

THE J. PAUL GETTY MUSEUM LIBRARY

THE BUILDING

AN

ILLUSTRATED WEEKLY MAGAZINE,

FOR THE

ARCHITECT, ENGINEER, ARCHÆOLOGIST, CONSTRUCTOR,
SANTARY REFORMER, AND ART-LOVER.

CONDUCTED BY

GEORGE GODWIN, F.R.S., F.S.A.

LATE VICE-PRESIDENT OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS;

*Honorary Member of various Societies; Author of "History in Ruins," "Town Swamps and Social Bridges,"
"Another Blow for Life," &c.*

"Every man's proper mansion-house, and home, being the theater of his hospitality, the seat of self-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kinde of private princedom, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned."

"Architecture can want no commendation, where there are noble men, or noble mindes."—SIR HENRY WOTTON.

"Our English word To BUILD is the Anglo-Saxon Bylġan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PUDLEY.

"Art shows us man as he can by no other means be made known. Art gives us 'nobler loves and nobler cares,'—furnishing objects by the contemplation of which we are taught and exalted,—and so are ultimately led to seek beauty in its highest form, which is GOODNESS."

VOLUME FOR 1868.

LONDON:

PUBLISHING OFFICE, No. 1, YORK STREET, COVENT GARDEN, W.C.

INDEX TO VOLUME XXVI.

ABBEY MILLS PUMPING STATION, treat to the workmen at, 627
Aberdeen public and municipal buildings, 410

The BUTTERFLY

Curiosities of London.

R. JOHNSON once remarked to Boswell, "It is wonderful, sir, what is to be found in London." We may apply the same statement to Mr. Timbs's new edition of his work, entitled "The Curiosities of London."* It would be difficult to exceed the diversity, collectiveness, the quaintness, interest—in a word, the curiosity of its contents. Beginning alphabetically, with the Adelphi, and ending with the Zoological Gardens, he carries us from place to place, from building to building, till all London has been traversed, and peopled with its most famous worthies, and pictured with its most remarkable scenes. As page after page flutters past, we see

brave, busy, beautiful, beautiful London in a hundred different aspects, not indeed through the medium of a continuous narrative, but in groups of facts connected with the principal objects of interest in the wide "world-city." Mention of the finds of the fossilized teeth of an elephant in the formation of the great sewer in Pall-mall; of remains of numbers of turtles, crocodiles, elephants' teeth and tusks at Highgate and Islington; of bones of the elephant, hippopotamus, ox, and deer in the brickfields at Brentford; and of the general subterranean presence of vast quantities of pyritized twigs and fruits allied to the class of vegetation now flourishing in the Eastern Archipelago, brings us face to face with the distant ages when London possessed a climate identical with that of the Spice Islands in the Indian Ocean, when from the hot, moist soil rose mighty palms, under whose feathery shade glided immense ho-constrictors and in the branches of which chattered troops of monkeys; while sharks, turtles, and crocodiles disported in the waters once covering part of the metropolitan district: those distant ages, indeed, when the hippopota-

mus lounged in Regent-street, the elephant sauntered down Pall-mall, and London had not become a British settlement. On another page we are reminded that Moorfields is probably the site of the first group of Celtic dwellings, and of the evidence that has pointed to this conclusion. Then we have Roman London picked out for us; and here and there we catch glimpses of the principal events, the stately pageants and banquets, the odd customs, the topography of London in the various centuries of the Middle Ages. Interspersed with all this come the sparkling sayings, the gay doings of the comely personages and wits of the days of the Stuarts; the pith of much that concerned London in the last century; and countless facts belonging to our own day. Mr. Timbs's hook is, in fine, a literary kaleidoscope; for, though his subject is always London, the varied pieces of information he has collected concerning it fall together in such diversified combinations that it is scarcely possible to take it up without seeing a new picture. It is the compression, too, of the industrious accumulations, the painstaking researches, the methodical classification, and the vivid recollections of sixty years: no trifling piece of mental labour.

Perhaps, we should say, off-hand, that one of the most interesting districts in London, from association of ideas, is St. James's, if we were not confuted on the threshold of this observation by the equal claims of other quarters. Even madly, murky, misty Bermondsey has had its romance as charming as that of the Blind Beggar of Bethnal-green; for in the parish register there is an entry inditing an Enoch Arden, in the "form of a solemn vow made betwixt a man and his wife, having been long absent, through which occasion the woman being married to another man, took her again." Prosaic Paddington has but to be unveiled of its modern disguise, to be revealed as the Saxon settlement of the sons of Pæd. Stop the omnibuses, put up the horses, sweep away the straight rows of houses, and straight lines of metal ways, and we can picture a knot of rude homes of blue-eyed, yellow-haired Pædings, bare and brawny armed, half cultivators of the soil, but whole warriors, sheltered to some extent by Notting-hill near by. The omnibuses, railways, and rows of new houses have not quite effaced the Paddington of the Middle Ages even yet. The White Lion, Edgware-road, dates 1524, the year when hops were first imported. The Red Lion, Harrow-road, is supposed to have seen Shakspeare; and Ben Jonson went to the Wheatshaf, Edgware-road. But St. James's, where Swift found lodgings so "plaguy dear," is fuller of more modern associations: it seems studded with familiar names. The courtly poet Waller,

lived on the west side of St. James's-street, when it was called "the long street," and had a terrace-walk before the best houses at the upper end. Pope, as he himself says, lodged "next door to ye Golden Ball, on ye second terras." Gibbon, the historian, died at No. 76. Below the Thatched House Tavern was the shop of Rowland, the author of the fame of Maccassar oil. Sir Christopher Wren died at his own house in this street. Lord Byron lodged at No. 8, in 1811; and Gillray, the once celebrated caricaturist, committed suicide in it by jumping from one of the upper windows of No. 24, says Mr. Timbs; but, according to Mr. Cunningham, No. 29. It is not, however, to the main street that these personal associations are confined. Addison lodged in St. James's-place, and we know whose footsteps came to and fro his lodgings, as well as we know the brilliant list of guests of Samuel Rogers a century afterwards in the same "place." Swift, Steele, Crabbe, and Moore all lodged at different times in Bury-street. The poet Gray, Sir Isaac Newton, and the two Hunters once lived in Jermyn-street; and in this place was enacted the burlesque farce in real life by Mr. and Mrs. Howe, the former of whom left his wife for the space of seventeen years, causing her to believe that he was in Holland, but in reality he was living in the immediate neighbourhood and part of the time exactly opposite to a house to which she had removed, and going to St. James's Church every Sunday for seven years, where he saw her without discovering himself. More especially is this locality associated with the rank and fashion that frequented Almack's in the middle of the last century. St. James's-square takes us back to the reign of William III. and Mary, when Sir William Temple and Sir Horace Walpole lived in Pall-mall, though there were some few houses on the spot in the days of Charles II., as witness that of Moll Davies, one of his mistresses. It was at No. 4 in this square that the late Earl de Grey received the Royal Institute of Architects, during several years, and invited brilliant women as well as eminent men to meet them. Great nights were those.

St. James's Park brings us into contact with Nell Gwyn; for here, as has been oftentimes told, Evelyn, attending Charles II. through the park, heard a conversation carried on between this famous couple, "she looking out of her garden on a terrace at the top, and the king standing on the green walk under it,"—a site identified by Mr. Cunningham as under the park wall of Marlborough House; and in the dining-room of the Army and Navy Club House is preserved one of that ancy lady's looking-glasses. The Strand is another district full of memories, as indeed are the vicinities of St. Martin's-lane, many of the squares, the sites of old religious houses and their gardens, old inns, the halls of

* *Curiosities of London: exhibiting the most rare and remarkable Objects of Interest in the Metropolis; with nearly Sixty Years' Personal Recollections.* By John Timbs, F.S.A. A new edition, corrected and enlarged. London: Longmans, Green, Reader, & Dyer. 1868.

the City companies, the mansions of the nobility, and scores of other places. Indeed, there are few spots in London that some association with celebrated persons or their sayings has not invested with human interest. The north end of Beaufort-row, Chelsea, will always have a charm for those who remember that here lived Sir Thomas More, with his son, daughters-in-law, grand-daughters, and great-grand-children, when he was visited by Henry VIII. and Erasmus, the latter of whom pronounced his house "a practical school of the Christian religion." Scraggy, straggling Kent-street, Southwark, will be as though decked with cloth of gold when we think of the Black Prince carolling along it on his way home from Poitiers; Paddington Canal will be eyed with curiosity in connexion with Lord Byron's remark that the canal of Venice would not be more poetical were it not for its artificial adjuncts; and London Bridge will recall other tragedies besides the ghastly spectacles exposed upon the gatehouses, when, looking down upon the swift waters, we remember their velocity past the narrow old arches caused suicides to choose the minute of shooting through them in boats to destroy themselves, first filling their pockets with heavy stones, as did Sir William Temple's only son; and a brider, braver deed, will cast a glitter upon the tide when we think of Edward Osborne, in 1536, leaping into the river to save the life of his master's infant daughter, dropped from one of the windows of the houses then built upon the bridge, which infant daughter was bestowed by her father, the lord mayor, upon her gallant rescuer in after years, and became in good time great-grandmother of the first Duke of Leeds,—as pleasant a tradition as that of Dick Whittington. A large array of this class of facts will be found in Mr. Timbs's volume. In King-street, Covent-garden, are a few street-doors of solid mahogany, this being the street in which the lady lived for whom that wood was first used in England. In Southampton-street, No. 31, phosphorus was first manufactured in England, by Ambrose Godfrey Hauckwitz, under the instruction of Robert Boyle, who seems to have done for the popularizing of chemistry what the Tradescants did for natural history a century before him; for his laboratory was a place of fashionable resort. In Maiden-lane, the birth-place of Turner, the painter, ledged the incorruptible Andrew Marvel, in a second floor, while M.P. for Hull; and fifty more of such bade-bright spots might be easily counted up: or, for different moods we might seek out where Sterne died, in 41, Bond-street, or the pawnbroker's shop in Wardour-street where Sheridan used to deposit his valuables.

We have had many writers on London, many of whom were Londoners; sometimes, however, it is to provincials or foreigners that we are indebted for sketches that enable us to realize the manners and customs of Londoners in the days of yore. After Stowe sets us down, it is to James Howell, the Welshman, first of the line of historiographers-royal, that we are indebted for many particulars concerning London, before we find Evelyn and Pepys waiting in their gilded coaches to carry us further on. From him we learn that Tothill-field-gardens were the headquarters for the purchase of choice fruit, as Covent-garden is now. "I have sent you," he writes to Sir Arthur Ingram, "a hamper of melons, the best I could find in any of Tothill-field-gardens." To another friend he says, "You writ to me lately for a footman, and I think this bearer will fit you: I know he can run well, for he hath run away twice from me."

And again, July, 1632, he relates, not without a twinge of departing superstition,—

"As I passed by St. Dunstan's, in Fleet-street, the last Saturday, I stepped into a lapidary, or stone cutter's shop, to treat with the master for a stone to be used upon my father's tomb, and casting my eyes up and down, I might espie a huge marble, with a large inscription upon't which was thus to my heat remembrance:—Here lies John Oxenham, a goodly young man, in whose chamber, as he was struggling with the pangs of death, a bird with a white breast, was seen fluttering about his bed, and so vanished; which circumstance would not have been worth commemorating upon stone if it had not been that the sister, son, and mother of this goodly young man, all attracted a similar white-breasted bird to their couches when dying, as the inscription proceeded to relate. To these be divers witnesses," continued the travelled Howel, "whose names are engraven upon the stone. This stone is to be sent to a town hard by Exeter, where this happened."

From this we may glean that the London lapidaries excused some, at all events, of the ancient work now found in the provinces. Writing from the Fleet, where his political services finally imprisoned him, to a friend in Paris,

in 1646, he says, "The devil may walk freely up and down the streets of London now, for there is not a cross to fright him anywhere, and it seems he was never so busy in any country upon earth, for there have been more witches arraigned and executed here lately than ever were in this island since the creation." And, again, from the same confinement, he writes,— "The air of this city is not so sweet," especially in the heart of the city (in and about Paul's Church-yard), where borse-dung is a yard deep; inasmuch that to cleanse it would be as hard a task as it was for Hercules to cleanse the Augean stable. It was a litter taunt of the Italian, who passing by Paul's Church, and seeing it full of horses, "Now, I perceive (said he) that in England, men and beasts serve God alike." The same worthy gives us some word about Drapers' Hall, in a letter to his father, who seems to have sent two of his younger sons to be started in life by those already established. One of the lads was taken in hand by James, and the other by another brother, afterwards Bishop of Bristol, and both were apprenticed to mercers, the one in Chesapeake, and the other at the Flower-de-lance, in Lombard-street.

"When I went to bind my brother Ned apprentice in Drapers' Hall, casting my eyes upon the chimney-piece of the great room, I might spie a picture of an ancient gentleman, and underneath Thomas Howel. I asked the clerk about him, and he told me he had been a Spanish merchant in Henry VIII's time, and coming home rich, and dying a bachelor, he gave that hall to the Company of Drapers, with other things, so that it is accounted one of their chief benefactors. I told the clerk that one of the sons of Thomas Howel came now thither to be bound; he answered, that if he be a right Howel, he may have, when he is free, three hundred pounds to help to set up and pay no interest for five years. It may be hereafter we may make use of this. He told me also, that any maid that can prove her father to be a true Howel, may claim and demand fifty pounds towards her portion of the said hall."

Styrpe, for sixty years incumbent of Low Layton, in Essex, and subsequently rector of Hackney, is but a contumacious of Stowe. Both Pepys and Evelyn, the one president the other fellow of the Royal Society, bring us down to the commencement of the eighteenth century. Pepys died in 1703; Evelyn, in 1706. Then come Hatton and Pennant. From a galaxy of smaller wits two contributors of great celebrity sparkle on the scene soon after these expositors of manners in the days of the last of the Stuarts closed their eyes, in the persons of Dr. Johnson and Horace Walpole, both of whom have left Londoners many a legacy. "The man who is tired of London is tired of existence," said the former, in his admiration and appreciation of the boundless resources of a metropolitan life; and the threads of Walpole's life are so interwoven with London society as to be inextricable. These two were contemporary centres, having distinct rings around them, never clashing, but between them attracting all that was brilliant and gifted in the society of their day. It was Johnson who laid down the scheme upon which George III. formed the most complete private library in Europe, in the "dull, dowdy, and decent" Buckingham House, now at the disposal of the public in the British Museum; it was Walpole's pen that, despite his own proclivities towards pseudo-Gothic ornamentation, swept away all regard for what he called Adam's "gingerbread and sippets of embroidery," in his rapturous praise of the "chaste palace" the Prince of Wales, afterwards George IV., made of Carlton House, from the designs of Holland. His own Strawberry Hill became as nothing in his courtly haste to follow the regal taste. "We went to see the Prince's new Palace in Pall-mall, and were charmed," he wrote to the Countess of Ossory; "it will be the most perfect in Europe. There is an angust simplicity that astonished me;" with more raptures to the same effect; and straightway London became full of "chaste palaces" of every dimension, down to that of a park-gate lodge. "There will soon be one street from London to Brentford," he prophesied with a foresight only surpassed by the great lexicographer's celebrated prophecy that Lexington would be some day lighted by gas. "I have twice this spring been going to stop my coach in Piccadilly, to inquire what was the matter,—thinking there was a mob: not at all; it was only passengers." And as his buckled, and frilled, and spencered men-folk, and his gored and frilled, narrow-skirted, and high-bonneted women-folk jostled one another as they streamed up and down Piccadilly, what a mere thread of a concourse they must have made compared with that which is pouring up and down there now, all hours of the busy day.

"London," says the great authority for many of

the vital curiosities of the metropolis in our own day, the Registrar-General, in 1866, "London is growing greater every day, and within its present bounds, extending over 122 square miles of territory, the population amounted last year by computation to 3,087,991 souls. . . . As far as a radius of fifteen miles stretches from Claring-Cross, an ever-thickening ring of people extends within the area which the metropolitan police watches over, making the whole number on an area of 687 square miles around St. Paul's and Westminster Abbey, 3,521,267 souls." Horace Walpole's pace would be seriously affected could he revisit his old haunts with his old curiosity as to what was going on around him. Mr. Timbs quotes the late return that shows the number of passengers and vehicles passing over London Bridge in twenty-four hours. Surely those who have gone before us, and those who have to come after us, could not light upon a fact more indicative of our strenuous activity than this traffic-gauge. 167,910 passengers pass in twenty-four hours over this bridge, or 6,996 per hour, night and day. Sometimes there are 2,000 persons upon the bridge at once going about their avocations, and 1,764 carriages have been counted to pass over in an hour. And yet, in all this toil and traffic, and jostling and jogging, there are people, ever and anon, who turn their backs to the crunching wains, the swift rumbling omnibuses, the rattling carts, the rind and roar of the multiplicity of vehicles, and, looking over the parapets at the water, through nearly three centuries of time, say "I must have been hereabouts that Osborne struggled with the infant in his arms; and perhaps here that John Temple drowned because he feared his king had suffered an ill-turn through his inexperienced statesmanship; and somewhere here that Margaret Roper must have waited in her boat to catch her father's honoured head, when it was thrown over the bridge to make room for another on the pole on which it had been exposed." Such supreme and ineffaceable attraction have the tragedies of life for us. Man's sympathy is with man.

Mr. Timbs gives us a capital chapter upon the great metropolitan hwereries. Although Whitbread's is the oldest, and, in spite of Peter Pindar, the house of Barclay & Perkins has most interest for us, perhaps, from its having belonged to the Thralls in the last century, and so in some way become part of our associations with the great central Londoner who have just mentioned as giving tone to so much we have met mentioned as Johnson. Certainly his brew-house is one of the curiosities of London, and crowds of foreigners go to see it. Think of a brew-house as large and lofty as Westminster Hall; malt-bins as high as three-storyed houses; a standing army of well-fed cats, to keep the rats in check; 200 horses, costing some 80l. a-piece, each ranged in its own stall, with its name painted on a board over the rack; and some scores of men, every one of whom is taller than a Life Guardsman, and heavier by two stone,—not to say one word of the bewildering furnaces, cisterns, wells, shafts, boilers, details of all sorts, and utensils. He is also definite and minute upon other branches of trade followed by wealthy firms that are as commercial duchies or petty kingdoms to their possessors and their inheritors. Paternoster-row is traversed with this object. From a street in the occupation, first, of turners of rosaries; then of mercers, silkmen, and lacemen (Pepys bought for a morning waistcoat here in 1660); then of sempstresses,—Paternoster-row became one of the head-quarters of the publishing trade, by the removal of the booksellers from Little Britain in the reign of Queen Anne. Mr. Timbs records,—

"At No. 39 have lived nearly a century and a half the Longmans; the imprint of Thomas Longman, with Thomas and John Osborne, at the sign of 'The Ship and Black Swan,' is dated 1725. For several years the firm gave here dinners and *soirees* to authors and artists; and they have acquired world-wide repute as the publishers of the works of Scott, Mackintosh, Southey, Sir Walter Scott, Moore and Missolonghi, Messrs. Longman's own sale of books has amounted to five millions of volumes in the year. They possess some portraits of eminent literary persons. The premises were rebuilt in handsome Renaissance style in 1863; the design including the rebuilding of the adjoining house of Messrs. Blackwood & Sons, of Edinburgh, at the extreme north-west corner. The facade is executed in Portland stone. The character of the carving, especially of the lower stories, is somewhat symbolical nature follows. On the keystone of the central arch is represented literature supported by the arts, sciences, and education. In the spandrels of the same are the 'Ship' and the 'Swan,' being half-sized copies of two medallions, saved from the old buildings, and which had been trade signs on part of these premises since the Great Fire."

Lomhand-street tells still more of its archeology. Before the reign of Edward II. this street

was called by the same name from the fact of the Rothschilds of the Plantagenet era having settled there. These were the Longobards, whose badge, which is that of the Medici family,—three golden balls,—is now the sign of pawn-brokers, who perform for modern millionaires and spendthrifts the part played by the wealthy bankers and goldsmiths in old times. And from that day to this it has been a great money mart. Here dwelt the husband of Jane Shore. Sir Richard Gresham's shop was on the site covered by the banking-house of Martin, Stone, & Martins. Only so recently as ten years ago it has been ascertained that the father of Alexander Pope was a merchant living in Broad-street, when the poet was born, and not a linen-draper in Plough-court. Out of the forty-four names of firms of "Goldsmiths who kept running cashes," mentioned in the "London Directory for 1677," twenty-seven were in Lombard-street.

Dip where we may, there is something entertaining in this new edition of "The Curiosities of London." Mr. Timbs declares correctness to be the cardinal point of the volume; and considering every statement is associated either with names or dates, it is remarkable that so few errors have crept in or escaped the eye of revision. Holborn theatre, however, will scarcely be found on the south side of that ancient thoroughfare. In the list of statues we find no mention of that of the late Prince Consort on the memorial of the 1851 Exhibition in the Horticultural Society's Gardens, the best out-of-doors monument in London. The Art Union, a real curiosity of London (44, not 445, Strand), has raised and expended 351,000*l.* in the production and dissemination of works of art (instead of 150,000*l.*). In the account of Covent Garden Theatre there is no mention of the great conflagration that destroyed it, nor of its rebuilding by Barry. The same calamity at her Majesty's Theatre is, of course, of too recent occurrence to be looked for. Some of the signs that remain might have well been included among minor curiosities, especially those known to have been painted by celebrities, as that by Hogarth in Oxford-street. But we will not pursue these ungracious suggestions.

Everybody who likes London cannot fail to like the more for such labours as those of Mr. Timbs; and those who, for want of information or caprice have not hitherto done so, will find so many historical and personal associations cropping up about them as they wend their various ways, that they will alter their opinion and be grateful to the pens that have added so much to their every-day enjoyment. Every Londoner should read Mr. Timbs's book by way of thanks for the taste, industry, and enterprise that have placed it in his power to do so; and every one else, that he may get a notion of what London includes.

THE EIGHTEEN ERAS OF THE ARCHITECTURE OF JERUSALEM, WITH THE DATES, LOCALITIES, AND PROMINENT CHARACTERISTICS OF EACH EPOCH.

The first occasion on which our present historical knowledge supplies a direct reference to the city of Jerusalem is at a date contemporary with the reign of nine Syrian and Mesopotamian kings, the bricks of one of whom "Arioch, King of Ellasar," are to be seen in the British Museum, impressed with the monarch's name in cuneiform characters, now read as Uruk. The exact date of this reference is of extreme interest, inasmuch as it closely preceded that great geological convulsion which depressed a portion of the valley of the Jordan by more than 2,000 ft., and, arresting the natural course of the river along its still traceable channel to the Red Sea at Akaba, spread its waters into a lake so large that the evaporation from its surface has ever since disposed of the influx. As, however, the historic investigation now attempted refers to architectural dates alone, it is enough here to say that the most careful attempt to restore the chronology of the Book of Genesis with which we are familiar, fixes the interview of the King of Salem with the victorious Arah Sheikh Abram in the year 2533 of the Julian Period. At that early date the city was already devoted to monotheistic worship, the King of Zedek, Salem, or Kadesh being also the "Priest of the Most High God."

In the fragments of Manetho preserved by

Josephus we find the building of Salem ascribed to the Shepherd Kings or Hyksos. There appears, however, to be so much confusion between these shepherd and probably Phœnician invaders and lords of Lower Egypt, who were finally subjugated by Thothmes II. about 577 years later than the above-cited date, and the Jewish bond-slaves, who fled to the desert sixty-three years afterwards, as to render the passage from the Egyptian historian, thus preserved only in a quotation, of little value except as indicating the current opinion as to the Phœnician or Semitic origin of the founders of the Holy City. The supposed reference in Homer possesses little more than a literary interest, and our present historic account of Jerusalem may thus be taken as commencing with the storm by David of the citadel of Zion, J.P. 3670, being 1137 years later than the date assigned to Melchizedek.

The only intelligible explanation of the mode in which Josh entered the Castle of Zion is, that, like Ferdinand of Aragon, in the siege of Naples, nearly 2,500 years later, he introduced a forlorn hope through an unheeded conduit. The fortifications at this time would appear, from the language used in the books of Samuel and of Chronicles, to have crowned the hill of Zion. David "built the city round about, from Milo and inward;" and to the labours of David or his immediate successors the circumvallation of the lower city is, in the first instance, to be attributed; being effected by a wall surrounding the second hill, Acra, built to a considerable height above the bottom of the valley; megalithic in its structure, and to some extent coinciding in its site with the first of the three walls mentioned by Josephus. It is thus to the characteristics of megalithic structure, of position on the steep slope of what was formerly Acra, and of the comparative narrowness of the space that it encloses, that we must look for indications of the wall of David, while it is (with two exceptions) only high up on the southern hill, Zion itself, that we can expect to find even the faintest traces of his predecessors.

In the reign of Solomon the circumvallation of Moriah was commenced, and the Temple was raised upon its summit. To this great monarch is also ascribed the completion of the wall commenced by his father. The main characteristics pointed out by Scripture and by Josephus to denote the work of Solomon are, the enormous size of the stones, the careful dressing of the joints, the union of masonry with the native rock at the base of Mount Moriah, and the formation of the wall forming the then eastern scarp of that elevation close to the brook Kedron. The recent excavations of Lieutenant Warren, tracing the channelled megalithic work to this very point, and to a depth of 70 ft. below the present exposed portion of the Haram wall, when compared with the statements of Josephus, seem to leave no room for doubt that the original work of Solomon is here in good preservation. For similar reasons it would seem likely that the peculiar shouldered arches, or hollowed impost, formed within the vaulting of the south portion of the Haram, are part of the same monarch's work. Again, farther north along the line of the eastern wall, flanking the Kedron, the remarkable problem of the Golden Gate, the entrance of which is marked by some of the most enormous stones yet discovered, and which clearly formed a portion of a system of palatial works subsequently superseded by the military works of the Amœneen or Idumean kings, may find its solution in the name *Porta Judæicæ*, or *Porta Custodiam*, being probably the Porch of Judgment, leading to the palace (perhaps the "House of the Forest of Lebanon"), and to the northern entrance to the original, as well as to the Second Temple. The passage which seems definitively to identify the Golden Gate with the Gate of Judgment will be mentioned in its due order.

In connexion with the megalithic masonry of Moriah may be noticed the quarries entered by Dr. Barclay, and mined within the mountain, where stones in different stages of preparation have been left undisturbed for 2,000, if not for 3,000 years. The very marks of the masons, the smoke of their torches, and here and there some rude note or ornament daubed on the stone, are said to be traceable on the walls of these royal quarries; and it deserves a careful investigation to ascertain whether the square Hebrew characters,—the Phœnician letters to which it is now the fashion of learned men to attribute a greater, but perhaps a more questionable, antiquity,—or the Greek letters likely

to be used under the Idumean kings, are to be traced in these ancient caverns.

In the fifth year of the reign of Rehoboam, the son of Solomon, occurred the second of that series of successful sieges or storms of Jerusalem which, without counting unsuccessful attacks, like that of Sennacherib, or occupations without recorded fighting, as in the case of Necos, king of Egypt, three months after the battle of Megiddo, amount to no fewer than seventeen during the 2,230 years that elapsed from the capture of the Holy City by David to that effected by Saladin. The record in the Hebrew Scriptures is confirmed by the sculptures and hieroglyphics found in the tombs of the Egyptian kings of the twenty-second dynasty, the first of whom—Sesonkhis—is denoted by the same appellation of "subduer of the Menahom," or Syrian shepherds, that is ascribed to Thothmes IV., the Pharaoh of the Exodus, and among the portraits of whose captives that of the "Melech Judah" is represented with arms bound behind him, and with a face in which the Jewish features are as decided as is the expression of dismay and alarm which they are intended to betray. No great building epoch is recorded as intervening between the capture by Shishak, king of Egypt, and that by Joash, king of Israel, 150 years later, when the record of the demolition of 400 cubits of the wall of the city between the Gate of Ephraim and the corner gate affords a means of, to some extent, identifying the wall raised by David with that repaired by Nehemiah.

Uzziah, the eleventh king of Jerusalem, of the house of David, appears to have repaired the damage effected by King Joash, during the reign of the unfortunate Amaziah. "Uzziah built towers in Jerusalem at the corner gate, and at the valley gate, and fortified them. Also he built towers in the desert. . . . And he made in Jerusalem engines, invented by cunning men, to be on the towers and the bulwarks, to shoot arrows and great stones whithal." It seems hardly to be expected that we should now be able to distinguish the work of King Uzziah, whose long and glorious reign, ending in a cloud, was succeeded by that of his son Jotham, the fourth builder king, who "built the high gate of the House of the Lord, and on the wall of Ophel he built much." The former, the great eastern gate of the temple, now lies in undistinguishable fragments against the eastern wall of the Haram; of the latter it is probable that the foundations may be those of a wall now under course of examination.

After the idolatrous and unfortunate reign of Ahaz, whose extinction of the Lamp in the Temple, on the 17th Thamuz, is yet commemorated in the Jewish almanack, Hezekiah, the fifth builder-king, repaired and reopened the temple. "How he made a pool and a conduit, and brought water into the city," as recorded in the Book of Kings, is more minutely explained in the Book of Chronicles, by the expression that "he stopped the water-course of Gihon, and brought it straight down to the west side of the city of David." As it is added that he prospered in his works, and as a reason given for his "stopping" the water-course is, that it should be rendered unavailable for the supply of the army of Sennacherib with water, we may, perhaps, conclude that the diversion of the stream was connected, after filling tanks or basins, with the sewerage of the city. We can hardly fail to find traces of the work of Hezekiah, of which the locality is thus distinctly indicated.

Sixth and last of the builder kings of the line of Judah was Manasseh, the fiftieth and the longest reigning monarch of the dynasty. After his capture by a king of Assyria, whom the recent discoveries at the British Museum enable us to denote by the name, as at present read, of Ashur-bani-pal (a king whose cuneiform records mention a king of Judah as his tributary), Manasseh, on his restoration to his kingdom, "built a wall without the city of David, on the west side of Gihon, in the valley, even to the entering in at the Fish-gate, and compassed about Ophel, and raised it up a very great height." This wall, built at the foot of the hill, enlarged the area of the city towards the west. The wall now in course of uncovering at Ophel may bear traces of the labour of Manasseh, as well as of that of Joash. It abuts on the Haram wall, but shows, by not being bonded into that colossal structure, its later date. We have no further record of building at Jerusalem before the siege by Nebuchadnezzar.

The city of Jerusalem was captured by Nebuchadnezzar, king of Babylon, in the nineteenth year of his reign, on the 10th day of the month

Tamuz, after a siege of eighteen months, 467 years after its capture by David, of whom Zedekiah, the twenty-first king of the line of Judah, was the descendant in the seventeenth generation. On the 9th day of the succeeding month of Ab, being the sixth day of the week, the captain of the guard of the King of Babylon "burned the house of the Lord, and the king's house, and all the chief houses of Jerusalem," and "brake down all the walls of Jerusalem round about." Those familiar with military demolition must be aware that, in the absence of gunpowder, it would have been impossible to obliterate, or even to level, works of the character attributed to the building monarchs of Salem, excepting at a cost of labour and of time nearly equal to that required for their erection, and that such an overthrow and ruin of the bulwarks of the city as would render its walled interior accessible at all points, over the heaps of rubbish surrounding the bases of the ruined walls, was the utmost that we can suppose to have been effected by the forces of Nebuzaradan.

We find accordingly, that when, in the twentieth year of Artaxerxes Longimanus, king of Persia, his cup-bearer, Nehemiah, a noble of Judah, who was made Jirshatha, or governor of Jerusalem, commenced the restoration of the walls of the city, he found no difficulty in tracing their course, even though he viewed it in the first instance by starlight, in the absence of the moon, then in her last quarter.

The description given in the unrivalled portion of the autobiographic history of the Hebrew prince enables us so distinctly to understand the course of the external wall of Jerusalem at the period of the capture of the city by Nebuchadnezzar, as to feel assured that patience alone is requisite to enable the officers of the present survey to trace the remains of the imperishable foundations. The discrepancy between the period of fifty-two days mentioned by Nehemiah, for the finishing of the wall, and that of two years and four months, stated by Josephus, with the check of the dates of the 25th and 28th year of the monarch improperly styled Xerxes in our present copies of the Antiquities, may be understood by reference to the expression (Neh. iv. 6) "unto the half thereof;" the wall being just raised to a height sufficient to exclude casual assassins by the 25th day of Elul, J.P. 4267, and being afterwards raised to the full height attained by the work of Nehemiah, and consecrated on such completion, on the 25th of Cisleu, J.P. 4270, which day, in that year, fell appropriately on the Sabbath.

The key to the topography of the Book of Nehemiah is furnished by the Gospel of St. John (v. 2), where it states that there is (or was at the date of the composition of that history) "at Jerusalem by the sheep [gate] a pool, having five porches." This gate opens on the road from Bethany to the city. Starting from this point, now called the Gate of St. Stephen, the wall took a northerly or north-westerly direction to the tower of a hundred cubits in height, called the Tower of Emath or of Menh, thence, bending to the westward, it ran by the Tower of Hananel to the *Porta Piscium*, which, as commanding the only road by which fish was likely to be brought for the supply of the city, may probably be identified with the line of the Damascus Gate. This portion of the wall must have been on the line originally built by David or by Solomon, and a portion of megalithic channelled masonry has recently been exposed close by the present Damascus Gate. The sites of the *Porta Fetus* and the *Porta Ephraim*, and the question as to the identity of the former with the corner gate, await some further elucidation, the wall between the Gate of Ephraim and the corner gate having been previously repaired by King Uziah for the length of 400 cubits. Towers had also been erected by that monarch to strengthen the corner gate and the *Porta Vallis*, which latter, as its name imports, must have stood in the valley at the foot of Zion; but the western wall of the city, from Gihon to the Fish Gate, had been built by King Manasseh, and as that monarch is also said to have compassed about Ophel, it is probable that the whole line of wall west and south of the city, and returning northward to the recently discovered junction with the original wall of the Temple enclosure, dated from the restored power of that king, and was raised by Nehemiah upon the work of the sixth builder sovereign. The *Porta Vallis*, the *Porta Strepituum*, the *Piscina Subæ*, the steps to the ancient citadel, the second pool, the fort, the double bending of the wall, the water-gate to the east, and the tower gate, are all defined points which

the present explorers of the Holy City will be able, if properly supported, accurately to determine.

The comparison of the account given of the rebuilding of the wall of Jerusalem with that of the course taken by the two bands of priests who perambulated the bulwark on the day of its consecration, when thus applied to known topographical facts, leads to one of the most interesting discoveries which has resulted from the recent study of the subject. South of the Sheep-gate, and south also of the *Conaculum Anguli*, or north angle of the Haram wall, is the gate called in the Vulgate the *Porta Judicatus*, in the first passage, and the *Porta Custodia* in the second. Meeting in this gate, the two companies "stood in the House of God," with the northern courts of which the Golden Gate must have naturally communicated. The date and character of this unique piece of architecture will appear from the following considerations.

Permanent ownership of land was one of the most marked institutions in the Hebrew law of the time. The history of Ahab shows the difficulty experienced by even a sovereign in the attempt to appropriate a portion of land required for the completion of the enclosure of the royal palace. In inquiring for the site of the king's house built by Solomon after the completion of the Temple, and for which he left the City of David (2 Par. viii. 11), we are thus naturally directed to examine the locality of the land purchased by King David of Ornan or Arannah the Jebusite, "in Mount Moriah" (2 Par. iii. 1), on a portion of which the Temple was erected. The vast walled area of some 1,800 ft. by 900 ft., rising like an enormous altar from the very bottom of the Kedron and of the Tyropean valleys for a height (recently proved) of more than 150 ft., is identified with the enclosure of Moriah not only by the tradition of the spot, by the unmistakable evidence of the megalithic masonry, and by the relative position with regard to the other points topographically determined, but also by the minute details given by Josephus, and by the description to be gathered from the passages in his writing (Ant., xv. xi., 3; and Bell., v. 2), stating that the *enclosure* of the Temple and of Antonia was double of the (approximate) square occupied by the courts of the former. The length of the stadium mentioned by the historian must be determined by the fact. As to the position of the walls, and proportion of the enclosure, the colossal masonry bears unequivocal witness.

North-west of the Temple cloisters, and thus occupying half of the artificial summit of the hill, was the building which the High Priests Jonathan and Simon "made stronger by very high towers" (Ant., xiii. v. 11), and which became the only citadel of Jerusalem after the demolition by Simon of the fortress raised by Antiochus Epiphanes, on Acre, with a purpose similar to that with which Philip II., or his lieutenant Alva, built the citadels of Antwerp and of Naples. Hyrcanus added a tower. The filling in of the Tyropean valley with the material derived from the lowering of Acre by three years' labour under the pontificate of Simon, has been recently verified by Lieut. Warren. The Antonia of Herod was, we are distinctly told by Josephus, a rebuilding of the stronghold of the Amonean kings (Ant., xviii. 4. 3). If the consideration of the permanence of landed ownership be yet considered as inconclusive to identify the spot with the Palace of Solomon and his descendants, a further link is supplied by the reproaches recorded by the Prophet (Ezek. xliii. 8) against these princes for "setting of their threshold by my thresholds, and their post by my posts, and the wall between me and them," a passage most clearly descriptive of the relative positions of the Temple and the royal palace.

Tracing, then, the occupation of the northern half of Moriah from Herod, through the Amonean princes, to the kings of the house of David, and thus determining the position of the new palace of Solomon, the character of the *Porta Judicatus* seems to leave no doubt of its being great judge, even the porch for judgment," of the great king. After the completion of the new cloisters by Herod, the *Sica Solomoni* is mentioned by the fourth Evangelist; and as it is certain that no work attributable to the second builder-monarch would have remained at that time in existence on the summit of Moriah, it is most natural to attach the name to that porch

or entrance, of wonderful beauty of execution, marked by colossal stones, on which a false rustication has been wrought (as if to render an earlier work harmonious with the noble rustication of the lower wall), which must have given access to the enclosure of the palace and to that of the House of the Lord. The substitution of a porch, or open and canopied tribunal, for the tree under which the throne of the Eastern kings was erected for the most ancient sessions of a species of Court of *Pie-poudre*, or summary royal justice to every applicant, has a close parallel in the arched and canopied porch which the Crusader, Charles of Anjou, erected in his city of Sorrento (where the ancient arms of France, with the *brisure* of the red Angevin label, are yet distinctly visible), the Oriental character of the singular building recalling forcibly the idea, from which the Crusading king may have derived his plan, of the Golden Gate. As this entrance from the northern courts of the Temple to the road to Bethany, in the same way that the nearly adjoining Sheep-gate led from the interior of the city towards the same suburb, the reference in the passage quoted (John x. 23), and that in the Acts of the Apostles (iii. 2-11), in which the *Porta Speciosa* is identified with Solomon's Porch, are most simple and natural. The inexplicable character of the Golden Gate, its rare beauty of workmanship, its colossal stones, its quasi-subterranean position, now that the upper buildings of the Temple itself have been cast into that vast accumulation of *débris* that fills up the valley of the Kedron to the depth of 70 ft., cease to perplex the mind, when the structure is thus regarded as the Porch of Judgment, a building which retained its designation unaltered from the time of Solomon to that of Nehemiah, which was spoken of as "Solomon's Porch" by the Apostles, and which, giving entrance both to the palace and to the Temple, is situated in the very spot appropriate to its name and use. (See 1 Kings xxiii. 10; 2 Samuel xix. 8; Ezek. xli. 1, 4.)

It is necessary to refer to the restoration of the Holy House by Zerubbabel, as it will be soon perceived that no possible relic of this work can now remain *in situ*, and that the only imaginable connexion still traceable between the buildings of the first, the second, and the third temples, is to be sought in the Golden Gate, and in the massive structure of the Haram wall, with its yet remaining gates and vanils.

Of the noble works of the princes of the Amonean dynasty, at least in Jerusalem itself, we can look for no distinguishable trace, although the protracted and herculean labour by which they not only demolished the citadel built by the Great Persecutor of their countrymen on the summit of Acre, but reduced the height of that mountain itself, until it was below the level of the buildings that crowned the height of Moriah, has left evidence in that filling up of the Tyropean valley through which shafts have recently been sunk by Lieutenant Warren. We must pass, therefore, in our investigations over the 400 years that separated the rule of Nehemiah from that of Herod the Great, and even then we must pause with astonishment at the evidence of the thorough destruction effected by the legions of Titus. But traces must be certainly discoverable of the wall which surrounded the fourth hill, called Bezetha, the foundation of which was laid by Agrippa, in the reign of Claudius Cæsar, and which was afterwards raised to the height of 20 cubits. This, the third wall of Joshua, cannot, from its position, be confounded with any more ancient fortifications. On its line were built, by Herod, the great octagonal tower of Psephinus, at the north-west corner, and Hippicus, 25 cubits square, hard by, while the foundations of Psephinus, 40 cubits square, and of Mariamne of half that size, must still remain in the vicinity to mark the site of the older, or first, wall.

The utter destruction effected by Titus is witnessed at this distance of nineteen centuries by two striking facts, which the recent exertions of the survey have brought into full light. One is the relative level of the present surface of Moriah as compared with that of Acre, from which it is clear that the actual level of the area of the Haram enclosure must have been reduced far below that to which it had been raised by the Idumeans, and even by the Amonean kings. The second is the corresponding indication afforded by the immense mass of *débris* now covering the lower half of the existing wall of the mountain, which raises the level of the Kedron by more than 70 ft., and throws

the present false channel of the brook proportionally to the east of its natural course. The obscure passage in which Josephus speaks of the raising of the Temple 20 cubits by Herod, and of the rebuilding of this additional work, after the foundation had given way, by Agrippa, would not inappropriately describe the raising of the whole platform on the summit of the enclosed hill. But however high Solomon and his successors may have piled story upon story, each of which thus successively became subterranean, and was excluded from the light of day, the lofty cloister, with its spiral columns and Corinthian capitals, the ascending courts of the Temple, and the structure and site of the Holy House itself, have been so ruthlessly swept into the valleys at the foot of the yet existing Haram wall, that we can expect to derive but little information from investigation of the present domed surface of the hill; nor can we have any reason for attempting to connect the rock which in one spot protrudes, with any known feature of the destroyed sacred buildings. A pile of 70 ft. in depth of rubbish must be composed of the ruins of works more massive than those of the cloisters and the Temple alone; and the height now wanting to enable the observer on Moriah to look down on the summit of Aera may enable us to form some idea of the manner in which not one stone of the upper structure of the altar-mountain has been left upon another.

Later than the eleven, — or, including the hostile citadel of Aera, the twelve,—building epochs of Jerusalem above pointed out, are five distinct periods of less striking interest, of each of which we may expect to find some definite trace before we arrive at the last 600 years of Moslem rule and squalid neglect. Fifty years later than the siege by Titus, the relics of the work of Hadrian may be recognised, where lighted on, by deeply incised, rude Roman letters, by coarse cornice-work, by representations of human or of animal life, or by pagan emblems. Two hundred and ten years later the marks of the handwork of Constantine the Great; still later those of the Pagan Julian, and of the Christian Justinian, are fertile subjects of controversy. After 300 years of Christian occupation and architecture follow 460 years of Saracenic rule, the Arabic inscriptions, and the Mauresque style of which period are also the subjects of technical contention. To the succeeding ninety years of the Crusaders must be attributed all heraldic emblems, crosses of the Knights of the Temple and of the Knights Hospitaliers, inscriptions in Franco-Latin, and no doubt the cross, somewhat resembling that famous cross of Toulouse under which the followers of Raymond de St. Gilles flocked to the first crusade, which has been recently disinterred without the Damascus Gate. Finally, after the conquest by Saladin, we must look for Arabic, and then later for Turkish relics alone. A clear and close application of the rules above indicated as to the locality and characteristics of the sixteen, or, including Antiochus, and distinguishing the Turks from the Arabs, the eighteen, epochs of the architecture of Jerusalem will lighten the labour of the survey, and attach fresh interest to each successive discovery.

With regard to the yet undiscovered tombs of the kings of the house of Judah, to the description of which the remarkable group of monuments north of Bezetha in no way corresponds, it may be remarked that David and ten of his successors were buried in the royal sepulchres in the City of David, that is to say, in the original citadel of Zion. So little is said of this ancient fortress after Solomon removed his residence from the spot (2 Par. viii. 11), that it may be imagined that the site was chiefly venerated as that of the royal mausoleum, looking down, like the last resting-place of the princes of another line who bear the empty title of Kings of Jerusalem, from the magnificent Saperga, in solitary grandeur. Four of the dynasty of David are recorded in the Book of Chronicles as buried in the citadel, but not in the royal sepulchres; and two were entombed in the garden of the palace, or in the Garden of Uzza, which, from the denunciation of the prophet Ezekiel (xliii. 7-9), must have been within the walled precincts of Moriah. The remaining four monarchs of the race were not borne to the sepulchre of their fathers. The founders of the Assyrian dynasty were buried in their own city of Media, and the magnificent Herod was entombed as Herodion; so that the existing tombs of the kings, situated far beyond the limits of the City of David, and of the palace and enclosures

of the later kings, remain a problem of which the solution regards a yet higher antiquity than the consecration of the Holy City as the resting-place of the ark of God.

SYNOPTIC VIEW OF THE BUILDING EPOCHS OF THE CITY OF JERUSALEM FOR 4,000 YEARS.

Epoch.	Julian Period.	An.Urb. David.	King or High Priest.	Locality.	Nature of Work.	Characteristics.
I.	2533 3670	...	Melchizedek David (I.)	Zion	Wall on brow; condit. Storms and captures Zion.	Cyclopean masonry.
II.	Zion	Tomb; wall; fort.	Excavated tomb.
III.	3703	33	Solomon (II.)	Moriah	Wall of Mountain; Tem- ple; Palace; Porch of Judgment; ascent to Temple.	Rustic masonry work; shouldered arches; bridge; characters written in quarry.
	3749	79	Seeoukhoris, 1st king of 22nd (Buhastite) dynasty	...	Takes Jerusalem and breaks down wall, 400 cubits.	
	3986	228	Joash, 12th king of Israel	...	Takes Jerusalem and throws down walls; anno Sabbatico.	
IV.	3913	243	Ac. Uziah (XI.)	Lower city	Towers; corner gate; valley gate.	Position of gates.
V.	3985	295	Ac. Jotham (XII.)	Ophel Moriah	High gate of Temple.	Foundation of wall. Obliterated.
VI.	4011	341	Ac. Hezekiah (XIV.)	Lower city	Pool; wall repaired; con- duit.	Conduit.
	4059	289	Ashur-hani-pal, king of Assyria	...	Takes Jerusalem.	
	4137	467	Manasseh (XV.) Nebuchadnezzar, king of Babylon	Zion, Ophel	Wall; Burns Jerusalem and breaks down wall.	Base of hill; First wall of Josephus.
VII.	4137	467	Zerobabel	Moriah	Temple rebuilt	Obliterated.
VIII.	4193 4267	523 597	Nehemiah	Zion, Moriah, Lower city	Circuit of wall and gates	Hasty re-construction; position of wall.
	4544	874	Antiochus Epiphanes	...	Takes Jerusalem, and builds citadel.	
IX.	4547	877	Judas Maccabeus	Aera	Citadel Recovery and rebuilds wall.	Obliterated.
	4551	881	Antiochus Eupator	...	Takes Jerusalem, and throws down walls; anno Sabbatico.	
	4591	891	Jonathan, 53rd High Priest	Zion and Aera	Wall built between; re- builds and fortifies wall	Position of foundation.
	4685	895	Simon, 54th High Priest	Aera	Levels summit.	Filling Tyropoeon val- ley.
X.	4670	900	Hyrcanus, 55th High Priest	Moriah	Builds tower.	Rebuilt as Antonia.
	4651	981	Pompeius Magnus	...	Takes Jerusalem.	
	4674	1004	The Parthians under Pacorus	...	Take Jerusalem.	
	4677	1017	Sotius and Herod	...	Take Jerusalem.	
XI.	Herod, 1st Idumean king	Moriah Lower City	Town of Antonia, clois- ters, temple re-built, passage, four towers.	Margalithic stone, not rusted; measured bases of towers; similarity to work at Herodion.
XII.	4753	1083	Agrippa, 4th Idumean king	Bezetha	Foundation of wall north of city.	Third wall of Josephus.
	4753	1113	Titus	...	Takes and levels Jeru- salem	
XIII.	4831	1161	Hadrian	Moriah, City	Wall; gates.	Altars; deeply incised rude Roman letters; Pagan emblems.
XIV.	5043	1373	Constantino	Without wall	Church of Holy Sepul- chre.	Crosses; Christian in- scriptions; cruci- form plan of founda- tion.
	5066	1396	Julian	Moriah	Work on Gates.	Romanesque style.
	5199	1549	Justinian	...	Recovers Jerusalem.	
	5327	1657	Chosroes, king of Persia	...	Takes Jerusalem.	
	5341	1671	The Emperor Heraclius	...	Recovers Jerusalem.	
	5349	1679	The Caliph Omar	...	Takes Jerusalem.	
XV.	Moriah	Mosques.	Arabic inscriptions; Mauresque style.
	5399	2139	The Crusaders	...	Take Jerusalem.	
XVI.	Temples and Hospi- tallers' crosses; in- scriptions; churches, monasteries, walls, Arabic inscriptions.
	5699	2239	Saladin	...	Takes Jerusalem.	
XVII.	Saracens.	
XVIII.	6166	2496	Turks.	

THE ASH.

The ash (*Fraxinus excelsior*) is one of the most beautiful trees of our flora: it never possesses the rugged grandeur or attains to the gigantic proportions of the oak or the beech; but its loveliness and grace more than compensate for its lack of size and majesty. The timber, though little used for building purposes, is invaluable for special manufactures, and the life-history and associations of the ash are second to no other tree.*

At every season of the year the ash presents something worthy of close study, both to the naturalist and the artist. During the winter months the flowers are packed in rather large jet-black buds, which in April (and before the leaves appear) become ruptured, and an abundance of small thread-like golden flowers are thrust out. They soon become detached, and are then blown about in the air. They are at first sight not very easy to understand; for at times they are either wholly male, wholly female, or may be hermaphrodite. Taken in masses, however, they form radiating groups of yellow threads, with clubbed tops. When the tree is in

fruit in the autumn the well-known "ash-keys" take the place of the flowers, both flowers and fruit being always abundant.

The pendulous foliage of the ash appears late in the spring, and is known to every one for its surpassing grace and beauty. After being studied in detail for form and colour, the character of the foliage as a whole is perhaps best seen during boisterous and stormy weather. It is then that the lovely curves of the branches, and the lightness and grace of the drooping leaves, are best exhibited. The waving to and fro of the limbs, and the alternate display of the dark upper side and the lighter under side of the foliage, is very striking. The ash is very late in coming into full leaf, and is one of the most susceptible of trees to the frosts of autumn: in fact, the first severe frost of the year will frequently strip every leaf from the tree. It is, therefore, seldom that any autumnal change of colour, so remarkable in the beech and other trees, is to be observed in the leafage of the ash. Every one who has noticed groves of trees at the fall of the year must have remarked that it is no uncommon thing during the late autumn or early winter mornings to see an oak tree in nearly full leaf with every leaf and branch silvered with a thick hoar-frost, presenting one of the most beautiful sights it is possible to

* For descriptions of the oak, yew, beech, elm, &c., see previous numbers of the Builder.

imagine; but the effect of the frost on the ash is to lay every leaf in a thick carpet under the tree. When denuded of leaves the aspect of the tree is very variable, and often grotesque in the extreme. The odd shapes it sometimes takes, its chiroscrous bark, black leaf and flower buds, and curious parasites probably had considerable influence in the formation of the astonishing beliefs held by country-folk in the olden times regarding this tree.

The timber of the ash is noted before that of every other tree for its remarkable toughness and elasticity; it is superior to lance-wood for most purposes, because it will not suddenly snap, as the latter wood is apt to do; it is chosen invariably for all gardening and agricultural implements; it is frequently used by carriage-makers, and is not unknown as a building material, at least one odd staircase in this country being wholly formed of it. In ancient times its toughness and elasticity recommended it for the shafts of spears; in more modern ones for the staves of Alpine climbers, and for the horizontal bars of the "flying trapeze," on which the "Brothers Idiots" disport in the latter situation its springy and elastic character is seen to great advantage. It is said that a bar of ash-wood will bear a greater strain, without breaking than a bar of wood taken from any other European tree.

The parasitic creatures and plants peculiar to this tree are comparatively few in number, but the ash is very subject to attacks from the vagabond class of parasites, the members of which order are ever ready to fix on the vitals of any tree: one of the most striking is certainly the gigantic *Polyporus squamosus*; it is more frequently found on the ash than upon any other tree; sometimes it grows at the base amongst the grass and wild plants, almost out of sight; and at other times it affects the very summit; it sticks out like a huge shelf, and one instance is on record where the parasite attained a circumference of 7 ft. 5 in. It is common on ash trees every where; its spawm infesting the wood, and predicting speedy death. An allied species, *P. fracticosus*, which is quite peculiar to the ash, and at times attains a circumference of 9 ft., is very common in some districts, but for some unexplained reason it never occurs near London; it is similar to the huge *Polyporus* that attacks the elm, which is abundant in some districts; but although the elm is so common everywhere in the neighbourhood of London, the parasite never puts in an appearance. More singular than either of the foregoing, but far less common, is the "cauliflower Hydnum;" it is but rarely met with in this country, but when it does occur its appearance is so striking that the most unobservant person would not be likely to pass it unnoticed: in colour and form it is exactly like a large cauliflower; for food it is as good as the meadow mushroom. One of these curious objects grew on the extreme top of a very old ash this autumn not far from the "Cat" Inn, at East Barnet; with the assistance of a gardener and a high ladder we succeeded in detaching the specimen, and (after dissection) testing its edible qualities, which we found excellent. On very old ash trees, and on dead ash trunks, may often be seen jet black hemispherical bosses, 2 in. or 3 in. in diameter; old trees are frequently covered with these singular things, which are peculiar to ashes, and are known under the name of *Hypoxylon concentricum*. There is, too, a very curious flecked agaric to be found on this tree (*Lentinus Dunali*): last autumn we saw a tree on Stamford Hill covered from top to bottom with this curious plant; it is said to be rare.

When the fruits of the tree fall to the ground in the autumn, there are two species of fungi ready to attack them and prevent their germination, and what is most singular is the fact of these species being never found on anything else but ash-trees; there are also five species ever ready to attack the twigs and fallen branches.

There is a very singular growth of ash branches called by country-folk "stags' horns," in which the smaller branches are curiously flattened, having a width of about 2 in. or 3 in., and a thickness of $\frac{1}{2}$ in. only. At times this growth is not uncommon; we have frequently gathered specimens. Round holes, 2 in. or 3 in. in diameter, may often be seen pierced right through ash trunks and branches: they are made by the woodpecker. The roots of the ash (which are generally close to the surface) are usually very much knotted, and full of singular knobs. These are much valued for fancy cabinet-work. The *manna* of our markets is obtained from a near ally of the ash.

The ancient (and, indeed, the modern) beliefs

regarding the ash-tree are most remarkable. Given trees, through which ruptured children have been passed, are said to be common all over the country; but we have not met with them in our visits to ash districts. The old Northern mythology represents the earth as resting on a mighty ash-tree. The court of the gods was said to be held under an ash, and, in fact, that man himself was made from the ash. We read in old books that it was at one time a custom in this country for a new-born child to be made to drink of ash sap for its first draught. The feat was managed by getting a green branch and firing one end, to cause the sap to exude from the other, which, on being caught in a spoon, was administered to the child. Another curious custom, to avert evil from cattle, was (and is), to bore a hole in an ash-tree, and immerse a poor living shrew mouse in the cavity.

An old Elizabethan author, referring to this tree, says,—"The leaves of this tree are of so great a vertue against serpents, as that the serpents dare not be so bold as to touch the morning and evening shadows of the tree, but shuneth them farre off," and, in another place, that "the serpent being perced in with boughs laid round about, will sooner runne into the fire, if any be there, (t) than come neere to the boughes of the ash."

There is a very curious and ornamental variety of the ash common in parks and gardens, called the "weeping ash;" it has pendulous branches, which, on springing from the stem, make direct for the earth, sometimes in nearly a straight line; it is no uncommon thing, however, to see one of these trees, as it were, change its mind, and instead of sending its branches downwards, send them all, or half of them, straight upwards. The first weeping ash came up by accident from a seed, in a garden in this country about a hundred years ago.

The mountain ash, which is such an ornament to our parks and suburban gardens, with its masses of red berries in the autumn, belongs to the Rose family, and is in no way connected with the "common ash;" a similarity in the foliage probably suggested the popular name.

WORTHINGTON G. SMITH.

SYSTEMATIC PROPORTIONS IN ARCHITECTURE.

THE ARCHITECTURAL ASSOCIATION.

The ordinary meeting of members was held on Friday evening (the 20th December), at the House in Conduit-street, the president, Mr. R. Phéné Spiers, in the chair.*

The Chairman, in calling attention to some of the prize drawings which had been exhibited at the Royal Academy (and which were now shown in the room), observed that it was a subject for congratulation that all the students of architecture who had taken prizes at the Academy were members of the Association, including Mr. Gover, who had obtained the travelling studentship, and Mr. H. S. Wood, Mr. Morley, and others, to whom silver medals had been awarded.†

Mr. W. White then read a paper on "Systematic Proportion in Architecture," in the course of which he enforced the desirability of procuring general harmony of outline as well as of subdivision in buildings; and these, he contended, could not be obtained without a careful ground plan, drawn according to geometrical and arithmetical ratios. He was aware, he said, that exception might be taken by those who objected to a mechanical instead of a mental process; but he held that the most subtle eye and the most adroit hand could not regulate the proportions of a building without the aid of mechanical deductions. A school of architecture would, he thought, effect much towards accomplishing this object and establishing a national

* The following gentlemen were elected members of the Association.—Mr. S. Wall, Duke-street; Adelphi; Mr. C. E. Burt; Mr. F. W. Gritten, St. George's-road; Mr. A. Lockwood, Tooling; Mr. R. Rakes, Gloucester-street, Finsbury; Mr. T. W. Cutler, Winchester-street, Finsbury; Mr. E. E. Smith, Parliament-street; Mr. W. Oakley, Charles-street, St. James's; Mr. F. Mellor, Engineer's Office, London and North Western Railway, Euston Station; Mr. E. G. G. Lowe, Marylebone-street; Mr. R. E. Howard, Clapham Park-road; and Mr. R. E. Smiles, Denbigh-street, Finsbury.

† Touching the travelling studentship at the Academy, it has been complained to us that the drawings of the unsuccessful competitor, Mr. E. H. Fahey, were hung for inspection much less advantageously than those that were awarded. We are not in a position to speak of this; but, having seen Mr. Fahey's drawings, can, at all events, say that they are a very creditable set.

and feasible system. The early architects seemed to have worked by the equilateral triangle and the square, as an examination of their works showed that nearly all their buildings were made to work according to those mathematical outlines. Mr. White exhibited a number of drawings to prove this hypothesis, and explained, with the aid of the black-board, the theory which he advocated. His views have already been set forth in print.

Mr. Blashill observed that the most interesting portion of the question was that which related to its practical working. It might, he thought, be taken for granted that every one who designed a building had some system to go upon. Modern architects worked by feet and by inches, and to a much closer scale than there was reason to believe the Mediaeval architects did; but in his opinion the reason the equilateral triangle was found so frequently in their buildings was, that it was a form which could be most easily struck by the compass. In church building it was by no means so to suppose that the architects of the middle ages determined their proportions by the number of worshippers, the nature of the ceremonials, and so forth. But even if these considerations did not offer the true solution, he would like to know why a slight departure from the canons of symmetrical proportion, as laid down by Mr. White, should injure the design of a building. He owned that, after listening attentively to that gentleman, he still failed to get a clear notion of any fixed principle which guided ancient architects in the pursuit of beauty. He was quite willing, however, to express his agreement with Mr. White in the necessity of careful study of the ground-plan, without which it would be impossible to attain that harmony and repose so essential in all architecture, but more especially in church-building.

Mr. L. W. Ridge expressed his concurrence in the soundness of the propositions laid down by Mr. White, and gave it as his opinion that the architects of the most famous churches of the best period of art worked by the equilateral triangle and the square. He instanced the Abbey Church of Westminster as a case in point.

The Chairman was of opinion that the ancients were guided in the designing of their buildings by certain rules of proportion, although they had not the mathematical instruments and scientific advantages of those who followed them. It was, he thought, to be regretted that in the present day the study of proportion did not receive greater attention, and if the establishment of a School of Architecture would effect that object, he would be glad to see it. If, as asserted by members of the Gothic School, there was no proportion in that style, how, he asked, was that careful study and measurement of Gothic buildings proved that the architects of them had worked to certain proportions? This argument alone showed the want in our own day of a true understanding as to the manner in which architects should pursue their studies. For his own part, he could say that he always found the greatest assistance from having learned a certain system of proportion. In practice, also, he found that this knowledge enabled him to work much quicker.

Mr. White thought that Mr. Blashill had himself answered his own argument. What was wanted was—not that one man should be able to build a thousand churches, but that we should have a thousand men competent to build them.

The Chairman announced that a special meeting would be held on the 8th of January, for the purpose of resuming the discussion on concrete dwellings.

It was also proposed on an early day to pay a visit to East Sheen, in order to inspect the concrete houses built there by Mr. Blomfield.

HOW TO DEAL WITH "GREEK FIRE."—Amid so many Fenian alarms (more than there are sufficient grounds for), a reassuring voice is heard from Dr. Henry Medlock, who is satisfied that "Greek fire" is not so dangerous as it has been represented to be. It consists of phosphorus dissolved in bisulphide of carbon. When thrown upon any combustible material the liquid rapidly evaporates, and the phosphorus then bursts into flame, evolving suffocating vapours of phosphoric acid. Water will only temporarily extinguish the flame, which bursts out again when the water dries up; but the so-called Greek fire may be immediately and permanently extinguished by a solution of common washing soda,—one pound to a gallon of water.

DOMESTIC ARCHITECTURE OF MEXICO.

The Domestic Architecture of a people is a very interesting subject of investigation and inquiry. In the earliest ages man's wants and necessities were of the rudest and most primitive character, originating in the desire for protection from the inclemency of the weather, and from its ravages and attacks; and it is curious to observe how very similar are the ideas that prevail, how alike the hut of the ancient Briton to the wigwam of the American Indian, and also to the huts that now exist in many parts of Ireland, and even in some of the poorer agricultural districts of England and Wales, even in these days of the popular outcry for improved labourers' cottages. The first want of mankind, even in a barbarous state, after satisfying the cravings of nature, is to seek a shelter for himself and progeny, and to proceed to construct it of the first suitable material that comes to hand, that can be easily converted and rendered available, and fashioned with tools of the very rudest kind, made of stone or hard wood, or principally spced by hand. We cannot wonder at the rough and uncouth erections that have existed from the earliest ages.

The relative position of the architecture of a country is looked upon as a type of its state of civilization; and, where the principles of construction are unknown, or but imperfectly practised, that nation must be in a state of semi-barbarism, and its only hope to emerge therefrom is by the aid of spreading knowledge and as the arts progress, and some system is developed founded upon certain laws of proportion, and upon correct rules, deduced from an analysis of what is suitable to attain the end proposed.

As nations emerge from barbarism to a state of civilization, it will be found there are many different stages or grades of construction practised, suitable to their wants and knowledge at the time, and, as they progress in wisdom and skill, it assumes amended shapes and forms adapted to the further requirements and necessities of the period, and thus it continues its onward movements, until it has culminated in the various systems and styles of architecture that now prevail in the various countries of the world.

Hence it is that the practice of architecture has led by its different treatment to the many varied forms it has assumed in the respective countries, modified, no doubt, in various ways by the advancing civilization of each country, but in each case its peculiarities are stamped upon their important works in succeeding generations, even up to the present period of time.

The styles of architecture of a country are also regulated in a great measure by other causes, the geological and physical nature of the country, and its resources in materials of all kinds suitable for different species of erections, and that in all cases must have governed the mode of construction; and as the resources of a country are developed and its productions gradually brought into profitable use, it assumes the endless variety of shapes and forms that characterise the buildings of ancient and modern times in all countries.

In many parts of Great Britain we have different varieties of construction, although the style of architecture approximates: in many districts where the prevailing geological formation is clay, bricks are extensively used, almost to the exclusion of stone, except in ornament and decoration, and its parts are frequently frittered away from ineffective design or petty details; and we have not availed ourselves of many new and improved shapes for bricks, as was expected when the duty was taken off, and the size and shape were not restricted. Again, in other districts good building stone of various kinds are situated on the geological formation, and handsome and even elegant erections of stone, characterized with greater boldness, adorn our towns and suburban districts. Therefore, the style of architecture of every locality and country is governed in some measure by the natural productions of that country and its capability to supply all the many diversified and necessary materials required in the erection of buildings.

The style of Mexican architecture is decidedly of the Spanish type, influenced by changes brought about by its gradual development and modern practice; and, although there are many remains of remarkable works distributed over the country executed by their much earlier predecessors, the Toltecs and the Aztecs, who

founded cities, made roads, and constructed large and enduring pyramids, and other wonderful erections now in ruins, and, having no previous monuments of older nations to guide and regulate their ideas, their works are necessarily impressed with the stamp of originality and novelty, and the changes above alluded to were doubtless occasioned by the early examples left them by those migratory tribes, combined with the inventions and discoveries of their later and more enlightened masters the Spaniards; and their works are chiefly remarkable for great space and boldness of plan, rather than from elaborate design and workmanship, in the façades of their principal buildings, cathedrals, and churches. The outline of their domestic agricultural buildings is generally flat and low; but the architecture is pleasing from its boldness and originality rather than from its constructive detail; and ornament being generally but sparingly used, the mass of the buildings, their arrangement, and mode of construction give the erections an appearance of solidity, safety, and convenience that compensates in a great measure for their want of elaborate display in ornament and workmanship.

But there are many exceptions in their cities and towns, where they maintain their well-known boldness of design in the general erection and plan, and their façades are elaborately ornamented in a style peculiar to themselves, and which appears to be in good taste and pleasing, of an interesting and novel character, particularly to the traveller accustomed to European systems of construction and details of execution; but we shall return to this branch of the subject in a future paper, in which we intend to treat fully of town and suburban residences, jot down their points of interest and advantages, and draw useful conclusions from an analysis of this peculiarly interesting subject, which is imperfectly known: at the present time our object is to draw attention to their agricultural buildings, and other subject-matter indirectly connected with them.

The agricultural buildings of Mexico consist of the "wigwam" or hut; the "rancho," and the "hacienda:" the latter means, in pure Spanish, "estate" or "farm;" hut in Mexico, where pure "Castilian" is not spoken, it is applied to the "casa grande" of the estate. The hut is the residence of the agricultural labourer, or Indian, employed to work on the estate, to cultivate the land, clear away the bush and trees, plough and sow the seed, and gather in the crops. But since the period of anarchy has predominated in that unhappy country, when they achieved their independence and threw off the Spanish yoke, in the struggle for power by the different petty chiefs, plunder and self-aggrandizement was the ruling motive, and agricultural pursuits were neglected, vast tracts of country were thrown out of cultivation, consequently the forest and bush now cover the ground where once flourished abundant crops of the varied productions of this part of the tropical zone.

At the present time, whenever it is determined to cultivate the land, a clearance is first effected of the bush and trees, and when all is cut down and effectually cleared, the Indians generally select the timber and poles suitable for the erection of huts and ranchos, and these are carefully moved on one side to a place of safety, and at the same time they also procure what "vines" or tendrils of parasitical plants they desire and are necessary in the erection of the buildings.

After the whole of the timber has been overhauled, and all suitable pieces selected, the waste timber and bush are then allowed a little time to dry, which is soon done effectually under the powerful rays of a tropical sun; the torch is then applied to the dry mass, and an extensive conflagration then takes place, lighting up the surrounding forest and country, and striking terror into the wild animals and serpents that abound in those districts.

On the complete destruction of the *débris* the ground is cleared, and means are at once taken to erect the hut out of the materials previously selected, and that is not a very lengthy operation. Small huts of trees, cut with short lengths of the branches, so as to form a fork, are placed as corner-posts of the building, and wall-plates are let into the forks of the corner-posts, and secured in their places by the tendrils of parasitical plants, more particularly the "lianas;" upon the wall-plates are erected the rafters for the roof, similarly secured to the wall-plates and ridge-pieces. Uprights are

placed for doors and windows, with heads and sills, and these are usually made of cedar boards; and the sides of the building are closed in with small poles, laid horizontally, and close together, and well secured with ties to the upright posts. After the framework of the building has been completed, they then proceed to cover in the roof with slight poles or laths, and this is covered thickly with thatch, made of the long tough grass of the country, made up closely in bundles, and laid closely and firmly together on the roof, and secured with ties to the laths, and framework of the roof. The floors are sometimes nothing but the bare earth, but red tiles are sometimes used, which are about 12 in. square and 2 in. thick, for the superior class of huts. These huts are occupied principally by the permanent class of labourers, or sometimes by peons that are located on the estate, to work out some debt contracted or punishment inflicted by the State; in fact, another name for slavery, as they seldom obtain their freedom as labourers, and drag on a miserable existence in perpetual bondage and servitude.

The wigwam is not so permanent or substantial an erection as the hut, and is used chiefly by the wandering Indians, who form a considerable class in that country; and their nomadic life is instilled into their very nature, "grows with their growth and strengthens with their strength," and cannot easily be abandoned; and when a tribe of Indians break up from their cantonments, they selfishly burn and destroy their old residences, so that no one may profit by their labour, or other wandering tribes reap the advantage of their toil and care.

The wigwam of the Mexican Indian differs but slightly from the ancient low hut of their British contemporaries, or other primitive people: timber is used for the framework of the building (if it can be called such), for the support of the roof; in fact, the erection may be looked upon almost as a roof with its base placed upon the ground and its sloping sides supported by rafters, and ridge-piece, wattled or covered with thatch made of the strong tough grass of the country, which abounds in low swampy places in the forests and prairies. Openings are left in the side to emit smoke, and which serves for ingress and egress, but so very low that it is necessary for them to stoop, or creep in on their hands and knees. The framework is secured together with lianas, that abound so extensively in the forests, and which are readily and cheaply procured, and afford the poor Indian the only known method to secure his primitive building together, or to prevent it from being washed away by the torrents of rain that sometimes prevail, or scattered abroad by the strong "norths" or hurricanes of those latitudes.

It is truly astonishing how well this simple mode of construction lasts; the long, tough, and enduring grass of the country, and the tendrils of the lianas, effect the object to which they are applied; the building continues for a long period well and securely tied together and roofed in, as an effectual protection to the destructive action of the elements.

And notwithstanding their usefulness, the lianas are some of the most beautiful and graceful of nature's varied productions; they intertwine and interlace the whole of the interminable forests together, and their large lily flowers hang in luxuriant clusters of blossoms and glitter in relief on the dark foliage of the trees, adding with numerous others equally graceful, diversified, and beautiful, to the splendid aspect of tropical forest scenery. The lianas are some of the most remarkable vegetable productions of the tropical world, and constitute an ever-varying feature in the forest scenes. They are sometimes so gigantic as to overtop the tallest trees, and descend again to the ground in vast festoons; they pass from one tree to another, and bind the whole forest together in a maze of living network, and their stems are often as thick as a cable of a man-of-war, and in consequence it is not possible to penetrate the recesses of a forest without the aid of the axe. Some become quite tree-like in the thickness of their stems, and often kill by constriction the tree which originally supported them, and when these have decayed the convolutions of the lianas exhibit an astonishing mass of confusion, magnificent in their luxuriance of foliage and flowers. No tropical flowers excel some of them in splendour, and they are seldom to be seen in our hot-houses owing to the difficulty of cultivation.

Having given a short account of the homes of the native Mexican Indians, we will give an epitome of their system of agriculture. As soon as the *débris* of the forest is consumed with fire,

and reduced to cinder and charcoal, the whole of the remains are spread evenly over the surface of the ground, and prepared for ploughing, &c.; the plan adopted is rather unique in its character, and may interest our readers. It is not on every occasion that ploughing is resorted to, but when it is the instrument used is cut and shaped out of some of the hard woods of the country, somewhat like the plough and plough-shares of this country, but there is not a particle of iron about them, probably on account of its scarcity and expense, and these ploughs are drawn by a pair of oxen, yoked together (which are usually fine animals); the yoke is formed and shaped out of a hard piece of wood, and is fixed on the horns, so that the point and force of draught proceeds direct from the head and neck, and not from the shoulder, as with us.

In the same way the Mexican Indian carries extraordinary heavy weights for many miles on his back, with a hand or strap passed across the forehead to support the weight, so that the whole weight depends on his head and neck, and his shoulders and arms are free to aid his locomotion.

The other instruments used are hoes something similar to those for hoeing sugar-canes in the West Indies, but larger than we use in this country, they are sometimes square and sometimes round on the blade. The above constitute the whole of the stock of materials required by the small Indian farmer to cultivate his land, and produce his abundant crops of sugar-cane, maize, tobacco, coffee, and other valuable crops. In some cases ploughing is not even resorted to, but the bush and underwood are burnt down, and they then proceed to plant the land with maize beans, &c., and it is so rich and fertile with the decayed vegetation of years that, in rainy seasons in particular, it produces magnificent crops of maize and other produce to reward the husbandman's toil and to support him in indolence, probably for a long period, or until the time arrives again for a similar effort to sustain the wants of nature or to replenish his exhausted exchequer.

The habits and mode of life of the Mexican Indians are very simple and rude: the chief furniture of the hut is a stretcher for a bed, and which is also used as a seat or table as may be required; they usually place a few stones together to be used as a hearth, and their cooking, which is customary of the poorest and most meagre kind, is prepared in rough earthenware vessels of native make.

Their favourite aliment is "tortillos," "tamales," "atole," "tiste," and "frijoles." The first is prepared from maize by the female Indian as follows: the corn is first soaked in water until it becomes soft; it is then ground to a powder on a smooth stone, when a little water is added, and it is worked flat with the hands, and which (although they are very expert) takes them some time to do. It is then baked over a wood fire in an earthenware vessel, and becomes somewhat like a pikelet. The "frijoles," which are a species of small black beans, are cooked in pots, thoroughly stewed and mixed well with lard, so as to be of a thick consistency, and on this light and weak diet the Indian and his squaw not only satisfy the wants of nature, but esteem it a luxury, and might possibly be the envy of the gods. And thus they drag on their simple unenlightened life, satisfied with the meagre blessings Providence has vouchsafed them, and the poorest productions of a soil and climate that are equal to the supply of the wants of the most refined and fastidious.

The "rancho" is the next least important building on the estate, and is used principally by superintendents, stewards, foremen, or men placed in authority over the ordinary labourers in the cultivation of the estates.

It is a less pretentious building than the hacienda; but, nevertheless, is a very important structure in the management of the business of the estate, and is usually situated at those points best adapted for the purpose.

It is sometimes built of stonework, and frequently of timber. In fact, built in a similar manner to that described for the hut; but there is more labour bestowed on the timber and its framing, and greater care is employed in its construction.

They use similar angle-posts with uprights at intervals, to serve for doors and windows, with a roof constructed of rafters, collars, and ridge-pieces securely framed and pinned together.

The sides of the building are sometimes closed in with small round poles, or wattled, and even close boarded, and the doors and windows

are usually made of pitch-pine or cedar wood. The roofs, which are thatched with the strong and durable grass of the country, are made to overhang considerably at the eaves, so as to protect the walls of the building from the wash of the tropical rains; and many of them have a pretty and interesting effect, particularly when situated in a picturesque situation, surrounded with choice and beautiful tropical trees, and the artistic effect is further occasionally enhanced by the addition of an ornamental verandah or portico formed of trellis-work, in which are entwined the many beautiful tropical creeping plants, such as varieties of the convolvulid, Virginia creepers, jessamines, and others of the lovely flowers that adorn our gardens and conservatories. We should think there are few countries on the face of the habitable globe to which Nature has been so bountiful in the best and most heauteous of her choicest productions, such as we prize so much and cultivate with such assiduity in our conservatories and ornamental gardens of our gentry, that flourish wild and luxuriant in that highly-favoured land; as if Providence, to counterbalance the bad propensities and dark deeds of her people, had lavished all her beauties, richest treasures on the floral world as some trifling compensation to universal society.*

WHO SPOILT THE PARLIAMENT HOUSES.

As Mr. Edward Pugin "declines to submit his case to any jury except that of the general public," I presume it is intended that each member of that rather numerous body should deliver his verdict separately. After a careful perusal of the correspondence and of his pamphlet, for which I have waited till now, I have no hesitation about mine. It is that Sir Charles Barry was the real and responsible architect of the building, in every usual and proper acceptance of the term; but with this finding I should like to hand in the following rider:—That what is good and appropriate in the design of the Parliament Houses, we owe to Sir Charles Barry; and that almost all that is either bad or crotchety is due to the influence of Augustus Welby Pugin.

It is admitted on all hands that the plan of the buildings is "solely" due to Sir Charles Barry. This, however, involves the further admission that the architectural arrangement of the river front is also solely his. This, I presume, no one who knows anything of the two men would be inclined to dispute, even without this admission. Its formality and regularity are diametrically opposed to every precept that Pugin ever preached, and every principle he ever practised. However mistaken he may have been, he was so sincere and earnest in all that concerned his art that it sounds like a slur on his memory to say that he ever consented to be employed, even in a subordinate capacity, on what he must have considered such an abomination. All, on the other hand, who knew Barry, know what an intense admiration he had for Inigo Jones's works; and the river front is an exact reproduction of that architect's design for Whitehall, with only the Italian details changed into Gothic. What is meant by the "new design" mentioned in Mr. Pugin's pamphlet (page 21) is only too clear. In Barry's original design the windows of the two stories were grouped together with deep reveals, and considerable light and shade were obtained by the form of the buttresses. In the design on which Pugin was employed, the windows became merely pierced panels, and the whole is that unmeaning network of flat, overdone ornament which we now see. What we probably have to thank Pugin for, besides this, are the ugly but truly Gothic roofs that disfigure this and every part of the building,—there were no roofs shown in Barry's original design,—and the extinguisher that caps the Clock-tower, instead of the beautiful spire of the design as originally published.

It was, however, in the erection of the Victoria Tower that the influence of Pugin seems to have been most handsomely felt. As originally designed by Sir Charles, this tower was not only a beautiful object in itself, but harmonized most perfectly with every feature of the building to which it was attached. As executed, it contains as many offences against architectural propriety as any building of modern times. It always was a mystery to me how a man of Sir Charles's good

common sense, and acknowledged taste, could be guilty of such a blunder. But now that we know where the blame really lies, I regret the injustice that I did to his memory by what I wrote on this subject in 1862, at page 326 of my History of Modern Architecture.

The first thing that raised a suspicion in my mind as to the real state of the case was the publication of a design for the interior of St. George's Church, Southwark, in Mr. Ferrey's Life of Pugin (page 170); but it was not till the publication of his son's pamphlet that I knew how intimate the relation was between the two men, and how much influence Pugin had on the details of the Houses of Parliament. If other proof were wanting, the frontispiece of this pamphlet would suffice. The absurdly low aisle, attached to the exaggeratedly tall clearstory, is the counterpart of the big hole for the cat and little hole for the kitten style, which characterizes the entrance and exit doors for the state-coach under the Victoria Tower, and the still more absurd exaggeration of its upper stories.

In Barry's original design the state-coach passed through the tower by two similar and well-proportioned doorways to the royal porch at the foot of the great staircase, which occupied the position of the present royal gallery. This was a noble and dignified architectural arrangement, and worthy of the Palace. The present dark monastic back-stair may be archaeologically correct, but as an architectural design it is simply detestable, and one of those features which were no doubt due to the influence of the late Mr. Pugin.

It would be easy to go on and point out other matters for which Sir Charles has been criticised, but for which Mr. Pugin has proved that his father is to blame; but space warns me to desist, and there can be no doubt that now his challenge will be accepted and the matter thoroughly investigated. The controversy has, however, an importance beyond that of the personal interests involved in it, as it is another instance of the thoroughly vicious system on which architecture is now practised. Had Sir Charles Barry been left to follow the dictates of his own sound judgment and good taste he would have designed a modern building suitable to the age and purposes to which he had to fall to be an anachronism and an absurdity. He consequently fell under the influence of one whose facile pencil and marvellous memory for Gothic details dazzled him as they have done others. In a moment of weakness he forgot the distinction between archaeology and architecture, as too many have done before and since, and hence all this blundering and heart-burning.

It would be well if the lesson taught by this example served as a warning as to what we are to expect from the designs for the new Law Courts: there the matter, however, promises to be worse than in this instance. In the Parliament Houses it was only the design of a real architect marred in execution by the pernicious influence of a mere archaeologist. In the case of the Law Courts, we are threatened with the design of an archaeologist who has the skill of all the architects of Europe will not suffice to redeem for its inherent inappropriateness and absurdity.

JAS. FERGUSSON.

WHAT HAS BEEN DONE IN LIVERPOOL.

THE marked and progressive improvement in the health of both Liverpool and Leeds during the past three years has become a powerful argument in favour of those who have always urged the adoption of sanitary reform, and the appointment of efficient and responsible medical officers of health. It is at the same time a thorn in the side of that unfortunately strong party in Manchester and other large towns, where these matters are still only talked about, and discussed in the town council. An M.D. recently addressed a somewhat amusing letter to the *Manchester Guardian*, in which it was sought to prove that the improved health of Liverpool was due to the magistrates of that town not having increased in 1866 and 1867, the then existing numbers of 1,881 public houses, and 729 beer-houses. So absurd a conclusion may be excused from an enthusiast in teetotalism, more especially as his letter elicited a reply from Mr. Joseph Robinson, of Liverpool, containing a much more conclusive and satisfactory explanation of the improved health of Liverpool, from which we glean the following facts.

* To be continued.

PROVINCIAL NEWS.

Liverpool, as is well known, has long had its medical officer of health; but there is reason to believe that it is only within the past two or three years that the terrible mortality from cholera, and an ever-present epidemic of typhus, thoroughly awakened the corporation to their responsibility, and led them to an earnest co-operation with their sanitary staff. The officers whose duties are more or less intimately connected with the sanitary well-being of the town are;—a borough engineer and building surveyor, with a salary of 1,300*l.* per annum; a medical officer of health, 1,000*l.*; an inspector of scavenging, &c., 400*l.*; an inspector of nuisances, 250*l.*; and the deputy borough solicitor, who attends the health committee, 600*l.* In addition to these there is a considerable staff of subordinates, who act under the orders of these officers.

Now let us turn to what has been effected by these officials. Mr. Robinson traces the principal cause of the reduction of the death-rate to the powers given to the Corporation in the Liverpool Sanitary Amendment Act of 1864, and in the Liverpool Improvement Act of 1867, to raise and expend the sum of 200,000*l.* in the opening up, widening, and ventilating of courts and alleys, and in providing sites for water-closets in courts, instead of cesspools. About half of this sum has already been spent. Courts have been widened from 3 ft. to 13 ft., and middens have been done away with, and trough water-closets (daily attended to by the Corporation) have been erected at the ends of the courts in place of the middens at the entrances. Furthermore, the Corporation has, during the present year, done its own scavenging, finding the horses, plant, and men, superintended by an inspector, at a salary of 400*l.* a year, as above stated. Under the old contract system, the middens were incompletely emptied, and there were sometimes arrears to the extent of 1,500 left unemptied. It is said that there are never any arrears now; and that the system is so well organised that the nuisance arising from the midden system is reduced to a minimum.

To remedy, as far as possible, the evils of over-crowding, the Corporation has obtained Parliamentary powers to register all sub-let houses,—that is, houses in which more than the members of one family live together. The result is, that irrespective of registered lodgings-houses, nearly 2,000 other sub-let houses are under the direct control of the medical officer of health. The occupiers are authorised by inspectors to allow a certain number of persons, according to measurement, to occupy the different rooms; and any offence against the regulations is punishable by fine or imprisonment.

Among other results of the labours of the Health Committee which have no doubt exerted a beneficial influence upon the health of Liverpool, may be mentioned the ventilation of sewers, an inspection of all houses where infectious diseases have appeared, the daily inspection of courts, and all trough water-closets; the providing of suitable conveyances, gratis, for the removal of patients to hospitals; and the notices served to cab-drivers and owners of the danger and the penalties to which they render themselves liable for carrying in licensed cabs persons suffering from contagious diseases.

The above evidence brought forward by Mr. Robinson proves conclusively that the corporation of Liverpool has been lately dealing with the sanitary condition of the town in an earnest and a liberal manner. Now, the death-rate in Liverpool during the past ten weeks of the current quarter has averaged 23.7 per 1,000, against 29.6 and 23.4 in the corresponding ten weeks of 1865 and 1866. That this result should have no intimate connection with the labours of the corporation and the health committee, the most earnest opponent of sanitary expenditures can scarcely believe. The expenditure in Liverpool has been, no doubt, large; but if sickness has been reduced in the same proportion as the deaths, which there is no reason to doubt, the money, even financially considered, cannot be said to have been buried in a napkin; the return in reduced rates is inevitable. Sneb a *resumé* of what has been done in Liverpool well deserves the attention of the inhabitants of Manchester and other large towns, where this question of sanitary reform, and the appointment of a medical officer of health, has still to be decided. In Manchester and Salford the death-rate in the past ten weeks has averaged 31.5, against 35.0 and 28.5, in the same periods of 1865 and 1866.

Weston-super-Mare.—The foundation-stone of the wing to the hospital has been laid. The new wing will correspond with the one on the north of the building, thereby making the front uniform. It will be 26 ft. by 18 ft., and will accommodate six extra beds for fever or malignant and contagious diseases, so arranged as to prevent any spread of contagion. The design is by Mr. Hans F. Price, architect. Mr. R. Tripp, as already mentioned, is the contractor, for 308*l.*

Runcorn.—The new public hall recently erected in Runcorn has been formally opened. It is built of red brick, in the Gothic style, and is situated in a square off Church-street, the principal thoroughfare in the town. Mr. Culshaw, of Liverpool, was the architect; and Mr. Thomas White, of Runcorn, the contractor. The large hall will conveniently seat 800 persons.

Truro.—The foundation-stone of a suite of public rooms has been laid, with Masonic honours. The site is on the Quay, on ground formerly used as the Custom House, stables to the Dolphin, and cottages. The new rooms, as described in the *Cornish Telegraph*, will, by arrangements with the town, be carried back from the present point 5 ft., so improving the street and entrance to the town from the eastward. The building will have two fronts—one facing the Boscastle Bridge. The style is to be Tudor Gothic, and the building is to be of Mylor stone, with Bath stone dressings, and ornamented brick chimneys of Elizabethan style. On the north front there will be three entrances—one to the Bishop's Library, at the western end or wing; the eastern one to the Masonic Hall, which will form the ground wing to the block; and the main entrance in the centre, which will be carved, and over will be a large window, also decorated. On the south side there will be two entrances—one to the billiard-room, the other to the Bishop's Library. From the centre entrance will rise the staircase to the upper rooms. From the lobby, on the ground floor, there will be an entrance to a corridor, which runs the full length of the building. On the south side will be a room for the county library, 32 ft. by 27 ft. 6 in.; county library reading-rooms, 29 ft. by 20 ft. 6 in.; a billiard-room, 29 ft. by 20 ft.; Truro Institution library and reading-room, each 29 ft. by 17 ft. 6 in. On the north side, a club-room, 40 ft. by 21 ft. 6 in.; committee-rooms, 21 ft. 6 in. by 12 ft. 6 in.; offices and apartments for the keeper of the halls. From the lobby, 21 ft. 6 in. by 16 ft., will rise granite stairs to the second floor on either side. At the eastern end of this floor will be the Masonic Hall, 32 ft. by 27 ft. 6 in., with waiting-room, 23 ft. 6 in. by 17 ft., and closets, &c. Next, on the south side, will be the assembly and concert room, 85 ft. long by 38 ft. On the north side will be a supper-room, 40 ft. by 21 ft. 6 in.

Oldham.—The winter garden and ball-room just completed at Werneth Park, Oldham, for Mr. John Platt, from the designs of Mr. Peter B. Alley, architect, Manchester, were lately thrown open to a large gathering of Mr. Platt's friends, including the Right Hon. W. E. Gladstone, M.P., Mr. W. H. Gladstone, M.P., the Mayor of Manchester, Sir Elkannah Armitage, and others.

Saniford, Orms, Somerset.—The dilapidated old parsonage-house and offices have been pulled down, and a new rectory-house built from the designs of Mr. J. H. Colson, architect. The total cost, with offices, has been 1,456*l.*, partly defrayed by a loan from the Bounty Office.

THE CASTLE OF SCHWERIN, IN THE GRAND DUCHY OF MECKLENBURG.

The Castle of Schwerin (renovated and rebuilt by the reigning grand duke, Friedrich Franz, in 1844-57) has an origin of considerable antiquity. A castle was standing on the site in 1018, which belonged to Slaven Stammeder Obotriten, and bore the name of Zuorin, or Zuarin (*i. e.*, wild forest or hunting-part). In the year 1161 this castle was burnt down by Obotrite König Niclot, on his flight to the castle situated to the west of Mecklenburg, from Duke Heinrich der Löwen. It now fell into the hands of the Saxon duke, who immediately rebuilt it, and placed his brave knight, Gunzelin von der Hagen, in charge of it. It was, for those times, very strongly fortified, inasmuch as Niclot's son took all the other Saxon castles in 1164, but Schwerin and Thow he could not conquer. In 1166 Heinrich founded

the dukedom of Schwerin, and invested the knight Gunzelin von der Hagen with it, as first duke. The dukedom of Schwerin existed until 1353, when it was obtained by Duke Albrecht I., of Mecklenburg, and annexed to his dukedom. Schwerin immediately became the residence of the duke and his followers, and it has so remained, with little interruption, to the present day. It is worthy of note, that in the year 1629 the Emperor Ferdinand, after forcibly dethroning hereditary princes, invested Wallenstein, duke of Friedland, with the Mecklenburg lands, who in the same year continued the residence there; but in the year 1631 Duke Adolph Friedrich of Mecklenburg, aided by the Swedes, retook his castle.

Concerning the parts built by the first residing dukes no direct knowledge has come to us; still it is probable that the foundations of several buildings were laid in the middle of the fifteenth century, and Duke Magnus (1477-1503) may be considered the builder of the older parts of the castle on the south side. His successor, Duke Heinrich V. (1503-1552), but especially Johann Albrecht I. (1552-1576), continued the building; but it was Duke Adolph Friedrich I. (1608-1658) who entirely finished the old castle, as it remained until its break up.

Professor Semper, of Dresden; Government architect Stüler, of Berlin; and Government architect Demmler, of Schwerin, were ordered to furnish designs in 1843. None of the three designs, however, found unconditional favour. In the spring of 1844, Demmler went by special order to France, accompanied by Herr H. Willebrand, to study the castles of Chambord, Blois, and Fontainebleau; and to England, to examine in particular Windsor Castle. After this Demmler furnished a new design, which at last was approved. The Grand Duke himself had considerable architectural knowledge, and his Majesty King Friedrich Wilhelm IV. of Prussia much influenced the design.

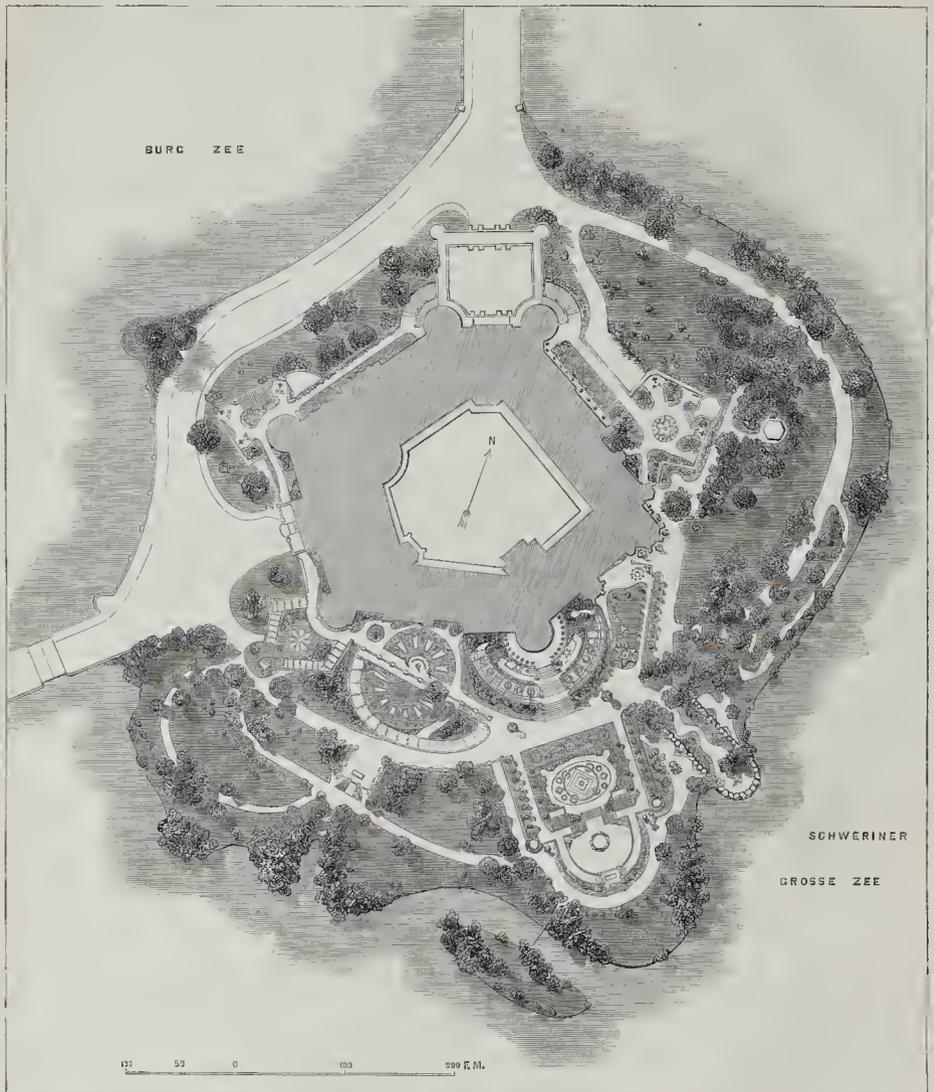

Demmler continued the building from 1844 until 1851, when in January he was obliged by political agitation to retire. Under him worked the following architects:—Behnke, Willebrand I., Willebrand II., Daniel, Lakow, Krüger, and Stern. From January 1851 Government architect Stüler, of Berlin, undertook the superintendence, and H. Willebrand I. became the head working architect.

To give an idea of the arrangement of the whole building, we may say that the castle has four stories,—the ground-floor, partly with an *entresol*; the main floor; the state apartments; and a fourth story.

The ground-floor has by far the greatest dimensions in consequence of its serving as support to the terrace surrounding the castle. It contains the church, the armoury, kitchen, and housekeeper's apartments, the gates and entrances to the castle, and the rooms for the office of the marshal of the court. In the *entresol* are the rooms for the princely children and their servants, the offices of the grand ducal cabinet, dwelling apartments for guests, and the official residence of the chatelein.

On the main floor are the residence of the grand duchess, the rooms for small court-festivals and for foreign princes; besides the upper part of the church, extending through two stories. On the state floor are the residence of the grand duke; the state apartments, with large saloons for court festivals (the saloons also extend through the fourth story); and some apartments for foreign princes. On the fourth story are the rooms for the court ladies, adjutants, and their servants; as well as for the *suites* of foreign guests. The grand staircase leads from the ground-floor to the state floor, and is principally used on great court festivals taking place in the saloons of the state floor; but also at smaller festivals on the main floor, and for the strangers' rooms in the *entresol*. The staircase is surrounded on each landing by a gallery connecting the localities adjoining the staircase: of this, however, we shall give an illustration hereafter.

The glass paintings in the armoury, as well as in the castle church, were done after cartoons of G. Leuthe by Gillmeister, the fresco paintings in the church by Professor Pfannschmidt, of Berlin. The walls and ceilings in the different state rooms and the church are by Pfannschmidt and Peters, of Berlin; Elster, of Brunswick; and T. Fischer and Tontzen, of Schwerin. The models of the statues of the grand dukes, as also the heralds of the south-west portal, are by Albert Wolf and Willgohs, both citizens of Mecklenburg.

THE CASTLE OF MECKLENBURG SCHWERIN.—Plan showing Position and the Building.

The immense equestrian statue in the first hall of the fourth story was executed by Genschow, also a native of Mecklenburg. How much the building cost is not known; but one calculation brought the amount to 3,000,000 thalers before its completion.

The garden, of which we give a plan, surrounds the ducal castle, partly ancient and partly restored, and was newly laid out in the Renaissance style, between the years 1844-57. Part is situated on an island to the south-east of the tower, with which it is connected. There are two bridges, one a massive stone bridge, which has five arches, joining the town; the other a wooden drawbridge, joining the garden. The plan of the castle is a pentagon, and the front looking towards the garden east and that

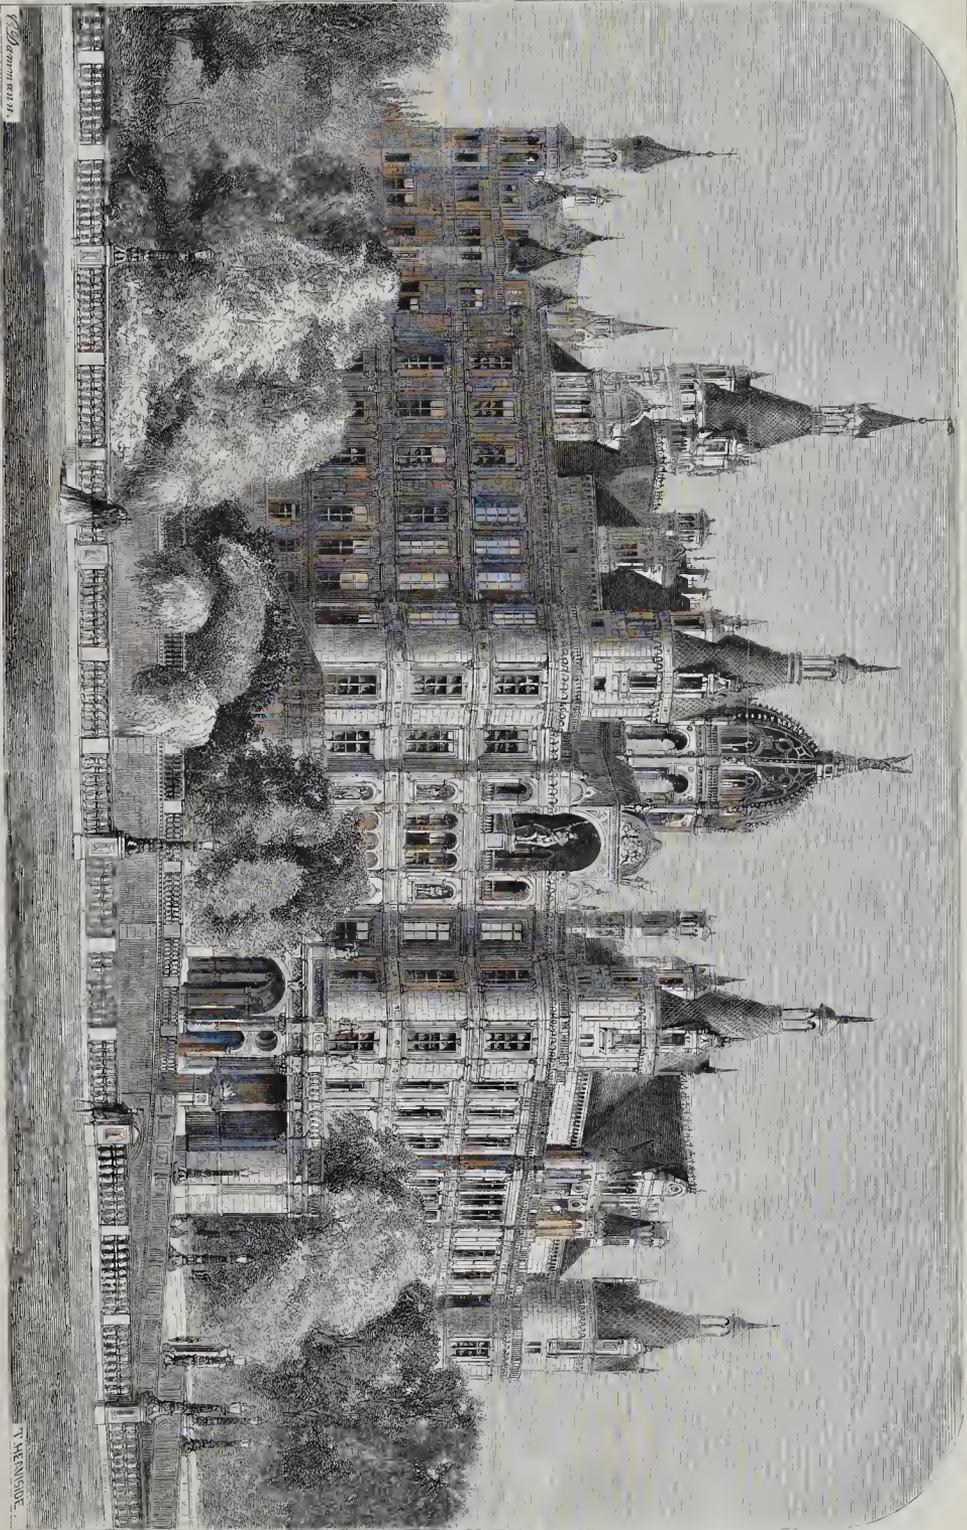

to the west have bastions 25 ft. high; there is also a third on the north side; all mounted with cannon.

On the south-east side is a way, partly by a viaduct, to a large staircase, which leads, in three landings, to the platform of the tower: this is 250 ft. high; and from the platform a door opens directly into the rooms of the grand duchess and the state rooms. The grand duke lives over these, and the church is situated to the north. In front of the staircase is a terrace borne by pillars, and richly garnished with statues, orangeries, flower borders, and arabesques.

The three granite landings are covered with vine trellis. The garden, in which are to be found statues and the choicest shrubs and

plants, is of no great extent, but is so interesting and varied, presenting alternately hill and dale, that the observer gazes delighted at the picturesqueness of its formation, and enjoys the charming views of the surrounding densely-wooded banks, the town, and the lake, a mile broad and three German miles long, through plantations of trees, lending light and shade to the view.

We may remind our readers that Mecklenburg, North Germany, consists of Mecklenburg-Schwerin and Mecklenburg-Strelitz, and that the House of Mecklenburg is the oldest reigning family in Europe. Mecklenburg-Schwerin is bounded east by Mecklenburg-Strelitz, south by Prussia, west by Hanover and Holstein, and north by the Baltic.

THE CASTLE OF NECKLENBURG SCHWERIN.—HEER WILHELM, ARCHITECT.

T. HENNINGSON.

THE NEW YEAR.

NEW YEAR, I greet thee with a trembling smile;
Thou art all cold and strange: I love thee not,
Yet would I strive to welcome thee aright.
No song of mirth, nor sound of revelry,
Within the sacred precincts of my home,
Disturbs the solemn hour of thy birth,
And the last moments of the Dying Year.
In silent contemplation I will part
From that old friend whose requiem e'en now peals,
And, peeling, quickens into gayer tones
To herald thy approach, thou New-born Year.
In silent contemplation, too, awe-fill'd,
I gaze upon the cross-roll'd scroll thou bearest,
In which is writ our future weal and woe,
Each private sorrow and each public care!
I would not loose the clasps of that dread scroll:
Sufficient to the day the roll is,
And good to come can scarcely come amiss,
No: keep its fastenings fir'd till, one by one,
Thy God and mine unbind them at His will!

The hour has fled. Now from the distant clocks
A single stroke boons on the frost-bound air,
And tells, a portion of thy life has pass'd
Already from thee, fleeting New-born Year!
Thus going at thee, thou no longer seem'st
So strange and cold; I kiss thy outstretch'd hand,
And swear myself thy soldier, bold and true,
To serve thee faithfully what'er betide,
So help me God!
And now pass on, New Year,
While I—with humble powers, but earnest soul—
Firm at my post, do battle for Thy Right.

R. F. H.

1868.

"THE TRINITY OF ITALY."

To this volume* there attaches much of the same sort of unusual interest which belongs to a portfolio of photographs, taken at leisure, on sunny days, and from well-chosen points of view, by some resident in a well-known and picturesque district. Accurate portraits of detached portions or isolated features of landscape, and of scenes and objects, sometimes graceful, often homely, but always picturesque, alternate in such a portfolio with general views of those grander and more startling features, towards which alone the passing artist would find time to direct his camera, and the result is a deeper realization of the essential character of the locality than could be obtained otherwise.

The hook under notice has provoked this comparison, both by the vividness and truthfulness of many of its descriptions and scenes, and by the remoteness of the subjects of many of them from the heat of an ordinary tourist or traveller. The author appears to have resided for a considerable number of years in Southern Italy, chiefly in or near Naples, and he has here produced a book, of which the scope embraces the consideration of the past history, the present position, and the future possibilities of the Italian peninsula, and which, in handling such subjects, shows grasp, and breadth, and vigour.

The volume will, however, more generally attract readers, and we venture to add, not less truly inform them, by its portraits of peasants and princes, ministers of state and men of pleasure or of business, and by glimpses at society, national character, and Italian temper and habits, which it affords; these pictures, and especially the very curious details given of the court and person of King Ferdinand II., have been given with a faithfulness due to keen and habitual observation, and that, too, from points of view such as very few Englishmen have been able to occupy.

The strange title of this book gives no clue whatever to its contents or scheme. It is not a religious or a polemical work, but simply a review of Italy, as a sageacious writer has known her and reflected upon her condition and her prospects. Here are no descriptions of paintings, sculptures, and antiquities, nor oven of public works; and yet there are special grounds, beyond those which make a good book about one of the most interesting countries in Europe welcome to all persons of culture, why many of those who are habitual readers of this journal may find "The Trinity of Italy" repay the trouble of perusal. Those who have in the course of architectural studies visited Italy, and learned to feel for her that affection which no other country seems so uniformly to inspire, will find much here to gratify them. Those, too, whose business connects them directly or remotely with public works, or in fact affairs of any sort in Italy, and above all such as have actually to visit that country for business pur-

poses, may glean valuable cautions from such passages, for example, as the following:—

"The laws of Southern Italy are generally admitted to be excellent. Their administration parades one of the general administration of the country. It is unnecessary to say that in any cases where the interests of the Government are concerned the action of the tribunals is as heavily weighted in their favour as are the chances of the lottery. And this is the more easy, from the fact that the naked law of a case, so to speak, is not regarded in Italy as it is in England. The action of the courts is more like that of a court of Equity, or, at times, of inquiry. The legal documents, far from being drawn in the barbarous jargon adopted by the English lawyers of the nineteenth century, make efforts not only at logic but at rhetoric. The great cheapness of printing leads the better-occupied *avvocati* to put most of their briefs and arguments in type, an example that might be followed elsewhere with great advantage; but at all times the judges are in the habit of attaching as much weight to what they consider the merits of the case as to the letter of the law. *Salus populi suprema lex*, and the administration is naturally the judge of what is and what is not conducive to the *salus populi*. A court of peculiar infamy, that of the "Contumaziosi," in which two or three legal agents of the Government sit in order to decide on any inconvenient pecuniary claims urged against the administration, with full powers, which they freely use, to declare them void, has been abolished by the Italian Parliament. But the odious and unjust practice of *elevatione del conflitto* remains in full force. The meaning of this phrase is, that, if a decision has been pronounced by a court of justice hostile to the claims or to the interests of Government, the latter can withdraw the case from the court of law, and decide it by ministerial or Royal decree—that is to say, by a circular of the minister under the signature of the king. This absolute injustice is practised by the ministers of Victor Emanuel as complacently as by those of the Bourbon kings."

The picturesque account of the seldom-visited city of Bari, and the spirited descriptions of the court and rule of the faithless King Ferdinand (Bomba), of whose astute countenance, hy-tho-ye, a fairly good portrait is given in the frontispiece, may he referred to, and might have been quoted from, as among the best portions of the work; but we prefer making a few extracts touching the financial position of Italy. The writer has views as to the European public debt not unlike those that have been set forth in this Journal.

"A rise or fall," he says, "of one or two per cent. in the price of Consols, a fact absolutely unimportant from any but the most contracted and personal point of view, will fill men's minds with hope or with panic, while the slow, silent, overwhelming increase of the public debt of Europe takes place unheeded. What writer of the day has called attention to the fact that, with almost the sole exceptions of Holland and of England, every shilling paid to the public creditors of Europe during the last ten years has, with the other hand, been borrowed from other public creditors within the same time? Who has brought out into the light of day the ugly fact that 150,000,000 sterling, out of the 175,000,000 sterling annually due to the owners of rents and funds, has to be annually raised by loans; and that to keep faith with the fund-holder, without so steadily increasing the obligation as to make an ultimate crash only a question of time, the existing taxation of Europe must be increased by one-third? Yet these are the simple and unquestionable results of but a few lines of figures."

Taking the accounts as they stand up to the close of 1865, and saying nothing at present of the large increase in debt effected in 1866, he finds that during the last decade Italy has contrived to increase her debt at the rate of more than 18,000,000 sterling per annum. As yet there are little signs of checking that increase, which may be stated as the incurring of a debt of 19 francs per head per annum for every Italian for ten years.

So long as the national expenditure remains permanently in excess of income, so long as the maintenance of a host of *employés* who do not work, of an army that has not covered itself with honour, of a navy that seems as unable to meet the waves of the Adriatic as the shock of battle,—so long as the *status quo* in these matters is maintained, every help that is given to the minister of finance will but help him further down hill,—every fresh expedient for giving a temporary aid to the distressed exchequer will but augment the magnitude of impending disaster.

SCHOOLS OF ART.

The Dublin School. — The annual distribution of prizes to the successful students attending the Art - Schools of the Royal Dublin Society took place on the 23rd ult. by his Excellency the Lord Lieutenant, before a large and distinguished assembly. Mr. Waldron, D.L., opened the proceedings by explaining that the medals and prizes for distribution were of three kinds: first, the prizes of the Department of Science and Art; next, the Taylor prizes; and lastly, those of the Royal Dublin Society. Mr. Waldron said he believed his Excellency would be satisfied that, perhaps with no exception, next to the school in Kensington, their school in Dublin held the highest

place of any in connexion with the Science and Art Department. Lord. Colonel Adamson, Chairman of the Art-Committee, then proceeded to read the report, which spoke of the growing taste for art-study amongst the lower and middle, as well as the upper, classes. He regretted that they were only recipients from Government of what were called payments on results, although in this respect not differing from Edinburgh; and he thought that a suitable opportunity for publicly expressing their earnest hope that the Metropolitan Schools of both Ireland and Scotland might ere long each have some reasonable grant made to meet the expenses of these establishments. Colonel Adamson said he believed he would not be justified in omitting, on that occasion, in the presence of his Excellency, to express the high opinion entertained by the Fine Arts' Committee of the talent and zeal of their head master, Mr. Edwin Lyne. The report alluded to the absence of any systematic arrangement of the works of students of art-schools of this and other countries in the Paris Universal Exhibition,—tending, as it would, to enable us to form a true estimate of the relative degrees of perfection attained by different countries in art-instruction, more particularly with a view to the improvement of those branches of manufacture which are susceptible of ornamentation and the processes that unite artistic and manufacturing skill, such comparison would be of the greatest advantage, not only to those immediately concerned with 'art-education, but also to manufacturers and producers, who would do much to advance their interests were they to second more earnestly the efforts of the schools generally for the improvement of designs. They, however, relinquish the traditional patterns and processes with reluctance. There is even now a desire on the part of the public for design of a better kind than is generally furnished; for, by the teaching of Schools of Art and exhibitions, the public taste has rapidly improved, and the general training in drawing and the fixed positive rules of art, has resulted in influencing the public taste to a higher appreciation of the beauties of nature, and all rendering of it, whether conventional or otherwise." The successful students were then introduced to his Excellency by Mr. Lyne, and were presented with the various awards; after which Sir George Hodgson, bart., returned thanks to his Excellency for the honour of his attendance on that interesting occasion. His excellency applied in a speech of considerable length, and urged the importance of a more universal study of art on the part of artisans, and attributed the great deficiency of our day to artists not being workmen, and workmen artists, as was the case in the Middle Ages, when John of Bologna, Michelangelo, Benvenuto Cellini, and a host of others, united artistic and workmanlike skill.

The Manchester School.—The annual meeting and distribution of prizes in connexion with this school took place in the Lecture Theatre of the Royal Institution. Mr. Burge, in the absence of the Very Rev. the Dean of Manchester, presided. Mr. Aspin, the secretary, read the report. The total receipts for the year had been 1,019l. 2s. 9d., and the expenditure 899l. 4s. 7d. The balance in the banker's hands was 106l. 19s. 11d., against 77l. 4s. 9d. in the preceding year. Not a single donation had been received during the year, and were it not for the increase in the students' fees the financial position of the society would not be in so sound a position. Mr. Mückley, the head-master, read an elaborate report on the state of the school. Regret was expressed that the students were with great difficulty induced to undertake those studies which pertained to the decorative art. It was much to be deplored that students did not see their interest in working with a view to meet those demands for decorative design which would certainly be made in the future. At the Government examination held here in March last, forty passed, and seven gained third-grade prizes; and at the national competition, one gold medal, two silver medals, three bronze medals, and a hook prize were awarded. Mr. Tom Taylor, prior to distributing the prizes, delivered a lengthy and able address on art education. He was afraid, he said, that we must admit that whatever might be said of particular schools, or the activity of particular places, direct art-education in this country,—look at it from whatever point we might, and allowing as much as we could for the advances of recent times,—was still sadly deficient. Indirect art-education seemed, on the whole, to be in a better light. We educated, with more or less success,

* "The Trinity of Italy; or, the Pope, the Bourbon, and the Victor." By an English Civilian. London: Moran & Co., 1867.

a larger and larger number of artists, and their works found a larger and larger number of buyers. The material circumstances of professional art were wonderfully improved. Still, with all this, there was little direct art education. He saw many signs of improvement, however, but urged that very much more was required to be accomplished.

The Cork School.—The annual distribution of prizes to the candidates who were successful at the late competitive examinations in this school came off in the Athenæum. A large and respectable auditory were in attendance. The walls of the Rotundo were hung with a numerous display of the principal performances of the pupils. Amongst the most noticeable of these were works in mechanical and architectural drawing, which departments have the most immediate and practical application in the educational programme of the institution. Mr. Brennan, the master, read the report of the working of the school for the last twelve months. It stated:—The total number of persons who have received instruction was 364, being an increase of twenty-two on the preceding year. Of this number 182 students attended the classes at the central school, the remainder, consisting of National School and other children taught either in the evening classes at the central school, or in their own schools by pupil teachers under the supervision of the institution. Thanks to the continued liberality of the Earl of Cork, the committee have been enabled to continue the aid in teaching to the National schools. At the Government examinations in freehand drawing, geometry, perspective, model, and mechanical drawing, twenty students were successful; and four, having passed in all the subjects, received certificates of the second grade. At the last examination of drawings sent up by the school to South Kensington, the works of eleven students were marked satisfactory, six students received prizes, two received honorable mention, eleven students had their works selected for National competition, and one student received a Queen's prize for art.

MEDIEVAL SCULPTURE.

In his third lecture at the Society of Arts, Professor Westmacott said, the earlier painting and sculpture employed in the Gothic period scarcely deserves the name of fine art, wanting as it is generally in almost all art qualities. It is true it was only used for decoration; but still it professed to imitate something, and this should have been Nature. Wells cathedral is one of the oldest edifices in England which is richly ornamented in this way, and it exhibits crowds of statues on its exterior. These are of the most primitive character—out of proportion, and, in execution, rude in the extreme. The contrast, as regards the accessory art connected with Gothic architecture, is remarkable when compared with that employed by the great Greek artists—in the Parthenon, for instance. Here the most perfect architecture of its kind was enriched with expressive sculpture of the most perfect forms in nature; and it is this combination or union that constitutes the highest form of art. The short duration of Gothic architecture, and the constant changes it underwent, may account, in some measure, for the incompleteness of the imitative arts in connection with it. It must be borne in mind that in the short space of about three hundred years it passed through many phases—from the Romanesque to the Pointed, or Early English style—from that to the Florid or Decorated, and then to the Perpendicular, when it may be said to have collapsed altogether. So unstable and unfixed in its own principles, it scarcely allowed of perfection in the arts associated with it, though those arts had a fixed standard, had that standard been followed. No person of sensibility, or who has any genuine feeling for the beautiful and picturesque, can deny the charm, or altogether resist the fascination that is found in the best examples of true Gothic architecture. Much of this may be owing to religious association; much to the imagination, which is pleased to conjure up anew, and picture to itself, visions of the olden time. But there is, unquestionably, also a positive claim to admiration, in the originality, the bold fancy, the variety and play of parts, the contrivance of scenic effects in the perspective views, and in the striking contrasts in *chiaro scuro*, which are so remarkable in the monuments of this peculiar style of art. Still,

with all these admissions, the lecturer said he was bound to protest against the outrages committed against truth and fitness, and, indeed, common sense, which were so constantly seen in the Gothic use of accessory imitative art. This fault was the more to be regretted, because there were many redeeming indications of grace and feeling in the sculpture, especially in drapery and in the sentiment of monumental design. But how the fitness of nature was abused is seen when human faces of saints, kings, nuns, and ecclesiastics are found employed as corbels and brackets to bear weights, or as terminations to dripstones, or as gargoyles or draining pipes; or when entire or truncated figures, angels or others, are seen suddenly starting from walls; their drapery clinging to them in stiff horizontal folds, instead of falling by any law of gravitation; or standing figures thrust into arched hollow mouldings; or others dislocated and distorted to accommodate them to fill up spandrels of arches or other spaces. These incongruities are the more curious and striking because it has been seriously asserted by the admirers and advocates of Medievalism, that these were the days when religious art was actuated with a devotion, and a feeling of truth, purity, and a pious impulse, unknown at present. It is a mistake. Students of Gothic art must know instances enough which contradict this theory, not only as regards truth in imitation, but in the scandalous and even indecent sculpture still to be met with in screens, stall seats, and other parts of some of the most admired Gothic churches. These exhibit proofs of a license, in this respect, which certainly would not be thought of in these degenerate days, and more especially as decoration in places devoted to religious worship. Still, there was a promise of excellence in this Christian art. There often was much gracefulness in composition, and, in the draperies especially, elegance and beauty. Some places showed very superior art to others, as, for example, Lincoln; and there were signs of improvement of the most encouraging kind. Unhappily, a revolution, fatal to the progress of art, changed the character of the age. This was occasioned by the passion created for classical studies, by the discovery of manuscripts and remains of Greek and Latin literature, in the fifteenth and sixteenth centuries.

FROM SCOTLAND.

Auchingranton.—A united Presbyterian church has been opened here. The edifice stands on a piece of ground bounded on the south by Auchingranton-road, and has its principal elevation to that road. The design is in the Classic style of architecture, and, as there are no cross roads to open up the view, the main external features of interest are concentrated on the entrance front. The lower portion of this front is rusticated, and pierced by a central entrance doorway and windows to vestibule. Flanking the centre of the front, and slightly receding from it, is the staircase, on the one side rising to the level of the frieze below pediment, and on the other (the south-west angle) a campanile rises to a height of 95 ft. from the ground. This tower, which contains a stair to the gallery, hell-chamber, and other rooms, is covered by a projecting roof. The church is designed to seat from 800 to 900. In the area the pews are circular on plan, every sinner thus facing the pulpit direct. The extreme length of area from the front of the vestibule to a hall behind the pulpit is 70 ft.; the breadth between the walls, 51 ft. 6 in.; and the height from floor to ceiling 32 ft. 6 in. Behind and in connexion with the church, buildings have been erected, containing a hall to seat 150, head's house and offices, session-house, vestry, waiting-room, &c. Adjoining the church, a manse is being erected from designs by Mr. J. Grahame Peat, architect, Hamilton; and the contractors for the various works are as follow, viz.—Messrs. William Paterson, mason; Robert Henderson, joiner; John Buchanan, slater; William Hinchaw, plasterer; Lachlan Taylor, plumber; John Rae, gasfitter; Andrew Brotherton, painter; and Richard Ferrie, upholsterer, all of Hamilton; John Hay, heating engineer; G. Smith & Co., ironwork of tower, Sun Foundry; R. McConnel, iron parapet, railing, &c., Port Dundas Foundry, all of Glasgow. The measurements are not yet completed; but it is believed the expense of the church will amount to upwards of 4,000*l.*

Castle Douglas.—A new Roman Catholic church has been opened here. The edifice is built of the local trap stone, with hands and dressings of Dumfriesshire red sandstone, and consists of a nave 28 ft. wide and 74 ft. long, beyond which extends a chancel 16 ft. deep, terminating in a semi-octagonal apse, giving a total length of 80 ft. The principal front faces Cotton-street, and shows a large window of four lights divided into two compartments under moulded arches, having a circle through the head of each. The tympanum is filled with a large rose; and the whole is comprised under a deeply-recessed and moulded arch. A turret is attached to the left angle of this front, and contains in its lower story the stairs to the organ-loft; and above the belfry, which is octagonal in plan, and is pierced on each side by tall lancet openings. Above this the spire rises to a height of 85 ft. from the ground. The porch is attached to the tower. It is reached by a flight of steps, and is entered through a moulded arch carried on polished granite shafts. The pointed roof is of deal, stained and varnished. The nave is lighted with copied lancet windows, glazed with quarry glazing, but it is intended to fill them with stained glass. The organ gallery is at the end of the church facing the sanctuary. It will contain an organ built by Messrs. Forster & Andrews, of Hull. There is also a confessional at this end of the church. The congregation is provided with open benches of simple design. The roof of the church is of deal, stained and varnished, and hoarded over throughout. The sanctuary is divided from the nave by an iron railing, gilt and painted. This part of the church is paved with Mosaic and encaustic tiles. An arcade runs round three sides of the apse; each bay containing one wide arch, and one narrower on either side, carried by polished granite shafts, with moulded caps and bases, relieved by a background of enamelled majolica tiles. The centre arch of the side bays contains a lancet window filled with stained glass representing St. John the Evangelist, and St. Andrew. The rood-loft is of carved oak. The architect was Mr. George Goldie, of the firm of Messrs. Goldie & Chalmers, of London. Mr. McCartney, of Castle-Douglas, was the contractor for the general work, under the immediate direction of Mr. Lait, clerk of works. Various firms have contributed to the wood-carving, tiles, metal-work, &c., amongst whom we may name Mr. Hayball, Mr. Wailes, Messrs. Maw, Messrs. Hardman, Messrs. Peard, &c., &c. *Glasgow.*—In the late storms in the North Sea, four painted windows for Glasgow Cathedral have been lost. Considerable progress has been made in the erection of painted windows since we last noticed the state of the works. Thirteen have been commissioned for the clearestory by the Messrs. Graham, the Messrs. Thompson, Mrs. Ramsay, Mr. Walkinshaw, Mr. Rae Arthur, Mr. Towers-Clark, the Misses Urquhart, Mr. George Oswald, and Mr. Gavin Steele. Of these two are in progress; two lost now, but will be re-commissioned; the rest are erected. Two windows for the crypt were also on hand the *Finnis*; and as they have been for a considerable period in the hands of the artist, the loss will be much felt; but we understand that they will take much less time to replace, as all the drawings for them exist, and the glass has only to be executed. Wire guards have now been erected on the windows at the west end of the cathedral.—The Corporation is about to open new galleries for the exhibition of pictures in the buildings in Sauchiehall-street which it purchased some years ago. The collection bequeathed by the late Mr. McLellan was exhibited in three galleries built by that gentleman; but, on the suggestion of Mr. John Blackie, jnr., lately Lord Provost of Glasgow, these halls were refitted and set apart for public purposes, including the Annual Modern Exhibition of the Institute. Mr. Blackie also suggested that permanent galleries should be provided for the collection of pictures in the possession of the Corporation; and consequently a portion of the Corporation Buildings, measuring 180 ft. in length by 42 ft. in width, has been converted into picture-galleries by the architects, Mr. Heath Wilson and Mr. David Thomson. The space has been divided into an entrance-hall, to be occupied by sculpture; a gallery, 80 ft. in length; two square halls, and two smaller rooms; all suited for the exhibition of pictures, and lighted from the top. The Corporation intends to inaugurate these new galleries by a portrait exhibition, limited to portraits of Lanarkshire people

who have been eminent in connexion with the history of the county and of Glasgow during the last century or century and a half. It is intended that they shall be open free to the citizens when the local collection is hung upon the walls; the leading object of the Corporation being the education of the people, so far as it may be possible, in a knowledge of art. We hail the step with thankfulness.

FROM NEW ZEALAND.

Auckland.—Of the public buildings in Auckland to be erected under the Public Buildings Commission, appointed for that purpose by the General Government of New Zealand, the Supreme Court, and Post-office and Custom House, are now fast progressing. The Supreme Court is in a forward state. The building is situated on a reserve in front of the old House of Representatives, and forms a conspicuous object on entering the Bay. The principal front faces Waterloo-crescent, and the Government House is formed by an arcade of three pointed arches springing from clustered shafts, which forms the main entrance. The Supreme Court chamber, occupying the centre of the building, will have an open timber and panelled roof, surmounted with an ornamental lantern by which the court is lighted. The court is surrounded by a corridor, 6 ft. wide, connecting it with the Judges' Chambers, and suites of rooms for the counsel, jury, and witnesses. The registrars' and sheriffs' departments will be on the right and left, entered from corridors on either side of the building. On the upper floor will be an insolvent court, and suites of offices in connexion with the establishment. The natural slope of the ground has enabled the architect to introduce a basement-story at the north end of the building, which is subdivided into cells and rooms for prisoners awaiting their trial. The external size of the building is 145 ft. by 97 ft. It is being built of pressed bricks from the yards of Mr. Holland, of Newton, and Bath stone dressings from the Cornish quarries.

TECHNICAL EDUCATION.

A LETTER from Mr. B. Samuelson, M.P., to the vice-president of the Committee of Council on Education, concerning technical education in various countries abroad, has been issued in a printed form. The hon. member was appointed by the Government, on a special mission, to inquire into this subject.

In summing up the results of his investigations and observations, he says:—I have endeavoured to give a fair though brief account of the state of primary and technical education in France, Switzerland, and Germany, as well as a very slight notice of some of its features in Belgium. I have also attempted to show by examples what is the condition of some of the leading industries in those countries. I do not think it is possible to estimate precisely what has been the influence of Continental education on Continental manufactures. That the rapid progress of many trades abroad has been greatly facilitated by the superior technical knowledge of the directors of works everywhere, and by the comparatively advanced elementary instruction of the workers in some departments of industry, can admit but of little doubt. At the same time, it cannot justly be said that their superior education has led our neighbours to make any striking improvements. The manufacture of the more important textile fabrics certainly does not owe its present advanced position in any marked degree to Continental inventiveness. In the production of iron and steel, also, if a step has been taken in advance of us as regards some peculiar though important products, this is due, except, perhaps, in the case of the steel castings of Bochum and Firminy, less to the development of new discoveries than to a careful and intelligent improvement of processes—common to all, and to some priority in the utilisation of resources at least as readily within the reach of our manufacturers as of those of any other country. I have not the least doubt that the ground which we have lost will be speedily recovered, both by our ironmasters and our engineers, unless, indeed, a return of prosperity should lead to a renewal of the contentions between masters and workmen which have caused such mischief to both. It would be

an event of national importance if the iron and engine-building trades, like those which I named at the outset of this report, would establish boards of conciliation. Even as I write, I am rejoiced to learn from Mr. Mundella that the locomakers of Nottingham have followed the example of the kindred traders of that town, and that Sheffield is inclined to imitate them. It is not by the payment of low wages, or by the premature employment and overtaking of children, that any great manufacture can be made to prosper in this country, but by mutual forbearance and goodwill between those whose interests, though debatable and opposite in detail, are identical in the main.

At the close of his letter, Mr. Samuelson says:—If I may venture to suggest some further measures, which may, in my opinion, be speedily and safely adopted by the State to promote education, I would sum them up as follows:—First, as to elementary education. Let no child under twelve be allowed to work until it can read and write. Make it the duty of every parish to see that its children have the means of elementary instruction. Encourage elementary schools by special grants to establish advanced classes. Assist the pupils of elementary schools who have shown remarkable ability to continue their education in a superior school. Secondly, as to technical education. Revise your science minutes, and abolish the limitation to working-class pupils of the capitation grants to science teachers. It is simply a stumbling-block to the weak consciences of committee-men, and prevents the establishment of classes remunerative to the teachers. Pay a larger sum per head for the more difficult subjects, and thereby remove the temptation to the teachers of science schools to ride physiology and inorganic chemistry to death. Give a thoroughly scientific training in Jermyn-street to a small number of young men, chosen, if you like, in part from amongst your more promising "science teachers," in order to qualify them as professors of science. Distinguish between these and the men who merely get up one or two subjects in order to teach a science class. Supplement local efforts to establish or to extend secondary or superior scientific schools (not mere science classes), by building grants or loans, and by the endowment, or partial endowment, under proper conditions, of professorships. Begin with Manchester (if Manchester is not too proud), whose citizens are trying to raise 100,000*l.* for the enlargement of Owen's College. Let one condition of assistance to a scientific school be, that a perfecting school (Fortbildungsschule) shall be affiliated to it; and of the endowment of a professorship, that the professor shall teach in the perfecting school. Lastly, consolidate your department of education.

ACCIDENTS AT THEATRES.

LAST week, about ten o'clock at night, an explosion of gas occurred in the New Theatre Royal, South Shields, which for a time caused considerable consternation, though, fortunately, little or no damage was done. It appears, that during the evening, by some means not explained, a gas bracket at the foot of the gallery stairs was broken, and an escape of gas ensued. A light was taken to look for the cause, and an explosion took place. The play was brought to an abrupt conclusion: the actors for the moment being panic seized, ran from the stage; the audience, too, became alarmed, but no injury was done.

Joseph Shepherd, a carriage trimmer, has died from injuries he received at the Cabinet Theatre, Liverpool-street, King's-cross. It appears that a fellow workman asked the unfortunate deceased to leave his own work and go to the roof to assist him in removing a chandelier. This he did, but instead of walking on the planks, he stepped on to the canvas forming the ceiling of the theatre. He had no sooner done so than he fell through into the pit, a great distance, and was, it is stated, impaled on the spikes that are in that portion of the pit that separates it from the orchestra.

On Friday in last week a terrible babban and alarm were produced in the Lyceum Theatre, Strand, by the ignition of some small portion of the scenery and the want of presence of mind on the part of two or three of the performers. Other members of the company, however, behaved admirably, and the tumult was arrested. The scene at one moment was most alarming.

THE LAMPS IN HYDE-PARK.

WE were about to say the "Lights in Hyde-park," but that would have been too flattering. Well, a savant who has not seen the lamps, writes to prove that theoretically, with a reflector of the kind described, they cannot possibly give a bad light. Some of our readers will remember of the man who said to his comrade, "Never you mind, Tom, they daren't put you in the stocks;" and his reply, "I know they daren't, Jack, but they have." The lamps, theoretically, cannot be unsatisfactory, but they are. Our "Enraged Correspondent" was quite right in his objection. Beyond the mischief done by the form and position of the reflector, air seems to be wanted. A few nights ago, about eleven o'clock, we found several extinguished, and many filled with mist, and burning dimly as an old oil-lamp of past days. Lord John Manners should look to them.

THE TRADES' MOVEMENT.

FROM New Year's-day two Acts of Parliament of a similar nature take effect in the regulation of labour. The first, on the extension of the Factory Acts, was passed on the 15th of August, and the second, for regulating the hours of labour for children, young persons, and women employed in workshops, was passed a few days afterwards. The Factory Act is to apply to all works in the United Kingdom, in which fifty or more persons are employed in any manufacturing process, and the exceptions are set forth in the schedule annexed to the statute. In the second statute it is declared to be expedient to extend protection, so far as respects the regulation of the hours of labour, to children, young persons, and women working in the smaller establishments, and further to make provision respecting the employment of a fan or other mechanical means for the prevention of the inhalation of dust in workshops in processes of grinding. The Act is to apply to the whole of the United Kingdom. No child under the age of eight years is to be employed in any handicraft. No child is to be employed on any one day in any handicraft for a period of more than six hours and a half, and such employment is to take place between the hours of six in the morning and eight at night. No young person is to be employed for more than twelve hours, with intervening periods for taking meals and rest, amounting in the whole time to not less than one hour and a half, and the employment to be between five in the morning and nine at night. No child, young person, or woman is to be employed in any handicraft on Sunday or after two o'clock on Saturday, except where not more than five persons are employed, and where such employment consists in making articles to be sold by retail on the premises, or in repairing articles of a like description to those sold on the premises. No child under eleven years is to be employed in grinding in the metal trades or in fastian cutting. "Child" is to mean one under thirteen, a "young person" of thirteen and under eighteen, and a "woman" eighteen or upwards. Every child who is employed in a workshop is to attend school at least ten hours in every week during the whole of which he is so employed. On the application of a teacher, the occupier of a workshop is to pay for the schooling, and to deduct the same from the wages.

The General Union of Carpenters and Joiners of Great Britain and Ireland has just issued its fortieth annual report, which shows a steady increase of new lodges and members. The expenditure during the year ending July 31st, 1867, was 10,353*l.* 3*s.* 7*d.* Of this amount 2,392*l.* 9*s.* 3*d.* were expended in dispensing relief during sickness; there have also been paid 3,062*l.* 13*s.* 7*d.* in alleviating the privations of members and their families arising through loss of employ; also 127*l.* 14*s.* 8*d.* to members who have been compelled to leave their homes in search of employment; 12*l.* for loss of tools by theft and fire; and 2,229*l.* 7*s.* 6*d.* have been applied to the support of members thrown out of employ through disputes with their employers. Twenty new lodges have been opened during the year, and between 200 and 300 financial members have joined. In about thirty towns where the General Union has branches, the men have obtained advantages during the year in the shape of an advance of wages or a reduction in time, and in many instances of both.

A meeting of ploughmen has been held at Dunry to consider whether a sick and funeral society should be formed in connexion with the Farm Servants' Protection Society. There was a good attendance, though little interest seemed to be taken in the object of the meeting. David Runciman, farm servant, Spot, was called to the chair. The general opinion of the meeting was, that they were almost all connected with similar societies already; and after a somewhat protracted discussion it was agreed that the Farm Servants' Protection Society only should be supported.

The strike at Aberdeen on the part of the moulders and the lock-out by their masters have not yet come to an end. An amicable arrangement had been come to, and the men were to return to work. This they did; but at one establishment objection was taken to two non-union workers being allowed to work along with them. The masters would not give in, and consequently work was again suspended at all the shops in town. Matters remain in this position; and there appears to be a strong determination on the part of the masters to stand out. The workmen, on the other hand, it is believed, would give way on the point of wages, but not to allow other than members of the union to work along with them. Pretty freedom!

RAILWAY INTELLIGENCE.

A list of twenty-four British railways, with the prices quoted on the 1st of January, and on Thursday in last week, shows a loss of value in the twelvemonth of 17,137,000l.

The action of North v. Waring Brothers, & Eckersley, as to the Solway Viaduct, in the Court of Session, is concluded. The jury returned the following verdict:—

"The jury unanimously find for the pursuer in the first issue on the first and second counts of said issue, and award the damages claimed in the first count, viz.—225l. 6s. 3d. salary due pursuer at the date of his dismissal, with interest thereon, from 12th October, 1866; and on second count award three months' salary, at the rate of 332l. 6s. 5d. per month, due from 12th October, 1866, to 12th January, 1867, with interest thereon at the current rate."

On the third count, which claimed 5,000l. for "loss of profit and injury to his character, credit, and feelings," the jury found no damage due. On the counter issues, in which Messrs. Waring Brothers & Eckersley claimed 4,000l. damages from Mr. North for breach of agreement, the jury found unanimously for Mr. North.

The North-Eastern Railway Company have just finished a railroad from the quayside, Newcastle-upon-Tyne, through tunnelling up to the higher part of the town where their goods station is situated. Houses (some built only of late) had to be taken down, and other material hindrances removed. The railroad is nearly a semicircle, though only half a mile in length. About two-thirds of the distance is tunnelled, and where the road is open walls of brick support the banks. The masonry of the tunnelling is 2½ bricks in thickness, all set in Portland cement. The rails are of steel. Near Linnestreet the railway line is not only tunnelled itself but crosses another tunnel which has been in use for some time by the proprietors of the Spital Tongues Colliery for conveying coal to the quayside for shipment. Mr. Walter Scott was the contractor.

DUBLIN.

