was once the ancient seat of the family of Zouches. The ruins of their castle consisting of some of the round towers that fortified the courtyard, with fragments of walling, pierced with windows and doorways, are still standing. There was a moat, and there is still a pond in front of the relic, concerning which it is said,—

"When Codnor's pond runs dry,
The lordes may say good bye."

Among the local curious customs is that which was kept up for 140 years at Hilton Hall. On the first day of the year the lord of the manor of Esington brought a goose to the hall and drove it three times round the fire, after which he carried it to the table and received a dish of it for his own use. This droll proceeding was only discontinued when the manors came under one lord. At Walsall, there is an annual adult scramble; for here a custom exists of throwing out apples and nuts from the Town-hall, on St. Clement's day, to be scrambled for by the people. Happy are the boys that are horn in Walsall! At Wichnor, the same custom that has prevailed at Dunmow was once in use, and a wooden fitch of bacon still hangs in the hall. In this case it was John of Gaunt who instituted the custom by arranging that the owner of the hall should hold the tenure in virtue of his keeping a fitch of bacon always ready for any married pair who had been married a year and a day and would take the following oath:—"Hear ye, Sir Philip de Somerville, lord of Wichenor, mayntennor and gyver of this baronnie, I, A. B., sith I wedded my wife, and sith I had her in my keepyng and at my wyll by a year and a day for our marriage, I would not have changed for none other, fairer no fouler, richer no poorer, &c. And if the said B. were sole and I sole, I would take her to be my wyfe before all the women of the world. So help me God and all fleshes!" Before the bacon was conferred upon the happy man, it was carried a journey out of the county of Stafford, with some further ceremonial. At Ashford, besides the custom of ringing the curfew, they keep up the much rarer one of ringing the pancake-bell on Shrove-Tuesday. At Lyme Hall, the property of one family for upwards of five centuries, there was a custom once observed of driving all the deer in the park to the front of the hall and then causing them all to take to the water in one body. In this park are preserved a herd of the wild white cattle considered indigenous. In the hall, which is an antique place cased with a modern exterior, we may add, there is a curious bedstead with a canopy of carved black wood, which is shown as that in which the Black Prince slept when on a visit to Lyme. The Tissington custom of wall-dressing with flowers arranged in devices has been before mentioned in these pages, as well as that of hanging paper garlands in churches in memory of young people, venerated by the Swan of Lichfield:—

"Now, the low beams with paper garlands hung,
In memory of some village youth or maid,
Draw the soft tear, from thrill'd remembrance
spring;
How oft my childhood mark'd that tribute paid!"

But there is a less-known custom in vogue at Casleton, where it is usual for the ringers to hang a garland on one of the pinnacles of the tower of the church on the 25th day of May, and leave it there for the year.

There is a remarkable case of longevity chronicled in the Hand-book as having occurred at King's Bromley, where there was an old woman who saw six generations before she died, all living at once; and so could say, "Rise, daughter, and go to thy daughter, for thy

daughter's daughter hath got a daughter." Another natural curiosity we must pick out for mention out of this region of curiosities of a different character. At Roche Abbey there was in former times the form of a crucifix roughly indicated by nature on a limestone rock. This is thus mentioned by Hunter:—"A natural phenomenon, heightened possibly by art, might contribute to induce the monks to make choice of this spot. Among the fantastic forms of the limestone rock was discovered something which bore the resemblance of our Saviour on the cross. This natural image was held in high reverence, and devotees came on pilgrimage to our Saviour of the Rock. This fact is mentioned in the return made by Cromwell's visitors of the religious houses preparatory to their dissolution." The neighbourhood of Buxton, Matlock Bath, and the Peak is the grand region for natural curiosities, in the shape of waters, wells, and caverns. The fame of its waters brought visitors to Buxton as early as the reign of Queen Elizabeth. Four times was Mary Queen of Scots taken there by her custodian, the Earl of Shrewsbury; and thither went the Earl of Leicester and Lord Burleigh. Macaulay tells us, "England, however, was not in the seventeenth century destitute of watering-places. The gentry of Derbyshire and of the neighbouring counties repaired to Buxton, where they were crowded into low wooden sheds, and regaled with oxtake and with a viand which the hosts called mutton, but which the guests strongly suspected to be dog." The accommodation for the goodly company is thus differently described by the Elizabethan physician, Dr. Jones, who published a treatise upon the Well of Buckston, in 1572:—

"Joinyng to the chiefe springe betwene the river and the bathe, is a very goodly house, foure square, foure stories hie, so well compact with houses of office beneath the amynt wyre; and chimneyes for fyre, to drye your garments in the bathes syde, and other necessaryes most decent."

The unfortunate Mary may have been a patient of Dr. Jones's, for she was at Buxton, with the chary leave of Elizabeth, in 1573, 1576, and 1580. In this last-mentioned visit she met with an accident. The Earl of Shrewsbury, writing to Lord Burleigh at that date, says:—

"I cam beddar to Buxtons w^{ch} my charge the 23 of July. She had a harde byegynne of her journey for when she shuld have taken her horse, he started awaye, and therewith she fell and hurt her hake, w^{ch} she still complains off, notwithstanding she applies the bathe one or twise a daye. I doe strictly observe her mast com^{mand}ments, writen to me by y^r L. in restreynyng all resorts to this place; neither doth she see nor gett to any more than to her owne pepell and such as I appoynt to attende."

The last time the earl's royal charge visited Buxton was in 1582.

Among the minor architectural curiosities of this part of England pointed out are the Saxon crypt at Repton; a curious oak pav on Breedon Church, shut in at the top and sides so as to seclude its occupants from the rest of the congregation; a monument in Denby Church, of mosaic work, inlaid with gold; the crooked spire of Chesterfield; the octagonal church at Stoney Middleton, where is the lover's leap, of 100 ft. depth, taken by a young woman "crossed in love," who was not killed, as it is supposed she wished to be, but miserably lamed for life; many inscribed bells, as that at Eyan, on which is written, "Jesus has cutt spede;" some stained glass; several articles of ancient furniture, preserved at different seats, as state-beds; the dose-doe figures on the marble monument in Kellam Church; and similar notable objects, nearly as vexatious to miss as some of the ancient seats and churches.

The sanitary experiment at Clipstone is described as worth visiting. We quote the condensed account of it:—

"A road on the right leads to Clipstone, 3 miles from Mansfield, an estate of the Duke of Portland. It runs by the side of a canal of irrigation, formed by the duke at an expense of 80,000*l.*, and called the Duke's Flood Dyke, by which the stream of the moor, augmented by the sewerage [sewage] and washings of the town of Mansfield, is distributed by minor cuts, tiled drains, and sluice-gates, along the slopes below it, and has converted a previously barren valley, whose sides were a rabbit warren, overgrown with heath and gorse, and its bottom a swamp, producing barbedocks and rushes, into a most productive tract of meadow and pasture land, yielding three crops of grass annually. The river is diverted near the vale head and along the hill side, and the bottom has been drained. The canal extends to near Olterton, about 7 miles from Mansfield, the latter portion being applied to the lands of Earl Mansvers. These famous meadows have been often quoted, toge-

ther with those near Edinburgh, in sanitary and agricultural discussions. The canal water, after depositing all its more valuable contents upon the land, runs off through the bottom of the valley in a stream as clear as crystal and full of trout, though angling is forbidden. The domain of Clipstone exhibits a specimen of good farming, and is well worth a visit from all who are interested in agricultural improvements."

There is a group of attractions near this place, all duly pointed out in the Hand-book, and which should be borne in mind. It comprises the "Beautiful Gothic archway, called the Duke's Folly," serving for a school, and adorned with statues of the geni of the neighbouring forest; Robin Hood, Little John, Misd Marian, Allen & Dale, Friar Tuck, Cour de Lion, and King John; Birkland Forest, where the partridge has been hunted with the hawk within the memory of man; the Major Oak, 30 ft. in circumference, in which seven people have dined at once; Robin Hood's Larder, a hollow tree, in which a dozen people can stand upright, and in which a noted sheep-stealer used to hang up the carcasses of the sheep; the rubble remains of King John's Palace; the Parliament Oak under which Edward I. held a great council in 1292; and the picturesque forest-village and church of Edwinstowe.

THE CATHEDRAL OF TROYES.

THE Emperor has put Troyes into men's mouths, and tourists and travellers who are turning their faces homewards, either from Switzerland or from beyond the Alps, with still a reserve of time for the intermediate "few days at Paris," will do wisely to trench on their reserve for an intermediate day or two at that same Troyes. There is no city on the line of that long day's journey from Basle to Paris that will so well reward the lover of architecture, the student of its development, or the votary of the general arts, to each and all of whom architecture is almost equally welcome, whether good, bad, or indifferent, in progress or in decay, simple or sophisticated, provided it interests, as it may under any one of these conditions,—as it does under each in turn at Troyes,—to picturesque effect. There is interest at Belfort, there is instruction to be found at Langres, where the cathedral alone repays a halt; but a first halt at Troyes is likely to induce a resolution to make a second. So numerous are its churches, and happily most of them may be found just at this present time,—and even the cathedral to a great extent,—with all the testimonies of their history uneffaced by restoration, either in the best taste or the worst.

The history is much the same here as elsewhere, if here its annals in some chapters seem to be written a little more distinctly than usual. In general summary it may seem but a very old story indeed. Designs overmatched in daring the means of complete execution within reasonable time; fashion changed meanwhile or the directing influence was transferred to other hands. The self-assertion of each successor was as merciless here as elsewhere, and work was carried on according to the new taste, and often enough in an unparading disregard of the congenous. Where the transitions are less violent, and especially when they are towards improvement, we may designate them honorably as developments, albeit it may seem that a structure completed in a single though inferior style were better than a hybrid, whereof one-half is insulted by contemptuous disregard and the other only notably disgraced by unworthy association. Here at Troyes the story of transitions is continued well down to the days of the Renaissance, and the architectural *catena* is so unbroken that it seems clear enough that the men who put Roman façades to Gothic churches were no foreign intruders, but true and native sons of the fathers who had attached Gothic façades to Romanesque naves. It was clearly open to these later men to cite the precedent, and claim to be at least as good—if they had not the Stouenale confidence to "boast to be far better than their sires." They scarcely justified either pretension,—these later men,—certainly not at Troyes, only approximately elsewhere in France. But of the pretension itself they left no doubt. They turned to work in a revived style indeed, but with a resolution, while so working, to produce results similar to nothing that had ever existed before; and in this at least they succeeded where there was, perchance a little too often, no other success to boast of. Few nations can rival the French, it may be safely said, in the arts of peace, no less than of war, in conciliating large-

ness of design with a taste for detail : daring is the attempt to combine qualifications that seem so often hopelessly incompatible. The greatest results are only to be obtained by forcing them into union, and there is glory even in a splendid failure—"Magnis tamen cecidit ausis,"—but woe to him who can do no more than overwhelm elegant and ingenious detail by clumsiness of general mass, or who degrades nobility of magnitude and generosity of scale into a mere acrobatic and paltriness. The architects who built at Troyes just at the crisis when the revolution of taste came on, could not but prove themselves the sons of their immediate fathers. The tendency to the overdone and the fantastic that was rapidly choking the genius of the traditional style could not but reappear in the new adoption, and very extraordinary indeed are some of the new productions in which its survival is exhibited. The traveller who cares not to tarry may see an example close to the railway station, of a Renaissance façade applied to an elder Gothic church; elsewhere within the city we find works still more portentous; occasionally Gothic tracery has been removed from windows that are refilled with combinations of pilasters and dwarfed entablatures and flattened circles. In the façade of the cathedral itself, Gothic and Renaissance work were going on concurrently, and even low down about the piers of towers and doorways it is impossible to divide the schools and epochs by any horizontal line, or clear vertical section; if the right hand supplied the Gothic frame, the left seems to have been ready to fill it in with Classic details; and the cusps and foils of the panels have but the same relief as the sculptured grotesques of mingled foliage and mythological forms, that are niched within and below them. Better than this it was that the new style should strike for entire independence: it was not long in doing so; and at the little village of St. André, near Troyes, the church of the patron saint has an elaborate double portal, in which the self-assertion of the intrusive style is complete.

At this moment, however, we are concerned to point out the interest that lies in tracing the history of the transition to Classicism in architecture, and the seat of a fund of materials for the history at Troyes. The subject has many analogies to the investigation—so interesting, and yet of such tantalizing difficulty—of the more immediate stages of transition between one otherwise well-marked geological period and another: the architect has probably a better hope of completing his theory than the geologist, but only on the condition of taking timely note of monumental records that are liable to increasingly rapid obliteration year by year.

The transition—the impulse to transition—came forth from the country which abounded most in classical remains. Its course was moulded there by individual genius; and in passing to neighboring countries there was the additional influence of the circumstances of transport, and those of reception. History is here caught, or seems to be caught, copying her old exercises—repeating herself.

It is now well understood that the Gothic Church is a Romanesque Church translated into a new architectural dialect in which the expressions of pointed arches supersede the round. Reaction came on some three or four centuries after: the Pointed style—wonderfully developed since its first emancipation from a Round style—was even destined to be translated back into a round style. There was a more vigorous formative energy at work in the first case than in the second. There are incongruous mixtures, doubtless, of the Round and the Pointed in abundance, variously superposed and interposed, as of even transmutation with renovation; but the spirit of innovation was uncompromising and unhampered: it had no prejudices of its own—at least at first—and had no mercy on those of its predecessor. There was thus no detail in the old style that was not held to be open to most searching modification, and every novel exigence was met, for the most part, by novel adjustment, not by an evasion out of tenderness for the capacities of an imposed system. And so it was that this earlier transition had such a healthy development, and that the architecture that resulted was to its antecedent in the relation that a highly bred racer is to a well-conditioned roadster. The identity of species is unquestionable, but the breed and the training of generations have introduced differences before which even such an identity becomes of secondary importance. But when the time came that the transformed Romanesque was to be retransformed into

Roman, the reconquering Roman appeared with an authority that hampered both adjustment and invention, even when they seemed to be most free. The idea of the Order and its elements had an imposing dignity that was not to be trifled with. The changes that even men of decided genius ventured to make in these were but slight and inorganic as compared with the entire recasting by which a Romanesque was converted into a Gothic archivolts—a pilaster into a buttress. Roman architecture, at its very best, was an attempt to unite Italian architecture with the trabecative principle of Greece; an attempt which never was organically completed,—a cradling to the last, and falling as rotting on the bough rather than an over-ripe, or ripe, in any sense. The more truly artistic genius of the Goth succeeded where the Roman failed, and showed by what mutual adaptations the two systems could alone be, and might most happily be, co-operative and harmonious: the revision to the Roman system involved a liability to forfeit all the advantages of a solution already obtained, to resume an abandoned yoke. Architectural invention was owed by the habit of the time that ranged the dicta of Vitruvius with the renown of Cicero, and, in awe of the rediscovered genius of antiquity, had still to learn to distinguish the degrees of its hierarchy.

So it is that the tyranny of Rome, of which the architectural, even as the political type, is the Roman triumphal arch, came back upon us, and oppresses us to this day, but never was heavier than in the earliest generations of its revival. Palladio then took the outline of the façade of Lombard churches, and gained glory from men by changing what was in itself harmonious and original composition into one that was original only, and, as men should all have seen, neither harmonious in itself, nor even in the lower sense of being in accordance with ancient art, unless in the adoption of its faults.

In many of the Renaissance palaces of Venice we see the same manifest principle of substituting Classic details for Medieval, while the Medieval distribution of elevation as well as of interior is, in all the most important respects, unchanged. The transition in this form often commands considerable admiration in Paris, though as a whole it can scarcely effect more than dignity in palpable masquerade.

The proportion of Medieval mind that still survives unsoftened below this unnatural skin varies very considerably. Thus, to the west of the Alps the force of innovation was constantly checked by traditional attachment to the big-pitched roof as a beauty, if it were not, indeed, by traditional belief that, having been so universal and so customary, it must be a necessity; and thus the Palatial, and even the ordinary Domestic, architecture of France, from the time of Francis I. downwards, retained above its Classic details a feature that, more than any other allowed by the Gothic, is at odds with the genius as with the practice of the ancients.

At Troyes instances occur of that most uncleanly form of transition, when new features and details are intermixed incongruously with the old, or when new profiles are applied to old proportions; shafts, for example, being turned into abnormal Ionic columns, and a member is thus produced that is neither new nor old, proscribed both in the under and the upper world.

Matters mend somewhat when the ancient model is still the basis of design, with only so much adjustment applied to it,—it would usually be correct to say only so much violence done to it,—as enables it to be clothed with a tolerably self-consistent drapery of classicism. The process, if carried out with bold and inventive genius, might result in something so truly effective, expressive, and self-consistent as to disdain the qualifying term Transition, and be a term of transition in a better sense, a conclusive and proper Style.

Should failure ensue instead, there remains an impending punishment, and this comes with the accession of the dynasty of fastidious purity. The demand under such a dispensation is for copies pure and simple, literal repetitions of things once right, but only when left in their right places, and that even apart from transference of local relations, can impossibly be literally exact, while they are under penalty to be at least not better. Of this form of the revival there is at least nothing to be seen at Troyes, and it is not here that we recognize as we pass along her ancient streets reproductions of portals or porticoes from "the hooks," not even of a single column that would be acknowledged in

schemes of the five orders. The enormous tower added in the sixteenth century to the church of St. Madeleine is a most portentous, and yet in some respects historically, and as a warning artistically, instructive example. A more monstrous hybrid was surely scarcely ever compounded than has been born of this graft of classicism upon Gothic design; badly designed columns, neither pure as revivals nor desirable as novelties and variations, standing tier above tier on stages of buttresses, but "Talk we not of it,—look and pass along;" and pass we scarce can better than to the better and antique Gothic church to which has been added such strange disfigurement.

The Church of St. Urbain usually engrosses whatever attention can be bestowed on the smaller churches of Troyes; but after repeated visits to both it is La Madeleine that proved to have the strongest hold on the feelings. St. Urbain is dated 1262; the enrichments of its style are lavished on the exterior, while the interior is comparatively plain, and, sooth to say, and not merely by contrast, a little cold. La Madeleine includes whatever is most ancient in the ecclesiastical architecture of this ancient city, from pure Romanesque to the developed Gothic that corresponds, if it may not rather be called identical with, our Early English, and, indeed, in several stages of its development. Here the exterior architecture is comparatively uncareful and uninteresting. The eastern end was reconstructed in a still later style, but is not so unsparsingly out of harmony as the celebrated *jubb* or rood-screen of 1508-17, beautiful as it is. This is well engraved by Ferguson (109), but the figure introduced somewhat exaggerates its scale.

The nave is remarkably short, consisting but of a single system of separate vaulting precisely like the transeps. The western wall seems certainly original, and to preclude the supposition that the design is in this respect incomplete. The plan represents probably an earlier Romanesque church, of which the remains are seen in several piers and columns, with capitals rude enough in execution, but that from technical accuracy in distribution have claim to be called, if not Corinthian, Corinthianesque. The nave has double aisles opening into the pair of arches of the transept; and much as the various piers have been altered, usually to a very bad style, there are remains enough to prove that this distribution also was original.

The north transept, with the crossing, is the most unaltered portion of all of the church in its original Gothic state. A triforium arcade surmounts a string-course that is only slightly separated from the moulding of the large pointed arch below, and is included under another more important string-course that runs fairly into union with the capitals of the shafts that carry vaulting ribs and archivolts of the crossing. This is so far consistent with Early English practice, as we see it at Lincoln or Lichfield; but the tendency to loftiness could not be so prematurely checked in France, and the aspiring energy which presently carried the vaulting shafts as high as the shaft capitals of clearstory windows, asserts itself here, though in less conclusive fashion. Tall lancet-headed clearstory windows rise upon the string-course—a group of five, graduated from the higher central one at the north end,—and the main archivolts and the transverse ribs are stilled before they turn, almost as high as to the level of the springing of the lancet-arches. There are various indications of the extent to which the combination of vaulting and window arches was tentative, in want of correspondence between corresponding compartments. The diagonal vaulting rib of the north transept springs from a shaftlet superposed upon the tall shaft in the angle rising from floor to clearstory base, and takes a curve that has much appearance of being a true semicircle; to harmonize the transverse ribs of smaller span with an arch of such height was a necessity that thus early leads before our eyes to the invention of something much resembling the four-centred arch of latest Gothic. This was a great advance upon the unrefined form of a blunt oval which is given to the line of nook moulding over the clearstory windows on the north side of transept. Simplicity and dignity, too, were no doubt advanced by the change that so soon became universal to quadripartite vaulting; but a little longer perseverance in the earlier system might not have been unfavourable to richness and multiplicity of exercised embellishment.

On the northern wall of this transept the tri-

forum,—the blind-story arcade,—consists of a series of round arches against the wall divided by a group of imperforate shafts carrying the roll mouldings of pointed arches. The clear-story lancets descend on shafts sufficiently detached to admit of passage.

Only the first bay east of the crossing remains unaltered; the clear-story window here has a bold splayed arch filling the groin; a roll nook moulding springing from a slim Corinthian pilaret; the abacus of the pilaret is enriched with that dog-tooth moulding to which the heart of the lover of Early English always warms; it is returned horizontally across the splay, where it rises in the nook till it crosses the face of the wall again horizontally to the point of spring of the lancet roll moulding.

Very happy feeling for gradation is shown in the clustered shafts and the archivolts and diagonal ribs that spring from them at the great crossing. In their general abacus we have examples of those processes of modification that seem to have gone on concurrently at every architectural centre. The angular abacus that receives a diagonal rib, is turned from a feeling of harmony, in the diagonal direction; but only to substitute other discords by its acute and awkward angles with the sides of the adjoining abacus that are left parallel to a transverse springing. In one instance, at least, this difficulty also is corrected, the angles of the abacus being cut off, to the great gain of sweetness of transition. This was one of those cardinal changes that when fully appreciated—it begins sometimes with abacus, sometimes in the group of pilinths—carried forward a style to its correctest form, if sometimes also on its way to sophistication. It marks the great line of transition in the series of bays of Westminster Abbey.

Beyond the first bay of the choir we come upon absolute reconstruction, and here ensues a change of the same intention that governed so many alterations of the older cathedrals. In the interest of masculine expression the necessity was recognized of conferring very decided predominance upon one division of a bay over either of the other two, and, indeed, over the other two together. The transformation of our Norman cathedrals was effected on this plan. In the Madeleine at Troyes, as at Winchester, the later architect obliterated the triforium in order to give a larger share of the unchangeable total height to the pier arches. It is true that at Winchester a certain trace of triforium is left, but the mouldings of the clear-story window are so carried down as in effect to absorb it. The pier arch now becomes a term of sufficient importance to follow in the harmonious sequence of gradation that links the proportions of arches of nave, of transept, of severity, of pier, of window openings. The loftier arches of choir and apse are thus undoubted improvements,—beautiful as was the sacrificed triforium,—and nothing can be better than the vista that is managed to the magnificent painted windows beyond; but the mouldings of these loftier arches are not good, and they die poorly into the plain cylindrical piers without abacus or capital.

The *vitrains* of the Madeleine,—nine or ten large painted glass windows, in perfect preservation,—the church is enclosed towards the east—date in the fifteenth and sixteenth century. They will attract and detain long the attention even of those who may not be without awe of authority or unapprehensive of manifest interest and admiration that would get them into trouble with critics of the specialty. Let the quaintness but not the beauty of the subject of the Creation be inferred from the inscription written below it:—

"Comment après ciel et terre,
Et tout mi en son maylien [sic]
Fust fait nostre premier père
En bel image [sic] de dieu,
Comment il le faut refaire
Trompe de malin esprit
Par sacrifice et prière
De nostre seigneur Jesus Christ."

Finally, then, as regards the architecture of this really beautiful,—I speak of the interior,—interesting, and venerable structure. The style of its early Gothic appears in a remarkably unsettled state, and its tentative deviations for good and ill are as noteworthy as numerous. There is inconsistency, incoherence enough in the older portions, not only in the attachment of the Gothic to the earlier Romanesque, but even later, beyond even what may be palliated as due to the free manipulation of a confessedly elastic style; but the germs of dignified development

are strong around us,—in the masterly application of the dog-tooth moulding in various scales and modifications, the firm yet flexible treatment of the vaulting, the free modification of ribs in section, and of the abacus both in section and plan, of the capital both in proportion and ornament.

Hoardings and enclosures indicate that care is being taken of some portions that are in more or less of jeopardy from age or failure, and repairment will probably ensue. The condition of the building, however, is at present most favourable for pursuing into further particulars that study of its history that is due to its artistic excellence no less than to its antiquity.

GENERALISATION IN ART.

THE celebrated dictum of Hobbes, that "words are the counters of wise men, but the money of fools," has a double force in its first statement; for, while no wise man would accept any word as more than the symbol or concentrated expression of a fact or an idea; on the other hand, no one who thinks at all can be blind to the remarkable significance often attaching to a single word, especially when such word is either absolutely new, or has been brought into use to an unprecedented extent. Among such words, which may be said to stand as landmarks of the advance of the tide of human thought, there is none more noteworthy at present, and none certainly which represents a larger and more important modification of thought and association than that somewhat clumsy polysyllabic "generalisation." This word, along with its verbal compounds, meets us constantly in the pages of the foremost thinkers of the day, more particularly in those works which are devoted to, or connected with, natural science—from political economy to the Darwinian theory: everywhere we are exhorted to generalise our ideas, to generalise our information, &c., and the most important of recent historical works (that of Buckle) was nothing but an attempt to comprise under one vast generalisation the whole history and theory of art, science, and literature. There must be a reason for the constant use of a word which a little while ago was rarely met with in books; it must evidently stand for some general way of viewing things; and it may be worth while for those to whom art is something more than a mere plaything, or than a means of making a living, to consider for a moment what it is which this word generalisation symbolises, and what is its bearing both on the theory of art in general, and on the practice of the particular branch of art which they are interested in cultivating or encouraging.

The word "generalisation," then, seems to be the concrete expression for a remarkable and unmistakable tendency, among thinking minds of the present day, to regard every fact and study every phenomenon, not merely in itself, but in its relation to larger groups of facts, and, finally, to one great law imagined as pervading all nature, and of which isolated facts are merely so many different expressions. Of course the principle of this is nothing new; for the very process of reasoning consists, as all logicians know, of the reference of any particular statement to a general one, with which it does or does not agree. But the tendency to this broad view of facts in their relation to a general law certainly has possessed the minds of men in this generation to a greater extent than it has ever done before; and there can be little doubt that this is in the main the result of the scientific theories and discoveries of the day. Sciences which, when in their infancy, were only groping after elementary facts peculiar to each, and having apparently no connexion with one another, have gradually widened their borders till they have overlapped each other; and it has become evident that what were formerly supposed to be totally distinct branches of study, are, in fact, so much interdependent, that the one cannot be adequately comprehended without some knowledge of the other; and thus, while science was formerly, and in her elementary studies is still, concerned, mainly in studying the differences of things, in her higher forms she is almost entirely concerned with their resemblances and with the capability which they possess of resolving themselves into expressions of a single law.

Although the steps by which this comparatively commanding position of modern science

has been attained are inaccessible to the majority, it is impossible that such views can exist, and be constantly before the minds of those who write our best and most thoughtful books, without in the end influencing a great number of their readers; indeed, there are probably many whose tone of mind and habit of thought have been modified, even without such ideas in their passage through life; and which it cannot be denied that some of the leading apostles of generalisation (as Buckle, and in a lesser degree Comte) have been carried away by the splendid prospect which it seemed to open to them, into speculations baseless and visionary when regarded from our present standpoint, and that their theories would lead to an undue neglect of the claim of individual lives on our sympathy and attention; yet it is evident that this spirit of modern science, as it becomes diffused in society, must have the tendency to widen and enlarge men's ideas, to break down class and sectarian barriers, and, above all, to give to each man a more due idea of the relative value of his own particular occupation or pursuit, as a part of the great work of the world.

It is chiefly, perhaps, we may say only, in this last-mentioned view of the subject that we discern its significance in relation to the art-development of the present day; a significance to which it is all the more important to insist upon because just now art seems, of all the occupations which are engaging modern intellect, to be the one least penetrated or touched by this enlarged and comprehensive spirit,—to be, in fact, in opposition (in its popular forms at least) to the genuine feeling of the age, as exhibited in the ranks of the foremost intellect of our time. This is the more remarkable, since the history of the great artistic epochs of the world shows us art or poetry as pre-eminently the generalising influence,—the power which deals not with parts but with wholes, which concerns itself with those broad associations of ideas and feelings which can only have full play when the disturbing influences of minor details and facts are left out of consideration. At periods when geology and social science were unimagined, and before astronomy had emerged from what Comte would call its theological stage, the Greeks were generalising all the principles of beauty discernible in nature into those types of architectural and sculptural design, which have been surpassed certainly in intensity of expression, but never in perfection and completeness; and under the hands of Raffaele and some of his compeers arose the same broad and simple style of artistic expression, seizing upon the essential points which connect pictorial imagery with mental ideas, content to neglect all those minutia which, because they did not further, would on that account probably detract from, the main expression of the work; so that in their period art seems to stand as the one clear and comprehensible light, in a time shadowed by much moral, social, and scientific anomaly. In the present day the reverse seems to be the case; art and science have changed places. While we are gaining year by year those clearer lights on scientific and social subjects which enable us to connect the former with the latter, and to regard them as in a great degree different aspects of the working of one great law; there has certainly been no period when so much attention has been directed to, and so much energy expended in, artistic production of one kind or another, combined with such a want of certainty as to the object to be attained or the means of attaining it, and such a want of perception of the coherence of the various forms of art, and of the existence of broad principles which are common to them all. Take, for instance, painting, the most popular branch of art just now, and the one whose results are most easily compared side by side. The walls of our exhibitions are covered with what seem the productions of a dozen different periods and countries; so little evidence is there of any unity of purpose or principle, or any concurrence of opinion as to what art really is or what is required of it. And this want of generalisation is for the most part as apparent in single pictures as in the contemplation of the whole as a collection. For what is called generalisation in science is in the main the same thing, or at least springs from the same general causes as those which induce what is called "breadth" in art,—a quality which can scarcely be otherwise defined, but which was once well understood,

the main characteristic thereof being the recognition of a leading motive in a work of art, and the subordination of all details in the execution to the one end of emphasizing and clearly expressing that motive. This, it will readily be seen, is completely analogous to that peculiarity of modern scientific investigation and thought before described. But the majority of artists at present seem absorbed entirely in painting detail; detail of clothing, detail of anatomy, detail of flowers, trees, or still life, with much labour and accuracy, but in a mechanical purposeless manner—a state of things which is exactly reflected in the greater part, indeed almost the whole, of the poetical and architectural art of the day, if indeed these latter deserve the name of art. So that it has come to pass that art in our day is not, what in its two greatest epochs, those of the Greek sculptors and the Renaissance painters, it certainly was, the expression of the highest intellect of the day. On the contrary, the greatest minds now and recently amongst us, immersed in the great studies and results to which modern science, with her broad and coherent methods, has been leading them, have rather turned their backs upon modern art, even as Horatius turned from the Tuscan army, "as not deigning" to bestow serious regard on studies which seem to move by no rule and to be directed to no fixed goal.

These considerations may the more fitly be dwelt upon in these pages, since the conditions of architecture in a peculiar degree demand that, in its highest forms of expression, it should be the result of a wide and thoughtful generalisation; both from the peculiar position which it holds with regard to the other arts, and from the nature of the resources from which its own individual power is derived. Viewed in relation to the others, architecture may be called emphatically the generalising art. Its possibility of connexion with the other plastic arts, which are all susceptible of being used as attendants upon it, giving definite expression to its various parts, renders it absolutely necessary that architecture should be in harmony with, and form a kind of concentrated expression of, the artistic feeling and principles of its time (supposing these to have a definite and ascertained direction), in order to produce a harmonious unity of expression, and to appear as the natural centre round which the other plastic arts range themselves, and to which they owe their appearance of connexion and union for one grand end. And architecture being thus connected on all hands with other more definite though narrower forms of artistic expression, it is evident how necessary to its practitioners is that comprehensive view of the general art-principles and practice of their day, which will enable them to meet the practitioners of the other branches of art on common ground, and so to design the great monuments of their own art that these latter may appear as the proper and fitting background for the sculpture and painting which will always form their best decoration, and that such added decorations may appear to be only the more concentrated expression in detail of the same feeling which has been shadowed forth more broadly, though indefinitely, by the building itself.

But if we come to consider the problem of architectural design, *per se*, apart from any consideration of relation to the arts which accompany it, it is still more evident how necessary to its successful accomplishment is the study of general principles of beauty, as distinguished from the mere selection and reproduction of beautiful forms from nature. Much of the merit of the painter and sculptor consists in the fidelity with which they reproduce and copy in their respective materials the colour and forms of natural objects; and though no small industry and labour, combined with natural aptitude of hand and eye, are necessary to arrive at any real success even in this mechanical branch of the art, still it is a result which (given the requisite aptitude) can be attained by labour, without any great mental exercise or power of thought; and while it is admitted that no picture or statue can take rank as very high art which exhibits merely successful imitation unaccompanied by intellectual expression, yet even the successful imitation of nature is a power in itself, productive of pleasure to the beholder; while the fact that the sculptor or painter has to express his feelings through the medium of forms already made to his hand, no departure from which can be tolerated, certainly simplifies his path very much, and stands

him instead of a great deal of philosophising as to the true principles of beauty in form and colour.

But with the architect such philosophising would seem to be almost a necessity, if he would penetrate the mystery of his art, and give to it all the expression and power of which it is in reality, in its highest forms, capable. He has no "life" class to attend to, no model from which to copy direct, no forms of beauty around him, the mere faithful transcript of which will be sufficient to make his name honourably known among his brethren. He cannot, like the landscape-painter, collect during a summer tour boundless resources of colour and effect from the mere woods, and hills, and streams before him, which seem waiting there to yield their beauty up to the ready canvas and the practised pencil; the most that he can do in this way is to make a sketching-tour among the ruins of buildings erected long ago for different purposes from those which his own day require of him, and by workmen possessed of ideas of beauty quite distinct from those which would recommend themselves to the leading intellects now around him, even as their knowledge of construction and economy of material was based upon considerations widely different from the careful calculations of the modern engineer. This, however, is left him, and to this resource he commonly betakes himself, for it is the last harrier which divides him from the labour of original thought. It is well if he have a mind sufficiently educated to enable him to trace the principles which are exhibited in the works before him, to perceive the relation between the end aimed at and the means used to attain to it, and thus to read the works of his ancestors even as characters in history should be read, not merely with regard to what they actually did in the circumstances in which they were placed, but with regard also to what they, being the same men, would do under present circumstances, could they have experienced thereof. But the probability is, that there is little enough of this spirit in the architectural tourist, and that he comes back with his note-book filled with incoherently collected details, which are forthwith reproduced, with little alteration, in his works, where they tell the tale of his recent wanderings, and indicate what region of architectural remains he has last been groping amongst. What is really necessary to deliver him from this Slough of Despond is that education of mind which will lead to the habit of thought which we have called generalisation. The architect, having no definite forms to copy from, even in ornamenting his building (unless he commit the absurdity of reproducing in rigid stone or iron forms of which every line tells that they were originally created in a soft and yielding material), much less in its general aspect and plan, is called upon to generalise from the natural facts and incidents of beauty around him; to observe what one quality is common to a number of beautiful impressions, either in Nature or in the sister arts, and then to produce a design displaying that essential quality in a form suited to the material with which he has to deal; to give the essence of beauty, so to speak, without its accidents; so that where, for instance, a floral ornament may seem a proper and desirable accessory to the expression of a building, we may see there no partial attempt at copying the vegetable productions of nature, but rather a well-considered form, efficiently rigid not to appear in danger of being crushed by the superstructure, not out of keeping with the necessarily rigid lines of the building, and exhibiting not the accidental form of one particular growth of nature, but recalling the principle of growth which runs through all. So a column or support (as in that splendid instance of generalisation, the Greek Doric column), while free from all such absurdity as the copying of the limb of man or animal, will yet exhibit the same principle of form and balance which is exhibited in nature whenever strength is required. These are but isolated instances of the principle which should govern all relations between natural objects and architectural design; but even to rightly comprehend this principle, much more to rightly practise it, an intellectual education is required very different and very much beyond that which is attainable, and is considered sufficient, by most architectural students in the present day; and we propose in continuing the subject, to consider what are the defects in our architectural education suggested by this view of the necessity of generalisation in architecture, and how such defects may be in any degree remedied.

THE LAUNCH OF THE "BERMUDA."

The Talmud has preserved a tradition that the giants, who watched the shipwright labours of the patriarch Noah with the same incredulous dislike with which they received his oral warnings, were wont to ask, with jibes and scoffs, how the great ship was to be brought to the water. The world may have grown wiser during the 4,500 years, or more, that have elapsed since the date so memorable as an era to the builder, but it has not become so absolutely wise but that the questions, and even the lamore than one echo within the last dozen years. The refusal, on the first day's trial, of the floating-dock *Bermuda* to float, or to stir from the spot on which the enormous mass of 9,000 tons of iron plate has been riveted together, shows that our constructors have failed fully to profit by the lessons of the *Northumberland* or the *Great Eastern*, to say nothing of the humbler voice of counsel and of warning which has sounded from our own pages.

The last century has witnessed so signal an advance in the condition of the country, in so far as that condition can be affected by the knowledge and by the labours of the engineer, that we are apt to overlook our failures, or to count the cost of that habitual procedure by rule of thumb which may, without exaggeration, be said to have increased the expense of our public works by at least 30 per cent. It has been in works carried on avowedly at the public cost that this waste has been most enormous, attaining its evil maximum in the management, or rather the mismanagement, of our dockyards. But in all instances where the money of shareholders, or of sleeping partners of any kind, has to be expended, we are apt to find wasteful, or ill-considered, expenditure rather the rule than the exception.

When we consider the state of England a century since, we are entitled to take an honest pride in the results of the subsequent labours of our self-taught engineers. Our roads may be said to date from 1745. The reclamation of our fens, the erection of lighthouses, the formation of docks and harbours, the canal system, the railway system, all date within three generations. Since the days of our great-grandfathers we have not only covered our island and its coasts with these noble and useful works, but, which is more, we have produced the men who have not only carried them out, but have originated them.

It is only a thing of yesterday that engineering should so far take its station among practical sciences as that an expensive and highly-cultured education should be thought requisite for the engineer; and even at the moment it is rather for the military, than for the civil, engineer that such a training is viewed as absolutely essential. But the men to whom we owe the origination of English engineering (since the skill which moved the mighty blocks of Avelry and of Stonehenge has passed away, leaving no record but that of the blocks themselves) were not, for the most part, educated men. Rennie, the architect and builder of London Bridge, of Southwark Bridge, of Waterloo Bridge, was a self-taught millwright. Smeaton, the builder of the Eddystone Lighthouse, commenced life as a maker of mathematical instruments. Telford, author of the Menai Suspension Bridge, and of the Chester and Holyhead road, was a working mason. George Stephenson was a colliery labourer.

One marked distinction has very generally obtained between the works of these self-formed engineers, and those of the more cultured and highly-educated men who have replaced them. The workmen have advanced step by step. They have foreseen practical difficulties, and they have provided for those temporary stages of the work which the theoretic engineer is sometimes too apt to overlook. Thus, in the designs of Rennie for his great bridges, the construction of the centring appears to have occupied as much of the care of the designer as the elevation of the structure itself. The engineer of the London and Birmingham, and of the Great Western Railway, when they issued their drawings and specifications for public tender, left the centres of their bridges entirely undescribed. They were to be at the risk, and after the designs, of the contractors.

This neglect of minute attention to any detail, even to those of temporary and subsidiary work, has been illustrated by not a few great engineering mishaps. It is hardly fair to the memory of Mr. Brunel to class the launch of the

Great Eastern with that of the *Northumberland*. Those who had the advantage of personal intimacy with the engineer of the *Great Eastern* ship are aware of the remarkable and untiring patience with which he was accustomed to ponder over every step of his hold and original projects. This care had not been wanting in planning the launch of the *Great Eastern*. The enormous length of the vessel, as compared with the width of the river, led the great engineer to decide on a sideways launch. The displacement of so great a mass in a lateral direction, is attended by less impetus than the vessel naturally acquires in running headlong down sloping "ways," and, where there is not room for the full swing of the floating body, the motion in the river, in the former case, would be more under the control of the engineer. At the same time there arose danger from the want of experience as to this method of launch. It was this very want of experience with which the profound meditation of Brunel enabled him in so many instances to dispense. Nor is there any reason to doubt that the launch of the *Great Eastern* would have been a perfect success, but for a circumstance almost entirely independent of the mechanical conditions of the problem. It was not the mechanic who was at fault: it was the policeman. The river, at the time fixed for the launch, was covered with boats of every size. All attempts to keep the public at such a distance as regard for their safety demanded were set at naught, and the full surge that would have attended the unchecked launch would have caused the submergence of many of these foolhardy trespassers, and, very possibly, would have involved a great loss of life. It was to prevent this that Mr. Brunel, when the great mass was, in accordance with his provision, fairly under way, gave orders to check its accelerating speed. The check acted as a terrible blow on the whole of the subjacent structure. The inclination of the "ways" was disturbed, for the mass of the vessel was driven upon the piling as if by a gigantic fall. The result was natural and unavoidable, but it is to be attributed to Brunel's care for the careless spectators, and not to any miscalculation as to the mode of launch, or the power requisite to start the enormous fabric over the "ways."

In the *Northumberland* the case was entirely different. A mechanical error of great magnitude was committed, as we pointed out at the time, in the structure of the ways. Two separate inclinations were adopted, the result being the interpolation of an angle, or in fact a hill, in the line of descent of the vessel, the consequence of which it might have been easy to foresee.

In the present case the failure which threatened to be even more complete, is happily overcome. The vessel which did not move at all on the first day has been safely launched on the second. It is always unpleasant to be compelled to add one's voice to the chorus of discontent and of blame which misfortune is certain to raise; and it is a pleasure when the warning voice of the public writer has to dwell on what might have been, rather than on what actually was, a great misfortune. Still the failure to start in the first instance the great weight of the *Bermuda* is in itself highly suggestive.

An inference of especial interest, not to marine but to terrestrial builders, is deducible from former failures, as well as from the recent hitch. The Thames is not the best locality for building enormous iron ships. We say nothing for the moment of the labour question, of the slight which the shortsighted selfishness of the shipwrights has brought upon East London, of the wasteful absurdity of dividing our Government dockyards into so many disjoint and distant fractions. But the point to which we refer is the fact that, in this great haven and highway of commerce there is no room for the requirements of the builder of a leviathan fleet.

There can be no doubt that the launch of an iron vessel of the size of the *Great Eastern* or of the *Bermuda*, even if conducted on the most well-ordered design and with the most uninterrupted success, is an operation of great cost as well as of considerable risk. To some extent, indeed, cost and risk may be considered as counterbalancing one another, and such an arrangement as puts risk out of the question must be attended by an original outlay of a very heavy character. It is true that the steps taken to avoid it; but, leaving this out of the question, the provision of proper "ways" and the whole expense of the launch

form no trifling item in the total cost of the vessels of which we speak.

There is no adequate reason why this cost or this risk should be encountered. In the crowded Thames it is difficult—perhaps it is impossible—to avoid the necessity; but remove the scene of the labours of the ship-builder, and the difficulty entirely vanishes. There is no reason why a large iron vessel should have to be launched at all. The *Great Eastern* or the *Bermuda* might each have been at this moment afloat without undergoing that costly and hazardous process; and if either of them had been designed by a man of the patient forethought of a practical man like Rennie, it is probable that the difficulty would have been eluded.

In the case of the *Great Eastern* it is within our knowledge that a proposition was made to Mr. Brunel which would have entirely avoided the trouble and cost of the launch. It was considered by him for more than a fortnight, and was then declined on the sole ground that he wished to be able to give such constant personal attention to the construction of his favourite vessel as he could do only if she were built within a short distance of London. The proposition made was to build her in Milford Haven, which, at that time, had just been linked to the capital by the South Wales Railway.

In Milford Haven is to be found a vast natural dock, adequate to contain the navies of the world. Sheltered nooks, with deep water close in shore, tempt the builder of a *Leviathan* to establish his forge on the banks. Nothing would be more simple than to construct such a vessel afloat, either by launching the bottom, when the sides had been carried only so high as to secure flotation, or by constructing the entire work on a properly prepared cradle. The bottom once buoyant, the raising of the sides would be a simple and easy task, and the vessel, thus built afloat, would never have to be launched. The money value of the suggestion is not its only merit. Certitude would, by this means, be substituted for enormous hazard, and the influence of high tides would no longer have to be depended on.

The subject is eminently practical; so are our remarks. It is not the education or the ability of any individual engineer or ship-builder with which we have to do; it is the protection of the public against that needless loss of money which has converted so many of our public works into private misfortunes, instead of unmingled benefits. The writer in pages like our own occupies a position entirely different from that of the political journalist. The latter is an essayist, of more or less learning and ability, on the topics of the day, whose task it is to treat of each as it arises from a special point of view. Amongst politicians, men of the tongue or of the pen, he lives and acts as a politician. He engages in the current warfare, as if from a border fortress, or conspicuous watch-tower, but as one taking no interested part in the fray. With the writer on scientific or on practical subjects, the case is different. His aim is truth. He may, as all men are liable to self-deception, be turned from his course by crochets, by imperfect knowledge of his subject, or even, perhaps, by personal dislike of those of whom he criticises, not the character, but the works. But any such aberration must be the exception rather than the rule. The common elements of disturbance, from personal causes, that affect the political writer, are all but unknown to the scientific journalist. He does not take up the pen to comment on Mr. A.'s speech, or Mr. B.'s pamphlet, or fill his columns by endorsement of the arguments of his friends, or demolition of those of his foes. His writings ought to be, and often are, rather the reports of a consulting engineer on some subject of current importance, than the explanation of the lecturer, or the pleading of the advocate.

But the more fully the scientific writer attains to the fulfilment of his self-imposed task, the more disquiet does he feel that his labours too often miss that direct mark of recognition that would await them if they assumed the form of a professional report. They reach, it is true, a far more extended audience than does the former production. Not only a large number of our own readers, but those of the principal daily papers, for example, had under their eyes our former remarks on the misfortune of the *Northumberland*. That which we are anxious to make clear is, the grave responsibility that must attach to all professional men who are deaf both to the teaching of experience and to the voice of educated warning. We hope to see many more iron vessels of great size and weight constructed.

For a time, but we believe for a limited time only, we shall be building heavily-plated ships of war. The epoch of enormous merchant-vessels is only at its dawn. The *Great Eastern* was intended but as a feeler towards the construction of vessels of a thousand feet in length, or even more. Anything like a return of public confidence will be sure to warm into life a project for an enormous Channel ferry-boat, in the first-class carriage run easily on board of which the traveller may pass from England to France in unbroken slumber, contemptuous of seasickness. In all cases where enormous weights are to be set afloat, we call upon the designers to remember the lessons for which England, publicly or privately, has already paid so dear. We hold that the next engineer who shall fail to slide harmlessly and cheaply into the water 3,000 tons of iron which he has had such costly lessons not to pile together on dry land, will be responsible for the damage. What is it to lay down the finest lines, to calculate most exactly the displacement, to proportion the engine power to the intended speed, to carry into iron existence the creations of the drawing-board, if the step between the arsenal and the ocean has to be bridged at a cost of a tenth or of a fifth of the vessel? Why should the certainty of an outlay of thousands of pounds, and the risk of ten times the amount, be blindly and obstinately encountered?

It is possible that the vested interests of the owners of large ship-building yards may appear to be endangered by this view. We do not think this is the case. We have ample experience in similar matters. All such experience tells us that those who shut their eyes to the importance of admitted scientific truth will ultimately come by the worst. In any invention that has diminished human labour, there has been a division of interest between those who expected to be in some way inconvenienced by the change, and those who took the tide at the flow. It was thus on the one hand that the most enterprising coach-owners came to the front in early railway enterprise. It is thus, on the other hand, that the farmer who depends on horse culture, is distanced by his neighbour who uses the steam plough.

Those ship-builders who hold that, in order to avail themselves without further trouble of the costly conveniences of their own yards, they will run the risk of having to push into the water nine or ten thousand tons of iron in the lump, which they might have floated a ton at a time, will find themselves distanced by those who calculate betimes that it will pay them better to erect a temporary, or even a permanent establishment, on the shore of some available creek; and who, after their first proof of success, will find future work accumulate on them unsought. But engineers should not wait for the education of ship-builders; they should insist on the construction of vessels afloat. Considerations of individual convenience should not be allowed to weigh in such matters, against adherence to the laws of mechanics. We are said to have passed the days of miracle, although the wonderful works of contemporary science are such as to dwarf many of those labours which the superstition of the past attributed to a supernatural origin. But our ship-builders have no right to follow, in this respect, the example of the diluvian patriarch. If they persist, after this third warning, in building floating iron castles on dry land, they will deserve the satire of the lookers on. And if this satire be expressed in legal phraseology, and its point be impressed on the subjects of the joke by the officers of the law, the general comment on the judgment will be the memorable verdict, "Served him right."

While the builder of the *Bermuda* is entitled to adduce, in reply to any criticisms on his plans for launching his noble work, the fact that she is actually afloat, he deserves more unqualified praise for the skilful application of the method of weighting by water ballast, the introduction of which by Mr. Brunel into the double shell of the *Great Eastern* provoked the comment that the engineer had emulated an organic structure. The combination of an outer and an inner iron skin, a series of cellular compartments, and an apparatus for introducing or extracting air or water, is one capable of a very high degree of delicacy and efficiency. It may be noted that the plan of pumping water into the upper compartments, and at the same time admitting the access of the external water into the lower ones by gravitation, would give a double efficacy to every stroke of the pistons. The extraction of air, however, coupled with the

admission of water, will probably prove the most available means of dealing with the distribution of water ballast. The idea of building a large ship to serve as a dock for smaller vessels, a dock to be constructed in our own waters, and tugged to her destination in dependencies where labour is costly and scarce, is one of no small merit. We wish God speed to the *Bermuda*, and a safe arrival at her destination.

BRISTOL AND CLIFTON.

THE first of the new roadways to be constructed by the Bristol Board of Health,—namely, one running from Mauldin-street to Park-row,—has been opened by the mayor. It is called Perry-road after the name of the Chairman of the Streets' Improvement Committee, to whom the carrying out of this and other intended improvements in the means of communication has been referred. At an entertainment given afterwards by Mr. Perry to those who were concerned, that gentleman said the new road they had passed over that day, though it would be one of the greatest boons to the city, by reason of the easy access it would give to Clifton, would be done at this cost.—a man rated at 100*l.* would have to pay something like 2*s.* 6*d.*, while the poor man, rated at 10*l.*, would pay about 3*d.* a year, for the next thirty years. He did think that no one, be he poor or rich, would begrudge paying that amount for so great an advantage. The improvement, as they saw, was quite in its infancy; it was but part of a great scheme. Park-row would be widened, to the same width as the new road, from the new thoroughfare to the Drill-hall; and Mauldin-street would be widened to the same extent from the entrance to the new road to the Infirmary; and ultimately the thoroughfare would be carried through, though not at the same width, to Stoke's-croft, so that the inhabitants of the east end of Bristol would be able to ascend to the heights of Clifton by a very easy access. There were many other matters contemplated: the committee had not confined themselves to the improvement of one locality.

Mr. Alderman Proctor, in replying for the Improvement Committee, incidentally contrasted the new road with Steep-street, which was once the main road to the city. The house there which now stood back was cut away to let coaches pass when they were first introduced.

The City Hotel, which is being erected on the site of the old "White Lion" and "White Hart," in Broad-street, is making rapid progress. The builders are to have an extra 500*l.* if the building be ready for the furniture by the 31st of October. The hotel has a frontage of 110 ft., and it runs back a distance of 136 ft. The front entrance steps, in Broad-street, lead to the vestibule or lobby, 28 ft. by 11 ft., and from this an arched hall runs the extent of the building to the billiard-room. To the left of the hall, after entering, is the commercial-room, 50½ ft. by 27 ft. Opposite this, to the right of the hall, are the coffee-room and club-room, 42 ft. by 27 ft., and 36 ft. by 22 ft. respectively. Up-stairs there are upwards of 100 sitting-rooms and bed-rooms. There will be a range of shops, one story high, in front of the building in Broad-street, with kitchen beneath each. The shops will be covered in with iron and glass. Character is given to the upper part of the main building by a held cornice, the soffit of which is slightly relieved with colour, having beneath it a loggia or open gallery, the front of which is formed with freestone pillars and carved capitals.

New buildings are being carried up in Clifton with marvellous rapidity; in some cases indeed with so much rapidity that they do not get strength enough in their progress to remain up, notwithstanding the bracing air of the downs. Walkers in Clyde-road, Woolcut Park, on the 1st of this month saw a pair of what are called semi-detached villas partly roofed in, with low windows and everything pretty, but when they passed next morning they found in their place only a heap of dusty rubbish,—gold pieces today and only dried leaves to-morrow, as in the fairy tale. It seems that the front wall of the left-hand house fell first, then the front of the adjoining house, and then the flank walls of both as far as the partition wall dividing the front rooms from the back. A local paper gives as the most feasible reason for the fall that the stone was dug on the spot in close proximity

to the walls, and that there was a good deal of heavy blasting to get out stone on the previous day. Judging, however, from the walls that can still be seen, we should say that very heavy blasting was not requisite to produce the disaster; the workmanship is very bad. Moreover, the how-window of one house adjoined the how-window of the next, and they ran in so closely to the party-wall that there was probably but little strength at the junction to carry the bressumer which supported the wall above. As to the party-wall itself, it did not run through on the upper floors, but appears to have luted against the half-brick partition wall that goes from side to side through the two houses. When we add that this half-brick wall is made to carry the floor-joists of the back rooms, and is hulged and twisted in all directions, we shall have said enough to show that the parts of the houses which remain should be carefully examined, if not taken down. We know the difficulties that officers find in the discharge of their duties, or we might, in the interest of the public, have something sharp to say to the district surveyor. Had the fall taken place in the daytime, instead of at night, there would probably have been loss of life to deplore.

COMPLETION OF THE INDIAN COURT.

IN the *Builder* of October 26th, 1867, an illustrated description was given of the inner quadrangle at the New India Offices, Westminster. The reader might have noticed incidentally the remarkable variety of materials employed in the building for decorative purposes, a variety unknown in practice comparatively few years ago. The floor of the court is of tiles, laid to a pattern, and has parapets of Portland stone.

The main portion of the walling, plain and decorative, is of Portland stone. The Doric columns which face the piers dividing the bays of the ground story and first story are of Peterhead red granite, with red Mansfield capitals. The dividing columns of the second floor are of dark grey Aberdeen granite (now, we believe, worked out), with dark grey Dean Forest stone capitals. In addition to these materials there are majolica and mosaic friezes and pateras, and tessellated floors and ceilings in the loggias. In our notice we remarked that the Indian Court had served an important use in connexion with the reception of the Sultan. The result suggested the idea that it might be well to roof in the quadrangle, which has now been done with success.

The view given in the number of the *Builder* above referred to showed the finish according to the original design, by a balustrade round the four sides of the quadrangle at the top, leaving the entire area open to the sky. The after-thought to cover the court by a permanent roof presented a somewhat difficult problem. The whole of the daylight to be obtained had to be received from the sky-opening, which is 80 ft. above the floor of the yard; it was therefore essential that the minimum of opaque surface should be presented, and to this end iron as the hearing agent, and glass as the medium for light, were the only materials that commended themselves for use. The covering of an area 115 ft. long, with a span of 60 ft., would have necessitated the use, had the roof been constructed of timber, of a large aggregate of light-obscuring surface, and divers broad stripes of shadow, which the use of iron obviates.

The roof consists of principals springing from above the tops of the columns in the interior, which are carried up from the basement to the crowning balustrade. It is ironed, and has six laps on each side, each about 8 in. open for ventilation, with 18 in. of lap. The space between the principals is filled in with iron astragals placed at 18 in. between centres, and resting on horizontal angle irons at top and bottom. The ends of the roof are finished with pavilions, the eaves of which only descend to about half the depth of the sides. To compensate for the shorter slope of the roof and to complete the finish at the ends of the court, Mr. Digby Wyatt, under whom the work has been done, has designed a pair of truncated screens, in the Renaissance style, in Ranome's patent concrete stone. These screens, which are highly enriched, are probably the best specimens of their productions that the company has as yet turned out, not excepting the great capitals for the University of Calcutta, which were some 4½ ft. in diameter, and as much in height; or the capitals, finials, and

trusses of the Nawab Nizam's palace at Moorshedabad. The screens are each about 67 ft. long, and in the central or highest part about 7 ft. high. Their mean thickness is about 6 in.

Reverting to the roof and the management displayed in its construction, it should be stated that the cope of the balustrade, which was the original finish at the top, was inadequate to bear the weight of the superstructure that had to be erected. Mr. Wyatt served two purposes, to give extra strength and also finish by the expedient he employed of erecting a strong cast-iron framework behind the balustrade, and resting upon the top of the solid wall. This raised iron wall plate, which furnishes a base for the roof, stands 20 in. above the finished stonework. This contrivance enabled the workmen to construct the roof by travelling scaffolding, without the necessity for poles raised from below, excepting at the ends, at which the terraces afforded ready facilities, furnishing as they do a solid floor from the top of the second story to the roof.

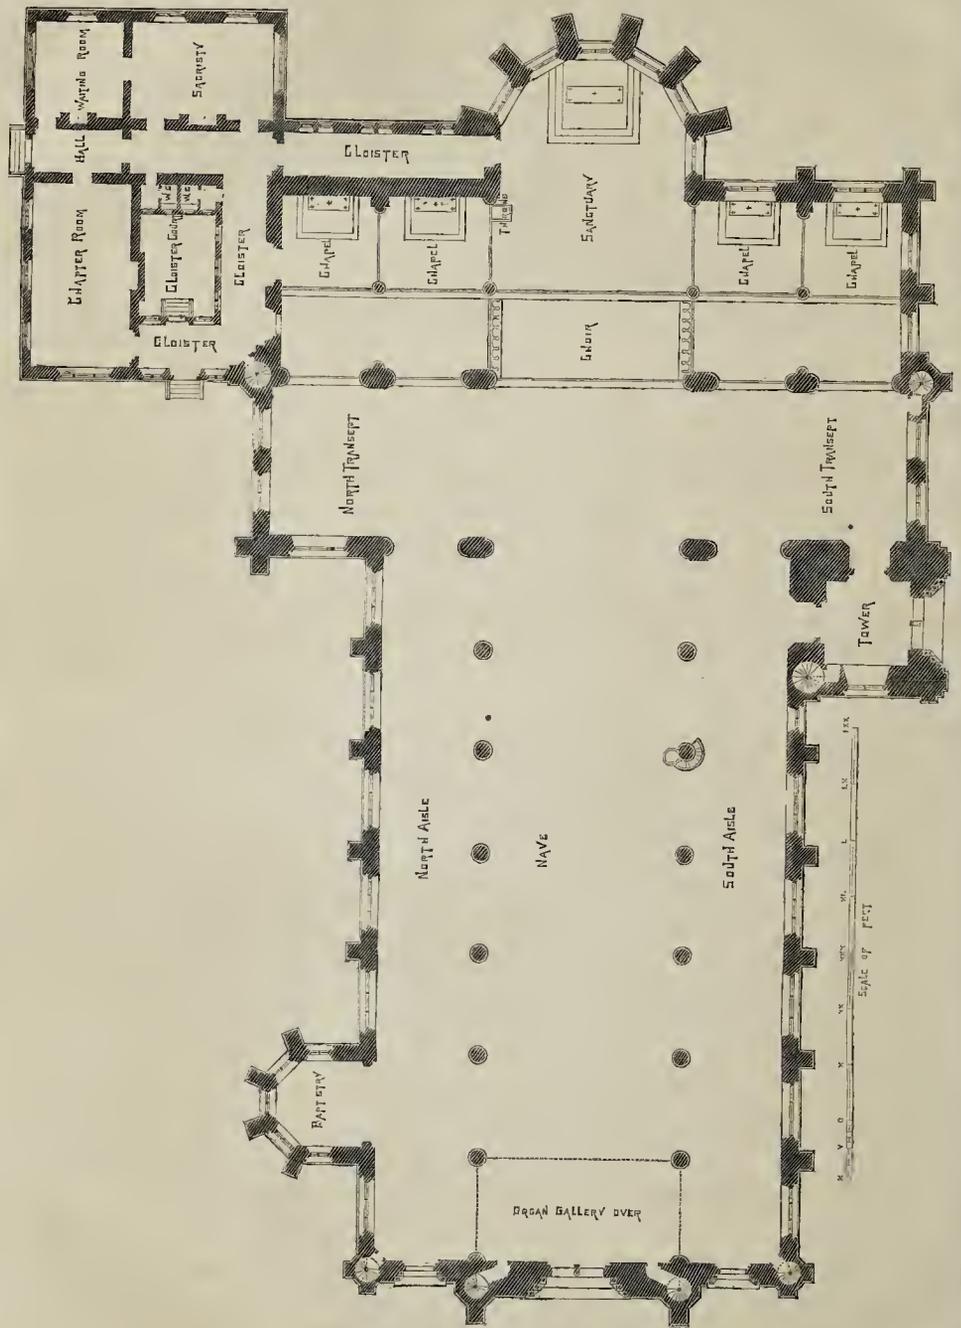

The double ties that connect the feet of the principals of the roof are covered with cast-iron perforated plates of ornamental design, with turned up edges showing about 1½ in. thick. The rolled plates of the principals—the real binders—are 4½ in. deep. The upper plates project over these at each side about 3 in., and the whole produces a good effect in giving the idea of a bound ceiling, the panels being as many skylights, instead of plaster as in an ordinary ceiling.

The colouring of the metal is pale blue, cream colour, dark red, and flat gold, and with the neutral or air tint, in which the metal work above the ceiling is coloured, which does not in any degree attract the eye, produces exactly the result designed. The framing, so to speak, of this great panelled ceiling corresponds, longitudinally and laterally, with the dividing columns and bays in the interior of the court, the decorated girders being carried over from column to column in each direction, single, or coupled as the case may be, in the corresponding girders and columns. Trusses of open iron work, and designed in harmony with the other portions of the ceiling, fill the spaces between the top of the balustrades and the girders above. Large pendants, also of open iron work, are suspended at the intersections of the girders, and the alternate panels have centre ornaments fixed upon rods crossed diagonally in the spaces. The angles at the intersections are enriched throughout with open iron ornaments.

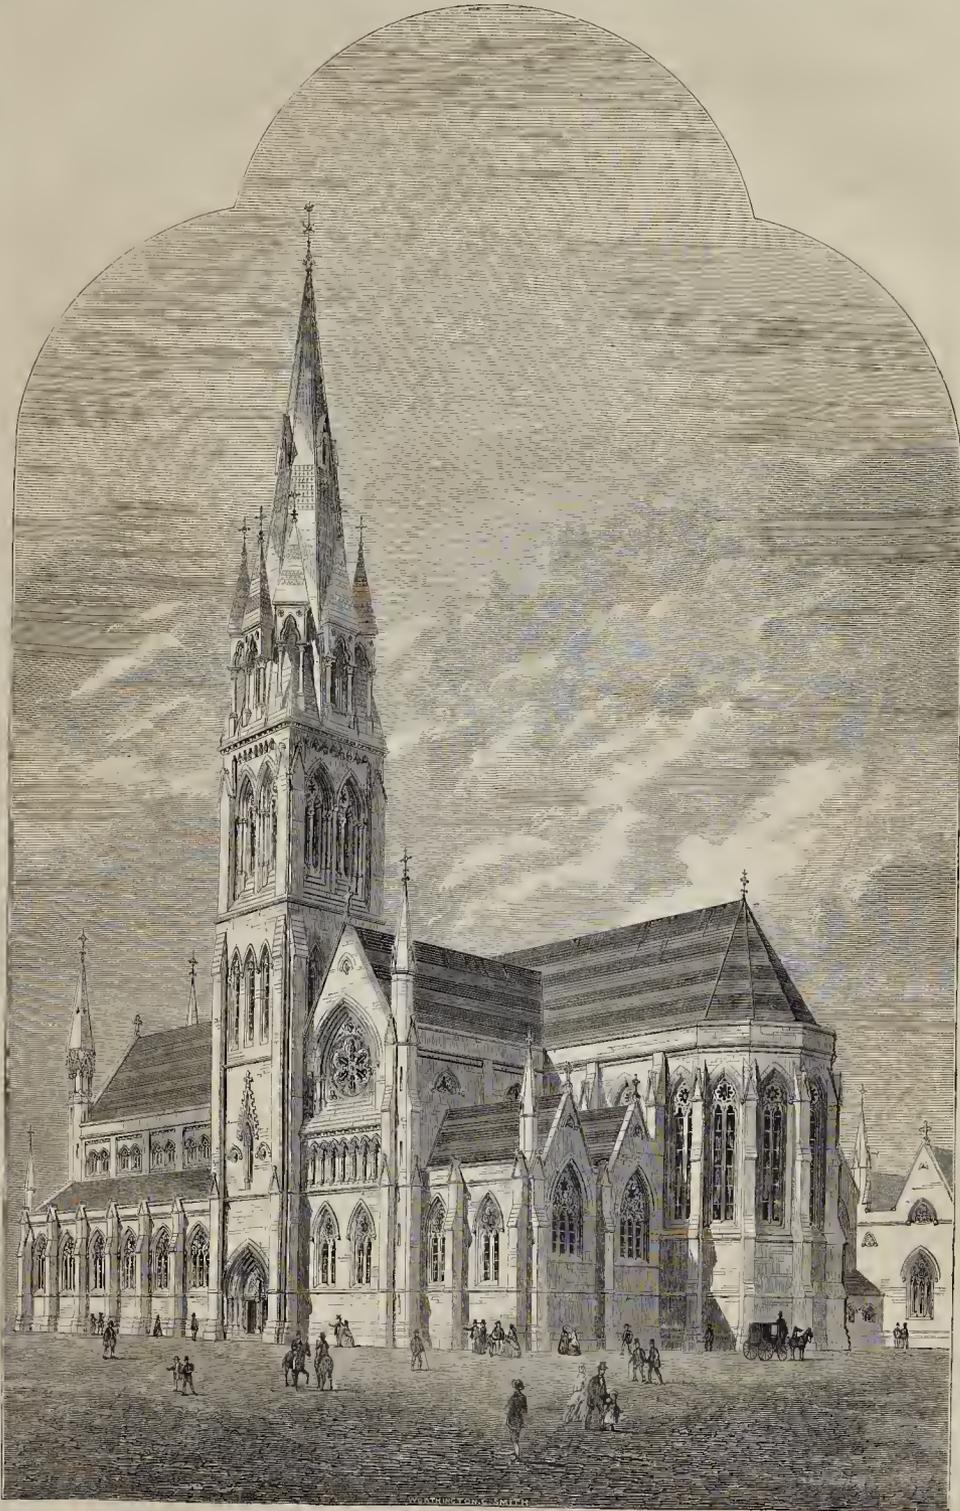

THE (R.C.) CATHEDRAL OF ST. MAC CARTHAIN, MONAGHAN.

THE ancient diocese of Clogher was founded in the fifth century by St. Patrick, who appointed his disciple, St. Mac Carthain, its first bishop. Clogher was chosen, say the antiquaries, by the national apostle, in order that "the disciple might not be too near the metropolitan see of Armagh for familiarity, nor too distant for friendly intercourse." During several centuries the now comparatively obscure town of Clogher, in the county of Tyrone, maintained the dignity of an episcopal city. By the Act of Parliament which suppressed ten bishopricks in 1838, the see of Clogher became united to that of Armagh in the ecclesiastical government of the Established Church. Other circumstances caused the removal of the residence of the Roman Catholic bishop to the more populous town of Monaghan, the capital of the county of the same name. Here the late Bishop Mac Nally commenced, in 1862, the cathedral of which the annexed illustrations show the plan and south-east view. Dr. Mac Nally did little more than lay the foundations. His successor, Bishop Donnelly, has continued the work with unabated zeal. The material of which the cathedral is built is hard grey sandstone from the immediate neighbourhood, relieved by dressings, mullions, and tracery of sandstone of a warmer tone. The building is carried out from the designs and under the superintendence of Mr. J. J. McCarthy, R.H.A., architect, by Mr. John Farrell, clerk of the works.