THE new Church of St. Bartholomew, situated on Elgin-road, Pembroke Township, has been consecrated by the Archbishop of Dublin. The site is at the junction of the Clyde and Elgin roads, an open situation, affording ample opportunity for displaying architectural beauties to the fullest extent. The plans were prepared by Mr. T. H. Wyatt, of London. Mr. James Scanlan was the contractor. The church is now complete, except the steeple. It is in the Early English style of architecture, of cruciform shape, and contains about 550 sittings. The church, in the interior, consists of a nave, with north and south porches, and double transepts opening into the nave by double arches at either side. The space under the tower forms the choir, beyond which is the apsidal chancel. At either side of the choir are aisles, forming respectively vestry and organ rooms. The length from east to west, internally, is 128 ft.; the width of nave is 27 ft., and the width across the

transept is 77 ft. The arches opening from the vestry into the choir and transept are filled with screens, and the corresponding arches at the opposite side with the organ pipes. The chancel and choir are paved with encaustic tiles. The seats in the choir are of polished oak, and the sittings throughout the church are of pine, stained, varnished, and polished, ornamentation to some extent not being neglected. The pulpit rests upon a base of Irish marble, with marble columns, and the superstructure is of Caen stone, carved. The gasfittings were manufactured at the establishment of Messrs. William Curtis & Sons, of Dublin. Mr. Harrison executed the carvings; Mr. Eakin, the staining and decorative work; Messrs. Brawn, Birmingham, the ironwork; and Messrs. Haden, the warming. The cost up to present is about 6,500l. All the seats are free.

MILTON CHURCH, NEAR GILLINGHAM.

THE new church at Milton was consecrated on Tuesday, the 17th ult., by the Bishop of Salisbury. The district in which it is placed adjoins the parish of Gillingham, and the greater portion of the expense is borne by Captain Matthews and family.

The church provides accommodation for adults and children, the seats being all free. It has been erected from the designs of the architects, Messrs. Slater & Carpenter.

The general character of the design is Early English, treated freely. The plan consists of a nave and two aisles, apsidal chancel, west tower and spire, vestry and south porch. The internal length from the wall of tower to the east wall of chancel is 85 ft., and the width of nave and aisles 40 ft.; the height to the ridge of the roof is 36 ft., of the tower and spire 100 ft.

The nave has on each side an arcade of three arches, with cylindrical columns and carved capitals, in which natural foliage, such as the fern, ivy, oak, &c., is introduced. The aisle windows are coupled lancet, with moulded internal arches resting on detached shafts with carved capitals (three shafts are to be replaced with red Devon and Irish green marbles). The roofs are of open deal, with curved and moulded trusses, with arched brackets and wind-braces and moulded collars. The chancel has moulded and cusped lancet windows, and a pointed harrel roof of deal, with mouldings forming the panels. The vestry and organ-chamber open by an arch on the north side of the chancel and east end of aisles. The chancel-arch is of lofty proportions, and on the caps are carved wheat and the vine, with conventional sculpture.

The communion-table is raised five steps above the nave, and the chancel is paved within the altar-rails with tiles,—the rest of the church with stone. The font stands in the tower. It has a circular moulded and carved bowl resting on clustered shafts with carved capitals. It is the gift of Mr. Lilly, one of the contractors. The window of the chancel and the east window of the aisle are filled with stained glass by Ward & Hughes.

The whole church is built and faced with Tisbury stone, supplied by Mr. Lilly; the woodwork and building being executed by local tradesmen, and the stone carving by Mr. Whitehead.

ENGINEERS AND LOCAL BOARDS.

I REMIT you the particulars of a decision given by Mr. Ingham, judge of the County Court here (Whitehaven), which is of the greatest importance to engineers, solicitors, clerks, surveyors, and every other person having dealings with local Boards.

The following is a brief summary of the facts. In the early part of 1866, I carried out for the Cleator Moor Local Board a system of sewerage, the Board paying me the usual commission of 5l. per cent. on the outlay. In November of the same year I happened to be at a meeting of the Board, when the chairman (Mr. Jonas Lindow Bars) proposed the following resolution:—"That Mr. Pickering be requested to make a survey of the country surrounding the district to discover the most available sources of water supply, and report thereon as early as possible." The resolution was carried unanimously, and duly entered on the minutes. In a conversation which followed, I had further verbal instructions to do all that was necessary to develop a satisfactory scheme in the following month (4th

December). After having made a survey, and having investigated five schemes, some of which had been suggested by persons having a knowledge of and interest in the district, I recommended the Board, in a lengthy report on the whole question, to carry out one of the schemes at a cost of 3,300l. The Board ultimately adopted my recommendations. Soon after this the greater part of the old members either retired or were not re-elected: the chairman leaving the Board. I sent in my account, charging them 1l. per cent. (on the proposed outlay) for the survey, preliminary plans, estimates, &c., intimating that if the Board wished me to carry out the proposed works to completion the 33l. would be in part payment of the usual commission. The Board never officially refused to pay me; and as there seemed some prospect of the works being carried out I did not press for a settlement, but reminded them in two or three letters, when they quietly shelved the letter without discussing it.

Ultimately, I brought an action for 33l. (12l. 10s. 3d. had been expended by me in the survey out of pocket). The judge held that I could not recover, as I had not a contract under seal and signed by five members of the Board (11 & 12 Vic., cap. 63, sec. 55), but remarked "it was a grievous case," and refused to allow the Board costs.

The effect of this judgment (if his honour's law be good) is that scarcely an engineer in England employed by local Boards can recover for services rendered (when a Board came forward and repudiated their solemn acts both orally and in writing). A clerk could not recover for any legal or other work he may have been ordered to do, nor yet for the expense out of pocket. A solicitor could not recover for any legal business, parliamentary or otherwise. No person whatever could recover for any work done or goods supplied. I never knew a single instance of an engineer having an instruction under seal, &c., for work for which the charge might vary according to circumstances; it had not been the practice at the Cleator Board to give instructions under seal, &c., nor is it the practice at any other Board with which I am acquainted. When a contractor is doing works of magnitude it is usual for a contract to be under seal, &c., but then the amount is fixed; but, as before, I never heard of an engineer having a sealed instruction. I trust that solicitors, being clerks to Boards, will look into this matter.

RICHARD PICKERING.

TWENTY-FOUR THINGS WORTH KNOWING.

1. Why is not Waterloo Bridge purchased and thrown open to the public free of toll? Other barriers are being removed.
2. Why do not people keep the way in front of their own doors clean in frosty weather, as they are ordered to do?
3. Why is there not a publicly-exhibited request to open-air orange-eaters not to drop the peel on the footpath?
4. Why is there not a horizontal railing, or some such contrivance, put over the Somerset House chasm (west front)?
5. Why are heavy bales of goods still craned high in the air, to the mortal risk of passers by?
6. Why are some of the Hyde Park grass-plots guarded by low rails, conveniently placed for falling over?
7. Why are the streets too feebly lighted to reveal lurking footpads?
8. Why are not the factories inspectors all practical men?
9. Why do bonseholders allow their coal-plates to remain unfastened, thereby imperilling pedestrians?
10. Why do dustmen demand "beer-money" when they have only done that which they are employed to do?
11. Why are not policemen authorized to take away the pipes from little boys who smoke in the streets?
12. Why are wayfarers almost compelled to enter a public-house if they want to rest themselves?
13. Why are vehicles allowed to charge the mob on illumination nights, after (say) nine o'clock?
14. Why, as the trees in Piccadilly are approved of, are not other leading thoroughfares planted likewise? This has long been talked of.
15. Why does not the Westminster Palace

clock come as prettily as it did at first? Surely M.P.s are used to its sounds by this time.

16. Why are the fountains in Trafalgar-square still as erratic as ever?

17. Why do many builders still put their water-pipes where the frost can easily get at them?

18. Why does not the mother of every child capable of losing itself stitch its name and address inside its frock?

19. Why is mortar (!) made with garden mould permitted to be used in house building?

20. Why are not the pipe and stop-cock attached to the water-tank over a theatre always comatible during a conflagration, so long as the outer parts of the building remain unburnt?

21. Why are the breasts of gallant firemen not decorated with the Victoria Cross, with or without the pension?

22. Why are certain railway-cars pierced with glazed holes, not big enough to pass your hat through, the idea being that such perforations afford protection to travellers?

23. Why does a sweep claim the soot removed from a stranger's chimney as his own property?

24. Why was the tank at Her Majesty's Theatre expected to melt while it held water? It is a fact that you may boil water in a pewter pot.

J. G.

ON ART EDUCATION.

SIR.—We in England have latterly been informed of some particulars respecting art education in France, and we are struck by the paradoxical nature of the former, thought that facility of design among Frenchmen was due to greater attention to outline drawing being paid abroad than at home, and less to shading and colouring. We are in the habit of practising in the workmen's drawing schools of France consists in working at shadows with a stump.

Imagining that a grave question among art principles lies in this matter, I take the liberty to request some space in order to enlarge upon it.

If English artists are, or once were, pre-eminently behindhand in design, through concentrating their attention on effect and colour, and *chiaroscuro*, how can French workmen be taught design by working at shadows with a stump? That is the question upon which I wish to suggest an explanation.

French workmen are said to be expert in adapting their hands to the supply of their wants under new circumstances. In the Crimean campaign French soldiers made themselves at home, while the English starved, in England, we carry division of labour to such an extent that a woman from Sheffield, emigrating to America, and being asked what she could do, answered "Pack files."

Now, under such a division of labour as this, the facilities that relate to precision of form tend to become monopolised in a few hands. The carpenter may acquire a correct eye for form and dimension—so may the engraver, by means of processes incidental to their trades; but if a lawyer crosses a street, he is not led by his habits to judge whether the street be 50 ft. or 100 ft. wide; and not only so,—he might say, were the question started, "That is a thing which I leave to a surveyor to judge of," and he takes no shame to himself for his want of discrimination. Modern habits tend to increase the division of labour through which the judgment of form and space becomes leviated by the majority. How many miles off is that distant church? Will my legs carry me so far, or must I hire a horse? might have been queried fifty years ago. At the present time, the question of distance is replaced by a habit of inspecting the time-table, not improbably to the injury of our power of comprehending a landscape by Claude or Turner.

Such a habit of thought, with regard to distances, forms, and contours, tends to become confined to particular classes, through an extensive division of labour, this limitation does not extend to the more sensual elements of the beautiful. Abstract thought cannot divorce itself from all fleshly lusts, in the same degree as a lawyer may divorce himself from the knowledge proper to a surveyor. Art requires a common ground of interest between the professor and the rest of the world. The more sensual features of painting, namely, glowing colours, afford this common ground. A person who is incapable of seeing any more grandeur in the form of an oak-tree than in that of a dumpling when impaled on a stick, may, nevertheless, enjoy the greenness of the foliage. Does not this point out a reason for the cultivation of colouring in England, the country of division of labour?

The son of a carpenter, while incapable of the kind of precision which the father displays in setting out a hand-rail, may, nevertheless, have a vivid sense of the difference between green and red colours. He may turn painter and gilder, and win more admiration from the tradesman whose shop-front he decorates, than ever falls to the lot of his father on the score of precision in lines.

On the other hand, the son of the tradesman himself may be incapable of sufficient precision of thought to balance his father's ledger. If he have an eye for colour, he may turn artist, and become patronised by the wealthy, while the tradesman who has inherited the precision of thought from his father is in the business of the nation. "Oh for pure outlines!" says the departing Academy professor. The pupils in reply turn pre-Baphaelite, and work outline to death.

Now, if we strive to teach drawing to those who are free from the prevailing looseness of ideas of form,—to the Frenchman who gets his money,—to the English tradesman who is precise in setting out a hand-rail or a toothed wheel,—we are delivered from inducement to work outline

to death. The workman whose daily labour has filled his brain with visions of straight edges and mitre-boxes and angles of 90°, and angles of 45°, and distinctions of probably straight lines, from exceedingly straight lines, may be safely allowed to indulge at the evening drawing-class, in processes of blending, and rounding off, and softening, and shading, which would be ruinous to pupils with a contrary set of antecedents. In the one case it is the hard man to be humanized; in the other, the effeminate man is to be endowed with force and decision of character.

G. M.

ASSESSMENT OF GAS AND WATER WORKS.

THE important question of the proper rateable value of gas and water works has recently arisen with respect to the parish of Nottingham. Notwithstanding the extension of the two establishments in this important town from time to time, the amounts at which they have been assessed to the poor rate have for several years remained stationary, the companies maintaining that they were assessed at their full value, whilst the parochial authorities believed them to be considerably underrated. Mr. J. S. Norris, of Nottingham, was therefore directed, on behalf of the parish (St. Mary's), to value the works of the respective companies, and the result was that he returned the rateable value of the gas-works as 4,280*l.*, instead of 2,700*l.*, the old amount, and that of the water-works as 4,927*l.*, instead of the old amount of 1,550*l.*, the valuation being made under considerable difficulty, owing to the companies refusing the parochial authorities access to, and information concerning, any of their works other than those in the respondent parish. Against the new assessment the two companies appealed to the Court of Quarter Sessions, but eventually both parties agreed to refer the matter to, and abide the decision of, Mr. Sergeant Hayes, of the Midland Circuit. The two cases accordingly came on for hearing before that gentleman in London, when Mr. Field, Q.C., and Mr. Cave, of the Midland Circuit, instructed by Messrs. Hunt & Son, of Nottingham, solicitors to the Gas Company, and by Messrs. Fox, Brown, & Barrow, of Nottingham, solicitors to the Water Company, appeared for the appellants, and Mr. Keane, Q.C., of the Norfolk Circuit, and Mr. Gine, of the Oxford Circuit, instructed by Mr. C. G. Croft, solicitor of Nottingham, appeared for the respondents. Evidence was given in support of the companies by Mr. T. Rawley, C.E., Mr. T. G. Barlow, C.E., and Mr. H. A. Hunt, surveyor, all of Westminster; and Mr. Norris's valuation was supported by Mr. H. J. Castle, surveyor, of Chancery-lane, London; Mr. John Higginbottom, surveyor, of Longton, Staffordshire; and Mr. Westcott, accountant, of Coleman-street, London. After several protracted hearings and repeated adjournments, the learned Arbitrator has at length made his award, fixing the rateable value of the gas-works in the parish at 3,020*l.*, and that of the water-works at 3,740*l.*, being an increase upon the old rateable values in the gas case of 320*l.*, and in the water case of 2,190*l.* The cases were strongly contested throughout, but the chief points of contention were the proper percentages to be allowed to the hypothetical tenant in respect of the three items of interest on tenant's capital, trade profits, and casualties, the companies claiming under the three heads admitted only 5 and 10 per cent., whilst the parish insisted on 15 and 20 per cent., and the two first-named items, and ignored the last. Reference was made in the course of the arguments to various leading cases, particularly that of the Parish of Lee, in The Phoenix Ins. Co. v. Westminster, decided by the Court of Queen's Bench in the early part of the present year.

RATTENING IN THE BUILDING TRADE.

SIR.—I read in your paper a few weeks since of a case of supposed rattening, at a church, building at Nottingham by Mr. Cowland. It occurs to me that I have been treated to a similar case in the same compound of steel and mischief, as, on the night of December 27, some person or persons, evidently in the trade, broke into the premises, 115, Euston-road, and damaged several chimney-pieces, knocking off the trusses, and taking them away with them.

Your insertion of this in your widely-circulated paper may assist in bringing the guilty parties to justice, by putting persons likely to purchase such things on their guard, as they have evidence of having been on chimney-pieces before, having holes drilled in them for dowels.

J. W. BIRD.

BATHS.

SIR.—To obviate the difficulty of heating the water for a bath, in a small house where proper appliances are wanting, could any of your ingenious readers suggest a floating stove, or any other mode by which the water might be heated in the bath itself?

A POOR VALETUDINARIAN.

CHURCH-BUILDING NEWS.

Bradford.—St. Michael and all Angels' Church, Brick-lane, has been consecrated by the Bishop of the diocese. The church is the eighth of this town which the Bradford Church-building Society was formed to provide. The plan of the church consists of nave, with north and south aisles, chancel, vestry, with organ-chamber over, and tower to the south of south aisle. The style is Geometrical. The chancel, which is a continuation of the nave, without the usual division of a chancel-arch, contains a large five-light east window. The organ-chamber, with the view of economising space, is placed above the vestry, with arches opening into the north aisle and chancel. The nave is four bays in length, lighted by a large circular window in the west

gable, with an arcade of five lancet-windows beneath. The tower opens into the south aisle beneath an arch, and the upper portion contains a gallery for children. At present the tower is roofed in at the level of the aisle walls. The benches and other fittings of the church are executed in deal. The church is warmed and ventilated on the hot-air system, by Messrs. Haden, of Trowbridge. The works have been carried out under the superintendence of Mr. D. Kersbau, as clerk of the works; and the contractors for the various portions of the building were Messrs. Foulds & Brothers, of Bingley, masons; J. T. Sagar & Co., Manningham, carpenters and joiners; Charles Wilson, plumber and glazier; Hill & Nelson, slaters; J. B. & J. Ackroyd, plasterers; and Brown & Pullan, painters. The total cost of the church, including the boundary wall, will be about 3,600*l.* Accommodation is provided for 705 persons. Messrs. T. H. & F. Healey, of Bradford, were the architects.

Oving, Bucks.—The church here has been re-opened by the Bishop of Oxford, having undergone restoration. The whole of the interior has been refaced, and an arch on the north side, which had been built up, has been thrown open, and now forms the entrance to a new vestry. It is evident that at some time there has been a north aisle. New clearstory windows, in the Decorated style, have been substituted for the old square ones. The new seats are in deal. The east, and part of the south wall of chancel, are re-built. The character of the old windows is retained. There is a new open roof, and an oak screen has been placed in the south arch. The new rood is of alabaster, with Devonshire marble; super-altar and cross (by Mr. W. Thompson). The floor has been laid with Maw & Co.'s encaustic tiles, and part of the east end in panels, with freestone bands. The whole of the work has been carried out under the direction of Mr. G. E. Street, architect. Mr. G. Cooper, of Aylesbury, was the contractor. The plan adopted for warming the church is Porritt's underground stove.

Croxtan, Kerrial (Leicestershire).—The complete restoration of the interesting church in this parish is in an advanced state. The works are being carried out under Mr. G. G. Scott, by Mr. John East, of Melton Mowbray; and Mr. Youmans is clerk of the works. It is said the bowels of King John were interred in the south aisle of this church. In the burial-ground are many ancient monumental slabs and tombs.

Alfreton.—The restoration of the parish church of Alfreton promises to be speedily accomplished. The plans have been prepared by Messrs. Hine & Son, Nottingham, and contemplate the pulling down and rebuilding of the present chancel (which much needs repair), and of the vestry; the erection of a north and south transept, and an organ chamber; the throwing open of the tower to the church; a new roof to the nave; new windows to the north side aisle; the taking down of the present unsightly galleries, and the entire re-peaving of the church. By the contemplated enlargement and alterations many additional sittings will be obtained; and the committee, on the authority of their architects, estimate the entire cost of the restoration and enlargement at about 2,000*l.* A new clock and organ are both greatly needed.

Lyncombe.—The new church of St. Luke, Lyncombe, has been consecrated. The church is in the Early Decorated style, with nave, chancel, and transepts; and when completed there will be a tower and spire, running, it is intended, to a height of 120 ft. The architects were Messrs. Hickee & Isaacs, who furnished the designs gratuitously. Mr. E. Hill was the contractor; the carpenter's work being done by Messrs. Smith & Son; and the plastering and painting by Mrs. Mole. The interior presents an unassuming appearance. There are 384 sittings—one-third free. The total cost of the church, purchase of land, &c., is, we believe, 2,150*l.*, which is not wholly subscribed, and to build the contemplated tower and spire will entail a further expenditure of 250*l.*

Ashton-under-Hill.—The parish church has been re-opened. The restorations consisted in clearing away the school-room, lengthening the aisle, to the extent of two bays of the arcade, and new roofing the tower; taking away all the old seats and pews, and replacing them with open seats, all of one design, in deal, stained and varnished; placing a new pulpit of oak on the south side of the chancel arch; and a reading-deck opposite to it on the north side; flooring the space within the altar-rail (which is new

* As regards the point of class distinction, though with an application quite wide of artistic purposes, the keynote of the present article is struck in a succinct speech by the Bishop of Oxford, at the recent Church Congress at Wolverhampton, as reported in the journals at the time.

and very simple) with encaustic tiles from Maw & Co., of Broseley; paving the chancel with glazed bricks of two colours; adapting the space under the tower for a vestry, &c. The architect was Mr. Baker, of Birmingham; and the builder, Mr. C. Ancill, of Overbury.

Scarrington.—The small church of Scarrington, with Aslockton has been restored. The old edifice was in a very dilapidated condition; but the restoration has done more for the interior than the exterior of the edifice. A good south aisle has been added, and the interior generally has been renovated. Mr. J. H. Hakewell is the architect, and the works have been carried out by Messrs. Marriott, Warrant, & Scott, Nottingham. A new arch has also been thrown out from the belfry, through which the congregation pass on entering the church. An organ-chamber has been erected, in which it is intended, at some future day, to place an organ. The two windows on the north side and the centre compartment of the chancel window are filled with stained glass from Messrs. Ward & Hughes, of London. The figures in the chancel window represent the Ascension of Our Lord, and the window was placed there in memory of Mr. Henry Flowers. The other two windows represent the Annunciation, the Adoration, and the Circumcision, and were erected by Mr. T. Vincent, London, in memory of his father and mother. The seats in the church are red deal varnished, and accommodation is afforded for 200. The total cost of the restoration has been about 700*l*.

Burnley.—St. Andrew's Church, Burnley, has been consecrated by the Bishop of Manchester. The edifice is situated on a rising ground adjoining the new schools, on the Colne-road. It is of stone, and will seat about 550 persons. The cost has been about 3,000*l*. The plan consists of a chancel of about 27 ft. by 18 ft.; a nave and north aisle of six bays each; a north chancel aisle, roofed transept-wise, and arranged to serve as organ-chamber; and minister's and choristers' vestry, the minister's vestry being partitioned off, and entered through an inner porch; a south aisle of five bays, a sort of double transept on the south side, nearly square on plan, partly projecting from the chancel and partly from the south aisle, and having a central pillar with arches springing from it. This transept, or south chapel, is approached through a separate door, and is appropriated chiefly to the school-children. The tower stands at the south-west corner of the church, buttressed at the angles, and surmounted by a broached octagonal spire, the angles of which are placed in the direction of the cardinal points. The belfry stage has four two-light traceried windows, and the spire gabled storm-lights and other cusped piercings. The basement of the tower serves as a porch, in the western side of which is a cinquefoil-headed door, and on the northern side an arch opening into the nave. The west wall of the nave contains a large four-light traceried window, beneath which stands the font, which is of Portsmouth stone, the gift of Mr. T. Chaffer, the owner of the quarry. It has been executed by Mr. Shaw, of Liverpool, from the architect's designs. The east window is of three lights, with a traceried rose in its head. In the absence of a recess the east chancel wall will be temporarily relieved by a little colonnade. There is a legend referring to the monogram, "We have redemption through His blood." The chancel stalls, subsele, and other fittings, are of the best Danzic oak; the other seats, which are low, open benches, are of deal. The passages to the seats are laid with black and red tiles, in patterns, and the chancel and sanctuary with encaustic tiles. The aisle windows are arched and cusped: that of the north transept is a traceried rose, and those of the south transept are of two lights, with traceried heads. There are two gabled clerestory windows on the south side and three on the north side, each containing a two-light traceried window. The west gable contains a panel, with St. Andrew's cross. The walling is of Parpout stone, banded in two different shades. Catlow stone is used in the ashlar of the doors, windows, &c. The windows are glazed with tinted cathedral glass; the east chancel window is filled with coloured cathedral glass in geometrical patterns. This and the glazing have been done by Messrs. Edmundson, of Manchester. The work generally, with but little exception, has been done by Burnley tradesmen. The architect was Mr. J. Medland Taylor, of Manchester.

Exeter.—The ancient parish church of St. Mary Major, Exeter, which was removed in

1865, has now been rebuilt, and consecrated by the Bishop of Montreal. Known in Norman times as the place of holding the Archdeaconry Court of Exeter, distinguished by the remains of a massive Romanesque west tower, recorded in history as one of the parish churches of Exeter in 1222, it would seem to be an offence almost against archaeological feeling that so venerable a monument should have been entirely rebuilt. The requirements of so large a parish for more church accommodation, however, and the ruinous "patched up" state of the building, its dark interior encumbered with two awkward galleries, determined the case. The church has been designed by Mr. Ashworth, in the Early English style, the principal features being tall, twin lancet windows, and canopied buttresses. The enlargement has been effected chiefly by adding an aisle, 56 ft. 6 in. by 20 ft., which is divided from the nave by an arcade of four deeply moulded arches springing from piers, each formed of a cluster of marble shafts. The nave has been lengthened 8 ft., the chancel 9 ft., and the whole is removed nearly 12 ft. farther west, a house having been taken for a site for the west tower, which it is intended to surmount with a stone spire, rising to a height of 75 ft. The roofs are of red deal stained, ceiled between the rafters, the chancel roof being boarded, and covered with lead. The principal ribs spring from carved stone corbels, and these and the capitals are by Mr. Herley, of Taunton. The seating is all open with fittings of wainscot; the avenues are paved with Minton's tiles, and the tower with the old monumental slabs. There is an organ chamber on the south side of the chancel, and new vestry, with external door adjoining. The cost of the edifice is so far 6,000*l*. The contractor is Mr. Tozer; Messrs. Mitchell & Son doing the Bath-stone work. The stained glass is chiefly by Mr. Wailes, of Newcastle. The north window of the chancel, a memorial given by the parishioners to commemorate the rebuilding their parish church, was furnished by Mrs. Beer.

Tattenhall.—The old parish church of Tattenhall is fast falling into decay, but a movement is being made to erect a new church, from plans submitted by Mr. Douglas, architect, which will give increased accommodation to the parishioners. The architect has examined the fabric, and finds that it will require 3,000*l* for the rebuilding. Contributions will be received by the Rev. Fielding Ould, Tattenhall Rectory. The sum of 1,200*l* has been promised.

ROMAN CATHOLIC CHURCH BUILDING NEWS.

Whitby.—St. Hilda's Church, Whitby, has lately been completed, and solemnly blessed by the R. C. Bishop of Beverley. It has been upwards of two years in course of erection. The style of architecture adopted is severe Early Pointed, founded on a careful study from the best work, in the time-worn ruins of the old abbey, so familiar to all lovers of pure Early Pointed work. The plan has been determined by the peculiar nature of the site, which has a rapid fall along the line of Brunswick-street, to the corner of Bagdale. It has nave and aisles, the southern being considerably wider, and having cross arches to carry the roof. The total internal length is 101 ft.; width from wall to wall, 54 ft.; height from floor to point of barrel vault of nave ceiling, 54 ft., and a spacious sacristy, forming the connexion with the old presbytery. The necessity of using carefully the limited quantity of ground at the architects' disposal, has rendered necessary the omission of a chancel arch: a distinction, however, is made, the roof over chancel being panelled and boarded. The nave arcade has columns 18 ft. from centre to centre, and is 27 ft. in height, the walls being of great thickness. The aisle windows are 14 ft. from the church floor, and give abundant light throughout. There is no clerestory; one roof of braced and coped curved rafters, spanning nave, and aisles. The interior is far from complete. The altar is of Caen stone and alabaster, with pillars of serpentine, and has a rich enamelled tabernacle door, of *reposse* brass work, by Barkentin, of Regent-street. The font is of stone, carved with shafts of alabaster and serpentine, and is the gift of the principal entrance is in Bydale, a flight of sixteen steps, 18 ft. wide, approaches the doorway, which is

deeply recessed, and has nook shafts of red granite, one on each jamb, with a niche over, and statue of patron saint. The great doors are of English oak, 12 ft. high, with carved meeting post. Above is an arcade of lancets, and in the gable a large wheel window. The baptistery terminates the north aisle, and at the opposite corner rises the octagonal helix or campanile, to a height of 145 ft. The cross and vane of lead and wrought iron, are 12 ft. high. The front to Brunswick-street has a series of gables, which give the opportunity of well lighting the church. The roofs are covered with small strong Welsh slate, arranged in simple patterns, and crested with a bold rigging of red tile. The architects were Messrs. M. E. Hadfield & Son, of Sheffield. The font and altar have been executed by Mr. Earp, of London. The contractors were, for the masonry, J. Seales; carpentry, J. White; plumbing and glazing, Brown; plastering, Blakeley; slating, Hargreaves; painting, Readman, all of Whitby. A memorial window has been placed in the church. It is by Messrs. Wailes, of Newcastle, and has been placed in the church by the families of Lawson and Tarnbull as a memorial. In one of the lights is the Resurrection, and in the second, our Lord blessing little Children.

Boole.—St. Alexander's Church, close to the Miller's-bridge Railway Station, has been opened for divine service. The edifice is a parallelogram, divided into nave and aisles, the former terminating in an apseal end. The extreme length of the building is 108 ft. by 50 ft. in width, and is 53 ft. high. The building is extremely simple in outline. The architect was Mr. E. Welby Pugin, whose designs have been carried out by Mr. Glaister, the contractor, the woodwork being supplied by Mr. Hughes.

DISSENTING CHURCH-BUILDING NEWS.

Middlebros.—The foundation-stone of a chapel has been laid in Milton-street, Newport-road, for the United Methodist Free Church. It will be in the Gothic style of architecture, and will accommodate from 320 to 350 persons. The building will be 48 ft. in length, 35 ft. in width, and about 30 ft. in height, and, exclusive of the site, which has been given by a few proprietors of land in the neighbourhood, will cost about 850*l*. There will be a schoolroom underneath, and the chapel itself will be so constructed that a gallery may easily be added. The seats will be open; there will be a platform pulpit, and an orchestra behind it. The plans have been prepared by Mr. John Hunter, of Middlebros.

Bradford.—The Old Chapel-lane Unitarian Chapel has now been removed, and the work of erecting a new edifice already commenced. Messrs. Andrews, Son, & Pepper are the architects of the building. The front of the church will face Chapel-lane, the principal feature being a gable, rising 84 ft. from the ground to the top of the cross, with a large five-light window, 21 ft. wide and 41 ft. 6 in. in height, in the centre. This window will be filled with tracery, and above it in the gable, a cinquefoil window will afford facilities for ventilation. It was originally proposed to erect a spire at the western side of the gable, 125 ft. high, but this idea was abandoned. The nave is to be 40 ft. wide, while the height to the top of the ceiling will be 50 ft. The pillars supporting the five arches forming the nave into which the church is divided will rise from a narrow aisle at either side, and this aisle in addition to the central one, will give access to the seats. The church will be lighted from the sides by two-light windows, and the aisles by small windows. A chancel, with organ-chamber, vestries, and other conveniences, will be provided. The pews will be of red deal, and of modern design. The church will seat 500 persons, and it will cost about 5,000*l*. Upon stone, from Idle quarries, will be used for the exterior, and it will be covered with red and blue slates. The works have been let to the following tradesmen:—Messrs. Barraclough & Son, of Horton, masons; Mr. W. Crabtree, joiner; Mr. Schofield, plumber; Mr. Dixon, plasterer; Mr. H. Briggs, painter; and Messrs. Hill & Nelson, slaters.

Blandford (Dorset).—The new Independent Chapel in this place has been opened. It is a Gothic design, and occupies a site in the centre of the town. It contains chapel, class and assembly room, a large school-room, and vestry. The architect was Mr. Street, of Warminster; the builder, Mr. Walden, Christchurch.

Widfield.—A new Congregational Chapel has been erected in Gardau-street, and recently held for divine service.

Newcastle-upon-Tyne.—The Methodist New Mission Chapel, Garden-street, was to be opened on Sunday, the 15th inst. The building occupies a site on the north side of Snow-street, at its junction with Derby and Garden Streets, adjoining the ordinary street dwelling-houses, and its side or front wall running with them, the architect has so far succeeded in his design as to destroy the blank monotonous appearance a long wall in this position is so liable to give, without losing space or encroaching on the footway. The chapel measures externally 100 ft. by 30 ft., and is 24 ft. in height from floor to ceiling. It is computed to seat 260 persons, and the whole cost will be 7000. Mr. S. Oswald, was the architect, and the various works have been executed by Mr. R. Ridley, mason; Mr. R. Matfield, carpenter; Mr. Hastie, slater; Messrs. G. & Son, plasterers; Mr. Charles G. Plumber, Messrs. Glaholm and Messrs. Ker & Emley having supplied the gasfittings. The painting and glazing have been executed by Fenwick Pickup. It is intended to erect school and class rooms, and vestry in connexion with the chapel.

Leighley, Yorkshire.—The Wesleyan Chapel has been painted and decorated. The scheme of colouring adopted is much fuller in effect than that usually ventured upon in chapel decoration. The colouring generally is subdued in hue, relieved slightly by touches of colour. The whole interior effect has been produced by colour only, graining having been dispensed with. The effect of the whole has been heightened by the introduction of inner windows of ground glass, transmitting a soft diffused light over the whole. Messrs. Forster & Andrews, of Hull, have just erected an organ in the chapel. The whole of the decorations have been carried out by Messrs. S. Bottomley & Sons, of Cross-street.

INVENTS CONNECTED WITH BUILDING.

APPARATUS FOR MIXING, PRESSING, OR BUILDING COAL AND OTHER SUBSTANCES FOR THE FORMATION OF ARTIFICIAL FUEL, AND SPLITTING THE SAME INTO BLOCKS.—*D. D. Parker.* Dated 17th January, 1867. —The object of this machine is a rectangular receptacle placed upon a bed-plate, a vertical shaft mounted in suitable bearings being placed in the centre thereof. The upper portion of the shaft is furnished with blades or knives affixed at convenient distances from each other, and to the lower end thereof is attached eccentrically a circular disc so as to revolve therewith, and in the manner mentioned. The disc is placed in the interior of a rectangular box of cast-iron or other suitable material, such box fitting the exterior of the lower portion of the before-mentioned receptacle, but free to move thereon on the bed-plate, at each end of the main shaft of the machine, and extending beyond the same, is placed a series of tubes of rectangular section, such tubes being constructed of cast-iron or of any other suitable material. The upper portions of such tubes which are within the interior of the machine are open for the admission of the substances under treatment, as hereinafter mentioned. Above the tubes, and within a main body of the machine, are hollow iron rods, the faces of which have slots formed therein, through which slots project iron points or teeth, the same being mounted loosely on eccentric spindles in the interior of the rollers, in such manner that they shall project the required distances from the faces of the rollers during the revolution thereof. The rollers forming each pair revolve in contrary directions, so as to draw down between them, by means of their motion and of the points or teeth, the substances under treatment. The substances to be submitted to the operation of the machine having been, if necessary, prepared in a pug-mill, or in any other suitable manner, are conveyed by means of endless bands, or in any other convenient mode, and introduced at each end of the machine on either side of the central shaft. Upon the central shaft being caused to revolve the revolution of which, together with that of the before-mentioned rollers, is effected by means of wheels and gearing actuated by any suitable motive power, as well understood, the materials introduced into the machine are subjected to the action of the knives or blades, and

also of the points or teeth carried by the rollers, and being thereby mixed and incorporated pass into the before-mentioned horizontal tubes. By the action of the eccentric disc the rectangular box in which the same is contained is alternately moved back wards and forwards so as to force the materials through the tubes towards their respective extremities, the entrance of such materials into the tubes being alternately permitted and prevented by the motion of the box. As the blocks issue from the tubes they may be received by revolving moulds divided into compartments and mounted upon axes, and caused respectively to revolve through the required distances by rods connected with the moving box. Upon the box issuing from the tubes and being received by the moulds, the latter are caused partially to revolve by the operation of the connecting rods, whereby the blocks are brought into such a position that they can receive additional pressure or impressment from any suitable apparatus which it may be considered desirable to use in conjunction with this invention; or, instead of using revolving moulds, the blocks may be subjected to additional pressure or impressment upon issuing from the moulds in the manner usually practised in similar operations. The like process takes place alternately at either end of the machine with the motion of the box.

APPARATUS FOR PREVENTING DOWN-DRUGHT IN CHIMNEYS. *C. Wenner.*—Dated 19th February, 1867. —This invention consists in the use and application of a curved hood or cowl, into which the upper portion of the chimney-pot or funnel is made to project, such hood or cowl being open at the exit end and turning with the wind on a vertical shaft, and has an opening in the back or long curve of a smaller sectional area than the area of the exit end of the cowl, and into this back opening a horizontal funnel or conical tube is fitted in order to catch the wind. By this arrangement the air passes from the small opening in the back of the hood or cowl over the top of, and at right angles to, the chimney or air shaft through the said hood or cowl of larger sectional area, expanding at the same time, and causing a great upward draught in the chimney or ventilating shaft. To prevent any back current the hood or cowl is made of sufficient length to allow the current of air which issues from the small opening in the shape of a cone to touch the sides of the cowl before passing into the open air, so that no air current can enter through the front opening.

FLOORS AND ROOFS OF HOUSES, &c. *H. Y. D. Scott.*—Dated 19th February, 1867. —The object of this invention is to construct fireproof floors and roofs of houses and other buildings in concrete in a more economical manner than has heretofore been accomplished. The patentee proposes to dispense with the use of the ordinary joists, and to make use of wrought iron tie-rods extending from wall to wall (or when the space to be covered is of large extent or span from girder to girder), placed at intervals of 10 ft. or 20 ft. apart to assist in carrying the weight of the concrete, the thickness of which will increase with the increase in width of the span to be covered. These girders will form part of the main supports of the floor for large spans, while the tie-rods will hold together the mass of concrete between the girders.

APPARATUS TO DEEPEN, EXCAVATE, SCOUR, AND REMOVE THE MUD, SLIME, STONES, AND OTHER FOUL MATTERS FROM THE BEDS OF RIVERS, STREAMS, &c.—*H. A. Bonneville.* Dated 27th January, 1867. —This apparatus consists of a wheel or cylinder bearing teeth and iron hockets on its periphery, which serve to deepen, excavate, scour, and remove the foul matters at the bed of all running waters, the axis of the said wheel being upheld by two boats bound together and placed on each side of the said wheel. Movable dam boards and hatches or flood-gates are placed at the back of the apparatus, in order to intercept as completely as possible the current of the watercourse, so that all its strength may be brought to bear on the said dam-boards and hatches or flood-gates, and compel the boats to follow more or less rapidly the course of the stream, as may be required, by means of moorings which are gradually let go. The downward motion of the boats gives rotation to the wheel, which, in its rotation, will dig the bed of the river or watercourse according to the greater or lesser depth at which the said wheel has to be let down, and it removes the matters to the upper surface of the wheel, whence they are thrown into an overflow or conduit of the wheel placed above the boats, which serve to carry the said matters away.

Books Received.

Original Designs for Wood-Carving; with Practical Instructions in the Art. By A. F. B. London: Longmans, Green, & Co. 1867.

This handsome folio volume contains very useful instruction for those who would acquire the valuable art of wood-carving, the attainment of which in a greater or less degree is within the reach of most persons. The writer keeps the whole process under three heads: 1st. Preparing the block; 2nd. Blocking out the work; and 3rd. Moulding and finishing it; and gives good instruction on all. The designs are twenty in number, partly from nature (foliage and fruit), and partly geometrical. We must confine our praises to the former.

VARIORUM.

"A HANDBOOK of English Literature." By W. G. Larkins, published by Routledge & Sons, gives in very small compass a general view of the authors of English literature, both prose and poetry. Each author is spoken of in the order of the date of his or her death, succinctly and sensibly. Passing by opinions from which we might dissent, we have no hesitation in saying that a careful study of this little book, an easy task, will serve to give to those who have neglected the knowledge, or not yet commenced its acquirement, a very clear idea of the history of English literature. —Mr. Tegg has issued reprints of several standard works, in small compact volumes, —"A Sentimental Journey, and the History of a good warm Watch-coat" (Sterne seems in demand just now); "A Tale of a Tub," with "Life of Swift;" and "The Life of Nelson," by the Old Sailor. The latter popular little volume contains a *fac-simile* of one of Nelson's letters. —The January number of the *Popular Science Review* (Hardwicke) contains a very interesting paper by Dr. Maxwell Masters, on "Sensitive Plants," with illustrations, and a chapter by Mr. Robert Hunt on "The Science of a Snow-Flake," also illustrated. —"Spider Nests" are illustrated in the new number of Hardwicke's "Science Gossip," and Dr. Lucecum gives some information concerning the "Agricultural Art of Texas." In the course of the observations it is stated that these ants sow the seeds of a grain-bearing grass (*Aristida stricta*) weed and preserve it, and at the proper time gather the seeds and carry them to the granary: something more than instinct this. —The re-issue of "Cassell's Popular Educator," in parts, deserves notice. It treats continuously and in a good manner of all sorts of subjects, astronomy, botany, drawing, English, mechanics, and fifty others. We can recommend it strongly. —The January number of *Cassell's Magazine* is full of entertaining reading, with illustrative engravings. —*Echoes from the Clubs* become louder and more entertaining, and wital may now be enjoyed for less money than at first.

Miscellaneous.

SACKVILLE-STREET, PICCADILLY.—With reference to some notes of Sackville-street, recently given in our pages, a correspondent points out that there is not a lamp-post in the street. The lamps are all suspended upon iron brackets, in the fashion so prevalent in the days of oil, before the age of gas. The remark is quite correct.

NEW PULPITS.—The new carved pulpit at Christ Church, Bath, which has been designed by Mr. J. Elkington Gill, is Early English in character. The body is circular in form and stands upon an oak pedestal. Below the cap mouldings are nine trefoil-headed openings, exclusive of the entrance, with carved columns, at the foot of which there are eighteen panels minutely carved in foliage pattern. The frieze mouldings are descriptive of foliage. Messrs. Brown, of Frome, were the builders; Mr. Skilman, of Bath, executed the carving; and the iron and brass work was done by Mr. J. Brown, of Frome. —A new stone pulpit, with lectern and altar-rails in iron and brass, and prayer-desk and choir seats of oak, have just been erected in the church of Finstock parish. The whole work supplied by Messrs. Hardman, of Birmingham, has been provided at the expense of Lord Churchill and his family connexions, as a memorial to their mother, the Dowager Lady Churchill.

WAGES IN NEW ZEALAND.—A correspondent, recently returned from New Zealand, denies the correctness of the wages stated by Mr. Ross, in his recent letter to us, from Dunedin. We have no reason, however, to doubt the accuracy of that gentleman, who is in practice there as an architect.

A PAINTED BEDSTEAD.—We have seen with much pleasure a bedstead of yellow deal, made by Edward Grimes, builder's foreman, and with the assistance of R. Edge, house-painter, decorated in Mediaeval style. The wood was first stained clear and varnished, and then stencilled in various patterns called from the Art-library at South Kensington, of which Grimes is a frequenter. The result is highly praiseworthy. The originator of the bedstead has also invented a cooking-stove which has a promising feature.

THE PRIORY CHURCH, MALVERN.—Lately it was discovered that something had gone wrong about the roof over the north-east aisle, whereupon the vicar and churchwardens instructed the Messrs. Haddon to examine into the cause of the apparent failure, who reported that, in the absence of proper means of ventilating the chamber formed between the stone groining of the ceiling and the roof timbers, *Merulis lachrymans* had been generated, the result being dry rot to such an extent that the whole of the upper timbers and hoarding must be taken off and replaced with new; and, at the same time, the architects recommended the construction of ventilating flues in order to prevent a recurrence. This report having been submitted to Mr. G. G. Scott, the architect on the former occasion, and having received his approval, the contract for taking down and replacing the roof timber and the performance of the other works incident thereto has been made with Mr. Smart, builder, who will forthwith carry out the same under the supervision of Messrs. Haddon, Brothers, architects.

THE YORK WORKHOUSE CHAPEL AND DINING-HALL.—Lately Mr. J. L. Foster, one of the guardians of the York Union, applied to the Board for permission to undertake the decoration of the large room in this workhouse, which is used as a chapel and also as a dining-hall. Leave was given, and the funds were provided by a private subscription.

Mr. J. W. Knowles, of this city, mural decorator, carried out the work. The ceiling, which is divided in certain places with beams (supported by pillars), has been coloured a warm buff, and thrown into panels by an ornament of a darker shade. The walls from the ceiling to the window-heads is coloured the same buff as the ceiling; from thence down to the dado they are sage green, having ornamented hands of a deep yellow and red running across horizontally, the intermediate spaces being filled with fleur-de-lis of a darker green. On the face of each pillar, which is coloured grey and deep yellow alternately, is a fret in Indian red, banded by a style of sage green. A fret is also stencilled under each beam. The seats have also been stained and varnished.

FIRES.—The workshops at the Derby station of the Midland Railway have been burnt, and property valued at several thousand pounds destroyed. The cause of the fire is unknown. The *Newcastle Chronicle* takes the town Council to task for its obduracy, indifference, and inactivity in the question of grappling with fires. "The whole town," says the *Chronicle*, "is at the mercy of the Water Company. Having few other means at hand to grapple with a fire other than those which the Water Company supplies, everything of course depends, in case of an accident of this kind, on the quantity of water in the mains. In the instance of the *Queyside* fire, the force was only sufficient to supply a single hose. It is simply ridiculous, however, to complain of want of water when the Tyne itself was flowing within 100 yards of the burning buildings. How did it happen that that magnificent supply could not be used till some hours after the fire had been in full play? The simple fact is, that this wealthy and populous town of Newcastle is not furnished with proper means for extinguishing fires. Fire-engines and fire-brigades are elsewhere held to be necessary institutions in a town. Here, however, we seem to think they are not worth our attention. Is it creditable to Newcastle that it should not itself possess the means of meeting its own emergency? All that is wanted is that the Council shall vote a few hundred pounds for the establishment of a volunteer fire-brigade."

SOUTH LONDON WORKING MEN'S COLLEGE.—The principal of the college in Blackfriars-road is Professor Huxley, who is to deliver an inaugural address on (this) Saturday, the 4th inst., in the evening at 8.30. The admittance to strangers is 6d. each, and to members 4d. The entrance is in Collingwood-street. The secretary is Mr. William Rossiter. The college is intended to offer to working men in South London an education of a sound and efficient character on terms within their means.

PREPARATIONS FOR SNOW.—The Board of Works for the Westminster district (Mr. Arntz, surveyor), has issued printed instructions for the removal of snow in the event of its fall, a praiseworthy step. If all the other metropolitan Boards do the same, London will not again be exposed to such an annoyance in this direction as once befell it. We have not heard the result of the offer of premiums by the Metropolitan Board of Works for the best method of getting rid of snow from the streets. Some time ago we described an invention having this end in view, wherein a jet of steam was the means employed.

A NEW NORTH LONDON SYNAGOGUE.—The foundation-stone of a new synagogue has been laid in Thornhill-road, N.W. The building will be in the Italian style, and is divided into three bays, and has an octagonally-coffered ceiling. It has a large gallery round three sides of the interior. The dimensions of the synagogue proper are 65 ft. by 45 ft. wide, by 35 ft. high. In the basement is situated a house for the headle's residence. The accommodation in the synagogue will be for 700 persons. The cost, it is anticipated, will be about 5,000*l.* The architect is Mr. H. E. Collins. The stone was laid by Baron Ferdinand de Rothschild.

EXPLOSION OF A POWDER-MILL AT FAVERSHAM. Eleven persons have been killed by an explosion at Messrs. Hall & Sons' Powder-mill, Faversham. The exploded buildings were the press-house, the corning-house, and the powder-house, the roofs of which were blown high into the air. Walls 9 ft. in thickness were blown down, elm trees in the surrounding fields torn up by the roots, and dykes emptied of water. The sight was a most sickening one as the remains of the poor fellows were collected. The cause is believed to have been accidental, notwithstanding rumours that the Fenian conspirators had done it. These wretches must be glorying in the panic that attributes all sorts of accidents to their devilry, which seems to have no intelligible purpose but the production of just such a panic.

A CURE FOR NEURALGIC HEAD-ACHES, FACE-ACHES, AND TOOTH-OR JAW-ACHES.—Sir: About ten years since I was laid up with an excruciating neuralgic headache, which seemed to encircle the ear of that side of the head alone affected. The idea that the headache had something to do with the ear as a centre occurred to me, although, in the ear itself, there was no pain. I had a little almond-oil, and also spirits, dropped into the ear, but without any good effect; when the thought suggested itself that perhaps a little of the anæsthetic ether (not the nitric) might do good, by deadening the nervous pain. I had some drops of rectified sulphuric ether, therefore, put into the ear; and, in the course of half an hour, my headache was entirely gone. I have since found, both from my own occasional experience, and that of others, that ether, so applied, is, in nearly all cases an effectual cure of these very painful head-aches, face-aches, jaw-aches, and tooth-aches, which are commonly known as neuralgic and rheumatic. If a very severe case, two or three days may elapse, during which the pain may be apt to recur, especially from new and even slight exposure to draughts; but repeated application of half a dozen drops, or less, of ether, at a time, seems certain to subdue the most violent attack, sometimes in a very few minutes. A drop or two of almond or olive oil, afterwards put into the ear, I have thought, tended to protect from a new attack. As the ether sometimes gives pain in the ear for a moment while being applied, a single drop should, first of all, be carefully put in, and then more, as the case will allow; but I have never suffered the least bad effect, either in my hearing or otherwise, from the use of ether in this way, nor have I heard of any from others who have tried it at my recommendation.—J. E. DOVE.

SOUTH KENSINGTON MUSEUM.—In the week ending December 28th, 1867, the visitors were 17,490 in number.

ROYAL LITERARY FUND.—We understand that the Right Hon. B. Disraeli, Chancellor of the Exchequer, will preside at the next anniversary dinner of this corporation.

THE COPPER TRADE.—Messrs. Vivian, Young & Bond (Dec. 27) write:—Business in West Coast produce has been confined to about 20 tons bars, which were taken at 68*l.* in Liverpool at which price there were no longer buyers.

BUNHILL-FIELDS BURIAL-GROUND.—On New Year's-day, Bunhill-fields Burial-ground fell into the possession of the corporation, by Act of last session. The corporation will once set about planting the ground, laying out walks, &c., and preserving the tombstones. The ground will then be thrown open to the public under proper regulations.

GALVANISED IRON CISTERNS.—Recent experiments conducted by the French Government show that the water-tanks on board a ship should be coated inside with tin, and not with galvanized iron, as at present. It was discovered that the water, under certain various conditions, dissolved the zinc off the iron, and rendered it injurious to health.

DISTRESS IN LONDON.—At the suggestion of Miss Bardett Conitts, an association has been formed for behoof of those suffering in the Eastern district, based on the wholesome idea that wages paid for work done are more welcome and really paid to the poor than gifts in charity. Men of various persuasions have met on a common ground to perform a public service; and with the unanimous vote of the Dissenters, the chosen president is the Bishop of London. The work proposed is exactly that most needed in the Bethnal-green parishes—the cleansing of the streets, alleys, and courts, and the making or repairing of roads. The labour performed will be supplementary, and in excess of the ordinary proceedings under the local boards. Money will be needed. Miss Bardett Conitts has undertaken to pay the wages of two hundred and fifty persons for six months, at eighteenpence a day; she has guaranteed the rent of ground required for stone-breaking,—employment suited to dock labourers,—and has contributed 300*l.* towards the road-making fund.

THE RESTORATION OF BANBURY CHURCH.—At a meeting of the members of the Royal Archaeological Institute, held on the 7th December, Mr. Octavius Morgan, F.S.A., vice-president, in the chair, the Rev. W. Lowe, M.A., vicar of Banbury, Cheshire, communicated an account of the church there, now in course of repair, and of interesting objects found in the progress of the works. Surrounding the chapel of the Calveleys, in the north aisle, and of the Spurstows, of Spurstow Hall, in the south aisle, were elaborately executed and painted screens, formed of oak. A large number of the panels, tracery, and other parts of these screens, were exhibited by Mr. Lowe. The paintings were remarkable for the force and brightness of the colours used, but the execution is somewhat coarse, and was most probably provincial workmanship. Remains of painting in distemper had been found on the walls, probably a St. Christopher and an altar-piece, apparently representing the Resurrection of our Saviour, with attending saints, &c., painted on a red hack-ground powdered with white stars, and edged with black.

TENDERS.

For the erection of a theatre and publichouse at Croydon. Mr. T. Smith, architect:—

Hill & Keddell	£3,767 0 0
Emor	3,665 0 0
King & Sons	3,610 0 0
Harell	3,470 0 0
Masley & Rogers	3,378 0 0
Tongue	3,237 0 0
Chappell	3,205 0 0
Dover	3,207 0 0
Sawyer	3,042 0 0
Erbecher & Son	2,883 0 0
Fellner	2,719 0 0
Kelting	2,630 0 0
Munday & Hutchinson	2,593 0 0

For new residence and apartments at Great North-street, Herts, for Mr. Frederick Potter. Mr. Frederick Gotto, architect:—

Chappell	£1,959 0 0
Skinner	1,631 10 8
Cook	1,616 16 0
Nash & Matthews	1,438 0 0

The Builder.

VOL. XXVI.—No. 1301.

English Artisans on the Paris Exhibition.

VERY remarkable book has been published; a book likely, if we mistake not, to effect a considerable amount of good.* It will be remembered that the Society of Arts raised a subscription with the view of sending to Paris a certain number of selected workmen, each of whom on his return, was to make a report of what he had observed during his stay, in reference to the special industry in which he was engaged. H.R.H. the Prince of

Wales aided, and the Privy Council Committee on Education, offered 500*l.* towards the intention, provided that the Society raised at least the same amount by voluntary subscriptions.

The sum subscribed amounted to 1,039*l.* 9*s.* 6*d.*, which enabled the council to assist upwards of eighty skilled workmen, representing the principal industries of the country, to visit Paris, and to examine the quality and cost of the work executed in their respective trades by the best workmen of foreign countries.

The council received valuable co-operation from the Chamber of Commerce in Birmingham, who subscribed to the fund and recommended twenty-five workmen and foremen to represent the various branches of trade carried on in that district. The visit of the workmen from Birmingham was organised by a local committee, who received valuable aid from Mr. W. C. Aitken. The various reports sent in, edited by Mr. Charles Critchett, the assistant-secretary of the Society of Arts, are now before us. All such forms of expression as, though not strictly in accordance with grammatical rules, appeared to convey more forcibly than any other the writer's meaning, were retained, and only such literal and grammatical corrections (with a few trifling omissions) have been made, we are told, as were absolutely essential. The reports bearing upon cognate branches of industry have been generally kept together. We give a list of all the writers, to mark our opinion of the credit they have done themselves and their class.

The reports, fifty-three in number, by artisans from London, Sheffield, Coventry, Bradford, Newcastle-under-Lyne, &c., are,—

Cabinet-making	Charles Alfred Hooper.
Ceramic decoration	Aaron Green.
Saws and tools	William Bramhall
Cutlery	John Wilson.
Chair-making	Benjamin Lucraft.
Glass-painting	Francis Kirchhoff.
Wood-carving	James Mackie.
"	R. Baker.
Cabinet-work	Thomas Jacob.
Wood-cutting machinery ..	William Walker.
"	Thomas J. Wilkie.
The Ribbon trade	L. S. Booth.
Ribbon-weaving	Joseph Gutteridge.

* Reports of Artisans, selected by a Committee appointed by the Council of the Society of Arts to visit the Paris Universal Exhibition, 1867. London: Bell & Daldy.

Lace	Edward Smith, Joseph Bird, and George Dexter.
Hosiery	George Kondall and George Cault.
Pottery	William Beardmore.
Tiles and Pavements	Samuel Cooper.
Terra-cotta	Michael Angelo Pulham.
Pottery and porcelain, with some notes on iron manufacture	John Randall.
Bricklaying	George Howell.
Plasterers' work	John Jeffery.
Carpenters' and joiners' work ..	C. Bartlett.
Joiners' work	T. W. Hughes and John D. Prior.
Masonry, &c.	Alexander Kay.
"	George Broughton' Forbes and John McEwen.
"	Thomas Connolly.
Couch-making	Thomas Magrath.
Ship-building	E. F. Mondy.
Mining and metallurgy	Francis Oats.
Silver-work	P. A. Rasmussen.
"	George Page.
Silver chasing	R. E. Barrett.
Hammered iron	William Lethereu.
Ornamental wrought-iron work	T. Winstanley.
Ivory-carving	Joseph Bentley.
Engraving	G. Berry.
Die-sinking, especially adapted to silversmiths and other metal trades ..	William Elliott.
Watch-making	John Gregory and James Strager.
The Horological Department ..	Hermann F. Jung.
State of the watch trade	George Cook.
Tailors' work	R. Sinclair.
Book-binding	Leeds Great.
Leather-work	Walter Blunt.
The manufacture of caoutchouc	William Bourne.
Figured shawls	Samuel Bosst and John Appleton.
Machinery for worsted fabrics	John French.
Worsted yarn	George Spencer.
Worsted and mixed textile fabrics	Daniel Hillingworth.
French horticulture	John Evans.
Mechanical engineering	William Learmouth.
The condition and habits of the French working classes (special report)	Robert Coningsby.
"	Richard Whiteing.

The reports, twenty-nine in number, by artisans from Birmingham, are,—

Introductory Report	Mr. W. C. Aitken.
Gas-fittings and chandeliers ..	Sam Taylor.
Plumbers' brass foundry	Thomas Bexley.
Cabinet brass foundry, &c.	William Gorman.
General brass foundry	Henry Dry.
Church bells	James Ansell.
Tubes in all metals	John Fisher.
Saddlery, &c.	John Clay.
Leather, harness, saddlery, whips, portmanteaus, &c.	Frederick Thompson.
Jewelry, with diamonds and precious stones	W. G. Deeley.
Jewelry and gilt toys	James Plamplin.
Buttons	Thomas Johnson.
"	S. W. Richards.
"	William Bridges.
Steel pens	J. L. Pettit.
Small arms	Charles Hibbs.
Paper-maché	David Sarjeant.
Japanising in general	Thomas Archer.
Needles and fish-hooks	William Guise.
Sheet and plate glass	Richard Pearshall.
Table and fancy glass	Thomas C. Barnes.
"	W. T. Swene.
"	T. J. Wilkinson.
Die-sinking	Charles Wm. Moore.
Electro-plate	Henry J. Fellows.
Tin-plate working	Edwin Poole.
Labour-saving machines ..	Henry Fowler.
Railway carriage and wagon building	Benjamin Whitehouse.
Design	Frank J. Jackson.

It is scarcely necessary to say that some of the writers, when they make comparisons, do so without full knowledge of both sides,—several of them of either side. A large amount of common sense, however, is shown by the great majority, and what they have said should set many of their fellow-workmen thinking. The writer of the report that stands first, C. A. Hooper, goes into raptures with all he sees and finds every comparison very disadvantageous to his countrymen, of whom he has, seemingly, but a poor opinion. On the road, when in Paris, he meets a van full of joyous workmen in blouses,—

"They are singing French songs; the van is hung round with Chinese lanterns; they are going home, sober and happy, from some excursion. I think for the moment of a similar scene in London; had they gone through Holborn in this same manner, hundreds of boys would have followed and roared and shouted, and would have smashed every lantern on the van; here the people simply looked and smiled as they passed. Again, I thought of a party of British workmen returning from a banquet, as I have often seen them, roaring drunk, swearing, and howling and stopping at every 'publie' to drink, and 'drive dull care away.'"

The carving seems to him wonderful; it must

have "grown into shape and form." In the workshops of London they have foremen and overlookers who wear fine cloth, and decorate their persons with jewelry, and to whom they are expected to look up as to some one very superior. In Paris the foreman appeared in the same garb as the men—the fine blouse common to both; each one treated the other with proper respect, as became the office he fulfilled; you were not disgusted with either the pride of the one or the degrading servility of the other; each man knew his place and kept it. Oh! I many times while in Paris blushed for my countrymen! He often asked himself, "Where are the Paris roughs?" Everybody was not only smooth, but highly polished. In Paris the man in his blouse could sit and enjoy the society of the upper class in a grand *café*; but he is not at all surprised that it is not so in England, because there are people in his own trade with whom he finds it impossible to associate out of the shop; how much more were they separated from the educated and refined. "The great fault must be in the training of the people." To him the life of a Parisian workman appeared to be all happiness. And then every one behaved to him so well.

The question naturally arose, what is the cause of this marked difference between us and them? and his reply is, we want in our country a system of "national education," free from all sectarianism, and entirely secular, leaving every one to exercise his own judgment in religion, and to worship God according to his own conscience. Let us have free access, Sundays and week-days, to all the national institutions. Let there be no restraint on rational, healthful, innocent recreation, and let us have this always encouraged. Let Government restrictions be put upon, and strongly enforced against, every thing and every place of a vicious, low, or degrading nature.

The next writer, Aaron Green (Ceramic Decorations), takes a cooler and deeper view, as do the majority of those who follow. Mr. Green, with due admiration of what is done in Paris in his department, maintains the excellence of the English works, and denies the truth of the assertion that has been made that "the best specimens exhibited by English manufacturers are painted by French and even German workmen": and that in "elegance of outline and delicacy of tint these artists excel all rivals."

"Is it true that our artistic deficiencies are really so great? My answer is, no. And in corroboration of my opinion, I beg to refer to remarks made by J. C. Horsley, R.A., who, in his report, published in the *Illustrated London News* of August 17th, says—'In porcelain painting there is nothing better than the works of Allen, Mitchell, and Simpson, artists employed by Minton. Now, these are all of them Staffordshire men, born within three or four miles of the manufactory where they are now employed. Another witness to this fact is found in Leon Arnoux, esq., himself a Frenchman, and one who knows more than any living man of what Minton's workmen are capable. What does he say? Why, I find in his report published in the *Illustrated London News* of September 14th, the following, when speaking of Minton's productions:—'But the best things in their glass cases are the many vases of soft porcelain with figure paintings. The largest pair, in *bleu-de-roi*, representing the toilet and birth of Venus, are from original paintings by Francois Boucher; they exceed in size all other vases produced in the soft material; they have been very successfully painted by Messrs. Allen and Mitchell, the same artists who have executed the painting on an Italian pair of vases decorated with a frieze of young Cupids playing in a picturesque landscape.'

William Bramhall, speaking of saws and tools, thinks England is still in advance of France, Belgium, and Germany for the highest excellence in the perfection of model and of a cutting edge in saws and tools (without regard to their price), principally owing to the finer quality of the steel and greater care in their grinding, having greater natural advantages for superior grinding and facilities for power. The same does not apply to American tools, however, axes more especially, which for exactitude and finish have the appearance of being die-struck, so uniform are they in every respect. They are models of their kind, and show the grit of the Old Country in their formation, *minus* the prejudices that

cing to us, and having a freer scope for individual exertion.

One peculiarity in Paris he finds is the giving of a share of the profits to all employed, — to those who conduct themselves properly and respectfully to their fellow-workmen as well as to their employers. Another is the development of "speciality," or a gift for a particular kind of work. A man or boy is encouraged to express his likings or dislikings for his employment; and it is no rule that because his father was a chimney-sweeper he must through life pursue the same vocation. "If he has the ability to command an army there is a place for him in prospect. One of the leading French generals is of humble origin. Worthy sons of labour, who strive for progress, are recognised, honoured, decorated, and pensioned."

He finds the general domestic condition of the French *ouvrier* greatly inferior to that of the British workman. If we speak of him with regard to his family comforts, adjudged by the English standard, home he has none. "There is not a word in the French language which can express the idea of an English home, for the best of reasons—the idea has never been conceived."

"We have said of the *ouvrier*, 'home he has none'; but he has a French home, which is eight stories high,—as on Boulevard Richard Lenoir and numerous other places,—is a B. square, and he pays eight francs per fortnight for the accommodation, and must carry his muddy waders,—which he has previously bought,—and all he needs, to his sky-high chamber, and must bring all his refuse down from that elevation; and he is in good quarters when he is thus located. He has a little bed that turns up, and a little table that lets down, which must be done alternately each night and morning in order to make room. He has a couple of small chairs, as many basins, plates, knives, forks, and tablecloths, and a *bonnet* (a red cap) which is a tasty pot if possible, and a bird in a cage, nearly comprise his household goods. One suit of clothes, with blue cotton overalls, and a change of under-linen, constitutes his wardrobe (he is substituting leather shoes for wooden shoes); he has a perforated treepot for a stove, and with this, with a basket of charcoal and charcoal dust, whose fumes are poisonous, he must cook his Christmas dinner; and his condition is improved, for ere there are no lavoirs, or washing-houses, where his wife can wash for the public, if she does not work at any thing else?"

Instead of envying them, he has to report upon the inferior condition of our Continental fellow-labourers, with deep thankfulness that "we are not as other men are."

Benjamin Lucraft, writing of chairmaking, arrives at the conclusion that, with the single exception of France, but little or no progress has been made since the Exhibition of 1852. As to Great Britain, without the least doubt or hesitation, yet with the most profound regret, he says, our defeat is as ignominious, and, he fears, disastrous as it is possible to conceive. He feels that the art-workman of France has a great advantage over those in England. In Paris they are surrounded by works of that kind which none but the most obtuse can long remain unimpressed by. Their museums and palaces are central, and most numerous; their decorations and furniture are of the highest order, and nearly always open to the people.

"Do our aspiring artists take up their abode in Rome on account of the climate? Not a bit of it; there they are surrounded by works they venerate and love, and their very nature gets impregnated with them. But I do not want London kneecap to pieces to make a city of palaces, that the people may acquire a taste for things lovely to the eye; still, something must be done, or the working classes of this country will be grievously wronged, and the whole nation suffer."

He would have the council of the Society of Arts use its influence with her Majesty's Government for the establishment of local museums of art-manufacture, with lecture-halls, libraries, and other necessary adjuncts and appliances for the use and instruction of the people, and open at such hours as would suit their convenience and opportunities for going, which, as a matter of course, is in the evening, when lectures by competent men would be largely attended.

Many of the other reporters dwell on the desirability of establishing museums and lectures, for which we have ourselves called for years. Nevertheless, we must say that, besides the museums and means of study, we want, on the part of workmen, a determination to use them. They do not at present avail themselves of the opportunities the schools of art, and such collections as the Architectural Museum, afford, to the extent they should.

Mr. Lucraft inquired particularly into the apprenticeship system. Seeing some lads at work with the men in a carver's shop, he went to the head of one about fourteen; he was carving a chair-back of a Medieval pattern from a working drawing; it was nearly finished, and well carved. Finding, from inquiry, that he had

done the whole himself, he expressed his surprise that one so young was found capable of carving so well; and was informed that boys at school were specially prepared for the trade they fancy, or that their friends have decided upon for them; so that a boy about to be apprenticed to learn carving, is instructed in ornamental drawing, modelling, and designing. Three or three years and a half is the longest time they serve. It would be a good law, he thinks, for this country, that prohibited the hiding of any one for more than four years; our young men of seventeen or eighteen would then be better instructed than they are now at twenty-one;—not simply by hiding them only for four years, let us interpolate.

Francis Kirchhoff, as to glass-painting, is of opinion that the French work, when compared with the English, shows a greater diversity of design in construction, and more freedom and grace in the drawing of the ornament; but that, in excellence of colour and pleasing harmony, the English glass is much superior.

James Mackie, after giving an account, according to his light, of the wood carvings at the Exhibition, speaks of the art-education of the carver, and sees that the inquiry proposed occupies too large a field for one whose personal observation and experience are confined to England and a short stay in France, and therefore that he must look solely to those countries.—France in particular deserving our best attention.

The people of France are in the midst of glorious monuments of grandeur and beauty bequeathed to them by their forefathers. The people appreciate them, and industriously and intelligently continue to build up and still further heighten the great edifice of art. The architecture of Paris is a great school, and the student who enters daily receives valuable instruction. It would seem almost impossible, he thinks, to be in the midst of so many examples and not grow up imbued with a love for, and also instructed in, the art of carving. Fine and well-carved oak doors are to be seen of a character we never see publicly exposed in England. The stone carving is good and well finished; and by the circumstance of its thus being side by side with the wood, the quality of the latter must, he maintains, be greatly and beneficially influenced.

He visited the *Ecole Impériale Spéciale pour l'Application des Beaux Arts à l'Industrie*. On that occasion there was an exhibition of the works of the students, and the number and variety were considerable and interesting. These studies were little more than good sketches in clay, but it was evident that the students were learning a most useful lesson, that would stand them in good service when they went forth into the world. It seemed abundantly clear that the system pursued was simple and rapid, and that the teaching and practice produced valuable results. "It seems to have great vitality never being without deep and warm interest to the students, features that should distinguish every school, and without which they will assuredly fail in accomplishing the objects sought to be attained. This system of being content with good sketching in all branches of instruction in art seems to be the life and soul of art as applied to manufactures; good sketching is acquired, and as few will require to gain a subsistence by making finished pictures, a valuable and sufficient power is gained that is always in great request and is never lost."

If a workman desire to study animal and vegetable life in connexion with his art, the entrances of the Jardin des Plantes are free to him and the public at all times. This is a great advantage. Galleries being open on a Sunday, he considers, must have considerable influence on the taste.

From what could be gathered, piece-work seems to be the prevailing system, and by the workmen is preferred to journey-work, or payment by the hour or day. In the piece-work system there is a liberty that is very precious to Frenchmen. However valuable machinery may be, our French brethren consider that their faculties are such as to make them very different things to a mere tool, or a convenient piece of mechanism.

Much of the inferior work in Paris is hadly paid for, and the pay is said to be less than is given in England for a similar class of work; but the good average workman, and particularly the superior workman, is paid in accordance with a scale of remuneration that is much higher than that which prevails amongst us. "A franc an hour, and sometimes more, is a very general

price, whilst piece-work is much more remunerative."

"To sum up, it is asserted by Englishmen well acquainted with the Paris workshops, and also by French workmen, that our system requires great alterations, and, among other things, piece-work, where practicable, should be substituted for journey-work, paying more liberally,—not adhering to a level scale of remuneration, which is alike assented to by both employers and workmen, amongst us,—letting each gain that which his unfettered hands will obtain. Not till then will our work be characterised by anything but dexterity and mediocrity. To keep down energy by insufficient remuneration, is to establish a class of dull workmen, who will never give us good art. To insist upon long hours of labour, with no rest, on some days, will not give facilities for study, or enable the workman to enlarge his store of knowledge, or give him that interest and pleasure in his labour without which no great success can be expected."

With regard to the associations of the workmen, he could learn but one or two facts. The carvers are associated together, numbering several hundreds. The members consist of workers in both wood and stone, but principally wood, and also modellers. Their objects are to promote the exchange of friendly sentiments, furnish trade information to each other, and especially to the unemployed. They have a committee in hand to the subject of wages. Having found that some of the Paris shops were paying a very low rate of remuneration, it was determined to ask for an increase of 20 per cent.; and the demand was acceded to in each case.

He feels that the education of the workman is of primary importance. Our schools have rendered valuable service, and much of our progress is traceable to their influence; but they are capable of doing more, if only a new life be infused into them. Our great buildings are full of excellent examples, which deserve to be more studied than they are. In our museums and galleries there are splendid examples of art that, if studied, would work wonderful changes in our taste and power. He knew that they were not esteemed as they should be, and also that they were not so accessible as they should be.

"Establish more museums of industrial art, he they ever so small, and let them be open at convenient hours and days for the artisan class. Let the architects look to the carving that is being done in our new London, for much of it is a scandal and a disgrace to our taste, and its effects upon the carver's education are most damaging. Something better is demanded. If we are to have any art in our streets, pray let it be good and instructive." Let our system of instruction and practice at our schools be simple, inviting, and interesting; not dull, repulsive, and crushing, as it certainly has been to many. We have the stuff amongst us,—let it be cared for in a large and liberal spirit, and it will be strange indeed if the England of the future does not see something more worthy of her great name.

R. Baker, on Wood-carving, writes very well. Take a specimen:—

"In comparison with the French, the English carving is tame and spiritless; the French workman seems imbued with a true sense of his art, and with a warmth of feeling which gives it life and sentiment, and this gives his work its superiority. If we examine attentively a portion of French work, we find the main object of the carver is to give his work spirit and expression. Take a rose, for instance: it expresses all the characteristics of a rose; the form, the life, and even the colour is there substituted; and yet it is not the exact copy of the form of a rose, for if it was, it would look poor and lifeless, and it looks rich and full of life, and this is done with comparatively little labour. The carver must understand and feel the true spirit of the object he is carving; otherwise he may bestow much labour, and display much skill and cleverness in tooling, but his work will still be deficient in that which is essential to its artistic merit; not that there is a total absence of this artistic feeling in the English work, but they seem to have studied cutting their work sharp and clean, in preference to anything else. As a whole, the English carving is equal, and, perhaps, superior to any of their previous exhibitions. Their progress is seen not so much in what is actually exhibited, as in the almost entire absence of decidedly bad work. There are scarcely any of those tasteless and inferior institutions of nature which usually abound in our exhibitions; this indicates improvement in taste."

Their workshops are conducted in a manner which allows the greatest individual freedom; by conversation, and the mutual exchanging of thoughts and ideas, the workshops become an important source of information and instruction; but the most important difference, he says, between the French and English workmen is, in Paris they are paid according to their abilities; in London wages are nearly uniform [notwithstanding what Mr. Roddis said in our pages]: one encourages a man to become proficient, the other is discouraging, because he has no hopes of being rewarded for his perseverance. "As soon as a French workman shows signs of special abilities he is patronized and encouraged, and by working in accordance with his inclinations, he con-

tinuously gains experience, and ultimately arrives at great perfection. In England we have not such special stragglers, but spend the best part of our time in executing work repugnant to our feelings."

The writer makes the odd observation that "our architects leave the embellishment of our cities too much in the hands of the builders, who are not notorious for their refined taste. I think this is the root of our inferiority." He ought to know better than to suppose that the architects have any control in the matter.

Thomas Jacob, who reports on cabinet work, thinks a person who has once seen Paris, walked through the main thoroughfares, and visited the public buildings and churches, must feel quite contented to be beaten by a people for whom their Government has done, and is still doing, everything possible for their artistic improvement, and whose wish it seems to be that every building shall be not merely just sufficient for the purpose it is intended to serve, but, in the true sense of the word, a monument, erected and decorated without any apparent regard to cost; the material which is principally used (a white stone) having the double advantage of being quite soft, and almost as easily worked as a Bath brick when new, and of becoming as hard as a rock after being some time exposed to the atmosphere. A Parisian, he thinks, may very properly be considered to "live in a school of art; and a taste for the beautiful is so diffused amongst the people (a natural consequence), that scarcely anything is attempted that does not exhibit considerable taste. Besides the advantage of being continually in view of these fine buildings and monuments, they have several splendid museums, in which all who are disposed can study, at almost any hour convenient to themselves, particularly on Sundays.

He thinks an excellent method of raising the character of the English workman as a mechanic or an artistic workman would be something of this sort:—

"Whenever a boy leaves school, let him be furnished with a certificate, stating the progress he has made in learning while at school (as is done in a few schools at the present time); and if he is apprenticed to any trade let him be encouraged to bring to the school, periodically,—him a year,—specimens of his work, or a note from his foreman, stating what progress he was making towards usefulness. Here would be an opportunity afforded of giving him a few words of encouraging, sound advice, which parents are too often unable to give."

He wishes Mr. Cole, or his colleagues, would publish a series of popular essays on various subjects; such, for instance, as the harmony of colours, adaptation of form to material, &c. Why should there not be an elementary work on geometry, perspective, and orthographic projection, for, say, 2d.? All these things would tend greatly to increase the abilities of the workmen, as many are quite ignorant of even the simplest problems, in consequence of the difficulty they have to obtain such works.

The two reports on Wood-cutting Machinery are interesting and useful. As to Pottery, William Beardmore says, without fear of contradiction, that the British potters have nothing to dread in coming in contact with foreign workmen; "our superior style of work, the beauty and simplicity of our designs, the excellent ornamentation, the richness of colours, the white firm body, the fastness of the glaze, make us feel proud of our position in the great Paris Exhibition, 1867."

Writing on the subject of terra-cotta, Michael Angelo Pnabm considers that England stands foremost in the quality of works in terra-cotta, for specimens exhibited for architectural purposes, in beauty of design, good taste, displayed in harmony of colours, and in the adaptation of terra-cotta for building purposes; also for the execution of works, in this beautiful material, requiring artistic skill, forethought, and perseverance to bring about successful results, as shown in many of the English examples. It is not surpassed for good colour, finish, straightness of mouldings, and is in long lengths; it is also well fired to stand any climate; and that next to England stands Prussia.

The wages or salaries paid to men, women, and boys, in Paris, seem to be according to their grades or different kinds of work. Good finishers get from 8s. 6d. per day (10 hours) downwards, according to merit or skill; some as low as 2s. 6d.; but at piece-work they can earn sometimes 12s. per day,—those are the best workers,—others in proportion; some piece-work prices are more remunerative than others; some goods can be hurried over quicker.

Women get 1s. 3d. per day of 10 hours; boys according to their abilities. He learns that there are about 500 hands employed in pottery and terra-cotta works in Paris, numbering about 55 or 60; there are about 420 men, 40 women, 40 lads; only four manufacturers have steam-engines to mix and grind their stuff. About 350 men are in lodgings with their own furniture, 80 in furnished rooms, others as boarders; 40 lodge with their parents.

Although Paris is not a brick city, there are many bricks used there; and on the subject of Bricklaying, George Howell writes a useful report. Coignet's *béton* he finds dearer than brickwork. Of first-class brickwork in Paris he finds none, judged by an English standard. The best attempt yet made was at their market, "Les Halles," which was executed at the expense of the Corporation of Paris, and designed to ascertain the difference in cost between stonework and brickwork, the result being as follows:—Brickwork per cubic metre, 12l., or 8l. 8s. per cubic yard; whereas, Raviere stone, which is considered very good, is delivered in Paris at 4l. 8s. per cubic metre, or about 3l. 7s. 6d. per cubic yard. This latter price leaves so large a margin for working and fixing, that it may easily explain how little first-class brickwork is done in Paris. But this is only judging from their (the French) standard; for a more monstrous absurdity could not be conceived, as he reasonably says, than the notion of paying at the rate of 94l. 6s. per rod for brickwork. Yet this was the price, he was informed, these "halles centrales" cost in erection. It is a very fair piece of ganged brickwork, every brick rubbed and squared, bed and face, with joints not exceeding one-eighth. He thinks that the finest piece of ganged work in London could not exceed 20l. per rod, and in very many instances excellent work is done for 15l. or 16l. The prices for materials, taking one thing with another, will be found pretty nearly equal: their bricks and sand are cheaper; their lime dearer.

Writing of bond, he gives an amusing anecdote:—

"I once saw a curious historical blunder by an able architect, a member of the Antiquarian and other learned societies. Having a great liking for the thirteenth century style, he determined to carry it out; in all its details, in a large residence he built for himself on the banks of the Thames, about 12 miles from London. He carefully prepared all his plans; had castings made purposely for bolts, brackets, grates, &c.; carefully selected his tiles from Milton's for the halls, and also the flat tiles for the roofs; polished oak floors, beams, stairs, &c.; and doors and frames, windows, &c., scrupulously exact as to their historical character and appropriateness. In fact, he bestowed all possible care on his residence to make it a reflex of the thirteenth-century style. As it neared completion, he invited several friends from London, professional and otherwise, to inspect his mansion. Many, very many, expressed their hearty approval. About this time I went to take charge, as foreman, of a large pair of villas, built in a kind of Venetian-Gothic style, close to the thirteenth-century specimen I have described. I at once noticed the unfortunate incongruity, but did not deem it advisable to rush into print with the discovery, as I knew that the proprietor had bestowed great pains on, and felt great pride in, his undertaking. Some short time after, he came to reside in his chosen home, and personally superintended the few finishing touches to his creation. One morning, about breakfast-time, he came to me, and asked my opinion as to the style, &c., of his residence. After cordially approving of every thing which he pointed out with some enthusiasm, I told him that it was all very well, but he had dressed it in a modern costume. I then explained to him that whilst he had bestowed such care upon all possible details, yet he had adopted a style of brickwork totally unknown in this country till the time of William III., viz., Flemish bond, when it should have been the Old English. He at once saw his error, and acknowledged it; but I determined not to send a letter, as I had at first intended, to the *Builder*, for I saw that it would give him intense pain."

Mr. Howell (who, like Mr. Lucraft, is a leader amongst his class) confesses that their *Conseil des Prud'hommes*, is of essential service, and he hopes Lord St. Leonard's Act will pave the way to a thorough system of arbitration in this country.

John Jeffrey, who writes also on bricklaying, coincides in this. "I should like," he says, "and I believe thousands of English workmen would like, to see a *Conseil des Prud'hommes* in England, similar to the one in Paris, which would prevent those outrages, so painful for us to hear of, now being revealed to the Royal Commission."

We are not half-way through the book, but must break off, possibly to return to it. It is published at a very small price, considering the amount of paper and print, and we shall hope to hear that it has reached every workshop, Working-men's Club, and Mechanics' Institute in the kingdom. It should set our workmen thinking, as well as those who are interested in industrial and social progress, and do good in more ways than one.

THE WORKS OF BARRY.

The life and career of Sir Charles Barry have already received a notice in this Journal, and references there applied to former notices of his works have revived past recollections and given renewed interest to that last summing-up of works and ways that every artist must be prepared for who sets his mark upon the world,—may, will ever have in mind as the future occasion of his best, because most disinterested, rewards. His biography has already been amply characterized,—the life as lived,—and of the life as written it is not necessary,—as now we propose to restrict ourselves to architectural criticism—to say more. We are presented with illustrations with a certain liberality; we read the motives that influenced various peculiarities of design, the architect's own afterthoughts and self-criticisms; and, moreover, some interesting independent observations by no means dictated by the disposition to worship without scruple. We may differ in opinion from even what we find so candidly set down, and must very frequently; but shall often owe the opportunity of differing to frank revelations. We discern no endeavour either to bide away evidence or overlay it with painful sophistication, or to smother objections however legitimate, in the birth; and the author of the biography, and they who have assisted, show the true respect they devote to the subject of it by not sacrificing their individual independence.

A list in the appendix, of architectural designs executed or not, in order of date, enables us to arrange our observations, as we propose to do to some extent, with reference to that historical development that results from a development within the designer's mind under counter influences reacting from without.

"The building," says the author, "which first gained him high reputation, and which even now holds a high place among his works, was the Travellers' Club." The select competition for this dates 1829, when he was in his thirty-fourth year. The building is small, but that the arrangement of the ground brought its narrowest ends only into view, was perhaps from the height that it was contemplated to allow, a favourable circumstance. Again, that the two fronts have no connecting flank view gave an opportunity to treat them with a certain comity of contrast that still by no means compromises unity.

That the design, to a certain extent, recalls the villa Pandolfini, is only to its honour; for assuredly it does not repeat it. The simplicity of the rectangular building and the proportion of the details and delicacy of their finish, are very agreeable. The unbroken cornice unites the whole, and is happily relieved by the depressed but visible roof above, as below it is united to the ashlar by what is rather an enriched wall-plate than a proper frieze.

The gradation thus obtained, and which is repeated with modifications in the adjacent Reform Club, is certainly very happy; its capabilities are even yet not fully worked out. The expression of the articulation of roof and wall that so often unhappily fails, is thus perfectly vindicated; and wall-plate, bed-mouldings, and sloping roof introduce the same effective triplicity that has helped so much to secure permanent admiration for the grouping of architrave, frieze and cornice.

Barry, we read, held the position of the door at one extremity of the street front to be a blemish inconsistent with the symmetrical principle of his design, but forced upon him by considerations of convenience, and the very small frontage at his command. We should rather be disposed to applaud the success with which he contended against limitations, than assent to an objection which amounts at last to a regret that the problem before him was not this but another altogether. The door at the extremity is the standing difficulty in the treatment of our ordinary street houses. The more important it is made—and the tendency runs in this direction—the more lopsided does the front become; and the illustrative vulgarism of a pig with one ear becomes exaggerated by hypertrophy.

We lately remarked in an old-fashioned street an ingenious attempt to meet the difficulty, in a house of sufficient importance to have five good-sized windows in each story and four to the right of the door. The centre of the house comprising three windows on all the stories was set forward so far more than the thickness of a brick; yet even so it dominated the lateral narrow one-windowed divisions, and the door thus became only an irregularity in a subordinate part. The

front of the Travellers' Club is happily of sufficient breadth for the windows on a level with the door, to intimate an apartment of handsome dimensions, and in no way strained by the reduction for entrance; while the treatment of this avoids enhancing to the point of obtrusiveness its natural superiority. Under the given necessity, the case could not be better managed; there is nothing for it in such circumstances but to accept the conditions, repress the pretensions of the doorway (which scarcely become it in such fortune), equalise it as nearly as may be with the window embracement, and then make some sacrifice to give a predominant importance to the symmetrical window-range of the best floor.

The garden front, as it exists, is at a disadvantage as compared with the engraving; for the balustrade has been forgotten, abolished, or economized, and the structure thus appears sinking into, or rising out of, a hole; and the expression of basement, on which Barry was always so anxious to insist, is quite lost.

Another objection, it may be as little, attaches to the original design. As we look at this front at present from Carlton Gardens, we see an attic story growing up irregularly from the centre of the building, and garnished most unhandsonely with ventilators and chimneys. The parasitical out-growth,—such it seems,—has the appearance of rooting deep among the very central organisms of the structure; the difficulty that might be found in giving it the desired amount of extension,—to a design already complete, is quite conceivable, but the mischief has surely been aggravated beyond imposed necessity.

One word more: the unpierced space above the windows is so excessive, that it suggests darkness within, whether the space be occupied by unusual height in the room above the windows,—the semicircular heads of these are unpierced,—or by unhandsome and unnecessary cocklofts between the ceiling and the roof.

Reason, no doubt, steps in and volunteers the inference that the interior space is occupied by rooms lighted by a skylight, unseen and unindicated, or by windows turned towards an interior court or borrowed light. But architectural expression ought not to be, and will not be dependent on ungrounded conjecture. This is a difficulty that we may notice several times within a walk,—we see it in the upper stories of other club-houses, and it is apt to beset picture galleries. The case is one of necessity, for such blank walls of rooms so lighted will have to be presented to view; but there are preferable options in dealing with them. In the case of interior windows the utmost that can be said is, that the outer blank wall can still be so treated as to intimate that it does not at any rate shield only the dark top of the ill-proportioned story below it. When a skylight is in question, we have no hesitation in affirming that its existence should be expressed by at least a coping on the visible roof, the necessity for the definition of the floor it pertains to, remaining the same.

It is on grounds here implied that we have ever believed that in the Greek temples that were lighted from openings in the roof, the visible roof must have exhibited the coping of the opening that interrupted the ridge, though probably raised so high that the sides ranged with it. So far from such a feature deforming, it appears to be an æsthetic necessity; by such frank and conspicuous admission stone could be excluded the suggestion of the cella as being blocked in and miserably dark in the midst of its highly-illuminated porticoes and ambulatories.

The elbowed vousoirs of the lower windows—a misery of architectural anachronism—cause a certain pang.

The Gothic design of the Birmingham Grammar Schools dates four years later, in 1833. Barry had by this time become dissatisfied with his earlier works in the style, and did not enter on a new design without having studied both the original examples and the literature of the Mediaeval Renaissance.

The building, we read, "attracted great attention and considerable admiration from the public and from the critics." This is but a cold account, and the tenor of other observations intimates that again the artist failed to satisfy himself. Several objections are noted, and various plans for improvement; yet we miss an allusion to one of those errors that declare themselves too distinctly to spectators of the executed work, though invisible in the drawings and ever evaded instinctively by the draughtsman or the photographer. New-street, in which the schools are situated,—and situated on the side

where they are most advantageously seen,—is but narrow as compared with the length of front to be taken in at a view. The building, therefore, when we stand opposite to it is seen but momentarily, and to disadvantage, and the best aspect—frontispiece, as our ancestors would have said—should have presented itself well to the oblique view as approached from the direction of the town-hall. This fails, however, and unhappily. The seven lofty and enriched windows are enlaid between rectangular buttresses of such projection, and that hug them so closely as, from the approach indicated, to produce entire eclipse. They only declare themselves at a point from which the full line of front cannot be taken in, and then begin again to retire at our next step, and the blank sides of the buttresses fold round like shutters. The effect is much the same in the engaged colonnade of the Royal Institution in Alhemarle-street; but there, at least, the windows are plain and the interposing shafts are ornamented. There would have been but poor palliation by a clock-tower, which the architect proposed to erect at one end of the front, "for greater variety, and also to give greater importance to the building as seen down the street." Still less desirable, for more incongruous, would have been the lantern which is shown in the engraving as designed, but was never executed.

Symmetry and regularity are claimed for the design, and as regards the latter, with justice; but the symmetrical scheme is not vigorous. The front, no doubt, is divisible into equivalent halves, but the dividing line passes through no more important centre than a window,—one of seven similar and a door. A bay window over the entrance and a gabled parapet above were thought of, but renounced for a reason that seems illusory enough, but that always deterred Barry from advancing the centre of a composition,—he fancied the effect would be to destroy the apparent size of the building. In result, the centre of the front has less emphasis than the centres of the wings, which, disproportionately small as they are, completely overmaster it by this point of dignity and assertion of superior organization.

Passing over the alterations of the College of Surgeons, we come to the design for the New Palace at Westminster, begun August 23, 1835. The drawings were sent in on the following 1st November, and the award was published on leap-year's day, 1836. From this date almost to the death of the architect the design may be said to have been in progress,—so considerable were the extensions required, so important and vital,—in respect of some we are almost induced to say fatal,—were the modifications originated or adopted. New developments rose before him to the very last, and assuredly in respect of vigorous and rapid industry, courage and enterprise, versatility of resource and strength of will, never was there an architect more equal to the greatest architectural opportunity that has occurred since the Fire of London, than Sir Charles Barry. So far as his qualifications failed to produce a result fully worthy of the occasion, we are inclined to ascribe it in part to certain deficiencies in his intellectual education, and then to the circumstance that he came into the great battle of professional life precisely when taste was taking a direction opposite to that for which his own excellently conceived and executed plan of self-education had prepared him. It was due in part of his own otherwise valuable self-reliance that to the end of his career he had little esteem for theory; and finding good sense and instinctive apprehension so often leading him right, he lost the advantage of the counterbalance that definite principles give to personal predilections. The Travellers' Club and the Reform Club are those of his works that best embody the ideal that he brought home with him from the observations and studies of his great tour, and that show both within and without how prepared he was to nationalize, to acclimatize, all that his models have of most effective, to the exclusion of not only what would be out of place in England, but also of what was unhappy even in Italy and would be anywhere. Thus prepared, he was turned at once aside upon competition for Gothic churches at Brighton and elsewhere; he was thrown out of his natural stride at the very start—he had to give the world not his best, but the best he had that they were in a humour to bear, and this best could scarcely be at a postponed notice what it would have been had his early years anticipated the kind of claims that would be made upon him. That he was, at least, equal

to the occasion as against all competitors, might freely be allowed by those who would still be conscious that in a style that to him was not old but new,—less antique than modern,—his practice could scarcely be decided in a moment, and he to the last proved open to biases of influence and winds of secondary suggestion that he would not have admitted for a moment had fortune led him by his expected path. Hence came in a certain vacillation, as unfortunate as unnatural to him, in his development of the Westminster design; and we may trace its influence and intrusion even into later works professedly in Italian taste. The Reform Club dates in 1837—a year or so after the Westminster award—and it still retains the original Barry stamp of elegant simplicity and vigour; but if we look back to the design that gained the award originally we shall find the same mint mark is there also. Years of every varying design are expended at Westminster; a new aspect has come over the palace entirely, and the latest work of the master in Classic Renaissance—the Halifax Town-hall—betrays the same, but no more vigorous and sophisticated than transformed the competitive design which still remains warm admiration into the palace as executed.

Those who are so fortunate as to have preserved a copy of the engraving that long ago headed the Stationers' Almanack, will see the image of Barry's original and really noble conception. We cannot pursue the comparison into all its details. Some of the most critical changes were these:—The original buttresses of the river front, however little else there was in their favour,—and a buttress inevitably suggests not a front of a building at all, but a side,—were at least a relief to the decoration of the windows, and so rendered a service that is forfeited by the turrets, which, though of greater projection, are now so mingled with the general surface by the diapering and panelling, fretwork and flagrees,—the very tangled web of uniform enrichments, as to give no aid to breadth or relief in any sense. "The towers of the river-front remained for some time without visible roofs; and, when the roofs were introduced, they were so kept down (in deference to the advice of others) in relation to the angle turrets, that some confusion of principle resulted. He regretted afterwards that he had not kept down the pinnacles and made the roofs boldly predominant." The architectural pretensions of high roofs is a question that here must be for the present declined; but there need be no reservation in lamenting the equipage, so to speak, that is involved in their conflict with the pinnacles. The most conspicuous instance is, of course, the most unfortunate; and nowhere is the comparison of the original with the executed design more painful than in the skyline of the Victoria Tower as executed. Pinnacles assert themselves shamelessly in competition with the high-pitched roof, which still is sufficiently master of the situation to vindicate at least its pretensions, and lifts aloft the armooring flag-staff in token of a spirit protesting against tyranny, if incompetent to conquer. The pen is rather apt to run away with the intention when the comment turns to such unfortunate alterations; but, at least it is Barry that we would vindicate against Barry. The reduction of the height of the pinnacles would have mended matters but slightly, while the roof, to which predominance would then have been transferred, retained the inherent weakness of expression due to its emergence from belting walls, with which articulation fails to be effectively pronounced.

"The great Victoria Tower underwent repeated alterations. It had been originally treated with all the solidity of a 'keep.' But the reduction on plan was compensated by increase in height, and the whole character of the design was necessarily changed. The entrance had been of moderate dimensions (professedly designed on the model of the Erpingham Gate at Norwich), and the top of the niche-hand ranged with the cornice of the building. It was now raised to its present magnificent dimensions; the niches remained; and the upper part of the tower was divided into three large and two smaller stories. The design and arrangement of these cost incalculable trouble before it assumed its present form, divided into three windows, and the upper story rendered the prominent one by the arched and canopied leads of the windows."—P. 254. Mischief,—nothing but mischief; incalculable cost of trouble worse than thrown away. We reprint the paragraph from

the hook as it stands; but apparently an error of punctuation or style makes it read as if the division of the upper part of the tower into five stories were the later modification.

We observe here how liable an architect may be in the progress of a large work to sacrifice the effect of the whole by his efforts in favour of the part under his hand at the moment. "In the tower as it stands, he always felt pride and pleasure, and trusted that it would be the great feature of the building by which his name would be best known hereafter." But woe to the fame of an architect whose name is attached preferentially to a single feature, however vast, rather than to the entire building, to which, as a feature, it should after all be subordinate. "The magnificent dimensions of the entrance" as modified,—as exaggerated,—destroy the building attached to it. This doorway is equal to the joint height of the whole four stories of the facade seen along with it;—the stories are dwarfed even more than the entrance is enhanced. The height so rashly styled magnificent could only have become so by being supported by a certain proportionate gradation of openings; this, however, would have been quite out of the question, and the only opportunity,—the Peers' entrance,—is carelessly thrown away; it is an entrance ranging with the meanest,—the basement story,—and betraying infallibly the consciousness that always haunted Barry,—how very unnecessarily!—that a porch must of necessity have the appearance of being an excrescence.

The exaggerated height of the windows of the tower as altered contribute their share to the degradation of the dignity of the building. The great space between the tops of the upper range of large windows and the parapet is unhappily suggestive of darkness within,—of needless, uncomfortable emptiness or solid calosity.

The adaptation that was effected of Westminster Hall was, we must profess in all frankness in our opinion,—we have not here an alternative view of Sir Charles Barry,—a mistake no less and of much the same kind. It is not alone that some profanation of historical memories was involved in the change, and that what was a hall became reduced not even to an ante-room but to a passage; but the scale of this anterior so far surpasses that of the chambers and halls that are entered after passing through it, that we are confronted with the grossest architectural antinomia. Roominess is the characteristic that fails us most regretfully among the passages and corridors, and even in the halls of debate; but the sense of being "cabineted, cribbed, confined" is, in truth, artificially aggravated after such an introduction. The adaptation brought with it the necessity for the axial divergence of St. Stephen's Hall relatively to the central hall, and that man's sensibilities to angular bearing are little to be envied for their delicacy who is not put out by the irregularity and pursued by a feeling of disarrangement even into the depths of a committee-room.

The biography frankly admits, what otherwise we would willingly have doubted, that it was the individual preference of Sir Charles that led to the so uniformly distributed surface decoration (p. 257). He became averse to leaving any surfaces plain, as liable to have the appearance of "neglected spots." We almost could recognize here a revival of the early impressions that engaged his admiration for the lavish decoration of wall surfaces by the incised sculpture of the Egyptians. The tendency was not confined to his Gothic works; it spread to his designs in other styles; it is as rampant in his last work, the Halifax town-hall, as at Westminster,—and even in the quieter elevation of the Treasury buildings, or Board of Works, it has its willful way.

The world had little to regret when the elevation of Sir John Soane was superseded here, and where now is there one of his elevations remaining?—but, at least, his Corinthian order was in itself very beautiful. The columns were adopted in the new design; but they may now be passed unadmired and repressed by the most enthusiastic devotee of Classicism, and be unrecognized. They are now engaged in a wall, of which the masonry is so channelled that the grooves only confuse the flutes and arrises of the shafts, and by the breaking of the stylobate below, and the entablature above all the contrasts that were relied on in design, to add glory to foliated capital and moulded base, are lost for ever. We cross over the road, and notice how Inigo Jones secured the dignity of his columns, and gave by moderated subordination an organic vigour to his design, and re-

gret that Barry, who felt such true admiration for him, had not rather laid himself open to the influences of his predecessor than of contemporaries.

Other works remain that may hereafter afford scope for further observations; at present, we conclude. We have endeavoured to emulate the spirit that we have praised in the biographer; to employ the one weight, the one balance, to be just both to an artist, of whom the nation has many reasons to be proud, and to ourselves as critics, whose only concern is, that the pride should be so intelligent as to the past as to involve no dangerous contingencies of wrong imitation in the future. W. WATKISS LLOYD.

DOMESTIC ARCHITECTURE OF MEXICO.*

THE "hacienda" is the most important building on an estate, the residence generally of the proprietor, and stands somewhat in the same position as the mansion or castle of our landholders and gentry: it is frequently of very large extent, quite equal in space and proportions to some of the largest mansions of this country, and we dare say at one period it exercised the same wide civilizing influence that emanates now from those important places.

Attached to every hacienda is a capacious chapel fitted up in the gorgeous style of Roman Catholic countries, and there was a resident priest to administer to the spiritual wants of the proprietor and his dependants, and whose business, it was presumed, was to lead them in the right path; but as most of these are closed or in ruins, and the priest *non est*, it may account in some measure for the want of their deterring influence to the serious depredations that very frequently occur, and to the anarchy and disorganization that exist in that distracted country.

As the grandeur of our feudal castles has departed, and the feudal lord and his retainers exist only as matter of history, we think the social position of the Mexican hacienda has dimmed its lustre and usefulness; it is no longer the centre from which emanates all emoluments and pleasures, and pains and penalties; it is no longer the magnet of attraction for the surrounding country, with open house at all times to dispense hospitalities and as a resting-place for the wearied and benighted traveller: the will to dispense these good and benevolent duties now exists in many places, but the means to discharge them are wanting; the shadow is there, but the substance has long ago disappeared; and these *advantages* are doubtless due to the republican form of government they so much extol, and seemingly admire.

The hacienda, as the principal building on the estate, generally occupies the most commanding and best position as to site and aspect, and is built on a plan best adapted for the business of the estate: we will briefly describe one at which we spent some weeks of our sojourn in Mexico, the property of one of the wealthiest dons in that country.

It is called "Potrero," and is situated about half-way between Paso del Macho and Orizaba, a convenient halting-place for rest and refreshment, and is just on the borders of that immense forest that covers a large tract of country for about twenty miles, running east and west, and embracing the rugged and lofty Chicahuiztlan mountains, the haunts of the Mexican brigands and desperadoes. On arriving at Potrero you enter upon a comparatively open and level country, but still very much covered with hush and plantation. The building is square on plan, though many are rectangular, and the outer area of the square is covered with a block of building composing the different apartments, properly roofed in, and with very wide overhanging eaves, supported on pillars at intervals; and this forms on the outside a wide arcade or gallery, and on the inner side a covered corridor that extends quite round, from which the different apartments are approached; and the centre part of the enclosed area is open and uncovered, and used for various purposes of the estate.

It is erected only of one floor, and the site is raised, so that the apartments are approached by a step or two, and in the middle of the front is a large gateway, closed in with folded doors, which forms the only access to the building and premises. In the inner area are placed the plant, and frequently the valuable live stock of the

estate; so that the whole are secured safely within the four walls of the hacienda, and, indeed, the walls are built so substantially and well that they would withstand an ordinary siege.

In the front part of the building are the principal apartments,—the reception and dining rooms; and in the wings, on each side, are the sleeping apartments, and the back of the building is occupied with the kitchen and servants' apartments, stables, &c. The apartments are lighted with large windows opening down to near the level of the floor, and are closed in and protected with iron gratings, and shutters to close at night. The floor is covered with large red quarry tiles, about 12 in. square, of native manufacture.

The walls are thick, and built of very small rubble masonry, almost like *béton*, with bondstones at intervals to tie them together; and it is astonishing to see how substantially they are built, and how well they resist the vibrations and concussion of earthquakes, showing the excellent quality of the lime they use for building purposes; and the fronts, when finished, are plastered over smooth and coloured.

The roofs are of the ordinary collar-beam construction, covered over with close boards and bright red horse-shoe tiles, laid double, one course with the convex side down, the other the convex side uppermost, and made to overlap one another: these tiles are also the produce of the country.

The interiors of the rooms are tastefully fitted up in the Mexican style. The walls are usually pale green or blue, pale salmon colour, pink, or French white; the base moulding, for about 15 in. deep, is dark brown, or black. About 4 ft. 6 in. above the floor there is a surbase formed of a wreath or scroll of coloured leaves and flowers, to imitate nature, laid on by means of stencil-plates, and a cornice is formed in a similar way, and these are generally well executed, and give the apartment a finished and even elegant appearance.

They do not disfigure their walls with ugly, ill-designed paperhangings; but resort to Nature to afford them suitable patterns for decorations, and to display their artistic skill.

The furniture of the houses is generally made of the excellent hard woods which the country produces, and usually in the European style; and some furniture, such as rocking and other chairs, and other common-place articles, are imported from the United States of America.

We have seen some old furniture, doubtless of Spanish make, tables and other articles, beautifully designed and carved, that would do credit to any age and country, showing that the Mexican is not totally devoid of taste for the fine arts, however he may be morally and politically debased.

The principal apartment being in front of the building, on each side of the windows are placed rows of rocking-chairs, with a piece of rich carpeting placed between on the floor opposite the window for the sitters to place their feet upon. It is to this rendezvous they resort in the leisure hour, or when the business of the day is over, to chat with their friends and indulge in the fragrant weed,—*cigarrillos* or *cigarras*,—a luxury both sexes are habituated to.

In the chambers it is usual to place one or more beds or "cots," as they are called. A "cot" is simply a stretcher or frame-work, supported on cross-legs, which are made to fold up, and covered with stout cloth or strong wrapping. On this are erected at each corner slight posts to support a tester frame-work, over which the "pavilion" mosquito-net is placed; and sometimes you are supplied with a mattress and sheet, "serape" or quilt; at other times you lie without a mattress, and simply a sheet and quilt, which is usually sufficient for comfort, except in the rainy seasons, when everything feels damp and chilly.

In the kitchen they have no grates or stoves for cooking and the culinary business of the houses. A hearth is formed of masonry, solidly built together, about 2 ft. 6 in. high, and of sufficient length and width for their requirements; and upon this hearth is prepared everything that is necessary, and the cooking is principally accomplished with charcoal fire.

The cookery is usually in the Spanish style. Almost everything is cut up into small pieces and stewed, sometimes plentifully seasoned (spiced) with garlic. They use a great quantity of lard, so their dishes are of very thick consistency, and very unctuous to the taste, not agreeing with every appetite. Their soups of different kinds are generally well prepared, and, perhaps, almost the only thing an Englishman

* See p. 7, ante.

can relish. Their meats are hard and tasteless; their pastry indifferently made, although they possess a superabundance of the finest fruit possible for the purpose, and other good ingredients. The wines they generally use are claret and catalan, although other kinds may be had in abundance by paying a good price for them; and our favourite beverage, beer, is sold at $\frac{1}{2}$ dol. (2s.) per pint bottle.

The clarets are tolerably good, but the catalan is very indifferant, occasioned, it is said, by adulteration, as it is asserted that Compenchy logwood is extensively used in the preparation of that article, which, doubtless, would produce the peculiar well-known tint, but not the requisite fruity flavour. Their dinners usually consist of six courses, finishing up, as the last course, with the inevitable "fríoje," a dish composed of small black beans, as aforesaid, stewed until quite soft, and thickened plentifully with lard. This dish is devoured with much gusto by the native-born, but is not much relished by Europeans.

The hacienda before alluded to was built on the side of a large square, forming one side of it; another side was occupied by the chapel; another the sugar-boiling houses and buildings connected; and the other with workshops, stores, &c. In this square it is their custom on their high days and festivals to indulge in sports and public pastimes, such as the bull-fights, which are not conducted in that barbarous and cruel way they are in old Spain; and in the evenings of those days they display their skill in pyrotechnics, in which they have the vanity to think themselves *au fait*; indeed, their exhibitions are exciting and brilliant, and very attractive to the beauty and *élite* of the country.

At this historic hacienda, the late Emperor Maximilian, and almost every important personage that has visited that country, has taken up his temporary abode, and shared the hospitalities of the generous and wealthy proprietor. Emperors and princes, ministers, marshals, and generals, "who fill the roll of fame," and others, too numerous to mention, have partaken of the hospitalities and obtained temporary shelter, which its strong enduring walls and substantial roof afforded; and in a thinly-populated country like Mexico, the advantages of such a place can only be appreciated by those who have borne the fatigue and danger of travelling through such a country, over the worst and most detestable roads in all Christendom, and successfully escaped the revolver or macheta of the ever-to-be-expected and dreaded Mexican brigand.

During the reign of the ill-fated Maximilian, and the occupation of the country by the gallant French army, the main roads had assumed, to a considerable extent, a degree of safety, quite unusual for such an ill-trained and ill-regulated country; but on the restoration of the republican form of government, presided over by that arch-traitor Juárez, the main roads, as heretofore, will be occupied by the hold and villainous banditti; and every person, foreigner or otherwise, possessed of any means, will be mercilessly robbed, and perhaps savagely murdered, as a fit inauguration of the re-establishment of the so-called *liberal* Government.

Close to "Potrero" are many huts erected for the use of the labourers of the estate, occupied by Indians and Negroes, who live on good and harmonious terms, and there does not appear to be any jealousy of races; but in other instances, where the estates have been thrown out of cultivation, the Indians and Negroes have resorted to the neighbourhood of some of the towns, and there have erected huts and established regular villages, some of considerable extent and population, as they prefer living detached and isolated from the more civilized part of the community established in the towns.

The estates in Mexico are seldom fenced off or divided into inclosures, except in a few cases, where walls are built as a boundary to the public roads, or in separating estates, or in sunk fences in separating pasture from cultivated land; and it is no uncommon thing on the extensive prairies to see no fence or boundary, even so far as the eye can reach, over the broad expanse of country.

The landed estates of Mexico are of fabulous extent: the Potrero estate, we understand, covers an area of 25,000 acres, which is covered to a considerable extent with forest, containing a great variety of magnificent timber; the fortunate proprietor owns other estates also of considerable magnitude; and there are other estates of even still greater extent than these, and we cannot wonder that, with so much land placed in the

hands of one man, and with such a sparse and unsettled population, it is not all cultivated, or at least but partially, although it is probably as rich and productive as any tropical land in the world. And to show how very productive it is, we may mention there are eighty acres that have been laid out of the Potrero estate for a coffee plantation that produce to the fortunate cultivator 3,000*l.* per annum; and if every part of this huge estate were cultivated in a similar way that was suitable for it what a magnificent and princely income it would yield to its wealthy proprietor. Of this there cannot be any doubt, as coffee is in great demand, a ready sale is effected in the country, and even exported abroad through the merchants at Vera Cruz. Under the mild, benevolent, and enlightened government of the late Emperor, forfeited estates, and those which the proprietors refused to cultivate, were taken possession of by the State, and an attempt was made to colonize the land with immigrants from the United States, and other countries, by dividing it into farms of from 320 to 640 acres, to be paid for at the rate of $\frac{1}{3}$ dollar per acre, and the payment for which was to be spread over five years.

These farms were much sought after by the disbanded soldiers of the Confederate armies of the United States that escaped to Mexico, and by immigrants who left the United States in consequence of the protracted and bitter war raging there; and many of the parties had entered upon their allotments, and had commenced operations to clear and cultivate the land; but this was not accomplished without considerable opposition from the old proprietors, and from parties of Indians and Negroes who had been old dependents, or had squatted on the land, and which was shown in deprecations upon the stock, and even by shooting one or two Americans; but doubtless on the fall of the empire, all the well-considered plans, the enlightened arrangements for bringing that fertile and fruitful land generally into cultivation, would be abandoned, and this fine and productive soil will relapse into its original barrenness, and the impenetrable bush and forest will spring up again and obliterate, as it were, this otherwise highly-favoured land from the fair face of a bounteous nature.

The mechanics employed on the estates, and in the construction and repair of the buildings, are not a very industrious or skillful race of men; their carpentry is generally roughly finished, being principally jack-planed: to plane it smooth would be attended with too much labour, and their framing is generally in square panels, formed of small scantling for the doors and window sashes: the carpentry to the roofs is generally of the roughest character, but they are strongly framed together. The material they prefer to work in is cedar wood, principally because it is soft and readily converted; the better and harder woods are utterly rejected, because of the extra labour attending their manipulation.

Their turned work also is not well executed, and is likewise finished roughly, on account of the extra labour required; and this is to be regretted, as there are vast quantities of fine tough wood suitable for turning, and which would have afforded a fine field for employment to an industrious population.

Their mason's work is generally very good; their rubble stone walls, composed of very small stones, is remarkably sound and good, and this arises principally from the superior quality of their limes and mortars, which set exceedingly hard, forming a wall almost as solid as a rock.

There is not much ashlar used in their buildings; but where it is employed, it is skillfully squared and dressed; but it is attended with a great expense, on account of the small amount of work executed by each man per day.

In plasterer's work they excel considerably; but that in a great measure may arise from the superior character of their limes and mortars, as before mentioned. The walls are smoothly and finely finished,—indeed, so well finished that they take colour and look well, and are frequently handsomely ornamented with elaborate designs in stencils, of a variety of colours, representing animals, foliage, fruit, and wreaths or scrolls of the heauteous flowers of the country.

In smith's work there is not much scope for their skill. Iron is expensive in the country, and not very easily obtained, and it is not much employed about the estates or in their agricultural implements; nevertheless there are some fine specimens of ironwork used for window-guards, with ornamental heads, about the

haciendas and the houses in the cities and towns, possibly imported, or the remains of those introduced by the Spaniards.

The price of labour varies from about 4 reals * to 6 reals a day for agricultural labour; and for mechanics, from 1 dol. to $\frac{1}{4}$ dol. per day, according to experience and skill; but there is very little dependence to be placed upon them so as to obtain their services regularly: they would, perhaps, continue in your employ until paid, which was sometimes weekly or fortnightly, and if you paid them on a Saturday night they would leave without saying a word, and when Monday morning came you would not see them again,—not a man would he there to resume the work. This frequently causes great inconvenience, but as it is the custom of these roving Indians, inherited from their forefathers, to constantly change their places and employments, and as their wants are so very few, and their necessities of life so cheap and abundant (a few reals would keep one in idleness a considerable time), it must be submitted to, and borne with patience and equanimity.

It is wonderful how small a portion of soil under the bright and azure sky of Mexico will maintain and afford sustenance to a family: the same extent of land which would yield wheat for two persons in this country would produce sufficient, in that prolific soil, for fifty persons; and the return of corn for that highly-favoured and productive country is never under seventy, and sometimes exceeds a hundred-fold.

In the foregoing remarks upon the agriculture of Mexico we have alluded more particularly to the great staple productions of the soil, and have omitted to mention a great variety of fruits and vegetables that abound very extensively in the cultivated parts, and that yield large profits to the producers; and when we observe, that in addition to the vegetable productions of the tropical zone it produces almost every species known to Europeans, it once shows the great advantages of its soil and climate, and which only requires an orderly and industrious people, and sound and enlightened government, to be one of the richest and most flourishing countries on the habitable globe.

MORE SCHOOLS OF SCIENCE AND ART.

At the present time a representative of the Department of Science and Art in the Privy Council, Mr. Baekmaster, is travelling and explaining, in various towns, an offer from the Government to assist in the formation of local schools of science and art. This is done in the form of a lecture, generally given in connection with the local mechanical and scientific institution.

We will mention the kind of aid Government proposes to give. Existing classes, drawing attention to the fact that the teachers are paid according to the efficiency shown by their pupils, and that the latter are encouraged by prizes of hooks and medals, and the prospect of being considered qualified to teach others on the same terms, when they have passed a first-class examination. Situations on Government works in the colonies and elsewhere, have occasionally rewarded exceptionally apt scholars; but this was only mentioned as a fact conversationally, at the close of one of the lectures, and not held out as any part of the promise. First as to the teacher. The inducement held out to him is that for every pupil he has who can pass an examination which will be held on a certain day all over the kingdom, he will receive a fee of 1*l.* There are, however, to be five grades of efficiency; and for every pupil passing the second grade, he will get the larger premium of 2*l.*, and the third grade 3*l.*, and the fourth 4*l.*, and for those who pass the fifth or highest class of examination, he will receive the still larger fee of 5*l.* Now for the pupils. Those who pass the lowest and middle classes of examination, will be entitled to Queen's prizes, or a stated value of hooks, to be selected from a printed list sent for the purpose; and the four pupils obtaining the highest number of marks on each subject will receive four Queen's medals, one gold, one silver, and two bronze. Adult pupils of day classes will be entitled to receive certificates instead of medals. Furthermore, the Department of Science and Art promises to assist the expenses of apparatus to the extent of fifty per cent. upon the outlay.

The sciences recommended are practical, plain, and descriptive geometry, building construction,

* A real is equal to 6*d.* of our money.

elementary mathematics, advanced mathematics, theoretical mechanics, applied mechanics, acoustics, light and heat, magnetism and electricity, inorganic chemistry, organic chemistry, geology, mineralogy, animal physiology, zoology, vegetable physiology, systematic botany, mining, metallurgy, navigation, nautical astronomy, steam, and physical geography, or any one or more of them.

The first step to be taken towards the formation of a school of evening classes to teach either of these sciences, or drawing, is the formation of a committee of five persons. It is with this committee the Government co-operates, and it is by the means of the various local committees that the examinations on the sciences are all held on the same day over the kingdom. Any one who has taken a degree in either of the universities is qualified as a teacher, or any one who has passed an examination in any science, in any of the Government schools, is qualified to teach that science. After twenty-five lessons the pupils are allowed to compete for the prizes offered. A further convenience is offered in permission for persons who have not been instructed by the certificated teachers to attend the examination if they desire to do so.

Three hundred classes are now in operation, some of which are in small agricultural villages; and last May 15,000 pupils were examined through the agency of the local authorities. To show the need of a wide dissemination of the good intentions of the Department, we may add that of all this number, seventeen only belonged to the vast tract of country lying between York and Glasgow.

What are the difficulties in the way that prevent a large, if not general, adoption of the proffered assistance to cultivate the brains of the rising generation? First, there must be a long suitable room; then it must be warmed; then it must be properly lighted, before a single article of apparatus need be purchased. This involves a considerable outlay, amounting in most small towns to an insurmountable obstacle. A small grant towards this "money sunk" and generally inevitable preliminary expenses would clear the road in many cases. If our skilled artisans are to keep their place among the artisans of the world, they must look to their heads as well as their hands. And this appears to be an opportunity of doing so worthy of their best consideration.

THE BEHAVIOUR OF CONCRETE IN FRANCE.

As the subject of the employment of concrete in the construction of buildings is attracting a good deal of public attention, the following letter from M. Boileau, the architect of the concrete church at Vésinet, near the terrace St. Germain, not far from Paris, which appears in the *Moniteur des Architectes*, will be read with interest. It will be noticed that M. Boileau points out one or two defects in the French material (not exactly the same as our concrete, by the way), which have been only slightly alluded to before,—the liability to contraction and expansion in particular.

Illustrations, consisting of plan and an exterior and interior view of the church at Vésinet, will be found in our volume for 1865, pp. 800 and 805, and we also gave some particulars of the building in the preceding volume.

The following is M. Boileau's letter, which we print with some few unimportant contractions:—

"I ought first to observe that the merit of having been the first to suggest the use of *béton* instead of ordinary masonry in the church at Vésinet does not belong to me. It was M. Pallu, the founder of the park of Vésinet, a gentleman fond of new inventions, who gave M. Coignet the opportunity of using his plan for the first time in the erection of a monumental building. My responsibility as architect having been properly provided for, I, of course, had nothing to object to the trial of such an interesting experiment.

Although the concrete used in the church at Vésinet is not employed in those parts on which the stability of the building mainly depends, the vaulting of the nave being constructed with ribs of cast-iron in the ordinary manner; the enclosing walls, and especially the tower, which are of concrete, and were moulded at a height of about 100 ft. from the ground, with all the architectural and sculptured details required, enable me to judge of the results both favour-

able and unfavourable which have been obtained. * * * * *

The sand used in the *système Coignet*, as in all good mortar, ought to be sharp river sand, not too fine, so that the proportion of lime or cement used should be merely sufficient to bind the grains together, but not to fill the interstices between them. These pores, by allowing the air to pass freely, cause the concrete to set rapidly; but when once the concrete is dry it becomes extremely absorbent. It was found that during rain the projecting cornices, which ought to have protected the walls, served, on the contrary, to wet them, by communicating the moisture deposited, and that the rain was driven by the wind entirely through the thickness of the walls and injured the painted decorations. The susceptibility of the blocks to the influence of moisture varied according as the pressure applied, which was by hand-power and consequently irregular, had more or less consolidated the materials of the concrete.

The inventor asserts that this inconvenience will cease when once the walls shall have become thoroughly saturated. This remedy, which may be satisfactory in the case of sewers constructed of concrete by reason of the impurity of the sewage, cannot, it is evident, operate upon buildings until after the lapse of considerable time in consequence of the intermittent character of the rainfall.

It must not be concluded from what has been said that a permanent dampness is to be feared; for, although the concrete absorbs moisture very freely, it dries again with incredible quickness directly the moisture ceases to act upon its surface.

Concrete, in the same manner as large masses of rubble, but to a much greater extent, is subject to contraction and expansion, which relegates to the category of chimeras the inventor's pretensions to construct monolithic edifices with this material. In walls of a certain extent which were built in one continuous length, the action of cold dry weather occasioned vertical cracks at intervals. . . . It was noticed that in the spaces of from 5 ft. to 6 ft. wide between these fissures there were no secondary cracks. From this circumstance it may be assumed that concrete, when undergoing contraction or expansion, behaves in the same manner as metals, glass, &c., and that a wall of this material placed freely on a level surface would contract and expand as a whole like an isolated bar of iron, without fracture; but walls built in the ground not being able to contract for their entire length, the shortening necessarily takes place in divisions, and cracks are caused by the resistance of the foundations to the general movement.

In order to reconcile the assumption of obtaining a monolithic construction with the results occasioned by the elasticity of the material, it is necessary, supposing, by an effort of the imagination, walls could be completely disengaged to admit that their dimensions might be increased or diminished, according to the variations in the temperature. Without considering the disturbance which would be produced in a house of this description, there is no need to point out the resistance which would be offered by the floors and roof to the general movement to annihilate this fiction.

However, the inconveniences of elasticity are less irremediable than those arising from permeability, and they might be, if not entirely avoided, at least considerably decreased, by a combination of divisions, allowing free expansion, such as are used only on a smaller scale in zinc work and joinery.

Besides the effects of elasticity which prevent the successful application of concrete (*béton aggloméré*), for the formation of large monoliths, there is a practical difficulty which cannot be obviated without great precaution, when it is intended to construct large blocks, which are required to be perfectly solid and immovable, such as engine-beds, &c. In order to ensure perfect consolidation, it is necessary that the fresh concrete should be added before the other is dry, and constantly pressed, which requires uninterrupted attention by day and night.

The vibration of the engines has in some cases separated the layers of concrete, forming the engine-beds, in consequence of the concrete not having been added continuously.

With regard to appearance and decoration, it is not to be expected that the same regularity of line and surface can be obtained in concrete as in worked stone. Besides the great difficulty of placing the wooden boxes which serve as moulds, which conceal the surfaces and joints, the in-

fluence of the weather causes distortions which are necessarily reproduced in the blocks moulded in these faulty receptacles.

With regard to the question of cost, concrete can only be used advantageously for building in places where stone is dear, and where river-sand can be procured cheaply on the spot. At Paris, where masons' work costs as much again as in those departments which possess quarries, the cost of concrete is equivalent to the cost of rubble masonry, rendered with Roman cement. This is quoted in the builders' price-list for the City of Paris, at 50 francs for plain walls and arches, which is double the price of squared limestone masonry in the same list. For architectural works in which mouldings are introduced, it costs as much as stone of good quality, including labour and fixing. From this comparison, which is based upon the relative high price of masons' work in Paris, it will be seen that concrete costs four times as much as worked stone, and twice as much as rubble work costs in places where these materials are not found on the spot. Finally, it is shown that even in Paris, if in a concrete building, the same prices were allowed as for ordinary masonry, the remuneration would not cover the expenses.

Setting aside buildings constructed on the spot after a special design, the true economy of concrete consists in its application for portions of decoration which require to be reproduced a great number of times, and in which hand-labour is superseded by a system of manufacture, such as balusters, which are now executed equally well in terracotta and with some improvement in point of colour.

With a reservation in favour of what a longer experience may produce, the advantages and disadvantages of the use of concrete, which has only been employed during the last ten years, and has only been under observation at the church at Vésinet for four years, may be summed up as follows:—

- Resistance to the atmosphere, crushing, and frost.
- Decided permeability.
- Percipible expansion and contraction.
- Imperfect adhesion between the layers.
- Irregularity in decorative features.
- Economy not proved.

I hope that the preceding information will fulfil the expectations of my fellow architects, who have wished to have my experience to enable them to judge of the results obtained by the use of concrete in building.

L. A. BOILEAU."

THE GLASGOW SEWAGE QUESTION.

A PAPER on this question has been read before the local "Association for the Consideration of the Sewage Question," by Mr. John Mierchie. He made various objections to the sending of the sewage to the sea, and to its being used for irrigation purposes, as being detrimental to the sanitary condition of the city. I propose, he continued, that the water-closet at present in use be given up, and that a thoroughly-trapped air-tight dry ash closet be substituted; such closet being fitted with a hopper for riddled ashes, and having efficient mechanical appliances for injecting ashes when the closet is used; that each closet be connected with a perpendicular glazed fire-clay soil-pipe from 6 in. to 8 in. diameter; that this pipe be connected at its lower end with an air-tight bucket, and that its upper end terminate above the roof of the house for ventilation and easy access for regular sweeping and cleansing, with an apparatus fitted for the purpose. It is possible that in many tenements and houses it may be found impracticable to find conveniences for working the closets in connexion with a soil-pipe as described. In such cases, or as an alternative modification of the plan altogether, if it were preferred, I would have an air-tight box or bucket attached to the bottom of the closet, but removable at pleasure, into which the excreta, urine, and riddled ashes should drop, such bucket or box being carried down, or out, every evening into the court or close, and the contents therein deposited in an air-tight receptacle provided for the purpose. I propose, further, that the city provide a complete plant of railway manure trucks, lorries, and iron boxes, fitted to contain about half a ton each; that manure depôts and sidings be constructed at numerous and convenient points along the various railways branching from the

city. I propose that the municipality be mapped out into districts; that to each district be attached a lorry and staff of assistants, whose duty would be every night to visit every tenement and house in their beat, detaching the buckets affixed to the end of the scull-pipe, or removing the box or bucket from the close, or court, or door, as the case might be, emptying the contents therein into the half-ton boxes on the lorry, replacing the buckets, and, when loaded, proceeding to the appointed station, transferring full boxes to the trucks, and retreating to their beat with a complement of empty ones. In the districts of the city, or tenements, where private closets were not introduced, and where common privies were used, I would have provided an iron box with screen, into which all ashes produced by the tenants would be introduced; and over the top of, and communicating with, this box, I would place closets, the droppings from which should mix with the ashes, the whole to be removed nightly, in the manner described as applicable to private closets.

Mr. Marchie gave estimates, showing that by the sale of the excreta, after paying all expenses, an annual balance of 15,430*l.* 10*s.* would remain in favour of the city; and that, even after paying interest on an expenditure of 220,000*l.* for remodelling the whole water-closet system of the city, and providing plant and appliances to work the system, a balance of 5,439*l.* 10*s.* would annually remain in favour of the city.

The local association before whom the paper was read, it may here be mentioned, are anxious to give the fullest ventilation to all theories on the sewage subject, whether propounded by any of their own number or others who have given attention to it, and the committee are open to receive and consider all plans which may be submitted to them. We need scarcely say that we do not recommend Mr. Marchie's plan for their adoption.

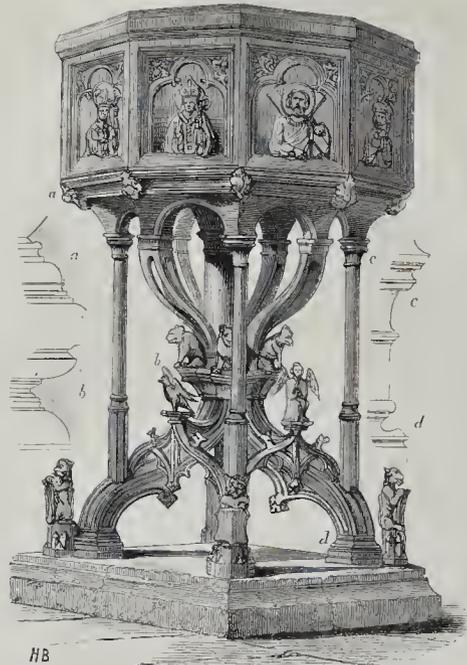

BRONZE FONT AT OCHSENFURTH, BAVARIA.

It would be difficult to describe the form of this font, but we give an illustration which will be more intelligible than any description. The font is said to be the work of Peter Fischer; the workmanship is exceedingly delicate. The eight bas-reliefs round the basin represent the following saints:—St. Clara, St. Henry, St. Catherine, St. Andrew, St. Killian, St. Burkard, St. Mary, and St. Barbara. This font, like some we have before mentioned, is cast in bronze.

NEW PALACE YARD, WESTMINSTER.

The design of Sir Charles Barry for the completion of his great work in Westminster, towards New Palace Yard, is familiar to readers of the *Builder*, from an illustration recently given in these pages, on the occasion of our notice of Dr. Barry's memoir of his father. The Government having left the question in abeyance, decided in 1864 to complete the unfinished western face of the Clock Tower, and to enclose the two open sides of New Palace Yard with an iron railing, sufficiently high and strong to exclude a mob on important occasions. The works now nearly completed, under Mr. E. M. Barry, A.R.A., and represented by our engraving, are the results of this determination, and consist of the facing with stone of the lower part of the western front of the clock tower, the erection of a very handsome iron railing, with gates and stone piers on the north and west sides of New Palace Yard, and the construction of a cloister or covered way on the eastern side. The railing is entirely of wrought iron, made by Messrs. Hardman. It is in bays of 17 ft. long, between piers of Portland stone, upon each of which is placed a globular lamp on a wrought iron standard. At the gates and angles the piers are larger, and are surmounted by clusters of lamps. Each bay of the railing is subdivided into three compartments by groups of standard bars, arranged on plan in the form of a cross. The ornamentation of the upper part of the railing is composed of the Tudor rose, well beaten up; and the lower portion displays the portcullis of Westminster. The globe lamps were manufactured by Messrs. Stevens & Son.

In the centre of the western railing, between the carriage-gates, is to be placed the statue of Sir Robert Peel, by the late Baron Marochetti;

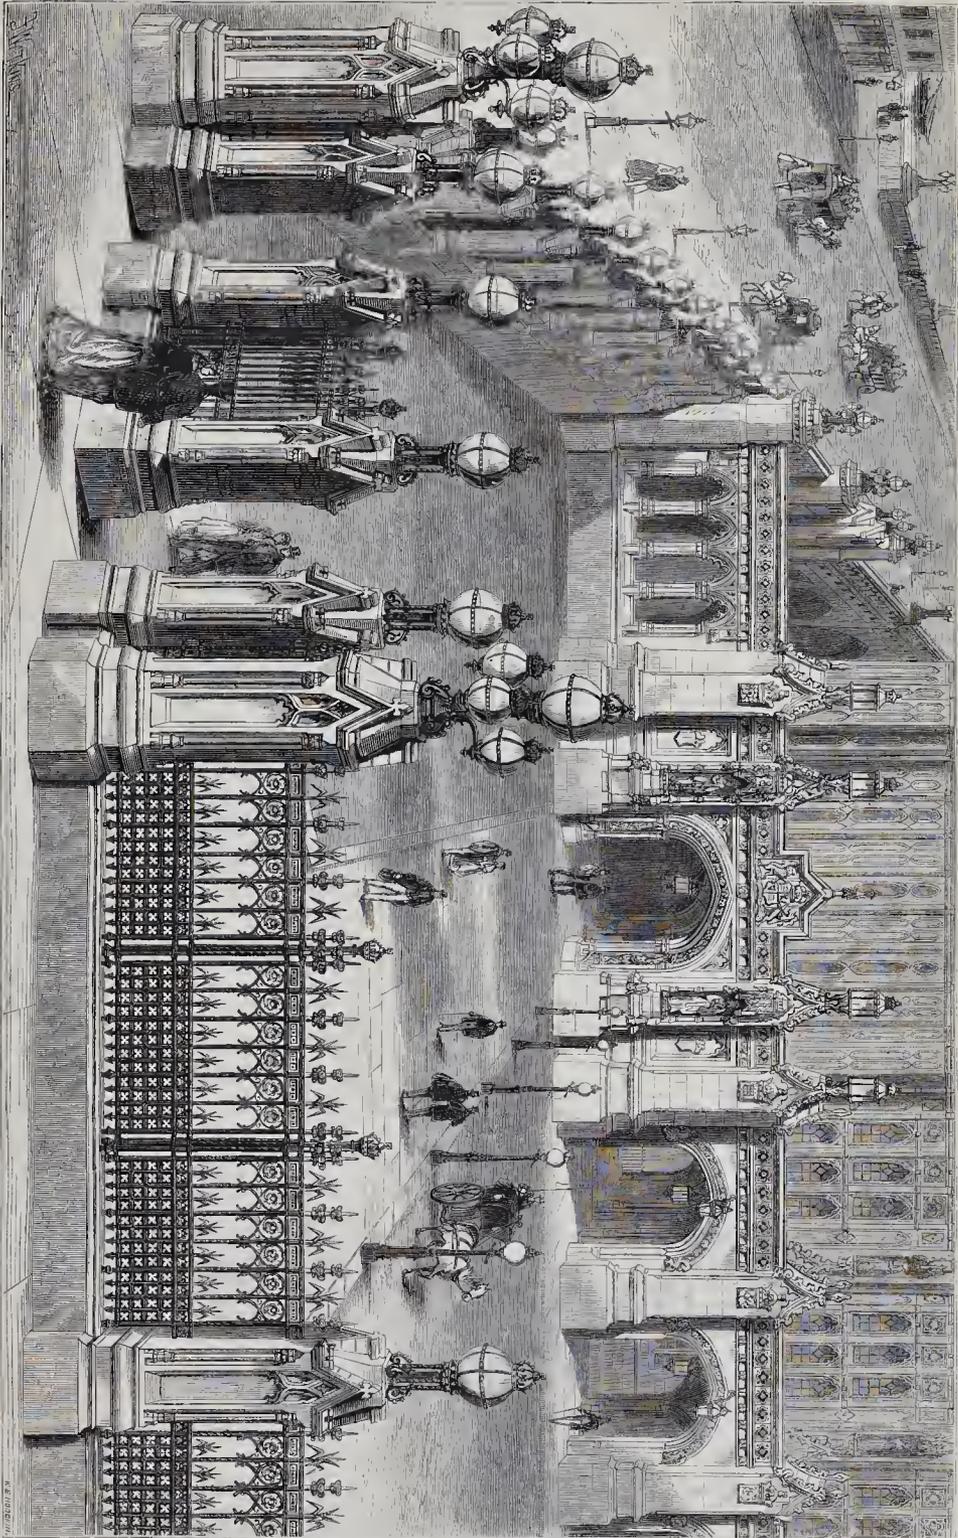

BRONZE FONT, OCHSENFURTH, BAVARIA.

and the corner opposite to Parliament-street is the site allotted for Mr. Woolner's statue of Lord Palmerston. The tops, and some other portions of the railing and lamps have been gilt, by Mr. Craze.

The interior of New Palace Yard has been levelled throughout, and its surface lowered in some places as much as 10 ft., with the object of preventing the disagreeable effect of raking lines against the building, and of increasing the apparent height there of Westminster Hall. A portion of the plinth of the latter which has hitherto been buried, has been exposed to view by the excavations. The cloister along the eastern side gives a covered access, for foot passengers, from Westminster Bridge to the Commons' private entrance, and to Westminster Hall: a flight of steps leads from the bridge at the foot of the Clock Tower. It is intended to carry on the cloister, by means of a tunnel or subway, under Bridge-street, to the Thames Embankment, and the underground station of the Metropolitan District Railway, about to be formed on the north side of Bridge-street. When this subway is completed, Members of Parliament and others, coming from the West End and City by the Railway and the Embankment, will be able to enter the New Palace by means of a covered way extending the whole distance, and almost on a level. They will thus avoid the necessity of ascending to Bridge-street, and descending again to the New Palace, having encountered by the way the dangers of a crowded crossing in Bridge-street increased by the accession of traffic coming to it at right angles from the Thames Embankment. The external design of the cloister is made to range with the existing archways and buttresses to the members' private entrance, with which it is joined, at the south-east corner of the yard. Two of the archways form carriage entrances to the Speaker's court, and these, with the archway in front of the Clock Tower, are flanked by niches, and are distinguished by their details from the rest of the arches. The niches are to be filled with statues of kings, by Mr. H. H. Armistead;

those of Alfred and William I. are already placed in the niches near the Clock Tower. The aesthetic objection to leaving New Palace Yard open has always been felt to be the difference between the level of Westminster Hall (and consequently of the New Palace) and Bridge-street, causing the former to appear sunk in a hole. The erection of the cloister has been adopted as a mode of lessening this difficulty, by advancing the lower story of the building after the precedents of Belgian Town-halls, and other edifices. The cloister is rather higher than the upper part of Bridge-street, which it joins, and thus serves to mask, to some extent, the difference of level, and at the same time provides a convenient covered approach, as above described. Each bay of the cloister has a groined roof, with a circular aperture in the middle of each groin, covered by a sheet of glass. The groining of the bay next to Westminster Bridge, at the entrance of the subway, is square on plan, with diagonal ribs filled with perforated tracery. Polychromy is introduced in the interior of the cloister by the use of red Mansfield stone in bands, and for the groining ribs and hones. The exterior is entirely of Portland stone. The works are contracted for by Mr. W. Field, and the carving has been executed by Mr. T. Earp, and his assistants, in a bold and effective manner. Mr. E. C. Pressland is the clerk of works.

A PRESENT TO BOLTON.—Dr. Chadwick, who formerly resided and practised at Bolton, has intimated his intention of making a magnificent present to the town. He intends to offer 10,000*l.* to be applied to the erection of working men's model cottages, the rentals from which are to be devoted to the maintenance of an orphanage which he proposes to erect. In the first instance, the orphanage will be for the admission of girls, but it will ultimately be extended so as to receive boys; and to carry out this benevolent design a sum of about 17,000*l.* will be necessary.

NEW PALACE YARD, WESTMINSTER.—MR. E. M. BARRY, A.R.A., ARCHITECT.

W. & A. GILBERT

MURAL DECORATIONS.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The first ordinary meeting (after the recess) of this Institute was held on Monday evening last: Mr. David Brandon, vice-president, in the chair. Mr. Weale, of Belgim, author of various works on architecture, was elected honorary and corresponding member. Mr. Charles Innes, of Whitehall, was elected fellow, and Messrs. John Hebb, of Tollington Park, and E. H. Bown, of Harrogate, were elected associates.

Professor Donaldson announced a donation of 500*l.* from Mr. Tite, M.P., president, to the Library Fund, for the purchase of selected works on Architecture by English and foreign authors, of which the library is at present deficient. A special vote of thanks was passed to Mr. Tite for his munificent gift; and, on the motion of Professor Kerr, it was referred to the council to consider an appropriate form of recognition of the president's liberality and warm interest towards the Institute.

Mr. W. B. Scott read a paper "On Mural Paintings for Penkill Castle, Ayrshire." The subject of the pictures, of which the cartoons or preliminary drawings necessarily made when the artist has to paint on the wall itself were exhibited, is taken from "The King's Quair" or King's Book, by the first King James of Scotland, being already partly executed as the decoration of the walls of the circular staircase leading to the present drawing-room of Penkill Castle, the method employed being a kind of tempera,—the author would not call it encaustic, since that is not applied to fast the colours into the plaster. The medium used is a solution of wax in turpentine, and the use of this medium has been an experiment which Mr. Scott thought might be worth a few minutes' consideration. Having given a general description of the arrangements of this old "peel-house," or castle, as it existed up to the beginning of the seventeenth century, he went on to state that this interesting old place was left to go to ruin at the end of the last century, and when the late Mr. Spencer Boyd repaired and inhabited it, a few years ago, he built an entirely new staircase, more commodious than the old one, although retaining the newel form proper to the date of the house. It was for the decoration of this circular staircase these cartoons were drawn; and in carrying out the commission, the artist, being allowed to choose his own subject, selected an early Scottish poem, written by James I. of Scotland, when a prisoner at Windsor, in 1420, on his love for Jane, granddaughter of John of Gaunt, a poem in six cantos, in imitation of Chaucer, and one of the most beautiful and perfect productions of that epoch, although very little known. The pictures, six in number, illustrated the several cantos which Mr. Scott described. The first and second of these pictures, he stated, were painted on the wall in the summer of 1865, the medium used being, as already remarked, wax dissolved in turpentine, a medium frequently used in Italy for the common decoration, of which one sees so much there, and adopted by Mr. Parris, in going over the pictures in the cupola of St. Paul's. This medium Mr. Scott tried, in the first instance, on one of the figures of artists for the Museum at South Kensington, and as he was expressly required, at Penkill, to paint on the wall itself, he determined to try it on a larger scale. The effect was all that could be wished. He explained that when employed on a surface not previously touched, the turpentine is absorbed with a portion of the colour and the oil in which the colours are originally ground, whilst the wax retains a great amount of luminosity in the tints, with the uniformly dull surface absolutely necessary in wall-painting. The unity of surface is attained characteristic of fresco and the simplest tempera painting, with greater brightness in colours. The pigments used are not restricted to earths, as in fresco, but embrace nearly all the wide range now furnished by the colourmen, without any perceptible chemical change resulting, the medium employed penetrating the plaster sufficiently to protect the colouring matter on the surface from contact with the lime. Notwithstanding this, it was stated that the part of the wall which is exposed to the south wind, the wet wind in that locality, has in the course of the last two severe winters and wet springs shown symptoms of decay. The great enemy of painting in this country is damp, and it appears that no external wall, without slothing or other means of ventilation, is a safe surface for the artist. Whether the wall in ques-

tion had never been allowed to become dry during the four years from its construction to the time of the artist's commencing his operations, or whether the wet soaked through from without, in spite of the Portland cement with which it was painted from the first, was a question which no one seemed able to solve. The remaining portion of this south side has been lined with sheets of zinc, on which the future pictures will be painted, with what result has yet to be seen.

With regard to the remarks on a former occasion relating to fresco painting by gentlemen who appeared to urge the superiority and desirability of that method, Mr. Scott stated he was afraid that his assertion that it would never be practised again in this country, or perhaps anywhere else, might be construed as an effort at self-defence, the work he then submitted to the members being rather easel pictures than wall decorations, having comparatively little of the simplicity induced by tempera painting and necessitated by fresco. Such, however, was not the case; but a deliberate opinion, the result of many years' consideration. He did not mean that we should never see little pieces of fresco on lath-and-plaster frames, as we may see books illuminated by hand or imitations of ancient enamels; perhaps we might even see fresco on a small scale applied to some purpose by some one who persists in conjuring by an old form of incantation; and if the artist abstains from all colours but those composed of earths, if he has ten years to prepare his lime, if his wall is thoroughly protected and ventilated, if the weather is every day favourable, and if the artist has had a lifetime of practice, perhaps once more we might have a good result; but this was certain, fresco had had a revival of twenty years in England and forty in Germany, and all the best artists in both countries who had practised it—Kaulbach in Germany and Maclise in England—had gladly resigned it for the newly-invented *silica* medium. In Italy itself (continued Mr. Scott) the reign of fresco lasted little more than a century. All the earlier works remaining are tempera. Not many years ago it was not unusual to hear people talk of all Italian wall paintings as fresco; but it is quite certain no such thing exists. When the Commission was appointed to consider the application of painting to the new Houses of Parliament, in 1841, Cornelius, a German artist residing in Rome, was called over in November of that year; and the late Prince Consort, who was at the head of that Commission, seconded the views of his compatriot, and fresco was determined upon. Tempera and the earlier works were scarcely ever alluded to; and while the Munich frescoes—all the open-air ones, at all events,—were beginning to peel off, English artists who had never painted anything but *genre* pictures in oil produced those examples now going to pieces in the so-called Poets' Hall. Fortunately, the *silica* process was shortly afterwards discovered, so that Maclise, the greatest of English historical painters, and one of the greatest European artists, has been freed from the waste of energy and danger of premature decay in painting his two great works, "Waterloo" and "The Death of Nelson;" but the last years of Mr. Dyce were embittered by the difficulties, delays, and repaintings involved in this primitive process, fitted only for a dry climate and a summer of continuous equable temperature.

Professor Donaldson, in proposing a vote of thanks to Mr. Scott for his communication, referred to the unsatisfactory results which had invariably attended fresco painting in this country. Notwithstanding the most diligent researches on the part of the late president of the Royal Academy, both as to the surface of the walls and of the materials to be used in the case of the decorations of the corridors, &c., of the new Houses of Parliament, it seemed that all the endeavours of artists to conquer the difficulties of fresco painting, so as to render it imperishable, were always frustrated. He thought we might look with great hopes to the new process of water-glass painting; but even where that process was adopted, there was a dampness which covered the surface, which, though not chemically affecting the picture itself, was prejudicial to the just appreciation of it as a work of art. Under these circumstances it was gratifying to find that a gentleman like Mr. Scott, with his large practical experience and knowledge of his art, had adopted a process which he believed was calculated to be successful in this country.

Mr. Scott remarked that the effect upon the surface of the pictures in water-glass mentioned

by Professor Donaldson arose from the accidental circumstance of too great a quantity of silica having been dashed upon the surface with a large and clumsy kind of brush, instead of by the more careful method of using a syringe for the purpose; and that tended to impart a whitish bloom to the surface of the picture. He believed it was Mr. Maclise's opinion that that effect could be removed without injury to the picture.

Professor Kerr having offered some critical observations with regard to the disposition of the pictures before them and the treatment of the figures, remarked that the practical question of damp in walls was one which ought not to be passed over by a body like this without some consideration. They all knew very well that a stone wall, even when built of granite, would draw the water through several feet thickness. It seemed to him the best advice he gave with regard to walls on which these kind of paintings were to be placed was to treat them with one or other of the recognised stone-preserving processes: probably that of Ransome was the best for the purpose. If that were not successful, it might be desirable for the sake of the paintings to coat the outside walls with some material impervious to wet, as paintings of this description should not be allowed to go to ruin from the unfortunate state of the stone wall on the outside. With regard to the water-glass pictures in the Houses of Parliament, he thought that process would eventually prove to be a mistake, because silicate of potash has a very strong attraction for the moisture of the atmosphere, which might produce a damaging effect upon the pictures. Even where the water-glass was treated with chloride of lime, there was a large quantity of salt thrown off; and, until that was got rid of, there was a strong tendency to absorb moisture. With regard to the material Mr. Scott was employing in the execution of these pictures, he had no opinion to offer; but he strongly advised that gentlemen to reconsider the idea he appeared to have formed, of painting any portion of them upon plates of zinc. It would, in his opinion, be preferable to remove the portion of wall which showed appearances of dampness to a sufficient depth, and replace it with a composition of a more satisfactory kind.

Mr. Charles Barry complimented Mr. Scott upon the successful treatment, as he regarded it, of the subject he had taken in hand, in this, as in the former case, which he brought before the Institute. Looking at the instance now before them, he hoped Mr. Scott would be able to find some means of protecting the inner surface of the walls from damp, without depriving the external wall of its original stone character, and not sacrifice the ancient glory of the exterior of the building by coating it over with a foreign material. He suggested two ways of obviating the difficulty of damp in the wall. The most obvious one, if they had any apprehension from the porosity of the material, that the moisture would get through, was to make an inner wall, with interstices of space between it and the outer wall. He agreed with Professor Kerr in the caution he had given, as to the contemplated use of zinc plates, on which to paint the pictures remaining to be executed.

Mr. Wm. White, after some general remarks on the treatment of mural painting, observed that he had seen several of the pictures of Mr. Gambier Parry, which he understood to be in a sort of tempera, and he did not know of an instance in which they had failed. With reference to the use of zinc plates, he had been informed by decorators, that thoroughly scrubbing the surface of the metal, and either gilding or silvering it over before the paint was applied, a very excellent and durable surface for painting upon was obtained. A further suggestion was that zinc paint should be used instead of lead paint, inasmuch as the latter would set up galvanic action, which deteriorated the surface. He agreed that the most efficacious way of keeping damp from pictures of this kind, was the plan of double walls, in which case any dampness that penetrated through the outer wall dropped down, and left the interior wall, ventilation being duly attended to, perfectly dry.

Mr. Barry hoped that the notion would not be endorsed by the meeting that gilding or silvering of the zinc plates would prevent the destruction of the surface by galvanic action, inasmuch as a greater amount of galvanic action was set up between metals of different degrees of oxidation.

After some further conversation, in which Mr. Wyatt Papworth, Mr. Charles Fowler, and

Mr. Collman took part, the vote of thanks to Mr. Scott was unanimously passed.

A short paper by Mr. J. MacLean descriptive of "The Old Roof recently discovered over the Nave at West Chnroh, Stirling, N.B.," having been read, the meeting adjourned.

THE STONEMWORK OF LONDON AND PARIS, CONTRASTED.*

In the first place, we will look at the method of building, and then at the quality of the work, and the scaffolding used for the purpose. We will take Paris first. In 1862 I visited Paris, and while there saw most of the large works which were in course of erection, such as the Great Northern Railway Station, the New Opera, and many others which I need not mention. The first thing that struck my attention was to see all the buildings constructed from the stone as it left the saw; that is, not worked on the face. I saw the men working the stone after being fixed, and came to the conclusion that there was something deficient either in the contractors, or in the managers of the several works, and those impressions were confirmed when I visited Paris in September last. While there I again had the opportunity of visiting numbers of large works in course of erection, and on examining the mason-work I found it would not bear the inspection which mason-work ought to be able to bear. Now a word or two on their method of building. I was much struck with the method they employ in fixing their work. They have one or two hoisting-places, as the case may require. The stone is lifted up at these places and rolled from the place where it is landed some 20 ft., 40 ft., or even 80 ft. on the wall. I saw them roll a stone, some 7 ft. by 3 ft. by 2 ft., on a wall some 5 ft. or 6 ft. thick. This stone was rolled about 70 ft. by 8 or 9 men with bars. It is then laid in the required position, lifted up some half an inch from the stone below by bars caulked all round with rope or some soft material to prevent the mortar from running out from the horizontal bed. It is fixed,—in fact, by a process of grouting. You must hear in mind that this stone was rough on the face. Most of the horizontal beds are grouted with plaster and dust from the stone. These beds are from $\frac{3}{4}$ in. to $\frac{1}{2}$ in. thick. This style of fixing I saw at the New Opera, which has recently been uncovered. This method of grouting the beds they have found to be an improvement on the old method of fixing. Another thing which I saw was the party walls of the houses left some $\frac{1}{2}$ in. or $\frac{3}{4}$ in. from the front wall; that is, not worked close up to the bond. This space is to allow for swelling, as the party walls generally swell, and would otherwise push out the front work. I need not mention that the want of connection of the party walls with the front walls causes very unsound work.

We will now look at the quality of the work as done in Paris, and from the facts which I shall mention, we shall be able to judge which is the best method when our own work is described hereafter. All their projections are roughly cut out before being fixed, and after being fixed, they commence at the top of the building to form the moulding roughly with chisels almost similar to our own. After they have attempted to put them in shape by the chisel, they scrape them over with a tool something like a plane. On passing along the scaffolding, I noticed the manner in which the men generally hold their tools, which perhaps some of our Englishmen have noticed. The tool passes from the thumb over the little finger, or under three fingers and over one, and they use an oblong mallet. One could not help noticing the attitude in which these men work; some are sitting down, some kneeling, and some standing. The slow motion of the mallet also drew my attention. The sound of the first blow had disappeared before the second one was given. Some of the men were working a plinth of a hard stone, kneeling and sitting down to it, the plinth being before them in a perpendicular position, fixed in the building. I shall have more to say on this part when I draw the comparison between the London work and the Paris work.

The scaffolding now claims our attention. Their lifts generally are square on plan, with a large

piece of timber at each angle. These pieces are braced together, and act as standards, regulated according to the height the lift is required. Some are worked by hand and some by steam; they are fixed at the most convenient points of the building; and right and left of them a scaffold is erected for the men to fix the stone, and also to stand on to work the stone when fixed. This sort of scaffolding seems to be woven into the nature of the French people. Wherever you go, you see this style of scaffolding used, and some of these lifts were exhibited at the Exhibition.

I will now draw the contrast between the French work and our own, so that we may be able to judge whether our fixing, working, and scaffolding are equal or not to the French.

It is well known that most of our fixing is executed by the use of the "traveller," by which we lift the stone, in place of the French lift. If it is necessary, we have one traveller on the top, in addition to the one we lift with. If the stones are not too heavy, several are lifted together. The edge of the stone is brushed off, and then wetted. A soft bed of mortar is laid on the lower stone. The ends of the stones are generally grooved, and run with cement. The fixer can lower the stone on the bed, and seldom does he require to lift the stone a second time if he be master of his business.

It has been said that we cannot erect a stone building so quickly as they can in Paris. I think we can. By the above method, I have seen from thirty to forty stones fixed in ten hours; and a stone from 150 ft. long and 100 ft. high, with mouldings and projections, columns and caps, fixed in twenty-five weeks, including building the scaffold. I have also seen 40 tons of stone lifted 70 ft. high in eleven hours; and stone 15 tons lifted 31 ft. from the ground and fixed in two hours. This is quite sufficient to enable any one to judge which is the quickest way. I have come, indeed, to the conclusion, that we can fix six times the quantity of stone that the French can in a given time, and with half the number of men. If the contractor or manager of the New Opera had erected a timber scaffold, such as I have described, instead of having nine men to roll the stone to the appointed place, three men would move it, and a fixer and his man would fix in a given time six times the quantity of stone than they now fix. It must be a great saving to the contractor to have six times the amount of work done with half the number of men, and, moreover, the work done by this simple method will be much sounder. As we mentioned above, the party walls were not worked into the front walls to allow for swelling. This swelling might be prevented, and the walls could be joined together, if they were to use more sand with the plaster employed as mortar, and keep the stones well wetted while being fixed; or, if they use lime for mortar, the mortar should be made up some two or three months before being used, and then tempered up again. Treated in this manner, mortar will not swell, but will set hard. The fixing in Paris is not good, because it is impossible to fix ordinary stones by hand to make that sound work which is required; and it is also impossible to wet the beds of the stone sufficiently as the Paris stone requires when fixed by hand.

Let us now look at the contrast between their work and our work. In the first place, it seems to me that the foreman of masons in London requires more thought and talent than the foreman in Paris. Here all the mason's work is got out to dimensions worked on the banker, and jointed to sizes to fit the position where it is intended to go. Blocks of some hundreds of different dimensions, and for many jobs, varying in shape and form, all worked true and straight so that when fixed, they will require no working. I have seen on one job twelve or thirteen hundred stones all worked before the commencement of the fixing. I mention this in proof of what I said above in reference to the foreman. These stones have a hare $\frac{1}{2}$ -in. bed, and 1-16th in. joint instead of the $\frac{1}{2}$ -in. bed of the French style. The mouldings at Paris which have been worked after being fixed, have scarcely a straight portion two feet long in them, and the model in which they are moulded and scraped about is almost a disgrace to the empire to which Paris belongs. I mentioned above the attitude in which the Paris workmen work. In London the men generally stand upright to their work. If my readers had been with me and seen the position of the men working the plinth at the New Opera, they would have come

to the conclusion that these men had recently been imported from some island where mason's work was never done. I mentioned to the manner in which they hold their tools. This manner is a great hindrance to the progress of the work, as is also their sitting and kneeling down. In these positions they cannot put forth the strength required. The business-like way is to stand upright, and have the stone before you so that the weight of the mallet when lifted up will cause it to drop down with the force required. In the French method you have to push the mallet from you to the work, which will not come with such force as if the men stood upright, and let the mallet drop down.

I will now mention our method of timber scaffolding, so that you may judge between ours and the French. Our scaffold varies according to the weight we have to lift; we always pitch the standard inside and outside of the wall at a proper distance, so as to allow the scaffoldings to be erected, one for the masons and one for the bricklayers. The standards are some 12 ft. apart, and 10 in. to 12 in. square. This scaffolding can be taken up to any height that may be required by throwing out braces and forming cross ties. The span from the inside to the outside will be regulated according to the thickness of the walls and the convenience of the rooms. When the scaffolding is erected to the height required, horizontal pieces of timber are laid across to brace the iron metals to; then we have two pieces of timber which answer as trusses, resting on either side of the horizontal timber on a cradle with two wheels at each side: this is moved about by cog-wheels. A jenny is placed on the top of the trusses, which is also moved in a similar way. This jenny travels on the metals above mentioned, and is constructed so that the block and fall may be attached to it. In many cases the traveller is worked from the centre as well as the jenny. The timber scaffold saves all poles for standards; you want only the horizontal poles for ledgers. The French people have a pole scaffold inside and out; but if they were to adopt our plan of scaffold, it would be a great advantage to them, both in time and money. A timber scaffold may be regulated to any strength required, and can be erected to any ordinary small front as cheap as, if not cheaper than, a pole scaffold. There is a timber scaffold in Hyde Park, at the national memorial to Prince Albert, which is an exception to the general rule of scaffold for strength. It would be of some advantage, perhaps, to the French mechanics when visiting London to look at it. I might have entered into this subject on a much larger scale, but have mentioned a few plain facts, so that readers may be able to judge if the English method of fixing, working, and scaffolding, is not better than the French.

I might have expressed a few thoughts also on the brickwork of Paris, but suffice it to say that in some of the brickwork the mortar joints were not close like ours, but almost as large as the bricks. Since the mortar they use swells, the more mortar they put in the beds the greater will be the swelling. The remedy for this swelling would be as above described, and keeping the joints to $\frac{1}{4}$ in. or to $\frac{3}{8}$ in. thick; then they would not have any explosion in the brickwork.

THE CO-OPERATIVE MOVEMENT.

A GENERAL meeting of operative masons has been held at Wilcock's Rooms, Westminster, for the purpose of hearing from Mr. Alfred Walton, architect, a proposition for the formation of a co-operative building company among the different branches of the building trades' operatives. The chairman having opened the business, Mr. Walton said he had come specially to London to address the men in the five branches of the building trades—the masons, bricklayers, plasterers, joiners, and painters, each body separately, for the purpose of ascertaining if there were not a few hundred men in each trade, out of the many thousands composing them, prepared to unite together and establish a building company on a large scale on the co-operative principle. He believed if they carried out the principle to any extent it would do more than anything else to counteract the evils of lock-outs and strikes. He then went on to detail his plans at some length. He would recommend the shares to be fixed not higher than 1s. each, and that as soon as 500 members had taken up and subscribed for their shares, business should at once be commenced. He referred to what

* The following remarks are by a practical man, Mr. William Cross, manager of works at the Prince Consort Memorial, Hyde Park.

had been done by the masons of Scotland, who a few years since had begun in a more humble manner, and had built several squares and terraces of large and substantial houses. Mr. T. Conolly, a mason, who had been sent over to the Paris Exhibition by the Society of Arts to inquire into and report upon French masonry, gave a full and interesting account of the successful working of the Co-operative Masons' Society of Paris, who were now executing some half-dozen of the largest building contracts in the city of Paris. He cordially recommended the proposal of Mr. Walton to the consideration of his fellow-workmen. A long discussion ensued, and a resolution was adopted approving the plan laid before the meeting, and calling an aggregate meeting of the whole of the London masons, unionists and non-unionists, further to consider the subject.

A meeting has been held at Heckmondwike in connexion with the Co-operative Society in that town. Lieutenant-Colonel Firth presided. The report submitted was of a very favourable nature, showing the society to be in a flourishing condition. Mr. Powell, M.P. for Cambridge, was present, and delivered an address, in the course of which he observed that it was the desire of every member of the Houses of Parliament to give to his working fellow-citizens every means and every facility whereby they might combine for purposes calculated to promote their happiness, or to increase their wealth. If there was any country calculated to be the field of successful co-operation, he believed that country was England. If there was one national instinct more strong than another, it was the instinct of association. Mr. Powell quoted statistics in respect of the condition of co-operative societies in England. He saw it stated that there were in England at the end of last year 752 societies, but out of these only 436 sent in their reports to London. In these 436 the number of members was 173,000. The cash received for goods sold in the year ending 31st December, 1866, was 4,445,000*l.*, and the total value of assets and property was somewhat more than 1,000,000*l.*, but on the other side of the account the total amount of trade liabilities was 334,000*l.*, being a very large balance in favour of co-operative associations. He did not believe that any great revolution would be brought about by these societies—he meant any fundamental revolution entirely changing the condition of affairs which we saw around us; but he believed that by means of these co-operative associations friendly relations might be brought into existence between different classes. By their agency the labouring and working man, himself having capital, would sympathise more with the trials and the difficulties which beset capital; and, having some property himself, he would understand more how to value and how to defend it. Mr. Powell, in closing, urged that working men by being members of a co-operative association would benefit themselves, and be enabled the better to educate their children.

A lecture was lately delivered by Professor Fawcett, at the Workmen's Hall, Barnwell, before a crowded audience. The lecturer said, in 1844, twenty-eight poor weavers in the town of Rochdale thought they could improve their condition by chibbing together their small savings, and then purchasing commodities at wholesale prices and selling them out by retail. They were so poor that they could not embark in a large way, so they put into a common fund 2*d.* per week, which was increased to 3*d.*, and at length gathered together over 20*l.* With this a few articles of grocery were procured at wholesale prices. They soon found that there was a considerable profit on the transaction, and in 1864 the number of members was 4,747, while the profits amounted to 20,000*l.* a year. Their success, said the professor, was mainly owing to a rule they laid down when the society was established, from which they never departed; if they had departed from it he had no hesitation in saying that the scheme, instead of resulting in most splendid success, would have been a disastrous failure. That rule was, that under no circumstances whatever should any credit be given. The result was that from the establishment to the present time there had never been a single farthing of bad debt. Proceeding, he observed that within the last few months a co-operative society had been formed at Barnwell, and although the amount of business might not be now large, yet, if it was carried on upon the same principles, and with the same skill as that at Rochdale, there is no reason why similar success should not be realised, and the same

benefits would then be conferred upon them as upon the labouring community of Rochdale. But, though he had spoken of the Rochdale Society in flattering terms, he was anxious to impress upon them that that institution did not illustrate co-operation in its highest and most useful form; in fact, defining co-operation strictly, it scarcely deserved the term. What he understood by co-operation was a union between capital and labour. Unfortunately for the industrial interests of this country they were thus divided: the capitalist found the capital, and another class the labour; the capitalist was remunerated by profit, and the labourer by wages, and there was no connexion between them but a pecuniary one; the capitalist was anxious to hire labour at the lowest, and the labourer to sell at the highest price, and this led to the most baneful antagonism. How much better a system might be introduced. The Professor mentioned that in Manchester there existed a co-operative society of haters, and in London of picture-frame makers, and then proceeded to state that on the Continent they were more frequent than in this country. Some said the French loved co-operation, because they were socialists and communitists. Socialism and communism were most impracticable schemes; but they were not wicked ones, and socialists and communists, though their schemes always had resulted and always would result in failure, deserved this praise, that their advocates first established co-operation. It could not be said that they were bad and wicked men, but enthusiastic, and their enthusiasm was always directed to what good they could do for their fellow men. He gave instances to prove that beneficial co-operation between capital and labour was not a utopian idea, but one that could be realized, if those who engaged in it had sufficient moral qualities to combat the first difficulties they had to encounter. Modified results might be obtained by some co-partnership schemes between capital and labour, and he thought those schemes would become most common in England; they would be transitional as it were, and would prepare the workmen by degrees for something higher.

PHYSICAL COMMOTIONS THROUGHOUT THE GLOBE.

At the beginning of last month we drew attention to the curious coincidence of burricues or cyclones, earthquakes, and volcanic eruptions which was then occurring. Since that time at least thirty earthquakes have been announced as having taken place at St. Thomas, where the great hurricane played such havoc; and in America generally there have been many earthquakes, both in the States and in Canada, and long-extinct volcanoes at Rota, in Nicaragua, on the western slope of the American high-land, have broken out afresh, blazing with a light which lighted up the cathedral-towers of Leon city, ten miles off. Vesuvius is still becoming more and more active; and not long ago Hecla had a tremendous outburst. Even in this country there have been slight shocks of earthquake in the west of England. In September last we collected together and published in the *Builder* accounts of a most unusual number of casualties by lightning, far beyond anything we recollect of having ever occurred in this country. What does it all mean? Are we on the eve of some great geological crisis or convulsion? or is it merely a passing thro, anticipative of, or preparative to, some such great crisis in a future age?

GUISELEY NEW TOWN HALL.

ON the 26th ult. this edifice was opened with a performance of the "Messiah." The building is prominently situated on a site of 1,200 yards of land at the end of the town of Guiseley, near to the railway station.

The arrangement in the building for the local government offices consists of a board-room, clerks' offices, fire-engine room, lamp-room, &c. The rooms set apart for literary and educational purposes, comprise a public reading-room, 30 ft. by 17 ft., a large room for library, a school-room, 32 ft. by 18 ft., class-room, lavatory, and conveniences. The whole of these rooms are heated by hot-water pipes. The public lecture-room is 65 ft. long, 36 ft. wide, 27 ft. high, and will accommodate upwards of 800 persons seated. The platform and gallery for orchestra are

placed at one end, and a gallery at the other. The principal entrance is 24 ft. by 13 ft., with a flight of stone steps to the lecture-room and gallery. The erection of the building, which is due principally to the munificence of Mr. M. W. Thompson, M.P. for Bradford, has been effected at an outlay of about 3,000*l.* The contractors, who have executed the works from the designs of Messrs. Knowles & Wilcock, architects, of Bradford, are Messrs. Freeman, masons, of Otley; Jessop & Westmoreland, joiners, of New Wortley; Mr. A. K. Kenyon, plumber, of Yeadon; Mr. Alfred Firth, plasterer, of Rawdon; Mr. Edwin Thornton, slater, of Shipley; and Mr. Edward Haley, painter, of Bradford. Mr. Abner Rhodes, of Bradford, was clerk of the works. It is intended to transfer the building, under certain trusts, to the members of the local board, as trustees for the time being, for the benefit of the public of Guiseley for the purposes of education, and for the transaction of the town's business, making it, in fact, into the town-hall of the place.

REREDOS, ST. PETER'S, THANET.

A REREDOS has lately been erected in the parish church. It consists of a retabulum in stone, in which are sunk a central niche, flanked by two quatrefoils, each filled with mosaics. The former bears a white marble cross, and the latter contain angels carrying shields charged with the sacred monograms IHC and XPC respectively. Wheat and vine are carved on either jamb of the central niche, and the whole is surmounted by a cornice of leaves, severe in form. The wall on the sides, up to the height of this cornice, is lined with slat slabs, with a rough face, and bearing the Creed, Lord's Prayer, Commandments, and apostolic emblems painted on them in oil, and in the last and largest space, the pelican, as an emblem of our Lord and of the Holy Communion; below them is a dado of marble and alabaster inlay. This and the stonework were executed by Mr. Thos. Earp; the painting and mosaics were done by Messrs. Heaton, Butler, & Bayne, from the designs of Mr. Edward J. Tarver, architect. The whole was put up by a subscription amongst the parishioners, raised by Mr. Thomas Gray, of Orlihar House, whose family have long dwelt at St. Peter's.

"WHO SPOILT THE PARLIAMENT HOUSES?"

SIR,—The petulant tone of Mr. Fergusson's letter, in the *Builder* of the 4th inst., convinces me of the soundness of my judgment in besitating to submit my case unreservedly to the decision of a committee of which he would possibly have been a member.

While, on the one hand, the evidence he has examined compels him to give a verdict, to a certain extent, in my favour; on the other, the almost childlike delight with which he perverts it into an opportunity for vilifying my father, is so clumsily disguised as to make his criticism of little value.

1. Mr. Fergusson is not satisfied with having to find on the evidence, but he advances a question totally foreign to it. His letter is as ingenious as it is disingenuous. Never mind who "spoilt" the Houses,—that is a question of principle and taste. Who produced the original designs in 1855 before they were "spoilt?" Mr. Fergusson having come forward to record his decision on a proposed examination of my pamphlet, I refuse to release him from his obligations to meet the main question and the evidence on which it rests. At present he has only admitted the force of what is supposed to prove that my father "spoilt" the original designs; but he ignores altogether the evidence on the special point in dispute, and assumes that Sir C. Barry was the real architect, for the sole purpose of propounding the absurd, though amusing theory that my father "spoilt" all Sir Charles's work by his "crochets." My evidence all proceeds from the same sources. Half of it proves that Mr. Pugin spoilt the other half, says Mr. Fergusson; therefore Pugin was the author of the bad half,—Sir Charles Barry of the good. I do not know whether Mr. Fergusson is a Cambridge man; but I doubt it. Meanwhile, what becomes of the Messrs. Barry's emphatic denial, and Mr. Wolfe's assertion, "that all the import-

ant changes in the building which decided its character were originated and designed by Sir C. Barry alone, in the country, when he was not in communication with my father."

2. I beg to remind Mr. Fergusson that I qualified my statement about Sir C. Barry being the sole author of the "plans" of the Houses, by suggesting that even these must have been modified by the exigencies of the elevations. The formality and regularity of the south front do not necessarily prove that it was originally the design of Sir C. Barry, any more than the substitution of "pierced panels and an unmeaning net-work of flat overtones ornament" for "windows grouped together with deep reveals" and massive "buttresses," prove that Sir C. Barry was over-persuaded by my father to relinquish the latter, his own design, for the poverty and flatness of the present elevations. Setting aside the gratuitous assumption of all this, the direct opposite is the more probable fact. Who better than my father could appreciate "deep reveals" and grand effects of light and shade, and who knew better how to produce them? I shall be happy to submit to Mr. Fergusson a design of my father's, prepared in 1833, showing a façade quite as regular as that of the Houses of Parliament, having "windows grouped together with deep reveals and considerable light and shade obtained by the form of the buttresses." The real truth is that my father's original work was "spoilt" by Sir C. Barry, to whose decision, so far as "architectural arrangement" was concerned, he was obliged to yield; and Mr. Fergusson shows his entire ignorance of my father's early works in propounding a supposition which entirely reverses the probabilities, if not the facts, of the case.

3. The cat-and-kitten simile is, no doubt, remarkably amusing and quite satisfactory to Mr. Fergusson, but, for the life of me, I cannot see the point of it. As an architect, I know that contrast is the essence of effect: I know also that without contrast size is neither adequately distinguished nor appreciated. Neither do I perceive the value of Mr. Fergusson's application of his criticism to the entrances under the Victoria Tower. At all events, he has failed to perceive from Sir C. Barry's own letter that he himself sent the "plans" of this part of the building to my father to design the elevations, and at the same time furnished the dimensions for them. But considerations as to the true apportionment of the various parts of the work to their relative authors do not seem to trouble Mr. Fergusson in the pursuit of his extraordinary proposition.—"All that is Pugin's is bad: all that is Barry's is good." That is enough for him. His partiality is as plain as it is pungent. A fair and equitable judge truly in deciding on the present rival claims!

4. As regards the Victoria Tower, the entries in the diary prove that my father was at work on the original production, and few will accept Mr. Fergusson's oracular denunciations of its present appearance. He complains that an "extinguisher" caps the clock tower, instead of the beautiful design as originally published. One may well question Mr. Fergusson's competency to set up as an architectural critic if he desires to see a spire on the present clock-tower; but what will he say when I tell him that such a spire on a clock-tower, proportioned to it, is actually executed at Scarisbrick Hall, whither I shall be happy to accompany Mr. Fergusson whenever he may claim my promise to do so. This building was designed and partly carried out at the same time as the Houses of Parliament, and is sufficiently successful to elicit from one of the first statesmen of the day the following expression: "If I have reason for not believing all that you claim for your father regarding the Houses of Parliament, it lies in the fact that the work at Scarisbrick is so much holder, effective, and more successful than that at Westminster."

Mr. Fergusson contrasts archeology with architecture, as though the results of the two studies were absolutely incompatible with or spoilt each other; and that whilst the Gothic revival had alone been archeological, the Classic were quite free from this vice, and altogether creative. But I should like to know, if my father and others of his contemporaries had not been archeologists, where would Gothic architecture have been confined, I imagine, to such specimens as Sir Charles Barry's original churches, of imperishable mark, which are certainly as free from archeological cypisism as any Classical buildings are, for the most part, mere

plagiarisms as existing edifices. There is quite as much, if not more, archeology in Sir C. Barry's Palladian or Renaissance structures as in any Gothic works I have ever seen, and as perfect a freedom from the true originality of genius. Successful more or less, as reproductions or adaptations of existing works, they may be, but original productions they are not. And why it should be culpable and ridiculous to revive the glories of an old minister or civic hall, but praiseworthy and excellent to transfer the Farnese Palace or the Venetian Library from their own sunny soil to a London street, I am at a loss to conceive; or why the architect in his study and adaptation of the latter buildings should be less an archeologist than the architect of the former. What Mr. Fergusson from his normal condition of fretfulness and querulous dissatisfaction ridicules as a fault in others he exalts as a merit in Sir C. Barry. Happily he is always in such exaggerated extremes of praise or blame, that his judgment in questions connected with Gothic art has little influence, and we may be allowed to place his taste on a level with his impartiality. He has often done great service in destroying monsters, but he must leave to others the task of restoring what they have laid waste. A man who stigmatizes an architect like Mr. Street as a mere archeologist, is but little likely to do more than destroy. Mr. Fergusson stands in relation to architecture as Mr. Carlyle does in some respects to philosophy: he can tear a fallacy to tatters, but oh! for something good to replace it. Mr. Carlyle, however, thinks. Mr. Fergusson assumes and decides. *Sic volo, sic jubeo; stet pro ratione voluntas.* (It is an idiosyncrasy of his literally to rage in the presence of Gothic art. He must be exorcised before he can pronounce on its merits).

E. WELBY PUGIN.

SOME SUGGESTIONS.

Snow in the Roads.—I beg to suggest that snow could be speedily and economically removed from roads and streets by a few yards of stove-piping laid along the gutters (the ends partially stopped with a brick), having a few strong gas-jets flaming within. All snow swept or shovelled against it would instantly melt and run down the gratings.

A Foothold for Horses.—Short steel spikes (similar to cricketers' spikes) could be made to clutch firmly the rim of the horse-shoes, thus enabling the horse to have a sure foothold on frost-bound roads. They could be fixed quickly, as many to each shoe as deemed needful. They would not clog, and could be renewed at a penny each.

A Plea for worn Flagstones.—I recently noticed some paviers wantonly breaking a great many old stones, some large and in tolerably good condition. It seemed a pity, when so many places are yet unpaired. Why could they not be disposed of cheap, the same as old bricks?

Water and Fire: Plugholes in the Roads.—Would it not be an improvement to remove them to a cut bay or recess in the curbstone? They would be easily found on emergencies, and not so liable to get clogged with stones, dirt, &c., as they are daily now.

R. T.

THE THAMES EMBANKMENT.

At the meeting of the Metropolitan Board of Works, Mr. Bazalgette, the chief engineer, presented his report on the progress and cost of the Thames Embankment. As regarded that portion between Westminster and Waterloo Bridges, the whole of the dams had been completed, and considerable portions thereof had subsequently been removed from the face of the work. The Westminster Steamboat Pier and the Charing-cross Steamboat Pier were in progress, and other necessary works were considerably advanced. Filling-in behind the Embankment walls and in the works generally had been carried out to the extent of about 500,000 cubic yards. With respect to the contract between Waterloo Bridge and the Temple Gardens, a length of 1,280 ft. of the parapet was complete, and there remained but 210 ft. to be formed to complete the entire length of the river wall comprised in the contract. The Temple Steamboat Pier was also in a forward state, not more than 2,000 cubic feet

of stone, the whole of which was upon the ground, being required to complete this portion of the work. The approximate cost of the whole of the works executed, including 350l. for the materials upon the ground, was 22,500l., of which the sum of 1,060l. was due to the progress made in the past month. As regards the south side of the river, of the 2,370 ft. of dam and staging constructed between Westminster and Lambeth Bridges, 1,100 ft., had been removed from the face of the works. Within the completed dams a length of 1,900 ft. of the river wall had been constructed to a height of 7½ ft. above Trinity high-water mark. The approximate value of the whole of the completed works, including 23,900l. for the materials upon the ground, is 147,000l., of which the sum of 1,000l. was due to the progress made in the past month.

HOW THE THAMES EMBANKMENTS ARE GETTING ON.

Sir,—It may be interesting to your readers to have placed before them the following summary of progress during each of the past seven months of the three contracts at present let of the Thames Embankment:—

1867.	No. 1, North. Mr. Furness's.	No. 2, North. Messrs. Ritson's.	South. Mr. Webster's.
June	47,555	41,137	42,000
July	8,911	1,106	1,500
August and	16,890	3,127	6,500
September	11,000	1,566	6,220
October	6,000	3,348	1,000
November	7,900	1,989	1,000
December			
Seven Months ...	66,366	11,363	19,220
Total done to end of 1867 ...	435,000	224,000	147,000
Total to complete	85,000	4,400	162,000
Total of Contract	520,000	228,000	309,000

JASPER.

SNOW AND THE SEWERS.

Sir,—The original idea of using the main sewers for the removal of snow from the streets was mine, and was made public in the *Builder* last January. If the snow be put down the sewers, whether it be melted by "gas-jets," "steam-jets," or "water-jets," I claim the original idea of using the sewers for that purpose. This plan was never put in practice until I suggested it.

JOHN PHILLIPS.

HOME COLONIZATION.

"We've got no work to do."

Sir,—As the columns of the *Builder* have always been open to suggestions for social improvements, I hope this privilege will be accorded to the following on home colonization. In this large manufacturing community, where fluctuations in trade are inevitable, the choice of a trade perfectly free to every youth, and from several other causes, an excess of craftsmen over the labour in demand will repeatedly occur. How may this be alleviated? By emigration to the colonies, is the ready reply. Nor do I deny that this is the true *dernier ressort* of overpopulation: but there is yet plenty of room at home if labour could be better distributed. It has, I believe, been officially stated that "there is in this country as much cultivatable land lying waste and profitless as would employ all the unemployed in England." Now the English people, with their usual tenacity to any notion they have once adopted, rest in the delusion that going half round the world, paying large sums for passage, outfit, &c., has some peculiar efficacy in establishing all who go through the preparatory process, in opulence in a distant colony. This is a great mistake. There is no special virtue in the mere emigration, but, on the contrary, a loss of human power and energy to the old country; the most vigorous and enterprising leaving a constantly-increasing residuum of enervated and unhealthy population behind: in fact, distant colonization is doing in some measure for England what continuous war did for France. Now the virtue of a colony lies intrinsically in this,—the withdrawal of surplus labour from overcrowded centres and re-aggregating it in natural proportions. This might be accomplished as well, and at less cost, upon the cultivatable, but at present neglected, lands in Great

Britain. To do this scientifically, statistics should be consulted, in order to obtain an approximate idea of the relative proportion which different trades have to population. A capitalist so informed might establish a colony which would well repay a large outlay. But a national scheme of home colonization could be devised, which would effect a redistribution of labour highly advantageous to the happiness and prosperity of the country.

W. CAVE THOMAS.

. The question, of course, would be, can the land be made remuneratively productive? There is no doubt that much of it could be made so. We may mention that for some few weeks past, an "Association for the Employment of the Destitute Poor in Reclaiming and Improving the Waste Lands of the Kingdom," has been in progress of formation.

THE DEATH-PLACE OF GIBBON.

"CURIOSITIES OF LONDON."

THE very interesting leading article in last week's *Builder*, founded on Mr. Timms's admirable book on the above subject, contains an error which—as a denizen of Sussex and jealous of its honours—I beg permission to correct. In column 3 of the first page I read, "the courtly poet Waller lived on the west side of St. James's street . . . Gibbon, the historian, died at No. 76." This he certainly did not, if the "History of Sussex," and a long inscription cut in a marble slab in Fletching Church, Sussex, are to be believed.

Every Sussex man and woman who has dipped at all into the history of the county, knows, and is proud to know, that the last resting-place of the Historian of Rome belongs to us. Gibbon came over from Lausanne on a visit to Lord Sheffield, at Sheffield-place, Fletching; and while there was seized with the illness of which he died. Lord Sheffield buried him, with all the pomp and ceremony he could command, in his own family tomb—an enclosed hay, on the north aisle of Fletching Church; and on the front of the tomb, facing the congregation, he placed the engraved slab mentioned above, to lead to future ages how great he considered the honour of having been able to call Gibbon his friend.

If I were in Sussex, I would be delighted to send you the inscription in its entirety; but, being in London just now, I am separated from my authorities, and am forced to draw on my memory,—not on my imagination; so Mr. Timms must not lay that flattering unction to his soul, and think I may be wrong after all. "Fletching Church and Gibbon's Tomb" are among the sights we delight in showing to visitors to our "Sussex wilds,"—now rapidly becoming "wilds" no longer.

. That Gibbon is buried in Fletching Church we are aware: that he died at Lord Sheffield's we are not so certain. The statement in the "Handbook of London" is precise,—"Gibbon died January 16th, 1794, in No. 76 [St. James's-street] (south corner of Little St. James's-street), then Elmsley the bookseller's, now the site of the Conservative Club."

"CURIOSITIES OF LONDON."

I THANK YOU for the special care and tenderness with which you have treated the new and enlarged edition of my "Curiosities of London," in the *Builder* of Saturday last. Allow me to state, in reply to the omission you advert to in the Covent Garden Theatre article, page 782, that the burning of Smirke's Theatre, in 1856, is there mentioned, as well as the present theatre from the design of Mr. E. M. Barry, in 1858. JOHN TRENDS.

. We had looked to the paragraph headed "Royal Italian Opera, Covent Garden Theatre," which did not give the information referred to.

MARKS ON DEALS.

SIR,—Would any of your correspondents kindly give particulars of the various marks by which the different kinds of deal are denoted? For instance, so that if a young beginner enters a timber-yard, by such and such kinds of mark he can go and select best and second of Peterburg, &c., without being deceived by the yard foreman or others who are trying to effect the sales. Y. Z.

THE DEATH OF BARON MAROCCHETTI.

WE heard with great regret that Baron Marocchetti, the well-known sculptor, had died rather suddenly in Paris, on Saturday last. He was born at Turin in 1805, and was hence in the sixty-third year of his age. He was of French extraction, though born in Italy, and was educated in Paris, at the Lycée Napoleon, and afterwards with Bostio, a Parisian sculptor of some note. He completed his studies in Italy. In 1827 he returned to France, and in the same year exhibited a group, "A Girl playing with a Dog," for which a medal was awarded him. This group he presented to the King of Sardinia. In 1831 he exhibited his "Fallen Angel," and somewhat later he executed for the Academy of Arts of Turin a statue of Monsignor Mossi. Shortly after the revolution of February, 1848, Marocchetti came to England, where he soon became known in art circles. In 1851 he contributed the model of a colossal equestrian statue of Richard Cœur de Lion to the Great Exhibition. This model brought the sculptor into very general notice in this country. The statue was afterwards executed in bronze, and placed close to the Palace of Westminster, the cost being defrayed by national subscription. For the citizens of Glasgow he executed an equestrian statue of the Queen, which was inaugurated in 1854. In that year he exhibited at the Royal Academy, "Love Playing with a Hare." In 1856 he executed the granite monument to the memory of the English soldiers slain in the Crimea. He also executed the statue of the late Duke of Wellington at Stratfieldsaye. One of his most recent works is the monument to Lord Clyde, in Waterloo-place. Marocchetti was made a Chevalier of the Legion of Honour in 1839.

THE ARCHITECTURAL ASSOCIATION.

THE ordinary meeting of members was held on Friday evening (the 3rd inst.) at the House in Conduit-street, the President, Mr. R. Phéné Spiers, in the chair.

Mr. J. A. Bunker read a short paper on plumbers' work, in the course of which he touched upon the use of lead historically, chemically, and practically, showing that the Babylonians, Persians, and Egyptians used it for carrying and storing water, and that the invention of soldering was a very ancient one. In our own country the Saxons made lead a useful auxiliary in their buildings, especially for roofing, as also for the coffins of persons of distinction. In the Middle Ages, too, organ pipes were made of lead, and it was matter of tradition that the old St. Paul's Cathedral was accidentally burned by the carelessness of some workmen who were employed to solder the pipes of the organ. Having explained the manner in which lead was cast and milled, and the proper mode of soldering pipes, Mr. Bunker recommended that in using lead for gutter flats, flushings, &c., care should be taken to leave room for expansion of the metal, and that snow-boards should be used to protect roofs from the feet of careless workmen. In conclusion, he recommended students of architecture to pay especial attention to that portion of the specification which included the plumber's work, as want of attention in this respect often entailed much loss and inconvenience.

A member inquired whether Mr. Bunker could give the meeting any information with reference to the merits of sheet zinc (Vieille Montagne) as compared with lead. Objections had, he said, been made to lead on the ground that the chemical action of the atmosphere occasioned it to corrode; but the excellent condition of the roofs of some of our cathedrals and old parish churches would lead to an opposite conclusion. He also desired to know what was the best and easiest mode of preventing pipes from bursting in frosty weather. He had tried the experiment of allowing the tap to run very gently at such periods, and never had a pipe burst.

Mr. Bunker said he had come prepared to speak about lead, and not zinc, although he believed that the latter metal, if properly laid, was a very useful material. For his own part, however, he always recommended the use of lead, as although the cost was in the first instance greater than zinc, the old lead was always worth from 18s. to 20s. a cwt. He was unable to state why lead did not answer upon oak wainscot, but the solution might be found in

the circumstance that oak contained a good deal of iron. In the old cathedrals it would be found that lead was not laid upon oak. With regard to the best mode of preventing lead pipes from bursting in frosty weather, he believed the most effectual remedy was to insert a stop-cock at the lower end of the service-pipe. As for allowing the tap to run, he feared the water companies would strongly object to such an expedient, however useful it might appear.

The Chairman, in calling attention to some drawings of lead finials and vases in Continental ohniviches, exhibited by Mr. Bunker, pointed out the beauty of the design, and the solidity of the material. It was, he thought, a pity that architects of our day did not endeavour (wherever practicable), to introduce lead work for finials and vases, as there was a hardness and solidity about it, which recommended it for general adoption. In cases where it was necessary to use ornamental ironwork, it would be very desirable to make the design as bold and solid as possible.

It was stated that at the next ordinary meeting of the Association, a paper would be read by Mr. Henry Mathews, "On painting as a fine art, and its principles, and their full development in the works of the ancient masters."

LEICESTER CLOCK TOWER COMPETITION.

A DESIGN by Messrs. Goddard & Son has been selected after modifications. Messrs. Millican & Smith write:—

"The 'Haymarket Structure' Committee having received 106 designs in reply to their advertisement to architects, proceeded to select the best, and to assist them in the selection, obtained votes from the subscribers who visited the exhibition of the drawings at Messrs. Vico & Moore's: the votes so recorded gave ours a majority of twenty-four over any other of the 106 designs.

The Committee in their own voting again placed ours first among the three designs selected by them. At this point, for reasons best known to themselves, instead of awarding the premium according to their election, the Committee broke faith with all the competitors by handing over the final selection of one design to the Town Council, who, having chosen two out of the three designs submitted to them, appointed a sub-committee to issue further instructions for modified drawings from the two competitors. Against the unfair decision of the Council upon these modified drawings we now beg to protest.

We claim that our design is entitled to the first place, by the choice of the subscribers and that of the original Committee, and because, to comply with the modified instructions of the Council Committee, we had merely to omit the buttresses to the base and increase the height of the statues from 5½ ft. to 6 ft., whereas Messrs. Goddard's design required an entire remodelling of the base; the statues to be increased from 3 ft. 6 in. to 6 ft.; the canopies to be reduced from 12 ft. high to about 4 ft.; the clock dial to be increased from 2 ft. 6 in. to 4 ft.; and the roof to be reconstructed. Is it too much to assert that the design requiring the least alteration ought to have been selected by the Council?"

CHURCH-BUILDING NEWS.

Ovington.—The church of this little village has just been repaired and resetted throughout. Last year the parishioners determined to put the church into a more seemly condition; and the rector took the opportunity to restore the chancel. Accordingly the stone-work has been cleaned and made good throughout, the windows and the old Norman doorway have been repaired, the tower has been thrown open to the church, the timbers of the roof freed from whitewash, and the walls (inside) replastered and brought to a warm sober tint. The floor has been laid with tiles in ornamental patterns. The nave is furnished with low open benches. All the fittings are of oak. The cost of the work in the nave has been about 250*l.* The whole of the work (except a stove supplied by Mr. Gidney) has been carried out by Mr. Hubbard, of Dereham, builder, under the direction of Mr. E. J. Tarver, of London, architect.

Leigh.—Not content with what has been done in the way of restoration to the parish church, the parishioners recently decided on doing something more towards refitting it, and also that it should take the form of a testimonial to their rector, the Rev. H. B. Cocks. Accordingly a subscription-list was started, which was headed by Earl Somers with 25*l.* and the Countess Somers 20*l.*, and soon a sufficient sum was raised to purchase a redwood, a pulpit, stalls for the choir, and a brass lectern. These articles have now been placed in the church. The redwood is of freestone, having in the centre, over the communion-table, a Greek cross on a diaper ground within a sunk circle, and the passion-flower

carved in the centre of the cross. The pulpit is of oak on stone steps, and has carved on it a representation of the Ascension, &c. The stall-ends are also carved, the whole of the above work being by Mr. Forsyth, of Worcester. Messrs. Hardman, of Birmingham, supplied the brass lectern.

Bedale.—A new church, to replace the old one, has just been erected at Thornton Watlass, four miles from Bedale. The tower of the old edifice, however, has been retained, and forms part of the new edifice, which has been erected from designs and plans of Mr. G. F. Jones, of York, architect. The style of architecture adopted is Early English, and the edifice consists of a nave and north aisle, north and south transepts, and a chancel, the porch being on the south side near to the old tower, which is about 80 ft. in height. The windows are filled with cathedral glass, and have coloured margins, except one window, which is of stained glass. The windows in the north aisle are lancets, and those in the transepts are of three lights. The west window underneath the tower is of three lights, with plate tracery, and has been restored by Lady Milbank. The east window is a triplet, with plate tracery, and Mr. J. Puleine, of Clifton Castle, has had it filled with stained glass. The church will accommodate about 250 persons, for whom in the nave, north aisle, and transepts, open seats of varnished deal are provided. The chancel is fitted up with oak seats, having moulded and carved ends. The cost of the erection of the edifice has been about 1,500*l.*

Hooke.—The small church of Hooke has been opened for divine service. The foundation-stone was laid in the spring of last year, by Earl Grosvenor, M.P., and since that period great difficulties have been experienced in raising the necessary funds. The amount promised having reached the sum of about 2,500*l.*, architects were invited to furnish plans of the same, and Mr. Danke, of London, proved the successful competitor. He estimated the cost at 4,600*l.*, including spire, or 3,500*l.* without. The edifice stands by the side of Hooke-road, in close proximity to Newton-lane. It is in the Transition style, and is built of the red sandstone of the district. It consists of a nave, chancel, and north aisle, with organ-chambers at the east end. The nave is separated from the aisle by a row of pointed arches. There is a tower at the south-west angle of the building (upon which the spire may be placed), the main entrance being from the Hooke-road, through the north porch. The church will accommodate 600 persons, but it is so built as to admit of a south aisle being added.

Miscellaneous.

COMPENSATION.—On the 6th inst. Mr. Humphreys, the Middlesex coroner, presided over a special jury in a compensation case, "Clayton v. The Metropolitan Railway," at the Sheriff's Court, Red Lion-square. The premises were not required by the company, but in making the inner circle the water damaged the plaintiff's oven, and he required the company to take the whole premises. The shop had been closed a month, and the company in possession. It was suggested that the claimant could return, but he declared that his business had been destroyed by the company, and he claimed three years' profits. He made, he said, 12*s.* on a sack of flour. After several witnesses had been called, a verdict was agreed upon for 300*l.*

HEMEL HEMPELSTEAD.—The High Bailiff held a court of pie poudre in the Town-hall, to receive the report of the committee appointed to erect a new market-house, &c. The bailiff produced a coloured drawing of the exterior of the proposed building, and of the Town-hall, with plans of the internal arrangements. The building, he said, would be in architectural conformity with the Town-hall, and would be surmounted by a turret, on which there would be a market hell. The corn-lofts would be 30 ft. by 24 ft. The plans had been unanimously adopted by the committee, and he calculated that the shop, cellarage, &c., would yield an income of about 80*l.* a year. After considerable discussion, the following resolution was agreed to:—

"That the plan proposed be adopted, and that the architect be requested to give his special attention to the possession of the most efficient means for the delivery and discharge of grain to and from the corn-loft, and that the elevation of the shop front should be in accordance with, instead of subordinate to, the designs of the main building."

SELSEY, SUSSEX.—A new chapel, 46 ft. by 31 ft., belonging to the people called "Bible Christians," was opened for divine service on the 26th ult., when a sermon was preached by the Rev. J. Horwill, of Southsea. The proceeds of the opening services are nearly 50*l.* The plans of the above building were prepared by Mr. E. J. Smith, of Portsea, architect. The structure is Gothic, and has flint walls, with white brick quoins.

ROAD ROLLERS.—We observe a patented form of this great desideratum, among many other useful implements, illustrated in a catalogue issued by Messrs. Amies, Barford, & Co., of Peterborough, ironfounders, machinists, and agricultural implement makers. It is a substantial and weighty-looking article certainly. It is made of cast metal cylinders, laid alongside of each other in rings, each 12 in. broad: so that the requirements of road surveyors, contractors, and others who wish to have one very heavy roller can be met to any extent, as to breadth, and the same as to thickness. The outer rim of the one illustrated was about 4 in. thick, of solid iron. It can be fitted with a turntable, which allows the horses to turn with the frame-work without turning the weighty roller. Prices seem to vary from 65*l.* for a 5-ton one to 115*l.* for a 9-ton one. No steam-power is required or used with this road-roller.

FRIENDLY SOCIETIES' ASYLUM.—The annual dinner to the inmates of the Metropolitan Benefit Societies' Asylum, Ball's Pond-road, was given on New Year's day, Mr. W. G. Ledy, trustee, presiding. As we have said before, "this is the only institution in the kingdom for the special benefit of members of friendly societies. To the credit of the metropolis be it said, that a few working men in it founded the asylum in 1829." In proposing success to it, and the health of the inmates, the chairman said that 184 persons had been admitted, of whom 111 had died, and thirty-eight now remained. There was accommodation for sixty-nine married couples, but so many could not be elected until the building debt of over 3,000*l.* was paid off, and it behaved every society and member to aid in making that good, when the Endowment Fund of 7,500*l.* would be available for paying increased annuities to the inmates.

BELL CHIMING AT GREAT BEDWYN.—A simple and ingenious arrangement, of which some account has already been given in the *Builder*, has been adopted for chiming the fine old bells of Great Bedwyn Church. It is that invented by the Rev. H. T. Ellacombe, rector of Glast St. George, Devon, and has been used for some years in various churches in the West of England, but is little known elsewhere. It brings all the hells under control in the body of the church, where they are chimed for service with perfect ease by one man or boy. Being independent of the holly, it interferes in no way with the ringers when a peal is to be rung. The chiming gear being distinct from the clappers, it does away with the destructive practice of "clocking" the bells, or tying the clappers, by which numbers of fine bells are cracked. The apparatus has been put up by Mr. Hooper, of Woodbury, near Exeter, at a cost to the parish of about 1*l.* per bell, and his travelling expenses.

ATROCIOUS ATTEMPT TO BLOW UP THE WORCESTER GUILDHALL.—A meeting of 400 special constables was about to be held in the Town-hall, Worcester, and the hull-keeper, as was most fortunately usual with him, went without any light to turn on the gas, when he found from a hissing noise that something was wrong, and he instantly turned off the gas again. He obtained assistance, and on examining the meter it was ascertained that some dastardly miscreant had removed and taken away the plug of the main service pipe connecting the main with the meter. Workmen were fetched from the gas-works, who gave it as their opinion that whoever had removed the plug had a thorough knowledge of the construction of gas meters. The pipe out of which the plug was taken is an inch pipe, and if its removal had not been found out, sufficient gas would have escaped in five minutes to have blown the front of the hall out. It is presumed that this attempt was made with the intention of stopping the meeting of the special constables, if it were not ignorantly intended to destroy the constables themselves, which, however, it could not have done, as the hall would have been destroyed before they could have assembled.

VICTORIA PARK.—The bathing lake in Victoria Park is to be made about double its present size. The First Commissioner of Public Works has decided to follow the precedent established in Lancashire during the cotton famine and under the Public Works Act. The work will be offered to men who cannot just now find any other employment, and they will be paid according to the amount of work done.

RINGWOOD TOWN HALL.—The old Town Hall, or Market House, which has stood for nearly a century and a half, has been destroyed, and the bricks carted away. The removal of the dingy old building is an improvement to the town. The new Town Hall has been built after plans by Mr. Wyatt. It contains a justice-room, and a corn-exchange, suited for a ball and concert room; while below are two other rooms for general purposes, adapted for reading, club, or lecture rooms.

ST. STEPHEN'S MEMORIAL CHURCH, DELHI.—This little church was consecrated by the Bishop of Calcutta, the Rev. Dr. Milman, on the 17th of October. The building is situated in one of the most populous thoroughfares of the city of Delhi, immediately facing the Queen's garden. The interior is decorated, and the walls are covered with scrolls, symbols, and texts. The inscriptions are in Persian character as well as in English. The service and sermon were in the Oordoo language, which the bishop has qualified himself for reading and preaching in.

ANSON'S "DRAMATIC ALMANACK."—The "Dramatic Almanack" for 1868, by Mr. J. W. Anson, of the Adelphi Theatre, besides containing a very large amount of information of value to those who are connected with the stage or interested in it, includes several amusing articles on Macklin, Astley, and Wohlwell. We have not checked the correctness of the facts given in the various lists, but the intention is excellent. Mr. Anson is the secretary of the Royal Dramatic College; the honorary secretary of the Dramatic, Equestrian, and Musical Sick Fund; and is in other ways honourably known.

THE WORCESTER DIOCESAN ARCHITECTURAL SOCIETY.—The annual meeting of the members of this society has been held in the Council-room of the Natural History Society, Worcester. The chair was occupied by Mr. G. J. A. Walker, and there were also present the Revs. T. G. Curtler, W. W. Douglas, H. G. Pepsy, G. S. Munn, W. Thorn, Messrs. H. Holden, E. Lees, and J. S. Walker. The proceedings having been opened, Mr. Walker proceeded to read the report, which was of considerable length, and commenced by congratulating the members on the appointment of one of their body to the episcopate, and then went on to speak of the excursions of the society, and the architectural doings at Worcester, &c. The report was adopted, and the whole of the officers reappointed. It was agreed that Earl Beauchamp be requested to take the chair at the meeting to be held on the 14th of January, when Mr. Beresford Hope will read a paper on the Cathedral.

THE PENN-SQUARE BUILDINGS, PHILADELPHIA.—A great day has dawned upon Philadelphia, says the *Journal* of the Franklin Institute of Pennsylvania. It is proposed to give to her libraries and museums enlarged space. At the last meeting of the councils of the city, the resolution to ask the Legislature to grant the four small public parks or squares, situated at the corner of Broad and Market Streets, and formerly the site of the waterworks of Philadelphia, to the following named institutions,—The American Philosophical Society, the Philadelphia Academy of Natural Sciences, the Franklin Institute of Pennsylvania, the Philadelphia and Loganian Libraries, and the School of Design,—was agreed to, without deliberation and without debate. Such a cluster of buildings, it is added, with an unequalled library, a vast store-house of specimens in natural history, an immense number of models of mechanical inventions, a complete catalogue of philosophical apparatus, great galleries of paintings and statuary, would afford students in every department of literature, science, and art all the facilities requisite to the most elaborate research. Within a compass of 1,000 ft. square, he will look upon the labours of Andron and Wilson, Benjamin Franklin and Dr. Robert Hare, and of hundreds of others, who spent their lives, retired from public gaze, in building up these great collections of fossils, minerals, shells, plants, and models.

The Builder.

VOL. XXVI.—No. 1302.

English Artisans on Paris Work.

PENING again the volume resulting from the visit of British workmen to Paris,* we light upon a notice of Plasterers' Work by C. Bartlett. The writer of it is better satisfied with the skill possessed by our plasterers than we are. We have reason to fear that the number of artistic plasterers is very small; the great majority are utterly incapable of anything like art. In plasterers' work, as in brickwork, plumbers' work, and other trades, there has been a woeful falling off in England. The speculative builder's six, eight, and ten roomed houses, made to sell, which the reporter speaks of as the rough nursery for many of our plasterers, and "in many cases the starting point of some of our best workmen," have been the ruin of the craft as an art. However, we will keep just now to what he tells us. The French architect, he says, uses plasterers' work sparingly in their first-rate buildings, and in situations where the presence of plastering would not be suspected. For instance, in the new Imperial Library, the coffers of the arch springing from the gigantic piers in the reading-room or hall are plasterers' work of first-rate quality; but from its great height, and the absence of plasterers' work in other parts of the hall, plasterers' work would not be suspected. First-rate plastering is not the rule in Paris, but the exception; more so, he thinks, than with us. In secular buildings, viz., dwelling-houses and hotels, the plasterer has less to do than with us. The ceilings are not enriched so commonly with mouldings as with us—the painter and artistic decorator superseding all others in making blank spaces agreeable to the eye.

"The French artisan has less choice of materials than the English. While the latter has many different cements to work with, the Frenchman has very few indeed, mainly working in that plentiful material plaster (gypsum, or sulphate of lime), the coarse being used for rough floating, and for finishing the plaster is sent through a fine sieve. The plaster setting quickly is a great advantage, as it enables them to finish a room off at once, so that one preparation is enough for, say, one room. With us it is very different, as we have to wait for the drying of the different coats, causing delay, besides keeping more in hand at one time, and finishing nothing right off. The style of work seems rather wasteful to an Englishman."

In cornices, whether inside or out, the Frenchman uses more tools than our men do. We use straight-edges, or joint-rules, of cast steel, with a few small tools; this is all that is required for our intersections or "mitres;" but in Paris the workman uses wooden moulds, made to the shape of the various members of the cornice he is forming, moulds which are akin to those used by our masons. This takes considerably more time than we are in the habit of spending on such work. In plain work they use fewer tools than we do. The principal tool is a rather broad, thick, triangular trowel. They are not so particular as ourselves regarding the colour of their plaster. We look with distrust

upon high-coloured plaster, well knowing it sets too quickly to be worked properly, with the grave defect of "giving" or softening after it has been laid on for a few hours.

The display of plasterers' tools in the Paris Exhibition was very meagre, and the worst was that in the Royal Carriage Department, contributed by England. To show how deceptive such exhibitions may after all be, we may mention that there was a plastering trowel of very old date, nearly out of use, and only to be met with in some very odd nooks and corners of old England.

The plasterers in Paris, like their English brothers, complain of the exceeding difficulty of obtaining lodgings in a central spot, so as to obviate the need of long journeys to and from their work. Most of them reside in the outskirts of the city, the single men in lodgings, paying for a single room about 15 francs per month for the exclusive use of it. When two share the same room, they pay 2 francs or mostly 3 francs more. The married generally rent two or three rooms, on a third or fourth story, at a rental of 250 francs or 300 francs per year, paid by the quarter. In addition to the preceding, when the rent exceeds 250 francs per year, a tax of 9 francs is paid by the tenant. He learns that there are about 1,000 men engaged in the plastering trade of Paris. Many of those coming from the provinces are very indifferent scholars: some few can read, fewer still can read and write. Nearly one-half of the men engaged in the plastering trade attend some school or institution, at the rate of two nights per week. The instruction is free, the schools being supported by a Government grant, and by the donations of private individuals. Often the priest opens a free place of instruction, teaching geometry, drawing, and other branches of education. The two principal educational institutions for them are the Polytechnic Association and the Philotechnic Association.

Wages were paid once a fortnight, and in some cases once a month; but everything getting dearer—provisions and house-rent—there was a general move made by the men for shorter reckonings, and now the practice pretty generally prevails of drawing on account as often as twice a week, viz.—Wednesdays and Saturdays, and settling up once a fortnight or three weeks, sometimes once a month. He states their wages as sixpence per hour for those men who only do plain work; eightpence for those who run mouldings.

The reporter mentions the Conseil des Prudhommes, and says no sane man can doubt that these councils do a great deal towards preventing strikes. "Still, your reporter found the workmen in the building trade of Paris in a rather unsettled frame of mind."

T. W. Hughes and John D. Prior, who write a joint report on carpenters and joiners' work, wisely admit that to do justice to the subject, they should require a much more intimate acquaintance with the French workman than could possibly be acquired during a short visit. They find that carpentry is gradually falling into disuse in Paris, in consequence of the substitution of iron for wood in the erection of buildings. Nearly all the houses now in course of construction are being built fire-proof, with iron lintels and girders, the floors being constructed of iron joists filled in with brickwork, with flat roofs of a similar character. Such specimens of carpentry as they saw were generally of a very rude description. Their partitions are mostly constructed of crooked and rough scantling, which would be condemned by any surveyor in this country. Their joists are placed at very irregular intervals, and appear to have been laid at random by labourers, rather than fixed in their proper positions by mechanics.

"Joiners' work in Paris is, in our opinion, defective in its construction, and roughly finished. French joiners have apparently no idea of wedging up a piece of framing. In framing a room door with stiles $\frac{1}{2}$ in. or $\frac{1}{4}$ in. wide, they

would not carry their tenons through the stiles, and wedge up the frame, as would be done in this country; but their tenons would go only half way through the stiles, and be fastened with pins. This system of pinning, which is a favourite one with the French, is considered very objectionable in this country, as the head of the pin never fails to project beyond the face of the work as it shrinks. In making sashes and other framing with narrow stiles, in which the tenons are carried through the stiles, we saw no attempt to wedge, but everywhere we found even the least of their work disfigured by the unsightly pin."

On the whole, they consider Parisian joiners' work to be far inferior to that done in this country. Their mouldings, as a general rule, are very well designed, they note, and the carving is remarkably well executed; and they can easily understand how an art-student may be attracted by the tasteful and artistic appearance of a piece of joiners' work, and may fancy that he sees in it an evidence of the superiority of French work; but the practical workman will arrive at a very different conclusion. He will at once understand that for the portious of the work which are so attractive to the eye, the joiner is in no way responsible, since he is neither the designer nor the carver; whilst the framing itself would be found to be very defective, both in strength and finish. French workmen, they consider, will require better tools, and an entire revolution in their system of working, to enable them to execute a class of work fit for the English market.

They find in the Belgian oak pulpit and staircase a quantity of very good carving; but his joiners' work presents to them all the objectionable features which characterise French work, with the addition of a few novelties which are peculiarly their own. One of these is to be found in the hand-rail of the stairs, the lengths of which are united by means of a scarf-joint. "We have no very strong objection to a scarf-joint, if properly made, albeit we feel a very decided preference for a good butt-joint, properly doweled and screwed together; what we particularly object to in this instance is that the scarf is made the wrong way, with the sharp edge of the wood in an upward direction. Now, we know that usually a man grasps a rail firmly to assist him in ascending a staircase, and slides his hand over it in descending. Should any incautious stranger pass his hand quickly down over this rail in the way we have indicated, now that the work has been exposed to the action of the sun and air, he will, in all probability, suddenly find some small splinters of the wood imbedded in his flesh,—a sensation which will be more exciting than agreeable."

In Paris the wages, they state, vary from 4 $\frac{1}{2}$ frs. to 6 frs. per day, according to the ability of the workman, or "rather according to the amount of confidence in his own ability which he professes, self-confidence being a quality which naturally enhances the value of a man's labours under such circumstances as these." Six francs per day is the largest amount paid to any working joiner, and this is only paid in very exceptional cases. Ten hours generally constitute a day's work, the working hours being from 7 a.m. to 7 p.m., out of which two hours are allowed for meals. Sunday work is general.

The polite manners of workmen delighted them. They found, too, a great appearance of gaiety; but they were not to be taken in by the tinsel, and state thus energetically their opinion of the life led by Paris workmen:—

"The French people appear to us to be immersed in vain and frivolous pursuits, which hide from them the true purposes of life, to be bound by trammels which they must cast aside ere they can hope to rise to the dignity of a free and independent nation. They want more energy, perseverance, and strength of character; they want to learn that there are aims in life more noble than emptying a wine-bottle, or skipping about a dancing-room; to learn that to spend a life in the service of liberty is even more noble than to die for it. When the French people have learnt to govern themselves, they may expect to be governed wisely and well; and, no longer tools in the hands of ambitious rulers, they may build up for themselves, upon a sure and certain foundation, the edifice which some among them have so long and earnestly desired."

They arrive at the conviction that in their trade they have little or nothing to fear from foreign competition; and if the specimens of

* See p. 21, ante.

work exhibited in the Paris Exhibition may be considered as a fair representation of the workmanship of the various Continental nations, very little indeed to learn from them. They wisely urge upon the carpenters and joiners of this country to become thoroughly acquainted with the principles of geometry, and their practical application to their own trade, as being of the utmost importance; and at the same time, fully acknowledge the necessity of working to appreciate all that is beautiful and noble both in nature and art, and shall induce him to strive after a combination of the ornamental and the useful in the objects by which he is surrounded in his daily life.

Alexander Kay, who also writes on joiners' work, gives a more elaborate report. At starting he says that the price of materials and rates of wages are regulated by the Prefect of the Seine, at his palace, Hôtel de Ville, and that the hook is sold at 12 francs. He appears to have inquired very carefully as to the foreign works, and has a somewhat higher opinion of what is done abroad than Messrs. Hughes & Prior. He nevertheless finds the French joiners' work defective.

British joinery, he thinks, holds its place amongst the nations of the world, although England has to import the materials which are the component parts of joinery from America, Russia, Norway, Sweden, Prussia, Spain, Hindoostan, Australia, &c.

Messrs. Clerihew & Lascelles, of Bunhill-row, Fishery, exhibit various articles of joinery in the testing-house, sashes and sash-frames, doors and furnishings, staircase and mouldings, all worked by machinery, being only put together and cleaned up by hand. The mouldings are without glass-paper or scraper; and, the character and quality of the work, and the prices at which they produce such articles, most convince any French joiner that he is far behind a British joiner, as it convinces me. Persons, when they require joinery-work, wrong themselves when they go to foreign countries for joinery, as there is none to excel, and little to equal, our own.

He found no proper representation of the tools used by British joiners in London and many of the provincial towns. "There are many of our British tool-makers able and willing to risk the enterprise of sending a case of tools properly got up, and of a class far superior in utility to those of the joiners of any nation, but costing the joiner more money than the tools of any other nation, although repaying the British joiner for his outlay, and benefiting the employer by causing a great saving of time and labour, and economy of material."

The following comparison of the price charged for some of the ordinary tools used by joiners is curious:—

	British.	Austrian.	French.
Jack plane.....	2 s. 3 d.	2 s. 3 d.	2 s. 3 d.
Trying plane.....	0 6 .. 0 1 10 ..	0 2 .. 0 2 ..	0 3 2 ..
Smoothing plane 3s. to 4s. ..	1 7 0 .. 0 1 7 ..	0 1 8 .. 0 1 8 ..	0 2 6 .. 0 2 6 ..
Head plane	0 3 0 .. 0 1 10 ..	0 1 10 .. 0 1 10 ..	0 3 0 .. 0 3 0 ..
Brace	0 7 6 .. 0 1 2 ..	0 1 2 .. 0 1 4 ..	0 7 6 .. 0 7 6 ..
Hand saw	0 6 6 .. 0 2 5 ..	0 2 5 .. 0 2 0 ..	0 6 6 .. 0 6 6 ..
Lock saw	0 8 .. 0 8 ..	0 8 .. 0 8 ..	0 8 .. 0 8 ..
Square	0 3 0 .. 0 2 ..	0 2 .. 0 2 ..	0 3 0 .. 0 3 0 ..

He thinks that the foreign tool-makers must be in a very bad plight indeed.

He found that the locksmiths fitted all the locks and hinges on the doors, windows, &c., which in a measure accounted to him for the insufficient and clumsy nature of their fixing throughout the different buildings in Paris. He says, "The locks were all box-locks, and badly made. The hinges were likewise bad, and of ancient design." He has not said, as he might, that these clumsy-looking fastenings answer their purpose for years, while a vast proportion of the neat fastenings put on in England are utterly worthless in a few months.

Being asked in the British Workmen's Hall in the Exposition his opinion of the joinery in the New Imperial Library and Hôtel de Ville, he replied that it was the best joinery he had seen in Paris, but was not equal to the joinery in London Government buildings, such as the Houses of Parliament, British Museum, and the new Indian and Foreign Offices in course of erection, neither for solidity of workmanship nor beauty of finish; for in those buildings all the architraves, &c., were finished without a screw or nail being seen in any way whatever, and well fixed too; such not being the case in the Paris buildings, where the heads were either obviously visible, or punched in and covered with a mastic, like common putty.

He is surprised they do not adopt the mortise lock. He could not find one of French manufacture in the Exposition.

In the building of the Conseil des Prud'hommes the joinery he considers, is truly bad, although re-

cently constructed, being made of unseasoned oak, badly joined together by the French joiners. The work does little credit, he considers, to the workmen or to the contractors, as any person can see through the doors at the mitres of the mouldings, the joinery being far from equal to the masonry; the same is the case in all the other buildings in Paris. He found the joinery manufactured by Messrs. Petit-Jean & Cavet, which the fortifications on the bank of the Seine, well supplied with machinery, cheaply got up, but mostly of rude construction, and the work produced was as rude as the machinery. They had several upright saws for cutting ornaments in wood, such as tracery, bracketing, and so on, the spring for producing the back motion being made of ash, and constructed as British coach-smiths make springs for carriages and wagons. Their moulding and rebating machine is worked on a vertical motion, with vertical cutters, and executes very rough joinery, the feeding motion being of had principle, and not keeping the piece of wood steady to the cutters.

At M. Havel's the interpreter told M. Theodore Canonnet, the staircase-builder there, that Kay considered the workmanship not good.

"He got quite offended, and told the interpreter that he would defy any man to make a better job. I had then to explain to him that his hand-work was good, but the system he adopted was expensive, requiring a great quantity of timber, and a greater amount of labour than was actually necessary, and not making, as strong a staircase, which seemed to take him by surprise. I endeavoured to explain to him the orthogonal or square-cut system, brought to such a state of perfection by William Perry, staircase-builder to Messrs. William Lawrence, & Sons, Lambeth, which he seemed to comprehend a little, and desired the interpreter to thank me, and wished me to call on him again. I then endeavoured to show him how to produce a staircase with a cylinder, and to block and glue his steps to make them more solid, which he seemed to see the great benefit of. He has to cut the string for the whole for his stairs out of a solid block of timber. The string was 3 in. thick, 11 in. deep, with a scroll of diminutive size attached. He told me that the work was mostly done by the piece, he had spent from ten pence, besides the use of the machinery, which I considered was a good price for the work."

The reporter feels quite certain that British joiners could get through more work than they do if they were fairly and civilly treated by employers, which, he says, is not usually the case. He relates, for example, what occurred in the preparation of the quadrangle in the new Indian Offices, for the Sultan's *filie*, a work of great interest to the workmen as well as those who had the management. It was well arranged, and executed by the managers and the workmen in a short space of time; but he knows that had a slight measure of refreshment been meted out to the workmen, especially to those who were labouring on their knees, planing the ball-room floor, with the promise of a reward if they were done by a certain hour, it would have been ready several hours earlier than it was. When they left work for half an hour at a clock p.m., to get some refreshment, they were not allowed to have any money to purchase anything with, and returned to work till midnight without having tasted a morsel from 5.30 p.m., and some from noon; and on the night of the entertainment more than one hundred joiners alone worked from noonday to 10 p.m. without having eaten or tasted a morsel of bread or drunk a cup of tea, and then were grumbled at by some persons who knew not how hard they had worked, and were hustled out of the building by a police-officer.

We agree with him that there was want of good feeling and wisdom shown here, if the statement be correct. The reporter urges strongly the want there is of education in his class, and says he finds that education greatly assists the workman in the execution of his duty, in adopting the speediest and best methods for the construction of his work, both as to time and quality. The educated workman always returns the greatest value to the employer, especially if he is an anti-associate of the *gilt-palace*.

Masonry is written of by George Broughton Forbes and John McKew, who say masons' wages are from 6d. to 8d. per hour in the city. There are three classes of workmen: roughers at 7d., finishers at 6d., finishers at 8d. per hour. On hard stone they have to pay 5d. per day for sharps. On granite, the employers pay for the tools sharpening. The cost of their living is about three francs per day. They work ten hours per day, seven days per week (including Sunday), and, when required, overtime. These reporters appear not to have found much done in Paris that could not be better done in England. "We claim for our countrymen in the trade as masons to be more skilful and systematic in the executing of their work, either

for quality or quantity, than we have yet seen."

Thomas Connolly, stonemason, goes into the same subject at much greater length, and commingles a valuable and readable report. He found Paris a wonderful place; everything on a grand and magnificent scale; and thought they had a better way of managing improvements there than we have at home:—

"In Paris it would appear that the authorities and the architects combine to make a perfect street; in London the Board of Works, the vestries, and the architects agree to differ; and when there has been an opportunity of making a decent street, as in Southwark, a number of buildings are erected in every style of architecture, from Hindoo to Pantonian, and some in no style at all, but each vying with the other in hideous deformity."

In the science of construction, and the judicious use of the materials, stone, wood, and iron, the French architects, he thinks, display great skill. The right material is generally used in the right place. Their buildings being constructed as much as possible fire-proof, were seldom read of a great fire in Paris. They are generally well-built, for the builder and the architect have to insure their stability for ten years, and are held accountable during that period for the expense of any repairs arising from imperfect workmanship or from defective materials. The fronts are all built of large stones, bedded and jointed, which go through the whole thickness of the wall. They are laid dry on each other, and afterwards run with plaster.

There are openings left for the doors and windows, and projections for the cornices, mouldings, and carving. When the walls are carried to their full height, the masons work the front of the building, commencing at the top; they finish and take down their scaffolding as they descend. The back and end walls are built with small squared stones on the outside, and with unsquared or rubble on the inside. They are hedged in plaster: very little care is used in the hedging of this rubble, as the plaster sets soon after the stone is laid. The flues to carry off the smoke are constructed with earthenware pipes built into the walls; and as those walls settle unevenly on the foundations, you observe on every gable-end exposed to view that open joints are left close to the quoins, so that each wall may settle of itself, without drawing the other with it, and causing rents in the building. These open joints may be filled up when the work is seasoned.

He gives a very good account of the mode of performing different sorts of work. He arrives at the conclusion that when a stone has to be worked to a mould, or fitted to a square or a straight edge, no man can do it more workmanlike or to greater perfection than an English mason; but that when the hands have to realise the imagination, the Frenchman's familiarity with art, and his early training in its principles, enable him to outstrip us; and as every building in Paris is more or less decorated with carving, he was at a loss to know at first how they got all their art-workmen.

"But the difficulty would not appear so much if you could read the large placards, in French, which are posted up at the ends of the bridges and other public places, informing workmen where they can be taught drawing and modelling every evening free of expense. That is outstripping the Englishman in this respect does not, I feel certain, arise from the possession of an especial art-genius, but because whatever it is in him is fully developed, and encouragement is given to its practice; and if English workmen are behind in this respect it is not because art-genius is deficient in our nature, but because it is not developed and encouraged sufficiently."

He thinks it impossible to estimate the loss which is entailed upon England through the neglect of art culture in every department of our industry. Through it we are reduced to mere hewers of wood and drawers of water for other nations. The bulk of our able-bodied population is engaged in manufacturing goods to be sold cheap, or in producing raw material for other people to work up; while the more delicate portion have to subsist on their earnings for want of employments suitable to their strength. The streets of London and our large towns, he remarks, are torn up with heavy traffic, which is scarcely perceptible in Paris; for if a ton of iron enters there, for which we may get less than 11., they are sure to put 100l. worth of labour on it before it leaves their hands.

"But 'all is not gold that glitters,' for among all the enjoyments of a Parisian workman, there is nothing to compare with the substantial comfort of an English workman's home, or the quiet repose and respite from labour which the Sabbath brings him. Nothing is more intolerable or repugnant to the mind of an Englishman than the description of this day of rest."

We must hurry on. William Lethers, speaking of hammered iron, says, as far as he is able

to judge, the French excel in taste and effect, but that they are not more skillful as smiths; in fact, he thinks the English excel in hammered iron-work. There is a great difference in the design. The French make their work strong and very effective; the ornamentation, being of this sheet-iron, is light and elegant, but forms a separate part from the other portion of the work, and consequently must decay very soon; another fault is that, being thin iron, recourse must be had to riveting or brazing. To weld iron so thin to a larger substance would be a difficulty, if practicable at all. If iron-work is to last a long time, it must be welded together, or worked from the solid bar; then the leaves can be made sufficiently strong to last for a number of years.

The skill of the smith is displayed in uniting the parts of a piece of iron-work, so that the different leaves and other parts, when completed, form a whole, blending one with another. Then we get use, durability, and ornament combined. This the older smiths made their study, and it should be our aim, he rightly remarks, to excel them; in this class of work, the workman must not only be practical, but have a knowledge of design; we may find many a good smith in England, but, having no knowledge of drawing, he only destroys the good effect intended by the designer. The French have an advantage in this respect; the master of an apprentice is bound by law to give him two hours a day for education; and the class of schools formed for such have a peculiar advantage, inasmuch as the artisan is invited to bring specimens of work of whatever kind, and prizes are awarded, at certain times, to those that excel. In this respect the French, he feels, are far before the English.

Two special reports on the condition and habits of the French working classes, one by Robert Coningsby, the other by Richard Whiteing, occupy fifty pages, and contain much that is interesting and worth examination. It is curious to hear that most of the French workmen with whom Mr. Coningsby spoke, were of opinion that art and handicraft are declining among them. They said that the excessive division of labour had had a tendency to make men more like machines; and the constant breaking up of small workshops has had the effect of disheartening men from attentive study, because they see that, without an enormous capital, it will be impossible for them in the future to improve their position. He says he had heard something of the same sort at home, but, for his own part, believed that the most direct way of producing anything must be the best, and that compensations abound even in the matter of trade ambitions. "If a young man sees the extinction of his hopes in one direction, he will most likely be encouraged by the sight of chances in another."

Mr. Whiteing says that the French workmen do not avail themselves of the means of technical education in the same proportion as they did five-and-twenty or thirty years ago. It is an undoubted fact, testified to by the complaints of all large French manufacturers, that though in numbers the attendance at the various schools is perhaps as great as it has ever been, yet, in proportion to the increase of population, it is smaller than in former years. The reason, as gathered from the testimony of men, seems to be that the work exacted during the day is now so much harder than in former times, that there is no energy left for the evening-school studies. Whatever may have been the alterations—and they are but few—made in the hours, the *rate* of labour has gone on steadily increasing. "More work is now demanded of a man in a given time, and when that work is done, body and mind are so fatigued that relaxation is sought in the *café*, or at the theatre, and none but the most active intellects have the energy for the additional labours of the school."

The reports by the Birmingham artisans are pithy and pregnant, and we can give particular praise to one that ends the volume, that "On Design," by Frank J. Jackson, designer and art-teacher, who sees in the apathy of the British public one great reason for our slow progress in individual art. The general public must be educated in art by familiarizing them with artistic works and an improved street architecture. Museums will have to be multiplied, and every town of any manufacturing importance must have its store-house of art treasures, from which the student and art-workman may gain inspiration. Lastly, he thinks, our schools of art will need re-modelling, and will require

energetic support to relieve them from the half-starved condition in which too many of them are, so that they may be prevented from sinking into mere drawing academies, which is the present tendency, and become what they really should be—schools for the promotion of industrial designs. If this question of decorative art is taken up in the spirit it demands, success will be ours. We believe that if energy be brought to bear upon design as it is in developing the processes of manufacture, we shall yet have a school of art second to none, inasmuch as our national love for the substantial and for correctness of construction will ever prove to us safeguards against that vice of art—prettiness of effect gained by the sacrifice of truth, a vice which disfigures other schools whose good qualities we so much admire.

THE DWELLINGS OF THE LABOURING CLASSES.

The publication of a "revised and augmented edition" of the work by Mr. Henry Roberts, F.S.A., bearing the above title, being the sixth thousand, is of itself so conclusive an evidence of the growing interest in this all-important social question, as to call for some notice in these columns, which have been so often devoted to the furtherance of this object, even did not this new edition also contain a valuable contribution of new matter, dealing with the most recent efforts that have been made to supply the increasing want of suitable dwellings for the labouring classes.

Previous editions of this book have from time to time been noticed in these columns; but it may not be out of place to touch slightly upon a few of the more salient points in the crusade commenced more than twenty years ago against the apathy which permitted the unfit and inadequate housing of our labouring classes so long to remain a hot spot upon our social system. It is more than twenty-three years since the Society for Improving the Condition of the Labouring Classes, which had for its first object the improvement of their dwellings, commenced their labours. Mr. Roberts, now a vice-president of this society, was at first its honorary architect, and the essay which forms the basis of the work under notice was originally published seventeen years ago at the request of Lord Shaftesbury and other gentlemen distinguished for their interest in the social improvement of the labouring classes. The work which was thus begun so long ago has been steadily progressing; and, induced by the rapid growth of large towns, the increasing tendency to encroach upon and demolish portions of the larger cities for railway and warehouse purposes, and so-called improvements, without the erection of even a corresponding number of dwellings in other neighbourhoods, the crying evils of overcrowding have since increased rather than decreased. Apart from the efforts of associations and of private individuals which have recently been greatly multiplied, some measures of a legislative character have been adopted within a short period, which had been long urged in this journal and in other quarters. The most important of these has been the power given under the Act of 1866 to Government to grant loans upon the security of improved dwellings of the working people. Municipal and parish authorities have not at present availed themselves of this Government aid to any considerable extent; but it is to be hoped that the very vastness of the field of labour and the increasing urgency of the need of improvement, will lead to an important increase in the employment of national capital in furthering this object.

The first appendix in the volume before us gives a few of the incidents in the early stages of this important movement which are of general interest. The intimate relation known to exist between the fatality from various epidemics of cholera, typhus, and other zymotic disease, and the overcrowding of our poor in unsuitable dwellings, was one of the earliest means of directing public attention to this subject. The first cholera epidemic in London in 1832, and the wide-spread ravages of typhus in 1837, both of which were most severe in the East of London, led the Poor Law Board, in the latter year, to institute a searching inquiry into the social condition of the working-classes. A second report, published in 1839, threw further light upon the physical and moral degradation of the very classes that had most severely suffered from

those epidemics, and among other evidence it was shown that of 77,000 persons who had received out-door parochial relief in the twelve months ending 25th March, 1838, no less than 14,000 were the subjects of fever. Some of the most distinguished statesmen and philanthropists of the day, with a view to devising remedial measures, established the "Health of Towns Association" in 1839. A committee of the House of Commons followed in 1840; and the earnest exertions of Dr. Blomfield, then Bishop of London, in the House of Lords, led to an Act being passed through that House in 1841, which, however, in consequence of a prorogation of Parliament never reached the Commons. In 1842 the report of "an inquiry into the sanitary condition of the labouring population" was published; this report was alluded to by Lord Stanley in 1857 as the "text-book of sanitary research." In the same year (1842) a Royal Commission was appointed to inquire into the condition of large towns, which was especially directed to inquire "as to how far the condition of the poorer classes of the people, and the salubrity and safety of their dwellings, might be promoted by the amendment of laws, regulations, and usages." Successive reports were published by this Commission in 1844 and 1845, containing an immense mass of evidence conclusively tracing a vast amount of the excessive mortality and sickness in all large towns to the condition of the abodes of a large portion of the inhabitants. Beyond, however, serving the purpose of attracting public attention and interest at the time, no important legislative enactments immediately followed. Almost the only practical results of these official inquiries and reports were the establishment of two societies, having for their object the providing of a remedy for the great social evils arising from the state of the dwellings of the working classes. The earliest, in point of date, of these two societies, was the "Metropolitan Association for Improving the Dwellings of the Industrious Classes," which was founded in 1842, on the sound principle that the investment of capital in furthering its object should make a fair return upon the outlay; on no other principle can this important work ever be effected on anything like a scale commensurate with the necessity. The second society, not founded till 1844, was the one above alluded to, with which the author of the work before us has been so long officially connected; it was started under the immediate patronage of the Queen, with the late Prince Consort as president, and the Earl of Shaftesbury as chairman of the committee, which post he still occupies, in addition to the presidency to which he was elected on the death of the Prince Consort. This society, although two years the junior of the one previously mentioned, was the first to put its objects in practice, by commencing a range of model-houses in the first year of its existence; while the Metropolitan Association did not begin to build until its incorporation by Royal Charter in 1845. Of the labours of these two societies since their foundation to the present day, we shall say a word or two presently; we now pass on to subsequent events relating to the same object, the social and sanitary elevation of the working classes. The Public Health Act of 1848 was the first important legislative result of the different Parliamentary inquiries, followed by the Nuisances Removal and Disease Prevention Act of 1848 and 1849. The Public Health Act has been since frequently amended, and in 1853 the Local Government Act transferred the power of the General Board of Health to the Privy Council, to which was added a medical officer; this Act was further amended in 1860, and again in 1866 by the Sanitary Act, the last, and in many ways the most important of the various sanitary enactments, as it also dealt largely with the Nuisances Removal Act, not only enlarging the definition of nuisances, but considerably increasing the power of the local authorities in dealing with them. As early as 1851 power was given to all parishes and boroughs containing not less than 10,000 inhabitants either to build new houses, or to improve old ones, in order to provide better lodgings for the labouring classes, and also to raise money, and to defray necessary expenses out of the poor-rates, such houses being made as nearly as possible self-supporting. The "Common Lodging-houses Act," passed also in 1851, was in results second only in importance to the Public Health Act; but the almost impossibility of enforcing its clauses in all the town tenements let at low weekly rents to the working population, renders still further

legislation desirable, although the Act of 1851 has been finally amended by the Sanitary Act of 1866. A Bill, entitled "The Labourers' Dwellings Act," was passed in 1855 to facilitate the building of improved dwellings, and the formation of Joint Stock Companies for the same purpose, which has since been amended by more recent enactments, and extended in its operation to Scotland and Ireland. The last, although very far from the least important Act hearing directly upon the subject of labourers' dwellings, was the one of 1866, above alluded to, giving power to the Public Works Loan Commissioners to advance sums of money in furtherance of this object: by this manner the operation of the Act of 1851 was much facilitated. Still further power is thought desirable to enforce owners of unsanitary dwellings to improve their condition, to part with them to those who are able and willing to do so, or to shut them up; but the difficulty of adequately dealing with this question, without infringing too greatly upon the right of private ownership, appears to have hitherto baffled our legislators. In the conclusion of this Appendix the author bears evidence to the "lively interest and wide-spread influence which the example of the late Prince Consort had in promoting this important object."

The new portion of the work before us, which deals with results of the experimental building of Model Lodging-houses and dwellings, both from a sanitary and pecuniary point of view, is, perhaps, on the whole, the most important, as it must be upon a successful fulfilment of these two considerations, that hopes may fairly be founded that the public will be induced to interest any adequate amount of capital to such undertakings. First, as regards the sanitary and social result. As far as it is at present possible to derive reliable statistics of the mortality among the residents in the Improved Dwellings, it is confidently stated that the death-rate has been reduced from 25 per 1,000, the average of the metropolis and other large towns of England, to 17 per 1,000; a similar reduction in the mortality of that large class, for the benefit of which these efforts are particularly directed, would be the means of saving at least 50,000 lives per annum in all the large towns of England. Within ten years of the building of the first model houses—namely, in January, 1855—an official report was made upon the influence of these houses, and laid before Parliament. In this report, relating to buildings which for three years had averaged 450 tenants, congregated in the worst localities of London, and including an unusual proportion of children, it was stated that the mortality had been remarkably lower than in neighbouring tenements; that there had been an almost entire absence of epidemic disease; and moreover that during the cholera visitation of 1854 there had not been a single death from cholera or diarrhoea in any of the houses. A marked improvement in the cleanliness, propriety, and general moral bearing of the tenants was also reported by the superintendents of the different establishments. Since the date of these reports these benefits resulting from the improved dwellings have undoubtedly steadily increased; but it would tend greatly to increase the public interest and confidence in these undertakings if full statistics of the births and deaths in all such buildings, with the proportion of the latter resulting from epidemic diseases, could be made available.

Bearing upon the pecuniary result of the efforts of the two most important pioneer societies having for their object the improvement of labourers' dwellings, some interesting tables are given, which, after taking fully into consideration the difficulties in the way of the earlier ventures, which were more or less experimental, must be considered satisfactory. The Metropolitan Association has expended 94,000. (In round figures) in providing accommodation for nearly 450 families, and about 350 single men. In the year ending March, 1866, the net rental on the whole of this outlay was rather more than 4,000*l.*, sufficient for a dividend exceeding 4 per cent. per annum. The second society in date of establishment, that for Improving the Condition of the Labouring Classes, had up to the 31st December, 1865, expended rather more than 37,000*l.*, and during the year 1865 the net rental was 1,600*l.*, showing a return of nearly 4½ per cent. The Metropolitan Association has recently obtained a Government loan of 18,000*l.*, under the Labouring Classes' Dwelling-house Act of 1866, in order to carry out a project for building at Fenge; the London, Chatham, and Dover Railway having undertaken to carry

the workmen to and fro at a charge of 2s. per head per week. The same Association has undertaken to build and manage an extensive pile of model dwellings in Pimlico, near the new barracks, Chelsea Bridge-road: the Marquis of Westminster finds the capital at a low rate of interest.

Among the various individual efforts which have been made in the same direction as those of the two societies which first set the example, one of the most successful was the rebuilding of Cowley-street, Shadwell, by Mr. W. E. Hilliard, of Gray's-inn, on the general plan of the Prince Consort's Model Houses; these buildings accommodate 112 families, are always fully tenanted, and make a net return of between 6 per cent. and 7 per cent. upon the outlay. Five piles of improved family dwellings in Grosvenor-mews, Berkeley-square, erected by Mr. John Newson, a builder, at a cost of 13,200*l.*, make a return of 5½ per cent. on the outlay.

In the concluding portion of the appendix to the new edition of Mr. Roberts's work, some information is added relating to the employment of Mr. Peabody's princely gift to the city of London of 250,000*l.*, "to ameliorate the condition and augment the comfort of the poor." While leaving the utmost latitude to the trustees in whose names the money was invested, it was suggested by the magnificent donor, "to apply the fund, or a portion of it, in the construction of such improved dwellings for the poor, as may combine, in the utmost possible degree, the essentials of healthfulness, comfort, social enjoyment, and economy." Acting on this suggestion, the trustees determined at first to confine their operations to this special object, "the improvement of dwellings for the poor of the metropolis," and building sites for five different piles have been already purchased, situated respectively at Spitalfields, Islington, Shadwell, Chelsea, and Brompton. The three first blocks of buildings were opened previously to January, 1867, and accommodated more than 400 families: they were erected from the designs of Mr. H. Darbishire. In presenting to the trustees his second gift of 100,000*l.*, in order to enlarge the sphere of usefulness of the fund, power was given to purchase freehold sites in any locality within ten miles from the Royal Exchange, accessible by means of railways.

Mr. Roberts's "Dwellings of the Labouring Classes," as at present revised and enlarged, is a most valuable hand-book to all those interested in this important subject; whether the architect, builder, or the general public, from the support of which alone can be expected any rapid extension of the useful labours of existing associations or the establishment of new ones. The condition of labourers' dwellings, not in London alone, but even more especially in our large provincial towns, cries loudly for more capital to employ in their improvement. The object is national, philanthropic, and fortunately calls for no sacrifice; if the public will only show confidence and subscribe the necessary capital, the object will be attained, and dividends as large and as safe as from money in the Funds will be returned, if only ordinary caution be employed and full use made of past experience. A perusal of Mr. Roberts's book cannot fail to further the interests of the cause in which he and we have laboured for so many years.

THE DRAINAGE OF LAND.

It may be thought that drainage has been so fully discussed and written about that there is no need for anything more to be said on the subject, but old things pass away and all things become new; and the maxim made use of by the politician to his followers, "agitate, agitate, agitate," applies equally to all scientific improvements which require adoption for the purposes of every-day life. And while new generations of men are continually springing up requiring fresh information, old writings and sayings are becoming antiquated and forgotten, and require replacing with fresh thoughts and ideas.

In the following remarks it is not intended to advance anything new, but simply in as concise a form as possible to lay before the readers the theory and practice of the modern system of land drainage as collected from the writings of eminent agriculturists and drainage engineers; and the reports and evidence prepared for parliamentary committees, aided by a practical

knowledge of the subject gained by practice and experience.

Amongst the readers of this paper there may be many who, from the nature of their occupation, may have a thorough knowledge of the principles of the science of drainage, yet who may not have studied the question practically, and to whom these hints may prove acceptable. The architect, in designing a gentleman's mansion or large building for a public institution, may be called upon to give his advice in the laying out of the grounds, involving, as a first requisite, their drainage. The town surveyor has under his care, most probably, the corporate estates, and is often called upon to superintend the drainage of the same. He may have to lay out an undrained farm for sewage irrigation, or to design a public park or pleasure-ground, in both of which cases thorough drainage must be the first operation; and there may be even engineers who may be called upon to advise on questions of drainage, whose engagements may have taken them in other departments of their profession, and who may, therefore, profit by the practical experience of those more intimately acquainted with the subject.

The history of the modern system of drainage dates back only to a time within the memory of the present generation. Mr. Joseph Elkington, a Warwickshire farmer, about the end of the last century, acquired a very considerable reputation by the skill with which he drained wet and boggy land, and converted wastes into fruitful fields. So important was Mr. Elkington's practice considered, that one of the first acts of the then newly organized Board of Agriculture was to use their influence in obtaining from Parliament a grant to Mr. Elkington of the sum of 1,000*l.* as an inducement to him to make known his mode of drainage, and as his health at that time was precarious, and it being considered that there was a risk that the public might lose the benefit of the knowledge he had acquired by the experience of above thirty years, the Board resolved to send Mr. John Elkington, a surveyor, to visit, in company with Mr. Elkington, the principal drainages he was executing, and to learn from him the art and practice, and afterwards to write a full report on the same for the public information (Introduction to "Elkington's Mode of Draining Land," 1814). From this time drainage was no longer confined to the removal of water arising from springs, to which the merits of Mr. Elkington's system chiefly applied, but gradually extended itself to clays and other impervious soils. Mr. Smith of Deanston may be considered the first who reduced the practice to a system and showed the principles upon which its efficiency depends. Through the exertions of this advocate, ably followed by Mr. Parkes, thorough drainage has become a *science and art* in the efficient cultivation of all tenacious soils. In the early stages of the art, turfs, thorns, and straw were used to fill the bottom of the drains; then stones, either broken into small pieces, or laid in the shape of a triangle, or hollow cube; then tiles were used, made in various shapes, the most common being that of a horse-shoe, in some cases laid on a sole, in others without, till, finally, the cylindrical pipe was introduced, and is now universally used, in preference to any other make.

The art of drainage has passed through many stages. Experience has had to be purchased at great cost, but the general result can only be looked upon as one of national importance in the improvement of the climate, the health of the population, the facilities afforded for the use of improved machinery in working the land, and the consequent vast increase of produce.

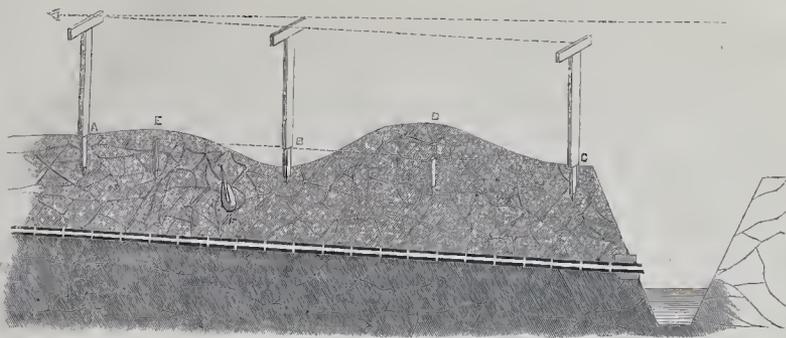

We shall first treat of—
The theory and practice of land drainage, as applied to single fields and small inclosures; and may afterwards speak of—

Arterial or outfall drainage, and the drainage of springs; and give,—

An analysis of the several enactments which have been made for the encouragement of drainage, and for giving greater facilities for procuring outfalls.

Drainage is an art, and only required in an artificial state of society, where the numbers of the population, as compared to the space on which they live, compel them to resort to art to extract from nature the supplies necessary to their existence. It has been remarked by a modern writer "that man's whole time is engaged in a constant struggle in submitting to his purposes the

* Kingsley, "The Roman and the Teuton."

THE DRAINAGE OF LAND.—Section.

laws of nature; and, although nature must be obeyed, she is to be conquered. All human invention is but the conquering of one natural law by another: thus, the first savage conquered the natural law which put wild heats in the forest by killing them; conquered the natural law which makes raw meat wholesome by cooking it; conquered the natural law which made weeds grow at his hut door by rooting them up, and planting corn instead; and his successor has conquered the natural law which saturates his fields with water to the detriment of these corn crops by removing the impediments which prevent this water from obeying nature's law of gravity, by which the water will leave his land and flow away to feed the brooks and rivers.

The man who refuses to acknowledge this law, and to become artificial with the times, and to profit by the genius of his fellow men; who is content to let nature be his lord and not his servant; who leaves his fields in the state in which nature presents them to him, and does not avail himself of the inventions of modern cultivation and drainage, must be content to be left behind in the race.

Air, moisture, and warmth are all absolutely necessary to vegetation. The use of the earth is, to act as the vehicle by means of which a supply of these can be kept up, the object of drainage being not to deprive land of moisture, but to regulate the supply; and while, with drawing the surplus moisture, to admit in its place an adequate supply of air, and so also to increase the temperature of the soil.

All soil consists of a number of particles more or less closely united together, according to its nature; but even in the most compact soils these particles do not form a solid mass, but between each there is a space, so small, indeed, as not to be seen without the assistance of a microscope, but still, sufficient for the admission of air. These small spaces are called pores, and they exist not only between the particles, but in the particles themselves, which consist of decomposed rocks and organic matter. To make this plainer, the above illustration is given, which is not intended to represent exactly the appearance the soil would present if magnified, but only to serve to illustrate the mechanical properties of the soil.

The shaded pieces are intended to represent the particles of which the soil consists, and the small dots in them the pores; the spaces between being the larger pores, which communicate freely with each other so that they form canals. Now, a soil is said to be wet when these interstitial spaces or canals are full of water: it is moist when only the small pores are full of water; and it is dry when both pores and canals are empty of water, and consequently filled with air. If a seed be placed in the ground as shown at F, and both the pores and canals are free from wet, it is evident it has plenty of air but no moisture; and if, on the other hand, both canals and pores are full of water, it has plenty of water and no air,—the two conditions of a very dry and a very wet soil. If the canals are empty of water, and the pores full, the seed is then supplied with both air and water, and is in a condition to undergo that chemical change which is called germination.

When water is first applied to a dry soil from

the rain, it sinks by the law of gravity to the lowest place it can find, flowing downwards through these canals. If the supply be moderate, the water is soon absorbed from the canals into the pores of the particles, the soil becomes moistened, and the canals refill with air. This is a healthy condition of soil. If, however, the rain continues after the pores are full, the water remains in the canals and the ground is completely saturated, and will so remain until the water either soaks away into the ditches or is evaporated by the sun and wind. This is the condition of undrained land, interfering most materially with the process of the germination and growth of vegetation. It is evident, therefore that, in a compact soil, where the interstitial spaces are small and the particles lie close together, it must be a very slow process for the water to find its way by gravitation to the ditches; and in winter, before one shower is thus disposed of, another follows, and the canals are never empty.

The object of drainage is by facilitating the discharge of this surplus water to such a depth from the surface, that while, on the one hand, it is removed so far from the roots of the plants as not injuriously to affect them, yet, on the other, not so deep as to retard, during the dry weather of the summer months, the supply of moisture which will arise from the substratum by the action of capillary attraction. To explain more fully: if the average quantity of rain that falls in a lowland district were to remain on the surface, it would cover it to a depth of 24 in.; but, instead of remaining, it either flows off, or soaks in, according to the texture and condition of the ground. The rain which falls in summer time is nearly all absorbed by the vegetation and the dry soil, or is evaporated, and little or none of it soaks through the ground, and is carried away by the drains to the ditches and outfalls, and provides the supplies that maintain the springs and rivers. Supposing that rain has been falling for some time, that the ground has become thoroughly moist, and that the pores of the particles in fig. 1 are full of water, the rain then percolates through the interstitial spaces, or canals, and, by the law of gravity, proceeds downwards, until its progress is arrested by some impermeable stratum, or soil already fully charged with water. It then accumulates, rising higher and higher, until it arrives at a line level with the drain pipes, beyond which it cannot rise, as obeying the law of gravity the water must flow along them in order to obtain a lower level. In fig. 1 a section is shown of a drain, the soil below being fully saturated with water, as shown by the shading, and above the pipes the canals being free from water. From this explanation it will be seen that it is a mistake to suppose that the water flows in at the top of the pipes. Such is never the case. The water always finds its way in at the sides or bottom. This can easily be proved by a very simple experiment with a common flower-pot, or other similar vessel, filled with soil, and having two holes bored in the sides, one near the top and the other near the bottom, and then after the soil has become well settled in the pot, gently watering it with a

watering-can. It will be found that the soil becomes saturated first at the bottom, the water flowing out freely from the lower hole, while none passes out by the upper, unless so much water is poured in that the lower hole becomes incapable of discharging it.

In properly drained ground, then, while the rains of winter leave the surface soil in a healthy moist condition, that below the drains becomes completely saturated, and this supply of moisture is gradually drawn up, by capillary attraction, to supply moisture to the pores of the upper soil, which had been absorbed by the roots of the plants or evaporated by the summer suns. It is unnecessary here to explain what capillary attraction is, but its action may be explained by the familiar illustration of a piece of lump sugar placed on a damp sponge; the moisture from the sponge quickly spreading itself throughout the pores of the sugar.

Thus it will be seen that, other considerations apart, drains should be laid sufficiently deep to remove the surplus water from the roots of the plants, yet not so deep as to retard the moisture from rising, when wanted, from the supply stored up in the stratum below the drains.

Drainage also acts mechanically on a tenacious soil, and assists in the discharge of the rainfall and the improvement of the texture of the ground by contracting it, and thus increasing the number and size of the larger pores, making more numerous crevices or canals. That this is the case may easily be proved by taking a roll of wet clay, 1 ft. in length, and drying it, when it will be found to shrink in length about half an inch, which, in a drain 100 ft. long, would be equal to increased spaces, which, if added together, would measure 4 ft. 2 in. The value of these crevices and contractions may be more fully realised by examining the appearance of two seeds of barley, the one of which has been sown in well-drained land and the other in a hard, cold soil. In the former case the rootlets are able to travel in all directions in search of food, and the plant is strong and healthy; in the latter, the delicate fibres of the roots are unable to force their way through the hard ground, and the plant, lacking nourishment, is stunted and unhealthy.

Air and Warmth.

Both these are absolutely necessary to the germination of seed and the growth of plants. The admission of air to the soil not only improves its texture, but also raises the temperature, and supplies nourishment to the roots of the plants. The difference between the surface and subsoil, is mainly due to the fact of the former being constantly brought in contact with the atmospheric air by ploughing and harrowing. This is exemplified on lands where steam cultivation and deep ploughing are in operation, the depth of the tilth, or workable soil, being equal to the depth at which the ground is stirred up. Jethro Tull, who is called the father of husbandry, had such strong faith in the advantage to be derived from the beneficial effects to the soil from the atmosphere, that he went the length of saying, that if the ground were only properly cultivated it would always be in a fit condition to support vegetation, without manure; and although this theory has not been supported

in practice, yet there is no doubt that a well-drained, and consequently a well-aerated soil, requires much less manure than one that is sodden with water. There are many mineral and organic substances in all soils which remain dormant, and useless to vegetation, until decomposed by the action of the atmosphere; there are also many salts which are unsatisfied by the water in the ground, but which, on exposure to the air, are immediately set free and dissolved, and carried to the roots of the plants. An excess of water will thus neutralize the chemical decomposition of the substances contained in the manure laid on the fields, and which largely supply food to vegetation. Now drainage is as useful in promoting the circulation of atmospheric air as in removing the superabundance of moisture; for if the canals shown in fig. 1 are emptied of water, it is evident that its place must be supplied with air; and as the effect of drainage is, by mechanically improving the texture of the soil, to increase the number of these crevices or canals, so it also increases the circulation of the air, which passes through the soil to the drains, and along them to their outlets, thus keeping up a constant supply of fresh air, so necessary to the healthy existence of plants as to that of human beings.

The subject of air drainage was very warmly advocated by the late Mr. Hutchinson, of Grant-ham, who advised the tenants on Lord Brownlow's estate, to whom he was agent, to lay out their drains with as much regard to the air as the water. To prove the advantage, he tried several experiments, one of which was on a field at Marnham, near Newark-on-Trent, which consisted of ten acres of strong loamy soil, upon a clay subsoil. The field was drained in 1843 with horse-shoe tiles, laid 2 ft. deep, and 5 yards apart. In the autumn of 1846, Mr. Hutchinson caused the field to be divided into four compartments, each containing five of the drains. The outside and centre compartments were not interfered

with: into the other two were introduced what Mr. Hutchinson called an "air-drain," that is, a drain laid across the upper part of the field, connecting the upper ends of the five drains in each case, the air-drain communicating with the open air at each end, thus establishing a natural current, or circulation of air, through the ordinary drains. The field was sown that year with turnips, followed by wheat. The turnips on the whole field were an indifferent crop, and were therefore condemned, as being too inferior to stand the winter. The produce of the turnips and wheat, in portions of nearly one acre each, of the several divisions, were carefully weighed, the result being as shown in the annexed table.

The quality of the wheat on the air-drained land was judged to be superior, by threepence per bushel, and the straw of a better and brighter description.

The conclusion Mr. Hutchinson drew from these experiments was, that land which has been insufficiently and imperfectly drained, as this field was, may be considerably improved by the system of air-drains he recommended.

Further to prove the important part that air plays in the development of vegetation, the following experiment is copied from Griffith's "Chemistry of the Seasons":—

"Two hundred pounds of earth were dried in an oven, and afterwards put into a large earthen vessel, the earth was then moistened with rainwater, and a willow tree, weighing 5 pounds, was placed therein. During the space of five years, the earth was carefully watered with rainwater. The willow grew and flourished, and to prevent the earth being mixed with fresh earth, or dried blown into it by the wind, it was covered with a metal plate, perforated with a great number of small holes suitable for the admission of air only. After growing in the earth for five years, the willow tree was removed, and found to weigh 109 pounds and 3 ounces: the leaves, which fell from the tree every autumn, were not included in this weight. The earth was then removed from the vessel, again dried in the oven, and afterwards weighed: it was discovered to have lost only about 2 ounces of its original weight; thus 104 pounds of lignum or woody fibre, bark, roots, &c., were certainly produced, but from what source but the air?"

ARCHEOLOGY v. ARCHITECTURE.

As Mr. Pugin is far from being the only person who cannot appreciate the difference between archeology and architecture, let me try if I can express my own view of it in a few words.

An archeologist is a man who, in making the design for a building, tries to imitate the form and details of some bygone age so exactly that it might, but for its newness, be mistaken for a work of an earlier period than that in which it was erected. The term applies equally to Egyptian, Classical, or Medieval reproductions. In many respects the portico of the British Museum is a worse example of archeology than the design for the Law Courts, because besides pretending to reproduce a dead style, it is one wholly unsuited to our climate. On the other hand, however, it may be urged, that as the classical styles attained to a higher and more intellectual development than the Medieval styles, they are therefore more suited to the refinement of the nineteenth century. As examples of archeology usurping the place of architecture, both are equally bad; though, owing to its superior refinement, a new style, based on the Classic, might be more suitable to our wants than one developed out of the Gothic style. Barry, in his design for the Parliament Houses, tried a compromise between the two. He adopted the symmetry and formality of a Classic, or, rather, of an Italian design, especially for his river front, and clothed it in a Gothic garb. Like most compromises, it was only partially successful. Many, no doubt, would, at the present day, prefer a building designed on Pugin's "Principles," with all its variety of light and shade and wild picturesque irregularity. It would, at least, have been more fashionable,

though less dignified and probably less permanently pleasing. The true solution of the difficulty would, probably, have been to throw archeology overboard and try architecture.

An architect I define to be a man who in designing a building thinks only of the purposes and age for and in which it is to be erected; who uses only those constructive means and forms which are best suited to his purposes; who groups the parts thus designed so as to form the most symmetrical and harmonious whole which the other exigencies of his building will admit of; and who then seeks to ornament the whole with the most elegant details he can design, and those best suited to express the purposes of the building on which he is employed; and all this without thinking of the past or any other climate.

Historically the distinction is easily marked out. Down to the end of the fifteenth century in Europe, and in many countries of the East to nearly the present time, archeology was unknown as a principle of design, and all the buildings erected before these periods are more or less successful as designs, many pre-eminently so.

Since the building of St. Peter's, at Rome, archeology has been the ruling principle, and consequently no building erected in Europe since that period is entirely successful. All are, more or less, failures, and are so, nearly in the proportion in which archeology supersedes architecture.

In other words, before the year 1500, architects thought and did not copy. Since then they have copied more than they have thought, and hence the very unsatisfactory state of the art since the period indicated.

* To be continued.

The only remaining question is, if we are to abandon the present system, what are we to do for the future? No man, or set of men, can at once invent a new style. It must be developed out of some previous form, and by a slow and gradual progress of growth. The question is, shall we plant the tree that is to bear our "style of the future" in a Classic or a Gothic soil? Bearing in mind that of the new style, to be worth anything it must be neither Classic nor Gothic: I for one would give my vote for the elegance of the first-named in preference to the picturesqueness of the latter. If we are only to continue to copy, my personal sentiment would be on the side of our national style. But my hope is, that we may yet see true and real architecture, properly so called, again clothing the land with beauty, and the battle of the styles relegated to oblivion as one of the strange aberrations of a bygone age. JAS. FERGUSON.

THE NEWSROOM BALLROOM, LIVERPOOL.

We make a brief allusion to the hall given by the corporation of Liverpool on the 9th inst. to the Princess Helena and her husband, Prince Christian, Prince Arthur, and the Princess Henrietta, simply that we may record the admirable effect of the Newsroom in the New Exchange built from the designs of Mr. T. H. Wyatt, who himself assisted in the arrangement of the decorations. The three drawing-rooms of the Town-hall were used as reception-rooms; the large and small ballrooms as drawing-rooms for the general company; and the small dining-room as a supper-room for the royal party. From the Queen's balcony, at the back of the town-hall, a communication had been established, by a temporary wooden corridor or bridge, with the Exchange Newsroom. This corridor was draped with fluted turlatan, green and white, bordered with flowers, adorned with mirrors, and brilliantly lighted. The floor of the rooms and corridors were carpeted with crimson cloth. By the corridor opening from the Queen's balcony the visitors as they arrived proceeded to the Newsroom, which had been prepared for dancing. The room and dome were flooded with light, which was reflected from the varied and polished marbles extensively employed in the walls. The architectural details of the interior were brought out with photographic minuteness. At the south side of the hall a dais, surmounted by a canopy of purple and gold, had been placed, with chairs of state. At the side of this dais were marble busts of the Queen and the late Prince Consort, with red velvet drapery at the back.

We gave a view, not very long ago, of the very noble room in which the ball took place, and our readers will be able to imagine for themselves the effect that was produced under the new circumstances by its size, fine proportions, and sculptured decorations. Mr. Wyatt has reason to be satisfied with the encomiums that have been bestowed on his work. The visit on Wednesday, as well as the ball on Thursday, appears to have been very satisfactory to the royal guests, and very creditable to the corporation. The Princess Helena, on leaving, said to the mayor, with expressive simplicity, "My Mother will be very much pleased to hear of this."

'ART IN ATHENS.

At the last meeting of the Institute of Architects the following communication was read by Professor Donaldson, being an extract from a letter from Signor Kantangioglou, architect, Athens, dated 26th December, 1867:—

I wish to give you some account of art at Athens, knowing the interest you take in the subject. After the fall of King Otho, art lost a great protector at Athens, and I was myself obliged to resign my appointment as Director of the School of Fine Arts, which is now in the hands of the military engineers. In revenge I was happily charged by the executors of a rich individual to execute my project for a school of the Fine Arts, called Polytechnic, at a cost of 80,000. Four years are passed since it was commenced. The sub-basement, all the columns, the cornices, windows, are of Pentelic marble. The plan of the edifice is divided into three separate blocks; three-fourths are now built, and I hope to cover it in in the course of the year. The

elevation has a length of about 330 ft., English; in fact, it is the largest building now constructing at Athens. Besides the Polytechnic School we are now erecting a Museum for Antiquities after the plan of a German architect, Professor Lange, of Munich. The expense will be met by a rich Greek at Petersburg, M. Tosigon, and a Candiot lady, Mme. Bernardachi. The works also of an Academy of Literature and Science will be soon resumed, after having been suspended for some time: it is being built by Hansen, at the expense of the rich Greek banker, Sina, of Vienna. The Archaeological Society have decided, with the money raised by means of a lottery, upon laying open the remains of the Temple of Apollo at Delphi, which, as you know, are covered by the houses of the village. But unfortunately the money acquired, amounting to 8,000*l.*, is not sufficient to buy up the village. Neither France nor England has yet taken part in this important matter. In the meantime I send you a leaf of laurel, which I plucked on the spot. The day before yesterday a representation took place in the Odeum of Herodes Atticus, of the *Antigone* of Sophocles. Thus, after so many centuries the Theatre of Herodes Atticus again vibrated with the accents of the universal poetry of Sophocles. The rail-road from Athens to Piræus, by an English contractor, is on the point of being commenced. Unfortunately, the line chosen for the station is not favourable either for the antiquities or commercial interests, having been injudiciously selected.

STREET IMPROVEMENTS IN LIVERPOOL: CROSSING A CHURCHYARD.

A SINGULAR arbitration case has been heard at St. George's Hall, Liverpool. The Corporation require 22 ft. of the frontage of St. Peter's parish churchyard for the purpose of widening Church-street. They propose to disinter the bodies and remove them to consecrated ground at either Anfield or Smithdown-road Cemeteries. The inscriptions on the gravestones have long since been obliterated. The Rector of Liverpool, on behalf of his successors, claims 18,000*l.* for the strip of land thus required, the sum originally asked being 26,000*l.* Witnesses on behalf of the Corporation were called to prove that even if used for building purposes the land could not bring more than 9,000*l.*, and their counsel argued that it could not be so used. An intimation was also given that it was intended to appeal to a higher court as to whether the Corporation can be made to pay anything, as they were the original granters of the land for the construction of the churchyard. For the Rector, Mr. Louis Hornblower estimated the value of the property at 40*l.* a yard, making a total of 18,600*l.* Mr. Thomas Wylie gave similar evidence. Mr. Peter Ellis valued the land at from 34*l.* to 35*l.* per square yard. Mr. John Evans, ironmonger, was called to prove that he had offered 45*l.* per square yard to the Corporation for land adjoining the present property, and that the Corporation had refused his offer. Mr. James Holme valued the land at 36*l.* per square yard. Mr. Henry Arthur Hunt estimated the cost at 30*l.* per yard; and Mr. George Pownall gave his estimate at 30*l.* On the part of the Corporation, Mr. Charles Edward McAnlay, C.E., London, said the strip of land to be taken would be useless for building purposes unless one-third of its depth were given to the public for a footpath. He valued the land at 35*l.* per square yard. Taking off 6 feet for a footpath, the value would be 8,995*l.* Mr. J. A. Pictou stated that he thought it was impossible to build on the strip of land in question unless a footpath were provided for the protection of the public. He valued the land at 30*l.* a square yard. Mr. Calshaw gave his valuation as at 34*l.* a square yard. He was also of opinion that one-third of the space should be converted into a footpath. Mr. Clifton, of London, gave similar evidence. The arbitrator, Mr. H. Hannsly, took time to consider his award.

ARCHITECTURAL HISTORY.—The Belgian Academy of Sciences and Arts offer a premium of 1,000 francs (40*l.*) for the best Inquiry respecting the period at which the Architecture in the Low Countries was affected by Italian influence, with indications of the persons to whom such influence is attributable, and citations of works in illustration of the same.

VENTILATION.

In referring to the necessity for floor ventilation in your very liberal notice of the little pamphlet I sent you, you say, "Opinions in these matters supported equally by large experience, strangely differ." I quite agree with you that this is the case; and I think to be so? Does not this strange difference show conclusively that there is a great want of accurate knowledge upon this subject, even among some of these men of large experience?

You refer to the very interesting communication of Dr. Templeton, printed in your issue of September 14, 1867, as illustrating that difference of opinion, compared with the opinions expressed in the pamphlets under discussion. You could scarcely have selected a better article to illustrate that difference. You appear by your approval to have some confidence in the arrangement there illustrated, and, from my own experience, I fully believe that nine-tenths of your readers would one year ago have accepted that illustration as entirely correct, and been quite willing to act upon it.

Yet I will endeavour to explain to you why I think the theories upon which the doctor has based his operations are entirely incorrect, and why I believe the practice is wrong altogether; and the reason for my thinking he has mistaken the results of his work which he supposes to have been so satisfactory.

If I had written a description of what was designed to be expressed by the first diagram on the sheet of lithographs sent you, I could scarcely have expressed it more clearly than your extract from Dr. Templeton's letter referring to the pond in the meadow. By reference to the diagram you can see the revolving motion around its centre caused by the friction of the passing current, and that some of the foul air of the room is being swept out by its becoming entangled in the passing current; and an equal portion of the pure air left in the room, by striking below the opening.

By taking two pieces of ordinary window-glass, and with a strip of rubber and clamps, or a frame of wood, making a little glass house as described in the lecture, with openings on opposite sides, both top and bottom, this whole subject can be illustrated in the most beautiful manner. With both openings at the top, and the stream of air and water (either can be used) flooring across as described, it will be noticed that it requires as much as twenty roomfuls to remove all the originally contained air by mere friction on the plan illustrated; but if by closing the upper outlet, and opening one on a level with the floor, it will be seen that the whole contained air will be removed by displacement, by the introduction of one-and-a-quarter or one-and-a-half times the quantity contained in the room.

The doctor makes no allusions to the variation of temperature or density; and yet this is of great importance, and will, on close investigation, be found to interfere very materially with his theory: for instance, if the external atmosphere should be twenty degrees lower than the room (which must often occur) it would, if allowed to enter in quantities sufficient to effect much good, come tumbling down in "those horrid descending blasts" so bitterly complained of in the barrack-rooms, even if partially protected by the draught-board shown.

But the doctor says this does not occur in practice with his arrangement. Why not? Let us see. 15 in. by 4 in. is the size given for the conduits; these are covered on the outside of the wall by an iron grating punched with $\frac{1}{2}$ -in. holes $\frac{3}{4}$ in. apart. This would admit of about 85 $\frac{1}{2}$ -in. holes, giving an area of about 17 square inches. This again is still more throttled by the zinc plate on the inside of the wall with only $\frac{1}{4}$ in. holes, which according to my experience, and I think the experience of the screens for the fresh-air ducts at the Houses of Parliament, would be almost entirely closed by dust in six months, and those horrid draughts would not occur, because not sufficient air would come in to cause them.

But the doctor says, "since then a most gratifying change has taken place, and this result, both novel and striking can be attributed to no other cause than the thorough ventilation of the above-mentioned rooms."

In each room on the plan is shown a fireplace, with the ordinary flue of 16 in. square would give an opening of 256 in., or $7\frac{1}{2}$ times as much as both of the conduits together. Is it not possible that the fire-boards were removed

without special notice? or the openings of an ordinary window a very small crack, the half of an inch only, would admit as much air as one of those conduits, even before being choked with dust. The habit of closing or leaving the door open into the hall might change the condition of the room probably one hundred times as much as the conduits, and the attention of the attendants being drawn to the subject of ventilation these other favourable conditions would be likely to occur.

I fully believe, if the rooms described were otherwise entirely tight, relying exclusively on the conduits, and were crowded, as were the barrack-rooms of the 95th regiment during the prevalence of the cholera in the East, so graphically described by the doctor, and the external air was warm and calm, as frequently occurs in summer, that the flames of the lantern, when placed below the level of the beds, would not only become small and red, but would soon be entirely extinguished, and the result of continual occupation would be but little more favourable than that of the "Blackhole of Calcutta."

It will be found on careful examination, that these openings do not work just according to theory all the time—probably not more than one day in ten; for instance, if the room was tight in the spring of the year, and the chimney was a little colder than the external atmosphere, both openings would be exits, and the air would enter by tumbling down the chimneys; and again, when the chimney was the hottest, the air would go out there, and both openings would be inlets. But you may say, what difference does it make, so that there is a change of air in the room? I agree with you that it does not make any; but then what becomes of our beautiful dynamic theory?

My opinions are not based on the supposed effect in a few isolated cases; but in the Quartermaster General's office in this city, are plans of the ventilation of hundreds of buildings, in which hundreds of thousands of men have been treated, and the effect of the ventilation watched most critically—because in the early part of the war, when it was proposed to introduce floor ventilation, there was scarcely one surgeon that at first agreed to such a radical innovation upon their long-established practice. It gained favour very rapidly, however, in opposition to their frequent formal protests, and by the pamphlet which is herewith sent you, in which has been printed a few of the letters received, you will see how heartily it is now endorsed by the most eminent sanitarians, and men of the most extensive practical experience, in this country.

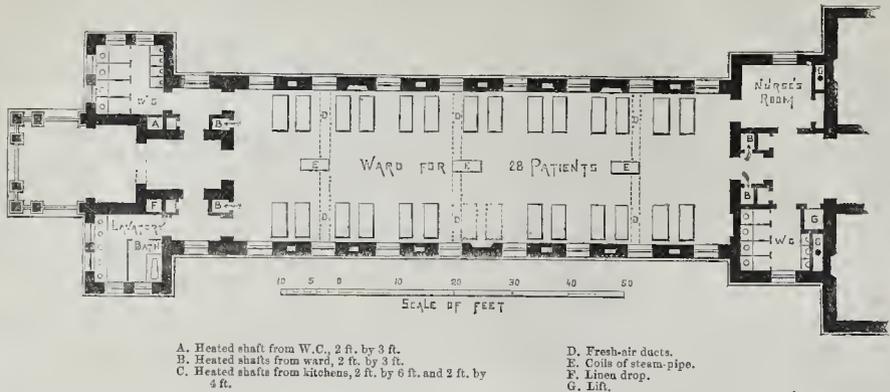

I consider all theories for the direct and uncontrolled introduction of fresh air into a house, incorrect. I am by no means certain, that if the inhabitants of London could have sufficient blankets and external fires to preserve a comfortable warmth, and every one of their present dwellings should be destroyed, so that they would have to live in the open air, that they would be more unhealthy: upon the contrary, I believe it would add greatly to their health and strength. Yet I am not willing to admit that it is impossible to build houses that may be made perfectly air-tight, when desired by the occupants, and in which may be maintained a uniform temperature, irrespective of the many sudden changes of the external atmosphere, and which shall be entirely comfortable and wholesome for the occupants: and we "builders" are the ones to teach the people how to do it.

Through the kindness of Mr. A. B. Mallett, Supervising Architect of the Treasury Department, I have been permitted to make a sketch of a ward of the Marine Hospital now being erected by the department at Chicago, Illinois, which I enclose.

The four heated shafts (two at each end of the ward) apply equally to the three wards, one in each story. The area of the four flues being 24 ft., would give 8-ft. for each ward. In addition to this, there are ventilating flues in the exterior walls, one for each two beds; these flues are each 5 in. by 16 in., and a separate one for each story. There are fourteen of these flues from each story, each ward being designed for 28 beds: this gives 2,944 square inches for permanent openings for exits for 28 beds—that is, while I have 105 in. to a bed, he has only $4\frac{1}{2}$ in. The openings into these flues at the floor will merely have light screens over them, as there is no necessity of closing them at any time.

There are three fireplaces shown in each ward, either or all of which may be used if necessary, or when not in use the beds will stand in front,

VENTILATION U.S. MARINE HOSPITAL, CHICAGO, ILLINOIS.

fireplace acting merely as a ventilating flue, heated flue in the water-closets acts as a ventilator for the closets only, in this case, as great care has been taken to isolate them from the wards by the vestibules and thorough cross draughts; but where they communicate directly with the ward, I fasten the sash in the closet, and put Venetian blinds in the communicating doors, so as to cause a constant draught from the wards into the closets. There is no direct opening into the shaft from the room, but it is drawn down around the seats to below the floor in each story; the ceiling of the story below being fired down 3 ft. (leaving the ceiling in the water-closet 11 ft., the wards being 14 ft.), and from this space the opening is made into the heated shaft.

These shafts will be heated by a steam coil at the bottom, not at the top, of each one, and are designed for summer ventilation also, as we believe this is a much better application of power for forced ventilation than is made by the use of the fan.

Now if these exhaust shafts were permitted to act freely in exhausting the air, and if fresh air to supply the place thereof was permitted to snok in at window cracks, and flow unwarmed across the room to the heaters, the cold draughts over the feet and backs of those sitting near the windows would be unbearable, and the system would be condemned at once. To avoid such a calamity, all the air is conducted between the joists in each story, through the centre to the top of the steam coil, and all obliged to enter the room through it, and be partially warmed by steam in winter and cooled by ice-water in the pipes or ice in the evaporating pans in summer, if desired. These openings will be about five square feet to each coil, the outer rows of pipes being left entirely exposed for direct radiation into the rooms. I decidedly prefer having the coils for heating in the rooms, instead of in chambers in the cellar, because it is absolutely necessary to have some direct radiation to make a comfortable room; for even when the air is heated by pipes filled with warm water, if it is all made warmer than the required temperature of the room, it causes a languid, debilitating feeling. The most perfect arrangement is to have walls, ceiling, floor, and all solid bodies in the room heated to about 98°, the temperature of the body, and then the fresh air may be 50° or 55°. My office is thus heated before entering in the morning. The gas-burners will be placed in front of the flues, with a special opening directly above them for their exclusive ventilation.

And now you may ask—Where is your provision for flue ventilation from the ceiling? My answer is—I have made none. You say I am "quite right in urging the value of the open fireplace; but this must by no means be taken to mean that exits for foul air in the upper part of apartments are not absolutely required."

Do you find in those lectures any want of earnestness or vigour in urging that every window should be made to lower from the top for summer ventilation, or whenever the room is warm enough to admit of it?

Now as this upper ventilation must be regulated according to the temperature of the room, what means have we that can be so easily understood by every one, and that will be likely to be used judiciously and whenever necessary as lowering a window or opening a door? In connexion with the window ventilation, the Venetian blinds, so common with us, which direct the inflowing current toward the ceiling, allowing it to fall gently and well diffused, are very useful.

I admit that there are times when ceiling ventilation through the heated flues would be desirable; yet with the exclusive ventilation in connexion with the gas-burners for carrying off immediately all products of combustion, the additional advantage to be gained by more openings, I fear would scarcely compensate for the harm resulting from their abuse. Less fuel will maintain a uniform and agreeable temperature in the lower and occupied portions of the room, even with this very liberal ventilation from the floor, than is often used where only one quarter the amount of air passes through the room, and ceiling ventilation only is relied upon.

I must really beg your pardon for troubling you with this very long communication, pleading as my excuse my extreme anxiety to convince the *Builder* of the correctness of my views, hoping to secure its strong and powerful influence in dispelling the strange difference of opinion upon this very important subject now existing among men of large experience.

Washington.

LEWIS W. LEEDS.

GATES, CASTLE ASHBY, NORTHAMPTON-SHIRE.

CASTLE ASHBY, our readers will little require to be reminded, is the fine old seat of the Comptons, in Northamptonshire. This family is one of the most ancient in the country, and has occupied from time immemorial large estates in Warwickshire, upon which the celebrated Sir William Compton, the friend and companion-at-arms of Henry VIII., built the beautiful old mansion of Compton Wynates, which has been recently, in a great measure, restored by the architect of the work which we now illustrate, Mr. Digby Wyatt.

The estate of Ashby was purchased with others by Sir William Compton from Richard, the third Earl of Kent.

Sir William's great-grandson, the second Lord Compton, married the daughter and heiress of Sir John Spenser, alderman of London, proverbially called "Rich Spenser," who was not only the owner of a vast real estate, including Canonbury House, Islington, and Crosby Hall, in

London, but who died possessed of an enormous personality, estimated at half a million sterling at least. There is no doubt that the existing mansion at Castle Ashby owes much of its splendour to the lavish outlay of funds derived from the "rich" Spenser.

The house is well known to architects, from the fact of its complete illustration in Robinson's sequel to the "Vitruvius Britannicus."

The mansion is of two periods, the older portion built in Queen Elizabeth's reign by Henry, first Baron Compton, consisting of a middle and two projecting wings, enclosing a square courtyard, and a facade containing a chapel, long gallery, and series of rooms subsequently added from designs by Inigo Jones, forming a fourth side to the square courtyard, which it now entirely encloses.

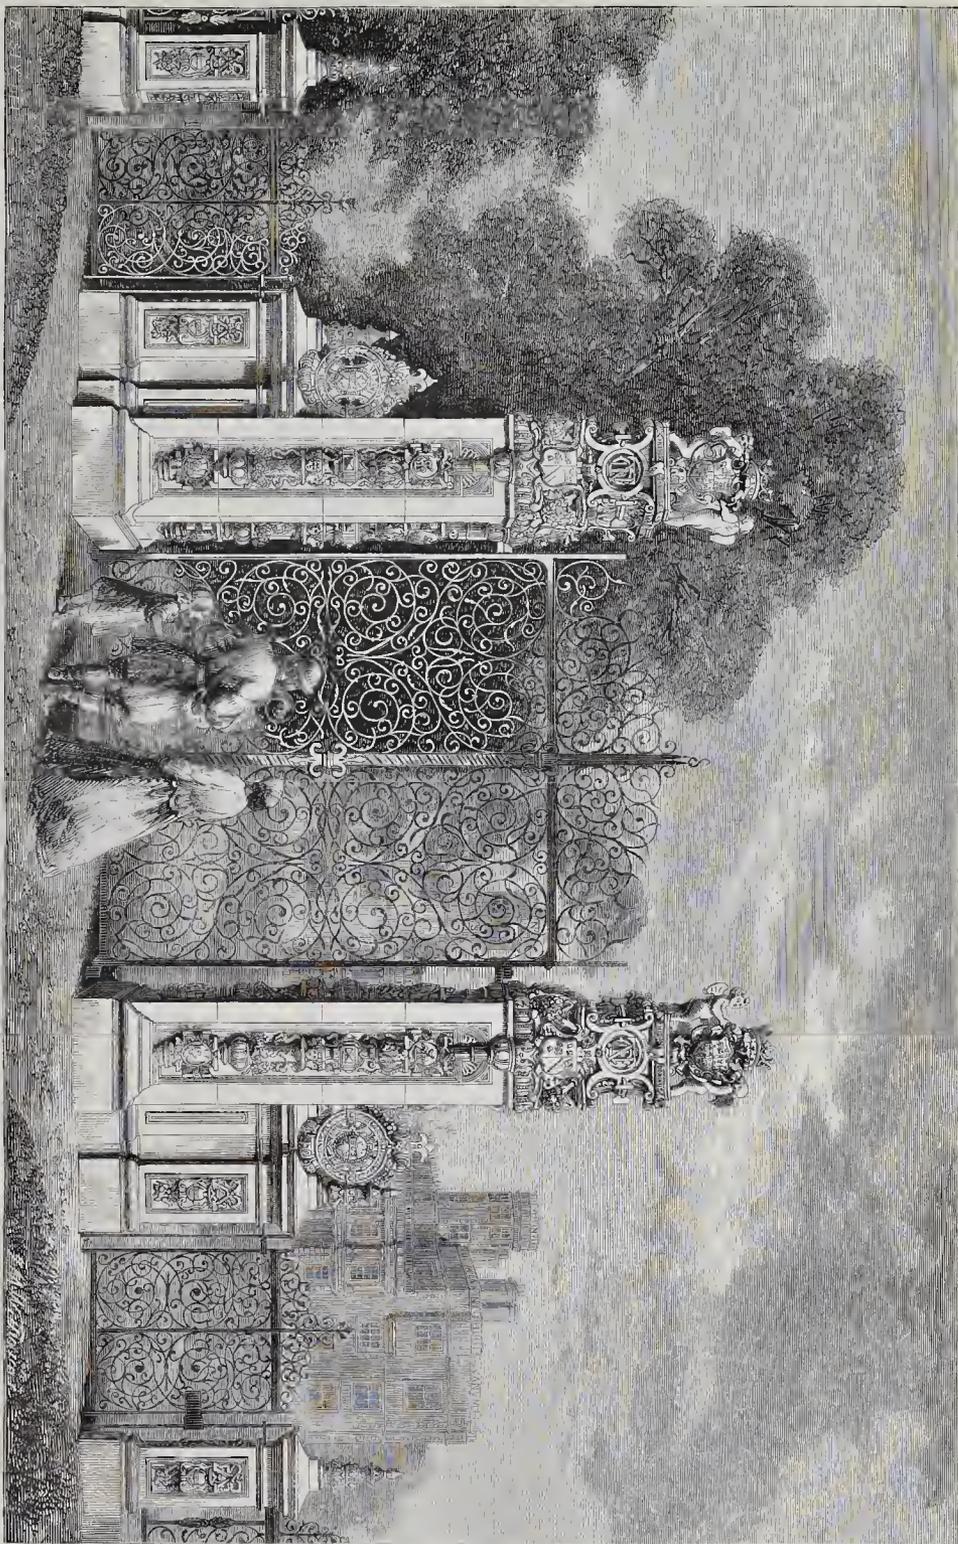

Some idea of the extent of this grand old building may be formed from the knowledge of the fact that it covers an area equal to about the square of 170 ft.