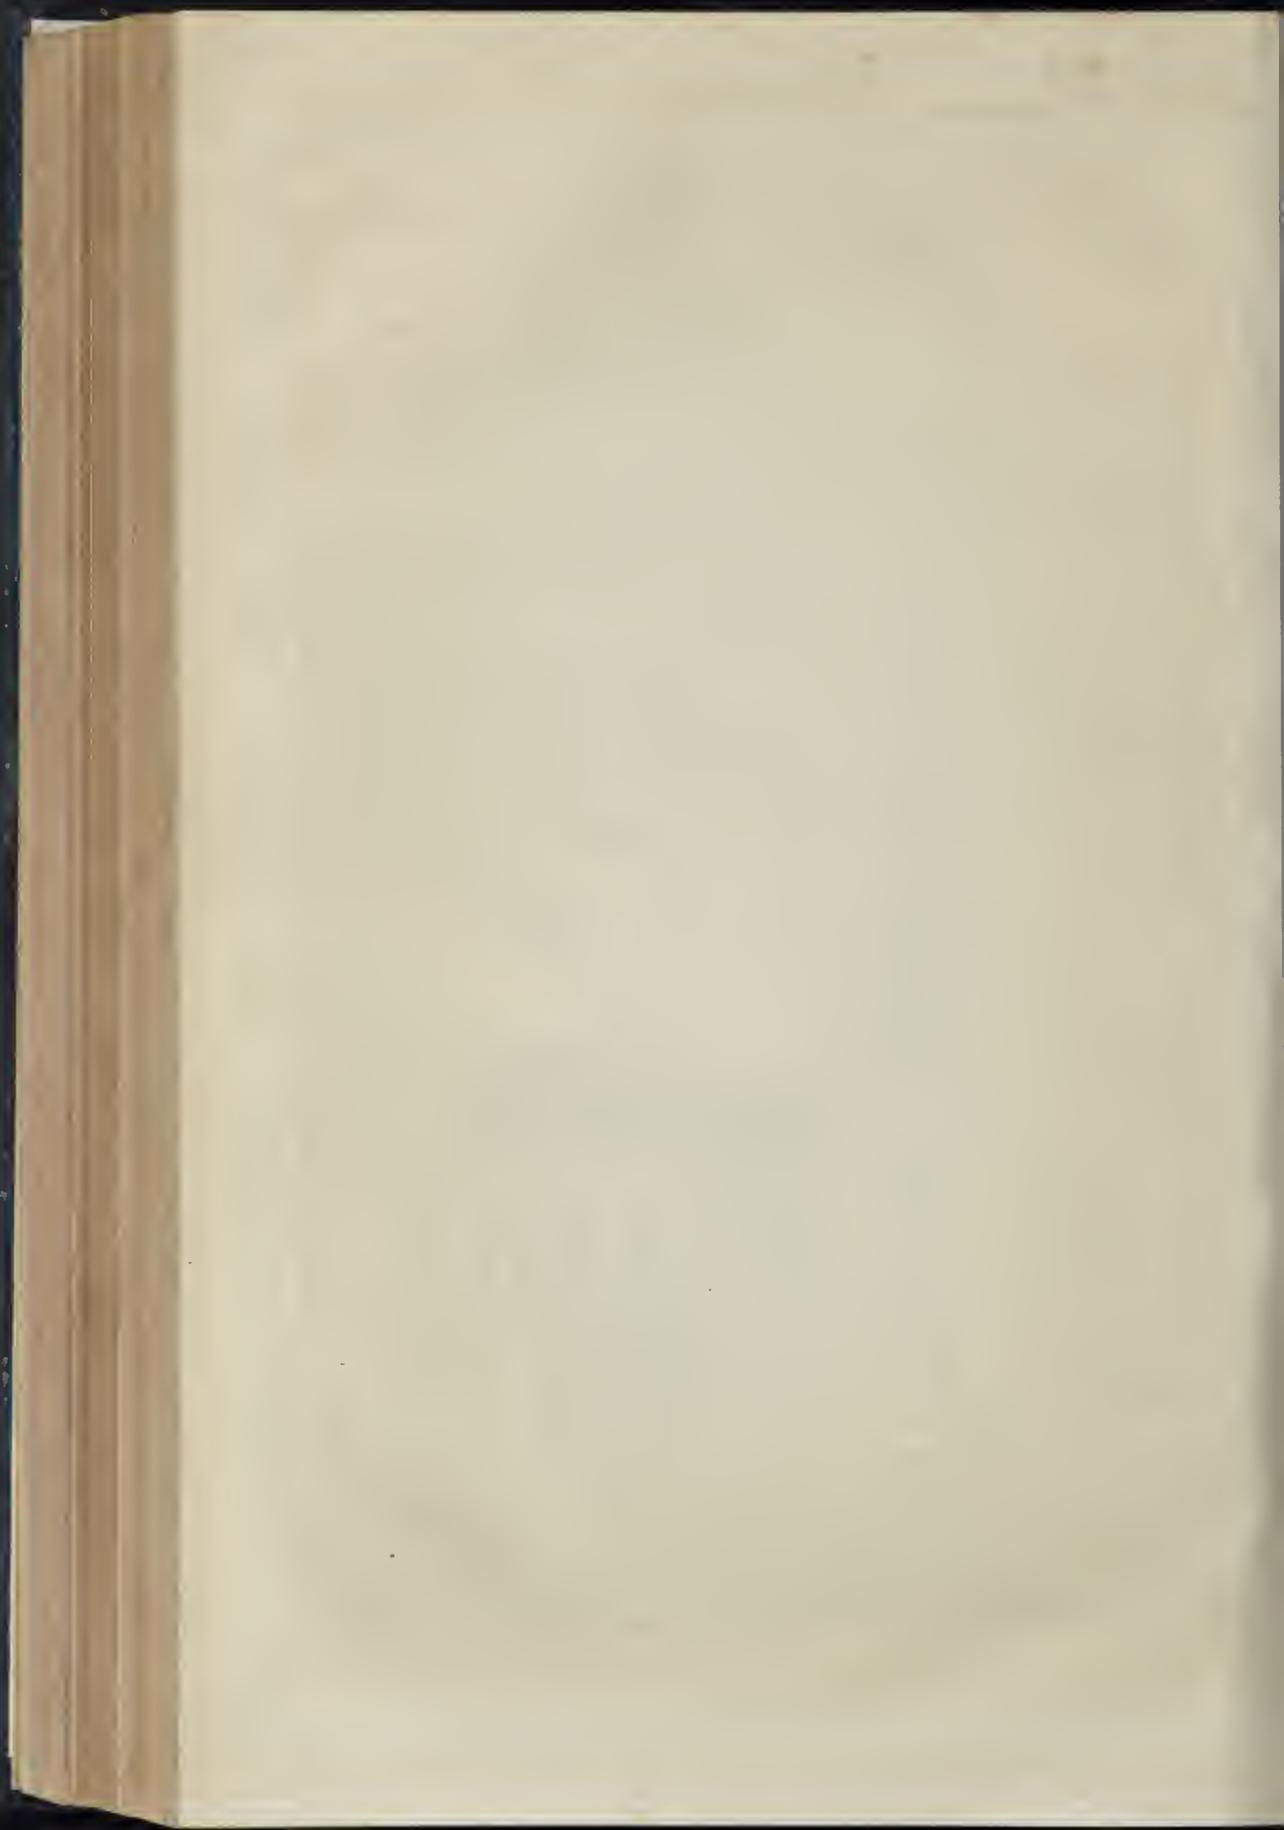

INCREASED PARK EXPENDITURE IN LIVERPOOL. At the last meeting of the Liverpool Town Council, it was resolved that an additional sum of 150,000*l.*, as provided by the Act of 1865, should be borrowed, for the purpose of improving the public parks of Liverpool.

THE CATHEDRAL OF ST. MAC CARTHAIN, MONAGHAN.—Plan.

THE CATHEDRAL OF ST. MAC CARTHAIN, MONAGHAN, IRELAND.—Mr. J. J. MCCARTHY, ARCHITECT.

THE FIFTEENTH CONGRESS OF GERMAN ARCHITECTS AND ENGINEERS.

In our last number we gave the programme of the annual meeting of architects and engineers, which, as we stated, was to take place this year at Hamburg. A temporary tastily-decorated pavilion* had been erected on piles in the centre of the handsome ornamental piece of water, the "Inner Alster," and this was the general rendezvous of about 2,000 architects and engineers on the evening of the 31st of August. Of course much small-beer was consumed on the occasion, but it must have proved an interesting evening to those who had—aa most of these gentlemen have—studied at the Polytechnic schools of Berlin, Hanover, Karlsruhe, Munich, and Stuttgart, to see faces again which they had probably not met since the days when, arrayed in diverse-coloured "coats" caps, they used to hear the same lectures, or went on skeltoning tours under the same professor. The following morning the first general meeting was opened by the president, Mr. F. G. Stammann, architect, of Hamburg. He welcomed the strangers to his ancient Hanse Town, and regretted the unavoidable absence of several leading men of the council, such as Director Karmarsch from Hanover, Mr. Engert, Mr. Theophilus Hansen, and Mr. Fr. Schmidt of Vienna, Mr. G. Semper of Zurich, and Messrs. Wiebe and H. Strack of Berlin. He then read the list of members of the council deceased since their last meeting, all standing up whilst the short list was being read. They were Maack of Hamburg, Siccard von Siccardenburg of Vienna, and Stüler of Berlin. This and other business closed the first general meeting, and the visitors then dispersed in order to visit the various sights of the city. The quays in progress of construction at the harbour and the preliminary works for the new railway bridge across the Elbe attracted considerable attention. The evening again brought all the members together at a special representation at one of the theatres.

The second day, September 2nd, after breakfast at the Zoological Gardens, was chiefly devoted to the reading of papers, followed by discussions, in which many of the leading men of Germany took part. The discussions in the architectural sections included a paper by Dr. Heinzeling, "On Aesthetic Design," and one by Professor von Rügen, "On the Wartburg in the Thuringian Forest," lately restored by him, with discussions on both subjects. Two important subjects were referred to committees to be reported upon, namely, "Professional charges" and "Competitions." To the former of these we propose to return another day; the latter was decided as follows: that the Institute of Architects at Berlin should be requested to publish all *bona-fide* competitions, and that advertisements emanating from other sources should be disregarded. This is a decision which we in England might reflect on with advantage.

The following gentlemen read papers in the sections for civil engineers:—Mr. Hoffmann, C.E., "On Economical Construction of Railway Bridges;" Professor Baumeister, of Karlsruhe, on the History of Bridges and Aqueducts;" Mr. Kúpeke, C.E., also, "On Bridge Construction;" Mr. Haack, C.E., "On the Quays and Works connected with the new Harbour at Hamburg;" Mr. Plath, of Hamburg, on what he calls "The Water Plague," or infusoria clinging to ships.

For the 3rd of September an excursion had been arranged to the interesting old city of Lübeck, which was reached by tea a.m. Tickets of four different colours had been issued to the members, and, on arrival, they mustered under small flags corresponding in colour with their tickets. By this simple contrivance, the otherwise unwieldy number of eight-seers was sub-divided, and visited every point of interest, but in different order, so that they never met, and therefore never obstructed each other. To describe what they saw would be to transcribe from Murray or Bradshaw. Lübeck, as well as Bremen, has its "Bethlehämeller," with the twelve Apostles, or huge variety of Rhenish wine, some so old that both taste and colour have departed long ago; and we are especially told that this, not the least crions of the sights of Lübeck, was by no means forgotten.

* This pavilion was built with consent of the authorities, on condition that it should be removed immediately after the Congress. It is now to remain until after the festivities in honour of the King of Prussia, who is expected to visit Hamburg, on his return from a tour in the Holstein and other new provinces of his extended dominions.

The 4th of September was the last day of the congress, and was chiefly occupied in committee meetings and in the final general meeting, in which Dr. Stammann reviewed the proceedings, of the various sections, and then brought the business part of the congress to a close. In the evening a *conversazione* united all for the last time; and although it was announced that pleasure trips to Heligoland and to Kiel had been arranged for those who could or would remain a few days longer, the great majority left the next day for their various homes.

NOTES FROM SIENA.

It is satisfactory to find that, notwithstanding the present somewhat anti-ecclesiastical tendencies dominant in the political and social temper of Italy, all due care is taken for the dignity, decorum, and restoration of great religious monuments. A sojourn at Siena has afforded the writer the opportunity of inspecting and admiring works now in progress; for the most esteemed local sculptors have been engaged in this fine old city, still so decidedly Medieval. On the façade of the glorious Duomo, the statues of prophets, by Jacopo della Quercia (his first works executed in marble), are now being, or have already been, restored by two native artists—Sarrocci, a pupil of Dupre, and Maccari. Other statues and emblems, by three pupils of Niccolò Pisano, named Goro, Donato, and Lapo, are, so far as restoration is required, to be in the same manner retouched; and a half-length statue of an ancient king is now in the studio of Sarrocci, to be renewed for the same church-front. Two of the emblems of confederate cities are already finished, the one (an ox) completely renewed, the other (a horse) renovated on the antique original. Della Quercia's majestic statues, on the summits of the two pilasters flanking the chief portal, are, we are glad to see, still preserved in their integrity, though somewhat worn and much discoloured. For the upper parts of the façade, around and above the great circular window, have been commissioned to the same Sienese artists, twenty-four statues, in full or half lengths, of the saints and kings of the Old Testament. The celebrated intarsio pavement of the interior is never shown to the public, in those portions the most prized, except on a few high feast days; but private views are obtainable, when, for a cicerone's fee, the boarding that protects those admirable specimens of inlaid marble work will be removed. We had the pleasure of seeing everything, in this way, and have only to regret the much damaged condition of several among these beautiful *intarsi*, especially those on the landing-places of the stairs external to the Duomo and the Baptistery, or *San Giovanni*, and the two that strikingly illustrate, in groups, the parables of "The Blind leading the Blind," and "The Mote and the Beam," both of date about 1433; also the "Seven Ages," small but admirable figures, by Antonio Federighi, 1475; and the "Death of Absalom," by Pietro del Minella, 1447,—all more or less injured. The ten sibyls, in the aisles, a series commenced 1481, each figure by a different artist, three are now being restored, and, so far as we could judge from what is already done, with intelligence. We understand that it is the intention to accomplish much more for the benefit of this noble church, both inside and outside, where repairs may be found requisite and means are not wanting. There is, happily, no occasion for any modern touches to the sculptures of the famous pulpit, by Niccolò Pisano (1266), which stands in its rich originality and exquisite elaboration intact, revered by time, as by man, to this day.

The total renovation of the *Fonte Gaia*, on the principal piazza of Siena, has been going on for several years, and is now so near to completion that nothing but the figures of the emblematic wife (representing this city) to be placed on different pedestals, advancing into the water, are still wanting. It is well known that the sculptures on this fountain, commenced in 1419, gave a new name to the successful artist, so that thenceforth Jacopo della Quercia became locally celebrated as "Jacopo della Fontana." But time and rigours of climate have dealt hardly with his admirable *chef d'œuvre*. It has been necessary to remove all the marble panels on which his reliefs are executed; and the above-named artist, Sarrocci, has had the commission for copying the entire series,—the Virgin and Child, enthroned

in the central compartment, eight personified Virtues, all being female figures seated, under arched niches, and on the wings that project laterally, the Creation of Adam and the Expulsion from Paradise. In careful execution the copies seem to us praiseworthy; the *ornate* details or pilasters between the niches, graceful; but, in the state in which we have seen the originals, we find it scarcely possible, without opportunity of immediately confronting them with Sarrocci's works, to decide as to the modern artist's fidelity to the spirit or style of the great master, Siena's pride in the fifteenth century. It is consolatory to know that, in their sadly-mutilated condition, his reliefs for the fountain will be, at all events, preserved for posterity, being now deposited in the Communal Palace, there, we understand, to remain. Judging from what we have seen on the piazza, we might observe the inequality of merit in these sculptures, the somewhat heavy, though dignified character of the Madonna's form, and the comparative coarseness of the Adam and Eve, both too fleshy for grace, in the group of the Expulsion. Other things noticeable in the achievements of modern art, within or near to this city, might well repay the visitor for stopping to inspect them.

PAY IN THE PUBLIC WORKS DEPARTMENT, INDIA.

The civil engineers in the employ of the Government of India have just now, we believe, for the second time, tendered a memorial to the Governor-General regarding the smaller rates of pay they receive when holding places of exactly the same responsibility as military officers. To understand the question, it is necessary to go back awhile, and look into the history of the Indian Public Works Department. In the early days of the East-India Company frequent wars left little funds for the improvement of the country. Roads were made to facilitate the movements of troops; barracks were the chief public buildings; all such works were under the Military Board, as it was termed,—a body of four members, consisting of the chief engineer, the commandant of artillery, the commissary-general of the army, a stipendiary member with a secretary. These, besides attending to the public works, had to control the commissariat stud and other departments of the army; and this continued till the business to be done became so extensive that the arrears broke down the system. Thus up to about 1853 the public works were a purely military department, about half the officers composing it being trained military engineers, and the other half officers taken from the cavalry or the line regiments with or without an examination in surveying and the native languages. The departmental rules they followed were those of a compilation entitled the "Barrack Master's Assistant." When Lord Dalhousie commenced civil works on a large scale it was clearly seen that the Military Board was an ineffective means of direction, and its powers were transferred to the Secretariat, whilst the entire organization of the Public Works Department was remodelled. But it still continued to be supplied exclusively from military sources with engineers. India has all along had a civil service, and the civilians, as they are termed, have filled almost every description of office,—judge, magistrate, opium agent, collector of the revenue,—but none of the scientific ones. The reason is obvious enough. The latter have always had small salaries attached to them, and therefore offered no very attractive career as far as emoluments were concerned. Why science should of necessity be rated so low is a matter not easily justified. The effect was to throw them into the hands of the army. The company used to maintain for each native regiment an establishment of some twenty-three officers, whilst the duties of the service in time of peace could in reality be carried on by half that number. The remainder were encouraged to acquire Hindustani or some other of the vernacular languages, and leave their regiments for civil employment; in fact, it was the prospect of obtaining this transfer that led young men of any ability into the Native Military Service at all. For in itself the purely regimental life in time of peace was monotonous, and to an active mind disgusting to the last degree. Everything was settled by regulation, and if not fond of sport or of idleness, there was nothing to be done but drag out existence, creeping out of doors late in

the evening, and indoors early in the forenoon, keeping well out of the way of the sun, and longing for the coming round of leave time or retirement. Promotion was by seniority and excessively slow. A captaincy had often to be awaited fifteen years, and meantime the lieutenant was drawing what his brother civilian, now a collector or nearly 3,000 rupees a year, got when studying the languages upon first coming out to this country, or something like 300*l.* a year. It was, in consequence, a great matter to escape from the insipid and unprofitable life of a native garrison to situations of responsibility and independence. No one could quit his regiment without passing an examination in languages; but once through this, it was seldom any further qualification was exacted. But to secure the most eligible and best-paid appointments it was necessary to have what was called "interest;" that is, to be related or known to men in power. Officers who had interest would never go into such a department as the public works, so the selection was thus far narrowed; and as it was in no way better paid than departments in which the work was lighter, it is unlikely to have had the pick. The corps of engineers having no option, were employed as a matter of course, and seldom or never allowed to select another line. The rest of the department was filled, it may be presumed, chiefly from the cavalry and infantry officers, who could not get in elsewhere. There was one great principle adhered to in remunerating officers withdrawn from regiments for civil duty. They received a civil salary in addition to the pay of their rank. When military promotion was very slow, this enabled the company to secure the services of good men at a most moderate figure. A consolidated salary of the same amount would never have had the appearance of a staff salary, these terms being respectively used in India to denote whether a salary takes regard or not of military rank and pay. But a staff salary was readily sought. That mode of payment, however, was hard on rising merit. A young officer of ability, had he been in the civil service, might mount the ladder very quickly, and be as well off as men of twice his standing in seniority; but it could not be so with the recipient of a staff salary, for his deserts could not accelerate his military advancement, and what he could add to his salary by them was trifling. In 1861 the whole scheme of military promotion in the company's army was altered. Instead of attaining higher military rank by seniority, it was reached by length of service. A lieutenant of twelve years' service became captain, and a captain twenty years in the army became major. The alteration vastly increased the number of officers of field rank, and many who would have been captains for years found themselves majors and colonels. The change told seriously on the Public Works Department. Qualifications are by necessity more attended to than seniority in posting to the different grades, and a captain who is a talented and experienced engineer may be chief engineer while an infantry colonel may be in the lowest grade of executive engineer. Yet the subordinate would receive the most pay of the two under the regulations formerly in force. This was an inequality too glaring to be passed over, and in 1865 a maximum scale was fixed, and above this no military officer, whatever his rank, could draw.

The staff salary principle was, as far as possible, retained, and officers of no particular army standing might draw less than the maximum. The subject of complaint by the civil engineers may now be easily comprehended, if we give the maximum salaries fixed for military officers side by side with the maximum salaries given to civil engineers holding exactly the same appointments and performing precisely the same duties:—

Engineer.	Military.	Civil.
Chief, 1st class	Rs. 2,500	Rs. 2,500
" 2nd	2,000	2,000
" 3rd	1,850	1,750
Superintending, 1st class 1st grade	1,800	1,800
" 2nd	1,650	1,400
" 2nd	1,550	1,200
" 2nd	1,350	1,000
Executive, 1st grade	1,250	900
" 2nd	900	750
" 3rd	750	600
4th	600	500
Assistant, 1st	500	400
" 2nd	450	300
" 3rd	450	200

The memorial does not confine itself to this disparity, but enters into questions of military rank, still further influencing the maximum scale, which would be too much complicating

the matter to consider at present. In a general way there seems no reason for the two classes of chief engineer to receive the same, and the civil executive engineer to receive 25 per cent. less than the military executive engineer. The higher, or military scale, does not appear an excessively liberal one. If 2,500 rupees a month be divided by two, since a rupee and a shilling are in their respective countries practically synonymous—they change rupees for shillings in the shops in the presidency towns of India—1,500*l.* a year is not a great deal for the few at the very head of their profession. Nor is a salary of 1,250 rupees in the same way to be taken as representing an income of 750*l.* a year more than enough for an executive engineer who has been long enough in the service to rise to the first grade of executive engineer, and so on down the list. The Government of India could end the whole business by merely declaring the maximum for military officers to be that for civil engineers. To do so would only be to adequately remunerate a body equally meritorious with the civil service. But the Indian Government is still ruled by prejudices of long standing, and, on grounds it does not relish very much making public, will probably do its utmost to maintain the difference. That the way officials in India are classed and paid is arbitrary in the extreme is sufficiently well known to those connected with the East. The civil service proper, styled the Covenanted Service, has all its leave and pension rules on the most liberal possible footing. The Uncovenanted Service, comprising judges of the High Courts of Justice, educational inspectors, engineers, legal functionaries, surveyors, and others, are mostly under rules framed to suit the native Indians, working in their own country and a congenial climate, which read as harsh to a European as those of the Covenanted Service read generous. Of civil engineers there are two divisions also—the never-ending covenanted and uncovenanted—and the covenanted are not allowed the benefit of covenanted, but are related to the harshness of the uncovenanted rules in all points not provided for in their covenants. If the Government of India will not do away with such anomalous distinctions, it should explain to the public satisfaction why it is they are expedient.

THE SCIENCE OF COLOUR.

I AM sorry that my attempts to define and defend what I believe to be the true theory of colour have been unsuccessful with Mr. Colling. Part of the mystification he complains of seems to arise from his not distinguishing three things that are different,—namely (1), the colour which is the sum of two given colours; (2) the colour which is the mean of two given colours; (3) the colour which is common to both of two given colours.

The sum of two colours is obtained when we add together the whole of the two coloured lights; as, for instance, when we collect all the rays of the red and green portions of the spectrum, without any of the blue rays, and obtain thereby the brightest yellow which it is possible to obtain. This may be done by throwing together the red and green portions of a sunbeam which has passed through a prism upon a white screen, which will reflect them together to the eye; but the experiment requires the aid of some optical appliances, and is not easy for an unskilled observer to perform. The same thing is much more easily done in the method pointed out in my last letter, the rationale of which I there fully explained, as it is not apparent at first sight. If Mr. Colling will give himself the trouble of a little more study he cannot fail to see that the modification of the experiment which he suggests gives no other result than what I stated. It is not correct to say that the green is formed by allowing the yellow to approach the blue ray; the truth is that the yellow disappears where the red rays are not added to the green. He must remember that the purer the spectrum (the narrower the line of white from which it is made) the deeper is the green, and the less conspicuous the yellow; while the bright yellow only appears where the white space is so wide that its red spectrum overlaps its green; and that if it is made still wider, or, which is the same thing, brought nearer to the prism, white appears where the same overlaps the blue spectrum also. When these things are seen it will not be thought ridiculous to say that green added to red makes

yellow, and that by adding blue yellow is converted to white. It is the simple truth of nature, and so clear that if after this Mr. Colling writes any more to the contrary, I shall be tempted to think, in return, that if he is an earnest student in the science of colour, he must be but a dull one.

The mean of two given colours, or that proper to the sum of half the two coloured lights, we may correctly obtain by the method of rotation, or by using a piece of glass as recommended in my treatise and former letters. Let the colours be those of the best pigments, and I do not think better can be found than scarlet vermilion, emerald green, king's yellow, and the powder of cobalt blue, laid on with the least quantity of gum in the water, that will make it adhere to the paper. The results perfectly agree with those obtained by adding the prismatic rays; that is, the vermilion and emerald green give a shade of yellow, of the mean brightness of those pigments, and the king's yellow and cobalt blue give a shade of white of their mean brightness, or a neutral grey, about half way between black and white. If Mr. Colling has a piece of Iceland spar, which gives two images of an object each half its proper brightness, and will lay small round spots of the colours to be mixed side by side on a neutral ground, and view them through the spar in such a position that one image of each shall overlap and be seen together, he will see the same result.

The third point, the colour common to two given colours, is found by the mixture of two transparent pigments; or the superposition of coloured glasses or solutions, against white; and this, in the usual erroneous theory of colours, seems to be regarded in general as the sum, or at least as the mean, of the two colours. I had thought this mistake too well known, and too generally admitted, to need explanation even in a popular treatise; but Mr. Colling's endeavour to explain the production of sky-green by the blue sky being seen through a yellow medium, and of the green of leaves by the mixture of blue and yellow colouring matters, and then to defend the usual theory by such illustrations, proves that he is not aware of the fallacy involved, or quite overlooks the fact that his illustrations (even if the enposed cases are admitted), are but other instances of what is better seen when washes of gamboge and Prussian blue are laid on white paper. The yellow pigment most powerfully absorbs or extinguishes the blue rays, and very freely admits the passage of the red and of the green, as may be seen by analysing its colour by the prism: the blue, especially if it be of a sea-greenish hue, like a moderately thick indigo or Prussian blue, most powerfully extinguishes the red, and admits a considerable quantity of the green rays. Thus the green rays penetrate both pigments together, down to the reflecting surface below and back again, more freely than the rest, and reaching the eye, excite their proper sensation without complication with the red and blue rays which overpowered them in the separate pigments. Thus the green, supposed to be created by the mixture of blue and yellow, is in reality merely filtered out; and the purer the colour of the blue pigment is, the less is the residuum, and the darker the resulting green. When a surface, blue by daylight, is viewed by candle-light, which is deficient in blue rays, its colour is of course modified in like manner on the same principles.

I hope I have made my meaning sufficiently clear; but unless Mr. Colling patiently experiment for himself, and study the subject till he clearly understands the results of the experiments, I have no hope of convincing him. He has wrapped the veil of a false theory about his eyes, and holds it fast at present; and this makes him suppose that a fallacy, obvious to an unprejudiced mind, is a self-evident truth which it is as absurd to deny as "that two and two make one."

One remark I would make on the last sentence of Mr. Colling's letter.—"It is a question whether what we call white light exists at all; probably the term is only comparative, and that we view everything more or less through a coloured medium, according to circumstances." Assuredly no simple or homogeneous light exists which produces the sensation of white; but when we look at a piece of chalk illuminated by the common light of day, and in the normal state of the eye, we can hardly question that the sensation of white we receive is excited by a certain mixture of rays which may therefore be correctly called white light, even though the same

object illuminated by the yellow light of a candle, or seen by an eye which is affected by a predominance of some non-white combination of luminous rays, may not then appear white. In truth, white in all its shades is more easily and correctly determined by the eye than any other colour, probably because, all the three simple sensations being equally excited in it, the eye is not distracted in viewing a white surface by a greater sensibility for one of those sensations than for another.

W. BENSON.

Few of your readers can have failed to see with interest your notice of Mr. Benson's investigations on this subject, the animated controversy of which it has been the occasion, and the author's calm and logical defence of views that seem to some too heretical to deserve patient and candid examination.

I have little desire to enter into the contest, and shall, therefore, not trouble you with any expression of my own opinion on a matter which is purely one of experiment and induction; but I think such of your readers as may be disposed to look at a new theory in your own impartial spirit, may like to see the enclosed extract from Sir John Herschell's "Familiar Lectures on Scientific Subjects," as showing the conclusions of that eminent observer.

CHAS. E. CONDER.

"The consideration of these facts has given rise to a speculation which, if not demonstrable, has at least a high degree of plausibility, and which, at all events, has never yet been disproved,—viz., that there is no real connection between colour and refrangibility, but that there exist three inherently distinct species of light, each competent *per se* to excite the sensation of one of three primary colours, by whose mixture all compound tints are produced, white consisting of their totality, and black being the exponent of their entire absence; that, moreover, each of them has a spectrum of its own, over the whole length of which it is distributed according to its own peculiar law of intensity, and from whose superposition on the same ground results the prismatic spectrum, coloured as we see it."

"In this view of the subject, the prismatic colours, with the exception of the extreme red, are all more or less mixed tints; and this agrees well with its general aspect, in which the red and indigo-blue are the only full and pure tints, the green being by no means a saturated or full green, and the violet having a strong dash of purplish red in it."

The three primary colours assumed in the above figure are red, green, and blue, each in its highest degree of purity and saturation; for it will be readily apprehended that while the admixture of any one, in however small a proportion, will produce a rich though a mixed tint, that of both the others tends to dilution. The only three colours which answer all the experimental conditions, are these three. This may seem contrary to the experience of the artist, who, from his habitual practice in mixing the colours he uses (all of them without exception compound tints) would name yellow, in place of green, as the intermediate primary. The reason is obvious. In all the yellows which he sees there is a large admixture of red with green, and in all his blues more or less green. When mixed, then, there is sure to be a preponderance of green, while the red goes to neutralize a portion of the other two, and so to dilute the outstanding green. On the other hand, the direct mixture of the prismatic yellow and blue, in water proportions, can never be made to produce green, as Professor Maxwell's, M. Helmholtz's, and my own experiments have distinctly proved; while that of the prismatic green and red does produce yellow."

LOCKING RAILWAY CARRIAGE DOORS.

This practice generally conduces to the safety of passengers, that is, if one door only of each compartment is locked, the door on the "six foot" (or middle of the line) side. But of course there are occasions, and the Abergele catastrophe was one of them, when the power immediately to open the locked door is all-important. Allow me to suggest that in each compartment of all passenger carriages, a door-key should be hung up in a glass locked case. On an extreme emergency the glass could be broken, and the key taken out and used. But it should be a criminal offence to break this glass without sufficient excuse.

PASSENGER.

MARGATE AND RAMSGATE.

PERMIT me to inquire again through your columns whether the town councils of these places have had a return of the number of houses in which cesspools, or fever-pits, exist; and the number to which there are proper drains and water-supply. It is my belief that a much more intimate connexion exists between the one of them, when the other is absent, than that is at all desirable. Until the whole system of drainage and water supply has been completely remodelled, neither place can be deemed to fulfil sanitary conditions.

A SURVEYOR,

Holding a Public Appointment.

"JOSEPH NOT A CARPENTER."

SIR,—In your paper of 29th ult. it is stated in a paragraph under the above heading that "when the British Archaeological Association were inspecting the gallery of paintings at Charlton House, attention being called to the picture of Joseph working as a carpenter, assisted by the child Jesus, Mr. Black said he wished that Joseph had been represented in his proper business as a mason, the original term used signifying architect, builder, or mason, and not carpenter. The term carpenter, he argued, was undoubtedly an error, as in the climes where Joseph dwelt no wood was used in the erection of the structures of their houses, but stone only."

Now, without in any way calling in question the merits of Mr. Black as a Greek scholar, I am inclined to believe that in the present instance the authorised version of the New Testament gives the proper translation of the word in question, it being a fact, as well authenticated as any fact connected with the history of Jesus and His relatives can really be held to be, that Joseph was not a mason, but a worker in wood, and that he had nothing to do with building operations.

Justin Martyr says that Joseph was a carpenter, and that Jesus assisted him in his business, which consisted in "making ploughs and yokes for oxen" while the "Gospel of the Infancy of our Saviour" says that "Joseph took Him [Jesus] along with him to all the places where he was sent for to do business, to make gates, and milk-pails, and sieves, and trunks."

W. M.

LIGHT WANTED!

SIR,—Why did not the authorities place the new lamp in Holborn, 3 ft. to the eastward of its present situation, to throw the light up Gray's-inn-road? Why do guardians of the poor, after erecting schools for the children, employ pauper attendants, for the sake of a miserable and short-sighted economy? B.

DAMP DRIVING THROUGH BRICK WALLS IN EXPOSED SITUATIONS.

SIR,—I have found two coats of raw linseed oil a perfect remedy against the above. See that the pointing is good. Apply the oil when the walls are dry. A little Venetian red, in dry powder, added to the oil, improves the colour of the bricks. Cost, about 3d. per yard.

T. R. Y.

WHITEWASH ON STONE.

SIR,—Will any of your readers kindly inform me of a method of freeing a rubble stone wall from many coatings of whitewash otherwise than by the tedious and very inefficient process of scraping? I. H. S.

HERNE BAY.

PERHAPS it would be difficult to name a place where by judicious expenditure of capital so much could be accomplished. The town is half a ruin; houses incompletely—never finished; skeleton frames of houses,—in fact, some are dangerous from the timber supports having perished, and this is a matter requiring the attention of the local board. A number of sheltered retreats want constructing towards the railway; a bend-house, similar to that in Regent's Park; a reading-room; and, above all, a market-place. Everything is very dear; fish supply nil; and Whitstable and Faversham are the depots from which supplies are drawn. The water supply is very defective and scanty.

Surely the *on dit* is not true that the ruinous pier is to be allowed to remain for two years as at present, and that then the London, Chatham, and Dover Railway Company either pull down or rebuild? NEMO.

CHURCH POLYCHROMY.

CONSTRVING a letter in your columns signed "R. C. H.," and asking for information on polychromy, as an effective and cheap way of imparting a warm and cheerful tone to church-walls, I beg to say that I have just had some work of that kind executed in my church, at a very moderate cost, and with extremely satisfactory results. I have had a reredos painted in distemper, with an effect very similar to that of Minton's richest encaustic tiles, and my walls decorated with a dozen boldly-written texts, the whole for the cost of 15*l.* My texts are written in very legible characters, 6 in. in height; and, with the addition of a tall border of a simple pattern, they constitute an ornamental, as well as an edifying, addition to the fabric. JAMES FRASER, *Upton Rectory, Reading.*

ELECTRICAL PIANO.

M. SPEISS, electrical instrument maker at Sumiswald, Switzerland, has invented an excellent combined electric piano, which can be set in movement either in the ordinary way or by means of a battery, giving a current of electricity which acts upon a most ingenious mechanical arrangement. Thus any airs can be played automatically. They are written by means of a contrivance on a hand of paper similar to those on a Jacquart loom.

The apparatus as it stands consists of two different sections, which can be separated from each other at a considerable distance. The first portion or controlling agent is a mechanism of clock-work, the uniform motion of which can be modified at will, which passes a roll of strong paper from one cylinder to another. Between these two the paper is stretched against a brass roller put in contact with one of the wires of an electric battery. Above these three rollers there is a small key-board, the hammers of which, of very thin brass, are in communication with the other pole of the electric battery. The hand of paper prevents the passage of the electricity except where it is pierced with holes of different lengths corresponding to the notes of the air to be played on the piano; the neatness of execution, and the rapid "fingering," are most astonishing; although the battery which performed before our eyes and ears was only composed of thirty-six elements of Daniell's, the force of the piano was fully equal to that exerted by a good player.

Each of the hammers of the piano can be set in movement in two different ways; one, by means of the ordinary touch of the pianist; another, by a small vertical rod of wood, which can lift the lever and strike the note when it is lifted upwards. In the execution of the music this traction is effected by electro-magnets, equal in number to the notes, which are set in motion as soon as the small copper or brass hammers connected with them come opposite to the holes in the governing paper-roll, and establish a current. Thus, every note marked by a hole in the paper-roll sets to work and animates an electro-magnetic coil, which raises the wooden lever and makes the note speak. Other details of contrivance work the pedals; and implies so as to give the necessary intonation to the instrument have been adapted.

THE NORTH OXFORDSHIRE ARCHÆOLOGICAL SOCIETY.

THIS Society had, on the 24th ult., another of their pleasant gatherings. The churches visited were St. Leonard's, Ensham; St. Michael's, Stanton Harcourt; St. Mary's, Cogges; St. Mary's, Witney; and St. Kenelm's, Minster Lovell; three of these cruciform, with a tower in the centre; the other two without transepts, but not without aisles, and with a tower at the east end of north aisle. The party were met at Ensham by the vicar, the Rev. W. G. Bricknell, and at once led to the church, and thence to the old abbey, the vicar being the leader of the party. Stanton Harcourt was next visited, and the incumbent was the guide through the church and the old manor-house. Thence the party went to Witney and afterwards to Cogges, through the fields, receiving attention from the incumbent and his family. Returning to Witney, and having lunched, the party visited the church, after which they proceeded to Minster Lovell Church and the priory ruins. Returning to Witney, a visit was paid to the Museum, under the guidance of Mr. Perdue and a clergyman.

THE FAIRFORD WINDOWS COMMITTEE.

At a special council of the British Archaeological Association on Thursday, the 3rd, Mr. Godwin, V.P., presiding, the following were appointed a committee for ensuring the illustration and preservation of these windows:—Earl Bathurst, president of the association; the vice-presidents, officers, and council of the association; the Rev. D. T. Rice, M.A., vicar of Fairford; the Ven. T. Thorpe, archdeacon of Bristol; the Rev. Canon Powell, vicar of Cirencester; the Rev. Canon Howman; Mr. Tom Taylor; Mr. B. B. Woodward, F.S.A., librarian to the Queen at Windsor; Mr. G. W. Reid, print department British Museum; and Mr. J. D. T.

Niblett, M.A., F.S.A.,—all of whom have consented to act. It was resolved to invite other persons distinguished in art to join the committee, including the presidents of the Royal Academy, Society of Antiquaries, Institute of Architects, and the Archaeological Institute. A "Fairford window account" has been opened at the National Bank, Charing-cross, and some subscriptions are already paid. The honorary secretaries of the association—Mr. F. Leven, M.A., F.S.A., and Mr. E. Roberts, F.S.A.—act as honorary secretaries to the committee. The first work of the committee will be to obtain careful tracings of the whole of the windows with a view to the exchange of portions wrongly placed.

FROM SCOTLAND.

Crief.—The new bridge across the Earn at Crief has now been finished at a cost of several thousand pounds. The building, which was erected under the superintendence of Mr. Alexander Haig, of Edinburgh, will afford accommodation for all descriptions of vehicles, besides a broad footway on the east side for pedestrians. It contains four arches extending to a span of 42 ft. each, and the parapets are fully 100 yards in length.—It appears that efforts are being made for the erection of a new hospital in Crief for the benefit of the poorer classes.

CHURCH-BUILDING NEWS.

Brompton.—The old church, Brompton, has been restored and re-opened. The roofs of the nave and south aisles were unsafe from decay, as well as the walls of the clearstories, owing to the original stone pillars and arches on each side of the nave having been taken out and substituted by elliptical arches of wide span and inferior material. The whole of these and the chancel arch have been restored, together with the clearstory and south aisle windows, which were divested of their mullions and tracery heads, and converted into square elongated openings to afford light to the galleries, of which needless encumbrances the church contained four. The whole of the windows have been glazed with cathedral tinted glass, the floor of the church lowered to its original level, and fitted with benches instead of the wooden box pews. The tower has been thrown open to the church, and is now provided with seats for children; the belfry staircase has been built outside as originally, and all the masonry inside the church has been repaired and cleaned. The outside walls of the church and tower have been pointed, and a new vestry built; and the church has been warmed by hot water by Messrs. Oliver & Co., Chesterfield. It is the intention of the Duke of Devonshire to restore the chancel. The cost of the restorations is about 1,600*l.* The works have been executed by Mr. Marriott, of Staveley, builder. Mr. S. Rollinson, of Chesterfield, was the architect employed.

Llanfair Caerlwinion, Welshpool.—The new church here, which has been rebuilt as far as possible upon the old foundations, consists of nave and chancel, north aisle, vestry, and south porch; and, when the tower (the base of which alone remains) is carried up and thrown open to the church, will provide accommodation in open seats for 427 persons, including children. Every interesting feature from the old church has been carefully preserved. The Transitional south doorway has been restored and re-set; the font repaired and provided with a cover; and the recumbent figure of Einion replaced in the chancel. The old oak roof, having been repaired, is now refixed over the nave and chancel. The north aisle and vestry roofs are new. The chancel is marked internally by a low stone screen, and provided with prayer desk and stalls. The pulpit of stone, with marble panels, &c., stands on the south side. The floor within the altar rails is laid with encaustic tiles from Maw & Co.; the slab at the back of the altar table is also inlaid with majolica and other tiles. The windows, with the exception of that next the pulpit, which is filled with Messrs. Heston & Co.'s glass, are glazed with thick green cathedral glass (the east window being arranged in geometrical patterns, &c.) by Messrs. Dove & Davies, of Shrewsbury. Local blue stone is used for the walling, and red Shelooke for dressings to windows, &c. The work has been carried out at the cost of about 1,900*l.*, by Mr. B. Lloyd, builder, Welshpool,

under the direction of the architect, Mr. E. Haycock, junior, of Shrewsbury.

Llandysilio.—The new church at Llandysilio has been consecrated. By the time the edifice is quite completed it will have cost 2,220*l.*, the contract for the building itself being 1,775*l.*, the residue being required for extras, and nearly the whole amount has been subscribed. The church, which is a Gothic structure, built of Welshpool stone, with Cefn stones for dressings, is erected on the site of the old church, the area being extended. The bell-tower and steeple are at the west end; the steeple rises on a number of Gothic arches from the tower itself. The church is lighted by fifteen windows, full of tracery, the glass being of cathedral tint. On the south side there is an oak Gothic porch-entrance, supported on stone pillars, and seats. The buttresses around have Cefn stone dressings. The interior consists of a principal nave, 20 ft. wide by 80 ft. long, and a north aisle, 16 ft. wide by 80 ft. long. The chancel is approached by five steps, with an additional one to the altar. The reredos is of Caen stone, by Mr. Earp, of London. The choir is divided from the chancel by a stone screen. The seats are open. They are made of Baltic timber, varnished, and are capable of accommodating 300 persons, partly free. The roof is open, and is composed of Baltic timber, but not varnished. In the east end is a painted glass memorial window, by Messrs. Clayton & Bell, of London, the gift of Mr. J. J. Turner, and representing "The Resurrection and the Life." In the centre is "Our Lord and the Clergy," and the other portion "The Perpetual Intercession of our Lord." The arcade is composed of four stone pillars and arches of Cefn stone. The church has taken about eighteen months in the erection, and was built by Mr. J. Potter, of Welshpool, from plans of Mr. J. E. Street; and Mr. W. James, of London, was the clerk of the works.

St. Anthony's (Diocese of Durham).—The church recently erected at St. Anthony's, has been consecrated. The edifice, as at present built, consists of a chancel, 30 ft. by 22 ft.; a nave, 63 ft. by 24 ft. 6 in.; with a south aisle, 10 ft. wide; and an organ chamber and vestry. The arches for a north aisle, to be hereafter erected, are built complete, and a temporary wall encloses them within the church. The accommodation at present provided is for 360 persons. It is intended to build a steeple above the organ chamber as soon as the funds will permit; the foundations having been specially prepared to support this additional weight. The architects, Messrs. Anstn & Johnson, of Newcastle, have designed the building in the Early Pointed style of architecture, and it is constructed, both outside and inside, of red bricks, with some bands of darker bricks internally, with some bands covered with sea-green Westmoreland slates. The choice of the materials was influenced a good deal by the locality, as it was felt that the ordinary local stone so soon becomes black and unpleasing in appearance, and that the common Welsh slates are open to the same objection. The east window of three lights is placed very high in the wall, and below it there is a reredos of Caen stone and tiles. The chancel has a pavement of encaustic tiles, by Maw & Co. The chancel arch, and the arches separating the nave from the aisles, are acutely pointed, and spring from the pillars without any capitals—a local peculiarity observable in St. Nicholas and other of the Newcastle churches. In the west end of the church there are two two-light windows, with a rose window in the gable above them. The seats throughout are low and open, and of Vancouver's Island deal. The church is heated by hot water, and lighted by gas standards and a corona in the chancel. These fittings are the work of Mr. John Davy, of Manchester. The other contractors are Messrs. Potts & Moat, masons; John Irving, joiner; E. Beck, slater; H. Watson, plumber; and Wilson & Romants, painters. All these tradesmen are Newcastle men.

Hastings and St. Leonard's.—St. Paul's Church, for the north-eastern part of St. Mary Magdalen, has been opened for divine service. The contract price for walls and roof exceeds 12,000*l.* The character of the interior fittings is said to warrant the assertion that the expenditure cannot be less than 20,000*l.*; and there is yet a lofty spire to be added to the tower of 82 ft. The style adopted is fourteenth-century Gothic. There are a nave, north and south aisles, chancel, chancel aisle, and chancel apse; also north and south porches,—the former being the principal entrance. Arcades of four arches divide the

nave from the aisle. The columns are of Tinos and Devonshire marble, alternately arranged. Above are clearstories, with quadrupled windows, divided by columns. The chancel is a mass of ornamentation,—floor, walls, and roof each being highly decorated. The chancel floor, which rises considerably above the ground-level of the nave, is laid in encaustic tiles. In the centre is a line of medallions, representing the Slaying of the Innocents; the Stoning of Stephen; the Beheading of St. Paul and St. James; and the Crucifixion of St. Peter. Within the communion are five other designs, of an allegorical character, connected with the Crucifixion, representing the lash, the ladder and rope, the lantern, nails, and hammer; the spear; and the heart, hands, and feet. The floor is entirely covered with coloured encaustic tiles, in various designs. The sedilia, in the southern wall, is in carved Caen stone, with shafts of Derby fossil. The different columns throughout the apse and chancel are of marble, either from the Isle of Tinos (Crece) or from Devonshire. The reredos is also of marble; and the side panels are inlaid with alabaster marble, in patterns. The apse windows are filled in with stained glass, by Messrs. Clayton & Bell, the central subject being the Crucifixion. The other compartments represent the Last Supper and other incidents in the life of the Saviour. The roof is groined, in brick and stone bands. The arches of the transept, sacarium, &c., are moulded, and exhibit some carved angels' heads. The pulpit is constructed in alabaster, with green marble panels, divided by columns and capitals. Some inlaid work and carving are also shown. The organ is one by Mr. C. M. Haldich, of London. It is placed in the north chancel aisle. The walls internally are of dark red brick, with bands of tile work at intervals. The aisles, as high as the dado, to a level with the top of the seats, are lined with encaustic and plain tiles, in various patterns. The stalls for the choir (carved), and the sittings throughout, are of wainscot oak. The roof of the nave is of open timber work, stained. Under the western window is a tablet to the memory of the late Mr. William Gilliat, of East Hoathly, through whom the new church was principally erected. Sittings are provided for about 700 persons. Externally the walls are built of local blue-stone, with Bath stone dressings. The tower will form a prominent landmark. The architect of the new church is Mr. John Newton, of London. He has been represented by Mr. Geo. Walters, clerk of the works. The builders are Messrs. Jackson & Shaw, of London.

Blakenham.—The church of Little Blakenham has been restored. Both roof and walls were in a dilapidated condition. The edifice was filled with square pews, and the pulpit and reading-desk were both badly placed against the north wall. These defects have now been remedied, the pews replaced by benches. The south porch has been renewed, and a new oak door provided. In place of the old ceiling roof is a stained wooden roof. The east window, like the rest of the church, is very simple; it consists of three lights, and is wholly without ornamental tracery; on either side, however, of the window, is a recess, and on these more decoration has been laid than on any other part of the church. In each is a fresco, that in the southern recess being a *fac simile* of the painting, evidently hundreds of years of age, which occupied it previously to the restoration, but which it was necessary to obliterate in order to carry out the repairs. This represents St. John the Baptist holding in his left hand a book, with the lamb, &c., in his right, and on the scroll is written *Eccc Agnus Dei*. The style is quaint, and the old painting is reproduced. In the northern recess it was considered desirable to substitute a new subject for that which existed before the restoration, and the altar-piece of Magdalen College, Cambridge, has been copied, in style resembling the companion fresco on the opposite side, the subject being our Saviour bearing the cross, and on the scroll is inscribed *Eccc homo*. There is a similar picture on the sides of the easternmost window in the north chancel wall, and here the subject is supposed to be St. John receiving the bride. The alterations were carried out from plans prepared by Mr. F. Josselyn by Mr. Hewitt, of Ipswich.

Stoke.—Christ Church, Stoke, has been consecrated. The building was commenced in July, 1867, from a design by Mr. E. Christian, of London, the builders being Messrs. Swayne & Sons, Cuildford. The total cost of the structure when

completes will be about 2,300. The side walls are temporary, it being intended, when sufficient funds are raised, to have additional aisles at each side, with steeple, chancel, &c. The design is in the Pointed style. The church at present consists only of nave. The columns which carry the side arches are of polished Devonshire marble from Torquay. The caps are in Bath stone, carved. The arches consist of alternate layers of brick and Bath stone. The church is paved with 6 in. Staffordshire tiles, red and black. The sittings are open, of Oregon pine, varnished. The roof is of Memel fir, with tie-beams and king-posts. The ceiling is wagon-headed, in panels. The doors are of English oak, with scroll hinges. The western end of the building is finished with Bargate and Bath stone. The west-end gable is surmounted by a cross. The tiling of the roof alternates six courses of new and two of old plain tiles, with a crested ridge. The building is fitted with gas, with corona lights, the fittings being attached to the pillars.

Raglan.—Raglan Church, Monmouthshire, has been re-opened after restoration. The Duke of Beaufort gave a donation of 600l., and also a piece of land for enlarging the churchyard; and the Duchess gave the pulpit, of carved oak. The chapel has been restored as nearly as possible to its former character. The cost of the whole restoration was 2,600l.

South Petherton.—The new cemetery belonging to this parish has been consecrated. The site was known as the Chapel Field, adjoining the road leading from Ilminster to Yeovil. Mr. J. M. Allen, architect, of Crewkerne, prepared the plans. The cost of the two chapels and a lodge, together with the laying-out of the grounds, was estimated at 1,500l. The land cost 200l. per acre—400l.; and the inhabitants voted the required sum, 1,900l., to be raised by rate. Mr. Bartlett undertook the carpentering, and Messrs. Gould & Hallett the masonry. The chapels are not exactly alike. That belonging to the church has a bell-turret and an octagon vestry. The windows are also somewhat different. Both chapels are built of local stone, with Ham stone facings, and have open roofs of stained deal. The floorings are tiled, and the fittings are of stained deal. The windows are filled with stained glass. The cemetery is enclosed by a wall of local stone, the pillars supporting the entrance-gates being of Ham-hill stone. A path of 4 ft. divides the consecrated from the unconsecrated portion. The ground has been levelled and trenched, and several fir trees have been planted. The banks close to the walls are stocked with lambs.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Staines.—The first stone of the proposed Church of St. Ignatius, at Sunbury, has been laid by the Roman Catholic Archbishop of Westminster, in the presence of a numerous assemblage of the laity, including many from London. A site of half an acre of freehold land has been given for the new church. Mr. Charles Buckler is the architect, and the builders are Messrs. Castle, of Sunbury, and Whitte, of Twickenham. The entire length, including the chancel, is 84 ft., and the width 24 ft. The style is Gothic.

STAINED GLASS.

Defthick Church.—The east window of the parish church of Defthick, co. Derby, has been filled with painted glass. The style of the church is Early English, and the window is composed of three lancet lights and tracery openings. The central light is occupied by the Crucifixion enclosed within a canopy, above which is seated our Lord in sovereignty surrounded by cherubim, and enclosed by conventional foliage and canopies. The side openings are filled respectively with Abraham's sacrifice and Moses lifting up the brazen serpent; these are enclosed within canopies, over which are angels holding scrolls with texts. A base of mosaic work, with inscription, forms the base of the general design. The window is from the works of R. B. Edmundson & Son, Manchester.

Whitchurch Church (Shropshire).—Messrs. Ward & Hughes, of London, have recently completed a stained glass window in this church. The architecture of the old fabric is of the Roman

type; and it is a semi-circular-headed window measuring 22 ft. 6 in. by 8 ft., on the south side that has been filled with painted glass of the sixteenth century character, treated with large sized figures, the costumes of which are executed with a view of representing the Biblical period. There are two subjects—that above the gallery is the meeting of Jacob and Joseph in Egypt. The subject below is the death-bed of Jacob. The ornamental portion is characteristic, and a jewelled border surrounds the whole.

The Brunel Window in Westminster Abbey.—One of the windows in the north aisle of Westminster Abbey has just been filled with stained glass, manufactured by Messrs. Heaton, Bayne & Butler, from the designs of Mr. Henry Holiday. It is placed there as a memorial of the late Sir Isambard Brunel, who died in 1859. The architectural framework consists of two tall lancet arches, surmounted by a quatrefoil opening in the head of the principal arch. The artist has filled the quatrefoil head with a Christ in glory, surrounded with hovering angels with censers. Each of the lower lights contains three subjects from the history of the Jewish Temple, and the lowest portion of each is occupied by two allegorical figures, those on the western side representing Fortitude and Justice, those towards the east Faith and Charity.

St. Saviour's, Eastbourne.—A stained glass window has just been erected in the chancel of St. Saviour's Church, to the memory of Benjamin and Mary Backhouse. It has been erected at a cost of about 200l. The subjects represented are from the closing scenes in our Saviour's life. The work has been executed by Messrs. Clayton & Bell, of London.

Books Received.

Sussex Archaeological Collections relating to the History and Antiquities of the County, published by the Sussex Archaeological Society. Vol. xx. (Vol. viii. of Second Series). George P. Bacon, Lewes. 1868.

The active and prosperous Sussex Archaeological Society have issued another of their interesting and well-edited volumes. It contains papers on Midhurst, Glynde, Cowden, and East Grinstead; on the Buckhall at Cowdray; on Mural Paintings in Pimpton Church; Memorials of the "Lady Percy" of Shakespeare, and her husbands, Hotspur and Camoys; and a variety of others.

VARIORUM.

"The History of the Borough, Castle, and Barony of Alnwick," with numerous illustrations. By George Tait, F.G.S., &c. Alnwick: Blair. 1868. Vol. II. Part I. We have already favorably noticed the issue of this History of Alnwick. The author is a distinguished local antiquary and archaeologist, and the chief discoverer of those curious rock sculptures of Northumberland of which the readers of the *Builder* have before heard. The present part of Mr. Tait's history contains full historical accounts of Alnwick Abbey, Holn Priory, St. Michael's Church, and various other Alnwick edifices; the Chantry of St. Mary and Grammar School, the Scientific and Mechanical Institution, &c., besides a portion of the appendix to the work, and a variety of illustrations of local edifices and antiquities.—"A Guide to the Geology of the Yorkshire Coast." By Martin Simpson, Lecturer and Curator. London: Whittaker & Co. 1868. The Yorkshire coast is a capital field for young geologists as regards the secondary strata, and the overlying drift which has so much increased in interest of late years. The Scarborough and Whitby museums are good schools of illustration also to the geological student of the Yorkshire coast. The Guide under notice is illustrated by sections of the strata, and seems to be a useful little book for local visitors with a turn for geology.

Miscellaneous.

THE PRESIDENT OF THE INSTITUTE OF ARCHITECTS.—The proposed portrait for the Institute of Mr. Tito, M.P., is to be painted by Mr. J. P. Knight, R.A. It will be uniform in size with that of the late Professor Cockerell now in their rooms.

ENGLISH CHURCH AT HOMBURG.—The Bishop of London has consecrated the new church erected for the English at Homburg. The church holds fully 600 persons.

MEMORIAL OF LEIGH HUNT.—The suggestion of Mr. S. C. Hall that a memorial of Leigh Hunt should be set up in Kensall-green Cemetery, where he is buried, is about to be carried out. A number of well-known men have agreed to act as a committee. Mr. Durham, A.R.A., has made progress with a bust of the writer which, with a fitting pedestal, will form the memorial, and a certain amount of money has been subscribed. About 70l. more are required, and some of our readers will probably be glad to assist in raising this.

THE LONDON LABOURERS' DWELLINGS SOCIETY (LIMITED).—The fourteenth half-yearly meeting of the members of this society has been held, Mr. Richard Foster in the chair. The directors presented their report for the six months ending June 30th, which was adopted, and the usual dividend, at the rate of 5 per cent. per annum, free of income-tax, was declared. The capital of the society now amounts to 33,400l. They have purchased twenty-eight small houses in Prospect-place, Rotherhithe, and commenced a block of buildings at Vauxhall.

PALACE OF FINE ARTS FOR VIENNA.—A Vienna letter gives an account of a ceremony which has just occurred in that city on laying the first stone of a Palace of the Fine Arts. The Emperor, after signing the foundation Act, fixed the first block in its place, while the Society of Orpheonists sang a chorus of Mendelssohn. His Majesty before leaving visited the Exhibition of German Art, and spent some time examining the paintings. The city of Vienna also organised a banquet in honour of the German artists, who were holding their tenth meeting.

FIRES.—In Southampton Docks the most valuable part of the Royal Mail Company's factory, and part of an adjoining sugar-house, have been destroyed by fire, originating in a carpenter's shop belonging to the factory.—An extensive cooperage in Vaudries-street, Liverpool, has been destroyed by fire.—A large farmyard at Bulley, in Gloucestershire, filled with wheat ricks, vatches, &c., a barn filled with wheat, a second filled with vatches, and outbuildings with agricultural implements and machinery, have all been destroyed by fire, originating, it is believed, in the accidental fall of the ashes of a cigar on short straw covering the dung in the yard.

PROPOSED TRADE SCHOOL FOR BIRMINGHAM.—At the request of the committee of the Birmingham Midland Institute, a conference of the principal manufacturers in the town has taken place, to consider the propriety of establishing a trade-school similar to that in Bristol. The proposal was warmly received, and on the motion of the mayor it was resolved that such a school be established in connexion with the Midland Institute. Half a dozen of the largest manufacturers have entered their names as subscribers, and their efforts are supplemented by donations from other gentlemen who always forward movements of this kind. About 250l. is the sum wanted to fit up the rooms now lying idle at the Institute, and 300l. or 400l. a year will defray the current expenses. Once established, the school may be expected to prove self-supporting.

THE NEW THEATRE ROYAL, CROYDON.—This new theatre has been opened with an equestrian entertainment. The exterior of the theatre has no pretensions to architectural beauty, the frontage being of plain red brick with stone copings. Part of the outward walls incloses a public market. The theatre proper is about 54 ft. wide by about 100 ft. deep, the proscenium being nearly midway between the walls. The stage is so constructed that it may be entirely removed when the space occupied thereby is required to be used for horsemanship or other purposes. The auditorium consists of fifteen private boxes, similarly placed to those behind the balcony stalls at the New Adelphi; 100 box seats, and 50 balcony or dress-circle seats; and a spacious pit and gallery. The decorations partake of the characteristics of the Greek order, but quite simple. In consequence of the peculiar shape of the ground, the architect (Mr. T. T. Smith) had some difficulty to contend with in the appropriation of space. The architect has been assisted in the work of decoration by Mr. Dillon; and the construction of the building has been carried out by Mr. Hutchinson.

THE INTERNATIONAL CONGRESS OF WORKMEN.—The third congress of the International Association of Workmen opened on Sunday at Brussels. The subjects of discussion were eight. Strikes and councils of arbitration being among them. The English and American workmen introduced the subject of shortening the hours of labour; the Germans asked what ought to be the attitude of workmen in case of a conflict between the great European Powers; the Belgians offered "a résumé of the special grievances of the workmen of each profession."

THE ADELPHI SCHOOLS IN SHOREDITCH.—An effort is being made to raise a fund to defray the expenses of enlarging the Adelphi Chapel Schools, in Gloucester-street, Hackney-road. The Council of Education gave notice to the managers that they should either dismiss one-third of the children or provide a more commodious building. Having sought in vain for a suitable site at a reasonable price, the managers decided on the addition of another story to the existing premises, merely providing an increased school accommodation of 50 per cent. The cost of this addition, with other necessary improvements, has been estimated at about 500*l.*, and the committee solicit the practical sympathy of friends of education and Christianity throughout the metropolis to aid them in their efforts. In the daily schools there are at present over 400 children; and in the Sunday schools the rears over 500 on the books.

SOCIAL SCIENCE CONGRESS.—The arrangements for the meeting in Birmingham, under the presidency of the Earl of Carnarvon, are proceeding satisfactorily. A guarantee fund has been subscribed, and much good spirit shown in the town. The Mayor has announced his intention of inviting the members of the Association to a *soirée* in the Town Hall, which will take place on Thursday, October 1st; and a second *soirée* will be given on Monday following, the expenses of which will be borne by the local fund. The Earl of Dudley has offered the members of the Association an opportunity of seeing the Dudley caverns, and proposes to illuminate them for that purpose. The Congress commences at Birmingham on Wednesday, the 30th inst., when the opening sermon will be preached in St. Philip's Church by the Bishop of Worcester, and the inaugural address will be delivered in the Town Hall in the evening by the Earl of Carnarvon.

THE MEMORIAL TO LORD HERBERT.—The memorial committee to whom the superintendence of the Herbert Sea-side Convalescent Home erected at Bonremont by the liberality of friends and admirers of the late Lord Herbert was entrusted, have issued their first annual report. The home has been handed over, free of debt, to the governors of the Salisbury Infirmary, the chairman of the committee, the Right Hon. T. Sotheron Estcourt having generously paid the sum of 2,000*l.*, the balance against the committee; and the expense of furnishing the home has been met by the receipt from Lady Herbert of nearly 400*l.*, the balance in hand after closing the establishment at Charnmouth. The home, which was opened for the reception of patients on the 1st of October last, has already been attended with great success, 128 patients having been admitted in ten months, and disposed of as follows:—Sent home recovered, 71; much improved, 20; too ill to be benefited, 4; transferred to hospitals, 3; died, 1; remaining in the house, 29; total, 128.

SMOKE FROM RAILWAY LOCOMOTIVES.—At Tadcaster, on Tuesday, the 1st instant, before the West Riding magistrates, a case of some public interest was mentioned. Birkbeck Forrest, a police constable, had laid an information under the 5th & 9th Vic. cap. 20, sec. 114, against the North Eastern Railway Company, for having, contrary to the section, emitted smoke from one of their locomotives on the 12th ult. The section referred to enacts that "every locomotive steam-engine to be used on the railway shall, if it use coal or similar fuel emitting smoke, be constructed on the principle of consuming, and so as to consume, its own smoke; and if any engine be not so constructed, the company or party using such engine, shall forfeit 5*l.* for every day during which such engine shall be used on the railway." Mr. Dale, of York, represented the company, but the charge was not pressed, on their undertaking that the offence should not be repeated, and agreeing to pay costs. There was a new Act passed last year with reference to this clause, which makes the act of the servant the act of the company.

MANCHESTER EXHIBITION OF WORKS OF ART.—The Exhibition of Modern Paintings and Works of Art at the Royal Manchester Institution was opened to the public on Thursday, the 10th instant.

OPENING OF THE NEW THOROUGHFARE FROM LONG-LANE TO FARRINGTON-ROAD.—On Thursday in last week the new roadway which passes in front of the new meat and poultry market was opened for traffic. The street has been lowered to suit the market level, so that in front of some four houses in Long-lane they will have to go up some two or three steps to get into their shops.

DEMOLITION OF CLEMENT'S INN.—The demolition of Clement's-inn, at one time an inn of court, but now a place of little mark, has commenced, to give room for the New Law Courts. Mr. Glasier, instructed by her Majesty's Commissioners of Works, sold by public auction all that portion of the inn which extends from the porter's lodge, just inside the gate, at the south end near the Strand, to the wall at the north end, and as soon as it was disposed of the process of demolition and removal commenced.

EXHIBITION OF HISTORIC PORTRAITS IN PARIS. A society of literary men, who hold conferences on the Boulevard des Capucines, have conceived their rooms during the off-season with a collection of portraits of notable persons of the time of the Revolution and of the Empire. The collection is not large, including only seventy-two works, and many of these of little artistic merit; but it is interesting, and the managers have set a good example. The admission is one franc, but each visitor receives a catalogue with annotations by two known writers.

THE DRINKING FOUNTAIN MOVEMENT.—A memorial drinking fountain is to be presented to Wighton by Mr. George Moore, of Whitehall. The memorial is intended to be in memory of the late Mrs. George Moore, of Whitehall. The site selected is the centre of the market-place, where three streets meet in the centre of the town. Mr. J. T. Knowles, of London, architect, attended a town meeting on the subject, and produced a plan of the proposed monument. It is square, 30 ft. in height, standing on a base of about 14½ ft. square, and will be built of various coloured granites, with sculptures in white marble on the four sides, and surmounted by a massive cross in bronze and gold. On each side are to be drinking fountains, with receptacles of water for dogs, horses, &c.

ENLARGEMENT OF THE POST-OFFICE.—The greater portion of the property required for the enlargement of the Post-office in St. Martin's-le-Grand, Bath-street, Newgate-street, and Angel-street, has now come into possession of the Postmaster General, under the provisions of the "General Post-office (Additional Site) Act, 1865," and the work of demolition has commenced. Workmen are busily engaged pulling down the houses numbered 74 and 75, Newgate-street. The Act gives power to the Postmaster-General to take properties and lands situated respectively in the parishes of Christ Church, Newgate-street; St. Anne and St. Agnes; St. Leonard, Foster-lane, Bath-street, and the intervening courts lying within the area of the block behind St. Martin's-le-Grand and Bath-street on the west.

TENDERS.

For rebuilding 5, Fashion-street, Spitafields. Mr. H. H. Collins, architect: £330 0 0

For the erection of dwarf boundary walls and entrance gate piers, Twickenham Park, for Mr. William Budd. Mr. F. Warburton Stent, surveyor to the estate:—
Gascrope £210 0 0
Hill, Keddell, & Waldram 730 0 0
Nicholson 710 0 0

For extension of County Lunatic Asylum at Brentwood, Essex. Henry Stock (county surveyor), architect. Quantities by Mr. James Marsland and Mr. F. G. Widdows:—
Brown £29,470 0 0
Hammond 29,215 0 0
Hart 19,985 0 0
Adamson 19,847 0 0
Perry & Co. 19,505 0 0
J. & F. Coleman 19,355 0 0
Ashby & Son 19,224 0 0
Wells 19,254 0 0
Brown & Robinson 19,130 0 0
Knox 19,030 0 0
Webb 18,965 0 0
Hill, Keddell, & Waldram 18,590 0 0
Rider 18,560 0 0

For main drainage for the borough of Southampton, contract No. 3, for penstocks, &c., including fixing. Mr. James Lemon, engineer:—
Barton, Sons, & Waller £392 0 0
The North Staffordshire Engine-
ing Company 390 0 0
Hodgkinson 295 0 0

For mortuary for the parish of Marylebone. Mr. E. T. Gaal Browning (chief surveyor), architect:—
Jennings £125 18 0
J. Brown 875 0 0
E. Brown 349 0 0
Crabb & Vaughan 345 0 0
Scrivenor & White 325 0 0
Stevens & Watson 334 0 0
Taveur 311 0 0
Crockett 299 0 0
Turner 277 0 0
Temple & Forster 265 0 0

For villa residence, Chertsey, for Mr. J. Madocks. Mr. T. Wonnacott, architect. Quantities supplied:—
Britton & May £2,208 0 0
Foister 2,118 0 0
Duke 2,109 0 0
Knight & Sons 2,081 0 0
Simpson 1,950 0 0
Marden 1,894 0 0
Harris 1,887 0 0
Turner 1,877 0 0
Nightingale 1,777 0 0

For the erection of a house at Barnet. Mr. F. Webb, architect:—
Hill & Sons £5,478 0 0
Ashby & Sons 5,422 0 0
Bress 5,157 0 0
Longue & Furrer 5,014 0 0
Sharpton & Cole 4,971 0 0
Turner & Sons 4,859 0 0

For finishing fifteen houses, for Mr. Jones, at Eumore Park, New Norwood Junction. Messrs. Mathews, architects:—
Slapley & Webster £1,396 0 0
Hurley 1,310 0 0
Pearso 1,220 0 0

For new coal-store roofs and works at Bankside, for the Phoenix Gas Company. Mr. Innes, engineer. Quantities by Mr. Shrubsole:—
Westwood & Bailey £1,153 0 0
Reddell 1,135 0 0
Weston 1,110 0 0
Sharpton & Cole 1,082 0 0
Weeks & Co. 1,070 0 0
Garner 1,059 0 0
Aird & Sons 1,057 0 0
Tyler 1,052 0 0
C. B. M. O. R. J. P. E. T. W. C. F. R. Y. H. K. & A. W. H. T. E. Street Lamp—L. T. W. C. T. H. P. (most consent former members of the Builder for himself)—H. M. (the Eleazar Crosses award an answer to the inquiry).
Adams 981 0 0
Till 960 0 0
Falkner 912 0 0

VOL. XXVI.—No. 1337.

Gossip in the South Kensington
Museum.

ELICS from Ahyssinia, no great things, have doubled for many weeks the usual number of visitors to the Kensington Museum; the ordinary average of 10,000 giving place to one of about 23,000. Very puzzling are these spontaneous regularities, as

we have said before. Thus in the week ending July 25th, there were 22,000 visitors; in the week after, 21,000; and then in following weeks, 20,000, 25,700, and 21,000. The number is now lessening somewhat, and then will come for weeks and weeks again a steady 10,000, little more or less. There is always something new in the Museum, and if this lead to such constant change in the arrangements that it is sometimes difficult to find what is wanted, it has the advantage of assuring visitors that they can scarcely go too often. It is to be hoped that some of our student readers sketched the carved pine-wood doorway, of the eleventh or beginning of twelfth century, from the destroyed wooden church of Sanland, in Norway, and which was in the north court for some time. It is a remarkably fine thing of its sort: the vigour of the large dragons in the spandrels, and the beauty of the curves in the foliage, are very noticeable. The wood is remarkably sound. This, together with another not in such perfect condition, and which came from the church of Fla, demolished in 1854, were lent by the Norwegian Government, and have been recently removed from the Museum. Plaster casts, however, are in their place, so coloured, that they closely resemble the originals. On another page we print a letter from a correspondent, who, looking at these doors and their surrounding framework, asks whether it can be necessary to paint deal used externally in order to preserve it, no paint or varnish, apparently, having been applied to these doors. The difference in climate would have to be considered in giving an answer, as well as the difficulty of obtaining in this country such pine-wood as the Norwegian doors were made of. Our own experience with unpainted deal doors in England, exposed to the weather, is not satisfactory.

It may be as well to add, touching the Norway work, that some similar carved early doorways from Norwegian churches,—Hitterdal, Tind, and Brand,—are illustrated in Weale's "Quarterly Papers."* The older timber churches of

Norway are very curious piles, wrought piecemeal and constructed without any skill in forming a whole; carved work being introduced by individuals here and there to lessen the original rudeness and want of design.

Carved work of another kind will be found in the very curious pulpit, or "mimbar," from a mosque in Cairo, which has been set up in the same court that holds the doorways, and which is becoming a court of fine pulpits. The mosque, built between 1412 and 1421, was pulled down not very long ago, and the Department were enabled to buy the pulpit, the date of which, according to an Arabic inscription on it, must be between the years 1468 and 1496. Its general form is excessively ugly, but the carved and inlaid work, ebony and ivory, with traces of colour, is very elegant. The surfaces are covered with star-shaped panels, formed by a moulding of triangular section; and within these panels are the carvings, which include inscriptions from the Koran. The styles, with their coarse sunk ornament, seem scarcely to agree with the panel-work.

Near the pulpit there is a table-top of fifteenth-century work, also from Cairo, which shows the same stellar forms and inlayings.

Look to the modern wrought-iron Prussian gates close by, purchased at the Paris Exhibition for 400l.—a very small sum considering the remarkable extent to which they are wrought. These materially lessen the effect of the Norwich gates now standing close to them, and of which we gave an illustration some time ago. What would a similar pair cost in England? Perhaps the Skidmore Company will tell us. The Museum, by the way, contains some capital specimens of English iron-work, especially the gates formerly in the gardens of Hampton Court Palace. These were made by Huntingdon Shaw, a native of Nottingham, about the year 1695. These gates should be carefully studied by all our smiths: it was quite right to bring them under cover.

The vicissitudes through which some of the objects now in the Museum have passed are remarkable. A cognate story occurs to us. Some little time ago, at a sale in an ancient house in inland England, the auctioneer said, "How much for the plaster cast in the hall?" and a whitewashed head in a niche over a door was knocked down for 7s. 6d. When taken down it proved, however, to be of metal, and it was at once sold for 3l. or 4l., and then went to a shop in Brighton for about double that sum, where it remained for many months, until it was purchased for something under 20l. by a well-known art-loving resident there, who thought it rather to serve the shop-keeper than to please himself. It remained in his house, and was very little cared for, until the Exhibition of Works of Art in Lewes, to which he had sent it, was opened, when a London dealer sought to buy it, but did not go the right way about it, and so failed. Up to this time it had been called at a guess Sir Thomas More; but being sent to a London friend and talked over at the Society of Antiquaries, some good eye said it was very like Henry VII., and on being taken to the chapel at Westminster it was found to be nearly identical with the bust of the recumbent effigy of the monarch. Tradition says something of a trial piece made by Torrigiano before executing the monument, and here it is thought we have it. Torrigiano seems to have been brought to England expressly to work for King Henry VIII., and according to Vasari did an infinite number of works for him now unknown. The king made an agreement with him to execute a monument for himself and Queen Katherine, and Torrigiano tried to persuade Cellini to come to England and help him in it, but through circumstances unknown it was never carried out. After the bronze bust of which we

have been speaking had been identified it was lent to the Department of Art, and the Committee of Privy Council thinking it desirable that the nation should possess it, the seven-and-sixpenny "plaster cast" was bought for the Museum for some hundred and fifty guineas, and may be found there (and a fine thing it is) not far from a cast of the Westminster effigy, so that those who are curious may compare for themselves.

The New Lecture Theatre is fast approaching completion: it will hold from 500 to 550 persons in the body of it, besides 200 in the galleries on special occasions. It is somewhat lofty: how this may interfere with its acoustical qualities will have to be seen. The tympanum externally, above the entrance, is filled with a large inlaid picture commemorating the Great Exhibition of 1851: a draped figure, probably her Majesty the Queen, is presenting wreaths to representatives of the various nations who approach on each side, a view of the building forming the back-ground. The figures are in outline, the colours being buff and blue, with a gold sky. In circular frames under the arcade, and so protected, three of the workers in mosaic now practising in England have been each enabled to put up a specimen of their art and workmanship, and with good effect.

In the new refreshment-rooms some interesting experiments in decoration are being made. Mr. E. J. Poynter, who has designed a quaint range, being entrusted with one of the dining-rooms, and Messrs. Webb, Morris, & Co., with another. We cannot say that we greatly admire the ceiling of the latter; but, as the room is at present unfinished, like the rest, it will be better to withhold judgment. The painted glass in the window here is very agreeable: the figures show the hand of Mr. E. Burne Jones, who is also, we believe, to fill some of the panels in the high wood dado round the walls. It is assuring to hear that Mr. Morris, of this firm, is the author of "Jason," and "Earthly Paradise," poems that have been well received by critics. The design for the large window on the chief staircase was obtained in competition, the jury including several members of the Royal Academy. It is by Mr. Renhen Townroe, a pupil of the late Mr. Godfrey Sykes, and has been well produced in glass by Messrs. Lavers & Barrard. The design urges "Work while it is day," and is intended to illustrate part of the 38th chapter of "Ecclesiastics," beginning, "How can we get wisdom that holdeth the plough." A series of small pictures represent suggestively the labour of the smith, the potter, and so forth. The style may be called Cinque-cento. The semicircular head is full of a debased sort of architectural ornament, and is over-fussy. The window at the foot of the stairs, illustrating "Fotile," "Architectura," and "Fabrense," was designed by Mr. Moody, and for parts deserves praise. To an eye fresh from the study of the windows in Fairford Church, it is, nevertheless, thin and poor.

Travelling to that same Fairford, by the way, the other day, we were greatly struck with the exceptional fruitfulness of the herry-bearing trees and shrubs. For at least four miles the hedges are as red as a soldier's coat. The "hips" and "haws" of the wild rose and hawthorn are in the majority, but others contribute, and are added to by unripe blackberries and occasional masses of elder-berries not yet black. The effect is quite remarkable. Shakspeare, the omniscient, describes it. Changing only one word in two lines from *Macbeth*, these heries,—

"The multitudinous trees incarnadine,
Making the green, one red."

We have been led away, however, from South Kensington, so will here end our present gossip.

* Vol. i., under the heading of "Primitive Churches of Norway."

COURTS OF CONCILIATION AND ARBITRATION.

In Plantagenet and York and Lancastrian times most of our leading trades were under the management of a knot or certain number of the "good folks" of each of them. These "good folks" made for their respective trades the regulations that governed them; and, in the city of London, at all events, were supported in their decisions in the settlements of disputes by the chief magistrate. In France, as early as 1285, there was a court of *Prud'hommes*, or prudent men, who were appointed to sit in the Civic Hall, Paris, for the purpose of advising in cases between the citizens; and, in the fifteenth century, there was a similar court established at Marseilles, for the adjustment of all disputes between fishermen and their employers, and another at Lyons for the settlement of the disputes of merchants frequenting the fairs. But where there is now a man on the ground in those days there is now a little crowd, and regulations that were seldom broken through then are quite obsolete, either scorned or forgotten, now. The French were the first to exhibit a desire to return to the old system that was found to work so well in former times and elaborated it to suit present requirements. In 1791 a court composed of masters and workmen was established at Lyons, for the settlement of differences occurring in the various trades. But it did not maintain its authority during the eventful years that followed; for, on the visit of the Emperor Napoleon, in 1806, to Lyons, the municipal leaders represented to him the great desirability of renewing its powers then in abeyance. Not only did Napoleon re-establish this court, but he resolved to found similar institutions in all the principal manufacturing towns. Up to 1844, however, Paris was not included in the list of towns and cities so benefited, on account of the apprehensions that were entertained that the numerous varieties of industries carried on there would occasion too many complications; but Louis Philippe was not appalled by the prospect of any difficulties, and created four councils of *Prud'hommes* for the department of the Seine. In 1849 there were twenty-four of these councils in France. There are now eighty. The first approach to the formation of a court in England having similar powers, was made on the present decade, when the hosiers of Nottingham established a court of conciliation and arbitration, an example that has been since followed by the joiners of Wolverhampton, and still more recently by the potters in Staffordshire.

We have before us a work written for the especial purpose of promoting the formation of courts of conciliation by placing within everybody's reach exact particulars of the steps necessary to be taken for this purpose.* The author, who is a Scottish harrister, says, "The example afforded by the success of the Nottingham Court of Conciliation and Arbitration is one which will no doubt be followed by other communities; and should the Government not at once lead, instead of being led by the people, the result will be—certainly one of a very humiliating, if not dangerous character—that the people will learn to do that for themselves which their legislators have either been unable or unwilling to do for them." He contends that the present authorities for adjudicating upon disputes between employers and employed—justices of the peace—are quite unqualified for their task, and prophesies, indeed, their abolition. In their place he would institute boards or courts of conciliation and arbitration framed on the model of the councils of the *Prud'hommes*. Accordingly, he shows us these last-mentioned courts, describes their powers and machinery; describes the French justice of the peace, or *Juge de paix*; paints their English and Scottish counterparts, and gives some of their questionable judgments; describes the civil legislation affecting masters, workmen, servants, and apprentices prior to 1824, and that which has been enacted since that period; and finally depicts the practical working of courts of conciliation and arbitration, descants upon their advantages,

* "Handbook of the Law relative to Masters, Workmen, Servants, and Apprentices, in all Trades and Occupations. With Notes of Decided Cases in England, Scotland, and Ireland; together with Forms of Proceedings and Procedure, to enable Masters and Workmen to establish Courts of Conciliation and Arbitration, and to carry on the same." By Alexander Macdonald, Solicitor, Glasgow; Member of the Faculty of Procurators, Brecknock; William MacKenzie; London, Edinburgh, Glasgow, and Dublin, 1868.

and describes the best modes of establishing and conducting them. All this is done in an impartial and earnest, though at the same time arousing, manner. He points to the facts of foreign locomotives running upon British railways; wagon-loads of doors and windows arriving ready made from Norway and Sweden; the accession of business to the forges of Crenoot; the activity of the hammers of Essen; the shuttles of Verriers, and the frames of Chemnitz; and calls upon employers and employed alike to cease the absurd system of strikes and lock-outs, which is gradually reducing the national powers of development, and organize a tribunal at which their differences may be discussed and the causes of them removed, without the extreme measures that are introducing foreign industry into the country. He says:—

"Never, perhaps, in the annals of trade has there occurred such a number of strikes in almost every branch of it, as has taken place within the last two years; and seldom have they continued in individual cases for such lengthened periods. At no time were they so likely as they are now to cause the loss of that rank and pre-eminence in the world's industry, so nobly won for us by the skill and energy of our forefathers. Thousands of workmen and their families must have suffered privations of which we can never know the extent; while many employers have doubtless sustained losses which it may take years of exertion to repair. The inveterate character of these disputes would seem in a great measure to have arisen from the want of some adequate machinery in our judicial system, by which the questions involved could be fairly determined. Employers and employed have been hitherto in the position of litigants without a forum to decide their differences."

This desired forum is to be found in the proposed extension of courts of conciliation and arbitration, the outlines of which were indicated in the bill introduced into the House of Peers by Lord St. Leonards, in February, 1867, entitled "An Act to establish Equitable Councils of Conciliation to adjust Differences between Masters and Workmen." Few of our readers need be informed that the distinguishing characteristics of these courts is the absence of professional legal men. In the French courts, upon which they are modelled, "no practitioners of the law are allowed to appear upon any pretext whatever." There are three paramount objects kept in view,—the provision of judges skilled in the matters in dispute, the inspiration of confidence in the justice of their decisions, and the conciliation of litigants; and these are deemed best managed by the selection of an equal number of representatives of capital and labour as members, and persons of standing and character in the community as judges. To make the province of the French courts clear, we cannot do better than quote the words of M. André, president of the Council of Troyes:—

"In every case the council endeavours to discover the truth,—to find out from what side the wrong comes. Sometimes by observations addressed to the masters the latter are induced to modify their demands. By remonstrances, friendly but firm, they cause the workmen to see the unreasonableness of unfounded pretensions. Both are reminded of their reciprocal duties,—the masters that they ought to forego everything tending to humiliate, to overlook a first offence, to be mild in command and moderate in reproof, and to respect the position of men whose lives are consecrated to toil. To the workmen they recommend deference to the employer, who by his wealth and enterprise furnishes them with the means of earning a comfortable subsistence; regularity and care in performing their work; and a faithful and zealous use of their master's time. It is by approaching cases in this spirit that the *prud'hommes* succeed in getting the parties to see their complaints in their proper light, to retire from the court reconciled, and disposed to resume relations which have thus been only temporarily disturbed."

Does not this calm, kind statement show us the crowded French court? We cannot turn over the page without feeling we have seen Alphonse, or Jules, or Emile, in house and belt, mustachioed and snubnurt, active, dexterous, and good-looking wital, explaining his case to a bench of men, heard also as an grave, older interest in it, and as he and, perhaps, his *chef d'atelier* embrace through their good offices and mediation, we fancy there is a little flutter in the air as though angels were rejoicing over this scene of goodwill among men. Contrast this with the dismantled room of the operative who has struck or who is locked out, his wife too ill-clad and ill-fed to have a smile or pleasant word left, his children too reduced to be anything but an agony of misery to him, and we must own that the offices of the "good folks" of yore and the "prudent men" of to-day are not without their value. The classes of disputes of most frequent occurrence in France are thus divided by M. Mollot, one of the numerous authorities consulted by Mr. Macdonald to give weight and testimony to his work:—

A master brings a complaint against one of his workmen.—

For having inflicted upon him some injury by contravening a law or regulation;

For having refused to fulfil a contract either actually entered into or implied by the custom of trade as to work, time, or price;

For having purloined or injured materials given him to work upon, or committed other offences of a like nature.

On the other hand, the workman complains—

That his master has injured him by contravening some particular law or regulation;

Or that he has dismissed him at an inopportune time, contrary either to actual agreement or established usage;

Or that he keeps back the whole or part of his wages;

Or that he refuses to give him a *compté d'aquêt*, or certificate of his having fulfilled his engagements; or to return him his *livret*, a book containing his name, age, birthplace, trade, and other particulars, which he is obliged to hand to an employer on his engagement. And though some of these are not the sort of disputes that arise among ourselves, we have few indigenous grievances that might not be settled at similar tribunals.

Mr. Macdonald gives some droll stories to light up his subject. He would show the inadequacy of Scottish justices of the peace to cope with industrial legislation, and says that the jurisdiction exercised by them should be transferred to trained and independent judges, even though the change would deprive the country squire, after the gout had destroyed his aptitude for fox-hunting, from sitting in judgment upon his natural enemy, the poacher, and should also prevent Ballo Maknamsmt from repeating the address maliciously ascribed to him when sentencing "an ill-fared lon frae the Briggrate" to thirty days, "because the offence hadna been fully proven;" but adding, with a look of ineffable wisdom and severity combined, "had it been sae, I wad hae gien ye saxty!" Again, he gives slight biographical sketches of the professional men mentioned by Boswell in his account of the action of the negro knight to maintain the freedom he believed he was entitled to by touching British land; and in that of the matter-of-fact Lord Hermand he relates that a pleader of protracted eloquence was one day stating a case before him, when his patience was quite worn out; at last the laborious pleader saw his lordship in the act of hounding up his papers, and evidently not listening to what he was saying, "But, ma lord," said Mr. Baird, in consternation, "I'm no accouted yet,"—meaning, of course, that he had not exhausted the case; to which Hermand, in a deep growl, replied, "But I am," and so closed the debate. And there are more anecdotes of legal celebrities. The most practical part of his volume, however, is that which relates to the formation of the courts he advocates. This information is as valuable as the process is simple. It was Lord Brougham's suggestion that an English harrister should visit Paris for the purpose of examining the working of the French Courts of *Prud'hommes* and then lecture upon them throughout this country, so as to prepare the public mind for them, that first drew the attention of our author to the subject. The machinery to set the formation of such a court in motion is merely this:—A meeting must be called, when a minute must be drawn up to the effect that it is convened for the purpose of forming a Board or Council of Conciliation and Arbitration between masters and workmen, and appointing a committee to prepare the necessary rules and regulations. The committee and secretary duly appointed, their names are recorded in the minutes. A second meeting must be called by the secretary to consider the rules and regulations drawn up by the committee; and these being discussed and approved, and the expenses of the court provided for, nothing remains but the drawing up and despatch of a petition to the Queen to grant a licence for the court to exercise its powers. Our author gives the proper form of the minutes and petition; and also shows the rules for regulating the carpenters' and joiners' branch of the Wolverhampton building trade, and those of the board of arbitration and conciliation of the hosier and glove trade, Nottingham, which contain material enough to serve as models for any other. It seems to us his labours will materially assist the movement that is tending to supersede the present cumbersome mode of managing industrial relations.

Mr. Macdonald extracts from the reports of the artisans selected by the Council of the Society of Arts to visit Paris and report upon their various trades such passages as relate to the Courts of the Prud'hommes. Although these reports have been before the public in various forms, they are useful to look at again in illustration of the question before us. They sing a uniform note of praise of the French plan. The sentiments of Mr. L. S. Booth, a working representative of the Coventry trade, may be selected as a sample of the rest:—

"There subsists a very friendly feeling between the manufacturers and workpeople; this has been attributed to the action of a society called Conseils des Prud'hommes, a Society of Prudent Men, formed of various trades of workpeople and masters, to adjust the differences that from time to time arise. A gentleman, occupying a responsible position in St. Etienne, assured us it was the best institution in France, and had the confidence of all the parties. It does not interfere with the price of labour or the working of contracts. It is a council of conciliation legally established, and all its decisions of not more than 200 francs are binding upon both parties; and though it often deals in matters involving a greater sum than this, appeals against those decisions are very scarce."

Mr. A. Kay, joiner, states, in plain terms, not only the well-working of the courts, but the mode in which a case is conducted. He says, the workman who considers himself aggrieved has merely to go to the court, report his wrongs, and pay a fee of 5d. A summons is then issued for the complainant and defendant to appear before the council within a day or two. If the council should fail to reconcile them, which is seldom the case, for nine cases out of ten are settled at this stage, the plaintiff pays into court two francs, and another summons is issued for a fresh appearance in the judgment-hall. This is generally appointed for an early day, as no time is lost in unnecessary delay:—

"When the parties appear in the judgment-hall, they find ten members of the Conseil des Prud'hommes seated on a raised platform, the president sitting in the centre, when they courteously and with great familiarity hear the statements each have to make. In some cases the matter is so clear and evident that the judges give their verdict without rising, and give the injured party a slip of paper to take to the officer who is appointed to carry the sentence into execution. But the case may require some consideration; the ten judges then rise and retire to the adjoining room, and then they compare the facts of the case, and decide on judgment. That judgment may not be final; the one who deems himself the injured party may appeal to the Chamber of Commerce before his case is entertained there he must deposit 400 francs to pay the expenses, and the case is not often worth that amount."

Mr. Macdonald says, however, it is not necessary to deposit the 400 francs mentioned above. He states that, when the demand does not exceed 200 francs, the judgments of the court are final; and where it is above 200 francs the court can order immediate execution of the same to the extent of 200 francs.—"That is to say, the party obtaining a decree to be put immediately in force for a sum exceeding 200 francs, must find caution or security for the surplus in case of appeal to the Tribunal of Commerce." In fine, he has gathered together much that has been said about these courts, and adds exact particulars that he has spared no pains to verify.

As incidental to his subject, our author has compiled a long list of decisions in England, Scotland, and Ireland, illustrative of statutory and common law. Most of them relate to workmen and servants of various kinds and their employers. They are useful as showing how the law has been read in these instances, and, consequently, how it may be expected to be read in others of a similar nature. A large number of them relate to persons engaged in building trades. We would refer our readers to them as concise statements of liabilities and responsibilities of general industrial interest. Here and there amidst his pages we find little scraps of history that are suggestive. Thus we learn that justices of the peace were first created in France by Edward I. of England, though, as is now constituted, they only date from 1790; that the Scottish colliers were really bound to the coal they worked, and were sold with it when a coal-seam changed hands down to the year 1775; that the whipping of females was not abolished till the reign of George IV.; and other curious facts. Take it all in all, Mr. Macdonald's work is, in many respects a fit lay sermon to the text he has chosen as a heading for it:—"Moreover, there are workmen with timber in abundance, hewers and workers of stone and timber, and all manner of cunning men for every manner of work. Of the gold, the silver, and the brass and the iron, there is no number. Arise, therefore, and do, and the Lord be with thee."

THE "BUILDER'S" PLEA FOR CABBY.

A PARTIAL insurrection, which our French or our PRANSIAN neighbours would have harshly and summarily dealt with, has been suffered to bleed itself to death in the streets of London. It has bled, happily, from no wounds but those inflicted on the pocket. These belligerents are happy who stanch such wounds before they become fatal. The cab proprietors of London, having, or pretending to have, a grievance against the railway companies, caused their drivers to strike against the public. In order to compel the railway managers to admit to their station-yards, on equal terms, those vehicles the owners of which were willing to give certain guarantees, and those not so recommended to the public, the cab-working interest had the wit to persuade their servants to refuse, in defiance of the law, to serve the general public. The ill-designed strategy had the result inseparable from ignorance of the laws of war. The aggressors had to beat a retreat, and this was happily effected before any great amount of ill-feeling had been developed on either side.

With the public, then, the victory remains, and, as far as the specific cause of complaint, and the means chosen to enforce it, rightly so. But it not infrequently happens, in social disturbance, that the immediate occasion of an outbreak is not its real cause. That may long have been smouldering beneath the surface, ready to burst forth on the slightest opportunity. Let us ask ourselves whether such may not have been the case in the present instance. The railway companies may be altogether justified in their treatment of public vehicles. Are the general mass of the inhabitants of London equally in the right?

The point to which we refer, and which belongs specially to our columns, is that of the shelter afforded to public vehicles in London. Shelter, indeed, there is none. A wealthy and luxurious people, proud of their humanity, supporting by voluntary subscriptions a society to prevent cruelty to animals, a people specially addicted to the breeding, the riding, and the driving of the horse, is content to leave all the animals which carry on the public internal communication of the metropolis without any recognised provision for shelter or for feeding-place.

That cab-horses have stables somewhere, and that their drivers may sometimes (perhaps on Sundays) retire to some other bed than that which is extemporised from the interior of their vehicle, we take, indeed, for granted. That much we love to private enterprise. Perhaps we are right in so doing. To take us through the streets, whether with the easy speed of a Hansom, or at the more deliberate grind of a four-wheeler, it is essential that the horse should have been fed, and groomed, and rested somewhere or other, within a day or two; and, though we allow feeding, and that waiting which is a substitute for rest, to be carried on in the very midst of our most crowded thoroughfares, we have not yet come to see much grooming on the stands. Evidently, therefore, there must be cab-stables somewhere, but *where* is known to none but their occupiers. In all weather, and in all seasons, by day and by night,—in summer with a temperature of 90° in the shade, in winter with the ground covered with snow and the thermometer below zero,—the horses and the drivers, on whom and on which we all depend when time is an object, are left unsheltered and uncared for. Their normal shelter is the sky.

Is this as it should be? Is it fair to a large body of hard-working, industrious, careful men? We expect very much of the London cab-driver, and not only so, but we obtain very much from him—very much more than we did ten years ago. Civility is now the rule; formerly it was the exception. Knowledge of the town, care and speed in driving, cleanliness of vehicle, and we may say of person, we demand without stint. It may often happen to a person not over familiar with town to ask direction from a policeman, and to discover, after a bout of that amusing fence in which the natives of the Emerald Isle so much delight, that he is seeking guidance of an Irish recruit, who knows less of London than himself. But how rarely do we find the cabman as faultless; and when he is, how patiently he follows up the scent! What is his pace, and what his care at crossings and corners, when you can only catch the express train by making for the station at some ten miles an hour? In all frequented streets of the metropolis, for at least twenty hours out of the twenty-four, we expect, by lifting up the finger and vociferating

"Hi!" to be accommodated with a carriage driven by a man who can tell us where we want to go when we do not exactly know ourselves.

Now, it is a great hardship that no public shelter is provided for these hardworking public servants. What we say of the men will apply with even more force to the horses, for the horses are unable to pop inside for an occasional nap. Their food is given by the painful and unsatisfactory appliance of the nose-bag. Their protection, after an hour or two of rapid driving, is a rank that enables them at leisure to fill their bellies with the east wind. No valuable horse can be exposed to the unsheltered vicissitude of a cab without almost the certainty of disease. In all this lies a great and unnecessary waste,—a cost to the owner which the public, in one form or another, must ultimately defray. To demand the constant attendance of thousands of horses, and to make no provision whatever for their protection from the weather, is a disgrace to our civilisation.

Who should provide the shelter? It may be asked. Our reply is, that we are indicating a want, but not promoting a speculation. Some co-operation should be brought to bear on the matter. Public shelter, protected sheds, in which the tired horses could feed and rest till their time came to leave the rank, ought to be provided at public expense. If this were done, it would no doubt admirably pay to attach stables and mews to the public sheds. If an association of the cab owners were formed, or any arrangement were made by which a horse that had set down his last fare at Paddington should not have to be driven to Islington or to Southwark to pass the night, the economy of labour would be its own reward. The lodging of the drivers themselves is another matter for consideration, and the men would, of course, wish to regain their own homes. But when we remember the hours which they keep, the distances which they are forced to drive empty-handed, and the constant exposure incident to their vocation, as well as that to which they are unnecessarily exposed, we cannot suppose that the drivers, as a body, would not rejoice at any step in the direction of organising their protection from needless toil.

Let us heap a few coals, then, on cabby's head. Let us tell him, and not in print only, but in brick and mortar, that we are better friends to him than he has been to himself. "You have been out of temper, my good fellow," let us say; "small blame to you for being a little vexed at times. You have a good deal to put up with. You have been hardly used. But you have made an ass of yourself, notwithstanding. It is not the railway managers of whom you should complain, but the Lord Mayor, Aldermen, and Burgesses of London; the vestrymen of Marylebone, of Southwark, of St. James's; the municipal authorities, in fact, who neglect you. Call another indignation meeting, and direct your resolutions against the fact of utter want of shelter for so large a body of the servants of the public. Ask for shelter for man and beast—for yourselves and for your cattle. Tell your great employer, the public, that it was but natural you should have made that earnest, though ill-considered, effort to take shelter under a roof of any kind. Even drangy stations are preferable to the open street. Put your shoulder to this wheel, and call on the humane, the benevolent, the prudent, for aid. Enforce the view that the reform of street vehicles depends on some better shelter being provided for them than the centre of the street. Stick to this, worthy friend, and when one, or five, or twenty years hence you rest quietly for your barn in a clean, light, airy, sheltered stand, thank us for the hint, and remember "the Builder's plea for the cabman."

VIEWS AS TO THE GREAT PYRAMID AND OTHER ANCIENT STRUCTURES.

SIR J. Y. SIMPSON has published in pamphlet form a corrected abstract of his remarks on Professor Smyth's idea of the Great Pyramid, from No. 75 of the Proceedings of the Royal Society of Edinburgh.* Some additional points, such as with reference to the concentric circles and other carvings on rocks and kists, are dwelt upon in an appendix. The communication may be called a review of a review, inasmuch as it was provoked by previous criticisms of Professor Smyth, who still maintains the metrological hypothesis.

* Is the Great Pyramid of Gizeh a Metrological Monument? By Sir J. Y. Simpson, bart. Edinburgh: A. & C. Black, 1868.

Sir James here demolishes this hypothesis with a heavy hand; and to that end he has made able use of Professor Smyth's own implements, as well as others. The Professor, it will be recollected, made a special journey to Egypt for the purpose of verifying his own idea; and it must be said for him that he appears to have given a very faithful account of the result, inasmuch as it was mostly dead against himself. This Sir James Simpson clearly and forcibly shows. The kist in "the King's Oratory," as it has been called, instead of being cut out with all that mathematical accuracy with which it was said to be cut, and which was to have been anticipated had it really been the result of inspired handwork, and destined to form a strict measure of capacity to the latest ages, was found by Professor Smyth, as he himself reports, to be of even carelessly irregular form. On this subject Sir James, after having pointed out other facts adverse to Professor Smyth's hypothesis, says:—

"But in regard to the coffin as an exquisite and marvellous standard of capacity to be revealed in these latter times, worse facts than these are divulged by the tables, &c., of measurements which Professor Smyth has recently published of this stone vessel or chest. His published measurements show that it is not at all a vessel, as was asserted a few years ago, of pure mathematical form; for externally it is in length an inch greater on one side than another; in breadth, half an inch broader at one point than at some other point; its bottom at one part is nearly a whole inch thicker than it is at some parts; and in thickness its sides vary in some points about a quarter of an inch near the top. But, Professor Smyth adds, 'if cultered lower down, it is extremely probable that a notably different thickness would have been found there. . . . Further, externally 'all the sides' (says Professor Smyth), 'were slightly hollow, excepting the east side,' and the 'two external ends,' also show some 'convexity' in form. 'The outside' (he avows) 'of the vessel was found to be by no means so perfectly accurate as many would have expected, for the length was greater on one side than the other, and different also according to the height at which the measure was made. 'The workmanship' (he elsewhere describes) 'of the inside, in as far as the outside, but yet not perfect.' For internally there is a convergence at the bottom towards the centre; both in length and in breadth the interior differs about half an inch at one point from another point; the 'extreme points also of the corners of the bottom not being perfectly worked out to the intersection of the general planes of the entire sides;' and thus its cavity seems really of a form utterly unaccountable in a correct way by mere linear measurement—the only measure yet attempted."

One would have thought that the Professor himself had thus demolished the metrological hypothesis even in his own estimation, but it seems not; and although he admits that "the coffin's precise size is the question of questions," its precise size is still undecided; for Professor Smyth has only measured what remains of the defaced kist, and his measurement is only one of twenty-six varying measurements. Nevertheless—

"This broken and damaged stone vessel is professed to be the permanent and perfect metrological standard of capacity-measure for the world for present and still future times; and (according to Mr. Taylor) that it might serve this purpose, is formed of one block of the hardest kind of material, such as porphyry granite, in order that it might not fall into decay; for 'in this porphyry coffin we have' (writes Professor Smyth in 1864) 'the very closing end and aim of the whole pyramid.'"

Sir James Simpson's own idea is that the kist was merely a sarcophagus; but, although we have already expressed our own opinion also that it was a sarcophagus, there are peculiarities about the case which induce us to believe that, like the coffin in Freemasonic rites,* it was originally "used for the living, and not for the dead," as has actually been said of "the King's Oratory" itself, in which it stands, and which was carefully and scientifically ventilated, and closely resembles a temple or chapel in sectional outline and general arrangement, with its vestibule and its stately and hall-like penetralia, divided by its screening but lifted partition, or "portentilla," of stone. The fact now adduced by Sir James Simpson, on the authority of an ancient author, Ibn Abd al Hakam, a contemporary, or nearly so, of the Caliph al Mamoon, who tunneled into the pyramid and discovered the King's Chamber, that the body of a man was found in the sarcophagus, does not settle the question any more than the discovery of the body of a man beneath a church altar would decide the question whether the edifice in which it was found was merely a sepulchral monument.

Herodotus tells us, as to the Pyramid of Belus at Babylon, that it had a shrine below and a chapel above, in which chapel there was a bed on which a priestess lay by night [entranced in "the semblance of death," as the manna have been, like "the mad prophetic Sibyl" of *Æneas*, who, "in her cave, upon a rock, by night, reclined"], while God-possessed, or visited by

the God Belus; and a golden table, on which, we may conceive, the Sibylline oracles of the God were probably written down. The shrine below, in the Babylonian pyramid, would respond to the sepulchre, indicated but not completed, in the rock below the Egyptian pyramid, while the Pharaoh's chamber or oratory above would respond to the chapel. Now, had the body of a man been recorded by some old author to have been found in the bed of the chapel of the pyramid at Babylon,—and it was not unusual in the East to have beds in sepulchres,—that might have been supposed to settle the question of its merely sepulchral nature; but this would have been quite an erroneous settlement, since Herodotus happens to have recorded the fact of a very different purpose. Yet there is nothing improbable in the supposition that a dead body might have been found there after Herodotus's time. The practice of interring the dead in edifices devoted to religious rites has been a very common one, as we all know. Moreover, as regards the religious rites of the Egyptians, they were magical, just as those of the Babylonians and other heathen nations were. So were the Mithraic rites; and the Mithraic caverns, or cells of the Cabiri, in which these very rites were practised, although they were sometimes subterranean, also, according to Faler, sometimes lay concealed in the centre of enormous buildings of the pyramidal form, or even in a temple at the top of the pyramid. The temple or chapel of Belus at Babylon stood exactly in such a position as the temple of Buddha now does in modern Chaitany in Ava and Siam. So is it with many American pyramids, their temple having been called by the aborigines, "the house of the God." New Grange, in Ireland, of which Sir James Simpson speaks, is entered, like the Egyptian pyramid, by a long narrow passage, or transe, as it might be called in Scotland,—leading to a central chamber or cell, deep in the heart of the pyramid; and the analogy, which was long since pointed out in the *Builder*, Sir James appears to consider a very strong one. Now, it is evidently of precisely such a pyramid or tumulus as that of New Grange that the Taliesin or Druidical records, quoted by Davies, to whom Sir James also refers as an authority, have thus spoken:—

"In the dales where the courses surround the circle [and the Caer] He (the god Hu—pronounced Hee) arouses who is partly covered and partly bright" [like the soul-translating Mercury of the "entrancing rite" of whose sides was dark and the other bright]. "He is now," says Davies, "in the mystic cell. 'Let the renowned, the enterprising (hero, Eiddi [Image of the God], or Amhrosus whose actions are recorded in the *Gododin*), be lulled in sleep [or 'die'] while the God' arouses 'or swakes and 'lives alternately.' . . . let Hu mildly warm him with his divine presence. The man who rushes forth [as the God does suddenly in the Oracle] . . . is the benefellow of him who rests in the narrow house, under the tumulus [as Belus was the benefellow of the priestess who rested on the bed in the chapel of the tumulus or pyramid at Babylon] . . . the victor directs 'his view over Manon, the liminary with the lofty front and the red dragon, the Budd (or Victory) of the Pharon' (or higher powers)."

In this fragmentary record of Druidical rites there is, as we see, a curious conglomeration of remarkable words suggesting those close connexions which actually did exist between Druidism, Buddhism, and Egyptian magic. "The Budd of the Pharon" is a very notable phrase in this respect, and the connexion between the Budd and the dragon suggests the curious penchant of the Chinese and other Buddhists for dragon forms. Even the Manon, or liminary with the lofty front, smacks not a little of the Memnon statue and its peculiar relationship to the rising sun.*

It is also notable, with reference to what we have said of the New Grange Pyramid, that, according to an eminent Runic scholar, Mr. Rafn, a similar tumulus, harrow, or pyramid, at Maeshowe, in Orkney, is called, in a Runic inscription within the chamber, or cavern, in the heart of the pyramid, a "sorcery hall," which name very curiously responds to what is said of the cell,

* Another of the Taliesin fragments given by Davies is as follows:—"In the sacred course, on a serene morning, when Hu sent forth his dancing beams, making this demand—'I require men to be born again [into the new life of initiation—the life of entrancement, or God-possession] in consideration of those liberal ones [those liberated or blessed [those ecstatic or entranced] ones—] they have been intoxicated and lost.' Here and in the other fragment we find that the cell or chamber within the pyramid or tumulus where the God (and hero) "lived and died" afterwards, as the coffin has in the Freemasonic mysteries, which are believed to have been identical in meaning and purpose with ancient religious mysteries, both Gentile and Christian, those under consideration inclusive.

or cavern, in the heart of enormous pyramids, where the Mithraic rites of magic or sorcery were practised.

We may here suggest, in the form of questions,—Were not the *Druids* closely related, at least in magical practice, or religion, to the northern *Draus* or *Trows*, the fairy-like *dwarfs* of the *Scalds*, who seem to have been sorcerers or spirit raisers, "most powerful at midnight," like the *Druidical* "night hags" or "children of the evening," and to have inhabited dales, caverns, and the interior of green "knowes" or hilly mounds, so that they were called "the subterranean people?" The existence of sorceric and caverned or called tumuli or pyramids,—artificial caverns in fact,—not only in Ireland, but in Orkney and Baffin's Bay, points attention in this connexion, as we have before observed, to such northern peoples as the *dwarfish* *Picts* and *Draus* of ancient times, as well as to the *Esquimaux*, and especially to that curious people the *Laps*, who are not only a "little people," or *dwarfs*, but still abound with magicians or sorcerers; and are said to be, as a people, so singularly susceptible to nervous impressions, that the sudden clapping of the hands will sometimes cause them to fall into trances. It would be interesting and important to know more of the *Laps* and *Esquimaux*, their habits and customs, than we do yet. As the present inhabitants of Norway are specially related to those of Orkney, so may the ancient inhabitants of Lapland have well been to the *Draus* and *Picts* of Scotland, especially at a time when frozen seas united the higher lands of the two partly submerged countries in the winters of the glacial and early post-glacial eras. No doubt there are traces in ancient legend and tradition allusive to the peoples of the drift, the lake, the dale, the cavern, and the tumulus, just, such as we have of the *Druids* in connexion with *celled* or *chambered tumuli* and with *dales*, as well as *lakes*, like the *Irish* *faeries*, or "little people;" and of the *Picts*, or at least the *Draus*, in connexion with *dales*, *caverns*, *mounds*, and *subterranean dwellings*. Now is the time to collect every scrap of such legendary and traditional traces, and to bring them to bear upon the great pre-historical questions at issue in geological archaeology.* Then, perhaps, we may find that the Great Pyramid, ancient as it is, forms not a link between the historical period and the pre-historical, and is of less antiquity than many of the chambered tumuli either of Western or of Eastern climes.

It is no doubt the most popular and sceptical, and hence the *safest* policy, at present, to ignore all magical practices and doctrines while attempting to unravel the mysteries of ancient chambered tumuli, or pyramids, cromlechs, &c., and ancient sculptures; but there is no better ascertained fact than that ancient and pre-Christian nations, in all parts of the world, were deeply,—intensely, and probably universally, embedded with such magical practices and doctrines; and no archaeologist who is ignorant of these, or who attempts to unravel the mystery of ancient structures and sculptures without taking them into consideration, is at all likely to be able to advance the true theory of the uses or purposes and meanings of such structures and sculptures.

Before concluding, we may refer to what Sir James Simpson says, in the appendix to his pamphlet, as to the concentric circles and other sculptures on rocks and in cells such as that of New Grange. He appears to have been much inclined to resolve many of these into mere unmeaning ornament, and perhaps he is, to a certain extent, right. Yet he admits that the concentric circles with central cup inscribed on the inside surface of the lid of a stone kist or two, to which, in a general way, he himself alludes, were, like some others, "possibly of a religious character." Still he speaks of "the probable ornamental origin of our cup and ring carvings" in a very general way. There is nothing more probable, however, than that the cup and ring, or centre and circle form, was of symbolical origin, however frequently it may have been finally used, like the *T* in Etrurian pottery, as mere ornament. This was sufficiently shown in the letters On Rock and

* The truthfulness involved, to some extent at least, in Eastern tradition or legend, with its enormous elephants and tortoises, long disbelieved in as utterly devoid of truth; and in Western as well as Eastern legend, with its dragons and its other monsters, equally disbelieved in, has been singularly corroborated and illustrated by the discoveries of geologists; and so may the truthfulness of the traditions and legends to which we have just been referring, be illustrated and confirmed by the discoveries of pre-historic archaeologists.

* See Letters on Geometrical Symbols, by J. E. Dove, in *Builder*, vols. xxi. and xxii.

other Symbols by J. E. Dove, in our columns, a few years since. There it will be seen not only what the circle and centre symbol denoted among various nations, this being an almost universal symbol; but that the concentric circle and centre forms were, in particular, an ancient Jewish symbol, named the Sephiroth, the precise meaning of each portion of which is recorded and known.

The prominence which Sir James gives to the comparatively rare occurrence of the concentric circled symbol on knots, as evidence that such symbols were "connected with the burial of the dead" gives an erroneous idea of the small evidence,—if any,—of their sepulchral character which really exists; for it is known and has been specially remarked by those versant with the localities in which such symbols are mostly found, that very few have any connexion with ancient places of the dead, while hundreds appear to have had distinct associations with the ancient haunts of the living. Nevertheless, even though they were proved to be sepulchral, that would not disprove their magical or religious character—quite the reverse.

BEDFORD CASTLE.

On the left bank of the Ouse, about 50 yards from the stream, within, but upon the eastern edge of the town, is to be found all that remains of the once-celebrated and very strong Castle of Bedford. These remains, though scanty and confined to earthworks, are very marked and of a durable character, and although the fame of the castle rests upon its adventures as a Norman fortress, there is reason to suppose that it had an earlier history, and that its present relics belong to that earlier and Saxon period.

The principal work is a motte or mound of earth, wholly artificial, placed upon the gravelly plain across which the Ouse winds its way down the broad hand of the middle colite. This mound is circular, now about 15 ft. high and 150 ft. in diameter at its summit, which is perfectly level, and has for above half a century been employed as a howling-green. The slopes are uniform and moderately steep, and planted with trees and shrubs. On the north side, or that farthest from the river, an excavation has been made for an ice-house; but this is of modern date, and does not appear to have laid open any traces of masonry below the surface of the ground.

Towards the river, and westwards towards the town bridge about a furlong above this castle, the ground is perfectly flat, and under cultivation as a garden; but, on the north and northeast it is rather higher, and here are traces of a ditch at the foot of and concentric with the mound, and no doubt a part of its defence upon this its weaker side.

The only masonry that can possibly be old is a small rectangular mass on the south side of the mound, and which now carries a modern summer-house. The ragstone of the country, of which this fragment is comprised, weathers so rapidly, that it is difficult to form an opinion upon its age; but, though possibly old, it is probably of very recent date.

Looking to the position of the mound as regards the river, and to the low and flat character of the ground about it, it is evident that the great strength of the place must have been derived from the Ouse, here deep and broad, and from banks of earth and ditches filled from and communicating with the river. The entire absence of masonry and the disappearance of all but a trace of the surrounding banks and ditches, commemorated in the Chronicles as once so high and deep, are fully accounted for by the circumstances recorded of the famous siege by Henry III.

Bedeacum, or Bedford, was well known to the Saxons, and a town probably of Saxon origin. Here, just outside the town, was buried in 796 the Saxon Offa, king of Mercia, in a chapel long since swept away by the flood waters of the Ouse. Early in the tenth century the town was attacked by a party of Danish settlers from the five burghs, who were beaten off by the townspeople, and shortly afterwards Edward the elder repaired the place, and erected what some call the snhrth of Mikesgate, and some a strong place, on the southern side of the river, possibly a cover for the "ford," which contributed towards the name of the town. Bedford was without doubt an important town

under the Saxons, and as at Tamworth, Leicester, Wareham, and Wallingford, had a citadel at one angle of the enclosure, upon the river.

The Barony, also called the Honour, of Bedford, was conferred by William Rufus upon Payn, second son but eventual heir of Hugh de Bello-campo, or Beauchamp, a companion of the Conqueror, and possibly allied to the greater family of that name, who afterwards held the earldom of Warwick. Hugh was the recipient of many manors in Buckingham, and about twenty in Bedfordshire. Payn is the reputed holder of the Norman castle, described as of great strength, with ditches and ramparts of earth, and which descended to his son Simon, steward to King Stephen. The family, however, afterwards took part against the king, who seems to have attempted to settle the barony upon the daughter of the eldest brother, married to Hugh, surnamed "Pauper," brother to the Earl of Leicester. Stephen laid siege to the castle in 1137, and after five weeks of assaige, obtained it by a compromise.

Simon de Beauchamp held the castle through the reigns of Henry II. and Richard I., until his death, about the 8th of John. It appears from the red book of the Exchequer that he held 36 and 5-10ths knight fees of the old feoffment, and 8 fees of the new, all in the barony of Bedford. In his time the castle seems to have been held against Henry II. since in the second year of that king, 1156-6, those burgesses of Bedford who were in the castle against the king were fined twenty marks, of which sum they rendered account in 1157-8. In 1190 Simon fined 100*l.* for the government of the castle.

William, son and successor of Simon, is described as lord of the strong castle of Bedford, the captain of the honour or barony. He took part with the rebel barons towards the close of John's reign, and in 1215 admitted their forces into his castle. In consequence it was attacked by the well-known Falk de Breauté, and, not being relieved, was surrendered in November, after a seven days' siege. John was himself present at Bedford thrice in that year, in all for eight days. He granted the confiscated barony to Falk.

Falk strengthened and held the castle into the reign of Henry III., and hence ravaged the country below the Chilterns. At first a supporter of the young king, he afterwards resisted his authority, and, at the instance of his opposed neighbours, Henry de Brailroc was sent to Dunstable in 8th Henry III., 1224, to try their complaints, when thirty verdicts were found against the baron, and fines of 100*l.* upon each of them imposed. In revenge, Falk kidnapped the judge and lodged him a prisoner in Bedford Castle, treating him with much indignity. His wife complained to the Parliament then at Northampton, and the king ordered him to give up the judge, but in vain. Henry was probably glad of the opportunity of crushing a very turbulent subject, and appears to have lost no time in punishing the affront. In June, 1224, commenced a series of orders, issued by the king himself, and which show the greatness of his preparations for a siege, and the vigour with which he pushed them forward. On the 22nd of June, Henry was at Bedford in person, and there remained during the siege until the 19th of August, nearly two months. The preparations were both extensive and minute, and the mandates, always described as pressing, were issued to a vast number of sheriffs and other persons as far south and west as Corfe Castle and St. Briavels. They include men, money, arrears of scutage, cord, cable, iron, steel, hides, leather for slings, twine for strings, mangonnals, petraries, halista, quarrells, stone shot, quarrymen, masons, miners, carpenters, saddlers, wagons for conveying the royal pavilions, and almonds, spice, and ginger for the royal still-room. All the smiths in Northampton who can forge quarrell bolts, or leather when forged, are to work day and night until 4,000 are ready and despatched. Large quantities of wine from the royal stores in London, at Northampton, and elsewhere, are to be forwarded with speed to Bedford. Knights performing castle guard at Lancaster are ordered up: greyhounds are sent for to sport. The sheriff of Bedfordshire is to supply quarrymen and masons with their levers, hammers, mauls, and wedges, and everything necessary for the preparation of stone shot for the mangonnals and petraries. Miners come from St. Briavels, in the Forest of Dean. Windsor supplies its master carpenter and his mates. Charlbridge sends cord and cable. Charcoal comes with the iron and steel from

Gloucester, and the adjacent Abbey of Newsham spares a large quantity of raw stone to his converted into shot.

The details of the material supplied are recorded in the close rolls of the period. The particulars of the siege itself have been preserved by the neighbouring monks of Dunstable, from whose town, and probably from whose monastery, the judge had been taken, and whose fellow-townsmen played an important part in the siege. The king brought with him the Archbishop of Canterbury and divers bishops and abbots, by whose interest was granted to him two men from every hyde of their church lands, to work the siege engines; an aid of "carriages" or a mark from each caruca or plough land of demesne, and 2*s.* from each held in tenancy, gifts which were guarded against being drawn into a precedent by special charter from the king.

Falk left his brother to abide the attack, and sought aid on the lands of the Earl of Chester, Ranulph Blundeville. The earl, however, was with the king, together with Peter de Ruphins Bishop of Winchester, William de Cantelupe, Brian de l'Isle, and Peter de Maulay. All were suspected of disaffection, and in consequence the earl and the bishop left the camp, although the earl was afterwards brought by the Bishop of Chester to his duty. Falk remained at Northampton until he fled to Wales.

The siege operations included on the east front a petrary and two mangonnels, which daily hattered the opposite tower; on the west front, two mangonnels bore upon the old tower; on the north and south fronts were two mangonnels, one on each, and each breached its opposing wall. The operations of these seven pieces of ordnance were materially aided by two large wooden turrets, tall enough to command the whole castle, and supported by other smaller turrets, all charged with archers and crossbow-men. There was also the timber covered-way known as a cat, by the aid of which miners were able to undermine the wall, while the bowmen cleared the battlements above. These works were thickly covered with hides, rendering them proof against fire; and the slingers, of whom there were many, probably kept up a general and incessant shower of pebbles upon all who dared to show themselves on the ramparts.

The works were stormed by four vigorous assaults. First the barbican was taken, with a loss of four or five of the assailants. Then entrance was effected into the outer ward. This was the work of the men of Dunstable, and was attended with severe loss. In this ward were stored most of the munitions of the place,—arms, horses and harness, cattle, bacon, and live hogs. Much forage was here burnt, with the houses and sheds in the ward.

The miners next underworked the wall next the old tower, which wall fell. The resistance here appears to have been obstinate, many lives were lost upon the breach, and ten of the most forward assailants were taken and carried into the interior of the place.

Finally, on the vigil of the Assumption, 14th August, about the hour of vespers, the miners having undermined the foundations of the old tower, fired the props. The walls split, the smoke rose, and the place being no longer tenable, the garrison hoisted the royal banner and surrendered, sending out de Brailroc with the wife of Falk, and the other women. Next morning the king took possession. William de Breauté and the garrison were put upon their trial, and he and about eighty of his men were hanged out of hand. Three were allowed to join the Templars in Palestine, and the castle chaplain was delivered over to the archbishop as the spiritual power. It appears from the records that the remainder of the garrison escaped with fines and confiscations. The spoil was considerable, in treasure, provisions, and munitions of war. Henry left for Keston (Kempston) on the 18th, but was again at Bedford on the 19th, and at Dunstable on the 26th of August. Even when flushed by success he seems not to have been severe upon those not actually implicated. Alice, widow of the executed William de Breauté, was allowed her dower-lands in Bedford and Cumberland. On the 19th and on the 22nd Margaret, wife of Falk, was allowed for her subsistence the manor of Heyford and Shridge-worth. Gilbert de Breauté also was allowed a manor; and Falk, the author of all the mischief, had twenty marks allowed for his personal expenses on his way to exile.

Immediately upon the surrender Henry broke up the siege establishment. 900 quarrells, the residue of the 4,000, were returned to North-

1st. To what extent the hydrate of lime becomes re-carbonated by exposure to air?
 2nd. What is the physical condition of the carbonate so produced? and
 3rd. Whether in this long interval the silica and lime can directly unite with each other?
 Different views on these subjects have been advanced, the prevailing opinion undoubtedly being that the lime never becomes thoroughly re-carbonated, but stops short at a point when a definite combination of hydrate and carbonate of lime is formed; and, secondly, that lime is endowed with the power of attacking sand and other forms of insoluble silica by long contact at the common temperature.*

The conclusion to which I have been led by the chemical examination of the ancient mortars from Burgh, Pevensey, and other Roman castra, is that the lime and carbonic acid are invariably united in monatomic proportions as in the original limestone rock, and that there is no evidence of the hydrate of lime having at any time exerted a power of corroding the surfaces of sand, flint, pebbles, or even of burnt clay, with which it must have been for lengthened periods in contact. Further, that the water originally combined with the lime has been entirely eliminated during this process of re-carbonation, and, this stage passed, the amorphous carbonate of lime seems to have become gradually transformed by the joint agency of water and carbonic acid into more or less perfectly crystallised deposits or concretions by virtue of which its binding properties must have been very considerably augmented. It is proper to state that Messrs. Abel and Blount assign as one of the causes of the hardening of mortars, the formation and subsequent crystallisation of the carbonate of lime.

Analysis of the Roman Mortar from S.E. Tower, Burgh. —

Samples II. and III. were taken from the south wall; specimen IV. from the north wall.

SUNDERLAND GASWORKS.

THE Sunderland Gas Company opened their new offices on the 9th inst. They occupy a conspicuous position at the south-west corner of Fawcett-street, and are erected from the design of Mr. G. H. Hoskins, architect, whose design obtained the first premium in a public competition in March, 1867.
 The style of the building is Gothic, and is dependent for its effect rather upon breadth of treatment of the whole than the elaboration of parts. The materials employed are red pressed bricks, with Dunhouse stone dressings. The whole of the windows and principal entrance-doors on the ground-floor have segmental-pointed heads, those of the doorways being recessed, and furnished with columns of grey Dalbattie polished granite, with carved caps of Dunhouse stone. The south front, or principal elevation, occupies a frontage of about 80 ft. towards the Borough-road, and is distinguished by an oriel window, supported by a stone buttress and shaft of grey Dalbattie polished granite, which is surrounded by a carved cap representing a group of ferns.

On the ground-floor the following accommodation is provided, viz.—public offices, 33 ft. 3 in. by 22 ft.; secretary's office, 24 ft. 4 in. by 17 ft. 3 in.; out-door manager's office, 17 ft. by 15 ft.; metre inspector's office, 14 ft. by 13 ft.; principal or director's entrance from Fawcett-street,

26 ft. 6 in. by 10 ft.; strong rooms, with iron doors, by Chubb; lavatories; water-closets; &c., &c. The first-floor comprises director's room, 33 ft. 3 in. by 22 ft.;—this room has a handsome panelled ceiling and an oak dado 3 ft. 6 in. high, the oriel window forming a good feature;—photometrical and experimental room, 17 ft. 3 in. by 13 ft.; metre warehouse, 35 ft. 1 in. by 15 ft.; book-room; lavatories; water-closets, &c.

The top floor and basement are principally devoted to the storage of materials. The principal stairs and landings are of stone, and the entrances laid with Maw & Co.'s geometrical mosaic pavement. The whole of the furniture for the director's room, and the several offices, and principal landing, is of oak. The marble chimney-pieces have been executed by Messrs. Fisher & Dyson, of Huddersfield.

The contractors for the various works have been as follows:—masonry, bricklaying, and plastering, Mr. James Young, Sunderland; plumbing, Mr. H. Tuckson, Sunderland; slating, Mr. Robert Preston, Sunderland; carving, Messrs. Farmer & Brindley, of London; carpentry and joinery, Messrs. D. & J. Rankie, Sunderland; painting and glazing, Mr. George Kirkup, Sunderland; ironwork and lamps, Messrs. W. H. Walker & Son, Newcastle-on-Tyne; oak furniture and office-fittings, Messrs. W. Jobling, Sunderland; S. Atkinson, Sunderland; Knaping & Appleby, Darlington; and Hobbie, Smith, & Whitecross, Sunderland; bellhainging, Mr. T. Heslop, Sunderland. Mr. Robert Hodgson has acted as clerk of the works.

COMPLETION OF THE BEDFORD DRAINAGE AND WATERWORKS.

THE mayor and several members of the corporation have inspected the waterworks on the Clapham-road. The storage well was also visited, and the level of the water found to be 2 ft. 3 in. above the surface of the river. Several gentlemen tasted the water and pronounced it excellent. The reservoir, a subterranean brick-built tank capable of holding 400,000 gallons, was also examined, and the party remained until the town was pumped in. The main sewers of the town were afterwards flushed, and the party drove off to the drainage works at Newnham, which were also thoroughly inspected. The storage well yields 200,000 gallons every twenty-four hours. It is 60 ft. long, 18 ft. wide, and 25 ft. deep; with this is connected a pumping-well by a heading 60 ft. long and 6 ft. wide. For raising the water there is erected a perpendicular plunger, worked by an engine of 40-horse power, of combined high and low pressure, made by Bevington & Co., of London. This engine will pump 30,000 gallons in an hour if needed. The water is lifted from the well to the reservoir on the summit of the ridge known as Foster's-hill. The perpendicular lift is 150 ft. The rising main is taken across the Clapham road direct to the hill.
 The reservoir is cut out of the dense boulder-clay which forms the eastern ridge of the Ouse valley, and as the top-water in it stands 140 ft. above the average level of the town of Bedford, there is pressure sufficient not only to supply all the houses with water, but to throw a jet to the top of the highest building when needed in case of fire. The tank is 64 ft. long and 60 ft. wide, and contains 15 ft. 6 in. of water: in round numbers, it gives an available reserve of 400,000 gallons of water, double the quantity required at present for a day's consumption. The roof is supported by columns and arches, all being covered in to ensure coolness, and prevent impurities coming into the tank.
 On the visitors leaving the hill and descending the slope to the north end of Tavistock-street, the engineer, Mr. John Lawson, explained that this was the highest portion of the system of sewerage, and gave a practical illustration of the advantage of bringing the water-works in union with it at this point, so as to flush the whole of the drains throughout the town. This can be done at any moment, and perfect cleanliness of the sewers obtained by the mere act of turning on the water at certain points. There are thirteen miles of main sewers, which are all straight, and can be seen through at the manholes when inspection is needed. There are two levels in the system, but they come to one outfall, and provision is made in the upper one for conveying sudden overflows of storm-water into the river. The main sewer on the north side is brought to the left bank of the river and passes along the margin by the premises of the Swan Hotel, and here the surface is utilized: over the main is an embankment 25 ft. wide, forming a

fine promenade. At the suburb known as Waterloo the main sewer of the south side of the town is brought in a tube under the river to the main above referred to, and the whole is conveyed straight under the roadway by the side of the river to Newnham, three-quarters of a mile. Inside the walls of the old Priory-mead a tank has been constructed which receives the sewage, which is then raised to the desired height by two horizontal 12-horse engines working centrifugal pumps. From the lift the sewage passes along by gravitation to a field of 54 acres, where it is distributed. A portion of the field is not yet brought into cultivation, but a large breadth is now bearing a fine crop of rye-grass, which has sprung up in a very short time.

The borough treasurer, Mr. James Wyatt, in writing to us on the subject of the drainage, says:—"It is very successful, and a great triumph over the 'dirty party.' I think the distribution of the sewage is a very satisfactory solution of the great question; and that Mr. Lawson deserves credit in the engineering world, as he receives commendation from the local governing body of Bedford. I say this as a disinterested person so far as concerns any connexion with the engineering profession, or with Mr. Lawson personally, although greatly interested in the success of such works everywhere."

HEALTH AND DISEASE IN ROMSEY.

OUR attention has been drawn by the surveyor of the Romsey and Winchester turnpike-roads to the fact that upwards of thirty cases of fever have occurred this season at Romsey; and to the probable cause of this. Some years since the surveyor recommended a plan whereby a constant flow of water at all times down the main sewer of the hundred was obtained, and the health of the community secured, after the removal by the railway company of the canal whereby the sewer was flushed. On the subsequent complaint, however, of a mill-owner, a hatch which had previously existed while the canal water was available, was placed on the sewer, in order to accumulate water for the use of his mill, and by way of flushing the sewer at stated times. The surveyor's plan had been in operation during the years 1863, 1865, 1866, and 1867, in none of which years was there any such fever as there has been since the hatch was replaced. The surveyor, therefore, considers that the replacement of the hatch on the sewer, and hence the cessation of the constant water-flow, are the cause of the prevalent fever. Anyhow proper inquiry is called for.

AUSTRALIAN MEAT FOR THE ENGLISH MARKET.

EXPERIMENTS in the preservation of meat still excite public interest. From New South Wales we learn that an attempt is about to be made by Mr. Mort in conveying a cargo of meat, frozen by his process, from Sydney to England. The process has been for a long time before the public. An instance of the success of the chief process carried on by the Victoria Meat Preserving Company has recently been brought under notice. Two legs of mutton cured by their process were hung in the rigging of the brig *Greyhound*, and remained there six weeks. The meat was afterwards cooked, and proved to be perfectly sound and palatable from the outside to the bone. The Victoria Company supply meat cured in this way at a cheaper price than salt beef. Besides the vacuum or tin-enclosing process, this company salt and smoke dry meat. Their rolled mutton hams are sent to India, Japan, &c. Meat biscuits are also made. The Melbourne Meat Preserving Company still carry on their operations in the preparation of tinned meat, to which they limit themselves. A satisfactory trial of this process has been made by Mr. Welch, in London, of some Australian roast mutton, cured by Mr. Ritchie before his connexion with the company. Mr. D. Medlock's process of curing joints of meat by dipping them in bisulphate of lime has been put to a public trial at Melbourne, where a number of gentlemen dined off roast and boiled legs of mutton, and roast and boiled beef, which had been subjected to the process about three weeks before. The meat was served up hot, and proved to be quite equal to fresh cuts, the gravy being

* Vide "Knapp's Technology," edited by E. Ronalds and T. Richardson, vol. ii., p. 386; and *see* General Gilmore's "Practical Treatise on Limes, Cements, and Mortars" (New York, 1863), pp. 174 and 188; Mr. G. R. Burnett's "Radiatory Treatise on Limes, Cements, and Mortars," &c., p. 49.
 † "Handbook of Chemistry," p. 236.

retained. Mr. Medlock is desirous of trying to get at the home-market, and a shipment of meat prepared by his process was sent to England by the *Lincolnshire* on her last trip. The result of the experiment cannot be known in Australia for some time to come; but, should it prove successful, a cheap way will have been found of solving the problem which has engaged so many ingenious minds. We may here add that the most convenient mode of preparing sulphurous acid for the preservation of meat on Dr. Dewar's principle is said to be by adding a few drops of sulphuric acid or oil of vitriol to sulphate of soda, the sulphurous acid gas being thus evolved in great quantities.

THE PHYSICAL COMMOTIONS THROUGHOUT THE GLOBE.

THE "BUILDER" was the first to point the attention of the public to the indications, ever and anon occurring, of some tremendous impending crisis, which the activity of volcanoes, the frequent recurrence of earthquakes, and the prevalence of hurricanes, in various parts of the world, seemed to betoken. It now appears that numerous cities in South America have been more or less completely destroyed, shipping wrecked, and twenty to forty thousand persons killed, by a series of terrible earthquake shocks. The country chiefly ravaged is Peru and Ecuador, where, along 3,000 miles of country and coast, property estimated roughly at three hundred millions of dollars has been destroyed. The shocks continued from the 13th to the 16th of August; and it may be that they were not even then over; but it is most earnestly to be hoped that the actual crisis had then come, and that the hidden force which has been so long threatening is now expended. Earthquakes have of late occurred not only in America, North as well as South, and in Europe, but in Asia, and also in Australia. The commotion is evidently cosmical: it has affected the whole globe, north and south, from Iceland to the Sandwich Isles, from Britain to Australia, and east and west, from America to Asia. Perhaps even our strangely arid season, like last year's hurricanes, has had something to do with this cosmical disturbance.

The late Mr. Hopkins, of Cambridge, calculated that the force which produced the great geological rents in the earth's crust was one operating "upwards and outwards from within." Does not such a force denote the expansion of the fluid though encrusted sphere, probably from the centrifugal force of its rotation, by which expansion it relieves itself, so preserving uniform the rate of rotary motion so long as the crust gives way to the force of expansion?

SOMERSETSHIRE ARCHÆOLOGICAL SOCIETY.

THE twentieth annual meeting of this society commenced at Williton on the 25th ult., and the weather being fine, there was a good attendance, including Sir Alexander Hood, bart., M.P., the president for the year, Sir P. P. Aoland, bart., Mr. Vanderhyl, M.P., &c. The business meeting was held at the National School-room. The report referred to the labours of Mr. Sanford, in compiling the first volume descriptive of the contents of the Somersetshire caves. Mr. Freeman described the construction of Dunster Church. The officers for the ensuing year were appointed. The meeting was attended by nearly eighty ladies and gentlemen. In the afternoon an excursion left Dunn's Hotel for Bicknoller, Halby old Manor-house, and Stogumber. In the evening an ordinary took place at the same hotel, of which nearly the same number of persons partook.

It was intended to hold the meetings for the reception of papers at the National School-room, but in consequence of the want of accommodation many persons were obliged to return home by the quarter to nine train: these papers were therefore read at the dinner-table. The Rev. Mr. Hingo read a paper on "Ina, the King of the West Saxons," and of his residing in the neighbourhood of Taunton. Mr. Parker then read a few remarks about "Old Cleeve Abbey," where they purposed to go next day.

The members did not go to Orchard Wyndham on Thursday to see Old Mother Shipton's stone,

as intended, not having time. They went direct to Combe Sydenham, once the residence of Sir F. Drake; thence to Netticombe Court House, thoroughly examining it; and thenceforth to Cleeve Abbey, where Mr. Parker again read the paper of the evening previous respecting it. Thence they went to Dunster Castle. The park-gates being thrown open, they drove to a large marquee erected by Mr. C. Luttrell, to entertain them at luncheon, where upwards of 100 sat down, and the society afterwards made an examination of the outparts of the building. On their return, Carhampton Church was visited, and thence home to Williton, where an ordinary at Dunn's awaited them, as on the preceding day.

Next morning, thirty-two members of the society proceeded to East Quantoxhead Church and manor-house, Strington-cross, Stoke Courcy Church, Fairfield (the seat of Sir P. P. Aoland, where the president, the son-in-law of this gentleman, entertained them at luncheon), whence they proceeded to the old manor-house at Doddington, the church, and old mines and marble quarries; thence to old Dousborough Camp, back to St. Audries, by way of the park, the residence of the president; and so ended the meeting.

OPENING OF THE HOP AND MALT EXCHANGE.

THE new building in Southwark-street, Borough, of which we gave a view in our volume for 1867, page 731, has just been opened for business purposes. It was not publicly inaugurated, in consequence of the unavoidable absence of one of the members of the royal family, who, however, promises that he will consent to officiate on his return to town in November. The building, as already noticed, is situated at the corner of High-street, Borough, in the immediate vicinity of the hop trade operations. It contains an exchange 80 ft. by 50 ft., a subscription-room, 40 ft. by 32 ft., a refreshment department, about 120 offices, 50 stands, $\frac{1}{2}$ acres of warehouse room, and $\frac{1}{4}$ acre of vaulted cellarage. Of the offices and stands about half are already let and tenanted, and a brisk application is being made for the remainder. Several suites of auction-rooms adjoin the exchange. The capital of the company paid up is 70,000*l.*; the land is freehold, and cost 60,000*l.*; and the building, erected under the supervision of Mr. R. H. Moore, the company's architect, has cost about 65,000*l.* The figures in the pediment and the whole of the other carvings were executed by Messrs. Frampton & Williamson.

FROM SCOTLAND.

Aberdeen.—Free Cilcomston Church has been opened for public worship. It has been built from designs prepared by Mr. William Smith, city architect. The style is Early Decorated Gothic, the walls being of hammer-hocked granite, with freestone dressings. The front to Union-street includes a main door, and wheel window over it $1\frac{1}{4}$ ft. in diameter. When finished, the height of the tower and spire will be 145 ft., and the base of the tower contains one of the gallery staircases. There are three passages along the area of the church, one in the centre, and one on each side, with a cross passage in front of the pulpit, which is at the north-east end. Easy access is afforded to every part of the church. In all, there will be six exits. The interior length, exclusive of vestibule, is 80 ft., and the width 54 ft. 6 in. Two rows of iron columns run up the full height of the building, supporting the middle roof. At the north end of the building there are provided session-house, vestry, and other necessary accommodation. The contractors were,—mason work, Messrs. P. Bisset & Son, 2,750*l.*; carpenter, Mr. Middleton, 1,546*l.*; plumbers, Messrs. R. Gordon & Co., 1,601*l.*; plasterer, Mr. Morrison, 89*l.*; Slaters, Messrs. Florence & Kemp, 101*l.* 13*s.*; iron columns, Messrs. W. McKinnon & Co. 40*l.* The total cost is upwards of 4,786*l.* 13*s.*

Jedburgh.—The new Commercial Bank now in progress is in the Italian style, and has a frontage of 52 ft., and will be three stories in height. The first story is finished, and the second is being proceeded with. At each side of the doorway are two pillars with composite capitals, from which spring two arches, an inner

and an outer. The outer arch, which has a carved male head for a key-stone, spans the whole breadth of the doorway, while the inner one is supported in the centre by another pillar similar to those at the sides, thus forming two small arches. The soffit of the doorway is carved, with representations of oak and laurel foliage. The spandrel is also filled with sculptured foliage. Above the door is a balcony, supported by two ornamented trusses or brackets, and surmounted with a balustrade. Above this again will be a two-light window, divided by a shaft with moulded base and capital. This window is also to be surmounted by a light balcony and plain balustrade. The arches of the windows are round. Along the top of the building there is to be an enriched cornice, surmounted by a balustrade and pedestals. The hewing and sculpture work has been executed under the superintendence of Mr. William Brunton, jun., of Jedburgh. The architect is Mr. Rhind, of Edinburgh.

FROM IRELAND.

Antrim.—The foundation-stone of a new Protestant hall has been laid in this town by Viscount Massereene and Ferrard. The proposed hall, which has long been much wanted, is to be erected a short distance off the road leading from the Northern Counties Railway Station to the town. The dimensions of the proposed building are,—length, 63 ft.; breadth, 42 ft.; and height, 25 ft. It will consist of two committee-rooms, and a large assembly-room, which will accommodate about a thousand people. The building, which is to be erected with block stone, will be in the Doric style, and will have an ornamental front. The plans for the building were prepared by Messrs. Young & Mackenzie, and it is being erected by Mr. William Vance, sen., builder, Antrim. It is estimated the building, when completed, will cost about 700*l.*

Dalkey.—The foundation-stone of Dalkey Harbour has been laid at the Coolmore landing-place. It will supply the want, much felt, of a comfortable landing-place, besides being adapted for the reception and unloading of vessels of small tonnage and fishing craft. Two piers, in accordance with a plan drafted by Mr. B. B. Stoney, C.E., of the Dublin Port Board, will extend, the one at the north side about 150 ft., and the other about 50 ft. into the sea, and will embrace an area of about half a mile. The cost will be about 2,000*l.* It will be built of granite, which will be obtained from excavations in the hill close by. The contractor for the work is Mr. John Cunningham, of Dalkey, who has engaged to complete them in six months. They will be superintended by Mr. Stoney, on the part of the Port Board, and by Mr. Quirk, on the part of the Dalkey Commissioners.

Sherries.—A new church has been erected in and for the parish of Holmpatrick, adjacent to Sherries, the old church having been lately found insufficient to meet the requirements of the Established Church, besides having fallen into a condition of ill repair; and the ceremonial of consecration has been performed by the Archbishop of Dublin. The site of the new church is close to the old one, and is a donation from Ion Trant Hamilton, M.P., who also contributed 700*l.* towards the building-fund. The edifice is built according to a plain Gothic design, by Mr. James Rogers, architect, Dublin. It is about 90 ft. in length by 25 ft. in breadth. This length includes that of the chancel, which is about 24 ft. by 16 ft. in breadth. The side walls are 17 ft. high, and a very pointed roof gives an elevation of at least 17 ft. more at the centre within. Close to an entrance porch rises a square tower on the north-west angle, surmounted by a broached octagonal spire. The material used in the building is chiefly limestone, from the Milverton quarries, and also from quarries at Athlora. The side walls are each pierced with one triplicate and two duplicate windows. A second external porch on the same side with the other leads to the vestry-room. The interior is plain. The seats are in the most modern style, and, as well as the roof, are of varnished deal. Opposite the chancel a gallery has been erected at the private expense of Mr. H. H. Woods. From the ceiling depend two Medieval chandeliers, supplied by Messrs. Sloane & Co., of Dublin. All the buildings and fittings have been executed by Mr. Walter Doolin, also of Dublin.

SCHOOLS OF ART.

A Swindon School.—A local committee has been formed to establish a school of art in this town, and the use of the Great Western Schoolroom has been granted for this purpose. Sir Daniel Gooch, bart., M.P., and Mr. A. L. Goddard, M.P., are patrons of the Swindon School; Mr. J. Armstrong, chairman; and Mr. Miller, the very successful master of the Cirencester School, will be the art-teacher. It is proposed to open the school on Tuesday, the 6th of October next.

The Salisbury School.—The annual distribution of prizes to the students of the Salisbury School of Science and Art has taken place at the Council-house, the mayor (Mr. S. Eldridge) being chairman on the occasion. Amongst others, the master of the school, Mr. Fraser, addressed the meeting. The school, he said, though but in its infancy, was progressing hopefully.

THE SEWAGE QUESTION.

EXPERIMENTS are now being made at Tottenham with a mode of treating sewage called "the German system," which is in practical operation at Berlin, Hamburg, and Potsdam; but is, nevertheless, appropriated by the experimenter, who declines to publish the nature of the ingredients used for the precipitation of the sewage and clarification of the water holding it in solution and suspension. Surely there could be no difficulty in obtaining the information for behoof of the public from Hamburg or Berlin.

The plan adopted is to allow the sewage to run continuously through a pit of about 50 ft. long, 20 ft. wide, and 10 ft. deep, running in at the same time one two-thousandth part by weight of the disinfecting agent; the result is said to be that almost the entire quantity of solid matter, say one and a-half thousandth by weight of the fluid sewage, is precipitated, its volatile parts fixed, and the water allowed to flow away from the farther end of the tank clear in appearance, and almost without smell. The disinfecting fluid consists of nine parts water and one part composed of three simple substances, which any one may see employed at Tottenham, but the composition of which M. Hillé, C.E., the experimenter, declines to give to the general public.

From the data supplied we understand that the solid ingredients used in this process cost about 20*l.* a ton; so that in the proportion in which they are employed, they would cost about one farthing per ton of liquid sewage dodecided, or 1*l.* 9*d.* a ton for the solid matter obtained. The effect of the agent, setting cost aside, is considered to be successful, settlement taking place with surprising rapidity, and deodorisation being almost complete.

A conference has been held at Leamington on the sewage question. The committee of the Milverton, Lillington, and Leamington Local Boards met at the townhall, to further consider what steps shall be taken for the purpose of disposing of the sewage of the three parishes. At a previous meeting the committees adopted the principle of irrigation, and now resolutions and letters were produced, showing that each Board acquiesced in the decision. The following resolution was unanimously adopted:—"That it appears to the Sewage Committee of the three Boards that it would be for the advantage of the district if the three parishes were formed into a united district for the purpose of sewage utilisation." The meeting then adjourned.

THE SUBWAYS ACT.

The new "Act to make provision respecting the use of subways constructed by the Metropolitan Board of Works in the Metropolis" (which is a "local" Act), has been referred to in several journals, but an analysis of its clauses has not yet appeared. As it is a subject of special interest to our readers, we present a carefully arranged outline.

The Act commences by reciting the construction of subways in the new streets which the Board are authorized to make; and that it is expedient, in order to prevent inconvenience to the public by the frequent breaking up of such streets, to enable the Board to require companies, when placing gas, water, and other pipes, to lay them in the subways. To effect this it is enacted that the Board may serve a

notice on any company going to lay down pipes, requiring them to lay them in the subway; and the company must do so, notwithstanding anything in any special or general Act. After the receipt of such notice the company must not break up the street. The penalty for disobedience is to be 2*l.* (without prejudice to other proceedings), and the pipe may be removed and surface made good at the expense of such company. Pipes already laid in streets under which a subway is made, must be removed into the subway; but this is to be at the cost of the Board. If, however, it seems necessary to substitute new pipes for the existing ones, the cost is to be fairly apportioned. Differences are to be settled by an arbitrator appointed by the Board of Trade. All companies or persons are to be allowed to use the subways without favour, so far as space will admit. The companies are to maintain the pipes, under the supervision of an officer appointed by the Board; and the subways are to be maintained by the Board in an efficient state of ventilation and repair, and to be free from water and other obstruction. The Board and the companies are to agree as to the pecuniary and other details connected with supervision; and in case of any difference, it is to be settled by an arbitrator appointed by the Board of Trade, on the application of either party. The powers of the Local Management Acts are to be applied to this Act. No bye-laws under this Act shall come into operation until allowed by the Board of Trade, and twenty-one days' notice of the intention to apply to the Board of Trade for the allowance of such bye-laws, shall be given to the gas and water companies supplying gas and water in the district. The Act is only to apply to subways constructed under the Covent Garden Approval and Southwark and Westminster Communication Act (1857); Victoria Park Approach Act (1855); Thames Embankment Acts (1862, 1863, 1864); Metropolis Improvement Act (1863); and the Whitechapel and Holborn Improvement Act (1865).