Until within the last few years the garden and approaches have not been worthy of the fine old structure; but now, thanks to the taste and liberality of the present Marquis of Northampton, a worthy Compton in his love for and proficiency in the arts, a fitting balance has been restored. Mr. Thomas has ably seconded his lordship's views as landscape gardener, and Mr. Wyatt, as architect. Under the latter and from his designs Mr. Blashfield has thoroughly vindicated a truth we are just beginning to fully realize, *videlicet*, the admirable capabilities for such works of the long comparatively neglected material, terra-cotta.

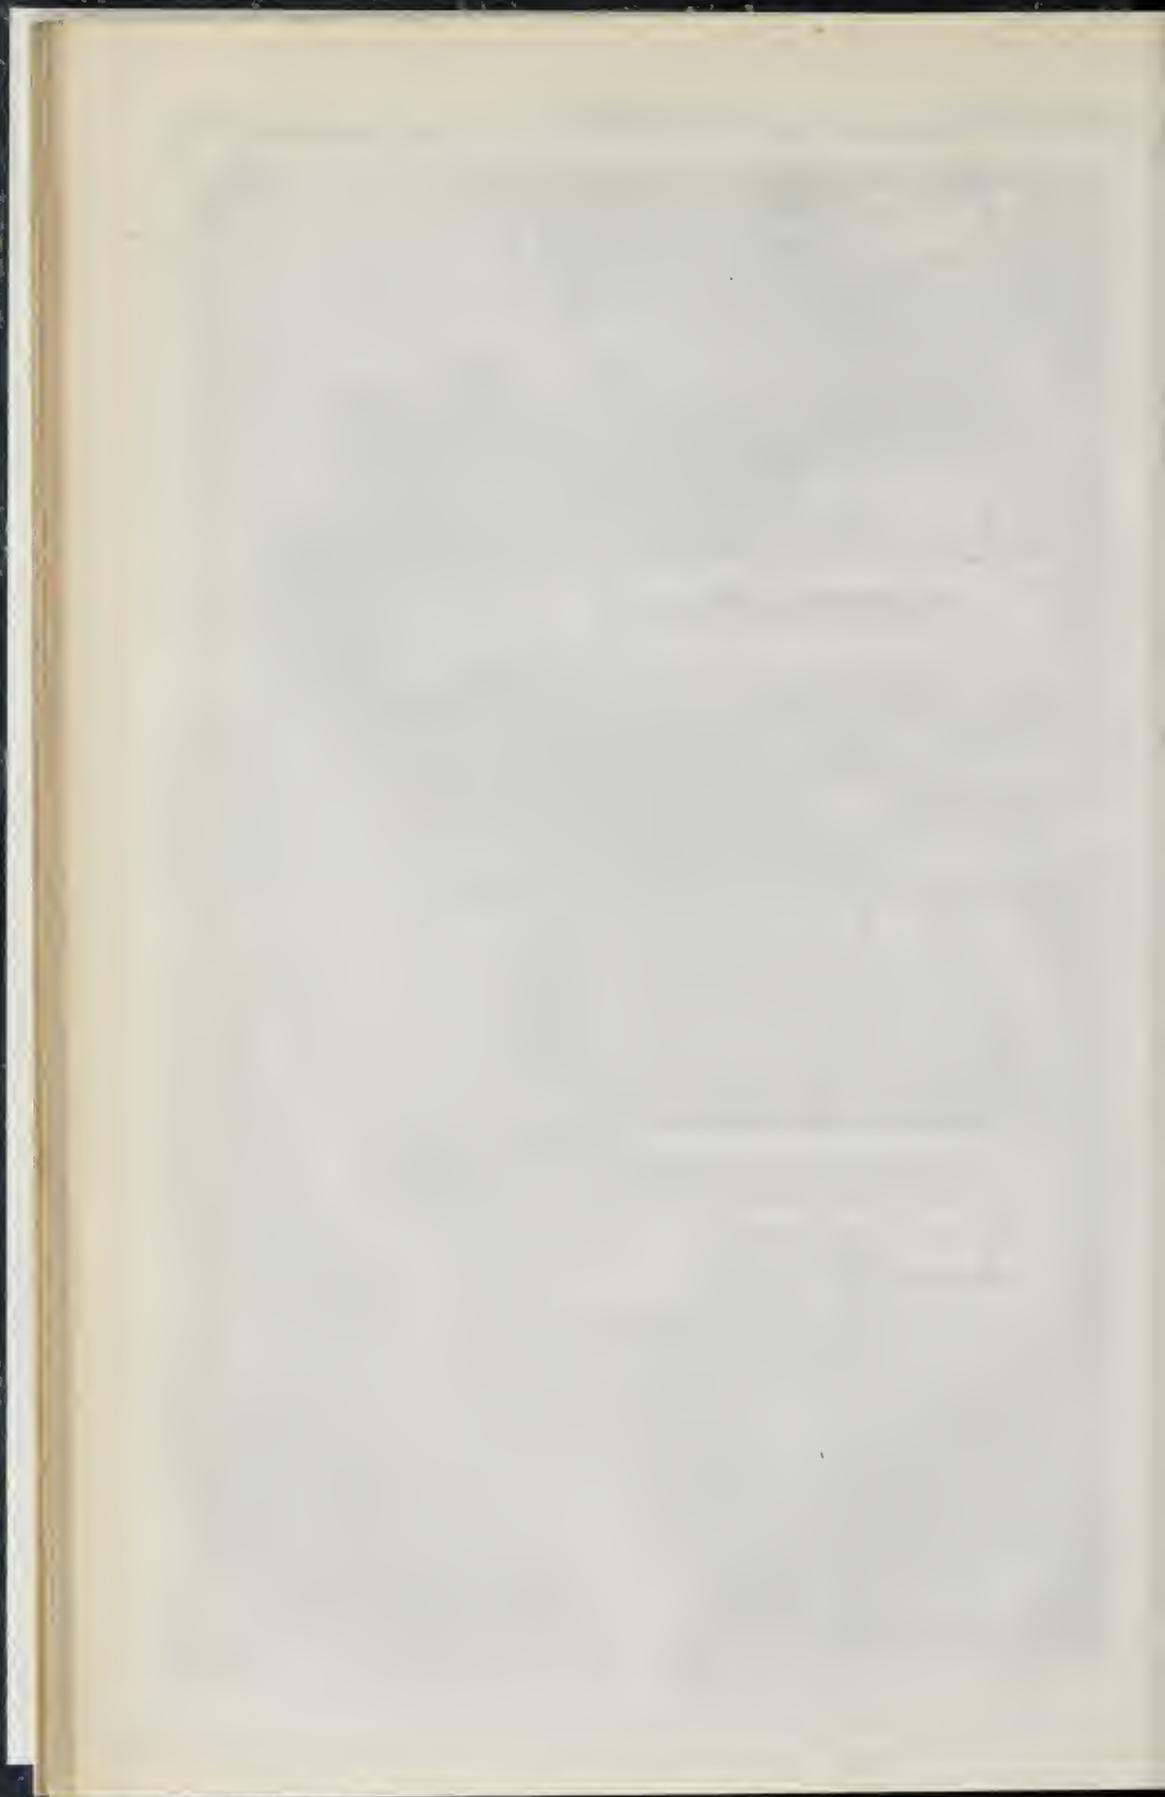

The grounds are now laid out in a series of terraces, inclosing sunk gardens at various levels, connected by flights of steps. Nothing can exceed the sharpness and artistic spirit with which the terra-cotta has brought out the mass of elaborate decoration displayed on the various pedestals, balustrades, bastions, and fountains.

These works are of great extent, and have occupied several years in erection. Their effect is greatly heightened by the masses of flowers arranged under Lord Northampton's personal direction in the most elegant patterns, and in a succession of contrasts of colour such as one might fancy a Persian alone could have elaborated in the all but fabulous gardens of the East.

Some time ago Lord Northampton purchased a number of fragments of ancient iron-work. These it fell to Mr. Wyatt's duty to combine and supplement, and, having done so, to design fitting piers to which they might be hung. In the first part of his task he called Mr. Potter, of South Molton-street, to his assistance, and in the last Mr. Blashfield. The result is before our readers, who can, however, form but an imperfect idea from our engraving of the effect the gates present as seen with the ancestral trees of the beautiful park surrounding the noble old mansion.

GATES, CASTLE ASHBY, NORTHAMPTONSHIRE.—MR. M. DIGBY WYAT, ARCHITECT.

BUILDING IN CONCRETE.

A special meeting of the Architectural Association was held on the 8th inst., at the House in Adnuit-street, for the purpose of resuming the discussion on concrete dwellings. Mr. R. Phadgers, who presided, observed that, accompanied by several members, he had a few days before visited East Sheen, to inspect a concrete house in course of construction there, from designs by J. B. Blomfield. Here the apparatus patented by Mr. Tall was seen at work, and the various methods of construction in concrete were examined, and afforded much satisfaction to the members.

Mr. J. D. Mathews (hon. secretary) observed that, in discussing the subject of concrete dwellings, it would be desirable to consider, not so much the material itself as the application of it to different buildings. Concrete had been used as a building material from the earliest times, and the ruins of the abbey at Reading showed very strong was the core, which, after the lapse of several centuries, was perfect, although the stones with which it was originally faced had been picked out. In our own day, too, concrete had been used in the construction of Dover harbour and breakwater; in works at Brighton and other places; and abundant evidence had been given that it could stand the assaults of both sea and weather. The strength of the material had been tested in that room on the 6th of December, when a small block of concrete, 3 ft. in length, 6 in. deep, and 4½ in. in thickness, had borne 100 cwt. without breaking. It seemed to him that the introduction of concrete as a building material was entirely a question of expense; for, unless it could be shown that the cost was much less than that of brickwork, considerable difficulty would have to be encountered in any attempt that might be made to substitute it for that material. Two essentials appeared to be necessary in dealing with concrete: the first, to put the foundations right (always an important consideration in every building, but especially so in concrete dwellings), and secondly, to see that the material was mixed in the proper proportions. He believed that both difficulties might be got over in the erection of new buildings were deputed to competent persons. Concrete floors, when practically made, were very desirable, but he confessed he would be afraid to trust to a cement or concrete roof. With regard to the architectural treatment of them, there were difficulties no doubt in the way; but he could not for a moment suppose that the architects of the United Kingdom would take account finally of dealing with a new material if it had solid advantages in other respects to recommend it. A concrete wall looked undoubtedly very rough, but in the country that drawback might be met by the introduction of creepers and other forms of vegetation, while in towns the surface might be ornamented by introducing horizontal and vertical lines, tiles, or possibly terra-cotta.

Mr. Blashill remarked, that as wood, brick, stone, and iron now entered so largely into the construction of buildings, there was no reason to suppose that a fifth material might not also with advantage be pressed into the service. He could not, however, ascertain, from the consideration which he had been able to give to the subject, that there would be so great a saving in the use of concrete as compared with brick as to warrant any general substitution of the former for the latter. He feared that the cost of the apparatus (which appeared to be considerable), would be a great drawback to its use, as builders would not like to add the machinery to their ordinary plant unless they saw a reasonable prospect of making it remunerative. The next difficulty which occurred to his mind would be to get competent workmen to carry out the instructions of the architect in reference to mixing the concrete, or unless this were properly attended to failure would be the result. This objection might, however, be got over if Mr. Tall were himself to supply the concrete, and contract with workmen to do the labour. He (Mr. Blashill) was satisfied that Mr. Tall could not construct concrete buildings at half the cost of brickwork, and this conclusion he had arrived at by the figures quoted by that gentleman himself. If, however, the materials were economically supplied and the materials mixed in the proper proportions, a considerable saving might be effected by the use of concrete. The concrete walls and floors might be dry and warm. This he did not dispute, but he could not agree with Mr. Tall that a solid wall was more impervious to sound than an ordinary one, as it was well known that in the

case of prison cells the inmates were able to communicate with each other by tapping the wall even though an empty cell might intervene. This proved that solid walls were conducive and not antagonistic to the transmission of sound.

Mr. Potter expressed himself generally favourable to the use of concrete, and asked a number of questions with the view of eliciting explanations. He had himself contemplated building some houses at Wimbledon of either brick or concrete, and he found that the estimates for the latter material were higher than for the former. He wished to obtain some reliable information as to the cost of the apparatus.

Mr. Tall said it was not to be presumed that a separate apparatus would have to be made for every house. The apparatus once made would build 100 six-roomed houses; so that its cost, divided over this whole, would be too insignificant to be appreciable. When people came to him and said they wanted to build only one or two concrete houses, his answer was, "Do not build with concrete; but if you want to build a number of houses, you will save the cost of the apparatus on the first two or three." He was prepared to say that in any clay country, with bricks even as low as 20s. per 1,000, he would build concrete houses at half the expense of brick. If, on the other hand, there was no clay, but gravel, stone chippings, clinkers, or any thing of that sort, he would undertake to crush the stuff and use it up with the concrete at much less cost than brickwork. If, however, brickwork could be done at 8s. a rod, he confessed himself beaten.

Mr. Blashill.—I am doing it myself now, in the West of England, at 7s. 10s. the rod.

Mr. Tall said if that were so he would undertake to put up concrete in the locality named for half what Mr. Blashill was paying. There was no portion of the country in which concrete buildings could not be put up; and, as an illustration, he might mention that a nobleman had written to him to say that he could not use it because he had not a yard of gravel on his estate. The reply he made was, "That is so; but you don't want gravel, for you have a material ten times better,—you have sandstone, which, if crushed, will make the best concrete in the world." All that was required to get the concrete was to have the proper machine to crush it; for there was no place so situated that suitable material could not be obtained within four or five miles of the building site. He contended that concrete properly prepared (and none other should be used) was not only stronger than brick, but would bear ten times the weight of brick, and ten times the pressure of wind. This was proved in the case of some houses built at Gravesend. While in course of construction, some bricklayers employed on some adjoining houses said to the men engaged on the concrete work, "Look out, or you will have your houses blown up by Windmill-hill." Strangely enough, a great storm blew that night, and so powerful was the wind that it blew the scaffold-planks off the concrete houses into an adjoining field, but the houses themselves were uninjured, while the brick houses in the neighbourhood were levelled to the ground.

A member pointed out that as the wood used in concrete dwellings would absorb moisture and eventually cause the concrete to crack, it might be desirable to set, in the first instance, patterns or moulds in iron, which could be removed when the concrete was set and wooden plugs introduced. Another speaker also pointed out the difficulty among unskilled labourers of getting the materials mixed in the proper proportions.

Mr. Tall replied, that if wooden joists were put in, and the interstices filled up with cement, the timber would swell, and the concrete would undoubtedly be cracked. This, however, could not occur if common mortar were used, and not cement. The suggestion made to introduce iron patterns in the first instance, was however a good one. The iron banding, in the shape of hoop-iron, 2 in. wide, was used merely to bear the weight of the joists until the concrete became hard. With regard to stone steps, they could be put in either on the splay or a simple riser and step. As for the proper admixture of the concrete, it was presumed that the foreman would be responsible for this. A foreman was necessary, whether the material used was brick or concrete, and he saw no reason why the foreman should not see to the matter with respect to concrete roofs. He had not patented them, but he would undertake to build cottages with such coverings no thicker than 2 in., and to warrant them waterproof for seven years.

Concrete roofs had not, he frankly admitted answered at Bexley, simply because at that time he had not had sufficient experience as to the mode of laying them. As for the exterior appearance of concrete, he did not consider that in small dwellings or cottages any architectural ornamentation was necessary; and in the case of the cottages built at Maidstone, for Mr. Whatman, M.P., that gentleman declined to have them stuccoed, although he did give them a coat of colour. In reply to a question, he said that he had carefully examined the concrete ruins at Reading, which he found to be composed simply of lime and gravel. There was, however, plenty of "packing" in it; and with regard to the latter, he was quite prepared to recommend 75 per cent. of "packing" to 25 per cent. of concrete. He repeated that it would not answer a builder's purpose to buy the apparatus for one or two houses; but that he was quite willing to take it back from any builder who might have built a dozen houses with it, at a reduction of 50 per cent. on the cost price. It was a mistake to suppose that skilled workmen were required to build concrete dwellings; any ordinary carpenter could fix the frame; and when once made level, it was absolutely impossible for it to go wrong. It would not even be necessary to plumb it. In the hands of a competent foreman, the work would go on with great rapidity; but in order to remove all objection on the score of want of experience by third parties, he was quite prepared, in all cases where the apparatus was purchased, to see the first two houses carried out.

The chairman observed, with reference to the absorption of water by a concrete wall, that in exposed situations it might be desirable to use stucco or tile, to prevent the penetration of a driving rain from the south-west. With regard to the hardness and solidity of the material, it struck him, as a drawback to the use of concrete, that it would be difficult, if not impossible, to make those subsequent alterations, which every architect knew that clients were always anxious to make, so long as they could be carried out without expense. When he saw the building at East Sheen, he was persuaded that some exterior ornamentation would be necessary, as not only was the concrete not all the same colour, but there were (so to speak) strata of unequal degrees of smoothness, some being rougher than others. He hoped, however, that in cases where stucco might be employed to improve the front, stone-joints would not be introduced, and that the system of covering the whole building with glazed tiles would not receive any countenance.

Mr. Tall said, that if the concrete was mixed in the proportion of one of cement to eight of other material, the absorption of rain would be impossible. With regard to the objection to the use of concrete, on the score that subsequent alterations would be difficult, if not impossible, a greater fallacy did not exist, as he would undertake to knock away a hole—say, to admit a door or window—in a concrete wall, in less time than a similar aperture could be made in brickwork. He would not cut away anything, but he would simply make a hole, and then the concrete would crumble away without difficulty.

THE TECHNICAL EDUCATION MOVEMENT.

The public are being awakened to the importance of this subject, which is being brought before them continually in addresses, speeches, reports, and letters.

Professor Leone Levi, of King's College, London, has delivered an address on the subject in the Chamber of Commerce, New Exchange, Bradford. The Council of the Chamber had given a general invitation to all interested in the question to hear the Professor. In the course of his address, Professor Levi said he had attended the International Statistical Congress at Florence, and had visited in Italy, Switzerland, Belgium, and Germany, those technical institutes which were so numerous, and which had been productive of such beneficial results on the Continent. He had been desired by the Privy Council to prepare a report on these institutions; that report had already been laid before Parliament by Lord Robert Montagu; and it was with a view of maturing this report, especially as regarded the suggestions contained in it, that he had asked the Chambers of Commerce to favour him with an interview for the purpose of consulting them on the subject. By technical instruction was meant instruction in the sciences

and arts which entered into the various industries carried on in different localities, and whether it was the science of chemistry, botany, or mineralogy that was adapted to the interests of the locality, that particular science was made the subject of study in the technical school there. Technical schools were not exactly industrial schools, because industrial schools implied the teaching of the industries themselves, whereas technical schools were particularly applied to instruction in the sciences which were technical or appropriate to various branches of industry. In considering the subject of education abroad it must be taken into account that elementary or primary education was much more extensive there than in this country; and, as he should show in his report, whereas in this country the state of education in the manufacturing districts was worse than the state of education in the country as a whole, in the manufacturing districts of France the state of education was considerably in advance of the state of education in France as a whole.

The peculiarity of the technical institutes was that they did not give instruction in several branches without any reference to one another, but they had courses of study extending over two or three years; and a student entered for the whole term, and had to follow the system established. He commenced at the commencement and ended at the end. It was not as in the mechanics' institutes in this country, where a student might enter for three months or so, and change about from one study to another; if he entered the technical school, he must go through the whole course of study. Then there were many museums, where lectures explanatory of the objects exhibited were delivered. These seemed to be the general appliances scattered extensively throughout the Continent for improving the instruction of all persons connected with industry; and there could be no doubt that, to a great extent, owing to these means and the circumstances already alluded to, foreign manufacturers had not only succeeded in meeting the necessities of the times, and in coming up to what had been done in this country, but that in many respects they had excelled us.

It had been suggested whether, in addition to the central university in London, there should not be similar institutions, say, in Lancashire, Yorkshire, Cornwall, or the agricultural districts; for if there were only one it would be inconvenient for the students from the country to attend in London. But it was quite evident that it was not sufficient to have institutions for teaching the teachers; there must be institutions for teaching workmen, foremen, and those who intended to be at the heads of workshops or in mercantile houses, which would, of course, be of a much more local character. These institutions would have to be established in agricultural, shipping, manufacturing, and industrial towns, in each of which there ought to be a school for teaching the sciences appropriate to the localities.

In order to form such institutions, he thought Chambers of Commerce and other public bodies might form themselves into committees to see what could be done. Of course he thought it extremely desirable that in such institutions there should be museums, libraries, laboratories, and workshops, with tools and instruments. He thought the more we could teach by the eye and the more extended we made the practical illustration of what was taught, the better it would be for the student. He did not think abstract science was what was wanted so much as science exhibited and expounded in its practical application to industrial pursuits. A free library should also be connected with the institution. As to museums, it would be desirable that they should be open at night, for many, unable to go in the daytime, would derive great advantage from being able to go in the evening. He thought the British Museum would be of tenfold utility and benefit to the community were it open in the evening. Then lectures, explanatory of the objects exhibited, should be given at these museums. The want of such lectures made the valuable exhibition of patents at South Kensington as a dead letter to the nation.

In conclusion, he remarked that the subject was altogether one of great importance, but it was one in which all parties could and should combine on a common platform. A question had arisen as to how technical schools should be supported. The opinion of some people was that there should be an educational rate,—of others, that grants should be given from the Consolidated Fund; but it seemed to him that action should be taken, in the first place, in the

large towns themselves. Much greater loss would be sustained in having a comparatively bad description of manufactures than would be sustained in the expenditure of a few thousand pounds in the establishment of schools for the training of our workmen. The matter was purely one of investment, and be trusted traders and manufacturers would look at it in this light. The Government, he had no doubt, was ready to assist if the people would take the initiative themselves. If Britain was to continue to maintain her industrial and manufacturing superiority, it would depend very much upon what was done to improve and extend the means necessary for advancement in science and art. We could not force people to take our manufactures unless they were at least equal in quality to what could be obtained from other countries.

The Council of the Birmingham Chamber of Commerce having received an application from the Government to furnish information on the subject of technical education, a meeting has been held at the Exchange there. Mr. George Dixon, M.P., presided. The chairman explained that the movement on the subject of technical education originated with the Associated Chambers of Commerce, who, at their meeting at Westminster, in November last, discussed the matter, and brought it under the notice of Lord Robert Montagu, the Vice-President of the Committee of Council on Education. His lordship desired to be informed—

1. What trades are now being injured by the want of a technical education?
2. How, and in what particulars, are they being injured?
3. How do other countries, from their greater attention to technical instruction, absorb our trade? (Give instances and, if possible, statistics.)
4. What plan of technical education would remedy the evil?

Mr. Mundella, president of the Nottingham Chamber, introduced the subject at the meeting of the Associated Chambers, and, on behalf of the Association, laid it before Lord Robert Montagu. Various gentlemen besides Mr. Mundella addressed the meeting, which was adjourned. There was a good attendance, and Mr. Samuelson, M.P., was present, at the adjourned meeting, and in his address said that his recent mission to inquire into the state of education, as applied to manufactures abroad, was not made by the authority of the Government, and was a private undertaking, in which he received what assistance the Government could give him. With respect to scientific education in Birmingham, he thought the shortest and easiest way was for the local manufacturers to support the Midland Institute. In the country generally, he thought the Government should assist all localities that, by the efforts they made, showed plainly that they desired scientific or technical education. It was evident, however, that the aid given to science schools was insufficient. Every child should be taught geography, and something of physics and drawing, the Government giving aid according to the results in these different departments of education. The following resolution was proposed:—

"That the Council be instructed to request the Associated Chambers of Commerce to inform Lord Robert Montagu, that in the opinion of the Chambers it is of the utmost importance that Government schools of science should be established in the great centres of industry, for the purpose of giving technical instruction to the middle and working classes."

After a long and animated discussion, the resolution was carried by a large majority.

A speech, partly on technical education, was delivered by Lord Edward Clinton in distributing the prizes at the Nottingham School of Art. His lordship said,—With reference to technical education, it had been stated with truth that we were losing ground in comparison with our foreign competitors. Belgium, France, Switzerland, and Germany were all going ahead of us,—though that was scarcely the right term, because we were not exactly standing still. We were making progress ourselves, but letting them go too fast. To his mind a good deal of this had been caused by the unfortunate strikes which had occurred in many trades, and the extent to which trades unionism had been carried. A very interesting letter on that subject had recently been published by Mr. Samuelson, M.P., which was addressed to the Vice-President of the Council of Education. Now it appeared to him (Lord Clinton) that the extent to which trades unions had been carried struck at the very root of this matter. The tendency was to crush all talent; everybody was to be put on a level; and therefore those who wished to rise were crushed, and could not rise at any

rate beyond mediocrity. Trades unions said the business of the employed was to look after their own interests, leaving the employers and the rest of society to look after theirs, and support themselves as best they could; that it was the interest of the masters to get labour at the lowest possible rate, and the interest of the servants to get the highest rate of wages they could. They looked at the masters as seeking the utmost profit they could get out of their capital, and that they must get the utmost profit for their own labour, and get as much as they could. These principles were given in the evidence before the Trades Unions Commission, and whilst such a feeling existed, he was afraid they would never surpass foreign countries. Mr. Samuelson referred to that. The noble lord then read an extract from Mr. Samuelson's letter, referring to the great importance of attending to foreign competition and the injury caused by strikes. He added that it was very satisfactory to know that the arbitration system had begun in Nottingham.

Mr. James Ford, the head master of the Macclesfield School of Art, is writing a series of instructive letters on technical education, especially abroad, in the columns of the *Macclesfield Courier*. These letters give a clear idea of the large amount of technical education and special training abroad, and especially in France. Even classical colleges are there being turned into technical schools; and, not yet satisfied, adds Mr. Ford, "the Emperor has just caused to be set on foot a most rigorous examination into the condition of professional institutions in France. May no revolution again occur to break the neck of such a profound system of consummate wisdom."

A minute has recently been passed by the Committee of the Privy Council on Education, on scientific instruction, wherein their lordships announce their resolution to assist artian classes by aiding local efforts to found scholarships and exhibitions. They will make grants of 5*l.* and 10*l.* towards each scholarship, and 25*l.* towards each local exhibition at some college or school for scientific instruction, under certain conditions as to local subscriptions and maintenance of the students, which are detailed in the minute.

An address on technical education was delivered by Mr. Baines, M.P., at the annual distribution of prizes in the Leeds School of Art. In the course of his address, Mr. Baines said he had that day received the report of Mr. Samuelson on technical education on the Continent, and in that report he was assured that there were things stated concerning Leeds which ought to make the inhabitants look about them. Leeds was in some branches of industry very eminent, but there were other branches which seemed to be neglected, so as to run in one groove, and to be incapable of improvement or extension, and especially so in the staple branch of the woollen manufacture; and he did not understand how they could allow Belgians, French, and Prussians to pass them and beat them hollow in their own staple manufacture. The suggestion that he would make was that first of all we should endeavour to perfect, as far as we could, all the present appliances for art and scientific education in Leeds. We had institutions and classes for teaching art and science to the great body of the mechanics and artisans of England, and they and the night schools, the classes for art and science instruction, ought to be perfected as far as possible, and we ought to make them infinitely more perfect than they are. That was one important matter in which they at Leeds were especially concerned; then we ought to have such schools and colleges for the imparting of technical education as existed in very great perfection on the Continent, and in which there should be professors in art and science, and connected with which there should be museums, models, laboratories, all apparatus, and all the means for carrying on every kind of instruction, and a gallery of art. These ought to be established in Yorkshire, Lancashire, Nottinghamshire, Warwickshire, Glasgow, and a college should be established in London upon the basis of the College of Science in Jermyn-street, London, the College of Chemistry in Oxford-street, and the South Kensington Museum. If these expedients were adopted, he believed he should be in the way to make satisfactory progress, and redeem the character we might have lost in regard to our industry, and put the industry of England upon a footing from which we could never afterwards be removed.

BUILDERS' PRICE BOOKS.

We have two before us for 1868, one "The Builder's and Contractor's Price Book," revised by G. R. Burnell (Lockwood); the other, "Atchley's New Builder's Price Book," by P. Atchley. If either had reached us alone, look at the mass of prices furnished, and the care evidently taken, we should probably have contented ourselves with recommending it as being the best of the kind. But we have now before us two, and we are led to pause before recommending either. Beginning with the Bricklayers' Price Book, we find, in Lockwood's publication, place-work put at 11l. 10s. per rod, and stock-work at 13l. per rod; while in Atchley's the same items stand at 13l. 13s. and 15l. 15s.; and if we rectify them as directed, to allow for extra price per thousand at which the bricks were calculated in the latter, 13l. 3s. and 15l. 3s. the charge allowed for a bricklayer in Lockwood's is 6d. per hour (6s. 8d. per day), and for the mason 5d. an hour; while in Atchley's the mason is put at 9d. an hour, and the bricklayer at 6d. In carpenter's work the differences are on the other side, Lockwood's book giving per foot cube for fir in round timber, walls, &c., 3s. 4d., and for fir wrought one side, 2s. 6d.; while in Atchley's these items are put respectively 2s. 6d. and 3s. 4d. Milled timber in the former is put at 30s. per cwt., and in the latter at 28s. For a painter, in Lockwood's, 6d. a day is allowed, while, according to Atchley's, 7s. 6d. may be charged; and, so far as material as putty is put down in the former at 3d. per lb., while the latter allows for it at 2d. For ordinary painting, Lockwood's has 10s. 3d., 2 oils, 6d.; 3 oils, 8d.; and 4 oils, 10s.; while in the other we have these priced at 11s. 7d., 10d., and 12d. We might carry this comparison much further with similar unsatisfactory results, but we have said quite enough to justify our hesitation.

LABOURERS' COTTAGES.

There have been lately erected in many parts of the country cottages for the labouring classes, and plans and particulars of which were designed by Mr. Birch, architect, to whom the Society of Arts awarded the Denton prize for the best design. Mr. Birch's plans have been approved of by the Inclosure Commissioners, and have been adopted in the erection of cottages for the Earl of Warwick, at Witham and Ringmer, in Sussex; Mr. J. H. Arkwright, in Herefordshire, for Mr. G. Calthorp in Surrey, for Earl Spencer in Buckinghamshire, Mr. S. Carter at Battle, and the Rev. C. Allington at St. Neot's, and others. The cottages include three bed-rooms, a living-room, and scullery, with offices and out-houses. The internal fixtures and fittings include stoves, ranges, ovens, washing-coppers, plate-rack, &c., with hard and soft water supply to a cottage. The walls are built of brick, the roofs being covered with plain tiles, with projecting eaves and gables. The cottages are estimated, and the average cost of their erection is about 250l. a pair. A group of four cottages, recently erected by the Salisbury and Yeovil Railway Company from Mr. Birch's plans, differed slightly in design from those mentioned—the bed-room being placed on the ground-floor. The total cost of this group was 610l.

The Liverpool Health Committee have recommended—"That the council be recommended to the sum of 100l. to Messrs. Redmond & Skelthorpe, for the plan of labourers' dwellings adopted by them, in consideration of their making complete drawings of them and supplying specifications to the satisfaction of the committee, and that the council be requested to erect dwellings on the site between Ashfield-street and Sylter-street." The mover of the resolution said he might remark that 5 per cent. was the usual amount in such cases, and if they got the plan and specifications for 100l. they would get on at one-fifth of the ordinary price, and the engineer's department would be saved a large amount of work. [Cool, certainly.] With regard to the plan not being strictly in accordance with the by-laws, he mentioned that under the authority of the council had a discretionary power, and in such a case a sufficient equivalent was given for the plan not being literally in compliance with the by-laws which would justify them in exercising

that discretion. The chairman said there were 146 houses proposed in the plan. A resolution recommending that the council be requested to erect labourers' dwellings on a site in Tallock-street, on plans prepared by Messrs. Culshaw & Summers, and presented to the committee, was postponed.

COMPETITIONS.

Bracebridge (Lincolnshire).—Schools being desired for this place three architects, Messrs. Bellamy & Hardy, Mr. Michael Drury, and Mr. William Watkins, were invited to compete for the arrangement of the buildings, and in accordance with the instructions issued the designs were sent in to the committee last week. Mr. Watkins sent one set of designs, with an alternative plan, and Messrs. Bellamy & Hardy and Mr. M. Drury two sets each. The committee selected those by Mr. Watkins as being most suited to their requirements. The design selected comprises a schoolroom, 31 ft. by 16 ft.; class-room, 12 ft. by 11 ft.; and a separate entrance for boys and girls. The master's residence is placed at the extremity of the land nearest Lincoln, and consists of recessed porch, entrance, and staircase, on the left-hand of which is a parlour, and on the right a kitchen; at the back of the staircase are placed the pantry and scullery.

Burton-on-Trent.—Several thousand pounds have already been raised towards the purchase of land and erection of buildings for an infirmary and dispensary at Burton-on-Trent. A site has been secured, and the building committee have selected the design of Mr. Edward Holmes, which was submitted in limited competition.

THE CROYDON WATERWORKS.

The new waterworks in Surrey-street have been thrown open for public inspection. The new Cornish engine, which was constructed and erected by the Kirkstall Forge Company, is of 90-horse power nominal. The beam connecting the piston with the plunger or pump weighs 27 tons, and the balance box 20 tons. They are of wrought-iron. The engine is worked with a surface condenser, and the steam, after having done its work, is conveyed intact back to the boilers, thus saving fuel. The piston has a working stroke of 10 ft. 6 in., and the diameter of the cylinder is 60 in., the diameter of the plunger being 2 ft. The engine is registered to work ten strokes per minute, but the speed is regulated to eight strokes, and these are correctly registered by a counter, patented by Messrs. J. Richmond & Sons, which indicates the number up to ten millions. Supposing the engine to be kept working day and night without intermission for one week, the number of strokes given will be 80,640, and as with each stroke 220 gallons of water are pumped, it would give a weekly supply of water equal to 17,740,800 gallons, or a daily supply of 2,534,400 gallons; but the estimate is, of course, a maximum one. An average daily supply of two million gallons is, however, afforded, and this ought to be more than sufficient for the requirements of the town, providing that no improper use is made of the water. The bright portions of the machinery are relieved with dark blue and red tints, which harmonize with the colored brickwork and decorations of the internal portions of the new engine-house. Since the new engine has been at work the water-level in the well, instead of falling, has risen 2 ft. higher than it was before.

ACCIDENTS.

EXPLOSIONS and theatre accidents seldom or never come single: there is generally a series of them. The last theatrical accident we have heard of was a lime-light explosion in the Royal Albert Theatre, Middlesborough, while the house was crowded. The report when the bags connected with the lime-light exploded, was like that of a cannon, and it produced great confusion, but no one was injured by the crash or escape, although two persons were somewhat injured by the explosion itself. The manager succeeded in restoring order, and announced that, for the future, he would use the magnesium light during the time light. Lighting holiday time an escape of gas accu-

mulated in the safe-room of the Hereford Branch of the National Provincial Bank of England, in Broad-street, Hereford; and the instant the room was opened an explosion took place and blew out the skylights in the roof of the building. A tap had been carelessly and imperfectly turned off.

Nackington Church has been injured by fire. Smoke was first noticed issuing from the roof where a fire was carried through, and the rafters were partially burnt, damage being done to the extent of 100l. to 150l. before the fire was got under. The overheating of the fire, as usual, on Sunday, was the cause of the fire.

In the Blackness-road, Dundee, at some houses in course of erection, a rafter, while being put in, loosened a stone, which fell upon the head of a mason below, who was polishing a stone. The skull was fractured, and the poor fellow died the same day.

About fifty persons have been killed while in transit by train from Cleveland, on the Lake Shore-road, to New York. Near Angola the two rear cars got off the line and fell down an embankment. Strange to say, it was chiefly by fire that the passengers were destroyed, the car containing them having taken fire, from the overturning of the stoves in them, and only two escaped, while others were wounded. It seems probable, however, that the charred remains spoken of were the bodies of those who were disabled from making their escape, at least, if not killed, before the fire affected them.

The roof of a house near the Fisherman's Inn, Liverpool, has fallen in. Three persons were in bed beneath the roof at the time, but were protected by the timbers. The block of buildings to which the fallen roof belonged is more than 100 years old, and is made on the old principle of a wooden framework filled in with bricks and stone. They are in an unsafe state generally.

At Swansea one of the railway arches near Pailley's quay has fallen into the quay: no one was injured.

THE DEATH-PLACE OF GIBBON.

SIR,—Your correspondent who signs with a star is under a wrong impression when he states that Gibbon died in Sussex. In December, 1793, he left London, to make what proved to be his last visit to Sheffield, the seat of his friend, Lord Sheffield; but, owing to a serious attack of illness, he returned to St. James's-street earlier than he had intended, and here he died January 16, 1794. His remains were removed from London and deposited in Lord Sheffield's mausoleum in Fletching Church, Sussex, on which is inscribed a Latin epitaph written by Dr. Parr. These facts, on the authority of Lord Sheffield, will be found in the first volume of Gibbon's Miscellaneous Works, where is also a copy of the epitaph. HENRY B. WHEATLEY.

THE CONDITION OF ARCHITECTURAL SCULPTURE.

SIR,—Any one with a true love and feeling for architecture cannot help feeling grieved, in walking through London, to find carving generally carried out in such an artistic manner, as is the case. I should much like to know how it is that carvers and architects do not work more hand-in-hand with each other, so that the employers of carvers should receive a thorough knowledge of the style and character of work to be done; and then for the art-workmen to have every opportunity in carrying it out: so that when the building is completed, it shall show how all employed have laboured and studied together in a meritorious work.

Surely there are men who, by propere encouragement and opportunity, could carry out these ideas, and I feel certain are grieved in not having that opportunity of studying a piece of work sufficiently, and time given to develop it into excellence; for it is a daily occurrence for carving to be done in one-half the time that is just and consistent. The carver is brought to feel that a certain work must be done in a certain time, and he naturally loses in such a case all other interest.

There seems to be a want of more confidence between architects and carvers; and, be it said, there is a class of carvers who feel deeply that for some reason or other they are not looked

upon as art-loving men, as a great many of them really are. Did they receive more confidence and encouragement from those from whom such is naturally expected, I feel certain of the results being much more satisfactory, and the condition of architectural sculpture more worthy. Sincerely thanking you, Mr. Editor, for your energy and ever-ready encouragement in this question, and all others tending towards advancement, I remain,

A WORKING CARVER.

THE ARCHITECT OF THE PARLIAMENT HOUSES.

SIR,—I am not at all concerned to defend Mr. Ferguson, who is fully able to take care of himself, nor to endorse either his criticisms or his inferences as to the New Palace.

But I would remark, that neither he nor any one else can give a verdict on the facts now at issue without hearing both sides of the case. If Mr. Pugin had acted on the suggestion of a reference of his statements to the Institute, all the evidence would have been long ago discussed and sifted. As it is, Mr. Murray will publish, in a very few days, a statement of facts, which I trust will be sufficient to set the question at rest. We shall leave the whole matter, in perfect confidence, to the judgment of the architectural profession and the public.

ALFRED BARRY.

TO HEAT A BATH.

I SEE in your last week's issue a "POOR VALETTINARIAN" inquiring the manner in which baths may be heated where it is inconvenient to have the ordinary and proper appliances.

The only method that I am aware of, and which is, I believe, the best, is to have a Gas Stove, of the ordinary size and shape, with a small boiler in the inside, the same to be connected with the bath by means of two pipes from the boiler, one from the upper end and the other from the lower end of it, both pipes going into the end of the bath. The water is then put into the bath and the gas lighted in the stove, and the water then freely circulates till hot enough for use.

If gas cannot be applied, have the stove made to contain a small grate for coals.

A PLUMBER.

SNOW AND THE SEWERS.

SEVERAL correspondents deny Mr. Phillips's right to any claim to priority in the suggested use of the sewers for the removal of snow. Thus Mr. Lovegrove, surveyor to the Hackney Board of Works, says that twenty-four days before the publication of Mr. Phillips's suggestion in our pages he employed the roadmen with their trucks, and the cartmen with their carts, to collect the snow from the several leading thoroughfares of Hackney, and had it shot down the side entrance shafts: thence the sewer-men shovelled the snow direct into the sewers.

"Several workmen were also instructed to pass along the sewers to observe the result, and it was found that each shaftwell was carried away by the stream and quickly dissolved.

Another thought has occurred to me to have a tank with an open furnace bottom and tank over it, so that the exposed fire beneath the tank should thaw the snow; the tank also to be filled with snow; then, as the snow in the tank is melted, the water could be drawn off into the channels or discharged down the nearest gully-hole."

Mr. Gadd, too, road surveyor, of Croydon, says,—

"Without having ever read or heard of the plan, I had a large quantity of snow cast into the main sewer in Brighton on the first heavy fall of snow last winter. The idea suggested itself to me from knowing the great warmth of the sewers, and it needed nothing to thaw it, for long before it had reached the next man-hole it had melted."

Another writer, E. J. Dudman, says,—

"On reading the article headed 'No Thoroughfare' in the *Builder* of January 12th last year, the thought occurred to me that, by using plenty of water to wash it away, the snow might be put down the street gullies by simply opening the gratings; and, on looking over the next number, January 19th, I there saw the idea made public by Mr. Phillips, only that he proposed to make special shafts; following which is a note to the effect that a communication had been received from Mr. Jennings also, proposing to use the sewers for the purpose, so that both ideas were made public at one time; but in the number for January 26th, a letter from Mr. Lovegrove appeared stating that he actually had put the plan into practical use on the Saturday following the snow storm (or January 6th), so that Mr. Phillips can neither claim entirely the original idea, nor of being the means of putting it into practical use."

HERNE BAY PIER.

FOR some years past this landing-place or jetty has been closed, and this former inconvenience pronounced shut to the general public, steamers no longer deposit passengers, and the whole wears an aspect of desolation and decay. Want of funds is the plea, but surely this difficulty might be overcome, and some contractor from the north, great in iron, led to put up a similar structure to the one at Margate, or replace the damage by wooden piling as before. The tolls and general undertaking might be assigned as security, and an amount raised by 15,000 shares giving free passage, so as to reimburse the necessary outlay.

PATLAIN.

AN ARCHITECT'S ACTION TO RECOVER PAYMENT FOR PLANS.

At the Manchester City Court of Record, in the case of *Waddington v. The Rev. Joseph Steinthal*, the plaintiff was an architect in Manchester, and the defendant the minister of the German church there. This was an action to recover 15*l.*, which the plaintiff alleged was due to him on account of work he had done in preparing plans, &c., of a church and schools which it was once the intention of the defendant to build in Park-street, Manchester. It was understood that plaintiff was to receive 5 per cent. commission on the cost of the buildings. In June last an interview took place between the parties, in course of which defendant stated, that owing to the German war, contributions which he expected were not forthcoming, in consequence of which he would be obliged to abandon the idea of building the church for some time to come. Plaintiff replied, that he would not press for payment of his commission if the erection of the church was postponed with a reasonable time. It had not yet been commenced. The defence was, that the plaintiff had not taken to supply the plans, on the understanding that if they were approved by the committee who had charge of the building arrangements, he would be paid a certain per centage; but in the event of their not being approved there was to be no charge made. The committee did not approve of the plan of the church, which they regarded as clumsy, and it was not finally approved. It was also urged for the defence, that the idea of building the church was not abandoned, but simply deferred, in consequence of the want of money. The jury returned a verdict for the defendant.

CHURCH-BUILDING NEWS.

Brentford.—The foundation-stone of the new church of St. Paul, Old Brentford, was laid on the 80th ult., by H.R.H. the Princess Mary of Teck, in the presence of the Prince of Teck, the Right Hon. Spencer Walpole, M.P., and the principal clergy and gentry of the neighbourhood. The Bishop of Tennessee was present, and took part in the ceremony. The new church consists of nave, north and south aisles, porch, chancel, chancel aisle (used as an organ-chamber), vestry, and tower and spire, at south-west angle, rising to a height of about 150 ft., and suitable for a good peal of bells. The total length of the church, internally, including chancel, is 118 ft., and the width, 58 ft. The chancel is 34 ft. 6 in. long, by 22 ft. wide. The nave is divided into five bays, the piers and arches being of Bath stone, with carved capitals. The material used for the exterior will be Kentish ragstone, with Bath-stone dressings; and for the interior, pale marbles, with coloured bricks in pattern. The roofs will be of Memel, hoarded and felted, and will be stained, but not varnished. The seats will be uniform throughout, and without doors, the majority being iron and unsapropriated. The chancel is arranged with stalls and desks, a credence-table, and other fittings, the altar being raised about 4 ft. above the level of the church. The east wall, should funds permit, will be decorated with a handsome reredos, in alabaster and coloured marbles. The works are being executed by Mr. T. Nye, of Ealing Green, builder, under the superintendance of the architects, Messrs. Francis, of Upper Bedford-place.

Mistley (Essex).—At a recent vestry meeting, convened for the purpose, the plans of an intended new church were submitted, when a subscription was set on foot, and sums exceeding altogether 2,600*l.*, were at once put down. The cost of the new building is estimated at 5,000*l.*, so that much still remains to be done; but it is fully anticipated that the amount required will be forthcoming.

Westhampton.—The parish church of Westhampton, near Chichester, has just been reopened for divine service, after restoration and enlargement. The whole cost of the restoration has been about 1,000*l.* Of this the chief share has fallen on the rector, and the Duke of Richmond, who has restored the chancel and rebuilt the chancel-arch; the rest of the expense has been defrayed by the incumbent and parishioners, with little extraneous aid. A new pavement has been laid down in the chancel; a stone reredos has been erected; a new aisle has been added; a gallery has been abolished, and open seats have been placed throughout the church.

Urmston.—St. Clement's Church, Urmston, the foundation-stone of which was laid in March of last year, has been consecrated by the Bishop of Manchester. It is picturesque situated in the country village of Urmston, distant about two miles from Stretford. On approaching the church from the latter place, the chancel-gable with its traceried three-lighted window, is seen standing out well among the trees. On the left appears part of the roof and the east window of the children's chapel; and on the right, the gable and three-lighted window of the vestry. The bell-turret springs up in the angle formed by the west wall of the vestry and the north wall of the nave, at the junction of nave and chancel. It contains a good sounding bell, by Mears, of London, and is capped by a six-sided slender-slatted spirelet, terminating with a movable gilt vane. The church is built in the Geometrical Decorated style. The external walls are faced with stone, three colours being employed for variety and relief. The roof is covered with slates in two colours. Accommodation is provided for 360 persons, with an arrangement for a future north aisle to hold 200 more. The plan, as now carried out, consists of a chancel, with the usual provision for seating a choir; a south chancel-aisle, devoted to the use of the school children; and a north chancel-aisle to serve as organ-chamber and vestry. The body of the church, comprising a nave and south aisle, divided from each other by an arcade of four arches, resting on pillars, with moulded and floriated capitals, increasing in richness of carving as they approach the east end. In the easternmost capital are introduced the evangelistic symbols. The main entrance is through the north porch. The reredos is of Can stone, relieved with marble. It occupies the whole space between the Lord's table and the east window. The rest of the eastern wall of the chancel, and some other parts of the church, are decorated in colour with various devices and symbols. This work, as well as the reredos, is given by Mr. Joseph Deakin. There are three large windows on the north side,—one of three and two of two lights; one gabled clearestory window on the south side, and three tall windows in the west gable, the centre one being of two lights, flanked by a single light on each side. The windows are all traceried, and of different designs; repetition, either in the general elevations or in the details of the different parts, having been avoided. The tracery in the tracery of the windows has all been drawn out to suit the various forms of the stonework. The chancel fittings were originally intended to be in red deal, but Mr. J. E. Cockrell (a non-parishioner) offered to bear the extra cost of oak, and also of additional ornamentation. This will amount to upwards of 50*l.* The heating apparatus is by Messrs. G. Blake & Co., of Coventry, and is contained in the basement. The warm air passes into the chancel by gratings in the floor. Messrs. G. Blake & Co. have guaranteed the success and efficiency of their apparatus. The general contract was taken by Mr. M. Foggett, of Manchester, for 2,125*l.*, but there have also been employed,—for the font, reredos, and pulpit, Messrs. T. R. & E. Williams; for the gasfittings and lectern, Messrs. Thomson; for the carving of the pillars, &c., Mr. Green; for the coloured decoration, Mr. R. Park. All these have worked from the designs, and under the direction of the architect, Mr. J. Medland Taylor, of Manchester.

Dinnington (Yorkshire).—A new church is about to be erected in this village, replacing the present structure, which has no pretensions to beauty or antiquity. Mr. R. C. Sutton, of Nottingham, is the architect, and Mr. Canthorpe, of Retford, the builder.

Chesham (Ducks).—The church of Latimer, near Chesham, having become inadequate to the increasing requirements of the neighbourhood, has been enlarged and improved at the cost of the present Lord Chesham from the designs of Mr. G. G. Scott. The architectural pretensions of the original church were not of the highest order, but in its present condition it may fairly claim a higher place among the churches of the county. The improvements which have been effected consist in the addition of a north and south transept, a new chancel with an arcuated apsidal termination, a vestry, organ-chamber, chancel and sacristy arches, and an extension to the nave westward. The chancel and the sanctuary are paved with encaustic tiles. The windows in the apse are filled with memorial stained glass. The window of the south transept is filled with stained glass from the old east window. The chancel is fitted with new

als, and the nave and transepts with new open
ants, all of pitch pine, and polished. The heat-
y, performed by hot water. The local mate-
red brick, moulded where required, and with
h stone dressings, &c., has been used. The
orks have been carried out by the contractors,
Messrs. Fassnidge & Son, of Uxbridge. The
ifice has been re-opened.

Books Received.

FROM another bundle of almanacs for 1868
very interest, almost every Company, now
ublishes its almanack, we name "The Rail-
y, Banking, and Commercial Almanack"
ited by W. Page Smith), as containing a large
ount of information on economical and com-
ercial subjects.—"The Post Magazine Al-
manack" gives special information as to insur-
ce companies.—"Deane's Illustrated
almanack" has some pleasant chatty matter
ixed up with it.—"The Engineer's and
ntractor's Office Sheet and Engineering
almanack" is well adapted to its purpose.—
id we may say the same for "The Engineer's,
hitect's, and Contractor's Pocket-Book,"
ock-wood) but it chiefly addressed to engi-
ners.—Taylor & Son's "Northamptonshire
handbook and Almanack" is intended for that
ounty, and is noticeable for a sketch of "The
mpower Treason," and some particulars of
The Triangular Lodge at Rushton," long ago
ustrated in our pages.—"The Bombay Builder,
sider the head "Adjutor Memoria," gives refer-
nces to the page in which, in our own and other
emporary journals, papers or information
ertain subjects may be found. In the
umber for December there is an article on the
ombay Black-wood Furniture, mentioning with
egret the falling off apparent in the manufac-
ere. The specimens in the Paris Exhibition
ere purchased by the committee from the house
a private gentleman, the specimens obtainable
at the maker's being very inferior. Even what
as sent to Paris seemed to us very badly made,
and we are not surprised that the jury would
y nothing to it.

Miscellaneous.

THE ABYSSINIAN EXPEDITION.—Four locomo-
tives will be shortly at work in Abyssinia upon
the railway formed in connexion with the Eng-
lish expeditionary force now in that country.

A POLITICAL MONUMENT NEAR ROME.—The Pope
is erecting at Monte Rotondo a monument to the
military soldiers killed in that town and at
Monte Rotondo, and has entrusted the work to Count
Cespi gnani, one of the best architects in Rome.

THE ANCIENT CHURCH OF MONKWEARMOUTH.
We are told that the old tower of this well-
known interesting structure is in so bad a state
that it can scarcely be expected to remain up-
right longer, unless something be done to
strengthen and preserve it. The income is only
£500l. per annum. The Bishop of Durham, we
understand, inspected the church a few weeks
ago. Let us hope that he will institute some
improvement in its favour.

FREEHOLD GROUND-RENTS, LONDON.—The
ground-rents created in Garrick-street, Covent-
garden, by the Metropolitan Board of Works, were
sold by auction by Messrs. Foster, at the following
prices:—No. 1, Garrick-street, ground-rent 108l.,
sold for 2,700l.; Nos. 3 and 5, ditto, ground-rent
166l. 10s., sold for 1,220l.; No. 7, ditto, ground-
rent 20l., sold for 530l.; Nos. 9 and 11, ditto,
ground-rent 37l., sold for 960l.; Nos. 13 and 15,
ditto, ground-rent 90l., sold for 2,400l.; Garrick
street, ground-rent 289l., sold for 7,350l.; Nos. 19
and 21, Garrick-street, ground-rent 96l., sold for
2,440l.; No. 23, ditto, ground-rent 55l., sold for
1,460l.; No. 25, ditto, ground-rent 25l., sold for
440l., &c. Nos. 10 and 12, ground-rent 15l.,
sold for 450l.; No. 8, ditto, ground-rent 12l.,
sold for 400l.; No. 6, ditto, ground-rent 30l., sold
for 500l.; No. 4, ditto, ground-rent 45l., sold for
1,240l.; No. 2, ditto, ground-rent 12l., sold for
400l.; No. 3, Long-acre, ground-rent 40l., sold
for 1,070l. Also the following rack-rents:—No. 18,
New-street, Covent-garden, let at 180l., sold for
2,000l.; No. 63, St. Martin's-lane, let at 200l.,
sold for 4,000l.; Nos. 64, 65, and 66, ditto, let to
several tenants at 220l., sold for 4,000l.; total,
332,770l.

HONOUR TO SCIENCE.—We are glad to hear
that Wheatstone is knighted in testimony to the
value of his labours in telegraphy. Mr. Fox
Talbot should be made a baronet for his inven-
tions on which rest all that we now do in photo-
graphy.

FEVER AT TERLING.—The *Chelmsford Chronicle*
speaking of the fever prevailing at Terling,
says there have been 180 cases, and sixteen
deaths. Bad water is believed to be the
chief cause, and the privy Council have pressed
this upon the local authorities, but as yet without
avail.

THE ROYAL EXCHANGE CHIMES.—Messrs.
Moore, of Clerkenwell, write to us to say that the
clock and chimes of the Royal Exchange, which
have been in their hands for repairs, are now all
right again, and that the clock is going, chiming
the quarters, striking the hours, and playing a
tune at 9 a.m. and 9 p.m. each day.

AN ARCHITECT KNIGHT.—It is stated that the
honour of knighthood will be conferred by the
Lord Lieutenant on Mr. Charles Lanyon, M.P.
for Belfast, and President of the Royal Institute
of the Architects of Ireland. There will then be
three architects knights in Ireland, while the
architects of England have not a Sir amongst
them. We must call out, "Justice to England!"

"GAS SUPERSEDED."—An improved method of
lighting the streets, invented by Messrs. Tessie
dn Motay & Marechal, and one of their assist-
ants, has just been tested in Paris, and, it
is said, has proved successful. The light is
described as being intense. The mode of apply-
ing oxygen to the flame is the principal secret of
the process. A small cylinder of magnesium,
placed in the centre of a jet in combustion, be-
comes luminous, and produces sixty times as
much light as ordinary gas, or about 2l. 3s. 2d.
worth of light for 7d.; at least, it is said so.

INDUSTRIAL SCHOOLS FOR BIRMINGHAM.—At a
recent meeting of the Birmingham town council
the Mayor submitted a letter from Mr. T. C. S.
Kynnersley, stating that the magistrates of
Warwickshire had for some time been anxious
to establish an industrial school for the county,
but had not been able to agree to a site. At length
it was recommended that application should be
made to the town council of Birmingham, who
were understood to have a similar establishment
in contemplation, with a view to ascertain
whether they would be willing to admit boys
from the county, and also on what terms. The
letter was referred to the General Purposes
Committee, with power to appoint a deputation,
if necessary. The committee have ascertained
from the Rev. Sydney Turner, the Government
Inspector of Schools, that if properly and
economically managed, a school for forty boys
should cost, over and above the Government
allowance, not more than 208l. a year. The
committee recommended that 250l. be provided
for this purpose. The committee have been
authorised to take a lease of a farm, and to ap-
point officers and servants, and take the neces-
sary measures for the establishment of an in-
dustrial school.

"THE WHEEL OF LIFE."—A lively wheel, at
any rate, and very amusing. The notion is not
a new one. Every one has seen that a lighted
stick swung round quickly and continuously
produces the effect to the eye of a circle of fire,
one impression succeeding another so quickly on
the retina that they all remain there. There was
an optical illusion founded on this principle
exhibited at the Polytechnic Institution long ago,
but the Wheel of Life, as issued by the London
Stereoscopic and Photographic Company, is a new
and very satisfactory application of it. It consists
of a topless metal drum with thirteen upright
slits in it, having around its inner circumference
certain sketches of figures, and made to rotate
at a pin. The result is that the figures are
seen through the apertures in a remark-
able manner. Amongst the best of the dozen
strips of subjects already prepared are the
man jumping through a hoop, the acrobat
spinning a ball with his feet, and a little old
gentleman walking with his umbrella while
it is "raining pitchforks." Some of the subjects
are very comical when turned upside down, and
other combinations may be obtained by pitting
in two slides at a time; so that a great deal
of fun may be got out of this toy, and any particu-
larly clever gentleman who happens to be present
when it is shown may improve the occasion and
deliver a neat lecture on optics. New subjects
may, of course, be constantly supplied.

OPENING OF A CHURCH AT PAU.—A new
Russian church, built by the liberality of various
members of the Russian nobility, has just been
consecrated at Pau. Rev. Father Prilejoleff, of
Paris, officiated at the ceremony. The interior
is handsomely decorated. The paintings, on
cedar, on a gold ground, framed in the icono-
stasis, were executed by an artist of St. Peters-
burg.

TELEGRAMS.—The receiver of a telegram can-
not maintain an action for a mistake which has
caused him damage. The person who pays for
the transmission of a message is the only person
who has a right of action in case he is damaged
by the negligence of the company or its servants.
The Court of Queen's Bench thus held, in the
case of Playford v. The United Kingdom Electric
Telegraph Company, which was an action
brought by a person to whom a telegram had
been sent from one of the stations of the com-
pany, and who, in consequence of a mistake in
the transmission of it, was so misled that he was
damaged.

THE LONDON ASSOCIATION OF FOREMEN EN-
GINEERS.—The fifteenth annual meeting of mem-
bers of this society took place on the 4th inst., at
its rooms, Aldermanbury. The number of ordi-
nary and honorary members on the books is 163,
and the funds invested for all purposes amount to
1,264l. 10s. The president, Mr. Joseph Newton,
J.M. Mint, delivered an address. He reviewed
at much length the progress of mechanical en-
gineering at home and abroad during 1867, and
contrasted the educational machinery of the
Continent with that of this country. The com-
parison was not flattering to our national pride,
and it went to account for the superiority of
foreign workmen in certain branches of manu-
facturing industry over those of Great Britain.
The evil was patent, and the remedy should be
speedily applied. Comprehensive systems of
technical schools for each branch of science and
art must be established forthwith. Defective
legislation had impeded national progress, at all
events in regard to manufacturing industry, and
we had now to cure a disease which ought never
to have existed.

BATH OF THE ROMANS.—Excavations now being
made on the site of the old White Hart Hotel,
Bath, have opened up the basement of a large
building, and the continuation of the frieze of the
great Roman temple dedicated to Minerva, a
portion of which is preserved in the museum of
the Bath Literary and Scientific Institution.
The temple stood on the eastern side of the
great Pusey-road, running through the city from
north to south, and nearly midway between the
Porta Decumana, North Gate, and the Porta
Flumentana, South Gate, leading to the river.
Its front was towards the west, and consisted
of a portico supported by very large fluted columns
of the Corinthian order, crowned with rich
sculptured capitals. Behind this temple, towards
the east, stood the Roman baths, the foundations
of which were discovered in 1755, at the depth
of 20 ft. beneath the surface of the ground.
The recent excavations have laid bare a kind
of concrete pavement, leading to the inference that
there had been a large area of parade-ground
adjoining the temple. Other discoveries show
that the Roman Forum extended considerably
beyond the east end of the present abbey church-
yard.

NUISANCE FROM SMOKE, EFFLUVIA, OR NOISE.—
The Lord Chancellor has finally decided, on
appeal, the case of Crump v. Lambert. The
plaintiff was the owner of two houses at Wal-
sall, and he was the occupier of one of them.
The defendants were iron bedstead manufac-
turers, and had recently erected a factory on
land adjoining the plaintiff's property, where
they smelted iron for the purpose of their busi-
ness, and also employed a considerable number
of men in hammering iron bars. The plaintiff
alleged that the smoke and effluvia issuing from
the chimney of the manufactory, and the sound
proceeding therefrom, were a nuisance, and he
instituted this suit to restrain it. The Lord
Chancellor held (affirming the decision of the
Master of the Rolls) that nuisance arising from
smoke alone, unaccompanied by noise, or from
noise alone, or effluvia alone, might be the sub-
ject of substantial damages to a plaintiff in an
action at law; and that wherever a jury would
give substantial damages at law in respect of
any such cause of action, the Court of Chan-
cery would grant an injunction to restrain a
continuance of them. The injunction in this
case was, therefore, made perpetual.

GOOD NEWS FOR THE VERY POOR.—The guardians of the Holborn union have had "evidence laid before them," that married couples, with or without children, and widowers and widows with children, do not, as a rule, wish to become inmates of the workhouse, and frequently struggle on and on with insufficient allowance until their homes are entirely broken up by parting with their furniture and effects to maintain themselves. "The home when once broken up can rarely be renewed, and these persons of necessity then become inmates of the workhouse, and thus add greatly to the expense of the union." How often have we used these very words! The Board, therefore, have resolved that a more liberal system of outdoor relief shall be adopted according to the necessities of each case, and that an additional officer be appointed to inquire into and report on every case.

TENDERS.

For alterations and additions to Sylvan Lodge, Brighton, Mr. T. Simpson, architect. Quantities applied:—
 Jackson & Shaw £1,310 0 0
 Nightingale 4,203 0 0
 Anson & Newham 4,195 0 0
 Bruton 4,147 0 0
 Cheesman & Co. 3,850 0 0
 Steddy 3,697 0 0
 Chappell 3,687 0 0
 Sawyer 3,669 0 0
 Farr 3,490 0 0

For a new warehouse in rear of 21, Coventry street, Haymarket, for Messrs. Charles Lloyd & Son, Mr. W. P. Griffith, architect.
 Patman & Fotheringham £1,064 0 0
 Clemence 1,047 0 0
 Webb & Sons 895 0 0
 Macey 676 0 0
 Dunsdale (accepted) 626 0 0

For two houses, to be built at Dover, for Mr. S. Finnis, Quantities applied:—
 Page £3,367 0 0
 Datus 3,175 0 0
 Featherstone & Co. 2,879 0 0
 Adcock 2,862 35 0
 Cozens, Brothers 2,850 0 0
 Tunbridge 2,810 0 0
 Stiff & Co. (accepted) 2,750 0 0

For a house, offices, and conservatory near Ascot, for Mr. William Chapell, Mr. Alfred Smith, architect.—
 Longmire & Burge £2,983 0 0
 Lawrence 2,877 10 0
 Norris 2,718 0 0
 Patten (accepted) 2,650 0 0

For Leytonstone main drainage. Mr. John T. Bressay, surveyor to the Committee:—

We are compelled to decline putting out books and giving addresses.
 All statements of facts, lists of Tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

TO SUBSCRIBERS.

An INDEX and Title-page to Volume of last year, and a COLOURED TITLE-PAGE, can be had on application.

The TWENTY-FIFTH VOLUME of "THE BUILDER" (bound), for the year 1867, will shortly be published, price One Guinea.

CLOTH CASES for binding the Numbers are NOW READY, price Two Shillings and Nine-pence.

SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of Three Shillings and Sixpence each.

Advertisements cannot be received for the current week's issue later than THREE o'clock p.m., on THURSDAY.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

[ADVERTISEMENTS.]

CHURCH, TURRET, and STABLE CLOCKS.
 J. W. BENSON, having erected steam-pumps, and improved machinery for clock-making, at the Manufactory, Ludgate-hill, will be glad to furnish to clergymen, architects, and committees Estimates and Specifications of every description of Horological Machines, especially cathedral and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 25, Old Bond-street, and 33 & 34, Ludgate-hill, E.C. Established 1749.

BUENOS AYRES GOVERNMENT CERTIFICATE.—TRANSLATION. We, the undersigned, at the request of Messrs. Jas. G. Thompson & Co. certify that the IRON SAFES of Messrs. CHUBB & SONS, London, of which these gentlemen are agents, were exposed for several hours to the fire that took place in the offices of the National Government on the evening of the 26th inst.; that in our presence they were easily opened with their respective keys; that the moneys and important documents they contained were found in perfect order; and that these safes are now in use in the National Treasury Office.—(Signed) J. M. DRAGO (Treasurer of the National Government), JOSE TOMAS ROJO, JUAN M. ALVAREZ. A true copy—A. M. BELL.—Buenos Ayres, July 31, 1867. CHUBB & SONS, makers to the Queen and the Bank of England, 57, St. Paul's churchyard, London; 68, Cross-street, Manchester; 28, Lord-street, Liverpool; and Horsley-fields, Wolverhampton.

ADVERTISEMENTS.

NOW READY.
 Companion Volume to "The Grammar of Ornament," by OWEN JONES.
EXAMPLS OF CHINESE ORNAMENT. Selected from Objects of FOREIGN ART, AND WOVEN FABRICS, BY THE SOUTH KENSINGTON MUSEUM AND OTHER COLLECTIONS. BY OWEN JONES.
 Comprising One Hundred Elaborate Plates, Beautifully Illustrated in Gold and Colour, with Descriptive Letterpress, and a Notice on Chinese Ornament, forming altogether an entirely new and superb Text-book of Decorative Design, from types hitherto little known, and a valuable Aid towards the Success and Development of Ornamental Art.
 Small folio, handsomely bound crimson cloth, gilt edges. Price 41s.

From the *Observer* of the 27th. "Does persons who have been accustomed to look at the ordinary Chinese patterns that may be seen copied upon some of our China ware will be perfectly astonished at the appearance of such a book as this. Many of the designs are new, and some are of a walking amidst their blue and white and blue and white, and their specimens of the last and initiative art throughout the country. We may say at once, in our pride of observation, that we could not equal a half-dozen of these books like the Chinese in ornamental design; but Mr. Owen Jones has done quite enough to take down our national pride. . . . We have here no fewer than one hundred large-sized plates, executed in admirable style, taken from the most perfect specimens of the art of ornamentation. The volume is set up in decorative style, and is in all respects one of the most beautiful works we have ever met with. It is not only a splendid book to possess, but it is one that will be in our hands that must of necessity improve the art of design in this country in all branches."
 Although copied from china and porcelain ornaments, these designs are well adapted to numerous other articles, such as beds' dresses, perforating machines, and other articles, and, in fact, we may anticipate seeing, in a very short space of time, every species of ornamentation copied from this book of Mr. Owen Jones, who will doubtless feel pride in having, by his talented enterprise, introduced an entirely new and "celestial" order of design into this country.

Published by B. & T. CLIBBERT, 4, Cross-hill-buildings (back of the Bank of England), London, E.C.

In the press, New Engineering Work, demy 8vo. cloth, 29s. Subscribers, until Feb. 1, 1868.
ON WATERWORKS, SEWERAGE, IRRIGATION, TRAFFIC, SURVEYING, &c.—The Second Volume of Engineering Fieldwork.
 By W. DAVIS HASKELL, C.E.
 London: ARCHLEY & CO., Engineering Publishers.

GILWILL'S ARCHITECTURE. Illustrated with more than 1100 Wood Engravings, Revised, with Alterations and considerable Additions.
 By W. DAVIS HASKELL, Fellow of the Royal Institute of British Architects.
 Additional Illustrations and many new Wood Engravings by G. ORWITT; and more than 100 other Woodcuts.
 "We said when reviewing a previous edition of Gilwill's 'Engineering and Architecture' that it was one of the few books to which we always found what we looked for, and a longer experience of it does not lead us to withdraw the observation."
 Mr. Wm. Fairbairn has executed his task admirably and has ought to have a place in every library, and must find one in the library of every architect.—*Builder*.
 London: LONGMANS, GREEN, & CO. Paternoster-row.

The Builder.

VOL. XXVI.—No. 1303.

The Education of the Craftsman.

HE general problem of education, to employ the language of one of the most original thinkers of the present century, is to lead, in a few years, a single understanding of moderate capacity to the same stage of development which has been attained, during a long course of years, by the successive labours of a great number of men of genius, who have devoted their entire energy during their whole lives to the study of a single subject. Without attempting in any way

to discuss the subject of the positive philosophy of M. Comte, or to indicate how boldly this great thinker at times takes the well-known step which separates the sublime from the ridiculous, we think it impossible to read the above statement without admiration of its comprehensive truth.

The problem thus stated, regarded both in its most general aspect, and in its separate cases or subdivisions, is one that assumes at the present moment an importance which has never before been so distinctly recognized. Turn where we may, we find indications that the great task of 1868, and of its successors, consists in finding the solution of the above problem. To say that the human mind is becoming impatient of empiricism is perhaps to mistake partial for general symptoms. But it can scarcely be denied that there is a movement in that direction. Nostrums are at a discount. The commercial shocks of the last two years have only formed a portion of the causes of the wide-spread uneasiness and want of faith that become manifest, from day to day, in almost every direction. A period of agitation and of alarm has been entered on in the moral and intellectual world, as marked and as portentous as is that season of volcanic activity, earthquake in unnumbered localities, storm and fire and unreasoning human violence, which disfigure the physical world at this present period of its existence. Political throes and struggles for the last twenty years have had such unintended and unexpected results that all men, except the professional agitators, look with doubt on projects of change. Forms of thought that were once regarded as essential to the very name of Christianity have been rudely and perseveringly assailed, and ancient formulae and dogmas have been supported by nominal defenders who have proved far more damaging than their fiercest assailants. The central form of absolute power, the relic of the Holy Roman Empire, has dissolved

into a constitutional rule. The party of action has been for the time extinguished by M. Chassepot. The calm of metropolitan security, the regularity of respectable fathers of families, who never miss the morning train or omnibus that bears them to their daily duties, have been shaken by the portentous meteor of Fenianism. In every corner is to be detected some menacing shadow. The most novel, and certainly the most hopeful, sign of the times is, that men, instead of rushing to the empiric for a remedy, shake their heads and say that, whatever palliations may be available for the moment, the only hope of permanent peace and prosperity for the future lies in the comprehensive and adequate education of the entire people.

It is not for the first time that we have admitted this fact. But if we can imagine the demons of misrule to watch the actions and to listen to the words of the members of that society on which they prey, we may well depict them in the language of the fable of the lark and her young ones. We have talked very much of the necessity of education, but we have found so many difficulties in the way that our neighbours—some of them, at least—have got their work done before us. They have cut their corn, it may be, with sickles of our own manufacture; but while we have been talking of the great reaping-machine that is to garner all the harvest in a week, they have got their little patches of oats and rye, and wheat too, under cover. In a word, in the special branches of technical education we have been told more than once, many foreigners are much in advance of ourselves. All honour to their efforts and to their energy; we wish it every success, save one, that of leaving England behind, and of securing not only an actual, but a comparative advantage. But we can afford to loosen our tongue in the matter. There are two distinct sounds of warning in the air, which none but the wilfully deaf can neglect. One is the improvement which is so rapidly taking place over a large portion of the Continent in the soundest organisation of labour, the educational formation and development of the workman. Instead of a struggle between the churchman and the dissenter to control the polemics of the schoolmaster, and to make use of his services chiefly to give an ecclesiastical or a political bias to an education which is comparatively useless, because it is exclusively general, we find the very opposite system pursued abroad, and that with its natural result. The primary instruction once given, the general elements of all sound education once secured, the second step is the special education appropriate to the future occupation of the child. A person who can devote twelve or fourteen years to the grounding of his own education may attain a very high degree of general proficiency. But even with those whom wealth and leisure enable to avail themselves of our best opportunities for study, the time always arrives, sooner or later, when education must become special, if the man looks to support himself by his own exertions. His course of study will, or at least ought to, be very different, accordingly as he seeks to enter the church, the bar, or the army. To attain eminence in the higher and more certain branches of military service, for instance, mathematical study must be carried to a point unnecessary, perhaps even not advantageous, to the harriester or to the divine. Geometric and free-hand drawing, which to the man of the robe would be only valuable aids, are necessary attainments to the Engineer officer. The dry and painful study of the vast library in which Englishmen are ironically bidden to discover the laws of England would be pure waste of time to the clergyman, unless on such a limited scale as may enable him to discharge the somewhat incongruous duties of a county magistrate. If this speciality of education be so necessary for men who can devote twelve or fourteen years to the pursuit, what

must be the case with children to whom every year given to the school is an expense supported with difficulty by their parents. "Given a certain number of years, how to make the best of them." That is our most practical and important problem. At present we must look for its solution abroad rather than at home.

While we find, as matter of fact, that the special and well-considered education of youth is becoming an essential feature of the chief centres of Continental labour, we have proof that the result is as practically advantageous as the sound theorist might anticipate. Have any of our readers amused themselves of late by reading the London signboards? An hour or two so spent is not without its lesson. Look at some of the most important streets. Look, for instance, at the fine line of Cannon-street—a line of warehouses and shops befitting a great commercial capital. We will not refer to the Post-office Directory—our readers may do so for themselves,—but if a person took down at random the names engraved on the brass plates that catch the eye as designating the occupants of the most imposing buildings in this locality, we question whether he would draw the inference that he was walking through an English city. The number of foreign names strikes one as being preponderant. The indication is not to be neglected with safety. A similar lesson is to be drawn from the increasing employment of foreign servants by English principals. The trade of the dyer has been pointed to as an example. The facility of producing a given tint, or even of matching a given tint from among a number of shades, is said to be so much greater in the German workman or shopman, educated to that business, than it is in the generally (i.e. imperfectly) educated Englishman, that the former is gradually, but surely, displacing the latter. We have here an effect—we have a cause assigned—can we doubt the inference?

The constant change in social habit, that change which men call, and which good men strive to believe to be, progress, is not by any means uniform, constant, and unvarying. We know of few things that are so. The rise of the tide, in many localities, appears to be capricious. Wind, local obstacles, approach of neaps or of springs, give to the daily influx a variety which seems due rather to intelligent volition than to mechanical law. The history of modern civilization shows similar apparent vagaries. Within the present century an immense revolution has been effected in the education of the craftsman. We have broken in upon his old course—we have not supplied its place. We have gradually learned to discontinue the seven years' apprenticeship, to neglect the gradation of apprentice, journeyman, and master, to despise the slow and cumbersome methods by which the younger members of a craft became gradually and unconsciously imbued with the practical knowledge of their predecessors. The spirit of the age has been hostile to these relics of the old guild system; but, while destroying the old method, we have failed to replace it by a better. We have introduced more of the element of chance into the daily life of the great mass of the productive classes. Symptoms which attract little attention from day to day, or from year to year, assume far greater importance if compared at more distant intervals of time. Take a single instance of the apparent change of a craft, properly so called, into a trade, of the replacement of the small manufacturer by the large higger. Ten or a dozen years ago, if you required a pair of boots in London, or in a country town, you found a hootmaker close at hand, you entered his shop, and described the article of which you were in need. If you happened to be in urgent need you *might* be fitted with a ready-made pair. But this was the exception, not the rule. The bootmaker always prepared to take your mea-

sure. Both you and he were better pleased when he did so. It was the usual course.

What is the case now? You may remember your old shop, and, if so, you may keep up your old custom. But the chances are ten to one against it. You may look, in many localities, in favor of a *bonâ fide* hootmaker. Hootmakers you may find in abundance, and from their ready-made wares they will urge you to make the selection they recommend. But these shops will not care to take your orders if they involve the further trouble of taking your measure. They will sell their wares if they can, but they will not study your convenience. The tradesman has replaced the craftsman. The man of money, or of knowledge rather of the world than of the *last*, has come in between the manufacturer and the consumer, and that, we venture to think, to the manifest detriment of both. The tender care that the old-fashioned hootmaker had of your feet—his respectful provision for the obdurate corn—his solicitousness if the last pair of soles had worn out ten days sooner than their predecessors—his representation that, in your excellent state of health, you were so far increasing in weight as to throw more stress on the very best of leather—all these are, to a great extent, things of the past—and thus we are at the same time worse shod and more separated from a class of men with whom we were wont, in other years, to have a sort of occasional confidential intercourse that was naturally beneficial to us both, and was one of the useful and inartificial bonds of the body politic. The replacement of the hootmaker by the hootseller tends to loosen a social tie of extreme antiquity. It is a feature of the time which would, we conclude, have never appeared had the special education of the hootmaker replaced the earlier regulations under which no man would have been applied to for boots who had not passed his apprenticeship in learning how to make them. We will not further ask how many of the boots sold are made out of England.

The above is a familiar instance of what is taking place all around. The tendency to replace the manufacturer by the salesman is a sign, we think there can be little doubt, of the declivity of the quality of manufactures. In many instances, indeed, the salesman is a necessary intermediary between producer and consumer. No one would go to Manchester to buy a cotton gown. No one would go to Lyons to select a piece of silk. In all these manufactures which are carried on in great bulk and a large supply of simultaneous labour, and especially by the aid of the steam engine, production and distribution are naturally, and beneficially separated, and room remains for the old and rapidly becoming obsolete distinction of wholesale and retail. But in those numerous crafts in which human handwork is still unrivalled, all that tends to keep the consumer at a distance from the actual workman tends also to deteriorate the quality of work, to destroy the proper pride which a good craftsman takes in the execution of his work, to substitute the cheap for the good, and thus to cause the disappearance of the excellent.

If the craftsman is thus losing the position which he has maintained from the earliest date at which his craft was known, if kept from his customer, and screwed into a false and uneasy position between an employer who is not a fellow-craftsman on the one hand, and the trades union on the other, he has not come to the end of his troubles. As his inducements to work *well* are replaced by inducements to work *cheap*, the relative advantage of the foreign workman will increase. With the abrogation of import duties, and with the increased facilities of transport, the Continental workman is brought very close to his English fellow-craftsman. A very small difference in price will be sufficient to transfer the custom of the salesman from one to the other. We have had numerous instances of this late. Of course, there is the usual conflict of opinion as to fact. One competent judge will tell you that he can and does procure castings in Belgium, because he can do so cheaper than he can in England. Another may tell you that, if French manufacturers had supplied locomotives to English railways, they have done so at a loss. It is not by any means necessary to wait till this point is settled. The fact that the question can be raised at all ought to be enough for us. Who would have believed it possible twenty years ago? What would have been thought of the contractor who, to supply the Menai suspension chains of Telford, or the

Menai tubes of Robert Stephenson, had thought of asking for prices from a foreign house? He would as soon have thought of seeking them from the moon! At present, sharp competition exists, to say the least of it. That least is ample.

We trace then in our own industries a change of system, and a consequent defect. We have lost the old teaching, and we have not replaced it by new. We can trace, in many instances, positive deterioration of produce. We can trace, in almost every instance, comparative deterioration. While we have been standing still, or advancing slowly, or even actually receding, our neighbours have been getting well to the front. We cannot doubt the fact. Nor can we doubt that they have taken, in very many instances, the right course—a course which has been attended by the predicted results. They have provided special education, of a technical or quasi-technical kind. They have endeavoured to educate the young weaver to understand design, the young smith to understand metallurgy. And they have found the attempt to answer.

Let those of us who have any interest in education, any interest in handicraft, any interest in the stability of our welfare or the hope of our future greatness, ponder well over these facts. Is it only the ostrich that seeks to shun danger by shutting its eyes? Naturalists, indeed, say so; but they say so in error, for we cannot pass a day without encountering many a biped that shares the improvidence, though destitute both of the speed and of the plumage, of the great two-toed haunter of the desert.

THE DRAINAGE OF LAND.*

Warmth.

The wonderful and mysterious ways of nature are shown more and more by every step we take to investigate the laws that govern the operations which are daily going on around us, and in none is this displayed to a greater degree than in the processes of vegetation. The beautiful action of capillary attraction, by which the surplus of moisture of winter, stored up in the ground, is drawn up to supply the loss occasioned by the summer drought, has been already alluded to; and as warmth is as necessary to vegetation as moisture, so nature has provided for a regular supply of heat to be stored up in the earth, to be given out when required.

It need scarcely be said that the temperature of the atmosphere attains a maximum in summer; and from observations made by meteorologists, extending over a series of thirteen years, the average time is placed on the 21st of July; the cold period attaining its maximum on the 20th of January. The heat that is given out in the summer is absorbed by the earth, and gradually finds its way downwards until it reaches a depth, beyond which, speaking as an average, the temperature of the soil is not affected by the heat of summer or the cold of winter. This depth is found to vary from 50 ft. to 100 ft. below the surface, the variation of temperature between winter and summer being only 3 degrees at 24 ft. below the surface, the mean variation of the atmosphere being, on the surface, nearly 30 degrees. The heat travels through the soil at a rate proportionate to the depth, as will be seen from the following table:—

Situation of Thermometer.	Middle of Warm Period.	Middle of Cold Period.	Mean Range.
In the air	Month. July 21	Month. January 20	Degrees. 29.8
Sunk one inch in ground	July 28	January 24	25.4
Sunk 3 ft. do.	August 9	February 8	21.7
Do. 6 ft. do.	August 25	February 24	18.4
Do. 12 ft. do.	September 25	March 27	9.5
Do. 24 ft. do.	November 30	June 1	3.4

Thus it will be seen that it takes six months for the alterations of heat and cold to affect the soil at a depth of 24 ft., and when it is coldest above ground, the subsoil at this depth below the ground is the warmest, and the heat of the summer sun is gradually ascending through the soil during the winter and early spring months to assist the germination of the seeds sown and to keep warm the roots of the plants during the snows and frosts of winter. When we are hardly able to keep life in some of the plants above ground, those beneath are luxuriating in a temperature many degrees warmer, provided they have fair play and are not over-supplied with

moisture, the excess of which makes land cold and ungenial to vegetation.*

The effect of judicious drainage is to warm the land; that is to say, in point of fact, to increase its capacity for absorbing heat, and also to enable it to keep up the temperature of the soil during cold weather.

Water is a better conductor of heat than air, and thus in cold weather, and when the ground is covered with snow, undrained land, having the crevices or spaces between its particles filled with water instead of air, on the one hand parts with its supply of heat more rapidly than drained land; and, on the other hand, is less calculated to take in as large a supply in the warm period of the year.

To prove the effect of drainage in raising the temperature of the earth, a premium was offered by the Marquis of Tweeddale, about five years ago, for observations and experiments to be made on soils of a similar character, growing the same crops, and situated in the same locality; the result of which was a collection of carefully prepared and thoroughly reliable observations, from which the following results are culled:— That during a long-continued frost, the mean temperature of drained land at 90 in. below the surface was nearly 1½ degrees warmer than the undrained. That showers of sleet and cold rains lowered the temperature of drained lands 2 degrees, and undrained land 4 degrees. That in every instance drainage gave a decided advantage in an increase of temperature, except only in summer, when a heavy fall of rain was found to lower the temperature of the drained land 1 degree more than the undrained,—an evident advantage to a hot, parched soil.

Experiments also made by Dr. Madden led him to the conclusion that an excess of water in the soil reduced its temperature in summer 6½°, which amount he considered equivalent to an elevation above the level of the sea of 1,959 ft. So that, supposing two fields, lying side by side, the one drained, the other undrained, and supposing them both equally well cultivated, there would be nearly as much difference in the amount and value of their respective crops as if the drained one was situated at the level of the sea, and the other on an elevation as high as the Pentland Hills.† Dr. Madden also, in order to dispel the idea, where it existed, that the interstitial spaces or canals, being so minute, that their contents could be of no consequence, quotes the fact that in moderately well pulverised soil they amount to no less than one-fourth of the whole bulk of the soil itself; for example, 100 cubic inches of moist soil contain no less than 25 cubic inches of air. According to this calculation, in a field pulverised to the depth of 8 in., a depth perfectly attainable on most soils by careful tillage, every acre will retain beneath its surface no less than 12,345,280 cubic inches; and for every extra inch in depth the ground is cultivated 235 tons of additional soil are called into activity and rendered capable of retaining beneath its surface 1,568,160 additional cubic inches of air.

It has been already stated that undrained ground is less calculated to take in a store of heat in summer than drained land. To explain this more fully, the summer sun is wasted in drying up, by evaporation, the water rain from the soil, and in the process cooling down the land. In illustration of this, it is only necessary to refer to the practice often pursued in hot climates for cooling wines and other liquids, by wrapping a wet cloth round the bottles and exposing them to the sun, the evaporation of the moisture rendering the liquid as cool as if it had been iced. A very simple way of testing the effect of the evaporation is to take two thermometers and to place them side by side, and to cover the bulb of one with a piece of muslin kept constantly wet by allowing it to communicate with a small vessel containing water. The thermometer with the wet bulb will be found to be several degrees lower than its companion, the difference varying with the weather; the greater the heat and dryness, the greater will be the difference, and the moister the state of the atmosphere the more nearly they will coincide; and when the air is completely saturated as when heavy rain or heavy mists are falling, the two thermometers will read alike. When such is the case in fine weather it is a sure sign of approaching rain. This instrument is termed by meteorologists an hygrometer, and is a most valuable assistant to every one interested in the various changes of the weather. It is only

* See p. 49, ante.

* Steinmetz, "Sunshine and Showers."
† Lecture on Agricultural Science by Dr. Madden.

necessary to compare a wet and dry soil to the wet and dry ball thermometer to have a clear perception of the effect of the sun and wind in cooling down the wet soil by evaporation, and that at a time when warmth is most necessary to the proper development of vegetation.

Having thus explained the theory of drainage, the next thing for consideration is the practical part of the question. The advantages of drainage will be the better understood from the following vivid description of an undrained soil by one of the most eminent and practical writers on agriculture.

"The injury done by stagnant water to arable soil may be estimated by these effects. While hidden water remains, manure, whether present or absent, imparts no fertility to the soil; the plough, the harrow, and even the roller, cannot pulverize it; new grass that it contains little nutriment for live stock; when old, the sward sours and disappears, and are succeeded by coarse sub-aquatic plants. The stock never receives a hearty meal of grass, hay, or straw, nor land in that state; they are always hungry and dissatisfied, and of course in low condition. Trees acquire a hard bark and stiffened branches, and become a prey to parasitic plants. The woods in the neighbourhood are constantly soft, and apt to become rotted; while ditches and furrows are either plashy, or like a wet sponge, ready to absorb water. The air always feels damp and chilly, and from early autumn to late in spring the hoar-frost meets the face like a damp cloth. In winter the slightest frost enravens every furrow and plant with ice, not strong enough to bear one's weight, but just weak enough to give way at every step, while snow lies long lurking behind the sun in corners and crevices; and in summer mosquitoes, green flies, midges, gnats, and gadflies torment the cattle, and the ploughman and his horses, from morning to night; whilst in autumn the sheep get scalded heads, and are eaten up by maggots during the hot links of sunshine."

The opposite picture shall be drawn partly from the more prosaic source of a Blue Book, a work belonging to a class generally considered as the driest of the dry; but which, as a rule, contain the most valuable information on the subjects to which they refer to be found anywhere. The advantages may be thus set out:—

1st. That when properly executed, drainage always proves remunerative:—

The actual increased return from drainage cannot vary a great deal according to circumstances and the nature of the soil. Numerous cases were given in evidence before Parliamentary committees of rents being raised from 50 to 100 per cent. after drainage, and the average of several different classes of soils showed a net return of 10 per cent. on the outlay. As a fair average it may be taken that on clay soils a wheat crop will yield one quarter to the acre more on drained than on undrained land, and this without any additional seed or labour. In wet cold seasons the increase will be much greater, and the drainage is often paid for by the increased produce of a single season.

2nd. That after a series of years the ensouling of a thorough-drained field changes into the nature of soil as far down as the level of the water in the drains. This change is accounted for,—

1. By the ameliorating effects of air and water producing healthy decomposition of the organic and inorganic constituents, and thereby eliminating substances which constitute the food of plants.

2. By the washing out of the deleterious ingredients.

3. By loosening its texture. When the working of the land and the treading of the horses is considered, a treading which in the case of a pair of horses leaves more than 200,000 foot-prints when cutting a 9-in. furrow over an acre of land, the effect of this in puddling a wet clay soil and injuring its texture, and the advantage of freeing such a soil from surplus water may more fully be estimated.

4. By the penetration of roots, and by their ultimate decay in the subsoil.

5. By the penetration of earth-worms and insects. The drainer has not a better assistant than the worm. These insects work their way down through dry soil to great depths. The author has seen worm-holes at depths of 10 ft. and 12 ft. below the surface; and in a drained soil their burrows always extend as low as the

pipes, the cavities made in their progress acting most effectually as feeders to the drains.

3rd. That by thorough drainage and subsoiling, the quality, as well as the amount, of the crops is improved.

4th. That clay lands, which in the raised ridge form could produce only wheat, beans, and clover, have, when thoroughly drained, been found capable of producing root crops, such as turnips, mangold wurtzel, and potatoes, thus enabling the naked fallow to be dispensed with, and permitting the adoption of a much safer and more profitable system of farming, in which the rearing and feeding of stock are combined with the growth of valuable grain crops.

5th. The thorough-drained fields stand wet and drought better than undrained fields of the same sort of soil. From the principles already laid down, it is evident that this should be the case. It is well known by those who have paid attention to the matter, how, during protracted droughts, the thorough-drained fields call attention to themselves by their superior verdure. By their improved texture they are not liable to become baked, and the free soil is in a condition to take in a supply of moisture from the dews of the summer night, which the hard dry skin of the undrained land is incapable of doing.

6th. Thorough-drained fields are more easily tilled, and are in a fit state for the operation of tillage a much greater number of days in a year.

7th. All manures produce a much greater effect on drained fields than on undrained ones.

8th. Drainage has also a most beneficial effect in improving the climate, by removing stagnant water; the air is freed from those noxious vapours which hover over all damp land, to the injury of the health of both plants and animals. Ague, rheumatism, and low fever, which prevailed extensively in low wet situations, have died before the drainer, and are now unknown in situations where once they ruled paramount.

W. H. W.

ART-WORKMANSHIP: SOCIETY OF ARTS.

There is so much going on just now at the Society of Arts that a commensurate report would occupy a large proportion of our space. We have elsewhere given a brief account of a paper on a mode of supplying cheap food in a metropolitan, read to the Society last week. On Wednesday evening last Mr. William Hawes discoursed upon the workmen's reports from Paris, to which we have already drawn attention at some length; and on Thursday a conference on Technical Education was opened, and will, we trust, be productive of good results. This conference, we may mention, relates to,—

1. The necessity of improved national education for the working classes generally.
2. The necessity for the establishment of schools for technical and industrial education in relation to science and art, in which pupils after leaving the primary schools may obtain instruction suited to the special industries with which they may be connected, as workmen, foremen, or managers.
3. The best measures for securing that object.
4. How far technical education can be promoted by the aid of existing educational endowments.
5. The appointment of a standing committee to take whatever steps may be required to advance the objects approved by the Conference, and to send deputations to the Government to support such applications as may seem desirable.

Dr. Lyon Playfair moved the first Resolution, and Earl Russell seconded it.

In addition to these matters, the council have under consideration the various specimens of art-workmanship which have been sent in competition for the prizes offered last year. These are ninety-four in number, and come under three heads,—works in accordance with prescribed designs, 46; works sent without prescribed designs, 16; and specimens of wood carving without prescribed designs, 32. The majority of the latter profess to be designed as well as executed by the competitor. In this division, as in the other two, the chief weakness shown is in want of mastery over the human figure. Two of the specimens sent in might have come from the Sandwich Islands. There are two or three very delicately carved heads, a decent Gothic panel in oak, H. G. Price (91); two pretty frames (76 and 81), some fruit and flowers in the style of Gibbons (R. A. Brangan, 84), a dead hawk (75), an allegorical clock-case (63), and some other creditable works. Part of

a frieze (J. M. Leach), the subject from "Midsummer Night's Dream" (the craftsmen flying from the transfigured Bottom), is spirited and vigorous, but can only be regarded as a sketch. It leaves in doubt the artist's power to carry it out to completion.

Amongst the miscellaneous works without prescribed designs, is a whole dessert service, painted in majolica style, by Miss Lolia Hawkins. This includes a considerable number of pieces, and is priced at 100 guineas. The signs of the Zodiac form the subjects of the plates, the Seasons and the Masos are given to the dishes. The heads display a great deal of nice feeling, and the whole work shows much thought. Repoussé work in metal (Gwillim), hammered work in metal (Bush & Winstanley), Henry Brownsword's tazza, and the engraved jug and two goblets, by Oppitz, deserve and will doubtless receive due consideration from the adjudicators, whose decision on this occasion we are not seeking to forestall.

In the first division, works from stipulated designs, some of the carvings in stone and oak, repoussé work, and hammered work in iron, are very good, though not better than has been before sent. An engraving on metal, by G. W. Hindley, may be mentioned as the work of a lad of eighteen. A piece of decorative painting, by C. P.; a female head in mosaics, for a wall, and two specimens of bookbinding, by Louis Gentz, have claims. It was very satisfactory to see on the day of our visit a considerable number of workmen examining the specimens with care and interest.

WESTMINSTER HALL.

In the course of a few days five marble statues of kings will have been erected in Westminster Hall. They are being placed on the east side of the Hall, near the members' private entrance to the House of Commons, and will stand on temporary wooden pedestals. Two, James I. and Charles I., are by Mr. Thornycroft; another couple, George IV. and William IV., are by Mr. Theed; and the fifth is of William III., by Mr. Woolner. It was originally intended that these statues, with three others not yet completed, should occupy the niches in the Royal Gallery of the new palace at Westminster; but Mr. E. M. Barry having represented their unsuitableness for this position by reason of their size, has obtained permission from Lord J. Mansfield to place them as an experiment on temporary pedestals in Westminster Hall. Mr. Barry has proposed that the Hall should contain a complete series of statues of our monarchs from William the Conqueror to her present Most Gracious Majesty. He suggests that they should be placed near the side walls, on pedestals under each principal of the roof and on the steps. He further proposes that the walls should be ornamented with bas-reliefs in panels, each bas-relief representing the principal event in the reign of the king whose statue occupies the adjoining pedestal. By this means, additional historical interest would be acquired by the old Hall of Rufus. The site proposed for the statue of her Majesty is the centre of the wall under the great window of St. Stephen's Porch, at the top of the flight of steps leading from Westminster Hall. The present five statues are not placed in the positions which they would permanently occupy under this scheme, as this is as yet merely proposed for consideration.

Outside the Hall, on the west side of New Palace Yard, the statue of Sir Robert Peel, by the late Baron Marochetti, has been placed on its pedestal. The latter is of red Aberdeen granite, polished, on a plinth of grey granite ranging with the plinth of the wrought-iron railings which have been recently erected. The statue of Sir Robert Peel is exactly opposite to that of Mr. Canning in its new position.

INDUSTRIAL DWELLINGS COMPANY.—The report of the Improved Industrial Dwellings Company (Limited) has been issued. It states that the total subscribed capital is now 88,350*l.*, of which 7,122*l.* have come in since the date of last report, and that the operations of the society with their various blocks of buildings have been successful. The revenue account shows a sum to credit of 1,795*l.* 14*s.* 11*d.*, and the directors propose the usual dividend of 5 per cent., carrying forward a balance of 327*l.* 7*s.*

* To be continued.

THE ARCHITECTURE OF RUSSIA.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the ordinary general meeting of the Institute, held on Monday evening last, M. Constantine Thon, of St. Petersburg, Government architect, and author of the work on "The Palace of the Cæsars, Rome," was unanimously elected as honorary and corresponding member. Mr. Wm. Fogarty, of Dublin, and Mr. G. Judge, jun., of London, were elected as fellows; and Mr. H. Vale, of Liverpool, and Mr. Samuel Brooks, of London, were elected associates of the Institute. Professor Donaldson (hon. sec. for foreign correspondence) announced the decease, in November last, of M. Baudirector Fischer, architect, of Carlsruhe, honorary and corresponding member, and read a necrological notice of that gentleman.

The subject of the proposed new Building Act was introduced by Mr. Chatfield Clark, with a view to inquire whether the attention of the council had been directed to some of the provisions which tended to hamper the profession in the execution of works, more especially in the neighbourhood of London. He thought it most desirable that the stringent provisions he referred to should be watched by the council.

Professor Donaldson stated that the Bill in question had been examined by the Association of District Surveyors, of which he was a member, who had made some emendations and had submitted them to the Metropolitan Board of Works. The proposed prohibition of the use of stone in staircases, &c., he believed resulted from the recommendations of Captain Shaw, with a view to the prevention of accidents at fires; but there were other parts of the Bill which required to be considered.

Mr. Charles Fowler considered an expression of opinion by the Institute on this subject highly desirable, and the Chairman promised that the matter should have their consideration.

The paper read was, "On the Kremlin of Moscow," by Mr. Edward P'Anson, who said that he trusted the subject he had chosen for his paper, contained a sufficiently complete and rich collection of buildings to enable his audience to understand something of the architecture of Russia before it merged into the prevailing architecture of modern Europe. He would make a few allusions only to the architecture which he had the opportunity of seeing in other parts of the empire. After describing the imposing view which Moscow presented as first seen from the eminence of the Sparrow hills, some 3 or 4 miles from the city, the reader dwelt at considerable length, on the vast aggregation of buildings, especially of churches, there being no fewer than thirty-two churches, and 170 chapels, cupolas, and towers, within the walls of the Kremlin. Situated in the centre of the town the Kremlin, he said, is, as it were, the kernel of the whole city, and is wrapped round with the other portions of Moscow, and is the oldest part of the town. It is nearly triangular in form, the base of the triangle next the river Moscowa, by which it is bounded on the south side, being as measured from the map in Dr. Clarke's "Russia," about 2,000 ft. The greatest width on the north-east side is also about 2,000 ft. The total circumference of the walls is 7,280 ft., within which are the numerous churches, chapels, and public buildings already mentioned. The walls are chiefly of brick, as indeed are almost all the buildings incorporated with or contained within them. The finest range of towers is on the river-side, where they are seven in number. Beyond the long vista of towers on the river-side, is a modern church, much larger in size than the churches of the Kremlin, viz.—the Church of St. Saviour, still in progress, the interior of which is being finished, as he was informed, for he did not visit it himself, with the richest mosaics, and coloured decorations.

Externally, the bulb-shaped domes are remarkably elegant in their contour. On the north side there are five towers, the most ornamental being the Trinity tower. After giving a description of this and the succeeding towers, Mr. P'Anson proceeded to point out the leading characteristics of the various gateways forming the entrances to the Kremlin. Having described the Kremlin walls, he then entered the interior. As the heart of Moscow is the Kremlin, so the heart of the Kremlin is the patriarchal Cathedral of the Assumption or Repose of the Virgin. This, one of the oldest and most interesting churches in the Kremlin, is in dimensions what in the West would be called a chapel rather than a cathedral, but the smallness of space is forgotten

in the fulness of its contents. On the platform of its nave, from Ivan the Terrible to this day, the Czars have been crowned, and along its altar-screens are deposited the most sacred pictures of Russia. Round the walls are buried the primates of the church, and at the four corners lie those most highly venerated. The floor is paved with slabs of polished steel. Hieroglyphics and pictures constituted more than half the education of those grown-up children of the ancient world, and they still constitute more than half the education of these grown-up children of the modern world.

Notwithstanding various alterations and repairs at various epochs, the Cathedral of the Assumption probably retains much of its primitive form, and is therefore one of the most interesting church monuments in Russia. Next to this in situation and size is the Church of the Archangel Michael, where lie each in his place, the coffins ranged round the wall, the long succession of Czars, from the founder of Moscow to the predecessor of the founder of Petersburg, and twice a year a funeral service is performed "for the sins of all of them." Near to the two churches above-named is the third most important church in the Kremlin, and completing the group of those intimately connected with the history of the Czars. This is the Cathedral of the Annunciation, in which the Czars are baptised and married. It is the smallest of this group of three monumental churches of the Kremlin. The arrangements and decorations of this cathedral were described in detail. Amongst the other objects of interest in the Kremlin is the lofty tower or belfry of Ivan Veleiki—John the Great—erected in the year 1600. The cross on the summit is about 18 ft. high, and the total height about 270 ft. It is one of the buildings injured by the French during their occupation of Moscow, all traces of which at the time of Mr. P'Anson's visit were concealed by plaster and whitewash. In the lower part is a chapel dedicated to St. John, the tower being, in fact, its campanile. Above this are suspended thirty-four bells, the largest of which weighs no less than 61 tons, or about 140,000 lb. The celebrated Great Bell of Moscow lies at the foot of this tower. Its weight at present is 440,000 lb., its height 19 ft. 6 in. and the circumference 60 ft. 9 in.

In size no building in the Kremlin approaches that of the Palace and Treasury combined. Within the palace itself, in addition to numerous magnificent rooms appropriated to state occasions, is also a labyrinth of fourteen chapels, multiplied by sovereign after sovereign, till the palace has become more like the dwelling-house of the Pope than of the Emperor. These chapels, crabbled-ribbed, low-browed, painted within and without in the old barbaric grotesqueness of Mediaeval Russia, are encased with the external magnificence of modern civilization and European grandeur. The Treasury, which adjoins the palace, contains a vast collection of trophies and standards, coronation chairs, state robes, crowns, imperial orbs, plate, &c. In addition to these there is still another palace; a small church; the sacristy of the Holy Synod; the Miracle Monastery, the Ascension Convent, the High Court of Appeal, and several Government buildings. That which he would last allude to—the Arsenal, which stands close to the Nicholas Gate—is a building of the date of 1713, where are deposited the cannon taken by the Russians to the large number of 875, of which no fewer than 365 are the cannon taken during the retreat of the French, and, as the least honourable place, they lie prostrate on the ground; the Austrian, Italian, and other trophies, lying tier above tier over the French pieces below. He next proceeded to describe the church outside the Kremlin known as the Church of St. Basil. This, he said, is the name given to one church in the general structure; still, it is only one of twenty-one churches which are there co-existent,—the whole together being known to the natives as the Cathedral of the Protection. Although styled a cathedral, the building is circumscribed probably within 150 ft. square on the ground, agreeably spire in form, with nearly a dozen domes grouped around a central summit, like a close-clustering grove of young pine trees. There is harmony among them, yet with variety infinite. The titles of each of the coalesced churches, as given by Lyall, were enumerated in the paper. Immediately adjoining the Kremlin, to the north-east, is the Chinese quarter of the city—the mercantile part—which is walled round like the Kremlin. This also has its ancient gates, and several ancient (for Russia) buildings within its walls. One of them is a small church, "The Mother of

God of Georgia," which is a perfectly typical church, nearly square in form, from the roof of which rise elongated octagonal spires, crowned with five bulbous-shaped gilt domes, terminated by the usual iron cross standing over the present. In this quarter of the city are also the Corn Magazine, the Custom House, the Fish Market, and an establishment peculiar to Russia resembling the bazaars of Constantinople, or the French passages. The reader then went on to remark that the modern churches of Moscow and all the others he saw in Russia are in the Italian style, generally of the worst character; from which remark, however, he excepted one great church, the work of a French architect, the St. Isaac's Church, which he described as a grand and imposing building, having the usual central dome and the four small surrounding domes common to all the Russian churches. The great ribbed dome is covered, it is said, with actual plates of gold, and the imperial records have never revealed the cost of this church. It is a great, but not a Russian work. The domes of the various churches were described as being for the most part more graceful than those of Constantinople, and approaching nearer to the four used in the tombs of the caliphs at Cairo.

A striking feature in the neighbourhood of Moscow is the number of important monasteries which stand the plain in many directions, most of them very extensive, for they contain within their walls the conventional buildings, and many chapels, bell-towers, and burial-places. Mr. P'Anson next proceeded to speak of the great extent to which public veneration is carried by all classes throughout the whole of the empire. These, he said, in public and in private, constitute the consecrating element. Sacred pictures are to be seen in the corner of every room, at the corner of every street; in offices, in steamers, and in taverns, with the lamp burning before them. It is against the canons of the church to have any grown images in the churches, and therefore the decoration of them is confined to pictorial representations; but the strict rule is often departed from by embossing the background to the pictures, and the jewelled crowns with which they are surrounded are in full relief. St. Isaac's Church at St. Petersburg was the only one in which he recollects this rigid rule was departed from; the general rule being that the edifices themselves are as simple and undecorated as possible. The apical termination, as far as he saw, was a constant feature in all the churches. Another subject of remark was the marvellous value of the decorations of gold and silver and precious stones in the churches and upon the shrines and tombs, and the priests themselves, often men of great stature, being clad in heavy gold and pearl embroidered robes; and all this took place in a country where there is hardly any metallic currency in circulation. He alluded also to the large bequests made by the wealthy portion of the population to the funds for the repair and preservation of the churches, more especially to meet the large cost of gilding the domes, which, with the other parts of the building, suffered much from the extreme severity of the climate; and in conclusion, he remarked, that the source whence the architecture of Moscow was derived was, he thought, clearly Constantinople. The historical evidence on this point appeared to him conclusive. Any observer who had seen the architecture of Constantinople could not doubt as to its being the parent of that of Russia. As regarded the towers, there is a more complete Italian feeling than in the churches. No doubt the plan was precisely defined by the tradition and usages of the Greek Church; but the whole treatment is traditional, just as we in England now cling to the older form practised in church building. There could not be a more suggestive type of the architecture of the Kremlin than several of the fine fountains at Constantinople. Although the relation between the two nations has, from political causes in modern times, not been always preserved, yet in earlier times, and in ecclesiastical matters, the relations between the two were always preserved with filial fidelity, the more remarkable from the reversal of their respective positions in everything else. It was said generally, that Russian architecture is not original, and that it is only a coarse and rude imitation of other works; but he asserted that all the three principal churches of the Kremlin, to which he had referred, more particularly in detail, bore a distinct and special character, and on the whole he felt that the Russians might fairly lay claim

to very considerable ingenuity, good taste, and artistic power.

A brief conversation, in which Professor Donaldson, Mr. W. Haywood, Mr. Basil White, and Mr. Charles Barry, took part, followed the reading of the paper, in the course of which it was sought to elicit from the author of it a more definite opinion with regard to the distinctive features to which Russian architecture could lay claim; but on that point Mr. F'Anson said he could give no further opinion than that which he had already expressed upon it.

EDINBURGH: WORKS IN PROGRESS AND IN PROSPECT.

The number of important buildings erected each year in this city is comparatively few, but from the nature of its site and plan they tell more upon its aspect than in other cities where greater activity prevails: the buildings are generally seen from many points of view; and then, being situated within a limited area brings more of them into groups than would otherwise be the case, and they are thus made to form part of a *tout ensemble*.

Of works in progress, the Bank of Scotland, both on account of its isolated and elevated position in the centre of the city, and the highly ornate character of the building, challenges attention. It differs entirely from any other structure here in the style adopted, which is Late Renaissance. The sky-line is broken by a central dome, open lantern, and sculptured groups. The elevation towards Princes-street is completed, and that towards the south nearly so, and operations are being actively pushed forward on the roof and accessories above the cornice-line. Although this is merely an addition to an old building, the alterations are such as to give it an entirely new character. The sum to be expended is said to be about 50,000.*

The Fettes College, a large structure in the Late French Gothic style,—as seen in the well-known example of the Palais de Justice at Ronen,—is ready for the roof, with the exception of the central tower: the grouping is very picturesque, and it is profusely ornamented with carving, which strikes us as very unequal in execution.

The foundations of Free St. George's Church have been laid. It is to cost 15,000*l.*, exclusive of the site, upon which an equal sum has been expended. In style it is to be Palladian, and is hardly the kind of church we look for in the present day.

The Chalmers Memorial Church has had a tower, turret, and cloister added to it, as originally intended; but one spire is to be left unfinished till additional funds are forthcoming.

The Roseburn Free Church will soon be ready for occupation. It is Early English in style, and has a well-proportioned broach spire, but is otherwise far from being satisfactory in design. The finial of the main gable consists of a pedestal more suited for supporting a vase than the light iron cross which surmounts it, and the necessity for the clump of ugly buttresses around the slender octagonal turret flanking the spire, is not at all obvious.

All Saints', Brougham-street, is in use, but the west elevation is incomplete, and it has not a prepossessing appearance.

New poor-houses are in progress for the West Church and City parishes. The latter is being erected on the estate of Craiglockhart, within three miles of the city, which was purchased by the Board. It is to embrace all that modern science has discovered in the construction of such establishments. The former occupies a commanding site to the north-west of the city, and architectural effect has been sought after by the adoption of *louvre* roofs.

In Victoria-street a large and highly-ornate block of offices, in the Scottish style, are nearly ready for roofing in. They add greatly to the effect of this picturesque street; but this effect is unhappily marred, to some extent, by the erection of a clumsy mass of buildings on Johnston-terrace, the back elevation of which fills up the vista. This is much to be regretted, as by the introduction of a few gables, and the grouping of chimneys, it might have been brought into harmony with the surroundings, at little or no additional expense; in fact, the back elevation of this terrace is the most important

one, as it is seen from many points of view, in combination with the Castle and group of buildings on the ridge of the High-street.

Within the garden enclosure at the angle of North Charlotte-street and St. Colms-street a cross is being erected to the memory of the late Miss Catherine Sinclair.

At the west end new terraces and crescents are springing up, comfortable residences doubtless, but with nothing outwardly attractive. To the north-west of the meadows we notice in Lonsdale-terrace a praiseworthy effort to break through the stereotyped style of elevation hitherto adopted for house fronts; the elevation is of the usual sort where oriels are used, but it has been enlivened by a judicious use of incised ornament of a Greek character; the effect is pleasing and the expense moderate,—not more, we should think, than that spent on the ordinary moulded architraves, &c.

The last work in progress we shall notice is a large brewery to the west of the ancient Palace of Holyrood in the *castellated style*!

As to work in prospect the most important is the City Improvement Scheme, the Act authorising which passed last Session. Operations are to be commenced upon one of the worst of those dense blocks of buildings between the High-street and the Cowgate, through which a street is to be driven, admitting light and air to a locality which is a hotbed of fever and immorality. It is also proposed to run a broad and handsome street along the north side of the University and Industrial Museum, and in connection therewith to clear away certain buildings surrounding the Infirmary, which latter, being antiquated and ill-adapted for its purpose, is to be replaced by a new one.

The restoration of St. Giles's Cathedral is in contemplation, but we fear it will not be carried out in the thorough manner which will alone be satisfactory.

A large space of ground has been cleared at the junction of Rutland-street and the Lothian-road, for the proposed Caledonian Railway Station. The site is a good one, and the building promises to be highly ornamental: a large hotel, as at Charing-cross and Cannon-street, is to form the chief feature.

The directors of the North British Railway procured an Act some time ago, securing the Green Market for an extension of their station. This necessitates, in the first place, the construction of a new market, but there is no sign of movement in that direction.

A site has been secured at the Grange for the erection of the Robertson Memorial Church, which is intended to be a handsome structure.

The sculptors are busy with the Albert memorial, which our readers are aware is to take the shape of an equestrian statue, on an elevated pedestal, with accompanying groups. We still entertain a hope that the question of site will be re-considered.

A commencement has been made to the south end of Castle-terrace, which is to be an exception to the usual rule, as to elevation in domestic street architecture, and will be striking in effect.

The large plot of vacant ground between the Protestant Institute and the Cowgate, on the west side of George IV.'s Bridge, has been secured for the erection of warehouses and offices, which are to be carried out on an imposing scale, and in handsome style.

UPSALL CASTLE, YORKSHIRE.

For above 200 years the Lords Scroopes, of Upsall and Masham, numbering in their ranks earls, ambassadors, archbishops, chief justices, and knights of the Garter, lived at their castle of Upsall, three miles from Thirsk. The last authentic resident we have proof of, who lived at Upsall Castle, was John Constable, a firm Royalist during the Commonwealth, when, in his exile, the castle is supposed to have fallen into ruins. In the present memory of man, backed by local histories, that castle, with very slight exceptions, has remained a mass of incongruous ruins. Under the superintendence of Mr. G. Goldie, Captain Turton, the owner, has built a large range of farmsteads, bailiffs' and labourers' houses, gardens, hot-houses, and vinerias. The workmen are now engaged upon clearing away the mass of rubbish, preparatory to a new mansion being erected on the site of the old castle. In doing this, even so far, the workmen have laid bare part of an old wall, of large-sized dressed blocks. Each block has its

"mason's mark" different and various. A Gothic-headed carved doorway has also been found. Whether the joints were mortared is doubtful, but a strong, heavy iron lead, bedded inside the joints, and run with clamp, is to every stone. Parts of a fine tracery window have been found; also several coins,—a sixpence of Queen Elizabeth, a penny of George I., a bodle of Charles I., a silver penny of Edward III., and several copper coins of Carausius, the founder of the British fleet. Weather permitting, the excavations will proceed, and doubtless other antiquarian relics will be turned up. The castle has formerly covered a vast area. The Scroopes, of Danby, are now asserting their claims before the House of Lords, for the title of Lords Scroopes, of Bolton, with its earldom, &c. These Scroopes of Bolton were a senior branch of the Scroopes of Upsall.

THE LIVERPOOL DWELLINGS COMPETITION.

THE town council at their last meeting confirmed the recommendation of the health committee, that the offered premium for the best labourers' dwellings be awarded to the designer of plan marked "John E. Reeve," and numbered 47.

Mr. Bowring, in moving the confirmation, said that the committee, with reference to doubts that had been expressed at the attention paid by competitors to the by-laws, considered the fairest plan was to be guided by the natural legal adviser of the corporation, namely, the town-clerk. The report of the town-clerk was, that all the twelve plans selected from those submitted were admissible under the first paragraph of the terms of competition, which requires conformity with the local Act and by-laws of the council. The medical officer prefixed to his report on each separate plan a statement that in his opinion every house with four rooms ought to contain a living-room of at least 1,200 cubical feet, and with three rooms a living-room of at least 1,100, and with two rooms a living-room with at least 1,000 cubical feet; and that every dwelling should have one parents' bedroom with at least 900 cubical feet. The borough engineer made a financial analysis of the twelve plans by estimating their cost and gross rentals upon a common basis, and then deducting from such gross rentals 20 per cent. to cover landlords' taxes, repairs, losses by bad debts and upset houses, collectors' commission, and fire insurance. The particulars of the twelve plans selected upon and financial results are as follows, arranged in the order of their financial results:—

No. of Design.	Name or Motto.	Established Cost.	Gross Rental.	Net Rental.	Interest per Cent.
64	John Birch.....	£. 33,730	£. s. 2028 16	£. s. 1623 1	6 17 0
62	Redman & Hesketh & Keth.....	17,797	1280 12	1031 14	5 18 0
69	W. R. Duckworth.....	17,992	1146 12	917 6	5 6 0
47	John Reeve.....	12,935	803 0	642 8	5 0 0
38 B	Pro Bono Publico.....	6,778	1019 4	815 7	4 17 2
5	J. B. L.....	8,420	1078 8	861 3	4 13 6
6	C. E. Grayson.....	15,760	870 16	718 13	4 13 0
32	W. G. Habershon.....	24,984	1248 0	988 4	4 7 0
68	H.....	19,854	1055 12	814 10	4 5 0
26	W. L. Moffatt.....	14,198	707 12	586 2	4 0 0
24	P. Thompson.....	15,463	860 12	680 0	4 0 0
50 & 53	J. C. Crofts.....	24,483	884 0	787 4	3 4 0

It will be seen from this analysis that the most economical designs are No. 64, signed by John Birch; but this result is obtained by making a large number of the rooms very small, much smaller than the moderate size considered by the medical officer essential to health; and these designs were therefore rejected on sanitary grounds. The designs are in many respects extremely meritorious, and are upon the principle so common in London of making the blocks five stories high, exclusive of the shops on the ground floor. The designs which showed the next best financial results were No. 52, unsigned, which were much admired, and on the arrangement of which the borough engineer reported very favourably; but these plans were inadmissible on the same grounds as No. 64, namely, the inadequate size of the rooms. The designs which were next in financial merits are those numbered 59, exhibited by Messrs. W. & R. Duckworth. These designs, though not without defects, had much to recommend them; but they were inadmissible on the grounds of the architects not having sent in proper specifications. The designs which come next in economy are those recommended for the prize by the Health Committee, No. 47, signed John Reeve. On these plans the medical officer reported that "The ventilation of the water-closets and rooms is very good. The blocks admit of thorough circulation of air, and there does not appear to be any sanitary objection to this plan." The borough engineer's report is,—"This design is simple and good, and the masses of buildings well arranged for aeration." The remainder of the twelve designs are all too expensive in proportion to the accommodation they would provide; and some of those which are the most attractive on a cursory examination, prove on closer analysis to have serious defects.

The council, after a long discussion, also confirmed, by 27 to 13, the recommendation we mentioned last week, "to give the sum of 100*l.* to Messrs. Redman & Hesketh, for plans of labourers' dwellings signed by them, in consideration of their making complete working drawings of them, and supplying specifications

* Views and a plan will be found in our Volume for 1865, pp. 572, 573.

to the satisfaction of the health committee, and that the council erect labourers' dwellings in accordance with such plans, on the site between Ashfield-street and Sylvester-street." It was stated that the return would be at the rate of 6 per cent.; that the estimated cost was 17,500*l.*, and deductions had been allowed at the rate of 20 per cent.

The reason given by the committee for awarding the premium to one competitor and selecting the plan of another to be carried out, was, that the prize was offered by the council under certain conditions, and the plan to which the premium was awarded was the best plan under those conditions. In the opinion of the officers of the health committee, however, a better building could be deduced from Messrs. Redman & Hesketh's plan, by making certain alterations in it; and, therefore, the committee made the recommendation which has been adopted by the council.

Sir,—You will have noticed the report of council meeting in reference to labourers' dwellings. You see they give the prize to one competitor, adopt the plans of another, and will carry them out, if they build them, with the corporate staff, I am told. You have been a true prophet so far. No. 52 in the altered plans submitted to the council has the bed-rooms enlarged by contracting the sculleries. The size 9 ft. by 8 ft. 4 in. was the original size aimed adverted upon in the *Builder*. Mr. Pictou was quite right in his objection as to the requirement of 150 ft. of area for each house by the Act, and the town clerk got out of the matter badly. The affair is unsatisfactory.

ONE ON THE SPOT.

THE EDUCATION CONFERENCE AT MANCHESTER.

This Conference was convened by the Manchester Educational Committee, who promoted the bill introduced last session by Mr. Bruce, Mr. Forster, and Mr. A. Egerton. The committee, having come to the conclusion that the hon. members should be requested to re-introduce the bill or to support any measure of the Government based on similar principles, invited the Conference together for the purpose of aiding them in the consideration of matters of detail. Numerous gentlemen, Members of Parliament, and others, attended the Conference.

The proceedings were opened by a preliminary meeting of the Education Bill Committee, at which the following report was presented explanatory of the purposes of the Conference:—

That, in the opinion of this committee, it is expedient to make greater provision for the education of the poorer classes, and to provide funds for that purpose by means of local rates under local administration.

That the union of existing schools, either as free schools or aided schools, should form the basis of operation, subject to the conditions laid down in the minutes of the Committee of Council on Education in force for the time being, as reported to Parliament from time to time, and the provision of a concourse clause, but without further interference with the instruction, discipline, or management of such schools.

That power should be given to establish new schools out of the rates, where there is insufficient school accommodation in the schools in union in any locality, if, after due notice, voluntary effort fails to support the deficiency.

That Messrs. Bruce, Forster, and A. Egerton be earnestly requested to re-introduce the bill of last session, or to support any measure brought forward by the Government, if based upon similar principles.

That, with the view of aiding the Education Bill Committee in matters of detail, the opinion of the Conference be invited on the following questions:—

1. The relative advantages of a permissive Bill, and one based on compulsory rating.
2. If the Bill be based on compulsory rating, would it be desirable to make it applicable at once to the whole country, or applicable only by Order in Council, on the report of her Majesty's school inspectors?
3. Is there anything peculiar in the condition of rural parishes which renders it needful to make special regulations on their behalf, or to exempt them from the operations of the Bill?
4. To what extent is it desirable to modify the Minutes of Council so as to include purely secular schools?

After numerous letters, from Earl Russell, Lord Stanley, Mr. J. S. Mill, Mr. T. P. King Shute, and various others, had been read at the committee meeting, the Dean of Manchester moved—

"That the Conference be now opened, and that the Right Hon. H. Austin Bruce, M.P., and Mr. W. E. Forster, M.P., be elected presidents; and that Professor Christie, Dr. John Watts, Mr. Herbert Phillips, Mr. John E. Mayson, and Mr. J. H. Bremner, be requested to act as honorary secretaries."

The motion having passed, the conference was formally opened in the town-hall, where the preliminary meeting was also held.

We cannot give even an abstract report of the conference proceedings, but we may state that, Mr. Bruce having taken the chair, Dr. Watts presented the report of an educational inquiry at Manchester, and the chairman then addressed the meeting, and afterwards a discussion took place on compulsory rating and attendance. Earl de Grey and Ripon then moved the following resolution:—

"That this conference respectfully requests the Right Hon. H. A. Bruce, Mr. W. E. Forster, and Mr. A. Egerton, either to re-introduce the Bill of last session, with such modifications as may be deemed desirable in conference with the Education Bill Committee, to render it more complete, or to lend their support to any Government measure based on similar principles."

This resolution was agreed to, with one dissentient,—the Rev. Mr. Conder.

The special condition of the rural districts was next discussed, after which the subject of secular schools was taken up, and the chairman announced that, in accordance with the wish of the committee, the naming up proposed in the programme would be reserved to the close of the Conference, which was then adjourned till next day, under the chairmanship of Mr. W. E. Forster, M.P.

On the second day there was also a large attendance. The chairman addressed the meeting, and the first two points discussed were—"The Operation of the Industrial Schools Act," and "The Extension of the Factory Act."

After an adjournment, the subject of compulsory school attendance was discussed, and the affirmative was strongly urged and maintained, and the resolution finally adopted and unanimously passed was—

"That the Education Bill Committee be requested, in conjunction with Mr. Besley, to prepare such clauses as they may consider practicable to enforce the attendance of school of neglected children, and to request Mr. Besley to give notice, before any Education Bill that is brought into Parliament arrives at a second reading, that he will introduce such clauses in it."

The Chairman then summed up the principal points of the day's discussion; and Mr. Bruce summed up the principal points of the discussion of the previous day.

A vote of thanks having been passed to Mr. Le Mare, Mr. Bruce, and Mr. Forster, for presiding over the Conference, the proceedings terminated.

THE CO-OPERATIVE MOVEMENT.

The united committees appointed by the operatives in the various branches of the London building trades, for the purpose of establishing a Co-operative Building Company, are at work. At a meeting recently held at the Brown Bear Tavern, Broad-street, Bloomsbury, there were ten committee-men in attendance from the masons, and the same number from the painters, both being elected at meetings of shareholders,—five from the plasterers and five from the carpenters, the two latter bodies not yet having appointed the full number. The bricklayers were not represented, but a communication was received from that body to the effect that their representative would be in attendance at the next meeting. A mason occupied the chair. Several speeches were made, and the details of the plans discussed, together with the draught of the prospectus to be issued; but it was not thought desirable to come to any decisive resolutions until the whole of the five branches were fully represented on the committee. It was stated that nearly 500 members had already joined, the great majority being from the masons and painters. From the reports given in it was estimated that 5,000 shares of 1*l.* each would be taken up in a few weeks, and that the company would be prepared to undertake building operations by the commencement of the season, in March next. No one but operatives will be admitted as shareholders, or to take part in the management of the company. Is this wise?

"A Plumber," writing us from Hyde, draws attention to the circumstance that Mr. Walton, the architect who lately addressed the various branches of the London building trades in favour of co-operative building companies, forgot the plumbers, who, as one correspondent remarks, form a very essential class in house building of the better order. He feels confident that the plumbers would be ready to take shares, and offers to do so himself.

We must suggest caution in the establishment of such a company, or the money subscribed will be lost: everything will depend on the sort of management set up.

A co-operative meeting has been recently held in Birmingham. It appears from the speech of Mr. Dixon, M.P., who presided, that co-operation has not yet struck so deep a root in that town as might have been anticipated. Archdeacon Sandford, who warmly supported the movement, candidly admitted that he had learned political science from Mr. Holyoake, and only wished that, in return, Mr. Holyoake would allow him to give him some lessons in theology. Mr. Hughes stated that there were at present no fewer than 752 societies in this country, with 173,000 members—heads of families, representing a million of population. Mr. Hughes was not satisfied with proving the great financial success of the co-operative system, but showed how greatly the development of that system would tend to improve the moral and social condition of the working classes, and therefore the happiness and prosperity of the nation.

THE INSTITUTION OF CIVIL ENGINEERS.

On the 14th inst., Mr. C. Hutton Gregory, on taking the chair for the first time after his election as president, delivered an address.

He remarked, that when the Institution was founded, fifty years ago, on the 2nd of January, 1818, the members were six in number. Two years later, Thomas Telford became the first president; and the Royal Charter of Incorporation was obtained on the 3rd of June, 1823, by which the Institution was firmly established as the recognized representative body of the engineering profession in the United Kingdom. There were now on the register 1,472 members of all classes, besides ninety-five students. The present condition and prospects of the profession were briefly alluded to, and it was observed, that the railway system of this country had, by economy of transport alone, been productive of direct saving to the public of 15 per cent. on the capital expended.

A reference to the past records of the Institution had brought to light one document, which, Mr. Gregory believed, would be interesting to every engineer. This was a description of the Nature and Objects of Civil Engineering, by Thomas Tredgold, some of the expressions in which had been embodied in the charter; but as it had never yet been printed in a complete form, the president gave it unabridged. After defining the duties required of the civil engineer, Mr. Tredgold concluded by saying that,—

"The real extent to which civil engineering may be applied is limited only by the progress of science; its scope and utility will be increased with every discovery in philosophy, and its resources with every invention in mechanical or chemical art, since its bounds are unlimited, and equally so must be the researches of its professors."

It could hardly, however, have been foreseen that the attention of the civil engineer would have been directed to aid in constructions for defence from hostile attack, and even to the improvement of weapons of war; but as, more than 2,000 years ago, Archimedes, distinguished first in mathematical science, after carrying out the great work of the embankment of the Nile, devoted the last efforts of his genius to engineering appliances for the defence of Syracuse against Marcellus, so now, less directly and less prominently, but with marked success, the combined labours of modern engineers had been applied to the purposes of national defence, and to this subject the president devoted his address.

The Small Arms Factory at Enfield was set to work in January, 1857, under the direction of Colonel Manley Dixon, R.A., the present superintendent. Up to December 26th, 1867, the total number of new arms made at Enfield was 616,828; while the number converted to breech-loaders on Snider's plan to the same date was 175,550. The long Enfield rifle consisted of fifty-three parts, and passed through about 740 processes of manufacture. The machines used were to a great extent varieties of copying-machines, where a standard model was reproduced by a revolving cutter, in wood or metal as might be required. The different pieces, as produced, were checked with the templates and gauges, and, finally, the stock, lock, barrel, bands, bayonet, plates, screws, &c., and their way in numbers to an "assembler," who, furnished only with a screw-driver and a chisel, took up the pieces indiscriminately and fitted them together; and so entirely interchangeable were the parts found to be, that a payment of 3-29 pence for each rifle put together, gave the workman wages

of about fifty shillings per week. It was stated that the average cost of the long Enfield rifles, made at the Government factory, including an allowance of 5 per cent. on the cost of buildings and machinery, for depreciation, had been about 2*l.* each, and of the short Enfields complete, 2*l.* 14*s.* each. The cost of converting to the Snider breech-loader, including 10,000*l.* for the alteration of old machines and the supply of new ones, as well as 5 per cent. for depreciation on buildings and plant, was said to be about 16*s.* 3*d.* per arm.

As a *resumé*, Mr. Gregory admitted, that while it was advisable to maintain the efficiency of the Government establishments, yet that it would be a mistake to extend them so far as to cripple individual enterprise. In the next place he referred to the comparatively unprotected state of the Thames, the Mersey, the Clyde, the Tyne, and other rivers leading to rich towns, docks, and shipping; and he suggested the inquiry, whether if forts were thought to be desirable at such places, they might not be of small size, and capable simply of offering resistance to a sudden attack.

THE PACKET STATION IN THE WEST INDIES.

It is thought that the small barren island Virgin Gorda, will be selected for the station, which will not bear the slightest comparison with Falmouth, Antigua. In the first place, it does not possess the conveniences of the latter; it is more like an open roadstead than a harbour, is equally exposed to the destructive influences that so fatally affect St. Thomas's, and it is in perilous proximity to the dangerous Anegada reef, on which the Royal Mail Company lost one of their most splendid vessels, the *Paramatta*, and on which reef sixty-seven vessels have been wrecked between the years 1811 and 1830, and many others subsequently. It is very remarkable that the Royal Mail Company should cling so tenaciously to the Virgin Islands as their central depot, after the sacrifices they have made, and the heavy losses that have fallen on their shareholders; and this fatal infatuation and preference will seriously injure that company, as at the present moment the French Packet Company are reaping the advantages of this ruinous policy, as who will run the dangerous risk that appears to envelope the Virgin Islands, when he can take a safer and more southerly course.

COOKED FOOD FOR THE PEOPLE.

At the Society of Arts, Adelphi, last week, Mr. S. Teulon in the chair, Mr. W. Riddle, civil engineer, read "The details of a project for the preparation and distribution of hot food, by delivery service, at the homes of the people in cities and towns."

Mr. Riddle proposed to raise a capital of 7,000*l.* to hire a piece of ground, and erect on it a building of iron and glass, 160 ft. long by 40 ft. deep, in sixteen squares of 20 by 20 ft. each, and about 18 ft. high, with louver ventilators. The building, he continued, should be of interchangeable parts, a plain cheap rectangular, probably ridge and furrow-roofed, structure, like a section of the Crystal Palace of 1851. This building would cost, he had been told, from 1,500*l.* to 1,800*l.*; and the district he proposed to work in the first instance was Holloway and its neighbourhood.

One great object he had in view was to show that in small families there was an enormous amount of waste which might be avoided, and his desire was to remedy this evil by cooking plain food on a large scale by a fuel-saving apparatus. With such apparatus they would be enabled to roast, boil, and bake meat, vegetables, and puddings of a plain description, to have the meat carved from the joints by skilful carvers, to have it weighed by assistants, and then placed, with gravy, in tin cases or in covered cylindrical jars. These jars were at once to be placed hot or japanned iron cases, or enchaînés, mounted on a tramway in a room; these cases to be 4 ft. in 5 ft. square, and about 2 ft. 6 in. high, and each to form the separated interior of a cart, about the size of a parcels delivery cart. The vehicle, being thus loaded, and closed behind by a panel, in which there would be as many doors as compartments of jars, would then be driven off to deliver the goods.

After giving an explanation of the system which he suggested should be carried out with regard to the distribution of tickets, and to the general regulation of the carts, &c., Mr. Riddle proceeded to show that the required building should be such as to make it convenient to carry on the various operations of storing, trimming, cooking, carving, weighing, &c. The remains of provisions might be sold to the soup-kitchens of the poor; and it was believed that if this undertaking were carried out in a respectable manner, and on an efficient scale, great public economy of fuel and food would be the result. But if time were money, there would be a saving in thousands of households for the better education, nursing, or general care of children.

Thereafter went on to urge, in favour of his project, that the Glasgow system had proved a paying system, and that if Mr. Corbett, the promoter of that undertaking, could give, as he said, a good dinner for 4*d.*, it was only reasonable to believe that he (Mr. Riddle) could supply a similar benefit, superior in character, and to a somewhat higher class of persons, for 6*d.*—the meal consisting of meat, potatoes, greens, pudding, all of the best quality, and thoroughly hot. He saw no reason why eventually soup should not be provided for the poor and delivered in the poorest districts in common earthen jars carried in carts; and the system of what he denominated (perhaps erroneously), a "civil commissariat" might extend upwards, so that at one-half the prices charged by the great purveyors known in London, elaborate dishes of French or other cookery might find a large sale—the demand arising from the reduction of price, and the public becoming used to the system.

In the discussion which ensued an opinion appeared to prevail that, while there could be no doubt about the feasibility and expediency of providing food for the people, a difficulty suggested itself in regard to the means of conveying cooked food to their homes under such circumstances as would insure the timely attendance of some one to receive it. Mr. Riddle proposed to give only 45 seconds (measured by sand-glass), at each door to answer the dinner knock. This difficulty might not apply to cases where a large number of persons engaged in a manufacture were in the habit of dining together at a regular period, but under an ordinary condition of things the system might prove to be less practicable than was now supposed. However, arrangements were provided by Mr. Riddle for pouring boiling water round the tins, and so keeping the dinner hot even though it were delivered at eleven o'clock, a.m.

THE POLLUTION OF RIVERS COMMISSION.

At Liverpool, the Royal Commission inquiring as to the pollution of rivers, namely, Mr. R. Rawlinson, C.B., as chairman, Mr. J. T. Harrison, C.E., and Professor J. T. Way, have been holding their usual meetings, with, however, a somewhat unusual result. At Liverpool, the great question, water-closets *versus* middens and cesspools, has, as our readers know, been for some few years in process of settlement, by the conversion of thousands of privies by the corporation into thousands of water-closets, with the result, already, of assisting to reduce the previous mortality of 33 in 1,000, in 1863, down to 22·4 in 1867, although, in the interim (as at Croydon, till the new drainage was finally completed), with an increase of mortality and an intervening epidemic. This intervening rise of mortality, as at Croydon, was seized upon by the dirt and midden interest at Liverpool, as against the somewhat expensive water-closet system, and was, in fact, attributed to that system, just as the fever epidemic at Croydon was attributed to the new drainage. Now, it appears that one of the commissioners, Mr. Harrison, seems to have been got hold of by the midden upholders, and was induced to put unanticipated questions on that subject, in the midden interest, to Dr. Trench, who has done so much for the sanitary improvement of Liverpool; and for which unanticipated questions, of course, he did not come prepared, although a single day's previous notice, he said, would have sufficed. The retrogressive tendencies of the opponents of water-closets were materially served by this rise, and serious injury done, as Dr. Trench conceives, to sanitary progress in Liverpool; while, no doubt, the instigators are chuckling at the use to which they have put the

royal commissioner, as well as at the disadvantage to which they have put the local sanitary reformers.

Mr. Rawlinson, with his twenty years' experience as a sanitary reformer, amongst whom he is a leader, felt indignant and annoyed that a fellow-commissioner should have been so green as to allow himself thus to be made a tool of, and expressed himself, in his place as chairman of the commission, rather strongly, on the subject of Mr. Harrison's ignorance of sanitary science; declaring that he could no longer continue the inquiries which the commission were appointed to make, and must submit the matter to the Home Secretary.