PARIS.

M. VIOLETTE DUC's small building, constructed at the south of Notre Dame, as a residence for the arch-priest and beadle, is terminated. It is in the style of the French "Modern" Gothic, with square-headed windows and high-pitched roof. The enormous works of restoration of the Cathedral are drawing to a close, and the iron railing surrounding it progresses rapidly. Some important experiments have been made lately for playing the new grand organ by electricity, in adapting to it the system of apparatus invented by Lanenberger & Co. of Smiswald (Switzerland), and presented to the Society of Encouragement by M. Spiess, a member of the above firm, in the shape of an electric piano. We attended by invitation at a rehearsal at Notre Dame, and had an opportunity of examining the mechanism of the apparatus. Several pieces from the "Traviata," "Trovatore," the March in "Norma," &c. were well played on the grand organ in good time, and also Handel's "Creation," the "Domine salvum fac," &c. &c. The great difficulty is to contrive a battery which will remain with closed circuit in constant action for two months without diminution of force. Daniel's battery improved by M. Bonlay, is likely to effect this, as he has one working an electric clock, which has not been disturbed for a month, and though the circuit is always closed, no weakness has been observed in the current.

The double syphon for conveying the sewage of all the south side of Paris, to join the great northern collector, discharging at Asnières, was finally sunk on the 31st ult., into its channel in the bed of the Seine, near the Pont de l'Alma, without accident. The channel receiving the tubes is 5 ft. deep; the tubes are 3 ft. 3 in. each in diameter, and rest on a layer of concrete 16 in. thick. Another layer is to cover them 19 in. deep. The syphon is 407 ft. long, and it weighs 150 tons. As soon as it was laid the sunk towing-chain in the river, which had been severed, was again united, the towage and general traffic of the river was resumed, and the fly-boats resumed their active service.

At the church of Saint-Germain-des-Près, the new "place" of that name, through which the Rue de Rennes passes, has been completely put into shape, and will measure about 30,000 square feet. A refuge has been placed in the centre. Repairs are being executed to restore the north-west corner of the old church tower, found to be, on

its being disengaged, in a sad state of degradation; the counterfort has to be entirely renewed. There were formerly three towers to the church, two placed at the angles of the choir and transept, and that standing at present. All three were capped with steeples, which gave it the nickname of the *three-steepled church*. About forty-five years ago the two towers at the transept, threatening ruin, were taken down; but the lower portions were allowed to remain as they do at present: it was deemed unsafe to remove them as they serve as counterforts.

THE TRADES MOVEMENT.

A MEETING of masters and workmen in the building trade of Nottingham and district has been held in the Exchange Hall there, for the purpose of forming a board of arbitration in connexion with the trade. A resolution was carried—"That this meeting is of opinion that it is very desirable that a board of arbitration and conciliation should be formed in connexion with the building trade of this town and district." Mr. Mundella stated that there were already 500 boards of arbitration established, and there were 200 candidates for the coming Parliament who had adopted it in their electioneering speeches, and who were going to the House of Commons on this principle; that workmen have a perfect right to combine for their own protection; and that the funds of working men ought to be protected just as effectually as the funds of life insurance or any other society which belongs to the middle and upper classes. The following were appointed on a committee in connexion with the joiners' and carpenters' branch:—Messrs. R. Dennett, Lynam, Barker, Vickers, Stevenson, and H. Marriott, sec. Workmen: Messrs. Ellis, Rowland, Martin, Hutchinson, Drury, and Hicking, sec. In reply to a vote of thanks awarded to him, Mr. Mundella said he hoped their example would be followed throughout England, and that one day he might see a rennon of boards of arbitration in Nottingham. He expressed his belief that the masons, although slow in their movements, were coming right.

At a recent meeting of the Liverpool Trade Union of Operative Bricklayers, held in the Concert-hall, Lord Nelson-street, it has been unanimously resolved to request the Master Builders' Association to join them in settling a permanent code of regulations which shall be satisfactory to all parties, through a court of arbitration, as suggested by the masters in May last. A resolution was also passed in favour of conducting the business of the society in its own offices, instead of at a public-house, as heretofore.

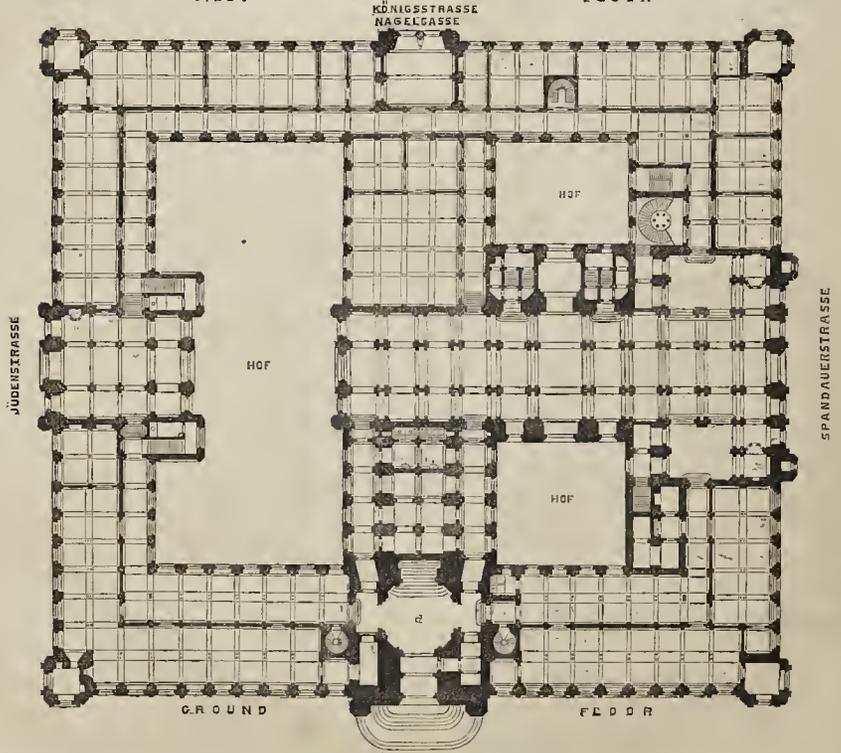

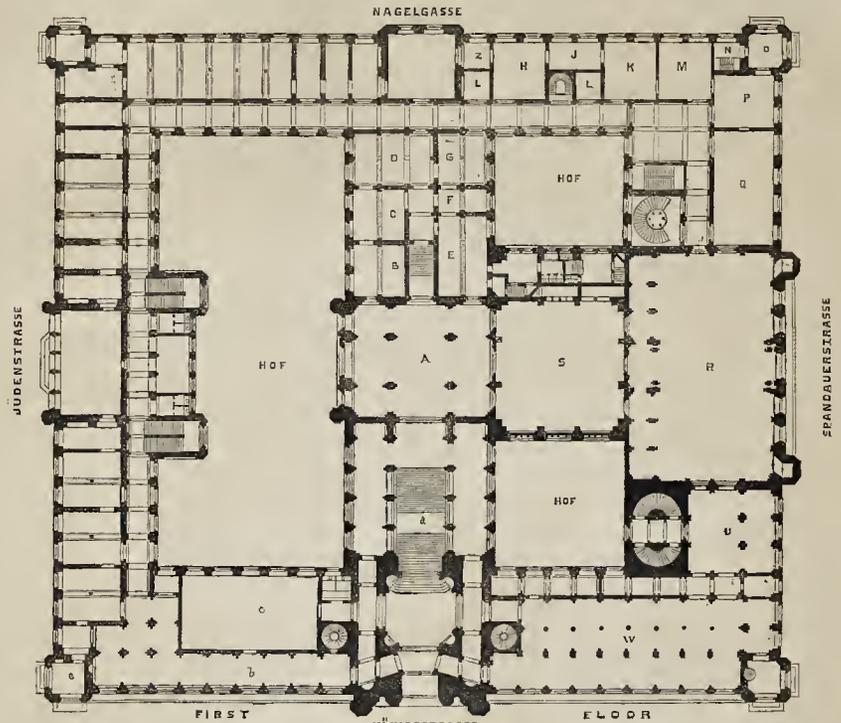

Several mill operatives at Lewiston, U.S., are building houses in their spare hours. Working in the mills nearly twelve hours per day, they manage to scrounge a little time in the morning before the bell rings and after they come out at night, which they devote to building operations. A short time ago one of these persevering men was seen shingling after eleven o'clock at night, and the next morning was at work almost before daylight.

PROVINCIAL NEWS.

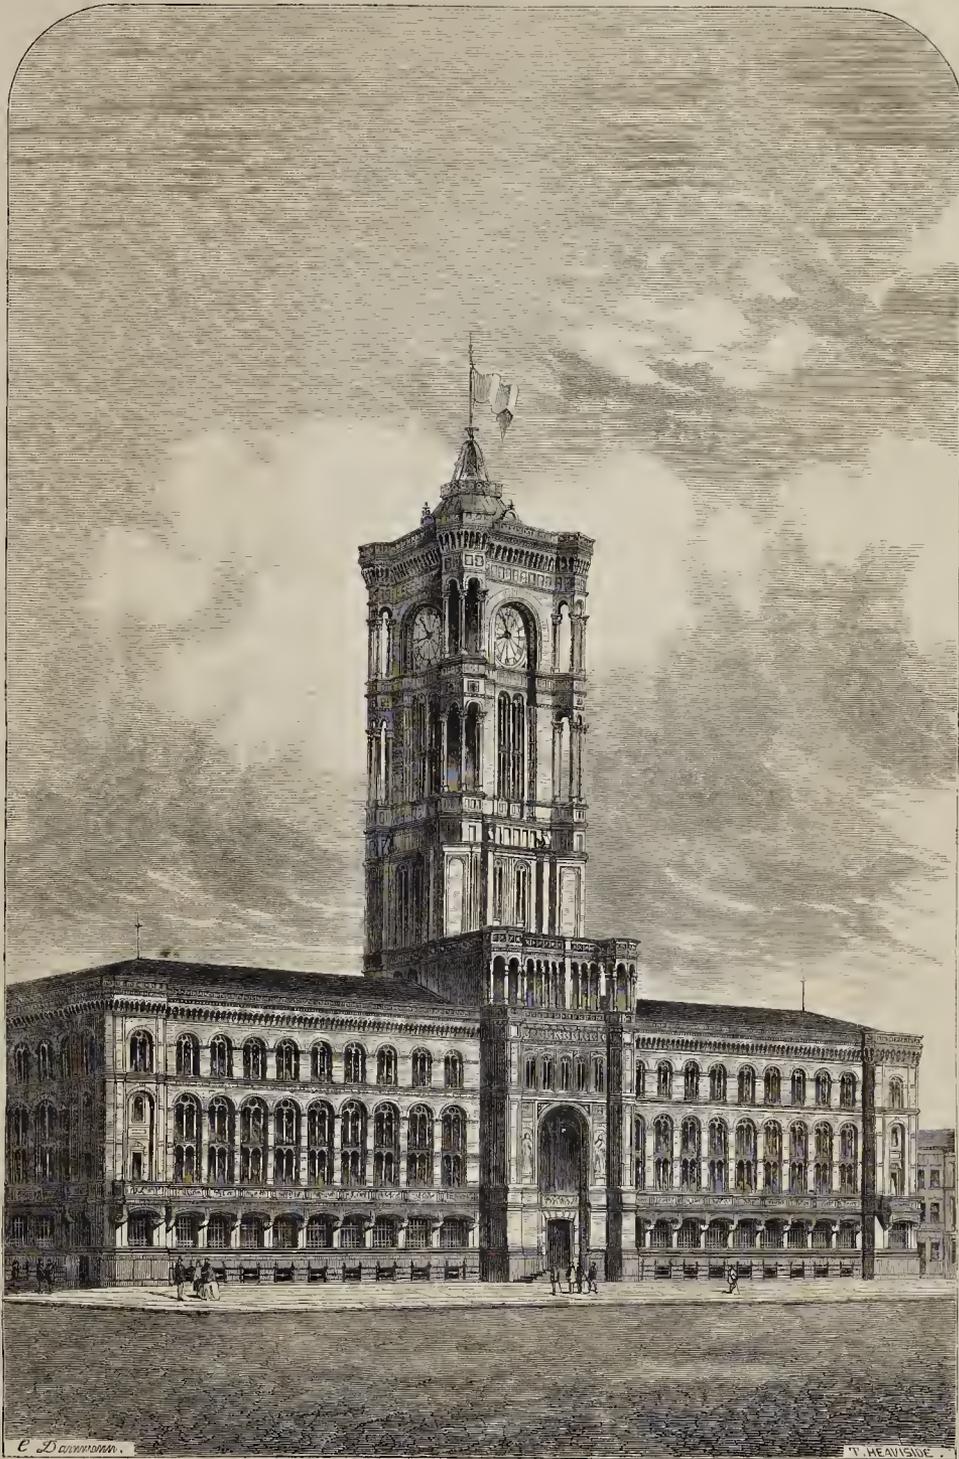

Blackburn.—At the adjourned annual county sessions at Lancaster, the Finance Committee have been empowered to negotiate for the purchase of a site for a new lunatic asylum, and to secure land for the purpose to an extent exceeding immediate wants, in the vicinity of Blackburn, Chorley, or Preston.

Deesbury.—Mr. J. Day, a member of the town council, with the object of promoting the erection of an infirmary for the town, has offered to subscribe 2,500*l.* if 50,000*l.* should be raised; 2,000*l.* if 40,000*l.* only be subscribed; and so on in proportion to 20,000*l.* Should the effort be accomplished, Mr. Day promises further to subscribe 50*l.* a year towards the maintenance of the institution.

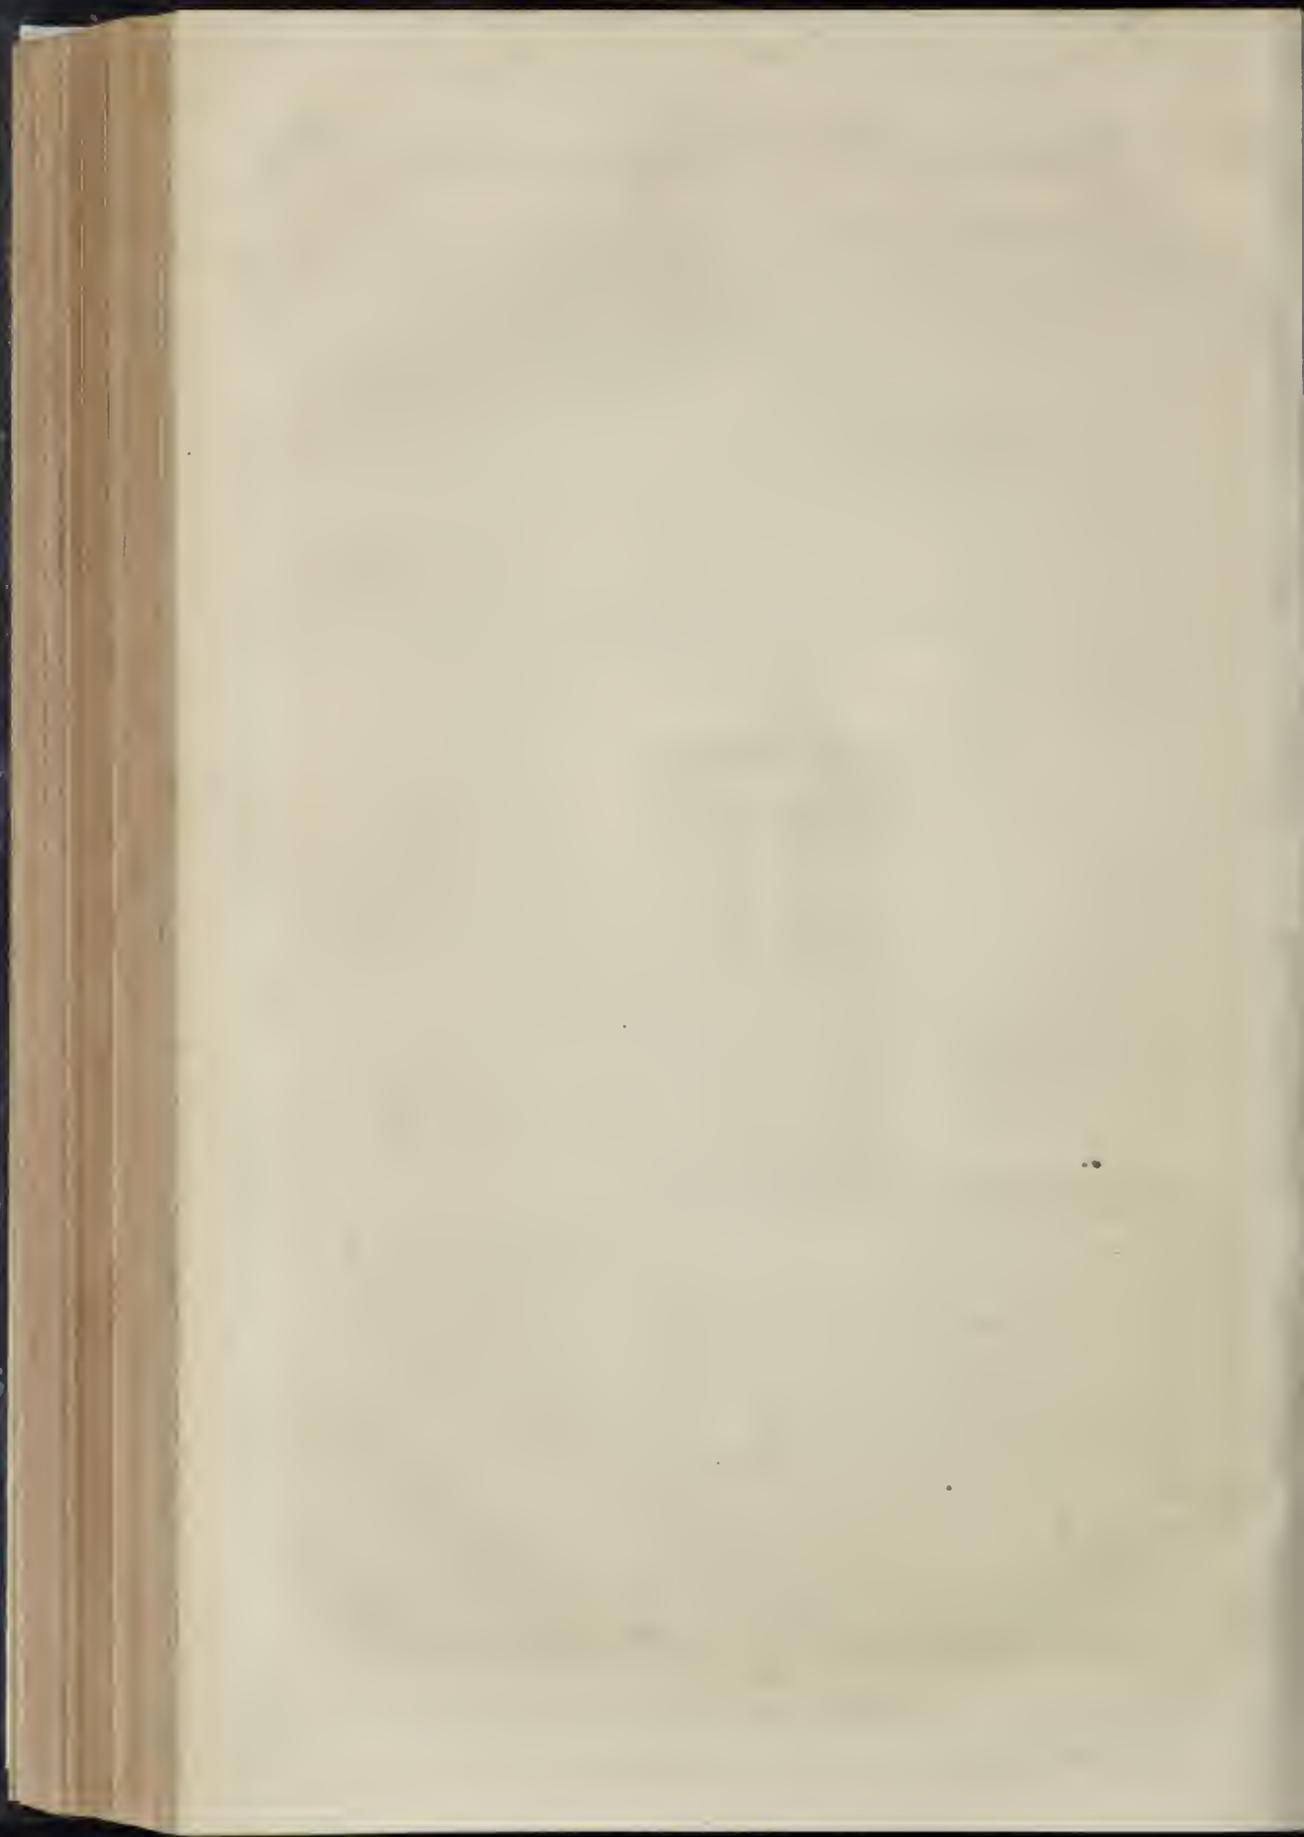

Kirkdale.—At the county sessions in Preston, it has been resolved, that towards the carrying into effect resolutions of the Courts of Annual Session, 1866, authorising the General Finance Committee of the county to borrow 35,000*l.*, for altering, enlarging, and repairing the county prisons at Preston and Kirkdale, to approve of the mortgage of the rates for these purposes for the sum of 8,000*l.*

NEW TOWN HALL, BERLIN.

BERLIN TOWN HALL. — HERR WAESEMANN, ARCHITECT.

THE NEW BERLIN TOWN-HALL.

BERLIN, after something like 600 years of struggle, has risen, from the humblest village, from the position of a simple fishing village, to be the seat of a powerful government, and the capital of all North Germany. Berlin contained at the commencement of the last century, 55,000 inhabitants, at the end of it 169,000, and in December 1867, 703,000, thereby taking rank amongst the largest populations in Europe; whilst the increase of building during the last ten years, has not only placed it on an equality with, but even in advance of, many capitals of much longer standing.

Around the year 1850, the council-house, situated nearly in the centre of the city, being found utterly insufficient for the purposes of government, it was determined to remedy the evil by erecting a splendid building, and thereby provide at the same time a worthy and lasting monument of the increased importance of the city. The first thing, however, to be done, was to increase the irregular, confined, and cramped site, which, on account of the high value of the surrounding land and buildings, was only accomplished by an outlay of nearly a million thalers.

The architectural competition, invited by a circular issued in 1856, created an active interest; but although the prize designs were highly praiseworthy, no definite selection was made from them. Mr. Architect Waesemann was then ordered to prepare a design, with the use of the best designs already sent in; and this, after a careful supervision by a professional commission, was approved and put into execution by the authorities. On the 1st of August, 1860, part of the ground was cleared and ready to be given over to the architect, and all was ready for the triumphant laying of the first stone, in the presence of the king, on the 11th June, 1861. On the 1st of April, 1865, by great press of work, the contract made at the beginning, viz. to have ready for use that portion of the building next the Juden and König streets, and the Nagelgasse, was fulfilled.

The rapid progress of the building of the tower (nearly 300 ft. high) now showed the technical necessity of pushing forward, as much as possible, the König-street front, and the second part of the building generally. The external portions of this, consisting principally of reception-rooms, and large handsome apartments, are now nearly finished, whilst the interior will probably take about two years to complete.

The whole building, of which we give a view as it completed, and plans, will without doubt take a most prominent and important position amongst Berlin edifices; and through the perfection of the artistic brickwork introduced by Schinkel, an epoch in Berlin's building history has been created. The stately building rises from massive foundations of grey Silesian granite, in well-designed blocks of brickwork, the dark red tone of which is varied and lightened by mouldings in granite, and window ornamentations in red sandstone. The complete rectangular ground-plan is 310 ft. long by 235 ft. broad, with a height in the ground-floor of 16 ft., in the first floor 14 ft., in the mezzanine-floor 14 ft., and in the second floor of 16 ft., the front reaching an actual height of 85 Prussian feet. The employment of space is as follows:—

The basement, including the carriage of the two small yards, contains all along the König-street front, the "Rathkeller," so often found in old German towns, dwelling-rooms for under-servants employed in the building, and space for the hot-water warming apparatus and storage of fuel.

In the ground-floor, which is traversed by a handsome corridor, running from the Spandauer-street to the Juden-street, besides the space set aside for the service, are placed the fire-offices and treasury; and it having been found necessary to protect the doors and windows, an iron ornamental wrought-iron grating was provided. Light, roomy, fire-proof passages and vestibules, which are well warmed in winter, afford the means of convenient communication for servants and the public on all the floors.

The first, mezzanine, and second floors, contain offices for the government of forests and landed property of the city, the direction of churches, schools, charities, trade, and the building commission. For those branches of the government which come under the jurisdiction of the civic authorities only, the large council-chambers necessary, as well as a large designing-room for the building commission have been provided on the second floor.

The transport of papers, &c. to the upper floors is effected by means of lifts. Gas, water-supply, closets, &c. are arranged with all the latest improvements, and the greatest care has been paid to the security from fire, in that every compartment, divided by fire-proof walls, is well supplied with hose, and spacious water-tanks under the roof. Most of the apartments are vaulted, the corridors and floors are nearly all paved, and the staircases constructed in granite.

The connexion between the reception-rooms and principal council-chambers is as follows:—

The public steps at the principal entrance lead through the dome, *a*, which terminates in a star-shaped vault, after passing through three floors, and then on to the grand staircase, which forms the approach to the hall, *A*. From here one ascends by the state staircase, lighted from above, and of which the walls are ornamented with frescoes, to the chambers destined for public meetings, *B*, immediately adjoining which are the council-chambers, *C*, *D*, and *E*.

On leaving the hall, *A*, and going to the right, is the court of the city authorities, *S*, which is supplied with a lofty gallery for the use of the public during session. In close proximity with *S* is *R*, the noble principal room, which runs up through all the floors, and is used for receptions on grand occasions. It is rich in architecture, and forms a sort of two-storied arcade, the gallery being connected with the ground by alternated twisted columns and pillars. The walls are painted in gold and light colours, and a rich parquetry floor helps to make up a harmonious whole. The high vaulted hall, *U*, forms the means of communication by a circular staircase, with the largest passage connected with the State staircase, and leads immediately to the library, *W*, with its minor rooms. A corridor, finely decorated with historical frescoes, runs through the tower to the hall, *b*; *o* is the magistrates' court, already completed, and imposing from its stately solidity; *e* is a room for the *sheriff*; and above it, in the mezzanine floor, is a similar one for the *sheriff*. The rooms *Z*, *L*, *H*, and *I* to *Q*, on the first floor, and others on the mezzanine floor, are used, with necessary corridors and staircases, as dwellings for the principal officials; but in case that at some future time it should become necessary to abolish such dwellings, they have been planned and constructed in such a manner as to allow of their being turned into offices.

To conclude. The cost of furnishing, and decoration by gilding and paintings, will bring the whole cost of the building to about four million thalers. Something like 800 officials will be employed in the various offices.

CLEMENT'S INN.

SOME of the members of the Inn are afraid our paragraph last week may lead to the impression that this Inn has ceased to exist, which is not the fact. The Commissioners of the Law Courts have only taken a small portion of the buildings. Mr. Fairfoot, as one of the senior members of the Society, and as representing a firm which has occupied chambers there for nearly half a century, writes:—"The status of the Society as an Inn of Court is not affected, and the present members entertain a confident hope that a new and appropriate edifice will be erected on or near the very important site they still possess, where the Society, which has been in existence at least 300 years, will continue to flourish for many future generations."

EDUCATION.

THE elementary principles of all useful arts and sciences should be sown broadcast among the people; indeed such matters, besides simple reading, writing, arithmetic, and catechisms, should be taught alike to growing boys and girls in the schools of the rich, the middle-class, and the poor; for the truths of natural philosophy are not abstruse but plain, even to the understandings of intelligent children, when they are expressed in simple and familiar language, and illustrated by clear drawings and proper models. If such things were taught at schools with care and persistence the minds of the recipients would be expanded and trained to right principles; sound knowledge, that would be useful to them in after life, would be acquired, and develop with their growth; and they would, by such

knowledge, be brought to perceive and understand more of the attributes, omnipotence, and boundless beneficence of the Creator. In this way, as ignorance and irreligion die out, useful art-and-science-knowledge, combined with true religion, would fructify, and be matured in coming generations. The time has arrived when useful-knowledge-schools should be established in every parish, when the people should be obliged to send their children to them, and when equalized educational rates should be levied to defray the expenses. It is singular what little technical knowledge is taught at schools, and at many schools much that is taught is worthless. The deplorable ignorance among the working-classes is due chiefly to the elimination of art-and-science-knowledge from the teachings at schools, and to the indifference with which such knowledge has been treated in its relation to religion. The non-education of the people is a disgrace to the age; for there are vast numbers of men and women, of grown boys and girls, and of children in the metropolis, as well as in all large cities and towns, whose ignorance is so intense, and whose means of existence are so precarious that they live in a state of semi-barbarism, and are ripe for any crime and mischief. With the majority of these plunder is fair game, and crime is a rule. But establish schools in every parish, teach the rising and coming generations really sound and useful knowledge, and open up for them fields for thought and for labour, then right principles would be fostered, industrious habits would be acquired, and crime and pauperism would be diminished.

JOHN PHILLIPS.

LIGHT AND COLOUR.

THE discussion on the science of colour, which you have permitted in the columns of the *Builder* for these several weeks past, is a very valuable opportunity for ventilating the subject, as I am more than ever convinced that a deeper and clearer understanding of the two great hypotheses of light and colour must supervene ere we shall have an enduring and thoroughly useful aesthetic theory propounded; for the language generally used in speaking and writing upon this topic is inconsistent with those hypotheses, and too often expresses erroneous notions formed on our first and false impressions derived from the sense of sight.

The two hypotheses which for some time divided the scientific world, were the corpuscular (Newton's), and the undulatory (Huyghens's). But the advocates of the former are few indeed, if any; and the latter is now generally accepted as the true theory. Sir John Herschel thus describes the reason of its acceptance:—

"An analogy subsisting between sound and light has been gradually traced into a closeness of agreement, which can hardly leave any reasonable doubt of their ultimate coincidence in one common phenomenon, the *vibratory motion of an elastic fluid*. Any æsthetic superstructure raised upon a Newtonian foundation, therefore, will be insecure. But there is one important point in the Newtonian hypothesis which may serve as a stepping-stone to a clearer view of the fundamental principles of the subject, viz. that it does not suppose the different colours to be inherent in the fasciculi, or bundle of rays, producing, according to this system, the effect of white light; but that the velocity of the atoms of each fasciculus, or ray, determines the particular sensation of colour which we experience on its impinging upon and disturbing the retina, as will be plainly perceived from the following authoritative statement of the hypothesis: 'It is a difference of velocity in the particles which produces in the eye the sensations of different colours.'"

It is therefore inconsistent, according to this statement, to talk about coloured rays, or to talk of colour as if it had an objective existence out of and independently of the eye: the hypothesis only postulates the externality of rays of force.

The undulatory or received hypothesis which supposes the production of light and colour to be analogous to that of sound and music is, however, totally different from the *emissive*; a solid superstructure consequently cannot be built partly upon one, and partly upon the other: we may test either, if we please, and wait till we are convinced of the truth of one of them before attempting to construct the æsthetic portion of the science, which should of course be a deductive sequence of the first principles of the adopted hypothesis. To contend that yellow is a "secondary," is not to make a new theory; all that we can do is to show whether this view is more consistent with the received hypothesis than that formerly taken. It will be evident then that if we do attempt to build up the æsthetic portion of the science one or other of the famous hypotheses must be chosen; and I accept,

in common with the majority of thinkers, the vibratory as the true theory. But the undulatory is as innocent as the corpuscular hypothesis of postulating the external objectivity of colour; the vibrations of the elastic medium only become light and colour in conjunction with the retina, just as the pulsations of the air become sound in conjunction with the auditory nerve; and people who do not think deeply on these subjects erroneously believe in the external objectivity of sound as well as of light and colour.

Thus we may proceed a step further, and show that the compensating spectra your correspondents so frequently refer to have no external existence whatever, but are merely states of reaction of the retina within the eye itself; for it is clear if they had, another person would be able to see the spectra, though the wafer were hidden from view; and that this is not the case has been repeatedly proved by experiment. Every colour, therefore, may be raised in the eye as a compensation to some direct excitement of the retina from without, independently of any external and corresponding vibration; the retina in this way balancing its disturbance by the external ray.

Now, as there may be infinite variation in the external vibrations, which produce "in the eye" all the variations of colour, we may inquire why one colour should be dubbed "primary" in preference to another? There would appear to be two reasons, either for marked or distinctive difference, or the impossibility of blending any two vibrations to produce that particular sensation of colour. Yellow, for instance, would be a "primary" by distinctive difference, and "secondary" also if it cannot be compounded in the way suggested. "Primary" and "secondary" are not entities, and every colour is a compensation to some other.

Now, although accepting the undulatory theory in the main, I do not accept some of the notions imported into it from the corpuscular hypothesis; as, for instance, separate vibrations, as of separate fasciculi, issuing from the sun, but in a general vibratory motion of the elastic medium, which, modified by the prism or other means, produces in us all the varieties of light and colour. This I hope soon to have the means of demonstrating: it has indeed been demonstrated over and over again, had the significance of the fact of the reconcentration of the rays of the spectrum been duly appreciated; for, when the various vibrations are thus recombined, they produce one homogeneous action, and the sensation of white light.

According to the received theory, the analogy between music and colour is no longer a fanciful conjecture, these as well as other phenomena pointing to a science of proportion underlying all nature as the basis of harmony which I am endeavouring to work out.

W. CAVE THOMAS.

P.S.—To work out the aesthetic theory scientific artists should unite their endeavours with those of Professor Tyndall.

STREET LIGHTS.

I SHOULD like to occupy a small space in your paper on the subject of street lamps. I think every one will allow that throughout the metropolis they are in a most defective condition. There is hardly a capital in Europe where the lamps are so neglected. Why I wish at this moment to intrude upon you is that we are opening large and important thoroughfares, in which I wish to see suitable lamp-posts erected, a design which will assist the effect of the street architecture. On the new embankment, as far as I can understand the plan, it is proposed to place standards on the granite wall; if so, I think it will require an unusual treatment. The lantern should be brought out from the lamp-post by an arm bracket. The lantern, at least the lower part, should be spherical, in one piece, without any framing, so that the light may be thrown on the pavement without shadow. The upper half may be any form, but the material should be opaline glass, which acts as a reflector, and it also gives a more brilliant appearance to the street than a metal cover. The opal glass could easily be kept clean. The base of the lantern should not be more than 10 ft. from the ground, and the distance from lamp to lamp about 25 yards. There is at present, I observe, an experiment in Piccadilly, of three lamps, but they all have their lantern framing too heavy, especially the base, throwing thereby

a deep shadow. The Paris post and lantern are good: some specimens may be seen in London. There are two in Oxford-street; and in the Duke of Buccleuch's carriage-drive they are in use. In the Builder, some two or three weeks since, a large lamp was figured; and, taking the dimensions from your account of it, it appears that the centre lantern is 25 ft. from the ground. That is a great waste of light, and at such a height it becomes certainly inconvenient, if not dangerous, to the lamp-lighter. More might be made even of our present lamp-posts and lanterns. Why should the former be painted white? It seems to mock the light of the lantern, which surely ought to give light enough to show the lamp-post. If they are not white, the colour selected is pea-green, as in St. James's-square. The lanterns, too, are not only heavy-framed, but are again placed in an outer cage, so that there are eight lines to throw a shadow. The patty, again, is smeared over the glass, to assist in obscuring the light. A square frame is not the worst form of lantern, but a polygon is an absurdity; the height of which seems to be in the lanterns of the Guards' Memorial, where the frame obscures the light entirely. A. B.

CAMPANOLOGY.

SIR,—Allow me to send you a note on the celebrated peal of St. Bride's, Fleet-street. Thanks are due to Mr. Walesby for his labour in supplying such interesting particulars of the bells. In addition I wish to record it on your pages, that the two trebles, added to the peal of ten in 1719, were presented to the parish by the two Societies of Ringers, the College Youths and the London Scholars; the latter ancient society having afterwards assumed the new name of the Cumberland, in 1748, after the victory of Culloden, and in honour of the Duke of Cumberland, who presented the then London Scholars with a gold medal on the occasion of their ringing the bells of Shoreditch Church when he entered London that way on his return from Scotland.

After the bells of St. Bride's were augmented to twelve, the College Youths rang, in 1726, the first peal of Bohé Maximus, or all twelve in. Among the performers were several gentlemen; and I was told by Mr. Osborn, a late secretary, that it was very commonly reported by the old ringers that every one who rang in that last-mentioned peal left the church in his own carriage; and also that when St. Bride's bells were first set up, by the Rudhalls, and for some years afterwards, Fleet-street was thronged with the carriages of gentlemen, who came from far and near to listen to the ringing; the bells were considered the greatest novelties of the day. Benjamin Annable was a noted composer and ringer, and a College Youth at the above date. I have in my possession a thick octavo MS. full of peals most beautifully written by him, from three to twelve bells. John Hardman, too, of 37, Fleet-street, was a celebrated ringer with them. It would be well if other gentlemen and respectable Londoners of the present day would take more interest in the noble and manly science of ringing (I lately heard two Etonians say that cricket is a farce to it), and associate themselves as members of one or other of the old societies of clever ringers, whose masterly performances may still be heard weekly at their respective churches.

H. T. ELLACOMBE, M.A., College Youth.

THE STONE OF THE PARLIAMENT HOUSES.

SIR,—We are now told by Mr. Abel, the chemist appointed to examine into the matter, "That of the processes employed, not one has proved successful in arresting or preventing the decay of the stone." A very conclusive declaration, no doubt, and sufficiently decisive to arrest public inquiry. * * * In his report, Mr. Abel very affectingly speaks of the decaying stone by the name "dolomite." I say he so speaks affectingly, because, as a chemist, he must know that the proper name of the stone is magnesian limestone; and, as I shall hereafter show, it is just because it is a magnesian limestone (a compound of magnesia and lime) that it is decaying. The word "dolomite," I may remark, was formed many years ago, in the infancy of science, by torturing, more geologically, the name of M. Dolomieu, a French savant of that period.

But as a clear comprehension of the cause of the evil will be greatly facilitated by the knowledge that the stone in question is composed substantially of the carbonates of magnesia and lime, I throw the dolomitic distortion onboard, and adhere to the name-magnesian limestone in my remarks. In Mr. Abel's opinion, the "principal cause of decay is the lodgment of water;" and therefore he advises us to protect the projecting surfaces "either with a light metallic covering or with some other sufficiently impervious coating." This kind of advice has at least one merit, it is sufficiently impervious to argument; for we are left in utter darkness both as to the specific nature of the metallic covering and the sufficiently impervious coating. In order, therefore, that I may do no injustice to projects which, it is no demerit for me to say, I do not understand, I will leave Mr. Abel to enlighten the world, and meantime the following observations may prove not altogether uninteresting to the public.

About thirteen years ago my attention was drawn by my friend Mr. Goldsworthy Garney to a crystalline efflorescence which then presented itself on many parts of the exterior of the Houses of Parliament. Upon examining this efflorescence, I found that it was composed almost wholly of sulphate of magnesia, or Epsom salts; and an extended examination of the building proved to me that, more or less, the whole surface of the new Houses was charged with sulphate of magnesia, which, of course, would be dissolved and washed away by the first heavy fall of rain that might occur. The question which naturally arose upon this was, what is the cause of this destructive formation of Epsom salts under these circumstances? It could not be, as Mr. Abel now asserts, due to the "lodgment of water;" for the cathedral at Milan, the minster and the city walls at York, and a vast number of other public buildings, not to mention St. Stephen's Chapel itself, have all been built with magnesian limestone, and have, nevertheless, resisted the effect of this lodgment of water for many centuries; added to which, the well-known Parisian marble is a magnesian limestone, and the same remark applies to the marble of Iona, in the Hebrides, from both of which statues have been sculptured, whose high polish and beauty remain unimpaired after centuries of exposure to the weather. To solve this decaying problem practical experiments were therefore needed, and, in conjunction with Mr. Garney, I commenced a series. We soon found that water supersaturated with carbonic acid gas had no appreciable effect upon the magnesian limestone, and that to render such water effective it was necessary, in the first instance, to roast the magnesian limestone at a red heat, a plan used many years since by Mr. Pattinson, of Newcastle, for extracting carbonate of magnesia from such limestone. Disappointed in this experiment, we next passed 500 cubic feet of common air through an imperial pint of distilled water; but this water was still without action upon the magnesian limestone. Rainwater collected at Croydon was then tried; but this also was inactive. Distilled water was then mixed with common soot to the consistency of thick cream, and filtered through paper; the clear solution thus obtained was found to act rapidly upon the magnesian limestone; and when portions of it were placed upon a polished surface of the stone and allowed to evaporate to dryness in the sun, minute crystals of sulphate of magnesia or Epsom salts were formed, and the polished surface was found to be highly corroded. It was afterwards demonstrated by analysis that the sooty solution contained sulphate of ammonia in considerable quantity, and that the corrosive effect and production of Epsom salts were due to the presence of sulphate of ammonia in the soot. Hence, therefore, an answer to the seeming contradiction with respect to the durability of magnesian limestone in different localities. The soot formed from pure vegetable matter, like wood, contains no sulphate of ammonia whatever, and it is consequently inactive upon magnesian limestone; but the soot formed from coal invariably contains a large quantity of sulphate of ammonia; and when such soot lodges, as it will do in the cavities of finely-chiselled stonework, a concentrated solution of sulphate of ammonia will drain from it under the influence of the first shower of rain; and this it is, and not the "lodgment of water between string-courses," as suggested by Mr. Abel, which causes the decay. In fact, the whole subject was gone through and explained by me before a Committee of the House of Commons in answer

to questions from Lord Palmerston twelve years ago; and I then said, what I now repeat, that no practical method will ever be devised to prevent the deterioration of the stone.

Within the last forty years the consumption of coal in London has increased a hundredfold, and it is absurd to expect that such a change should bring no inconveniences along with the immense advantages which it has bestowed. And here let me say a few words upon coal soot. It may be supposed, perhaps, that if the formation of this soot were prevented by what is called "thorough combustion," no sulphate of ammonia would be produced. This, however, is not so, for the sulphate of ammonia would then continue to be generated, perhaps even in larger quantities; and it would fall, as it now does, under the influence of the wind and the neighbouring buildings. In other words, the evil would not cease, though the production of this kind of soot were put an end to by combustion, since the soot is only a companion and not a mere vehicle for the sulphate of ammonia. In conclusion, I will briefly explain the mode in which sulphate of ammonia acts upon magnesian limestone. This limestone consists of carbonate of magnesia and carbonate of lime, both of which are decomposed under the sun's rays by the power of sulphate of ammonia, with the production of carbonate of ammonia, which flies away, and sulphate of magnesia or Epsom salts and sulphate of lime, which remain and form an efflorescence upon the surface of the stone.

L. S. D.

MADRAS IRRIGATION.

SIR,—In your No. 1,325* appears a letter asserting that "the Madras irrigation has been a complete failure." As the father of one of the gentlemen employed in the undertaking, who has not the opportunity to reply, perhaps I may be allowed to observe that my son is not one of "a lot of speculative adventurers," but is well versed in the works required of him, and is progressing satisfactorily towards the very some of your correspondent's desires, in effecting "useful land-marks" of a generous and civilizing occupation.

So far is this commendable enterprise from being "an entire failure," as the language of seeming disappointment has laboured to indicate, that (as I have intelligence by this week's Indian mail) portions of earthworks are completed in the Pennar Division, where also the masonry is in full swing; so as to justify the conviction that at least in this district, which is thirty miles in length, a result will issue from skill and economy actually applied that must be considered prosperous; and that ought to reassure all parties concerned throughout the broad scope for kindred undertakings. Indeed, I look forward with full confidence to the period when such works besides being thoroughly remunerative in a commercial sense, shall have a very exhilarating and exalting effect upon the natives of that splendid empire; and I trust that the vigorous refreshments, faintly so represented, will at length invigorate their religious susceptibilities, to the glory of the great and true God.

T. CRUSE.

CONCRETE BUILDING.

HAVING noticed a letter in your paper from "G. C. J." (p. 645, ante) on the above subject containing a challenge to any one to erect concrete walls at the prices quoted by Mr. Tall; and having had some experience in the construction of concrete buildings; a few facts from my own might be of service to him.

I am now engaged as surveyor in erecting a large building on the St. Margaret's estate, Saleworth, intended for a private residence, and the following is the actual cost I am now paying for labour and materials:—

1 Thames ballast, delivered on the ground, per cubic yard	2s. 11d.
1 Best Portland cement, per bush	1 10
1 Labour, including all plant necessary to mix the concrete, raise it to the scaffold, and fill into the walls, per cubic yard	2 3

and I may add that the contractor for the labour is quite satisfied with his bargain; and, I have no doubt, would take any given quantity of the work at the same rate.

I have erected boundary walls in concrete on the same property, each 118 ft. long, 6 ft. 6 in.

* See p. 473, ante.

high, and 6 in. thick, with a pier at each end only. The total cost was 11l.: each wall including a projecting saddle-back coping running the whole length, and caps to the piers. The lowest estimate for wood fencing for the same place was 15l. 10s.; and for 4 ft. brick, with 9-in. piers, 20l.

W. F. HOOPER.

MESSRS. T. LYTHGOE & H. THORNTON, Manchester, have patented improvements in the construction of walls, &c. This invention consists, first, in lining the wood or other frame or mould into which the concrete is filled with an improved concrete having a hard and smooth surface. Secondly, in forming the outer and inner surfaces of the wall of fine concrete, which is run in between the outer frame or mould and a small inner frame. Thirdly, in certain improved apparatus employed in the construction of walls and other parts of buildings made of concrete. Fourthly, in attaching to the inside of the frame or mould triangular or other shaped projections placed horizontally and vertically, or otherwise, which projections produce corresponding recesses in the face of the building in imitation of the joints of the stones or panels, or other designs; and in making recesses in the mould to produce ornaments or other designs in relief. Lastly, in certain improved modes of constructing floors and roofs with bars of iron and concrete.

TO KEEP BRICK WALLS DRY.

SIR,—I have noticed in your paper the letters respecting damp walls. I beg to state that I have tried the application of a solution of soap, followed by one of alum, with great success. This was recommended by you some two years ago. I tried it on the front of a red-brick farmhouse, and it gave such satisfaction that I have orders to continue the dressing every summer. I could not perceive that it in any way altered the colour of the bricks till this year (this being the third dressing), and now only by a slight tinge of white scarcely perceptible. I have great faith in this preparation, believing it is a certain cure.

ANTHUR CHAMBERS, Builder.

UNPAINTED DEAL WORK.

SIR,—I have been informed by a London architect of some standing and experience, in whose opinion and judgment I should be disposed to place confidence, that it is not necessary to paint deal timber in external work in order to preserve it, and that its appearance without any paint or varnish is much improved by time. In proof of this he mentions some very ancient doors, made of deal which have been recently brought from Norway and placed in the South Kensington Museum. I should be very glad if some of your professional readers could be induced to give their opinions, or the result of their experience, on this subject.

PLAIN DEALER.

SCHOOLS OF ART: EDINBURGH v. NOTTINGHAM.

SIR,—To studies in the Nottingham School of Art and in the South Kensington Museum, and to the opportunities there afforded me, I owe an acknowledgment at least, as I have been much benefited thereby in my professional career. It is, therefore, but natural that I should evince considerable interest in the various schools throughout the country, and more especially in the one in such active operation in my native town, Nottingham. Hence I have constantly examined the reports of the schools whenever any comparison as to their efficiency has been published; and I have recently had an opportunity of so doing, for the Department of Science and Art has, with very great wisdom, offered premiums to the masters of the various schools throughout the country who, at the annual examinations into the state of the schools, could show the greatest amount of proficiency amongst the students; and the list of awards to those masters has now been published; and the statistics from which these awards have been adjudged have likewise been printed by the Department.

In the award Edinburgh stands first, Nottingham second. I take exception to this award, thinking, according to the statistics given, that to Mr. J. S. Rawie, the Head Master at Nottingham, the first premium should have been awarded; and as your space is valuable, I will add little more, except to subjoin an extract from the statistics, merely explaining that the number of students in each of the two schools is nearly the same; that the Edinburgh School heads the list in one item only, namely, the elementary; while the Nottingham School gained the greatest number of medals for advanced work, and in what may without doubt be considered the most important section of the whole, namely, the annual examination of the Department (the real test of the efficiency of both master and pupil), the Nottingham School surpassed Edinburgh by double the number.

The figures subjoined are abstracted from the report printed by the Department of Science and Art, and therefore may be presumed to be correct.

Surely Nottingham and its Master in Art have not had justice meted out to them.

Comparison between the Nottingham and Edinburgh Schools of Art, as regards the honours gained in 1868 in the Medal Competition and Examination, instituted by the Department of Science and Art.

Nottingham. Edinburgh.

1. Number of students attending the school	389	404
2. Number of medals national competition awarded for works in the advanced stages of study	8	5
3. Number of Queen's prizes for advanced works	2	2
4. Number of book prizes for works in the elementary stages of study	4	33
5. Number of students who passed in the Government examination in drawing, &c.	142	76
6. Number of prizes for great excellence in the above examinations	55	37

The 2nd, 5th, and 6th items in the above list tell their own tale.

S. DUTTON WALKER.

THE WATERING AND CONCRETION OF ROADS.

At the Norwich meeting of the British Association for the Advancement of Science, Mr. W. J. Cooper read a paper on "The Watering of Roads," in which he thus speaks of the new system of watering with which he is connected:—

"At an expense of about 100,000*l.*, the various parishes of London have been watered this season; but, notwithstanding this enormous outlay, the dust could not be laid; and it is quite evident that the time has arrived when the assistance of deliquescent salts is absolutely necessary to aid in this operation; and from the results obtained by the use of the chlorides of calcium and sodium mixed with the water in certain localities, there can be little doubt that they will soon be generally adopted. A patent was taken out in September last for a compound of these well-known deliquescent salts, and its application to the purpose of road-watering.

The proportions used are 1 lb. or 2 lb. of the mixed salts to one gallon of water. The salts are put into the cart before it is filled; the water is then laid on; and by the time the cart is full the salts are in solution. The application of the salts has produced a most important effect upon the surface of a macadamised road, hardening and concreting the material in such a manner that, when it is perfectly dry, no dust whatever arises from the passage of ordinary traffic. The light dust always found upon a dry road surface which is usually watered with plain water is not to be seen, the surface remaining smooth, firmly bound down, with no detritus whatever upon the surface.

In considering the economy of road-making, this state of the road is very important. There is scarcely anything for the scavenger to sweep up and take away; and what has usually been carried away by waggons, as waste, remains an integral part of the road; consequently the repairs to the road would be much less frequent, and a considerable saving would be effected. The chloride employed, being antiputrescent, tends to alleviate the evils arising from organic matter deposited on road surfaces; a sanitary advantage is therefore gained, and the economy in the water is also a favourable feature of this method of watering roads.

The water consumed in watering roads in London is one-sixth of the daily supply for all purposes; and as, by the introduction of the chlorides, so much less water is required, a saving of at least 75 per cent. would be effected, which is really an important consideration, as this water is required at the hottest period of the season, when the demands for other purposes are more urgent than usual; and the necessity of an increased water-supply is being seriously discussed.

Thus the effect produced by the use of deliquescent salts mixed with the water is not only the essential and complete laying of the dust, but the collateral advantages of economy in labour, in road-making, and in consumption of water. It also obviates the necessity of Sunday labour in road-watering."

The result of a trial of the new system of watering during this very arid and trying season may be seen in Baker-street, where it is applied once or twice a week. Arrangements are now made, we understand, for the manufacture of the chloride of calcium, in large quantities, all over the kingdom, so that numerous applications for leave to use the patent can now be responded to. The municipal authorities of Calcutta, under the sanction of the Government, are about to test the system in that distinguished city.

CHURCH-BUILDING NEWS.

Stinsford (Dorset).—St. Michael's Church, Stinsford, has been re-restored. The chancel floor has been raised 6 in. above the level of that of the nave. Open stalls of stained deal have been placed in the chancel. The east window of the chancel was formerly a plain structure, divested of its tracery, and filled in with common lights in iron framework. It was also blocked up on the interior by the reredos of the Corinthian style in plaster; but this has now been re-opened, and a window of Bath stone constructed after the old pattern, with the perpendicular tracery added. The window, which consists of three

compartments, is filled with stained glass, the subject being the Ascension of our Lord. The old-fashioned lights on the north and south walls of the chancel have been substituted by small windows, with heads of tracery, and filled in with diaper glass. On the south side of the chancel a stained window has been inserted by Mr. John Floyer, M.P. There are two subjects, representing Dorcas and the Good Samaritan. The chancel is separated from the nave by an archway of Early English design. The north aisle, which we understand was enlarged from its originally limited dimensions as a "lean-to" to a size parallel with the south aisle, was erected by some members of the Pitt family in the latter part of the eighteenth century, the structure bearing the style of that period. The old windows, which were of very meagre dimensions and quite plain, have been removed, and on the north wall two windows of chiaroscuro glass have been inserted, the compartments being filled with representations of the major prophets. These windows were supplied by Messrs. Lavers, Barrand, & Westlake, of London. At the eastern end of this aisle a new window of stained glass has also been placed, in which the subjects represented are Faith, Hope, and Charity. Underneath them, as though in illustration of these three great attributes, are representations—of Faith, in the woman having an issue of blood touching the hem of Jesus's garment; Hope, in the Magi offerings; and Charity, in the widow's mite. The perpendicular tracery of the window is filled up with angels bearing instruments of music. This window, together with the three chancel windows, and one on the east end of the south aisle, were given by Mr. James Fellowes, of Kingston House. The latter is a *Te Deum* window, and contains subjects illustrative of the passages, "The glorious company of the apostles praise Thee," "The goodly fellowship of the prophets praise Thee," "The noble army of martyrs praise Thee," "The Holy Church throughout all the world doth acknowledge Thee." The tracery of the window is filled with the representations of angels bearing scrolls, upon which the word "Alleluia" is inscribed, the centre light containing the symbol of the "Descending Dove." The two remaining windows in the south aisle are filled with tinted cathedral glass, and were made of corresponding shape with the chiaroscuro lights on the opposite side, both of which are ornamented with dressings of Ham-hill stone. The roofs of the nave aisles and chancel are ceiled, and thus the perpendicular oak roof are obscured from view; they are so decayed as to preclude the possibility of their renovation and repair. The new vestry is built of Portesham stone, and covered with a roof of stone tiles, to match the exterior of the nave roof. The whole of the stone carving has been executed by Mr. R. F. Chapman, of Bath. The old Perpendicular tower, shrouded in its mantle of ivy, has not been interfered with. The works were carried out under the direction of Mr. J. Hicks, of Dorchester, architect, by Messrs. Wellspring & Son, builders.

Lechwyfaryny, Anglesey.—The parish church has been re-opened for divine service. The new edifice, the style of which is Late Decorated, has the same ground-plan as the former one, with the exception that it has been lengthened to the east, and widened towards the north, the nave and chancel now measuring together 39 ft. 6 in. from east to west, and 16 ft. 7 in. from north to south; the south transept or chapel being 12 ft. 6 in. wide by 11 ft. 6 in. long (internal dimensions). The porch, which is on the north side, has been entirely rebuilt and enlarged. By the lengthening of the building the chancel has been rendered a more marked feature. The nave is lighted by a square-headed window in three compartments on the south, and on the north by an arch-headed tracery window of two lights placed under a small gable to light the pulpit and prayer-desk. The transept is lighted by an arch-headed window in two lights. The east window, which is of three lights, has an arched head with tracery, the whole being filled with stained glass tracery, bearing the "dove" in the upper part, the Alpha and Omega on the north side, and the sacred monogram on the south. Messrs. J. A. Forrest & Co., of Liverpool, were the artists. The bell-turret is new. The roofs, which have arched principals, resting on stone corbels, have the timbers exposed and lightly stained and varnished. The seats are all open, and with the rest of the internal fittings, are lightly stained and varnished. The church will

accommodate 105 persons. The plans, &c., were prepared by Messrs. Kennedy & O'Donoghue, of Bangor and London; and carried out under their direction by Mr. Joseph Hughes, of Llanstffraid Glan Conwy, builder. The total cost has been 540*l.*

London.—The parsonage of St. Michael's, Mark-street, Finsbury, has been laid with Ridgway & Bellerocche's tiles. The architect is Mr. James Brooks, of London; and the builder, Mr. Henshaw.

Wembdon.—The parish church of Wembdon, near Bridgwater, which was destroyed by fire in the spring of the present year, is about to be rebuilt, from plans prepared by Mr. J. M. Hay, of Bath. The sum of 760*l.* has been subscribed towards the rebuilding.

Little Ellingham.—The first stone of the nave of Little Ellingham Church has been laid.

Leeds.—St. Clement's Church has been consecrated. The site is on Chapel-town-road, and was given by Mr. Nicholson, of Roundhay, at a cost of upwards of 1,200*l.* The edifice has been erected from the plans of Mr. George Corson, of Leeds, architect. The scheme in connection with it is an extensive one, as the Board of the Church Extension Society have purchased land sufficient also for schools and parsonage house. The church is so placed as to leave on the north ample space for the latter, and on the south for schools, playgrounds, and master's house. The church may be described generally as consisting of nave, north and south aisles, with open porches at the west end of them, apsidal chancel, with organ chamber on the north side, vestry under the tower on the south side, and chancel. The tower is placed in the angle formed by the south aisle. It has been erected in this somewhat unusual position in order that its proportions may be seen from the principal approaches to the church. It is 19 ft. square at the base, with octagonal buttresses on the angles, that at the south-east being made larger than the others, as it has to contain the stair giving access to the various stages and to the flat roof of the tower. The stages are five in number, the lowest containing the vestry, the third the ringers' loft, and the fifth the bell chamber. The first bell of an intended peal of eight has been cast by Messrs. Taylor, of Loughborough, and will be hung as soon as the tower is completed. The height from the ground to the top of the parapet is 90 ft.; to the top of stair turret, 122 ft.; and 113 ft. 6 in. to the top of the others. The nave is 88 ft. long from the west end to the chancel arch, and 29 ft. 6 in. wide from wall to wall. On each side an arcade of five arches divides it from the aisles, which are each 75 ft. long by 15 ft. wide. These arches are supported on cylindrical pillars of red sandstone from the Damfries quarries, with moulded bases and caps, the latter being carved with natural foliage conventionally arranged. The arches are of red Suffolk bricks, the springers, keystones, and vousoirs being of stone. Above the arches, on either side, there is a range of sixteen single light clearstory windows, with tracery heads. The west end of the nave is filled in by a window of five lights, its dimensions being 13 ft. wide by 25 ft. high to the crown of the arch. The head is filled in with tracery. The roof is framed with principals, with curved ribs. A ceiling is formed between these ribs, and following their line, it forms a pointed wagon vault. A ventilating chamber is thus formed in the roof, having openings at each end to the outer air, and the curved ribs at the ceiling ridge being framed double, with spaces between and connecting fillets, the vitiated air escapes into the air-chamber above, and is expelled by the through draught. The aisles have each five two-light windows, with tracery in their pointed arches, each window being set between buttresses. The aisles do not extend up to the extreme west end, the space of one bay on each side being occupied by a porch 17 ft. by 11 ft. 9 in., with inner door admitting to the nave, and a large open outer doorway, with clustered shafts of red sandstone, caps, and bases, and deeply moulded arches. The chancel is divided from the nave by a lofty arch of red brick and stone, carried on pillars of the red stone already described as from Damfries, with corbels under them, carved with natural foliage. The chancel is 37 ft. 6 in. long by 24 ft. wide, and the east end forms a seven-sided apse, with buttresses on the angles, and a double tracery-headed window on each of the seven sides. It is hoped that the whole of the windows in the chancel will be filled with painted glass. A scheme has been drawn up so that the designs

may form a consecutive series, illustrating the principal events in the life and death of our Lord. Each window having two lights, will contain a couple of subjects. The following is the proposed arrangement:—

South window.....	{ 1. Entry into Jerusalem.
	{ 2. Mary anoints Christ's feet.
North window.....	{ 3. Christ washing the disciples' feet.
	{ 4. Last supper.
South.....	{ 5. Agony in the garden.
	{ 6. The betrayal.
North.....	{ 7. Before Pilate.
	{ 8. Ecce Homo.
South.....	{ 9. The crucifixion.
	{ 10. The descent from the cross.
North.....	{ 11. The body of Christ.
	{ 12. The entombment.
Centre.....	{ 13. The resurrection.
	{ 14. The ascension.

Nos. 9 and 10 have already been given by Alderman Hornby, and No. 13 by Mr. J. Morris. These three designs have been executed by Mr. Wailes, of Newcastle-on-Tyne. One of the two-light windows of the south aisle has been filled with painted glass by Wailes; the subjects delineated illustrate the texts, "Suffer little children to come unto me," and "Feed my lambs." In the quatrefoil above the two lights is an angel bearing a scroll. If funds can be obtained, the large west window will also be filled with stained glass. It is probable that the subjects will illustrate Old Testament events. The church is provided with open benches of white deal, varnished, and will seat about 750 adults. The contractors for the various departments are as follows:—Mr. Thomas Whiteley, mason; Messrs. Shires & Son, joiners; Messrs. Watson & Wormald, slaters; Mr. Lindley, plumber and glazier; Mr. Blakey, plasterer; Messrs. Wood & Son, painters; Messrs. Nelson & Sons, for heating apparatus, &c.; Messrs. Mawer & Ingle, for the stone carving, and for the pulpit, reading-desk, font, and communion rail. Mr. John Kay has performed the duties of clerk of the works. The cost of the church, inclusive of the purchase of the land and the stained-glass windows, may be roughly estimated as above 8,000*l.* This sum includes the tower, which was not originally contracted for by the Board.

DISSENTING CHURCH-BUILDING NEWS.

Ilkley.—The memorial stone of a new Methodist Chapel, at Ilkley, has been laid. The new buildings, inclusive of 1,000*l.* for the land, are estimated to cost about 4,500*l.*, of which upwards of 2,000*l.* have been subscribed. These buildings will front the Wells-road, having Promenade-road on the western side. The style of the chapel is Gothic of the twelfth century, and the front has a centre and two side-entrances. Over the principal doorway there will be a large four-light window, having tracery in the upper part. The staircases to the galleries are placed on either side, that on the east being of a semi-circular shape, and forming a termination to that front, whilst the corresponding one occupies the lower portion of the tower. The side elevations of the chapel contain alternately two-light and three-light windows, with tracery heads, the latter of which are carried up above the eaves, and surrounded by gables. These fronts are also improved by the gables of the minister's residence, which contain circular tracery windows, and help to express the character of the building. The tower rises at the south-west angle of the building, with buttresses terminating at the heltry windows. Each face of the tower contains one of these windows. The spire is carried to a height of about 120 ft. from the ground, with angle pinnacles and gables. The interior of the chapel is divided into five bays by iron columns which support the galleries, and are continued up to the roof. These columns have ornamental hands and enriched capitals. There are also recesses at either end, that at the front extending over the entrance vestibule, and the one at the other end forming an organ chamber and staircase communicating with the minister's vestry, and enclosed by an open screen of a decorated character. The centre part of the ceiling is formed by curved ribs springing from the caps of the columns which support the roof timbers, the greater portion being exposed to view, but the spars of the roof are concealed by a plaster ceiling, in order to add to the warmth and acoustic properties of the building. Ventilation is provided by openings in the ceiling, and the lighting is effected by star pendant gas burners. The seats, gallery fronts, pulpit, and the joiners' work throughout, are

designed in accordance with the character of the building, and will be stained and varnished. In addition to the chapel itself the building comprises a school-room, 40 ft. by 36 ft., and two rooms for the chapel-keeper in the basement. The width of the building is 45 ft., and the extreme length 96 ft., of which about 20 ft. are occupied by the minister's house in the rear, and the chapel is calculated to seat 650 adult persons, 400 on the ground floor. It is estimated that the total cost of the building, exclusive of the land, will be about 3,500l. The design for the chapel was selected in a competition, Messrs. Andrews, Son, & Pepper, of Bradford, the architects, being the successful competitors.

Coventry.—The memorial stone of a new Baptist chapel has been laid in Gosford-street, a desirable part of the city. The style of architecture is Italian, with a slight Gothic treatment in mouldings and other details. The total cost, including land and fittings, will be 2,100l., of which about 1,007l. have been already subscribed or promised. The architect is Mr. J. D. Webster, of Sheffield, and the builders are Messrs. Hallam & Co., of Coventry, who have entered into a contract to complete the whole for 1,011l. 5s. 5d. The materials used in the construction of the walls are red brick, from the neighbourhood, with Bath stone dressings; the arches to windows being relieved with vousoirs of white and blue brick. The woodwork is stained and varnished. Galleries are provided at the sides and one end of the chapel, and are reached by stone staircases. Behind the chapel, and immediately adjoining, are the schools. On the ground-floor is the boys' school, 35 ft. by 27 ft.; also a commodious kitchen and store-room. The upper floor is devoted to the girls' school, which is 45½ ft. by 27 ft., and is approached by a stone staircase. Attached to this room are two classrooms, each 13½ ft. by 13½ ft. The schools and classrooms will be heated by open fireplaces. Attention has been paid to the means of ventilation, which are simple. The schools provide accommodation for about 450 children, and the chapel will have sittings for 700 persons. The total cost, including site, gas-fittings, law expenses, &c., will be upwards of 2,100l.

SCHOOL-BUILDING NEWS.

Wolstanton.—The foundation-stone of a new Sunday-school building has been laid on a piece of ground adjacent to the Wesleyan Chapel at Wolstanton. The plans of the new building have been gratuitously furnished by Mr. T. Roberts, of Trentham. The school will be in subordinate keeping with the Gothic chapel, near which it is to stand, with its front towards a new street which is to be laid out shortly. There will be one large room 70 ft. by 50 ft., with five classrooms for teaching and for a library. The roof of the building inside will be supported by four circular ribs, and the floors will be boarded. The place will be lighted with three Gothic windows, glazed with the same kind of glass as that used in the windows of the chapel, and it will be warmed with hot-air pipes. The contractor for the building is Mr. W. Sutton, of Newcastle, and the cost will exceed 900l.

Bilston.—The memorial stone of the new day and Sunday schools, which are now in course of erection by the side of the Wesleyan chapel, Bilston, has been laid. According to the plans which have been accepted by the committee, the new buildings will comprise one large school-room, 58 ft. 6 in. by 45 ft. 3 in., with a range of ten classrooms,—five on each side. Eight of the classrooms will measure 8 ft. square each, and the other two 15 ft. 6 in. by 8 ft. There will be a gallery over the front entrance 18 ft. long by 11 ft. 6 in. wide, and two side porch entrances. At the two back external corners space will be provided for warming apparatus and boiler. The large school-room will be lighted from windows placed above the elevation of the classrooms, which are a few feet lower than the main building. The walls internally will be wainscoted 5½ ft. from the floor, and all the joinery-work inside will be stained and varnished. The ceiling will be a level one. The front of the building is to be of pressed bricks. The schools are intended to accommodate about 600 children, and the total cost is estimated, exclusive of the value of the old materials, at about 1,000l. The contract for the joinery and timber work has been taken by Mr. R. Hickman; that for the brickwork by Mr. Thomas Johnson; and the plumbing and slating by Mr. Beebee.

London.—New schools in connexion with the district parish church of Edensor have been erected and opened. The site,—upwards of 1,400 square yards,—is adjacent to the church, and is the gift of Mr. Heatbroke. The schools have been erected from the plans and designs of Mr. C. Lyman, of Stoke, by Messrs. Collis & Hudson, of London, who have carried out the contract. The total cost, exclusive of the land, will be upwards of 1,100l. The internal arrangements include accommodation for a mixed school of boys and girls and an infant school.

PATENTS CONNECTED WITH BUILDING.

APPARATUS FOR VENTILATING BUILDINGS, &c.—*J. S. Smith.* Dated 27th November, 1867.—The patentee claims the use and application of a movable cap, cover, plate, or equivalent for opening and closing the upper end of air-shafts used as ventilators for the purpose of excluding dust, dirt, and extraneous matters, irrespective of the form thereof, or of the mechanical means employed to effect their rise or fall. Secondly, the general construction, arrangement, and combination of the apparatus for the purpose, as described.

CONSTRUCTION OF ARTICLES OF EARTHENWARE.—*J. R. Pratt.* Dated 28th November, 1867.—This invention relates to an improved method of joining together the separate parts of articles of earthenware by forming on them male and female screw threads while the clay or plastic material from which the articles are made is in a soft state.

VENTILATING ROOMS, &c.—*J. P. Parkes.* Dated 29th November, 1867.—These improvements are applicable chiefly to such houses or buildings as are provided with a circulation of hot water. In carrying out the invention the patentee encloses a tube or series of tubes in a casing forming an air space, and placed above the chamber to be ventilated, the said tube or series of tubes being heated by the hot water circulating through them. The casing is placed in communication with the chamber to be ventilated by means of a tube terminating in a grating placed in the wall of the chamber. The upper end of the outer casing is connected with a pipe leading out into the open air, where it is surmounted by a cowl. The rarefaction of the air surrounding the heated tube or tubes, and contained in the outer casing, causes the air to ascend and escape into the atmosphere by means of the pipe and cowl above mentioned, thus forming a partial vacuum in the pipe below the heated tubes, the air in the chamber being drawn off through the grating to supply its place, thus effecting a continual ventilation of the chamber so long as the tubes are kept heated.

CONSTRUCTION OF METALLIC AND OTHER BUILDINGS.—*R. Porter.* Dated 2nd December, 1867.—This invention has reference principally to buildings constructed mainly of metal, and consists, first, of the following method of constructing the walls of the said buildings:—The patentee makes the said walls of corrugated sheeting, either of iron or zinc, the corrugations being situated vertically, and he supports and strengthens the said walls by means of standards made of metal, rolled or otherwise formed into a trough-like figure. The said standards are fixed against the corrugated walls in such a position that the edges of the said trough-like standards fall into and fit against the bottoms of the corrugations in the walls. The standards may be made of a width proper to include two, three, or more corrugations. Along the interior of the walls, and nearly midway between the floor and roof, he fixes horizontal rails, which may be made of wood, iron, or of both combined. The said horizontal rails are supported in brackets connected with the standards, the connexion between the said standards and brackets being effected through holes in the corrugated walls. Horizontal rails of the kind described may also be fixed in a similar manner at any required height inside the building. The standards may be fixed inside the building, and the horizontal rails outside, where required. The walls may be lined internally with a cheap description of paper board, such as mill-boards, straw-boards, and the like. He attaches the said lining by making it in sheets or panels, which are inserted in rebates, or grooves of wood or metal, fixed to the walls or to the horizontal rails. The invention consists, secondly, of the following method of attaching the ridge-caps on the roof of metallic buildings, and other buildings having cor-

rugated metallic buildings. On the summit of each side of the roof he fixes a strip of hoop-iron, which has been corrugated with corrugations similar to those of the roof-plates. The said strips of corrugated hoop-iron are so fixed on the summits of the sides of the roof that the concavities in the said strips are opposed to the concavities in the roof-plates, and there is thus formed a series of nearly circular spaces or openings. The ridge-caps are fixed upon the said corrugated strips of hoop-iron. There is thus left a series of nearly circular openings along the whole length of the ridge of the roof, by means of which the ventilation of the building is effected.

IMPROVEMENTS APPLICABLE TO WATER-CLOSETS AND PUMPS CONNECTED THEREWITH.—*J. H. Wilson.* Dated 3rd December, 1867.—The patentee claims, first, constructing closet pans or basins of glass; secondly, forming the same at the lower end with a shank or hollow faucet, having a lateral opening or aperture therein for discharging the contents thereof, substantially for the purpose and in the manner described and set forth; thirdly, turning the closet pan on its vertical axis for discharging its contents, substantially for the purpose and in the manner described and set forth; fourthly, constructing closet pans so that they may be removed or lifted from their seats, substantially for the purpose and in the manner described and set forth; fifthly, forming the rotating pan, neck, or seat of the rotating pan with recesses to receive tallow, or other lubricating material; lastly, the general arrangement and combination of the several parts described and set forth as applied to ships' and other water-closets.