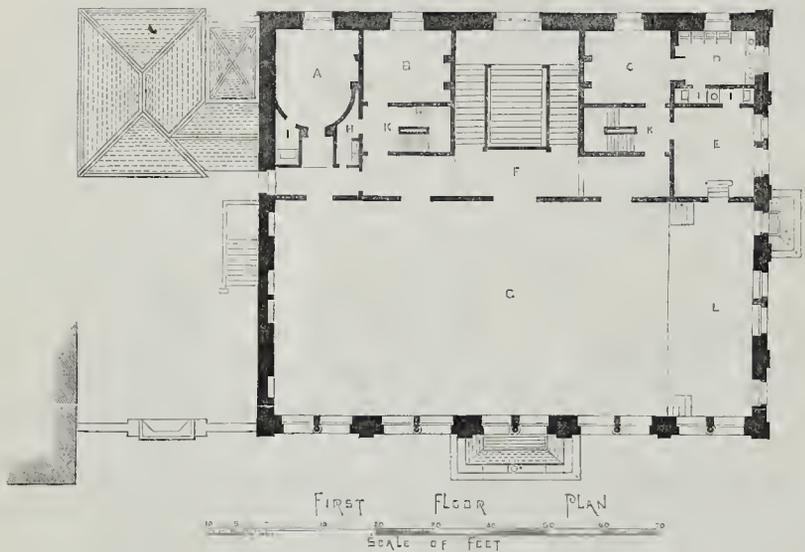

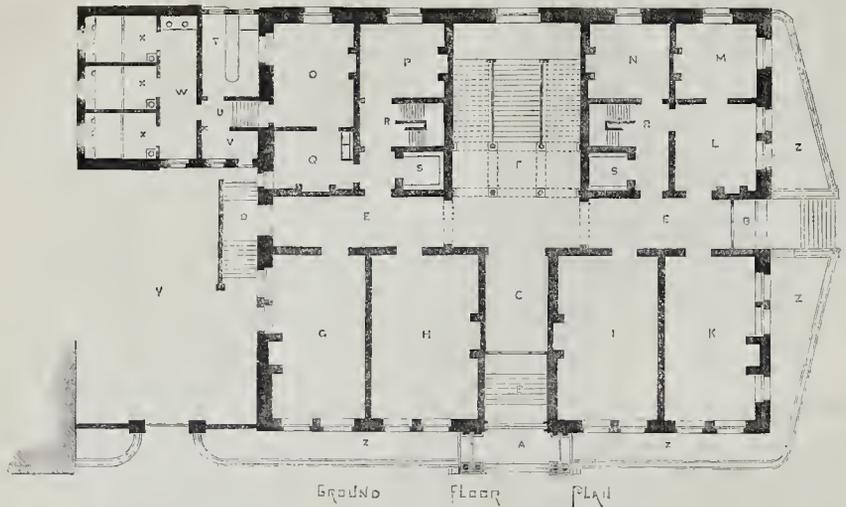

PENDLETON TOWN-HALL, CORPORATION OF SALFORD.

The new Town-hall for Pendleton is now completed, and arrangements will shortly be made for a formal opening of it. It has been erected from the designs of Mr. Alfred Darbyshire, architect. The first stone was laid on the 22nd of November, 1865, on which occasion the Mayor, Mr. Wright Turner, gave some interesting particulars of the progress of the district. In looking back to what Pendleton was half a century ago, he found, he said, that in 1801, that district was but a small suburban village of Manchester or Salford. It contained at that time 3,611 inhabitants, and in 1831, 8,455, the number of people having more than doubled in the course of thirty-one years. But in 1861 Pendleton had increased threefold in this respect, as in that year it contained 20,900 inhabitants, or, including a sub-district now incorporated with Pendleton, a total of 25,448. However great the increase of inhabitants might have been, the property in the district had increased in a greater degree. He could find no record of the assessable property in 1801; but in 1831 the property assessable to poor rates amounted to 16,542*l.*, while in 1861 the total was 107,308*l.* Thus, it would appear that the population had increased sevenfold in sixty years, and the property sevenfold in thirty years. Under those circumstances, the conclusion must be arrived at that the Finance Committee of the Salford Town Council had not gone far wrong in determining to erect a town-hall of the dimensions proposed, especially as, according to the past increase, the number of inhabitants would, in the course of thirty years, equal the population of Bolton, namely, 100,000, and would have property of the rateable value of a million of money. If in Bolton 80,000*l.* were to be spent in the erection of a new town-hall, surely, he said, the Pendleton people ought not to be blamed for contemplating the expenditure of 9,400*l.* in a town-hall for a district which would before long be as large as Bolton was.

The style of the building has been termed French Italian, having, however, a Mediaeval character introduced into the details. The two fronts to Broughton-road and Broad-street are faced with stone from the Halifax quarries, with bands of gray introduced. The portico in Broughton-road contains in the pediment the arms of the Duchy of Lancaster, and the keystone over the doorway is carved with a head of "Time-honour'd Lancaster," with the rose underneath. The pediment under the dome contains, surrounded by scrollwork, the arms of the borough of Salford, and the arms of the corporate towns of the county are introduced in medallions on each side of the assembly-room windows. The pediment is crowned by a figure of Civic Dignity, holding the corporate mace. Between the ground-floor windows are large medallion heads, representing Conquest, Monarchy, Commerce, and the Laws.

On the ground-floor are the offices for the transaction of the district business, such as for the overseers and collectors, surveyor, and two large committee-rooms. The police department contains a dwelling for the inspector, police-office, charge-room, parade-room, and three cells. The whole of the building is clad, and here are the heating apparatus, kitchens, lamp-glasser's room, lavatories, and conveniences for the offices above.

The principal staircase is lighted by a large semi-circular-headed window of stained glass, by Messrs. Edmundson & Son, of Manchester. The centre compartment contains a figure of the Queen, in the robes of the Garter, as Lady of the Manor of Salford and Duchess of Lancaster. In the semicircle above are the Royal arms and

PENDLETON TOWN-HALL.

supporters, and under the figure are the arms of the duchy. In compartments running round the window are the seals of the corporate towns of the county, as also those of the late Prince Consort and the Prince of Wales.

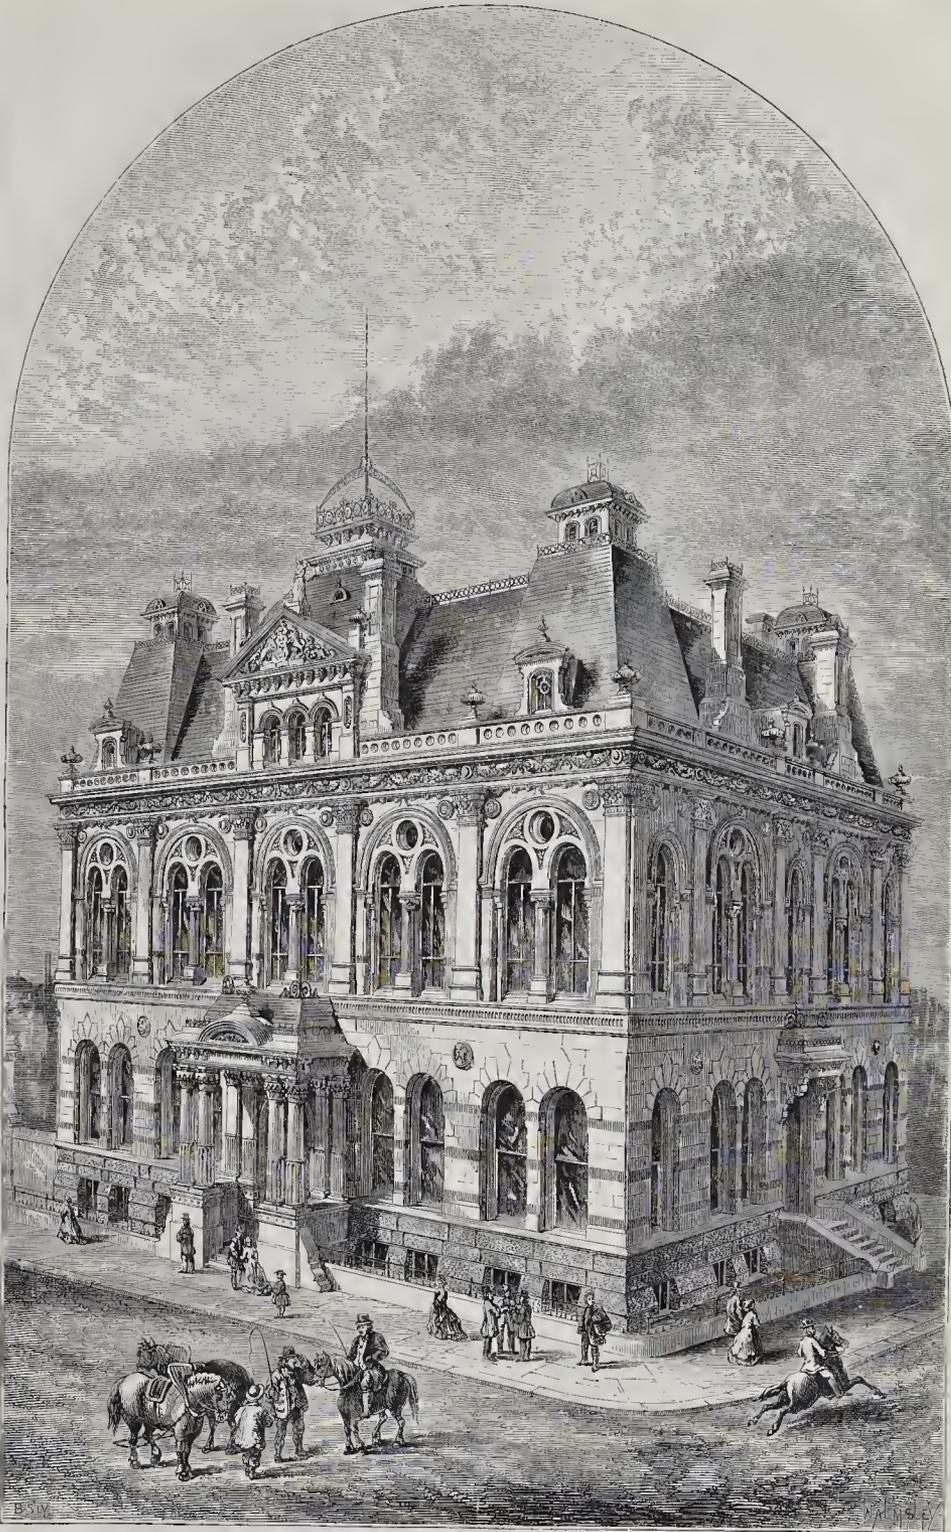

On the first-floor is an assembly-room, 85 ft. 4 in. by 39 ft. 5 in., and 29 ft. 6 in. high. The ceiling is divided into bays, richly panelled, and laid on Nickson & Waddingham's patent slate ground. Attached to this room are retiring-rooms for ladies, gentlemen, and performers. On the second-floor is a lecture-room, 29 ft. by 21 ft. 6 in., and several spare rooms. The roof of the building is so constructed that additional accommodation can be obtained with ease at any future time.

The contract was let to Cochran & Co., of

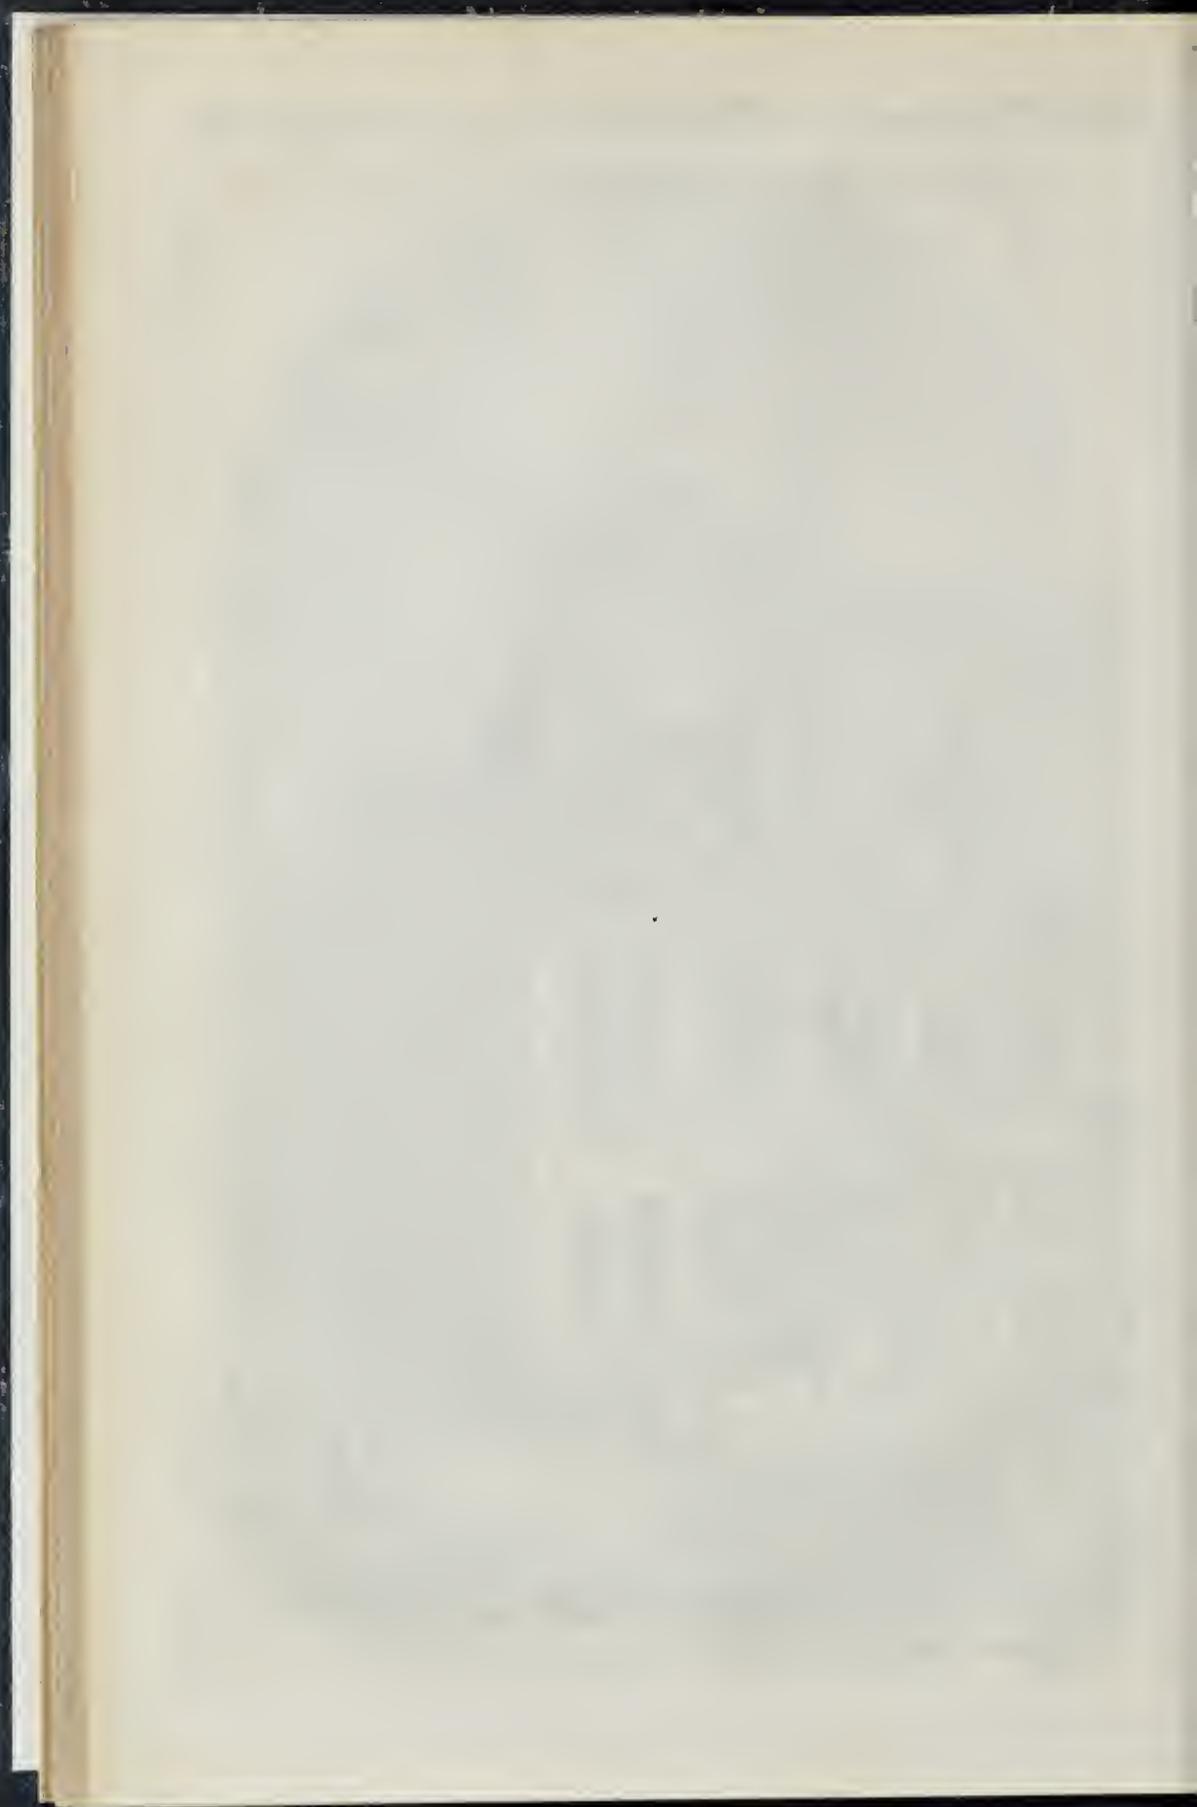

Manchester, for 9,245*l.*; the total cost, however, by improvements and additions, will exceed 10,000*l.*, exclusive of fittings and furniture. The stonework has been executed by Mr. G. Sanders; the brickwork by Griffiths & Johnson; the plastering by Mr. Jelly, of Pendleton, assisted by Mr. H. George; the heating apparatus was supplied by Mr. Cowell, of Salford; and the carving, sculpture, and plaster enrichments have been executed by Mr. T. Gregory. The floor and wall tiles are by Godwin, of Hereford, laid by Mr. D. Conway; the crests and ornamental ironwork were supplied by Macfarlane & Co., of Glasgow. Mr. R. Riding was the clerk of works. We may add that the whole of the works have been executed under the immediate superintendance of the architect.

PENDLETON TOWN-HALL, CORPORATION OF SALFORD.—MR. ALFRED DARBYSHIRE, ARCHITECT.

WARRINGTON SCHOOL OF ART.

The annual meeting of subscribers, and distribution of prizes to the successful students of this Institution during the past year, took place in the reading-room of the Museum, Bold-street. The Right Hon. Col. J. Wilson-Pattin, M.P., occupied the chair, and there was a very large attendance of students and their friends. The chairman, in the course of his address, said he thought the circumstance on which they ought to prize themselves most was this:—The number of gold medals awarded to the whole of England had been 10; of these Birmingham, with 1,009 students on its books, got 1; Glasgow, with 771 students, got 1; Bloomsbury, with 123 students, got 1; Lambeth, with 372 students, got 3; South Kensington, with 839 students, got 2; while Warrington, with only 131 students, got 2 gold medals. This was against the whole of England, and out of ten gold medals Warrington succeeded in getting two. That was very good proof that the School of Art was doing its work well in that town. He believed that it was the same throughout, and that there was more interest taken in the subject here than in any other town in England. Their object was a national one; and as Britons it was not only their interest but their duty to promote institutions of this kind to the utmost of their ability. The mayor and Mr. Rylands had referred to the difficulties under which the country was at present labouring. One of the difficulties was financial, as they could not according to the present regulations afford an instructor in the School of Art to assist their able master, Mr. Thompson. He could only say that his best endeavours and influence would be at their disposal to provide a remedy.

A WORKING MAN'S OPINIONS ON EQUAL WAGES, PIECEWORK, AND EDUCATION.

SIR,—At the present time the British workmen are in great disgrace; all sorts of people have lately taken to giving them advice. It is said that trade is leaving the country, and British goods are losing their place in the markets of the world. Various causes are assigned for it, the principal being deficient education and the action of trades unions, and their opposition to piecework; "and their attempt to reduce wages to a uniform standard, to make all men equal, to bring the good workman down to the level, if not of the worst, of the middling workman." I suppose all, or nearly all, workmen have, at some time or other, cogitated and thought over this matter; and what is more, many of us have had practical experience of an unequal standard of wages, or, as some are pleased to term it, the paying of men according to their abilities, and have found that system anything but satisfactory.

It requires some practical knowledge of the working of different trades before any one is in a position to condemn their system of working. And I think those engaged in the trades are the best able to understand which system is the most workable and advantageous for them; and therefore it is evident that those—he they little or great—who have spoken and condemned us have done so for what they know nothing about. It appears the building operatives are the greatest transgressors in this matter. Now, supposing the advantages of every man working in a shop or on a farm are equal, and that they possess various degrees of efficiency. Even then the best workman has a great advantage over the inferior one, as he is sure of the best work, which, as a rule, is the lightest, so far as physical exertion is concerned; and, of course, the best workman under the equal wage system is the one who would be longest, or even constantly employed, whilst the inferior would suffer from short jobs and precarious employment. It is well known that in the building trade there is a great deal of jobbing and repairs, the greater portion of it being day-work; and among the small builders this is to a large extent done by cheap and inferior workmen. And if the advocates of the unequal wage system want to see it in operation, there is a first-rate opportunity among the small builders of London, and they would find their theory entirely upset, as it is the cheap and inferior workmen that are kept in, and the superior one who is discharged; and thus the clever public is doubly defrauded. But suppose the better class men were willing to make the same rate as the men who stop in it:

would be a wholesale lowering of wages, as the others would be willing to go still lower. And I think it is evident that the best system for the superior workmen is that of a standard rate of wages.

It has often been said that working men object to piecework. As most trades now work piecework, and do not appear anxious for a change, this charge especially applies to the building and allied trades. I have had some little experience of that system, and I believe the objection is greatly exaggerated. The reason why we now object to it is, because it is not carried on in a systematic manner. It is now a system of extortion and imposition. A short time ago I was working in a shop, rules were hung up, stating that all work was to be paid for according to the prices given in "Laxton's Price-Book." No one in the shop objected to it. But we soon found it was a mere hoax, and from the time the rules were hung up till we left, the employer shuffled out of his agreement and proposal.

His method was, where a workman had earned above his usual wages, to pretend the work was wanted, and two or three others would be sent on to help him, and make day-work of it. Another method of the piece-master is to give so much for a job, and then, if a man make more than day-work price, to cut down the next job, so that a man could not earn day-work wages. I might go on adding cases like the above; and I would ask, if the employers are anxious to introduce the piecework system, why do they not issue a fixed price-list, which shall be general throughout the trade? And if it happens that here and there, one man can, by extra skill or over-physical exertion, make more money than the rest, let not that be made a plea for reducing the prices till men cannot earn day-wages.

It is a well-known scientific fact, that great workers, as a rule, are short-lived, the loss of force which the extra and over-physical exertion entails has more than counter-balanced the pecuniary benefits. It has induced disease of their system, and brought them to an early grave. I have known men in small towns who have been pointed at as those who by over-work had brought themselves to Death's door; and if such cases are to be found in villages and small towns, it appears to me that the dictates of reason and the well-being of society demand that such trades as require both physical and mental labour should be regulated by those concerned, so as not to bring ill upon them which time cannot repair.

Education is all the cry; and I think the intelligent workman, the capitalist, and philanthropist will call it a very good cry. I think it has long been apparent to many of the leading minds of this country that the system of education in every branch of knowledge, whether of the school or the workshop, was miserably deficient, and required great reform. I believe there is not an intelligent workman but feels that, in spite of the many advantages which a cheap press and the works which have been issued from the press of the ever-to-be-honoured Knight, Cassell, Chambers, and others, much is still wanted; but still a great deal more might have been done had working men thirsted for knowledge. And it appears to me that, in all the discussions which have lately taken place on that important question, one fact is entirely lost sight of, and that is, that a large portion of the employing class are hardly one degree removed in technical knowledge from their workmen; many of their businesses are carried on, not by their knowledge or intelligence, but by those whom they appoint as foremen; and unless something is done for that class, their selfishness and ignorance will go far to mar the progress of the other.

A master now takes an apprentice, and agrees to teach him a trade; but experience proves that in so doing there is no well-defined system; he is left to catch it up in a haphazard manner. The process is rarely scientifically explained, nor are works upon the various manipulations required to perfect him in his art within his reach. The employer does not provide anything of the sort, although common sense would suppose it would be in his interest to make such provision; and I believe there is not in London, with all its pretended enlightenment, a public scientific library that is within the reach of the working man; and, what is more, the employers as a class do not support educational institutes when established. Three or four years ago much noise was made about establishing working men's clubs, and it was sup-

posed that the movement would have received a large share of the employer's support; but time has proved that effort has been nil. And it is a lamentable fact that many of these social and intellectual institutions are entirely closed, and many others are in a sickly condition. I have been a member from the first starting of the Clerkenwell club, and of all places it was supposed that an institute upon the club system would flourish there. Clerkenwell is noted for watch-making and other fancy and artistic trades. But the public spirit of the employers is at the lowest ebb; and I believe I am justified in saying that, not since the club commenced, three years ago, has it received the support of even three or four of the employers, either pecuniary or otherwise. The consequence of their neglect has been that the club is a failure: the lectures have failed; the classes, for want of funds and efficient teachers, have not been attended. Although the club is not closed, it has only been kept open by the efforts and pecuniary sacrifice of its secretary, who is an enlightened and patriotic working man. It may in this case be truly said, like master like man, as both parties are sadly deficient of those qualities which constitute the progress and well-being of the nation. There are many other questions which form a part of the great social problem, and I think a moment's reflection will convince the public that the workman is not the only transgressor, and that he can, whether agreeing or disagreeing with trades unions, show that there are two sides, and both must be considered before a satisfactory issue can be arrived at. I hope you will think a working man's opinions worthy of insertion in the columns of the *Builder*.

JACK PLANE.

PIECEWORK.

SIR,—In reading your interesting review of the reports of the artisans who visited the Paris Exhibition, I am pleased to find a few of them are in favour of piecework. I hope soon to see it the general rule throughout the building trade. I am sure it would be beneficial to both employer and employed. I will give you a proof from my own experience. Some time ago, my wife's health being delicate, change of air became necessary. I resolved to leave London for a time, and got a job in a joiner's shop in the country, some fifty miles from town, at 61d. per hour. I soon began to feel the effect of the reduction from 8d. per hour, as provisions were in excess of London prices. As the firm was busy I applied for piecework, and obtained it, at a price which may be termed moderate. I was then able to earn, instead of 61d., 9d., per hour, and I may add, my employer gained an extra profit of about 17 per cent. The piecework system is, I believe, rather objected to by the trade union. Now, I am not an enemy to trade societies, if based upon a sound and reasonable principle; but I cannot see the justice of first, second, and third ability receiving an equal remuneration.

I once questioned the justice of this system to a chief member of one of the lodges (I was then a member myself). His answer was, that the good must make up for the bad, which, as I understand it, amounts to this:—Supposing myself to be a good workman, and with me is put an inferior one. To work out the above rule, I must exert myself to the best of my strength and ability, so that my employer may not be a loser, by paying a bad or lazy workman more than he is able or willing to earn. That this is right and just is believed by thousands. Hitherto I am one of the unconverted. I think that every man, before being admitted a member, should prove that he is qualified to demand the highest sum paid; or otherwise, every man should be allowed to carry his labour to the highest market.

I remember, in the summer of 1862, I had charge of a job at the West-end. Being in want of hands, I called at one of the lodges, and left my address, for two good workmen to come as soon as possible. The next day two brought their tools and started work. A worse pair I never met with; and one, in particular, was perfectly useless. I took him from a job I could see he was totally ignorant of, and put him to one more simple: that was still worse.

I recollect he remarked, at starting, that there would not be much of it done for 7d.; he was quite right, for I found at the end of the week he had earned about 2s. a day. On the

Saturday I paid him at the rate of 7d. per hour, and told him for the future I could not give him more than 6d. At that he began to abuse, demanding his back day. His mate stepped forward, saying he would have his, too, for they had both come together, and they would both go together: so away they went,—I have no doubt to their lodges, to place their names again upon the books. I afterwards found that both of them had been discharged from seven different jobs, in about twelve months, for either drunkenness or laziness. These are the class of men who, sheltering themselves under the protection of a trade society, do so much injury to social society. Should piecework become general, the next ten years would produce a better class of men in every respect, as each would stand upon his individual merit, and receive a fair remuneration according to his ability. I am afraid, Mr. Editor, I have trespassed too far upon your valuable space, but this is a question of great importance to the mechanic in whatever branch, and I know you are ever ready to assist in promoting the welfare of the working class.

F. D., a Working Man.

WORKING-MEN, HELP YOURSELVES.

Sir,—The reports by the working-men who visited Paris, to which you have given prominence, are exceedingly interesting. It seems to me, though, that they insist too much on the necessity of having museums and schools provided for them. Doubtless, these are a want; but since the wanters have grown so independent of the moneyed classes, who alone supply all these things in England, they ought to put their own shoulders to the wheel and leave their own cars out of the mire of ignorance. They seem not to remember that here everything has to be done by private benevolence, whereas on the Continent the Government (which means taxation on rich and poor alike) supplies education and educational exhibitions. The best help is,—

SELF-HELP.

MORE SCHOOLS FOR SCIENCE AND ART.

In the *Builder* of January 11th, is an article, entitled "More Schools of Science and Art," which contains a statement that needs explanation. The payments made on results, of sums varying from 1l. to 5l. per pupil, are for Science Schools only; and, I regret to say that Art-Schools have to thrive as best they may on a much lower scale of payment on results. The sums paid to Schools of Art, are 10s. for every paper passed in either of the five subjects of examination, viz.—Free-hand drawing, model drawing, practical geometry, perspective, and mechanical drawing; 15s. for every student who sends to London a satisfactory set of studies in the earlier stages of instruction; and 20s. for satisfactory sets in the advanced stages. So that when once a student has passed in his four or five papers (the mechanical examination being only passed by machinists, &c.), the highest amount which can be received according to present regulations is the 1l. for advanced works, or the 15s. for elementary works, the latter, including the most elaborate drawings of machinery, made from actual measurement. I know that there are two classes of higher payments offered; 5l. for national scholarships; and 10l. for a student who can gain an "Art-Master's certificate!" These high payments sound very well, but are so rarely obtained by schools, as to preclude them being looked forward to as Government help.

All the above-mentioned amounts are paid on those only who are *artisans*, the Department definition for an "artisan student" being one who belongs to the working-classes, or is a clerk, &c., but who does not pay income-tax. So directly an artisan gets his 2l. per week, the Government aid on him is cut off; and the artisan, with his increased wages, does not seem inclined to pay higher fees for his art-instruction. Thus, what with this "income-tax" regulation, and the very unsatisfactory construction which the Department puts upon "satisfactory" results, the Government aid to art-schools is in many cases hardly worth receiving.

Science schools get a much greater amount of aid from Government than art schools. I do not consider that the former get too much, or even enough; but I do think that art should not re-

ceive less encouragement than science, especially when we take into consideration the fact that, in most cases, a science class meets only for some thirty or forty lectures during the year, perhaps in a national school-room or mechanics institute; whereas a school of art is a special building set apart for one specific purpose. It has to be fitted with valuable art-examples, and is kept open for ten months for three or five days and nights a week (with expensive gas-bills, &c.). The masters, too, are especially devoted to their particular duties as art-teachers, and are not, as in the case of the great majority of science-masters, otherwise professionally occupied as national school-masters, or medical men, &c.

I give the following tabulated statement, comparing the aid given to science and art schools. The figures speak for themselves, and, for their correctness I beg to refer your readers to the "Fourteenth Report of the Science and Art Department," at pages vi, vii, 153, and 159:—

	Science Schools.	Art Schools.
For the year 1868.		
Total number of Schools	153	112
Total number under Instruction	6,535	18,139
Number of Successful Students	3,562	6,301
Payments on Results	£5,002 7 6	£4,192 0 0
Average amount of Government aid per Student	18s. 6d.	4s. 7d.

In conclusion I must state that, if the country wish to secure the services of efficient masters for art-schools, the Government aid must be greatly increased. I know several masters who intend giving up their connexion with the Department if masters are not speedily metted: I, for one, will follow their example.

Q., Art-Master.

HERNE BAY PIER.

Sir,—I very much hope that the suggestion offered by "Paulatin" in your last week's number will be earnestly taken up, and that Herne Bay Pier may once more be a favourite promenade and landing-place. I should be most happy to render assistance in the matter; and if the requisite funds were raised, I would cheerfully give my professional services in carrying out a substantial reconstruction; this would, of course, be equivalent to a subscription. I hope "Paulatin" will not let the matter rest; there are many who, I am sure, would cordially cooperate.

C. E.

OUR DAILY WATER.

Sir,—In our establishment there are two hall-locks, which have long been out of order. I every day hear the water gurgling down the overflow-pipes. None are inconvenienced, so no one cares; and the water goes on wasting daily (more than is used), till turned off at the main. Why not a constant supply of turning it on and off twice a day? Let there be periodical inspections of hall-locks, cisterns, &c.; it would be an improvement without objection, and a decided gain to all. None of our men remaining down a "visitation" of the water "vigilants"; their dangerous grations amidst vehicles ought to be discontinued.

R. T.

SNOW AND THE SEWERS.

Sir,—There can be no doubt that the plan of using the sewers for the removal of snow from the streets is not only the quickest and cheapest, but the most efficient that can be adopted. Those who are in the habit of entering the sewers know that the temperature of the sewer air, and also of the sewage-currents, ranges, at all seasons, from 70° to 80°; so that if the snow in the streets be thrown or washed down the air-shafts, the gutters, or the side-entrances, which communicate with the main sewers, the currents there are not only warm enough to melt it, but strong enough to carry it away. This is the idea originally occurred to me. Subsequently I proposed, in the *Builder*, that snow-shafts, with tanks at bottom, and gratings near the top, should be built at convenient situations at the sides of the main sewers; and that the snow should be thrown down the shafts, and washed into the sewers by forcible jets of water directed upon it from hose screwed to stand-pipes in the streets. This process, I believe, would be found far more expeditious and efficacious than that of melting the snow by complicated and expensive "gas-jet" or "steam-jet" arrangements, however applied. This, however, can best be ascertained by properly-conducted experiments.

As to the original idea of using the sewers for receiving the snow from the streets, I may observe that when the first heavy fall of snow occurred in January last year,

* That the comparison may be perfectly fair, this item is 500s. more than it actually was, so as to bring it up to our present scale of results for Art-teaching, which are in advance of those that existed in 1866.

I suggested the plan to one of the metropolitan district surveyors, who immediately put it into operation with successful results. I also at the same time wrote a letter to the *Times*, making the same suggestion; which, however, they did not publish. I first proposed the plan on the 2nd or 3rd of the month, which would be some two or three days before Mr. Lovegrove, or any one, other than the gentleman referred to, used the sewers for the purpose. My letter, written from the Isle of Wight on the 7th or 8th, did not appear in the *Builder* until the 19th, more than a fortnight after I first made the suggestion.* Mr. Lovegrove was close on my heels, and perhaps he, as also your other correspondents, but upon the plan without knowing that it had been already proposed and acted upon. The priority in the suggestion, therefore, still remains with me. I should not have said so in the *Builder*, the week before last, had I not known that such was the fact.

JOHN PHILLIPS.

* Mr. Phillips has done so much in respect of drainage that we are unwilling to refuse insertion of this note. In truth, however, many must have said, when the snow was in the way, "Why not throw it into the sewers?" And many did say it, though without knowing whether it would have fast enough to get away or not.

HEATING A BATH.

Sir,—I do not agree with the Plumber whose letter appeared in your journal of the 18th. At present, in an ordinary house, there is no better plan than to let the kitchen fire warm the water. If you do not wish the trouble or expense of carrying hot-water pipes to your bath-room, place your moveable bath before the kitchen fire, and draw hot water from the boiler, which need not be large, as much cold may be added. If you object to make your kitchen or adjoining room a bath-room, affix a boiler to a fire-place in another room, or even a moveable boiler placed on the fire would be less troublesome than a fire attached to a bath.

C. E. B.

MARKS ON DEALS.

Sir,—I would advise "A Young Beginner" not to enter a timber yard until he has obtained a sufficient knowledge of the material to understand its nature and value; for, should he buy on his own account, he will be apt to deceive himself; or if purchasing for another, probably injure his employer, especially if he will not believe the word of foremen and others, whose employers are generally a respectable and substantial class of traders, who would be liable to an action for fraud and misrepresentation.

A YARD FOREMAN.

A LIGHT AND AIR CASE.

Cooke v. Fowler.—This was an injunction suit in the Vice-Chancellors' Court, to restrain the defendant from interfering by the raising of a certain building, with the plaintiff's light and air. The plaintiff's premises were at Bristol; and, till the interference complained of, he had been in the enjoyment of an extended view over the country. The defendant's new building which he proposed to raise was to be 6 ft. above the plaintiff's window site, obstructing nearly two-thirds of the window itself, and 6 ft. nearer to it than the old building. The plaintiff had offered to compromise the suit by allowing a certain portion of the defendant's new structure to be built; but that offer was refused.

The Vice-Chancellor, after referring to the evidence in the case, which he saw in great instances, contradictory, granted an injunction, as prayed by the bill in the suit, and ordered the defendant to reduce his building to its original proportions, or, if he had refused the offer made by the plaintiff to compromise the suit, he must pay the costs.

THE EPITAPH ON GIBBON.

ONE correspondent having been at the trouble of transcribing the inscription by Dr. Parr to the memory of Gibbon on the Mansoleum erected by the Earl of Sheffield in Fletching Church, Sussex, and two or three having expressed a desire to have it as complementary to what has been said in our pages on the subject of his death-place, we print it:—

EDWARDUS GIBBON

Criticus ac ingenio et multiplo doctriinis ornatus
idemque historicorum qui fortissimus
vel latentis et inludat vel eversi et funditus delati
litteris mandaverit
omnium facile princeps
cujus in mortuis erat modesto animi
cum liberali quadam specie conjuncta
in sermone
multa gravitate comitas suaviter adspersa
in scriptis
copiosum splendidum
concinnum breve verborum
et summo artificio distinctum
oratiois genus
recomendat exquisitae sententiae
et in summo rerum politico
sentis et perspicue prudentis

ex voluntate Johannis Domini Sheffield
qui amico bene merenti et fovitori humanissimo
H. TAB. P. C.

* Mr. Lovegrove had already written—"In my letter to the *Times* and to the *Surveyors*, twenty days should be allowed for the snow to be melted. Will you kindly correct this in your next."—Ed.

METROPOLITAN BOARD OF WORKS.

SOUTHWARK PARK.

At the meeting of the Metropolitan Board of Works on Friday, the 17th inst., Mr. Cyrus Legg, the member for Bermondsey, drew the attention of the Board to the slow progress of the works in this park, and moved, "That a special committee be appointed to lay out and superintend the planting of Southwark Park, and that they be instructed to open the same at the earliest possible period for the use of the public." This was seconded, and upon a division negatived, the numbers (49) being equal. Mr. Freeman, the chairman of the works and general purposes committee (which has the management of the park), remarking that "the matter was being pushed on as speedily as was advisable." Mr. Collinson then moved, "That the works and general purposes committee be requested to report to this Board at the earliest opportunity the present condition of Southwark and Finsbury Parks, and the earliest date at which they can be opened." Agreed to.

NEW STREET IN LIMEHOUSE.

It is proposed to cut through the notorious St. Ann's Rookery, Limehouse, a vile quarter lying between Limehouse Church and Limehouse-cut, by a broad new street. The length of the street will be about 190 yards, and it will run in a straight line, in continuation westward of Dod-street, Bardett-road, to the gateway at the north side of the churchyard. The inhabitants generally of this extremely backward parish seem much pleased at the prospect. The expense will be trifling, considering the great good to be effected.

At the last weekly meeting of this Board, Mr. Shaw moved that all future inquiries regarding the matter of security given by Mr. Furness, the contractor, he held at an open board; and that copies of all proceedings already printed by the Board be forwarded to the several vestries, &c.

The chairman asked the solicitor to state whether in his opinion they would be justified in publishing, as proposed, the evidence received by the committee.

The solicitor of the Board intimated that he had put his opinion in writing, and begged to read it for the Board. He saw no reason why the Board should not create a division amongst themselves, for their own private use, any paper hearing upon any matter before them; but he considered that great care should be taken in publishing any matter of the making public of which would injure another, or in publishing papers or documents that would have the effect of exposing the concerns of others.

Mr. Weston moved as an amendment, "That, as the inquiry into the statements of Mr. Furness by a committee of the whole Board, has been hitherto conducted by the members of that committee as all other business of this Board is transacted, and as the inquiry is still in progress, it is inadvisable to take the course proposed by Mr. S. Shaw."

The motion being seconded, Mr. Thompson said he was one of those who had supported the proposition that this evidence should be taken in public; but, having heard the opinion of the solicitor of the Board, he must vote against it. The motion of Mr. Shaw, because it was premature and inefficient, the committee not having yet made up a report.

After an animated discussion a division took place on the amendment, with the following result:—

Table with 2 columns: Motion/Amendment and Count. For the amendment: 25. Against: 7. Majorly for the amendment: 18.

The original motion was accordingly lost. Mr. Doulton, M.P., and two other members did not vote.

COMPENSATION CASE: HOUSES IN THE POULTRY.

Wheeler v. The Metropolitan Board of Works.—In this case, tried in the Lord Mayor's Court, Guildhall, the claimant, Mr. Wheeler (according to his counsel, Mr. H. Hawkins) carried on business as a hosier, glove-maker, &c. in No. 24, the new street in the Poultry, and the removal of the Blackfriars to the Mansion House, would have the effect of utterly and entirely destroying a business which had been carried on for many years in the premises. The claimant held the property under two leases, the first of which was granted in July, 1852, which comprised the whole of the front part of the shop, which lease he took from his landlord, Mr. H. under the Clothworkers' Company, and for which the claimant paid a premium of 2,000*l.*, and was obligated to pay a rental of 65*l.* per annum. He also held out a considerable sum of money upon this property. In the rear part of the shop, there were 15 years unexpired, and of the second 18 years, giving an average of 10 years purchase. He should call three witnesses of long and unimpaired experience, who would say that first premium should be deducted the reserved rent of 65*l.*, leaving a profit of 47*l.*, which, at 10 years purchase, gave a sum of 470*l.* The annual value of the back portion was

estimated at 230*l.*, giving a profit rental of 103*l.*, and that, at 10-25 years purchase, gave a sum of 1,057*l.* To these two sums he added 10 per cent. for compulsory sale, making the value of the leasehold interest 6,774*l.* The fixtures had been valued at 800*l.* The next question to be considered was, as to what sum the claimant was entitled in respect of the loss and destruction of a business which had been established for more than forty years. The profits were estimated at 4,000*l.* per annum, from which amount they must deduct whatever they found to be the amount of the profit rental, and then he should confidently ask the jury to award Mr. Wheeler three years' profits. The remaining items of claim were depreciation of stock, 3,078*l.*, and 100*l.* for personal inconvenience and removal.

The total amount of the claim as set in was 21,600*l.* Mr. Clerk (Farebrother, Clark, & Co.), Mr. Edwin Fox (Fox & Bousfield), and Mr. Farmer (Debenham, Tesson, & Farmer), gave evidence as to the value of the leasehold interest; and Messrs. Hillebrand, Markin, Vining, Hong, Head, and Lewis, as to the trade claim.

The witnesses for the Board of Works were Mr. Trist (Norton, Trist, & Co.), Mr. St. Quintin (St. Quintin & Nott), and Mr. Marsh, who severely valued the leasehold interest very much below that of the claimant's witnesses, although the latter witness admitted that property had doubled in value in the city.

The jury, after a lengthened consultation, awarded the claimant 10,200*l.*

SOCIETY OF ENGINEERS.

At the first ordinary meeting for this session, held on Monday, the 20th inst., Mr. W. H. Le Feuvre in the chair, premiums for papers read during 1867 were presented to Messrs. S. W. Worssam, jun., for his paper on "Mechanical Saws;" A. Riggs, jun., for his paper on "Heavy Guns;" J. Gresham, for his paper on "The Injector;" Ewing Matheson, for his paper on "The Quality of Iron." Mr. Baldwin Latham, president for 1868, delivered his inaugural address. A vote of thanks to the retiring president was passed.

The following candidates were balloted for, and duly elected as members:—R. F. Fairlie, J. F. Chappell, Henry Groe, Lieut.-colonel Henry Wray, R. E., George Spencer. As associates, James Knox, Edward Harlock, C. W. Salmon.

TRADES UNIONS AND ANTI-TRADES UNIONS.

The Cheshire and South Lancashire Branch of the General Builders' Association held their last monthly meeting at the Blossoms Hotel, Chester, when there were present, from Warrington, Alderman Hepher (in the chair), Councillor Whittle, and Mr. Gibson; from St. Helena, Messrs. William Harrison (president of this branch), Harris, and Belsler; from Northwich, Messrs. R. Beckett, W. Leicester, W. Cross, J. Holland, J. Bostock, C. Shaw, W. Chadwick (secretary); there were also Messrs. Brazendale (Lynn); Penington (Earlstown); Cochrane (Knuttsford); Clay (Manchester), and about twenty others from different parts of Cheshire and Lancashire.

At the conclusion of the usual routine business of the association, an animated discussion took place on the registration scheme, now established in various towns, the object of which the following notice will best explain:—

"To Workmen of the various Branches of the Building Trades in

Operative bricklayers, carpenters and joiners, labourers, masons, painters, plasterers, plumbers and glaziers, and slaters, who are not members of any trades union, are hereby requested to register their names with ——. This registration office has been opened for the purpose of enabling non-society workmen to obtain work when they are out, and employers to obtain non-society men when requiring them. It is in connexion with other offices in all parts of the country. Men who register their names will be informed what masters in their own or other towns require men, and who will, as far as possible, protect them from intimidation or interference. But every man will be at perfect liberty to go, or refrain from going, to any place as he may think fit. There will be no payment required whatever. It is proposed, as soon as arrangements can be made, to establish a benefit society in connexion with this registration, but no one who registers his name will be required to join this benefit society unless he wishes. For the present, the only purpose is to enable non-society men, who are for the time unemployed, to obtain work, and to know each other, and to get support in their endeavour to keep free from societies whose acts and objects they do not approve. The office is situated in ——. It is open from ten till seven daily; and there all further particulars may be obtained. Master builders, and other masters connected with the trade requiring workmen, are requested to apply as above."

It being hinted that some intimidation was intended towards the registrars appointed under this scheme, a resolution was passed pledging the support of the association to these officials in case of any illegal interference.

The entire company then adjourned to the Groevoren Hotel, where they were met by a number of the builders of Chester, who had

been specially invited to be present to hear an exposition of the objects and aims of the association by Mr. A. Manly, of Birmingham, the general secretary, with a view to the formation of a local society at Chester.

Several members from Manchester and other places also gave their opinions of the value of such an association, at the conclusion of which the Chester gentlemen present gave in their names as members.

The Edge-tool Trade-union of Sheffield have returned to Mr. David Ward, of the firm of Ward & Payne, edge-tool manufacturers, the sum of 30*l.*, which was extorted from them by the union in August, 1865, under the following circumstances:—Messrs. Ward & Payne brought from London a first-class maker of graving tools, named Addis, who, having some acquaintance with engraving, was able to make tools better adapted for engravers than any which mere ordinary workmen could make. The Edge-tool Union objected to Addis being employed, and refused his offer to pay 15*l.* and join the union. Eventually they fined Ward & Payne 30*l.* for employing the man, and in the then condition of affairs, with rival manufacturers waiting to make their market out of the dispute, the firm paid the money under protest.

IS WESTMINSTER ABBEY A ROYAL PALACE?

The Dean and Chapter say it is, and that the District Surveyor has no jurisdiction there. The surveyor, backed by the Board of Works, thinks otherwise; and shows he has good reason for interfering, whatever may be his right, by the statement that a pipe for heating part of the Abbey has been placed so close to the roof of the Jerusalem Chamber that the venerable pile is endangered by it. Last week the question was argued before Mr. Arnold at the Westminster Police Court. Mr. Vaughan Richards, for the Chapter, referred to the *Gazette* of April 13, 1838, in which in the royal proclamation the coronation is appointed to be held in "our Palace of Westminster." In the time of Edward the Confessor the Palace of Westminster and the royal chapel were closely adjacent, as illustrated in a piece of the Bayeux tapestry, in which a man is represented standing on the roof of the chapel holding on by the weathercock of the chapel and the tower of the palace. Further, he referred to a work lately published by the Rev. Dean Stanley, entitled "Memorials of Westminster Abbey," in which was said:—"The monastery and church of Westminster were, as we have seen, enclosed within the precincts of the Palace of Westminster as completely as the Abbey of Holyrood and the convent of the Escorial were united with those palaces of the Scottish and Spanish sovereigns; the abbey was, in fact, a royal chapel on a gigantic scale. The king had a private entrance to it from the south transept, almost direct from the Confessor's Hall. Even to this day, in official language, the coronations are said to take place in our Palace of Westminster, though the sovereign never sets foot strictly in the palace so called; the whole ceremony is confined to the abbey, which for the time passes entirely into possession of the Crown and its officers." He mentioned instances in which the Crown showed its entire control over the abbey at coronations, and amongst other arguments spoke of the Pix Chamber, where the standard coins and measures of the realm are kept, and of that chamber the Dean and Chapter never has the key, but it is in the safe custody of an officer of her Majesty's Treasury. Finally, he quoted the case of "Say v. Hammond," in which it was held that a place where the arms of the militia were kept was held to be a place for the use and service of her Majesty.

Mr. Philbrick, on the part of the district surveyor, contended that the freehold having passed by charter from the Crown to the dean and chapter, it could not be considered a royal palace, or one intended for the use and service of the sovereign. It was a place of public worship, and therefore was included in the Act of Parliament under discussion as a place not exempt from the operations of the Act.

Mr. Arnold said, in adjoining the matter *sine die*, that so important a question should rather form the subject matter of proceedings in a superior than in a police court.

CHURCH-BUILDING NEWS.

Wapley (near Yale, Gloucestershire).—Wapley Church has been re-opened. The edifice is very small, not exceeding the size of many a village school-room. Being very old, the interior was found some time ago to want improving, and it has been closed for several weeks while the work was being carried on. It was found that there were no repairs wanted to the main fabric, and the walls of which are at least 2 ft. thick, and in a good state of preservation; and in the alterations effected it was resolved to leave the interior of the church in its plain and unadorned state; but a variety of alterations and improvements have been effected in the church and churchyard, at a cost of about 600l. In the work of restoring the church, and building a new school, the vicar has been largely helped by the farmers, and by many personal friends. A high wall which surrounded the burial-ground has been removed, and a sunken fence made all round. The whole of the churchyard has been drained, in some places as deep as 8 ft.; and new iron entrance-gates have been fixed. The old high-back seats in the church have been taken out, and low stained deal seats substituted. A new flooring has been laid. On the south side of the chancel there was, until recently, "The Codrington Chapel," a part screened off from the body of the church; the screen has been removed, and the "chapel" is added to the church, by which a gain of nearly fifty seats has been made. The church altogether will seat only about 150 persons. The heltry was originally on the stone floor of the tower; a ringing-loft has now been erected, and the stone floor having given way to a timber one, the base of the tower will in future be used as a vestry, instead of the Codrington Chapel. In this latter place—the chapel—a window, with colored glass, designed by Messrs. Foster & Wood, has replaced the old plain glass window, as a memorial of the late Sir C. W. Codrington, who was lord of the manor. This makes the third stained window in the church, there being one over the reredos and one in the west window, which was placed there during the period Canon Girdlestone was vicar.

Lower Heyford.—The Parish Church of St. Mary, Lower Heyford, has been re-opened for divine service after a restoration and renovation at a cost of about 1,240l., of which 350l. have been borrowed from the Public Works Commissioners. The works just completed are for the most part restorations, and do not in any way alter the general character of the building. The roofs of the south aisle and chancel have been repaired. The plaster ceiling having been removed from the latter, the old oaken timbers are once more exposed to view. New oak boarding has also been introduced into this portion of the edifice, where it seemed requisite. A complete clearance has been made of the old floor and seats, and new ones substituted. The floor is hoarded under the seats, but the passage-ways and chancel are laid with encaustic tiles from the works of Mr. Godwin, of Lugwardine. The seats are all of oak, the parts next to the passage-ways being of panelled tracery. The chancel stalls, altar, altar-rail, pulpit, and lectern, are likewise of oak. The windows have been glazed with tinted glass, and the walls inside replastered. The church is heated by a system of iron stoves placed beneath the floor, by Messrs. Remington, of Bolton. The five bells have been rehung, and the large tenor bell recast by Messrs. Myers & Stainbank, London. Mr. Buckeridge, of Oxford, was the architect employed, and Messrs. Jos. Castle & Co., of that city, the builders.

Weymouth.—For some considerable time the accommodation afforded by St. John's Church has been felt to be inadequate to the requirements of the district and the increasing population of the neighborhood. In consequence it has been at length determined to enlarge the church, and a sufficient amount of funds having been obtained to justify the commencement of the work, the initiatory proceeding of laying the corner stone of the new buildings has just taken place. The contemplated extension consists in taking down the existing chancel, chancel arch, vestry, transepts, &c., and prolonging the nave 15 ft., extending the transepts 6 ft., at the same time doubling the width, and dividing the centre by arches and piers to support the roofs, which are to be constructed double, thus making two gables to each transept. It will, of course, be necessary to rebuild the chancel, which will have an additional length of 9 ft., having a

chancel-chapel and porch facing the Preston-road, with vestries for the clergy and choristers abutting on the Dorchester-road. It is intended that the style of the new work shall be in conformity with the style of the existing building. It is calculated that the enlargement will give extra accommodation for about 320 persons. The architect is Mr. T. Bennett, of Weymouth; and the contract for the completion of the works has been obtained by Mr. T. Dodson.

Lichfield.—It is proposed to restore St. Mary's Church, Lichfield, as a memorial of Bishop Lonsdale. At a recent vestry meeting of the parishioners the vicar stated that the private friends of the late bishop had promised substantial help towards meeting the expense of rebuilding the body of the church, and he should be glad to hear whether the parishioners would co-operate in the work. A committee was appointed to obtain drawings and estimates for rebuilding the body of the church, and, after laying them before the friends of the late bishop, to submit the same to a future meeting. A meeting of committee was subsequently held, at which it was decided to advertise for plans and estimates (the cost of the work not to exceed 6,000l.), and to open a subscription. The vicar has guaranteed the sum of 4,000l.

Leeds.—A new church and churchyard, called St. Chad's, have been consecrated at Headingley, near Leeds. The church is built at the joint expense of Mr. Edmund Denison, of Doncaster, and his son, Mr. E. B. Denison, Q.C., and endowed by the former with 200l. a year, Sir Thomas Beckett, the elder brother of Mr. Denison, giving the land. Mr. Crossland was the architect. It has a tower 28 ft. square, and spire 186 ft. high, at the west end of a nave of six bays, with a five-sided apse and periscope, or aisle carried round the apse, in which are the vestry and organ-chamber, and an entrance to the church. The internal length is 126 ft.; the width of nave and aisles 52 ft.; and the total area within the walls 5,500 square feet. Local stone has been used throughout, with the exception of the reredos, pulpit, font, and all foliated capitals, for which a finer stone has been employed. The roofs and seats are of deal, slightly stained; and polished flags have been used for the floors, with the exception of the sacrum, which is tiled. The tradesmen employed in the work were,—Messrs. Sutcliffe & Deareley, Huddersfield, masons; Mr. James Sykes, joiner, Huddersfield; Mr. G. Walsh, plumber, Halifax; and Messrs. Knight, Hardy, & Jackson, painters, Huddersfield. The gisittings, of a style in harmony with the architecture (fourteenth century), are by Mr. Skidmore; and the three helts have been cast by Mr. Taylor, of Loughborough, from designs by Mr. Denison. The sittings in the church, although free in one sense, are not in another. The residents in the parish have the first choice, and their applications for two-thirds of the sittings have to be made to the recently-appointed incumbent. The remainder of the sittings will be free and unappropriated. This is the third church built by the Beckett family within the old parish of Leeds.

SCHOOL-BUILDING NEWS.

Newcastle-upon-Tyne.—The chief stone of national schools for the villages of Woodhorn and Newhiggin-by-the-Sea has been laid. The contract for building the schools (a mixed school and an infants' school) and a house for the master amounts to 820l., and that amount has already been obtained. The ground on which the schools are being built is the gift of Mr. Baker Cresswell, of Cresswell Hall.

Aston.—The foundation-stone of St. Mary's Schools, Aston, has been laid. The building will be a Gothic structure, with bell-tower and spire, in the same style as the church, and when complete will consist of an infant school, 60 ft. by 20 ft., and boys' and girls' schoolrooms, each 64 ft. by 20 ft. Mr. Chatwin, of Birmingham, is the architect, and Mr. Wm. Partridge, the builder.

Frimley.—The new National Schools here are completed, and have been formally opened by the Bishop of Winchester. They are on the Government system, and were assisted by a grant from the Privy Council. They contain a school for sixty boys, one for fifty girls, and another connected with the girls' school for seventy infants. There is also a teachers' residence. The materials used were red bricks, with white brick arches, quoins, &c., and the

total cost was under 1,000l. The site was presented by Mr. J. F. Barrill, J.P. The architect was Mr. T. Goodchild, of London; and the builders were Messrs. Swayne, of Guildford.

Doncaster.—The foundation of the new building for the Doncaster Grammar School has been laid. Mr. Scott is the architect, and Mr. John Athron, of Doncaster, the builder.—The new national schools, in connexion with the parish church, have been opened by the Archbishop of York. They have been built from designs by Mr. J. F. Teale, architect, Doncaster, at a cost of nearly 5,000l.

Idle.—The sum of 1,050l. has been raised, and a school-room has been erected at a cost (including the site) of about 1,350l. The new buildings comprise a day and Sunday school. The Sunday school forms the principal feature in the group, and is 66 ft. long and 36 ft. wide, by about 17 ft. high. One end of it is formed into three small class-rooms, which on occasion requires it, he thrown open to the main room. The day school (which is also used as an infants' Sunday school) is simply the old school-house rebuilt at right angles to one end of the Sunday school, with which it communicates by a moveable partition, so that both the rooms are available at once for any large meeting; the size of it is 49 ft. by 21 ft. 10 in. (outside walls), and 16 ft. high. Both schools are warmed with hot water, by Mr. Jas. Pearson, of Shipley. The contractors were,—Mr. Jahez Myers, mason; Mr. Jas. Naylor, joiner; Mr. Jas. Garth, plumber and painter; Mr. Nathan Baxter, plasterer; Mr. H. Thornton, slater—all of Idle. Messrs. Milnes & France, of Bradford, were the architects.

Rhayader (Radnorshire).—The new schools were opened on Tuesday, the 31st ult. The large room, which accommodates 120 children, is spanned by an open timber roof, covered with Major's patent dau-colored tiles. The walls are of red brick, relieved with bands of firebrick. The general style of the structure is Gothic, of a Continental type, the grouping of which is assisted by a bell spirette. Monie's dry-earth closets have been supplied, and a fair trial will be given them. The works have been carried out by Mr. William Evans, of Rhayader, from the designs of Mr. E. H. Lingen Barker, architect.

Alderley.—St. Philip's Infant School, Alderley, has been completed and opened. The school is 40 ft. by 20 ft., with two class-rooms, library, &c. The roofs are open, and the windows are glazed with geometrical panes. All the works have been executed by Messrs. Royle & Mellor, builders, Wilmslow, from designs furnished by and under the superintendence of Mr. John Lowe, architect, Manchester, at a cost of 750l.

Cotes Heath.—A new National schoolroom, capable of holding fifty children, with a master's house, has been built at Cotes Heath, near the railway station at Stanton Bridge. The former school was at Cranberry, at the edge of the parish. The new school is near the church, and the site of the building, with a large master's garden on one side and the play-yard on the other, occupying upwards of a quarter of an acre, was given by the 'Squire of the parish, Mr. Cotes, of Woodcote, near Newport. The total cost of the building is about 430l. Mr. Thomas Espley, of Eccleshall, was the builder.

STAINED GLASS.

St. Mark's Church, Dewsbury.—This church has been enriched by the addition of three painted windows. The first (a memorial) is in the east window, which is of considerable size, having five main openings with stone tracery above. The subject in the base of these lights is the "Resurrection," and in the centre light above, the "Ascension" with the mother of Jesus and groups of the Apostles placed in the side lights. In the tracery above is our Lord in glory, surrounded by attending angels, some playing instruments and others bearing palm-branches. The subjects represented are divided by a conventional treatment of ornament, founded on the passion flower and leaf. The second is the west window; the subject is the "Crucifixion," on a ground of mosaic diaper, varied in tones and by the vine. The figures stand out in simple relief, our Lord on the cross, attended by adoring angels, and beneath are the holy women, with St. John and Simon the Cyrenian. The third is a small window in the north aisle, opposite the south porch. It is of three lights, and, being near the font, represents the

appropriate subject of our Lord Jesus's little children, in the centre, with groups of the Apostles and women and children on each side. The artists were Messrs. A. & W. F. O'Connor of London, by whom all the windows have been designed and executed.

St. Michael's, Coventry.—A stained glass window, by Messrs. Heaton, Butler, & Bayne, of London, has been placed over the south-eastern entrance to this church, in memory of the late Mr. Thomas Sharp, formerly of Coventry, an antiquary, and author of the volume entitled "The Coventry Mysteries." The subjects in the window are "The Faithful Servant," "The Good Samaritan," "The Publican and the Pharisee," and "Giving up the Talents." A window, by the same artists, to the memory of the late Earl of Craven, will shortly be placed in St. Michael's.

Church of Our Lady (R.C.), Kentish Town.—A stained glass two-light window, in memory of the late Mr. Edmund Kelly, architect, has just been placed in this church. The work was designed and executed by Mr. A. J. Mingaye. The subjects are the "Raising of Lazarus," and the "Healing of the Son of the Widow of Naim."

St. James's, Plymouth.—A window has just been erected in this church, to the memory of the late Colonel C. Owen, C.B., who for some time before his death was the Engineer commanding officer of this district. The design includes four subjects—"The taking down from the Cross," "the Resurrection," "the Holy Women on their Way to the Sepulchre," and "Their Arrival at the empty Tomb." The window was executed by Messrs. Clayton & Bell.

Books Received.

Workmen and Wages, at Home and Abroad; or the Effects of Strikes, Combinations, and Trades Unions. By J. WARD. London. Longmans, Green, & Co. 1868.

THOUGH rather extreme in some of his views, the author has made good use of much useful information, gleaned from various sources, on the important subject of workmen and wages, at home and abroad. His volume treats of the various strikes, of more or less importance, which have taken place in this country of late years, including those of the building trades. It then goes into the subject of workmen and wages abroad, and makes comparisons between foreign and British labour; trades unions, both at home and abroad; and other correlative subjects are also discussed, the work concluding with the author's opinion of what trades unions really are.

On the question of taste and skill as between English and foreign workmen, the author is not at all inclined to despair: he says,—

"It has been and is said, that the rude energy of the English workman will, in the long run, prove no match for the exquisite taste of his foreign competitor. Now, if it were a necessary—*a law of nature*, in fact—that things should for ever continue as they are now; that the Englishman was ordained to excel in what is useful only, and the Frenchman in what is ornamental only, we would not exchange the Englishman's lot for that of the Frenchman. The useful is for the many, and in a very great measure for all; the ornamental is only for a few, and we would much rather have the supplying of the former than that of the latter. But there is no such necessity, no such law, no reason whatever, why the Englishman should not acquire the Frenchman's taste, although there would be much more difficulty in the Frenchman acquiring the Englishman's energy."

As to the comparative energy and activity of English and foreign workmen there is thus full faith in the Englishman, and not much respect for the so-called cheap labour of the Continent:—

"Several years ago, there was a general impression that it would be impossible for us to sustain our manufacturing pre-eminence against the cheap labour of the Continent, and this was supposed to be cheap simply because it was, in comparison with English labour, cheaply fed. Our capital and machinery, it was said, had alone enabled us to carry on the contest so far, and that we had better abandon it in the future. It should come to pass that the foreigner should depend on us in respect of capital and machinery, on an equal footing with us. The cheap labour of the foreigner, it was positively concluded, would then decide in our favour, and we should be enabled to compete with the best of our own manufacturing capitalists affected with this apprehension, that some of the most noted for forecast and enterprise withdrew themselves and their capital to those countries where they could do with them the best advantage. It was positively concluded, to instruct and to encourage the English who could obtain, to instruct and to encourage them. Amongst others who thus (wisely, as it was thought) anticipated the shipwreck of our native manufacturers, Mr. Cockerill, a gentleman of vast capacity and resources, was the foremost. He took into partnership with himself no less a personage than a foreign capitalist. It was principally the Belgian cheap labour—cheap in name only, and also we have endeavoured to show, in reality twice as dear as English labour—which he aimed the concern. Mr. Cockerill and his royal partner did not lack capital to give the experiment a fair trial; they staked themselves of the best English manufacturing

machinery—a subject upon which no man living was better informed than Mr. Cockerill himself,—of the best English processes, and of the best English skill to be procured for directing them; and yet, from the first to last, their competition with English labour was ruinous one. English capital, English machinery, English system, English knowledge—they had every element, as far as manufacturing is concerned, of English success but one—the energy and activity of the English workman. This establishment fell to the ground because Mr. Cockerill found, by experience, that English labour was in reality the cheap labour after all, inasmuch as the English workman proved that he did more than three times the work of a Belgian workman for less than twice as much pay."

Mr. Ward is severe upon trades unions as they are, apart from their theoretical merits and demerits:—

"Instead of being a benefit to the working class, they are an injury, for they can only be carried on by means fatal to every right that a free people respects. They are destructive, also, to the legitimate ambition of industry and merit, and in their practical operation they are simply a premium upon incapacity. These unions vary considerably in character, conduct, and spirit; but they all contain within them the germs and elements of injustice, if not of crime, inasmuch as they are founded upon the right of the many to coerce the few, and the employment of such means as may be deemed necessary to give effect to these dangerous and delusive principles."

As to strikes, he says:—

"The working man who feels conscious of his superior skill, or manual dexterity, ought to depend upon his own work as a labourer, and act upon his own judgment, and not permit himself to swerve from the straight line of his own interest, by the suggestions of the cunning, the clever, and the unscrupulous who belong to the same body. Let him abandon strikes and combinations; they are the premium upon incapacity. Examine minutely their various workings, and mark their inevitable and uniform results: the able hand, who could always obtain work at good wages, is sacrificed to his comparatively feeble and inefficient colleague. All strikes, therefore, with scarcely a single exception, are the sacrifice of the skilled few, to the presumed advantage of the indolent, ignorant, and indifferently honest many. Let the workman wish to derive its condition, must eschew combinations and strikes; it must endeavour to establish itself upon the same conditions as capital, and submit to the healthy and invigorating influence of competition, by which alone it can realise its best and most permanent interests."

Miscellanea.

MARKETS FOR LONDON.—We understand that the question of proper market accommodation will shortly be brought to the consideration of the Court of Common Council.

REDUCTION OF IRONWORKERS' WAGES.—The ironworkers of South Yorkshire have come to the conclusion "that it is injurious to their interests to carry on a hopeless opposition to the proposed reduction in their wages, and that, considering the present dulness of trade, the widespread poverty through working on half-time, and the time of the year, it is advisable to accept the terms of the employers." They have, therefore, agreed to resume work at a reduction of 10 per cent. for millmen, and 1s. per ton for puddlers.

HERALDS' COLLEGE.—A paragraph in some of the papers, to the effect that the Metropolitan Board of Works has paid 7,500l. into court as purchase-money for the Herald's College with the intention of pulling it down in order to form the new street from Blackfriars to the Mansion House; and that as compensation for removal Nory King-at-Arms has received 70l.; York Herald, 70l.; Portcullis Pursuivant, 25l., and so on, is calculated to give a wrong impression. The fact is, the college remains; it is merely a small part that has been taken down, and the sums given to certain of the officers are for the cost incurred by the removal from one part of the building to another.

BURSTING OF A CISTERN AT CARLISE.—A large cistern at the top of the new buildings recently erected by the County Hotel Company in Botchergate, Carlisle, has lately given way. The cistern, which was 10 ft. square, was placed on the south-east side of the new County-hall, and its height would be about 60 ft. from the ground. It was constructed of Memel planks 2 in. in thickness, with cast-iron struts built in the cill, and tied with wrought-iron ties. It was lined with lead, and outside but not quite touching it, was a brick wall. The cistern contained upwards of 6,000 gallons of water, which inundated the adjoining premises. Two of the sides had apparently given way. The damage to the restoration of the cistern, which, by the architect's estimate, will cost only 15l. or 20l. more. The architects attribute the accident to flaws in the cast-iron struts, caused by the frost having so weakened them, that they were unable to resist the pressure of some 25 tons, which the four sides of the cistern would have to bear when it was full of water.

THE VALUE OF SEWAGE.—Among the topics which receive attention in the current number of the *English Agricultural Society's Journal*, is the agricultural value of town sewage. It appears that nitrogen, equal to 200 ounces of ammonia, passes annually from every average individual of a general population, and this being mixed with the usual annual water-supply to our towns of 40, 60, or 80 tons per head, gives only 9½, 6½, or 4½ grains to every gallon of the resultant sewage. If the average be taken at 7 grains to every gallon, which is equal to 1 in every 10,000 parts of the drainage water, then that is worth about as much as half a ton of Peruvian guano for every 1,000 tons, or between 1½d. and 1½d. per ton. Nothing like this valuation has, however, yet been realized in agricultural experience. The large quantity of water with which the guano in sewage is diluted interferes its fitness for our more valuable crops.

WORCESTER DIOCESAN ARCHITECTURAL SOCIETY. An evening meeting and *conversations* of this Society has been held at the Natural History Society's Rooms, Worcester, to hear Mr. Beresford Hope, M.P., deliver a lecture "On Cathedrals and their arrangements." A discussion on this subject, with special reference to the contemplated re-arrangement of Worcester Cathedral, was also invited. Earl Beauchamp presided. Mr. Beresford Hope, in introducing the subject of his lecture, said that he would not detain the company by any lengthened prologue, but at once enter on the subject of "Cathedrals and their Arrangement." As the fine old Cathedral of Worcester was now undergoing restoration, and various opinions were entertained as to that restoration, he should say as little upon that matter as possible, or else he might put his head into a wasp's nest; and therefore he spoke on the general question only. After the lecture the company took tea, coffee, and other refreshments; and on resuming his chair, Earl Beauchamp proceeded to read a paper from Mr. Freeman, also on Cathedral Arrangements.

THE RESTORATIONS AT GLOUCESTER CATHEDRAL.—The restoration of the Eastern Chapel of the transept, dedicated to St. Andrew, may now be regarded as complete, with the exception of the fixing of the three windows, which are not expected from Messrs. Hardman's until the spring. This restoration has been made chiefly at the cost of Mr. T. Marling, under the direction of Mr. Gambier Parry, as a memorial of Mrs. Marling. The paintings on the walls are illustrative of incidents in the life and of the martyrdom of St. Andrew. The exterior of the chapel has been renewed, under Mr. Gilbert Scott's directions: new stone has been employed where the walls were crumbling into decay. This gives the building a patchy appearance till the new material tone down in colour. A scaffolding has been erected against the great window and east end of the south transept. The dean and chapter, according to the local *Chronicle*, have arranged to defray the renovating of the stonework, at an estimated expense of 750l., and Mr. Marling has undertaken to defray the cost of filling the window with glass. The outlay will, it is said, amount to about 800l. The glass will be supplied by Messrs. Hardman. Workmen are also employed at the chapel eastward of that of St. Andrew, which is to be restored as a memorial of the late Sir William Codrington, bart., M.P. Only one window in the south aisle now contains plain glass, and this is shortly to be replaced by painted glass, the gift of the Rev. Sir Lionel Darrell, bart., of Fetherne. The chapel in the north transept, corresponding to that of St. Andrew in the south, and dedicated to St. Paul, is being restored, at the expense of the Earl of Ellenborough. Skilled workmen are restoring the canopies, &c., of the reareds, and remains of the ancient decoration in gilding and colour have been found under the limewash. It is expected that the vaulting will be coloured. Mr. Redfern, of London, has been instructed to supply models for the three chief figures, and also for the statuettes, to be placed in the reareds. The three windows over the reareds will be filled with painted glass by Messrs. Hardman. The windows in the East Walk of the cloisters will also shortly be completed, the last of the series of ten being about to be erected in memory of Canon Banks. The subjects, in accordance with the plan for the whole series arranged by Bishop Jeune when Treasurer of Gloucester, will be the Samaritan Woman, Jairus's Daughter, and the Transfiguration.

THE BIRMINGHAM SOCIETY OF ARTISTS' EXHIBITION.—The Exhibition of Pictures at the rooms of the Birmingham Society of Arts has been closed, after a successful season. The number of visitors was 28,054, including 3,263 admitted by Art-Union tickets. The sales of pictures were even more satisfactory, having amounted to a total of 3,135l. 19s., of which sum 625l. were spent by the Art-Union.

SEYTON PARK, LIVERPOOL.—At a special meeting of the Improvement Committee of the Corporation, the tenders sent in for making the roads, sewers, and lakes, and the general formation of the Seyton Park, with the exception of the buildings, were examined. There were eleven tenders, all by Liverpool contractors. The amounts ranged from 75,000l., to about 85,000l., and the difference between eight of them did not exceed 4,000l., but one tender was nearly 10,000l. more than that which the committee ultimately accepted. It was resolved to recommend for adoption the tender of Mr. Campbell, of Liverpool, which was the lowest, the amount being 75,000l., and to ask the mayor to convene a special meeting of the council, for the purpose of confirming the recommendation.

THE SOUTH NORWOOD BUILDING FRACAS.—At the Surrey Sessions, on Friday, Saunders, Cooper, and Neal, charged with willfully demolishing some houses at Enmore Park, in the course of erection, were acquitted on the charge. It will be remembered that the defendants held some plots of land in Enmore Park, under a building lease from a Mr. Jones, the prosecutor, who was to advance money on certificates of work done and value placed on the land. The mode of building did not please Mr. Jones, who stopped the supply; and the defendants, not having the means to complete the building, and seeing that the work they had done would probably fall into Mr. Jones's hands, took on themselves to pull the buildings down, for which they were brought before the Croydon magistrates and committed for trial at the sessions. The criminal charge having failed, Mr. Jones is, we hear, about to commence proceedings in a civil court.

A NEW OPERA HOUSE IN NEW YORK.—Mr. Pike, a successful trader in New York, has erected an Opera House, in Twenty-third and Eighth Avenue. According to a correspondent, it is built of white marble, and its architecture is Italian. One of its fronts is 120 ft., and the other 112 ft. wide, and the building is 325 ft. long. The entrances, which are very wide and handsome, lead into a vestibule, which is 40 ft. wide, 80 ft. long, and 30 ft. high. From this ante-room a staircase leads to the dress circle of the house. From the front row of the dress circle it is 185 ft. to the footlights. Above is the family circle, below the parquet, and the house will seat 2,600 people. From the floor to the ceiling is 70 ft.; the stage is 70 ft. deep, 80 ft. wide, and 50 ft. high. Beneath the stage is a room 23 ft. high for the traps and lower machinery of the stage. For the interior decorations of the house the prevailing colours are white and gold; the curtains of the private boxes are white and blue; the seats in the body of the house are crimson; and there is a profusion of stately, chandeliers, candelabras, and paintings.

FATAL EFFECTS OF IMPURE WATER.—Eight or nine men of the Plymouth division of Royal Marine Light Infantry, stationed at Stonehouse Barracks, died lately within a short interval of each other from fever of a typhoid character. A medical court of inquiry was held, and the six medical gentlemen connected with the division found that the deceased men had been living in the recently-erected wing of the barracks, the men in which were supplied with water by a pump connected with a large reservoir or well beneath a portion of the barrack-yard. This water has been so highly prized that it was supplied to the officers' mess. The court of inquiry, however, came to the conclusion that this water contains organic matter and gases detrimental to health, and ordered that the pump in question should not for the future be used. Since this order has been in force there has not been any case of typhoid fever in the barracks. The *Western Morning News* states that when the houses were first erected in Stonehouse, some of the buildings compensated for the absence of any system of sewers by making openings and draining into subterranean chasms or caves in the lime-stone rock into which wells have been sunk, and it is believed that to this day some houses in that manner dispose of their sewage.

THE WALLS OF HER MAJESTY'S THEATRE.—A correspondent says he was nearly killed last Saturday by the sudden fall of a portion of the wall of the Opera House while he was passing along the arcade.

OPENING OF NEW WING OF SOUTHAMPTON INFIRMARY.—The Royal South Hans Infirmary at Southampton has had a new wing erected, at the sole expense of Mrs. Eyre Crabbe, one of the lady patronesses of the institution, at an expenditure of upwards of 3,600l. The committee have named it "The Eyre Crabbe Wing." It comprises two wards, each 81 ft. long by 24 ft. wide, and 13 ft. high, making up a total of thirty-six beds, and giving about 1,300 cubic feet of air to each patient. The wards are to be devoted specially to cases of accident, where free and pure air is especially required. The floors are of polished English oak, to prevent absorption, and the walls finished with polished Parian cement, to resist the intrusion of damp. They are ventilated on improved principles, and have been approved by Dr. Parkes, professor of hygiene at the Royal Victoria Military Hospital at Netley. The new wing was designed by Mr. Robert Critchlow, architect, and erected by Mr. Christopher Martin.

IMPROVED LABOURERS' DWELLINGS FOR CROYDON.—New buildings have just been completed in a poor district of this town, and are now open to receive tenants. They have less of the barrack character than usual. There are ninety-two rooms, the tenements consisting of from one to three rooms, to meet the requirements of all; and, so far as can be ascertained at the outset, the single rooms are much in request by those who are unable to pay for more, and whose families do not require more. Each living-room is provided with an oven and large cupboard, and every room has a fire-place. Provision is made for the tenants to place flowers in the windows. Every landing has a large sink and water-tap, and all is well lighted with gas. A wash-house, with six boilers, has been erected in the yard for the free use of the tenants, and a large drying-ground has been provided. There is also a room in the centre of the building where various agencies for the benefit of the poor may be carried on.

CONFERENCE ON TECHNICAL EDUCATION.—The council of the Union of Lancashire and Cheshire Institutes have held a conference, at the Trevelyan Hotel, Corporation-street, Manchester, with Mr. B. Samuelson, M.P. for Banbury, on the subject of technical education. Mr. Alderman Rumney occupied the chair. The council had invited Mr. Samuelson to attend the conference, so that they might be able to discuss the question with him. At the close of the discussion Mr. Samuelson said that he intended to move for a commission of inquiry into the subject of education; but he thought it would be some time before he would be prepared to agitate the question. He would like to see given by schools of art a more direct bearing upon the trades of the district. He thought this was a subject which might be taken up advantageously by Chambers of Commerce. In the evening a meeting was held at the Athenæum, to hear an address from Mr. Samuelson upon technical education, with special reference to its state and operations upon the Continent, (as evidenced by his own recent personal observations. The chair was taken by Mr. Jacob Bright, M.P.

NEW PROMENADE AND SEA-WALL AT REDCAR. The property owners and ratepayers of the township of Redcar have adopted a report on this subject, by Mr. Fowler, the engineer to the Tees Conservancy Committee, and the work has been entrusted to a committee to carry it out. The committee consists of twelve responsible townsmen, six to look after the work and six to collect and disburse the money. At the meeting deciding on these measures, it was resolved that each section of the work be done to the satisfaction of Mr. Crabtree, the planner of the work. Mr. Pickett asked if they meant Mr. Crabtree to be clerk of the works. He was surveyor, and it would need some one to be there from six a.m. to six p.m. every day. Mr. Lennard said Mr. Crabtree was the servant of the town, and would have to ask leave of the Board of Health to attend to this. The promenade will be an additional attraction to the numerous visitors who spend a part of the summer months at Redcar. It will afford them a fine promenade at all states of the tide, and open a carriage-way to the houses on the beach, which at present does not exist.

SOCIETY OF FEMALE ARTISTS.—The private view of the works of the Society of Female Artists will take place on (this) Saturday, the 25th inst.

DAMAGE TO WELLS CATHEDRAL.—It is stated that, during a violent wind on Saturday last, a quantity of the ornamental work was blown from the northern tower of the west front.

TENDERS.

For Turkish bath, Brighton. Messrs. Gontly & Gibbins, architects. Quantities supplied by Mr. Lansdowne:—

Patman & Fotheringham	£8,697 0 0
Lockyer	8,653 0 0
Piper & Wheeler	8,600 0 0
Nightingale	7,633 0 0
Chappell	7,470 0 0
Hal	7,363 0 0
Cheesman (accepted)	7,263 0 0
J. Sawyer	6,953 0 0

For alterations and additions to warehouse, Monkwell-street. Mr. H. H. Collins, architect:—

Sale	£313 0 0
Cohen	478 0 0
Pearse	381 0 0

For the erection of one and two villa residences at Pinner, Middlesex, for Mr. L. Green. Messrs. Walford & Dakin, architects. Quantities not supplied:—

One Villa.		Two Villas.
Kemp	£2,100 0 0
Ward	2,100 0 0
Shurmer	1,915 0 0
Fish	1,890 0 0
Stanger	1,630 0 0
Mundy & Hutchinson	1,600 0 0
Kent	1,650 0 0
Sharlington & Cole*	1,497 0 0

* Accepted.

For residences at Isleworth, for Mr. A. H. Johnson. Mr. C. Jones, architect. Quantities furnished by Messrs. Richardson & Waghorn:—

Hiscock	£3,250 0 0
Mitchell	3,021 0 0
Nye	2,867 0 0
Kilby	2,867 0 0
Gibson, Brothers	2,737 0 0
Waters	2,765 0 0
Adams & Sons	2,668 0 0

For the lodges, bridges, fountains, colonnades, and other architectural works at Stanley Park, Liverpool (exclusive of boundary railings), for the Corporation of Liverpool. Mr. E. R. Robson, architect:—

Robson & Sons	£24,460 0 0
Wells	18,700 0 0
Lee	18,250 0 0
Hughes	18,239 0 0
Burroughes & Son	16,968 0 0
Tomkinson	15,700 0 0
Jones & Son	15,538 0 0
Urmson	15,415 0 0
Hugh & Co.	15,413 0 0
Mellin	15,363 0 0
Campbell (accepted)	13,456 0 0

For alterations and additions at No. 29, Porchester-terrace. Mr. Charles Innes, architect:—

Fish	£1,280 0 0
Macey	1,232 0 0

For building tavern and stables at Richmond, for Mr. John Peck. Mr. J. I. Stewart, architect. Quantities supplied:—

Keay	£1,405 0 0
Skinner	1,371 0 0
Mundy & Hutchinson	1,352 0 0
Shurmer	1,295 0 0
Adams & Son	1,184 0 0
Nutt & Co.	1,149 0 0
Parson & Smith	1,089 0 0
Girdling & Son	1,020 0 0
Hookham (accepted)	1,011 0 0

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of Tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

TO SUBSCRIBERS.

The TWENTY-FIFTH VOLUME of "THE BUILDER" (bound), for the year 1867, will shortly be published, price One Guinea.

CLOTH CASES for binding the Numbers are NOW READY, price Two Shillings and Ninepence.

SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of Three Shillings and Sixpence each.

The Builder.

VOL. XXVI.—No. 1304.

The Sculptured Stones of Eastern Scotland.

RECENTLY there have been submitted for consideration two readings of the meanings of the curious symbols engraved upon the numerous ancient memorial stones found in eastern and lowland Scotland, identified as the Picts' land mentioned by Bede. The first of these is that given by Mr. Stuart in the sumptuously illustrated volume he has recently published under the auspices of the Spalding Club. The second emanates from a northern philologist, Mr. Ralph Carr, in the form of a pamphlet, recently issued, and was first given by him to an archaeological circle at St. Andrew's, in the present year. The two interpretations are quite of a different character; but before we proceed to record them, we must give a few particulars of the stones on which the symbols occur. The sculptured stones, to which we refer must be confounded with the rocks *in situ* and down stones, bearing the concentric circular designs, with central dots, first observed in Cumberland, and since found in the highland district of Scotland, and in Ireland and Wales. In the land of the Picts, that is to say that portion of the eastern coast, or lowland of Scotland, that lies north of the Forth, there are found a large number of sculptured stones, on which are sometimes incised, and sometimes carved in relief, a set of symbols found elsewhere; accompanied, however, we may add, in some instances, by a few others which have been found in various parts of the island. Some of these stones are much richer than others, being carved with the elaborate designs of lines with which the initials in Saxon MSS. are ingeniously depicted, which leads to the inference that they belong to a more advanced age than that which contented itself with the mere incision of a symbol. This contains, moreover, certain representations of scenes and transactions that it is believed to be the work of men endeavouring to indicate similar passages in Scripture. These, therefore, are assigned to the Christian era; but whether the symbols marked upon the ruder, and apparently earlier stones, are Christian or Pagan, is a question. Elephants, with upturned trunks, like those on the sides of the caves in the Alps, with a Z or N like mark crossing the trunk folds; birds, fishes, animals' heads; and a crescent something like a double eye-glass; a circle with a central dot in it; an angle combined with another figure, which is called a crescent and a square figure, something like an altar, among the signs; and besides these, there are delineations of mirrors, and combs, which have, however, been found elsewhere. Mr. Stuart refers them all to be personal distinctions, or badges, and that they were placed on the memorial stone of departed persons in much the

same spirit as men of the Middle Ages indicated the trade or occupation of deceased friends on their grave covers. It is not, however, with Mr. Stuart's interpretation of the meaning and use of the symbols that we are about to concern ourselves, except so far as to show in a few words the view that he has taken of them. His laboriously got up volume places all the stones under the eye in a group, and therefore has done real service towards an accurate conception of their signification. It is, indeed, the facility thus given to scholars that has placed it in Mr. Carr's power to give his new reading. We may here state that this gentleman is an Anglo-Saxon student of considerable experience, and that his knowledge of this department of literature has led him to believe that some of the hitherto undeciphered inscriptions on the stones are in Saxon words. It was the inscribed stone at Newton Insh, in Aberdeenshire, that first made this apparent to him, and the next stone he examined, that of St. Vigean, confirmed his conviction. The first mentioned exhibits, he considers, just such peculiarities of orthography as enable him to assert that the work is Saxon, as distinguished from Anglo-Saxon. In his hands this "wall-cry" from those who have preceded us says,—

"To Ella (or Elle),
(or Eita or Eite),
(his or her) grand-daughters,
on stone wrought
a lamentation—
(namely) this Gaelic wall-cry."

The threnody, or chant of sorrow, thus indicated, is believed to be what is inscribed in a chain of writing in ogham, which, beginning below the Saxon inscription, runs up the whole length of the margin of the stone on one side. The writing on the St. Vigean stone, as read by Mr. Carr, merely tells us that it is a family monument, impictured or embellished to the memory of an honoured kith-man or relative. What he considered the indisputably Saxon authorship of these stones brought them into his department of scholarship, and induced him to examine the others minutely, which, as we have said, Mr. Stuart's book renders an easy task. The result of his scrutiny is, that he attributes to the Saxon Church and clergy a system of symbolism, some traces of which are handed down to us on the pillar-stones in question. Not to make the undertaking too niggardly or abstruse, he first studied the most highly finished and, probably, least ancient of the monoliths, and, guided by the clues he obtained from them, has managed, he considers, to unravel much of the mystery of more ancient ones. The first item of explanation thus suggested appears to have been that some of the richest ornamentation is no more nor less than alphabetical letters fancifully and flowingly wrought into patterns, only requiring, in fine, a little colour to make their presence seen at a glance, which colour, it is deemed possible, they may have been decorated with when first set up. In two or three instances these characters follow each other and form a word, which, according to Mr. Carr, is also in the same Saxon speech. Thus, in the fine battle-cross at Aberlemno, once attributed to the Danes, but now repudiated by the leading Scandinavian antiquaries of the present day, there occur the letters G B D in an elaborately ornamental monogram, which Mr. Carr reads GEDED, or, Pray ye. The second conclusion at which he arrives is, that the Saxon Saxons wrote also with ciphers, as, indeed, ancient Scottish historians affirm they did; that is to say, used the same sort of word painting that when practised by us we call a rebus. And the third conclusion he is nearly sure of is, that the other marks not falling under either of these heads must be studied as Christian monograms belonging to a peculiar school of ecclesiastics,—the school, in fine, that had for its field the land of the Picts.

The first sculptured stones that Mr. Carr reads by the light of this discovery are the richly-carved slabs which were exhumed in the cathedral-yard at St. Andrew's a few years ago, and may probably have once occupied a conspicuous position within the cathedral. On one of these slabs are delineated three figures, by common acceptance believed to be the Israelitish king David represented in three stages of his history; but by Mr. Carr concluded, also, to mark another David, namely, the first king of Scotland of that name. Between the three pictures of this monarch there is a stiff and stilted representation of a wolf destroying a foal, standing on its back, and crushing it down on its nose and knees. The outline of this extraordinary attitude forms the letter D or P, corroborating the supposition that David is the person sought to be honoured. The other slab is divided into four quadrangular panels arranged around a central boss. These panels are full of figures of cats or monkeys, locked in one another's arms, or otherwise, nondescript embryos of eels, all of which our author believes to be merely instrumental in forming elaborately ornate characters. He makes out these letters to form the word KIUNG,—a semi-Saxon rendering of the Saxon *cyning*—king. The interpretation seems to suggest that these remains belonged to a cenotaphic monument, raised with all the magnificence, cunning, and skill then available in the cathedral church to the memory of the great Scottish sovereign who was one of the most munificent patrons that the early Church could boast.

The next stone read by the aid of these views is that now reposing at Abbotsford, which was found at Woodray, in the parish of Aberlemno, in Forfarshire. Here we have again six groups of animated creatures placed in strained attitudes, as though with the intention of forming fantastical letters by the aid of their outlines. There is also upon the slab a cross, upon the defaced surface of which is to be made out the characteristic wickerwork ornamentation. A broad margin of the same ornament runs across the summit of the stone and down each side. The first letter Mr. Carr decipheres as B; it is formed by two serpents knotted together. A rampant dragon swallowing a boy is so posed as to suggest the letter E. Two long-bodied dog-like creatures, locked together in combat form the vowel A. In a hind or giraffe Mr. Carr sees the converse outlines of the letter H. Another dog-fight may be read C or G; and a dog or griffin carrying another animal in its mouth, represents the letter N with a sign of elision. BEAH'CN, is thus made out, a word met with on Saxon tombstones, and signifying monument.

A similar picturing of letters has been made out on another stone found in the burying-ground of an old church at Aldhar, near Aberlemno. A cross is depicted on one side, having two accessory figures; and the supposed letters, formed of fantastic groups of animals and other objects, are on the reverse. Two female figures, seated on a settle, first occur. Below them is the figure of a man, playing with an animal, in such a posture as to suggest to Mr. Carr the letter H. A staff or club is read I; and is, perhaps, hints our ingenious author, an intimation to the beholder of the double character of the inscription, as *staf* in Saxon means also a letter. The Saxon W, which is nearly harp-shaped, is next suggested as the rendering of one of those instruments. So far we have H I W, the Saxon term for a family or household, which we still retain for our bees in the word hive. Besides this, the epigraph contains the figure of a sheep, *scop*, with which Mr. Carr completes the word H I W S C E P, family circle, or relationship. *Scop*, like *hive*, we may here remark, is a word applied to bees even now in Scotland. *Bee-scop*, or simply *scop*, is *bee-hut*. If this interpretation be accepted, it must be confessed that the Saxon-Saxon stone cutters were as clever at riddles and

rebuses as many of our contemporaries. At the bottom of all this stand two wolves, one behind the other, so stiffly as only to suggest to Mr. Carr the idea of plurality, or rather not wolf but *truffles* in the genitive or possessive singular. This device is used, our author doubts not, to indicate the ending of one of the many Saxon names terminating in *wulf*.

On the grand cross at Aherlemuo, once regarded as Danish, because tradition handed down a belief that it was erected to commemorate the death of a Danish leader and the discomfiture of his host, there are, again, as Mr. Carr states, Saxon words to be made out, disguised in a similarly far-fetched and elaborate manner. In the monogram in the middle of the cross be entwined the letters G E B E D, pray ye; and below them are the representations of two seals or sea-calves, which Mr. Carr takes to be a sort of pun upon the word *sool*, as seal was pronounced in nearly the same manner, *soel*; and more especially because another clue is given in the shape of human feet (soles?) as tips to the tails of the seals. Their snail, as in the case of the wolves before mentioned on the previous stone, is supposed to represent plurality. Thus, with the monogram of Jesus at the head of the stone, Mr. Carr reads,—

"To Jesu
Pray ye
for the soles."

We give one more example of this section of Mr. Carr's interpretations. At Largo House there is a sculptured monolith which has a human figure on it looking up at a cross carved above its head, and two of the metagraphic seals, which have been deciphered as indicating the word *sool* in plurality, not necessarily two departed persons only. On the other side, there are three men on horseback. The figure placed in the most important position has a swan represented behind him, and a mystic knot in front of him. "Was the name of this stately leader Swegn Canute?" asks our author. "Canute was written Knut, Canut, that is Knot; and swan might stand for Swegn, though a different word."

In his attempt to interpret the apparently still more mysterious and ancient diagrams or symbols with which he next proceeds to deal, Mr. Carr does not seem to us to make out so feasible a case as he ingeniously does with the probably less ancient ones. As he retreats into what he himself regards as the more ancient, he admittedly gets "beyond his depth," and explanations which he gave at St. Andrew's he now renounces, and explanations which now appear clear to him he could not at all see when he read his paper there. The N or Z symbol especially is the *pons asinorum* where the break-down occurs. This symbol, according to Mr. Carr, is the Saxon S, or seal, which "meant primarily a small ornamental sign or device of distinction, such as an ornamented brooch or clasp, a collar, or armet;" and accordingly it is often combined with another form which is usually called "the spectacle ornament," but which Mr. Carr regards as a circle for the arm "laid out flat," but is it not rather odd that a circle should be spread out flat to show that it is a circle? The whole was intended, he considers, to signify a seal, and for the meaning of that he refers us to the book of Revelations, chapter vii., and other Scriptural passages in respect to those "that were sealed."

Had Mr. Carr's knowledge of the N symbol been a little more extensive, he never could have rested content with such an interpretation as this. Was it likely that the pre-Christian N symbol on the Carthaginian tablet which was brought under the notice of the Society of Antiquaries by Mr. Godwin, and engraved in the *Archæologia*, was a Saxon alphabetical letter, or had any such significance as Seal? Was it likely that the pre-Christian N symbol of ancient Persia, brought under notice in the *Builder*, of 6th June, 1863, by Mr. Dove, was Saxon, or had any relation to "the sealed" of the Revelations? Is it even likely that the multitude of N symbols, cut in all their varied forms, and amidst a host of others, upon various foreign as well as British churches, as *masons' marks*, adused by Mr. Godwin in the *Archæologia* and elsewhere, were all (if any of them were) the Saxon S? Some far more universal, and far more recondite, original meaning must be given to this remarkable symbol.

In the paper read at St. Andrew's, Mr. Carr's interpretation of the "broken sceptre" and "spectacle ornament," as the Scottish archaeologists commonly call the N symbol and the double and united circles, was quite different.

He took the N simply for the Saxon S, and the double circle for "that form of the omega where it is composed of two omicrons," the whole denoting "the syllable SO, which [he adds], I conceived might be the initial one of Soter, Saviour."

In another example of what is clearly just still a form of the N symbol also, on an altar-like object, he suggests its resemblance to "the Saxon capital H, which had its transverse line so much sloped as almost to resemble a Roman N. If the letter be H, as is perhaps the most likely [he adds, not we], it stands in all likelihood for Hostia, the host. . . . If instead of H the letter he read S, then it would stand for Sacramentum." There is not much, we fear, to be expected from this style of interpretation. Nevertheless, there is no little ingenuity in some of Mr. Carr's guesses and explanations.

At the close of his paper he says,—

"Such of the sculptured stones as merely mark the graves of private persons or families are assuredly the enduring evidence of friendly international mingling. They are Picto-Saxon and Soto-Saxon tombstones, showing how the Saxons came and settled and intermingled with the Picts, but left Saxon records over their dead."

The common tradition of Scotland itself connects these sculptured stones with the times of the Danes, though, as works of the native inhabitants, not of those invaders, whose defeat certain of them were said to commemorate. This, as related by old Boece, appears to Mr. Carr, in respect of chronology at least, no small approximation to the truth. He has the support of Buchanan; and Boece tells us, in "The New Manneris and auld of Scottis," that

"In all their secret business they used not to write with common letters, but among other things, ever with sifers, and figures of beasts made in manner of letters; sic as their epitaphs and superscription above their sepulchris aches: nocht the less this crafty manner of writing, he gabat slecht I can not say, is perit, and yet they have certain letters propir among themselves, quilk was some time vulgar and common."

As an archaeologist Mr. Carr holds by this old school, and with its worthies is content, he says, to wait till the tide turn.

PROFESSOR G. G. SCOTT ON EARLY ARCHITECTURE IN BRITAIN.

IN commencing a series of lectures in my capacity as the official occupant of this professorial chair,* I feel in some degree shackled by the circumstance that, though the office is new to me, its duties (so far as the lectures go) are not so: inasmuch as during the latter years of the tenure of this office by the venerated Professor Cockerell, I was, in conjunction with Mr. Smirke, called upon to occupy the place from which ill health and infirmity compelled him to be absent; and at a later time I have done the same for my immediate predecessor, Mr. Smirke, when circumstances interfered, for one season, with his lectures. I have, consequently, already given seven lectures from this chair without being its rightful occupant; and, now that I commence officially, I find the novelty of anything I might have had to say in a great degree worn off by anticipation. I have consequently been puzzled whether to begin afresh or to go on from the point I had reached. The former would, perhaps, be the most correct course; but, after long uncertainty, I feel it to be too artificial to sever what I said out of office from what I have to say in office, and I have determined to link my future lectures on to those which have preceded them. I shall also for the present limit myself to Mediæval architecture as the subject on which I have been engaged.

In my previous lectures, I have given an outline of the development of Pointed architecture from the preceding round-arched style, and followed on with some practical suggestions as to the study of these phases of architecture. In this, I have treated equally of foreign and English buildings, or have, perhaps, dwelt more at length on the former, and have carefully traced the connexion of English with French architecture as they grew up, side by side, from the common germ, each to its glorious perfection.

I purpose now to fall back upon the commencement of this series of developments, and, while I go more in detail into the varied features of the architecture of these periods, to limit myself, during the present session at least, very much to its English productions.

* At the Royal Academy, January 23.

My reason for this is, that we have of late been directing our attention too exclusively to foreign buildings, greatly to the neglect of our own,—so much so, that many of our architectural students seem to be as little acquainted with the Mediæval works of their own country as if they were brought up in Italy or France.

I hold the study of the contemporary buildings of neighbouring countries especially those of France, to be essential to the due understanding of our own, and of the style as a whole; but this affords no excuse for the neglect of English architecture, to which, beyond all question, we are bound, as English architects, to direct our primary attention, and which will repay our study by a series of special beauties of its own, which have of late years been almost wholly overlooked.

In reviewing the changes in the architecture of our own country, it may be wholesome to begin early—to "look at the rock whence we were hewn, and to the hole of the pit whence we were digged." A retrospect such as this gives rise to some curious reflections. At one time we feel perplexed by the depth of antiquity into which we are directing our view, and at another with the very reverse of this.

How beyond the Norman Conquest,—beyond the destructive ravages of the Danes,—through the half-mythic times of the Ioptarchy and the heroic age of the Pagan Saxons; and, again, beyond the destruction of the Roman arts through the mystic and hazy age which intervened between the withdrawal of the Roman and the conquest by the Saxon; again, through the four centuries of Roman domination into the unknown abyss of prehistoric Britain, what a vast lapse of time does it represent! Yet the earliest period we thus reach is, nevertheless, some four centuries subsequent to the close of the Old Testament history and the period of Pericles and Phidias, and perhaps fifteen centuries subsequent to many of the great monuments of Egypt!

Archaic art seems to have the power of reproducing itself; and even the ages of heroic and barbaric myth may re-occur after periods in which society and civilization may appear to have worn themselves out by over-refinement and thus, when we attempt to trace out the early Christian architectural arts of the nation of Northern Europe, we find ourselves as much in the mist of antiquity as if we were prying into that which preceded the Pyramids or the earliest palace of Nimrod, though we are in reality examining works subsequent to the time when the empire of Rome fell to pieces from sheer old age.

In taking an enlarged view of Mediæval architecture, we must view it in two distinct but at the same time united aspects: we must view it as the architecture indigenous to the modern as distinguished from the ancient civilization; but we must also view it as having been developed upon an antique nucleus.

There are also two other separate, though united, views which we ought to take of it. We should view it, on the one hand, as the work of men elaborating, as from the beginning, a new system of art on the mere reminiscences of a old and defunct system,—absolutely defunct as relates to the northern races,—but we should view it also as, all the while, aided by the living art of the Eastern Empire and by the smouldering embers of that of Rome itself.

In some districts there may have been tradition remaining of some old method of building which had prevailed among the Pagan, Celtic, or Teutonic tribes; but the germ was generally said to have been Roman or Byzantine,—founded on reminiscences, and aided from time to time, by direct communication.

The two great divisions of Mediæval architecture are, firstly, that which preceded, and secondly, that which followed the great transition of the latter half of the twelfth century. The whole may be viewed as the one great development of arcuated construction into style of art, and its two great divisions are the round-arched and the pointed-arched styles.

It is my purpose during the present session to limit myself very much to the former; but, viewing it, not only in its own bearings, but also as the precursor of the latter. Though I intend to choose my illustrations almost wholly from buildings in our own country, it would be taking a very narrow view of our subject if I were to consider the great round-arched style otherwise than as a whole, and our own portion of it other than as a branch of that magnificent tree whose boughs, whether growing

from its eastern or its western stem, spread themselves over the whole civilised world.

It has been well remarked by Mr. Freeman, in his "History of Architecture," that the ancient Roman manner of building was essentially an *arcuated* style, though its true character was artificially overlaid by the features belonging to the purely *trabeated* style of Greece; and that the whole course of change through which it, in after ages, passed, may be described as the gradual throwing off the trabeated overlaidings and the perfecting into an architectural style its vital germ,—the *arcuated system*.

This process was carried on equally in the East as in the West, though under circumstances accidentally differing. The two great metropolises of the Christian Roman empire, commencing with the same architecture, gradually changed it into two distinct branches, though clearly belonging to the same great trunk. In both the changes or developments took for their starting-point the architecture, not of Greece, but of Rome. In the West, they continue to follow the natural suggestions of that style, influenced deeply by the changed religion, and subsequently curbed and held down, first by the removal of the seat of government to Constantinople, and then by the continuous waves of the northern invaders who gradually brought down to a very low ebb the civilization and arts of the Western empire.

In the East, the influence of the Christian worship was at least equally deep; while the presence of the imperial court and government offered greater advantages to development, and the accidental preference for *domed* construction gradually gave a wholly new tone to the general character of the architecture, while the proximity of ancient Greece remains had a very strong influence on the ornamentation.

Different, however, as is the general aspect of a Byzantine and Romanesque building,—especially when the former assumes its crowning feature, the dome,—it cannot be denied that they are, nevertheless, the same style in two phases; and that there is no such contradiction between them as to forbid their amalgamation to any extent. In proof of this, we have the not inconspicuous character of the Crusaders' buildings in the East, in which the dome was not forbidden; the similarity to Romanesque of such of the Byzantine buildings as do not happen to have domes; the introduction into France of the domed architecture by a colony of Greeks; the admission of much that is Byzantine into the Romanesque buildings of Germany; and finally, the very extensive use of purely Byzantine foliage and other forms of ornamentation into the buildings of Western Europe in the twelfth century. This last-named circumstance I have dwelt upon at length in one of my former lectures, and I shall, no doubt, have frequent occasions again to allude to it. The fact is, that the ornamentation of the later examples of the Romanesque style is for the most part rather Byzantine than Roman in its origin: even the acanthus-leaves in the capitals and cornices more resembling those of the monument of Lysicrates than those of any Roman building; while the surface-ornaments—so profusely used—are often traceable to the patterns of the various manufactures of the East, so largely imported into Western Europe.

Much light has recently been thrown upon the Byzantine style, especially in respect of its secular productions, through the discovery by the Count de Vogüé of a vast number of ruined towns in the mountains towards the north of Syria, which have remained almost untouched (except by time and earthquakes) just as they were deserted in the seventh century on the approach of the first Mahomedan invaders. These remarkable remains give us the connecting link between Classic and Mediæval art, though greatly influenced by the traditional mode of building belonging to Syria. It is a subject which would need a separate lecture to deal with it as it deserves, and I only mention it here for the sake of saying that the carved ornamentation of these remarkable buildings is Greek in its feeling, and not Roman, and that it is evidently allied to that imported at a much later period into Western Europe; and which especially characterizes the buildings of the twelfth century in France, and (though less constantly) in England: all tending to establish the essential unity of the round-arched architecture of the early Middle Ages, and the fact that the East and the West were much more united in artistic affinity than has generally been admitted.

My main object at the present time is to trace the history, and investigate the character of those branches of this great round-arched style which have developed themselves in our own country: and my purpose in the foregoing remarks has been to lead you to view our own architecture, not as an essentially separate style, but as a part of that which pervaded Christian Europe, and extended till the Mahomedan invasion, far both into Asia and Africa, which was the nucleus even of the Mahomedan styles, and which in Sicily (as in the Holy Land and in Spain), again met and coalesced with its infidel offshoot, and produced by this reunion the noble architecture of Palermo, and other cities of Norman Sicily.

Among all the races of northern Europe, who were either conquered by Rome, or aided in the overthrow of her empire, I do not know that any has left a vestige of what may be viewed as indicating, in any intelligible manner, the existence among them of a distinctive style of architecture. Stonehenge and the cromlechs can hardly be viewed as exceptions; and, when the Angles and Saxons invaded Britain, they found, so far as we know, no architecture but the Roman, nor brought with them any of their own; while, to make matters worse, they seem to have devoted themselves to the destruction of what they found.

What was the character of their buildings while they continued Pagan, we have no means of judging. We have proofs that timber was their most customary material, though it would be unreasonable to suppose that they were unable to build in stone. It is likely enough that their houses were generally of wood, but such was the case throughout the Middle Ages, and continues to be so to this day, where timber is abundant. Many of the churches afterwards were of the same material; but such also has at all periods been the case when dictated by local circumstances, and is still frequent in our colonies, so that it is insufficient to disprove the contemporary use of stone.

There is a curious parallelism in this respect between the buildings of ancient Greece, of Etruria, and of England. In Greece we find clear proofs of the architectural style having been founded on timber construction, though the Cyclopean walls, &c., of the primeval cities (whether the works of the same or a different race) forbid the thought that the use of stone was ever unknown. In Etruria we find no less gigantic walls, though we learn from Vitruvius that timber entered largely even into the construction of their temples, and suggested the peculiarities of the Tuscan order. If, then, in Saxon England we find the words "*to build*" to be derived from *timber*;—if we learn from early writers that the majority of their buildings were of wood; and if we find in their stone buildings indications of their imitating the construction of timber framing, we need no more conclude that our forefathers were ignorant of stone building, where it was useful, than that the early Greeks or Etrurians used timber from ignorance of the use of stone.

They were colonists, though conquerors. They were, no doubt, but very partially civilized; and, settling down as strangers in a country from which they had driven out the old inhabitants, and whose towns they had in great measure destroyed, they were likely (as colonists do in our own day) to make the largest use of the material most ready to their hand, and to permit to more settled times the use of a more permanent manner of building.

The paucity of remains of buildings of the period between the dissolution of the Roman Empire in the West and the eleventh century, is by no means peculiar to our own country. Throughout Northern Europe the same fact prevails. The earlier waves of northern invaders were absorbed in the old civilization, but each successive wave made a deeper and a deeper inroad into the remaining arts of the old world. It was natural then, that, on the return of art and civilization, the works of this dark period should be deemed unworthy of preservation, and were replaced by new erections. In our own country the Roman had not been overcome, but had simply withdrawn, so that the dissolution of art was a more rapid work than in most other parts of the old empire, while the early efforts of the Saxons were over and over again destroyed by the yet uncivilized and unchristianized Scandinavians, from the last of whose devastations there was hardly time to recover before the Anglo-Saxon monarchy was overthrown by the Normans. No wonder, then, that the conquerors,

though but then become adepts in architecture themselves, should disdainfully reconstruct nearly all the churches and greater edifices of their predecessors in that new manner of building in which they had been so recently instructed, and for the carrying out of which their conquest had supplied them with such ample means.

It would be a curious and interesting investigation to trace out the history of what may be styled the Primitive Romanesque architecture of Northern Europe; or, in other words, to examine into the style of building which prevailed during the long interval between the overthrow of the Roman power in the fifth century and the final establishment of that family of nations which for the last eight or nine centuries has been the embodied representative of Europe.

The thousandth year of our era seems as if it were the beginning of a new state of things: as if what succeeded it were in the open daylight, while the six preceding centuries could only be viewed by the glimmer of twilight. This is especially the case as regards our own art. How little do we know of the architecture of Western Europe, north of the Alps, during that long interval! Only here and there a building equally obscure in character and date,—a dull ray of light only just sufficing to render the darkness visible. No doubt a careful investigation would increase the number of known examples on the Continent. At present they are but few, such as the *Basée-courve* at Beauvais; the Church of St. Jean at Poitiers; that of Quenouville in Normandy; the church at Lorsch, on the Rhine, and the older parts of St. Pantaleon at Cologne; all of which possess a character so distinct from that which prevails among the buildings of succeeding times as quite to sever from all which followed the architecture of these primitive ages,—this gulf which divides the ancient from the modern world. Our business, however, at present, is not with the Continent, but with the sister islands of Britain.

The circumstances of the various portions of the British isles differed in those early times so much that it is difficult to view them at all systematically. South Britain, early overspread with Roman art, civilized and Christianized while Scotland and Ireland were yet barbarous and Pagan, became again, in its turn, both Pagan and barbarous when Ireland and Scotland had received the light of Christianity and civilization.

Early in the fifth century these blessings were conveyed to Ireland from then Christian Britain, and in the next century South Britain was sunk in almost impenetrable darkness, and was subsequently held out to Ireland and the Irish race dwelling in Scotland, from the one side, and to missionaries from Rome from the other, for rekindling the extinguished lamp of religion and knowledge.

Of all the churches which must have existed in what is now England when inhabited by the old Britons, I am not sure that we possess a single relic; nor is there any certainty that even in Wales or Cornwall, where they were comparatively undisturbed, the case is much better. More curious still is the scarcity of early buildings in Scotland; though I shall be able to show you that some exceptions exist. Bede speaks of timber building as the "*Mos Scotorum*," and of stone building as "*Mos Britannicus insolitus*," which may account for this dearth of objects of high antiquity. However this may be, we have to look mainly to Ireland for relics of the early modes of building among the British races; and here we happily find much to gratify our curiosity.

It was early in the fifth century that Patrius, or St. Patrick (who describes himself as at once a Briton and a Roman), went from the northern parts of Roman Britain to instruct the then Pagan Irish, or, as they were more generally called, Scots. It was about the time when the invasion of Alaric had compelled the Emperor Honorius to withdraw his legions from Britain; and was, consequently, at the precise moment when our country was about to pass from the age of Roman subjection into that of mythic confusion,—beginning with the frightful devastations of the Picts and Scots, and subsequently of the Saxons; passing on through the semi-fabulous days of Vortigern, King Arthur, and Merlin, and ending with the flight of Cadwallader from desolated Britain; the driving out of the ancient inhabitants; the destruction of Christian churches and Roman cities, and the re-establishment of Paganism.

As there seems good reason to believe that,

among the existing remains in Ireland, some are actually of the age of St. Patrick, it follows that in them we possess remains two centuries earlier than any left us by our own Anglo-Saxon forefathers, and that their type may be founded on that of the lost British buildings, though no doubt far humbler in scale and mode of building than those erected in South Britain with Roman aid. The Early Irish remains are mainly of three classes: the cells and other domestic buildings of the monks; the oratories and churches; and the round towers. The former class are of the rudest and most ascetic description, and seem to be founded on the customary dwellings of the Pagan inhabitants. The monks evidently eschewed all pretensions to personal comfort, and took up at once with the scale of dwelling common among their flock. They lived in stone huts, built without mortar and vaulted over;—more like ovens than human habitations, and so small as only to be sufficient for one person. With these they surrounded their churches, adding a few buildings, similar in character but somewhat larger, for more general purposes. Some, even of their oratories, were almost as pristine in their construction; and the churches themselves, though less rude, were of the most severe simplicity.

The form of dwelling indicated by the Cells or "Kills" which I have alluded to is not wholly alien to that still existing (or at least in use at the commencement of the present century) in the distant island of St. Kilda, excepting that the cells were for one person while the St. Kilda houses are for a family. Dr. Edward Daniel Clarke thus describes these houses in 1797:—

"The construction of their dwelling-houses differs from that of all the western islands. They consist of a pile of stones without cement, raised about 3 ft. or 4 ft. from the ground, forming a small oblong inclosure, over which is raised a covering of straw, bound together with three or four ropes of bent. . . . Round the walls of their huts are one or more arched apertures, according to the number of the family, leading to a vault, like an oven, arched with stone, and defended strongly from the inclemency of the weather; in this they sleep. I crawled on all-fours, with a lamp, into one of these, and found the bottom covered with heath; in this, I was informed, four persons slept. There is not sufficient space in them for all men to sit upright, though the dimensions of these vaulted dormitories varied in each hut, according to the number it was required to contain, or the industry of the owners."

The central apartment he describes as without either chimney or window, but with two holes, some 7 in. square, to let out a little of the peat smoke.

There exists in the greater Island of Arran, in the Bay of Galway, among many primeval antiquities, a house, supposed to be of the Pagan period, which is thus described by Mr. Petrie, in his admirable work on the "Ancient Architecture of Ireland."

"It is in its internal measurement 19 ft. long, 7 ft. 6 in. broad, and 8 ft. high, and its walls are about 4 ft. thick. Its doorway is but 3 ft. high, and 2 ft. 6 in. wide on the outside, but narrows to 2 ft. on the inside. The roof is formed, as in all buildings of this class, by a gradual approximation of stones laid horizontally, till it is closed at the top by a single stone; and two apertures in the centre served the double purpose of a window and a chimney."

The cells of the monks differed but little from this, excepting in being quadrangular within, though round or oval without. It would appear that some of the Irish monasteries had whole towns of such insulated cells, and it was from the great number of these erected by St. Columba that his name received the affix of "Kill," and which caused his famous foundation in Iona to be called "I Colmkill."

The earlier oratories seem frequently to have been a development of the construction of these cells, "built of uncemented stones admirably fitted to each other, and their lateral walls converging from the base to their apex in curved lines."

These pristine oratories are surrounded by the cells and the graves of their founders, the latter inscribed with the cross. I give, from Mr. Petrie, a sketch of the oratory galleries, which he describes as externally, 25 ft. long by 10 ft. broad, and 16 ft. high to the external apex. It has a small doorway in the west end, and is lighted by a single window in the east end, which east gable was finished by a cross. Of very similar construction are several in Scotland and the Western Isles. Of these I have been enabled to give some illustrations, which are, in one respect, more complete than Mr. Petrie's drawings, inasmuch as they are furnished with plans.

"The early Irish churches are of two very simple types, being either oblong, with a door at the west end and a window at the east end,—a mere development, with upright walls, of the oratory just described,—or a double oblong, forming a nave and chancel, and united by a chancel arch,

—the distinct prototypes of the simplest forms of an English church. The one doorway is always west, and one the windows to the east, though side windows are also introduced, all apparently without glass; the doorway usually square-headed, the windows round-arched or triangular-headed." "In all cases the sides of doorways and windows incline, like the doorways in the oldest remains of Cyclopean buildings, to which they bear a singularly striking resemblance." "In the smaller churches the roofs were frequently formed of stone, but in the larger ones were always of wood."

The doorways are, however, sometimes arched. The apsidal termination is, I believe, wholly unknown in these churches; and it would appear from this fact that the square end of the majority of English chancels is a tradition from the ancient British churches: the apse, which so frequently made its appearance and was again so frequently removed, being a foreign importation, against which the national feeling rebelled, as opposed to the local tradition. Of a piece with this feeling was the indignant protest of an Irishman against the intention of one St. Malachy to erect a church in an unaccustomed style. "Good man, what has induced you to introduce this novelty into these regions? We are Scots not Gauls; why this levity? Was ever work so superfluous, so proud! This feeling, rather than the poverty of the country, may have occasioned the rigid severity of these early churches in Ireland, the largest of which rarely exceeded 60 ft. in length,—the very length prescribed by St. Patrick for one of his churches, and which Mr. Petrie thinks was his usual dimension for churches of the largest class. This was also the length of the original church at Glastonbury, probably the first erected in Great Britain, while it differs but slightly from that of the nave of Brixworth Church, Worth Church, and that on the Castle Hill at Dover, three of our oldest remaining Pre-Norman English churches.

The difficulty naturally arising from the limited size of the churches and the unlimited number of the monks, appears to have been met by multiplying the number of the former. Thus we find several—up to seven—chiroches continually forming a single group. Just as at Glastonbury, there were at one time three in immediate proximity, though subsequently united into one.

Besides the more or less numerous cells which surrounded the churches, or groups of churches, there were usually houses for the abbots, hardly less ascetic in their construction than the cells of the monks; halls for strangers, refectories, and kitchens. Of the abbots' houses we have several remaining, especially those of St. Columba at Kells, and of St. Kelvin at Glendalough, for sketches of which I am indebted to Mr. Barchett. These were single rooms, about 18 ft. to 25 ft. long, by 15 ft. or 16 ft. wide, vaulted and covered by a stone roof, with a window and a door of very small size, all perfectly plain, but skillfully constructed.

All such groups of buildings were surrounded by a high and thick wall of defence, with strong gateways, and somewhere at hand was often erected a round tower, at once the bell tower of the monastery and the place of refuge in case of attack.

We know nothing of the internal arrangement of the churches, excepting that in some cases there is a stone bench across the east end, the altar standing a little in advance; a square version of the Basilican arrangement; for, be it remembered, the apse possibly only came into use when secular Basilice were converted into churches, while those under consideration were probably founded upon the traditions of chiroches which existed in Britain before the time of Constantine, so that our English square east-end may after all be the more primitive type, though, if such were the case, it would appear that the seats of the clergy were at first along the eastern wall and behind the altar, as in the apsidal churches. To these views, however, I will not pledge myself, as we do not know how soon apses came into use.

This system, too, of erecting monasteries, not with general dormitories, but with numerous private cells, seems to have been founded on the early Eastern form, of which so many existed in the deserts of the Thebaid, and of which many ancient notices exist. The most perfect remaining specimen of this kind of monastery in Ireland is one on a most minute scale founded by St. Fechin, in the seventh century, in the almost inaccessible island of Ardillon, off the coast of Conemara, which, excepting only that all its buildings are vaulted, agrees almost precisely with Bede's description of that founded about the same time in the island of Farne, on the

Northumbrian coast, by St. Cuthbert, himself a Scot or perhaps an Irishman. Those in the north of Ireland and in Scotland seem to have been usually of timber, "*more Scotorum*," as Bede says, and have consequently perished; and in the south and west of Ireland they were of stone, and remain, in many instances, in a more or less complete state to our own day.

Some, however, in Scotland were of stone, like those of Ireland.

It was in these establishments,—so severely simple in their architecture,—that the lamp of piety and learning was preserved during the darkest period of our history; emitted its light not only among the British islands but to Continental Europe; and here were followed up even the decorative arts,—as illumination, embroidery, and jewelry. Such, no doubt, was the famous monastery of Iona, which, as an able historian, says,—

"Soon became morally and religiously a spectacle as glorious as any that Christendom could afford. . . . The school, of whatever knowledge, sacred or profane, was then within the reach of its northern people,—the nursery of many arts, the centre of a Christian colour, and the mother of priests and missionaries."

It was on landing here that Dr. Johnson exclaimed,—

"We are now treading the illustrious island which was once the luminary of the Caledonian regions, whence savage clans and roving barbarians derived the benefits of knowledge and the blessing of religion. . . . But man is little to be envied whose patriotism would not gain force upon the plain of Marathon, whose piety would not grow warmer among the ruins of Iona."

At somewhat later periods the severity of the Irish architecture became gradually relieved, while its leading types remained unaltered. As the dates of the more decorative buildings are unsettled, I will not enter upon the discussion how far their ornamentation was indigenous, and how far derived from other countries. Towards the Norman period, we find features agreeing with the details of that style united with Irish forms and mixed with ornamental details,—such as those which decorate the well-known Irish crosses, and are common on the monumental slabs in the monastic cemeteries. We also find the jambs of doorways, and chancel arches, losing the square form extending through the thickness of the walls which characterises the earlier examples (like those of our own Anglo-Saxon buildings), and becoming divided into separate orders, with decorative mouldings, shafts with caps and bases, and thus exhibiting the most important elements of the advanced Romanesque and "Gothic" styles. These features increase in distinctness till we reach examples known to be contemporary with our own Norman works, and culminate in the charming Chapel of St. Cormac at Cashel, which, though in outline, evincing an adherence to Irish tradition, is in all its details distinctly Norman, and is known to have been erected in the twelfth century. Mr. Petrie thinks that these decorative features are in many instances of very early date. I can quite agree with him when he says that Norman details appear; for, though a system of ornamentation may appear early in a particular county, it is impossible that it should anticipate the precise forms elaborated much later by a regular course of progression elsewhere.

There is in Scotland, at least one specimen of parallel character to these later of the old Irish churches. I allude to the church of St. Regulus, which stands side-by-side with the cathedral of St. Andrew's; just as that of St. Cormac does with the cathedral of Cashel.

Mr. Billings has given a good view of this interesting, and, I may say, beautiful, remnant; and I am enabled, by the kindness of a friend (Mr. R. Anderson, of Edinburgh), to show you detail drawings of it. It consists either of a nave (with chancel arch) and a western tower, or of a chancel with apse arch and a central tower, in which latter case it would be parallel to the remains of Jarro Church. In the other case, it may have had a lofty western porch as had those of Wearmouth and Barton-upon-Humber. The large western arch or the tower must have opened into either a nave or a porch; and, as this is actually larger than the chancel arch, and the mark of the roof of equal height, it certainly suggests a nave. Its workmanship is of a very superior character; and its details, though plain and archaic, are very good. The tower is of great height, evidently, like many other early towers in Scotland, founded on the idea of the early campaniles of Italy. The capitals of shafts closely resemble those of St. Pantoleon at Cologne, which are of

the tenth century. I find it difficult to conceive the age of this church; but, I imagine it to be anterior in its date to the introduction of Norman architecture into England. It is said that when the surrounding ground was excavated the foundations of an apse were found.

I will not dwell on the Irish crosses, and the round towers,—time not permitting,—though they are among the most remarkable features of Irish art. The towers agree precisely in their architectural details with the churches, and never appear but in connexion with them. They are known in the Irish language by a name signifying a belfry, and were no doubt the companions of the monasteries; their unique type showing the originality of invention of these early architects. Their doors were placed at a considerable height for the sake of security; they were divided into several stories, each with a single window except the upper one which had two or more,—all pointing out their double object of bell towers and places of defence. Two similar towers remain in Scotland.

The Irish and Iona crosses are works of extreme beauty, and of very decorative detail. I shall have to allude to their anti-types in England when speaking of Anglo-Saxon architecture, to the consideration of which I will now proceed.*

THE PROPOSED ENLARGEMENT OF NEWGATE.

THE public will learn, with extreme surprise, that it is intended by the City authorities to enlarge Newgate to nearly double its present size. During the whole lifetime of a generation, the prison of Newgate has been condemned as a public nuisance by every intelligent man; and now, when its presence has become more unbearable than ever, the "statesmanship" of the Guildhall proposes to enlarge it! Newgate-street is already almost crowded to impassability during business hours, whilst Ludgate-hill, a confined neighbour, is in a condition of traffic-jam the greater portion of every day. "Newgate" itself is able to be extended. Newgate, which, with the Old Bailey, may be taken as the obstructive barrier between the two great arterial thoroughfares, ought to have been carted out of the public way half a century ago. Common-sense, at this time of day, might have suggested a "clean sweep" to give more elbow-room to the public. The Holborn Viaduct, one of the historic building-works of modern London, is being constructed at a cost of something over one million sterling; Middle-row has been cleared away at an expenditure of more than 50,000*l.*, to give full effect to the western approach of the new high-level roadway; whilst the eastern end of the same roadway is doomed to open out upon—what? The felon's door, from which the condemned wretch marches forth to be hanged. Then, there is the new meat-market, raising its cheerful-looking eyes in Smithfield. Its main north and south roadway will pass at right angles to the viaduct, directly over the spot where the gallows stands. What, Newgate must be enlarged! The admirer of the viaduct, when going Citywise, will have something to "season" his admiration with, when he finds the eastern terminal faced by the bloody corner of the old prison.

In 1857, when the interior of Newgate was reconstructed at an outlay of between 12,000*l.* and 15,000*l.*, land were the cries against either the expenditure of the money, or the continuance of the prison. The cries died out, as such senseless wallings had often done before, and Newgate still stands, awaiting a yet further enlargement.

It is proposed to take in the best part of Warwick-square, some of Tylor's Market—which many people think is part of Newgate Market—and some courts and alleys adjacent. If this is done, of course the present proprietors of the required premises will have to be bought out bandedly. As they are mostly publishers, or connected with the commercial department of literature in some shape or other, they cannot be "improved" out of the way without money. When there will be the freeholders to settle with, and, after that, the old buildings to be pulled down and the new ones put up. Rumour ascribes the project to Mr. Hardy; but the Home Secretary would hardly of himself be hardy enough for that. It was stated, years ago, on every credible authority, that the space occu-

ped for each prisoner was equivalent to more than 150*l.* per annum ground-rent! It must be remembered that the site is within a stone's throw of the General Post-office, and within pistol-shot of the Bank of England and the Royal Exchange, the very heart of the City. The frontage of the prison in the Old Bailey is 300 ft., with a back extension line of 192 ft. The net area is, however, much less, being only 124 ft. by 46 ft. for prisoners' use. In the reconstruction already mentioned, 130 modern cells were built, and accommodation can be given to nearly 200 prisoners; but the average is hardly ever over 100,—sometimes not more than forty at once. The grim walls which we see on passing every day are not a century old, having been built by George Dance, the then City architect, between the years 1776 and 1782, the Gordon riots having destroyed the old prison.

Newgate has been a prison since the thirteenth century, and the time has come when it ought to be removed for the purpose of public convenience. Were Newgate-prison and Newgate-market gone, there would then be ample room for the glories of "the Row" to expand. A fine, broad street might lead off from the eastern part of the viaduct, cross the end of the Old Bailey, and cut through, in a right oblique direction, to the north-eastern corner of St. Paul's Churchyard. Once there, the rest is all plain sailing. It has long been "on the carpet" to remove St. Paul's school beyond the metropolitan barriers, and widen the street right through. Were the plan here sketched carried out to fulfilment, all the Holborn and Smithfield traffic for London Bridge could branch off direct south-east to Cannon-street, and so relieve the whole day-block of Newgate-street, Cheapside, and King William-street. This Newgate enlargement scheme has been taken for joint incubation, beneath the aldermanic feathers of Mr. Lush, the liberal member for Finsbury, and Mr. Warren Hale. The more than average enlightened character of these gentlemen, in conjunction with their proposal, has created a source of unusual surprise, as expressed within the sound of Bow-hells. The folks say there, that this is progressing as the crab goes—backwards. Surely, there must be some men beneath the shadow of "Pan's Cross," who have the souls of earnest, onward hurghers in them? If such are in the land of their fathers let them hestir themselves; let them raise their voices in a firm, determined tone, to sweep away this blot from their famed—and justly famed—city, or ever after bold their peace. Let them "buckle on their armour," for the onemy is already within the gates.

THE NORFOLK SEAT OF H.R.H. THE PRINCE OF WALES.

THE transformation that has been effected at Sandringham within the last six years is very remarkable, and we have reason to know that what has been done has been in great measure the result of that practical interest in such matters which the Prince of Wales largely inherits from the late Prince Consort.

The estate is called *Sant Dersingham* in Domesday-book, and was held by a freeman under Harold Earl Godwin, for a brief period of England. It was purchased, as is pretty well known, by the Prince of Wales in 1862, since which time works have been in progress to render the estate suitable for a royal residence. A large portion of these works has only recently been completed. The Norwich Gates, royal gardens, pheasantry, comptrollers' and equerries' residences, labourers' cottages, and new roads, have been previously described, and it is no part of our intention to farther allude to them now. The completion of the model farm premises marks the fact that the Prince of Wales has become a practical agriculturist, and some few particulars respecting the farm will be read with interest. The estate consists of about 7,000 acres, 2,000 of which are heaths and plantations, and about 500 acres of these are planted. The park is only about 200 acres in extent, and a portion produces useful herbage, but some of it was very inferior till improved by drainage and moulding, with top dressing and sprinkling with seeds. For many years a small piece of freehold land, belonging to another owner, about 3 acres in extent, abutted into the park; but this has recently been purchased by the Prince, and has been thrown into the park, and all the cottages on this (the West Newton) side of the park are being removed. The farm, which the

Prince has taken into his own hands, is about 450 acres in extent, and includes the Home farm at Sandringham and that which was formerly Cork's farm at West Newton. Of this we find there are 365 acres of arable land and 47 acres of grass, besides about 70 acres of marshes at Wolferton and Babingley. The Wolferton portion of the estate has recently been considerably added to by the reclamation of the Norfolk Estuary Company. About 100 acres of the Prince's arable land consist of good and productive land; about the same quantity is a fair soil, on a chalk subsoil; and the remaining 165 acres are poor or sandy light land, resting upon the carr and gravel on the West Newton heath. The poorest of this land is prolific of building and road-making materials. It will be seen from what is stated above that, including the park, His Royal Highness farms about an equal quantity of arable and pasture land. The Prince's flock is made up of about 10 score of pure South Downs, and about 11 score of half-bred and Down hoggets, and Down shearlings, the ewes being from the celebrated flocks of Lord Sondes and Sir Willoughby Jones. The herd of stock numbers 77 head, including a dairy of 10 Alderney cows, with their yearling produce and calves. Twelve Devons occupy the stalls of the fattening boxes, and 31 Highlanders are in the park, as well as an Azore bull, 2 cows, and a calf, which have been presented to the Prince. The Highlanders are being fed on cake and hay, &c., and will be fat by May or June, when they will be disposed of, and a fresh importation will be received at Michaelmas direct from the Highlands. The park also contains 200 deer.

The model farm-buildings have been erected at the rear of the royal gardens, and face the south, being well sheltered on the north and west. They are built with the native carr, with stone and brick facings, and slate roofs. The square block of buildings contains two open yards, and this block is 168 ft. in width and 113 ft. deep. Each of the open yards contains in the centre an iron water-tank, 13 ft. 6 in. by 6 ft. 6 in., underneath which is a cistern, into which the liquid manure drains, and is afterwards carted on to the land. Each yard is surrounded by a pavement 6 ft. or 7 ft. wide. The north end of the east yard is a hospital-stable, and the east side consists of a twelve-stalled stable for the farm-horses, but at present is occupied by the Prince's horses which cannot be accommodated at the royal mews. A large straw-larn, 60 ft. long by 20 ft. wide, with sliding doors, and asphaltic flooring, occupies the centre of the north range of buildings. The yards are separated by the calves' boxes and piggeries, the latter being fitted up with Crosskill & Son's patent troughs, and tenanted with some exceedingly pretty little members of the porcine species. At the south end is the meal-room and hoiling-house. The west and part of the north side of the second yard consists of the cow-stalls and fattening-boxes. The Alderney cows are brought here to be milked, and the fattening-boxes are occupied by twelve Devons. These boxes are supplied with Cottam's patent feeding-troughs. The windows are fitted with sliding shutters, and oak panels separate the stalls. At the south end is a capably fitted-up slaughter-house, in which beef, mutton, and pork, for consumption at the table, is slaughtered and dressed. All these premises are lighted with gas. Beyond the north end of this block is a roadway, 41 ft. wide, on the other side of which is a range of buildings, 168 ft. long by 26 ft. 4 in. wide, at each end of which is a three-storied octagonal tower. The east tower contains a large cistern, to supply the whole range of buildings with water, which is conveyed to the cistern, by means of a force-pump, from a well which has been sunk contiguous, the water being found 27 ft. below the level of the soil. The other tower is used as a granary, and the range of buildings comprises cart-sheds, implement-houses, machine-rooms for cutting, thrashing, and dressing, and the large granary-chamber, capable of holding 400 combs of corn. They have sliding doors; and the machinery is supplied by Mr. Dodman, of King's Lynn.

The gas works have been constructed on the north side of the farm premises by Messrs. Walker, of Donington, in Shropshire. The retort-house contains three D iron retorts 9 ft. long, and a space has been left for another retort, 12,000 ft. or 14,000 ft. of gas are produced every twenty-four hours. Adjoining is the condenser, and in the next room the purifier, connected with which is the workshop. The gasometer is 25 ft. in diameter, and 12 ft. deep, and holds about

* To be continued.

4,000 ft. of gas. The works are under the care of Mr. Robert Borne, from the Crystal Palace district works. The shaft of the gasworks is 41 ft. high, and octagonal in shape, with a square base. The various rooms in Sandringham House, the Norwich gates, the several drives and walks, the royal mews, the offices, and the farm premises are lighted with gas, and the appearance presented in the park after dark is exceedingly picturesque owing to the undulating nature of the land. We lately mentioned the new offices, billiard-room, and howling alley, and need not again refer to them.

ARCHÆOLOGICAL ITEMS FROM ROME.

Though alarm in high places and extraordinary precautions against political dangers be still the order of the day in Rome, we are happy to report the progress of undertakings that may interest the antiquarian, and that afford proof of the attention paid by the Papal Government, even amidst exceptional circumstances, to things apart from the diplomatic and ecclesiastical. The excavations on the Palatine, as well in that region where the Roman as in that where French authorities are carrying on such works, proceed with something like alacrity, and have led to important results at various points on the Imperial Mosaic's acclivities. In the Catacombs of St. Calixtus labourers are daily engaged. In the *Thermae* of Caracalla, the diggings commenced in the last spring, and soon rewarded by the discovery of a fine male torso in Greek marble (conjectured to be a Hercules), are also continuing, though but few hands are employed; and at the southern side, just beyond the walls of the vast ruin, we see still in progress the works that led, about two years ago, to the opening of chambers, with mosaic floors and painted walls, and (most interesting) a domestic lararium, with its altar *in situ*, and bright-hued frescoes of deities, priests, &c., colouring its walls,—identified as the palace of the well-known Asinius Pollio, the friend of Augustus and patron of Virgil. In Trastevere we find like activity at the spot where (as already reported by us), some two years ago, were found the remains of a military station of the Vigiles (or Fire-brigade), and the most noticeable detail among which ruins is a beautiful porch, with terra-cotta ornamentation, in truly Classic style, leading into a painted chamber, not yet quite disencumbered of soil, supposed to be another lararium. Other wall-surfaces have been alike adorned with painting, the character of which is Pompeian. A treasure-trove of uncommon value was obtained, a few weeks ago, through works of excavation below the garden of the convent attached to SS. *Cosmo Damiano*, the church on the Forum. Here have been found, at considerable depth, eight additional fragments of the famous *Pianta Capitolina*, the plan of Rome incised on marble, referred to the times of Septimius Severus or Antoninus Caracalla, and believed to have formed the pavement of that temple; other principal portions, brought to light near the same spot in the sixteenth century, being now in the Capitoline Museum (hence the conventional name), where they occupy twenty-six compartments set into the walls of the chief staircase. Of these newly-discovered fragments two are large, comparatively speaking; among the smallest and most valuable of the others is one on which we see the well-nigh complete plan of the Portico of Livia on the Esquiline Hill, an oblong parallelogram surrounded with a double colonnade, and containing, at its centre, what seems a small temple within its sacred enclosure, also parallelogram, the name "Porticus Liviae," preserved in large letters on the surface. The fragment next in importance presents an edifice recognisable as a basilica, divided into three aisles by colonnades, and with a hemicycle at one extremity, but no name here preserved; as alike are the other portions wanting in respect to names, but on one are the letters A I, on another N alone left. These marbles have been lithographed, and will be eventually placed beside their companion-pieces in the Capitol. The same diggings behind the church on the Forum brought to light considerable masses of brickwork, and remains of a corkscrew staircase, that obviously pertain to the adjacent basilica, called after Constantine, though built by Maxentius, the three enormous arcades of which are so grandly conspicuous. The German Archaeological Institute com-

menced, about a month ago, its sessions for the winter at the well-stored library, belonging to that association, on the Tarpeian Rock. Most interesting among papers read at that inaugural meeting was one on the representations of Venus in Classic art, illustrated by a very precious and original specimen, a marble bust of the Cyprian goddess, for this occasion exhibited; the story of which is that, about twelve years ago, it was found beside the street ascending the Colian towards the Lateran church (*Stradone di S. Giovanni*), in laying foundations for walls to a garden, the property of Cardinal Tosti; that till that Cardinal's death it remained in his keeping, little known, and seen by few, as we understand, afterwards passed to his eminence's heirs, who soon sold it; and thus did this Classic treasure eventually reach the hands of a person named Milani, who collects objects of *virtu* with a view to their sale in case liberal offers be not wanting. The notion entertained, and which that collector himself advances with some reasoning, is that the head in question either belongs to the Medicean Venus, and ought to be on the shoulders where another has been fitted by mistake, or that it is one of several copies from a highly-prized original, the Medicean statue being another. However this question may be regarded, there can be no doubt as to the analogy between the two, with some slight difference of pose indeed, and a rather more downward cast in the Roman than in the Florentine antique; whilst, at the same time, we must notice a more serious, intellectual, and (as it impressed us), more *morally* beautiful character in the bust thus found within recent years. As set on its neck, it is evident that the latter head belongs to a statue no other portion of which was found in the Colian, together with this most lovely representation of the goddess.

On the 27th December, the English archæologists met for the opening of their winter sessions, at our Consulate, in the Palazzo Poli, after two preliminary committee meetings. At that first public assemblage, Mr. J. H. Parker read a paper of about an hour's length, on the methods of construction in Rome's ancient buildings, taking up his theme from the earliest, and bringing it down to the latest period in the city's history, before the empire had fallen. We need not add that so able an authority as the above-named gentleman proved himself fully equal to cope with, and to present in attractive form such a subject, on this occasion rendered more appreciable to his hearers by the several spirited coloured drawings, on the exact scale of the originals, the work of Mr. Charles Wood (brother to the honorary secretary of the Association), hung round the walls of the lecture-room. Before Mr. Parker began, the chairman (Mr. Lecky, one of the committee), said a few words respecting the Society's actual circumstances (not at present favourable), and the intention formed of creating a fund, through subscriptions among co-nationals at home and abroad, for undertaking works with the object, either to excavate or explore, on sites where Rome's soil is not yet exhausted. Next day ensued an open-air meeting for the visit to different ruins, within the walls, on the Palatine and Aventine, under the conduct of Mr. Parker, who now resumed his account of the antiques in face of extant examples of such characteristics in Roman building as his lecture had dwelt on.

Among losses to the antique, matter for regret, and a consequence of the late troubles in this region, is the ruin of the Sularian Bridge, which was blown up, too hastily indeed, by Roman soldiers, under a false alarm of Garibaldian attack. As all visitors here know, that picturesque bridge (still picturesque in ruins), was thrown across the Anio, about two miles from Rome, in a period of remote antiquity, and restored by Narses, after being demolished by Totila during the Gothic siege. We hear of no intention for a second restoration.

FALL OF A PINNACLE FROM A CHURCH.—One of the pinnacles on the east end of St. Mary's Church, Shrewsbury, has been blown down. A portion of the falling masonry struck the iron railings which surround the church, and the iron work for two or three yards was smashed to pieces. The pinnacle itself was broken up. Some of the carved work on the end of the church was slightly damaged; but, fortunately, the stained glass window in the chancel escaped without injury.

WORKS ON GEOMETRY.

THE very useful work before us* is compiled for the use of land-surveyors, architects, and engineers, and its author (formerly an *élève* of the Quebec Seminary) has put into a concise form most of the geometrical problems which the members of those professions have to work out in their daily avocations. The amount of originality which it displays is rather in the arrangement and simplification of the propositions, than in any really "new" information which it affords.

M. Baillairgé considers (preface) that, to the student who has many other subjects to learn, the study of the first six books of Euclid is rather a sacrifice of time, owing to that geometer's minute attention to detail in his demonstrations; most eminent mathematicians are, however, of opinion that it is this very exactness in Euclid's reasoning that makes the "Elements" so valuable as the student's first book of geometry, whereby he is compelled, step by step, to admit the truth of the propositions. It is therefore to be hoped that the old Greek author will continue to maintain his position in our schools and universities, in spite of all that any "new" treatises on geometry may say to the contrary.

Our author defines geometry (1) to be a science having for its object the *measurement* of space. This is what modern geometers generally term "measurement," with which science, in fact, M. Baillairgé principally deals. The work is divided into seven books, in the first of which we find the problems and theorems treated in the first six books of Euclid, but arranged in a different order and their demonstration shortened and often simplified. We must, however, take exception to the placing of the 2nd and 3rd propositions of Euclid's 1st book among the "postulates" (220, 221), as they are problems requiring solution, and not to be taken for granted. The plan adopted of generalizing the propositions so as to make one demonstration include a number of particular cases of the same problem might have been considerably extended; for instance, the 47th of Euclid's 1st book, and the 12th and 13th of his 2nd book, are all particular cases of one general theorem, but the author has followed Euclid in treating them as separate propositions.

In the 2nd and 3rd books the subject of solid geometry is treated so as to render it easily understood, and the lengthy demonstrations of Euclid (Books 11 and 12) much simplified. There exist five, and *only* five, "regular" solids, namely—(1) Tetrahedron, formed by uniting four equilateral triangles; (2) Cube, formed of six squares; (3) Octahedron, of eight triangles; (4) Dodecahedron, of twelve pentagons; (5) Icosahedron, of twenty triangles. The measurement of the solidity of each is, the area of the surface multiplied by one-third of the radius of the inscribed sphere; which rule may be considered as a generalization of that for the solidity of a sphere.

Spherical geometry is described in the 4th book; this relates to figures drawn on the surface of a sphere, and is preliminary to the study of spherical trigonometry.

The 5th book is devoted to plane trigonometry, or the relations existing between the sides and angles of triangles drawn on a plane surface. In a treatise that is called "new" we are surprised to find the old-fashioned system adopted, in which the angle is taken at the centre of a circle of radius R, and certain lines which are then drawn are called the *sine*, *cosine*, *tangent*, &c., of that angle. In the modern system a right-angled triangle is substituted for the circle, and the names *sine*, &c., given to six ratios which the sides have to one another. When R is made *unity* the functions in the two systems agree in value. It is very confusing to the student to have to learn two different methods, and we therefore hope to see no more "new" treatises on trigonometry that keep to the "old" system, now universally discarded by mathematicians. The author has omitted to notice the *circular* measure of angles found in all modern works on trigonometry, in which the *unit* is the angle subtending an arc of the circle equal to its radius, or nearly 57'29"; this number is the divisor whereby degrees are turned into *circular* units.

The usual modes of calculating triangles are

* *Nouveau Traité de Géométrie et de Trigonométrie Rectiligne et Sphérique*, &c. Par Chs. Baillairgé. Québec, 1868.

ven, and the use of logarithms explained, excellent tables of which will be found, together with tables of natural sines, cosines, tangents, areas of circular segments, length of arcs and chords of circles; also a useful table of multipliers and reciprocal divisors for every integer from 1 to 1000.

The 6th book treats of spherical trigonometry, the application of plane trigonometry to the solution of triangles whose sides are arcs of great circles drawn on the surface of a sphere: this is a branch of mathematics chiefly used in astronomical and nautical calculations.

The seventh book, or appendix, contains various rules for measuring the surface and solidity of various figures, without employing the processes of the integral calculus to which this subject especially belongs. The quadrature of all surfaces is based on that of the rectangle or its half the right-angled triangle; the area of the surface being divided into a number of rectangles or triangles whose sum makes up the whole surface. When the surface is bounded by curves, the area can only be obtained approximately, but the error may be made as small as we please by increasing the number of rectangles. In measuring the length of a curved line we really measure a large number of small chords of the curve, and the greater the number the less will be our error. Thus, $2\pi r$ represents the circumference of a circle whose radius is r ; but this is in reality the perimeter of a polygon either outside or inside the circle, and approaching very closely to it; the amount of error depends on the accuracy with which π is determined; for ordinary calculations $\pi = 3.1416$. . . , but where great nicety is demanded its value must be found to a larger number of decimal places. The circumference of an ellipse can be approximately found, and with sufficient accuracy for practical use; but as the rule given in the work (M61) requires the extraction of the square root, the following will be found easier of calculation as well as more accurate (a and b being semi-

axes); circumference of ellipse = $\pi \frac{3a^2 + b^2}{2a}$.

The rule which the author gives (1651) for finding the area of a spherical triangle is wanting in simplicity, and the following will be found easier of calculation:—

Area of spherical triangle = $\frac{A + B + C - 180^\circ}{57.296} r^2$

where A , B , and C are the angles of the triangle in degrees, and r the radius of the sphere.

The rules given for measuring the contents of solid figures of various shapes, regular or irregular, will be found of great practical utility.

The following general rule (1621) will apply to a large number of solids:—"The volume is equivalent to the sum of the area of the base if it has only one, or of its parallel bases if it has two, and four times the area of a section at half-distance between the bases, between base and summit, or between the opposite summits, as the case may be, multiplied by one-sixth of the height of the solid."

The second book on the subject of Geometry before us is a small work by Major Rouse,* the object of which is to simplify the study, and to induce an interest in it which may bring about a desire to obtain further knowledge. We recommend the mastering of this little volume to those who have not time to tackle Euclid.

SOME NOTES FROM YORK.

THE church of St. Michael le Belfre has just been new fronted, in the Tudor style of Henry VII. It now has a projecting porch, which is ornamented with the Tudor badge of the portcullis, derived from the House of Somerset, and some crosses, probably to represent the White Rose of York. A large window in the centre, above the porch, replaces the old one, in which were two roundels of ancient painted glass, which I hope will be replaced in the new window, or otherwise preserved in some other window of the church. Above each of the side windows is an inclined parapet, battlemented, with a Gothic pinnacle, on each side of a belfry of open Gothic work, which was put up before this renovation was carried out. The style of this, before the latest repair, is shown in an old book which I have now before me, entitled "A List or Catalogue of

all the Mayors, and Bayliffs, Lord Mayors, and Sheriffs, of the most ancient, honourable, noble, and loyal City of York, from the Time of King Edward I. to the Year 1664, being the 16th Year of the most happy Reign of King Charles the Second. Together with many and sundry remarkable Passages, which happened in their several Years. Printed in the Year 1664; and now reprinted.

Published by a true Lover of Antiquity, and a Well-wisher to the Prosperity of the City; together with his hearty Desire of the Restoration of its former Glory, Splendour, and Magnificence. London: printed for W. B., and sold by Jonas Browne, at the Blak [sic] Swan, without Temple Bar." Small 8vo. In a plate in this curious work is shown, by the side of the Minster, Belfry Church; and in this representation it appears to have a plain parapet, with a plain embattled belfry, but does not show any tower at the right corner, but a tower probably then existed, embedded in the wall of one of the buildings known to have been built against the church, and which are shown in this curious plate. The tower which was taken down before the building of the present seemed to have been a restoration of recent years. The present tower is in shape hexagon, with moulded base and string-course joining heraldic string-course, which goes round three sides of the church. The side doorways of this church are now Gothic, to replace plain doorways; but the Gothic crockets come in front of the windows, which is a defect; and the quatrefoils and form of heraldic shields do not correspond with the rest in the string-course, which goes on each side of the church. In this church was baptized Guido or Guy Faux (he was born in the hamlet of St. Marygate, in which is situated St. Olive's Church). A very excellent account of Guy Faux has been written by Mr. Davis, late town clerk of the city of York, and now President of the Subscription Library in St. Leonard's-place, in this city. Guy Faux is a singular instance of that political fanaticism which we see displayed in the death of Henry IV. of France, and the attempt upon the life of King Charles II. by Lord William Russell in the case of the Rye House Plot. As regards the minster, the south door,—a very beautiful work in oak, as old probably as the minster, that is, the time of Edward III., and which, till it was oiled, retained its ancient vermilion colour,—has been sawn through, in order that it may admit persons to a sort of enclosed screen of oak with doors next to protect the minster from cold; but a screen might have been contrived of the same height as the ancient door without sawing this remarkably fine old door in two halves. A very bad piece of taste is said to be projected,—to take down the altar-screen and throw the lady-chapel into the choir, making the floor of the same level as the altar floor, and having a recess against the wall under the great east window. I hope the citizens of York will prevent this project, if it is attempted, as it would spoil the beautiful aerial effect produced by the high altar-screen as it is at present. The ancient chair which used to be within the altar-rails, and in which King James I. sat (on his progress to London from Scotland to take possession of the English crown) has been removed to the vestry. In this same vestry is preserved the three silver-gilt crowns which were carried before this king on his entrance into the city of York. And in mentioning King James I., I cannot help noticing the ancient palace of the manor (that old Stuart palace, as Mr. Canon Harcourt called it), the interesting history of which is as follows:—It was erected by Henry VIII. out of the materials of St. Mary's Abbey, and there was established in it a council, called the Council of the North, at the head of which was placed the Earl of Somerset. In this palace were taken the depositions for the trial of Mary Queen of Scots. The next circumstance worthy of notice was her son, King James I., taking up his residence on his way to London, as before narrated; it then became the residence of King Charles I., in the time of the great rebellion, when he came down to Yorkshire to assemble his forces in the Forest of Galtres (called the Forest of Gawtries in the old work before cited). Then, on the Earl of Stafford's trial, one of the counts in the indictment mentions the earl having put up his arms in the king's palace [of the manor]. The restored fac-simile is in the second count; and, lastly, it was the abode of King James II. when Duke of York and Lord High Admiral, in the time of his brother King Charles II., in the Dutch war, when the Duke of York went thence to join the fleet at Hull.

And I cannot close this account of the old palace without mentioning the circumstance that the clerk to the Council of the North was the founder of the estate of Heslington Hall, which is now vested in the family of Yarborough; the singular tenure of which estate is that it shall remain in the family as long as the present portion of the old Hall is preserved, and which was consequently replaced on the renovation of the Hall. In Heslington Hall is preserved a fine portrait of Lady Derwentwater, wife of James, Earl of Derwentwater, who suffered death for his support of the Stuarts in 1715; also a very interesting portrait by some foreign artist of Prince Charles Edward Stuart when a boy. I saw lately in York copies of portraits of the Earl of Derwentwater (James, who died in 1715), Mary, Lady Petre (married to Lord Petre), and of Charles Ratcliffe, brother to the Earl of Derwentwater, who suffered for adherence to the House of Stuart in 1745. I think this letter of Charles Ratcliffe, from the Tower of London the night before his death, is one of the most beautiful letters which the English language contains:—

"From the Tower, the 7th of December, 1746. The best of friends takes his leave of you. He has made his will: he is resigned. To-morrow is the day. Lore his memory. Let his Friends join with you in prayer. 'Tis no misfortune to die prepared. Let's love our enemies and pray for them. Let my sons be men like me: let my daughters be virtuous women like you. My blessing to them all. My love to Fanny, that other tender mother of my dear children.—Adieu, dear friend."

DERWENTWATER."

This letter was addressed to the Countess of Newburgh (in her own right), his wife. To return to Heslington Hall. The Yarboroughs were Barons de Terrie, in the county of Lincoln, and obtained the Heslington estate by matching, I believe, with a descendant of the old clerk of the Council of the North. One of this honourable family was page to King James II. Of the present possessor of Heslington Hall, I may say with Walter Scott, when speaking of the palace of Dalkeith,—

"Dalkeith, which all the virtues loved,
And classic Hawthornden."

though the only object near Heslington Hall which partakes of the classic is a Roman road, which I take to be the same (I have not a map of the Roman roads before me) that proceeds from the city of Lincoln.

Before concluding, I would hope that the directors of the Midland Railway will, now they are borrowing 5,000,000*l.* to improve their railway by a central station in London, not forget the good it would do the city of York to have the 2,000,000 persons who travel from Scotland and the north pass through York instead of past it, as they do at present. This, and the improvement of the river by raising the lock at Newburn, so as to allow of vessels of large tonnage from London, and the connecting the River Ouse with the Till and Calder Canal, thus bringing it into connexion with Manchester (a plan of which, I am told, was deposited in one of the chambers at Guildhall during the mayoralty of Mr. Alderman Meek), would, I am convinced, raise the city of York to a state of respectable opulence; and I hope the citizens of York, now that the railways are (I am happy to say) under the Board of Trade, will petition the Board, if necessary, to that effect. Of course, when I mention a central station for York, I mean only a central station for passengers, like that of the city of Carlisle (without workshops and smoky chimneys, which they have unfortunately added at Carlisle), leaving the workshops where they are at the York station on the other side of the river. This would make the matter complete, and the passengers would then all come into York instead of a tithing of them as at present, several of whom are only attracted to do so by the antiquarian glories of the Minster and the city;—at least, such ancient glories as are left by the present people of the Minster and the corporation, seized, as corporations sometimes are, with a spirit of destruction which has made only so-called restorations, instead of leaving to the joy of the antiquary the ancient, though perhaps broken, memorials of the past.

It has been proposed in a council of the Corporation of the City of York to alter the disposition of the pillars of the present portico of the Assembly-rooms in Blake-street, instead of making the portico like the new Theatre in Grey-street, Newcastle-upon-Tyne, in which portico the passengers pass through between the portico and the principal building. If iron gates were placed at each side of the portico of the Assembly-rooms in Blake-street they might be

* Practical Geometry on an entirely new Plan. By R. Rouse. London: W. Maxwell.

closed, whenever a ball is held, so as to exclude the public from the roadway under the portico and leaving them to the present footpath, which plan would not involve the present proportions or position of the pillars, both matters of the most rigid rule in Classic architecture. Drake, the historian and antiquary of York, gives the following account of the Assembly-rooms in Blake-street:—

"In this street, whilst I am writing, is now building and pretty near finished, a magnificent assembly-room for the gentry of the city to meet in throughout the year, and for the entertainment of the nobility, gentry, &c., who usually honor our horse-races with their presence. The room is an antique Egyptian hall; but the dimensions and grandeur of the building will be best understood by the adjoining plan, section, and upright of it. The design was first set on foot by a set of public-spirited gentlemen, for the most part resident in the city, who put out proposals for raising the sum of, first, 3,000*l.*, then 4,000*l.* for the carrying on and erecting this useful and ornamental structure. The subscription met with great encouragement from the nobility and gentry of the county, and several other parts of the kingdom; and though the expense has oversteered the first or second proposals, yet no gentleman can be uneasy when, at the small request of 2*sh.*, he is a proprietor in one of the finest rooms in Europe. The design was taken by that English Vitruvius, Richard Earl of Burlington, from Palladio, who gives the plan, but tells you that it never was executed out of Egypt. Our noble lord, finding that the ground the gentleman had bought would accept of this grand design, somewhat altered its dimensions from Palladio, threw it in, and added the common assembly-room, &c., on one side, and the offices on the other, as further conveniences. The first encouragement of a work of this nature—so much for the credit of both city and country—ought to have their names handed down to posterity. I have for that purpose caused the proposals and abstract of the purchase-deeds of the ground, the names of the first chosen stewards to the building, with an exact list of the subscribers, to be all placed in the appendix. Before the building of these rooms the street ran parallel with the great house facing it; but the proprietors have lately purchased all the houses from the new building to the end of the street; and by pulling them all down, a handsome area is now made before it. Towards which good way, the lord wanted in several other parts of the city—the lord mayor and commonalty gave 50*l.*"

So far Drake, and I will only add the following to what he says.—Where are Lord Burlington's original plans of the Assembly-rooms deposited? It was intended to make a perfect small palace of this building, but the Earl of Burlington was stopped from proceeding, in consequence of the Committee of Management being frightened at the magnificence of the ball-room he had planned. I may mention, in conclusion, a curious circumstance which regard to the old news-rooms adjoining it (the old one is rebuilt); there could not be discovered, when it was rebuilt, any deed to the upper room over the news-room, which belonged to the hotel in Museum-street, and it is supposed to have been forgotten in consequence of the alarm of Prince Charles Edward Stuart's advance from Scotland in 1745.

AN OLD CORRESPONDENT.

PAINTING AS A FINE ART.

At the ordinary meeting of the Architectural Association, held at the House in Conduit-street, on Friday evening, the 17th ult., Mr. R. Phénix Spiers, the president, in the chair, a paper was read by Mr. H. Mathews on "Painting as a Fine Art and its Principles, and their full Development in the Works of the ancient Masters." Referring, in the first instance, to the general desire for the introduction of mural decorations, he observed that the subject of painting as a fine art was one to which the architect could not be indifferent. Delineation was the most ancient of the arts, and it was used long before the introduction of painting. The Egyptians especially excelled in it, and much of their early history and character might be gathered from an attentive study of their paintings. The early Greeks had but a circumscribed knowledge of painting before the reign of Alexander the Great, who turned his attention to its development. At first they had but four colours, namely, white, yellow, red, and black; and yet with these they eventually carried the art to such perfection that it was related that a painter copied grapes so admirably that the birds pecked at them; and that on one occasion, when a celebrated painter was invited to inspect the work of a brother

* The whole is now finished, and the rooms finely illuminated with lustres of an extraordinary size and magnificence; and inures of which, with many other ornaments, as chimney-pieces, &c., were the gifts of the noble architect of the building.

† I need hardly say that it has not one feature of the architecture of ancient Egypt about it.

‡ I must not omit that a later inscription was done in brass, and riveted into the first stone of the building, which was laid with great solemnity by the lord mayor, &c., March the 1st, 1739, under the north-east corner, a copy of which I have, but I hope the original will be buried for many ages.

artist (consisting of a curtain only), he asked that it might be drawn aside in order that he might see the picture which he believed to be behind it. The ennoblement of Greece to Rome enabled the victors to reap the full benefit of that culture of the arts in which for three centuries the Greeks had so much excelled. The Romans, however, used floral colours, in addition to those borrowed from the Greeks; and the facility with which they painted on wood, cloth, plaster, and other surfaces, was demonstrated by the remains discovered both at Rome and at Pompeii. It was supposed that the ancients were not acquainted with perspective; at all events, they commenced practising the art of painting in a rude elementary manner, by the representation of objects or emblems only. The anchor, the dove, the lamb, and other symbols were frequently repeated; but in course of time their ideas became developed, and they began to put subjects together, and thus to form pictures. When the Papacy became established, a great impetus was given to the arts, and popes, bishops, and abbots vied with each other in adorning their churches with the most beautiful works they could obtain. In succeeding centuries the interests of art fluctuated with the rise or fall of various dynasties; but in the thirteenth century an extraordinary revival took place, and many artists arose whose works were still held in high estimation. A study of the pictures in the National Gallery would enable the student to trace the various schools which sprang into existence about that time, and to mark the progress which successive generations of artists had made.

Our national collection was not, it was true, as large as those of other countries; but still it contained pictures of the greatest interest and of the highest character. It was a pity, however, that a better system of classification was not adopted, so that the visitor might be able to note more clearly the various periods of art represented by the works exhibited. In 1270, Giotto, the son of a shepherd, first appeared upon the scene, and his fame spread so rapidly that popes, bishops, and ancient citizens became his patrons. He was said to have been the first inventor of portrait painting, and the introducer of allegorical subjects. He was also a sculptor and an architect. After the death of Giotto the number of painters in Italy increased, and they associated themselves together in religious confraternities, calling themselves "The Brothers of St. Luke." Having referred to the liberal encouragement, not only of the art of painting, but of architecture and working in metals, afforded by the family of Medici and other wealthy patrons of that period, Mr. Mathews traced the progress of painting from the time of Van Eyke (the first painter in oil colours) to that of Salvator Rosa, including Domenichino, Leonardo da Vinci, Michelangelo, Raffaele, Titian, Correggio, the Caracci, &c. Commenting upon the works of Correggio, Mr. Mathews stated that the "Christ on the Mount of Olives" in the National Gallery, long supposed to be an original, was only a fine copy, the true picture being in the possession of the Duke of Wellington. The word "after" (Correggio) had now been inscribed on the frame of the picture; but the copy was a very fine one indeed, and gave an excellent idea of the manner of the master. Of all the painters of Italy, Raffaele was by general consent admitted to be the prince; for nothing could exceed the grace, the dignity, and the harmony of his pictures. Correggio, who had heard of his fame, exclaimed, after a careful scrutiny of his works, "I am still a painter."

Mr. Tarver asked whether Mr. Mathews, in the course of his inquiry, had been able to throw any light upon the school of painters who seemed to have flourished many centuries ago in Norfolk. Many of the churches in that part of the country had their screens and other portions painted with great care.

A Member observed that, some four or five centuries since, a large trade was carried on between Norwich, the capital of East Anglia, and Flandere, and that it was highly probable that foreign artists were invited over to help in the decoration of churches in that city, and in the adjacent counties. Indeed, he was able to state, from personal examination, that many of the paintings, and some of the metalwork in Norfolk churches, were from the hands of foreigners.

Mr. J. D. Mathews corroborated this statement, observing that in Suffolk churches, also, there was abundant evidence of the presence of foreign artists.

Mr. H. Mathews thought it highly probable

that the English abbots invited foreign artists to assist in the decoration of their churches. He also suggested that foreign monks, many of whom were good architects, as well as painters and carvers, had contributed to this object.

Mr. Tarver said it was quite evident that the paintings which he had seen in Norfolk churches were not by native artists.

The Chairman called attention to the paintings in the chapter-house at Westminster, which it was reasonable to suppose had been executed by monks, who were acquainted with this description of art. He quite agreed with Mr. Mathews in recommending a careful study of the pictures in the National Gallery, which, however, might be made far more instructive and interesting if a proper system of classification were observed. It was a reproach to all our national collections, as contrasted with those of foreign countries, that, owing to a total absence of careful and intelligible classification, the value of their contents was greatly diminished.

TECHNICAL EDUCATION.

A MEETING of managers, practical foremen, artisans, professional gentlemen, and others interested in the advance of technical education in Birmingham, has been held in the Committee-room of the Town-hall. Mr. Sebastian Evans, M.A., presided over a large meeting.

The Chairman, in the course of a long speech, said,—With regard to the actual business before this meeting, ours is an exceedingly modest programme. What we want to do is, if practicable, to take the greatest possible advantage of the local institutions for the furtherance of technical education. We want as far as possible also to take into consideration that great question the art-education of workmen, for it seems to me that at all of the meetings which have been held on this subject far too much stress has been laid on the scientific instruction of the workman, and far too little importance has been attached to his artistic education. We shall do well, I think, to remember one fact, that in all scientific, mechanical, chemical, and other matters of the kind, the real technical education of the workman, must, after all, be given in the workshop itself. The chairman concluded an able address, in the course of which he reviewed the state of the various educational and art and science institutions in Birmingham, by moving the following resolution:—

"That in the opinion of this meeting the existing institutions for conveying technical instruction in Birmingham, by judicious administration and extension, and by encouragement and assistance from Government, may be rendered adequate to supply the needs of the town without the establishment of new Government schools of science."

Mr. Aitken also addressed the meeting at some length; and Dr. Melson said,—Don't let them take any hasty action which would thwart their purposes with reference to the Government. He would suggest that they adjourned the meeting until that night week; let them give, in the meantime, those valuable observations of Mr. Sebastian Evans, and those equally valuable ones which fell from Mr. Aitken, an opportunity of telling on the Birmingham public, and upon the London public, and upon all England. He moved as an amendment that the meeting adjourn for a week.

Other gentlemen addressed the meeting, and the chairman afterwards said his friend Mr. Aitken had put it that they were acting rather against the Chamber of Commerce, and against the Society of Arts. What he wanted to do was to work with them as far as ever they could. But he thought they had to take this into consideration. Here was the Chamber of Commerce committed to the theory that the Government ought to found new schools throughout the country for the furtherance of art education. It was the Chamber of Commerce who broached a new theory. They alleged that the duty of the Government was to establish new schools; but he maintained that the real duty of the Government, under the present circumstances, was to assist those institutions already in existence. Dr. Melson appeared to have misunderstood his remarks about throwing the Government overboard. They wanted assistance from the Government; but they did not want to place the exclusive control in their hands. The amendment was carried unanimously.

Professor Leoni Levi recently attended a meeting of the Manchester Chamber of Commerce, and delivered an address on the industrial competi-

tion which England is now encountering on every hand. Mr. Henry Ashwin told the Chamber, that not only was Belgian iron being used in the construction of our warehouses, but Belgian manufacturers were actually sending agents to Manchester for the sale of cotton goods. French and Belgian cloth is, it appears, regularly sent into Lancashire to be bleached. It is stamped with the bleacher's stamp, and is thus sent into the market as cloth of English manufacture. Principal Greenwood, who was present, said that Owen's College was being put upon such a basis as would enable them to carry on the work of technical education.

A joint meeting of the Liverpool Library, Museum, and Education Committee and School of Science Committee has been held to confer with Mr. Bernhard Samuelson, M.P., on the subject of science education in schools. Mr. J. A. Pictou (chairman of the library and museum committee) presided at the outset, but being obliged to leave to fulfil another engagement, at his request Mr. E. Samuelson took the chair. Mr. Gregson, in speaking of the School of Science, said that about three years ago the number of students fell off from 160 to 28. That was on account of the fees being raised, a measure that was rendered necessary by reason of the Government reducing its support. Last session the fees were reduced to the lowest point, and the result was that the number of students increased to sixty-eight. The number of students this year was only fifty-nine, but considering the difficulties they had to contend with, that result was deemed satisfactory. A want of funds crippled their energies.

SOCIETY OF FEMALE ARTISTS.

The twelfth exhibition by this Society, now open in Conduit-street, consists of 413 works, including the model of a "Moping Owl." Mrs. E. M. Ward leads, rather than contributes, a work; Miss Adelaide Claxton sends one of her clever spiritual appearances, "It would be spoken to;" Mrs. Swift and her daughters, and Mrs. Melville, contribute; but still the gallery makes no pretension to showing what our female artists really can do, such of them as have gained a power preferring always to take their chance with male competitors. It contains, nevertheless, many agreeable pictures, of which we may mention, as amongst landscapes, those of Mrs. Marshall, Harriette Seymour, Miss Heathcote, Miss E. D'O. James, S. S. Warren, and Middle. Bodichon; for views of old buildings, Louise and Margaret Rayner; for flowers and fruit, Miss Emma Walter (we give the names either with or without title as printed in the catalogue), Alice E. Manly, A. M. Fitzjames, Emily Lane, Mrs. Newcomen, &c.; and for dead game, Miss A. Baker and A. Dundas. "320," "Resting," Elizabeth Thompson, "322," "Elaïne," Miss Amy Butts; and "350," "On the Look-Out," all in oil, deserve praise. Miss Eliza Sharpe, we may add, exhibits a copy of Macclise's "Hamlet," made probably to assist Mr. Sharpe in producing the plate for the Art-Union of London.

SCHOOLS OF ART.

The Worcester School.—The fifteenth annual meeting of the subscribers and friends of this school has been held in the Music-hall. The meeting for the distribution of prizes, from some cause or other was not held last year, and consequently the successful student had to receive the reward of two years' labours; and, as this year only three days' notice was given of the intended meeting, the platform was but thinly occupied. The works of the students were exhibited in the school. Altogether the collection of works was a great improvement on those of former years, and reflect great credit on the pupils,—evidencing, at the same time, the ability and attention of Mr. Yeates, the master. The chair at the meeting was occupied by Mr. Henry Cole, C.B., of the Science and Art Department, South Kensington. The chairman, in his address said,—If they were readers of newspapers at the present time, they would read a great deal about what was called "technical education." The speaker pointed out that such education was indispensably necessary to enable English manufacturers to compete with foreign countries. The School of Art taught this "technical education," so important to manufac-

turers. At their china factories it was essential that the persons employed in them should have the knowledge that was acquired at schools of art. He was bound to say he thought the institution was tolerably prosperous.

The Gloucester School.—Mr. Cole also visited the Gloucester School, with the object of conferring with the committee relative to proposed changes in the system of Government aid to science and art schools. Mr. Cole strongly urged the desirability of uniting in one building the School of Art, Free Library, and Museum, and explained the extent of the help which would be given by the Department in the erection of such a building. He further said that however long it might be postponed, the demand for technical education, one of the greatest exigencies of the day, would ultimately compel the founding of such an institution, and that it was not unlikely that an education rate to provide for such objects would before long be made compulsory.

The Dorchester School.—This school, which was established at the beginning of last year, has completed its first session prosperously, and the only circumstance which tends to mar what would otherwise be its complete success is, that the artisan—for whose special benefit the Government foster such schools—have not availed themselves of the advantages offered so largely as it was hoped they would do. The report stated that the prospects of the school were satisfactory. It opened in April last, with fifty-six students, and had been attended during the nine months of its existence by seventy-nine, including temporary pupils, and sixty-four still remained upon the books. The income of the school was in a healthy state.

GLASGOW ARCHITECTURAL SOCIETY.

At the usual monthly meeting of this society Mr. John Honeyman, jun., president, in the chair, Mr. J. J. Stevenson read a paper on "Labourers' Dwellings," and the effect of municipal restrictions on them, as shown in the recent competition in Liverpool; and afterwards Mr. Alex. Thompson addressed the meeting on the City Improvement Scheme.

Mr. Stevenson, in the course of his remarks, referred to what prevented the erection of residences for the working classes in towns. He said,—Municipal regulations, not in Liverpool only, but in every town in the kingdom, throw obstacles almost insuperable in the way of this, while they do not prevent bad building, bad arrangements, and bad ventilation; in fact, render these essential to make the scheme pay, for it is only the "jerry" builders who seem to be able to build at a profit. But it is, as has been already said, much easier to find fault with present regulations than to suggest better; and it would be presumptuous to do more than indicate the direction in which they should aim.

At present they insist on a certain width of street in proportion to the height of the houses. This has given us a town like Manchester, with acres of streets in dreary sameness with stagnant air. Would it not be better to encourage variety in planning narrower streets, opening out into wider spaces and squares, where the difference in temperature between the wider spaces exposed to the sun might draw the air from the narrower streets, causing drafts and movements of the atmosphere? It is clear that streets might be built closer and higher, if their ends opened out on parks and greens, without harming their ventilation, than if they were extended for square miles of regularly disposed street, and court, and house, though only two stories high. This might be accomplished by fixing the proportion of space left open to ground built on, permitting builders to arrange their blocks as they liked, subject to conditions, of which the most important would be one which present building Acts ignore, that there should be no stop-gaps to the circulation of the air, no dwelling-rooms opening out into wells or small courts, in which there is no through current. Such an arrangement might be difficult to adjust to work fairly. It would have a tendency to raise the value of property near public open spaces, which, however, is not unreasonable; and it might necessitate power on the part of the Corporation to decide how streets should be laid off on private property, so that where one man had commenced a street it should not be blocked up by his neighbour, as happens in some of our English towns.

But we doubt not legal acumen could frame a regulation which would secure the desired result directly, instead of the present roundabout attempt at it, which provides streets of a certain width at every part, and yards of a certain size attached to every house, which does not always secure ventilation, and, though a good thing in some circumstances, is often unjustifiable waste. Again, it is obvious that in a short street, if it opens into wider streets, the houses may be made high, and the width confined, without the injury to its ventilation which would ensue if it were longer. So that there would be more reason in municipal regulations if they made the height of the houses dependent on the length of the streets, instead, as at present, only on the width.

OPENING OF RETFORD NEW TOWN HALL.

THE new town-hall at Retford has been formally opened. The main elevation fronts the square, so that its architectural proportions can be readily seen to advantage, and the side elevation faces Carolgate. The front to the square, which is entirely of stone, is divided into three compartments, two wings, and a centre, recessed. It is Italian in design, of a Palladian character, having a channelled base and moulded impost up to the first bay, and detached columns with carved caps and bases, moulded archivolts and spandrel, plain frieze, a bold cornice with cantilevers, balustrade, parapet, and a high Mansard roof, surmounted with iron cresting. From the centre of the roof rises the clock turret, which crowns an elevation of nearly 100 ft., and in which is fixed the clock, to which have been added by public subscription four new bells to chime the quarters and hours, and having four illuminated dials, facing the four cardinal points of the compass. In the main portion of the structure is situated the new town-hall, and in the other the market and corn exchange. On the ground floor, and immediately in front of the square, is arranged, on the west wing, the main entrance to the hall. The grand staircase has a spacious centre flight leading to the front landing, and returning right and left, at the level of the council chamber. The floor of this staircase, as well as of the vestibule, is laid with encaustic tiles, from a special design, supplied by Messrs. Maw & Co., of Broseley. The large hall is 90 ft. long, 40 ft. wide, and 26 ft. high. It is lighted by ten large French casements, with circular head. The hall has been decorated by Mr. Foster. All the panels have been relieved. Over the orchestra at the north end an allegorical picture has been painted, and contains the ancient armorial bearings of the borough. The council chamber is 40 ft. by 23 ft. The mayor's parlour is at the east end of the council chamber, and fronts the square. The hall-keeper's residence is in the rear of the large hall. The kitchen is fitted up with a Learning range, capable of cooking a first-class dinner for 500 people; a hoist and necessary apparatus are provided for special occasions. Underneath the large hall is the poultry market. The Corn Exchange is spacious, warm, and well lighted; and the markets are conveniently arranged for the accommodation of butchers. The architects were, Messrs. Bellamy & Hardy; and the contractor was Mr. Thomas Hopkinson. The work was superintended by Mr. Richardson. The architects' estimate was 6,057l., and the land cost 2,600l.

RESTORING AND SILICATING ABROAD.

THE Church of St. Madeleine, in Rouen, has been treated with the process of M. Léon Dalemagne with the view of preserving the stone, and, if we understand M. Dalemagne correctly, the parts wanting were first made good with some composition that he uses. The whole of the front, he says, was in a very bad state, abraded and broken away, columns, mouldings, and sculptures, and no one could have dreamt of replacing the wanting parts in stone! but all has been reinstated; and it may be as well to note, he continues, that experience has taught me it is not desirable to restore stone with compositions too compact. M. Dalemagne points to a part of the Louvre operated on by him in 1853 to prove the value of the system adopted by him, which is that of Fuchs.

MURAL PAINTING, PENKILL CASTLE, AYRSHIRE.

MURAL PAINTINGS FOR PENKILL CASTLE, AYRSHIRE.

We have already mentioned at some length a paper on mural paintings at Penkill Castle, read at the Institute of Architects by Mr. W. B. Scott.* The house where this series of pictures is in course of execution is an old peel-house or castle, as such partially fortified old houses are always called in Scotland, near the coast of Ayrshire. The subject of the pictures (as we previously mentioned) is taken from "The King's Quair," or King book (*cahier*, or *quatre* of paper) by the first King James of Scotland; and the medium used is a solution of wax in turpentine.

The first picture illustrates the first canto, in which the poet describes his rising in the early morning while the bell is ringing for matins. He bewails his luckless fate, having been a prisoner since his boyhood, and consoles himself by reading Boethius, and then calling upon the

Nine Muses, he sets about to write some new thing. The materials of the picture, as suggested by the poem, are the matin-bell, the warder, the night-watch going home, the young king in his chamber, and other matters suggested, as, for example, the brazen statue of Boethius adorning the wall.

The second picture illustrates the second canto. He looks from his prison window, and sees, as he believes, the fairest of womankind listening to the singing of the birds in the terraced prison garden. She has with her two maids and a little dog. As mythological persons are largely introduced into the poem, master Cupid,—Dan Cupid, as Chancer calls him,—is shooting the king from behind the bed.

In the third picture our poet falls into a dream. He is carried away to the Court of Love to get the assistance of Queen Venus. Master Cupid comes down to him from the starry sphere while he sleeps, and carries him away. Here the first flight of the stair is terminated by the landing of the ball or dining-room.

The fourth picture, which begins the second flight of stairs, is the most elaborate of the series. At the Court of Love the poet finds all the lovers recorded in history, and sees Queen Venus reclining on a couch. James, on his knees, prays her aid; but she sends him to the Court of Wisdom to get the assistance and advice of Dame Minerva.

To give an idea of the character of these works, we are enabled to reproduce an illustration of the first picture. The block is made by a new process, which is probably susceptible of improvement.

CONCRETE BUILDINGS IN THE METROPOLIS.—The officers of the Board of Works have prepared a form of license for using concrete as a building material, with conditions for the guidance of builders, also rules relative to the granting of licenses. These will be submitted for the approval of the Board at their meeting on (this) Friday, 31st January.

HYDE PARK DRINKING FOUNTAIN, LONDON.—MR. KEIRLE, ARCHITECT.

HYDE PARK DRINKING FOUNTAIN.

The Drinking Fountain represented by the accompanying engraving has been erected in Hyde Park at the cost of H.R.H. the Maharajah of Vizianagram, with reference to whom our readers will probably be glad to have particulars of some of the instances of public spirit and enlightened philanthropy for which this gentleman has already received the thanks of Government. In October, 1863, it was officially brought to the notice of Government that his Highness had offered to endow a dispensary at Vizianagram, with 2,000*l.* for its permanent support; and it was at the same time mentioned that during the previous ten years, setting aside roads and irrigation, on which the Rajah had expended two lacs of rupees (20,000*l.*), he had contributed upwards of one lac of rupees to purely philanthropic uses. At Vizianagram he had long supported a dispensary and lying-in hospital; he had maintained in that town a school of a grade equal to that of a Government district school, and he had established schools in every chief town on his estates. The agent to the Governor added that, "in all these respects, and in the liberal systematic management of his estates, the influence of the example afforded to the surrounding zamendars and proprietors was very perceptible indeed." One of the roads referred to above was to open out the cotton-growing districts of Nagpore, with reference to which the Secretary of State for India, in his despatch, dated 14th of August, 1862, wrote as follows:—"The importance, both political and commercial, of such a line of road has long been recognized, and the Home Government fully shared in the appreciation of the liberality and public spirit evinced by the Rajah on this and on former occasions." Lord Harris, when Governor of Madras, fully admitted the service rendered by the Maharajah, and as a token of friendship and approbation presented him with a valuable ring, bearing the motto "Ever Loyal," which motto the Maharajah immediately adopted, and is with good reason highly proud of it, especially as coming from one so well able to estimate the value of the assistance received from the Rajah during the troubled times of 1857—1858. In November, 1863, Sir William Denison offered the Maharajah a seat in the Legislative Council at Madras, and in doing so wrote as follows:—"The large stake which you possess in the country, your acknowledged public spirit, loyalty, and energy, have pointed you out to me as one whose claims to act as an adviser to the Government are well established, while your attainments and the general respect in which you are held are a guarantee that your counsel and advice will be of much use to the Government." Before the Maharajah could take his seat in the Madras Council he was appointed to the still more distinguished post of member of the Legislative Council of India.

Since the beginning of 1863 the Maharajah has made Benares his head-quarters, and this being the place of his birth, and where his family have resided for many years, it was but natural he should show special interest in it; and this he has done by endowing a dispensary there to the extent of 2,000*l.*, and also establishing a scholarship, value 30*l.* per annum, and carrying with it a gold medal, for the best English scholar of the year in the Government College, Benares.

It was a worthy and becoming supplement to such a series of well-directed efforts to ameliorate and improve the condition of the people of his own country, and to further the views of the Government, from which he had received so many tokens of approbation, that the Maharajah should have turned his eyes towards England with a wish that he could there also in some way show his hearty appreciation of the benefits which it had conferred upon India.

He therefore communicated with the committee of the Metropolitan Drinking Fountain Association at the commencement of 1866, and offered to defray the entire cost of a handsome drinking-fountain for the use of the public in the metropolis. A design having been prepared by Mr. Robert Keirle, the architect of the Association, and forwarded to India, met with the entire approval of the Maharajah, and the drawings having also been submitted to and approved by her Majesty the Queen (who has thus graciously manifested her interest in the princely liberality of her distant subject), a site was designated for its erection on the north side of Hyde Park, opposite the end of Albany-street.

It is this that we illustrate. The landings are of York stone; the general body of the structure, of polished Bath stone; the bowls are of polished red Aberdeen granite; and the columns blue Pennant stone.

The main structure is about 12 ft. square at base, and 46 ft. 6 in. high from ground level to the summit of spire-finish.

It was executed, at a cost of about 1,200*l.*, by Mr. J. W. Seale, East-street, Walworth.

The fountain is approached by means of three steps extending all round; there are four howls and water-jets; and under each bowl is a galvanized iron grating, let into the landing, and having communication with the drain to carry off spilt water. In the tympanum of the canopy over two of the bowls are the royal arms, and in the other two is the motto of the Maharajah, "Ever Loyal," with an Indian crown, and the symbolical elephant's head, which alternates with the royal arms; and in the third stage, over the pediments containing their respective arms, are portraits of the Queen and the Maharajah. Under each portrait of the Queen is the shield of St. George; and under those of the Maharajah a five-pointed star. There is a trough for dogs under the howl on the north side. Access to the interior of the fountain is had by means of a man-hole. The stonework was treated with solutions of soap and alum before the scaffold was struck. The following inscription, "THIS FOUNTAIN, THE GIFT OF THE HON. MAHARAJA MEERZA VIDEHAN GULSHAN RAJ MUNEA SOOLTAAN BHAHDOR OF VIZIANAGRAM, K.C.S.I., WAS ERRECTED BY THE METROPOLITAN DRINKING FOUNTAIN ASSOCIATION, 1867," engraved on a brass plate, by Messrs. Cox & Son, is to be placed in the howl above on the south side. The fountain will shortly be publicly opened by his Royal Highness the Duke of Cambridge.

AN OPTICAL ILLUSION.

M. FELIX LUCAS, engineer of bridges and roadways of France, has written a memoir on transparent mirrors, by which singular optical illusions take place. Divide a circle into 2*n* sectors, of which *n* has a central angle, α , and *n* has a central angle, β , the sectors α and β succeeding alternately. Cut out the sectors β so as to form spaces. A sort of star will remain, formed by the *n* sectors α , on which either silvered glass or, what is preferable, metallic plates silvered over and polished are to be placed. This apparatus being placed vertically in front of an observer, he can perceive by the reflection produced by the silvered sectors his own image, and generally those of other objects and persons situated in front of the star. He can also see through the open spaces persons and other objects placed behind. No optical illusion can result from this superposition of two visual phenomena, because the observer distinguishes clearly the apparatus, and becomes acquainted with its action. But supposing that this star takes, round a horizontal central axis, a very rapid movement of rotation. The reflecting sectors are no longer distinguishable from the vacant spaces. The observer will think that he sees only a plate of glass almost invisible like window-glass. He will behold, not without astonishment, the images of the anterior objects superposed more or less confusedly on the objects behind; strange illusions can be the result. We all know that similar phenomena are produced by means of an unsilvered sheet of glass, when the anterior objects are much more illuminated than the posterior ones. The images of the first are then of a peculiar paleness and indistinctness: one would imagine them to be the species of real objects. During the last few years these circumstances have been greatly taken advantage of for creating astounding illusions.

The transparent mirror that we have described can serve the same purposes as unsilvered glass without requiring the same conditions of lighting. M. Lucas has constructed a small apparatus in which this disposition is realized. There are four radiating sectors, and the means by which they are fixed and traversed by a geared shaft are hidden under the table. A slit parallel to the foremost edge gives passage for the metallic blades. By the most simple gearing, we can obtain, by turning a handle, a rotation sufficiently rapid to produce the effect of an unsilvered vertical and semi-circular sheet of glass. The edge of this glass apparatus is concealed by a wooden frame.

A person being placed behind the mirror, at a distance of 6½ ft. from the vertical plane passing through the axis of rotation, we place another person in front of the mirror, at the same distance of 6½ ft. from the other side of the vertical plane. The latter individual sees two persons side by side, and the illusion is perfect.

The mirrors are made of metal, silvered and polished on both sides; the effect obtained is reciprocal, and the illusion is the same for the two persons.

M. Lucas obtains a curious effect of another nature by placing a common mirror vertically, at the distance of 2½ ft. behind the transparent mirror. The reflected image is repeated a great number of times at greater and greater distances, as is the case with an object placed between two mirrors. Yet, while in the latter case the successive images are in reversed position, those in the apparatus are face to face.

RAILWAY INTELLIGENCE.

Smokeless Coal on Railways.—The North London Railway for three or four months have used anthracite instead of bituminous coal, and the result is said to be highly satisfactory. Numerous accidents had been raised or threatened for damages for the emission of "opaque smoke." By the use of anthracite coal the company not only avoid all ground of complaint, but effect an annual saving of several thousand pounds. The coal is found to be 25 per cent. more effective than the bituminous coal previously used. The smokeless coal is as applicable for fixed steam-engines as for locomotives, and is now used at the City Flour Mills and other places where steam-power is required.

Opening of the New Line between King's-cross and Farringdon-street.—On Saturday afternoon the principal officials of the Metropolitan Railway made an inspection of the new or widened line between King's-cross and Farringdon-street Stations, previously to the opening of the line. The works upon the new line consist principally of covered way and tunnel.

Seven Years' Railway Accidents.—The result of the railway accidents of the last seven years is that one passenger in 8,746,475 was killed, and one in 350,831 was injured, from causes beyond their own control; and one passenger in 11,548,081 was killed, and one in 31,450,993 injured, owing (according to the companies' returns) to the misconduct or want of caution of these passengers. This statement is, to a certain extent, more unfavourable than the facts; for, as it is not known how many times the season and periodical ticket-holders travelled, they are counted only once. In the seven years the number of ordinary passengers increased from 163,435,678 in 1860, to 274,293,668 in 1866; and the number of season and periodical ticket-holders from 47,894 to 110,227, the latter class of travellers increasing the fastest. The length of line opened increased from 10,433 miles at the end of 1860, to 13,854 at the end of 1866, the number of passengers increasing a great deal faster in proportion than the number of miles.

The Summit Tunnel of the Pacific Railway.—A writer for the *San Francisco Alta*, who has just gone over the Central Pacific Railroad from Sacramento to the summit of the Sierra Nevada, says:—"There are about fifteen tunnels, so far, constructed on the road, and they are all known to the initiated as number So-and-so, each tunnel having a number of its own, beginning with Tunnel No. 1. The king of the list, however, is No. 6, that being the tunnel, or the Summit Tunnel, as it is generally called. It ought to be called No. 1. This great hole is 1,659 ft. long, and was about a year in being cut through. The rapidity with which the work was finally prosecuted to a close, however, was chiefly due to the discovery and use of that terrible explosive compound, nitro-glycerine. Experiments were commenced in February, and, after some considerable delay, the engineers became sufficiently familiar with the compound to use it constantly and safely, after which the works advanced with accelerated speed, equal to about 50 per cent. increase on all the former operations. Most of these tunnels are cut through the solid granite formation. The bridges on the Central Pacific are all built on the 'Howe truss' model, and are now eleven in number, making an amount of bridging equal to half a mile. Not the least noteworthy of the many curious things to be seen on this line of travel are the snow-

galleries. They are roofed coverings thrown over the track in such places as are likely to be blocked by snow. It is expected that about thirty miles of this protection against snow will be built. The track is now laid within nine miles and a half of the Summit Tunnel, and about twenty miles on the other side of it. After this connexion, now approaching, is made, the greatest obstacle between Sacramento and Salt Lake, in the way of road-building, may be considered overcome. There will be left a section of 600 miles to build, which will require about one year and a half to complete, making in all about three years and a half to finish the road to Salt Lake. In two years hence we shall be able to whirl across the vast continent from Missouri to Sacramento in three days and a half."

PROVINCIAL NEWS.

Luton.—The foundation-stone of a Corn Exchange for the town of Luton has been laid. The new building is to be erected on the site of the old market-place, which is being pulled down. The style of the structure will be Venetian-Gothic, and it will be surmounted by a turret containing a clock. There will be two large rooms, the upper one being for the sale of corn, and the lower for the sale of provisions. The cost will be about 2,550*l.* The architects are Messrs. Messenger & Grundy, of London; and the builders, Messrs. Stuart, Brothers, of Luton. A straw-plait exchange is to be erected in Cheapside at a cost of 6,000*l.*, for which Messrs. Smart, Brothers, also have the contract.

York.—Extensive additions to Castle Howard reformatory are in progress, and some have yet to be begun. An Early English chapel is nearly completed, one of the greatest wants having hitherto been a place of worship for the inmates. The chapel is a memorial one for the late Earl of Carlisle, and has been paid for by subscription, quite distinct from the English memorial of the late earl which is in course of erection on a hill two miles off. The memorial chapel will soon be ready for use. A schoolmaster's house was also required, and this is about to be built, a grant of money having been obtained from the North and East Ridings towards it.

Bradford.—New premises for the Bradford Old Bank have been erected and opened, at the junction of Lower Cheapside with Market-street. The architect was Mr. Alfred Waterhouse, of London. The style is Gothic, with semi-circular arches. The site which the bank occupies is perhaps the best in the town for situation, but the shape of the plot was one which must have given difficulty to the architect. The bank is entered at the corner of Cheapside, through a groined porch; over this is an oriel window. This is surmounted by a two-light window and a pinnacled gable, with a cinquefoil window in the centre. Three large windows light the bank-room from Market-street, and additional light is gained from five other windows looking into a yard at the side. In Lower Cheapside, besides the windows to light the rooms, other windows follow the line of an inner staircase, terminating in a lofty gable, relieved with a window in the centre. The ridges of the roof are ornamented with iron cresting and finials. The whole of the building is fire-proof. Concrete is used for most of the floors; they are first arched with this material, and the spaces being afterwards filled in with a preparation of the concrete, a firm flooring was obtained, impervious both to heat and moisture. The bank-room is lofty, and well lighted. The furniture was all designed by Mr. Waterhouse. The floor is of oak, except that portion in front of the counter which is laid with encaustic tiles of a quiet pattern. The furniture is of oak and mahogany, bordered with ebony. The room is lighted at night by sun-burners. The "strong-room" is constructed of ashlar, 18 in. thick, covered with iron plates and boiler-plates. In it is one of Chubb's strongest safes with all modern improvements. An ornamental iron descending gate, and an iron door of similar construction, combined with iron slutters, and window-frames of the same material, will protect the bank from outside. The contractors were Messrs. J. & W. Beauland, of Bradford, and Mr. Wilson was the clerk of the works.

Bristol.—The Wedmore Assembly Rooms have been opened. The necessity for a public room, for meetings, vestries, committees, &c., and also for concerts, lectures, balls, and amateur theatricals, had long been felt. Some twelve

months ago, an eligible site offering, a limited company was formed for the purpose of supplying the want. The front elevation is built of limestone from the Cheddar rocks, relieved with freestone dressings, and the arches of the windows and porch are supported by carved pillars. The interior contains two retiring-rooms, a reading-room, and the great hall, which is capable of accommodating from 350 to 400 people. Attached to the rooms is a ten-roomed dwelling-house, with a shop. Mr. John Tonkin supervised the progress and completion of the work.

Northampton.—The new brewery at Northampton, belonging to Messrs. P. & R. Phipps, which has been two years in hand, at a cost of 22,000*l.*, is now complete, and in full work. Messrs. Davison & Scamell, of London, were the architects and engineers. Mr. Dunkley, of Northampton, was the builder. The works have been carried out under the superintendence of Mr. H. J. Treasure, as clerk of the works.

Longstaff.—It is contemplated to erect, at a cost of something like 8,000*l.*, assembly, billiard, and reading rooms, near the Royal Hotel. They will be surmounted by a spire. The plans have been prepared by Mr. J. L. Clemence, we believe, and builders have been invited to inspect them. It is proposed, we understand, to raise the money by shares, and to complete the building by July next.

Evesham.—The new Corn Exchange here has been opened. It contains rooms for public meeting, balls and concerts, lectures, &c. The building was erected by Mr. H. Workman.

FROM SCOTLAND.

Edinburgh.—The Edinburgh and Leith Joiners' *société* came off in the Queen-street Hall, which was comfortably filled with a mixed festive company, including children as well as ladies. Mr. Duncan McLaren, M.P., had been expected to take the chair, but being prevented from attending, his place was filled by Bailie Fyfe. Visitors were supplied with fruit as they entered the hall, and the greater part of the evening was agreeably devoted to music, only two or three addresses being given. Banners were suspended round the hall, bearing trade emblems and political mottoes. Among other addresses given was one by the secretary of the association, Mr. Paterson, giving a brief sketch of the working of the society, and expressing the pleasure experienced by the workmen in consequence of the attendance of numerous employers at the *société*. The relations between employer and employed, he said, were much in want of revival; and if a better feeling prevailed, many of the disputes that had recently occurred would never have been thought of.

Leith.—A stained glass window has been put up on the northern side of the nave of St. James's Episcopal Church. This window is the work of Mr. F. Barnett, of Leith. The present window was presented by the late Mr. John Scougall in memory of his family, for many generations merchants in Leith. Its subject is the history of John the Baptist. The central figure, under a canopy, is that of the great forerunner of our Lord, and, in four compartments, are recorded the principal incidents of his career,—the naming of him as an infant, the preaching in the wilderness, the baptism of our Saviour, and the coming of the disciples to Jesus to inquire about John. The windows on either side of that lately supplied by Mr. Barnett are to be also put in by him,—one being destined as a memorial window to the father of the late Mr. Scougall, and the other as a memorial of that gentleman himself. The incidents of the sacrifice of Isaac, we believe, are to form the subject of the other.

Kelso.—An alarming and destructive accident has occurred in Kelso. The town is supplied with water from a large iron tank or reservoir, capable of containing about 60,000 gallons, and this is raised on stone walls to a height of 60 ft. or 70 ft. Into this tank the water is pumped by a steam-engine, and on the occasion to be noticed it was filled, no one supposing that there was any danger. The man in charge had not long left the place when a loud report was heard, caused by the bursting of the tank, and the water rushed out in a torrent, carrying all before it. A dwelling-house close by was completely shattered and a young lady severely injured. The damage to property is consider-

able. It is not yet known where the blame lies, if blame there be. The sides of the tank were not quite an inch in thickness.

Perth.—The Episcopal Bishop of St. Andrew's has commenced his new school house at Perth, on a site near the railway station, being a large room, 75 ft. in length by 21 ft. wide, a first portion of a group of ecclesiastical buildings, with church, to be erected for the Episcopal Establishment in his diocese, to serve as a church, in which the bishop may meet his clergy in the central spot. The buildings are from the designs of Mr. Joseph Peacock, of London, architect, and are to be built of stone, the inside faced with brick. The present room is to be used for service, until the church can be finished.

Dumfries.—The upright lights of the great east window for Greyfriars' Church, Dumfries, are in the saloon of Messrs. Ballantine & Son, of Edinburgh. Greyfriars' Church, Dumfries, is a new structure, now nearly completed, from the designs of Mr. Starforth, of Edinburgh. The church is in the Decorated style, and the glass is treated in the same manner. There are six upright compartments, each containing an incident in the life of Christ, viz., the Worshiping of the Magi, Christ seated amongst the Doctors in the Temple, the Baptism, the Last Supper, the Entombment, and the Resurrection announced by the Angel to the Marys. The glass is of a rough crystalline texture throughout.

HARTLEPOOL HEADLAND.

The Hartlepool Harbour Commissioners and the corporation a short time ago jointly offered a premium of 50*l.* for the best design of works for the protection of the headland north of Hartlepool, where the sea has made serious inroads on the cliffs, which are of soft magnesian limestone. The joint committee of selection have adopted the plans and estimates of Messrs. Martin & Fenwick, civil engineers, Leeds.

SANITARY MATTERS.

The Fever at Terling.—Active preparations, we learn, are in progress for removing the sanitary evils to which the fever has been traced, and arrangements have been made for most of the inhabitants quitting the place while these measures are being carried out. The total number of deaths that had occurred up to last week was twenty-three out of a population of 900, not far short of 200 of whom were attacked by the fever.

At a recent meeting of the committee of rate-payers of Ingatstone and Fryerning to take into consideration the imperfect state of the drainage of the village, it was proposed that Ingatstone should contribute about one-third and Fryerning two-thirds of the expense. This was objected to by Fryerning, on the ground that the proportion was unjust, and an amendment was accordingly moved to leave the question of the proportion to the decision of the Home Secretary, or to any other person named by him. On a division the votes were equal, and the chairman gave his casting vote in favour of the original proposition. As Fryerning will not agree to pay more than its due proportion, the drainage will probably remain in its present unsatisfactory state, and which is calculated to produce the same sad and alarming results as the unfortunate inhabitants of the village of Terling are now unhappily being doomed to suffer.

A writer in the *Times*, with reference to the Terling case, and while urging the sinking of wells as far from the house as possible, though the pumps and waste-pipes may be near, conveniences, says:—

"Polluted water does not generally betray its condition till possessed of a strong odour. Earlier intimation may, however, be obtained by the following tests.—Half fill a common water-bottle, cover its mouth with the hand, violently shake for a minute, and quickly apply the nose. If nothing unpleasant is detected, tightly cork the bottle, set it aside in a warm place at about the temperature of one's body for a couple of three days, and repeat the shaking, &c. Water of very bad quality may thus be recognised without any trouble and expense of analysis."

The letter is signed "John Attfield, Professor of Practical Chemistry to the Pharmaceutical Society."

Health of Hertford.—The health of the town, says the local *Mercury*, is improving. There

has been only one case of small-pox during the week. In the circumstances in which the town has been placed, the sanitary department of the corporation was called upon to perform a duty which has been most strangely neglected. In times of cholera some activity is usually displayed in the abatement of nuisances and the flushing of the sewers; but it does not seem to have been remembered that, though small-pox is a disease *sui generis* , it is intensified and extended by precisely the same conditions which cause cholera and fever to spread. During the whole period of the present visitation, the sewers have been left unflushed, and there has not even been an attempt to disinfect the poisonous emanations from sewers and drains, by sprinkling chloride of lime over the apertures through which they rise. At the meeting of the borough magistrates on Wednesday, Mr. Hancock stated that there had not been a single meeting of the Sanitary Committee since the present mayor came into office, nearly three months since.

ARCHITECTURAL INSTITUTE OF SCOTLAND.

At the first general meeting of the architectural institute of Scotland, to be held on the 11th inst., Mr. John Dick Peddie, architect, is to read a paper on "The Improvement of the City of Edinburgh."

According to the report of the council, the prizes offered,—1. For the best geometrical drawing, being an elevation of any existing example of Gothic architecture, to be competed for by apprentices, of not more than three years' standing, of any Scotch architect, was gained by J. L. Campbell; 2. For the best perspective line drawing of any existing example of architecture, projected and raised from the plan, by Mr. Jas. Darling; and 3. For the best original design,—subject, a memorial cross, by Mr. John Ord.

Mr. David Cousin, architect, offered a prize of £2. 2s. for a series of drawings of Magdalen Chapel, Cowgate; for which only one person competed, Mr. Andrew Dower, to whom the prize was awarded.

The Illustrated Transactions for the year consist of eight large folio sheets of lithographs, in a cover, illustrating Melrose Abbey; measured, drawn, and lithographed very creditably by Mr. W. H. Syme. The council appear to do a great deal with very small means. The annual subscription for 1866-7 was hut 100l. 16s. If the council are careful, as they say they are, to engrave those subjects only which, besides possessing architectural interest and beauty, have not been satisfactorily engraved already, the series they are issuing will be very valuable as an illustration of Scottish edifices of historical importance, of which no good memorial exists elsewhere, and which are exposed to dilapidation and natural decay.

OLD BUILDINGS ABOUT BIRMINGHAM.

BIRMINGHAM ARCHITECTURAL SOCIETY.

At the last meeting of this Society, Mr. J. J. Bateman in the chair, a paper was read by Mr. Allen E. Everitt, honorary member, on "Old English Buildings and their Restoration." In the course of it the reader said,—

"I feel that one of the objects contemplated by the Society,—viz., the cultivation of an artistic feeling for, and a true appreciation of, the value of our ancient remains,—will be best served by briefly noticing what there is of special interest near at hand, and also venturing to give an artist's thoughts on their present appearance and future prospects. For this purpose we will take our town as the centre of a radius extending for about fourteen miles; and first and nearest comes Aston, with its grand old mill and highly interesting church, rich in monumental remains of the last four centuries, and which we have the moated hall of Perry, dating from 1679; the old parish church at Handsworth, with its tower placed at the east end of the south aisle, and the towers of the old churches at Edgbaston, Harborne, and Moseley, with little else of ancient worth remains. The old house at Camp Hill, dated 1601, and the Old Crown, and a few others in Deritend, and a few picturesque bits scattered here and there at the outskirts of the town, but these are fast being displaced by the business requirements of modern days, serve as a lingering relic of the artistic taste of our ancestors; and even St. Martin's Church, although surrounded by a churchwarden's brick great coat, has still many points of interest, especially in its monuments of the old lords of Birmingham. Looking southwards, at a distance of about five miles, we have King's Norton, which, with its fine church and adjoining picturesque school, and the well-known objects of old gabled houses of Elizabethan and Stuart days surrounding the village green, forms a most pleasant architectural group, and one that will repay a visit. In its close vicinity lies Northfield, with a church of interesting Early Pointed date, having a massive tower and other curious features; and Coufton Hackett, with its quaint bell-

turret and adjoining hall. The latter, although apparently a modern house, has still remaining a portion of a fine old hall, with open timbered roof. We also have Bart Green, where the high picturesque half-timbered mansion, situated at the foot of the Lickey Hills, is well known to travellers on the Midland Railway. In this direction also is Alcechurh, with its old houses, and lately-restored church, to be referred to further on. Beside, with a curious church, containing some early Norman portions, and some admirable Elizabethan tombs, rich in decaying gold and colour; and the little town of Bromsgrove, full of interesting bits both for the architect and the artist. In a south-easterly direction we have Solihull, with a noble old cross church, worthy of attentive study; Knowle, with its Late Pointed church, once collegiate; and Temple Balsall, with its well-known church of the Knights Templars. Tanworth and Lapworth also have interesting features, the latter being especially noticeable for its almost detached tower and spire; and also Packwood and Baddesley Clinton, whose churches (more especially the towers) are similar in design, and are traditionally described as having been erected by Nicholas Bourne, in the latter part of the fifteenth century; the said Nicholas Bourne being the proprietor of the old moated house at Baddesley Clinton now remaining in its entirety, and perhaps one of the most interesting Medieval bits in this locality. The old mansion at Packwood, also, must not be overlooked, although many of its best features are concealed under a coat of roughcast, yet it is a fine example of the half-timbered structures of the Stuart days; and its ancient garden, with the clipped yew trees and formal hedges, is quite a gem. In the little town of Halesowen Arden may be noticed the remains of a picturesque old market cross, and many other bits of the olden time. In an easterly direction we have first, Yardley, with a spire church, having a richly decorated exterior, and an excellent open timber porch; Sheldon, with a good fifteenth-century tower, and portions of earlier work, lately restored (but which I have not visited since the same has been effected); Stion Hall, containing some good internal carving of sixteenth-century work; and Castle Bromwich, with its fine hall, rich in old tapestry and quaint carvings, and with a garden laid out with the clipped hedges and trim walks of Dutch William's days, forming a truly charming spot, and one well cared for by the Earl of Bradford, in whose family it has remained for several generations. Then we have Bick-minn, with a fine church, in which are many interesting Norman portions; and Hampton-in-Arden, noticeable for old cottage bits, subjects for no end of pictures, and a church in which are progressive examples of the Norman and early English architecture. A little further in this direction is Berkswell, whose church has a fine Norman chancel, under which is a good crypt, now used as the burial place of the Sir Sardley Wilmot family; and Packington, whose park comprises a relic of the once far-famed Forest of Arden, the grand old oaks in which have been immortalized on canvas by our worthy friend, Mr. P. H. Keneshaue. In this park is the old house built by Sir Thomas Fisher towards the end of the seventeenth century; and I may here mention that nearly all the old farm-houses in this part of Warwickshire have been furnished with a protection of wood, doubtless as a security required by the dense woodland tracts in which they were situated. In this neighbourhood also is Maxstoke, whose Priory ruins, with their closely-adjoining village-church, are objects of most careful investigation; and at a little distance the moated house, or rather Castle of Maxstoke, is the very picture of an old English feudal house. Near at hand, also, is Coleshill, with its restored church and High monuments, and other interesting relics of former days, including the pillory, a relic of old customs not often met with. In a north and north-easterly direction is Sutton Coldfield, where the good old Bishop Vesey must not be forgotten; and in its near vicinity is the moated house of New Hall, with embattled towers and quaint old work. There is Pipe Hayes, too, a timber mansion, now roughcast, but singular from having a number of little gables, and some massive bay windows. Curworth has a church, with a good Norman chancel arch; and Astley Church and Castle are well worth a summer day's journey. Kingsbury and Poleworte, the latter with its fine Coventry church, are objects of interest; and Tamworth, with its church and castle, the former rich in early monuments of the Ferrers and Neville families, must be well known to all. To the north-west there is not much of interest, the Black Country generally absorbed nearly the whole of the picturesque remains. The parish church of Walsall, however, has some chancel-stalls of rather good character; and at the edge of the town there is an old seventeenth-century moated brick, called Colmore Hall, worthy of inspection. At West Bromwich the old church of St. Clement has a few bits of good work almost buried under modern plaster; and in the neighbourhood are two old houses of timber construction. One near the church, called Bromwich Hall, has been greatly altered; but the other, called the Oak House, and situated near Spon-lane, remains in a perfect state, but surrounded with modern houses and smoky chimneys. At Wednesbury the old church, with its octagonal chancel, was sadly ill-used some thirty-five years since; and the Collegiate Church of Wolverhampton is too well known to be here commented on. At Tipton was an old church containing much early Norman work some few years since, quite in ruins; but I understand it has been rebuilt, but whether or not will come a day unknown. The Castle of Dudley is also one of the well-known objects of our neighbourhood; and in the vicinity of Stou bridge area, I believe, many old mansions of the Elizabethan and later periods, which should be well worth examination. To the west of Birmingham is Hales Owen, whose church has perhaps the largest amount of Norman work remaining of any in the neighbourhood, and the ruins of Hales Owen Abbey, close by, and the fine chapel of St. Kenelm, on the Cleat Hills, have much to render them interesting. The Hall and restored church of Hagley, and the picturesque Church of Clent, lying close under the shadow of the great hills, with their surroundings the list of the most noticeable architectural and antiquarian features concealed within what may be called "our neighbourhood."

The annual dinner of the society afterwards took place at the Exchange Restaurant. The chair was taken by Mr. Bateman; the vice-president, Mr. W. Harris, occupying the vice-chair. Amongst the gentlemen present were Messrs. B. B. Johnson, secretary; Joseph Hornblower, Thomas Plevins, J. H. Chamberlain, J. G. Bland, A. B. Fhipson, H. Corser, D. J. Williams, G. Inghal, and Hawkes, members of the society; W. B. Briggs, president of the Builder's Association; and Messrs. S. Evans, S. Timmins, and Allen E. Everitt, honorary members of the Architectural Society.

COMPARATIVE ALTITUDES.

COMPARATIVE altitudes having been to me for some years a favourite branch of study, I have often wished to publish a chart such as that desired by your correspondent, Mr. Middleton; but information has led me to conclude that, in scientific map-making, labour and profit are not always pleasantly connected.

Thinking that the subject may interest some of the numerous readers of the *Builder*, I have pleasure in offering, as a New Year's gift, the accompanying tabular view of certain altitudes in England, alphabetically arranged in six series, representing respectively cities and towns whose general levels do not exceed 100 ft., 200 ft., 300 ft., 400 ft., 500 ft., and 600 ft. Lincoln is included in the first series, although the altitude of the floor of the cathedral is figured 216 ft. High-street being only 23 ft. above the sea-level. A. J.

NEW MARKETS IN BERLIN.

The first of a series of market-halls has been opened in Berlin by a company formed for the purpose, and is intended as a specimen from which others will be built in various parts of the city, with such alterations and modifications as experience will suggest. This first is 270 Prussian feet long (which are nearly equal to our feet) by 160 ft. wide, with a height of 60 ft. to the ridge-piece. The cellars occupy an area of 36,000 square feet, and above these a street, 48 ft. wide, divides the market into two equal halves, each containing twenty stalls, with an area of 70 square feet each, and 220 stalls, with an area of 36 square feet each. Twelve groups of buildings surround these halls, containing forty shops and 120 separate tenements, the offices of the company, the market police, &c. On comparing the arrangements of these halls with those of Paris, for example, we find this improvement, that stalls of greater or lesser area can be hired according to the requirements of the stallkeepers; whereas, in Paris, the stalls in one building are, except at corners, &c., all of equal size. If we remember rightly, the stalls at the "Halles Centrales" are 41 square feet in area, and those in the Rue Château d'Eau 42 square feet. These at Berlin are 70 or 36 square feet, *au choix*.

THE ARTIST AND THE PUBLISHER.

STR.—In the new entrance to the South Kensington Museum, turning to the right, you enter a longish gallery, with drawings on the walls and table-like glasscases below. On the right wall the two sheets of "edible and poisonous mushrooms," produced by Worthington G. Smith, with the book, are hung. The publisher's name is black and distinct enough: "Exhibited by R. Hardwicke, Piccadilly," but the artist's is nowhere to be seen, excepting by an energetic person like myself, who takes the trouble to peer round the corners. Now, you know this is not "right," it is another instance of the mischievous presence of the middleman, who in England continually interposes between the producer and the consumer, as so ably shown in your interesting "leader" last Saturday, and which was therein illustrated by the case of the bootmaker and the bootseller.

R.

ARCHAEOLOGY v. ARCHITECTURE.

STR.—Mr. Fergusson should have been a bishop: he could then have pronounced dogmatic decisions, which, if not privately undisputed, would at all events have been publicly received in solemn assemblage. He must not, however, be permitted to rate a whole institute of architects with impunity; and it seems to me high time that some protest was made against his self-assumed authority. He always speaks, and wishes to be recognised as having spoken, *ex cathedra*. Hence, when another man would reason, he takes upon himself to judge and decide categorically, as though every one were hanging on his lips for a decree, noticing just so much of the matter under his consideration as is convenient for his own immediate purpose.

Without taking any particular credit to myself for the faculty, I claim to be competent to distinguish between archaeology and architecture; and at the same time I do not acquiesce in Mr. Fergusson's teaching or definitions. In opposition to him, I define an archaeologist—i. e., a mere architectural archaeologist—to be one who, in making designs, not only studies the works of antiquity as a hook, whereby he may learn the principles of the art which produced them, and see how these principles were variously developed by successive architects,—in what forms they resinited, what ideas sprang from them, how they were influenced by, and in what outward expression they satisfied and symbolised the wants of the then existing generation; but actually reproduces such works, irrespective of all considerations of appropriateness, and modern wants, convenience, and requirements,—thus making the present subservient to the past, and expressing not the thoughts and character of his own mind or the age he lives in, but those of men and ages long since departed. A good architect, however,

must be a sound archaeologist. In designing a building, whilst considering solely "the purpose and age for and in which it is to be erected," he will work it out from his own thought and brain-power, without reference to books and examples; but so far from "not thinking of the past or of any other clime," or unreservedly rejecting the forms and developments of bygone ages, he will bring to bear on his work the wisdom, genius, and power of the great men by whom they were produced. Far, moreover, from fostering a supercilious disdain for them, he will avail himself of their experience and reverence for the same wants. It is a shallow philosophy, which, from a morbid desire of being novel, or a slavish fear of being a copyist, shrinks from a loyal avowal of the obligations a man is under to those from whom he has learnt the very alphabet and grammar of his art. In saying this, I am not likely to be misunderstood. No man has more roundly abused archaeological whims and old-world copyisms than myself, and none have been more roundly abused for doing so; but I denounce quite as strongly a principle such as that enunciated by Mr. Fergusson, which, followed out without qualifications, leads to nothing but extravagance and eccentricities. The partial truth it contains requires carefully guarding by the principle of authority, and reverence for the past is the best guarantee for success in the present. This seems to me to be the great safeguard against a spurious originality, which, if sought for apart from the restraints I have mentioned, only results in the weak, crazy, and fantastic developments of modern Paris and London. To "throw archaeology overboard," is in order to get at "a real and true architecture," is very much like discarding grammar in order to write with real and true elegance.

All that is true in Mr. Fergusson's definition of an architect has been the burden of my saying for many a day; but what he really means is to be found in his article in the *Builder*, on the Law Courts, which, although containing much that is both true and admirable, is so disfigured by extravagance, that it loses half its value. His ideal architect, it seems, is to cut himself off from "the past, and from every clime" under the sun, except his own. He is to free himself from "the trammels of archaeology," and to "invent a new style," with no principles but "common sense" and "progress" to guide him. He is to engage on every fresh work with the animating conviction that "Gothic (English) spires and Grecian porticoes are equally absurdities" in England; that all modern architecture is "a falsehood;"—Classical, one falsehood; Gothic, another; that a love of Gothic art is a mania to be classed with crinoline and chignons, and consigned with them to the "limbo of absurd fashions;" that veneration for the Middle Ages is "sentimental," and (if I rightly understand Mr. Fergusson) that neither "Pointed arches nor Classical pillars" should be tolerated. With such convictions, and in such a spirit, a man is to be successful in producing an original and entirely satisfactory style of architecture, "in harmony with the feelings and advancement of the age." Will Mr. Fergusson for once be a little less visionary and a little more practical, and give us some idea of the "original common-sense architecture" about which he discourses so dogmatically? There are several newly-erected buildings in London which seem to be at least efforts in Mr. Fergusson's right direction. The Charing-cross Hotel is wildly original, details and all; does that please him? The Strand Music Hall has certainly no parentage: surely this cannot be far wrong. Better still, the new University buildings in Burlington-gardens, which were pulled down last summer, and bodily carried off, when but half erected: these, at any rate, ought to have passed Mr. Fergusson's muster, for they were totally unlike anything ever yet seen, not only in design, but even in their general construction and masonry.

In these buildings we certainly see few "crotchets" such as those Mr. Fergusson so flippantly attributes to my father; but a mass of childish fancies, ludicrous abnormal conceits, and fantastic originalities. My father's "crotchets," at all events, had authority on their side; but these are the coinage of the most doubtful taste, opposed alike to all "true and real architecture," as to every rule of art. These, then, are the results of a principle such as that we architects are called upon to adopt; these are the Will-o'-the-wisps we are to follow

in our search after a "new style" neither Gothic nor Grecian," until we are lost in a quagmire of incompetence and conceit.

Space forbids me to follow Mr. Fergusson any further. Perhaps another opportunity may be afforded me of noticing the "syllabus of errors" with which he has favoured us; but I do think, since we are all such beighted creatures that we cannot even appreciate the difference between "archæology and architecture;" and that all architecture since the year 1500 has been nothing but a failure. Mr. Fergusson, in addition to his darling occupation of finding fault, might take the trouble to build up as well as pull down, and substitute something "true and real" for the "strange aberrations" of the present day. We might then place a higher value on his crusade against all modern architecture and architects. From his remarks in "Modern Architecture" respecting my father, I am convinced either that Mr. Fergusson wants judgment extremely, or that he is blinded by his resentment.

E. WELBY PUGIN.

A REASON FOR JOINING TRADES UNIONS.

SIR.—In your last week's impression, your correspondent "Jan Plans" gives (in my estimation) one of the principal reasons that workmen have for joining trades unions, viz., that in nine cases out of ten masters do not ask themselves what is a fair wage, but what is the most they can induce a man to work for; and the combination of capital and trade gives the masters so much more power (and so well do they wield it over the men, who have only their own strength to depend on) that they can without the benefits accruing from the unions, when trade is in its present depressed condition, and no prospect of improvement for some time, sooner than a man would accept a considerable reduction in his wages; and when trade does improve the masters are reluctant to return to the old standard wage, seeing that for a length of time they have had their employ labors on less. I speak from experience, having found this to be the case at a large seaport in Norfolk.

A WORKINGMAN.

DURHAM UNION WORKHOUSE COMPETITION.

SIR.—When the guardians invited architects to compete for the extension of the workhouse, they issued printed instructions, as follow:—1. That the existing building is capable of accommodating about 125 inmates, and the proposed additions must be of sufficient extent to accommodate, with the present structure, 300 inmates. 2. The present workhouse to be utilised as far as possible. 3. Due regard to be paid to economy. The architects and competitors were not to be revealed until the premiums were awarded. Nine sets of plans were sent in. They were referred to a special committee, to make a careful examination of the merits, and report thereon. The vice-chairman subsequently tells us that it took the committee as much as two hours and a half before they came to a decision. I ask, how is it possible that any committee can carefully examine upwards of 181 sets of drawings, to say nothing about the hundreds of pages of specification which have cost the nine competitors not only weeks but months of hard work. The plans marked "Half Moon and Shield" and "Civic Mundi" were selected for the first and second premiums. When these plans came to be examined, it was discovered by "Civic Mundi's" father that the man in the moon had designed the site for his plan, not the plan for the site. "Half Moon" states that the land objected to was the result of straightening the crooked fence, and that it was done with the intention of improving the site more than the design. "I was not aware," says "Half Moon," "until I saw the report of the committee, that the adjoining ground was not property belonging to the workhouse." Now, the straightening of the crooked fence was just the obstacle which every competitor was desirous of removing, had it not been an unjustifiable license which could not be taken when the line was drawn for all. This so-called crooked fence is nothing more or less than a substantial boundary wall, built as straight as "Half Moon" could draw it upon paper, and in order to straighten this fence "Half Moon" sootly takes upwards of 800 superficial feet of the old nursery gardens. "Half Moon's" plans have been measured, and likewise the site, and the result is that the site will neither accommodate the plan in length nor breadth. Besides, "Half Moon's" plans are for a new house, and according to estimate cannot be built for less than 9,000*l.*, while the average cost of the original plan is from 4,000*l.* to 5,000*l.* Some of the guardians admit that, if they had not abandoned the idea of extending the house, they would not have entertained either of the plans selected. These plans were referred back to the committee for the whole to be reconsidered, when one of the guardians said it was an insult to ask the committee to reconsider the matter, after having spent so many hours in selecting the designs. Was it because "Civic Mundi" had two extra votes out of five against "Half Moon's" chance? At the next meeting, on the 14th instant, only the two plans first selected were examined. The committee was looked at. The competitors who applied to see the drawings were positively refused a peep even at their own work, for what reason I cannot say, excepting it be that, previous to the meeting of the 14th, the plans marked "Half Moon and Shield" were discovered to emanate from the office of A. & C. E. The author was sent for, and allowed to remove the plans and make any alterations he might think proper, and return the plans signed "Jan Plans" for the meeting on the 14th. How did they know whom to send for, when the author was supposed not to be known until the competition was concluded? I ask, is all this honest?

FAIRPLAY.

sculptured alabaster, and is the work of Mr. Earp, of Lambeth, from a design furnished by Mr. Street. The tripod gas-burners, intended to light the chancel during evening service, were supplied by Mr. H. Neal. The chancel aisles have been filled with oak seats, and all the monumental slabs have been relaid. Two slabs containing incised brasses, in a good state of preservation, have been removed into the chancel. Some old hatchments, formerly placed in the church, have also been removed. The font has been taken from the west end of the church, and placed near the pulpit. The church is heated with a new hot-water apparatus, supplied by Mr. Haden, of Trowbridge. The organ, until now standing at the west end of the chancel, and the Perpendicular west window has been exposed to full view from the body of the church. The instrument has been repaired by Mr. Walker, of London.

Bradley.—St. Martin's Church, Bradley, erected by the Baldwin family, has been consecrated by the Bishop of Liefield. The church is in the Geometrical style, and will seat 350 persons. The plan is cruciform; the length of nave 78 ft., and width of organ aisles 65 ft. 6 in.; the tower and spire, 170 ft. high, are at the south-east. The material used for the walling is Gornal stone in coursed rock-faced ashlar, box ground stone dressings; the nave, piers, caps, and bases of Hollington stone. All the capitals and corbels in the interior of the church are foliated, the carving generally having been executed by Mr. Allen. The pulpit and font are of Caen stone; the joinery is of pitch pine; the aisles are laid with Staffordshire and encaustic tiles, the chancel and communion with Messrs. Maw's encaustic tiles, and the reveries is inlaid with encaustic and majolica tiles. In the tower is the framework for a peal of bells, only part being intended to be hung at present. The builder was Mr. Nelson, of Dudley; and the architect Mr. Bidlake, of Wolverhampton; the cost about 6,000l. The lower portion of the tower opens with an archway into the chancel, and is in part used as an organ chamber. The seats in the nave and side aisles are of one uniform character, in the modern open style, with carved scroll ends: the wood used is pitch pine, stained and varnished. Across the west-end—which is lighted by a six-light window, of great size—are rows of seats, one above the other, which will be for the use of the scholars at the morning services, and at other times free. The chancel is lighted by three stained glass windows, executed by the Messrs. Pilkington, of St. Helen's. The windows are in three-lights, independent of tracery openings, of which a large cinquefoil forms a prominent feature. The north-east window has in its centre opening a representation of the Nativity of our Lord. Above is a choir of angels floating in the air, playing harps, and bearing a scroll with the text, "Glory to God in the Highest." The opening on the right is occupied by a group of the wise men, with their gifts. The left opening is filled with a group of shepherds. In the top cinquefoil is seen the "Flight into Egypt." In the south window the subject is the Crucifixion. In the cinquefoil above is a representation of the Agony in the Garden of Gethsemane. The centre window displays the subject of the Ascension of our Lord. Underneath this, and in the side openings are distributed the Apostles. In the cinquefoil is the figure of Christ in Glory, surrounded by angels. The upper tracery openings over the side lights contain scrolls, with inscriptions. The remaining tracery openings are filled in with cherubs, stars, &c. On the north side of the chancel is a memorial of the Baldwin family, being a token of remembrance from Mr. Edward Pugh. The design is that of a canopied niche, with trefoil arch of serpentine marble, and inlaid. The tympanum is diapered with raised shield in white marble; the inscription slabs, also in marble, are recessed under moulded arches, supported on rich coloured marble shafts. The side shafts are also in similar marble, bearing on an enriched corbel table. The canopy is enriched with crockets and foliated pinnacles, with carved angels on the knee stones.

Bishop Stortford.—Albury Church has been re-opened, after being restored and repaired. The stone-work of the pillars has been restored, the walls re-plastered, and the nave re-roofed. New flooring has been put down, and the old high pews have been replaced by open seats. The memorial slabs have been relaid, and the font has been retored. The gallery has been removed, and a window inserted at the west end

of the church. A large Gill stove has been provided for the purpose of warming the church. These and other works have been performed by Mr. Gibbons, of Buntingford, under the superintendence of Mr. Perry, of Bishop Stortford, architect. The tower has been repaired, and a new spire erected, by Mr. Ginn, of Puckeridge. The cost of the restoration is, we understand, about 1,000l.

STAINED GLASS.

Wroxhall (Warwickshire).—Mr. T. Dury, of Warwick, has just placed a large stained glass window in Mr. Dugdale's mansion adjacent to Wroxhall Abbey, illustrative of the legend of Hugh de Hatton, as described in Dugdale. From the legend it appears that the knight went to warfare in the second crusade to the Holy Land, where he was taken prisoner and continued "in great hardship" for seven years. At the end of this period he prayed to St. Leonard for deliverance, which was miraculously effected, and Sir Hugh, in accordance with a vow, established a monastery at Wroxhall. The subjects show Sir Hugh departing for the Holy Land, his being taken prisoner, his "making plaint" to St. Leonard, who appeared to him in the habit of a black monk, his suddenly being found at Wroxhall Wood by his own herd, his interview with his wife and family, who recognize him by the hair of a broken ring, his receiving a revelation where to build a church, and his two daughters being made nuns therein. Two other compartments represent the legend of Dame Alice Craft, from the same authority. This window was one of those lately exhibited in Paris, and for which Mr. T. Dury received an award.

All Saints' Church, Emscote.—A three-light window, representing the good deeds of Dorcas, and subscribed for principally by mites from the poor, has been placed at the west end of this church to the memory of Mrs. Nelson, of The Lawn, Emscote. This window was one of those contributed by Mr. Dury, of Warwick, to the Paris Exhibition.

St. Neal's Church.—"The Adoration of the Kings," by Messrs. Hardman & Co., of Birmingham, presented to this church by Mr. Charles P. Rowley, has just been returned from Paris, and is now inserted in the east window of the Lady Chapel. This window was chosen out of a great number exhibited to receive the silver medal. The window cost 245l.

Clothall Parish Church (Herts).—A stained-glass west window, executed by Messrs. Henton, Butler, & Bayne, of Covent Garden, has been erected in this church. It contains two compartments, one of which represents the Nativity, and the other the Adoration of the Magi.

PATENTS CONNECTED WITH BUILDING.

STOVES OR FIRE-PLACES.—*E. Thring.* Dated 2nd March, 1867.—For the purposes of this invention the fuel to be burnt is placed in a shell or grate, circular in section, or it might be of other convenient shape, and turning on centres at its two ends; an opening is made through one side of the circular shell or grate, at which fuel is introduced into it. When fuel is introduced into the shell, the shell is turned on its axis, so as to cause the fresh fuel to be covered with the heated fuel previously contained in the shell; and any smoke arising from the fresh fuel will be consumed by its having to pass through the heated fuel. Air is allowed to pass to the fuel in the shell through perforations or openings formed through its bottom, as well as from the front opening, and the products of combustion escape from the shell through similar perforations or openings at the top, and pass away by the chimney. The axis of the rotating shell may be carried by a movable frame, so that it may be placed in any ordinary fire-place, or they may be carried by a frame to be fixed in the fire-place.

CONSTRUCTION OF FLOORS AND ROOMS FOR BUILDINGS.—*R. Moreland, junr.* Dated 26th March, 1867.—Among the features of this invention are the following:—He takes a number of wrought-iron girders, either hot and string lattice girders or bow and string web plate girders, and he places them at convenient distance apart, and fixes them either on main girders, if a large area is to be covered, or he builds them into the walls of the building when the area is smaller. When main girders are used

he supports the bow and string girders on the upper or lower flange of the main girders. The upper flange of the bow and string girders may be elliptical, or an arc of a circle in outline—the latter is preferred; the lower flange may either be straight or curved. He prefers that it should be straight. The top and bottom flanges of the lattice girders are connected together with vertical and diagonal braces riveted at the connections. Where main girders are employed the ends of the lattice girders may be fixed, bolted, or screwed to the girders which support them; and in some cases he uses additional tie-rods to stay the supporting girders. He also places along the edges of the supporting girders, and between the lattice girders bricks or lays on the flange or materials, which he rivets or lays on the flange of the supporting girder, to ensure the equal and level bearing of the edge of the corrugated iron, as hereinafter described. He prefers a brick of an angular shape showing the projecting edge corbelwise. On the upper or curved surface of the lattice girders he then lays sheets of corrugated iron or other material in as long lengths as possible, and forms them into a continuous sheet by allowing the sheets to alternate, or, as it is more commonly called, to break joint, and by holding or riveting the edges of the sheets together. He also secures the ends of the corrugated sheets which touch the wall by bent dog-bolts or cramps, which are bolted or riveted to the corrugated iron, and built into the wall between the supporting girders. The curve of contrary flexure of the corrugated iron may be varied both in shape, size, and form, so that the greatest strength possible may be produced. The corrugated iron plates may be connected to the lattice girders with rivets or bolts, but it is not usually required. He places the flutes of the corrugated iron at right angles to the lattice girders, and on the upper surface of the corrugated iron. He then lays concrete composed either of shingle or brick rubbish, mixed with lime or Portland or other cement or brickwork, in mortar or cement. He either lays the concrete levels or concentric to the curve of the lattice girders—the former is preferred—and he then lays the floor with joists and flooring boards in the ordinary manner.

Books Received.

On the Ventilation of Dwelling-houses, and the Utilization of Waste Heat from Open Fire-places. By F. EDWARDS, Junr. London: Hardwick, 1868.

The principal point in this volume is an endeavour to set forth, by words and diagrams, the best mode of utilizing heat wasted up the chimney by our present method of consuming coals. The author says, let us suppose that, instead of the large channel in which the smoke-flue is inclosed being used for the purpose of providing for an escape of air, it be used to supply a current of warm air to every apartment with which it is placed in communication, and that all the lower chambers of a house be made thereby to contribute heat to the upper ones. He is not able, as a proof of the practicability and utility of such a scheme, to adduce an instance where it had been carried into effect, and where the various results, whatever they might be, had been well ascertained; but, in the absence of any such case, thinks it may be useful to attempt a consideration of what may appear to be the various conditions which would enable such a system to achieve success.

"In the first place, to change a channel for the escape of air into a channel to admit air, the aperture provided over the roof has to be closed, and a proper provision has to be made below for a free admission of fresh cold air from an external source to the lower part of the chancel. This free admission of air to the chancel is most important, and could be provided for by means of ornamental perforated bricks, fixed in an external wall, and made to communicate as directly as possible with the chancel. For the admission of warm air to the rooms, apertures capable of regulation must be provided near the floor, instead of near the ceiling, because a low level is always the proper position for introducing a current of warm air, and care must be taken that the total amount of apertures in the various rooms do not exceed the horizontal area of the warm-air channel, or there may be a liability of the warm air passing by one room and ascending to another. For the escape of air, the fireplaces may be supplemented by ventilating flues of proper area in the partition wall opposite the windows, as already described, or in the party-wall. The remaining condition appears to be, that the smoke-flue should be of cast iron, and not of fire-clay or brick."

He gives various sections and plans, showing how he would carry this out; one section showing a number of houses heated by warm air

ascending from warm-air shafts in the party-walls, and entering the various rooms and on landings, at openings provided. In his preface, Mr. Edwards styles his hook "the first attempt to call attention to the utilization of the heat which escapes by our chimneys," and expresses a hope that it will receive serious consideration, in which hope we fully agree, though we cannot admit that his hook is the first attempt to bring about what is desired. From the time of London, and before, till now, plans have been proposed to make available in one room the heat produced in another, and which would be otherwise wasted. In the hook itself, a diagram is given of the flue patented by Mr. G. Jennings, which has a space around it, "by which air descends, becomes warm, and enters the rooms through open gratings, when there are fires burning, and air is prevented from entering by other means." However, there is no occasion to dwell on this. An enormous amount of heat, in the aggregate, is wasted under our present arrangements, and good will be done if the hook in question draw fresh attention to the fact, and lead to the utilization of that heat.

VARIORUM.

"Street Tramways for London: their Utility, Convenience, and Necessity; with some Remarks on the Working of Street Railways in the United States and Canada." By Charles Mackay, J.L.D. London: King, Parliament-street. Dr. Mackay here gives us the result of his experience of the working of street tramways in America. He is strongly of opinion that there are no objections to them in London except such as are wholly untenable, and are the result of either ignorance and prejudice or interested opposition. Their advantages, on the other hand, are in his estimation manifold; their celerity, convenience, and comfort, far beyond those of omnibuses.—London omnibuses especially. The rail used by Mr. Train was unfortunately a defective one; but now this has been obviated, and rails of an unobjectionable kind have been invented, and are available. These rails will interfere in no way with the traffic. The saving of street tramways to the rate-payers would be enormous, as may be inferred from the fact, that while the carriages of the New York and Brooklyn railways, in 1866, with 70,791,625 passengers, passed over 11,700,000 miles of streets, built and kept in repair by the companies at their own expense, the carriages of the London Omnibus Company alone, with somewhere about 41,334,602 passengers passed over 13,000,000 miles of streets built and kept in repair by the metropolitan authorities at the expense of the ratepayers.—"Slater's Sententious Chronologies; Revised and much Enlarged." By Elizabeth M. Sewell. London: Longmans, Green, & Co. 1868. The usefulness of Mrs. Slater's Sententious Chronologies having been proved by experience, it has been thought advisable to revise and enlarge them, and a very competent editor has been chosen to effect this improvement of a useful little book. There is a peculiarity in it of which many of our readers may not be aware. This relates to the recollection of dates. A sentence is composed of dates relating to the event indicated, the first letters of which words, being consonants, are made to indicate figures. Thus "for instance the date of the Universal Deluge, which we find in the first part of our chronology, is contained in the following sentence:—

Not a Man Remained Behind.
N M R B
2 3 4 8

This sentence informs us, therefore, that the Deluge took place 2348 years before Christ. The following sentence gives the date of the destruction of Carthage:—

They Burn Carthage.
R C
1 4 7

By keeping in mind this sentence we shall remember that Carthage was destroyed 147 years before Christ."

Miscellaneous.

THE WORKS AT SEFTON PARK, LIVERPOOL.—The town-council have accepted Mr. Campbell's tender, 72,345*l.*, on condition that he deduct 1,000*l.* for taking out the quantities. What does this exactly mean?

FALL OF CUPOLA IN PESTH.—On the 22nd January, at three p.m., the cupola of the new church, in the Leopoldstadt quarter of Pesth, fell in with an enormous crash, causing the ground to tremble all around. The vault of the church was completely destroyed, and nothing remained but the four walls and the external towers. No lives were lost.

DESTRUCTIVE FIRE AT THE ROYAL MILITARY COLLEGE, SANDHURST.—The whole of the left wing of Sandhurst College has been destroyed by fire. Great complaint is made as to the protection against fire in the college, there being only two old-fashioned engines kept on the premises, and in addition to this there is an insufficiency of water. Had it not been for assistance from Aldershot, the flames could not have been got under short of the destruction of the whole building. The fire originated in the quartermaster's department.

THE ROYAL ACADEMY.—A paragraph in some of the morning papers, giving the names of four or five architects as nominated for election to fill the two vacancies amongst the Associates, was obviously erroneous, to those who know anything about the matter, there being nearly seventy names on the list all equally nominated. It had a strong family resemblance to a similarly erroneous paragraph about the rebuilding of her Majesty's Theatre imposed on the morning papers a week or so ago, in which two or three of the same names were given.

HOTELS.—The Palace and Burlington Hotels Company's ordinary half-yearly meeting of shareholders has been held. The report stated that the company was steadily improving its financial position, and yielding a fair return for the capital invested. The hotel returns for the past half-year amounted to 16,963*l.* 3*s.* 4*d.*, as against 15,179*l.* 17*s.* 3*d.* during the preceding half-year, and 14,179*l.* 0*s.* 9*d.* during the corresponding half of last year. There was a net profit on the half-year of 3,962*l.* 16*s.* 9*d.*, out of which the directors recommend a dividend at the rate of 6 per cent. per annum, free of income-tax, leaving 1,259*l.* 0*s.* 3*d.* to be carried to next account. The report was adopted and the dividend declared.—In the Equity Courts, on the 18th instant, before the Master of the Rolls, Mr. Roxburgh appeared on a petition praying the winding-up of the Langham Hotel Company; and his lordship ordered a voluntary winding-up under the supervision of the court.

PURCHASE OF THE LONDON COFFEE-HOUSE BY THE CORPORATION: EX-PARTE MAYOR, &c., OF LONDON.—Mr. A. E. Miller, barrister, appeared before Vice-Chancellor Wood in this petition, on Saturday last. The object of it was to have an agreement, dated in July last, carried into effect, by which the corporation agreed to purchase the London Coffee-house, Ludgate-hill, for the sum of 38,500*l.* It was stated to be of importance to the corporation to have this property, especially in contemplation of the proposed enlargement of Newgate. There was evidence that the price was a fair one, and it was proposed to make up the purchase-money by various sums which had been received from the Metropolitan Board of Works, the London, Chatham, and Dover Railway Company, the Commissioners for the erection of the New Law Courts, and the Charing-cross Railway Company. His Honour approved of the purchase, subject to a reference to chambers with regard to title.—City Press.

THE NEW HOTEL AT LIME-STREET STATION, LIVERPOOL.—The extensive new hotel which the London and North-Western Company have decided to erect in front of their Lime-street Station, will shortly be proceeded with. A few weeks since the company advertised for tenders for the new building, and the directors accepted the tender of Messrs. Haigh & Co., of Liverpool, the amount of the contract being about 72,000*l.* The hotel will be in the modern style of Italian architecture, Mr. Waterhouse, of London, being the architect. The Lime-street facade will extend nearly the entire length from Gloucester-street to Lord Nelson-street, and at the south and north angles respectively there will be two prominent towers. There will be an archway in the centre of the Lime-street frontage, which will serve as a means of ingress and egress for passengers to and from the station. The several large additional platforms have now all been completed, and active preparations are in progress for erecting the immense new station-roof, which will consist of one enormous span only.

ST. GEORGE'S OPERA HOUSE, LANGHAM-PLACE. We are glad to see that Mr. German Reed is about to follow up his present success in the representation of comic opera, with the engagement of Madlle. Liebhart, who will make her debut on the English stage in Auher's "Amhasadress," on Saturday Evening, February 5th. A new tenor, Mr. Wilford Morgan, will appear at the same time. The *Contrabandista* and Offenbach's extravaganza, which are now drawing crowded houses, will then be played alternately.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—The first *conversazione* of the society this season was held on the 24th ult., at the Gallery of the Female School of Art, Queen's-square, Bloomsbury; Professor Donaldson in the chair. The proceedings were opened with an address, in which, after remarking on the want of some such society for the encouragement of art, for art's sake,—not as an occasional popular pastime, but as a constant source of intellectual enjoyment;—and instancing the humanizing influence the general cultivation of music had exercised upon the masses in Germany, and regretting that in England there had been no one to supply the place of Mr. Hullah,—the chairman congratulated the members on the society having now reached its tenth year, with every prospect of increasing usefulness and prosperity. A concert was then given.

THE PROPOSED TOWN-HALL, SANDGATE. — A meeting has been held to consider a proposal for the erection of a town-hall. Mr. Pledge said that the cost of the building would be 2,000*l.*, including the purchase of land, the hall to accommodate the members of the Literary Institute, offices for the Board of Health, &c.; and the scheme he proposed was to form a limited company, putting out the 2,000*l.* in shares, and then adopting the system of prize drawing, entertainments, bazaars, &c., to meet the necessary outlay. The proposition was accepted by the meeting, and a committee was appointed to make preliminary arrangements for forming a limited liability company. The site selected for the building has a frontage of 70 ft. on the north side of the road, and is known as a part of Knool House Estate, fronting Devon-place, the purchase-money being stated at 300*l.*

THE PROPOSED NEW AGRICULTURAL HALL, WALLSALL.—The scheme for the erection of an agricultural hall in Wallsall may be said to be now fully arranged, and the project is fairly before the public. It has been formally resolved to form a joint-stock company for the erection of an agricultural hall, the shares being fixed at 2,000*l.*, and their value at 1*l.* each. At a meeting of farmers and others on the subject, the chairman and fourteen other shareholders were appointed directors, and other officers having been named, Mr. Nicholls, architect, gave an estimate of the probable expense of putting up a building 80 ft. long by 40 ft. wide, and was requested to prepare plans for presentation at a future meeting. The directors were also empowered to treat for a site, the plot of land adjoining St. Paul's Chapel being regarded as the most eligible of several named. In the course of the proceedings it was stated that nearly 1,000 shares had been subscribed for prior to the meeting, and this number was considerably augmented before the company separated.

MACHINERY IN THE BRICK TRADE.—On Saturday in last week, Mr. R. White, brick manufacturer, gave a dinner to his brickmakers and other workmen employed at New Grimesthorpe, in erecting an improved kiln and in fixing some machinery for making bricks. Both the kiln and the brickmaking machine are the first that have been introduced into this neighbourhood. The kiln is known as Hoffman's patent. It consists of twelve compartments, each of which is capable of burning about 20,000 bricks, and the kiln is so constructed as to consume its own smoke. The cost of burning the bricks is thus considerably reduced: indeed, it is said that as many bricks can be burnt for a penny as would cost a shilling if burnt in the old kilns. The brickmaking machine, which is patented by Messrs. Bradley & Craven, of Leeds, almost altogether does away with hand labour. All that is needed is simply to cart the clay to the machine, which then does all the rest of the operations required; and the bricks which it turns out are said to be equal to pressed bricks. Mr. White has incurred an outlay of about 5,000*l.* in erecting the kiln and fitting up the machine.

TOBACCO AND VENTILATION.—A novel plan was recently adopted at Berlin for testing the working of a ventilating apparatus attached to the new large hall of the Lower House of Representatives. The 300 men engaged in erecting the building were provided with cigars,—we are not told whether Imperiales or Piquicks,—and shut up in the Hall, with general orders to “blow away.” After a lapse of three hours, the thermometer showed a rise of only one degree, and the atmosphere was comparatively pure, notwithstanding the amount of tobacco (or other vegetable matter) which had been smoked. The apparatus was one by Messrs. Stumpf & Elsner, of Berlin.

ANCIENT IMPLEMENTS.—At the meeting of the British Archaeological Association, held last week, Mr. H. Kettel exhibited a very fine flint implement which had been picked up in the Weald of Sussex. The chairman, Mr. S. Cuming, remarked that the implement was, in fact, made of Hornstone, and was a remarkably fine specimen of the earliest known implements. Mr. Kettel also exhibited a very fine club, II in. in length, made of clay-slate, found near St. Isahel, in South America, in a district where clay-slate does not occur. It was precisely similar to a weapon of half the size found some years since in the North of Ireland. Mr. E. Roberts remarked that the great similarity of implements found in all parts of the world seemed to show that in the earliest times a much freer communication existed than we were disposed to believe.

EASTBOURNE COLLEGE.—A new building for this college is proposed to be erected by a College Building Company, which is in course of formation. Plans have been prepared by Mr. Henry Currey, and are now under the consideration of the council. It is not proposed to erect the whole at once, but only a sufficient part to accommodate about 100 to 150 boys, which can be effected at a cost of about 7,000l. Shares have been already taken in the College Company to the amount of 4,160l. Besides the college buildings, masters' boarding houses will have to be erected, and the council are desirous that one for the Head Master should be commenced at the same time as the college buildings. They are estimated to cost about 5,000l. each, and in order to create a fund for the purpose, and thereby assist materially the object in view, a College Building Company has been resolved upon. At an influential meeting, resolutions in support of the project have been passed, and additional shares taken.

CAST-IRON WATER-PIPES FOR ABYSSINIA.—Three weeks ago a telegram was received from the Abyssinian expedition for eighteen miles of cast-iron water-pipes, intended to convey water from the bottom of the Koomale Pass to Zonia. The first shipload has already sailed from Liverpool. The order for them was distributed amongst the following firms:—Messrs. D. Y. Stewart & Co.; Messrs. Edington & Co., of Glasgow; Messrs. Cochrane & Co., of Middlesbrough; and the Staveley Iron Company, in Derbyshire. The pipes are each 4 in. in internal diameter, 12-32 in. thick, and 9 ft. 3 in. in extreme length, giving 9 ft. clear when fitted; they are all supplied with hored and turned joints. Each pipe weighs about 1½ cwt., and is calculated to resist a pressure of 400 ft. The head to which it will be subjected is only 170 ft. As showing the resources of the Ormesby Foundry (Cochrane & Co.), we may mention that the five miles supplied by this firm were completed in three weeks.—*Iron Trade Review.*

COLCHESTER: ESSEX HALL ASYLUM FOR IDIOTS.—In consequence of an outbreak of fever a new hospital or infirmary has just been erected in the grounds of this institution built of wood interlined with felt and match boarding. It has this recommendation that it can be occupied immediately, whereas had it been of brick it would have had a delay of some months before it could have been used must have taken place. The building is slated upon two open trussed roofs, a layer of felt being placed between the slates and roof boarding. It is 46 ft. long, 33 ft. wide, and contains four wards each, 17 ft. by 15 ft. There are a nurses' day-room and dormitory, kitchen, and two of Monie's patent earth closets. The rooms are lighted by windows and lantern lights, the latter being made to answer as ventilators. The hospital has been sanctioned by the Commissioners in Lunacy. It occupied one month from commencement to completion, fit for occupation, at a cost of about 450l. Mr. Joseph Grimes, of Colchester, was the builder.

THE BATHIST INSTITUTION.—What steps do the directors intend to take? Surely the public have a right to some explanation.

A THEATRE BLOWN DOWN.—Lancaster was lately visited by a heavy gale. The theatre at the top of Penny-street was almost blown down, the only portion left standing being the stage and “scenery.” It was a wooden structure capable of accommodating 1,000 or 1,200 persons.

PROPOSED NEW BUILDINGS AT TAUNTON.—A plan has been prepared by Mr. J. H. Spencer, architect, of this town, for laying out as building-ground the Greenway estate, at Rowharton. It arranges for fifty residences and a church. The residences comprise semi-detached villas of various capacities, with rows of smaller dwellings, each having a garden in front, with courtlage behind. The site is said to be a pleasant one.

PROPOSED NEW STREET IN LIMESHOUSE.—The notice in our last of this proposed short street, to be made by cutting through a very drearful neighborhood (St. Anne's rookery), lying to the north of Limehouse Church, was, by accident, inserted as part of the report of the proceedings of the Metropolitan Board of Works. It should have appeared in the “Miscellaneous.” The new street has not reached the Board of Works stage yet, though we are told it soon may.

TESTIMONIAL TO THE INVENTOR OF THE REAPER. At a meeting of the Highland Agricultural Society, last week, the sum of 1,000l. and a piece of plate were presented to the Rev. Patrick Bell, a minister of Carnylie, Forfarshire, as a testimonial in recognition of his merits as the inventor of the first efficient reaping-machine. The Marquis of Tweeddale made the presentation; and Mr. Bell, in reply, said that it was just forty years ago since he appeared before the society with a little model of his invention.

DISCOVERY IN GAS.—In accordance with instructions received from the Secretary of State for War, some trials in connexion with the consumption of gas have been completed at the gasworks of the Royal Arsenal, Woolwich. It has been found, that by combining hitmen with coal in gas retorts, the gas is evolved with great rapidity, and that it gives an illuminating power from one burner equal to twenty-five spermaceti candles. The experiments, which have been conducted by Captain the Hon. Arthur Cocklin, C.B., of the Steam Reserve, Shrewsbury, have been so satisfactory that 200 tons of hitmen have been ordered by the War Department for use of the Arsenal.

THE TRADE UNIONS COMMISSION.—The Report of Mr. W. Overend, Q.C., Mr. T. I. Barstow, and Mr. George Chance, the examiners appointed under the Trade Unions Commission Act of 1867, to inquire into the outrages asserted to have taken place at Sheffield and elsewhere with the support and connivance of associations of workmen, has just been issued, together with the evidence taken at Sheffield. The report is addressed by the examiners to the commissioners appointed under the Act, and consists of little more than a history of their inquiry, the facts of which received so much attention during its progress. The accompanying evidence, filling 450 folio pages, contains nothing of importance that has not already been published.

A LOCK AND ITS WARDERS.—The *Sunderland Times* tells a story, which may or may not be exaggerated. However, here is the pith of it. “A lock was wanted on premises in Sunderland, of which the Board of Admiralty has the official charge. The proper local functionary accordingly made application to their lordships at Somerset House for an order to hny the lock, which would cost 2s. In due course he received four or five folio sheets of inquiries, the blanks in which he had to fill up, and forthwith return. This having been done, a gentleman was sent over from Tynemouth to survey the hole in the door on which the lock was to be put. He came and returned first-class, and his railway fare and hotel charges came to a good round sum. The surveyor's report was transmitted to London, under the orthodox envelope, and then an order came down to Sunderland authorising the lock to be bought and fixed on the door. Verily, England is a great country, and if it is not exceedingly well governed it is not for lack of what some irreverently call circumlocution, but which the more knowing term painstaking, forethought, and oversight, to prevent jobs.”

THE PROPOSED ART-TREASURES' EXHIBITION IN LEEDS.—A meeting, convened by circular, of gentlemen interested in art, has been held in the Town-hall, Manchester, to receive a deputation from the executive committee of the proposed Leeds exhibition. The deputation consisted of Mr. William Beckett Denison, chairman, Mr. A. Fairbairn, Mayor of Leeds, and other gentlemen. The Mayor of Manchester, who presided, explained that the object of the meeting was to render assistance to the exhibition. Perhaps there was no part of the country that the people of Leeds had a greater right to look to for assistance than to Manchester. In course of the meeting, various gentlemen promised to become contributors; and the Mayor of Leeds said that he had been much associated with Manchester through his relatives, and he was convinced the inhabitants of Leeds would be highly gratified when they heard how handsomely the people of Manchester had responded to the appeal of the deputation.

SERIOUS ACCIDENT BY STORM AT EDINBURGH.—Edinburgh was recently visited by a terrible storm of wind and rain, which lasted six hours. It did immense damage both to the city and suburbs. Men, women, and children were blown down in the streets or injured by showers of falling slates and stones. Even cabs were overturned, and the huge watches, hoots, hats, cages, and other articles that serve as signs, were blown from their fastenings and whirled through the air. The castle buildings were partially unroofed. In Dnke-street a stack of chimneys fell upon a house, and crashed right through it to the very foundation, six stories in all, leaving little standing but the bare shell. Four dead bodies were taken out of the ruins, and two men had miraculous escapes, one of them having been saved from injury by a desk, which fell from garret to basement along with him, and finally rested in such a position as to keep the falling rubbish from his head. The accident was so sudden that one of the dead bodies, that of a clerk, had the arm bent as if in the act of writing. The storm raged with fearful violence in other parts of Scotland, and on the west coast of England as well. The *Western Morning News* gives a long list of fatal shipwrecks on the west coast.

TENDERS.

For the erection of a pair of semi-detached residences, on the Norfolk Park estate, Maidenhead, Berks. Mr. Shrubsole, architect. Quantities supplied:—

Sawyer	£1,359 0 0
Fish	1,486 0 0
Gibson, Brothers	1,486 0 0
Bayes	1,410 0 0
Dover	1,890 0 0
Heavell	1,369 0 0
Garrud	1,357 0 0
Grever	1,530 0 0
Hinsley	1,219 7 2
Russell	1,255 0 0
Dover	1,240 0 0
Keys	1,237 0 0
Nightingale	1,234 0 0
Sharplington & Cole	1,222 0 0
Palmer	1,183 0 0
Wileox (accepted)	1,062 0 0
Neale	1,060 0 0

For building dispensary and relieving office, St. Paneras, Mr. E. C. Robins, architect:—

Collings	£1,027 0 0
Loxatt	1,628 0 0
Saxter	1,476 0 0
Abbot	1,321 0 0
Staines & Co.	1,497 0 0
Sheffield	1,480 0 0
Lathey, Brothers	1,467 0 0
Atcheson & Walker	1,447 0 0
Palmer	1,410 0 0
Nutt & Co.	1,407 0 0
Thomas & Son	1,390 0 0
Newman & Mann	1,395 0 0
Brass	1,381 0 0
Sharplington & Cole	1,375 0 0
Crockett	1,350 0 0
Mann	1,345 0 0
Scribner & White (accepted)	1,341 0 0
Nightingale	1,333 0 0
Perkins (withdrawn)	1,197 0 0

For alterations and additions, at Cambridge Lodge, Harrow. Mr. J. H. Rowley, architect:—

Woodbridge	£650 0 0
Craibe & Vaughan	636 0 0
Shurmer	565 0 0
Sharplington & Cole	553 0 0
Nightingale	543 0 0
Salter	490 0 0
Fole	475 0 0
Chapman	445 0 0

For alterations and repairs to houses, Nos. 4, 5, and 7, Church-row, Aldgate. Messrs. Davis & Emanuel, architects:—

Webb & Son	£280 0 0
Nolley & Son	478 0 0
Ring & Sons	326 0 0

The Builder.

VOL. XXVI.—No. 1305.

A Glance at the Position.

IF the legendary attribute of the month of March, that its close is the opposite of its commencement, may be held to apply to the year, 1868 should go out as a lamb, for it certainly enters as a lion. A grave and anxious care seems to brood over the civilized world. Fifty thousand London citizens quit the cheerful blaze of the yule log for the chilly duty of the special constable, — responding to the invitation given by ourselves and by other friends of tranquillity and good order, to see that the stable-door is shut *before* the steed is stolen. The ring of the bricklayer's trowel and the dull thud of the mason's pick, are less audible than is the hammer of the armourer. Too many, from sea-in-chief to "navy," find themselves and willing for the work which is not forthcoming. Our nearest neighbour is ornamenting and touching peace which her present invention, by raising her army from 800,000 to 2,000,000 combatants, and by extending the productive occupation of her youth from a period of seven years to one of nine years, wishing, at the same time, the limit of militia height for a soldier, already reduced by the loss of the first empire. Italy, the very stones which cry out for the magic and fertilising hand of the engineer, has thrown herself back, in a month's insanity, for another sorrowful slide. The great aggressive power of North-Germany pauses only, like the gorged crocodile, to digest the last morsel, before attempting a new swallow. The heirs of the policy of the Great are twisting and stealing towards the coveted capital of the Greek empire. The King of Hungary has hardly learned to recognise himself in his new clothes. Everywhere is portentous expectation, and expectation what injurious kind which stops, instead of stimulating, industrial activity; and that certain political barometer, the national revenue, for the first time for many years, lost its elasticity. The "turn of the year" has brought with it the illustration of that unprecedented and anomalous state of industrial life to which we are not unfrequently referred in these columns. The strong vitality of the commonwealth, using the term in its original sense of the actual well-being of the great mass of the nation, has resisted collapse, not only in that artificial and unsafe stream of credit into which the modern relations of commerce have been developed, but in the vitality of public enterprise, and even in the ordinary confidence of the English character, which has proved a main element of our national prosperity. We regard with wonder the attach-

ment shown by the inhabitants of the towns that lie at the base of Vesuvius to the perilous site of their abodes. Again and again has it occurred that Torre del Greco, Resina, and adjoining villages have been all but extinguished by the earthquakes that accompany an eruption, such as is now actually in progress, of their fiery neighbour. Not a house on the last occasion before the present escaped more or less injury. The most massive and imposing buildings were the greatest sufferers. The direction of the "earth wave" or line of vibration of the shocks, was most distinctly ascertainable from the cracks in the walls and roofs of the houses that were not thrown down. For three or four days after the sudden outbreak of Vesuvius, marked by a roar like the explosion of a gigantic powder-magazine, Torre was deserted, and a stream of boiling water ran in a constant and plentiful rivulet from a new spring that had opened near the town into the blue waters of the bay. Within a week or ten days the awful silence of the streets was exchanged for an unwonted activity. The mason and the carpenter were in occupation. Props and shores and wooden centering rose like a forest; and the ready and ingenious craft of the Italian mason, soldering a huge crack here, throwing a relieving arch there, cutting out and replacing a damaged portion of a façade in another direction, had, in a month or two from the desertion, restored the town to as much apparent comfort and regularity as is ever to be found in those buildings which, being chiefly constructed of tufa, have at the best of times somewhat of a decayed and ruinous aspect.

So it is with commercial credit. Its basis and element are the anticipation of profit. It is to Italian ingenuity that we owe the main instrument of credit—the great lever of the banking business,—the bill of exchange. Any remarks as to the hazardous terms on which the main part of the whole complicated financial relations of the country is conducted, are likely to be received by "men of business," with as much cool compassion as the householder of Torre del Greco will extend to the ignorant stranger who counsels him to change his place of abode. It may be thought that the persons mainly interested are likely to know more than the bystanders. In one respect, at least, they are, if they live long enough, certain to know more. They will enjoy the benefit of actual personal experience. Nay, the convulsions of the credit system occur with even greater constancy than do the Vesuvian earthquakes, while the damage which they occasion is felt over an incomparably wider area. So great an advance have the political economists of our time made in the science of commercial convulsion, that they have detected the existence of a cycle or decennial period, at the expiration of which ruin and disaster may be confidently predicted. A maximum of confidence is held invariably to precede, and to foretell, these periods of extreme depression of the barometer of public confidence. And the long stagnation that has succeeded the sudden thunder-hurst of the 11th of May, 1866, is now explained by the statement that the panic of that year was antedated. Panic was due in 1857—it was abnormal in 1866. The two systems of waves, the illegitimate and unwarranted panic which the failure (we will not repeat the adjectives) of the great bill-breaking house caused on its own account, and the duly to be expected alarm and ruin normal to 1867, have intermingled with mutually augmented intensity. And so an unprecedented tardiness of recovery has intervened.

This great adversity, bitterly felt as it has been by many a fireside, or by many a hearth where fire ought to have been cheerily blazing, in this inclement winter, is not altogether without its uses. Its prolongation, which has been its most painful feature, has perhaps, in this respect, been

its most useful characteristic. It has made men serve a long and unwillful apprenticeship to caution. Nothing short of so continued a strain would have compelled the directors of our great railway companies to set their houses thoroughly in order. This one after another has been compelled to do.

Considerations like these, or, at all events, the facts on which they are based, have called the attention of some of our daily contemporaries to what they term the "elasticity" of the national resources. The most familiar instance of this elasticity is the revenue. For a series of years the revenue has improved more rapidly than experience warranted the Chancellor of the Exchequer to expect. Let him make as much allowance as he could justify to the House of Commons for the increasing productiveness of the diminished taxes, there has been always an odd million or so to the good cropping up at the end of the year. This pleasing phenomenon has, for the time, ceased. The revenue, we are told, has lost its elasticity. It is of little use to quarrel with the language in which so discouraging a statement is made; but we think that the term which has been borrowed from the dictionary of the mechanic is not a happy one. It tends to conceal the actual fact, and, quite unconsciously, to "make things pleasant" by such concealment. Elasticity is not a force. It is merely a certain mode of resistance. It cannot, under any circumstances, improve the original condition of the bodies which it characterises. It can only restore disturbed equilibrium, or facilitate the disturbance which causes motion. But the increase of the revenue has been something far more vital. It has been actual growth. The revenue itself has been in this respect only an index and a consequence of the growth of our national wealth,—of the sound active vitality of our prosperity. So far as this index is to be trusted, growth has become slower. No one can dream that it has been stopped by the fact of arrival at maturity. It must, therefore, have been arrested either by disease or by decay. It is our hope and belief that the former is the true cause, and that acute, and not chronic, disturbance of the healthy functions of the body politic is evinced by this arrest of development. But it must not be overlooked how readily the one may pass into the other; nor must it be forgotten how serious are the symptoms which, as we have again and again pointed out, indicate that unless, in some particulars, treatment and regimen are changed, John Bull has trouble before him.

It is dangerous to mistake analogy for argument. That which is, perhaps the most powerful element of the rhetorician is logically of no value. But so long as men use speech, and are not driven by stress of business to think in telegrams, illustration will form a main part of language. It is no less true that both analogy and illustration are often guilty of misleading the mind. When we see part to resemble part, we are apt to conclude that the whole resembles the whole. It is impossible to reflect on the subject without becoming aware that in our impersonation of countries and states, in our representation of masses by individuals, we tend towards a confusion of ideas. We see that to a certain stage the analogy holds; we see that by-and-by it breaks down; we do not trouble ourselves to work out the idea thus arrested to its legitimate conclusion. Thus we may compare the wealth, the confidence, the good fortune of the country to that of the sturdy squire whose lineaments are so familiar to our comic draughtsmen. John Bull sometimes pulls a long face, but we never conceive it possible that he should come to great disaster. Countries never die, we think, and John Bull, if down in his luck to-day, will be himself again to-morrow.

But let us take home to our reflection a remark of one of the most philosophical writers

who has ever used the English tongue, the author of the work called "Ancient Law," "The unit of ancient society," says Mr. Maine, "was the family." The individual was unknown as a distinct element regarded by the lawyer. Let us carry on the observation, and seek analogies for the prosperity or decadence of a nation in the history of a family. We shall now find the parallel to be exact. Then comes home the knowledge of the dilapidation that may be effected by the prodigal son; of the weight on the family property of numerous jointures, charges, and mortgages; of the maintenance, generation after generation, of a corporate existence, while the head of the house is either increasing in wealth, and advancing in social influence and position, or gradually and unwillingly being dragged down by a combination of errors and mischances of his ancestors, his children, and his kinsfolk, from which he is unable, by his best efforts, to extricate himself. Such is the position of an independent state amid the sovereignties of Europe; and with such an illustration before us we can scarcely close our eyes to the importance of the service that the labour of each class renders to the welfare of the whole community, and to the peril and disadvantage that the failure of a single industry, the beggary of a single craft, causes to the entire nation.

This pause in growth is a warning that we shall do well to take to heart while as yet the mainsprings of the national welfare are untouched. We have suffered no material evil since the arrest of our cotton supply,—none at least but such as comes within the ordinary chances of the more or the less advantageous. Our losses and gains have been, for the most part, either upon paper or amongst ourselves. The nominal or selling value of much of our property has been unduly diminished. This makes little difference to the holder unless he seek to sell. Even in that case the nation is only a nominal loser. Our loss in 1856 and 1857 has not been deprivation of what we possessed, it has been simply cessation of production. We have not wasted large sums in war, we have not lost accumulated capital in foreign loans or in ill-advised speculations. We have failed to set the "drugging goblin" of the nineteenth century his annual task. We have not extended the rich frontier of the kingdom of steam. In ordinary trade there has been ordinary activity. We have eaten and drunk, housed and clothed ourselves much as usual. But we have done little for the future; little in the way of making our estate more productive by a present outlay; been content with the magazines, and roads, and ports that we found to our hand, and increased our possessions accordingly, little or none. In our defences, indeed, we have made some progress, though slow, and even in this particular rather theoretically than materially, rather by experiment than by armament. This is a state of things that we cannot safely allow to continue. The active rivalry that obtains in the social community obtains also in the community of nations. It is not by exhausting the resources of the country, in order to maintain a disproportionate force, that a nation secures any real advance. The opposite is the case. In the development of national wealth, in the true and evident sense of the term, lies the secret of national power. In the direction of the energies of the workman to the exercise and to the mastery of his craft, and not to the tinkering of the laws, is to be sought alone the maintenance and the restoration of that pre-eminence which the British craftsman has so long enjoyed that he has forgotten that he must labour to maintain it. The good sense of our working classes is, we rejoice to believe, awakening to this important truth. Very often are their actions such as ought to put to shame many of their self-elected guides and interested friends. They have another step to take in the present year, and we shall never be surprised if they take it before their political guides have finished their debates on its possibility. No one can mix much with the producers of labour without becoming aware of the strong instinctive demand for improved education. If the wisdom of Parliament fail to give us workmen's schools, it may be that the co-operative instinct of the workmen may put their legislators to shame. Of one thing we are sure, and that is, that it is only necessary for the real producers of labour, whether by the sweat of the brow or the wasting of the brain; whether by hammer, axe, tool of iron, or subtle quill, to become fully aware of the great revolution which is now going on in

the field of labour, to know what the working classes of Germany, of Belgium, even of France, are actually doing in this respect, in order to come to the front in the bloodless battle, and to show that the men among whom the steam-engine and electric telegraph were born are not about to allow themselves to be distanced by those who owe their great mechanical and social progress to English origination.

PROFESSOR G. G. SCOTT ON EARLY ARCHITECTURE IN BRITAIN.*

THE subject of the architecture of Pre-Norman England,—that is to say, of England (exclusive of Wales and the counties occupied by the Britons), between the arrival of Augustine in 536, and that of William of Normandy in 1066,—a period exceeding by ten years the interval between the reigns of Edward III. and Queen Victoria,—has been held by some to be involved in such utter obscurity as to leave it uncertain whether any such architecture existed, or, at least, whether we have any means of ascertaining what it was; and yet no period of history is, perhaps, more replete with accounts of the foundation of cathedrals, monasteries, and churches. The cause of this is clear. The churches of this period were, no doubt, frequently of timber; but, of whatever material, were subjected,—first to the destructive effects of the repeated devastations of the Danes, and subsequently to the greater architectural ambition of the Normans which led to a perfect mania for reconstruction. The consequence is, that we have no cathedral or great abbey or church remaining of this period, and have to content ourselves with such evidences of their style as may be gleaned from among ordinary parish churches for the most part in rural districts, and consequently of a humble class.

The historical notices of the erection of churches during the Anglo-Saxon period are more frequent than descriptive.

On the arrival of Augustine, he found the Church of St. Martin, Canterbury, already used by the Christian King Bertha. This was, no doubt, a Romano-British structure. He found also a second, but in ruins; and this he made the nucleus of his metropolitan cathedral. He constructed also a third, afterwards called by his own name. We know, too, that in his day were also founded the cathedrals of Rochester and London; and there is no reason to doubt that all of these were of stone. I am not aware that we hear anything more, in Anglo-Saxon days, of St. Martin's, or that we have any description of the Norman Conquest in the writings of one Eadmer, a singer at the cathedral, who wrote early in the twelfth century. Recapitulating the account of its having been erected by St. Augustine on the site of a Roman church, he proceeds to say that in the days of Archbishop Odo, in the tenth century, the roof had become so decayed as to require renewal; that Odo took the opportunity of increasing the height of the walls, and that the work occupied three years. He also tells us that a church dedicated to St. John the Baptist had been added by Archbishop Cuthbert in the eighth century near the east end of the church for baptisms, &c. He says that the church escaped the destruction threatened by the army of King Sweyn in 1011; but was subsequently burnt down by accident, and remained in ruins until rebuilt by Lanfranc.

He, further, gives a very clear description of the church, from which it appears that it was built in some degree on the model of the Basilica of St. Peter at Rome. He minutely describes the eastern altar space as greatly raised above the general level of the church, and having beneath it a crypt or confessional, made in the likeness of that of St. Peter at Rome. He further describes an oratory and altar of St. Mary at the western end raised on steps, behind which was the pontifical throne. Also two towers, the one on the north end the other on the south side of the nave, projecting beyond the aisles, and containing chapels.

Professor Willis, in his admirable history of the cathedral, gives an able dissertation on its plan at this period, showing how precisely the description of the eastern arrangements agree with those of the Basilica of St. Peter, but that

the Chapel of the Virgin at the west end must have been a western apse, like those so common in Germany, and of which we have an earlier instance in the ancient design for the arrangement of the monastery of St. Gall, supposed to be of the eighth century. Eadmer confirms his account by saying that he can answer for its correctness, for he saw the ruins himself when a boy at school.

From the above description we learn, first, that a Roman model was taken; secondly, that the church was of stone or brick; thirdly, that it had aisles; fourthly, that it had both an eastern and western apse; beneath the former of which was an extensive crypt, called a confessional, as containing the tombs of confessors.

The additional church of St. John was clearly a baptistery; and Professor Willis thinks that Archbishop Odo's addition to the height of the walls was a choir-story. I am not aware that we have any information as to the cathedrals built by the companions of Augustine (Mellitus and Justus) at London and Rochester; but it is unlikely that they would be otherwise than of cognate plan and materials; while, curiously enough, there continues to this day at Rochester, and continued to the seventeenth century in our own St. Paul's, equally as at Canterbury, a crypt beneath the elevated sanctuary, no doubt the lineal successor and representative of those erected by these missionary bishops, in imitation of the great basilica at Rome, whence they had been sent to evangelize this distant region.

A few years later, Paulinus, another Roman missionary, succeeded, under circumstances very similar, in converting to Christianity Edwin, king of Northumbria, who, while receiving instructions preparatory to his baptism, built a temporary church of timber at York; but subsequently erected around the same, and under the instructions of Paulinus, a larger and nobler church of stone, which was completed by Oswald, his successor. Here, again, we have still remaining the choir-crypt,—the probable successor of that of the original church, and as some say, containing a relic of its actual structure. Thus, we have the two metropolitan cathedrals distinctly recorded as erected of stone by their first bishops.

Bede also relates that Paulinus built a stone church, of beautiful workmanship, at Lincoln, the walls of which remained at the time he wrote, though, by some mischance, it had lost its roof. It is clear, however, that some of Paulinus's churches were of timber, and, later on, we find St. Aidan and St. Finan,—missionaries from Iona,—erecting a cathedral of that material in the Island of Lindisfarne "*mona Sodororum*."

Shortly afterwards, however, a church was built, after the monastic rule of Lindisfarne, but of stone, at Lasingham, in Yorkshire; where, again, we find the choir crypt,—the successor of the original one,—remaining to this day. Still in the seventh century, we have a more minute account given us by Bede of the works of Benedict Biscop, in the erection of the monastic church of Monk Wearmouth. This church he built of stone, "according to the manner of the Romans, which he had always loved." He built also, the church at Jarrow of the same material and the existing remains of both I shall have presently to describe. So much did he consider himself a follower of the Roman manner, that he went, over and over again, to Rome, to procure ornaments wherewith to decorate his two churches. This was about 670 and 680.

The successor of Benedict Biscop is said to have sent architects to Naulan, king of the Picts, to make him a church of stone after the manner of the Romans.

About the same time we find St. Wilfrid the roughly repairing, glazing, and "washing white than snow," Paulinus's Church, at York, an building two of great splendour (according to the ideas of the times), at Hexham and Ripon.

The former is described by a contemporary writer in extatic language, as "supported by various pillars and porticoes, adorned with marvellous length and height of walls, and with passages of various turnings; nor was it ever," he adds, "heard that such another church was erected on this side the Alps. He tells us, also, of its ornaments of gold and silver and precious stones," and of its altar, clothed with purple and silk hangings. This church remained, though in a damaged state, till the twelfth century, when the Norman prior describes it in very similar words to those used by the Saxon historian. He speaks of the crypts at

* See p. 70, ante.

terracean oratories, the walls of great height, divided into three distinct stories supported by polished columns, some square, and others various forms," of the "capitals of the columns . . . And "the arch of sanctuary," "decorated with histories and images and great figures carved in relief in stone and metal, displaying a pleasing variety and wonderful beauty." The body of the church was surrounded by aisles and porticoes, which with wonderful art were divided above and below by "sloping and winding stairs:" above he describes "galleries of stone," by which "a vast multitude of persons might be there, and pass round the church without being visible to any one in the nave below."

Of the church at Ripon, the contemporary historian says that "he [St. Wilfrid] erected and finished at Ripon a basilica of polished stone in its foundations in the earth to the top, supported on high by various columns and porticoes." This church was founded by Odo, archbishop of Canterbury, in the tenth century, "reduced by the same and hostile incursions to a deserted and desolate solitude."

All the buildings of the erection of which we have briefly enumerated the records, were erected within a century of the arrival of St. Augustine. Within the same century (about 660) we have reason to believe was erected the church at Brixworth, in Northamptonshire, which still remains in a fragmentary state, but which shall presently show, with sufficient proofs, to have been founded on the plan of a nave basilica, with an aisled nave and an undivided choir, an apsidal and aisled sanctuary and high on a vaulted crypt. This church is but a humble dependency of the great cathedral of Peterborough.

We would not have fatigued you with these elementary accounts, had I not felt it desirable to prove the importance of these earliest temples of our English Church. Cathedrals, churches, and monasteries were, in fact, built throughout the length and breadth of now Christianized England. The more important buildings were of stone; many of the humbler of timber.

At times of trouble were at hand: "there is time to break down" as well as "a time to build up;" and what the Christian English had, the Pagan Northmen too often overthrew. In Alfred's time (though in the reign of his successor), we find Croyland, Peterborough, and other monasteries ruthlessly destroyed, in some cases they lay desolate for very long periods of time, though in others they were speedily restored.

As a later period, a new impulse was given to building by the introduction of the Benedictine monks, and we find monasteries either founded or reformed on this rule throughout the kingdom. Two descriptions of such Benedictine churches I quote, the first being from the history of Ely Abbey, in the time of Dunstan.

The architect's name is for a wonder mentioned in this case: it was Adnoth, and he, as it would seem, from Worcester. The architect is said to have had "two towers rising from the roof. The smaller of these towards the west, in front of the Basilica, presented a fine arcade from a distance to those entering the choir, standing upon four columns connected by arches stretching from aisle to aisle." This brief description seems to indicate a church with aisles, transepts, central tower, and a western tower. It may be, however, that the word "aisle" signifies not an aisle, but merely a sept.

For the other church I will refer to under this title is the Cathedral of Winchester, as rebuilt in the reign of Edgar. It had been founded in the days of St. Birinus, the first missionary to the West Saxons, about 635. Athelwold, made bishop of Winchester in 963, was a great restorer of churches, which had been devastated by the Danes. Among those restored by him were especially named those of Ely and Peterborough. He renovated and partly rebuilt the cathedral at Winchester, which was renovated in 980. It is described by Wolstan, in a poem addressed to the succeeding Bishop St. Elphege. He speaks of the "lofty walls and arches, and various aisles; the many windows which so distract the attention, that a stranger is at a loss which way to turn, seeing it open to him on all sides." He mentions also "the fine roofs of intricate structure, and the brilliant variety of the fabric." St. Elphege is said to have added a new apse, with "secret

crypts, where secret recesses lay on every side, the structure of which supported the holy altar, and the venerable relics of the saints." "A sparkling tower," also "that reflects from heaven the first rays of the sun." "It has five compartments pierced by open windows, and on all four sides as many ways are open. The lofty peaks of the tower are capped with pointed roofs, and arc adorned with various and sinuous vaults, curved with well-skilled contrivance. Above these stands a rod with golden balls, and at the top a mighty golden cock, which boldly turns its face to every wind that blows."

Again, however, came the ruthless Northman, and destroyed church after church throughout the entire course of his desolating march.