Books Received.

"NOTES ON St. Patrick's Church, Jordanstown, in the parish of Cammonee," is chiefly devoted to an account of the saints represented in stained glass in the chancel windows. The building, designed by Mr. Lynn, is in the round-arched style of the early architecture of Ireland, and includes a "round tower," attached, 73 ft. high and 14 ft. 6 in. in diameter at the base. The upper portion of the tower forms the belfry. We do not know of any other modern appropriation of these forms in Ireland.—"Right to Light and Air, being a Summary of the Laws relating to Ancient Windows," by O. S. Round, Barrister-at-Law (Amer. Lincoln's Inn-gate), is a reprint from the *Estates Gazette*. It serves to introduce the matter to those who require a general knowledge of it; but those who have to fight the question must look to a bigger book.—The current number of the *Art-Journal* contains a view of The Hermitage (the picture-gallery), St. Petersburg, and, *inter alia*, a paper by Professor Ansted on "The Influence of certain Physical Conditions on the Origin and Development of Art." Mr. C. J. Richardson is contributing a series of papers, illustrated, "On Picturesque Garden and Villa Architecture." The admirable catalogue of the Paris Exhibition was concluded in the August number.—*The Broadway* begins a new series (giving up the special American element) with a very good number, including the vigorous commencement of a new novel by Mr. H. Kingsley, called "Stretton"; the Rev. Newman Hall's American Notes; and several other interesting papers.—*The Tourist's Annual for 1868* (Hogg, York-street) is damaged by a common cover. It contains a good deal of amusing and suggestive writing, and would be found valuable by many who are seeking to determine how to spend their holiday.—"Remarks on Street Tramways applied to London and its Suburbs," by Herbert Bright, G.E. London: Spon. In this pamphlet, which is printed for private circulation, the author gives an account of his patented plan of tramways with rails or trams sloping slightly outwards at either side so as to be adapted to wheels on round the circumference on the inside and flat on the outer, so as to enable them to run either on or off the trams. The vehicles are seated, inside and out, the reverse way to that of omnibuses, passengers sitting back to back inside, and face to face outside. The patentee proposes to form tramways, not through the main thoroughfares generally, but through bye streets near them, so that the tramway traffic would interfere as little as possible with that of the chief thoroughfares. A map shows several

proposed routes through London and its suburbs, south and north.—“The Saturday Half-holiday Guide to London and the Environs.” Second edition with map of the environs.—This useful threepenny guide gives particulars as to open-air resorts, such as the parks and environs, commons and open spaces, cemeteries, cricket-grounds, rowing clubs, rivers, and distances, fishing-waters, bathing places, and gymnasia; also as to the free national Exhibitions.—“On the Removal of the Sewage of the City of Glasgow and the Purification of the River Clyde.” By William Robertson, C.E. Printed at the University Press, Glasgow, 1868. The author some years since advocated a system of sewage by pumping and utilization. This system he now disclaims, and suggests another, in which the tidal waters of the estuary are to be used to flush the river from the point where the sewage would be discharged into it, carrying it out to the Firth, in front of the towns of Port Glasgow and Greenock. The reservoir would be 9½ miles long, with a wall 15 ft. high, inclosing an area of about 1,300 acres, so impounding 150,000,000 cubic feet of water each tide, or double that quantity daily, to be let out through flood-gates at its lower extremity, above Port Glasgow.—“Hand-book of Fresh Water Aquaria.” Edited by James Bishop, &c. London: Dean & Son. In this hand-book instructions are given for the construction and management of fresh water aquaria for gold-fish, &c., and the treatment of plants, fish, molluscs, beetles, &c., kept therein, or in glass globes. The present is the fourth edition, revised and improved. It is illustrated with engravings.—“Loughborough Water-supply.” A report prepared by the town surveyor, Mr. George Hodson, on this subject, has been presented to the local board. It points out the necessity for the adoption of some system of water-supply to replace the local wells in the midst of soil saturated with the contents of cesspools, which sufficiently account for the prevalence of diarrhoea and other ailments at Loughborough. There are two schemes under consideration; one by a company, who propose to impound the Black Brook waters; and another by the local board, who propose to take the Wood Brook waters. The reporter advocates the local board's scheme, which will cost about 16,500*l.*, including Parliamentary expenses, or 13,000*l.*, exclusive of these.

Miscellaneous.

HOT-HOUSE WORKS.—Messrs. Weeks & Co. (Chelsea) have issued the twelfth edition of their “Trade Book,” containing a number of designs, some of them very appropriate, for winter-gardens, conservatories, hot-houses, vineries, and forcing pits. If the approximate cost were attached it would be an advantage. The vulgar colouring of some of the views does them injustice. Mr. Weeks has long been known as a successful and trustworthy builder and heater of horticultural structures.

DEATH OF SCHONBEIN, THE DISCOVERER OF OZONE AND CUN COTTON.—Dr. Schonbein died the other day at Baden. He was born in 1799 at Mitzingen, in the kingdom of Wurtemberg, and was consequently in his seventieth year. He made the discovery of gun-cotton somewhere about thirty years ago. He disposed of his interest in the invention to Baron Lenk, who, after years of research and experiment, made the explosive manageable. Lenk span the cotton and wove it into fabrics suited for cartridges. Prentice & Sons, who hold the patent in this country, adopted his plan, but now make the gun-cotton into paper, which is rolled up for cartridges. Collodion, the solution of an imperfect gun-cotton in ether, became a valuable application in surgery, and afterwards became the film on which glass photographs were taken. Schonbein had then lost all interest in its development, and was busy with experiments in alchemy which led to the discovery of ozone. He had observed certain atmospheric effects accompanied by a peculiar odour, and research led to the discovery of ozone, which he pronounced to be oxygen in a different condition. The subject was one of intense interest to the chemist, and he worked at it till his death. Sanitary science, which has had many a death problem to solve, seems likely to have the road smoothed in no small degree by the discoverer of ozone.

SQUARE SET AND MACADAM PAVING IN LIVERPOOL.—At the local Health Committee, last week, Mr. Robertson Cladstone called attention to the large quantity of macadam being laid down in Church-street, and said he thought the question would arise shortly whether it was desirable to lay down so much macadam when there were now square sets equally available for the purpose. The small square sets which had been laid down in North John-street and Dale-street were almost noiseless, and far cheaper than macadam. It was agreed to refer the matter to the borough engineer.

STONE UNDER FIRE.—Some short time since a house in Hanover-square, the residence of Mr. and Mrs. Dallas, was unfortunately considerably injured by fire, more especially in the upper part. A glance at the cornice outside shows a suggestive fact. The flames rushed out of the two-pair windows, and above them, exactly to the extent of each opening, the heavy stone cornice is either completely burnt away, or otherwise destroyed by the effect of cold water on the heated stone. We should apprehend, however, that the former was the case; had the damage been caused by the cold water, it would not have been confined so exactly to the width of the window, as it is now.

THE SANGHI TOPE IN CENTRAL INDIA.—This is one of the most ancient and remarkable Buddhist architectural remains in India, dated 250 B.C.; and recently an application was made to the Begum of Bhopal, in whose territories it is, by the French Consul-General, M. Place, to allow the principal gateway of the tope to be carried off and set up in Paris! The Begum, who is Mahomedan, and indifferent to Buddhist buildings, before consenting to M. Place's proposal, offered the gateway to the Indian Government, to be sent to England. The Indian Government, with proper feeling, declined the gift, and recommended that the tope should be conserved, and suggested that it would be quite sufficient for France and England to have casts of the gateway, which is of a highly decorative character.

FATAL GAS ACCIDENT.—Mr. C. C. Lewis, the coroner for Essex, has held an inquest at Stratford on the body of Mr. Henry Bennett, late landlord of the Railway Tavern, Stratford New Town. A lengthened inquiry showed that the deceased took down a double branch gaslight in his bedroom, and ineffectually stopped the service pipe with a cork. Scenting an escape of gas, he lighted a match to discover the leakage, when an explosion took place, and his clothes becoming ignited he was so severely burnt that he lingered in great agony till the next day, when death ended his pains. His wife and also severely burnt. In summing up, the coroner pointed out the necessity of doors and windows being at once thrown open on the least suspicion of gas escaping, and the jury expressed a hope that the press would publish such a needful caution. A verdict of “Accidental death, caused by an explosion of gas,” was recorded.

CO-OPERATIVE ASSOCIATIONS.—The magnitude and progress of these great retail stores in the manufacturing districts of the north of England are very remarkable. In Lancashire there were 121 of them last year, and the large sum of 2,833,345*l.* was received by these establishments in cash for goods in 1867. The best of them appear to sell only for cash, and give no credit; but some allow a short credit to members up to a certain amount. Two great retail associations at Oldham do business to the amount, together, of about 200,000*l.* in the year, and realise good profits for the members. In Yorkshire the money received for goods sold by these societies in 1867 reached 1,425,021*l.* Yorkshire and Lancashire have several receipts exceeding 100,000*l.* in the year. In Durham the sales of the year were to the amount of 264,492*l.*; in Northumberland, 207,765*l.*; Cumberland, 91,105*l.*; Cheshire, 173,243*l.*; Staffordshire, 42,177*l.*; Derbyshire, 81,710*l.*; Monmouthshire, 24,918*l.*; Glamorganshire, 24,733*l.*; Gloucestershire, 71,599*l.*; Wiltshire, 28,955*l.*; Nottinghamshire, 45,795*l.*; Leicestershire, 26,251*l.*; Northamptonshire, 116,844*l.*; Middlesex, 140,647*l.*; Surrey, 60,109*l.*; Kent, 56,038*l.*; Essex, 23,316*l.* The amounts in other counties were below 20,000*l.*—in Warwickshire only 6,200*l.*, and not 4,000*l.* in Devon, Dorset, or Salop. These statistics would have gladdened the heart of Robert Owen had he been alive.

THE EGRESS FROM CONCERT-HALLS AT BIRMINGHAM.—At the conclusion of the local licensing meeting, the Mayor announced that the magistrates had adopted a resolution to the effect that the attention of the proprietors of music halls and large concert-rooms be especially directed to the necessity of having proper and sufficient means of egress in the event of an alarm. Particular attention to the subject is expected before next licensing day.

THE SCULPTURAL ORNAMENTATION OF CHESTER TOWN-HALL.—The raising of the images at the Town-hall, Chester, is a matter of embarrassment to the council. To one thing they appear committed, that is to spend 400*l.* on the matter, for that was included in the contract; but in what precise way they are not by any means determined. “Messrs. Lanyon & Co.,” remarks the local *Chronicle*, “are naturally anxious to have a fine building, adorned with stained windows, elaborate sculpture, and all that can make it rich in effect. The city would gladly second them but for one consideration—it has to find the money. At the present juncture the last thought will have to take precedence of the first.”

ROCK BLASTING.—At Caldon Lowe, Staffordshire, an attempt has been made to level a rock by a monster blast. The rock formed part of the limestone quarry of the North Staffordshire Railway Company, whose canal engineer, Mr. Forbes, directed the operation. The rock had been perforated at its base, a chamber 5 ft. square having been formed at the end of the tunnel. In this chamber 36 cwts. of powder were deposited; and when the powder was fired, the rock opened and crumbled as if by magic. The blast was not quite so successful as was anticipated, but a minor blast was expected to complete the operation, by which, in all, some 14,000 tons of limestone will have been dislodged.

THE GERMAN WORKMEN'S CONGRESS.—This congress has now closed. The programme of the International Working Men's Association, emanating from London, was adopted by a majority of 69 delegates, representing 61 associations, against 46 delegates, representing 32 associations. The consequence was a split, and the minority determined to hold a separate meeting of their own. Some of the resolutions arrived at by the majority are regarded as being rather Utopian. The congress rightly set their faces against war. They recommended working men to abstain from all work on war taking place in their respective countries,—rather an odd determination, certainly, unless the congress disapprove of all defensive no less than offensive war: as well recommend them to abstain from food and drink. That labour is of no country is the fundamental principle of the association; yet their principle is scarcely cosmopolitan; for the congress voted against giving the German Austrians and all other foreigners a deliberative voice in their assembly, although, we presume, they allowed it to Germans resident in countries not German.

FALL OF A HOUSE.—On Sunday evening, a number of persons miraculously escaped death by the fall of a house in Park-street, Birmingham. The house was a three-story building, adjoining other houses on one side. It was occupied by several families, who rented furnished apartments; and, at the time of the occurrence, there were two persons in the attic; five on the middle floor; and three on the lower floor. The whole of the front and side of the house gave way and fell forward, leaving nothing standing except the chimney portion, and the flooring of the attic. The two persons in the attic escaped injury, but the occupants of the second floor were carried away with it, precipitated below, and buried beneath the falling debris. The ceiling of the lower floor did not entirely give way, but became formed in the shape of an arch, affording protection to the three inmates below, who would but for this undoubtedly have suffered serious injury from the full weight of the falling materials. In a very short time, however, the whole of the inmates were got from beneath the debris, and it was then found that none had received fatal injuries. The building was a very old one; and a house on one side having been removed some time since, attention was called to the unsafe appearance of the structure on that side, but no precaution would appear to have been taken to erect proper supports, a necessity for security which is alleged to have been urged by the tenant.

THE ORPHAN HOUSES, ASHLEY DOWN.—Mr. George Muller has just published his report relative to this institution for the past year, and the following are a few of the interesting facts which he gives:—The amount which he received for the support of the orphans between May, 1867, and May, 1868, was 15,878l. 11s. 6½d.; for the building fund he received 6,633l. 18s. 5½d.; his receipts in aid of the school, Bible, missionary, and tract fund were 7,825l. 8s. 10½d. The average cost of maintenance, including every expense, is 12l. 10s. each child.

THE POLYTECHNIC.—A very interesting lecture is daily delivered here by Professor Pepper on the eclipses of the Sun in general and the recent total eclipse in particular. Some of the illustrations are remarkably good. The electric organ has been set up, as we mentioned a few weeks ago, over the proscenium of the large theatre, a scale of 120 wires communicating with it from the key-board at which the organist sits during the performance. The lecturo on the eclipse is accompanied by an organ performance. The organist sits at his key-boards in the orchestra, and therefore instantaneously realizes all the suggestions and directions of the conductor, although the organ itself is distant behind the scenery. Moreover, perfect accord with the band is insured with more precision than before.

THE RIGHTS OF RAILWAY TRAVELLERS.—At the Uttoxeter Police-court, Mr. Buchanan Finlayson, a commercial traveller from London, was charged by the North Staffordshire Railway Company under the following circumstances:—He took at Derby, a few days previously, a third-class ticket to Ashburn, for which he paid 1s. 3d. On reaching Uttoxeter he alighted, and 3d. was demanded from him, that making, with the 1s. 3d. he had already paid, the third-class fare from Derby to Uttoxeter, which latter town is about ten miles nearer to Derby than is Ashburn. He refused to pay the sum demanded, and hence the summons. Mr. Tennant, of Hanley, the company's solicitor, contended that a demand had been attempted, but the defendant argued that he had a legal right to break his journey at any station short of that to which he had booked. The bench concurred, and the defendant was dismissed the case.

GAS.—The Sunderland gas company have declared a dividend of 4½ per cent. for the last half-year. A meeting of gas consumers has been held at Black Heath. The meeting was informed that the Rowley Regis and Black Heath Gas Company are unwilling to grant a reduction except to the smaller class of consumers, who would in future be charged 6s. instead of 6s. 6d. per 1,000. The reason assigned by the directors was, that the shareholders had not received sufficient remuneration for the money invested. The meeting was unanimous in the opinion that it was bad policy on the part of the directors to expect to increase the dividends of the shareholders by continuing to charge so much for their gas, and expressed themselves unwilling to pay such a high price. It was decided to discontinue burning gas at the end of the present quarter, unless the price be reduced to 4s. 6d. per 1,000 ft.—A mode of lighting by gas, to which General Fave has called the attention of the Emperor, is being tried in Paris. The gas is self-made, and the apparatus easy to manage and move about. They say it can be used for heating as well.

SIZE OF THE HOUSE OF LORDS.—Oddly enough while a committee of the Commons has been recommending an enlargement of their House, a committee of the Lords had nearly determined to report that their meeting-place was too large, and that the Peers' Smoking-room should be fitted up to serve the purpose better, the present chamber being retained for great State occasions. The size of the House of Lords, on the floor, is 84 ft. by 45 ft.; on the gallery level the length is 98 ft. The height is 46 ft. The cubical contents of the House are 173,000 ft., being 46,000 ft. more than the House of Commons. The House of Lords contains seats for 100 persons on the floor and in the galleries. The journals of the House were examined, and they showed that the attendance of peers exceeded 150 only thrice in 1865 and twice in 1866. The report prepared by the chairman of the committee, the Earl of Carnarvon, recommended the adoption of this plan, but it was not retained, the numbers for and against it being equal. The Lords and Commons might change, but this would not suit the arrangements made for the visits of the sovereign.

A NEW CEMENT.—The following directions are given for making cement impermeable by air and steam, which is said to be superior to any in use for steam and gas pipes. Six parts of finely-powdered graphite, three parts of slaked lime, and eight parts of sulphate, are mixed with seven parts of boiled oil. The mass must be well kneaded until the mixture is perfect.—*Mechanics' Magazine.*

A MILLION OF PAUPERS IN ENGLAND AND WALES.—On the 1st day of January of this year the number of paupers in receipt of relief, indoor or out-door, in England and Wales (including lunatics and vagrants) was more than 1,040,000. In the year ending March 25th, 1867, nearly 7,000,000l. were expended for the relief of the poor, or more than half a million in excess of the sum spent during the previous year. The rate per head on the population for the relief of the poor was 6s. 6½d. for the year ending March 25th, 1868.

PANIC AT AN AGRICULTURAL SHOW: FALL OF TWO GRAND STANDS.—An alarming occurrence has taken place in the show-ground of the West Riding Agricultural Exhibition, which was being held in Belle Isle Fields, Wakefield. There was a large concourse of people present. Two large stands or slanting [sloping floored?] platforms had been erected, which were thronged with persons. One of the stands fell, and the occupants were thrown upon each other, and some of them seriously hurt. The panic occasioned by the first fall had scarcely subsided when the other stand, which had been overcrowded, also went down. A number of ladies were seriously injured.

REOPENING OF RAOLAN CHURCH.—Raglan Church, Monmouthshire, has been reopened, after extensive restoration. The Duke of Beaufort gave a donation of 600l. and also a piece of land for enlarging the churchyard; and the duchess gave the pulpit, of carved oak. In the church is the Beaufort Chapel, which was erected by one of the Earls of Worcester (probably the third), who, in the reign of Henry VIII., greatly beautified the castle and extensive domains, and whose deplorably-mutilated effigy still lies here. Beneath the chapel, in a spacious vault, are interred the remains of many members of this noble family, and among them those of Edward, the sixth Earl and second Marquis of Worcester, who, as is well known, devoted himself to mechanical science, and left behind him an imperishable name as the inventor of the first practical steam-engine.

INFRINGEMENT OF A MANUFACTURER'S DESIGN IN THE POTTERIES.—At the Police-court, Fenton, Messrs. Cocksack & Chetwynd, earthenware manufacturers, Coleridge, were lately charged, on the information of Mr. John Edwards, manufacturer, Fenton, with unlawfully copying the design of a jug, for which Mr. Edwards claimed protection by registration certificate. At the beginning of 1866 Mr. Herbert Beech, Mr. Edwards's American agent, came over to England for the purpose of introducing, in Mr. Edwards's interest, a new design in jugs, which were to be specially for the American trade. The distinctive feature of the new jug was the angularity of its top and handle and its raised lip. Messrs. Chetwynd were entrusted with the modelling of the new jug, for which service Mr. Edwards paid them a sum of 120l. At this time Mr. Edwards was not aware that Messrs. Chetwynd were connected with a manufactory. Mr. Edwards was surprised a short time after to find that jugs similar in design to his own had been issued from the defendants' manufactory, introduced into the American market, and were "taking" immensely. The only apparent difference in the jugs was the embossed ornamentation of the imitation jugs. The defence set up was, that the said-to-be-new design of jugs, was simply a combination of previously existing forms, and that consequently there was no offence. A fine of 5l. was imposed.

TENDERS.

For a new public house, for Mr. G. D. Groom, at Hitchin, Mr. Shilcock, architect:—	Warren & French (accepted).....	£330 9 6
For a new house, for Mr. Joshua Whiting, at Hitchin. Mr. Shilcock, architect:—	Extra if stone dressings to front windows	
Butterfield.....	£200 0 0 £15 0 0
Amell.....	475 0 0 7 0 0
Stapleton.....	473 0 0 14 0 0
Jeeves.....	472 0 0 9 0 0

For alteration at the Infirmary, Brentford Union. Mr. Hoimes, architect:—		
Nightingale.....	£1,887 0 0	
Wiles.....	1,555 0 0	
Lodge.....	1,519 0 0	
Crab & Vaughan.....	1,517 0 0	
Gardiner.....	1,541 0 0	
Poole.....	1,397 0 0	
Brunden (accepted).....	1,323 0 0	

For six houses in Wynford-road, Barnsbury-road, Islington:—		
Mann, Junr.....	£2,900 0 0	
Hind.....	2,850 0 0	
Turrell.....	2,784 0 0	
Mundy & Hutchinson.....	2,650 0 0	
Pett.....	2,460 0 0	
Blackmore & Morley.....	1,950 0 0	
Stentford.....	2,200 0 0	
Pearce.....	2,190 0 0	
Heath.....	2,148 0 0	
Jay (accepted).....	1,770 0 0	
Harrison & Edwards.....	1,750 0 0	
Ireson.....	1,710 0 0	
Williamson.....	1,595 0 0	

For additions and part restoration of Bourne Abbey Church, Lincolnshire. Mr. Edward Browning, architect:—		
Hilton.....	£1,400 0 0	
Richardson & Roberts.....	1,372 0 0	
Milson.....	1,318 0 0	
Dagnell & Tinkler.....	1,193 0 0	
Halliday & Cave.....	1,172 0 0

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and not to the "Publisher."

The Builder.

VOL. XXVI.—No. 1338.

The International
Congress
of Working Men.

CLASS of men in whom we take a never-failing interest, the actual rank-and-file of the great army of industry, has been holding an international Congress at Brussels. Subjects of the deepest

social importance, not to the working men alone, but to all members of civilised society, have been discussed, and the opinions of the French, the Swiss, the German, and the Belgian, have been freely exchanged with those of the English workman.

The main subjects considered have either been those towards which the congress has sought to direct its action, or those on which it had to seek for further information. Of these, that which is the most important, because on its development depends the power and the wisdom of the workman to deal with the other, appears in the most shadowy state. The congress adjourns till 1869 its reception of a report on education. The main current of opinion, so far as we can gather from the reports, ran in the educational direction. That instruction should be practical and technical, not that of books alone (although not without the aid of book-learning), but that of intellectual, manual, and moral training combined, was the view of the majority; nor did it seem to be contested by any. The difficulties raised were chiefly those that regarded the action of the State upon education. All present appeared to concur in the feeling that education, to be worthy of the name, must be totally removed from the interference of the clergy; and it was pretty plainly intimated that ecclesiastical schooling, directed, as it usually is, chiefly to the maintenance of sacerdotal influence, has a "stupefying" effect upon its recipients.

On the subject of credit, banking, and currency, the discussion at Brussels might rather serve to enforce the necessity of elementary education, than to shed any light upon a subject of which the great principles are not actually unknown. Credit banks, giving aid to every one, and receiving profit from no one;—Government banks, the profit on which should amount to 40,000,000l. per annum, and thus save four-sevenths of the annual taxation of the United Kingdom;—above all, banks issuing a currency not convertible into the precious metals,—were among the improvements which the congress wish to see introduced. The one master idea that a bank note is simply a reliable promise from a responsible promiser, and that a promise, to be reliable, must be definite, has not yet been grasped by many of those who would fain instruct others on the subject. Let such a promise be regarded as a sale-note. A sale-note is definite. It undertakes to deliver, at a fixed date and place, a fixed quantity of a certain material. It may be ores, lead, coals, gold, or any other commodity. The principle is the same. We can imagine a highly organised state of barter, in which a very large amount of business should be carried on by means of these sale-notes. In

each instance the receiver runs a certain amount of risk. He makes his plans accordingly. We omit any notices of the risk as to the solvency of the issuer of the sale-note. Let us suppose that to be past question. But there still remains the risk of fluctuation in the value of the material. Three months hence the relative value of a ton of iron, and a ton of lead, or a load of corn, may be very different from what it is to-day. This risk is of the very nature of all commercial transactions, and success in speculative business depends, in great measure, on the skill with which the future course of demand and supply may be divined.

But if, to this unavoidable risk, the seller should seek to add another, and that, one dependent solely on his own interest or caprice, the conduct of business would become impossible. A has undertaken to deliver to B, at a fixed date, 100 tons of iron. When the date arrives, the supply of iron in the market is less than the actual demand. Iron has risen in price, as compared, say, with copper. But a large quantity of zinc has been imported from some newly-opened mines. A, therefore, sends to B, instead of the covenanted iron, 80 tons of zinc. B has no want of zinc; his works are standing still for the iron. If this method of substitution were allowed to the debtor, it is clear that all trade would come to a dead lock.

What some financial reformers propose is nothing more nor less than a recourse to such an indefinite system of promises. A five-pound note, now, is an order for the delivery, over the counter of the Bank of England, of an exact weight (an ounce and a third, in round numbers) of gold of a standard quality. So certain is this order to be honoured, that it freely passes from hand to hand as the representative of this ounce and a third of metal. The risk of fluctuation in the value of the gold is the only risk (beyond that of fire) borne by the holder of the note; and as this fluctuation is less than that contingent on the value of any other commodity, such an order, or sale-note, is the best possible common measure for all transactions.

The moment, however, that the note is rendered inconvertible,—that is to say, the moment that it ceases to represent a definite commodity, its value becomes matter of credit, or of caprice. We have seen, within the past year or two, how such imaginary or conventional notes,—promises to do nothing definite,—have fluctuated in their power of purchase, in the "green-backs" of America. And while the influence of the mere name of money, the prevalence of the ordinary idea of a bank note, has been such as to prevent these "green-backs" from attaining the extreme depression formerly reached by the French *assignats*, there has prevailed such a relation between the number of notes actually issued and their value as measured in gold, as to show that the printing of paper is not the coining of money. *Definiteness of engagement* is the life-blood of commerce. It is by making all engagements indefinite, or at the caprice of the purchaser, that the advocates of inconvertible notes seek to serve society.

A third subject has been approached by the Brussels Congress with considerable hesitation and suspicion. Men brought by steam to the bright little capital could hardly look each other in the face and deny the utility of machinery. Accordingly, more than one speaker carefully guarded himself against the imputation of hostility to the aid of machinery. But the subject was evidently one to which the general opinion was not altogether favourable. The mighty genius that had been invoked by Watt, and honned by Stephenson to the chariot of human progress, was looked upon as a very untrustworthy slave. "The machine was always well oiled,—that is, fat," said one delegate; "The workman was lean." It was proposed to the Congress to resolve that "machinery has

proved a most powerful instrument of despotism and extortion in the hands of the capitalist class." There is so much sad and sober truth in this position, that we must ask attention for a word or two on the subject.

It cannot be denied that the introduction of each successive improvement in machinery has been attended by a great amount of suffering among those whose labour is, for the time, displaced by the new competitor. Further, the great revolution which has taken place, and is still going on, in the method of performing what used to be manual work, has been attended, in many instances, with great aggravation of the misery of the producer. Not that this is altogether the case. The producer everywhere has benefited as a consumer by the introduction of machinery. But in that growth of great cities which has been stimulated by steam manufactures, in the agglomeration of workmen, the frequent fluctuations and rebate of wages, and all the untold evils of the worst phase of civilization,—very much direct suffering has been, and is, attendant on the development of machine power.

Attendant on it,—occasioned by it,—it is true, but not caused by it. This is the first point to bear in mind. To relieve him of the most crushing part of his toil, by substituting the motive power, first of animals and then of heat, for his sheer naked strength, is to remove the curse from his labour. The race has acquired a slave; the race is in an improved condition from the fact. That the result of that slave's labour has been so unduly proportioned,—that the rich has grown richer, and the poor poorer, by the distribution, may or may not be the case; but if it be so, it is the fault, not of the slave, but of the master,—not of machinery, but of man. It is not the introduction of machinery that has injured the labouring classes, but the contest between avarice and overhearing on one side, and ignorance and obstinacy on the other. Where were we without machinery?

We can answer that question pretty distinctly. Every year adds to the knowledge which we possess of the condition and habits of our ancestors before the invention of machinery. Man had a slave before he learned the use of the mechanical powers, as they are called. When there were no blacksmiths, because iron was unknown; when there were no joiners, because the rude hewing of timber had to be effected by flint axes; when the potter had not learned to use the wheel; and when the shuttle had not displaced the bone needle in the slow and imperfect fabrication of hempen web,—the slave of man was woman.

Our earliest historic works, the sculptures and bas-reliefs of Assian and of Egyptian antiquity, the implements discovered in barrows, at the bottom of lakes, and in the vicinity of other scenes of ancient habitation, the present habits of the wildest human races,—all tell the same tale. The traveller over many parts of the Continent who visits agricultural spots as yet undefiled by the steam-plough, may say that it is not with the naked savage alone that woman is to be found in a state of slavery. In the field labour of many parts of France, the hardest work still lies on the shoulder of the weaker sex. The earth of the railway embankments of the countries bordering the Mediterranean has for the most part been carried in baskets, on the heads or backs of women. When man has no other slave, he seldom fails to lay hard service on his wife.

In her own immediate sphere of the household, the labour of woman, before machines were made, was not slight. The preparation of bread was her daily task. To beat out the grain from the ears, and to grind it into a coarse and unpalatable meal between two stones, was the wont of our ancestors. The first lightning of their toil arose from the invention of the

quern, or hand-mill. How naturally do ancient writers speak of "two women grinding at the mill," and speak as if that hard and thankless labour were to be the constant duty of the sex!

During the darker ages of European history, disputes were high around the meal-sack. The tyranny of the feudal lord was at times bitterly complained of. He compelled his peasants to bring their corn to his mill to be ground. He took, no doubt, a heavy mulcture. Some of the grist, moreover, stuck to the dusty fingers of the miller. There can be no doubt of the abuses and of the hardships that often attended the compulsory age of the seignorial mills, in feudal times. But of what do those very complaints tell us? They tell us of the invention of the mechanical mill; of the minute reduction of grain to pure and wholesome meal, between a pair of stoues; of the whirling of the ponderous mill-stone, not by the hands of woman, but by the cheap and well-applied service of wind or of water. What was the gain to the position of woman in the family, and thus to the elevation of the race in the scale of intelligence, of comfort, and of elegance, by the displacement of the daily toil of the quern by the machinery of the flour-mill?

In this instance of the earliest introduction of machinery, propelled by any other than human, or, at least, by animal strength, we see an illustration of the whole history of the subject. The function of machinery is to free man from the more painful, more degrading, and more brutal, forms of labour, and thus to give him both time and stimulus to increase his skill, his knowledge, and the productive character of his industry. He may be slow and stupid in learning the lesson. So much the worse for him! But he can not fail to learn it sooner or later.

The history of individuals to a great extent reproduces itself. The same recurrent phases of life are undergone by the king and the peasant, by the Celtic rampart builder of thousands of years back, and the Coventry ribbon-weaver of to-day. To take his place in the series of fleeting generations, each individual must be born into the family circle. Arrived at maturity, he marries, or continues the family. He passes from it by death, and leaves his place to another. All the busy occupation of his waking hours only fills up the intervals between those three great duties paid to his species. But the history of the race is a widely different matter. Comprehending, as it does, nay consisting as it does of, individual biographies, it yet tells a tale of steady, certain, irresistible progress. That progress consists in the establishment of the dominion of man over matter. His mission is not only to replenish the earth, but to subdue it. He has been much more ready to fulfil the earlier, than the later, clause of the command; for man's subjugation of earth, to be worthy the name, is not that of the wild hunter and fisher who yet roves unclad in the interior of Africa or the fast-diminishing forests of America. It is not that nomadic possession which the Bedonins, and other pastoral tribes of our day, keep, with as loose and thriftless a hold as did their ancestry in the time of the shepherd kings of Egypt. It is not the possession enforced by a hedge of hissing bayonets, or by the loud-voiced thunderbolts of war. It is the possession of the cultivator, the builder, the architect, the engineer. It is the subjection to human service of the force of the wind and of the waterfall. It is the exaction of duty from the unimprisoned genius of heat, which has for so many thousands of years been bound in the unopened coal-seam. It is the power of putting nature to the question, by the analysis of the chemist, and of learning direct from her replies how best to feed, and to clothe, and to comfort the feeble infants of our kind. It is the power to raise a bushel of corn where once grew a tangle of conch-grass;—to span the ocean;—to defy wind and tide;—to make the very material of the lightning convey the articulate message of human will.

The advance which has been made in this method of subjugating nature, within the past century, has been far greater than that which all the preceding centuries of human aëdon on earth have witnessed. It is true that, in the great struggle, we may have lost, or thrown aside, some of the earlier marks of our nobility. In our pursuit of accurate scientific knowledge, and our attainment of practical mechanical skill, we may have deteriorated in art, in poetry, in oratory,—in the adornments of the infancy of a race. We cannot now produce sculpture like that of the age of Pericles, we cannot mix the unfading hues of Pergino or of Titian, we cannot speak in the music of Homer, or with the

perfect mastery of language attained by Shakespeare. Our pulpits may give forth uncertain and discordant sounds; our legislators may laugh in the sleeve if any one speaks to them of patriotism or of self-devotion; our men of business may have little time to spare from the rapid accumulation of capital.

But amid all this,—in spite of it,—by means of it,—the great scientific conquest is pushed on. We are advancing along the whole line. It is not a century since we made our island permeable by roads—since we learned to make smooth highways of broken stone, and to traverse them at the rate of ten miles an hour on carriages furnished with the novel appliance of steel springs. It is not longer since we opened water-ways from shore to shore, from Thames to Trent and to Severn, for the transport of heavy goods. Already our turnpike roads are grass-grown, and our canals are strangled with weeds. An entirely new locomotive system has superseded the great improvements in transit effected in the eighteenth century, and already our new roads are so choked by the traffic which they have evoked that great improvement is demanded. All sheer labour is being lightened to man. Even the ancient and simple toil, in the employment of which man has entered into partnership with the horse, and, long before he tamed the horse, with the ox, from the very commencement of agriculture, is becoming obsolete. If anything had a long future predicted for it, it was the plough. Where will the plough be twenty years hence? How rude and petty will be the tillage from which it is not driven by the use of the steam cultivator? If there was one section of human labour in which, more than in any other, it seemed unlikely that the steam-engine could be advantageously employed, it was that of breaking up the surface of a large extent of country. What is the case now? What, is, we do not say the opinion, but the experience, of any farmer who has given a fair trial to steam-cultivation? Like the spirit evoked by Michael Scott, the genius of steam is constantly demanding fresh employment at our hands. And are we now to speak of putting restrictions on the employment of machinery?

Those alone are the true friends of the working man who open his eyes to truth. There is much, no doubt, that yet remains for discussion and for elucidation in what has been called social science. There is room enough for the luxury of ample difference of opinion. But certain great laws underlie all human action. They are either laws of thought—such as are illustrated in the question of the measure of value, before referred to—or laws of observation, derived from a long series of observation, such as that which prescribes the gradual displacement of human labour by the use of machinery. In all social progress, and in every amendment of the position of the workman, these laws must have their due influence. Those who attempt to start theories, and to reform society, without, in the first instance, having the patience to ascertain all that is actually known on the subject of their incursions, do worse than waste their own time. In so far as they misdirect the working energy of those who listen to them, they become obstructive and reactionary. Those who seek to turn the stream of progress up-hill will only get drenched for their pains.

That a new era is opening for labour, we not only trust, but believe. That this latter age will be attained by the development of industry, within its own proper sphere of action, and not by its direction into political channels, we hold to be certain. The province in which industry has attained its greatest triumphs, is that which promises best for the future. That a co-operation of the productive forces, not a forcible antagonism between capital and labour, but the aid of the labourer of to-day by the stored labour of generations of labourers who have preceded him, is the great requisite for progress which experience denotes, there can be no denial. That the credit which arises from trust in character, and not the artificial operations of imaginary banking schemes, will form the sinews of successful organisation, we also hold. And it will be by the final performance, by tools and mechanism driven by steam or electricity, of all that man shall hereafter have to do, except to think, and to enjoy the full exercise of his intellectual and animal functions, that we hold that the final subjugation of the material world will be effected. It is towards that end that the race has, slowly and blindly, but no less certainly, advanced, since bronze replaced stone, and the corn-mill was substituted for the quern.

GENERALISATION IN ARCHITECTURAL EDUCATION.

In a previous article* we endeavoured to point out how much the idea implied in the term "generalisation," the perception of broad laws and principles permeating and linking together branches of study and knowledge, which to a cursory glance might seem perfectly independent, in a grand and comprehensive unity of plan, is underlying and influencing all the best intellectual life and progress of the present time; and how the art of architecture, as a kind of *microcosm* in the great world of art, seems peculiarly to demand this generalising spirit in its practitioners, both from its central position with regard to other arts, and from the absence of the definite expression† and imitation which serve to mark clearly the prime end and object of these latter, in the delineation and presentation of physical beauty; while architecture is rather occupied with that metaphysical beauty which, while directly imitating no natural object, seeks to govern itself by those general abstract laws of harmony of proportions, and fitness of means to an end, of which all natural forms are but so many separate and concrete instances. Nor is it possible to look at the profession of architecture from this point of view, without perceiving not only how much it is heretofore elevated above the commonplace brick and mortar and specification standard, but also how much mental training and delicacy of taste and perception is necessary to acquire even the capability of appreciating such subtle relations between principles and ideas and external forms, much more the power of designing and carrying out a work in accordance therewith. This we take to be the real reason why architectural art is so little comprehended by the mass of outsiders, and why, for ten persons who can form a fair judgment as to the merit of a painting, there is scarce one to be found who has the slightest notion of the merits or faults of a building, or why they should be called merits or faults at all, or what architecture essentially consists in; the preferences of the public on such matters being almost entirely governed (as some architects know to their cost) either by fashion and prejudice, or by whims of the most absurd and unreasonable description. The relation between the purpose and the site of a building on the one hand, and the form and character of its design and detail on the other, cannot be perceived or judged of without a degree of general cultivation of intellect which is at present, unfortunately, the reverse of ordinary; and, considering this—considering what a large demand must be made upon refined intellectual perception, in addition to mere practice of hand and eye, in determining, for instance, how an isolated building should be placed with reference to the landscape around it, what character of outline will best harmonise with such landscape, to what extent and in what manner the purpose and interior plan of the building should be indicated in the exterior design and grouping, what style and amount of ornament will be in keeping with that purpose, and where and how the decoration should be placed so as to enhance and not encumber the expression of the design, it certainly appears of great, even of paramount importance, that those who have to decide in such matters should have an education calculated to develop and strengthen the powers of the mind generally, and enable them to use pencil and compasses in accordance with certain and definite principles,—considerations which will appear of none the less weight when we reflect upon the monumental and enduring character of large architectural works, which, unlike pictures and poems, are forced under our notice whether we will or no, and remain as objects of pleasure or annoyance for perhaps many generations. Viewed in this light, how does our present system of architectural education appear?

It is customary at present to speak with much pity and contempt of those good old days when an architectural pupil was solemnly and in set form introduced to the "Five Orders" as the "he-all and the end-all" of architectural excellence, to be studied and copied with rigid exactness through all the conventionalities of "modules" and "parts." Doubtless there is an activity and energy in the modern practice of the art not

* See p. 672, ante.

† One of the many points in which architecture resembles music, and may be classed with that art in its effects on the mind; but to go at all fully into this fascinating subject would require a separate essay.

to be found among the dry bones of quasi-classicalities; yet it must not be forgotten that in that slower-paced generation there was more time given for thinking out the plan of a work than now, and that the mere study and contact with forms so lofty and pure in themselves as the relics of Greek art were not without their influence in refining and educating the mind and connecting the idea of an architect with that of a cultivated gentleman more decidedly than, it is to be feared, is now the case. How much of thought, and care, and study, how much of the refining influence of a familiarity with delicate and beautiful forms, either in drawings or their actual remains, went to the prodding of a first-class architect in those benighted Pagan times, let the lives and works of Cockerell and Barry* attest against all counter-pretence. But, admitting all that is to be said against the one-sidedness and comparative barrenness of the "five orders" system, an impartial observer will scarcely see that we are, in our theory of education at least, any more rational now. The usual course of things is much on this wise: a lad shows talents for drawing, and predilections for drawing buildings (this is supposing a favourable case, for natural talent is by no means considered a *sine qua non* for entering the profession); and hereupon his friends make exertions to get him into the office of some eminent architect, in the high tide of successful practice. "It is a heavy premium, to be sure; but then it is such an advantage to get him into —'s office!" and into —'s office he accordingly goes. And now, in the name of common sense, what is it that he learns, or is expected to learn there, in any sense which ought to be attached to the word "learn?" His friends give themselves little concern about this; it is the usual system, and everybody speaks very highly of this particular office, &c. But, in point of fact, architectural education he gets none, so far as education signifies the gradual development and strengthening of the abilities in a special direction and with a special object. He enters the office with no definite idea as to the limits and objects of the profession he is to acquire, no general idea of any leading principles connected with it, often with not even a general notion of its history (though this latter may be brought to his own neglect). The principal, whose time is probably occupied with multifarious works, of which he can only manage in a hurried manner to direct and oversee the leading details, cannot of course pretend to instruct the pupil systematically, or even to instruct him at all; and the latter is consequently simply thrown into the midst of a chaos of work to pick up what he can. By degrees he begins to attach a definite meaning to what at first seem the cabalistic and inexplicable diagrams that come under his eyes, and attains by little and little a facility in reproducing ornamental detail of the same kind as what he constantly sees, and a certain indiscriminate acquaintance with various details of construction; but in most cases it is long before he is able to generalise sufficiently from these to arrive at a comprehensive view of the whole system of design and construction pursued in the office, and the relation of one part to another. But having attained this, what has he really learnt? Proposing to qualify himself for a profession which, above all other artistic professions (if our views are correct), requires a comprehensive study of its history and its bearing upon other arts to rightly understand it, he has simply acquired a knowledge of one method of practising this profession by one single man at one single period; the said practitioner being by no means infallible, and indeed being by possibility a very shallow though clever and energetic hard-working man: for popular success is no evidence, either in architecture or in anything else, of the possession of any deep thought or clear principle. The pupil (we speak now of a good specimen) has indeed got what his parents and guardians paid for, the capability of making a living by his profession; even of getting some credit by it, as times now go. He has the prestige of the office he has served his time in, to begin with, which gains him credit

* As a single instance alike of the defects and merits of the period, take the Royal Institution at Manchester, one of Barry's early works: externally it is not the least fitted for a northern manufacturing town, whether as to expression of design or practical power to stand against the onslaught of snow and weather; yet in the interior, with its central staircase and rooms divided by low columned corridors, there is evident a distinct thought, and a simplicity, yet originality, of architectural effect, which we may look for in vain through many a score of sets of recent competition drawings.

with that large majority of persons who cannot judge for themselves, and are consequently obliged to take everything on trust; and he has gained by long habit a ready facility in "knocking off" designs and details in the style and manner of his former master; and in these hurrying days, when all who want buildings want them at once, readiness is everything, and no one stops to inquire whether (to parody Goldsmith's connoisseur) the building might have been better if the architect had bestowed more thought on it. And while, on the one hand, it must be owned that none but a man of very decidedly original talent could possibly go through this course of apprenticeship in one office, hard at work in only one style (or rather one manner), without unconsciously falling completely into the manner of his master, as a kind of transmitted instinct; on the other hand, it is evident that to acquire a power of rapidly "designing" (as it is facetiously termed) in this parrot-like manner demands no high order of talent, being little more than a matter of habit; the one thing indispensable to success being that the style or manner should be a popular one. It is owing, in a great degree, to this fatal facility in acquiring a popular style of draughtsmanship, that the intellectual status of the profession, even judged of from among the ranks of the tolerably successful men, is sensibly lowered. Without wishing to be censorious, it must be said that the gushing young architect of the present day is not a type of character on which men of intellectual training will be inclined to look with much respect. He has good qualities certainly; the best of which are that he generally has a love of his profession *per se*, and that he works very hard; commonly, indeed, to the exclusion of all interest in wider and more general and intellectual pursuits. But he is loud-talking, bustling, egotistical, and affects a kind of "slap-dash" manner calculated to impress you with an idea of the press of work he always has to get through. He has a great respect for Mediæval literature (it is the only one he is acquainted with), with an supreme contempt for the Renaissance in all its developments; and holds Rossetti to be the only modern painter worth looking at. His office is strewn with barbaric pieces of furniture of the most inconvenient and clumsy make, painted in violent colours or inlaid with Feejee ornament; he dabbles in Ritualism, and "goes in" for church millinery and floral decorations. As we have said, there is good in him; but on the whole we prefer the old classic type of architect to this latest invention; and at least it is not to such persons, trained under such a system of non-education as we have hinted at, that any thoughtful man would wish to find the future aspect and architectural expression of our streets and public buildings entrusted, seeing that what is done in these matters cannot easily be undone.

Neither type, however, we apprehend, will accomplish the work which seems likely to be demanded of the architectural profession in an age which is yearly showing stronger symptoms of its impatience of anything like a sham, which is getting into the habit of inquiring the why and the wherefore of everything, and of insisting on a general fitness of things, and a banishment of anomalies. The dissatisfaction expressed *in re* the Law Courts designs, with all their splendid elaboration of drawing; the strong sense exhibited, in some not unimportant quarters, of the absurdity of such an insane sprouting forth of towers and turrets as came to light on that occasion, show which way the wind sits, and indicate a possibility that the architect may even be called upon by the intellectual part of the public to show cause for his existence, unless he can do something more to the purpose than this. And if he is to go successfully through such an ordeal, architectural design must certainly be made more a matter of thought and reflection, and less a thing of habit, than it is at present. And the main step to this will be that the present system of what is called architectural education be as nearly as possible reversed. To turn a boy loose into the midst of architectural work, to fish up for himself a bit of information here and a bit of experience there, is to ignore all logical principles of education altogether; and is so far worse than valueless, inasmuch as it leaves him free to imitate and adopt any practice or predilection of his master, however illgrounded and absurd these may be, seeing that he is not supposed to be prepared by any study of the history and principles of architecture as a whole, which might teach him

how to refuse the evil and choose the good: nor, for the same reason, is he in any position to make the most of information which may be really valuable, nor having the data whereby to measure its real importance or bearing with regard to the whole field of his profession.

The branch of knowledge which alone can be acquired in a practising architect's office, and nowhere else, is just that which the pupil stands in need of rather at the close than at the commencement of his studies, viz., the practical constructive details, and the general working of the profession in its relation to the two classes, capitalists and the building trades, between whom it has to arbitrate. Before he can be competent to carry on a practice on his own account, it is necessary that he should have experience in these matters; but these do not constitute the art of architecture, the end and object of which, broadly stated, is so to plan, group, and ornament buildings as to transform that which is originally merely a material necessity into a source of intellectual pleasure.

Here, then, we return to our leading idea of "generalisation" and we do most strongly urge, upon the grounds aforesaid, that any proper, natural, rational system of architectural education must commence with, and indeed, mainly consist of, such a training in the general principles of art, and the application of these to the conditions and objects of the art-architectural in particular, such a general and comprehensive view of the history of all the leading styles considered in relation to the conditions of climate, society, &c., under which they were evolved—and such a cultivation and refinement of the intellect through the agency of literary, and what we will call metaphysical, study (taking the word in a wider sense than usual)—as may qualify the student when he comes to deal practically with his profession, to subordinate details into their proper place as parts of one scheme, to exercise a deliberate judgment as to what sources of effect commonly employed are legitimate and suitable for his purpose, and to take a comprehensive view of the requirements and tendencies of his own time and circumstances, and so produce, not at haphazard, but on principle, that which will be permanently acceptable and valuable to the best educated part of the public. Along with these general studies will, of course, go the practice of drawing and designing, instruction in the general principles of mechanics and of construction with various materials, and an elementary knowledge of the principles and practice of the various arts which touch upon architecture as ornamental and accessory, always keeping in mind the main object of architecture as just now stated, and admitting any accessory branch of study only so far as it educates the mind towards that end, not following it out to the point where it entirely diverges from any connexion with architecture.

This kind of scheme, thus roughly shadowed forth, is what we mean when we speak of a generalisation of architectural education; and all students of average ability, who had passed through the discipline of such a system, would, we apprehend, find themselves in a position to learn more of the practical working of their profession in the course of one year in an architect's office,—more, that is to say, which will be of real value to them,—than in the course of the five years now commonly spent in an architectural apprenticeship; while, if time and opportunity are favourable for the carrying out of a sketching tour or an extensive round of visits to existing buildings, ancient or modern, not only will this comprehensive education give a far deeper interest and significance to these than they can ever have for the mere facile draughtsman, but the cautious and judicial habit of mind which an education worth the name always induces, will guard them against being carried away by this or that grand relic of an old style into the lust of imitation, and the folly (so universal at present) of raking out details and oddities from old remains, to be repeated in a meaningless kind of manner at home. But the existence or carrying out of such a complete scheme of architectural education as we have indicated, presupposes either the foundation of a national college of architects and engineers (as the two professions overlap to some extent, though not so much as is often imagined), or else the institution of regular architectural degrees, combined with facilities for a complete education in the theory and a certain part of the artistic practice of architecture, at our existing seats of learning. With regard to the former idea, what difficulties there certainly would be in founding

it, and what drawbacks there might be in the working of such an institution it would hear too long a business to discuss here; but it is known that our German neighbours have long carried on the system of collegiate education for the architectural and engineering professions with apparently a great measure of success; and certainly, in conversing with German architects who have been so educated, we have always been struck, even in the case of men not distinguished for any brilliant talent in their profession, with the apparently complete and all-round character of their professional knowledge, as compared with the results, in men of the same calibre, of the desultory and one-sided, though, perhaps, in some respects, more practical education attainable among ourselves. The second proposition is one which we should imagine not only could he, but ought to be, and before long must be carried out at our universities, unless they are destined to lose all title to their supposed rank as the great centres of education for the youth of England. We are far from undervaluing what is called classical education, believing that the study of the Greek language and literature in particular is a refining influence which nothing can thoroughly stand in the way of; but does it not seem a gross absurdity that a man can attain the highest honours which the two older universities have to give without any knowledge of the science which has changed the face of the globe, and gone far to revolutionise society, and without having gained the slightest insight into the principles or practice of those arts which are the sources of the loftiest and purest enjoyment of which the human mind is capable?

It may be objected, with some show of reason, that in pleading for more attention to general education and mental culture, in preparing for the profession of architecture, we advocate a system which would needly distract the mind of the student from acquiring the practical knowledge and practical power of design, the adequate attainment of which, it may be urged, is itself enough for any one man's task. But this notion of the multiplicity of the subjects of architectural study is much exaggerated by the want of consideration on the part of both learners and teachers as to what is really required, and what is not. For instance, a move has lately been made in certain quarters for teaching water-colour drawing to young architects, and forming classes for the purpose. One can scarcely regret that so delightful a branch of art should be encouraged in any way, but it ought to be pointed out that the sole practical use of such an acquirement to the architect, is to enable him to enter the baneful lists of architectural competition (soon we hope to be closed), without the expensive aid of the professed colonist. For any aid towards the one object of the architect, the production of a well-considered building, the study of water-colour is all but valueless. This is one of other instances that might be named of the manner in which the energies of the student are often diverted to matters which are not really necessary or helpful to him as an architect; not to mention also the priceless time which, under the apprenticeship system, is wasted in mere routine office work, tracing drawings, &c., which might have been employed in studies of permanent value and importance. Let us also guard against another misconception that may be put upon our remarks, either willfully or otherwise. Let us not be understood to be for a moment upholding the visionary idea that a man may philosophise himself into an artist in any way; that thought and mental cultivation can supersede in any manner the training of hand and eye in practical drawing. There is no such royal road to success. But it is a fact, patent to all who live and work with their eyes open, that in the architectural practice of the present day a great deal too much importance is attached to mere *tour de force* in drawing; the result being not only that much valuable time is wasted in merely getting up drawings to look well (a process which, of course, has no more effect upon the ultimate value of the design than has the water-colour study before mentioned); but that success in the profession is really coming to depend very much upon mere rapid and clever draughtsmanship, the manner of which, as we observed, is caught up, with little aid from thought or education, from one successful practitioner by a number of pupils and draughtsmen, and thus disseminated abroad, cheating the public into the belief that we have an overflowing of talented architects amongst us; the real truth being only that we possess a number

of clever imitative draughtsmen. Now, it is peculiarly necessary in the present day, that the hand in using the pencil should be under the guidance of the mind; because, owing to the amount of material before us to choose from, in the histories and remains of past periods of art, and from the increased intercommunication between different countries, we are not in the isolated position that our Medieval forefathers (for instance) were in, and we must of necessity have some principle to guide us in selecting what is best to follow and imitate, so far as imitation is necessary, which it always will be to some extent. In a time when there is so much to be learnt, so much work to be done, and such an increasing necessity for something like a division of labour, nothing can be really of greater importance to a man, whatever his profession, than to ascertain his real place in connexion with the work of the world around him, and how he can so carry on his own branch of work as to go with and supplement the main current of human energy, which, labouring apparently in so incongruous a manner, is yet in the main proceeding so surely towards one end, that all work which does not actually conduce to that end will in time have its utility exposed, and be cast aside as rubbish. And what is the use of labouring violently and aimlessly at this or that so-called style of architectural design and ornament, if in the end this prove to have been merely a passing fashion, and your work, instead of remaining a monument to future times, be scouted by the next generation with "This is not what we wanted; you have wasted your time over what is of no use to us: away with it!" In all that concerns that which is enduring in art, the race is not to the swift, and while competition draughtsmen are turning out *bravura* drawings by the thousand, the final and lasting success will remain with those who have taken the trouble to look before them in the race, to ascertain what is really wanted of them, what is essential to their profession, and what is merely accidental, and whose motto has been that which must be adopted by all who would produce work worthy of lasting commendation—*festina lente*.

THE HALL OF THE REFORMATION, GENEVA.

On the 2nd of September, 1861, the tricentenary anniversary of Calvin's death, a congress, composed of Protestant delegates from different parts of Europe, assembled in Geneva, at the instigation of a society called the Evangelical Alliance. Its object was to commemorate this great and to confer on questions of church discipline, and on others of a practical religious character. At the end of its labours it was resolved to perpetuate the memory of this meeting by erecting a monument to Calvin. This object has been carried out, not by erecting a statue, but in conformity with what was the constant aim of the Reformer's teaching, by contributing in a permanent manner to the enlightenment of the people.

Every winter series of lectures on religious subjects are delivered in Geneva by distinguished laymen and clergymen. To these lectures the population, remarkable for its love of philosophical disquisitions and historical inquiry, flocked in numbers so large that no hall then existing could afford comfortable accommodation for the audience. This want of a large public meeting-hall was strongly felt. The Genevese, therefore, thought that the most worthy monument to Calvin would be such a hall destined to continue his mission and diffuse widely among the population the vivifying light of truth. A subscription was set on foot for this purpose, and soon contributions poured in from different parts of Europe. The English contribution was exceedingly large, inferior only to that of Geneva. The amount subscribed was about 10,000*l*. The committee formed for carrying out the resolution of the Congress determined, in order to increase the utility of the building, that it should contain the following rooms:—Firstly, a hall containing 2,000 seats; secondly, a room with 400 seats for smaller assemblies; thirdly, a library with reading-room, destined principally to receive the works of the Reformers; fourthly, two school-rooms for thirty or fifty children; fifthly, an assembly-room for workmen; sixthly, a porter's lodge.

This building was completed and inaugurated on the 26th of September, 1867. Worthy of our attention by the idea from which it origi-

nated, it is no less so by its constructive qualities. The architect was Mr. Brocher, of Geneva. It forms a long rectangular edifice, free on three of its sides; the fourth is built against a large dwelling-house. The principal front is divided into three parts by vertical courses in freestone, the mass of the walls being built in masonry parge-tinted. It is pierced by a large entrance-door and two smaller lateral ones, and by a large bull's-eye in the gable. The two lateral façades are without windows in that portion of their length which flanks the large hall. The walls of this portion are simply enlivened by equidistant vertical courses similar to those of the principal façade.

The inhabited part of the building or the annex, containing the library and schoolrooms, is characterised as such by the very contrast of its doors and windows with the blind wall of the hall. Through the entrances on the lateral façades we penetrate into the annex, which is two stories high, and may proceed by a flight of steps down to the under-ground floor, where we find, firstly, a room intended for evening and Sunday lectures to workmen; secondly, the heating apparatus, for the building is heated by means of hot air. Above this room is the small assembly-hall, from which a private passage, as well as the general staircase, leads to the committee-rooms on the first story. On the second story are the library, the reading-room, and the schoolrooms.

The principal entrance to the great hall is naturally from the front; moreover, three doors lead from the hall into the annex. The hall is rectangular, with two rows of galleries. It is 108 ft. long and 70 ft. wide. The side opposite the entrance presents to the eye a niche of about 20 ft. in diameter, giving to the interior a severe Byzantine appearance. In this semicircle of a choir is raised a "tribune," or speaking platform, on which benches for 200 places are arranged in the form of an amphitheatre. This arrangement permits the hall to be also used as a concert-room. The tribune is brought into immediate connexion with the smaller meeting-hall by a door at the back of the niche, so that the members of the committee and the speakers can enter the tribune without passing through the hall. The architect, in order to obtain a roomy, airy appearance, and also to give the hall a character of simple severe truthfulness, thus reflecting the spirit of Calvin's genius, decided on covering it with an apparent roofing of iron and wood, according to the Pellencé system. The acoustic qualities of this hall lead me to mention the construction of its ceiling. It is formed by a wood panelling fixed on the purlins, so that an empty space remains between the ceiling and the wall-siding of the roof. By this disposition the ceiling becomes a large sounding-board, so that the faintest sound is distinctly heard from all parts of the hall. But the most important innovation in this building is the fact of the hall receiving its light through a hypocaust opening in the roof, the walls, as above stated, being pierced by no windows. This disposition, while adding greatly, by concentrating the light, to the effect of the hall, offers considerable facilities for ventilation. But the most important advantage obtained by this arrangement, which leads me to think that this innovation will tend, with time, to gain ground and transform the church style in our towns, is the perfect exclusion of all sound from outside; for though the building is flanked by two large thoroughfares, the inside of the hall is as quiet as if it stood in a desert. Thus I should strongly recommend it as a step in the right way to the study of all thinking architects who seek originality in the real adaptation of our buildings to modern circumstances.

LAWRENCE HARVEY, Architect.

NARROW ESCAPE OF GUILDHALL, LONDON.—A workman, by allowing some turpentine to boil on a fire used for cooking dinner in the mess-room of the workmen employed in repairing the hall-keeper's house (No. 1 Committee Room), set the whole in a blaze; and the flame was not put out till water was brought from the pump in Basinghall-street, as no one knew where to find the key to turn on the water at the three hydrants in the yard. The whole building has thus been imperilled by the carelessness both of the workman and of the waterman, or watchman, or whoever was responsible for the prompt supply of water in case of fire.

ANOTHER TRIP TO NORTH WALES.*

HOWEVER small an old country church may be, there is always some architectural fragment,—a font, or a brass,—to contemplate. As Socrates says, "Pardon me, my excellent friend, for I am a lover of learning. Now the fields and trees will not teach me anything, but men in the city do." There is also always something to be learned from the old clerk's story, who will give an account of that which existed in the church prior to its being restored.

Tourists to Llangollen will doubtless recollect a lithograph, by Day & Hague, representing the Right Hon. Ledy Butler, aged 90 years, and Miss Ponsonby, aged 74 years (with a greyhound), in walking costume at Plee Newydd, with the old Welch babe, and in the background a pointed recess in a stone well with a fountain supplied by a spring. Now the font in Llangollen Church is situated at the west end, in form of a modern marble balustrade, surmounted by a wash-basin. In reply to an inquiry for the ancient font, the clerk referred me to Plee Newydd, and accompanying me thither through romantic grounds, now a wilderness, but formerly bedecked in tea-garden fashion with beautiful Medieval spoils taken from the church and from Valle Crucis Abbey, there was the identical fountain, *alias* the old Perpendicular (not the Early English) stone font, octagonal, and pinnacled, with rosettes and obelisk on the stem. The fount or coronet on the recess, shown in the lithograph, is an Early English foliated capital, perfect and nicely cut, placed upside down! Here is a good opportunity, prior to these curious old grounds, well known in history, being swept away, for the Architectural Museum, to ask for the ancient capitals, pedestals, bases, carved figures and panels (all from the old church and abbey, and many of them etched higgledy-piggledy on the house), and being in good condition they would form a valuable addition to the existing collection. The old font must of course return to the church. About five years ago the subject was discussed by the parish, but the cost of replacing, cleaning, and fitting up the old font would, it is said, cost as much as a new font! This ignorant argument was maintained when the question arose as to restoring the old nave of St. Sever's Church, Southwark; the estimate to restore it was 12,000*l.*; to build the present miserable nave was 8,000*l.*; but the latter really cost 12,000*l.* In an architectural and historical point of view there can be but one opinion,—*viz.*, that the retention of an original, properly restored, is by far more valuable than an ignorant new erection.

The "Llangollen Guide" is edited and printed by Jones, of course; who else than Jones is better fitted for the task? Upon the subject of architecture he is modest. Speaking of Castle Dinas Bran, he says that "We confess we are not learned in architectural knowledge." This admission enables us to understand his assertion "that the ancient Britons had a tolerably good conception of the Gothic style," and that the roof of Llangollen Church is supported by three massive octagonal pillars. Jones's account, however, of Valle Crucis Abbey is creditable.

Llangollen Church consists of a nave, with aisles, north porch, chancel with aisle, and a tower at the west end containing four bells. This was an Early English church, with a north aisle only; a south aisle has recently been added, and the chancel and aisles have been rebuilt. The new aisle and additions are in the Decorated and Perpendicular styles; the ornamental Early English doorway (formerly external on the south side of the church is retained as an inner doorway between the nave and new aisle. It is to be regretted that the additions were not made to accord with the original style remaining, or in the style of the day. In former times, if additions were made to our old churches, the additions were always in the new style—the style of the day: our ancestors never rebuilt in half-a-dozen styles. The tower was rebuilt about 100 years ago, and if it were again rebuilt it would be well.

The roofs over nave and north aisle in Llangollen church are original, of oak, open, and truncated, with collars, hammer-beams, carved angels, &c. The east end of the nave is ceiled with oak, and formed into panels, and enriched with ornaments. The new roofs are of deal varnished. It has been suggested that the roof of the nave formerly belonged to Valle Crucis Abbey: without

documentary evidence I saw nothing to confirm this opinion.

There are a few brasses; the clerk hands the visitor a paper with the inscriptions printed thereon,—not a bad precedent to be followed by officials in churches generally; there are loose brasses handed to you to read; on this I urged that they be immediately fixed in their proper places, as they might be lost: this was promised to be done.

With a view to obtaining a list of all the brasses remaining throughout the United Kingdom, the British Archaeological Association should issue a paper to each incumbent to fill with the number and dates of all brasses in his church. The Society of Antiquaries some years ago attempted to collect inscriptions, but did not succeed.

There is a tomb of the fifteenth century beneath an arched recess in the wall of the aisle, forming a canopy, with crocketed label, and pinnacles, springing from small attached columns. The effigy has gone; it was taken piecemeal to cure disease in horse's eyes! It was not a founder's tomb, but belonged to the Trevor family.

Prior to leaving Llangollen: the bridge was regarded as one of the seven wonders of the world. How many seven wonders there have been! This bridge was erected in the fourteenth century by Dr. Trevor, bishop of St. Asaph; and consisted of irregular, narrow, pointed arches. The bridge is not now attractive; it has been lengthened to accommodate the railway, a toll-house added, and raised 6 ft., and now it is proposed to widen the bridge to about double its present width, which is 11 ft. 6 in. The county has promised 600*l.*, the railway company 300*l.*, and the parishioners will give 100*l.*—total 1,000*l.* It would be, in my opinion, by far the wisest course to rebuild the bridge. There has been a market-hall erected at a cost of 3,500*l.*; the building is a great addition to the town. The architect was Mr. Pomfret Smith, Shrewsbury; builder, Mr. Morris Roberts, Llangollen.

About two miles from Llangollen, on the right of the road towards Ruthin, in a sequestered valley, is Valle Crucis Abbey. The stile, leading to the fields, on approaching the building, have two or three stone steps; these, it will be observed, are portions of the shafts of columns, fragments of the abbey. The edifice being a "Tinturn Abbey in miniature," affords pleasure to ladies to sketch; this interesting work, which at one time was useful, is now much lessened by the photographer relieving the ladies of their studies. It has also been visited by several London architects of extensive practice; who, no doubt, supplied their sketch-books with abundant material for new churches. The abbey affords an illustration of the maxim that heaviness is the offspring of simplicity. It is in one style of architecture, Early English, and was decorated just sufficiently to raise it above plainness, and no more. The ornamentation is really partly of a Norman character,—consequently the abbey is of a very Early English date.

It appears that this building was buried in obscurity until 1851, when, as the inscription (in Old English), cut in stone, and let into the wall of the south aisle of the nave) informs, "the leveling and clearing of the building, with the permission of the proprietor, was commenced May 28th, 1851, and completed May 14th, 1852, under the superintendance of Arthur Viscount Duncannon, of Brynkinalt; W. W. E. Wynne, esq., of Peniarth; R. K. Penon, esq., architect, of Oswestry."

At the west doorway is a rope suspended from the apex of the arch, and a notice to the effect that the bell will be answered as soon as possible, the house being some distance. The door is not opened by a Cistercian monk, but by a lady who has for many years taken a great interest in kindly explaining all the leading points. After a request not to walk over the memorials, and a compliment for not bringing a large hamper of provisions to decorate the spot, I was duly admitted.

The abbey, although a ruin, is by no means past restoration. The remains consist of nave, aisles, transepts with eastern aisle, chancel, and a tower at the intersection. The nave was separated from the aisles by clustered columns, with moulded haase (the base remain *in situ*) and sculptured capitals, lying about the ruins. At the west end is a large window in three lights under one label. In the gable is a rose window in eight radiating divisions, each having a trefoil head. The west doorway externally was originally highly enriched with attached columns, having sculptured capitals and mouldings. At the west end of nave is a perfect stone staircase,

with a small pointed doorway leading to the triforium, now gone. At the east end of the nave a portion of the stone staircase to the roof-loft remains.

The transepts, with their eastern aisles are especially interesting, particularly the south transept, which is more perfect than the north transept. It has the clustered columns and arches between transept and aisle remaining perfect. The arches are plain, and nearly equilateral, and have two courses of voussoirs, 9 in. wide, and over them a rough arch of ely stone, set edgewise. The groining is partly remaining, exposing the framework of the freestone-arched ribs, and the rough manner in which the banchées were filled with lime slate. The architectural student is enabled to gain more practical knowledge of the early stage of rib-vaulting from this ruin than from any book, however minutely it may be explained.

In the west wall of the south transept is a long, narrow window-opening, formerly filled with treceery of later date; and in the south wall is a large window-opening, now filled up, formerly connected with the conventual buildings. The transepts are joined to the nave-aisles by pointed-arched openings without response. In the transept aisles are the remains, *in situ*, of the altars, piscina, founder's tomb, sundry, &c. The aisles are connected with the transepts by two arches, supported by moulded piers. The window openings have moulded arches, with squared freestone quoins to jambs. The north transept has the lower portion of an outer doorway, and also a stone staircase in the north wall.

The east end of the chancel has five lancet window openings,—three lower and two upper,—with labels, string-course, &c. The lower central window has attached columns with ornamental capitals. Between the chancel and north transept-aisle are the remains of a shrine. Tombs of benefactors were discovered while excavating; the remains of these are placed at the west end of the chancel. One is an incised slab of a half-length knight, in chain armour, Jenafep Adam, of Trevor, and fragments of his wife Myfanwy's tombstone. Another, of a lady, with the following inscription: "*Hic jacet Gwercy filia Owain cyfus animus propitietur, Deus, Amen, 1290.*" On another stone is "*Edwardus filius Yo,*" date thirteenth century. Loose boards are placed over these stones to avoid injury. These memorials were found under 12 ft. of earth, on which ash trees had grown during 200 years. In the north transept is a large perfect stone coffin, found filled with bones.

The walls of the abbey are constructed with the blue local clay stone, and all columns, arches, window-heads, quoins, string-course, &c., are of wrought freestone. Ivy freely covers the ruin, and adds to their picturesque appearance. The stone corbels of the roofs of the chancel and the south transept remain perfect.

On the walls and piers of the south transept are several masons' marks, which, with the exception of two or three, may be engraven in the "Archæologia," vol. xxx., p. 113, illustrating a paper on "Masons' Marks on Buildings of the Middle Ages," by Mr. G. Godwin, F.R.S.

The slanting , it will be seen, occurs in

St. Pierre, Poitiers, France, diagram No. 88; the six-pointed star in Gloucester Cathedral, diagram No. 11; of these there are many. Also the simple cross, and others. These masons' marks have to be searched for, being superficially and unobtrusively marked.

The east front (externally) is plain and peculiar. There are no labels, except to the lower central lancet.

In concluding the investigation of this venerable ruin, it may be observed that the student will find ample materials for his pencil,—the stone fragments placed about the spot, consisting of ornamental lively-leaved capitals, bases, corbels, chamfers, &c., well repaying him for his time and trouble; and he must not be discouraged if a countryman should ask him, whilst sketching, if his labour will pay well. The cost of the excavation was 100*l.*, and making good to the west doorway, &c., about 60*l.*

Arriving per rail, at Corwen, and walking in a southerly direction, Llangollen Church is reached. It consists of a nave, south porch, chancel, and a stone bell-turret at the west end, containing one bell. This church has been closed since 1852, except for burials; and as it may not long remain (a new church having been erected else-

* See vol. xxii., p. 718, and vol. xxiv., p. 609.

where), it will be well to record a few notes. The date of the church is late Perpendicular. The font appears to be of an earlier date, although partly placed in a Tudor-headed recess. The lid of the font is like a modern copper-lid,—date 1755. The nave windows are square-headed, with moulded mullions, filled with quarry glass. There is a gallery at the west end of the nave, and a mural marble slab against the north wall, date 1851. The altar is raised one step. The east window, in three trefoil-headed lights, with foiled panels over, is peculiar. A locker is placed in the north wall, and there are mural monuments on the south side,—dates 1710, 1712, and 1742. The pulpit is on the south side, by the chancel. The stained glass in the window is to Johannes Hughes de Cymer, *obit* A.D. 1694. A stone staircase leads to the helly. The hatchments and shields against the walls are in bad condition. The porch has an open roof,—date 1702. There is a sun-dial on the south side of the church.

Leaving this church, and returning to Corwen, and thence in a northerly direction, the tourist arrives at Rhug, the seat of the late Sir Robert Williams Vaughan, bart. The Vaughans of Rhug, Henwrt, and Nannan, all branches of the same family, are all lineally descended from Owen Glyndwr, whose patronymic was *Fechan*, or Vaughan—*id est*, little. The guide-books pronounce the chapel to be remarkably diminutive, and very ancient; this is not correct, as it is in what is termed the Renaissance style. This building is under one roof, 37 ft. 7 in. by 19 ft. 8 in., inside measure; the roof is open, with collars, hammer-besoms, and the angels are as flat as if they were cut out of pasteboard. There is much ornament about the roof, such as bosses at the intersections, decorated with the thistle, goat, sacred monogram, and other devices. At the east end is an open screen, with crested top. At the west end is a large gallery, and beneath it an octagonal modern stone font, with quatrefoil on panel. The east window is pointed in three five-foiled lights (with five-foiled panels over), and filled with stained glass, in memory of Edward Williams Vaughan; Selesbury, Rhug, 1807; and Griffith ap Howell Vaughan, Rhug, 1848. The altar is inclosed, and has on each side monumental shrines, with quotations from Scripture in panels. The walls are covered with carvings and frescoes, which are fading. On the tie-beams over the east window is the sacred monogram and 1637. The altar table has an inscription in Welsh, and the sacred monogram. On each side of the chapel are open benches; at the base (on riser to seats) are carvings of grotesque animals in relief, also flowing stems with fruit and foliage. The chandelier, suspended from the roof, is an oddity: it consists of two tiers of imitation candles, painted. All the windows are new, of Perpendicular character. The pulpit is within the screen on the north side, with Welsh scriptural inscriptions in the panels. The sides of the chapel are lined with oak wainscoting, with carvings on rails. Rhug chapel is more interesting to the antiquary than the architect, being more curious than useful. Westward of the chapel is a large cross, erected, it is said, in memory of a favourite horse!

Returning to Corwen, and journeying per rail through Cynwyl, Llandreilo, and Llandderfel, the tourist arrives at Bala. The lake is well known, and speaks for itself. The town is small, clean, and neat, principally inhabited by Welsh woollen cloth and linsey manufacturers. The taste at some of the hotels is startling—bright green mouldings on French white grounds. On the ugly townhall is a clock turret; it has just been added, with a notification that it was erected "in honour of John Jones, esq., Trecyaty, 1868."

The parish church is at Llany Cil, a mile distant. Here a surprise was offered: the Rev. Mr. Evans had directed a woman to attend with the key wearing the old and formidable Welsh hat, now almost a matter of history. The key itself is curious, 8½ in. long, ½ of an inch diameter, with R R O H on one side and 1785 on the other, and L Y in the wards. The plan of the church is a parallelogram, 71 ft. by 21 ft. 9 in.; the date Perpendicular. It consists of nave, chancel, north porch, and bell-turret with one bell; roof ceiled, windows mere openings. The font is modern, a tall stone stem with basin. Part of the old font is lying loosely on the floor; it was octagonal, with water drain; a modern gallery at the west end; the pulpit is hexagonal, on the south side, with a brass plate to Elizabeth, wife of Mr. E.

Jones, curate, date 1770; mural marble monuments on south side, dates 1736, 1758, and 1824. There are two old benches, with carved finials. The east window is pointed, and in three trefoil lights, with three foiled lights over, filled with a memorial of painted and stained glass, put up by Robert Anwyl, 1855, to David Anwyl Plascock, 1831. A plain open screen between nave and chancel; altar enclosed with an oak balustrade, date on gate 1739; two boxes padlocked, date 1756. On the back of a bench is 1637. The altar table has D. R. (David Roberts), 1739 upon it; and on a box beneath, J. D., R. K., 1751. The decalogue is in Welsh. In the churchyard are objects of interest; there is a lych-gate, with an open-timbered roof. On the south side of the church are stone tombs, sculptured with columns and arches in relief, date 1695. On a stone set into the south wall is H W Y P E R Y C L O D N A H O E D L, on a shield, date 1671. There is also an ancient incised slab, with a sculptured half effigy, used as a base for a modern tomb. At the east end of the church is an altar tomb of great interest to Calvinistic Methodists, viz., to the Rev. Thomas Charles, B.A., of Bala, who died October 5th, 1814, aged fifty-nine. He prepared two editions of the Welsh Bible, and he had an important part in originating the British and Foreign Bible Society. There are eight yew trees in the churchyard. At funerals a leaden bowl is handed by the clerk at the grave to receive contributions towards digging the grave and tolling the bell.

Starting from Corwen to Cerig-y-Druidion (noticed in a former paper) over a mountain in an easterly direction, Llanfihangel church is to be seen; comprising a nave 41 ft. 2 in. by 12 ft. 11 in., south porch, bell-turret containing one bell, and a chancel 22 ft. 11 in. by 14 ft. 11 in. inside measure. The roof of the nave is of oak and open. Gallery at west end. Font modern, date 1853. The seats are open. Deal brackets against walls for candles. On a bench is "Hugh Davies s [his] hench, 1753." The roof of the chancel is ceiled. The pulpit is octagonal; it is on the south side. The altar is enclosed with railing; the decalogue is in Welsh. The table is old. There is a brass in the floor to "Alice Davies, daughter of David Davies, rector of this parish, 1771." This church stands on the side of the river Alwyno; about 1709 it overflowed, and the flood mark is still traceable 8 ft. 7 in. above the floor of the chancel.

On returning from Llanfihangel and alighting on the top of the mountain at Tal Drall, a good specimen of an old farm-house closes the note-book of the present trip. In this farm-house the kitchen is 21 ft. 8 in. by 17 ft., including the chimney. There is accommodation between the jambs under the chimney for a large party; and here the farmers smoke, being a great benefit to those who have to sit in the room. The clock is of pure brass (in a tall case), inscribed, "Hampton, Wrexham, 1528," and ornamented in the angles. There is an old oak chair, and other antiquities. One of the daughters produced a tin horn, 3 ft. 1 in. long, used to announce the dinner-hour, and sent a fine hlew over the mountains, distinctly heard for two miles. The result of venturing upon a blast was a sound similar to the squeak of a pig, proving that London lungs cannot compete with those of the mountain maidens.

W. P. GRIFFITH.

EXPLOSIONS AND OTHER ACCIDENTS BY FIRE.

EXPLOSIONS have been very frequent of late, as well as other accidents by fire.

A serious accident has occurred at the Foaty Station of the Queenstown Railway, in Ireland. Workmen are engaged nightly repairing an adjoining viaduct. As three of the men were filling the lamps with which they were furnished from a cask of paraffine, a spark ignited the oil, and a fearful explosion ensued. The men were dreadfully burned, and their lives, we learn, are despaired of.

A terrible disaster has occurred at Metz, on the Moselle. A loud explosion took place in the cartridge manufactory situated in the court of the arsenal. The number of persons employed in the place at the time was 109, the workshop being constructed of wood, and consisting of two rooms. In the first were 71 women, and in other 14; there were also 10 foot-chasseurs,

10 artificers, 3 sub-intendants, and an inspector engaged in the same employment. A young workwoman, it appears, in throwing a pair of scissors to one of her companions, struck the point of the instrument on the capsule of a cartridge, and so caused the explosion. In a moment a formidable detonation was heard; the woodwork of the building was blown to pieces; and the roof fell in. The fire having communicated to the heaps of cartridges, made in a few moments fearful havoc amongst the persons present. The court of the arsenal after the accident presented in some sort the appearance of a field of battle, being covered with dead, dying, and wounded. From beneath the burning *débris* 16 dead bodies were withdrawn, so calcined and mutilated as not to be recognisable, and 59 persons dreadfully injured and bruised lay on the ground until they could be conveyed to the hospital. The fire was soon extinguished, and by activity and courage further calamities were averted, as from under the ruins of the burning planks several barrels of gunpowder and of cartridges were got out, which the slightest spark would have caused to explode. The Minister of the Interior immediately forwarded 10,000 fr. to the families of the victims. The Emperor also at once sent word that both he and the Empress were prepared to give ample assistance in such cases as might be brought to his knowledge.

One of the most extensive fires that has been witnessed in Dublin for many years broke out lately in the timber-yard of Mr. Michael Meade, of Great Brunswick-street. The greater portion of the ground was covered with two-storied sheds, in which were considerable stores of timber, and steam sawing, mooling, and planing mills were erected on an extensive scale. There were also several large piles of valuable timber outside the sheds. The fire broke out from the roof of one of the sheds, and in a very few minutes after the whole of the stores were in a blaze. The entire premises and contents were destroyed. The origin of the fire is unknown.

A similar fire has occurred in a number of contiguous timber-yards in Lauriston Park, Edinburgh. The enclosures included five joiners' yards, in one of which the fire is believed to have originated. A large quantity of timber and joinery work, with several offices and their contents, have been wholly destroyed.

At Coxhoe, while a man was standing with his back to a burning brick kiln, the wall of red hot bricks gave way and buried him. He was brought out from beneath the *débris* as soon as possible, but expired shortly after being rescued.

FROM AUSTRALIA.

Melbourne, Victoria.—The design for the Church of the Immaculate Conception, Grace Park, Hawthorn, by Messrs. Crouch & Wilson, of Melbourne, was selected from about twelve or thirteen which were submitted in competition. It is in the Decorated style, and exhibits a church 119 ft. long, and 53 ft. 6 in. wide, comprising nave, aisles, transept, chancel, lady-chapel and vestry, and tower and spire. The whole building, when completed, is calculated to afford accommodation for nearly 1,000 persons. The width of the nave is 24 ft. from centre to centre of columns, which support a clear-story roof, rising to the height of 51 ft. 6 in. from the finished floor-line. The transept is 24 ft. wide, and 54 ft. long in the clear between the walls; the chancel, 23 ft. wide and 30 ft. deep; lady-chapel, 12 ft. by 20 ft.; vestry, nearly same size. Five entrances have been provided. The tower is 18 ft. square at base, and is nearly 170 ft. high to the top of vane on spire. It is not at present intended to go higher than about 60 ft. The walls will be of bluestone, in random uncoursed rubble, with tracery mouldings, weatherings, gables, and other dressings in best white freestone. The estimated cost of the entire design is about £5,000.

A rapid increase of buildings of every description, simultaneously with the establishment of valuable industries, is perhaps one of the best proofs that can be given of the progress of a young country. Such proofs of progress Melbourne is now more than ever displaying. The *Australian News*, in an article on architectural improvements in Melbourne and the suburbs, says:—

"Nearly all the rude structures which the climate and materials to hand twenty years ago compelled Victorians to adopt, have been superseded by buildings in the erection of which much taste, as well as a regard for the comfort and health of their occupants, has been displayed.

Side by side with these dwellings have sprung up ecclesiastical edifices, public buildings, and commodious stores, which, as architectural compositions, possess considerable merit, and denote very extensively the wealth and industry of an enterprising population. A very large majority of the buildings now in progress, especially dwelling-houses, have been commenced during the past few months, or shortly subsequent to the time when a reduction in the rate of bank interest took place. A great impetus has been given to the building trade; and, although the number of houses which have been built within the past few months, or during the corresponding period of 1867, is chiefly in the suburbs that the spare cash of the wealthy and the hard earnings of the industrious have been expended. The following statement shows the increase in the number of the population in the city, including Bourke, Gipps, Latrobe, Lopsdale, and Smith Wards, from 1861 to 1867, ending March of each year, together with the increase of houses, and their annual rateable value:—

Year.	Houses.	Value.	Population.
1861.....	8259	£632,676	37,165
1862.....	8019	581,774	38,785
1863.....	8814	655,708	39,663
1864.....	8999	650,298	40,955
1865.....	9632	699,483	47,734
1866.....	9182	695,265	42,534
1867.....	9722	613,655	43,749

The present total number of houses is estimated at 10,200, thus showing that during the last twelve months the buildings erected in Melbourne were erected by 500 those built in any preceding year. In 1861 A much larger number of buildings were, however, being erected during the first four months of the present year than in the corresponding period of 1867. In that portion of the city and the districts under the provisions of the Building Act, the number of buildings erected in the first four months of 1867 was sixty-nine, whilst 107, nearly double the number, were erected in the first four months of 1868, and some of these houses are contrasted with what has taken place in some of the suburban districts, is insignificant, the advancement, made from an architectural point of view, is great.

It would be tedious to enumerate the names of the streets in Melbourne in which new buildings have been erected since the commencement of the present year. There is scarcely a street or lane in Melbourne or its suburbs in which one or more houses have not been built within the last few months, or are now in course of erection. A good class of houses which have cost from 500l. to 1,000l., exclusive of the land, have been erected at Folliott, by Messrs. Leslie, Abraham, and Willoughby, and Mrs. Lush; at East Melbourne, by Messrs. McKenzie, Wilmet, and Grey; and at West Melbourne, by Messrs. Turnbull, Hill, and Cooper. In many other districts, more particularly in the suburbs, handsome villa residences have been built, and it is gratifying to notice that the more humble dwellings are of a much better class than those erected in former years.

In nearly every part of that immense and important wing of the metropolis, Collingwood, all classes of buildings are now being erected. In some of the districts, over 20,000, has been spent for building purposes during the last six months.

The change which Emerald-hill has undergone during the last eighteen months is also great. The buildings completed in that period are of a better class than most of those erected during previous years. The number of houses in June, 1867, was 2,250; since then about 1,500 have been added, a large portion of which have been but recently completed, or are yet in course of erection.

Bendigo (Sandhurst).—The orderly-room for the Bendigo Volunteer Rifles has been erected by Captains Taylor and Joseph, of the Corps. The architects were Messrs. Vahlund & Getzschmann; the contractors, Messrs. Webb & Harlow; and the clerk of the works, Sergeant Fly. The room is 70 ft. by 36 ft. inside, and the walls 22 ft. high. The style of architecture is Modern Ornamental Italian. The foundations are of granite, and the walls of white and red ornamental bricks. The hammerbeam roof, wrought, stop-chamfered, and varnished, is covered with corrugated iron, and has five ornamental ventilators on each side. The building cost 700l.

Ballarat.—The foundation stone of the new Primitive Methodist Church, Eyre-street, Ballarat, has been laid. The expense of the new building is estimated at about 1,400l. The design has been furnished by Mr. Doane, architect.

It will be of oblong shape, the dimensions being 57 ft. by 35 ft. on the outside, and capable of accommodating 325 persons. It will be in the Corinthian order; the front facing Eyre-street will have a large pediment supported by fluted columns with carved capitals, with pilasters at the angles, with circular-headed windows at the sides.—About four months ago the council invited competitive designs from architects for a new Town-hall for Ballarat West, and at the fixed date they received fourteen plans. The councillors determined to leave the awarding of prizes to competent judges, and therefore Messrs. Terry & Billing, two of the leading Melbourne architects, were requested to adjudicate upon the merits of the submitted plans. In compliance with this request, these two gentlemen examined the plans carefully, and submitted a report to the council, which was immediately adopted. On opening the envelopes containing the names of the successful candidates it was found that the winner of the first prize of 100l. was Mr. H. R. Caselli, a gentleman who has for many years successfully followed the profession of an architect in Ballarat. The

second prize of 50l. was awarded to Mr. Oakden, of Melbourne. The council were much pleased with a plan by Mr. J. T. Lorenz, a gentleman who has lately established himself as an architect in Ballarat, and therefore purchased his plan for 30l. The council in their instructions to architects had stated that, if in other respects suitable, the preference would be given to the plan that should leave the largest frontage for shops. In Mr. Caselli's plan only 20 ft. are taken up by the main entrance, and the superior convenience and good effect of the interior arrangements were especially commended by the judges. But Mr. Lorenz's plan included a clock tower, which feature Mr. Caselli had declared he could not erect for the amount to be expended now, namely, 6,000l. Several lively meetings and protracted debates have taken place in the borough council with regard to the different plans.—A peal of eight bronze bells in the key of E flat, is about to be cast by Messrs. Meares & Stainbank, of Whitechapel, the result of a subscription of the inhabitants of Ballarat, to commemorate the happy deliverance of the Duke of Edinburgh from the assassin. The tenor bell is to weigh 23 cwt. It is expected that the Duke and other members of the royal family will witness the process of casting. It is suggested to us from more than one quarter that the committee would do well to obtain a peal of bells the tenor of which should weigh at least 30 cwt., in order to secure dignity of tone.

Bengeo.—The ceiling of Bengeo Church has been removed, owing to the plaster having fallen away in places, and match-boarding has been substituted. The boarding has been stained, so as to resemble the other portions of the church.

Adelaide.—The cathedral for the diocese of Adelaide is to be begun forthwith, and the stone is expected to be laid in December next, when the bishop will have completed a residence of twenty-one years in South Australia. The designs are furnished by Mr. Butterfield, and the cost of the first portion is to be 10,000l.

Sydney, New South Wales.—A glass manufactory has been established in New South Wales. The premises are situated on leased land about an acre in extent, abutting upon the Camperdown-road, and midway between the Newtown and Parramatta roads. The buildings consist of a furnace-house, store-sheds, pot-rooms, and workmen's cottages. The fire-hole furnace is constructed on what is said to be the American principle. It is a quadrangular building, arched at the top, fed with fuel in the centre, and has at each corner a low flue. By having the flues so placed the heat is conducted to every part of the furnace. The draught is obtained by the ordinary cave. The furnace of five holes is capable of giving employment to fifteen blowers.

An Australian Scholarship.—An item of Australian interest appears in that unpromising source, the *Tasmanian Government Gazette*. Despatches from Downing-street inform the governor that a scholarship in the University of London, for Australian youths, has been offered by the trustees of the Gilchrist Educational Trust. This scholarship is of the annual value of 100l., and is tenable for three years. It will be annually awarded to a candidate resident in, and a native of, Australia, who shall have graduated in arts either in the University of Sydney, or in the University of Melbourne, and who shall be desirous of pursuing a further course of academic study in Great Britain under certain conditions.

POSSINGWORTH MANOR.

The building which we illustrate has been erected for Mr. Louis Hath, at Possingworth, about six miles from Uckfield, on the London and Brighton Railway. The house is situated on ground rapidly falling to the south, commanding extensive views, and is screened at the back by a belt of fir trees. The materials used in the construction of the house are red brick, with Bath stone dressings, and slated roofs.

The principal rooms on the ground-floor are the hall, dining-room, morning-room, drawing-room, picture-gallery, and conservatory. In the centre of the building is a quadrangle, entered under a gate-house, by which access is gained to the porch, forming the principal entrance.

The hall, which forms the south side of the quadrangle, is 50 ft. by 20 ft. in the clear, and 40 ft. to the underside of ridge-piece, with an open timber roof. In the hall are the principal staircase, entirely of oak, with carved panels, an

ornamental chimney-piece 15 ft. high by 9 ft wide, and several stained-glass windows by Lavers & Barrard, the one at the end of the hall having representations of the Seasons, the bay window on the north side the Months, and the other windows various subjects. At the end of the hall is a gallery for musicians or for lookers on.

The dining-room is 38 ft. long by 22 ft. 6 in. wide by 16 ft. high, and is entered directly from the hall. In this room are a large bay window, 17 ft. by 8 ft. inside; a recess, opposite the bay, in which is a carved oak sideboard, specially designed by the architect; a chimney-piece, carved in Mansfield Woodhouse stone, and an elaborate ceiling. From this room leads the southern turret, forming a recess on the ground-floor, and from the top of which a fine view of the country is obtained.

To the west of the dining-room and south of the hall, from which it leads directly, is the morning-room, 25 ft. by 22 ft. On the south side are steps into the garden. The drawing-room is 43 ft. by 30 ft., exclusive of two bays, each 17 ft. wide by 7 ft. 6 in. The walls are all panelled in oak, and the ceiling is elaborate. Between this room and the picture gallery is a fine flight of steps, leading into the garden, the balustrading to which is of pierced stone-work.

On the west of the quadrangle is a corridor, next which is the picture gallery, 60 ft. long by 23 ft. wide, by 22 ft. high. The ceiling is treated, the panels being of open ironwork, between carved and moulded oak beams, supporting the glass, forming the inner ceiling of the gallery, which is lighted from above; the beams rest on ornamental brackets, which are supported by corbelled heads, carved by Pfyffers. The gallery leads from a triple-arched doorway on the west side into the conservatory, which is composed solely of glass and iron. The roofing of glass is supported on iron columns with ornamental cappings, and is crowned by a light glass and iron dome. To the north of the picture gallery and conservatory is Mr. Hath's room, 48 ft. by 20 ft., with a bay at the west end, and a polygonal bay on the north.

The whole of the east wing of the building, about 100 ft. by 70 ft., is occupied by the kitchen and its offices. The kitchen itself is 36 ft. by 18 ft., by 22 ft. high, with an open roof, crowned by a lofty turret. It is fitted up with cooking apparatus, plate-warmers, ovens, &c. Round it are placed the larder, scullery, dairy, yard, servants' hall, and so on. There are four water-closets on the ground-floor.

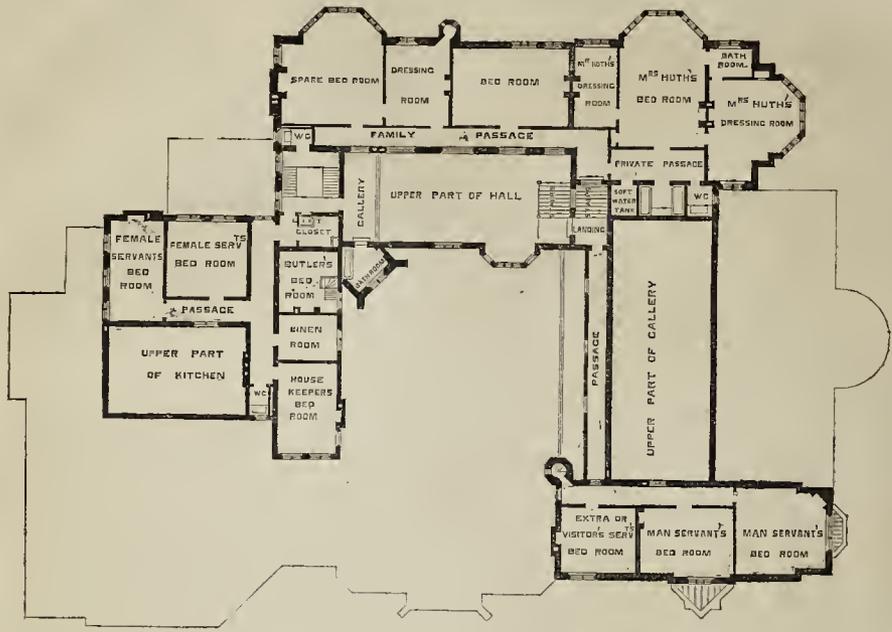

The first floor is devoted entirely to bed and dressing rooms, with a bath-room over the porch, and various domestic offices. The principal bedroom, with its two dressing-rooms adjoining, is about 50 ft. by 30 ft., by 12 ft. 6 in. high; the other rooms are in like proportion. The second or attic floor is also used for bedrooms; the rooms are 10 ft. high, and of various superficial areas.

In the basement are extensive coal, wine, and beer cellars. At some distance to the east of the house are the stables, containing coach-house, stalls for four horses, six loose boxes, harness-room, open sheds, carpenter's shop, &c., forming a complete block, and a stable-yard, 80 ft. by 70 ft. At the different entrances to the estate are three lodges.

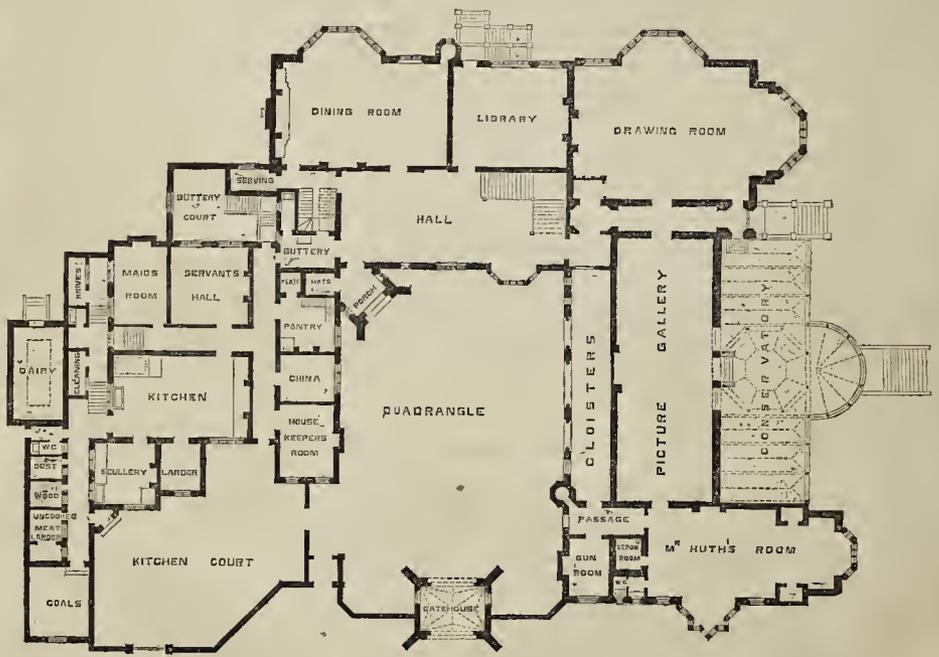

The builder was Mr. Alexander Cheale, of Uckfield; the resident clerk of the works was Mr. Winter; the landscape gardening was carried out by Mr. Marwick; the hydraulic engineers were Messrs. Easton & Amos, who have executed extensive works, including the formation of a large lake; the ironwork and heating were done by Messrs. Potter & Son.

The cost of the building, including the stables, was slightly in excess of 60,000l.; and the whole was erected from the designs, and under the superintendence, of Mr. Digby Wyatt, F.S.A.

SOOTFALL FROM CHIMNEYS.—A Peckham correspondent suggests the suspension of a bunch of light attractive substances,—perhaps feathers,—from a small iron bar, furnished with a small pulley and chain,—for working it,—at the top of the chimney, to intercept the smoke passing up, and convert it into soot adhering to it; the hunch in question, or "soot-collector," to be lowered down, by means of the pulley and chain, from time to time, and cleared, and rehoisted for a fresh collection. The hunch, or "collector," to be somewhat less in bulk than the area of the flues, so as not to interfere with the draught.

A SOUTH LONDON WORKING-CLASS EXHIBITION FOR 1869.

A CROWDED meeting has been held in the Congregational Church, Borough-road, for the purpose of promoting a South London Working Class Exhibition for 1869, and of explaining the price scheme in connexion with the series of scientific lectures to be delivered at the Lambeth Baths during the ensuing winter. The chair was taken by Mr. Thomas Hughes, M.P.

The Rev. G. M. Murphy read the programme of the lectures and prizes, and the proposed prospectus of the Exhibition, of which, among others, Lord Shaftesbury, Mr. Gladstone, and Mr. Bright are to be requested to become patrons.

Mr. Hughes said he believed that the objects of industrial exhibitions were, in the first place, to make individual workmen better acquainted with the principles of their own particular handicraft. After that, there was this further object,—to make men not only understand and take an interest in the craft by which they got their living, but to enable them to recognise and appreciate good work performed by other artisans. That being so, what did it come to? It came to this,—that we were providing them, or doing all we could to provide them, with technical education, and to promote it in the country. The programme of scientific lectures and the proposal of Mr. Twining as to prizes, formed an excellent leading up to the Industrial Exhibition for 1869. In foreign countries, and especially in Germany, there was a far better technical education and scientific instruction given to the people than there was at home in England. Surely it was high time that state of things should cease. There were many other things in which the English people were behind other nations besides mere mechanics. There were, for instance, the laws of form and colour, the knowledge of which added incalculably to the value of the work of skilled artisans. He hoped these matters would be attended to. It had been objected that, in a country like this where labour was so subdivided, instruction of this kind was likely to make men discontented. He did not believe a word of that. No doubt it was said, "Let the cobler stick to his last." (Yes; but let him know how to use his last to the best advantage. After all these things a good deal remained to be done.

Resolutions approving the programme of the scientific lectures and the proposal for the Exhibition were passed.

RAILWAY MATTERS.

THERE has been a private inspection of the Western Extension of the Metropolitan Railway, preparatory to the opening of the line for public traffic on the 1st of October next. This line leaves the existing route of the Metropolitan Railway at about 200 yards from the Edgeware station, continuing its course down Praed-street until opposite the Great Western Hotel, where a commodious station has been erected. A subway for passengers will be formed from this station to that of the Great Western. The line proceeds from this Paddington station to Queen's-road, Baywater, where the second terminus has been erected. Leaving Baywater, the line proceeds to Notting-hill-gate, where the third station is situated; and thence the district of Kensington is traversed until the fourth station is reached. This has been erected in the High-street, almost immediately opposite to the vestry-hall. This station will, at the terminus of the Metropolitan District Railway, which, it may be remembered, will run along the Thames Embankment, through Pimlico and Chelsea, to Kensington. The Kensington High-street station will be jointly used by both companies. From here the Western Extension proceeds to Gloucester-road, Brompton, where at the present it will terminate. When complete, however, it will continue its course some half-mile further to Cromwell-road, Brompton, the Metropolitan District and Extension lines running parallel with each other from Kensington High-street to the Cromwell-road. By the new line passengers will be able to travel from within a short distance of the South Kensington Museum to Moorgate-street in about thirty-three minutes. At present the fares have been arranged from the City to Notting-hill-gate, and the charges fixed between these points is eightpence, sixpence, and fourpence,

or one shilling, ninepence, and sixpence for return tickets. Ninety trains are to travel each way per day, commencing at five o'clock in the morning, and continuing until midnight. In compliance with the provisions of the Act of Parliament, workmen's trains will run every day conveying passengers between Notting-hill and Moorgate-street, at a uniform fare of twopence.

Another accident has happened to the Irish mail train since the recent dreadful catastrophe. On the night of Friday before last, as it was entering Chester station from London, it ran into a goods train standing in a siding, the points of which had been left open. Fortunately the mail train was proceeding at a very slow rate, and the damage was confined to the breakage of one or two of the wagons. The mail engine got off the line, but no person was injured. Another collision on the Chester and Holyhead line has occurred near Holyhead by the running of an express train into part of a goods train, smashing the trucks and throwing them off the line.

The shaft of the tunnel near Penge, on the London, Chatham, and Dover Railway, has fallen in, and for a time it completely blocked up both lines. The occurrence was fortunately soon discovered, and nothing serious resulted. The up and down traffic of the tunnel has since been carried on as a single line.

The station at Belfort (Haut-Rhin), the extremity of the branch of the Paris and Mediterranean railway in the direction of Switzerland, has just been burnt down. Thirty-seven trucks, loaded with merchandise, were totally destroyed, with their contents. The rapidity with which the fire spread, from the nature of the goods (a great part being oil) and the scarcity of water, prevented anything being saved. Nothing is known as to the cause of the disaster.

The traffic receipts of railways in the United Kingdom amounted, for the week ending September 5th, on 13,350 miles, to 857,031l., and for the corresponding week of last year, on 13,008 miles, to 817,374l., showing an increase of 342 miles and of 39,657l.

Railway travelling is a little exciting in America. The Indians recently in New Mexico stopped a train, hurst it, and scalped the engineer, stoker, six guards, and all the passengers.

SANITARY MATTERS.

THE vestry of St. Pancras have lately had occasion to complain to the New River Company of the very impure state of the water supplied by the company for watering some of the roads of the parish. On the officers of the vestry investigating the matter, it appeared that the supply was obtained from the Highgate ponds, into which there is "a flow of house drainage and an accumulation of black filth." The New River Company, in answer to the complaints of the vestry, call upon that body to construct drains to intercept the sewage, which has now become intolerable in the neighborhood, and prejudicially affects the water used by the company for non-domestic purposes.

The sanitary condition of Truro, at the present moment, is said to be in the highest degree unsatisfactory. There is a regular nest of typhoid fever in the centre of the town; and why is this? "The answer is," says the *Cornwall Gazette*, "bad drainage and inadequate supply of pure water. Who can be astonished at an outbreak of typhoid fever who passes over Lemon Bridge or Lemon Quay? The river above the bridge is no better than an open cesspool, and that abomination which the town authorities permit in the pig-market requires to be smelt to be appreciated. The system of sewerage, too, is radically bad. As a rule there are no drain-pipes; the sewage, as a matter of course, is to a great extent retained in the clay sub-soil, and under favorable atmospheric conditions gives forth noxious fever-bearing vapours. The long drought and great heat have produced these favourable conditions, and the consequence is the present unfortunate prevalence of typhoid."

A visitor in Lincoln, from the Antipodes, says,—

"There is one thing calculated to drive a stranger away as speedily as possible, and that is the dreadful effluvia arising from the great open sewer which, with its black fetid stream, flows through the heart of the city, and renders the atmosphere insufferable. That such a nuisance should be permitted to exist, when sanitary precautions are so generally adopted, is most astonishing, and the more so when the fatal effects of such negligence are

so apparent; for I am given to understand that the rate of mortality in Lincoln is very high, if not the highest in England. Can this be wondered at? It appears strange, however, that, even allowing the authorities of the place to be too indifferent or supine to correct the evil, the medical men do not one and all cry out against it, and let their protest be heard as loud as the Great Tom of Lincoln.

The canal, now converted into a common sewer, if returned to its original state, would bring health instead of disease; and why should not this be done? and in place of using it as a sewer, let proper ones be made, as in other places."

A Norwich medical man writes to the *Norfolk Chronicle* as to what he calls privy bins, of which he approves, yet of the state of which he complains:—

"At the White Hart, in St. Miles," (he says), "the neighbouring cottages were rendered unhealthily by parcellation from a bin which, by the carelessness of the tenant, contained a mass of floating ordure. Also in the Staff-of-Life Yard, in St. Edmund's, which I visited in consequence of a case of malignant scarlet fever having occurred in it, I found a similar condition in a bin which was the only accommodation for more than fifty persons, whose only water supply was from a superficial well in the same yard. Our local death-rate for the quarter will be a heavy one, from diseases which medical science believes to be preventable. My object in writing this letter is simply to ventilate the importance of the plain sanitary axiom, of keeping decaying organic matter from the contact of water, and, as at this time diseases from preventable causes are unusually prevalent, to recommend to the city's executive an immediate and searching inspection of the bins of the city."

Under such circumstances it was scarcely to be expected that the writer should speak approvingly of the "earth closet" system, even although, as he says, "nothing is more simple and easy than to render a privy bin harmless until it is required to be emptied, provided that its legitimate purpose he adhered to." It is (amongst other reasons) because earth closets are not likely to be properly attended to that they ought to be disapproved of in towns.

COMPETITIONS.

Olley.—*New Mechanics' Hall*.—About nineteen different designs were submitted for competition by architects from Leeds, Bradford, and other places. The whole of the designs were sent in under motto. The committee, in their selection, have been guided principally by the amount of money at their disposal. The subscriptions already promised amount to just over 3,000l., and the committee are anxious that the new building, when erected, shall be free from debt. The design and plans selected have been prepared by Mr. Charles Fowler, architect, Leeds. The design is Italian, and the following are the chief features of the internal arrangements:—On the ground floor there will be a small lecture-room, capable of holding about 250 persons, and which, if found desirable, may be divided into two class-rooms; there will also be retiring-rooms, reading-room, library, two class-rooms and lavatory, &c. The basement will contain kitchens, scullery, chemical classroom, heating apparatus, &c. On the first-floor will be the large hall, with gallery, platform, and orchestra, and space for organ. There will also be a librarian's residence attached to the premises. The large hall, including gallery and orchestra, will be capable of seating about 1,000 persons. There will be two staircases and three separate entrances and exits into and from the large lecture-hall, which will be very useful on occasions of large assemblies, or in case of any panic or pressure. The building is intended to be built of stone, at an estimated cost of about 3,000l.

THE NEW ALLIANCE BANK BUILDINGS, LIVERPOOL.

THE new buildings in Castle-street are now rapidly approaching completion. They have been erected from designs furnished by Messrs. Lucy & Little, of Liverpool, architects; Messrs. Holme & Nicol, of Liverpool, being the contractors. The building, which is erected in the Italian style of architecture, partaking to a considerable extent of the Venetian type, is square in form, the dimensions being about 70 ft. each way. The edifice has three prominent elevations, the principal facade facing Castle-street. This elevation, from the street level to the extreme summit of the balustrade, is 68 ft. high; the ornamental chimneys, which are carried to a considerable further height, increasing the entire altitude. There is a good deal of carving and sculptural ornamentation on the whole face of this elevation. The main central entrance is one of the prominent features in the facade.

It is upwards of 6 yards in height from the street level to the top of a projecting canopy by which it is capped, and the passage through it into the bank is nearly 3 yards in width, the inner sides of the entrance, as well as the top, being faced with polished grey granite. Circular-headed windows pervade the elevation, between which, in the third story, are semi-fluted columns and pilasters. The James-street elevation is uniform in height and general architectural character with that of Castle-street, though not so elaborately decorated. The Lower Castle-street elevation may be regarded, to some extent, as the rear of the building, and has not the same architectural pretensions, so far as regards artistic finish and decoration. In the construction of the building, stone from the Cefn quarries in Wales has been exclusively used. The whole of the ground floor and also all the sub-basement, with the exception of two apartments which it is intended to let off as offices, will be exclusively devoted to the purposes of the bank proper. The bank is a spacious apartment, its dimensions being 64 ft. by 65 ft., and containing altogether an area of more than 400 square yards. The ground-floor also contains the board-room, manager's room, tellers' rooms, besides other private and clerks' rooms. In the centre of the apartment there are four ornamental columns, the basement from which they spring being of stone, whilst the columns themselves are of Derbyshire marble, and are surmounted by Corinthian capitals. The walls are also ornamented by fourteen pilasters, composed of Derbyshire marble, between which will be highly decorated panelling. Although the light will be chiefly obtained from the windows in the James-street and Lower Castle-street elevation, it will be considerably added to by that proceeding from the dome, which will be inclosed and ornamented by eight stained-glass circular windows. The dome is not so large as that in the Exchange News-room. The ceiling and walls are being ornamented in stucco work, with festoons, grouping of figures, fruit, flowers, and sculptured classical heads, being in this respect a reflex of the carved work on the exterior, and will be finished in delicate painted colours, enriched by gilding. The bank floor is composed of polished oak, whilst the whole of the apartment will be heated by hot-water pipes running round the walls, the apparatus for effecting which will be in the basement. The interior of the bank floor, as well as the upper stories, approaches completion. The sub-contractors with Messrs. Holme & Nicol for the several portions of the works are Mr. Demeter, of Liverpool, who has executed the stonework; Mr. Green, of Manchester, the carving and sculpture; Mr. Thomas Jones, of Liverpool, the slating, plastering, and the whole of the modelling and interior stucco work; and Mr. Merrick, of Manchester, the plumbing and glazing. Mr. Kitchen, of Liverpool, has superintended the whole as clerk of the works.

THE SCIENCE OF COLOUR.

As opinions are frequently expressed on the subject of light and colour which betray an entire ignorance of the very first principles of the science of light,—a science which has already opened to us a more beautiful and wonderful view into the mysterious constitution of the universe than any other, and has been the parent of innumerable discoveries and inventions of the highest interest in every department of science and art,—Mr. Cave Thomas deserves thanks for calling your readers' attention to it by his letter in the last number of the *Builder*.

It may be safely said that no man with any capacity for reasoning, who knows what has been found out about light, can doubt the truth of the undulatory theory. It is now known that light is nothing but inconceivably minute waves or shocks of transverse vibration, arising in certain cases about the atoms of bodies, and transmitted with extreme velocity through an all-pervading ethereal medium; that these waves differ from each other in nothing but their lengths or periods of vibration; that when they traverse any material body, as air, water, or glass, their velocity (which is alike for all through the perfectly elastic homogeneous free ether in the interstellar spaces) is less for the shorter waves than for the longer, whence arises the difference of refraction; and that, when they fall on the retina, the waves of different

periods excite different sensations of colour. The magnificent assemblage of colours which constitute the complete and pure prismatic spectrum is produced when a series of the waves of light of all the different wave-periods fall in order side by side on the retina; and what we call "the colours" of the various bodies we behold are nothing but combinations of the sensations excited by the mixtures of the different kinds of waves which those bodies reflect or transmit to the eye. The term "ray" merely imports an imaginary line, perpendicular to the surface of the wave, in which direction it everywhere spreads; and when we speak of "coloured rays" or "coloured light" as white, yellow, or red, nothing more must be understood than such a compound of innumerable luminiferous waves as produces on the retina the sensation of white, yellow, or red, or whatever other colour it may be.

I mention these points, not as unknown to your correspondent, but because he seems to suppose that the discussion in your columns has arisen from some aesthetic theory, in part, at least, inconsistent with the undulatory theory; and I should be sorry to have it supposed that I am chargeable with the ignorance, folly, or presumption of a writer who contradicts or ignores what is firmly established in science. On the contrary, having studied the subject well, I fully accept what is called the undulatory theory, with the admiration due to it, not as a theory, but as known truth, and without the reservation which Mr. Thomas at present makes in respect of "separate vibrations;" but which, if I do not mistake his meaning, he will, on further reflection, find it necessary to withdraw. The whole essence of the theory is involved in the fact that every separate wave maintains its own time invariable, and produces its own proper effect at every point in the ether which it reaches, whether such point is at rest, or is disturbed by any other wave or waves at the same time. Without this doctrine the theory would be inconsistent with the simplest principles of dynamics; it is, indeed, merely the same truth which is so much used in acoustics, and so beautifully illustrated in Professor Tyndall's lectures on sound. The prism necessarily alters the form of the wave-surfaces, and therefore bends the rays in different degrees, because waves of different lengths traverse the glass with different velocities from those with which they traverse the air; but it in no way modifies the wave-periods, on which alone the colour depends.

Newton's great discovery in optics was that the sun sent out an infinite number of different kinds of light, all differently refrangible, and producing different sensations of colour; and that the property, whatever it might be, which gives to each kind its peculiar refrangibility, is invariable, together with the colour-sensation that attends it. This is the very foundation of the science of colour. Sir David Brewster attempted to contravene it, and by some inconclusive experiments to show that colour was independent of refrangibility; but the examination of the question has made the truth of Newton's doctrine more evident than it was before (see Professor Stokes's lectures to the Chemical Society, 2nd June, 1864); and though Brewster's hasty theory of three kinds of light may still be met with in popular works, no adept in the science of light will now, I think, be found to maintain it.

As few even of those who have paid some attention to these subjects have read Sir Isaac Newton's propositions in colour in his own language, the following quotations from his "Optics" will be interesting, as exhibiting some of his striking propositions which he established by unanswerable arguments drawn from an admirable series of experiments. They undoubtedly form the groundwork of the science of colour, properly so called, to which a knowledge of the actual nature of light is not at all essential.

Definitions.—"The light whose rays are all alike refrangible, I call simple, homogeneous, and similar; and that whose rays are some more refrangible than others, I call compound, heterogeneous, and dissimilar. The former I call homogeneous, not because I would affirm it to be so in all respects, but because the rays which agree in refrangibility, agree at least in all those their other properties, which I consider in the following discourse."

The colours of homogeneous lights I call primary, homogeneous, and simple, and those of heterogeneous lights, heterogeneous, and compound. For these are always compounded of the colours of homogeneous lights, as will appear in the following discourse."

Propositions.—"Lights which differ in colour, differ also in refrangibility."

"The light of the sun consists of rays differently refrangible."

"The phenomena of colours in refracted or reflected light are not caused by new modifications of the light variously impressed, according to the various terminations of the light and shadow."

[This refutes some of the then prevalent notions about colours, which Goethe and others afterwards attempted to revive.]

"All homogeneous light has its proper colour answering to its degree of refrangibility; and that colour cannot be changed by reflections and refractions."

Definition.—"The homogeneous light and rays which appear red, or rather make objects appear so, I call rufous or red-making; those which make objects appear green, blue, and violet, I call yellow-making, green-making, blue-making, violet-making; and so of the rest. And if at any time I speak of light and rays as coloured, or ended with colours, I would be understood to speak not philosophically and properly, but grossly, and according to such conceptions as vulgar people in seeing all these experiments would be apt to frame. In them there is nothing else than a certain power and disposition to stir up a sensation of this or that colour. For as sound in a bell or musical string, or other sounding body, is nothing but a trembling motion, and in the air nothing but that motion propagated from the object, and in the sensorium is a sense of that motion under the form of sound; so colours in the object are nothing but a disposition to reflect this or that sort of rays more copiously than the rest; in the rays they are nothing but their dispositions to propagate this or that motion into the sensorium, in the sensorium they are sensations of those motions under the form of colours."

Propositions.—"Colours may be produced by composition which shall be like to the colours of homogeneous light as to the appearance of colour; but not as to the immutability of colour, and constancy of light, or compound colours, by how much they are more compounded, by so much are they less full and intense; and by too much composition they may be diluted and weakened till they cease, and the mixture becomes white or gray. There are also colours produced by composition which are not fully like any of the colours of homogeneous light." [The last sentence refers to the purple formed by mixtures of the red and violet rays.]

"Whiteness and all grey colours between white and black may be compounded of colours; and the whiteness of the sun's light is compounded of all the primary colours mixed in a due proportion."

"All the colours of the universe which are made by light, and depend not upon the power of imagination, are either the colours of homogeneous lights, or compounds of these, and the latter accurately or very nearly agreeing to the rules of the foregoing problem."

The rule referred to in the last of these extracts is a very remarkable one; and had it been attended to by subsequent writers on the theory of colours as it deserved to be, the common erroneous ideas about complementary colours would never have obtained the credit they have been honoured with, both in England and abroad. Newton arranged the series of the prismatic colours in the circumference of a circle, and prescribed the parts of the circumference which are to be occupied by the colours of the seven parts into which he divided the spectrum. The colours which fall opposite to each other are those which he was led by his experiments to regard as most nearly complementary in hue. From his diagram it appears that the middle of his red space falls opposite to that part of his blue space which verges on the green; and as his blue space includes all the seagreen-blue rays, up to the seagreen itself, this is perfectly correct according to all those experiments with the prism and with pigments, which I have endeavoured in my treatise and former letters to point out. The middle of his orange space falls opposite to that part of his indigo space which verges on his blue space; the first or golden part of his yellow opposite to the middle of his indigo space, which contains the deepest and purest blue; the greenish part of his yellow opposite to the middle of his violet; and the middle of his green space opposite to that point in the circle where the extrem rays of violet terminate in darkness, and those of red begin. Had Newton let a blank space in this part of the circumference, opposite to the green rays, the whole would almost perfectly agree with the results recently obtained by accurate observations with refined apparatus by Helmholtz and by Maxwell. But how different from the conventional system which, contrary to all rational experiments, put the red opposite to the green, the orange opposite to the pure blue, the yellow opposite to purple, and has ever since been followed by artists literally blindfold, as one would think since the eye itself, if allowed to judge for itself uniformly declares for the other system! This any one may see who will take the trouble to compare the effect of placing side by side the colours asserted to be complementary in the two systems; or will look at a shaded white surface through a small hole cut out in a sheet of paper coloured strongly with scarlet vermilion, with king's yellow, with emerald green, with verdigris, with cobalt, or with rose madder. The white surrounded by scarlet will not appear green, but seagreen; that surrounded by yellow

will not appear purple, but blue; that surrounded by green, not red, but pink; and the reverse: and as according to the terms of the well-known law of simultaneous contrast, the white always assumes a hue complementary to that of the surrounding surface, this is another proof for those who seek one, or our conventional complementary colours are not the true ones.

Newton seems to have regarded all the prismatic colours as equal in depth of hue, or equally distant from a neutral colour of the same brightness. If they were so, it might not have been easy to answer the inquiry why some should be called simple or primary in preference to others. But they are not so; Mr. Maxwell has proved that they do not lie in a circle about a centre of white, but in the form of a triangle, imperfect on one side, whose angles are occupied by the deepest red, green, and blue: so that all the colours which lie in the spectrum between the first and second, and the second and third of these may be produced by mixtures of these with the same depth of hue (or strength in proportion to their luminosity) which they possess in the spectrum itself.

I am sorry that so ingenious a thinker as Mr. Thomas shows himself to be should seem to adopt the common but inaccurate idea that a colour "may be raised in the eye as a compensation to some direct excitement of the retina from without." The real cause of the complementary ocular spectrum so commonly observed when the eye excited strongly with any colour is suddenly directed to a dull neutral ground, and of all the effects above alluded to under the term "simultaneous contrast," is evidently nothing but a reduced sensibility of the retina for that one or more of the simple sensations of colour with which it has just been so strongly affected. Thus a spot of white, when surrounded by blue, appears tinged with yellow, because the eye then becomes less sensible than it ought to be to the blue rays reflected by the white.

W. BENSON.

Str.—Having had the advantage of a personal interview with Mr. Benson, and having put the question to him, "Why is green a primary colour?" I find that we are not agreed as to what constitutes a primary colour. His definition of primary colours is "the colours of the pure spectrum, being the *degrees* that can be found of their respective kinds," while I have assumed, according to the generally received theory, that red, yellow, and blue are primary colours, because they cannot be divided into two other colours of the prismatic spectrum, and are therefore not compound, as orange, violet, green, &c.

I have, then, received an answer to my question. I have simply to say that I cannot see the force of Mr. Benson's definition, and that I certainly remain unconvinced by his theory. But as I have no wish "to wrap the veil of any false theory about my eyes," I may perhaps let you know the result when I have further investigated it.

JAMES K. COLLINGE.

WAS JOSEPH A CARPENTER?

I In reply to Mr. Black's denial (see p. 647, *ante*) Mr. E. Gardner Smith writes,—"Mr. Black asserts that Joseph was not a carpenter, as has been supposed, but a mason, and for this opinion he gives two reasons. I. 'The original term used signifies architect, builder, or mason, and not carpenter.' The question then becomes one of philology, and I think it requires no profound knowledge of Greek to enable any one successfully to dispute the point. It cannot be denied that the word in question, *τίκτωρ*, does mean sometimes architect or builder; it is, as every Greek scholar knows, derived from a word signifying 'to bring into being,' so it sometimes in classic Greek may mean an author or planner, and, with qualifying adjuncts, a worker in metal or in stone. Both Homer and Euripides use the word in the former of these senses. Still, I maintain that in those passages in the works of Greek authors where the word is used, its meaning is by far the majority of cases will be 'a worker in wood,' a carpenter. Further, I dare affirm that if any English-Greek lexicon be consulted, the word *τίκτωρ* will not be translated by *τίκτωρ*; and, on the other hand, I believe no Greek lexicon can be found which does not give as the principal meaning of the word, a worker in wood. Again, I may say that the early Greek fathers, in their works, had this idea. Justin Martyr says:—"Christ, being among men, was a maker of desks and yokes, which were the works of carpenters."

III. The other reason assigned by Mr. Black is this—"In the times where Joseph dwelt, wood was used in the erection of the structure of their houses, but stone only." In other words,

Mr. Black's logic seems to amount to this—(1). Where the houses are built only of stone there can be no carpenters. (2). In Palestine the houses were built only of stone. (3). *Ergo*—In Palestine there could be no carpenters. (4). Conclusion No. 2. Therefore Joseph could not be a carpenter. Any schoolboy, I think, could detect the fallacy so palpable here. As to the first term: admitting that the houses were all of stone there were even then no need for workers in wood? Then as to these houses, was there really no woodwork about them? No beams in the roof, no doors separating the rooms, no lounging sofas whose framework was mostly wood, no elaborately ornamented ceilings of wood, no window shutters which often were beautifully inlaid with many pieces of polished wood? Historians then must have been dreaming, and Eastern travellers continuously deceived.

I have not time to say more, but I think, sir, that many of your readers will still believe that the translators of our Bible, the old writers, and the old painters, too, were after all right, and that Mr. Black is wrong."

SMOKING-CARRIAGES ON RAILWAYS.

Str.—I shall feel obliged if you will use your efforts to remedy an evil strongly felt by smokers. When gentlemen travel by rail they must do one of three things, *viz.*, travel in a smoking-carriage and endure an amount of suffocating smoke alike injurious and unpleasant, or deprive themselves of the pleasure of a cigar and go in an ordinary carriage, unless they smoke in the ordinary carriage, which is, of course, exceedingly wrong, inasmuch as it makes it very uncomfortable for those who enter the carriage afterwards. This evil, I think, be greatly averted by introducing a simple fan into the ceiling of the smoking-carriage, which would revolve directly the train was set in motion, bring pure air in and drive out the smoke; a string or other simple means should be attached which would stop it at the will of the passengers. The force of air met by the fan would cause it to revolve and ventilate the compartment in the manner I have described.

WALTER CHESTERTON.

UNPAINTED DEAL, AND DISTEMPER COLOURING.

In respect to the durability of unpainted deal, I noticed in a street of Vienna numerous instances of doors, &c., being of deal unpainted and unvarnished, and which appeared to stand perfectly well.

In this country it will no doubt last well indoors, but I think would not bear exposure to our moist climate. Apropos of atmospheric influences, I was struck in Vienna and also in Florence with the durability of the distemper colouring applied to the outside of houses, and giving to them as good an appearance as stone. I was told in the latter city it lasted twenty years. We know too well what an unsightly miserable appearance a house with us will present only three months after being coloured! This, I think, must be owing to the dampness of our climate. A durable water-colour is with us a desideratum.

P. E. MASY.

Str.—Noticing a letter in the *Builder* about the enduring quality of deal timber (unpainted), it brought to mind a circumstance noted when visiting Hertfordshire three years ago. I went to see the "great bed of Ware," and noticed a plain plank of deal, fastened at the foot of the bed, with a date roughly cut 1656. I was surprised at its perfectly sound condition after the lapse of so long a period, contrasting with the rotten state of harder wood of much later date; possibly this might not be the actual date of the addition to the bed.

A LOVER OF "THE BUILDER."

Str.—In answer to your correspondent of last week signed "Plain Dealer," respecting deal timber in external work, my opinion is that it would lose all its colour in a very short time, and decay for want of nourishment, such as oil, paint, or varnish. I have seen the two ancient doorways from Norway that were at the South Kensington museum, and must say that they were remarkably sound. I noticed them particularly as executed the colouring of the two plaster casts, mentioned in the leading article of your last week's *Builder*. The pine wood these doorways were made of seems to be of a very hard kind, but I am inclined to think they must have had some coating of oil or varnish. To preserve deal from decay in a climate like England, I should recommend one or two coats of boiled linseed oil, with best yellow bees-wax, say a quarter to one gallon: this would be found to be durable, and keep the deal from losing its colour, and much cheaper than using ordinary oil varnish.

THOMAS KESSEAW.

DEEP WELL SINKING.

This time of the year is the most suitable for well-sinking, and it can be done at half the expense when the springs are low. As to hydraulic machinery, atmospheric pressure should be thoroughly understood. In theory it is supposed to be 15 lb. to the square inch. In pumping machinery the pressure should not be more than 10 lb. to the square inch; that is to say, the seat-valve should not exceed 20 ft. in elevation, although the raising main pipe may be unlimited in height or distance. We find the air-pump will not raise mercury 29 ins. and at times, when the barometer goes down, we have 2 1/2 lb. less.

Then, you may say, friction and leakage would reduce the drawing power to 10 lb. Serious mistakes are made in the erection of such machinery of great magnitude. It will have the same effect in water mains, syphons, &c. Persons qualified should adopt methods simple in construction, and easy enough in case of repairs. The turbine is much used.

T. PARR.

SHIPBUILDING IN WATER.

AN ENGINEER writes—

With reference to the remark in your article on the "Launch of the *Bermuda*," that "Rennie, the architect and builder of London Bridge, of Southwark Bridge, and of Waterloo Bridge, would have done under the circumstances of having to place in the water such a structure as the *Great Eastern* or *Bermuda dock*," it is as well it should be known what the Rennies of the present age, the grandsons of John Rennie, have actually done in transporting a huge iron structure into the water. An iron floating dock, for the Spanish port of Cartagena, the first of its kind, was designed and constructed by them; and, instead of launching, it was built in a shallow basin, and when completed, the water was gradually allowed to flow in until the structure was afloat, as proposed in your article. The comparative size of the dock at Cartagena with the *Bermuda* may be made by the fact that the Cartagena dock has actually lifted a larger vessel, *viz.*, the *Namancica*, than the class of vessel, *viz.*, the *Bellerophon*, for which the *Bermuda* dock is intended. The following are the sizes of the *Namancica* and *Bellerophon*—

	<i>Namancica.</i>	<i>Bellerophon.</i>
Length	316 feet.	300 feet.
Breadth	57 "	56 "
Displacement at low draught	7,420 tons.	6,372 tons.

CHURCH-BUILDING NEWS.

Norton (*Radnorshire*).—The parish church has been re-opened for divine service after restoration by Mr. Coleman, of Claxhill, builder, under the supervision of Mr. G. G. Scott, architect. The whole of the interior has been coated with plaster. A small transept, suitable to the size of the building itself, has been let in by means of low turned pointed arches. The exterior has been freshly pointed and dressed down, and a new low shingle spire has taken the place of the old one. A new Early Decorated window, consisting of three lights, has been inserted in the east end, filled with stained glass, the subject being Our Lord's Ascension. New windows of a similar character have also been placed in the transepts, the subject of that in the south side representing the "Call of St. Andrew," to whom the church is dedicated. In the north transept window the subject is Christ blessing little children. The portion of the church parted off from the nave for the tower has now been opened out to form a baptistery. A west window of stained glass has also been inserted, the subjects being the baptism of Christ by John the Baptist, and the charge to the Apostles, "Go ye forth to all the world, and preach the gospel." There are besides two new windows of grissled glass placed in the chancels, and two others of the same kind in the nave. These latter all occupy the old window spaces, which are mostly played on the inside, and show an immense thickness of wall. The stained glass is from Messrs. Clayton & Bell's. The larger oak timbers of the roof have been preserved, but new intervening rafters of varnished deal have had to be used, the spaces between them being plastered. A new panelled channel roof of varnished deal has also been added at a somewhat lower level than that of the nave. The old carved roof-screen has been repaired whilst the pulpit and lectern—both of carved oak—are new. The seats are all open, are of pine, and have oak ends. The flooring-tiles are all of a plain red colour in the nave, with a little variation in the sacristy, but no speciality; they are from Codwin's works. A new organ, with complete pedal, six stops, and manual, has been placed in the north side of the chancel, at the sole expense of Mr. Cecil Parsons. It was made by Messrs. Forster & Andrews, of Hull. The contract for the restoration was 2,000*l.*, but extras have been incurred amounting to 200*l.* more.

Orlerton.—Boughton Church and the addition to the graveyard at Boughton have been consecrated. The old building was very dilapidated,

and inadequate to seat the population of the parish. The new church stands apart from the old site. The parsonage-house is nearly completed. Schools were erected a few years ago by Mr. J. W. Pickin, Whitmore. The style of the church is Geometrical Pointed, and it will seat 200. Mr. Fowler, of Louth, was the architect.

Newcastle-upon-Tyne.—The restoration of St. Nicholas's steeple has not yet been effected; nor indeed have the mears been collected, the subscriptions remaining at 2,862*l.* 10*s.* 6*d.* against a contemplated expenditure of about 7,000*l.* The committee have resolved unanimously, "That in order to raise the necessary funds for the completion of the restoration of the steeple, it is recommended that a voluntary rate of 3*d.* in the pound be levied, and that the Corporation at their next meeting be respectfully solicited to permit their officials to take the requisite steps for collecting the same." The mayor stated that, Dissenter though he was, yet so thoroughly did he appreciate the beautiful steeple of St. Nicholas, and sympathise with the movement for its restoration, that he had determined to make his subscription up to 50*l.* He therefore handed to the honorary secretary 30*l.* (having previously paid his first subscription of 20*l.*). The committee were informed that Messrs. R. Stephenson & Co. had obligingly consented to allow a collection-box to be placed in their manufactory, so as to afford their employes an opportunity of contributing towards the restoration fund.

Ryton.—The re-opening of the church at Ryton-of-the-Eleven-Towns after its restoration has taken place. The present vicar (the Rev. J. Paget Wilkinson) restored, re-roofed, and refitted the chancel, and has now effected the same improvements to the rest of the church—lowering the floor to one of the old pavements (one still older having been found some inches below), repaving, reseating with oak, warming with hot water, and generally improving the structure. It must also be mentioned that the peal of six bells which have been fixed in the tower were procured through the efforts of the vicar. Further efforts are required to recast the present very ugly porch, and to clear away the earth from the walls of the building. The whole of the work has been carried out under the superintendence of Mr. Pountney Smith, architect, Shrewsbury. A new window, which has been inserted in the south wall in the habitory bay of the church, was supplied by Messrs. Done & Davies, of Shrewsbury. The subject on the left-hand opening represents "The Baptism." In the right-hand opening is a design taken from the left, "Suffer little children to come unto me." Above each of the subjects is a canopy, and a narrow border runs round each of the openings. In the quatrefoil above the heads are introduced the lily and the passion-flower. The same firm has also filled the large west window with grained glass, with stained border all round. In the tracery of the window are the figures of our Saviour, and the patron saint of the church, St. John the Baptist, on either side of them being the figure of an angel, in standing attitude.

Halgrave.—The parish church has been reopened, after extensive alterations. The church was in a most dilapidated condition. The broach spire, being in a dangerous condition, has been partly taken down and rebuilt in the same form by previously marking the stones. In the south aisle the symmetry of the building is broken by an excrescence, in which there was formerly a vault belonging to the Langham family, and a gallery above it. These having both been removed, space is gained for a vestry (to be formed at some future time) and for a heating chamber below, which is entered from without the church, and contains a Haydon's heating apparatus. The west window and helfry arch which were both hocked up, have been reopened. The walls have been stripped of plaster and pointed. New high-pitched roofs have been put on the nave and the chancel; the aisle roofs remain in the same form as before. Open seats of unstained oak have been substituted for the old pews. The arcade is Early Decorated. In the chancel the high roof affords a view of the east window, the upper portion of which was formerly hidden by a flat roof. A low side window was discovered in the usual place on the south of the chancel, but the tracery had been cut away on the outside before it was built up. The remains of what was believed to be a lead casement were observed in one of the openings of the window. The tracery has been preserved on the inside, and reproduced on the outside in

one large hock of Ketton stone. The chancel has been paved with Codwin's tiles. Oak stalls are fixed in this part of the church.

Leyburn (Yorkshire).—The diocese of Ripon has had another new church added to its number, Leyburn Church, in the North Riding, having been consecrated and opened for divine worship by the Bishop of Ripon. The site is the joint gift of Lord Bolton and the Hon. W. T. Orde Poynter, the next heir to the title and estates of Bolton. Lord Bolton also contributed 1,250*l.* towards the building fund. The entire cost was 2,900*l.* In addition to this, the necessary furniture of the church is the gift of the richer members of the congregation. The church is dedicated in the name of St. Matthew, and has been built from the designs of Mr. C. G. Wray, London, architect, in the Decorated style. It consists of a nave 57 ft. long and 23 ft. wide, with a north aisle of the same length and 13 ft. in width, separated from the nave by an arcade of four moulded freestone arches and piers. The chancel is 24 ft. in length and 18 ft. in width. The tower is at the west end, rising to a height of 65 ft., and consists of three stages, and a prominent feature in its appearance is a projecting stair turret at the south-east angle. The lower stage opens into the nave by means of a high moulded arch, and has a three-light window. There is an ornamental opening for a clock in the second stage, and in the upper stage are deeply recessed two-light helfry windows, fitted with louvres. The porch is situated at the extremity of the south wall and nave, and an organ-chamber and vestry are built on the north side of the chancel. The east window of the chancel has five compartments. The sittings in the church are open, and plain; they are of deal, stained and varnished, to correspond with the roofs, and afford accommodation for 350 persons. The brass-work is by Messrs. Hart & Sons, of London. Mr. Jones, of Leyburn, has been the contractor.

SCHOOL-BUILDING NEWS.

Beaminster.—New parochial schools have been opened here. The site is in White Hart-street. The buildings, which consist of an infants' and a girls' school-room, with class-room and residence for the mistress, stand upon ground extending 100 ft. from front to rear, and having a frontage of about 40 ft. The whole structure is built of red stone, in "random work," with a roof of red tiles, and dressings of Hamhill stone. The front of the building is thrown back about 14 ft. from the road, and is enclosed by a wall about 4 ft. high, with triangular coping of Hamhill stone. At the entrance to each school is a porch lighted by two lancet windows, with a second door leading into the school-room. The interior walls of the infants' room are whitened, and the roof is supported by light principals of varnished deal, the ends of which rest on plain corbels of Hamhill stone. At the end of the room facing the street are two large windows with trefoil heads, surmounted by a fanlight, whilst light is obtained by three large plain windows inserted in the side wall. The room is 40 ft. long by 20 ft. wide. The girls' school is of larger dimensions, being 45 ft. in length, and at the head of it is a class-room 15 ft. by 22 ft. The style is the same as in the infants' room as regards the building; but all the windows in this apartment are plain, with merely a circular fan-light in the gable end. It is approached by a porch, and is separated from the class-room by folding or sliding doors. Surrounding the schoolrooms are necessary conveniences for the children, fuel-houses, out-buildings, &c. The yards, which are somewhat circumscribed, are gravelled. There is also a residence for the mistress. The structure was erected in accordance with designs by Messrs. Slater & Carpenter, of London, architects, Messrs. John Chick & David Hann, of Beaminster, contracting for the carpentering work, and Messrs. Chambers, of Beaminster, for the masonry. It is expected that the work, when completed, will have cost about 2,000*l.*, including the site.

Hurley (Berks).—The foundation-stone of a school has been laid at Birchet's Green, Hurley. This is a hamlet remote from the parish church and school.

Sharston.—The foundation-stone of the new national schools at Sharston, in the parish of Northenden, has been laid. The new schools are being built upon the site of the old one, at

the meeting of the three roads from Altrincham, Cheadle, and Northenden. The accommodation is for 154 children, boys and girls—the infants school being near to the church, in the village of Northenden, and more than a mile distant. There are two school rooms, one 39 ft. by 20 ft. and the other 30 ft. by 20 ft., with a class-room common to both. There are separate entrances play-grounds, porches, lavatories, and conveniences for the girls and boys respectively. There is a third porch to the schools, for visitors, with doors communicating with both girls' and boys' rooms. At the eastern extremity of the group is the master's house, with the usual complement of six rooms, and a cellar and pantry besides. The walls are being built of brick, of two colours with moulded bricks in arches, strings, cornices &c. The windows are all of white stone, contrasting with the framework of red brick which surrounds them. There will be one rose window and several others with traceried heads of various patterns. The style is Tudor, harmonizing with the parish church. The contract has been taken for 1,213*l.* by Mr. Joseph Daves, of Cheadle. The architects are Messrs. J. Medland Taylor & Henry Taylor, of Manchester.

Ashton.—The foundation-stone of a new school at Waterloo, in the parish of Christchurch, Ashton-under-Lyae, has been laid. The building will contain a room 60 ft. by 30 ft., and two class-rooms; and, with an apse at the east end, can be used either as a school or, when required, for divine service. It is calculated to hold 260 day scholars. Mr. John Eaton, of Ashton, is the architect.

Books Received.

A Treatise on the Steam-engine in its various Applications. By JOHN BOURNE; being the eighth edition of "A Treatise on the Steam-engine," by the Artisan Club. London: Longmans, Green, & Co. 1868.

Examples of Modern Steam, Air, and Gas Engines of the most recent approved Types, accompanied by Working Drawings. By JOHN BOURNE. Part IV. London: Longmans, Green, & Co.

We take it ill of ourselves that we have not before now mentioned the appearance of a new edition of Mr. Bourne's well-known and widely-appreciated "Treatise on the Steam-Engine." It is dedicated to Mr. C. Hutton Gregory, and contains some emendations and improvements; but finding that there was a large amount of important information which could not be added without too largely increasing its size, the author determined on publishing the second work named at the head of this notice, and concerning which we have already informed our readers. Mr. Bourne has long seen that in the case of steam-engines a given quantity of heat does not generate more than one-tenth of its equivalent power, the rest being lost in the imperfections of the machine, and believes it impossible that this enormous fault, now it is known, can be much longer tolerated. If we had a good way of transforming heat into electricity, we should be able to work an engine with little more than one-tenth of the fuel now required! In his new work he brings forward the expedients which have been proposed to take the place of the steam-engine, and criticises their merits and promise. We should not be surprised if important results followed its publication. We can conscientiously recommend strongly for increased circulation both Mr. Bourne's works.

Miscellaneous.

PLANS OF LABOURERS' COTTAGES.—Numerous plans by competitors for the prize of 20*l.* offered by the Hertford Labourers' Friend Society for the best plan of a pair of labourers' cottages to be erected for 200*l.*, have been sent in. In most of the plans, says the *Hertford Mercury*, the apartments are sufficiently wide and long, and some of the living-rooms are very good indeed; but the height is not what it should be. In awarding the prize, we suppose that the judges will feel tied by the conditions to those plans which are guaranteed to be carried out at a cost of 200*l.*; but the guarantee is in many cases made conditional on neighborhood, railway communication, &c. The prize was to be awarded at the dinner, after the Agricultural Show.

ROME.—A letter from Rome says:—"The discoveries of the Emporium continue, greatly to the satisfaction of antiquarian connoisseurs and to the increased reputation of Commander Visconti, whom the Pope has just nominated a Baron, as doubtless you have heard. The excavators have found 432 blocks of marble of colossal dimensions; 1,256 others suitable for statues, or the pavement of churches and of public buildings; and upwards of 2,000 of smaller size."

THE SEA-WALL PROMENADE AT BRIDLINGTON.—After an expenditure of much time and money in planning, forming, and perfecting the sea-wall promenade at Bridlington Quay, it is pleasant to see this place of resort so popular as it is. It does not appear that there is any special need of further improvement to be made in the quay at present other than getting the several lots of building-ground built on, as soon as possible, with mansions similar to those recently erected in the new street.

BARROW-IN-FURNESS.—The Corporation of Barrow-in-Furness has just acquired a public square, comprising a town-hall, a market-hall, police courts, and business offices, built in the centre of the town two years ago, and vested in the hands of the Duke of Devonshire and Mr. Ramsden, the managing director of the Furness railways, as trustees. The purchase-money, 15,000*l.*, to be paid immediately. The greater portion of the property has for some time been in the occupancy of the corporation.

VIENNA PALACE OF THE FINE ARTS.—On the 21st inst. the first stone of the Palais des Beaux Arts, in Vienna, was laid by the Emperor. The day chosen was that of the opening of the general exhibition of German art, which had attracted an immense number of artists to Vienna. The authorities of the city gave a banquet in honour of this the tenth meeting of the artists of Germany, the number of guests amounting to 550, the burgomaster of Vienna holding the presidential chair, and being supported by the ministers.

ACCIDENT TO TEDDINGTON LOCK.—A high tide, assisted by the low state of the water above, recently lifted out the paddles which are used in constructing the "weir," and carried them up stream. Sufficient time had not elapsed to enable some men to replace them properly, and the tide, which continued to run up for some time, no doubt reached Hampton Court. The wreck of the "weir" went as far up as Kingston, or rather the island below Kingston railway bridge. The water, it seems, by this occurrence, above the lock, was reduced between 4 ft. and 5 ft.

BEAULIEU ABBEY HOUSE, HANTS.—This Abbey house is now undergoing thorough renovation, previous to its being the permanent residence of Lord Henry Scott, a son of the Duke of Beaufort. The Abbey House was originally an abbey's residence and private chapel. Margaret of Anjou's apartments in the Abbey House, with their ancient furniture, are now closed to the public, and only the doorway where she made her escape from the abbey grounds, and a spot in Beaulieu river where she embarked during the period of her claiming sanctuary had survived, can be visited by tourists.

ARBITRATION CASE, LEEDS.—An important arbitration case has just been concluded at Leeds, where Mr. Hunt, from the Board of Trade, occupying eight or nine days in hearing it. The case concerned the London and North-Western Railway Company and the North-Eastern Company, in forming their new station at Leeds, take down the Midland Company's engine-house, and buy about eleven thousand yards of land from the former company, and also use the Midland Company's road in front of the Queen's Hotel as a passage to the new station, and the Midland Company arch over about half of the land which the London and North-Western Company had acquired the right over from the Leeds and Liverpool Canal Company, at a cost of about 10,500*l.* For that land the two companies asked 11,000*l.* from the Midland Company. But the free use of the surface of the arches is somewhat interfered with by lights and telegraph poles of them; and Mr. Hunt has awarded the Midland Company to pay 8,500*l.* for it to the London and North-Western Company. The Midland concluded their offer by crediting the value of the land they so recovered, and still asking for a balance of about 2,500*l.* from the two companies, whilst Mr. Hunt has awarded them 42,000*l.* only, and leaves the London and North-Western Company to pay their own costs.