No former incursion probably had been so fatal to architecture as that of Sweyn. Its very success, however, brought its own cure; for his son Canute, being allowed to succeed to the English throne, not only became Christian, but devoted himself with exemplary piety to repairing the devastations which the sacrifice of his father and himself had perpetrated. He not only repented, but brought forth works meet for repentance; so that the last half-century of the history of the pre-Norman England, is replete with accounts of the restoration and building of churches.

The foregoing notices are sufficient to show that throughout the continuance of the Pre-Norman English Church buildings were constantly being erected of considerable dimensions and sometimes of great intricacy, and even of some degree of splendour of design; and that the more important of these were uniformly of stone, though the humbler ones were often of timber. It further shows that the architectural style of these buildings, as well as the internal arrangement of the churches, was intended to be an imitation of the Roman buildings of the same period.

We will now proceed to inquire into the existence and character of any remains of buildings of this period.

Of the more important structures, I may say at once that nothing remains; the ambitious character of the Norman builders having led them to reconstruct on a larger scale all the cathedrals and great monastic churches, excepting, indeed, that one which they found in course of re-erection at Westminster, and which was designed in their own style.

There exist, however, throughout the length and breadth of the land, remnants, and, in a few instances, large portions, of buildings of a wholly exceptional character; not assignable to the Norman or any other of the well-known styles which have prevailed in England, but evidently of earlier date. They are clearly not early Norman; for, with the single exception of the round arch, they have nothing in common with the specimens of that style erected in the reign of the Conqueror, but are clearly of a style quite distinct from them. In one instance, we have a tower known to have been erected in the days of the Conqueror in juxtaposition with the remains of a church in this more ancient style; and in many other instances we have Norman features in connexion with these mysterious remains, and to every eye asserting the entire diversity of their art. In some instances, again, as at Monk Wearmouth, Jarrow, Brixworth, and Deerhurst, the remains of this style are on the sites where churches are recorded to have been built in Anglo-Saxon days. These remains correspond in character with buildings represented in Saxon illuminated books. They evince in many instances evidence of having been built in rude imitation of the Roman works of these periods, though in some instances they seem also to suggest the imitation of timber construction.

The most obvious rules of induction, then, point to the conclusion that these are the remains of buildings of Anglo-Saxon date. The leading characteristics of these remains (though not all of them to be found in every instance, and probably varying with the date) are as follow. The frequent decoration of the external walls with pilaster strips, as is so common in Early Italian churches, and afterwards in Germany; the bonding of these by alternate vertical and horizontal stones; the imitation of this mode of bonding in quoins where no such strips are used, and in the jambs of doorways and other openings, excepting where Roman brick is made use of, which is of frequent occurrence; the jambs of doorways running square through the thickness of the wall, without recessed orders, and the door itself hung against the inner face of the wall; the frequent use of a

kind of pilaster on either side both of doorways and arcways, the impost moulding sometimes breaking round, and sometimes stopping against them, and a continuation of the pilaster going round the arch; the occasional use of triangular heads to doors and windows; the use of what are called baluster columns, or short pillars, turned in a lathe, not unlike Elizabethan balusters, bulging in the middle and ornamented with a number of mouldings of trifling relief, such as turners of all ages delight in (these are used for the division of windows, and other purposes); the windows, which are usually set high in the wall, are often equally splayed within and without, and the arches sometimes more splayed than the jambs, and slanting upwards like a bonnet; a very abnormal kind of mouldings, unlike those of any other style, and generally a very strange archaic look in the whole of the work, which makes one conscious of being in the presence of the works of men in a very pristine state of civilization, the style having little or no relationship to those Mediaeval buildings with which we are familiar.

I ought, also, to mention the frequent use of tall, narrow towers, unbroken, or nearly so, in their vertical outline, either simply quoined with the long and short work already mentioned, or with their surfaces diversified by pilaster strips and string-course, the intervening surfaces being usually built of rubble and plastered. The halfy-windows are often of two lights, separated by a baluster or other form of pillar set in the middle of the wall, and bearing a transverse bracket of stone, to enable it to support the whole thickness of the wall. Such towers are clearly imitations of the Italian campanile, though in a rude form. They occasionally have oblique strips as well as the vertical pilasters and horizontal strings, which suggest the idea of an imitation of timber-work; at other times the pilasters are united by arches.

It is not easy to describe the general plans of churches, as the remains we possess are too scanty to be generalized upon. Some had aisles, some transepts without aisles, many had neither. One, at least, has a central tower without transepts; and at least one a central tower with transepts. Some had apsidal chancels, and some had the square end. The towers, in a great majority of instances, are at the west end. The walls are in some cases by no means low, and the naves occasionally of greater width than is usual in village churches of later periods.

What forms were made use of for the pillar we are but imperfectly aware. One of the notices I have quoted speaks of their being square and of other forms. The few which remain *in situ* are of the former kind, mere fragments of wall; but at Worth Church there are, in the jambs of the chancel arch, half pillars, 2½ ft. in diameter, with very perfect capitals; and certainly an entire pillar of this form must have suggested the demi-column. At Canterbury there are two round columns brought from Reculver, which are clearly of Anglo-Saxon date. Their capitals are of the most remarkable form.

I will make special mention of a few Pre-Norman churches and fragments of churches as specimens; but to do more in a lecture such as this would be both tedious and unprofitable; for, however interesting the study of the primeval architecture of our race, it must be confessed that, while in general plan these churches are the progenitors of those we think worthy of imitation, we cannot venture to say so much of their details.

I exhibit a plan and a general view of Brixworth Church, enlarged from drawings kindly lent me by Mr. Roberts, who has given the church the most careful study. We have documentary evidence of the erection of the church by the abbots of Peterborough, about 680. Being near the ruins of a Roman station, it contains much Roman brick.

The chancel, or rather the sanctuary, was apsidal, with a surrounding aisle, and raised high on a crypt of corresponding plan. This sanctuary and aisle open by three arches into a choir of 30 ft. square, and this, I think, by a single arch, into a nave about 30 ft. by 60 ft.

This nave had arcades opening into either aisles or, as Mr. Roberts thinks, into chancels or oratories, the foundation of which he has found. The arches are turned in Roman bricks, very strangely used; a steep skewback being formed for their springings to reduce the angle of convergence, and so moderate the thickness of the mortar-joint, which, in arches of such a depth, would have been inconvenient. The nave and choir have had a clearstory, the windows of

which have arches of Roman bricks. This is thought by some to be a later addition, from the reduced thickness of the walls; but of this I feel far from certain. Mr. Roberts suggests it as possible that the wide nave was again subdivided by arcades; but I confess I much doubt this.

To this original church a western tower was subsequently added, in which the Roman brick does not take so prominent a place; and later still, though still in Anglo-Saxon days, a very large round stair-turret was added, west of the tower.

The alterations introduced when the tower was added are clearly visible, especially the introduction of a triple window with haluster pillars, looking from the second story of the tower into the church.

I exhibit also a plan and other drawings of the till lately ruined church on the Castle-hill at Dover. Here, again, Roman bricks have been largely used, both for quoins and arches, and some other parts. The church is cruciform, with a central tower, the transepts being narrower and lower than the nave. Wide and lofty arches open into the tower on the east and west, but those on the sides were, no doubt, low and narrow, and consequently were replaced by larger ones late in the twelfth century. The chancel is square-ended. The windows are of a very large size, and about equally played without and within, and had wood frames for the glass, the grooves for which were quite distinct. The main doorway seems to have been that on the south side. It has stone jambs of long and short work running square through the wall, the door having been hung against the inner surface. The arch is of brick, and a pilaster strip flanked it on either side and ran round the arch. Similar, on a small scale, was a ruined doorway, found in the north transept, and now restored precisely to its original form. Similar, also, are the windows of the tower, which were treated like doorways, with a shutter within. At the west end stands the ancient Roman pharos, from which was a communication to the church, both on the floor-level and also above. The latter had a doorway in a very perfect state, which opened into a western gallery, of which I found the holes for the insertion of the timbers. Beneath this gallery, on either side, was a small window, which, for want of room for an arch, was made square-headed, with splayed wooden lintels, of which the exact impressions of the ends were found, giving its precise form.

The tower arches have the pilaster strips on either side, each of its western face, and continuing round the arch. Each has a stone impost with very abnormal mouldings. Several very ornate balusters of Caen stone were found among the ruins. They appear from their freshness to have been always *interna*, and I fancy formed parts of a screen under the western arch of the tower, of which some foundations apparently remain. Externally, the quoins are partly of Roman brick and partly of long and short work, with very large stones. This is, perhaps, the most nearly complete of all our Pre-Norman churches. There is no clue to its date. Some call it a British church: some say that it was built by Eadwald, the son of Ethelred, about 640, and others that it is of a much later period, to which opinion I confess that I incline.

Another nearly complete church is that at Worth, in Sussex. The plan may be said to be that of the Dover Church, omitting the central tower and adding an apse. The transepts, like those at Dover, are small, and their arches low and narrow, while the chancel arch assumes almost majestic proportions. The transept arches (now much mutilated) had the pilaster strip, both to jambs and arch, with a double square impost of massive proportions. The chancel arch is more artistic in its treatment, having a large demi-column in either jamb, 2 ft. 6 in. in diameter, with a regularly formed, though plain, capital; while, instead of the pilaster, a smaller semi-column is placed against the face of the wall on either side, and indirectly carried round the arch in the form of a square projection. The arch itself is square in section, and runs without break, through the thickness of the wall. No doorway nor window of the original date remains. The walls of the nave are about 25 ft. high, and are divided at mid-height by a large string-course, above which the windows were probably placed. The angles have pilaster strips in long and short work, and similar strips are placed at intervals along the walls reaching up to the mid-height

string-course, all of them standing on a continuous base of two massive courses of stone. The half height string-course of the nave is continued round the transepts, as are caves course, and run across their gable ends. The chancel was externally dealt with much as the nave, though a little less in height. This church had no tower, and, as a curious commentary on the fashionable opinion that the Anglo-Saxons nearly always built of timber and their successors in after-times of stone, we find a timber tower of the fifteenth century added to the stone church of Saxon date!

At Bradford, in Wilts, a very complete church has but recently been discovered; having previously been so surrounded by buildings that its character was unnoticed. I give drawings of it, made by my friend Mr. Irvine, a zealous antiquary, who has also sent to the Academy a cast of some uncouth sculpture found there. The church consists of a nave and chancel, and has every characteristic of Anglo-Saxon work strongly developed.

At Jarrow-on-the-Tyne, the chancel of the Saxon church remains. It has few characteristic features. The windows are of a very pristine form, in this case with no external splay, the jambs of upright stones with horizontal stones for imposts, and arches cut out of single stones. They have been walled up at a very early date to a certain thickness from the exterior with very small perforations,—some circular and some more elongated,—in the filling up wall. This, I fancy, was done as a means of defence. There is one doorway, which is a plain arched opening running square through the wall, the door having been hung as usual against its inner face, and the jambs formed of large stones facing the reveal. There are some signs of an apse having existed, but of this I cannot speak with any certainty. A tower was erected between the nave and the chancel—as I am informed by a local antiquary—in the reign of the Conqueror. The nave has long since perished, but in the walls of a modern erection on its site were found, used as building material, about twenty haluster columns, some 2 ft. 3 in. high and a foot in diameter, of which I exhibit some drawings. This was in all probability the very church erected by Benedict Biscop, and in which the venerable Bede worshipped.

At Monk Wearmouth are the remains of the other church of Benedict Biscop.

This church was burnt, as also was that at Jarrow, by the Danes in 867, and both remained in ruins till about 1074, when (or a few years later) both churches were re-roofed and raised to their sacred use. It was at this time that the tower at Jarrow was erected.

The most interesting portion of the church at Wearmouth is its western end. From this projects a tower evidently of Anglo-Saxon date. This tower has arches on three sides of its lower story, which, till recently, were not only walled up, but almost buried in the accumulated earth.

In September, 1866, they were excavated, and the western entrance opened out by the local Archaeological Society, with the help of Mr. Johnson, architect, of Newcastle. The side doorways were found to have monolith jambs, 6 in. wide on the face, which are notched into a continuous cill, and support massive imposts, from which the arch springs, with very bold vousoirs. The western entrance, which is 6 ft. 4½ in. to the springing and 4 ft. 6½ in. wide, has an arch springing from massive abut 10½ in. thick, which are supported by haluster-shafts very similar to those found at Jarrow, two of which occupy the width of the wall on either side, and stand upon jambs each of a long and a short stone, the reveal of which is curiously sculptured with entwined serpents. This is decidedly the most remarkable doorway of this kind yet known. Above the doorway runs a hand or string sculptured with animals and edged with the cable mould. At the same time, the two lower stories of the tower were found to have originally formed a gabled porch,—two windows, of construction very similar to the side arches above described, having been stopped up in the end of the church by the conversion of this porch into a tower. Baluster-shafts have been discovered in the internal jambs of these windows.

At Jarrow, amongst many curious fragments discovered, is a stone in which is sculptured, as a continuous ornament, a long row of the balusters represented on a miniature scale as if they were established as arcades and windows are in Gothic architecture as a mere ornament.

The church at Stow, in Lincolnshire, con-

tained extensive remains of Anglo-Saxon work, but of doubtful date. The church was founded about the time of Paulinus, as a cathedral for the Bishops of Lindsey, but was burnt by the Danes, as it is believed, in 870. It was refounded about 1040. The tower arches and transepts are in one style, but of which date is doubtful. I confess I think the preponderance of evidence is in favour of the earlier date. Foundations have been discovered of aisles to the nave, clearly of the same age with the transepts. The older parts show everywhere marks of fire, and the transepts have been heightened in Saxon times; and, as I should think probable, at the time of the second foundation. The present nave and chancel are Norman. I have been enabled by the kindness of my friend, Mr. Pearson, to exhibit drawings and photographs of this venerable church, once the mother church of Lincolnshire.

There exist several crypts beneath chancels, which are of this date. Among these, besides the fragmentary remains at Brixworth, I will mention one not generally known, at Wing, in Buckinghamshire. It is of excessive rudeness, being built only of very rough stone; but it is notable for the completeness of its plan, being apsidal, with two ranges of piers, and as having remains of the two doorways through which it was approached by steps from either side of the chancel arch.

The apse in this case is polygonal, with pilaster strips up its angles, and parts of the nave are of pure Norman date, and show clear evidence of its having had aisles.

The crypt at Repton is famous for the finished and decorative form of its architecture. I give a drawing of it.

The crypt at Linsteadham is not of Saxon date, but its Norman successor. The original church was destroyed by the Danes. Its foundation I have already noticed.

The most numerous of the Anglo-Saxon remains are the bell-towers. These have almost always the peculiar characteristics which I have already noticed. Their number is so great that it would be impossible to enter into any enumeration of them. One of the best known, perhaps, is that of St. Benet's, Cambridge. It has pilaster strips up each angle, with long and short work. The string-courses are merely square courses: each story recedes a little in width. The lofty windows are double, divided by a mid-wall haluster, and bracketed, and there are plain windows again over their spandrels. The intermediate surfaces were plastered. The tower arch is of strangely rude design. The tower of Trinity Church, Colchester, is peculiar, as being, to a great extent, of Roman brick.

Earls Barton tower is the most remarkable of its class, uniting the profuse use of pilaster strips, diagonal strips, arched strips, long and short work, haluster columns, and other characteristics of the style. I have noticed here that the majority of the arches are so in form rather than in construction, some being cut out of the solid, some built up with horizontal courses projecting one over the other, and others, again, formed by a number of flat stones set on edge one behind another, and the arched opening cut through them all.

Baruch Tower is something like it, though with less variety,—a more Cyclopean look. I give some excellent drawings of it by my friend Mr. Graham Jackson.

The tower at Barton-upon-Humber bears considerable resemblance to that of the Earls Barton, though with less profusion of the usual characteristics and less rudeness of construction. This tower is rendered remarkable by having attached to it a very large and lofty western porch, apparently of about the same date.

Among the most remarkable towers, however, is that at Sompting, in Sussex. Its most striking characteristic is, that its sides are each gabled, and it is roofed like the typical steeples on the Rhine. I am told that an instance of this also existed at Flixton, in Suffolk. The details at Sompting are somewhat elaborate.

The tower of Clapham Church, in Bedfordshire, is chiefly remarkable for its great simplicity and plainness. The chancel arch, of great simplicity, here remains, as did one window of the chancel (a small honest-arched opening like some in the tower itself) till destroyed recently by a stupid builder.

One more building, I must notice. It has often been mentioned that our Anglo-Saxon forefathers built largely of timber; and, strictly to say, after the lapse of more than eight centu-

ries, we have one of their timber structures remaining!

Edmund, king of East Anglia, who had been slain by the Danes in the ninth century, had been canonized; and on the invasion by Sweyn, more than a century later in 1011, his relics were removed from Bryr St. Edmund's to London for security. On their being carried back in 1013, an old register of Bryr informs us, "he was also sheltered near Angre, where a wooden chapel remains as a memorial unto this day."

This chapel still exists at Greensted, near Ongar. It consists of cleft oak-trees grooved and tongued together by their edges, and let into grooves in horizontal sills and heads. The exterior of the trees was exposed on the outside of the chancel, the sapwood of which having long since perished, the furrowed and gnarled heart is now seen, presenting a most ancient and interesting appearance. It is more than thirty years since I visited this most venerable relic. Since then it has been repaired; but I trust that its antiquity has not been compromised, and that it will long remain as a relic of the royal saint, and a visible exponent of the old Anglo-Saxon verb *getymbrtan*—to build.

I must not, however, go on enumerating specimens: they will be found in great numbers in several publications, as Mr. Bloxam's "Principles of Gothic Architecture," Mr. Parker's "Glossary," Britton's "Antiquities," and elsewhere; while very interesting articles have been written on them by Mr. Freeman, Mr. Ayliffe Poole, Mr. Paley, and others. In my own practice I every now and then fall in with minor specimens not mentioned in books, and often walled up and hidden from view, to make way for later work.

Fragments of Saxon crosses are frequent. They are usually covered with that platted ornament so frequent in the illuminations of the period.

In proof of their early age, we often find them imbedded, as mere material, in Norman walls. In St. Peter's, at Northampton, I found the base of one of the Norman columns to be wrought out of a piece of one of these crosses; and at Jarrow there are several portions of them built into the tower, which was itself erected in the reign of the Conqueror.

Though this form of architecture sprang over a period of some 470 years, we have little or no means of classifying it into distinct divisions of date. It would seem that the system of rapid change which characterizes the centuries succeeding the tenth had not then commenced, and that much the same manner of building pervades long spaces of time.

On a conjectural view of the case, one would look, perhaps, for the following divisions:—

1st. From the arrival of Augustine to the earlier devastations of the Danes.

2nd. From the time of Alfred to that of Dunstan.

3rd. The period of the general establishment of Benedictine rule up to that of the devastations of the Northmen under Sweyn.

4th. That from the accession of Canute to the Norman conqueror.

Mr. Freeman divides the style into three:—
1st. The direct but rude imitations of Roman work, of which Brixworth is an instance.

2nd. The developed Saxon manner, with its high towers, its pilastered stripes, and suggestion of imitated timber-work, as at Earls Barton, &c.
3rd. That in which Norman features are introduced or anticipated.

I may mention, however, that we have proofs, as at Deerhurst, which is said to have been rebuilt in 1056, and elsewhere, that the style remained with little modification to the last.

I shall show you in my next lecture (in which I propose to treat of the earlier Norman buildings, erected by those who actually came over in the days of the Conqueror or of his companions) that the two styles overlapped; that there were pre-conquestal Norman and post-conquestal Saxon buildings. I will, however, at present detain you no longer; and if I have trespassed upon the rules of the Academy by giving a lecture more on *archæology* than on *art*, I must apologize on the ground that I have treated of our own early efforts at architecture; of buildings whose bold and archaic rudeness was so strangely accompanied by exquisite skill in other arts,—as in illumination, in embroidery, in jewelry; and the contemplation of which, to use the eloquent words of Mr. Freeman, "Should raise a thrill of patriotism in the heart of every genuine Englishman," "whose barbaric grandeur breathes in its fulness the spirit of England's ancient days of freedom and isolation," and reminds us "of the long roll of our native saints and heroes; of holy bishops and no less holy princes; of Ina, and Alfred, and Athelstan; of Bede and the martyred Alphega; of Harold and Gurth, and Leofwine; of St. Wolstan and Abbot Frederick; of the battle-axe of Hereward and the martyr-block of Waltham; and all the glorious train of the 'England of saints' are yet she bowled beneath the yoke of a foreign lord."

THE DRAINAGE OF LAND.*

Soils that require Drainage.

MR. STEPHENS, in speaking of this subject, gives it as his opinion, arrived at by dint of long and extensive observation of the state of the agricultural soil over a large portion of the country, "That not one farm is to be found throughout the kingdom that would not be much the better for drainage."† Fully sharing in this opinion, it may be said that lands absolutely requiring drainage are, all peat mosses, clays and tenacious soils, and others of a more porous character holding water, such as silts, sands, gravel, and chalk, and all soils in which springs exist; in fact, all lands of every description whereon the produce cannot be consumed at any season without detriment to the stock feeding thereon or without injury to present or subsequent produce. Drainage is very advantageous to grass land in improving the quality of the herbage and the healthiness of the stock. It is true that in many cases the result appears to be at first unfavorable. This cannot be better explained than by quoting from the prize essay on the management of grass land by Mr. Robert Smith, who observes: "The remark, that land has been overdrained, is familiar in many districts; hence it is inferred that the pastures have been spoiled. Now this inference is inapplicable to the draining: the soil being changed for the better, the food of the aquatic grasses having been removed they become dry and inactive: it is true the existing grasses become more like stubble than grass, but having so far changed the soil, it is equally necessary to change the herbage by other agents, such as suitable top-dressings to sweeten and increase the herbage, that the truly important branch of close-feeding may be effected. The pasture then becomes gradually improved, and Nature supplies her indigenous grasses, suitable to the then improved character of the soil, as the aquatic or other spurious grasses, in the absence of their food, decline."‡

On the same subject another authority says,— "Jow, wet, clay soils may be converted into good pastures by draining them well; and the improvement thus produced is so great, that judicious draining in such soils is the most profitable investment of capital.§

Let it not be supposed that the indiscriminate drainage of all pastures and meadows is here recommended. There is an old saying,— "Let well alone;" and when a field is superior to any in the neighbourhood, is yielding large supplies of food, and the stock are healthy, it would be folly to experimentalise upon it. Judgment and discretion in the application of drainage are as necessary as in every other alteration and improvement.

Time of Year to Drain.

The time chosen for putting in drain-pipes must be regulated by the cropping and other circumstances; but it may be stated, that the drier the weather the better for the drainage. In clay soils, the drying action of the air and wind on the trenches allows the soil to contract and form the crevices necessary for the rains to escape to the drains. Experienced drainers recommend the month of February for the work, and that the pipes, receiving a light covering of soil, should be left open through March, if it be a drying weather, by which means the cracking of the soil is much accelerated, and the complete action of the drains advanced a full season.

In laying drains in a silty soil, the worst time to choose is when the ground is full of water; the feet of the men working in the grips cause the silt to purge, so that it is impossible to get a good and even bed to lay the pipes on; and

even when laid they are extremely liable to choke, by the loose silt in the trenches being washed in by the water which pours out of the ground. If the pipes are laid when the silt is dry, or only slightly wet, the bottom of the trenches may then be taken out hard and firm, and the ground, owing to the effect of the drainage, will never again become so charged with water as to make them liable to be stopped up; and even should the ground, from any exceptional cause, be drowned, after the soil in the trenches had once become settled and consolidated, there would be no danger of the water washing it into the pipes, as it would find its way to them through the regular crevices or canals. A few years since the author had occasion to lay some large drain-pipes at a depth of 5 ft., under a road, for carrying away sewage, the soil being silt, and at the time very full of water. In fact, the "soil" was within a few inches of the surface, and it was only with the greatest difficulty the pipes could be laid, the water pouring in out of the sides of the ground, causing the bottom of the trench to purge and be all alive. The pipes were ordinary stoneware socket pipes, and the joints were made good in the sockets with well-puddled clay. In the course of a very short time the ground on either side for a very considerable distance became dry; in fact, a large pool of stagnant water more than 50 yards away dried up, and has remained so ever since; but from time to time the surface of the road kept settling in places, and this went on to so great an extent that it became necessary at last to open out the trench and examine into the cause: when it was found that the pressure of the water, soaking out of the sodden silt, had forced an opening through the puddled joints into the pipes. In many places the silt had eaten away all the clay, leaving the joints bare, and the pipes were found to be nearly full of silt, and had to be taken up and relaid. Such an instance has never happened in the author's practice when at the time of laying the pipes the silt has been free from water.

Whether, then, for a tenacious or a porous soil, it is better, where possible, to choose a dry time in preference to a wet one. The only advantage of wet being to make the digging better and to give the workmen a guide to level by, which may be accomplished by other means to be explained hereafter.

Depth.

Perhaps on no question relating to drainage has there been a greater diversity of opinion than as to the depth at which drains should be laid below the surface. The two great drainage engineers, Mr. Smith and Mr. Parkes, who may be considered the founders of the modern system, entertaining very different views. Mr. Parkes advocated drains 4 ft. and 5 ft. deep, and from 10 to 13 yards apart on stiff clay, and 14 to 19 yards on mixed soils. Mr. Smith's opinion was, and he carried it out most successfully in his practice, that distances of 6 to 8 yards, with depths of from 2 ft. to 3 ft., have been found, over extensive tracts, and in soils of various texture, to effect complete thorough drainage for agricultural purposes; and that he had invariably found from experience that when distances beyond 8 or 10 yards had been adopted in compact soils, there had not been a perfectly uniform dry condition of the soil, especially when rain had recently fallen. Another great authority, Mr. Spooner, considered,— "That in the generality of soils drains are not safe at a depth of much less than 3 ft., and that they may to greater advantage be laid at a depth varying from that to 4 ft.; but he had not seen evidence to prove that a greater depth than this is attended with such advantage as to sanction the increased incidental expenditure." Mr. Stephens, in endeavouring to determine the proper depth, remarks that a drain is not a mere ditch for conveying away water; were it only this, its size would be easily determined by calculation or experiment, of the quantity of water it would discharge in a given time. But the principal function of a drain is to draw water towards it from every direction; and its secondary purpose is to convey it away when collected. The depth of a drain, he further remarks, must to a certain extent be regulated by the culture of the ground; that for ordinary ploughing and cross furrowing it may safely be assumed that a greater depth than 10 in. is never reached, but in an soil and trench ploughing the ground will be disturbed to a depth of 16 in. or 18 in.; that the drawing portion of the drain ought to lie below this, and

* See pp. 40 and 51, ante.
† "Book of the Farm," vol. 1.
‡ Journal of Royal Agricultural Society," vol. ix.
§ Rham's "Dictionary of the Farm."

in a tenacious soil 1 ft. is sufficient to allow for it, so that in such a soil a depth of 2 ft. 6 in. is the minimum, and when the subsoil draws slowly the depth should not be less than 3 ft.

Having quoted the opinions both of engineers and agriculturists of the greatest experience, the various points to be noticed in determining the depths will now be considered, which, after all, must be regulated by the special circumstances of each case, rather than by any fixed rule.

The object to be kept in view in determining the depth of any drain, as already stated, is that it may be placed so deep that, while it rapidly draws and conveys away the surplus of the rainfall, it shall also be so situated as most effectively to promote a circulation of air, and allow the moisture to be drawn up from the subsoil below the drains to the roots of the plants in dry weather. Where no special circumstances arise to prevent it this object seems to be most effectively attained where there is a covering of 3 ft. on the top of the drain pipes; and this may be taken as a safe depth to lay drains, whether in tenacious clays or silts and more porous soils; and 8 yards or 9 yards in the former class of soils and from 10 yards to 15 yards in the latter, is as great a distance as the drains can drain the water from the soil with uniformity and regularity.

A depth of less than 2 ft. 6 in. or 3 ft. does not allow of sufficient space for the proper filtration of the water. Earth has a wonderful facility of absorbing from water any organic matter which it contains, and this has been taken advantage of in many towns, to purify the sewage which is allowed to flow over the surface of the land, and to gravitate through it to the under-drains, from which it passes away clear and pellucid. But there must be sufficient of the filtering medium, or else the water will escape to the drains, together with the greater part of the matter held in suspension. If two drains, the one very shallow and the other at a proper depth, were watched after a heavy rain, it would be seen that the water running from the shallow drain would be muddy and turbid, while that from the deeper one would be clear and bright. This is especially the case in a field which has been recently manured; and thus a great part of the virtue of the manure is carried away to the drains. Shallow drains are also very liable to choke in silty or sandy soils, by the fine particles of earth washing into them.

On the other hand, it must be borne in mind that any increase of depth adds considerably to the expense of the labour; and if it does not add to the efficiency, is only waste of time and money. There may be special circumstances where drains may be advantageously laid at depths from 4 ft. and 6 ft.; for instance, supposing a mouldy, deep soil, 4 ft. in depth, resting on an impervious subsoil; in this case the drains ought to rest 3 in. or 4 in. in the subsoil, making them more than 4 ft. below the surface. By neglecting to descend a few inches in certain soils, many of the benefits of drainage may be lost. Again, where springs occur it is often necessary to lay the drains at considerable depths, and to resort to special means of getting rid of the water, as by boring down through an impervious soil to the porous stratum below. But these are cases which fall within the province of the engineer, and need not, therefore, be further alluded to.

But if it be waste of money laying drains too deep, it is worse than useless laying them too shallow. Many hundreds of acres have been drained with the pipes scarcely out of reach of the horses' feet, and have now to be re-drained. An authority writing on this subject, says,—So generally is the practical part of the operation diffused, that every manager of land conceives that he knows the whole subject of draining so correctly that he will commence his operation with the utmost confidence of success; and this confidence has caused much money to be expended in draining that has in great part been ill-directed. Were the efforts of ignorance in draining confined to the squandering of money, they might be compensated for by superior management in the other operations of the farm; but unfortunately the sinking of valuable capital in injudicious draining cripples the means of the farmer, and at the same time prevents his reaping all the advantages derivable from drainage itself.*

Shallow drains have been laid under the erroneous idea that the water enters the pipes at the top, and flows immediately through the

soil into the drain; the fact being that the water enters the pipes at the sides or bottom, and a field may be drained with tiles laid at a depth of 9 in. or 1 ft., and yet the surface be wet and ponchy. A striking instance of this came under the author's notice a short time ago. Having occasion to lay a main drain across a grass field for the purpose of conveying away water from an adjoining site, it was found, on opening the trench, that the field had been under-drained with pipes, laid at a depth of about 9 in. below the surface. These drains were perfectly dry, although the surface of the field was so wet that the water oozed up over the hoot-soles. The trench was cut 3 ft. deep, and as soon as a depth of 2 ft. was reached, the water began to flow freely out of the sides of the trench, and continued to do so for more than a week, during which time it remained open, the land for a great distance on each side becoming dry and firm. The soil was a clayey silt, of a class that receives very great benefit from drainage; but here money had been completely thrown away, which, if it had been expended under the guidance of skill and experience, would have been of the greatest service.

Although it is recommended that 3 ft. should be considered as a minimum depth under ordinary circumstances, there are cases where a drain laid 2 ft. deep will prove more effective than one laid at a greater depth. The depth a drain is laid must always depend on the outfall; and there are many cases in fens and marsh land, where the state of the outfall ditches and drains will not allow of a greater depth than 2 ft. The pipes should never be laid so low that their ends are buried in the water in the ditches into which they empty; such a practice is simply laying pipes for the purpose of soddening the land with water instead of draining it. It completely stops the whole circulation of air, and arrests all the benefits to be derived from a properly laid drain. A drain laid 2 ft. deep, and free at the end, is far more effective than one laid 3 ft. with the outfall constantly under water.

The outfall should always be the first care in draining, and, where it is deficient, means should be taken for improving it by scouring out and deepening the ditches. This may involve works on adjoining lands, and is more a matter for a civil engineer than an agriculturist; but it may not be out of place to remark that special enactments of the Legislature have given powers to carry out works on the lands of adjoining proprietors where necessary to procure outfalls, and have also given great facilities for mutual operation where the works may be beneficial to several adjoining estates.

The outfall of the drains, where they empty into the ditches, should be constantly inspected, to see that they are free, and not stopped with weeds and earth. The ditches ought to be regularly scoured out and cleaned once at least every season; and the master of the farm should make it his own peculiar business to inspect the outfall-pipes, to see that they are clear. It is a good plan to lay the last tile of the main drain on a flat paving tile or brick, and to place a small iron grating before the mouth of it, to prevent the vermin from getting up; and too much care cannot be bestowed in keeping these outfalls clean and free.

Direction and Fall.

Drains should always be laid to run with the fall of the land, and not across it. A different theory was held for a short time by some drainers, but practice has proved, what theory would teach, that the drains should fall with the land, the only exception being in the case of springs. A consideration of the subject will show that the water has the least distance to travel to the drains when laid in this manner, and, when there, will get away most quickly. For, supposing the strata to have the same inclination as the surface, and the drains to be laid 30 ft. apart, the water will of necessity flow in the direction of the strata, and a part of it must, therefore, travel 30 ft. if the drains be laid to run across the slope; but, on the other hand, if they be laid to run with the inclination, the water will flow from the centre space between the drains in both directions, and thus have only 15 ft. to travel, or only half the distance.

When the inclination of a field is in one direction, the drains should be laid parallel throughout the field, terminating in a main laid at right angles to them across the lower end of it; and if there is a ditch at the upper end they should be continued through the headland to it,

which will allow a free current of air to pass through them. In an undulating field the main drain should be carried up the hollow part of it, and the minor drains brought in parallels down the inclination to it.

Where a field is in one plane, and level throughout, it is better to lay the main across the centre of the field, letting the drains radiate from it at right angles towards the sides. The object being to get rid of the water quickly, the less run it has through the small pipes the more rapid will be the discharge, the friction in the mains being much less than in the smaller drains. And so, in a very large field, it is never desirable to lay the smaller drains of a greater length than 200 yards. Some engineers allow 300 yards as a maximum length, and instances have come under the author's observation where 2-inch pipes laid in a clay soil in lengths of 20 chains have been in effective working order for the past ten years, and will possibly remain so as long as the pipes last; but, under ordinary circumstances, 10 chains may be taken as the maximum safe working length.

The fall of the drain must be guided more by the shape of the ground to be drained than by any arbitrary rule. Where the surface of the ground slopes, the drains should be laid parallel with the slope, and have the same mean inclination; but where the field is a horizontal plane, it is better that the drains should be laid perfectly level than that a fall should be acquired by laying them shallow at one end, and deep at the other, a practice recommended by some of the early drainers. The advantage gained by a fall, thus acquired, is neutralised by the varying effect the difference of depth must have on the uniform drying of the ground. The distance the drains are apart is determined with reference to the depth; therefore if the drain be laid shallow at the upper, and deeper at the lower end, the distances must either be too great at one end, or too little at the other.

Fall is not necessary to the safe working of drains. By the action of gravity, water is attracted towards the earth's centre, and travels towards that point until its progress is arrested by some impediment. Water varies from more solid substances in that all its particles are free to act. If a piece of wood be dropped from a height, it falls bodily, and retains its shape, the cohesion of the particles of which it is composed counteracting the action of gravity on each individual particle, and allowing it to act only on the mass; but the particles of water have so little cohesion, that every particle is free to obey the influence of gravity; and therefore if a body of water be allowed to escape from a vessel, each particle immediately acts on its own account, and seeks the lowest place it can find; that is, the nearest point to the earth's centre. So when the rain falls on the land, in obedience to this law, it soaks downwards through the earth; still pursuing this law, it is attracted to the drains, and in the haste to reach a lower place, each particle pushes the others on till the drain is emptied. Fall only assists this action, because all falling bodies acquire a velocity, in proportion to the height from which they fall; and so the greater the fall the greater the velocity, and the greater the velocity the greater the power to overcome obstacles, and the more certain and rapid the discharge. Thus, while fall is a great advantage, and even a necessity in drains which convey water having matters in suspension, as in town sewers, in enabling the water to keep the drain free from deposit, it is not absolutely necessary to the discharge of clear water, or for land drains laid at a proper depth; and many miles of drains have been laid that are now doing their work well, which have not an inch of fall.

A good working inclination for a drain is 1 ft. in 4 chains, which is equal to about $\frac{1}{4}$ in. in a length of 10 ft.; and for an open outfall ditch, 4 ft. in a mile will be enough to enable the water to flow away with sufficient rapidity to keep the drains clear and prevent injury to the land.

Where pipes are laid level, or where only a very slight fall can be obtained, the main should, wherever possible, be laid lower than the small drains, and the end pipes should always tip, or be laid at a greater inclination than the others, in order to assist in drawing off the water.

The connexions of the drains should never be made at a right angle, but the smaller pipes ought always to be made to enter the main with a curve, or at a very obtuse angle. The reason for this is obvious. When one current of water impinges on another at a right angle, it

* "Book of the Farm," vol. i.

causes a stoppage in both, and hinders the flow: an eddy is thus created, and any heavy matter held in suspension is precipitated, having a tendency to choke the pipes; whereas, if the smaller stream has the same direction given to it as the larger, by the pipes being made to join the others with a curve, the united currents flow on together without interruption. Experiments made in sewer-work resulted in ascertaining the fact, that when equal quantities of water were running direct, at the rate of 90 seconds, with a turn at right angles, the discharge was only effected in 140 seconds; whilst, with a turn or junction, with a gentle curve, the discharge was effected in 100 seconds.*

Irregularities in the cutting of the grips and in the form of the pipes are far more injurious to efficient drainage than want of fall. It is of the first importance that there should be no hills and holes in the bottom of the grips, but that a regular inclination, when there is a fall, should be given throughout the whole length of the drain. In selecting pipes, those should be chosen which are evenly burnt and which are not warped or twisted; and care be taken in laying them in the ground that the ends properly fit. There is a very great difference in the manufacture of pipes, owing either to the want of care and skill on the part of the maker or the nature of the clay of which they are made; and those yards should be selected which turn out true and straight pipes, although it may involve either extra cost in the purchase or extra leading.†

W. H. W.

FROM PARIS.

The cold weather having ceased, the works of demolition are being donbled in activity for the prolongation of the Rue de Rennes to the Place St. Germain-des-Prés, and for preparing the junction of this street with the Boulevard Saint-Germain. Already the block of houses formerly bounded by the Rues Bonaparte, Goulin, Childers, and d'Erforth has disappeared. On the opposite side clearance has been made as far as the Rue de l'Égout. The Mont Parناسse Railway Station is now visible from the Place Saint-Germain-des-Prés, and the *coup d'œil* is magnificent, especially as Saint Germain-des-Prés is on an eminence of considerable height.

The works for the new park of Mont Sorris progress rapidly at the side of the Bièvre. Two railways, in open cutting, traverse the new park, viz., the line from Paris to Seann and the Paris circular railway. To the west of the park are to be constructed, as we stated at page 714, vol. xv., the enormous reservoirs, similar to those of Menilmontant, to receive the waters of the Vanne for the further supply of Paris. At the south-east angle of the new park are to be placed open and covered riding and training schools for the cavalry. At the south, on the Boulevard Jourdan, in the gorge of a bastion, new barracks have been erected for the *employés* of the *octroi* and their families. Lastly, one of the points of observation of the meridian of Paris passing through Dunkirk, Montmartre, the Observatory, and Perpignan is at the south, and in the park itself.

Works are extensively carried on for the Boulevards drags, starting from the Place Enfer, Mont Parناسse, continued as far as the Boulevard de l'Hôpital, and Moulletard, between the Gobelins and the Place d'Italie; also the Rue Monge, and the Place Fer à Moulin, which will be an important thoroughfare. The ancient Faubourgs Saint-Jacques and Saint Marcel have already been pierced for these arteries some months since. The last works for the circulation of the Rue Monge are finished and the street opened, thus affording a convenient communication between quarters which were formerly separated more by the difficulty of access than by distance.

One of the most curious hotels of ancient Paris, is the Hôtel de Sens, at No. 1, Rue du Figuier, in the St. Cervalis quarter, dating from A.D. 1500, and built by order of Tristan de Salazar, Bishop of Sens, as we now see it. Before the construction of this hotel, there existed near the river, on the Quai des Célestins, a hotel, of the same name, which was constructed in the fourteenth century, and purchased by Charles V., to form the Hôtel Saint Paul, the irregular *ensemble* of which was composed of several buildings and hotels, such as those of Saint-Marr, Puto-y-muce,

&c. In 1622 the building was sold, and up to the year 1790 was the property of the Archbishop of Paris. It is now occupied by M.M. Lesage and Paignard, manufacturers of sweetmeats. The recent demolitions which have taken place around this remarkable building, led to fear that the fine front, with its two towers, would be sacrificed; but this ancient dependence of the Hôtel Saint Paul is to be preserved. The neighbouring space left vacant by the demolition of the Ave-Maria Barracks, is to be converted into a market. The Rues des Barres, Du Figuier, and Du Fauconnier, are to be widened out, or partly destroyed. At the corner of the Rue du Fauconnier there may be seen a niche, with its socle finely sculptured, on which was placed a small statue of the Virgin. Below is inscribed,—AVE MARIA. This is all that remains of the ancient Convent of Ave Maria, dating from the thirteenth century.

In the twentieth *arrondissement* a new hospital is to be constructed, so as to serve a district composed of a portion of Belleville, La Courtille, Menilmontant, and Charonne. The façade of the monument is to be parallel with the façade of the new mairie of the twentieth *arrondissement*.

The New Opera House began early to "pay its footing" in fire. On Sunday, the 19th ult., a fire broke out in the new building at the extremity of one of the *colonnades* leading to the Salle. The fire, which it is presumed was communicated to a tarpaulin screen by a stove chimney serving to heat the *ateliers* of the modellers, was put out at once by the *sompniers*, with a few buckets of water. An arch blackened by smoke and flame shows what proportions the fire would have acquired had it not been speedily extinguished.

On the Place du Château d'Eau, a vast promenade has been laid down in *huitmes*, corresponding to that already made at the right of the entry of the Boulevard du Prince Eugène, the dispositions of the latter *promenoir* being symmetrical with those of the former. Each contains four rows of young plane-trees, planted with every care, and calculated to give shade next year. Not less than 200 trees are employed in this portion alone. The site formerly occupied by the ancient fountain now re-erected at La Vilette abattoirs, has been levelled, and the Place du Château d'Eau will in a short time assume its architectural proportions.

FROM GERMANY.

Berlin.—The works connected with the new National Gallery are steadily progressing. The foundation-stone was laid without any public ceremonial by Professor Strack, the architect from whose designs the building is being erected.—A "Victory," by Rauch, has lately been unveiled near Babelsherg, the residence of H.R.H. the Crown Prince. Three steps of Camenz granite lead to the pedestal, which, together with the statue upon it, is of bronze, cast at Lauchhann. The height of the whole design is about 40 ft.—The battle-fields of Düppel and Alsen are about to have monuments commemorating the victories of the Prussians in the Danish peninsula. They will both be Gothic, somewhat like our Eleanor "Crosses," and about 60 ft. high. The cost of the one at Düppel is estimated at about 5,800*l.*; that at Alsen at about 4,500*l.* They will be executed in sandstone, and ornamented with figures representing the various branches of the service.

Vienna.—Professor Ferstel has completed his designs for the projected Austrian Museum. It is in the Renaissance style, and the internal arrangements specially include the means of accommodating a school of art.—The "Concordia" Club is about to erect a new club-house on a site given to it by the Emperor. Messrs. Schachner & Deter are the architects, and the building will cost about 12,000*l.*—On the occasion of the unveiling of the Schwarzenberg Monument, Professor Dr. Hähnel, of the Royal Academy of Dresden, received the Leopold Order, as did also the architect, Mr. Schwarz.

South Germany.—Those who have visited Nuremberg, and remember the dilapidated state of the cloisters of the Carthusian Monastery, now used as the "Germanic Museum," will be glad to hear that the sums now collected warrant the immediate commencement of the much-wanted reparation. Old King Ludwig and others have sent contributions of 250*l.* and upwards,

whilst the chief cities of Germany, North and South, have contributed to this national work.—The Committee for the Restoration of Frankfort Cathedral, lately partially destroyed by fire, call upon all natives of that city residing in foreign countries to subscribe and to collect from other Germans funds in aid of the Cathedral of the Kaisers.

GENERAL EXHIBITION OF WATER COLOUR DRAWINGS.

The fourth "General Exhibition of Water-colour Drawings," as it is called, in the Dudley Gallery, Egyptian Hall, consists of 684 works, ninety of which are by ladies. While many eminent names are in the list of contributors, such as E. M. Ward, R.A., F. W. Cooke, R.A., W. Cave Thomas, H. Dawson, F. Dillon, Holman Hunt, with others to whom we will briefly allude presently, this exhibition serves to bring before the public a number of promising artists, and some more than promising artists, at present little known out of doors. The exhibition as a whole is very interesting; thoughtfulness and harmoniousness being observable in the majority of the pictures. Mr. Poynter exhibits the original drawing for his now well-known picture "Israel in Egypt." Mr. Yeames has a picture, "Exorcising" (87), the merit of which becomes more observable the more it is studied; and Mr. Marks one of the best drawings he has yet made. For manipulative dexterity parts of "Heliogabalus, High Priest of the Sun and Emperor of Rome 118-22 A.D.," by Simeon Solomon, are a marvel.

Foremost amongst works of the as yet less known artists we must place "Preparing for Guests" (49), and "An Eavesdropper" (154), by A. C. H. Linnmore, for whom we prophesy a good future. Vicat Cole exhibits a charming landscape, "Evening Shadow" (283), and in the same department (75), by Geo. Mawley; "Luccombe Chine, Isle of Wight" (265), Frank Walton; "The Homeward Rookery" (323), M. F. Halliday; "Betwix-y-Cood, North Wales" John Ernest Croft; and several more, deserve the same adjective.

Amongst other noticeable works are "Calatafimi, the scene of Garibaldi's first victory in Sicily," Talmadge White (though over-hard); "A Mideummer's Night's Dream at Hampton Court" (353), Adelaide Claxton; Mr. C. Leslie's heads; and Mr. Donaldson's earnest works.

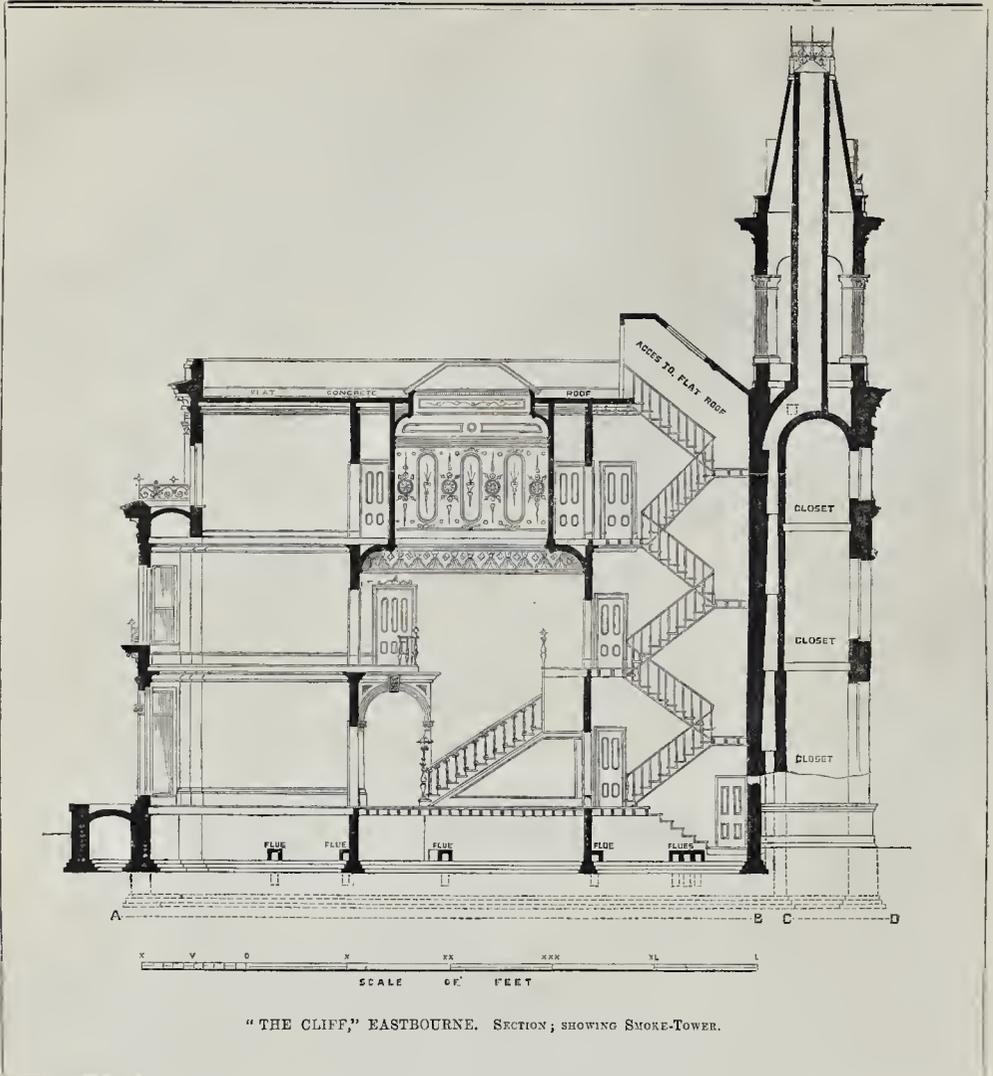

A RESIDENCE AT EASTBOURNE, WITH SMOKE TOWER.

The Cliff, Eastbourne, of which we give three illustrations, is now in course of erection for Mr. William Earp, of Eastbourne, upon land leased from the Duke of Devonshire; Mr. Henry H. Vale, of Liverpool, recently elected a Fellow of the Institute, being the architect. The site of the house is commanding; it is about half a mile to the west of Eastbourne, on the way to Beachy Head, with a prospect of the English Channel, Pevensey, Hastings, and St. Leonard's; and is approached by a new road, made by shelving down the escarpments of chalk, and so forming a terrace upon the face of the cliffs. This road has been recently made from the plans of Mr. Wallis, the resident surveyor, under Mr. Currey, the architect to the Duke of Devonshire, who is the owner of the land here,—in fact, of the whole of the land upon which modern Eastbourne has been built.

Those who know Eastbourne only from recollections of seaside holidays in the "Old Town," with its quaint tint houses, and ancient church, say some ten or fifteen years ago, would be much astonished on visiting the Eastbourne of to-day, with its handsome villas, hotels, and promenades. The present Duke of Devonshire has greatly promoted this change, and Eastbourne now bids fair to become one of the most architectural of our watering-places. The house under notice will, when finished, be a conspicuous building, partly from its elevated situation, and partly from its dimensions and skyline, but the special feature to which we purpose calling attention is the absence of visible roofs and chimneys.

The magnificence of the view suggested to the proprietor the idea of having the roof finished flat, to serve as a promenade, and, in order to remove the objections arising from the contiguity of chimneys, it was arranged that the

* Sanitary Report, 1852. † To be continued.

smoke should be carried into a smoke tower, some 55 ft. high at the angle of the building, as shown in the accompanying perspective view.

The plan of basement, which we have engraved, shows the direction of the horizontal smoke tunnels; and the section represents the construction of the same, together with that of the smoke tower. On reference to these drawings it will be seen that the smoke from the ground and first floors is to be drawn downwards to the basement by the extracting power of the tower, and taken thence in a double tunnel, 100 ft. long, underneath the vineries and conservatories to the base of the smoke tower. In order to regulate the draft, a system of dampers has been arranged so as to give command over the flues, whether only one or several fires be lighted. This tower is also used as a ventilating shaft, the vitiated air from the apartments being drawn upwards to the flat roof of the house (from each room and closet just underneath the ceilings) by means of wall cavities, and then conducted across the shaft in the tower, which is divided by a wall into two parts, the one serving for the smoke, the other for the foul air. Of the efficacy or otherwise of the mode adopted we have not at present the means of judging. Smoke and ventilating flues from

the stable buildings are also brought underneath the stable yard of the base of the tower, where they join the smoke shaft.

The main entrance to the house is by a large portico between the vinery and conservatory, with large glazed doors opening into them from it to the right and left, affording a view of the range of houses spanned by light iron roofs, with ornamental iron principals, and divided by glazed screens. The porch, vestibule, and hall under lantern light are to be paved with variegated marbles, with sunk avenues for strips of pile carpet to the various doors. The fireplaces of the rooms surrounding the hall are so arranged that the hall can be heated through ornamental metal grilles projecting into the hall and covered with marble tops. Steam piping is to be laid on throughout the halls and passages and attic story. There will be a Turkish bath and hot and cold showers upon the chamber floor.

The sloping nature of the approaches calls for careful treatment by terracing, so as not to cut off the views of the house, by running out the plateau upon which it stands too great a distance. This plateau has been formed by removing the top of the conical hill to a sufficient distance to receive the house, outbuildings and lawn, the gardens being placed at a lower level.

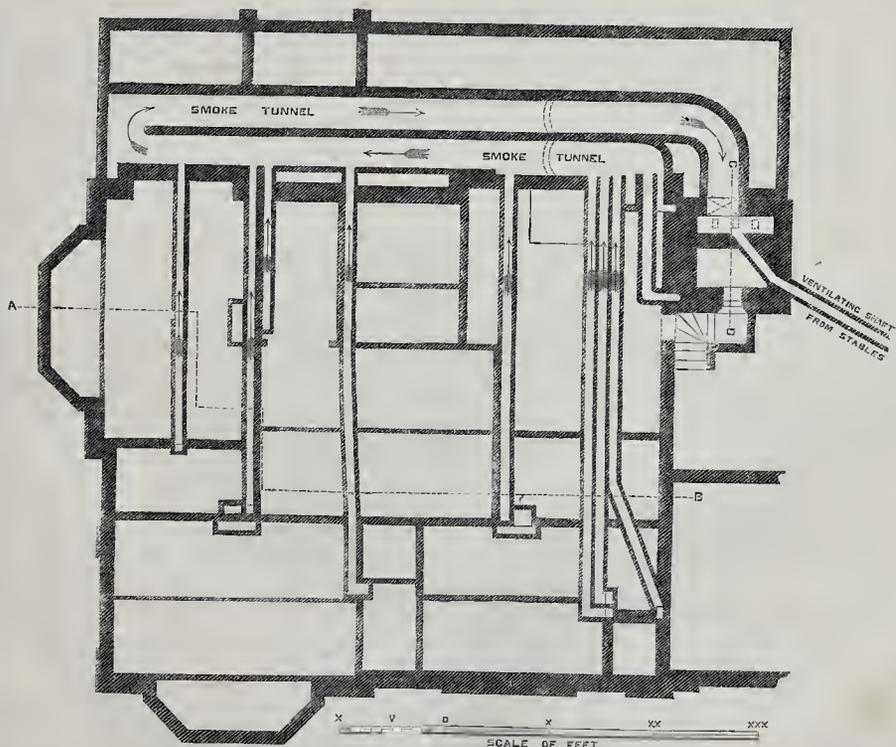

The upper parts of the stabling and offices are seen in the perspective view.

The bay windows of the house open on a terrace with steps and balustrades, the same being laid with Minton's tiles. In order to admit of a wide range of view the bays have been constructed of large dimensions, being 18 ft. in the clear opening. These and other windows are to have balconies and crests of ornamental iron-work, as indicated in the view. The materials of the buildings generally are local bricks, covered on the exterior with Portland cement. There is neither stone nor lead used throughout the works (excepting Portland stone for outside steps and landings); the interior piping is all of iron. The baths are of hard wood, screwed together and well painted.

An enclosed passage above the cove of the lantern of main hall leads to the various apartments on the second or attic floor; the servants' stairs are continued, as shown upon the section, to the flat roof, which covers the entire building. This roof is constructed of joists brick-grouted, concrete, and cement; the upper surface of flat being laid with falls to channels or gutters, which take the water to the down spouts. The cement which forms the top finish of the roof is of a special manufacture, found to answer the purpose in other buildings. The

"THE CLIFF," EASTBOURNE, SUSSEX. WITH SPECIAL ARRANGEMENTS FOR SMOKE AND VENTILATION. —MR. H. H. VALE, ARCHITECT.

PLAN OF BASEMENT. SHOWING POSITION OF SMOKE-TUNNELS.

arrangement of the rooms with regard to aspect has required consideration. Owing to the proximity to the chalk cliffs the heat in summer becomes intense.

The style adopted for the exterior dressings and interior decorations and enrichments may be called Anglo-Italian. Owing to the absence of the two leading features, viz., roofs and chimneys, the architect has had a somewhat difficult task to perform to produce a satisfactory architectural effect. As will be seen from the perspective view, he has designed the façades with strongly-accentuated grouped pilasters at the angles, finished at the top with acroterial terminations for skyline, the breaks being slightly pedimented.

Pressed bricks and stone being at Eastbourne very costly, almost all the buildings there are coated with Portland cement. The tower will form a belvedere, with open arches, and angle pilasters, leaving a space to walk round the circular smoke and ventilating shaft in the centre. The space not required for the smoke-flue on the lower stages is used for closets to the bedrooms and oven for the kitchen.

Provision is made for access to the top of the tower inside the ventilation flue, for painting the iron crests and for repairs.

We shall be glad to hear of the success of the system adopted for heating and ventilating this house. Mr. Vale is fortunate in having a client with the courage to leave the beaten track. It is the more important, therefore, that every care should be taken to render the experiment successful. Whether or not, the heat of the smoke-tower might be further utilised seems worth consideration.

Mr. Charles Naab Foster, of Whitefriars, London, is the sole contractor; Mr. Taylor, the resident foreman; the works being carried out under the architect's superintendence.

THE SEWAGE QUESTION.

MR. SLAGG, in a pamphlet recently issued,* objects not only to the casting of town sewage uselessly into the sea, but to the combination of towns as proposed in the Thames Valley, for its distribution, and even to its concentration in single towns. Sewage, he considers, ought not to be accumulated into one unwieldy mass of fluid anywhere, but should be radiated from towns in several directions, and distributed to the soil by underground or sub-soil pipes, or covered tile gutters rather, of a simple character, with serrated side openings, such as we have already described in the *Builder*; and these would require to be taken up every three or four years, by help of a ripping plough made for the purpose, and replaced for other three or four years as before; the sediment clogging them being ploughed into the soil on which it is deposited. Thus much difficulty as to the obtaining of sufficient ground for irrigation would be overcome, as in no one spot would a very large expanse of surface be required; and as building extended round a town, the irrigated suburban market garden, or farming ground, could be given up, and the sewage taken farther out in different directions around the town as might be requisite.

Mr. Slagg's system may be called the individualizing by contrast with the generalizing; the radiating by contrast with the concentrating, on which so many minds are now, as he thinks mistakenly, at work. And there is much in Mr. Slagg's system to recommend it to serious attention at the present moment.

On this plan an inhabitant of Kingston thus writes:—

"Surface irrigation has been tried again and again, and is an acknowledged success. The Commissioners for Preventing the Pollution of Rivers, after visiting Norwood, Croydon, Worthing, Edinburgh, Carlisle, &c., gave the following report:—

"That at the public inquiry at Croydon all the witnesses, medical gentlemen, and others, agreed that the irrigation works were not injurious to health. That, with the exception of lands liable to be flooded, there seems to be no soil that will not serve the purpose. Between the light and blowing sands of Edinburgh, and the stiff clay of Norwood, are included all the differences of soil which can be met with in this country, but at both extremes we find the application of sewage attended with success."

This, be it remembered, is said of surface irrigation. Now, what has Mr. Slagg got to

support the claims of subsoil irrigation? Why, the solitary fact that, in 1855, a Mr. Wilkins, of Reading, tried it on a very small scale, and found it answer. So that, on the one hand, we have offered us surface irrigation, the success of which has been amply testified, and on the other subsoil irrigation, which can be called nothing more than an experiment. True, Mr. Slagg might say, "Surface irrigation was at one time an experiment, and every great undertaking has been at first received with caution, if not with positive scepticism or ridicule." But the question is, Are the ratepayers of Kingston and Surbiton willing to risk 25,000l. or 30,000l. in endeavouring to solve the agricultural problem,—which is the best way to dispose of our sewage?"

Mr. Baldwin Latham, C.E., vice-president of the Society of Engineers, and engineer for the public works of Croydon, has written a pamphlet* under the title of "The Purification and Utilization of Sewage; with Plans of the Croydon Irrigation Fields."

On the results of the utilization of sewage he says,—

"The great result to be arrived at in the utilization of sewage is the prevention of the fouling of rivers, and the purification of the sewage before being turned into any stream; and upon this head the results are most satisfactory."

In the case of Croydon, the sewage of that town, after being utilised, is positively purer than the water supplied by some of the metropolitan water companies. The results of the application of sewage, in an agricultural sense, are also equally satisfactory. Indeed, it is surprising what enormous crops are produced under the influence of sewage, and the great difficulty is what to do with the crops; they grow so rapidly that it exceeds large, that it aspects all the preconceived notions of farming. Indeed, the only way in which sewage grass can be dealt with with certainty is the means of making it artificially into hay, and this the author has succeeded in doing, and is now about to submit the process to the test on a large scale."

In a paper read before the Society of Engineers in Exeter Hall, Mr. Latham remarked that 650 towns were now governed in their sanitary operations by the Public Health Act of 1848, and with great benefit to the various localities; and from a table which he held in his hand it appeared that, in the towns of Banbury, Cardiff, Croydon, Dover, Ely, Leicester, Macclesfield, Merthyr, Newport, Rugby, Salisbury, and Warwick, typhoid fever has been reduced at rates varying from 40 to 75 per cent., and at rates of from 41 to 49 per cent. Proceeding to examine the case of Croydon as one example in detail, Mr. Latham showed that the sanitary expenditure had been in the gross 195,000l., and the saving in thirteen years as follows:—Funerals (less), 12,195l.; sickness prevented, at 1l. each, 60,974l.; value of labour of persons kept in health, 166,828l. Total, 239,995l.

Mr. J. C. Morton, who has the management of the Lodge Farm, near Barking, where experiments are being carried out by the Metropolitan Sewage Company, gives the following account of these experiments:—

"It is not only on the sand-plot at the north London outfall that the experience has been obtained. They have there, as you appear to be aware, obtained great crops of grass and vigorous plants of wheat, mangold wurtzel, celery, and carrots, by the use of sewage poured over about an acre of the Maplin Sand, which had been brought up by barge and spread 30 in. deep over a contractor's yard. But, besides this, they have, since Lady-day, 1866, been tenants of 200 acres of light and gravelly land at Lodge Farm, two miles from the Barking outfall, and on this, by pumping apparatus, they can deliver sewage at the rate of 300 tons an hour. During the summer of last year about 60 acres of this land were laid out water-meadow fashion either on the ridge and furrow, or where the slopes are greater, on the catch-water plan; and from 53 acres of Italian rye-grass sown on this land and watered with sewage in this way, we have during the past summer cut 2,450 tons of grass."

"I believe that, fairly read, the lesson taught us is, that 60 tons per acre (and the quantity taken from that portion of the land which was in good producing order was more than this), or 2,250 tons of grass off 31 acres of ordinary land may be obtained from 250,000 tons of sewage properly applied. And if we deduct 12 tons of grass per acre (say 700 tons from our area) for the natural and unsustained yield of this soil under an Essex climate, we shall have 2,500 tons of grass as the produce of 250,000 tons of sewage. It is plain that if a ton of good grass can be obtained from every 100 tons of London sewage, a handsome revenue will yet be obtained from what now runs to waste at the Barking outfall. That sewage-grown Italian rye-grass is admirable cow food, and we had ample proof on Lodge Farm during the past summer."

Besides this large extent of Italian rye-grass, small experimental plots in wheat, mangold wurtzel, and other crops have been sown; and we may add the results to this report, notwithstanding that we cannot attach so much importance to them because of the small scale on which they have been obtained. Eighteen tons of mangold roots were weighed off rather more than a third of an acre, over which 1,100 tons in all of sewage per acre had been poured at three separate times during the summer. This was at the rate of 33 tons per acre,—more than twice the quantity obtained on fields close by, manured and cultivated in the ordinary way. And a plot of wheat (1 rood and 21 perches), which received three dressings of sewage when the land was dry in spring and early summer,

yielded 15 bushels of grain, which is after the rate of 43 bushels per acre; while, surrounding this plot on two sides of it, 2 roods and 23 perches of similar land, in all respects similarly treated, excepting only that it had no sewage, yielded 18½ bushels of grain, or at the rate of only 29 bushels per acre.

I will only add that, having had the management of this farm during the past two years, I know the circumstances, and can vouch for the accuracy of this account of them."

The local board of Tunbridge Wells having petitioned the Home Secretary to institute an inquiry with the view to obtaining a provisional order to enable them to take land for the purpose of sewage irrigation, &c., under the Sewage Utilization Act, 1867, an inquiry has been opened by the Government inspector (Mr. Arnold Taylor) at the Town-hall. There was a strong muster at the opening meeting of members of the local board, of gentlemen whose lands will be affected by the scheme which the board wish to carry out, and of professional gentlemen; but of ratepayers there were not many.

At a recent meeting of the Southampton town council the surveyor was directed, on Dr. Watson's motion, to prepare a report as to the best mode of ventilating the sewers. This was only, Dr. Watson said, carrying out the suggestions of the officer of health and of the surveyor. The system of drainage that prevailed in the town was modern, but the ventilation of the sewers was overlooked. If the report of the surveyor were true, the matter required immediate attention, as the decomposition of the solid sewage created obnoxious gases which ought to have a way of escape without entering dwellings. In the day time, he believed, the quantity escaping was small, in consequence of the continual action of the sewers, but there could be no doubt that much escaped by night, and created various forms of zymotic disease. The remedy was very simple, the admission of fresh air into the sewers, which could be done at slight expense. Mr. Chipperfield said that if people's drains and closets were properly trapped there would be no complaint, and that through attention to this in his own house, he believed 10 in. had not entered since it was built. Mr. Sharp, gas engineer, proposed ventilating the sewers through the gas columns, and thus burning the gases as they rose.

Mr. T. Hoey has read a paper at a meeting of the Glasgow Association for the Consideration of the Sewage Question in his plan for the reservation of water-closet soil in air-tight boxes, and its removal by pneumatic pressure, and through the intervention of larger receptacles, to the country for utilization in the soil as manure. We have already spoken frequently of such plans. Mr. Hoey's, if we mistake not, inclusive. On his system, as he stated, "the deodorizing of matter was secured by an apparatus on the 'bird-cage fountain' principle, so connected with existing closets, movements as to discharge the requisite quantity of sulphuric acid or solution of sulphate of iron into the basin along with the flushing water for the purpose of fixing the ammonia developed in the soil during the process of decomposition." He then explained how this apparatus would be worked and the quantity of sulphuric acid required. An intercepting tank could be placed directly under the lowermost water-closet, or a soil-pipe could be continued at a proper gradient for conveying the soil from the bottom of the vertical pipe tank to any convenient place at the back of the house. The emptying of these intercepting tanks would be effected by a cart carrying a cylindrical vessel divided into four compartments, each compartment being of such capacity as to contain the contents of one tank. Those compartments would be partially exhausted by air, through a process which will be expounded. He also explained the *modus operandi* of conveying the soil from the tanks to the carts, which was effected by pneumatic pressure. The matter would then be conveyed and discharged into large central tanks on the same principle, and when these depôts were full they would be discharged by air pressure acting on the surface of the mass, and conveyed to a general depôt situated in a suitable locality selected in the country. We do not recommend such a system.

MASTERS AND WORKMEN.—On the evening of the 31st ult. Mr. W. Higgs entertained the persons in his employ in South Lambeth, about 500, including wives and children, sitting down. Afterwards Mr. Higgs, the Rev. C. H. Spurgeon, and two or three other gentlemen addressed the meeting at some length.

* The Principles of Town Drainage. By Charles Slagg, Borough Surveyor of Kingston-on-Thames. London: Stanford, Charing-cross, 1868.

* Spou, Charing Cross, Publisher.

and inspector of weights and measures, prisoners' cells, large kitchen and offices, &c. The total cost of the building, which has been erected from the designs of Messrs. Bellamy & Hardy, of Lincoln, will be about 16,000*l.*, exclusive of the cost of site, &c.

The floor of the entrance is covered with Minton's encaustic tiles, and from the centre hangs a bronzed gaselier. Directly opposite the main entrance is the sessions court, 35 ft. by 34 ft., and 23 ft. high from the floor to the dome. Both dome and ceiling are ornamented. The remainder of the ground story is occupied by offices for the local Board of health, committee rooms, a town servants' room, and a record room for corporation deeds and documents; this last apartment is fire-proof, with a floor of Portland cement.

On the right of the main entrance is the magistrates' room, 31 ft. 6 in. by 26 ft. 6 in., and 19 ft. high. A grand staircase leads to a vestibule through which one passes to the council chamber. The decorations of the hall, grand staircase, and vestibule are to be noted. The staircase is 32 ft. long by 24 ft. wide. The council chamber occupies about the whole length of the western side: the length of this apartment is 74 ft., the width 31 ft., and the height 26 ft. On the left of the council chamber is a library, 40 ft. by 31 ft., and 24 ft. high. In the mezzanine story are the town-clerk's room, grand-jury room, another record-room, &c. The basement comprises a police entrance from King-street, an office for the superintendent of police, a charge-room, stores for stolen goods, and police day-rooms. Adjoining are an engine shed, parade corridors, seven cells, an office for the inspector of weights and measures, a large kitchen, &c. A patent lift to the council chamber, to be used on the occasion of banquets, is also provided. All the windows on the basement story are barricaded. Mr. E. Gibbons, of Ipswich, was the contractor. Mr. Edmund Catchpole has acted as the clerk of the works. Mr. W. P. Ribhaus, the town surveyor, also supervised the erection of the building. For the masonry, Mr. Ireland, of this town, was sub-contractor. The more delicate portions of the carving are the work of Mr. Barrett. The plaster work was done by Mr. Adkins. Messrs. D. & E. Haggard, of Ipswich, supplied the gaseliers, and executed all the plumbing, painting, and glazing. The gas pipes were laid by the local gas company, and the sun lights were fixed by Mr. Stroud, of London.

SULPHUROUS ACID AS A FOOD PRESERVEE.

Dr. BAIRIE, of Edinburgh, says,—

"We have, for some years, been in the habit of fumigating the larder with the fumes of sulphur, particularly in moist, muggy weather, and in summer, and have never yet had a single article spoiled or become putrid, which is the more remarkable as we have, during the whole time, derived most of our supplies from the extreme north of Scotland, so that they were exposed to the influence of the external air and sun for at least thirty-six hours before they reached us. The mode of fumigation adopted is to put a small crucible into a pan of hot coals placed on the floor of the larder, and, when heated, project into it two or three small pieces of common stick sulphur, shutting all the doors and windows, and allowing the vapour to diffuse itself through the larder. This may be repeated once or oftener each day, so long as the weather continues hot or muggy. In a similar way, whenever called upon to attend a case which either is, or shows signs of becoming, contagious, I am in the habit of directing the room to be fumigated with sulphur thrown on hot coals repeatedly in the course of the day and night, and have never observed or heard of the least inconvenience or even effect arising from or attributable to the process."

We have already more than once spoken of the utility of sulphurous acid in fumigation, and recommended it in cholera seasons. We stated that Government had for many years used it in lazarettos (as they may still do) for the fumigation of all articles coming from plague-stricken countries. It was also used whenever articles of any kind—even letters—were passed out of these lazarettos to friends outside. But it is not in modern times alone that sulphurous acid has been esteemed: the old pharmacopœists, such as Salmon, speak very highly of it as a medicine, and Dr. Dewar, of Kirkaldy, in Scotland, has revived its use in this respect. The writer of this, many years since, in a course of medical experiments on himself in Scotland, made special use of it; but one objection he recollects of is, that he thought its internal use required care to prevent catching cold under its influence. Of course this is no objection to its external use as a sanitary agent or an antiseptic.

EMPLOYMENT FOR THE POOR.

MR. THOMAS WEBSTER, Q.C., has read a paper on "The Industrial and Profitable Employment of the Casual and Destitute Poor," at a meeting of the Department of Economy and Trade of the Social Science Association; Mr. R. Rawlinson, C.E., C.B., in the chair. The remedy for the admitted shortcomings and evils of the present system which he proposed was that which proved effective in Lancashire, and was frequently had recourse to by the Governments of Continental countries, namely, a provision of work and wages for the unemployed. It seemed, indeed, most inconsistent at the same time to be squandering millions in poor-rates and punishment, which produced no return, and leaving useful works which were demanding execution all over the country undone, which would prove a source of additional national wealth and advantage, employ industrial energy, and be actually remunerative. It was proposed, therefore, that a society be formed for the furtherance of these objects, to be assisted by a Government grant of public money, in order to enable it to carry on its operations on a sufficient scale, and that the society, under its Act of Parliament, should have compulsory power to take certain land for reclamation, on the usual terms of compensation to owners; that laborers be then employed in large numbers, lodged in temporary buildings to be erected for the purpose, and, if necessary, fed and clothed by the society. Something also must be done for those who are not able-bodied, for women and children.

BOULEVARD OF THE ARTS FROM PONT-STREET TO SOUTH KENSINGTON MUSEUM AND A GREAT GENERAL MARKET FOR THE WEST.

ALLOW me on public grounds to submit to you the following observations concerning the above important West-end improvements:—

1st. That such an enterprise as is presented by the boulevard in question would be the greatest and most appropriate monument the British nation could offer to the memory of the late Prince Consort, as the creator of South Kensington and the successful promoter of arts.

2nd. That if carried out in the spirit recently suggested in the *Builder*, with triumphal arches at each entrance, statues throughout on either side of the boulevard, dedicated to the great men past and future of the British empire, gardens, fountains, &c., thus giving to it a thorough national character, the grandeur of effect would call forth similar efforts elsewhere in the metropolis, and give rise to an entirely new school of architectural design.

3rd. That such a site (between Belgrave-square and South Kensington Museum) thus developed would be at once rendered a centre the most valuable as well as the most fashionable in London.

4th. That the parties who have the direction of this important undertaking are equal to the responsibility devolving upon them, in having to metamorphose thus so large a space (some 70 acres), of which about 30 acres are uncovered with houses, for the future embellishment and improvement of the West-end, and to insure success the secret consists in beginning well.

5th. The residences built on the "boulevard" having all the improvements of the day, will find buyers, because no frehold is to be had in Belgravia, and certainly none in any way comparable with the future "Boulevard of the Arts" is in existence in London; and it may be safely said, without exaggeration, that such favoured property must continue to increase in value as the place would be unique.

6th. A *Great General Market* for the west is imperatively demanded, and the neighbourhood surrounding the spot to be thus occupied affords many advantages owing to the poverty of much of the adjoining district (say of Lower Sloane-street and White Lion-street in front of the new suspended Chelsea Bridge), its facility of access from all parts, proximity to the river, and being in the centre of several railway stations, &c. &c.

An additional attraction might be here set forth, which, if carried out and organized in departments (fruit, flowers, vegetables, meat, poultry, &c.), after the magnificent model of our Parisian neighbours, would at the same time afford a most acceptable lounge, and

one of the chief wants of the day, and of certain to result favourably in a mercantile point of view, which, after all, is the chief element of all English enterprise. The space occupied by such general market would be three or four times the size of Covent-garden Market. The place now of a very inferior description; the cost of the ground would be small, for it cannot be improved, having in front of it the new barracks and higher up Chelsea Hospital and Chelsea College, so that a market there is the only improvement suitable to it, and this would satisfy all classes, poor and rich.

7th. A great general market would improve our taste for better cooking and economy, and would be the only check on the extortions of tradesmen and retail markets from which the dwellers suffer, as the small dealers are completely now "masters of the situation." An very likely the architect who will build a city of palaces in Belgravia will see the opportunity and the necessity of turning his attention to this suggestion.

While on this subject, I venture to remark that a West-end fish-market somewhere on the banks of the Thames between Chelsea Bridge and Millbank would be a great boon to the inhabitants of its southern shore, as well as to those of Belgravia north and south.

A BELGRAVIAN.

ARCHITECTS' CHARGES.

RANDAL G. GRAY.

SIR,—I have seen a report in the *Builder* of trial (Randall G. Gray) in which a clerk of works in my employ gave evidence, and, as might be expected, incorrect evidence, about architects' charges. I do not see how he could have an acquaintance with the subject. Of my own practice in such matters, he certainly knew nothing. His appearance at the trial is greatly to be regretted on every account. Being engaged by me in the superintendance of a definite work his time, of course, is not his own property. Without my knowledge he was first consulted, and then was taken as a witness to Shrewsbury. This I learnt accidentally, and only a few days before the final trial. The case had then gone so far that had I forbidden him to appear I should have exposed myself to the charge of arbitrary interference with the course of justice. I think the charge would not have been an unreasonable one.

Judging by the report of the trial, my own name would seem to have been most improperly and unfairly used, the witness having been led to speak of that of which, I repeat, he could have had no accurate knowledge, and so to give an impression respecting my own practice altogether contrary to the fact.

W. BUTTERFIELD.

PIECEWORK AND APPRENTICESHIPS.

SIR,—I differ from your correspondent in his conclusions on the subject of piecework. To a skilful and muscular workman may find it sometimes advantageous to his interests to work by the piece, I admit; but that it is also to the advantage of the customer, who wants his work done well, I deny. An experience of nearly thirty years as journeyman and foreman has convinced me that, at least in the building trades, where we seldom do two things alike, and a pleasing variety prevails, if you want your work done well, you must get it done *day work*; and this applies not to the journeyman only, but to the master contractor also. The system of contracting must be abolished, and the far more equitable system of measure and value or daywork substituted.

Then, again, piecework causes over-exertion. I have known several instances of this. One in particular occurs to me;—a joiner, who worked so hard in the ten hours, that he was positively unable to walk to his home at night, without holding on to the shop-fronts and lamp-posts for support. After a very few years he died a premature death, and his family went to the workhouse. The extra money he earned was spent to support the extra waste of muscle, and his conduct led to the reduction of the price paid for the work; so that the employer got all the benefit.

I think that there ought to be, and that it will be necessary in the future to make, a difference

in the working hours in the summer and winter, especially for out-door work. I have often been on a scaffold for an hour or more in a morning, and from three-quarters of an hour to an hour in the evening, in raw, cold, foggy weather, when it has been sheer robbery to the employer to be there, and not only uncomfortable, but dangerous, to the workman. The same objection does not apply to the shop or indoors; but, independently of the saving in gas, I should be glad to see a reduction in the hours of daily labour in the winter.

Trade or "technical" education I hold to be absolutely necessary to every workman, if good work is to be done, and I think that can best be obtained by the establishment in every district of a school under the Department of Science and Art; and workmen should be encouraged to attend such schools, and should be able, other things being equal, to obtain priority of employment on showing certificates to employers. At present the knowledge of practical geometry is woefully at a discount even among joiners and masons, to say nothing at all of bricklayers and plasterers, who seem to think that subject altogether foreign to them. What per-centage of London painters could undergo a very mild examination on colour, or joiners on botany, and the strength of timber, or plasterers on the chemistry of cements and free-hand drawing, or masons on geology?

And that brings me naturally to the subject of apprenticeships. I find them to be mostly a sham and a deceit; for if the apprentice is placed in a small shop where the master works with the men, yet he calls himself builder, and undertakes all branches, so that the apprentice is expected to do a bit of jobbing carpentering, then a bit of painting, and it may be bricklaying, or plastering, certainly whitewashing and cleaning, and at the end of his time he may be fit for a respectable labourer.

But it may be that the apprentice is placed in a larger shop, where several men of each trade are employed, yet there are some masters who take so many apprentices, that there will be one to each journeyman, or more, on the average. Here the employer is seldom seen more than once a day, and the whole care is left to a foreman. His position is an unenviable one, for generally there is a combination of the apprentices, who work and play just when they please, and set him at naught. I know such a shop well. The master gets 25*l.* to 30*l.* with each boy, and they have to learn their trade as best they can. There are seven apprentices to about six journeymen, sometimes less. The kind of work turned out may be imagined.

Now, I should like to see a plan adopted something like that which obtains in France, where every apprentice is bound by his indentures to attend a trade school at least one hour per day during his apprenticeship. Such a school under the Department of Science and Art would give certificates of competency in theoretical knowledge. After the apprentice is out of his time, which might, I think, be limited to five years,—say from fourteen to nineteen,—he should then be bound to serve as journeyman for two years more in any shop or buildings as he pleased. He should then be able to come up for examination before a competent judge appointed by the department, who would, if satisfied, give a certificate of mastership.

I venture to say that, with such a training, we should hear very little of bad work; our eyes would not be so often offended by its appearance, and much valuable life would sometimes be saved. Employers would, on engaging a man with such certificates, be confident that their materials would not be spoilt, and their money wasted; and every workman who owned such certificates would feel that he would be quite capable of executing any work entrusted to him with satisfaction to himself and to his employer.

E. G., a Workman.

to be the case, it would make fourteen hours' extra work in a week, which would amount to 8*h.* 4*d.* As "J. P." seems to infer that the employer requires a greater amount of profit upon piecework, I deduct 2*s.* 4*d.* 7*½* would then remain, which, added to the present wages would form an income of 4*s.* 8*d.*; and there is not one man in twenty but would earn this amount if allowed to do so.

Quoting from the letter in question, "J. P." says, "I have known men in small towns who have been pointed at as those who, by overwork, had brought themselves to death's door." I do not remember to have seen any such case, but do not tell whether it was piece or day work that produced this disease of the system. I have known many such, and know in what manner it had been brought on; with a great many, by their own folly, through being hardworkers, as we hard-workers when under the piece-work system, by overtaxing their strength for three or four days a week—days of (perhaps) fourteen hours, in order to make six days' wages, the other two or three days being devoted to what they call a "fuddle." There are, I know, to be found in almost every shop a certain one or two who may be termed the "rascals," or "leaders," who tax their strength and skill to the utmost, for the only inducement of being on familiar terms with the foreman, and being able to boast that they do more work than any other man in the shop. Now, because a few choose to run themselves over, it does not follow that the whole working community would imitate their example through the introduction of piecework. Let a price-list be drawn up, of every kind and quality of work, per foot, and a fair understanding between master and man, and I venture to say the working of the system would prove its success.

F. D.

"THE ARTIST AND THE PUBLISHER."

SIR,—In the last number of the *Builder*, "R." complains that my name, as the exhibitor of some sheets of "edible and poisonous mushrooms" at the South Kensington Museum, was more prominent than that of Mr. W. G. Smith, the artist who drew them; and proceeds to say, "This is not right; it is another instance of the mischievous presence of the middle man." The idea is quite new to me, that it is "mischievous" for a publisher to put his name to useful books because he is neither artist nor author. Does "R." mean to say that artists and authors ought to do without publishers? The book to which "R." alludes is intended to give certain large diagrams of Fungi exhibited in the Food Collection of the Museum, and the sheets are published in a portable form to enable the public to carry true figures beyond the walls of the Museum. I have no objection to a source of profit, which may be had for the gathering. The prominence given to the name of the person from whom the public may obtain the work is therefore quite in order. If the pictures had been exhibited as specimens of botanical drawing, my name but that of the artist would have been out of place.

Surely there are but few people who would give credit to the publisher for the skill which so manifestly belongs to the artist. The allusion of "R." to middlemen cannot apply to publishers, as the relative positions of "the artist and the publisher" can be readily seen by any intelligent man who takes the trouble to think about the subject.

ROBERT HAWKES.

"R." makes no complaint against Mr. Hawdick, but claims, and we claim too, that if a work of art is exhibited, the name of the producer of that work be shown at any rate as prominently as that of the publisher or exhibitor of it. It is a matter of principle, an important principle too.

WARRINGTON SCHOOL OF ART.

SIR,—The account given in the *Builder* of the 25th ult., under the above heading, of the gold medal awards to schools of art, refers to the competition which ended in May, 1867, but was not announced, I think, till only far to those schools which were successful in the competition of March, 1867, to state, that in the latter competition the only provincial schools which obtained gold medals were—Glasgow, Kidderminster, Manchester, and Nottingham.

A SECRETARY.

DURHAM UNION WORKHOUSE COMPETITION.

SIR,—Being the author of the design bearing the motto "Shield and Half Moon," which was assailed in such an untruthful manner by a person signing himself "Fairplay" in your last week's issue, I consider it a duty to your readers to bring the true facts of the case before them.

In the first place, "Fairplay" says the "guardians issued printed instructions." This was not the case, the instructions provided were written; each competitor having to procure a copy for himself.

"Fairplay" says, "The crooked fence was just the obstacle which every competitor was desirous of removing," he contradicts himself almost immediately after by saying, "it (i.e., the boundary or fence wall) is built as straight as can be drawn upon paper." If this be the case, where was the obstacle that competitors were so desirous of removing?

"Fairplay" states that "the plans have been measured, and likewise the site, and the result is that the site will neither accommodate the plan in length nor breadth." This assertion, like the others, is not the truth, as the buildings are of considerably smaller area than the site.

"Fairplay" says, "The plans are for a new house, and, according to the estimate, cannot be built for less than 3,000*l.*, while the average cost of the other seven designs is from 4,000*l.* to 5,000*l.*"

This, again, is false, as nearly the whole of the present buildings are retained in the design; and the estimated cost is between 7,000*l.* and 8,000*l.*, and not 9,000*l.*, as "Fairplay" says.

Even in the number of competitors "Fairplay" is mistaken, as, according to the committee's report, there were only seven designs sent in, instead of nine, as "Fairplay" says; and the estimates of the unprejudiced designs range from 4,000*l.* to 8,000*l.*, not from 4,000*l.* to 5,000*l.*, as "Fairplay" says. The lowest estimate was submitted by the author states, an approximate one. Like this competitor I could have sent an approximate estimate between 4,000*l.* and 5,000*l.*; but what would have been the result if the design had been put into execution, and in the end (as

is frequently the case in competitions) the cost had doubled the estimate?

"Fairplay" says "the plans were discovered to emanate from the office of a C.E." This is very like "Fairplay" and, like his other lying effusions, is without foundation, as the plans did not emanate from the office of a C.E. but from my own residence. Where can "Fairplay" emanate from? No doubt, time will solve the mystery.

"Fairplay" intimated that the plans were altered after being before the committee. This is again false, as the plans can be at any time produced the same as first sent in.

The above facts ought to be sufficient to convince any one of the faith to be placed in "Fairplay's" statements.

WILLIAM FOX.

THE CO-OPERATIVE BUILDING COMPANY.

SIR,—Your report of the formation of the Co-operative Building Company, says that no one but operatives will be admitted as shareholders, or to take part in the management of the company. Being president of the committee, I can vouch for the committee that no such rule is contemplated. Mr. Walton, in his lecture to the meetings at Wilcox's Rooms, Westminster-bridge-road, January 12th, stated that he had not mentioned the labourers in his lecture, but that they must not think he had forgotten them, nor think that they would not be permitted to avail themselves of the opportunity to become shareholders, that the company would be open to the public in general as well as the building trades, and the more shareholders the better.

Also for the information of the Plumber who writes from Hyde, and the trade in general, I would beg to state that we should be most happy to receive a committee of plumbers to act with the committee *pro tem.* We meet every week at the Brown Bear, Broad-street, Bloomsbury, on Friday evenings, at eight o'clock.

THE PRESIDENT OF COMMITTEE.

DRAINAGE AND WATER WORKS, GIBRALTAR.

SIR,—Our attention has just been called to a letter appearing in your journal of 15th December last, with regard to the above works, and signed "The Contractor." Will you allow us to say through your columns that the said letter is not from us, and that we are totally unacquainted with the author.

A. KYAN & Co.

Gibraltar.

CEMENT KILNS.

SIR,—Will you permit me to inquire whether any of your readers can furnish me with information respecting the best description of cement kilns at present in use, especially with respect to the application of the heat given out by the exterior of the kilns, for the purpose of drying the washed chalk in the tanks.

W. E. H.

CORROSION OF LEAD PIPES.

SIR,—I shall feel obliged if any of your readers can tell me an effectual preventive of the corroding action of the ground on lead pipes. In a case now under my notice some section pipes laid in marl and clay were so eaten away in thirteen years as to require renewal. I had the new ones surrounded with sand, but find they are already so corroded as to admit air, though having been in use only three years.

The water of the well has no effect on lead, as is proved by the inside of the pipes remaining perfectly clean and smooth.

JOHN HART.

TWO DAYS' NOTICE TO DISTRICT SURVEYOR.

Tolley v. Kell, Waring, Brothers, & Lucas.—In Westminster Police-court on Saturday last, Messrs. Kell, Waring Brothers, & Lucas were summoned by Mr. James Tolley, district surveyor of St. Margaret, St. John, and St. Peter, Westminster, for not complying with the 35th section of the Metropolitan Building Act, which requires two days' notice in writing before any building of any work in, to, or upon any building is commenced, to be given to the district surveyor, under a penalty of 20*l.*, to be recovered before a justice of the peace.

The district surveyor conducted his own case; Mr. Joyce, instructed by Messrs. Baxter, Rose, & Norton, appeared for the defendants.

From the opening speech of the district surveyor, it appeared that the defendants, as contractors for the Metropolitan District Railway, had taken down a house, No. 1, Smith's-place, York-street, and re-constructed the greater part of what was originally a party wall between Nos. 1 and 2 as an external wall to No. 2, which work, he submitted, required notice under section 38. He then proved service of notice on the 10th of January, calling defendants' attention to their neglect.

Mr. Joyce claimed exemption for the work under the 6th section of the Act, and stated that the wall was erected upon ground belonging to the railway company, and, although they were not actually using the wall at present, they could, and probably might, use it for affixing signals or placarding with notices.

The district surveyor said, assuming it to be a party wall, half belonging to the railway company, that he was entitled to notice for the other half, and informed the counsel that he was in error in stating that the ground belonged to the railway company.

Mr. Arnold.—The railway company cannot have the right to cut a hole through the wall into a gentleman's drawing-room, for instance.

Mr. John Man Inghal was called, and examined by the district surveyor. I reside at No. 30, York-street, Westminster. I am owner of No. 2, Smith's-place and the adjoining houses. The railway company purchased No. 1, and caused it to be pulled down; the wall erected is in lieu of the party-wall originally existing between Nos. 1

PIECEWORK.

SIR,—If you will allow me, I should like to make a few remarks upon the letter preceding mine in your issue of the 25th ult., your correspondent "Jack Plaine's" ideas and mine so widely differing upon the subject of piecework. I will endeavour to give a clearer proof, apart from personal experience, in support of my opinion, that piecework, as a recognised system, would be beneficial to employer and employee. The standard wages now in London are 37*s.* 3*d.* per week of fifty-six hours. Now I feel inclined to asserting that nearly every man could in eight hours perform the same amount of work as he now does in ten, with the object of 1*s.* extra per day in view, without having to bring into action that amount of physical exertion that would be detrimental to health. Taking this

and 2. The wall is entirely on my ground. I pronounce the deeds with plain assent.

Cross-examined.—Taking down the wall left the rooms exposed; it was necessary to rebuild it; the house was dangerous without. I believe it is done properly.

The district surveyor remarked that making it a case of emergency would not help the other side, as section 44 made it a condition that before the expiration of twenty-four hours after such work has been begun, notice thereof shall be given to the district surveyor.

Mr. Joyce.—I cannot sustain the defence longer, nor resist the infliction of a penalty; but as it seems we have been labouring under a mistake, and as I understand the district surveyor not to press for a heavy penalty, I trust your worship will make it as light as possible.

The district surveyor.—The amount of penalty is not my object, but the clear enunciation from the Bench of the necessity of giving notice. He then directed attention to the greatly-increased labour thrown upon district surveyors by the neglect, and said, knowing the respectability of the firm, it had been his unpleasant duty to question, and feeling certain that it was with them a question of principle and not of fee, he begged to join in asking the magistrate to make the penalty as light as possible.

Mr. Arnold, in summing up, said, I never had a clearer case, and cannot understand upon what grounds the defence was undertaken, except, as the learned counsel has stated, under mistake; but as this is the first case against the defendants, and in consideration of your request, I think the object sought will be obtained by the infliction of a nominal penalty of one shilling and costs; but should another case be proved against the same parties before me, I shall feel it my duty to impose the full penalty, namely twenty pounds.

Railway Companies and the Building Act.—Sir: As London is threatened to be overgrown, perhaps some further legislation is required, so that protection may be afforded to the public, and a little restraint put upon those companies who completely set at naught and ignore everybody else. Ranges of wooden workshops, with felt roof and iron smoke-pipes, have been carried up in Clerkenwell, clearly abutting on dwelling-houses. Substantial brick cottages have been abutting on the backstreet by the contractor, for his own convenience; and he shelters himself under the plea that they are for the use of the railway, when, in fact, they are his own private property, over which the company have no control. A. RAVENHOLME.

THE TRADES MOVEMENT.

The operative slaters of Glasgow have taken advantage of the pressure of work consequent on the late storm to strike for a rise of wages. The masters have resisted the demand, on the ground, says the *Workman*, of its being a breach of a distinct agreement, arrived at some time ago, that no change should take place on the rates without three months' notice.

The reduction of 10 per cent. in the wages of ironworkers, which has been determined upon by almost all the principal firms in South Yorkshire, has resulted in a strike on the part of the men.

In accordance with a notice issued by Messrs. Hawks, Crawshaw, & Co., a reduction of 1s. 6d. per ton for puddling has been made in the new plate-rolling mills. The men turned out on strike. This strike has occurred at a very inopportune time, as there are some excellent orders in course of execution. One Russian order for sixty-three bridges is to amount to 120,000*l.* An amicable settlement, however, was anticipated, as masters and men were to have a conference on the subject.

Mr. Roebuck has attempted to read the working men of Sheffield a lesson on the proper relations between labour and capital. He was listened to for a time, but at length the men hooted the hon. gentleman down. Subsequently, a proposal to award him a vote of thanks was indignantly rejected.

CHURCH-BUILDING NEWS.

Grendon Underwood.—Grendon Church, which has just been restored by Mr. Bruton, of Oxford, consists of nave, chancel, and western tower. Its date is the latter half of the thirteenth century, except the tower, which was built in the fifteenth century, at which period the walls of the nave were raised, the present roof put on, and several windows inserted in the walls. At that period, the chancel escaped, but about two centuries ago it was "improved" in the style then in fashion—a wagon-headed roof was put on it, and a broad flat-headed window inserted in the eastern wall. Subsequently the wagon-headed roof was plastered to the form of a semi-ellipse, severed through its longest axis. Fortunately the builders of this latter period left enough evidence of its former state to enable the architect to ascertain the dimensions and period of the destroyed eastern window, and sufficient remains of the glass to enable Messrs. Clayton & Bell to effect a restoration of that also,

and these gentlemen have inserted all they could of the old glass to prove the faithfulness of the restoration. The nave roof has only been repaired, and stained to an even colour, and the walls newly plastered, while the windows and chancel-arch have had a million, or a portion of a jamb, &c., inserted where necessary, though all the windows have been newly glazed. A new open-timbered roof has been placed on the chancel, with framed principals and arched ribs, wind braces, &c., of as high a pitch as the gable end of the nave would permit. The walls of the chancel, where the work would allow, have been pointed instead of plastered. The floor of the church has been laid with tessellated pavement, increasing in richness as it reaches the east end, encaustic tiles being used with it in the sanctuary. The benches in the nave are wrought out of the old ones, which were of oak, the top moulded rails being re-used where possible, and the standards being also of oak. The remainder of the work is of stained deal, and the mixture of the wood does not detract from the effect. The old pulpit, of the Jacobean period, has been restored and removed to the north side and placed on a stone pedestal. The font has been repaired and placed near the south doorway. The doors are of oak, all new, and have ornamental hinges. The chancel-fittings, including lectern and altar-table, are also of oak, and were executed by Mayretts & Son, of Oxford. The rest of the work was by Jones & Sons, of Oxford, and Anthony, of Waddesdon, the latter of whom did the masonry, glazing, and chancel roof.

Mentham (Suffolk).—The church here has been restored. It was built in the time of Henry VII. in the Perpendicular style; and at a later date was added a clearstory, lighted by eight windows, and the roof was flattened. This had become in so had a state that about eighteen months ago, a beam fell and smashed some of the pews. Mr. R. M. Phipson, architect, Ipswich and Norwich, was consulted, and it was found that nothing but a thorough restoration of the nave, with entirely new roofs for the aisles, would meet the case. This has been done. The floors have been laid with Minton's encaustic tiles; the old loose-box sort of pews have been superseded by oak-benches, with stained deal seats, and carved poppy-heads, on which are represented many of the flowers and fruits of the country, some also containing inscriptions carved on scrolls, in church text. The stonework of the windows has been refaced and restored, and the windows are filled throughout with cathedral glass in two tints, worked in different patterns. In order to stop all appearance of damp, the walls have been cemented inside, and finished in stucco, which will obviate the necessity of whitewashing hereafter. The stone arches have been cleaned; a gallery at the west end has been removed; and the base of the tower thrown open to the church by a small and not very ornamental arch. There is a new panel ceiling to the tower, which contains six bells; the battlements have been restored, and the outer roof released. At the east end of the south aisle were found a priest's squint, a somewhat large one, with its original door, and in the south wall a piscina in good preservation, and both are now laid open. Originally there was a chapel here, and it is intended to throw a screen across and appropriate it to a vestry, the tower having hitherto served that purpose. At the east end of the north aisle a small organ has been erected upon a platform—the only elevation in the church. The church is heated with Gedney's underground stove. The entrance-door into each aisle is new. The outer walls have had the rough plaster taken off, the flint work has been pointed, and the stone millions of the windows have been restored, and the stone dressings refaced. Several old trees in the churchyard fence have been removed, and the paths fresh gravelled. The work has been carried out by Mr. Grimwood, of Weybread; Mr. Jno. Groom, of Ipswich, and Mr. R. Gobolt, of Harleston, in that gentleman's employ, executed the carving. The works have cost about 1,500*l.*

Stamford Bridge.—A Chapel of Ease, attached to the parish church at High Catton, has just been consecrated. The edifice is intended to seat an congregation of 170 persons. It is dedicated to St. John the Baptist, and has cost about 1,500*l.* in its erection. Mr. G. F. Jones was the architect. The architectural design is Early English, of the thirteenth century, and the chapel consists of a nave and chancel. Its extreme internal length is 75 ft., and breadth 22 ft. Of the former 25 ft. are given to the chancel, and

50 ft. to the nave. The height from the floor to the apex of the nave is 27 ft. 6 in. The roof is high pitched, open timbered, and boarded—stained and varnished, whilst it is covered in with Westmoreland slates. The interior is lighted by lancet windows, the east end having three lights, with a quatrefoil window above; the west window is of two lancets, with quatrefoil head; the side windows are lancets, with stained horlogers. The whole are filled in with cathedral glass. A bell turret, containing two bells, stands on the chancel arch, and the turret is surmounted by a cross, which makes the extreme height of the edifice 43 ft. The porch is on the north side of the nave, and the vestry on the north side of the chancel. The chancel arch is of stone, with nail-head moulding, springing from an impost. A font of Caen stone, and furnished with an oak cover, stands near the entrance to the church. The seats are open, of deal, and stained and varnished. The whole of the ironwork has been supplied by Messrs. Fryer & Son, of York. The material of which the chapel has been built is Bradford walling stone, and the dressings are of Ancaster stone. The yard is enclosed by a brick wall and iron fence. The masonry and brickwork of the place have been executed by Mr. Grange. Messrs. Weatherley & Rymer have been the joiners; Messrs. Hodgson the plumbers and glaziers; Mr. Worthington the painter and stainer; Mr. Wood the slater; and Mr. Young the plasterer.

STAINED GLASS.

Nottingham Parish Church.—A window of stained glass, in memory of Mr. George Mill White (an honorary surgeon of the General Hospital, and practitioner in the town and county of Nottingham), has been erected by his brother, Major Loraine White, Military Knight of Windsor, in the lancet light on the north side of this church. The window represents Hope, with face gazing upwards, the arms stretched down, and the hands clasped together in an attitude of rhapsody. The Holy Spirit hovers over the figure, and sheds rays of glory downwards: around the upper part of the figure are angels in attitudes of prayer; this is all upon a ground of ruby. In the top part of the window, and within a circle, is treated according to ancient form, the emblem of the Holy Trinity. In the lower portion, and in connexion with the simple inscription "In memoriam, G. M. W.," is a panel of grisaille, founded on an ancient glass in Salisbury Cathedral, in the centre of which, and placed on the grisaille, is shown the anchor (emblem of Hope), which is designed so that the upper limbs form a cross, on which rests the crown of thorns. Above this is the alpha and omega. The ground-work filling-in is of a grisaille pearly glass. The artists were the Messrs. O'Connor, of London.

Telsbury Church.—Another memorial window, the gift of Mr. W. Hamilton Yatman, of High-grove House, has just been completed. It adjoins the one lately placed in the church by Mr. Alexander, and was executed by Messrs. Wallces, of Newcastle. It consists of four lights, which are divided transversely, and embrace two subjects, extending the full width of the window. The upper and larger is the Crucifixion, with groups of figures in the several lights, illustrating the various incidents recorded by the Evangelists. The subject at the base is the Entombment. The tracery is occupied by angels, bearing emblems of the Passion.

St. Saviour's, Southwark.—A stained glass window has just been put up in this church, the gift of the Rev. S. Benson, M.A., chaplain of the parish. The subjects are—1. The Christian desiring his heavenly rest. 2. The widows showing to St. Peter the coats and garments Dorcas had made while she was with them. 3. The Christian encouraged to faithfulness to the end by the crown of life. The artists are Messrs. Ward & Hughes.

Godstone Church.—A stained glass east window by Messrs. Ward & Hughes has been put up in this church, in memory of the late vicar, Archdeacon Hoare. The series represents the ministerial offices of Christ in His Church. In the centre light are three medallions representing the three great wonders of Redemption, the Crucifixion, the Resurrection, and the Ascension of our Lord. The lower side-medallions are symbolical of the two Sacraments: Baptism—young children are brought to Christ that He may bless them; Holy Communion—He is

making Himself known to the two disciples at Emmaus in the breaking of bread. Above, Christ the Good Shepherd extends his care over the "little flock;" and on the other side the net of the Gospel is being brought to land, and the produce of the miraculous draught laid at the feet of Him who had blest the disciples' toil. In the two upper medallions are the woman of Samaria and the Sermon on the Mount.

Leintwardine Church.—A stained-glass window has just been put up in this church. The style is Perpendicular, and the window is composed of four main openings and tracery. The artist has sub-divided the window laterally, and the spaces formed by the two centre upper divisions have been filled with Our Saviour restoring the Blind to Sight, the corresponding spaces below being filled with the Adoration of the Magi. The four remaining spaces in the side lights are filled respectively with the Annunciation, St. John preaching in the Wilderness, the Baptism, and the Presentation in the Temple. These subjects are all inclosed within canopies and texts of Scripture explanatory of the subjects are inscribed beneath each picture. The tracery is filled with the Agnus Dei; cup and vine; the Pelican in her Piety; the symbol of the Holy Ghost; with sacred monograms, surrounded by foliated work. The window was put up by Mr. C. J. C. Prestcott, in memory of his father, Mr. John Clarke Prestcott. It was executed by Messrs. R. B. Edmundson & Son, of Manchester, and is one for which they received the jurors' medal at the late Exposition in Paris.

Books Received.

A NEAR edition, in two volumes, of John Spencer's "Things New and Old," has been issued by Mr. Tegg. It is a book full of wisdom, and not to be objected to because mostly taken out of other men's books and sermons. As Dr. Thomas Fuller says in his preface to it (January 10th, 1657), "Is the spider's poison the better for being sucked out of herself, or bees' honey the worse for being extracted from flowers?"—The current *Quarterly Review* contains a valuable article on the British Museum, and which advocates the removal of the natural history objects from Bloomsbury. The writer is wrong, as other writers before him, in giving the whole credit of the new reading-room to Mr. Panizzi. The idea of a circular building for the purpose on the site it occupies, was first published by the late Professor Hosking, in the *Builder*, and the present building is the work of Mr. Sydney Smirke. Much is, doubtless, due to Mr. Panizzi; but to say that the reading-room, "the largest," as the writer calls it, "best built, best lighted, best arranged, and really most beautiful apartment the world has yet seen," issued forth, "full grown, from the brain of the British Museum Jupiter, armed at all points against criticism," is downright nonsense and great injustice.—An agreeable paper, entitled "Ramblings," in *Fraser*, shows what Gilpin (of the "Forest Scenery" &c.) did by means of his sketches, which were of a bold, generalizing character, picturesque rather than precise. These sketches—made with a reed pen and a brownish "iron-water" ink, and afterwards "toned" with a yellow wash—he used to give away to his friends, until it came into his mind that he might make by these means some money for the benefit of his poorer parishioners. He had already, out of the profits of his books, built and opened a school at Boldre for the children of day labourers, twenty boys to be taught reading, writing, and cyphering; twenty girls, reading, sewing, and spinning. To this school he wished to leave a permanent endowment, and also an aid to the school at Brockenhurst: so he sold for these ends a collection of his drawings, received 1,200l. for them, and put this into the Three per Cents.—The sum being still insufficient to carry out all his intentions, he went to work again with his reed-pen, at the age of seventy-eight, and in two years produced a large number of drawings. These, "the last effort of my eyes," were sold by auction at Christie's, and produced no less than 1,625l. The schools were endowed accordingly, and the Boldre children, in addition to being taught free of all charges, receive yearly, the boys a jacket, pair of breeches, and a green vest; the girls, a green frock and black petticoat." We heard only a day or two ago of a clever lady who had taken a similar step, successful in a smaller degree. A stained-glass window was

wanted in the parish church, partly restored, and funds were not forthcoming, on which the lady in question went to work, made little drawings of a number of the churches in the country, which were lithographed, and have been sold readily, far and wide, for the benefit of the window fund.—The February number of *London Society* is more than usually entertaining.

Miscellanea.

THE ROYAL GOLD MEDAL OF ARCHITECTURE.—The council of the Royal Institute of British Architects have resolved to recommend Mr. LAYARD, M.P., to the members for the Royal Gold Medal.

NEW CHURCH AT BRIERLEY, NEAR CUDWORTH.—The tender of Mr. Ridal, of Sheffield, for a new church at Brierley, near Cudworth, has been accepted. Mr. G. S. Fojljambe, of Osherton, has presented the site, together with 1,000l. towards the building, besides providing the endowment.

JETS OF NAPHTHA.—An artesian well of naphtha has been discovered at Kudaco, in the Caucasus, by boring. At the depth of 274 ft. from the surface the liquid was first struck, and for a whole month gave a supply of 1,500 barrels daily. Since then a fresh source has been met, which rises with irresistible force to the height of 40 ft. above the ground, the jet being 4 in. in diameter, and delivering a daily supply of 6,000 barrels.

MANCHESTER FIRE BRIGADE.—The superintendent of the Manchester Fire Brigade, Mr. Fozer, has just issued his official annual return of fires that have been attended in that city from September 29th, 1867, to September 29th, 1867. Of the total number of 291 fires, thirty-two have been serious, or one-sixth or more of the property destroyed; and 262 slight, or less than one-sixth destroyed. The total amount of property destroyed is 42,207l., out of 1,116,604l. at risk. There are 41 firemen employed. In 1847, the amount of property destroyed was 42,653l., or 21.4 per cent. on the amount of risk; in 1857, the amount destroyed was 30,237l., or 5.3 per cent. on the risk; in 1867, the amount destroyed was 25,055l., or 2.4 per cent. on the risk.

THE INSTITUTION OF CIVIL ENGINEERS.—At the meeting on January 28th, Mr. C. Hutton Gregory, president, in the chair, the paper read was "On the Relation of the Fresh-water Floods of Rivers and Streams, to the areas and physical features of their Basins; and on a Method of Classifying Rivers and Streams, with reference to the magnitude of their Floods—proposed as a means of facilitating the investigation of the Laws of Drainage," by Lieut.-Col. P. P. L. O'Connell, R.E. With the view of illustrating how far this method of classifying rivers as flood-producers was likely to prove useful, reference was made to some facts respecting the Mississippi and its tributaries, as recorded in the report on that river by Capt. Humphreys and Lieut. Abbot, who intended to show, in the author's opinion, that the method might be useful, if cautiously applied.

MR. FOTHERGILL COOKE AND THE ELECTRIC TELEGRAPH.—While glad of the recognition of Sir Charles Wheatstone's claims to honour on account of his share in the advancement of electric telegraphy, we hope the Government do not intend to overlook the unquestionable claims of Mr. Fothergill Cooke to recognition also as the introducer of the practical telegraph. The Society of Arts awarded their fourth gold Albert medal to Mr. F. Cooke and Mr. Wheatstone, but Mr. Wheatstone himself, cordially acknowledging that "Mr. Cooke is entitled to stand alone as the man to whom this country is indebted for its practical introduction" did not even claim his duplicate medal, though we think he might have fairly done so; thus leaving the honour of receiving it to Mr. Cooke alone. We must recollect, too, that Sir Charles Wheatstone is not the only one who has been honoured in connexion with the electric telegraph, but that Mr. Bright, the engineer, was also knighted, in connexion with the certainly noble work of merely laying the first line of telegraph across the Atlantic. It would be most invidious now to overlook Mr. Cooke's claims; and even were a knighthood not acceptable to him, there are other modes of doing him justice as well as honour.

A MINE ON FIRE.—The mine of Trien-Raisin, in Belgium, has taken fire, and 12,000 tons of small coal are burning.

EDUCATIONAL CONFERENCE, SOCIETY OF ARTS. A full report of the proceedings at the conference will be found in the "Journal of the Society of Arts" for January 31st.

TO PAINT OR PAPER ON DAMP WALLS.—Messrs. De Grelle have sent us, in reply to "G. D. B." and others, a sample of their prepared tinfoil to lay over the damp parts. As the inquiry is from numerous quarters, we depart from our custom, and say the address of the preparer of it is 79, Basinghall-street.

THE DILAPIDATED COURT OF JUSTICE AT TONBRIDGE.—Mr. Lonsdale, judge for the district, had to sit with hat and overcoat in the primitive justice-hall at Tonbridge, the other day. It is a curious old edifice, and in a bad state of repair. Something should be done, either to put it in a proper condition, or to erect another building for the purpose.

THE SUFFOLK AGRICULTURAL ASSOCIATION'S COTTAGE PLAN COMPETITION.—It has been resolved to publish six only of the plans, including the prize ones, the subscription and vote together amounting only to 27l. The cost incurred in reducing the plans, and lithographing 1,000 copies of each, was 28l. 10s., and other charges brought up the outlay to 36l. Copies may be had at 3s. each. Competitors who refused to allow their plans to be lithographed will not have copies sent them, but the other competitors will.

THE HURRICANE OF FRIDAY AND SATURDAY.—We do not recollect of so many casualties in London by any single gale as were caused by the powerful wind of Friday in last week. Chimneys have been blown down, and roofs and floors smashed, houses unroofed, gables-ends and even houses thrown down in various parts of the metropolis. Similar damage has been done in many of our country towns, and the whole country has suffered. At Bradford two chimneys, each 90 ft. high, were knocked over. At Batley a building 50 yards long, and three stories high, was blown down, and so on. The rain, too, swelled rivers and destroyed bridges, as on the Cambrin railway.

PROPOSED REBUILDING OF ST. ANDREW'S, HERTFORD.—The *Herts Guardian* says,—The news that plans are again invited for a proposed new church in this parish will be received with general surprise, and by very many with regret. It is a matter of common notoriety that several years ago, when designs were sent in for the church, those of Messrs. Smith & Son were accepted. They were exhibited in the Shire Hall as the accepted plans, together with plans from Mr. T. Y. Kington and other architects. The public will await, with considerable curiosity, the reasons to be given for quietly ignoring of plans that have been accepted; and, as such, publicly exhibited.

RESERVOIRS IN INDIA.—In fourteen districts of the Madras Presidency there are 43,000 irrigation reservoirs now in operation; and 10,000 more have fallen into disuse. The embankments by which their waters are retained in natural hollows, valleys and combs, average half a mile in length: one dam, now broken, is thirty miles long, and incloses an area of from sixty to eighty square miles. The Veramm tank comprises fifty-three square miles, has a dam of twelve miles long, and produces 11,450l. per annum. In Ceylon is a solid dam, built of cemented stone, and covered with turf, which is fifteen miles long, 100 ft. wide at the base, and 40 ft. wide at the top. Generally speaking, these enormous tanks are effective.

THE EFFECT OF STRIKES.—In the Town-hall, Newcastle, a number of working men recently appeared on the platform before an immense audience, their object being to condemn strikes and endeavour to win either the sum of 15l. or a gold watch of the value of 5l. These prizes were offered by Messrs. A. B. Joseph & Co. Mr. Joseph Cowen, jun., occupied the chair, and some gentlemen officiated as judges. There were thirty-five competitors in all, representing nearly every trade, and belonging to different towns and villages in the district. The subject of the speeches was "Strikes, and how to prevent them: showing their Disadvantages to Nations and Individuals." Each competitor was a *bona fide* working man, and no speech was read. Many of the speakers displayed considerable ability, and were warmly applauded.

STOPPING-PLACES, RAILWAY STATIONS.—"Piscator" draws attention to the erroneous design of the pavement of these places, and the nuisance that results. We are not disposed, however, to go farther into it. The architects of railway companies should take the hint.

THE ROYAL ACADEMY.—On Friday evening, 31st ult., the full members of the Royal Academy assembled in their council chamber, Trafalgar-square, to elect three associates. The following gentlemen, Mr. George Leslie and Mr. William J. Orbardson, were elected associate painters; and Mr. Thomas Landseer was elected associate engraver.

COMPETITION, PERU.—An architectural competition, open to all nations, is announced by the Peruvian Government; the subject being a design for a monument to commemorate the victory obtained on the 2nd of May, 1866, over the Spanish squadron. Drawings are to be sent to the Peruvian Legation in Paris, 66, Rue de Ponthieu, on or before the 15th of February.

EVERY ONE TO HIS TRADE.—A Bellhanger complains that at a house in Croydon the bell-hanging has been done by carpenters, who know nothing about it, and that it will soon prove worthless. If the latter part of the statement be correct the transaction is a fraud on the employer, and should be condemned. To the mere assertion that a builder had a carpenter who understood bell-hanging and allowed him to do it, we should have nothing to say. We are perfectly satisfied as to the advantages of free trade.

TRAMWAYS IN LONDON.—The Metropolitan Tramway Bill has passed standing orders before Mr. Palgrave, one of the examiners for Parliament. This Bill failed to pass during two previous sessions, but owing to an alteration made by Parliament in standing orders during last session the numerous technical difficulties previously existing were removed. The Liverpool Tramway Bill, promoted by the same parties, comes before Mr. Palgrave on Thursday. All opposition to it has also been withdrawn, excepting that of the Liverpool omnibus proprietors. It has been supported by the corporation of Liverpool and all the local authorities during the last two years, and it is believed it will be successful this year.

THE CHADWICK MONUMENT FOR BOLTON.—A large and influential meeting was held in the Temperance Hall, Bolton, convened by the mayor (Alderman Barlow), to initiate steps for a public recognition of Dr. Chadwick's liberality to that town. The Mayor presided. Lieutenant-Colonel Gray, M.P., and many gentlemen of prominence in the town took part in the proceedings. Mr. Barnes, M.P., expressed by letter his entire concurrence in the movement. The following resolution was adopted:—"That in commemoration of the munificent donation made by Mr. James Chadwick in providing improved dwellings for the poor and the establishment of an orphanage in this town, a statue be erected by public subscription, the design, material, and site for which shall be such as may be hereafter determined by the committee to be appointed at this meeting." Other resolutions were passed appointing the committee for carrying out the object of the meeting.

DONCASTER NEW MARKETS.—The tenders for the extensions and improvements of the Doncaster Cattle Market were opened by the market committee, at the Mansion-house. They were in two sets, namely, for the builders' and contractors' work, and for the ironwork,—the former series consisting of nine tenders, and the latter of twenty-seven. The work to be done under the first-named head is the building and completing of three new slaughter-houses, with pinning-pens and boundary walls, &c.; the laying out of a new cattle-market, making roads and paving floors, constructing drains, sheds, with all the necessary adjuncts. The lowest contract was that of Mr. Wm. Huddleston, of Lincoln, 4,298*l.*, and it was unanimously recommended by the committee. The highest contract was that of Messrs. S. & W. Pattison, Ruskington, Sleaford, namely, 5,366*l.* The smiths' and ironfounders' tenders were required for "the cast and wrought iron work necessary for constructing and erecting pens for 5,000 sheep, 750 pigs, and 120 fat beasts." The lowest contract was here again accepted,—that of the York Railway Plant Company, York,—namely, 1,020*l.*; the highest tender being 2,050*l.* 10*s.* 9*d.*, sent in by Messrs. Cliff & Company, Bradford. These recommendations of the committee will come before the council for confirmation on the 11th inst.

THE ANSTICE MEMORIAL, MADELEY.—The committee chosen by the subscribers have inspected the designs and plans sent in by architects. Upwards of fifty designs were placed upon the walls, and their merits discussed. Ultimately it was agreed that they should be again exhibited, after which the subscribers to meet to make a selection.

A STATUE OF DEATH.—A singular will case has come before the Roanoke courts. A M. Pira died last year, and left his property to his heirs on condition of their spending 1,500*l.* sterling in erecting a bronze monument on his tomb representing Death, under pain of forfeiting the property, in which case it would go to the sick poor of the town. The heirs wish to evade this clause. Why should they be allowed to do so?

MR. GLADSTONE AND THE TRADES UNIONS.—A special meeting of the sub-committee of trades' delegates, to arrange the proceedings of the conference to take place with Mr. Gladstone on the 18th of February, has been held, and it has been decided that the following questions form the subject of the conference:—(1) The limits of apprentices; (2) the minimum standard of wages; (3) piecework and overtime; (4) the alleged action of trades unions in driving trade to foreign countries; (5) the practical advantages of trades' unions.

TRINIDAD BITUMEN AND CHEAP GAS.—A limited company appears to have been formed for the purpose of working the bitumen lake of Trinidad, which belonged to the late Earl of Dundonald, as a substitute for bog-head mineral in the improvement of gas from coal. Mr. A. A. Cochrane, of Westminster, it is reported, has succeeded in obtaining excellent results, although the bitumen in its natural state contains about 23 per cent. of water and 28 of ash, with a good deal of sulphur. The application of bitumen to coal in the economization of gas has been patented by Messrs. Cochrane & Upward.

THE WESTMINSTER PALACE HOTEL COMPANY.—The half-yearly meeting of this company has been held at the hotel, Sir Charles Russell, bart., M.P., in the chair. The report stated that the gross receipts for the half-year ending December, 1867, had been 11,970*l.* 16*s.* 5*d.*, and the expenditure 9,666*l.* 2*s.* 6*d.*, leaving as net profit 2,304*l.* 13*s.* 11*d.*, which, after deducting 737*l.* 7*s.* interest on mortgage, and after charging the amount of the reserve funds, 9,411*l.* 19*s.* 11*d.* would, with the amount carried over after paying the last dividend, namely, 1,523*l.* 0*s.* 10*d.*, leave to the credit of profit and loss account 2,145*l.* 8*s.* 8*d.* The directors recommended the shareholders to forego a dividend this half-year. The chairman, in moving the adoption of the report, regretted exceedingly having to place so unsatisfactory a state of things before the shareholders as the recommendation of no dividend. This result was due to the great depression prevailing, and to the fact that the portion of the premises lately occupied by the India Board was still unlet and unsold. The chairman asserted that the utmost economy had been exercised. The report was adopted.

TENDERS.

For pulling down and rebuilding house, 9, Woodstock-street, for Mr. Machu. Messrs. Parris & Co., architects:—

Table with 2 columns: Name and Amount. Includes Winterton (21,330 0 0), Sawyer (1,430 0 0), Nightingale (1,236 0 0), Wilcox (1,190 0 0), Palmer (1,267 0 0), Ennor (1,138 0 0), Sharpington & Cole (1,130 0 0), Schofield (1,110 0 0), Crabbe & Vaughan (1,068 0 0), Faulkner & Lee (1,089 0 0), West (1,053 0 0), Crabbe & Vaughan (1,049 0 0), Snowden (1,045 0 0), Rogers & Richards (870 0 0), Perkins (827 0 0), Chitt (818 0 0), Smith & Simmons (735 0 0).

For the erection of a clock tower in the Old Haymarket, Leicester. (The furnishing of four statues of ancient benefactors to the town and the carriage not included.) Messrs. H. Goddard & Son, architects:—

Table with 2 columns: Name and Amount. Includes Osborne, Brothers (6349 0 0), Neale & Sons (889 0 0), Barfield (accepted) (546 0 0).

For house at Twywell, Northamptonshire. Mr. R. W. Johnson, architect:—

Table with 2 columns: Name and Amount. Includes Wilson (4336 10 0), Barlow (434 12 0), J. Henshaw (433 0 0), W. Henson (437 10 0), Gubb (429 0 0), Coates & Fletcher (421 17 10).

For proposed new Workhouse for the parish of St. Mary, Heath. Mr. R. H. Burden, architect:—

Table with 2 columns: Name and Amount. Includes Heath (486 00 0), Hill & Kitchin (80,073 0 0), Simpson (73,350 0 0), Foale (79,600 0 0), Piper & Wheeler (79,100 0 0), Carter & Son (78,385 0 0), Jackson & Shaw (78,850 0 0), Patman & Fotheringham (76,698 0 0), Higgs (76,350 0 0), Palmer (74,860 0 0), Myers & Sons (74,280 0 0), Masley & Rogers (73,610 0 0), Carter & Son (72,385 0 0), Mansfield & Pritchard (72,347 0 0), Mansbridge (72,238 0 0), Bracher & Son (70,500 0 0), King (69,873 0 0), Executors of John Adams (69,194 0 0), King & Sons (68,985 0 0), Hart (68,790 0 0), Webb & Sons (68,340 0 0), Lacey & Flaxman (66,476 0 0), Henshaw (66,430 0 0), Nutt & Co. (64,000 0 0), Sawyer (43,668 0 0).

For alterations and additions to the house and business premises of Mr. John Elmona, High-street, Leighton Buzzard. Mr. Frederick Gotto, architect:—

Table with 2 columns: Name and Amount. Includes Dawson (4385 0 0), Holdstock (363 0 0), M. Leachman (494 0 0), Adams (310 0 0), Whiting (300 0 0), Groom (accepted) (295 0 0).

For residence at Kettering. Mr. R. W. Johnson, architect:—

Table with 2 columns: Name and Amount. Includes Hawthorn (21,899 18 0), Henson (1,277 0 0), Barlow & Britten (1,202 5 0), Wilson (1,197 0 0).

For erecting tavern and shop in Old-street, St. Luke's, for Mr. A. Bowden. Mr. T. J. Hill, architect:—

Table with 2 columns: Name and Amount. Includes Brown (23,307 0 0), Chestnut (3,134 0 0), Sabey (3,749 0 0), Perry (3,016 0 0), Morland & Burton (2,896 0 0), Rivers (2,983 0 0), Webb & Sons (2,769 0 0), Ennor (2,634 0 0), Henshaw (2,629 0 0).

For alterations and reinstatements of No. 5, Shepherd's Market, Mayfair. Mr. Charles Innes, architect:—

Table with 2 columns: Name and Amount. Includes Wilcox (429 0 0), Preedy & Son (416 0 0), Thomas & Son (405 0 0), Snowdon (398 0 0), Fish (394 0 0), Henderson & Cairn (383 0 0), Simpson (388 13 0), Nightingale (382 0 0), Perkins (377 0 0).

For alterations and repairs to premises, Backlebury. Mr. J. Ebenezer Sanders, architect. Quantities by Messrs. Birdseye & Stoner:—

Table with 2 columns: Name and Amount. Includes Young (21,481 18 7), Collins (1,134 0 0), Colla (968 0 0), Ramsey (956 0 0), Forrest (accepted) (847 0 0).

For the erection of new schools at Fallowfield, near Manchester. Mr. Ernest Bates, architect. Quantities supplied:—

Table with 2 columns: Name and Amount. Includes Robinson & Son (21,130 0 0), Ward & Co. (1,120 0 0), Porteous (1,100 0 0), Quillish (968 0 0), Thornton (1,055 0 0), Grimshaw & Co. (1,040 0 0), Meadows (1,127 0 0), Hrows (1,005 0 0), Barber & Gibson (accepted) (1,000 0 0).

For a factory and stables in Peckham-grove, Camberwell, for Mr. Jones. Mr. Coe, architect. Quantities supplied:—

Table with 2 columns: Name and Amount. Includes Larke (2785 0 0), King & Sons (769 0 0), Batchelor (739 0 0), Johnson (719 0 0), Shapley & Webster (673 0 0), Smith (638 0 0), Mortar (554 0 0).

For building two houses at Stratford New-town, for the Temperance Building Society. Mr. William Faice, architect. Quantities supplied:—

Table with 2 columns: Name and Amount. Includes Nightingale (425 0 0), Fidler (419 0 0), Snowdon (356 10 0), Wheeler (338 0 0), Pierce & Booth (323 0 0).

TO CORRESPONDENTS.

H. L. J. S. R. W. J. H. F. G. M. R. B. J. J. M. C. A. M. H. C. J. R. P. C. A. Z. H. L. P. W. F. O. & K. J. H. W. H. B. J. M. F. J. T. W. B. C. P. H. H. B. F. P. R. F. J. G. S. J. F. R. & Son. T. J. H. T. C. G. T. L. D. D. O. H. S. & W. R. & G. J. E. S. M. E. W. W. F. C. L. W. E. W. A. O. C. H. S. (we cannot write letters on private disputes).—If a correspondent desires to send his name as guarantee of good faith, &c. (we are forced, uniformly, to decline).—G. H. T. (A. is wrong).—Mexican Architecture (continuation sheet).—W. H. (next week).

We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of Tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the author.

The Builder.

VOL. XXVI.—No. 1306.

The Epidemic of Fever at Terling.

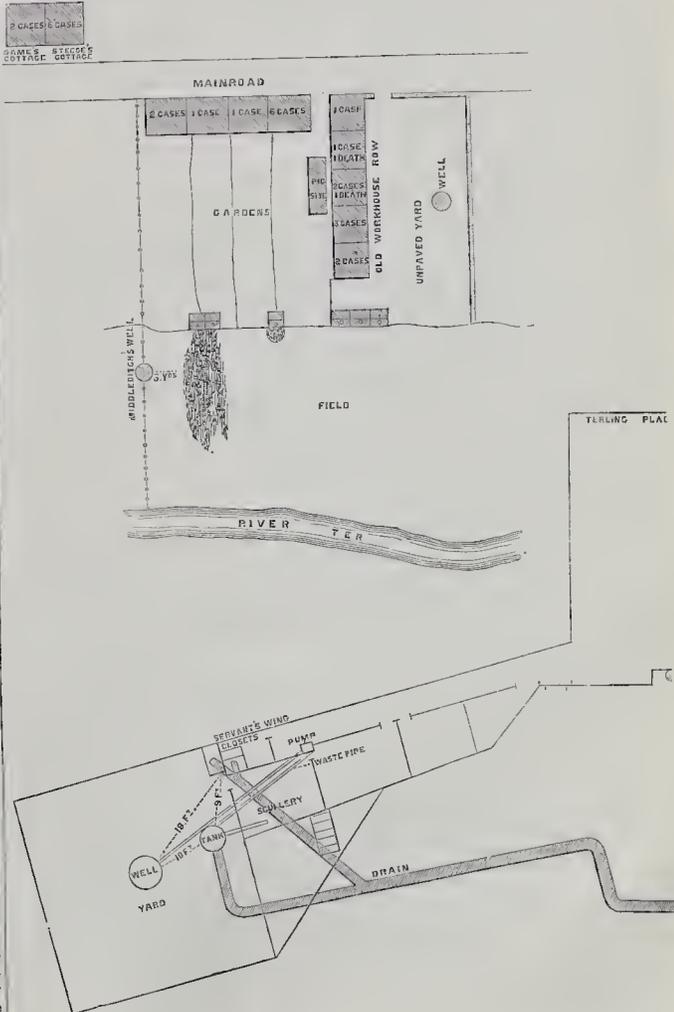

IN the whole range of medical science there is perhaps, in regard to acute disease, no causation so well made out as that of typhoid fever. It is now universally admitted to be the use of water polluted by fecal impurities. The evils resulting from sewage contamination are from day to day so prominently brought under the notice of the public in so many forms, the preventive efficacy as regards typhoid fever of perfect sewerage is so decided, and so many facilities are afforded by the advanced state of engineering science for the removal of objectionable conditions of soil, that one is fairly startled at the recital of the story of the outbreak of fever at Terling, as related by Dr. Thorne, the

Sanitary Council inspector, and which refers to outbreaks whose occurrence ought in 1868 to be impossible. Those who have had any experience of medical practice in low-lying country districts, know well enough that typhoid fever is seldom absent, certainly for any length of time, from the cottages that are seated beside the little running streamlets that meander through the villages in rural localities, and receive the filth from the privies, pigsties, and stables near them. The mischief thus done is great; it constitutes a very large amount of the sickness amongst the population of England, and a much greater crippling of the working power of the country, than appears on a superficial examination of the matter, for the simple reason that the death-rate is pretty low, and this is the only guide, and an indirect one is to the prevalence of the fever pest amongst the community at large. Water pollution, about which we have long spoken, is going on throughout the country, and its more than ordinary effects every now and again attract attention, as at the present time, and lead to the belief that some new influence is at work to produce disease where there is merely an intensification of a condition always existing to a slighter degree.

Too great prominence cannot be given to the matter. The facts of the Terling outbreak illustrate in a very clear and forcible manner the origin of typhoid fever so admirably that we place them on record as a valuable addition to sanitary science and to our earlier statements. Terling is a village in the Witham union inhabited by about 900 agricultural labourers, who are badly housed, and by no means well fed. The country is flat, and the important point to note is the fact that the soil is porous. In addition, all those conditions that conduce to the saturation of the ground with excrementitious and other filth, exist in abundance. The cottages are surrounded by every possible species of nuisance. In the first place, there is an allotment garden in the place, and the poor people assiduously collect whatever manure is to be got hold of into heaps, which are

allowed to stand undisturbed near their houses for a long time; moreover, cesspools abound,—the privy arrangements are of the most objectionable kind. Under these circumstances, there is abundant soakage into the soil of every kind of stercoraceous impurity. These nuisances are many of them placed on a higher level than the wells of the village which supply the water drunk by the cottagers. The wells are sunk in the gravel, are generally uncovered, and merely lined with bricks placed together without any mortar or cement. Some of the inhabitants drink water obtained from the ponds into which the drains from the field ditches and roadside discharge. Overcrowding is everywhere to be found in Terling; and this, of course, acts the part of an intensifier of the impurification of the place. In one instance, a woman suffering from fever occupied, with six of her family, a room 10 ft. long by 9½ ft. broad, and 6 ft. high; the chimney being blocked up, and the window less than 3 ft. square. So that each person in the room had less than the average of 82 cubic feet of air! The extent of the disease may be judged of by the fact that between December 4th, 1867, and January 13th, 1868, 208 persons had been attacked, and fresh cases were occurring daily. It is remarkable that the

majority affected by the fever were women, and children under fourteen years of age. It is supposed that the men and boys, being away from home in the fields at work, had no occasion to use the polluted water so frequently as the women and children, substituting beer instead to a great extent, and so escaping infection. Out of 145 attacks seventy-nine were those of children under fourteen years of age, and fifty of the remaining sixty-six were females. The presence of accumulated filth of all kinds upon and in the soil, and the peculiar porosity of the latter, were two factors which had much influence in the production of the epidemic; but the main point of interest remains to be discussed. The tendency of all the evidence which Dr. Thorne collected is to the effect that the great infective agency was to be found in a special state of the water-supply—a particular change in the level of the surface-water. It is held by some of the German authorities that typhoid fever breaks out when the surface-water falls; but Dr. Thorne arrives at an exactly opposite conclusion. He found that prior to the appearance of the epidemic the water had considerably diminished in quantity everywhere in Terling; during the preceding summer, in fact, there had been a drought. The lowest level, perhaps, was reached towards the

end of November. This was followed by a rapid and sudden flow of water into all the wells. In several instances the connexion between the rise in the level of the water and the outbreak of fever was clearly traced. Of course the sudden increase in the amount of water acted by washing the foulness of the soil into the wells. The following instances will illustrate the position here defined. In one of the most crowded parts of the village stands a row of five cottages,—Old Workhouse Row (see diagram). Behind them are some pigsties and accumulations of filth of every kind; there is a dirty unpaved yard in front; there is also an uncovered well. The cases of fever in the cottages were respectively, 1; 1 and a death; 2, and a death; 3, and 2. The water in the well having been deficient for two months, and others obtained from a well hard by called "Middleleitch's," rose again in November. A woman in house No. 1 was confined November 19th. She could get no water from the well in the yard, but a week after plenty was found in it, and this was used for drinking. The first case of fever in the "Row" occurred in this woman's family on the 6th of December, just ten days after the drinking of the water which had risen in the well,—and the interval here marked out coincides with the period of incubation of typhoid fever. Three days afterwards two more cases occurred in the same row of cottages, one on the 12th, and three more on the 15th. It seems that in these latter cases, as the water was not bright and clear at first it was not drunk for two or three days after its re-appearance in the well. Dr. Thorne, in like manner, accounts for the appearance of fever in the two cottages named Steele's and Gamo's, about a fortnight after they were able to procure water on their own premises, and in the four cottages intervening between the other two blocks already noticed. The epidemic did not spare any locality in the stricken district. Nine cases occurred in a detached wing of Lord Rayleigh's residence,—Terling place,—occupied by the servants; that is to say, amongst those who were living under conditions one would suppose of the most perfect hygiene. The only thing wrong was the drainage. Dr. Thorne says, in turning his attention to the discovery of the cause of the disease, he found "at the end of a long passage a pump, the water from which is used by the members of the household with the exception of the servants. This pump is supplied from a well 40 ft. deep, which is situated in a court-yard at the end of the servants' wing, and the pipe which passes from the well to the pump crosses a brick drain leading from two water-closets (see diagram). This pipe, which is a leaden one, I found to be perfectly sound. The drain was then opened, and, on examining it, it was evident that the mortar which was used to cement the bricks together was almost destroyed, and at the side of the drain which is nearest the well, a leakage had evidently taken place into the surrounding ground, which had a focal odour. Nine feet from this drain, and about midway between it and the well, is a brick cesspool, which ought only to receive the dirty water from the scullery and from a portion of the roof. On opening it, I was struck with the fact that the odour was most distinctly of a focal character." The well might have been polluted from the drain, or the cesspool. It is noticeable that the appearance of fever at Terling place and in the village was exactly coincident—a fact that suggests at once the operation of a general cause acting simultaneously over the whole area of the district. All the wells of the village are so placed as to be readily contaminated by focal filth.

Now, as we might have expected, typhoid fever has existed in Terling for several years past; and it is necessary specially to explain the peculiarly sudden and general outbreak of the disease recently. This is to be ascribed to the more than usual accumulation of filth and excrementitious matter, consequent upon the marked drought of last summer, and the saturation of the water to an intense degree by the rapid rise in the surface water which took place just before the outbreak in December. The points of prime interest in Dr. Thorne's report are these, viz., the coincidence of the onset of the epidemic with a rise and not a fall in the level of the surface water, and the correspondence between the ordinary period of incubation of typhoid fever and the length of time which elapsed between the rise of the polluted water from the before diseased well, and the occurrence of the first signs of disease. It may be as well to mention incidentally that the fever which has

lately prevailed at the Essex Hall Idiot Asylum, Colchester, has been shown to depend upon the use of water contaminated by sewage.

For the last two years occasional cases of fever have occurred in the institution; during the summer and autumn they increased considerably in number. The well was examined, and found to be poisoned by sewage from the common drain. Water was then promptly laid on from the Artesian well at the waterworks, and from that day the fever ceased to exist.

Terling has paid and is paying a terrible penalty for the neglect of the most ordinary sanitary precautions with which the nuisance authority is quite capable of grappling. The false economy of the owners of property will be seriously experienced in the expense to which the district will be put by the after-demands made upon the inhabitants, through the death and sickness which prevail.

An apt illustration of the want of "saving" faith is given by Dr. Lankester, as follows:—In Worcester typhoid fever is endemic, and the report made by the Sanitary Committee, appointed in 1866, to investigate the matter, showed that the influence of "overflowing privies and cesspools, imperfect drains, or an entire absence of them," in connexion with the use of wells very generally throughout the old cathedral town, must be exceedingly great. But the town council do not seem to be able to appreciate the idea of diminishing death and disease by the expenditure of a little money. Yet the death-rate, it is calculated, might easily be lowered from 27 to 17 per 1,000; or, in other words, the lives of 400 people and 8,000 illnesses might be saved annually. This would be equivalent to a gain to Worcester of 10,000l. a-year. It is to be hoped that the lesson of the Terling epidemic will have its due effect upon indolent nuisance authorities throughout the country. Typhoid fever is the offspring of deficient drainage, and it seems disposed to make its appearance throughout the country at the present time by explosions of serious intensity.