AIR NAVIGATION.—M. Joseph Lytchak, a Russian journalist, in a letter to the *Lemberg Slave*, maintains that he has solved the problem of navigating the air. The motive force applied by him is steam; the rate of speed attainable with his machinery he estimates at eighty miles an hour. Years ago we insisted that if we were ever to navigate the air it must be by power, not by lightness, and that until a steam or electrical engine were taken up the air would be mastered. A congrue rocket to take us up, and an umbrella to let us down, formed our initial machine.

PICTURES AT CRAWLEY.—Through the exertions of Mr. Mark Lemon and some few of the other inhabitants of Crawley, in Sussex, a collection of paintings by living artists has been got together, and will be open to the public on the 1st of October. It is advertised that it will be kept open "in the first instance" for ten days, probably to ascertain how it is appreciated; but the time will doubtless be extended if found desirable. Every landlord and employer in the neighbourhood should see that their tenants and workpeople and their children have an opportunity to visit the collection.

EXCURSION OF THE NORFOLK AND SUFFOLK ARCHOLOGICAL SOCIETIES.—It is usual for the former of these societies to make at least one general excursion during the year, but it has this season been put off later than usual. Arrangements, however, were at last made for an excursion, in conjunction with the Suffolk Institute of Archaeology, to the various churches at Haddiscoe, Haddiscoe Thorpe, Toft Monks, Fritton, Herringfleet, Blundeston, Flixton Rain, and Oulton. All the members had been advised by circular to meet at Haddiscoe station, and accordingly about fifty ladies and gentlemen were assembled there at the appointed time. Omnibuses and carriages had been prepared for their conveyance. In the course of the day this party was further increased at the different churches visited. The weather could not have been more suitable.

SCIENTIFIC INSTRUCTION IN YORKSHIRE.—A public meeting of schoolmasters on the subject of "Scientific Instruction," called by the Yorkshire Board of Education, has been held under the presidency of the Mayor of Leeds, in the Civil Court Room of the Leeds Town-hall. There was a numerous attendance. Mr. Sales, the secretary of the York Board of Education, stated that the Yorkshire schools were very deficient in the means of supplying scientific instructions, and the meeting had been convened for the purpose of affording information regarding the scheme which the Department of Science and Art had devised for the benefit of the industrial classes, and with the object of procuring them proper scientific instruction. Mr. Iselin then submitted a summary of the plan proposed by the Science Department for adoption. He also spoke highly of the success which had attended the scheme in Lancashire and Cheshire. Mr. J. G. Fitch, of York, and Mr. Traice, of Manchester, then addressed the meeting, and Mr. Jarman announced that he was about to establish a class, with the object of teaching chemistry to schoolmasters in Leeds. After some further conversation, the proceedings terminated with the customary compliment to the chairman.

"REARING" OF THE TOWN-HALL, ROCHDALE.—The "rearing" of the Rochdale Town-hall has been celebrated in the large assembly-room over the Co-operative Store, Toad-lane. The edifice, of which we gave a view and plan in our volume for 1866, pp. 868-9, is not yet completely erected, but it is far advanced. The west end is covered in and slated; portions of the east end are rapidly approaching completion also; and several principals for the roof of the great hall have been placed. The dimensions of this room will be 92 ft. long by 57 ft. wide, and 75 ft. elevation from the floor to the roof; it will be lighted by fourteen traceried windows of great altitude, and by a circular window 16 ft. 8 in. in diameter at each end, near the roof. At the west end will be an orchestra of some 33 ft. by 12 ft., separated from the large hall by lofty columns, divided into two bays. A portion of the tower has had to be taken down, in order to substitute girders for an arch which it was found would not be so safe as the former. There is now apparently sufficient stone on the ground to complete the job. About 200 persons, including several workmen employed by Messrs. Warburton, of Harpurhey, the contractors, on other works in different towns, partook of the entertainment, which was accompanied by music during the evening.

CLOSE OF THE NORWICH EXHIBITION.—The exhibition of modern paintings at the artists' room will close on the 26th inst., and the attendance of the general public, it seems, fully justifies the proposal to establish a permanent picture gallery in Norwich.

RAISING A FLAME.—Among the *trouvés d'invention* recently granted in France, we read of a strong coffer, the peculiarity of which seems to be that if fraudulently opened it will kindle a Bengal light, brilliant enough to assemble a multitude, who will firmly believe that the house is on fire.

ARTISANS' DWELLINGS ACT.—The Chelsea Vestry have the credit of being the first, we believe, to put in force the Artisans' and Labourers' Dwellings Acts. At the last meeting, with reference to a nuisance in Wickham-place, it was resolved that the new Act should be put in force.

THE NEW STREET THROUGH THE CITY.—In the course of a few days the block of houses extending along the Poutry, from the western side of the Mansion House, will be removed for the purposes of the new street which is to run from that point to Blakfriars Bridge. At the north side of Cannon-street the ground has already been cleared.

CLOSING OF THE LEEDS FINE ART EXHIBITION. The executive committee of this exhibition have decided that it shall close on Monday, October 26th, so that a month now remains during which the art treasures can be inspected. The total number of admissions since the opening day has been—by payment, 278,956; by season tickets, 67,981; total, 346,937.

KENSINGTON IMPROVEMENTS.—An improvement is now being effected in Kensington, involving the demolition of sundry blocks of buildings, to facilitate the passage of the traffic through the High-street of the "Old Court suburb." Yesterday, twenty-seven dwelling-houses and premises, situated in High-street, Young-street, Market-court, and Gardeners' buildings, forming a portion of the projected alteration, were disposed of by auction, and arrangements made for the immediate clearance of the ground to widen that great thoroughfare.

DESTRUCTION OF IRISH ANTIQUITIES.—A correspondent, writing to the *Cork Examiner*, gives this account of the way in which antiquities in the Green Isle are dealt with. The Earl of Dunraven, with Dr. Stokes, went to see the ruins of Nimard Castle, and the former, knowing the locality by means of previous visits, looked for the oratory of Kilmurry, which stood above the castle. A farmer, by way of accounting for the utter disappearance of the older structure, told the earl that the proprietor had thrown it down, in order to build his own house with its materials.

PETITION FOR A FISH MARKET IN THE LIMEHOUSE DISTRICT.—The Board of Works for the Limehouse district, learning that it is in contemplation to remove Billingsgate Market from its present site, in consequence of the inconvenience arising from its inadequate size and its crowded locality, have forwarded a petition, praying that in that event the Corporation will apply for an Act of Parliament to establish a fish-market at Shadwell. They suggest a site on the river-side at Shadwell, close to the entrance of the London Docks, as a most eligible spot, for various reasons.

COST OF ABBEY MILLS PUMPING STATION.—At the last meeting of the Greenwich District Board of Works, Mr. Maslem brought under notice the recent visit paid by the different metropolitan Boards to the Abbey-mills Pumping Station. He complained of the lavish expenditure for the building in question, which he said to a stranger might be taken for a mosque or Chinese temple, and the cost of which had not been less than 200,000*l.* For embellishments no music-hall in London could be compared with it, and the cost of the roof alone he held to be sufficient to erect a building suitable for the purposes for which the pumping station is required. Mr. Halsey, another member, spoke of the gold and crimson railings, the polished oak doors, filled in with bronze flowers, the cost of which could not have been less than 200*l.* each; and Mr. Hunt said the building was an elegant structure in a swamp, and had more the appearance of an exhibition than anything else. Ultimately a resolution was passed expressing the dissatisfaction felt at such use having been made of the ratepayers' money.

"IMPERIAL GREEN."—Once a Week announces the production of a green pigment which is above "suspicion." It is a preparation of a salt of chromium, is brilliant in tone,—the tone is not mentioned, however,—and is quite harmless. It is to be called "imperial green."

ARCHEOLOGICAL CONGRESS IN BONN.—An international archeological congress has just been opened at Bonn, Prussia. The proceedings were commenced by a speech from M. Noigeron, after which the burgomaster of the town warmly welcomed the visitors. In the evening a banquet was given to 200 members assembled.

EXHIBITION OF WORKS OF ART AT WEST BROMWICH.—An exhibition of works of art, chiefly contributed by the tenantry of the Earl of Dartmouth, on his several estates in Yorkshire and Staffordshire, has been opened, under favourable auspices, in the large drill-room and theatre, Queen-street, West Bromwich. According to the programme, the exhibition consists of "useful and ornamental needlework, works of art, cloth from the Yorkshire looms, hand-made lace from Buckinghamshire, and various articles of industry." The ultimate purpose is to raise a fund for the purchase of a lifeboat for the National Lifeboat Institution.

HOSPITAL FOR SICK CHILDREN, MANCHESTER. The foundation-stone of a new dispensary for sick children in Garside-street, Deansgate, Manchester, has been laid. The building is intended as an adjunct of the general hospital and dispensary for sick children which now occupies premises in Bridge-street. It is being erected by Messrs. R. Neill & Sons, from the designs and under the superintendence of Messrs. Mills & Murgatroyd, architects. It will cover a plot of ground of 550 square yards in area, with frontages to Garside-street and Green's-court. The building will contain, on the ground-floor, a waiting and reception room, 60 ft. by 32 ft., entered from Green's-court in the rear, and capable of accommodating at one time about 350 persons. Adjoining this, and so arranged as to be in the line of route to the exit, which is in Garside-street, are two surgeons' consulting-rooms, 27 ft. by 16 ft. and 17 ft. by 16 ft. respectively, followed by the dispensing-room. The building is to be warmed by open fireplaces. In order to give sufficient altitude to the front elevation, the ground-floor has been fixed at between 5 ft. and 6 ft. above the street level, and it is only in the Garside-street front that the very simplest and plainest materials and design have been departed from. This front will be executed in stock bricks, with stone dressings, Medieval in character, and will consist of a central gable with open porch. On each side a range of five arched windows will be surmounted by a frieze, with an inscription in coloured tiles. A moulded stone cornice and high-pitched roof will complete this elevation.

STEEL AND IRON BOILERS.—Messrs. Carroll & Snyder, proprietors of the Fort Pitt Boiler Works, Pittsburgh, have lately built a boiler of Black Diamond steel. It is a cylinder boiler, without flues, and is made entirely, even to the bolts, of No. 3 homogeneous steel, made at the Black Diamond Steel Works. The plates are full ¼ in. thick, and the heads ½ in. Its length is 5 ft. 8 in., and its diameter 3 ft. 2 in. A trial of the strength of the boiler has been made in the presence of the Government inspectors and a large number of boiler-makers and others. A small hydraulic pump, the same as is used in testing iron boilers, was employed. The intention was to put on pressure enough to burst the boiler if possible. As the gauge approached 600 lb., the gasket, or leaden joint by which the manhole is stopped, began to leak freely, and water also spouted in the form of spray from the seams, until it was found impossible to maintain the pressure. The circumference of the boiler was now found to have increased 1¼ in. by the stretching of the plates. The leaks mentioned having been partially stopped, three more trials were made, thus more severely testing the boiler by their repetition. By the last of these a pressure of 665 lb. was reached without producing any further effect than to cause the boiler to swell still more, until it increased 2½ in. in circumference. There were no signs of the plates giving way at the rivet-holes, where they are necessarily weaker than at any other part, the whole strain being thrown upon the part remaining between the holes. Heretofore no boiler has ever stood a greater pressure, it is said, than 538 lb., and that was one expressly prepared for the test.

PROPOSED MEMORIAL OF LEIGH HUNT.—The amount required, small as it is, has not yet been fully subscribed, and we therefore add to our former intimation that the treasurer of the fund is Mr. Townshend Mayer, of 25, Norfolk-street, Strand, who will gladly receive subscriptions.

FONTAINEBLEAU.—Extensive works have been commenced for the increase of the internal accommodation of the Château de Fontainebleau. The Court of the Fontaines will be soon completed, by a pavilion parallel to the Galerie François I. This new part of the palace will be called the Pavillon Napoleon III., and contain the apartments of the Imperial family. It will look on the court on one side, and on the artificial lake on the other; and will be separated from the theatre, and from the pavilion of the Queen Mother, by arcades designed from those of the Pitti Palace at Florence.

TENDERS.

For Congregational Church, at New Cross. Mr. J. H. Blake, architect. Quantities supplied by Mr. J. A. Barker:—

Rider & Son	£1,875 0 0
Brass	1,867 0 0
Macey	1,819 0 0
Brown & Robinson	1,790 10 0
Carter & Son	1,786 0 0
Turner & Son	1,756 0 0
Colls & Co.	1,747 0 0
Deacon	1,650 0 0

For Assembly-rooms at Havant, Hampshire, for Mr. C. Longcroft. Mr. R. W. Drew, architect. Quantities not supplied:—

Deacon	£1,729 0 0
Stallard	1,367 0 0
Tear	1,343 0 0
Carroll	1,127 0 0

For building 106, Fenchurch-street, and 62, Leadenhall-street, for Messrs. Innes, Brothers & Co. Mark-lane. Mr. R. B. Marsh, architect. Quantities by Mr. G. F. Baggett:—

Macey	£4,556 0 0
Henshaw	4,775 0 0
Carter	4,600 0 0
Newman & Mann	4,565 0 0
Foster	4,529 0 0
Coleman	4,500 0 0
Pritchard	4,427 0 0
Myers	4,389 0 0
Corder	4,380 0 0
Brass	4,003 0 0
Hill, Keddell, & Waldram	4,077 0 0

For warehouse for Messrs. Adams, Brothers, West Bute Dock, Cardiff. Mr. J. Hartland, architect. Quantities supplied:—

Shepton	£2,294 0 0
Lock	2,284 0 0
Sesgar (accepted)	2,230 0 0

For detached villa residence and offices, at Linkfield-lane, Redhill, for Mr. W. E. Dawson. Quantities supplied by Messrs. Rees & Son:—

Rees	£1,995 0 0
Holbrook	1,970 0 0
Wood	1,961 11 11
Abbott	1,950 0 0
Waterman	1,843 0 0
Wignore	1,800 0 0
Blake	1,800 0 0
Brown	1,783 0 0
Nightingale	1,757 0 0
Anson	1,690 0 0
Deacon	1,650 0 0

For new Wesleyan Chapel at Purton, Wills, near Swindon, exclusive of old chapel. Mr. T. S. Lansdown, architect. Quantities supplied by the architect:—

With Bath stone		Native stone
Gray	£372 0 0	£367 9 0
Titmarsh	300 0 0	200 0 0
Drew	275 0 0	...
Barrett	240 8 0*	238 0 0

For St. Ann's new Boys' Schools, Birkenhead:—

Fisher	£1,320 0 0
Cameron	1,311 7 0
Harkness & Dempsters	1,300 0 0
Dobson	1,250 8 6½
Black & Readie	1,233 0 0
Forde	1,170 0 0
Morris & Allen	1,167 10 0
Bleakley	1,145 0 0
Booth & Richards (accepted)	1,150 0 0

For additions to the Cheshamford Union-house. Mr. C. Fettes, architect:—

Chest & Son	£557 0 0
Roper	552 0 0
Baker	550 0 0
Thorn	549 0 0
Last	470 0 0
Fincham (accepted)	465 0 0

For heating and lighting Bocking Chapel. Mr. C. Fettes, architect:—

Harrison & Bettridge	£115 0 0	£46 10 0
Dennis & Scruby	85 0 0	45 0 0
Charley	80 12 6	...
Farrow	...	41 0 0
Crittall (accepted)	87 18 6	31 18 0
Bloomfield	...	45 0 0
Biggs	...	20 10 0

For house and offices, Woodford, Essex, for Mr. H. F. Barclay. Messrs. Hooper & Lewis, architects:—

For House		Fencing and Gates.
Sharpington & Cole	£2,570	...
Dover	2,434	115
Egan	2,316	110
Morter	2,287	120
Hedges (accepted)	2,240	118

For new villa residence at Swindon. Mr. T. S. Lansdown, architect. Quantities supplied by the architect:—

Woodbridge	£908 15 0
Draw	750 0 0
Draw	745 0 0
Spreadbury	597 0 0
Selby	572 0 0

For villa residences on Caterham Manor Estate for Mr. G. Farbury. Mr. R. Martin, architect. Quantities supplied by Mr. Bunker:—

Wheeler	£1,374	76	1,200
Axford	1,360	89	1,300
Deacon	1,344	70	1,250
Carter & Son	1,335	85	1,385
Gammum & Son	1,317	73	1,273
Stonor	1,274	66	1,200
Turner & Son	1,268	83	1,236
Colls & Co.	1,224	75	1,197
Rees & Son	1,207	68	1,165
Baldwin	895	68	895

For house at Caterham, for Mr. J. B. Fletcher. Mr. R. Martin, architect. Quantities supplied by Mr. Bunker:—

House.	Extra	Extra	Extra
	For Green	For Pitch	For Burham
	Slates.	Brick.	Brick.
Axford	£2,469	82	£107
Stonor	2,460	8	103
Wheeler	2,460	9	113
Gammum	2,453	10	123
Carter & Son	2,343	10	90
Colls & Co.	2,288	48	110
Turner & Son	2,278	34	82
Deacon	2,284	16	125
Rees	2,184	5	84

For the erection of a pair of villa residences, Fortingale, Finchley, for the Rev. C. Room. Mr. W. Waymouth, architect:—

Fish	£2,590 0 0
Axford & Whillan	2,515 0 0
Henshaw	2,378 0 0
Colls & Son	2,378 0 0
Webb & Sons	2,339 0 0
Foster	2,330 0 0
Cool & Co.	2,272 0 0
Merritt & Ashby	5,139 0 0

For fifteen cottages and three shops, at Ilford, Essex, for Miss Harvey. Mr. W. Allen Dixon, architect. Quantities supplied:—

Edon & Chapman	£2,985 0 0
Manley & Rogers	2,975 0 0
Staines & Son	2,948 0 0
Mann	2,879 0 0
Garrud	2,413 0 0
Withers	2,405 0 0

For two houses and alterations at Windsor-court Monkwell-street. Mr. W. Smith, architect:—

King	£975 0 0
Merritt & Ashby	851 0 0
Sherman	825 0 0
Bowley, Broad	800 0 0
Waters	796 0 0
Pearce	700 0 0
Blackmore & Morley	689 0 0
Crabb & Vaughan	596 0 0
Fletcher & Congley	604 0 0

For the erection of a warehouse, in the city of Canterbury, for Mr. James Green. Mr. John Green Hall, architect:—

Epps	£3,890 0 0
Drummond & Co.	3,810 0 0
Sollitt	3,610 0 0
Wilson	3,600 0 0
Gaskin & Co.	3,420 0 0
Adcock	3,444 0 0
Naylor (accepted)	3,385 0 0
Lawson	3,289 0 0

For alterations to the George Hotel, Strand. Mr. M. P. Manning, architect. Quantities supplied by Mr. D. J. Brown:—

Henshaw	£2,379 0 0
Longmire & Barge	2,233 0 0
Foster	2,230 0 0
Macey	2,196 0 0
Newman & Mann	2,045 0 0
Mather & Readie	2,022 15 0
Longmire & Way	1,969 0 0
Mann	1,977 0 0

For five houses and shops in St. George's-road, South-wark. Quantities supplied. Allowing for local materials. Mr. H. S. Legg, architect:—

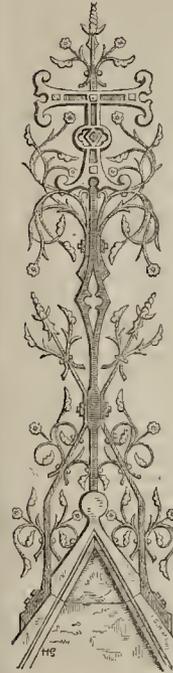

Ronald	£4,805 0 0
Raynham, Brothers	4,247 0 0
Carter	4,100 0 0
Henshaw	4,083 0 0
Blackmore & Morley	3,994 0 0
Landfield	3,994 0 0
Wignore	3,900 0 0

Gilks	3,188 0 0
Pearce	2,761 0 0

The Builder.

VOL. XXVI.—No. 1339.

Indian Engineering, and Social Arrangements.

WO more volumes of papers, detailing various experiences in Indian engineering, have reached us, since our notice of those first issued from the Roorkee College press.* These, likewise, contain professional accounts of several of the great public works now in course of execution, or recently completed, in India, and are illustrated with photographs, photozinographs, engravings, and lithographs, in the same manner as the two volumes first noticed. Among the photographs is one of Marochetti's colossal angel, and Colonel Yule's screen-work, which form the Cawnpore Memorial. This, however, we perceive, has been taken some time, as it does not show the hemishes in the marble, that recent

visitors deplore as becoming more and more evident. Another photograph shows us the Tonse Bridge, on the East-Indian Railway; a third, the process of launching girders for the Jubhempore Railway; and a fourth, a grim, grim, shadowless kirk at Dungalore. A lithograph of a Presbyterian church at Allahabad, revealing a similar stiff, martistic, unfeeling character as this last-mentioned building, is a further indication that Gothic architecture in India is in the same stage of development as that through which it passed in this country about forty or fifty years ago. More satisfactory is the exterior of an Artillery Mess-house, recently built at Meerut, in the style of a winged temple.

Among the papers is an account of the progress of the great Trigonometrical Survey. This is thus compressed by Sir Andrew Waugh on his retirement from the superintendence of the survey:—

"The almost impassable barriers of the greatest mountain range in the world, covered with perennial snow, have been unable to check the progress of our operations; for the Himalaya has been crossed and re-crossed, and our stations planted on peaks never before trodden by the foot of man; the swampy morasses and deadly forests, in several parts of India, have been traversed, and many tracts of hilly country covered by primeval jungles, scarcely inhabited by human beings, and forming almost *terre incognita*, have been covered by our stations. The Little Desert has been crossed by our triangulation, and several chains of great length have been carried across the Rann and its contumacious tract, uniting among themselves the worst features of the desert and swampy mo-

raases and jungles of other parts of India. All these undertakings have been arduous in the extreme, and have been achieved with small numbers and most inadequate means."

Major Medley, in a paper on the Public Works Department, in like manner furnishes testimony of the great difficulties and inadequate means which militate against the ordinary sequence of success that might be expected to attend upon industry and enterprise. We are accustomed to hear Indian engineers spoken of with very faint praise. We are sometimes told they are chiefly draughtsmen with a sprinkling of young farmers, and here and there an old soldier among them. The agents and inspectors, too, are eyed askance as the officers of a system of public waste rather than public works. But Major Medley, the principal of the dusky students at Roorkee, while owning that the Public Works Department is the "best abused" in the country, contends that this censure is most unjust, and affirms that on the whole this arm of the public service does good work. He takes no notice of the young farmers, looks with friendly eyes upon the old soldier as a comrade in arms, troubles not about unscrupulous agents or wealth-accumulating inspectors, but glances carefully over the area that comes within the jurisdiction of the Department, and sees that it is as large as two-thirds of Europe. In this vast tract of country every mile of road and canal, every church, barrack, and public office, nearly every building, in fine, that is of more consequence than a private dwelling, is constructed and maintained by the Department; and, besides this, it is responsible for the exercise of a control over the numerous railways far more close and minute than that required of the Board of Trade in this country. After calling attention to the fact that India is a poor country with a very inelastic revenue, he remarks that money has to be doled out with a sparing hand after anxious consideration of the innumerable wants of the whole country; and that, instead of the public pocket being kept open for any loose-minded persons to dip their hands into, the expenditure upon public works is jealously scrutinised and controlled. Those interested or curious about the *personnel* and organization of this department, will find a succinct account of its composition, working, and powers from Major Medley's pen, and from his point of view, to which we would refer them.

Taking the contents of these volumes as an index to the precedence enjoyed by the various engineering works in India, we perceive that bridges claim the first place. The particulars of twenty-two bridges have been given. Twenty-one of the papers refer to buildings, nineteen to irrigation, eighteen to railways, fifteen to roads, nine to military engineering, four to river improvements, four to drainage, three to water supply, and two to lighthouses. One of the four papers relating to drainage is an abridgment of a report on a project for the sewerage of the town of Madras, by Captain Tulloch. In this some facts are stated that would astonish the sanitary reformers who deplore the overcrowding in some parts of London. According to the last statement drawn up by the assessor to the municipal commissioners, in one part of Madras 70,931 persons were housed in 3,433 dwellings, the average number being 20.7. In no part of the town were there less than nine souls to a house, and taking one with another there was an average of 13.8 souls to every dwelling, or a density 2½ times as great as that of the population of London. In some of the villages there is a density of 31 souls per dwelling. The homes of the natives consist of terraced or tiled buildings, running round open courtyards. The first-class dwelling will have sometimes as many as five of these courtyards, one behind another. The water supply is drawn from the wells, hilt in one or more of the courtyards, and is always more or less impure, owing to the escape of the

sewage of the town from the badly-constructed drains into the stratum of sand that holds the supply. There are no cesspits, but every house has its privy in the back courtyard: it consists of two low brick walls, seat high, between which walls the ordure falls, and from which the watery matter escapes, and runs into the open channels which carry away the waste waters of the house into the street drain. The solid matter is removed by scavengers, who call at every house for it, sometimes twice a-day. There is a great deal of washing and bathing going on, which takes place, like the clearing of the pots and pans, in the backyard. The drains and sewers are built of ordinary bricks, set in shell lime mortar, and are as porous and offensive as can be supposed. In some neighbourhoods the sewage has no outlet, but stagnates in open trenches round the dwellings, from one month's end to another, only getting a partial removal when a heavy fall of rain causes it to overflow the sides of the trenches and find a way for itself. But there are three outlets into which other lengths of sewers are discharged—these, the river Cooum, and the canal. The dry conservancy system has been strongly recommended by its supporters for Madras, but Captain Tulloch sees insuperable objections to it in the publicity of its latrines and in its great cost. Dr. Cornish, in a pamphlet urging the adoption of dry conservancy, estimates the probable cost at 2½ lakhs of rupees. Captain Tulloch first makes a calculation that the cost of the privies, urinals, and earth-sheds for the city will not be less than 26 lakhs of rupees, besides a monthly expenditure of 20,385 rupees for looking after and cleansing them; and then proposes his own scheme, which is to separate the rain-water from sewage, carrying away the former by open surface drains, and the latter by sewers of moderate dimensions. This arrangement he assumes will vanish the difficulties attendant upon the fact that double the quantity of rain falls in India in thirty days, and sometimes in ten or twelve days, than waters England in the course of twelve months. If the sewers were constructed large enough to receive the down-pour of the rainy season they would be needlessly and ruinously costly. "While 4 in. are the utmost that has been recorded to have fallen in England during the day, upwards of 20 in. have been known to fall in Madras in the same period of time. How could Madras afford to pay for sewers constructed to discharge five times the quantity of water which the London sewers discharge?" asks Captain Tulloch. The existing large drains he proposes to use as the outlets for storm-waters, and new egg-shaped sewers with bell-mouth junctions are to convey the sewage matter from the town. This matter could be advantageously used on a low-lying tract of land to the north-west of Madras. A chart is given, based on five years' observations, showing the number of days in the year the wind blows in the town from the various points of the compass, by which we perceive that favourable breezes would blow away the smell of the sewage, in this low-lying tract, from the town, for more than nine months out of the year. The total of the estimated cost of carrying out this treble scheme is 31½ lakhs of rupees.

A manufacture of earthenware irrigation-pipes has been set up at certain stations superintended by English potters, concerning which Captain W. Jeffreys furnishes some memoranda. The pipes, it must be premised, are required for the purpose of regulating the supply of water from the canals to cultivators. This necessity has been hitherto performed by the aid of wooden boxes or covered troughs, called *colabas*, imbedded in the banks of raphas or minor irrigating channels. These were, however, clumsy, costly, apt to leak, and subject to the necessity of frequent renewal. Captain Jeffreys describes the tiles made by the natives as de-

* Professional Papers on Indian Engineering, Vol. III., 1866; vol. IV., 1867. Edited by Major J. G. Medley, R.E., Principal, Thomason C.E. College, Roorkee. Roorkee: printed and published at the Thomason College Press. Calcutta: Thacker, Spink, & Co. Bombay: Thacker, Vining, & Co. Madras: Gault, Brothers. London: Smith, Elder, & Co. 1869-1867.

fective, crooked, imperfectly burnt, porous, and not of uniform size. As a perfectly sound glazed earthenware pipe was expected to be the best cure for all sorts of irrigation and drainage to which they could be applied, an experimental manufacture was established at Nanon.

A moulding machine, consisting of a strong wooden vertical cylinder, 5 ft. 6 in. in length by 20 in. in diameter, constructed of seasoned, and strengthened with four iron bands, supported on beams securely embedded in masonry, was set up. In this cylinder is a piston worked by a wooden screw, and at the lower is a dod or die. The clay is thrown into the cylinder, and then pressed out of the dod by the action of the screw, in the form of a pipe. We quote the writer's description of the next process:—"Below the die is a moveable platform, balanced by means of weights attached to ropes running over pulleys, and arranged in such a manner that the resistance offered should just be overcome by the descending clay. When the necessary length of pipe is attained the action of the screw is stopped, the pipe is cut off with a piece of thin wire and removed to the drying sheds. Being relieved from the presence of the clay, the platform ascends to its former position, and the operation is repeated. The cylinder full of clay contains twelve 8-in. pipes. In this manner 250 to 300 can be taken out in one day. The pipes are then kept from four to five days under sheds to dry; if exposed to the sun or wind, they crack or lose their shape." The burning is the next process. Captain Jeffrey has designed a kiln of great depth of flue and thickness of arch, and suggested the use of fire-clay for cement instead of ordinary clay, which improvements he believes will put an end to the frequent falling in of the arches of the flues whereby so many of the pipes were at first cracked and broken. The pipes manufactured at Nanon are esteemed superior to those turned out of ordinary tile-making machines. The pressure to which the clay is subjected, on passing through the cylinder, is accredited as the cause of this superiority.

One of the most interesting papers is entitled "Engineering in the Derajat." It is written by Major Medley. The Derajat is a strip of country some 250 miles in length, lying between the Indus and the Sulaiman Mountains. Where the river approaches the mountains, it is not more than fifteen miles in breadth; where it recedes, it is fifty miles broad. In the southern district canals have been cut from the river, which there runs between low banks, and the country, being well cultivated, is also well peopled. Northwards, however, the river runs between high banks, and there are no inundation canals to moisten and enrich the soil. This upland district is stony, intersected by numerous dry torrents; has a hard, stiff, clay soil and one of the driest climates on the earth's surface; consequently a scanty crop of millet is all that is got out of the ground. Between the few villages is a coarse, scrubby jungle, upon which the barren hills look down with more desolation. There are more prosperous valleys among the hills, on which reside a lawless population ever ready for a raid into the plains. When Major Medley took up his quarters in this country there was not a map of it in existence, nor a mile of road in it; and the soil was either deluged with water or parched with thirst according to the season. He describes the population as scanty and the laborers as few when he set to work to survey the country and prepare a map. The natives of other parts, he records, looked on the Trans-Indus with dread, and could only be induced to cross the river by dint of much persuasion. Camels were the only beasts of burden, and there was not a single wheeled vehicle in the Derajat. Notwithstanding these drawbacks to rapid progress, a tolerably correct survey was executed by means of polygonal traversing with the theodolite and the filling up of details by the prismatic compass and chain in the hands of native surveyors, showing the course of the river, and the positions of the canals, towns, and villages. This accomplished, projects were laid out for the extension and improvement of the canals, most of which, with some others, have been executed by the major's successor, who was at that time his assistant; and the prosperity and revenue of the district, accordingly, improved. A system of roads is in the course of being worked out, in which there is a main line of road running the whole length of the two districts through the principal towns, and generally parallel with the river, and a series of cross-roads connecting the frontier

with the first-mentioned line of communication. Here is a fragment of this pioneering experience:—

"These roads were laid out from the map, or by means of special traverses made from place to place; they were then cleared for a breadth of 20 ft. or 30 ft., and inequalities of surface tolerably levelled, while temporary wooden bridges were made over the canals. Where the jungle was very thick it was cleared for some distance on both sides of the road. As money was not forthcoming to raise these lines clear of inundation, many of them were annually flooded, and repaired immediately after the subsidence of the river. For the passage of the dry hill torrents, the sides were sloped down and paved; causeways, in some cases, substituted as a cheap and efficient makeshift in lieu of bridges, which would have been practically not required for more than perhaps ten days in the whole year."

Another piece of experience detailed deals with the means taken to turn back the river from a passage it had newly made for itself, for a length of sixty miles, through the heart of the district, on which occasion one of the three cantonments from which the frontier garrisons are served, was cut off from the military poste that it was appointed to support, and 500 square miles of the best land swamped. A thousand laborers were brought to the spot from Hindostan and the Punjab, and, aided by labour in the district, were set to form an earthen embankment across the month of the inundation, so as to keep the waters back. Scarcely was the work finished when the river rose and made its way through in eleven places. Nothing daunted, these breaches were defended by spurs and brushwood piling, and when the waters fell again they were closed so successfully as to resist the next rise. In the following year, a heavy rain had so materially increased the bulk of the waters that they again swept through the embankment in several places, carrying away the outcrops of the Bera Ghazee Khan, and flooding the city. Many lives and much property were lost on this occasion. The third year brought a rise considerably less than the average, consequently the new work had time to consolidate before being put to another severe test, and has since stood well. It cost rather more than a lakh.

An account of the Hastings shoal, in the Rangoon river, by Mr. Hugh Leonard, is another descriptive sketch of a local difficulty and its removal. A paper "On Bridge Foundations in Sandy Rivers," by Mr. R. G. Elwes, comes under the same category. Lieut. MacNelis furnishes an able description of the Double Island Lighthouse, constructed under his charge; and there are papers "On the Mathematics of Engineering" in these Oriental volumes that are of professional interest and value.

In the May number for the current year there is an extract from a speech of the Viceroy, in which official mention is made of the numerous irrigation works in hand, or about to be commenced, for the undertaking of which thirty engineers were deputed from this country a few months ago. Among these, in the Punjab, is a new canal from the Sutlej, the remodelling of the Barea Doab Canal, the improvement of the Western Jumna Canal and its extension into the arid districts near Srest, and surveys for projects for new canals for the extension of the Ferozpur and Mooltan, and for the extension of the North-west Provinces, a new canal to irrigate the Agra and Malwa districts is already partly marked out, and the remodelling of the Ganges Canal is in contemplation, which will comprise a continuous water communication from Lahore to Delhi, Agra, the Doab, and on into Oudh. At Rohilkhand there are to be both irrigation and drainage works, and in Bundelkhand three rivers are to be placed in the hands of engineers for the utilization of their waters. In the province of Oudh a canal is in contemplation, to be taken from the Sarda, that will not be on a smaller scale than the Ganges Canal. In Bengal on the north, the Gandak river is to be utilized, and in Nuddea it is proposed to form a canal from the Ganges to Calcutta. Navigation and irrigation works are in store for at least three other districts in this part of India, and the canal from the Soane, undertaken by the East Indian Irrigation Company, is now about to be executed by the Government. In the central provinces further irrigation works are in contemplation. Madras is now likely to see the completion of the great work connected with the ancients on the Godavari and Kistna, and two very large tanks near the town are in course of execution. The irrigation from the Pennair river in the Nellore district is to be further extended. The survey for a canal has been made, which is to turn the waters of a river in its higher ranges of the Travancore mountains

into the plain of Madras. In the Bombay Presidency a large canal from the Indus to irrigate the Hyderabad collectorate, and a canal from the Tapti, are among the most considerable works in contemplation. Surely all this enterprise augurs a good time for India. In this number, too, are two designs for the ornamentation of the walls of rooms in Indian houses. In one case a surface of rich cream colour is bordered with a few green, black, and white lines, with floral scrolls at the angles; and in the other a green surface is bordered with red and yellow. These are given for the benefit of those in up-country stations where it is difficult to get suitable decorations. They have been prepared in the garrison engineer's office, Calcutta. After the walls are enamelled with lime plaster, a thick *crnd*, *orchana*, mixed with lime-water, or simply milk and water of equal proportions, is to be applied to them to form a body. The water-colours are directed to be mixed with milk and water, white of eggs, and pure China gline in a liquid state, and then laid evenly on the walls. The patterns are to be stencilled on this surface.

THE LESSONS TAUGHT BY THE ABERGEELE COLLISION.

THE inquest held on the sufferers by the Abergele disaster has been protracted to the length demanded rather by the magnitude of the calamity, and by the public excitement that it has awakened, than by any other cause. Into the details of the evidence and of the verdict we do not propose to enter. The *invidie* are beyond our province, and the special circumstances of the case, so far as they are independent of any questions of construction, are rather subjects for the consideration of the daily journalist, or of the papers more especially devoted to railway intelligence, than for our own.

There are, however, two independent considerations to which we have, more than once, more or less distinctly adverted, on which this great calamity sheds a lurid and warning light. The one is, in the main, a constructive question; the other is financial.

In all mechanical arrangements the question of "clearance" is one in the treatment of which the workman delights to show his skill. In some of the most beautiful productions of the lathe and the tool bench,—such, for instance, as Mr. Cotton's machine for weighing sovereigns,—the whole action of the apparatus depends on delicate and accurate "clearance" and successive movements of different parts of the machine through the same space follow one another with the precision of clockwork.

In a vast and complicated system of mechanical movement, such as is presented by a railway, it is obvious that the question of "clearance" must be dealt with in a very different manner from that which is appropriate to the arrangement of a simple machine. Where any movement depends on a preceding movement, after the manner of cause and effect, precision is to a great extent self-secured, and a delay in the first motion is not attended with danger, because the later movement waits upon the former. But where independent sources of motion produce action which, if not harmonious, must be destructive, the conditions of the problem are altogether reversed. What was, in the former case, a wise constructive economy, becomes, in the second instance, a foolhardy rashness. In the timing of railway trains almost every source of disturbance becomes possible. The same space, identically the same, has to be frequently passed over by bodies of great bulk, great length, great weight, and moving at very high velocities. The only tie to regulate the excessive timing of the transit of these bodies is human care. The case is not like that of street traffic. Let a traffic propelled by horses be as dense as that of Chesapeake, or as rapid and dashing as that of the Corso at Naples, and yet there is a natural element of safety in the instinct of the horses, as well as in the practiced skill of the driver. Collisions occur, it is true, but they form the exception and not the rule. Moreover, when they do occur, they are often slight—mere warnings, and that not too late, to slacken speed, or to give a wider sweep round a corner. Each independent source of movement, and thus of danger, has its own independent instinct of self-preservation, and by the action of this common instinct much of the danger arising from independent origination of motion is avoided.

In this case of railway trains it is widely

different. The iron horse has no instinct. It will rush as blindly on an invincible obstacle as it will over a perfectly clear course. The instinct of the driver remains, but his power is greatly diminished. He has no possible means of avoiding collision, except by stopping, or by reversing, the longitudinal movement of the vehicle which he directs. He requires a certain time, and generally a considerable distance, in order to do this. The attention of the engine-driver, unaided by the instinct of his steed, has to be kept constantly on the stretch; and instances are numerous in which no attention on his part can inform him of threatening danger in sufficient time to enable him to adopt the only means in his power to lessen or to escape it. In sudden fogs, in running round curves, and under circumstances which are more numerous than railway travellers would care to have particularised, the safety of a train is left pretty much to the PROVIDENCE OF GOD. The driver thunders on at forty or fifty miles an hour, keeping the best look-out he can, trusting that the coast is clear, but possessing the intimate knowledge that if a rail is up in such a spot, or if a wagon is on the line in such a station, collision and destruction are unavoidable.

It must be remembered, moreover, that the engine-driver does not time his own train. If he alters his regulated speed he is liable to be called to account. If he slackens, for instance, to run with less hazard round a blind curve, he disarranges a calculated series of movements, and may cause the very danger which he endeavours to shun. The independence of his movements is strictly limited. He does not even leave a station as he ought always to be bound to do, by the indication of the clock, but by the signal of the station-master. An important and redoubtable personage comes to the station just a little too late,—distanced, it may be, by the error of his watch, or by some slight obstruction to his carriage, in that race for the last minute with which busy Englishmen usually amuse themselves in the run to the station; or a large family, or a helpless old lady, arrives in time, indeed, but incumbered with a many-packaged luggage, which claims numerous and unattainable porters. In either case the station-master relents. He prefers private convenience, personal civility, avoidance of black looks or hasty words, to punctuality and the public safety. He detains the train till the fuming director, or the anxious *pater familias*, is comfortably ensconced in his seat. What may not those three minutes cost?

Now it is obviously undesirable that, where the sources of danger are so many, and the check is so slight, ample "clearance" should be allowed. It must be remembered that the velocities of the different kinds of trains, which follow one another over the same line of rails, differ so materially, that the result of an express train overtaking a luggage, or cattle, or ballast, or mineral train would be as disastrous as that of a collision with a train that was at rest. We have enormous weights propelled at great and varying velocities over the same space, each started by independent volition, and all regulated by no very distinct laws of sequence. It really speaks volumes for the practical sense and anxious care of railway servants that accidents are so rare.

For, it must be remembered, even the most indefatigable student of Bradshaw can never calculate the dangers he has avoided. The trains as to which the public can ascertain the timing, are the passenger trains alone. How shortly his carriage has been preceded, or may be followed, by a goods train a third of a mile long, propelled by three powerful engines, the first-class passenger, happy in his unconsciousness, has no means of judging; and the more the shareholders are congratulated, at their half-yearly gatherings, on the increase of their goods and mineral traffic, the greater is this invisible danger; invisible, it may be, not to the toil-worn and anxious staff, but to the comfortably conveyed and unconscious subjects of the peril. An accurate notation of the times at which trains pass certain spots on some of the most frequented railways could hardly be read without a shudder.

In all this there is much for which no one is to be blamed. The growth of traffic is one of the most valuable features of the railway system. It has been as unexpected as it has been stupendous; as great (or greater) a benefit to the English public as it has been to the railway proprietary. In all things that grow, the moment of crisis is hard to predetermine. What amount

of traffic may be safely taken over one pair of rails, and what is the actual addition that involves danger, no statistician can hope to define; for it is not a matter that admits of any universal rule. Much in each case must depend on mechanical conditions, on the gradients of the line, the power of the locomotives, the worthy state of the rolling-stock; more must depend on the brain, the eye, the habit of control of the manager of the traffic. But what is certain is this: there is a point, towards which the vows of the shareholders would urge the traffic of every line, at which it is inconsistent with public safety to carry passenger traffic and merchandise traffic over the same "metals." There is a maximum amount of service to be exacted from a single line of railway. There is an amount of traffic, possible and desirable, which demands a fourfold line in place of a twofold one. To go far beyond that point, without making that provision for the public safety, is to endanger the traveller. The remedy is costly; but it can only be postponed at the risk of a far more costly evil.

In the mean time there is much that may be done,—and *must* be done,—in the way of increasing the accommodation now afforded by sidings. In the Abergele case the train, into the detached portion of which the express dashed, was nearly as long as the siding into which it should have run. This siding, moreover, was partially occupied by another train. It is said that there was a second siding, of some 100 yards long,—but all those who are at all familiar with the working of railways know that the running of trains in and out of sidings, and especially the dividing and re-uniting of long trains, are costly, cumbersome, and delicate operations, which every careful manager will take pains, as far as possible, to avoid. The construction of long parallel lines,—portions of a future fourfold way,—in which slow trains may be conveniently accommodated, so as to place them out of any danger of collision with passenger-trains, is an expense which every well-to-do company must be prepared annually to encounter.

With this constructive remedy must be combined the faithful and rigid use of the electric telegraph. When our English railways were first opened, the most ordinary cause of accident was the inexcusable stupidity of allowing two trains to meet on the same line, advancing in opposite directions, as if for the very purpose of a charge. When single lines were introduced, it was supposed that the danger of accident, from this cause, was much increased. The opposite proved to be the case. As all danger that is foreseen is greatly diminished by due precaution, the obvious danger of a collision between an up and a down train on the same line was guarded against by the proper use of the telegraph. The up train X was not allowed to leave the station B until the down train Y had arrived. By the application of this simple rule of common sense the working of single lines was rendered at least as safe as that of double ones. Collisions on branches thus worked are simply impossible.

There can be no reason adduced, and there ought to be no excuse allowed, for the neglect of a similar precaution on all passenger lines. A certain, and sufficient, "clearance" should be allowed for every train. It is not for us to limit this clearance in minutes, although it is certain that it must to a certain extent be determined by the velocity of the trains. A rapid express, stopping at few stations, ought to have a greater length of clear unoccupied way in front of it, than is necessary for a slower train stopping at every station. But the clearance, once determined, should be enforced by the telegraph. The train Y should not be allowed to pass the station B until it was known that the train X had passed that point. To ensure this, the train Y should not be allowed to leave the station A until the passage of train X through station B was telegraphed up by the station-master. In the case of an express train that is not intended to stop at certain stations, the same rule should absolutely apply. Let us take Z to be an express train. Its starting from the station A should be dependent on the receipt of a telegraphic message from D that train Y had left that station. To insure punctuality of departure, let us consider that the proper time for the starting of Z from the terminus would be three minutes after Y ought to have left station D. As the hand of the station clock indicated that minute, the express should start, independently of any order or signal from the

station-master, but subject to the exhibition of a telegraphic notice that D was clear. The running of the express through stations B and C would thus be un-checked, provided no danger signal was shown at either of these stations. At F let us suppose train Y would run into a siding, and then Z would pass, without stopping, on the main line; but it would only be allowed to do so if it had received the intimation by the signal of station E that the line was clear at F. Until receiving the signal that train Y was safe in the siding at F, the station E would be blocked by the danger signal, and Z would be consequently detained there. During such detention station D would in its turn be blocked by the danger signal, so that no train could pass it towards F. By such a system as this, collision from overtaking would be rendered as impossible as collision from meeting may be considered to have been rendered on single lines perfectly worked.

It may be urged that the rigid enforcement of rules of this stringent character would interfere with the frequency of trains. "It is all very well," the manager of a line will say, "for an engineer sitting in his office to prescribe rules for the working of a line. As to absolute safety for passengers, as far, at least, as collisions are concerned, no doubt it would be thus secured, but how are we to conduct our traffic? We are at our wits end already how to divide the twenty-four hours. We are obliged to run it five every now and then; and if we are to have Parliament interfering, and rules of this kind laid down, so far from being able to increase our traffic, we shall not be able to carry what we have." It may be all very well for the passenger trains, but what is to become of the heavy traffic?

If the case be thus brought before the public,—and we are anxious to state it fairly,—we have little doubt as to the verdict. On the one hand we propose certain regulations, faithful adherence to what would render railway collisions impossible. This cannot be denied. But it is tacitly replied that it is inconvenient for the companies to adopt these rules. The goods traffic may be checked by their enforcement. That is as much as to say that the amount of fast and slow mixed traffic, which is carried on a single line of rails, exceeds the maximum that may be safely so conveyed. To squeeze a little more service out of the permanent way, the safety of the passengers must be risked. For if it can be shown that a practical regulation, which may, indeed, place the running of successive trains somewhat further apart, would render collision impossible, and that such a regulation is neglected solely because it thus "wastes time," or enlarges the distances between the trains, the question is broadly stated. It is one between safety and dividend.

Between certain safety and uncertain dividend, that is to say. For this brings us to the second consideration to which we referred, that, namely, of finance. Our recent remarks on this subject* received a sad and pregnant comment at the late half-yearly meeting of the proprietors of the London and North-Western Railway. The gloom of the Abergele calamity brooded over the meeting. There was evidence of the honest, human sympathy with which Englishmen are always accustomed to regard any great loss of human life. But with this generous and disinterested feeling was mingled emotion, not ungenerous, indeed, but of a widely different order. The commercial question could not be altogether lost sight of beneath the gracious mist of sympathy. Such was the dividend earned, subject to costs and damages from the recent calamity. Very freely, we doubt not, would the great majority of the shareholders, if the question could have been submitted to them, have subscribed the amount of the dividend to prevent such a sacrifice. But the sacrifices had taken place, and the shadow of the question of compensation to the representatives of the sufferers could not fail yet further to depress the spirits of the shareholders.

This risk of a great financial disaster is one as purely gratuitous as is the risk of collision itself. It may be avoided by every company, as we recently took occasion to show, by the simple plan of making every railway ticket at the same time a policy of insurance. Whether a direct addition to fares which are almost everywhere below the parliamentary maximum, should be made, to cover this insurance, or not, is one of those questions of detail into which we do not

* See p. 613, ante.

feel called to enter. It is certain that, if it can pay an independent company to insure a given proportion of railway passengers, it must pay the carrying companies to insure them all upon the same terms. It is probable that the mere simplifying the question of damages by an amicable assessment of their amount would pay the companies,—not for incurring new risk, but for defining the risk which they already run. The worst would be known in any case, and it would be pretty much the fault of the companies if that were not ever occurred.

All invidious distinctions between different classes of travellers, or different grades in the social scale, would be obviated by this plan. We should no longer be scandalised by the spectacle of juries awarding one amount of compensation for the death of a poor man, and another for that of a rich man. The proportionate sums already assumed for first, second, and third class passengers might be adopted, or might be modified. License might be given for the insurance of any individual for a higher sum at will. We repeat, that we do not wish to enter into details as to which there can be no difficulty, although there may be ample room for discussion or for modification; but as to the principle, we think there can be no doubt. We urged its adoption *à propos* of the exhibition of an unusual instance of ability and of success in the conduct of a line which was once the very byword of the traveller. We repeat it, after the awful echo to our recommendation that yet tingles in the ears from Abergele. Will shareholders prove themselves still neglectful of their own interests? Will they allow suggestions so obviously to their interest to be neglected, because they come from an impartial, disinterested source, instead of being the projects of any of their own officers? If they do, they will have only themselves to blame when dividend is absorbed as deadweight. More than that, in any future case (and would that such may never arise), it cannot fail to be brought before the notice of a jury, that a mode of rendering collisions impossible has been made public in our pages. If collisions occur in neglect of this precaution, and in defiance of this warning, the responsibility of all concerned will be aggravated in no slight degree. We do not say that the mere neglect to establish and to enforce such a rule, when its practicability and its value had been once clearly pointed out, would change a verdict of manslaughter into one of murder, but we can not deny that it might do so. The failure to use any certain precaution would be animadverted upon by every high judicial authority in no mincing terms. The criminal nature of an accident, or rather of the neglect that caused it, might be held to depend very intimately on such an omission. The civil responsibility, which is ordinarily measured by damages, might no less be held to be augmented; and the shareholders of a line which, six months hence, shall neither regulate the succession of its trains by telegraph, nor assure the lives of its passengers on their tickets, will assuredly deserve little compassion if, in the event of any accident by collision, the half year's dividend should be entirely swallowed up for compensation.

SKETCHES ON THE TWEED.

THERE are very few districts of country in the British islands possessed of more interest to the artist or the antiquary, or even, as we shall try to show, to the sanitary engineer, than the valley of the Tweed. The river itself is naturally of unexampled beauty and purity; and it has been the subject of more poetry, we suppose, ancient and modern, than any river of its class in Europe, excepting, perhaps, the Rhine. All along its banks we shall find ancient feudal castles proudly situated, like Norham or Neidpath; and princely modern palaces, like Floors Castle and Hildon Hall. Ruined abbeys there are of rare beauty, like Melrose and Dryburgh, closely allied with ruined moostowers' towers like Darnick and Smilholm. There are also some splendid bridges and railway viaducts: take Kelso Bridge as an example of the one, and the Berwick Viaduct of the other. Nowhere in Scotland have we seen such picturesque villas and gentlemen's seats. Then there are a variety of pretty, old-fashioned towns like Jedburgh and Selkirk, as well as their modern manufacturing compeers, like Galashiels and Hawick, singly situated on the tributary streams. With all this there is still a sylvan beauty and

an abundance of fine upland-hill scenery which make the valleys dear to all lovers of nature; and we must never forget that the whole atmosphere, so to speak, is redolent of the genius and the whole landscape teeming with the memorials of Border chivalry, poetry, and romance. It is almost unnecessary to mention Abbotsford or the name of Sir Walter Scott, for it would be as easy to go to Stratford-on-Avon and try to forget Shakespeare! There is not, we venture to say, a morsel of ground or a rivulet of water in the old Borderland that Sir Walter Scott has left without his footprints or his stepping-stones. He belonged to the clan of the bold Buccleuch; he was sheriff of Roxburghshire; Melrose Abbey was the scene of his meditations, the haunt of his muse, and the shrine of his inspiration. In Dryburgh a plain granite slab, under the window of a ruined chapel in the transept aisle, will long point out the spot where they have deposited his bones. The very railway which traverses the district is called the Waverley route. And it is curious to tell that the rocks of the valley will faithfully and readily show to the admiring stranger the identical spot in the fairy glen where Halbert Glendinning met the White Lady of Avenel, and the actual ford on the Tweed where that amiable phantom used to duck the Dominican friars.

The real facts of the case with regard to Sir Walter Scott and the literature of the Borders may be summed up in one sentence,—he has exhausted the theme. For the ancient poetry of the district we must go to the Border minstrelsy; for the modern renaissance, to "Marmion" and the "Lay of the Last Minstrel;" for the manners and customs of the people, to the "Monastery," or the "Bride of Lammermoor." Who does not remember, for example, the stirring lines in the opening canto of "Marmion"—

"Day set on Norham's castled steep,
And Tweed's fair river broad and deep,
And Cheviot's mountains lone."

We cannot venture to speak of his immortal delineations of Border character in the Waverley Novels; for the poetry and romance of the Tweed is not exactly our present subject. We happened to pass a week or two in this delightful district during the course of the summer, and we made a few stray notes, which may be of value to our general readers. We cannot hope to say much that is new to professional men, either with regard to its archeology or its architecture. The pollution of the Tweed does not differ very much from that of certain other arterial streams in this country; and the condition of the manufacturing towns is not so bad as we might, judging from previous experience, have been prepared to expect. At the same time, such disconnected observations as we have been able to make will possess this recommendation, that they are done in an impartial spirit and independent of all local influence or authority. Of course we must try, as we have said, to eliminate as much as possible the romantic element from our subject, and stick as far as we can to the scientific character of the facts. To this end we shall first of all say a few words concerning the physical aspects and hydrology of the river itself.

The river Tweed, then, has usually been ranked as the fourth in importance of the Scottish rivers; but if we look at it according to the extent of country which it drains it surpasses them all, except the Tay. The countries which it passes through are Peebles, Selkirk, Roxburgh, Berwick; and with some trifling exceptions these districts are entirely within its drainage basin, which has been estimated on the data of the Ordnance Survey, to contain an area of 1,870 square miles.* Its tributaries, and the bills which they drain, are too numerous even to mention; but we may state that from its source at Tweedsmuir, in Peebleshire, to the outlet on the sea at Berwick it performs a run of about 100 miles irrespective of windings. About one-third of this distance is overtaken in Peebleshire, and about another third in Roxburghshire. After leaving Roxburghshire, the Tweed becomes partially an English river. It divides Berwickshire from England till within $\frac{1}{4}$ miles of its outlet; then it bids adieu to Scotland altogether, and flows between the county of Northumberland and the liberties of Berwick, where it fulfils its destiny by finally mingling with the waters of the North Sea. The Tweed and the Clyde, we may add, for

many miles from their source flow nearly in a parallel direction; and it is worth mentioning that there was, at one time, a project conceived by the Tweedside proprietors of turning the Clyde into the Tweed, with the view of rendering the Tweed navigable. This must have been, of course, before Glasgow had acquired its present character for commercial greatness, and certainly many generations anterior to the splendid engineering operations which have made the Clyde itself navigable to the Broomielaw.* This extensive run of the Tweed is also accompanied by a corresponding fall. From its source to its embouchure, where it is crossed by the celebrated viaduct of the North-Eastern line, the river possesses a total aggregate fall of about 1,500 ft. Of this fall 1,000 ft. are obtained when it reaches the town of Peebles. In the very long run, therefore, as compared with the fall, between that town and the sea, the river might be expected to become sufficiently sluggish in its current as to be, at least over a considerable distance of its extent, navigable. But this is not the case. It accomplishes its remaining fall of 500 ft. in so many separate descents, so far apart, and of such gentle gradients, that it seems destined by nature to be altogether a stream of woodland beauty, and a total stranger to the ironroads of river-steamers or even of fishing-sloops.

This natural incapacity of the Tweed for commerce and navigation from the sea upwards becomes more apparent when we examine the nature of its bed. It abounds in deep pools and in long stretches of scarcely perceptible current, yet in almost every sweep of it which can come under the eye in the course of its beautiful curves it presents one or more soft rapids, sometimes of considerable length. The banks, also, which are thickly strewn with pebbles, or small boulders, and gravel, and which are chiefly formed by the action of these rapids, are very inaccessible beaches for boats. Again, in one instance, at least, two or three miles above Kelso, there occurs a perforated, broad, greywacke dyke, which crops up quite across the channel. All these circumstances render it both naturally unfit and artificially unimprovable for navigation. At the same time ferry-boats are stationed upon it in certain localities, such as at Dryburgh Abbey, where there is ample depth of water; and the small flat boats, used in salmon fishing (provincially called trows), are freely navigated even over the fords. A few miles above its embouchure the river loses its prevailing character, and becomes capable of admitting sailing craft of slight tonnage.

The tidal flow reaches beyond Norham Castle, ten miles above Berwick; and up to New Water Ford, four miles below this, it produces sufficient depth to float, at any time, a vessel of thirty tons burthen. The real navigation of the Tweed, however, is all confined to Berwick; and as to other capaciousness or depth of sea-room and harbourage afforded for it, might be quite as well accommodated in many a nameless creek of the rugged and indented Scottish coast. The fact is, that Berwick-upon-Tweed has long been regarded, not so much in the light of a seaport as a pleasant watering-place. While the Tweed was thus undisturbed by traffic, it was, up to a recent period, nearly as much untroubled by the liquid outpourings of manufactories; indeed, it has always had, up to a recent period, a clean, shining path of gravel and pebbles; and thus it almost everywhere possesses a remarkably limpid and sparkling appearance. This quality, combined with the majestic and placid flow of its current, and with the prevailing beauty of its banks, long ago suggested the poetical name of the Silver Tweed, with all the serene and joyous images which it recalls to the tasteful observer of landscape.

It would be easy to dilate, if this were the place, on the beauty of the flowers and gardens which adorn the verdant banks of this beautiful river:—

"What beauties doth Flora disclose,
How sweet are her smiles upon Tweed!"

So sang the poet more than a century ago, and

* These figures are quoted from "Chamber's Encyclopedia," vol. iv. p. 602.

* "The main water-shed of the country between the Tweed and the Clyde crosses at one part a low valley through which it would be easy to cut a channel from the Clyde. Indeed, if good care were not taken of its banks, the Clyde would ere long dig the channel for itself, and flow into the Tweed."—"The Scenery of Scotland, Tweed in Connection with its Physical Geology." By Archibald Geikie, F.R.S. London, 1855. P. 118.
* "The Fullerton's "Gazetteer of Scotland," article "Tweed."

his description is still exact and true to nature. There are valleys on the Tweed so richly wooded and so luxuriantly laid out that they give the spectator the impression that he is traversing a series of beautiful private orchards more than anything else; and we have no hesitation in saying that we seldom have seen such splendid old forest trees, such silver birches and stately oaks, as adorn the scenes of the principal estates on the Tweed. In the scenes of such exuberant beauty it is idle to particularise. Nevertheless, we may venture to point out the beautiful and stilly sheet of water, with its richly-embowered banks, which is partly retained, and to that extent formed by, the mill-weir at Melrose. This is to our taste one of the sweetest sylvan scenes on the whole river. The splendid woods of Gattonside in the middle distance, and the gently-sloping ridge of hills, covered with yellow corn, and towering against the horizon, constitute a picture which has, indeed, been often painted, but we believe has scarcely been done justice to. The wooded amphitheatre of Peebles is also very beautiful. But the view from Kelso Bridge, where, from the confluence of the Teviot, the noble river expands to a width equal, we should think, to the Thames at Putney, or the Tay at Perth, with the town on the right hand, the woods of Springwood on the left, and the Duke of Roxburgh's noble castle of Floors, surrounded with beautiful foliage, in the distance, is unquestionably the most magnificent.

The beauty of the valleys, it is interesting to note, has in a great measure originated their geological structure. The valley from Melrose, for example, occupies the basin of what was once an ancient lake. This is quite manifest whenever the ground is turned up. From east to west deposits are met with, quite close to the surface, of fresh-water sand-beds, inclosing water-worn boulders. In fact, this valley had at a very recent geological period,—certainly long after the era of the Silurian Rocks, which it traverses,—acted as a great basin or reservoir in the course of the river; and had so existed until, in the ordinary process of lake and river phenomena, it burst the eastern barrier and liberated the pent-up waters. It will at once be seen, on this hypothesis, what a rich and fertile soil, on the ancient lake-bed would yield to the future vegetation of the river valley.*

The same geological phenomena will account for the peculiar beauty of the Tweed-side hills. A little south of Melrose we have one of the most remarkable groups—the Eildon hills, once the Triontum of the Romans, so called from the peculiarity of their form. Properly speaking, the Eildons are only one hill rising from one base, but divided into three peaks.† The top of the highest summit is 1,364 ft., at above the sea-level, at which point there is a magnificent view. The composition of the rocks of the two northern peaks is a sort of felspar and porphyry. On the south-west descent of the southern hill the opening of a quarry has laid bare a number of perpendicular pentagonal prisms of beautiful flesh-colored felspar, each about 20 ft. high, as exposed, but probably of far greater height, with remarkably acute and distinct angles. Near this locality are traces of stair or trap, rising from the partly broken bed of the strata, and other evidences of a basaltic character. Sometimes pieces a foot square lie exposed jutting out from the surface of the ground, looking towards Bowdenmore. No less than sixteen terraces are traceable on the sides of these hills, rising above each other like the steps of a stair. On the summit of the eastern hill there are also unmistakable traces of a Roman encampment.

Keeping this character of an ancient river-basin in view, with its copious deposits of sandstone, and keeping in view the phenomena of the igneous intrusive rocks of the trifrom Eildon hills, we get some insight into the character of the stone. Hornblende rock, of a quality capable of being polished like marble, occurs in various parts of the valley. Greywacke, which abounds over all the north and west, with a north-easterly dip, is worked as a building material. There is also a species of conglomerate, which is at this moment regularly blasted at Quarry-hill (and an ugly gap it makes in the

landscape). But although sandstone of fair quality occurs in the south-east corner of the valley, that which is chiefly used for building purposes is brought from Spronston, or from Eccles, in Ancrum, on the estate of Sir William Scott. The splendid red sandstone of which Melrose Abbey was built seems to have been obtained from the old quarries in the vicinity of Dryburgh.

But, although so fertile in the possession of materials, it is curious that the Tweed was for the greater part of its history remarkable for its poverty in bridges. Up to a late period, indeed there were only three old bridges within a range of seventy miles: these were built at Peebles, Melrose, and Berwick respectively. But now within the same distance there are at least twelve bridges crossing the river, many of them suspension bridges: a timber bridge at Inverleithen; a good stone bridge at Yair, between Selkirk and Galahide; a suspension bridge (one of the earliest constructed, we believe) for foot passengers between Melrose and Gattonside; another stone bridge at Drygrange, near the mouth of the Leader. There was a suspension bridge at Dryburgh Abbey (which, we regret to see, has been allowed to fall to pieces, the chains only being now in existence); and another fine suspension bridge still connects Floors Castle and St. James's-green. Last, though not least, there is a magnificent stone bridge at Kelso, designed by Rennie, consisting of five elliptical arches 72 ft. in span, with deep narrow voussours, and adorned on the spandrels with Ionic capitals; and there is also a splendid stone bridge across the Tweed at Coldstream. We need not again describe the railway viaducts at Melrose and at Berwick. The latter is one of the most striking and costly viaducts we possess, and was only excelled by that of Plymouth in the difficulties of its construction.

In dry seasons the volume of water in the Tweed is not nearly so great as formerly. In very rainy seasons, too, the subsidence of the water is far more rapid than it used to be.* Agricultural improvements, draining more especially, clear away the surplus water from the land, with amazing rapidity, and the best pools, as the fisherman knows too well, are from this cause most seriously affected. Supposing these geological changes and improvements to continue, and ultimately to embrace the mountain slopes and high uncultivated districts of the Tweed, and its tributaries, the time will come, we think, when the heads of the weirs or canals must be lowered at the overshot; or many must go wholly to rest, together with the mills and machinery which are dependent on them. It becomes also more and more apparent every year that the salmon which seek their spawning beds high up the Tweed, cannot repass the mill weirs on their return to the sea; and accordingly the fish are compelled to remain too long in the river; to their great deterioration, and unnecessary exposure to the inroads of the most fisherman and the poacher.

The salmon fisheries were for many generations of great value. Of late years, however, these have sadly fallen off, to the extent, it is said by one authority, of nearly two-thirds of its former average produce. Many causes, in addition to those we have mentioned, have been assigned for this. The projection of the pier at Berwick into the *alevis* of the river, the very general use of lime in the agriculture of the hillsides, the increase of rod-fishing, the use of stake-nets by the lower proprietors, and, above all, the poaching and illegal destruction of fish during close time, have each and all been alleged, but have in their turn been severally pronounced by competent authorities to be inadequate. The real fact of the matter appears to be, that the deterioration and destruction of fish,—not confined to salmon alone,—in the Tweed, are due, in our opinion, to precisely similar causes as are at this moment operating in the Thames or the Trent—that is, in the first place, to the diminution, and secondly to the pollution of the river. This, however, is too important a subject to be discussed at the close of an article which is already too long. The same cause may be assigned for reserving our consideration of the value of the Tweed as a source of water-supply, and of its character with regard to public health.

THE METROPOLITAN RAILWAY.

The Underground Railway of London is *suo generis* among the railway systems of the kingdom. Other systems have their termini and their principal intermediate stations; this, when completed, will have neither beginning nor end. Other lines are alternations of cuttings and runs in the open, more or less elevated above the natural level of the surface, occasionally varied by a tunnel; this is a continuous burrow, a succession of covered ways, with troughs of various lengths, at irregular intervals, open to the sky, for light, but more especially for ventilation. On other lines the distance between stations is measured by miles; on this by furlongs and chains. On other lines trains are run by the dozen in a day; on this they are run by the hundred,—250 each way daily. On some lines trains run at intervals of hours; upon this at intervals of about two minutes and a half during the busiest times of the day. With other railways the increased passenger traffic is indicated by per-centage, greater or less; its traffic has tripled in four years: in the half-year ending June 30th, 1863, the number of passengers carried was 4,823,437, in the half-year ending June 30th, 1867, they reached 11,488,368, with an accelerated increase since then. The receipts of the most prosperous of other lines fall far short of 100l. per mile; its receipts exceed 1,000l. per mile. The construction and character of an important addition to such a system are worth longer notice than we gave last week.

In speaking of the Metropolitan Railway as to have, when finished, neither beginning nor end, the Metropolitan District Railway is included with it. Although the two companies are, and have always been, separate and distinct as regards financial affairs, they will be, as regards working, and as a system of communication, one concern. An ultimate complete fusion of the two seems one of the likeliest of all future amalgamations of railway companies. The portions of the systems of the Metropolitan and the Metropolitan District Companies which constitute to what is known as the inner circle, secured the special approval of the joint committee of Lords and Commons on Metropolitan Railway communication, which took evidence and reported in 1864. The advantages anticipated from the completion of the circuit were,—the distribution of the passenger traffic, arriving by the main lines coming within the metropolis, and also relieving the crowded streets by the absorption of a portion of the omnibus and cab traffic. Notwithstanding the enormous number of passengers carried by the Metropolitan, these advantages have been, as yet, only partially realised, although it is already in direct communication with the Great Western, the Great Northern, and the Midland systems, on the north of the Thames, and with the London, Chatham, and Dover on the south. The communications with the London and North-Western, at Willesden Junction, and with the South-Western, at Clapham Junction, by connexion with the West London, are less direct now than they will be ultimately.

The first portion of the metropolitan line was opened at the beginning of 1863, from Farringdon-road to Bishop's-road. Subsequently the company acquired an extension westwards to Hammersmith; the portion of the line from Farringdon-road to Moorgate-street has been completed and opened; and a line, which forms a junction with the Metropolitan at Baker-street, has been constructed and opened to St. John's-wood. The continuation of the Metropolitan scheme still remaining for execution to complete that company's portion of the inner circle are,—at the East-end, the short but important link between Moorgate-street and Broad-street stations, and thence, by a curve to the south, to Tower-hill, passing under Fenchurch-street station, where it will run into the Metropolitan District Railway. The works between Moorgate-street and Broad-street stations are expected to be completed and the line opened early in next year. The more important portion of the Metropolitan system, the works upon which are now all but finished, is the continuation of the circuit westwards, and round south and east, to return, running into the Metropolitan, *via* Westminster and the Thames Embankment, to Tower-hill. The Metropolitan and the Metropolitan District lines meet each other in the station at Kensington High-street station; but the Metropolitan overlaps the District to South Kensington station in so far as

* This statement first appeared, as far as we are aware, in the "New Statistical Account of Scotland," article "Melrose," vol. iii. p. 116. But the observation is probably due to Dr. Hutton or his school. See "The Theory of the Earth," vol. ii., p. 103.

† There is a foolish tradition in the district which says that these summits once formed a single cone, which was severed in three by an infernal agent of Michael Scott, the wizard. Vide "The Mistreley of the Scottish Border."

* Compare Mr. Geikie's book, cited above, p. 253, as to the geological causes of the change of the river-bed. The Tweed, it appears, has not always pursued an undeviating course. See also Wade's "History of Melrose Abbey," p. 136, *et seq.*, from which we learn that the monastery held a portion of land now divided by the river.

continuation of the circuit is concerned. From this point to Tower-hill the works belong to the District Company, but the running will be continued by the trains and rolling stock of the Metropolitan.

It is a strange experience to "foot" such a piece of new line as this;—to have to draw entirely upon memory and imagination, and to be utterly unaided by sight with respect to the character and appearance of the district overhead which we are passing through;—to be in constant wonderment as to whether we are walking under mansions or mews, wide thoroughfares or hack courts and alleys, green gardens or dusky coalyards. Our polite conductor, however, Mr. W. Morton, resident engineer on the line, was as communicative upon all points as we could desire. The extension about to be opened commences under Praed-street in a hell mouth, which was constructed when the first portion of the Metropolitan system was made, and is at a point rather less than half way between Edgware-road and Bishop's-road stations. From this junction the road is continued under a covered way, succeeded by a short length of open line within retaining walls to the first of the new stations—the Paddington,—which is situated immediately in front of the Great Western Hotel, the distance being 3 furlongs 689. At the point of the fork between the existing line and the extension a round house has been constructed and fitted with levers, and in connexion with them points and repeating signals, to be used for the block system of working. Intermediate signal-boxes are being fitted up between the stations on the new extension throughout. Their effect will be to double the number, and to halve the lengths, of the blocking sections. The additional stations beyond Paddington are at Queen's road, Bayswater, 4 fur. 9-24; Notting-hill Gate, 3 fur. 8-66; Kensington, High-street, 4 fur. 6-98; Gloucester-road, Brompton, 4 fur. 6-28; and Brompton-road, South Kensington, 3 fur. 7-02. The last stage is not yet ready for opening, but the works upon it, and upon the first two stages of the District portion, are being vigorously prosecuted, and in a few months will be so far completed as to admit of opening to Sloane-square, 6 fur. 0-96, and thence to Victoria, 5 fur. 1-10, and Westminster Bridge. The Thames Embankment stops the way eastwards, and financial difficulties may possibly retard the completion of the circuit to Tower-hill, and round to Broad-street. Although they had been made of money, the District Company could not get past Blackfriars now by any possibility, and they have allowed the Embankment to be filled in, in preference to expending capital upon heavy works to lie unproductive for an indefinite time. The only portion of the District work executed to the east of Westminster, is a short length of covered way under the forecourt of Cannon-street Station and Hotel.

The new extension is, as regards the measure of air and of daylight let into it, and especially in the cheery lightness and good looks of the stations, a great improvement upon the original section from Farringdon-road to Bishop's-road. A governing principle in constructing the line appears to have been to prefer the open to covered ways, wherever the property dealt with is of moderate value, and every opportunity appears to have been taken advantage of to lighten the road by open portions. In some districts, such as Pembridge-square, open lengths were totally inadmissible, and covered ways of extraordinary strength have been constructed to sustain the superincumbent weight. In that particular locality the company had to purchase five costly mansions in course of erection. These were underpinned, and now rest upon the roof of the covered way under them, which consists of pairs of strong cast-iron girders under each principal wall. Cross girders are also applied, and the spaces filled in with arches. The work was accomplished without the slightest settlement in any part of the buildings. Numerous other cases of underpinning large buildings were accomplished with equal success; amongst others of a public-house in Cambridge-place, at which business was never interrupted. At Leinster-gardens a curious piece of work presents itself. One tall house in the range had to be taken down, and the flank walls of the houses upon each side of it to be supported. This has been done by four pairs of strong buttresses built against the walls. These are supported by joists of rolled iron between the buttresses, resting in cast-iron sockets; the joists are strengthened by cross iron

ties. To prevent disfigurement of the other houses a wall, the same height as the fronts, has been built over the end of the covered way, and ranging with the house fronts. This wall will be finished as a dummy front. The wall behind the brick-work is at the back, about 90 ft. deep down to the rails. In one portion of the line, at which the depth from the overhead surface to the rails is so great as to have necessitated extra strong retaining walls, with double struts, one range above the other. Cast-iron struts have been introduced between the retaining walls wherever the mass behind them has been considered so heavy as to render this precaution against pressure necessary. The retaining walls are nearly uniform throughout, 8 ft. clear between the piers, piers 3 ft. on the face, or 11 ft. from centre to centre. They hatten about one in eight, and have a thick backing of concrete. The covered ways vary in section: when there is head-room, an elliptical arch, usually five rings of brick, is thrown; but when there is only 3 ft. 6 in., or less, to construct in, the roof is of cast-iron girders, with transverse jack arches between. In cases of heavy superstructures also, extra strong roofs, up to nine rings of bricks, have to be provided for the covered ways. The engineering difficulties encountered in the construction of such a line as this are numerous and peculiar. A minimum clear space from rail to roof must be had, and must be obtained by passing over a sewer here, and under gas or water mains, or a road near it there. An enormous number of owners and occupiers of property have to be satisfied. Occasionally, though very rarely, the engineer gets what he wants without satisfying the claimant. On a part of one of the covered ways sufficient thickness was not left between the face of the wall and the round end of a lumber cellar. The demand made was that the company should purchase the cellar, which would have been perfectly useless to them. While legal proceedings were pending, the work was pushed forward, the end of the cellar was closed up with strong cast-iron plates, which were faced with single brick, and there that matter ended. The line passes over the Ranelagh sewer—one of the main sewers of the Metropolitan Drains system, on the north side; near Sloane-square, on its way eastwards, the line will pass under the same sewer. Several instances were pointed out to us of heavy cast-iron plates laid between the girders, upon which water and gas mains are carried across the line, leaving just sufficient head-room. Near Bedford-gardens a tunnel proper occurs, which was driven in the ordinary manner; not worked from the surface; it is about 450 yards long, and about 65 ft. from the rails to the top at the deepest part. The stuff excavated was London clay, overlaid with loose ballast, that had to be worked out with sheet piling.

There is a long curve on the line, as it turns to the south, in the neighbourhood of Notting-hill. The centre of the curve, which is nowhere sharper than a 10-chain radius, is at about the point where the line crosses under the Uxbridge-road. The prevailing gradients are descending westwards and southwards; lengths, with gradients of 1 in 70 and 1 in 75, are the most severe on the whole line. These are now considered easy.

The stations are uniform in general plan, although varying in some particulars. The double station at Kensington High-street, which is to accommodate the Metropolitan and the Metropolitan District lines, is the largest and finest of the series. The centre consists of a spacious and lofty room, 44 ft. by 31 ft., which is to be used as a refreshment-room.

The two booking-offices are across the ends of the building. The booking-offices and station walls and roofs, although from an engineer's rather than an architect's designs, are very light, graceful, and effective structures. They are faced with white perforated bricks from the Halsey brick-fields, with stone dressings; the ordinary work is of the common Kentish stock-brick. The doors and windows have semicircular heads: each of the two sashes in the windows is filled with a single sheet of plate-glass. The entrances to the booking-offices are under iron verandahs, roofed with glass. The roof of the Kensington Station is 81 ft. in span and 418 ft. long. It differs from the other station roofs in having the principals carried down to within about 2 ft. of the platform level; whereas in the other roofs the principals spring from near the level of a string-course not much below the top

of the station wall. The string-course indicates generally the surface level on the outside of the station wall; but at the Kensington Station the ground slopes from the top of the wall at one end to nearly the bottom at the other, and the principals are hence carried down, that solid abutments may be obtained. There are twenty principals in the roof with two intermediate rafters, supported by trussed purlins. The form of the roof is elliptical, all the bearing and other parts being of rolled or wrought iron, excepting the corbels, spandrel scrolls, and ornaments, which are of cast-iron. The roofs are covered, in nearly equal proportions, with zinc of No. 14 gauge on boarding, and sheet-glass in three continuous belts. The lower edges of the glazed belt on the crown of the roof are set at about 20 in. above the zinc belt for ventilation. There are also ranges of windows above the string-course available for light and ventilation. Several of the booking-offices are built on and across the line, in some instances upon plate girders, 5 ft. deep, under its principal walls; in other instances, upon the covered ways at the ends of the platforms. All the stations are furnished with galleries across the line for exit and entrance or exchange of platform. The gallery and stair rails and ironwork of the roof are painted in two shades of green, picked out with a sober buff. The stations are fully supplied with closets, urinals, &c., substantially and neatly fitted up, the latter lined with blue and white enamelled tiles, with a patterned border at the top, and with divisions of slate slabs enamelled in white. The station platforms have plank floors, and are of sufficient length to serve six carriages, 40 ft. and 42 ft. long each, with their engine and tender. The stations will be lighted at night by globular lamps suspended from the principals over the platforms on each side of the stations. The gas-pipe by which they are hung works in a ball and socket joint. The ribs of the lamps are of copper, and very light, so that scarcely any shadow will be thrown from them. They are worth about 7l. each.

Above 500,000 cubic yards of earthwork have been removed in this length of less than three miles of railway. A considerable portion of the stuff excavated has been utilised in the work. Sand has been taken from it for the mortar, all the ballast for the line has been taken from it, and above 22,000,000 bricks have been made from the clay, tempered with loam and sand in suitable proportions.

The rails are of Bessemer steel, 85 lb., or rather over, to the yard. They are single-headed, and fixed without chairs; the flange is about 6 in. broad, and the rails fixed by $\frac{3}{4}$ in. bolts, with fangs below the sleepers.

An interesting experiment is in progress near the Gloucester-road station. An arch of wide span, and with a rise of only about a tenth of the span, has been thrown across a part of the District line in its course towards the West London line. The vault is formed entirely of concrete, and is about 12 ft. deep across the faces. It is only about 18 in. deep at the crown, and so flat as to give the impression that the tenacity and strength of the material has already borne successfully a crucial test in bearing its own weight without loading, as it has done since the centres were struck. It is expected that this structure will bear a distributed weight of 50 tons or upwards.

Several new streets and roads are in process of construction in the neighbourhood of the line at what will be its terminus for the present. One of these will furnish a short and direct communication between the station at Brompton Old-road and Cromwell-road, in the immediate vicinity of the South Kensington Museum.

The works have been executed according to the plans of Mr. John Fowler, engineer-in-chief, and Mr. T. M. Johnson, the company's engineer, with Mr. W. Morton as resident engineer, by Messrs. Kelk, Waring, & Lucas. They have been about two years and a half in progress.

NOTE.—All who are interested in art-workmanship will hear with regret of the death of Antonia Vechte, the *reposeuseur*, at the age of sixty-nine. Vechte, a native of France, worked almost to middle age before his talent was duly recognised. He worked in London from 1850 to 1860, and gained increased honour at the Great Exhibition of 1862. His reputation is European.

THE TEMPLE OF AVEBURY.

ARCHITECTURAL history, or, more correctly speaking, the history of civilisation which is indicated or recorded by architecture, may be traced back with considerable distinctness for some two thousand years. The exactitude of modern criticism tends to the substitution of actual knowledge for mere opinion; and, in dealing with the substantial facts of brick and stone, there is less room for the latest, or neo-German stage of criticism (namely, the substitution of the imagination of the writer for the traditions of his contemporaries), than is found in literature. With yearly increasing precision, therefore, we are learning to decipher the architectural records, back to that Augustan age which has so strongly impressed the subsequent course of Western civilisation.

Before the period which converted Rome from brick to marble, and which gives us the first historic glimpse of our own island,—a glimpse precious from its date, although manifestly perverted as to many of its facts,—we are able to take a retrospective view, less detailed indeed than in more recent times, but in which certain salient points are marked with great precision. The unearthed cities of Campania, the temples of Paestum, the marbles and the ruins of Greece, the *Cloaca Maxima* of the Roman kings, carry back the dated work of the builder to the period when the Canon of Hebrew Scripture was enclosed, and when, in the golden youth of Pericles, Nehemiah was repairing the megalithic walls of Jerusalem. Those same enduring walls carry back the architectural student for more than 2,800 years from the battle of Waterloo, and reflect a yet more remote antiquity. Nor are we without signed architectural work of a period far anterior to that of Solomon; for in the series of cylinders, purse-formed clay tablets, seals, and bricks, impressed with the long-forgotten cuneiform characters that Sir H. Rawlinson is teaching us how to decipher, we are led back from the reign of Nabonidus, the last king of Babylon, through that of Nebuchadnezzar, of Sennacherib, and of their predecessors, to that of Arioch, king of Ellasar, the contemporary of Abraham, of whom we have a memorial in the shape of a stamped brick, in the British Museum. This king was one of those who made war, "four kings with five," in the vale of Siddim 4,050 years ago.

To say nothing of the distinct and independent record of the wonderful Hindoo architecture, in which the forms and outlines of a wood-building people have been reproduced in stone, and marble has been pierced into lacework, we have a parallel line of historic record in Egypt, which allows us to trace, at irregular but clearly-marked intervals, an architectural and a sculptured record, from the fall of Cleopatra to the Theban tombs of the great Eighteenth Dynasty; under the eighth king of which (not counting the reigns or regencies of the famous queens of the house) the Exodus took place. We see represented on the walls of a tomb of this date the Syrian shepherds at work in the brickfield, and we are enabled to identify the buildings, and to understand the social life of Egypt 3,400 years since, with wonderful exactitude and detail. The erection of the unsculptured walls of the Great Pyramid, according to the patient researches of Brugsch, dates 2,000 years before the Exodus.

Earlier than any dated architectural record,—earlier, artistically (whatever was the case chronologically), than any raised obelisk or sculptured stone, are those Cyclopean remains that are found in certain localities, on the shores of the Mediterranean, and stretching on towards the Persian Gulf, associated, more or less closely, with traditions of a race of giants. Still ruder and more archaic than the megalithic walls of Cyclopean architecture, are those mysterious piles of gigantic stones which are to be traced in more than one line of travel towards the western shores of Europe, from the cradle of the Sanscrit family of speech; and of which some of the most remarkable instances are yet standing in our own islands, and known as cromlechs, or as Druidical stones. In associating these relics of a mighty past with those Druids of whom we form our opinion chiefly from the Commentaries of Cæsar, it is probable, as will be seen from what follows, that we have much undervalued their antiquity.

The general advance of all human art is evidenced by the attainment of a higher and more perfect finish, and by the substitution of the results of skill for those of mere strength. We may go further, and trace, in one direction, the

steady and marked development of skill as well as of taste; while we find, on the contrary, as we bend our glance back, proofs of the exercise of a strength which exceeds our comprehension. Thus if we contrast the enormous bulk of the unsculptured walls of the Great Pyramid, with the work of the tombs of the eighteenth dynasty of Egypt, we are led to the conclusion that a lapse of 2,000 years at once increased the skill of the Egyptian race, and diminished the impulse of the builders to affect the imagination by mere bulk. In the Cyclopean masonry, again, we can trace a growth of skill, evincing, no doubt, an increase in metallurgic knowledge, and the substitution of the craft of the mason for the labour of the giant. We must repeat the caution that it does not follow that artistic progress is absolutely chronological in its course. The migrations of races may lead to a displacement of architectural records of which we have yet grasped the law. The public are only now in India who yet venerate, or even erect, dolmens at any other conclusion than that the rude piling of stones, which we recognize under the term cromlech, marks an earlier stage in human progress than does the erection of even the rudest Cyclopean wall; even as the uprearing of single, massive, minicised stones is more archaic than the raising of wrought and engraved obelisks.

According, therefore, to all the testimony which archaeology has yet adduced, the cromlechs and memorial-stones of pre-Julian England represent a period in the artistic development of the human race approaching that of the construction (entirely undated) of the works of Mycene, or to the 5,400 years of antiquity attributable to the Great Pyramid.

Compared with the work usually called Cyclopean, Stonehenge and Avebury will rank in a late period of megalithic work,—when the mason had learned how to cut his material with the accuracy and the finish of the carpenter. On the other hand, great antiquity is denoted by the absence of cement. The British masons were, if not absolutely ignorant of the value of lime cement, at all events so unprepared to depend on its service, that they encountered vast labour in mortise and tenon joints to some of their largest stones. Indeed, the use of mortar to give that stability which, four thousand or five thousand years ago, Egyptian and Assyrian builders had learned to secure by mortar or by bitumen, was displaced by that of cemented temples rivals that of Solomon himself; but the masonic skill, the true building science, was far less advanced in the former case. The artistic period of our great circular temples may have been pretty close, speaking only of the character of the work, to that of the Pyramid, in which, although there is the later feature of cement, there is the same use of enormous and curiously wrought blocks in the more important parts of the structure.

In the centre of the rolling chalk downs of Wiltshire, about fifteen geographical miles, as the crow flies, nearly direct north of Stonehenge, at a spot where a line drawn from Calne to Marlborough intersects a line drawn from Devizes to Swindon, is the little village of Avebury, or Avebury. The spot is somewhat inaccessible, according to our present habits of travelling, being seven miles from the nearest railway station, and that only being the terminus of a branch of the loop line to Marlborough. A glance at the map will show that, in roadless times, this must have been one of the most central and retired parts of England; impossible of access from the coast, or by the course of any navigable river; and so hidden by the undulations of the ground, as well, in all probability, as by the depths of a vast forest, as to be the most secret, as well as the most sacred, sanctuary of a primeval faith, and capital of a forgotten dominion. The wide-spread traces of enormous labour point to this spot as the capital of the cromlech-building people.

The position of Avebury forms a remarkable contrast to that of Stonehenge, with which it is intimately connected, no less by the character of the remains than by vicinity of position. The latter named place of worship or of concealment appears to have been selected, unless it also was veiled by forest, rather as a conspicuous than as a concealed situation. With Avebury it is the reverse. The shrunken dimensions of Marlborough Forest no longer approach the village, and

the timber that clusters richly around its relics bears no signs of remote antiquity; but the sheltered character of the spot, and the luxuriance with which the indigenous forest trees thrive in the neighbourhood, indicate the former depth and shadow of the sacred grove; and, even in its present denuded state, the traveller must come very close to Avebury before he becomes aware of its claims on his attention.

Leaving the picturesque high street of Marlborough by the Bath road, and passing the quaint red-brick buildings of the college, and its noble chapel, less than two miles brings the traveller to the first station of the cromlech-building people. A grass-clad combe, or valley, known by the name of the Devil's Den, curves round to the north and west, and on this, out of sight of the highway, although at a distance of less than a mile from the road, stands a cromlech of three stones; the upper or horizontal one, of some 12 ft. by 15 ft. in size, being in fair preservation. The cromlech stands alone, in what is, at this moment, a potato-field, but at a little distance the pasture land is covered for a length of more than 600 yards, by a collection of immense fallen stones, filling up the whole of the valley. It must be remarked that all these stones have been brought from a very considerable distance. The geological formation of the country is chalk. The stones are of a fine silicious grit, white and clear when freshly cut, and resembling in their lithological structure the Bramley Fall stone more closely than any other with which we are acquainted. Wherever the quarry from which they were extracted was situated, a question which it is of the highest interest to determine, it must have been one marked by deep beds of solid stone, from which blocks of 18 ft. to 20 ft. square, by 3 ft. or 4 ft. thick could have been plentifully hewn.

At about two miles' distance from the widespread ruin of the Devil's Den, close by the side of the road, lies another site of similar nature, with the exception that nothing remains erect. The stones are known as the "Grey Wethers," and are even more numerous than at the former spot. A third group, of equal size, lies a little to the north, but it is evident that these and other relics have been unsparingly pilfered, and used as quarries for modern work. Gate-posts, retaining-walls, garden-walls, even houses, over the whole distance from Marlborough to Avebury, have been constructed from the noble blocks which formed the temples of the ancient race; and which, by means now unknown, they brought in such profuse quantity from such considerable distance.

Passing the second stone-spread valley, five large barrows strike the eye, on the summit of a swelling down, up which the road ascends. On reaching this ridge a panoramic view extends over wide and bleak downs, the outlines of which are everywhere dotted by large barrows, some bare, some clothed with trees.

At the village of West Kennet, between five and six miles from Marlborough, the stream turns at right angles, descending from the north, and striking an irregular basin, the slopes forming the verge of which are considerably lower than the harrow-crowned elevations, which in their turn look down on them. A road to Swindon diverges from the Western, or Bath, road at this village, running parallel to, though out of sight of, the stream, and at little more than half a mile from the village. This road climbs the brow of the inner circuit of the basin, and looks down upon the trees that shadow the village of Avebury.

The village itself is not seen until it is closely approached or actually entered, and the enormous stones which yet stand partially erect in the fields and yards with which the houses are interspersed are concealed by a remarkable earthwork which surrounds the village. This defence consists of an exterior mound and an interior moat or ditch, in a circular form, which has been preserved from destruction only by its great magnitude. The enclosure is some 500 yards in diameter. The line of rampart and moat is about forty-eight yards in width from the inner edge of the ditch to the outer foot of the exterior mound. The height from the summit of the highest parts of the mound to the bottom of the ditch is now from 50 ft. to 60 ft., and, when the whole work was in a perfect state, must have been considerably more. The temple within the enclosure was thus entirely concealed from view. As a defensive structure the earthwork is remarkably defective, from the circumstance that the moat is placed within the rampart, so that the only resistance afforded to assailants who might

attempt to ascend the former must have been that of the weapons of the defenders. The moat is now entirely dry, but from the depth at which the water is found in the village wells, it is probable that it was formerly wet, and supplied from the Kennet. At Chisbury, a lofty hill, ten miles, as the crow flies, from Avebury, exhibits a similarly moated enclosure. In the latter case, however, there is a rampart within the moat, and the natural elevation of the spot enabled the occupants of the central area to command the approach on every side. The outer rampart, at Chisbury, seems to have been chiefly intended to confine the water within the moat, and as this is now wet, although at the summit of the hill, it seems clear that the rampart makers were aware of the method of confining water by the use of clay, or what we now call puddling.

If the military strength of Avebury was diminished by the erection of an external instead of an internal rampart, the sacred character of the spot seems to be denoted by the position of its defenders without the precincts, and separated from the interior by a broad and deep moat. It is difficult on any other theory to account for this remarkable inversion of the ordinary section of a defensive work. No trace of a ditch exterior to the mound is to be found.

The gigantic stones, some of which are from 16 ft. to 18 ft. square, which yet stand and lie within the moated circle of Avebury, are too few and scattered to enable the observer to form any definite conclusion as to the original plan of the temple which they probably formed. Traces may perhaps be detected of an outer and an inner circle. Some antiquaries have thought that the gigantic blocks were originally disposed so as to form two circular temples. Two enormous blocks, which seem at one time to have been wrought slabs perhaps 18 ft. by 20 ft. in size, and a yard in thickness, stand angle-wise and near to one another, as if they had served for the supports of a cell or built shrine.

The weather has furrowed and grooved some of the stones in a manner which, considering the hardness and purity of the grit, denotes the lapse of an enormous period of time since they were erected on their present site. The labour of transport and of erection must have been stupendous. In the un cemented retaining walls which are to be found in several places along the side of the Bath-road, and which are constructed of this durable and beautiful stone, are to be seen the marks of drills, testifying to the use of powder. It appears, however, on investigation, that this powder could not have been employed in the quarry, but was pressed into the service of the makers of the macadamised road, in their destruction of these priceless relics of remote antiquity for the purposes of the most ordinary work.

The magnitude of the Temple of Avebury is not attested merely by the number, or by the size of the gigantic blocks which as yet have defied the economy of modern improvers. At nearly half a mile from the rampart, sixteen enormous blocks, in various states of erectness, obliquity, or overthrow, yet remain to indicate an avenue 72 ft. wide, and composed of blocks or slabs regularly placed in pairs at intervals of 45 ft. Two hundred yards beyond the last of these stones stands another, in the same line, indicating the former prolongation of the avenue towards Avebury; and two others are to be found at about the same distance to the south. The avenue ran north-west and south-east, and would seem to have been originally at least half a mile in length. The arrangement of the rows of sphynxes placed in the approaches to some of the Egyptian temples is recalled by the remains of this noble avenue of gigantic blocks of freestone.

Thus far the stupendous relics of the cromlech-building people may strike the attention of every intelligent observer. There is a point, however, which is less directly apparent, and which possesses extreme interest.

Great earthworks are not rare, either in this vicinity or in other parts of England. We have described the moated hill of Chisbury, in which no stone is to be found. The rampart of Avebury resembles that of Chisbury, although it is both larger in circuit, and far bolder in section. Neither of these can be referred to Roman work, from their circular plan and great size, as well as from the position, and even from the name, of each relic of ancient fortification. At Marlborough is a hill or tumulus of considerable height, and at West Kennet is the remarkable and lofty conical mound called Silbury Hill.

These truncated cones, in which art seems to have aided and supplemented nature, are spoken of as the tombs of British chieftains, which perhaps they were. But they differ so far, both in dimensions and in locality (close to the stream), from the numerous barrows that crest the downs, that we can hardly err in regarding them as ancient strongholds, even if they were also places of interment. Such tumuli occur in South Wales, where they are known by the name of Rath, and in some of them, certainly, no marks of sepulture have been discovered.

We have thus in the same valley a series of earth-works and, entirely disconnected with them except in one instance, a series of cromlechs and stone circles. But the most remarkable fact as to Avebury is, that the rampart does not appear to have been centrally or symmetrically disposed with reference to the stones. It is impossible, without a careful survey, to speak with certitude as to the evidence yet preserved as to the original position of the Avebury slabs. One of them, evidently *in situ*, is on the very edge of the ditch, and none of the others can be referred with any distinctness to the line of circumvallation. But the most remarkable point is, that the great avenue from the south, which we have before described, does not lead up to the centre of the circumscribed village, but points so far to the east as altogether to miss the opening in the line of the rampart. We speak with the reserve due to observation made on undulating ground, and in the absence of a minute survey. Still, it is undeniable that the blocks forming the remains of the grand avenue, of which there are a sufficient number, placed at an adequate distance apart, to define with accuracy the direction of the ancient approach, do not point to the centre of the space enclosed by the earthen rampart, or to the entrance through the latter, and do not give the idea of any symmetry, or direct relation of structural arrangement with the mound and moat.

The enlarged sheets of the Ordnance Survey containing Avebury are as yet unpublished. On the Survey on the inch scale ten of the large stones of the avenue are delineated. The single stone which serves to fix with accuracy the true centre line of the row is not laid down. The direction of the avenue, as far as can be ascertained from a map on so small a scale, points to the most eastern of the large stones marked within the circle. It misses altogether the opening in the rampart, and has no perceptible relation of symmetry or unity of design with the moat and bank.

The effect produced on the mind by this series of facts is, a suspicion that a spot once famous, and probably while still famous, for its stone circular buildings, was fortified by the earth-building people, who raised Chisbury, Silbury, Marlborough, and other raths or tumuli; and that this was done at a time when the temple had been already so far damaged or decayed that it was not thought necessary to preserve the line of the avenue of approach. There can be no doubt that the delineation of the ramparts of Avebury is as independent of the course of the megalithic avenue to the temple or circle as is the setting out of the modern macadamised roads that now pierce the ramparts. We have the marks of three successive series of workmen, and a question is possible whether not only the labour, but the date, of the rampart builders may not be as distinct from that of the stone transporters, as the work of Telford, or Macadam, or the modern road-maker whoever he was, is from either. It is impossible that the stone builders should have been later than the rampart builders, as in that case their work, even if not symmetrically planned, would have been so disposed as either to accord with the less laborious construction, or else to modify and control it. We find, therefore, evidence of the possible interposition of the labour of a great earth-working race, antecedent to the Roman invasion,—a race of whom we may trace the exertions from Wiltshire to Pembrokeshire, as well as in other parts of the country,—between the Saxonsettlers, who were not, as is notorious, a fortifying people, and the builders of cromlechs and transporters of megalithic blocks. To how remote an antiquity must the labour of the latter people be referred?

The impression produced on the imagination by a visit to this remarkable spot is not one lightly to be thrown aside. We are on the ancient holy ground of Britain—holy from an antiquity which we have as yet no means of determining. At

how distant a period we must fix the era of the giant stone-pilers,—giants in strength and in industry whatever was their actual stature,—we have no clear indication as yet forthcoming. One limit of time may perhaps be inferred. The hewers and transporters of the Avebury blocks must have been provided with metal implements. It is certain that some of the largest stones at Stonehenge were wrought. It is also certain that such blocks could not have been quarried without the use of metal wedges and metal picks or axes. The Wiltshire temples, therefore, are not of the stone age, but come down to the limit of the bronze period. On the other hand, we can find no trace of sculpture or incision on the stones. We have not, it is true, as in Egypt, an intermediate period of sculptured work intervening between our unwritten monuments and modern times; but we have a sign of what, in other parts of Europe, denotes immense antiquity. We can connect the cromlech-builders with a very early immigration from Asia. We recall the tradition of times when men "journeyed from the East," and when the use of bricks, which we can trace back without a doubt for four thousand years, was described as a substitute for stone. We have here enough, and more than enough, to suggest the extreme and venerable antiquity of these relics, which we have been accustomed to term Druidical; and we have pleasure in calling attention to the light which may be gathered from a yet more minute investigation of the relics of Avebury, or to the times when "there were giants upon the earth."

THE SOCIAL SCIENCE ASSOCIATION IN BIRMINGHAM.

CAREFUL arrangements have been made, many good papers have been prepared, and there is every reason to expect a successful congress. Amongst the special questions set down for discussion are, under the head of—

Education,

1. Is it expedient to make primary education compulsory; and if so, on what conditions?
2. In what form and by what means can instruction in science and art be provided, so as to promote the improvement of our manufactures?

In the Health department,—

1. Can the public hospitals and dispensaries of this country be so administered as to conduce more to the welfare of the community?
 2. What ought to be the functions and authority of medical officers of health?
 3. What is the relation of the water-supply in large towns to the health of the inhabitants?
- And in the *Economy and Trade* department,—
1. In what manner can arbitration and conciliation be best applied in the settlement of disputes between employers and employed?
 2. What are the social results of the employment of girls and women in manufactories and workshops?

A prize of 25l. was offered by Mr. W. R. Lloyd for the essay containing the best and most feasible plan for the temporary employment of operatives and workmen in casual distress. The essay to be read at the congress. Nearly eighty essays were sent in, and from them the council have awarded the premium to Mr. Arthur Arnold, barrister-at-law.

On Wednesday evening the opening address was delivered by the president, the Earl of Carnarvon. In the course of it the president said—

"Schemes of all kinds for an effective metropolitan water supply will next session come before us;—the storage of the Thames; the conveyance of the waters of the Welsh mountains; the sources of the Severn; the abundant but by no means inexhaustible resources of our great North-country lakes; and lastly, the as yet unknown recommendations of a Royal Commission that has now sat for some time past, and whose report is anxiously expected. Without venturing to anticipate, on such a point, the verdict of Parliament, I think there are some considerations that may be here briefly noted.

1. Though London, from its vast population and gigantic interests, has a special importance of its own, it is only one of many towns that suffer from a deficient water-supply; and I doubt whether the great manufacturing towns of the North would consent that London, great as she is in her population, her interests, and her

necessities, should intercept and appropriate that supply which they look upon as their own.

2. The relative merits of these two rival systems, distinguished by engineers as the intermittent and the constant supply, must be brought to a decision. Whilst 150 great provincial towns enjoy the benefits of a constant supply, the capital of England is dependent upon an intermittent provision. I hope that we shall, in the discussions of the week, hear it fairly elicited by fact and argument, whether or no there is, as is alleged, a serious waste of water under the constant system; and, if so, whether such a waste can be restrained by reasonable checks and supervision.

3. The question of a proper water supply is intimately connected with the purification of our rivers, and the restoration of their waters to all the purposes of domestic economy.

4. Hardly less important are the liberation and employment in the service of agriculture of all that matter which, whilst present in our rivers, poisons their waters, but which if once extracted would make the poorest soil rich.

Amidst the many questions which crowd upon the attention of such an audience as this, the consideration of how and whence a water-supply may be best obtained may seem humble and prosaic; but there is none which more closely affects the comfort and health and lives of men in our great towns. It is not too much to say that a good water-supply is a necessary condition to high civilization, which, if she too often exacts the sacrifice of many lives in the requirements of modern society, whether necessary or unnecessary, in the practice of unwholesome trades, in the crowded state of great towns, in the physical and mental over-work to which all classes are subject and which engenders disease and shortens existence, had at least the compensating merit, that whilst she consumes she also rates human life more highly, and proclaims in all her works that there is nothing so humble or so mean that science will not take account of it and true statesmanship ponder it, in order to add one week, or day, or hour to the average of life of the millions who are labouring with, and amidst, and around us.

But cleanliness and sanitary precautions, though powerful agents to morality, are not all powerful; and our artificially organised society is upheld and balanced by many provisions and safeguards. So long as human nature remains the same, the question that you propound for discussion, 'What are the principal causes of crime,' will always have to be asked, though it must receive different answers under different circumstances of national existence. But, whatever our wish and policy, one answer, at any rate, in an old and rich and populous country, will, I am afraid, be that the depraved and criminal classes, though they may be reduced in number, must always exist. That they can, indeed, be reduced, and considerably, must be the hope of the moralist, the statesman, and the Christian; or otherwise the course of legislation would be even more thankless and desponding than it sometimes is. But you proceed to the further question, whether 'Reformatory treatment should be extended to adults?' In a certain sense I answer, yes. Penal discipline may be, and ought to be, up to a certain point reformatory; but the reformation of the offender is not the only consideration: his punishment and the security of society are at least equally important. But the action of private individuals may usefully intervene where the State is powerless, and voluntary associations like the 'Société des Patronages' in France, and 'The Discharged Prisoners' Aid Society,' which are happily now common in England, may largely influence towards an amendment of life. Beyond this, I doubt whether the State can safely go, and mainly for these reasons:—

1. That our reformatory system seems to me chiefly applicable in its principles to the young.

2. That the law must presuppose a certain malice and deliberation in men of mature years, which it is willing, by a humane fiction, to ignore in children.

3. That with older men the confirmed habits of a life-time rarely admit of modification, still more rarely of absolute change. I personally have long entertained and expressed my opinion that repeated re-convictions, even for minor offences, ought to be treated with far greater severity than is now the case; and that for the sake of the offender, of society, and of the economical administration of the law, the withdrawal for any lengthened periods of the criminal from his companions and the opportunities of

crime, would be both the most effective and the most humane treatment.

Finally, I cannot, here in Birmingham, the centre of such great manufacturing and artisan life, pass by, without one word of recognition, the increasingly serious question of what is termed Technical Education.

I do not speak now of the technical education which the architect, the civil engineer, the merchant, the chemical manufacturer may require. Technical education for such classes as these has a very wide sense, and means instruction in mechanics, mathematics, physics, chemistry; and in this sense it is certain that the educational appliances at their command, and the special courses of study necessary for their training are much below their ordinary wants. I am rather looking to the technical education which can practically and advantageously be given to artisans. We are sometimes, indeed, challenged to define the meaning of this education. It would not be difficult to do so, but it can hardly be necessary in Birmingham, where I observe, by a recent Parliamentary return, that a school of art has been established since 1842, in which, during the past year, more than 1,000 pupils were under instruction. Let me only say, in passing, that if there is any one branch of such instruction more valuable than another to the artisan it is the drawing class. But the real defence and justification of technical instruction rests upon broader ground,—upon the necessities of that wide industrial competition with the other nations of the civilized world in which we are engaged. That other nations feel anxiety on the subject, that they are issuing commissions of inquiry, and are taking measures for the foundation of schools and institutes for securing a better technical education, is no evidence of our superiority—no argument for our acquiescence in the existing state of things. For my own national industry and skill is too close and severe to justify us in throwing away any chance that we can command; and though I have every confidence in English qualities, I doubt if our natural and acclimatized strength lies in those specialties of taste which have become necessary for many artistic productions. To the Englishman much has been given—the government of land and sea, colonization, the government of men; to the inhabitants of sunnier climates have been granted the instinct of form and colour, and that indefinable and almost nameless appreciation of what is beautiful, which we call taste. But, though we have it not by nature we may obtain some of it at least by education, and, inasmuch as taste is no longer the mere ornament of a cultivated and leisurely life, but has become an essential condition in the commercial existence of the nation, it is our duty somehow to secure it. I will only in conclusion say of all technical education—whether of the higher grades of professional life, or of those lower paths with which the manual labour of the individual artisan is concerned—that its basis must be laid in sound principles of elementary instruction; and that the later teaching is dependent upon the earlier.

I dare not enter here upon the question of State interference. I can only say that, within certain limits to be carefully defined, the State may, I think, afford aid and facilities for such a culture as I have indicated. At the same time, the principles laid down by a recent French commission, that the pupils should be mainly out-of-door pupils, that payment should be the fundamental rule, gratuitous admission wholly or partially the exception, and that the course of the instruction should be for not less than two years, seem to me substantially sound and right principles.

During the last year, we have all read the remarkable evidence published by a Royal Commission, appointed at the instance of working men, to inquire into the operation of that new and important phenomenon of modern civilization, called trades unions. That evidence has revealed the existence of a painfully unsatisfactory condition of things in some particular unions. It has exhibited a system of regulations at variance with all sound principles of trade, and, in some cases as oppressive to the ablest, as they seem unduly favourable to the least skilful, artisans; it has occasionally shown a lawless interference with employers, far in excess of the limits of that legitimate competition, which, though sometimes, perhaps, injurious to both masters and men, is yet strictly within the

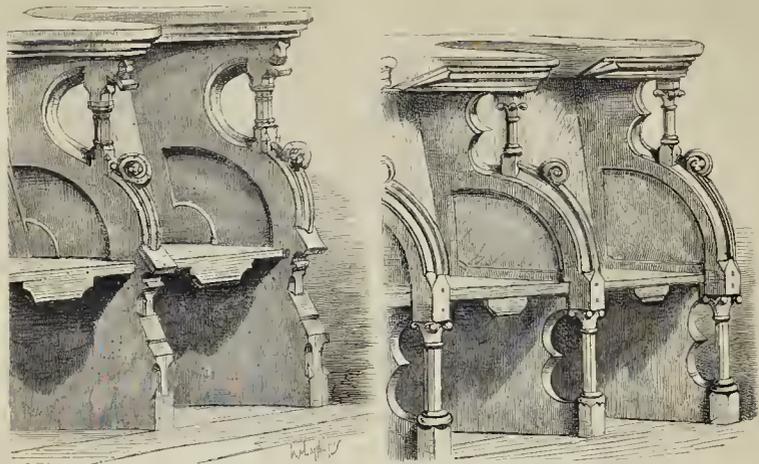

right of the latter; it has revealed the loss inflicted upon the great body of the nation,—the purchasers and consumers,—by the unfortunate discords of employers and employed, and by the injury done to the powers of industrial production; and, lastly, it has brought to light an amount of crime and outrage in particular unions, on the part of individual members of their executive, which has amazed and terrified the whole country, and which every right-feeling man, be he workman or employer, will not hesitate utterly to condemn.

But, whilst yielding to none in our abhorrence of the lawless and detestable crimes which have been committed under the sanction and in the supposed interests of certain unions, I sincerely hope that we shall not confound the existence of trades' unions with the crimes of which some individual members of their bodies have been guilty. *Abusus non tollit usum*; and if legislation on the subject is to be sound, the legislator must recognise the fact of the existence of such societies, and must do justice to what is fairly to be urged on both sides of this delicate question. I will endeavour to state some, at least, of the principal considerations which appear to me to affect the question, and which we may properly bear in mind during our discussions of this week.

On the one hand, it is untrue to deny to the trades' union all advantages and merits. As a benefit society it has an unquestionable value, and as an association for the protection of certain classes of workmen, against the possibility of undue pressure in particular circumstances, and at particular periods, by the preponderating influence of capital, it may also be beneficial. Wages, indeed, are generally defined as the working-man's share of the common product of capital and labour, and their amount must doubtless be regulated by the general law of demand and supply. This is a law deeply laid in the nature of things, against which it is worse than idle to contend. It is true not only in abstract theory, but in practice, if only a sufficient length of time be allowed in which it may work out its conclusions; but as a matter of fact the labourer has in former years been frequently too ignorant of the value of his labour, or too much at a disadvantage in his dealings with the capitalist, from the difficulty and expense of transferring himself from one market to another and from other causes, to enable him to make his terms. I am, therefore, ready to recognise in the union a protection to the labourer and an agency by which he may secure reasonable conditions in what is and must be a bargain between him and his employer. Nay, more, I can recognise, in the idea of the union, principles, however imperfectly developed, of mutual help and brotherhood, and an organisation which might educate workmen indirectly to those habits and that knowledge of business which I believe it is equally for the interest of his employer and for his own, that he should possess.

On the other hand, we must not allow any sophistry to blind us to the anomaly of combining the functions of a benefit society with those of an association for the enhancement of wages by means of strikes and such other expedients. It is an unnatural union, prejudicial perhaps to the association itself and to society at large, an *inceps usus*, a two-edged purpose, as it has been well termed, to which the funds of the body are applied. They are raised for peace, but they are applied to war.

"Fortunately, we need not look to arbitration alone for a solution of that labour question which seems sometimes so perplexing a problem in our present phase of modern commercial life. I have great faith in the sister principle of co-operation, if fairly and prudently applied, by which I mean both the union of workmen amongst themselves primarily and principally for the sale and purchase of articles of consumption, and the union of workmen and capitalists for the purpose of industrial partnerships. An instance of the first kind of co-operation is to be found in Messrs. Briggs's colliery, where we have seen, as its results, an improvement in the workmen's condition, increased profits to employers and a complete absence of strikes. We have an illustration of the second form of co-operative enterprise in the well-known history of the Rochdale Pioneers, an enterprise leading from small beginnings to almost gigantic results. Co-operation is, as yet, I believe, in its infancy; and yet nowhere but in England have we the same prospect of success, because no-

STALLS AT WÜRZBURG, BAVARIA.

where but in England has the enterprise been launched upon such sound principles. In Germany co-operation has mainly taken the form of societies of credit, and is, if I rightly understand the case, too much trammelled by State interference and protection. In France some of the associations have been formed on unscientific principles, some have been mixed up with the theories of political dreamers; whilst of those which have been successful the majority have assumed the character of societies for the purpose of production. In America, agitated as she already is by trade controversies, I believe co-operation to have made but little progress. In England alone it has had its origin, in what is probably the safest and best foundation, a society for the purchase and sale of stores and provisions and of articles of consumption, capable of expanding as time and circumstances may warrant into associations for the purpose of production, as in France, or of credit, as in Germany. In England, co-operation has stood free from State interference on the one hand, and from demagoguism on the other. It has, in fact, reflected some of the best of our English qualities,—good sense, and the practical adaptation of available means to the ends desired and the necessities of the time; it is accepted by most reasonable men of all opinions; it is at variance with no principle of political economy, no instinct of human sympathy; and it promises, I think, before long, to give to the working man many of those comforts and luxuries which have hitherto been only within reach of a far wealthier class. Whatever be our point of view, on any cordially wish it well, and accept it as one, at least, of the means granted us towards a solution of a most difficult problem."

On Thursday and Friday addresses were delivered in different departments, and papers were read and discussed. On Friday evening a working men's meeting was to be held. On Saturday, Lord Lytton, president of the educational department, will deliver an address, in the Friends' Meeting-house; and at eleven the departments will meet in their respective rooms to read and discuss "voluntary" papers. The sections will this day rise early, probably about two o'clock. Time will be allowed for lunch, and then a special train will convey members and others to Dudley, where they will be met at the station by Mr. Frederick Smith, who will conduct them through the caverns and the castle. The Earl of Dudley has been kind enough to order the caverns to be illuminated. The train will meet the party near the place where they come out of the castle, and it is expected that it will be able to arrive in Birmingham early in the evening.

STALLS IN CATHEDRAL AND NEW MÜNSTER CHURCH, WÜRZBURG.

We give sketches of two sets of stalls at Würzburg, in Bavaria. Those in the New Münster church are thirteenth-century work, and those in the cathedral fifteenth century. The latter are in the south aisle of the nave. They were removed from their original position in the choir to make way for the Rococco abominations which at present disfigure that portion of the cathedral.

FROM MELBOURNE.

AMONG buildings recently commenced, and of large proportions, with architectural features, is a warehouse now in course of construction on the north side of Flinders-lane, near Swanston-street. The style of architecture is Romanesque. The windows throughout are to be thrown into groups, and those on the ground-floor will be segmental headed. The building has a frontage of 48 ft. to Flinders-lane by a depth of 157 ft. It will be 78 ft. high, and will consist of six stories, including the basement. The several floors will be supported by ornamental iron columns, and the whole surmounted by a bold cornice with brackets carrying a pierced parapet. The contract price is 12,817l. 10s. Messrs. Reed & Barnes are the architects, and Messrs. Wood & Ireland the contractors.

The design for the new bank intended to be erected in Collins-street East, by the National Bank of Australasia, is that prepared by Mr. Lloyd Tayler, architect, and was selected in competition from among upwards of thirty other designs. The style is Palladian. The author appears to have aimed at producing a massive effect, avoiding as much as possible the use of minute mouldings and sculptured details, which, executed in the best freestone at command, would be the first parts of the edifice to suffer from the effects of time and exposure. The façade has a base of bluestone, above which it is constructed entirely of freestone. From the base rise coupled columns, and an entablature of the enriched Doric order. A balustrade separates this from the upper order, which is Corinthian. There are four floors altogether; the ground-floor rooms being 22 ft. high; the next floor, or "mezzanine," 10 ft. high; the first floor, 15 ft. high; and the topmost floor, 11 ft. high. The architect has received instructions to make the whole mezzanine fire-proof for the documents to be deposited there. The plan of the bank is a modification of all those at present erected in Melbourne. The entrance from Collins-street

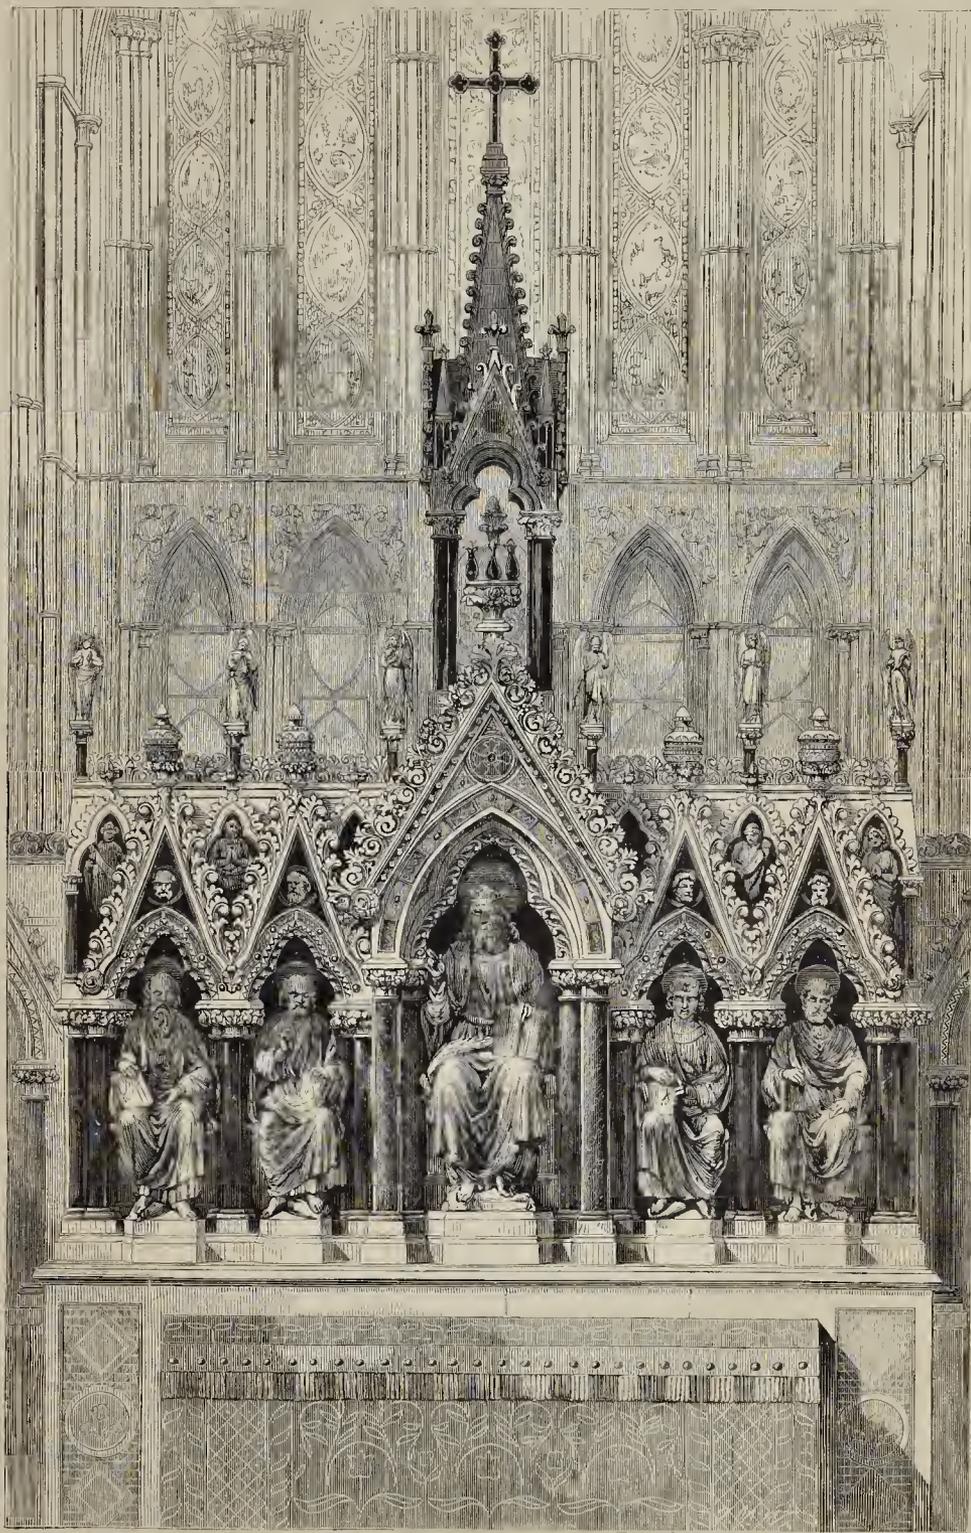

does not open immediately into the banking-room, as in the Bank of New South Wales, nor does it lead into a long passage with suites of rooms on either side, as in the Bank of Victoria and the London Chartered Bank, but through a circular vestibule, 20 ft. in diameter, surrounded by detached columns with niches between, leaving only one room on each side before reaching the banking-room. The banking-room is rectangular in plan, and measures 62 ft. by 53 ft. It is 32 ft. high to the springing of the dome. The dome is divided into enriched compartments, with a circular ceiling-light in each. The ceiling-lights are lighted from external skylights, so that the heating effect of the sun's direct rays is avoided. The dome springs from eight Corinthian columns, which are all placed behind the different enclosures for the clerks, so that they neither obstruct them nor the public in the transaction of their business. Two premiums, each of one hundred guineas, were offered by the Bank for the best and second best design.

REREDOS, WORCESTER CATHEDRAL.

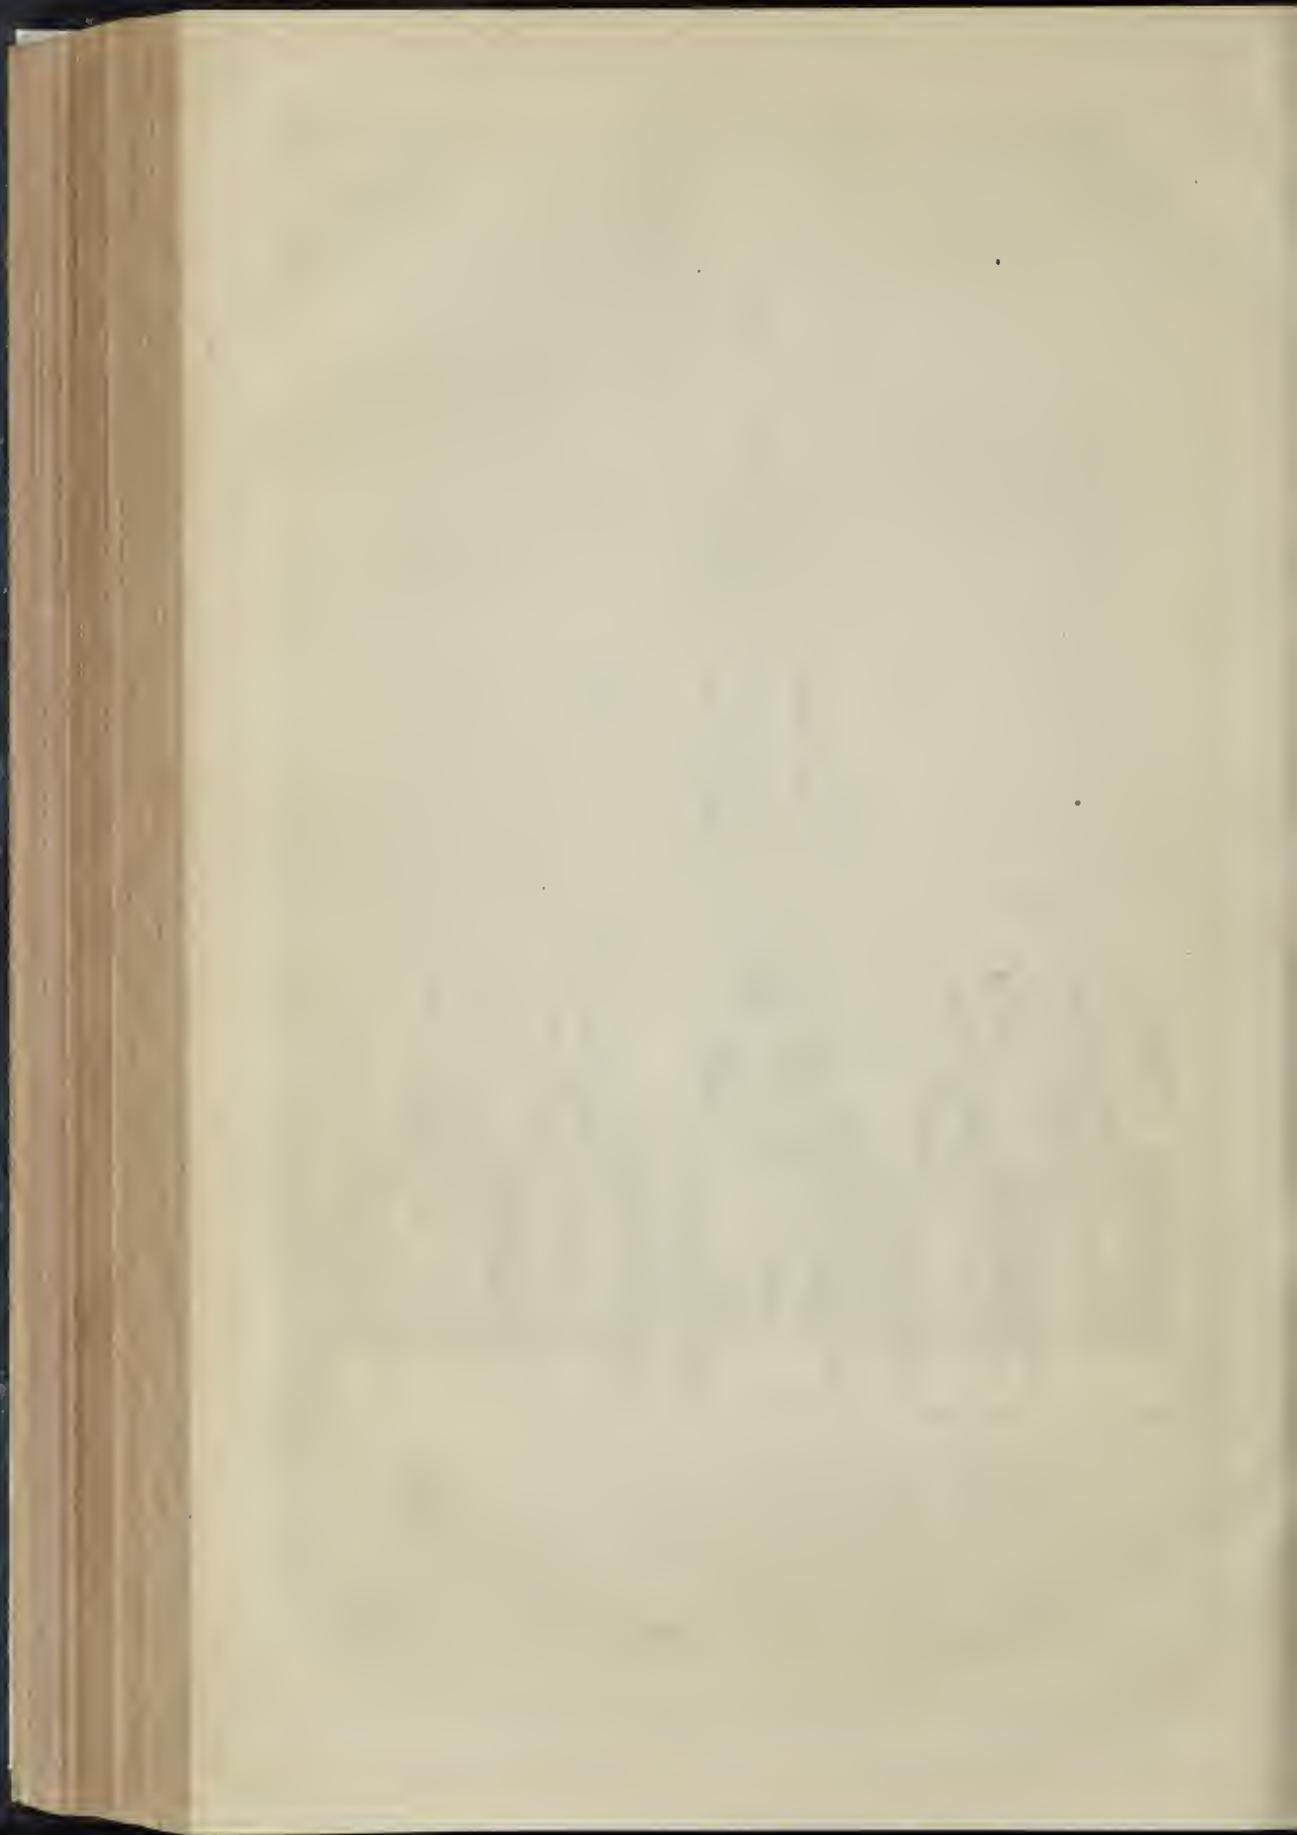

A HANDSOME reredos has been set up in Worcester Cathedral. It is scarcely finished, the steps not being laid yet. A screen connects it with the sides of the chancel. The materials of which the whole is composed are rich. The general structure is of varied alabaster. The columns are of verde antique, sanguine red, and Cornish spars. Plates of marble and mosaic are introduced. The jewels are of lapis lazuli, malachite, and Derbyshire spars.

The reredos and screen present a series of canopied arches. The five centre bays contain statues of Our Saviour and the four Evangelists, all seated, two on either side of the Saviour. The columns are adorned with carved clustered caps and bases. The whole is supported by a dado enriched with diapered work and jewels in rosso-antico, and rich spars.

The steps to the altar-table will be of marble mosaic. An elaborately carved cresting runs along the entire length of the screen and reredos. We should point out that the centre bay of the reredos is loftier than the rest, and above this rises a crocketed canopy terminated by a slender cross. Six figures of angels, upon dwarf columns, assist in enriching the front, and breaking the line of cresting. They are placed one at each end and at the intersections or springing of the canopies. There is a head under the apex of each canopy. The work has been executed, from the designs of Professor G. G. Scott, by Mr. Farmer; Mr. W. Terry having superintended it through the workshops.

RESEDS, WORCESTER CATHEDRAL. — PROFESSOR G. G. SCOTT, ARCHITECT; MR. FARMER, SCULPTOR.

THE SANITARY CONDITION OF GUILDFORD.

FEVER at Guildford has become a serious matter. There have now been about 600 cases, and forty deaths, in a population of about 10,000 inhabitants. Since our last notice of the case, the water has been analysed both by Dr. Letheby and Dr. Hassall. These gentlemen seem to differ in their result, and the local board have resolved that Dr. Hassall should make a second analysis. Dr. Letheby states that there are unmistakable evidences of pollution from surface drainage; and his opinion is that though at present the water is not unfit for human consumption, it may at any moment become so. The chief constable of Surrey writes to the *Times* to state that it is of no use the Mayor writing to show how healthy Guildford has been in past years while fever rages as it now does, and urges that steps should be taken to purify the town. The medical gentlemen practising in the town, to the number of five, have waited on the local board to make a combined representation of the increasing spread of scarlet fever, and the urgent necessity that exists for the provision of a fever-house for the reception of new cases, and also a house where clothes, bedding, &c., may be disinfected. Mr. R. Eager, surgeon, who introduced the deputation, stated that there had been nearly 600 cases of fever and thirty-seven deaths, and that the malady was still spreading. The board resolved to take immediate steps to provide a fever-disinfecting house.

LEGENDS IN STONE.

FROM the earliest times man has availed himself of the endurance of masonry to write upon it facts which he wished to perpetuate. The wandering Israelites, we know, as they neared the land flowing with milk and honey, were commanded to write the words of the Lawgiver upon the door-posts of their houses and upon their gates; and this indication of the capabilities of structures to bear witness, and at the same time to remind and record, has been accepted in many countries during the progress of civilization. Both Moses and Joshua, we are told, wrote the law upon stones; and it was upon the wall of the palace of Belshazzar that the wondrous writing appeared which held that monarch's fate. The remains of Assyrian buildings uncovered in our own times show us that inscriptions were sometimes used as a decorative feature. The ruins of ancient Egypt and of ancient Rome tell us of the same practice in those lands. The eyes of those who entered a Roman dwelling were arrested by an inscription, and those who departed from a building were bidden farewell by another. Every temple, every piece of architecture in fine, was enriched by inscriptions, and we find the deserted quarries the Romans used also lettered to tell their history. And coming northward, still in old times, we find runes treated at once as an ornament and a record, in a border-like arrangement round the edge of memorial stones. This feeling for inscribing upon stone has never left us, though there may have been intervals when it has been set aside. In the Middle Ages it took various forms. We know not whether the Saxon "unlocked his word-hoard" to grace his folkstead; nor whether the Norman attempted to enrich his "earth-house" by this means. When learning was still the gift of the few, the noble placed his heraldic device over his portal, or around his towers; for in those days these would have been more easily deciphered than letters. The ecclesiastic, again, placed the device of a generous donor to the church on some conspicuous place about it, to tell of his munificence. But as the darkness of ignorance rolled away veritable inscriptions took the place of these pictorial substitutes. The lintels of doorways, panels set in the front of houses for the purpose, labels, hands, were inscribed with short sentences, generally of a religious fervour. Thus, over an inner doorway of the entrance into the hermitage hewn out of the rock that rises out of the green shady bank of the river Coquet, in which the unhappy hermit of Warkworth used to dwell, there is a black-letter inscription which seems to take the place of the voice of salutation. It is in Latin:—"furrunt mihi largitur mura panis dat nocte."—"My tears have been my meat day and night." Have we not here the compressed

history of the sorrows of a life expressed in this passage from the Psalms?

In the Elizabethan era the custom of inscribing upon the fronts of houses distichs, quotations from Scripture, memoranda of various sorts, though generally relating to the ownership or date of the building, was quite in vogue in England. On an old house at Tarporley, in Cheshire, the two following curious distichs, accompanied with the crest and initials of Ralph Done, four other crests, and the coat of Arderne, were inscribed at this period:—

"Ralph Done Esquier, the Lorde of thys place
Was an aide to this buldyng in every case
JEON WINTER 1586."

"Feyns quoth Jehn Newson hath kept hys promys just
In buldyng of this house in August.
ANNO 1555."

Over the principal doorway of Dutton Hall, in the same county, may be read, "Sir Peyrs Dutton Knight Lorde of Dutton, and my lady Dame Julian his wyfe, made this hall and huylding, in the yere of our Lord God MCCCCXXIII, who thanketh God of all." And over the great window of Little Moreton Hall, still in the same county, runs the following inscription, carved in the woodwork:—"God is al in al thing.—This wyndows where made by William Moreton in the yere of our Lorde MDLIX. Mycharl Dale Carpenter made this wyndow by the grac' of God." The pleasant cider county has several examples on the old gabled houses that nestle among the orchards. In Tiverton there is an Elizabethan almshouse, very quaint and precious, with an open gallery in front of it, that has this inscription upon it, if the hand of the despoiler has not erased it:—

"John Waldron, merchant and Richard, his wyfe
Buldyd this house in tyme of their lyfe
At such tyme as the walls wer fourtyne foote hie
He departed this world, even the eightynthe of Julye
A.D. 1579."

And in the parish of Walborough, over the door of the hospital founded by Lady Reynalls, in the days of Charles I., for the widows of clergymen, about half a century after this, it is written,—"The widows house 1638.

"It strange a prophets widows pore should be
If strange, then is the Scripture strange to thee."

The writing over the doorway of the house in Rochester frequented by the famous "Seven Poor Travellers" will doubtless occur to many of our readers. There is another pithy inscription on the masonry of a house, far away from the smiling hop county, viz., in Alnwick. It is over the doorway of a long, low, two-storied house, and says,—

"That which your Father
old hath purchased and Left
You to possess do You dearly
Hold to shew his Worthiness.
M. W. 1714."

Sometimes we meet with a repetition of a favourite inscription. "God's Providence is my inheritance" is one chosen by more than one ancient charitable institution. How modest, reliant, and becoming such sweet-savoured sentences appear compared with the self-asserting vanities with which churchwardens and other public officers have, in later days, defaced structures to which additions and repairs have been made during their tenure in office!

Inscriptions of a similar class are frequently found in the interior of houses. In the picturesque manor-house at Ockholt the motto of the Norreys occurs over and over again:—"Feyth fully serve." The mantelpieces are often made the record of the name of the person who built the house, or his coat of arms and the date. In the old parsonage-house at Meppenshall, Bedfordshire, now demolished, there was a curious inscription. The gallant old place, surrounded on all sides by a moat, stood on the confines of the two counties of Bedfordshire and Hertfordshire, and the writing in question, which was carved on a beam in the dining-parlour, bore reference to this circumstance:—

"If you wish to go into Hertfordshire,
With a little nearer the fire."

The cornices of rooms were often inscribed with legends. In an ancient room preserved out of the ruins of Crendon Abbey, Buckinghamshire, the cornice was inscribed, with the Stafford knot, the words, "En lui plaisance." Legends were also sometimes placed over the windows, as in the vicarage-house at Colyton, huilt by Thomas Brerewood, vicar, in 1529, where might be read, "Peditatis totum, meditatio totum." The walls and ceilings of Leckenfield and Wressel were decorated with mottoes.

It is not surprising that this hoary old-world lettering should have a charm for most minds imbued with a love of antiquity. Sir Walter Scott introduced it as a feature of some of the mansions he describes. Waverley, we call to mind, found "Bretar the Baw" frequently repeated upon the bartizans and turrets of the Baron of Bradwardine's manor-house of Tally-Veolan; and the Quaker's pleasant parlour, known to Red Gauntlet, bore upon its chimney front the wise bidding to all who entered to "Trust in God." The great artist knew the mention of these writings would bring a swifter and more vivid realization to his listener's mind than any other word-painting could give.

In modern times crosses and other masonry on the sites of ancient heroic actions have frequently been inscribed with notices of the deeds that have been enacted near them in past centuries. Thus a clergyman has caused to be engraved upon a stone, near the Lady Chapel at Bothal, two dozen lines of the old poem that relates the death of Sir Bertram, beginning,—

"Thei schot hym downe on ye Elston-rigg,
Wher stands ye headless crosse,
Thei left hym swomen in hys bloude
In ye cold moor and moose."

We occasionally meet with inscriptions on the exterior of churches as well as in the interior. The principal fronts of the rich old abbeys were sometimes, too, thus embellished; and less important parts, such as the towers of the entrance-gates were, perhaps, still more frequently so treated. On the entrance-tower of Ford Abbey, Devonshire, below the battlement, runs a Latin inscription,—"An^o Dni millesimo quingesimo vic^o octo A Dno factum est Thomo Chard Abb." This Thomas Chard, whose bull-munch of the fabric, was the last abbot. The ruined Hartland Abbey once possessed a Latin inscription which ran thus:—"Istud: quadratum: claustrum: . . . et edificatum: marmoreo: lapide: perfect: sumptibus: ac: annis A . . . Abbatis: et: arte: Johis: Ewome: sit: et: gr:." But this has disappeared. In the Umerleigh aisle of Asherington Church, Devonshire, we read,—

"God save the church, our Queen Elizabeth, and realm
And grant us pees and truth in Christ. Amen."

And in Tiverton Church, in the same county, on a frieze on a chapel built by a rich merchant benefactor of the town, and elaborately decorated with the arms of the great companies of which he was free, his mercantile mark, anchors, woolpacks, waves, ships, and boats, probably to denote the means by which he made his fortune, is written,—

"Have grace, ye men, and ever pray
For the souls of John and Jone Greenwaye."

This approaches to a memorial character of which there are too many examples to permit of them being incorporated with the present selections; though it is probable it may have formed part of the original design, as a monument inlaid with brass indicates the tombs of these worthies. On the impost moldings of one of the arches of the tower of Sunninghill Church, Berkshire, is an inscription read thus:—"Undecimo Kalendas Martii obiit Longus Presbiter," which, however, we include on account of the peculiarity of its position. In the chancel of Coryton Church it is written,—

"This was a grateful priest: his wealth the small,
He to his patron gave, who gave him all."

Around the base of Lanneston Church, Cornwall, is a range of shields, on each of which is inscribed a letter, which, if commenced to be read from the south side, forms the following legend:—"Ave Maria gratie plena, Dominus tecum sponsas, Amat sponsam Maria, Optimum partem elegit, O quam terribilis ac metuendus est locus iste, vere aliud non est hic, nisi domus Dei et porta celi." The doorway of Dinton Church has another curious Latin inscription. It is in Roman capitals:—

"PREMIA PROMERITISSIGDESFPITHABENDA.
AVDIATHICPREETASIBIQVESITRETINSIDA."

The same county can show us another example. Under the east window, on the exterior of the chancel of the parish church of North Crawley, built by Peter de Guildford, rector, who died in 1321, runs,—

"Petrus cancellum tibi dat Firmine novellam,
Ut cum lauderis Deo, Zetri memoreris."

The font in Auroc Church, Northumberland, we may quote as a sample of inscriptions of a post-Reformation character. It says, "God his this church. R. M. W. Anno Dom. 1670."

Upon a beam of the roof of the wayside-chapel on Wakefield Bridge there is now carved "Verbum caro factum est. Gloria in excelsis Deo."

Melrose Abbey has several curious inscriptions. In a churchyard, on a tombstone, may be read the following vigorous lines, which, with slight variation, have, within the last few years, been inscribed on a panel and inserted on the north side of the ancient Edwardian pele tower, incorporated with the vicarage-house at Shilbottle, Northumberland:—

"The earth goeth On the earth Glistring like gold The earth goes To the earth Sooner than it wold.	The earth builds On the earth Castles and towers The earth sars To the earth All shall be ours."
---	---

On the west side of the south transept there are two inscriptions, which, taken in connexion with a shield close by them bearing compasses and fleur-de-lis, seem to indicate that the French architect here left a record of his courtship of a Scottish muse:—

"John: Andro: sum: hym: callit:
was: E: and: born: in: parysse:
certainly: and: had: in: keeping:
al: mason: work: of: saint:
drams: pe: hys: kirch: of: glas
gu: melcos: and: paslay: of:
nyddysdappil: and: of: galway:
pray: to: god: and: mari: bairth:
and: sweet: sant: iohn: to: keep:
this: baly: kirch: fra: skaith."

The second is still more Scottish. We give it a modern reading first, to assist in its deciphering:—"As the compass goes round without deviating from the circumference, so, doubtless, truth and loyalty never deviate. Look well to the end, quoth John Murdo."

"A gair pe compas roun about
sa truth and laite de, but doute
schaulde to pe hend e, iahie murdo."

Another touching, stirring kind of writing on masonry is that which State prisoners have traced on the walls of the dungeons in which they have been confined. Here we have wite reflections, expressions of faith, tender remembrances of absent and loved ones, records of facts, dates, names, initials, and oftentimes devices of considerable skill, both in design and execution. Of English State prisons, the Beauchamp Tower, in the Tower of London, has probably the largest number of these memorials. Whilst the Cheshire carpenter, Ryehard Dale, was making the great, low-window at Little Moreton Hall "by the grace of God," there was a prisoner languishing in this stronghold, by name William Rame. Nothing is known of him, neither his offence nor his fate. But we can tell, as the bright spring days went by, he solaced himself with writing on the wall, for his work is to be seen at this day. It reads like a string of sad proverbs, setting the "howse of mornyn" before the "howse of banketing," and is dated April, 1559. His mourning, or lamentation, has a consolatory tinge in it, which, it is to be noticed, is very general in similar inscriptions. The peril of the prisoners, the proximity of death, their alternations between hope and despair, perhaps, too, a certain dash of adventure that must have been in most of their minds when led to take part in the enterprises or plots for which they were incarcerated, seems to have led many of them to look upon their lives as a journey just concluding. "A passage perillua makethe a port pleasant," wrote Arthur Poole, in 1568, on the piltless walls of the same tower; and "Per passage penible passens a port plaisant," wrote Thomas Rooper, 1570. The unfortunate Duke of Norfolk expressed the general feeling of those confined for their religious opinions when he wrote over the fireplace of this prison-house some Latin verses to the effect that the more suffering for Christ in this world, the more glory with Him in the next; and near a loophole, "If is a reproach to be bound in the cause of sin, but to sustain the bonds of prison for the sake of Christ is the greatest glory." "My hope is in Christ," "Typing stand and here thy cross," are specimens of this feeling. The great benefit to be derived from patience is frequently laboriously set forth by the languishing souls in durance. "The most vnhapy man in the world is he that is not patient in adversities, for men are not killed with the adversities they have, but with ye impacione which they suffer," wrote Charles Bailly, among other records of sighs and anguish, in