THE DRAINAGE OF LAND.*

MEN by constant practice acquire a wonderful skill in judging of the fall of the ground and the regularity they give to their grips, and where the ground is wet and the water either runs away or follows them they cannot get far wrong; but in dry ground, and especially where it is uneven, the eye of a most practised drainer is apt to be deceived. Too much attention cannot be bestowed to this part of the work, and the pipes should never be laid in the grips or covered up until the work has been inspected by the master or a trustworthy foreman. To obtain the levels over an estate or to lay out a large system of drainage, the use of a spirit level is absolutely necessary; and this instrument should only be handled by those who are fully acquainted with its management. For the drainage of single fields several simple and inexpensive levels have been invented, but they are not more effective or useful than the ordinary honing rods commonly used by workmen in setting out short sections of earthwork. These rods are made in the shape of the letter T, about 3 ft. 6 in. long, the cross being 14 in., and the size of the rods 2½ in. by ½ in. They should be painted white, and to render them more visible the top of one should have a black line about ½ in. deep on its upper edge.

The method of using is as follows: supposing, first, that across an uneven field (see fig. 1†) it is desired to give the drainers a guide as to the depth at which they are to cut their drain in the hollows and on the hills: driving a peg in at A, the upper end of the grip, and another at C, the lower end, an assistant holds one of the rods on the peg C; the other is held by the leveller at A, and the third by another assistant at any intermediate space between. The eye of the leveller is then directed along the top of the three rods, the intermediate one being either raised or lowered according to the nature of the ground, until the whole three are in a true line; when the peg is fixed, and the intermediate rod removed to another place. At B and D it will be seen that the ground is above the true line of inclination, shown by the dotted line, and a hole has to be dug with a spade or other tool to admit

of the rod being placed on the head of the peg; at B there is a depression below the line of inclination, and the peg stands out from the ground. The pegs having been thus placed, the drainer has only to take a rod, the depth the drain has to be; if 3 ft. deep, then a rod 3 ft. long, and measure from the top of each peg as he comes to them, the bottom of his grip at each peg being exactly 3 ft. below its head. For ascertaining whether grips have been correctly dug a very simple plan has been devised by the

author, consisting of a rod having a leg (see fig. 2) with the feet and inches marked on it, which leg is made to slide up and down it by means of two screws working in a slot, and can be fixed at whatever depth the drain is to be cut, say again, 3 ft. Then, when the sliding leg is fixed, the rod is 3 ft. longer than the others. To use this, the foreman places one of the other rods on peg A, the assistant places the other on peg C, and the rod with the long leg is held in the grip and moved along by the assistant; the foreman meanwhile directing his eye so as to keep the three in a true line. Any elevation or depression in the bottom of the grip is by this means at once detected. The use of these rods is acquired with very little experience, and levels can be ascertained with quite sufficient accuracy for all practical purposes.

If it is desired to find the inclination or fall of the ground, all that is necessary is to fix two pegs, about 10 ft. apart from each other, making them level with the aid of a straight edge and spirit level, or with a carpenter's level and plumb-hob; and then holding the two honing-rods as before on these pegs. The third rod with the sliding leg is to be held at the lower end of the grip, or wherever else it is required to level to, and then sliding out the leg until the top of the three rods is in a line; the distance the leg has to be slid out being the fall.

Pipes.

After trying various sizes and shapes for the pipes, opinion is now universally in favour of cylindrical tubes, 2 in. in diameter and 1 ft. long, for the small or feed drains, and from 3 in. to 4 in. in diameter for the mains. Some tilth-hummers manufacture a circular pipe, having a flat bottom; if they could insure that these would burn without the least twisting, there would perhaps then be a slight advantage in their having a better bearing on the bottom of the trench; but, as this is never the case, the flat bottom is worse than useless in rendering the pipes heavy and cumbersome. The author has repeatedly watched men laying these pipes, and not one in ten is laid with the flat part downwards, the reason given being that the men cannot make the ends fit when so laid. The circular pipes are less liable to warp and bend in the burning, having the same thickness of material on every side, and are therefore easier and better to lay. Collars are occasionally used, but are quite unnecessary, except in very rotten ground, when they are useful in assisting to keep the ends of the pipes from dropping away from one another. In such ground, in order to lay the drains effectually, the expedient should be resorted to of putting sods at the bottom of the trench, and treading them well down, so as to give a firm bed for the pipes to lay on. This is often absolutely necessary, and the only way of putting pipe-drains in boggy soils.

As the expense of carting pipes from the makers is a consideration in the cost, it may be mentioned that a one-horse cart will carry 800 2-in., or 600 3-in., pipes; and one horse will take this load easily on a good road, but it will require two horses to drag it over soft ground.

Cost.

The cost depends upon so many local circumstances, as the quality of the soil, the rate of wages, the depth at which the pipes are laid, and the distances apart, that it is impossible to give any fixed or definite sum. But it may be stated, as an average, that two men can dig out the trenches in a soft clay soil free from stones, lay the pipes, and fill in again at the rate of from four to five chains a day; and that an average price for pipes, at the maker's yard, is

* See pp. 40, 64, 93, ante. † See p. 41, ante.

11s. per 1,000 for 2-in. pipes and 4s. for 3-in. pipes. Having ascertained the cost of the pipes and the rates of wages for the district, the cost per acre can be calculated from the following table:—

Distance apart.	Number of Pipes required for 1 acre.	Number of Chains of Digging.
Yards.		Chains. Rods.
5	2,905	44 0
5½	2,640	40 0
6	2,420	35 2½
7	2,015	31 1
8	1,816	27 2
9	1,613	24 1½
10	1,432	22 0
11	1,320	20 0
12	1,209	18 1½
13	1,147	17 0
14	1,037	15 3
15	974	13 ½
16	907	13 0
16½	880	11 1½

The following examples, selected from cases which have come under the author's own experience, and which agree with the results given in evidence before the Committee of the House of Commons, may be taken as a guide as to cost:—

County.	Nature of Soil.	Depth of Drains.	Distances apart.	COST OF LABOUR.				TILES.				Sundries.	Total Cost per Acre.
				Rate of Wages per Day.	No. of Chains per Acre.	Cost per Chain.	Cost per Acre.	Cost per 1,000.	No. required per Acre.	Cost per Acre.	s. d.		
Devon.	Hard clay with stones, requiring use of pick	3 0	10	2 0	22	2 10	3 2 4	1 0	1,432	1 9 0	8 0	4 10 4	
Ditto	Ditto	4 0	5 6	8 1 0	..	1,432	1 9 0	8 0	7 13 0	
Gloucester.	Clay	3 0	11	2 3	20	1 4	1 6 8	1 1	1,320	1 7 9	7 0	3 1 5	
Ditto	Ditto	2 6	6	2 3	36½	1 0	1 15 9	1 1	2,420	2 10 11	10 0	4 17 8	
Lincoln.	Ditto	2 6	10	2 3	27	1 5	1 12 2	1 1	1,432	1 10 6	8 0	3 0 8	
Ditto	Ditto	3 0	8	2 6	27½	1 3	1 14 4	..	1,816	1 18 2	9 0	4 11 6	
Ditto	Silt.	3 0	11	2 0	20	1 0	1 0 8	..	1,320	1 7 9	8 0	2 15 9	
Ditto	Ditto	3 0	10½	2 0	16½	1 0	1 0 6	..	1,037	1 3 0	7 6	2 6 0	

The head of sundries has been introduced to cover the extra cost of tiles used for the main drains, for carting, and for cleaning out the small ditches and other incidental expenses.

The annual charge which is put on the land, allowing 5 per cent. interest on the amount of capital expended, and the repayment of the principal by annual instalments spread over a certain number of years, may be ascertained from the following table, which gives the annual amount to repay every pound expended with the interest:—

Years.	s. d.	Years.	s. d.	Years.	s. d.
1 ..	21 0	11 ..	2 5	21 ..	1 6½
2 ..	10 9	12 ..	2 3	22 ..	1 6½
3 ..	7 2½	13 ..	2 1	23 ..	1 5
4 ..	5 7½	14 ..	2 0¼	24 ..	1 5
5 ..	4 7½	15 ..	1 11½	25 ..	1 5
6 ..	3 11½	16 ..	1 10½	26 ..	1 4½
7 ..	3 8½	17 ..	1 9½	27 ..	1 4½
8 ..	3 1	18 ..	1 8½	28 ..	1 4½
9 ..	2 9½	19 ..	1 7½	29 ..	1 4
10 ..	2 7	20 ..	1 7	30 ..	1 3½

Thus, supposing a tenant enters a farm on a ten years' lease, and lays out his capital in draining the first year, and reckoning his money worth 5 per cent. for every pound spent, he will pay an annual charge on the land of 2s. 7d.; or, making the cost of drainage of a clay soil at the rate given in the above table, viz., 12s. 1s. 6d., the annual charge will be 11s. 9d. per acre. Putting the increased produce for the wheat crop alone during the ten years at an aggregate of three quarters to the acre, and making the price of this at 50s., will be equal to an annual sum of 15s., leaving a balance of 3s. 3d. annual profit, in addition to the 5 per cent. interest, the increase of other crops, and the saving of labour in working the land.

Tenant Right.

In order to encourage the improvement of land, some well-defined and acknowledged system of allowances to out-going tenants ought to be recognized; but, unfortunately, at present such allowances are entirely dependent on the previous agreement between landlord and tenant, and the arbitrary custom of a particular district. While in some counties tenant-right has become so established a custom as to be acknowledged almost as a right by the courts of law, in others it has gained so slight a footing, that if the incoming tenant objects to pay for any particular improvement, the valuers cannot allow it.

An authority on tenant-right says on this subject,—"No valuation can be claimed by law for drainage unless allowed by agreement, and unless the farmer has paid such allowances on entering to the farm; for if the farmer commences such work without an understanding on

the subject, he must look for remuneration from the expectations which induced him to commence it, which must have arisen as much from the increase of produce he anticipated as from any allowance that might be made him."*

The Committee of the House of Commons, which was appointed in the year 1848, to inquire into this subject, examined some of the most eminent land agents and agriculturists from every part of the kingdom. The evidence given by these gentlemen as to the allowances to be made for drainage were very various. The case divided itself into two parts: one where the tenant found both tiles and labour; and the other, where the landlord found the tiles, and the tenant the labour and carting. The evidence as to the time over which an allowance should extend for the former varied from five up to twenty-one years, and for the latter, from no allowance at all up to ten years. But there was less discrepancy as to the time over which the former was to run than the latter, the general opinion being, that from ten to fourteen years was a sufficient time for the tenant to be paid for his outlay, with a fair amount of profit. As to the time the effect of well-executed drainage would last, the answer given by one witness

perly executed and the landlord's money not thrown away. The practice in use in some parts of Nottinghamshire, as given in evidence by Mr. John Parkinson, of the landlord, in addition to finding tiles also finding a man to lay them, affords some guarantee for the efficient performance of the work. Baydon advises that the landlord should execute the whole of the work, the tenant being at the expense of carting the tiles and paying five per cent. on the outlay, and remarks: "This is an excellent arrangement, the landlord having a permanent interest in the land, is secured by his own workmen executing the drainage against any imperfect performance of the work. The charge is light upon the farmer; and at the end of twenty years the expense is repaid, and the land to be re-let at an improved value of at least one-third."

The Effect of Drainage on the Climate.

Before concluding this article, reference ought to be made to the important effect drainage is having on the rivers and underground supplies of water throughout the country. However advantageous drainage may be to the cultivation of the soil, it cannot be denied that its effect is otherwise on our watercourses. The rain rapidly discharged from the ground is poured into the rivers, which rise with sudden and impetuous freshes, and then as rapidly subside. The land being thus cleared of its surplus water, there is little or none left to percolate to springs and streams during the summer months. This want of water is beginning in some places to be seriously felt, and to it in a great measure alone can be traced the diminished rainfall in some parts of the country.

Two remedies suggest themselves: the one, the conversion of suitable sites into reservoirs for the storage of water in winter, to be used during the summer in irrigating the poorer grass land, and thus affording a due supply of moisture to the air by evaporation; the other by stopping the cutting down of timber in the wholesale manner in which it is now carried on. A heated surface soil reacts by its radiation on the clouds as they pass over it, and thus prevents many a refreshing shower, which they would otherwise deposit, or disperses them altogether. The foliage of trees, on the other hand, defends the soil beneath and around them from the sun's direct rays, and disperses their heat in the air, to be carried away by winds, and thus prevents the ground from being heated in summer.* As a shelter from winds, the utility of woods is evident. The evaporation which goes on by their leaves is a powerful and incessant cause of moisture; the least lowering of the temperature precipitates the vapour of the air, and the resulting water penetrates into the soil. Evidence is at hand to prove the truth of this theory. The rainfall over large regions of North America is said to be gradually diminishing, and the climate otherwise altering, in consequence of the clearance of forests; whilst, on the other hand, we have the very remarkable fact that, under the beneficial influence of a largely increased cultivation of the palm-tree in Egypt, rain is annually becoming more frequent. The climate of parts of Scotland has been wonderfully improved, and the crops increased on the plains, by planting the mountain sides with larches; and this example should be followed throughout the kingdom. Every lover of his country should exert all his influence to prevent the growing utilitarianism of the age from denuding our hedgerows of some of the most ornamental and beautiful objects which nature has sent to enrich the landscape and cheer the weary traveller on his way, and to teach us to lift our eyes from nature up to nature's God. W. H. W.

LONDON AND COUNTY BANK.—The directors state in their report that, after paying all charges and interest to customers, and making provision for bad and doubtful debts, the net profits amount to 82,624l. 15s. 4d. This sum, added to 7,081l. 1s. 1d., brought forward from the last account, produces a total of 89,705l. 16s. 5d. The annual dividend of 6 per cent. for the half-year, together with a bonus of 3 per cent. which will absorb 81,895l. 6s. 3d., and leave 7,810l. 16s. 2d. to be carried forward to profit and loss next account. The dividend for the whole year 1867 will thus be 20 per cent. A statement of the accounts will be found in our advertising columns.

PROFESSOR G. G. SCOTT
ON EARLY ARCHITECTURE IN GREAT
BRITAIN.

LECTURE II.*

My last lecture was rather antiquarian and historical, than instructive in any principles of art. It showed you how the Celtic inhabitants of Ireland and Scotland worked out for themselves,—upon Romano-British reminiscences, added to those of their own race,—a manner of building which, though severely simple, was by no means to be despised; and also how our own Anglo-Saxon forefathers went through a similar process, working partly on the same foundations, but more directly on lessons brought to them from Italy, though not always very well understood.

I might further have shown you (had it been my subject) how that both of these races were far more successful in the more delicate arts of embroidery, illuminated painting, and jewelry; and how little in their practice of those decorative arts they trusted to any but their own traditions.

I am not sure, too, whether in sculpture the pre-Norman English may not have succeeded better than in architecture,— quaint and untechnical though their productions were.

I fear, however, that we must admit that, in our own particular art of architecture, we have little to learn from their buildings, however interesting and quaintly picturesque; and that, though belonging to a branch of the great round-arched family, they fall—almost of all effort, certainly of any success—in developing that manner of building into a style of art.

That fearful deluge, whose destructive waves swept with such overwhelming fury over our land after the decease of the last—the sainted—monarch of England's older dynasty, may be likened to the sudden breaking down of its banks by some mighty river, which, while it sweeps from the earth the crops and the homesteads, leaving nothing but devastation on its track, yet deposits, in subsiding, a film of foreign substance upon the deluged soil, which adds to it a new productiveness, and, in time, far more than compensates for the loss and havoc which accompanied it.

So it was (at the least with architecture), after the Norman conquest. The old manner of building which, during a course of nearly five centuries, had failed to generate any development of a truly artistic character, was swept once and for ever from the face of the earth, so much so that some have denied its very existence, but there was substituted for it a style which, if at first little less rude than its predecessor, contained within itself the germs of a thoroughly sound artistic system, which speedily germinated into a series of developments, the most glorious which, perhaps, man has ever yet seen.

We have the clearest evidence, both from the statements of old writers, and such as we derive from our own observation, that the style of building introduced into England by the Normans, was viewed as a distinctly new one—a "*novum genus compositionis*," and in no degree as a development of that which preceded it in this country.

How far the Norman style was distinct from the Romanesque of other parts of the north of France is a question which it would be curious, though difficult, to investigate. I think it might be shown that architecture, both in France and other countries of Western Europe, made a sudden forward start after the thousandth year of our era; possibly owing to the relief experienced at finding the futility of the prevalent fears that the world was to come to an end in that year. If such a simultaneous impulse did take place, it would be especially felt by a young and energetic race like the Normans, newly admitted into the Christian European family, recently reclaimed from the savage barbarism of Scandinavia, and grafted on to the old and comparatively civilized stock of France. Unlike, too, the other portions of France, Normandy had lost, in all probability, a large proportion of her ancient churches by the devastation of this very race while yet pagan; and nothing would be more natural than that, when Christianized, settled down, and instructed in the arts of their new neighbour, they would feel a special impulse towards repairing the effects of their own devastations, and would, while

doing so, take a vigorous course in developing the manner of building in which they had been so newly instructed. I would not, however, wish to claim for the Normans any great degree of originality in architecture. Different districts of France each possessed its own local variety of Romanesque, though all clearly of one family; and Normandy, like the others, had its own variety, and that a vigorous one; and to ourselves the most interesting, as having been transplanted into our own country and become the parent of all our architectural developments. What was the form of Romanesque which prevailed in Normandy before it was overrun by the Northmen and transformed into Normandy, I think we have no means of judging; the relics of its buildings being so few and fragmentary as to offer no distinct evidence; but just as the converted Northmen in the days of Canute were in this country the earnest restorers and builders of churches, so did those who had settled in France become the vigorous promoters of the art which they had once destroyed; while, by a remarkable coincidence, they were the means of bringing over in a succeeding generation to those of their own and kindred race in England the developments which they had generated under more favourable circumstances and guidance in the country which had for a century and a half adopted them into its own family.

If, however, the more vigorous pursuit of the building arts in France dates, as I have conjectured, only from the opening of the eleventh century, and was only contemporary with the revived impulse in this country under Canute, it follows that the mode of building introduced by the Normans was not only to the English, but in reality, a *novum genus compositionis*.

Quite in accordance with this is the character of what we call in this country Early Norman. Had Norman architecture been fully matured before its transplantation into England, we should not recognise its earlier productions by evidences founded upon rudeness and immaturity; yet such is unquestionably the case. Noble and vigorous as are the works of the Normans of the early days of their occupation of England, they undoubtedly bear evidences of an early and archaic stage of their form of art; and, even in Normandy itself, we do not find buildings of great architectural importance of dates much antecedent to those of the first structures built by the invaders of England. Early Norman in England would still be Early Norman, if in Normandy; so that we may consider the style, though generated on French soil, to have run the greater part of its course *pari passu* in both countries.

The investigations made, and recently published, by M. Bonet, of Caen, into the architectural history and changes of the abbey church of St. Stephen, founded in that city by the Conqueror, fully bear out this view, and show that the church, as built by William, was a very different and much more archaic structure than that which we now see; a large proportion of the more prominent features of which are proved to be the overlays of later, though still Romanesque, times.

As it is not my purpose, generally, to illustrate my description of the Norman style by its productions on its native soil, I shall select the church just named as the *point de départ*, by means of which I shall transfer my consideration of the style from Normandy to England. There are several churches of earlier date than this, such as parts of the abbey churches of Jumièges and Bernay, but St. Stephen's is clearly the great connecting link. In the first place, it was rebuilt by the Conqueror, and was in actual progress when he invaded England; and, in the second place, Lanfranc, the first abbot of St. Stephen's, which was built under his direction, was also the first metropolitan of England appointed under the Norman dynasty, and immediately on his assumption of the see of Canterbury,—only four years after the arrival of the Conqueror,—he commenced the rebuilding of the cathedral (then lying in ruins), after the almost precise design of his own abbey church at Caen. This abbey church, then, at Caen, and the metropolitan church of England, were built under the influence of the same monarch and at the same time; for, though St. Stephen's was first begun, it would appear that Canterbury was finished first: they were built under the direction of the same ecclesiastical head, and in all leading features are the same design, their plans being absolutely identical. The only difference of importance was the existence at Canterbury of the crypt, on which

the choir was raised by many steps,—a reminiscence of the church built by St. Augustine, described in my last lecture, while such did not exist at St. Stephen's. Both churches had naves of eight bays in length, in addition to which both had a western façade, with two flanking towers.

The transepts of both churches are of two unequal bays, and the outer bay of each had a gallery all across it, supported by a massive pillar (as at Winchester); in each there was in both transepts an apsidal chapel repeated on the triforium level; and though both have lost their original choirs, the probability is that both were of two bays long, with the addition of a simple apse. Professor Willis has shown that their very dimensions were nearly identical.

It has been discovered that at St. Stephen's the western towers were a subsequent addition, though so early that little difference can be observed in their details. I give drawings of capitals from the nave and the western towers, which are identical. I judge from this that the towers at Canterbury were a derivation from the design of St. Stephen's, which was at once rectified by adding them to the prototypic building.

The piers of St. Stephen's are oblong masses, divided at each end into groups of three large shafts. To this are added, on the side facing the nave, shafts, alternately single and triple, which ran up to the roof. The triforium story is almost a repetition, to a less height, of the main arcade; though, where it passes the western towers, it is divided into two sub-arches by a single shaft. Mr. Parker, whose excellent paper on the subject will be found among the Transactions of the Institute of British Architects, seems to think that the triforium floor was of timber, and the aisle unvaulted. Professor Willis was under the impression that it had no floor, but that the two stories were united, as is now the case at Rochester. This, I think seems disproved by Mr. Parker's paper, and by M. Bonet's drawings, which show a doorway opening into the triforium story. This story is at present vaulted above with a half-barrel vault. This Mr. Parker thinks an addition; but M. Bonet shows a remnant of it embedded in the east wall of the transept, where the old choir aisle has been removed, which seems to suggest its being original.

The greatest alteration which the older portions of the church have undergone is the addition of vaulting to the nave and the entire transformation of the design of the clearstory in a later Norman style, which, to a casual observer, seems to work in so well with the older parts as to appear original. M. Bonet and Mr. Parker have found the remnants of the original arcade,—which were uniform in height and incompatible with vaulting,—both in the nave and transepts, proving that vaulting was not contemplated in the first erection.

I am, however, rather anticipating my history, and must fall back upon a somewhat earlier period; for, though Canterbury Cathedral was probably the first church erected in England after the Norman Conquest, it was nevertheless by no means the first Norman church; for it was in a Norman minister that the Conqueror had, full four years before the works at Canterbury were begun, received at the hands of an English archbishop the crown of England.

You will remember that as early as 1013 Ethelred and Emma, the parents of King Edward the Confessor, had fled with their children from the fury of King Sweyn to the court of Bjarndar Bon, duke of Normandy. It followed that the education and tastes of the future king were Norman; and long subsequently, after he ascended the throne, England so swarmed with Normans as not only to excite discontent but to give occasion to civil war. It was, then, natural that, when King Edward determined (about 1050) to refund the Abbey of Westminster, he should adopt for his new work a Norman rather than an English design. We accordingly find it spoken of by William of Malmesbury (writing in the following century) as "That church which he, the first in England, had erected in that mode of composition which now nearly all emulate in its costly expenditure." Matthew Paris,—a century later,—says that Edward "was buried in the church which he had constructed in that new mode of composition from which many of those afterwards constructing churches, taking example, had emulated it in its costly expenditure." These notices by men of whom the one knew most and the other might have known all of the Norman

* Royal Academy, January 30, 1868.

† See pp. 70 and 80, ante.

churches in England, are sufficient to prove the Confessor's church to have been not of Anglo-Saxon but of Norman architecture; and, as they thought, the earliest of its style in this country.

Whether that erected by Earl Harold at Waltham, and consecrated in 1060, was in the same style, we cannot ascertain. His proclivities were certainly not Norman, yet he may have adopted the fashion just coming into vogue, though we find that other churches built nearly as late, and some even subsequent to the Conquest, still retained the older and more national character.

The church built by the Confessor at Westminster is thus described by a contemporary writer:—

"The house (*domus*) of the principal altar, constructed with very lofty vaultings, is compassed round with squared (stone) work uniformly jointed; the aisle around the building itself is shut off by a double tier of arches from either side, the continuity of the work being firmly consolidated in every direction.

Further, the cross (transept) of the temple which would enclose the choir of those singing the praises of God in its midst, and by its twofold support on either side would sustain the lofty apex of the central tower, rises at first simply with a low and massive vaulting; it then swells out with several staircases, skillfully ascending with many windings; then with a plain wall it runs up to the roof, which is of wood, carefully covered with lead.

Below, however, and above are arranged in order chapels (*domicilia*), which are to be consecrated through their altars in commemoration of apostles, martyrs, confessors, and virgins.

This multiplicity of a work so vast was, however, begun at such a distance from the east of the ancient temple, that even some part of the nave which was to lie between them, intervened with ample space, lest the brothers occupying it should be interrupted from the service of Christ."

Another contemporary writer describes the church as "upheld by diverse columns, and vaulted everywhere with multiplicity of arches."

- From these accounts we may gather:—
1. That the church was apsidal.
 2. That the aisles were of two stories, and each of them vaulted.
 3. That there was a lofty central tower under which the choir sat, and that this had winding staircases, and was covered with a timber roof and leaded.
 4. We further learn that the church contained numerous chapels and altars placed both below and above, and that in the eyes of one who had, perhaps, lived to see several of the new Norman churches commenced, it appeared a work of vast size and great multiplicity.

Lastly, we find that it was placed so far to the east of the ancient church, that not only were the services in that church never discontinued, but that a portion of the nave of the new church might be erected. The latter proves of course, that the entire nave was not completed by the Confessor himself, as he died within a few days after the consecration.

A writer of the thirteenth century, in a poetical life of the Confessor, thus describes his works at Westminster:—

"Now he laid the foundations of the church with large square blocks of grey stone; its foundations were deep; the front towards the east he makes round; the stones are very strong and hard; in the centre rises a tower, and two at the west front, and fine and large bells he hangs there. The pillars and entablatures are rich without and within, at the bases and capitals; the roof rises grand and royal; sculptured are the stones and storied the windows; and when he finished the work, with lead the church completely he covers. He makes there a cloister, a chapter-house in front towards the east, vaulted and round, . . . refectory, dormitory, and offices, in due order."

This description adds to what I have before stated, that there were two western towers, though these were not really erected till later, but were, nevertheless, in all probability a part of the first design. It tells us also of the monastic buildings.

Of the scale of this first Anglo-Norman church we have some indirect means of judging. In the first place, it is unlikely that a church of royal foundation, built in juxtaposition with the palace, and intended as the burial-place of its founder, built also in substitution for a pilgrimage which he had vowed to make, should be other than of similar scale to the

great churches erected at the time in the country whence he borrowed his architecture. In confirmation of this we have several evidences, not necessary here to state, that it differed but little in scale from the present church; indeed, had it been otherwise, the succeeding historians would hardly have spoken of it in the terms which they make use of.

As to its architectural character, we have little to guide us. We have the extensive sub-structure of the dormitory and the lower part of the refectory. From these we find that the offices were of the plainest variety of Norman; indeed, the pillars of the first-named structure are of the very extreme of massive simplicity, and the shafts of the refectory arcading have cushion capitals of the most normal type.

We have recently discovered, beneath the pavement of the altar space, the bases of two of the great piers of the Sanctuary; from which we find that they were clustered, not unlike those at St. Stephen's at Caen. The bases consist of a double hollow, precisely like one from that church. The work is by no means so rough as that common in early Norman buildings; a circumstance which I have noticed in several pre-conquestual works.

Having noticed this one building in which Norman architecture was used in England before the Conquest, I will mention one or two instances of Anglo-Saxon architecture being used subsequently to that event. I refer especially to two churches (St. Mary's and St. Peter's, at Gouta,) in the lower town of Lincoln. This portion of the city did not exist till after the Conquest; when, owing to the expulsion of many of the inhabitants of the old, or upper, city to make way for the Norman castle and cathedral, they were obliged to build below the hill, where they founded these two churches; building them in their own old English manner, while the castle and minister were being erected by the Normans in conformity with their own taste above. There are a number of towers between Lincoln and the Humber which correspond so closely in style with these as to lead one to assign to them the same date. Nothing can more manifestly prove the distinctness of the two styles than that the most marked church of the period was built by the Norman-loving Anglo-Saxon king in Norman architecture before the conquest, and that old-fashioned English people still built in the Anglo-Saxon manner in the days of the Norman Conqueror.

It is time now that we should consider what were the distinguishing characteristics of the Norman style.*

THE PROPOSED ENLARGEMENT OF NEWGATE: THE CORPORATION AND "THE BUILDER."

In the *Builder* of the 1st inst. there appeared an article under the heading "Proposed Enlargement of Newgate," which most of our readers have probably read. After explaining the costly surroundings of the prison, such as the City end of the Holborn Viaduct, the new Meat Market in Smithfield, and commenting thereon, the article goes on to say:—

"It is proposed to take in the best part of Warwick-square, some of Tylor's Market—which many people think is part of Newgate Market—and some courts and alleys adjacent. If this is done, of course the present proprietors of the required premises will have to be bought out handsomely. As they are mostly publishers, or connected with the commercial department of literature in some shape or other, they cannot be 'improved' out of the way without money. Then there will be the freeholders to settle with, and after that the old buildings to be pulled down and the new ones put up," &c.

Portions of the same article were copied into the *Times* and other daily papers, and opinions expressed in proportion to the extended circulation of the rumour, to the effect that Newgate, instead of being either altered or enlarged, should rather be swept away altogether.

It must be understood that the Old Bailey Court House—that terror of judges, but venerated pile of aldermen—was included in the condemnation. It is time that execution should be at last done on executing Newgate. We are not without sources of information in the City, and we have, upon wide inquiry, heard only one opinion, and that has been in perfect unison with what we previously expressed, and what we say now.

The proposed enlargement and alterations for the enlargement of Newgate, were

* To be continued.

the common talk of the "pigeons" in Guildhall-yard for many weeks before we sent the branded scheme flying through the town. Well, then, what was our astonishment to read the following in the report of the proceedings of the Court of Aldermen, held on Tuesday, the 4th instant, in the court-room, Guildhall:—

"The Gaol of Newgate.

Alderman Sir W. Rose called the attention of the Court to a paragraph relating to the gaol of Newgate, which had been copied from the *Builder* into several of the daily journals, to the effect that a very large and undesirable outlay was about to be incurred in extending the limits of the prison, and that with that view the Corporation was about to purchase a large piece of ground. The fact was, he said, that a very small outlay had been sanctioned by that Court, there being ample space within the existing walls for any enlargement that might be required. It was absolutely necessary that there should be a gaol of detention within the City and in immediate connexion with the Central Criminal Court, which had jurisdiction over eight counties. Under these circumstances, considering that only a small amount of additional accommodation had become necessary, and that an outlay of only about 600*l.* had been authorised for providing it, he had thought it right to make that statement, the more so as the public had been led to infer that the Corporation was about to expend a large sum, and, as in some instances, the paragraph in question had given rise to editorial comments founded on erroneous information.

Mr. Alderman Copeland said there were now only eighty-seven prisoners confined in Newgate; but when he was Lord Mayor in 1828-29, there were sometimes as many as 500 waiting for trial, and after trial hundreds were detained there awaiting transportation.

The matter then dropped."

We, however, beg leave to take it up for a short period. Alderman Sir W. Rose is, no doubt, a very estimable, truth-loving gentleman, but he will find, we hope, before he has finished reading this article, he is not the only truth-loving person in this world who goes about with his eyes open.

Again, in the Court of Common Council, held at Guildhall on Thursday, 6th inst., under the presidency of the Lord Mayor, the prison came up again:—

"The Gaol of Newgate.

Deputy Fry asked whether there was any truth in the report that an enlargement of the gaol of Newgate was in the contemplation by the Court of Aldermen. Again, if that were not so, whether the subject of removing the gaol to another locality had ever been under the consideration of that court.

Alderman Sir William Rose repeated the statement he made in the Court of Aldermen on Tuesday last, to the effect that 600*l.* was about to be expended in alterations connected with the prison; that it was a house of detention as well as a gaol, and was used as such in connexion with the Central Criminal Court, to which, as having a jurisdiction extending over eight counties, besides that of the Admiralty, it was indispensable. There had never, to his knowledge, been any intention on the part of the Court of Aldermen to remove the gaol to another locality.

Mr. Bonnewell reminded the Court of the statement in the *Builder* on the subject, and asked if it was true. The Lord Mayor said there was no foundation whatever for that statement.

The subject was then allowed to drop."

Mr. Bonnewell, because he had received no reply to a cool inquiry made by him as to the truth of our statement the day after it appeared, favoured us with a letter of reproof, wherein he takes upon himself to discourse thus:—

"You will see by the report in the *Times* that the matter was brought before the Common Council yesterday, when the Lord Mayor gave an unqualified contradiction to the statement. You will excuse my expressing an opinion, that in future, before you bring reckless and unfounded charges against any man holding a public office, it would be as well to make the necessary inquiries as to the accuracy of the charges made before publishing them to the world."

"We do not excuse Mr. Bonnewell; but let that pass for the present. The accuracy of this journal has been seriously, not to say grossly, impugned, and we have been very properly asked by some of those who have read the contradiction, if we could produce any tangible authority for saying that there was a proposal to enlarge the prison. It was thought probable that we might have been told of the matter as a rumour of idle gossip, and so have been misled, as many other well-meaning people have been before us. It was not so. We had very good authority, and here it is, in the shape of an advertisement:—

"We, being two of the aldermen of the city of London, and two of the visiting justices of the gaol of Newgate, and having jurisdiction within the city of London and the district of the said prison, do, by this our certificate, specify that there is a necessity for an alteration in or at the gaol of Newgate, and that the houses and premises specified in the schedule hereto are required for the purposes of effecting such alteration; and we do hereby give notice that this presentment will be taken into consideration at the Court of Lord Mayor and Aldermen of the said City, to be held in the Inner Chamber of the Guildhall of the said City, on Monday, the 13th day of January, 1868.

Dated this 15th day of December, 1867.
ANDREW LUSH,
WALTER S. HALL.

The Schedule above referred to:—
House and premises, No. 1, Newgate-street, in the occupation of the officers of the gaol of Newgate.
Passage to the premises known as Tylor's Market, and

the sites of houses now pulled down on the western side of the said passage, and the counting-house, stalls, and other conveniences abutting on the said passage.

House, workshops, and premises in Warwick-square, abutting upon Newgate, and in the occupation of Joseph Taylor & Sons.

House, workshops, and premises, No. 9, Warwick-square, in the occupation of Benjamin Manning.

House, workshops, and premises, No. 8, Warwick-square, in the occupation of Ann Straker & Sons.

The site of a house and premises in Warwick-square, now burnt down, late in the occupation of Messrs. Biggs & Collins, or their undertenant.

House, workshops, and premises, No. 11, Warwick-square, in the occupation of William Henry Hayden, or his undertenant.

House, workshops, and premises, No. 11, Warwick-square, in the occupation of Woolley, Sanders, & Co.

House, warehouses, workshops, and premises, No. 12, Warwick-square, in the occupation of Messrs. Copstake, Moore, Crampton, & Co., and the site of the court along the south side of the said premises.

A vacant piece of land in the south-west corner of Warwick-square, adjoining the last-mentioned premises.

The "presentment" is signed "Andrew Lusk," "Warren S. Hale." It appeared week after week in the advertising columns of the public journals. Is it a hoax, or is it a forgery? Let us know that. We wish it to be remarked that the aldermen whose names are to it are visiting justices of the prison, and they certify in a formal manner "that there is a necessity for an alteration in or at the goal of Newgate, and that the houses and premises specified in the schedule hereto are required for the purpose of effecting such alteration." It is addressed to the "Court of Lord Mayor and Aldermen," and the consideration was fixed for the 13th of January. That being so, both the Lord Mayor and Alderman Rose were bound, officially, to be in the knowledge of its contents. The next time, therefore, that Mr. Deputy Fry and Mr. Bonnewell meet the Lord Mayor and the Aldermen in the Common Council, let them put their fingers on the present page of the *Builder*, and ask, "What is the meaning of this?" Will either the Lord Mayor or Sir W. Rose have the bravery to repeat, in the face of this "presentment," that "there was no foundation whatever for the statement in the *Builder*?" We feel strongly on this matter. It looks somewhat odd—"a strange coincidence," we should say,—that neither Alderman Lusk nor Alderman Hale was "in his place" when this inexcusable statement was made.

Sir W. Rose told the court that not more than 600L. is to be expended. If so then the presentment must have fallen to the ground, still-born as it were. Let us look over the schedule and see what the houses are like, and how much of them could be had for 600L. We will pass by the house in Newgate-street, which is occupied by the prison officers, and go into Warwick-square. It may not be breaking confidence to state that the property of the Messrs. Taylor & Sons is considered alone worth 50,000L., and that they would be likely to present a claim to that amount were they forced to move. They are condensing apparatus manufacturers, and have a very extensive business in metal-work for building purposes as well. They possess a house, workshops, and premises, being part of the passage through Taylor's market, leading from Warwick-square. No. 8 of the square is in the possession of Messrs. Ann Straker & Sons, printers, a class of persons who must have, more or less, valuable premises, plant, and interests. No. 9 is in the occupation of Mr. Manning, a stereotyper; the house is an old one, but of ample size. No. 10 is in the joint occupation of Mr. Hayden, music publisher; Bancroft & Co., San Francisco; and the *Publishers' Circular*. No. 11 is occupied by Messrs. Woolley, Sanders, & Co., straw-hat manufacturers and warehousemen. This house is a very large one, and has only been built a few years. It is five stories high, and the newness of the bricks has not yet worn off. No. 12 is in the occupation of Messrs. Copstake, Moore, Crampton, & Co., the well-known Manchester warehousemen, of Bow Churchyard, Cheap-side. It has a frontage of probably 35 ft. It is five stories high in one half, and six stories in another. This is an end house of that side of the square, with a vacant piece of land beside it. The other end of the same side was a house with many tenants, but was burnt down, and has never been rebuilt. Such is the character of that side of the square which appears in the presentment schedule.

Let us return for a moment to Alderman Rose. In speaking of the article in the *Builder* and contradicting it, he said that there was "ample space within the existing walls for any enlargement that might be required." If this be so, why should two aldermen, visiting justices of Newgate, make a presentment to their own court that there was *not*, and schedule, say,

100,000L. worth of property, to be removed for its enlargement? Perhaps Sir W. Rose will be kind enough, in the fulness of his good nature, to "put that and that together" and tell us what it means? He "thought it right to make that statement, the more so as the public had been led to infer that the Corporation was about to expend a large sum, and as, in some instances, the paragraph in question had given rise to editorial comments founded on erroneous information." But who led the public to "infer," &c., and who applied the erroneous information? In the face of this advertisement it has been asserted there was not the slightest foundation for our remarks. What would be thought of the Chief Commissioner of Public Works scheduling all the houses on one side of Parliament-street for removal to enlarge the roadway, advertising each house and each tenant, and then, when asked in his place in the House of Commons why Parliament-street was to be widened, branding the assertion as a falsehood? It has been often said that one half of the world does not know how the other half lives. It would seem to be equally true that one half of the Corporation does not seem to know what the other half is doing.

A WORD OF CAUTION.

We have to call the attention of those whom it may concern to the present state of the lofty wall separating the courtyard of Burlington House from Piccadilly. The western angle of this wall has been taken down, so that the tie which it has for so many years formed is broken. The structure thus exposed in section is on the move, or, to speak with more precision, has visibly moved towards the street, and now overhangs its base by as much as its own respectable thickness. Without applying actual measurements to the spot, it is yet possible to speak with some certitude as to the fact of actual displacement. For an observer standing near the end of Burlington Arcade may note a well-defined vertical cleft which he may easily bring into line with the exposed section of the boundary wall in question. There are obstacles in the way of aligning this cleft with the inclined face down to the ground, but if they are made to coincide at a point somewhere between one-half and one-third of the height of the boundary wall, measured from below, the divergence at the level of the coping will be seen to be very considerable. That the fact has not escaped the attention of those in charge of the works is evident from the presence of two struts, not mere casual props, but struts formed with a care that seems to contemplate their maintenance for some considerable time. In fact, the wall is now leaning on these props, and, if they were suddenly removed, would in all probability fall on the footpath.

It is not fair to the public, nor is it desirable for the credit of those responsible for the works in progress on the spot, that the wall should be allowed to remain in this state. We do not say that there is any urgent menace of danger. It is quite possible, nay, probable, that if they are made to rest for months on its two wooden legs, like some of those veteran pensioners who exhibit their honorable losses, borne in the service of their country, in the corridors of Chelsea Hospital. But we cannot afford to leave such a matter to probability in an important thoroughfare of a great city. If the wall fell, the loss of life, though not so calamitous as in the case of the much loftier wall that fell the other day at Naples, might still be of a nature that would startle the public. It is a time when there are evil spirits abroad amongst us, if not exactly seeking whom they may devour, yet evidently bent on mischief. It is not justifiable to peril the safety of even a single passenger out of the many thousands who daily pass over the pavement on which this wall would fall if the props were struck, while cross-cut saws and sledge hammers are accessible to those who have the ill-will to use them. We must remember that apparent purposelessness is a feature of much of the destructive agency of the day. But apart from the last few weeks, had unusual proof of the violence of the wind. It is true that danger from wind depends not only on the velocity, but on the direction of the blast. But it is no less true that the direction is as little to be foretold with certitude as is the force. We do not think any man familiar with building would feel com-

fortable in taking shelter on the lee side of the Burlington House wall if such a wind as that which has recently visited us more than once were howling at his back. We make no prophesies—we express no vivid apprehensions. We only say that, in such a city as London, every possible precaution should be taken against fatal accidents. A lofty wall, overhanging its base, and propped by wooden struts, is a very possible cause of fatal accident. Are there any means of resisting the inference that that cause ought to be at once removed?

ON THE APPLICATION OF WATERGLASS (SILICATE OF SODA) FOR PAINTINGS AND DECORATIONS.

ALTHOUGH more than thirty years have elapsed since the introduction of waterglass, yet its application is at present but very limited.

It is a well-known fact, that paintings executed in oil or encaustic colours are soon destroyed in the open air; the fatty substances are consumed by a mortar ground, or by the oxygen of the atmosphere; the white lead used in paintings is soon converted, in large towns, into a grey and dirty mass (sulphurated lead); the latter process destroys all harmony of colour, and the result cannot be removed by any other means than painting over again.

With interior wall-paintings, a somewhat ro-verse action takes place; the oils become darker, and if—to counteract this defect—mud spirits of turpentine is used, the colours become harsh and adhere imperfectly: after a short time, minute particles are detached, through the variousities of temperature, through the heat of fires, gas, and candles. Now, if only portions of rooms, halls, schools, and churches were coated with waterglass painting,—walls, for instance,—the carbonic acid exhaled by our lungs would be absorbed with avidity, and assist in the solidification of waterglass colours, and of the plaster.

The white colours, used in common and elaborate interior paintings, are mostly white-lead; its actions upon the human frame are well known. The white colours employed with waterglass for large surfaces are perfectly harmless, and the obnoxious smell of oil paint is entirely absent with waterglass application. Yet oil paint and varnish are for many reasons more durable for *woodwork of dwelling-houses*; oil and varnish are of an elastic nature, more fitted for the changes of sudden expansion and contraction of wood.

Walls of mortar, stucco, Roman cement, stone, &c., are the substances upon which waterglass may be employed with the greatest advantage. There is great affinity and relation between those bodies; waterglass becomes an insoluble mass, which, by the absorption of carbonic acid, becomes harder and more indestructible. Cypium (plaster of Paris) ought to be avoided as a ground; there is no affinity between these two substances.

Mortar which is composed of lime and sand is the best ground for waterglass. The sand used must be free from salts, ground flints, &c. The so-called artificial sands are the best, they have an even and sharp "corn." The lime may be slaked; if fresh lime is used, it should be powdered fine to prevent "blowing;" in both cases the mortar should be rather poor in lime. Roman cement, mixed with mortar or with sand, also forms a good ground; but plaster of Paris must be avoided in the last layer of mortar.

The ground should be of an even grain,—not smooth; the larger the wall and the details to be painted, the coarser the grain of the sand may be. After the ground is perfectly dry it ought to stand for a week or two before painting is commenced. The colours used for painting pictures, decorations, or large surfaces, are—imply ground fine in pure water: the water is best purified by boiling. The colours are applied with water only. These artists and decorators who are used to paint in tempera, in body-colours, or distemper, will find this process easy; those who are used to oil-painting only, require some practice to master the details of manipulation. Before application of colour, moisten the places with water; and should the ground become dry under the brush it is kept moist with a syringe, throwing the water in the form of a fine mist. In all cases where it becomes necessary to paint over again, to deepen or lighten the colours, the places ought to be always moistened with the syringe. While painting is going on, the colours must not be touched or rubbed with

finger, as they are now only "hound" with water, and are soon damaged and rubbed off when a picture or a wall is finished, the colours must be "fixed," and now, for the first time, water-glass comes into operation.

For fixing the colours the "fixing water-glass" is used. The surest way of using it is to dilute the solution with pure water considerably. That water-glass which is of the consistence of thick syrup may be diluted with six times its bulk of water; that which is sold as "fixing solution," with an equal bulk of water. The whole surface is evenly sponged over. Care must be taken not to apply too much, or the colours may flow into each other. After the lapse of a day, the water-glass having had time to combine and harden, a second coat is applied: this time the solution may be a little stronger. In most cases the colours will be all "fixed" when the second "coat" is dry; if, however, some of the so-called meagre colours, such as black, &c., will rub off with the finger, it is best to go over these with a soft brush and water-glass.

There is no advantage in adding more water-glass than is absolutely necessary to fix the colours. If too much is used, the surface becomes bright, which is also the case if too much lime is in the mortar. These bright places, in the course of a few days, turn into a white film, which, however, will disappear in the course of time, or must be removed with a sponge and clean water. The safest way to ensure success is to begin the fixing with a weak solution, and repeat it rather three or four times, than to use a strong solution at once.

The colours or pigments to be used are as follows:—Zinc white, permanent white (artificial phosphate of barytes), dark yellow, burnt and raw ochre, terra de Sienna raw and burnt, cadmium and chrome yellows, red chrome, chrome green, blue and green ultramarine, oxide of iron in red, brown, and crimson, burnt umber, mineral and lamp black. No vegetable colour is admissible. Vermilion, cobalt, and light blue ought to be avoided also.

For larger surfaces, for walls where expense is a consideration, lime and chalk (whiting) may be used, only those latter do not cover well: a little addition of zinc white will balance that defect and produce a good "body." It should be also borne in mind that water-glass is antagonistic to oil paint; if any oil-painting is in proximity to water-glass painting, or upon a wall to be fixed, the oil paint ought to be covered with paper before fixing with water-glass, otherwise the oil paint will suffer.

Woodwork when new, where a smooth and even surface is not required, where the smell of paint is too obnoxious, may be coated with water-glass. In that case it is recommended to "bind" the colours with weak size, and apply the water-glass afterwards with a brush. Woodwork is also protected against fire by the simple application of two or three coats of pure water-glass, without any pigment. The wood so treated becomes darker.

One more observation as a guide to the operator is this: all the colours become a little darker under the fixing process, but in the course of a few days they regain their original tone. Certain colours, such as oxide of iron, artificial white of barytes, and some of the ochres, contain sometimes smaller or larger portions of sulphuric acid. These colours must, therefore, be washed with plenty of pure water before using them for painting.

Such are the principal features of water-glass painting, verified by practical success.

RAMBLES ON RAILWAYS.

CONNECTED for years with railways as Sir Casack Roney has been, and travelling largely as he did for a long time, both in the Old and New World, it was to be expected that he would introduce an amusing and instructive book, when he announced his "Rambles on Railways," and we are not disappointed expectation.* If he had trusted more to himself, and avoided a few of the quotations, introduced evidently through anxiety to make the book amusing, the result would have been even more satisfactory than it is. Best of all, if he could have brought himself to it, would have been his Rambles about Railways. An instructive story he could tell, we have a strong opinion; and one of these days he may perhaps

be led to do it. The present generation remember the commencement of the work of covering England with railways, and since that time 455½ millions of money have been spent. The story of how this has been done, in what ways it was raised,—who won, and who lost,—would make a wonderful book. Well, never mind that just now. The volume before us gives a variety of information concerning, amongst other undertakings, the Union Pacific Railroad, the Canadian, Indian, and Italian, and includes a number of maps and diagrams, with a view of a centre-rail-engine ascending a steep gradient amongst the Alps. The Pacific Railway, which is to cost thirty millions sterling (16,000,000 a mile), is being made at the eastern end wholly by Irishmen, and on the Pacific side by Chinese, to a man.

The longest of all European railways is nearly half Italian, and a little more than half "South Austrian." It is called in France, *Sud Autrichienne et Haute Italie*. In Italy the two last words are converted into *Alta Italia*. The total length is now 2,565 English miles, of which the South Austrian portion measures 1,349, and the Italian 1,216.

The two extreme western points of the mighty system of the South Austrian and Alta Italas are at Snaa, at the foot of the Mont Cenis Pass of the Alps, and Canoe at the foot of the Col di Tenda. Its two eastern are Vienna, and still farther, Pesh. Its northern is Kutzen, about a hundred miles to the south-east of Munich. Its southern, Piatoa, is twenty-two miles to the north-east of Florence. It possesses railways across two of the passes of the Alps, the Sommering and the Brenner. Its stations are at Genoa, Turin, Milan, Innspruch, capital of the Tyrol, Verona and Venice, Trieste, Vienna, and Pesh. It is equally fitted (as it has proved itself to be) for a great military railway, and for one to be devoted not to commercial and industrial development, but it has its skeleton in its closet,—it is not at Florence, capital of United Italy, nor is there prospect of its being there, except by a combination which shall unite with it the whole of the *Strada Ferrata Romane*.

The two next longest railways of Europe are French. The Paris, Lyons, and Mediterranean Company has a length of railway, in France, of 2,234 miles, and in 1864 it adopted a transitional little son, which is known by the name of the "Algorian Railways." At present the gentle youth is of modest proportions, only thirty-one miles open for traffic: eighty-one to be opened in the present year; and of the remaining 26½ which are to constitute its full-grown mileage (376 miles), little more work than *études préliminaires* has been bestowed upon them.

The railway that in mileage comes next in succession is the Orleans Company. Its length is 2,052 miles. The last of the four railway giants is our own English giant, the London and North-Western. Although the length of our countryman is the least of all,—only 1,320 miles,—it is shown that in its other dimensions it is in most respects superior, in none inferior, to its Continental brethren.

The gross receipts from traffic for the year 1866 were,—South Austrian, 2,957,713*l.*; Alta Italia, 1,738,202*l.*; total of the company, 4,695,915*l.*; average weekly receipts, 90,306*l.*; per mile per annum, 1,932*l.* Paris, Lyons, and Mediterranean, total traffic, 8,105,776*l.*; average weekly receipts, 155,691*l.*; per mile per annum, 3,640*l.* As the total traffic receipts of French railways was, approximately (but the figures are very nearly exact), 24,140,000*l.*, it follows that the receipts of this company exceeded one-third of the total railway receipts of the empire by 101,110*l.*, and that its average weekly receipts per mile exceed the average weekly receipts per mile of all France (2,865*l.*) by 956*l.*

The traffic receipts of the Orleans Company for 1866 were 4,401,894*l.*; average weekly receipts, 94,267*l.*; per mile per annum, 2,189*l.*; or 496*l.* per mile per week below the receipts per mile per week of the total French railway system. London and North-Western, 6,312,056*l.*; average weekly receipts, 120,400*l.*; per mile per annum, 4,782*l.*

The construction of railways cheaply in France is now occupying attention. A railway on this system was opened on the 25th of August last,—the line from Fongres to Vitry, on the Chemin de Fer de l'Est. Its length is twenty-three miles, and it has been constructed for 100,000*l.*, or at the rate of 4,348*l.* a mile, notwithstanding the fact that it is carried through a difficult country, necessitating numerous heavy works,

the greatest of which is a viaduct constructed of granite 120 yards long, and 22 yards high. The rails are Vignoles pattern, 60 lb. to the yard. The above price includes rolling stock, shops, and their equipments, &c. "But everybody received 'argent sonnante' as the works progressed, and the line was not opened until everything had been settled up and paid for. This is one of the secrets," continues our author, "appertaining to the economic construction of railways." That is just the text on which we should like a sermon.

The grandest exceptional run ever made on railways, according to Sir Casack, "was on the 5th of January, 1862, the occasion being when answers were brought to the despatches sent to Washington requiring the surrender of Messrs. Mason and Shidell, who had been taken out of the *Trent*, Royal West India mail steamer, by orders of Commodore Wilks. The steamer arrived at Queenstown at 10½ p.m.: at 11:28 p.m., Irish time," the special train started from Cork, and accomplished the journey to Dublin (166 miles) in four hours and three minutes; or at the rate of 41 miles an hour, including stoppages. The mail steamer *Utales* arrived at Holyhead at 8:15 a.m. The special train started at 8:28, and it is from this point that the most remarkable part of the express journey was accomplished. The run from Holyhead to Stafford, 130½ miles, occupied only 145 minutes, being at the rate of 54 miles an hour, and although so high a rate of speed was not attempted over the more crowded parts of the line approaching London, the whole distance from Holyhead to Euston was performed by the London and North-Western Company in exactly five hours, or at a speed of 52½ miles an hour,—a speed unparalleled for so long a distance on a line crowded with traffic."

We have travelled faster than this for shorter distances, fifty and odd miles, on more than one occasion. Years ago we travelled, for example, from London to Didcot at the rate of a mile a minute, Brunel being engine-man.

In France, the fastest train is timed for 35½ miles an hour; in Belgium, for 34½ miles.

One special purpose of the book is to fight the battle of railway companies as against the Post-office, and more than once the author asks:—

"On what grounds, other than the hollow one of pretence, can the Post-office claim special exemptions, as regards payments, as well as special rights and privileges, without adequate remuneration for them? Neither the Post-office nor any other department of the State assisted railways during their inception, or during their construction; on the contrary, whenever they had the chance of raising their hands against or making exorbitant demands upon railways, they never failed to do so."

It is quite right, he thinks, in the interest of the community at large, that, inasmuch as railways are the public highways of the land, the right of postal transmission upon them should be secured in the most complete, prompt, and absolute manner that law can enforce. There must be no doubt or hesitation upon this point; but that limit passed, the postal department is, notwithstanding that its officials are of "her Majesty's service," nothing more than, as a whole, an extremely well-organized, efficient trading establishment, protected, as a monopoly, by many Acts of Parliament."

"The railways have never shown themselves otherwise than ready, it might rather be said anxious, to serve the Post-office; but in this land of trade and commerce, their managers look for proper remuneration for services rendered. No more is asked, and no more is expected. The law and practice have very wisely instituted a distinction between the manner in which ocean and railway mail contracts shall be entered into. Because the ocean highway is open to all, tenders for conveyance upon it are invited from all; on the other hand, with railways it has been very properly decided that they shall convey the mails, whether they like to do so or not; but the same law that has enacted this compulsion, has also prescribed the manner by which a just and reasonable remuneration shall, in case of difference, be obtained."

The quotations made by the author in his account of the Indian railways (a system for which the Government of India has guaranteed to the extent of 88,000,000*l.*) seem to show culpable neglect of accommodation for third-class passengers at the different stations. Bad treatment of native travellers is also asserted. The shareholders in the various lines ought at once to take up this matter, and insist on an immediate change from this hind and suicidal course.

According to our author, the total amount

* There is a difference of twenty-six minutes between London and Dublin times; London being to the east is earlier. Dublin time has now become universal time in Ireland.

* Rambles on Railways. By Sir Casack P. Roney. London: Edinghams Wilson, 1868.

of guaranteed interest on railways which has been paid by the Government of India from the year 1849, to the 31st of December, 1866, has been 18,929,576l.; of course during the early period of the Indian railways, it was all expenditure and no profit, for, although guaranteed interest commenced in 1849, the first length of Indian railways was not opened for traffic until 1853, and then the miles opened were twenty-two miles. In 1854, the miles opened were fifty-five; in 1855, ninety-eight; in 1856, 102; in 1857, 145; in 1858, 145; in 1859, seventy-five; in 1860, 208; in 1861, 759, which is the largest number of miles opened in any one year: the following year, 1862, was nearly as much, being 747. Since then, the amount has been increased at the average annual rate of about 300 miles; and the total mileage now is 4,070.

The companies have repaid to the Government, out of net earnings, about 7,000,000l.; making the present debt of the railways to the Government nearly 12,000,000l. Their net earnings for 1865 were 1,341,550l., and for 1866 they were about 2,170,000l. The amount paid by Government for guaranteed interest during 1865 was 2,796,676l., consequently the net amount of money which the Government had to find, and to debit against the companies, was 1,455,126l.; but, in 1866, whilst the amount paid in guaranteed interest was 2,964,073l., as the net earnings were 2,170,000l., the Government had only to debit the companies with about 800,000l. It is expected that the sum deficient this year will not be more than 600,000l., notwithstanding that the amount of interest for which the Government is responsible will be about 3,900,000l.

We may not, however, accompany farther our agreeable guide. We introduce him to our readers, that they may take his "Rambles" and enjoy his genial gossip.

A VOICE FROM EDINBURGH AFTER THE STORM.

When a man makes a narrow escape of his life as I did the other day, his first duty, after thanking Almighty God for his safety and preservation, is to try and prevent a recurrence of the circumstances under which the accident had arisen. The best method of doing this appears to me to write a note to the *Builder*, which if you will kindly publish you will do me, and a great number of other residents in Edinburgh, in whose name I may venture to speak,—a very great favour.

You are aware, of course, that upon the 24th day of January ultimo the city of Edinburgh was visited by a severe and protracted gale of wind. There had been nothing like it in the recollection of the oldest inhabitant. By and by the gale grew into a violent storm, accompanied with heavy showers of rain and gusts of wind that blew with the noise of distant thunder and with the force of a whirlwind.

Just at the commencement of the most furious part of the storm I was coming out at the front door of my residence, and while standing for a moment hesitating whether I should venture forth, a whole avalanche of chimney-pots, fragments of mortar, and decayed masonry was precipitated on the landing of the outer stair! Literally, I escaped within an inch of my life. Had it not been for the signal of a tradesman opposite, who had observed the mass to topple, it is certain that I should have crossed the threshold, and so perhaps have been killed on the spot:—

"No reckoning made, but sent to my account
With all my imperfections on my head."

Having thus providentially escaped, I returned to the house, where, for six or seven hours we were prisoners. From our parlour windows, which overlook the intersection of George-street, and Castle-street, we watched the storm and its consequences; and I must tell you that I do not remember in all my life to have seen so much terrible damage done in so short a space. Life and property were alike in jeopardy: chimney-cans were blown down with great violence; slates were flung about in all directions; portions of chimney-stacks fell through roofs; several people were blown down and severely injured, and four people were killed. That I did not happen to be included in the latter category was due entirely, as I have said, to the timely warning I received from the oppositeside of the street.

Now, sir, what I wish to say is, that although this gale, or rather storm, was more than commonly severe, the accidents with which it has been accompanied are by no means uncommon. Indeed, they are the very reverse. Every year numerous accidents occur from chimney-pots and decaying roofs in Edinburgh, both in the old and the new town; and I do not need to inform your Edinburgh readers that it does not always require a terrific storm like that I have described to produce the fall of a lofty tenement and a destruction of human life. It is not easy to account in a single word for this condition of things; but one conspicuous defect in the Edinburgh municipal administration I will point out, and that is, there is no proper supervision, inspection, or regulation with regard to buildings in force in the city. *There is no Building Act in Edinburgh.* There are no district surveyors; nor any professional committee of the town council to supply the defect; and, finally, there is no organ like the *Builder* to advocate in such cases the public interest. I cannot better describe the Dean of Guild Court, which is popularly supposed to be entrusted with the order and regulation of buildings, than by comparing it to the Court of Wardens, or the lord mayor's show. It is an institution that has survived its usefulness, and become antiquated. The Lord Dean of Guild in Edinburgh (Law) is a tea merchant; the convener (Ford) is a cheesemonger; and so on. There is of course a city architect and a burgh engineer, or superintendent of buildings, and there is above all a legal gentleman of great power and nobility, *videlicet*, the town clerk. The case for these local authorities cannot be better stated than by quoting, with your permission, part of an article which appeared in the *Scotsman* the other day, which I think bears very strong internal evidence of an official affluat, but which seems to ignore or repudiate completely the whole theory of official responsibility. The *Scotsman*, you are perhaps aware, is more distinguished for its political than its technical articles:—

"The recent lamentable accident in Duke-street had the natural effect of calling an unwonted degree of attention to the condition of chimney-stalks and chimney-cans in the city; and it has also excited inquiry as to whether the woodwork ere of the better class of our dwellings, is such as it ought to be. We have seen, in another case where a chimney-stalk fell through a roof and one of the upper floors of a dwelling, that its further progress was then arrested, and that thus a sacrifice of life was happily prevented. *There is too much room to be seen that, had the woodwork of the roof and the floors of the house in Duke-street been of proper strength*, the community would not have had to deplore the awful results of the catastrophe of Friday week. It is not, however, to indulge in such speculations that we now refer to the matter, but to impress upon proprietors and tenants of property the responsibility which attaches to them individually to look immediately to the condition of the buildings in which they are interested, and to see that they are not such as to endanger either residents or passers by. From many of the communications which are addressed to our subject, it appears to be a prevalent idea that this is a matter for the authorities, and that if they do not take action, proprietors are relieved from all responsibility. This is quite a mistake. Nothing in our Police Acts can be construed to vest the vestiture of the responsibilities which attach by common law and common sense to the possession of property. It is the undoubted duty of every proprietor to see that his building and all its pertinent parts are secure, and if carelessness or neglect others suffer, the law will give the sufferers their recourse against him. *The instinct of self-preservation* also suggests to occupants of property the duty of seeing that they are not exposed to unnecessary risks. The landlord is bound to keep their dwelling wind and water tight. He is no less bound to keep it safe, so far as that can be secured by human care and foresight.

All this seems to be so obvious as not to require statement here. But, as we have said, there is a prevalent desire on the part of many to transfer the natural obligations of landlords in the matter of public functions, and such persons should be made aware without delay that this is impossible. In the interest of the public police officers are empowered to inspect, and punish the negligent or refractory landlord to do his duty, or, failing his doing so, to cause it to be done at his expense, and to subject him to the whole costs of the proceedings prescribed by law in that respect. But neither the action nor inaction of public functionaries can relieve any landlord of his own proper obligation and responsibilities, which extend not only to removing danger when that exists, but to seeing that none does exist. This, of course, involves the employment by the landlord of practical men of skill, and cannot be met by an appeal to the burgh engineer, who is bound to *quite different duties to perform*. No doubt, if the landlord fails to discharge his duty, the burgh engineer will interfere, in the interest of tenants and of the community, to compel him. But that is a purely official position. There are, too, emergencies when the burgh engineer must act spontaneously and decisively. When the risk of serious injury to human life, or when a serious accident has occurred, the law arms him with summary and arbitrary powers to protect or save life and property. But still the landlord remains liable for the consequences of his previous neglect, and of these he cannot by any means divest himself.

These remarks are certainly valuable as containing what we may reasonably assume to be a statement of the law in Scotland. How then

stands the fact? How far do human ingenuity and foresight go in repairing the errors of original defective construction? What weight per square yard of Ballachulish slates will a 3-inch deal support? How long is a rubble chimney stalk with a range of red tile cans supposed to last? What is the capacity of endurance of a zinc ridge at an altitude of 200 ft. above the level of the sea? How long does a slate nail last? Why should the best buildings in Edinburgh have such wretched dormers, covered with slates, no courses on the front wall, and no gables to the argument. "Human foresight" and "the instinct of self-preservation" are, I am afraid, too intangible and too perfunctory in their operation to be defended at this time of day, as the ultimate principles of protection to human life,—particularly when compared with the regular systematic and intelligent instructions of a skilled surveyor acting upon the said principles. What does a poor old woman left with a piece of rickety property know about such philosophy, even supported by such jurisprudence? Accordingly, some people residing in Edinburgh would be glad to know a little more of the nature of the duties of the "Burgh Engineer." I have not a single word to say against him either professionally or as an individual; for Mr. Charles Macpherson is, I believe, a competent engineer, and he comes of a good stock. But it is the system I wish to attack. As far as I know, he issues no annual report, takes no cognisance of new buildings, and does not even, except by way of mild remonstrance, require people to clean out or abolish their underground cesspools. I universally find him called in to do something when it is too late. He is more of an undertaker than a physician. There, for example, was erected in an exposed situation at Morningside a United Presbyterian Church, one of those deluded and grotesque imitations of Early English—the chief feature of which is a high-pitched triangular roof with perpendicular windows in the gables. It has very properly been pronounced a sham, and its downfall had been often predicted. But the first and only occasion on which I ever heard of the engineer surveying it was on the very day I refer to, when he had to survey its ruins! I will give one more instance if you will allow me another quotation from the report of our town council proceedings respecting the accident at Duke-street.

"The clerk read a report by the burgh engineer, stating that he had employed workmen to remove dangerous portions of chimney-stalks during the storm, and rubbish at the scene of the accident in Duke-street, and that the expense of the work amounted to 26l. 5s. 6d.

Mr. Stott said that in Duke-street he believed the work was well done, but in other parts of the town, great mischief was done to the roofs of the houses by the rough manner in which the chimney-cans were thrown down. In one case in Lothian-street, he said chimney-cans actually smashed on the roofs instead of falling them down. The Lord Provost said that he could bear witness to the activity of the superintendent and burgh engineer. In the middle of the storm he went down to Duke-street, and saw an immense deal of exertion employed to extricate the people from the fallen ruins. As some reflections had been cast upon the city officials in regard to other matters, he felt great pleasure in saying that the burgh engineer's anxiety was shown to extricate the sufferers. In the name of the Council, he would say he thought the workmen who were labouring amidst the dust to remove the rubbish, and extricate, if possible, the people from the fallen ruins,—he thought it was a matter of thankfulness that the work was done with so much activity.

Dean of Guild Law said that among those who were exerting themselves at the Duke-street accident he noticed Mr. Slater (who recently got a medal), with some of his best men; and it was astonishing how much exertion was made by these men. The Lord Provost.—He is a most useful citizen that." [He is a Slater to trade.]

I will not dwell, sir, on the lugubrious gratification one may derive from a consideration of the fact that in Edinburgh the work is well and actively done in digging one's body out of the fallen ruins! Even the circumstance of a Lord Provost, or a Lord Dean of Guild, superintending the operation, does not, in my estimation, make the prospect one whit more pleasant. I had rather a thousand times hear of a good slater or an honest chimney-sweep inspecting my roof now and then, and pointing out to my "instinct of self-preservation" that my chimney-stalk was in need of pointing, or that my chimney-pots were in danger of toppling down.

Even now the danger is very great. Since the storm occurred a period of a fortnight has elapsed, and very little has been done to repair the damage. My sky-line is every where bounded with broken and dilapidated chimney-pots, some of which are actually detached from the building.

In conclusion, I beg to say that you would

confer a great obligation on the Edinburgh public if you point out to their official representatives some of their positive duties with regard to sanitary police. I am aware the subject is not a favourite one here. That small report on the fatal accident which occupies, I shall say, three inches of space in the newspaper columns, was followed by one on Sunday-trading which occupied *three feet!* and that is by no means an unfavourable example of the municipal wisdom, sagacity, and public spirit of modern Athens.

AN OBSERVER.

STORM AND FLOOD.

The force of the wind in London during the late storm, reached a pressure of 35 lb. on the square foot, or 6 lb. more than that of the great storm of 1866, when the *Royal Charter* was lost.

The most serious destruction of property at Hull was at the works of the British Gaslight Company. No. 1 gascmeter, a very large structure, was blown bodily over and fell into pieces, the surrounding pillars and stonework being also very much broken. The gascmeter at the time contained about 250,000 ft. of gas. The whole took fire, and the flames raged for about half an hour with great intensity.

At Sheffield two chapels were partly blown down. A circus, a house, and a chimney were also blown down.

The oldest plane-tree in Scotland, and perhaps the largest of its kind in Britain, fell in the same gale. It grew by the side of the river Allan, near Dunblane, and was known as the "Big Tree in Kippenross," as long ago as the reign of Charles II.

Considerable damage was done along the Thames on Saturday last by an unusually high tide. The water rose 3 ft. higher than the usual spring tides, and it is some years since such an influx of water has taken place. At the present stage of the progress of the Thames Embankment, this tide did much damage. The water overflowed the walls, and the whole of the vacant space which is being reclaimed from the river was filled. Other damage to property has resulted on the Surrey side of the river. Several streets were partially inundated.

A remarkably high tide was experienced at Hull on Saturday morning, the water having risen to a height of 30 ft., or about 3 ft. higher than the usual heavy tides. Houses, cellars, and streets were flooded.

COMPARATIVE ALTITUDES.

The article upon comparative altitudes is one to which I have devoted considerable attention, and I had collected a number of examples of the section of many railways, showing the ordinates at each change of gradient, and their levels above high or low water mark, but there are not many of them connected with the sea level as a common datum.

But many of these levels are not connected with the high and low points of towns, as they might have easily been done when they were being prepared, and they would have formed an invaluable record of the respective levels of every place in the country.

This has been done, to a certain extent, in the Ordnance Survey, where the levels of some high points are noted; but I think it has not been carried out with especial reference to our towns and villages; and I think, on the ground of health, it is of the highest importance, as I believe the altitude, as well as the physical and geographical position of towns, has a very marked effect on the public health, much more so than is generally admitted; in fact, producing a difference of climate, and it does not appear to me to be sufficiently considered by those whose place it is to study the hygiene of the population.

In corroboration of the above remarks, I may instance places I have personally visited and known, viz., Havana, Vera Cruz, Belize (Honduras), and New Orleans, all situated very low, (few feet above the level of the sea. Most of those are well designed and laid out. Except in the first-named the streets are narrow, but in the latter they are wide and spacious, and built in special regard to regularity and order, to prevent overcrowding; and in respect to the public health, in all these places, notwithstanding they are greatly troubled and decimated with low

fevers, agues, yellow fever, &c., with all their attendant evils, and a change of climate, a sea-voage, or removal to a higher altitude, or one of them, is invariably recommended by the faculty to their unhappy patients, even when medicine has failed to remove the disease; and the result is generally successful. Some who visit these places are so constituted as to escape those deadly and depressing diseases, as did your correspondent; but these cases are few, and at those periods when they are the most rife and virulent, the air appears disagreeable and oppressive, and a feeling of lassitude seems to steal over your whole frame, rendering any exertion unpleasant and almost intolerable; but a relief is soon produced to those feelings by the springing up of the trade winds, or a cold "norther," showing the necessity and the benefit of a change of air. If such be the marked effect in a tropical climate, it certainly must produce a similar one in a temperate one, and the high and low levels of towns will, and doubtless do, play a considerable part in the hygiene of the inhabitants, and one that appears worthy of greater notice than appears to be bestowed upon it.

I beg to append a list of the levels of a few places, taken at the instance of the late Mr. Telford, C.E., between Holyhead and London, to supplement those contributed by your correspondent "A. J." It will be found there are some places where they differ from "A. J.'s;" but these are occasioned by the difference in datum, Telford taking high-water at Holyhead, and "A. J." mean level of the sea at Liverpool,—rather an ambiguous term, as the level of an average tide is a moot point with engineers. The following are the respective altitudes of the towns situated on the Great London and Holyhead road, running across the country diagonally from north-west to south-east:—

	Feet.
Highest point between the town and Stanley Sands, Holyhead	47
Bangor Cathedral	54
Town of Corwen	144
Llangollen	291
Chirk Village	334
Oswestry town	428
Welsh Bridge, Shrewsbury	474
Corner of town-hall, ditto	500
Cock Inn, Watling-street	532
Prior's Lee	495
Bridge at Shiffall	570
Wolverhampton Market-place	598
Summit east of Earl Dartmouth's Park	651
Ditto at Hockley Inn	425
Top of Bull-street, Birmingham	439
Summit of Meriden-hill	437
St. John's Church, Coventry	253
Opposite market-place, ditto	288
Summit east of Braunston	543
Ditto of Daventry-street	489
Opposite the Angel Inn (late the Dirt House)	447
Stoney Stratford-street	231
Church, Little Brickhill	480
Hockliffe-street	354
Dunstable-street (opposite inn)	374
Summit of St. Alban's-street	357
Ditto Peabrook Inn, ditto	358
At Sixth Mills Tollgate	257

I think I can further supplement this statement by the addition of many towns, taken from a number of canal sections that have intersected various parts of the country, and also from the sections of many railways, but I find there are many of them not at present connected with the sea level as a common datum, although such a one would have formed a capital basis for a record of levels throughout the country.

B. B.

THE OWNERSHIP OF ARCHITECTS' DRAWINGS.

An Architect writes as follows:—"I was employed to make drawings and specifications for a building with the understanding that I should carry out the works. Tenders were obtained, but owing to unforeseen circumstances my employer could not proceed with it. I have sent in my bill, charging simply for the work done, viz., making the drawings and specification; but I am refused payment unless I hand over the whole of the plans and specification. Am I bound to give them up?"

If the charge sent in is for "making drawings and specification," recovery at law could scarcely be expected as matters at present stand, unless the things charged for had been delivered. There would be more likelihood of success, without giving up the drawings, if the claim had been shaped as for time and skill employed in preparing the necessary documents and instructions for the production of a building not farther proceeded with, and obtaining tenders for the necessary works from builders. It is beginning to be

pretty generally understood, the understanding being assisted by the printed declaration of the Institute of Architects, that an architect's drawings, when the building has been executed, belong to himself,—they are simply the tools by which he has worked, and the client pays him for the result. The same understanding ought to prevail when only part of the process preparatory to the erection of a building has been gone through, but we are afraid it does not at present.

HYDE PARK AND KENSINGTON GARDENS.

OUR remonstrances have not been without some effect. The wrongly shaped and placed reflectors have been removed, and other hurners provided, with obvious improvement in the result. Something, however, is still needed, apparently, in the shape of ventilation. Many of the globes, when we passed them a few nights ago, were bedewed and bedimmed with water. Surely there has been a want of intelligence shown in this little matter which is scarcely creditable. The new railing which, after many months, has been put up in Park-lane, seems strong, but it is very ugly.

In Kensington Gardens, too, things are not always done thoughtfully. For many a year a covered garden-seat or alcove has afforded protection as well as rest to pedestrians. It was lofty, and the front very open; but being placed to back the sun and the prevailing rains it did good service. This alcove has been recently brought away from its original position and re-erected at some cost near where the fountains are; evidently, however, without a thought as to aspect and purpose, for it is so placed as to receive the full force of hot sun and rain.

The site of the new drinking-fountain in the park, of which we recently gave a view, would have been better described as near Stanhope-place Gate.

THE TRADES MOVEMENT.

THE operative builders of Sunderland are applying to their masters to be allowed to work only nine hours a day. The employers have appointed a sub-committee.

The operative masons in Halifax have sent a six months' notice to the masters to the effect that they will expect an increase of wages to the amount of 2s. each per week.

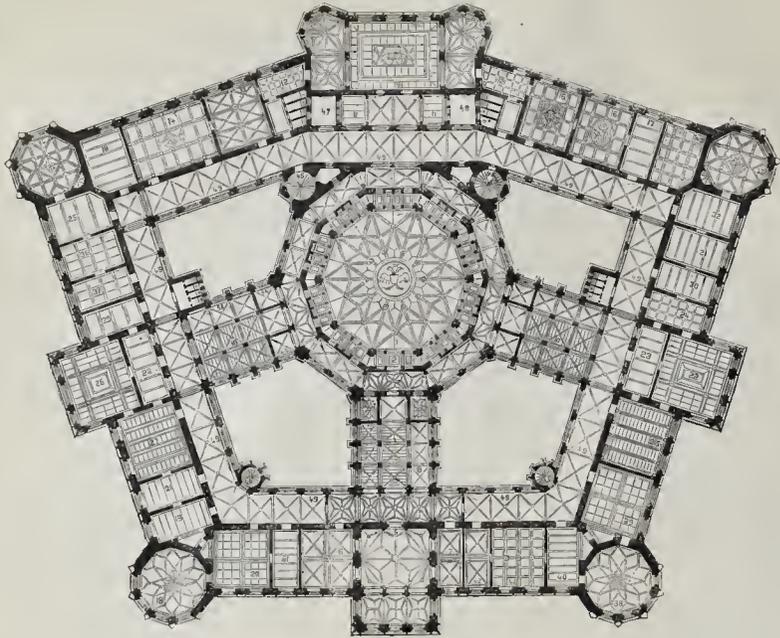

The master builders of North Staffordshire have given notice of a slight increase in the working time of their men, thus deviating from a mutual arrangement entered into by arbitration in May last. The men have determined "to retain the present code of rules by every legitimate means" in their own power. By a subsequent resolution, they have empowered delegates "to settle the dispute to the best of their judgment."

A lock-out has just occurred among the moulders at Glasgow, and it is believed will be general over Scotland. Fourteen shops in Glasgow are subject to the lock-out, and more than half the moulders in the city are involved. The men complain of harsh treatment by the masters in sundry trade matters, and particularly as regards wages.

A painful excitement has been produced at Brynmawr in consequence of the great iron-masters, Messrs. J. & B. Bailey, having announced the closing of their Nantyglo works. Something like 8,000 persons are employed at the works.

A deputation of trades unionists have had a meeting with the members for the city of Manchester, Messrs. Thomas Bazley and Jacob Bright. The purpose of the interview was to lay before the hon. gentlemen a copy of a bill which it is proposed to introduce into Parliament in the ensuing session, the main object of which is to give trade societies the same legal footing at present enjoyed by friendly societies, especially as to the safe custody of their funds, and the power to prosecute defaulting members for embezzlement.

A large meeting of the working men of Sheffield has been held in the Temperance Hall, Town-head-street, the chief object being to hear an address "on Trades' Unions, Mr. Roebuck, M.P., and the Royal Commission," by Mr. Applegarth, of London, the general secretary of the Amalgamated Society of Carpenters and Joiners. The meeting was convened by the Executive of the Association of Organized Trades, and although only a comparatively short

DESIGN FOR HOUSE OF LORDS, VIENNA.—Plan of Principal Floor.

notice had been given the room was well filled. Mr. George Anstlin, the president of the Alliance of Organised Trades, occupied the chair. After some discussion the meeting passed, amid acclamation, the following resolution:—

“That this meeting, believing trades’ unions to be essential to the well-being of the working man, and the best means at his command for successfully resisting the encroachments attempted to be made by unprincipled employers upon his rights and privileges, and seeing the numerous attacks made on such unions in certain quarters, pledges itself to do all in its power to promote their interest, and strenuously to oppose the return to Parliament of any gentleman who is not in favour of the legalisation of trades’ unions, the protection of their funds, and placing them more on an equality with other institutions of the country.”

A political resolution as to Mr. Rochuck was also passed.

THE TECHNICAL INSTRUCTION MOVEMENT.

A REPORT addressed to the vice-president of the Committee of Council on Education has been issued. It touches on technical, industrial, and professional instruction in Italy and other countries, and is by Professor Leone Levi, who visited for that purpose some centres of manufacturing industry in this and Continental countries. With reference to technical instruction, Professor Levi lays before Lord Robert Montagu suggestions for the establishment of an industrial university or a superior technical institute, as a normal school for teachers of science; chairs of lecturership; technical schools, with workshops, collections of tools and instruments, museums, and libraries; agricultural schools, with farms and gardens, throughout the country districts; schools in relation to weaving, dyeing, and mechanics, in places such as Manchester, Leeds, Glasgow, and Belfast; mining schools in Truro, Newcastle, and Glasgow; navigation schools in London, Liverpool, and Greenwich; agricultural schools in Bedford and Warwick; schools of metallurgy in Birmingham and Sheffield, &c.; studentships; technical school committees; also suggestions for the use and adoption of existing institutions, wherever available, for the purpose of technical schools; the extension of grants by the Privy Council for such schools; the extension of the factory laws to

agricultural labour; the establishment of a public primary school in connexion with every parish; the introduction of science instruction in schools and colleges, and the early introduction of the metric decimal system of weights, measures, and an international decimal coinage, to facilitate and shorten the time now employed in the study of arithmetic; the formation of manufacturing and industrial museums in the chief manufacturing and industrial towns; the diminution of the evil of a profusion of talents by giving to inventors the option of taking out a patent or accepting a Parliamentary grant for a limited period, on the recommendation of a committee of experiments acting under the Patent Law Commissioners; and finally, a further and more systematic inquiry as to the relative position and progress of Great Britain and other countries in manufactures and industry.

The adjourned meeting of the Birmingham artisans and others has resulted in the passing of a resolution,—“That a society be now formed for assisting the local institutions for promoting technical education in Birmingham, and other purposes, connected with the interests of skilled labour; and that the following twenty-five gentlemen [names not in resolution as reported] in conjunction with those artisans of Birmingham and the neighbourhood selected by the Chamber of Commerce, at the request of the Society of Arts, be appointed a committee, and he requested to take the necessary steps for organising the society, and report to a future meeting.”

DESIGN FOR HOUSE OF LORDS, VIENNA, AUSTRIA.

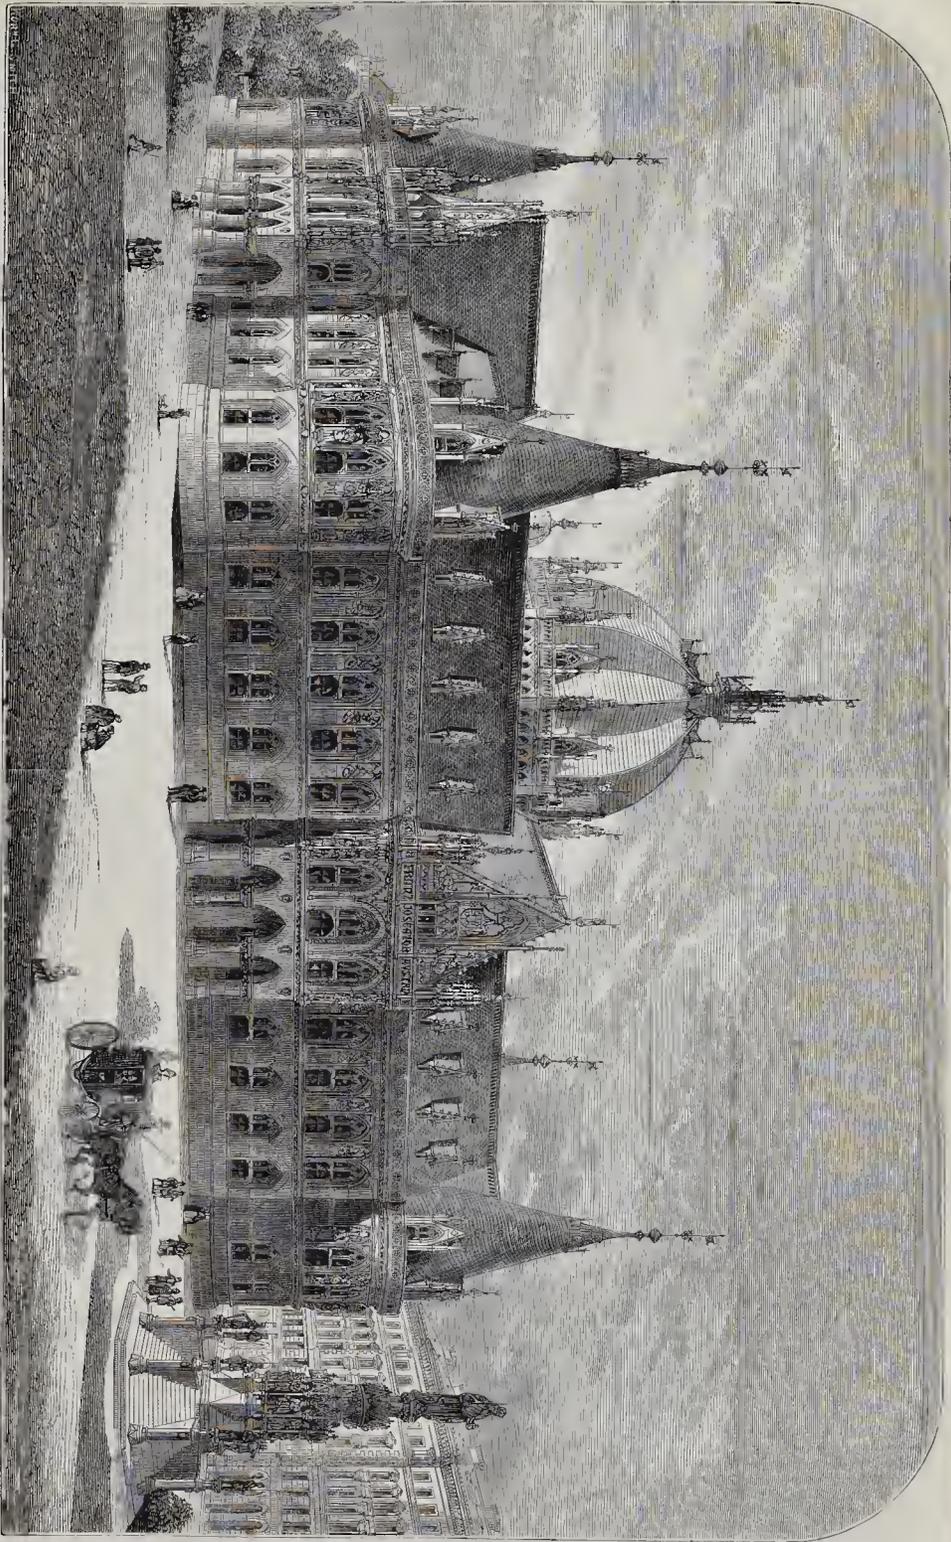

JUST previously to the war with Prussia, a limited number of architects were commissioned to submit designs for the erection of a House of Lords in the Austrian capital. No decision was come to in face of national troubles. The project, however, is now beginning, we believe, to be talked of again, and we give in our present number illustrations of the design that was submitted by Herr F. Schmidt on the occasion referred to. In some recent articles on the present position of ecclesiastical

architecture in Germany, we had occasion to mention with commendation and illustrate some of the churches of Herr Schmidt.* The present design will show his skill in dealing with a secular building. The style adopted may be termed Burgundian Gothic. The dome, the arrangement of which is felicitous, is similar to that of one of his executed churches previously illustrated in our pages. The dome, it will be seen, is over the great meeting-hall. The following references will serve to show the appropriation of the different apartments on the principal floor:—

DESIGN FOR HOUSE OF LORDS, VIENNA.—BY HERR F. SCHMIDT, ARCHITECT.

THE LATE MR. JOHN PHIPPS,
H.M.'s BOARD OF WORKS.

We mention, with great regret, that Mr. John Phipps departed this life on the evening of the 8th inst., aged seventy-three years. Mr. Phipps was an old and faithful public servant for nearly fifty years, and fulfilled his arduous duties as an architect and surveyor in the department of her Majesty's Works and Public Buildings, with invariable satisfaction to the heads of the department. He was possessed of great energy, and was of the kindest disposition,—qualities which gained for him the good-will and confidence not only of his colleagues, but of all the various classes with whom business matters from time to time brought him into communication. During his official career, many circumstances occurred to test his professional abilities; and his responsibilities at times were very heavy. In proof of this, it is only necessary to mention that, within his experience, the duties of devising and superintending the works, fittings, and decorations requisite for two coronations devolved upon him,—viz., those of King William IV. and of her Most Gracious Majesty the Queen. At the last coronation the fearful rush of people into the hanging galleries in the old Abbey of Westminster caused him great alarm. Although he had had them partially tested by gangs of men in marching order, he was unprepared for the forward rush of the people toward the fronts of the galleries, and this circumstance so shattered his nerves that it was a long time before he recovered from the shock, and his friends believed that he then received a lasting injury.

Among other works we may instance that Mr. Phipps had the planning and arrangement of the Royal Gardens at Frogmore, which brought him under the personal notice of her Majesty and the Prince Consort.

The decease of this gentleman was much lamented by all who knew him; and it is to be regretted that, at the date of his death, he had not had two years' enjoyment of the rest to which his well-earned pension entitled him.

DINNER TO SIR CHARLES LANYON, M.P.,
ARCHITECT.

The members of the Royal Institute of Architects of Ireland, and of the Royal Hibernian Academy, entertained the president of the former body, Sir Charles Lanyon, at dinner, on Thursday evening, the 6th inst., to congratulate him on the honour which he has lately received at the hands of his excellency the Lord Lieutenant.

The chair was occupied by Sir John Benson, fellow of the Institute, in the absence of Sir Thomas Deane, senior vice-president of the Institute. In reply to the toast that was drunk to him,

Sir C. Lanyon said he was proud to accept the honour that had been conferred upon him in connexion with his profession, and he believed that the honour was intended as a compliment to that profession as much as to himself. The chairman had alluded to his position as a member of Parliament. With regard to public measures, he thought that during the last session he had had an opportunity of being useful to the profession in the matter of the Law Courts competition. Sir C. Lanyon then gave an account of the course he adopted on the occasion referred to in the House of Commons, and of the result attending his efforts, by which two professional men were added to the list of judges. He regretted that at the present time he could not congratulate the Institute on the prospects of professional employment. He believed that the progress and enterprise of the country had received a most unfortunate check, and that their profession, intimately connected as it is with the development and improvement of the country, must be amongst the first to suffer from any check which may be given thereto. No one could deny that the feeling of insecurity and want of confidence at present prevailing in many parts of Ireland necessarily tended to prevent the outlay of capital and retard all improvement. Although he could not congratulate the profession in general on its present prospects, he could point with pleasure to the impress which the present generation would leave on this country, both in matters of taste and mechanical knowledge. At the risk of being considered tedious, he would, before con-

cluding, express a hope that the attention of the Royal Institute would be given during the present session to one or two important matters connected with the public interests. He desired much to see those satisfactory laws which had been laid down by the Institute for the regulation of competitions, and which were in the hands of the members, strictly enforced by committees and the members of the profession.

BREAKFAST AT BIRMINGHAM TO THE
ARTISAN REPORTERS AT THE PARIS
EXHIBITION.

Mr. J. S. WRIGHT, chairman of the Artisans' Sub-committee of the Birmingham Chamber of Commerce, has given a breakfast, at the Assembly-rooms, to the deputation sent to the late Paris Exhibition to report upon the Birmingham trades. The mayor (Mr. T. Avery) presided; and the borough members, Messrs. John Bright and George Dixon, were present.

The mayor, in opening the proceedings, said that the report which had been published must have convinced every one how very desirable it was that such a visit to Paris should have been made, and that the deputation should consist of persons of great practical knowledge and skill, who could judge for themselves what their rivals in other countries were doing in their particular trades, and who could supply their competitors and the artisans of their own and other towns with exact information as to what was really taking place. He believed that some of them returned sadder and wiser men, and exceedingly impressed by the visit with the progress that was being made in other countries. For his own part, he did not at all regret that this was the case; for the greatest of all dangers was the unconsciousness of danger; and the first lesson to be learned in overcoming difficulty was to recognize in an exact and precise manner what that difficulty was.

Mr. Bright strongly urged the Birmingham people to open their purses and contribute liberally to the advancement of technical instruction, and the establishment of a museum in Birmingham. There was no occasion to go to Government for it.

METROPOLITAN BOARD OF WORKS.

At the usual weekly meeting of the members of this board, the report of the committee of the whole board submitting evidence taken by them in relation to the depositions of Mr. Furness before the Registrar in Bankruptcy, was submitted, and various motions and amendments were considered, but without anything other than a negative result. The nearest approach to a majority in favour of any proposition or series of propositions, was made on the motion of Mr. Le Breton, who moved—

"That the board, having considered the allegations made by Mr. Furness before the Commissioner in Bankruptcy, and subsequently, as far as they affect Mr. Doulton and Mr. Roche, members of this board, as also the statements of those gentlemen, and of others, and the letters and documents now submitted by the committee appointed to investigate the matter, find—

1. That the terms on which Messrs. Cleland and Clench agreed to become bound for the due performance of his contract by Mr. Furness were negotiated by Mr. Doulton; that, though part of the consideration passed through his hands, he denies having retained any portion for his own benefit; and it is admitted by the sureties that the whole amount was received and appropriated by them.

2. That Mr. Roche, who was not the standing solicitor of the Lundy Granite Company, but engaged specially for the occasion while the acceptance of the tender of Mr. Furness was pending before the board, obtained a written agreement from him to purchase from that company, on certain specified terms, any granite which might be required on the works, and that it was stipulated in such agreement that Mr. Doulton should be the referee in case of any dispute between the parties. Mr. Roche has stated that he acted merely in a professional capacity, and such statement is proved to be correct by letters from officers of the Lundy Granite Company.

3. That the board deprecates the taking part by its members, in business or professional transactions, with parties connected with the works of the board in matters relating thereto, as calculated injuriously to affect the character of the board in the conduct of its business."

After a very long discussion a vote was taken, when there appeared—

For the amendment..... 15
Against it 15

The chairman gave his casting vote in favour of the amendment, and then vacated the chair, which was taken by Mr. Savage.

It was afterwards stated that Mr. Bevan's name had not been recorded, and after some

discussion the chairman ruled that it must be inserted, which negatived the amendment.

Eventually the original motion, by Mr. Silas Taylor, "That this board, having investigated the evidence of Mr. Furness, given before the Registrar of the Bankruptcy Court on oath, and adhered to by him, are of opinion that the statements made by him have been proved," was put, and seven voted for it and twenty against it, so that no decision whatever was come to upon the subject, although it had been discussed for upwards of five hours.

Mr. Doulton handed in a protest censuring the proceedings which had been taken against him, and taking exception to the way in which they had been conducted.

A motion was made, "That it be entered on the minutes," to which Mr. Richardson moved an amendment, "That the protest do lie on the table, and that the receipt of it be not recorded in the minutes," which was put, and carried by fifteen to six.

After sitting seven hours, the board adjourned.

FROM IRELAND.

Dunboyne.—The new church of St. Peter, Dunboyne, which has been erected from funds contributed by the Rev. James Hamilton, of Ballymacoll and the Ecclesiastical Commissioners, has been consecrated by the Bishop of Meath. The church has been built from the design of Mr. S. Rollinson, architect, Chesterfield. It is in the Early English style. At the east end there are three stained-glass windows, in memory of the late Major and Mrs. Hamilton, of Vessington.

FROM SCOTLAND.

Edinburgh.—At a meeting of the sub-committee on the improvement of St. Giles's Cathedral, Mr. R. Matheson, of H.M. Works, showed plans of the proposed improvements, which were cordially approved of. The intention, says the *Scotsman*, is to open up the building on the comprehensive scale adopted in the Cathedral of Glasgow; but, in the meanwhile, the alterations are to be confined to the Choir or High Churoh. The perspective view of the interior of the choir shows the galleries taken down, a new pulpit at a lower level, and the whole seats, with rows of stalls along the sides, in the style of the King's College Chapel at Old Aberdeen. The estimated expense is 3,500l.

Leith.—The foundation-stone of a Scandinavian Church, for the benefit of Danish, Swedish, and Norwegian seamen frequenting the port has been laid. The site is on the west side of North Junction-street, adjoining North Leith Poor-house. It was gaily decorated with British, Danish, Norwegian, and Swedish flags. Of 1,200l. required to complete the building, 800l. have been already subscribed.

Borrowstouness.—The Custom-house at Bo'ness and various adjoining properties have been burnt to the ground.

THE IRISH RAILWAY SYSTEM.

An influential meeting has been held at the Dublin Mansion House, to consider the present condition of the Irish railway system. The Lord Mayor occupied the chair. Lord Handon moved a resolution approving of the "policy of the purchase of the railways by the State." They were endeavoring to establish the cultivation of flax in the south, with the hope of having a portion of the linen trade established there, and some employment given to the people. The buyers from the north said they would be delighted to go frequently to Cork, but the fare was more than they would have to pay to London. Things in the west were the same. The fare from Cork to Galway was more than to London. Remonstances had been made to the Great Southern and Western Railway, but they gave a deaf ear to their entreaties, and nothing but the exercise of power by the Government would do any practical good. The Marquis of Clarinard moved—"That we rejoice to observe that her Majesty's Government, by issuing a commission of inquiry, have taken prompt and decided measures to ascertain the present circumstances, condition, and actual value of all the Irish railways, in view of the contingency of their eventual purchase." The resolutions seem to have been agreed to *nem. con.*

FORTIFYING POLICE-STATIONS.

The Government, it is said, have determined to fortify the police-stations in London, this being the preliminary step to a scheme of general fortification of all the police-stations and barracks in the United Kingdom. It is to be hoped this is not to be done without sufficient reason. The obvious purpose of the few invisible Fenians who infest this country has been to produce a panic; but surely the Government must have information which the public do not yet possess as to the magnitude of this movement, otherwise there is something very indiscreet in all this. The head office of the Metropolitan Police force at Scotland-yard will be the first, it is said, to be placed in a state of defence, and with this object Messrs. Clarke & Co., of Rathbone-place, are manufacturing bullet-proof iron shutters for the windows of the station. The shutters will be so constructed that they can be closed almost instantaneously, and an apparatus adjusted inside which will make them proof against any fusillade of small arms. Just think of the Fenians treating a London police-station to a fusillade of small arms, while the police and the military are nowhere! The doors, it is surmised, will be similarly protected. When all the stations in the metropolis and suburban districts are provided with the bullet-proof shutters, the stations and barracks of the police in Ireland, it is stated, will next be placed in a state of defence. Surely they should be the first to be protected.

PRIZE-WINNERS FOR ART-WORKMANSHIP.

We give a list of the works submitted to the Society of Arts to which prizes have been awarded:—

FIRST DIVISION.

- 1. Carving in Stone.—After a chimney-piece by Donatello. By H. Cole, Alma-terrace, Lambeth. (Prize of 5*l.*)
2. Carving in Marble.—After the same design, by John B. Fidler, Sheffield. (Prize of 15*l.*)
3. Carving in Stone.—After a chair-back in the South Kensington Museum. By W. H. Barrett, Alma-terrace, Lambeth. (Prize of 7*l.* 10*s.*)
4. Carving in Oak.—Panel, by C. H. Line, Prince of Wales-terrace, Kentish-town. (Prize of 7*l.* 10*s.*)
5. Reposed Work in Marble.—After the Martelli mirror case in the South Kensington Museum. By A. Dufour, Cleveland-street, Fitzroy-square. (Prize of 10*l.*)
12. Ditto, after a panel, in low relief, of the "Virgin and Child," in the South Kensington Museum. By J. Bunk Fide. (Prize of 5*l.*)
13. Ditto, after a tazza in silver. By Alfred Page, Myddelton-street. (Prize of 3*l.*)
14. Hammered Work in Brass.—After a knocker in wrought-iron, in the South Kensington Museum. By E. Millward, Little Clarendon-street, Clarendon-square, N.W. (Prize of 5*l.*)
16. Ditto, in iron. By W. Sendall, High-street, Wicheh. (Prize of 10*l.*)
17. Chasing in Bronze.—After a reliquary in marble, "Virgin and Child." Price 15*l.* By S. Beresford, Oxford-street, Stoney. (Prize of 7*l.* 10*s.*)
19. Ditto, by H. C. Hatfield, sen., Bolover-street, Euston-road. (Prize of 10*l.*)
20. Ditto, ornament after a missal cover. By H. J. Hatfield, jun., Bolover-street. (Prize of 5*l.*)
21. Ditto, in silver, after the same design, by A. E. Millward, New Compton-street, Soho. (Prize of 10*l.*)
22. Engraving on Metal.—After an arabesque by Lucas Van Leyden, by G. W. Hindley, apprentice to Messrs. Garrard & Co., 29, Pantoon-street, Haymarket, S.W. (Prize of 2*l.*)
23. Ditto on ivory, after the same design, by G. Barry, Brewster-street, Golden-square. (Prize of 5*l.*)
24. Painting on Porcelain.—After a drawing by Raphael. By Edwin Saunders, Marltha-street, Cambridge Heath. (Prize of 10*l.*)
25. Ditto, by Walter J. V. Nunn, Grafton-street, Mile-end. (Prize of 3*l.*)
26. Ditto, by Thomas Stanway, Lower Russell-street, Hanley. (Prize of 12*l.*)
32. Ditto, Ornament, by Alexander Fisher, Clyde-street, Stoke-on-Trent. (Prize of 3*l.*)
33. Ditto, by W. H. Slater, James-street, Stoke-on-Trent. (Prize of 3*l.*)
37. Decorative Painting, after a picture-frame in the South Kensington Museum. By Charles Pfander, Bayham-street, Camden Town. (Prize of 7*l.* 10*s.*)
38. Engravings on Glass.—Executed on a claret-jug, after an arabesque by Lucas Van Leyden, by E. Oppitz, Stamford-street, Blackfriars. Exhibited by Messrs. W. T. Copeland & Sons. (Prize of 10*l.* to E. Oppitz.)
41. Glass Blowing.—After an original in the South Kensington Museum. By Joseph Leicester, Tenison-street, Lambeth. (Prize of 7*l.* 10*s.*)
42. Bookbinding.—"Do Imitations Christ's" bound in calf, after a specimen in the South Kensington Museum. By Louis Genth, High Holborn. (Highly commended, but ineligible for a prize, the producer having received an award in the same class in a former competition.)
43. Ditto, Mosaic, bound in morocco. By Louis Genth, 90, High Holborn. (See note to 42.)
45. Illumination.—After a specimen in the South Ken-

ington Museum, by Miss Mary R. David, Anderson-street, Chelsea. (Prize of 1*l.*)
46. Ditto. By Charles Pfander, 28, Bayham-street, Camden-town, N.W. (Prize of 2*l.*)

WORKS SENT WITHOUT PRESCRIBED DESIGNS.

- 51. Chasing in Metal.—Emblem of bread and wine. Modelled and chased by C. Jacquard, J. St. George's-road, New Kent-road S.E. (Prize of 1*l.*)
54. Hammered Work in Metal.—Series of specimens. By T. Winstanley, New Compton-street. (Prize of 2*l.*)
55. Moulding in Plaster.—Etruscan emblems. By J. Meiklejohn, Sussex-street, Fulham. (Prize of 3*l.*)
56. Ditto, panel of spring flowers. Designed and modelled by E. Dujardin, Gambier-street. (Prize of 3*l.*)

SECOND DIVISION.

WOOD CARVING WITHOUT PRESCRIBED DESIGNS.

- (a). Human figure in the round, in alto or in bas-relief. Animals or natural foliage may be used as accessories.—1st prize of 5*l.*, and the Society's Silver Medal. 2nd prize of 15*l.*, 3rd prize of 10*l.*
65. Female figure, in carved panel of walnut-wood. By Samuel Moutrie, Stanhope-street, Hampstead-road. (Prize of 3*l.*)
68. "Summer," female head. By Mark Rogers, Techbrook-street, Fulham. (Highly commended, but ineligible for a prize in this class, the producer having received an award in the same class in a former competition.) (The "North London Exhibition" prize.)
70. Girl's Head, carved in pear-tree. By H. Godard, Upper Marylebone-street. (Prize of 2*l.*)
71. Medalion and Flowers. Designed and carved by E. Dujardin, Gambier-street. (Prize of 2*l.*)
(b). Animal or still life. Fruit, flowers, or natural foliage may be used as accessories. 1st prize of 10*l.*, 2nd prize of 7*l.* 10*s.*, 3rd prize of 5*l.*
73. A Dead Leaf. By John Wallace, Adam-street East, Portman-square. (Prize of 2*l.*)
(c). Natural foliage, fruit, or flowers, or conventional ornament, in which grotesque figures or animals may form accessories, preference being given where the work is of an applied character for ordinary decorative purposes, as representing commercial value. 1st prize of 10*l.*, 2nd prize of 7*l.* 10*s.*, 3rd prize of 5*l.*
80. Jewel Casket. By G. Rumford, Eccleston-street East, Fulham. (Prize of 2*l.*)
81. Portrait Frame. By G. H. Bull, Millman-mews, Millman-street, Paddington. (Prize of 1*l.*)
83. Panel of Flowers Carved in Satin-wood. By Edward Glancy, Manor-street, Chelsea. (Prize of 1*l.*)
85. Panel representing "Spring, Summer, and Autumn." Designed and carved by K. A. Brangan, Foley-street, Portland-place. (Prize of 5*l.*)
88. Panel for Cabinet Door. By G. H. Barnsdale, Queen-street, Peterborough. (Prize of 1*l.*)
89. Part of a Jery; subject from "Midsummer Night's Dream." By J. M. Leach, Ellingham-street, Pimlico. (Prize of 3*l.*)
91. Gothic panel in oak, for pulpit or reading-desk. Designed and carved by H. G. Price, 38, London-street, Fitzroy-square, W. (Prize of 2*l.* for the three works. Nos. 91, 92, and 93.)
94. Panel in Walnut-wood for a round-end sideboard. By J. Sparrow, Vauxhall Bridge-road. (Prize of 2*l.*)

A WORKING MAN'S OPINIONS ON MATTERS RELATING TO TRADES UNIONS.

Sir,—Questions which a short time ago were thought to be within the province of only a few of the massed minds of the country have, from a variety of causes, taken a wider range, and for important reasons, are now the all-absorbing matters of the day. The public mind is undergoing a change in relation to these questions, and almost every one, except those most interested, are saying that something must be done. Not long since, the popular panacea for slackness of work was emigration; but as time has passed, and they term the labour market of the superabundant labour; so as, by reducing the number of labourers, to raise the wages of those that remain. It appears that in this case the science of political economy is at fault, as no provision has been made to meet the present condition of trade. One of its axioms has been, that the condition of the laborer depended on the extent of the labor fund, and the number of claimants upon it; and according to that number would wages be high or low. But it is not now how few are the producing classes, in comparison with the upper or great-consuming classes; nor how much wages can be given, or what profit can be made by the production of articles for home consumption; but it is whether England can, with her present taxation, high profits, and wages, maintain her supremacy in the markets of the world. It is certain she will in the future have to compete for commerce with others in places where she has up to the present been the sole possessor of it. It is said that England is already fast leaving this country, and middlemen and others seem particularly anxious to verify it. Working men are often forced to listen to the arguments of these narrow-minded conclusions of the employing and selling classes, on economic science. One will tell you, with greatunction, that a friend of his bought iron castings in Belgium much cheaper than they can be produced in this country. Another will say that he can, and does, buy foreign glass of every description so cheap that he can sell for unpopace that which he could only sell for a shilling if manufactured here. But the worst part of the matter is, that these men, in their superabundance of wisdom, think the question of cheap production only concerns the working classes. And it seems to us surprising if workmen happen to be able to reply to them, and state, if the general condition of the working classes is lowered through foreign competition, or if the foreigner can only sell the English in the home-market, trade, which depends for existence upon the wages of the working classes, must fall; and the article which they retail to that class would

* This prize consists of the interest of 167*l.* 7*s.* 3*d.* Consols, invested in the name of the Society of Arts, to be awarded by the council "for the best specimen of skilled workmanship" at the Society's Exhibition.

not be of any use; and, as every class depends upon the profits of labor, they would in the end be reduced to the level of the workman.

I sometimes put the question to them in a practical manner. I ask them how much of these profits they are willing to forego, and how much reduction of expenses in every department of the trade they are willing to apply for to lower the chances of the English in the competition race. I now pay 5*s.* per year for an eight-roomed house, and the parish rates are 4*l.* per quarter, besides the fire tax, and assessor's tax; now how much will my landlord reduce that to allow me to hear a reduction of wages to meet the exigencies of the times? These questions are already answered by the workmen, and every day they will grow in importance.

It will not do to throw all the burden on the labour class; the others must look around to see if there is anything in their hands that wants putting in order; and I think it will be found that there is work for us all to do. It has been neglected too long; the warnings of fair-seeing men have been unheeded, and now the crisis has come. Old prejudices and habits must be eradicated; moral, industrial, and economic science must be placed on a firm foundation, if our country is to maintain her manufacturing prestige and supremacy.

Every one who is acquainted with the history of his country knows that the regulation of wages, capital, and labour has been one of the most difficult parts of Government. It is a question which these questions has in almost every case created general dissatisfaction. The guild system tried to produce the desired effect, and failed; and the same result was accomplished by the Government, almost every case created general dissatisfaction. The guild system tried to produce the desired effect, and failed; and the same result was accomplished by the Government, almost every case created general dissatisfaction.

The guild system tried to produce the desired effect, and failed; and the same result was accomplished by the Government, almost every case created general dissatisfaction. The guild system tried to produce the desired effect, and failed; and the same result was accomplished by the Government, almost every case created general dissatisfaction.

Although legislative and other means have not settled the labour problem, a portion of the labouring classes, through the action of unions, are trying by irregular means to compass that which the wisdom of ages could not do. In a free country, the members are bound to obey the laws made by the legislative assembly. If they are on one side, oppressive, or unjust, or otherwise unconstitutional remedy, the Government alone has the power of free action in matters relating to labour. Every one is at liberty to form his own judgment as to the nature of his employment, and to contract with any one, or decline the employer's terms. He also is at liberty to combine with others for any legal purpose. But if those combining agree to coerce or use force against others, or to deprive them of their means of obtaining a livelihood by labour, they then violate that liberty which the country says they shall enjoy, and commit a crime.

Although legislative and other means have not settled the labour problem, a portion of the labouring classes, through the action of unions, are trying by irregular means to compass that which the wisdom of ages could not do. In a free country, the members are bound to obey the laws made by the legislative assembly. He also is at liberty to combine with others for any legal purpose. But if those combining agree to coerce or use force against others, or to deprive them of their means of obtaining a livelihood by labour, they then violate that liberty which the country says they shall enjoy, and commit a crime.

Several other points I had marked down for a few thoughts upon, but I find I have sometimes said more than I intended to say. I have some questions are of some importance at the present time to masters and workmen, I hope you will think them worth a place in the Builder, and I shall be glad to have the opportunity of stating my opinion on various other points connected with economic and trade-union questions.

JACK PEARSE.

THE DUKE OF BUCKLEUCH AND THE THAMES EMBANKMENT.

In the Court of Exchequer, on the 8th inst., in sitting at 11th Place (before the Lord Chief Baron and a special jury), the action "Duke of Buccleuch v. Metropolitan Board of Works" was heard.

This action was to recover compensation in damages for injury done to the plaintiff's residence, at Whitehall, by the works of the Thames embankment. The defendants pleaded a variety of pleas, denying their liability.

Mr. Mellish, Q.C., for the plaintiff, said the Metropolitan Board of Works to recover a sum of 5,325*l.* which had been already awarded to him by Mr. Chas. Pollock, Q.C., as umpire, for the damage the duke had sustained as owner of the house, Whitehall, by the works of the Thames embankment. The freehold of the house and grounds belonged to his crown, but for 200 years the property had been in the hands of his predecessors, and the duke was to have a renewal of the term for ninety-nine years, in consideration of his expending 20,000*l.* in rebuilding the house. In 1794 an addition was made to the garden of the house by the erection of an embankment wall, surmounted by an iron railing, and having an iron gate with a key, leading to a causeway or jetty which ran down to lower-water mark. The Duke of Buccleuch had the advantage of water-communication to the river, and a perfectly free water-communication. It was well known that in the reign of Elizabeth, and three subsequent reigns, means of navigation were opened up the river, and the Duke of Buccleuch, Westminister, and that one of his chief attractions was the water-communication which they possessed, but those had all disappeared, and Mr. Montagu was said to be able to go to the house of that kind which remained. By the embankment the causeway or jetty in question was entirely destroyed, and in accordance with the provisions of the act, the Duke of Buccleuch was said to be entitled to a claim for compensation. The matter came before Mr. Charles Pollock, and in August last he awarded 5,325*l.* for the destruction of the jetty, and the closing up of the mansion by the erection of the wall. The defendants refused to pay the money, and hence the present action. In the first place, they denied that the Duke had any pro-

perly in the jetty; but, although it was not mentioned in the lease in express terms, he should prove that, as far back as anybody could recollect, there was a jetty running down to low-water mark, with an iron gate at the eastern end, and that it was used exclusively by the duke and his predecessors, and kept in repair by them. Between 1833 and 1834 the duke spent about 800*l.* in its repair. In the present mansion was built, barges brought the materials required to the river-front. There could be no doubt that the destruction of the jetty and of the access to the river had, within the terms of the Act of 1862, injuriously affected the premises.

Evidence *pro* and *con*, having been adduced, including that of the eritor, Mr. Rollock, Q.C.,
The Lord Chief Baron said.—I am of opinion that upon this evidence the Duke of Buccleuch is entitled to the full benefit of the award, and consequently to the verdict; but if you can show that the umpire has allowed anything which he has no power to give, that would be fatal to the award, and you can set aside the verdict and enter a non-suit.

A verdict was then returned for the plaintiff with the following damages.—Amount of award, 8,325*l.*; interest, 286*l.*; costs of award, 560*l.*; 11*s.* 5*d.*; total, 8,888*l.* 11*s.* 5*d.*. Leave was given to the defendants to move the court above on the points of law.

HERALDS' COLLEGE.

In the Equity Court, Feb. 8, before Vice-Chancellor Sir W. Page Wood, Mr. Amphlett, Q.C., appeared in support of a petition by the Corporation of the Pursuivants and Herald of the College of Heralds, Doctors Commons, praying that out of a sum of 7,600*l.*, which had been paid into court by the Metropolitan Board of Works for a part of the petitioners' estate, a sum of 2,150*l.* should be paid out at once to the petitioners, and the rest carried over to their account, with liberty to apply. It was stated that the sum was required to meet an instalment of payments on a contract which the college had entered into with Messrs. Villan & Co., of the Gray's Inn-road, for the rebuilding of their premises on their own ground, for the sum of 5,363*l.*; and the petition was supported by the affidavit of Mr. G. S. Bell, of the firm of Gardiner & Bell, architects, certifying that the plan and specifications were such as the court might approve.
The Vice-Chancellor made the order as prayed, and ordered the Board to pay the costs according to the Act.

CHIMNEY-STACKS AND THE LATE GALES.

SIR,—I wish to call attention, through your columns, to the numerous accidents and loss of life which have occurred in town and country during the late gales, by the falling of chimney-stacks; and also to obtain, if possible, some protection for the future from such catastrophes. I believe that when the late Lord Palmerston was Home Secretary, and his Metropolitan Smoke Nuisance Bill commenced practical operation, plans were proposed by which it was intended to abolish chimney-stacks entirely. Cannot some of the many scientific men and inventors of this country produce efficient plans for this object, and so get rid of those dangerous deformities of dwelling-houses? And further, if by some means the smoke arising from the chimneys can also be got rid of, it will assist to purify the atmosphere, and promote the health of the inhabitants of all large towns and cities. C. F. M.
* Several schemes with this view have been proposed. We print this note to keep the inquiry open.

ST. JOHN'S CHURCH, WEYMOUTH.

In your paper of January 25th, I find a notice of the proposed alterations to St. John's Church, Weymouth, in which it is stated that "the architect is Mr. F. Bennett, of Weymouth." Permit me to inform you that this is incorrect, as I am the architect, and have made all the designs, plans, &c., and, during the time thus engaged, I was in constant communication with the incumbent, the Rev. Mr. Stephenson, as such.
To save travelling expenses, it was arranged between that gentleman and myself, that some local clerk of works should be engaged to see that my designs were carried out in their integrity, and the party to whom you refer was engaged in that capacity. I may mention that this church was built from my designs some fourteen years since. The enlargement will consist of building an additional transept on each side, and lengthening the nave 14*ft.* (by which more than 300 additional sittings are obtained), and rebuilding the chancel. I should not have troubled you with this explanation, but that the same erroneous statement has appeared in the local papers: it is injurious to an architect to find that his designs are attributed to parties who are engaged only to see that his designs are properly carried out, and who may misstate things with a view to their own advantage. TALBOT BURY.

NOTES ON CHURCH BELLS.

No musical instrument has ever exercised so great an influence upon architecture as the church-bell. "To it," says the Rev. J. H. Sperling, "we owe the most striking external feature of our churches," namely, the tower, which, I may add, in many instances, surmounted with a beautiful spire tapering heavenwards; and "these towers were not built for mere fancy or picturesque effect, but to contain musical bells."
It is a lamentable fact, however, that many of our metropolitan church towers contain bells which, as I have often said, are a disgrace to the edifices to which they severally belong. Let one, possessing a grain of musical feeling, listen, on the Sabbath-day, to the hideous clang, clang, which issues from various one-bell towers, and then say whether these things are not "disturbances of the human race." It must be admitted, too, that the "hop, skip, and jump" style of music so often repeated in waltz time, at two or three West-end bellies, is extremely wearisome, while the jangling of the wretched

bells at certain other churches is truly painful to the ear. Now, I do not presume to dictate, but I venture confidently to assert, that if, in any parish, one or two spirited individuals would take up the subject, the evils in question could be easily remedied, for musical bells can be supplied in exchange for the present objectionable ones at a trifling expense. I say, at a trifling expense, because, for various one-bell towers, I would suggest a lighter and less powerful bell, and in such cases the proceeds of the metal of the old bell would very nearly pay for the undertaking.

Moreover, I may take occasion to observe that a bell is an appropriate gift to a church, and a lasting memorial. On this point the following statement will be found interesting.

On Tuesday, the 13th of August, 1867, Mrs. Gladstone laid the corner-stone of a new church at Penmaen, in North Wales; and, after the ceremony, Mr. W. E. Gladstone, in the course of a speech, said.—He was happy himself to be associated with this good work; and, if the parishioners would accept it, he would present them with interesting portions of the furniture of Christian temples, and they had been the subject in Germany of one of the most beautiful poems of the nineteenth century. But, he said, for he thought that bells were among the most charming, he confessed there was another circumstance which led him to make this offer, and that was, that he could not give the bell at all until there was a tower in which to put it; and, if they accepted this offer, they were pledged in the face of the world to the completion of the work they had undertaken.

In conclusion, allow me to call attention to another parishworthy example. A very grand bell which will be presented by the Duke of Bedford to the new church at Woburn, has just been cast by Messrs. Mears & Stainbank, at their foundry. It is the heaviest parish church bell in Great Britain, its weight being 35 cwt.

THOMAS WALDEBY.

HERNE BAY PIER.

SIR,—Evidently Lyon, as well as "Paulatin" and "C. E.," take an interest as to the present and future state of the pier at Herne Bay. If they, or any one who would cordially co-operate, will communicate with me, being the only director likely to see your notices, they can know the difficulties to be surmounted. H. F.

OUR PRISONS.

Some time back it was proposed to move the House of Correction, and now that railways have entirely changed the order of things, it is a question whether all prisons, common goals, &c. *et id genus omnia*, may not with advantage and considerable economy be taken out of London? They should be perfectly isolated, and not surrounded with buildings, which they must be if they remain in London. By their removal great improvements could be made.

EXTRA MURAL.

PIPES FOR WATER.

Mr family have been enquiring from lead in the water, occasioned by its passing through pipes of that material; will you be good enough to advise me, in your next paper, what will be the best substitute, as I am wanting seven water lead from the main and through the house without having it pass through lead at all. E. W. M.
* The tin-lined lead pipes have been recommended.

CHURCH GLAZING.

WITHOUT concurring in much that "M. P. G.'s" letter of February 1st contains, I am induced to re-open the subject of "church glazing" from another point of view. That lead glazing has its advocates no one can doubt; and of its appropriateness to certain styles of architecture each one is at liberty to form his own conclusions.

It is far from being universally known and appreciated, that glass is a rapid conductor. The fact that it is so, and that the artificial heat which is generated by any means, is rapidly "carried off" by contact with external glazing, is often lost sight of. Hence the complaints, alike from "church" and "chapel," to which I have frequently had to listen, of great draughts from the windows, even when hermetically sealed; but if otherwise so much the worse.

How is this to be avoided? I suggest by double glazing, from which the following advantages would accrue, viz., the draughts complained of would no longer be felt; all condensation of the moisture held in suspension, and which in many instances disfigures the walls, would cease; and the warming appliances be economized. The additional cost would be comparatively small, and right well applied. Lead glazing might thus, if appropriate, be used for the exterior, and stained glass, obscured or plain, according to taste or means, for the interior, with an air-chamber between the two. It may be inquired, "But how, in this case, is ventilation to be accomplished?" I reply, that windows are not the legitimate vehicles of ventilation: other and more appropriate means are usually available; and where not found they may be devised by the exercise of a little common sense. WILLIAM HILL.

THE MEMORIAL CHURCH, CONSTANTINOPLE.

SIR,—It is now nearly a year since I addressed you on the subject of the "Memorial Church at Constantinople," which produced a reply and statement from the contractors. The *Builder* reports regularly church-building news of every kind. Would you do myself and relations, as well as many subscribers to that very large fund (in the hands, for the last thirteen years, of the Society for the Propagation of the Gospel, who take no notice of us) the favour to procure some public report of its condition, present prospects, and expenditure, and when it is likely to be finished. H. F. AINSLIE, Colonel.

SIR,—Pray try and learn for us how it is that the Memorial Church at Constantinople has been dragging on for so many years. The whole affair has been a mystery and a muddle from the beginning. The architect first employed was dismissed. Will you ask why? and will you further say that England has gained very little credit in Constantinople by the way in which the affair has been managed. LEVANTER.

** We are informed that the building is now going on steadily to completion, and that no pause has occurred since the present architect and contractors commenced the work.

HEATING A BATH.*

SIR,—I can bear witness to the practicality of "Expertus" manner of treating a bath by use of coke-pan. In Japan and great part of China, every house, or rather hut, is provided with its bath, fitted at one end with a funnel about 7 in. diameter, for the reception of charcoal: by this manner a good hot bath can be obtained in about one hour's time. This bath is used by the natives both in winter and summer, and I wish I could see the poor in England follow the example of these we call uncivilized people. I am inclined to think Mr. C. R. Havell's plan is a natural patent to the poor, as you cannot use it without gas, and that you seldom find in their houses. ONE WHO HAS BEEN IN JAPAN.

THE WATER SCHEME FOR LONDON.

THOUGH the scheme for supplying London with water from Wales or Cumberland has been much canvassed in the newspapers, there is one unanswerable objection, which, as far as I know, has not been adverted to. The objection to which I refer touches that part of the scheme which proposes entirely to supersede all the existing water-works, thus making the whole city dependent on one source of supply only. Now, suppose after completion of the works, some accident should occur, so as to stop the supply of water for a time,—such an accident as the bursting of a reservoir, or the failure of the pipes at some point (as at the siphon across the Severn), which could not be immediately repaired,—how inconceivably fearful would the consequences be. Imagine a district of two million inhabitants suddenly deprived of all possibility of obtaining water. It would be little short of madness for any Government to permit the execution of a scheme which contemplates the supply of water for a large city from a single source. PROVIDUS.

ST. REGULUS'S CHURCH, ST. ANDREW'S.

SIR,—Professor Scott in his lecture on "Early Architecture in Britain," referring to the church of St. Regulus, says,—"I imagine it to be anterior in its date to the introduction of Norman architecture into England." This conclusion is at variance with that of our best modern Scottish archaeologists, such as Robertson and Wilson, who affirm it to be the work of Bishop Robert, 1127—44.
A careful examination of the present remains has satisfied me that they were correct in their views. The details differ in no way from the common at this date: the plan is that most usually to be met with in Norman churches in Scotland. Indeed, there is nothing about this

* See p. 85, ante.

building differing from other Norman churches of that date except the exaggerated height given to the tower and chancel.

I don't if it was ever intended to build a nave west of the tower; certainly none was ever built. Bishop Arnold, formerly abbot and builder of the great abbey of Kelso, succeeded to Bishop Robert; and his ideas on church building being somewhat grander than those of his predecessor, he laid the foundation of the cathedral, the remains of which indicate the noble design of the founder. In the meanwhile the priory church of St. Rule served as the cathedral, and here Bishop Arnold, dying before his church was well begun, was buried.

Various suggestions have been made to account for the peculiar proportions of this church of St. Regulus. Amongst the more feasible are the following:—

1. That it was intended by these means to give to a small church the dignity and importance necessary to mark it as the chief cathedral church in Scotland.

2. The priory of St. Andrew's, being composed of Cildan clergy and Augustine canons, it is not improbable that the Culdees may have insisted on a high tower, which was a characteristic feature of their own earlier architecture, and with them generally marked a principal station or collegiate establishment. The Norman architect, in carrying out this idea, followed the traditions of his art in building it square. The body of the church would of course require to be high, so as to be in some fair proportion to the tower.

3. That the tower was intended to serve as a "Pharos," for the proverbially dangerous coast of St. Andrew's.

Any one or all of these reasons would, to my mind, sufficiently account for the peculiarities of this church; but whatever the reason, I cannot understand how any architect, having personally examined the building, could arrive at the conclusion which Professor Scott has embodied in his able lecture, reversing the decision of our most enlightened archaeologists, and confirming the vague conjectures of the antiquaries of 100 years ago, whose knowledge of art was, to say the least, exceedingly confused.

ERKULPHUS.

DAMP.

I think, if "G. D. B." make a mixture of 1 lb. coal-tar and 3 lb. Portland cement, and lay that on, after having dried the present cement as completely as possible, he will find the paint will remain on it perfectly.

J. DE J.

CORROSION OF LEAD PIPES.

I RECOMMEND to your correspondent, who complains of the corrosion of the outside of lead-piping, the following simple plan, which I have practised, but with what success time alone can show. Procure common earthen drain-pipes of snitable diameter, and slide them over the lead-pipes close together, like beads on a string. By this means the lead will be effectually protected from contact with the corrosive soil.

In laying new pipes this plan is easily carried out; but piping already laid must, of course, be lifted and relaid before it can be applied.

EXPERTUS.

PAVEMENTS IN PARIS.

SEVERAL sorts of pavement have been for a long time tried in Paris without having led to the adoption of one that answers completely to the requirements of traffic. Pavements of all sizes and from all sources have been tried; pavements have been replaced by macadamizing, to which asphalt has succeeded in many parts of the capital, and in many quarters the macadamizing has been replaced by the ancient pavements.

An essay of macadamizing with the addition of iron turnings and filings, has been made on a small scale, it is said with admirable results: the ground, which had finished by obtaining a metallic consistency and solidity, did not yield under the pressure of the heaviest loads; but the enormous expense prevented its being adopted by the administration. As to wood pavement, of which there are several examples in various parts of the town, it has been abandoned on account of the considerable cost of maintenance. Still an

effort is made to return to it, and a new system of wood pavement, by M. Dagnan, has been tried on the Boulevard de la Chapelle, between the Rue des Poissonniers and the Rue Neuve de la Goutte d'Or. The system consists of iron plates, a metre square, pierced with holes, in which the wooden blocks are fitted. We have seen something of the kind in England.

MASONIC HALL, WINCHESTER.

THE inauguration of the new Masonic Hall took place here on Wednesday, the 29th ult. The new building occupies the site of an old chapel, which was formerly used by the French prisoners in the time of the war between France and England, but is now bapilly occupied by the more peaceable brotherhood of Freemasons. The edifice is Domestic Gothic in style, and is built chiefly of brick and flint stones, with Bath stone coping, and medallions with various Masonic emblems carved upon them. The gable on the principal front is surmounted at its apex by a triple Tau. The interior comprises a kitchen, ante-rooms, &c., and over all a handsome lodge-room of good proportions, well lighted by two sunlights. The works have been carried out under Mr. Stephen, jun., architect; by Mr. Newman, mason; Mr. Carter, builder; and Mr. Sealy, plasterer.

CHURCH-BUILDING NEWS.

Blunsdon.—The restored church of St. Andrew, Blunsdon, has been re-consecrated. The main portion of the restoration has been completed. The style of architecture may be designated Early English. The church as it originally stood only consisted, as it were, of one long room, the chancel being almost level with the nave, and an old elongated oak communion-table, the date of which it would be hard to speculate upon, stood at the east end. Now there is an aisle on the south side, and on the north side of the chancel an organ-chamber and a vestry. There was, too, only one entrance to the church—that from the north side—but an entrance has now been formed at the west end, approaching to the south aisle, whilst a porch is being added to the original entrance. Beginning with the church, we may first of all state that the Rev. W. T. Wyld has presented to the church a stained-glass window representing the Crucifixion of Christ. Over the altar-table is a stone cross, and in the chancel new oak benches have been constructed for the choir. The chancel walls have not been removed, but a new coating of stone has been put outside, and a new roof covering the old one. Coming to the nave there has been the same alteration. A new outside roof has been constructed over the old one, so as to preserve the old building as much as possible, and new seats of stained deal have been provided. They are open and free. When the architect came down to examine the edifice preparatory to commencing the restoration, he found that the south wall consisted of three arches, with short stone pillars supporting them. These arches were built up, but the material was removed from them, and thus the south aisle was enabled to be added. The pillars were strengthened, and the walls supported from the roof by beams. Mrs. De Windt, of Blunsdon Abbey, has presented a stained-glass window representative of the Resurrection, and which window has been placed on the east side of the south aisle. On the north side of the nave there are two other stained-glass windows, which have been made up of the glass found in the windows of the old edifice, and some which has been made to imitate it. The edifice is heated by Porritt's (Lancashire) apparatus, and the church is lighted in a very primitive fashion, viz., by the aid of candles. As to the exterior the walls have been strengthened, Bath corner stones have been used plentifully, new red tiles have been put on the roof, a turret over the west end for a couple of bells has been erected, surmounted by a pinnacle and vane. Two Maltese crosses are placed, one over the chancel and the other over the nave. A new porch is being made on the north side. The stained-glass windows are the work of Messrs. Lavers & Barrand, from the design of Mr. Butterfield, who is the architect of the church. The work has been carried out by Mr. W. Morris, of London; and Mr. Smith, of Highworth, the builder and contractor.

Harleston (Suffolk).—The parish church of Mendham has been re-opened. We gave an account of the restorations of this church, from designs by Mr. Phipson, in our last volume, page 551, along with other church restorations, in East Anglia.

Bishop Starford.—The ratersayers at a recent meeting unanimously resolved that the whole of the parish church shall be thoroughly restored so far as the work is not already done. Mr. Pritchard has made estimates of various restorations that are requisite, and a committee has been appointed to ascertain the amount of subscriptions likely to be raised.

Poplar.—St. Matthias's Church has been re-opened, after having been closed five weeks. The side galleries and the old high pews have been entirely removed, and new flooring and open seats substituted; also memorial stone re-laid. The church is heated with new hot-air apparatus, and lighted by gas standards fixed on backs of seats. The entire works have been executed by Messrs. Crabb & Vaughan, under the superintendance of Mr. Teulon, architect. Mr. Coleman was clerk of works.

Hernhill.—Through the exertions of the vicar, the chancel of the church here has been re-restored, at the cost of the Ecclesiastical Commissioners. The old rectorial pew has been moved, the pavement has been relaid with Minton's tiles, the roof re-fitted, and the walls re-plastered. The alterations have been effected under the management of Mr. W. Judges, jun., of Boughton-under-Blean. Coincident with the restoration, two painted windows by the Messrs. O'Connor, of London, have been inserted. The subjects are, in the two windows, the four Evangelists, with their emblems or symbols, and scrolls bearing the verses, "Ask and it shall be given you," "Be not afraid, only believe," "But one thing is needful," "God is love." There was already a window at the east—the subject, the Crucifixion, by the same artists.

DISSENTING CHURCH-BUILDING NEWS.

Balby.—The new Wesleyan chapel erected at Balby, during 1867, was from the plans of Mr. W. Watson, architect, Wakefield; and was built by Mr. Haxell Arnold. It is of Chasic design; the two fronts and sides are of red stock bricks, relieved with bands, strings, and arches of ornamental white bricks and stone dressings. The front towards the low road is of two stories, having the schoolroom in the lower part: the chapel is entered on the higher road, on the level of the road; and communicates with the schoolroom by a staircase. The gables are carried up in an ornamental manner, and finished with fancy brickwork and stone coping; the roof is covered with blue Bangor slates. The inside measurement of the chapel is 42 ft. by 37 ft., and is capable of seating 250 persons. The roof is open, and the timbers are divided into panels, stained and varnished. The internal fittings are of red deal, stained and varnished. The windows are glazed with ground glass. The schoolroom, of the size of the chapel, and 12 ft. in height, is adapted for public meetings, &c. The entire cost has been 1,000l.

Helidon.—St. John Baptist Church, Helidon, was some time since re-opened, after enlargement. When the church was re-opened, a re-rod for the east end was in the course of construction, but was not then completed; this has now been erected, according to the *Northampton Herald*. It is the work of Mr. Butterfield, the architect of the church. It consists of a centre, filling the space immediately behind and above the Communion-table, and two wings on a level with the table, extending to the north and south walls of the sanctuary. These wings consist of a zig-zag pattern, in Minton's coloured tiles and Bath stone. The central portion, behind the holy table, consists of a back-ground of Bath stone, inlaid with a cross of red Langmedoc marble, in relief, resting on a slab of the same material (under which lies a base of blue marble), and surrounded by circlets in green glaze-ware. The remaining space on either side of the cross is filled in with a rosette in coloured tiles, and the letters alpha and omega, each within a circle of blue and red marble, while the whole is flanked on north and south with a pinnacle of red Kenilworth stone.

Swansea.—The contract for the erection of the new Congregational Chapel has just been let to Messrs. Thomas, Watkins, & Jenkins, and they have commenced harricating and otherwise

preparing the ground for a commencement of the work. The chapel will be built upon Walter-street, Fynone.

Henley.—By the liberality of Mr. G. F. Muntz, of Umberslade, the members of the Baptist denomination in Henley-in-Arden have obtained a new chapel in place of the unpretending brick building which formerly occupied the same site. The new chapel has been opened by special services. The chapel is built of blue Wincoboe stone, with Bath stone dressings, and is constructed to hold 200 persons. The interior dimensions, exclusive of the apse and porches, is 42 ft. by 27 ft. 6 in. The roof is open timbered, and is supported by ribs springing from carved corbels. The ceiling is of stained hoards, and not carried up to the apex, a portion being flat, in which is made provision for ventilation. The front, which is gabled to the street, contains a wheel window over the porch, of large dimensions, filled with geometrical tracery. The north-east corner of the front is flanked by a small tower, surmounted by a spire reaching 60 ft. from the ground level. The entrance is through an open porch at the front, leading to the two inner porches, so as to prevent draughts. A small choir gallery is provided over the front porch, in which it is intended to place an organ. The seats are of stained pine, and open at the ends. The baptistry is open, and is placed at the front of the pulpit. Vestries, with connecting lobbies, are provided at the rear. The whole building is warmed by heated air. The building, which is Gothic in style, has been erected from designs and under the superintendance of Mr. George Ingall, architect; Messrs. Clark & Smallwood being the contractors.

STAINED GLASS.

Coggeshall Church.—The window just placed in this church, in memory of the late Mr. Arthur Gardner, is one of Messrs. O'Connor's works. The subject is the Transfiguration. The window is in three lights. The whole of the centre light is occupied by the figure of our Lord.

Church of St. John the Baptist, Chester.—The west window of the south aisle in this church has recently been filled with memorial painted glass. The subject is our Lord's Baptism in the Jordan, set in an Architectonic framework. The opening is a single lancet. The work has been executed by Messrs. Ward & Hughes, Soho-square, London.

Miscellaneous.

CONCRETE WALLING AND THE BUILDING ACT. The Metropolitan Board has granted leave for the erection of dwellings with concrete walls. Some correspondence on the subject appeared recently in our pages.

THE SHEFFIELD ARCHITECTURAL SOCIETY.—The inaugural meeting of this new society was held in the School of Art on Thursday, the 6th instant. A large number of members and their friends were present. Around the platform were exhibited several objects of archaeological interest, including the cast of the shaft of an old cross now at Westbourne; the indented chevron pattern stone found during the recent alterations in the tower of the parish church; a portion of an ancient quern, or hand-mill, found a few days ago at Wath Cemetery; some Roman coins found in the neighbourhood of Sheffield, and a number of rubbings from fine monumental brasses. The Hon. F. S. Wortley took the chair, and Dr. Arveling gave an address on Architectural and Archaeological Science.

GAS.—The Brecon gas company have declared a dividend of 10 per cent.; and the Frodsham one of 7½ per cent. The Frodsham company, says the reporter, "began its career with gas at 8s. 4d. per 1,000 ft. It then and for several years divided 2½ per cent. But one or two individuals contended that there would be no decided improvement until the price was reduced. This has gradually been done, and the price now stands at 5s. 10d. per 1,000 ft., and the dividends have also gradually improved so that for two years respectively 7½ per cent. has been divided among the shareholders." The Bridgewater gas company are about to reduce the price of their gas from 5s. to 4s. 6d. per 1,000 cubic feet. The Kidsgrove gas consumers are trying to obtain a reduction of the price of their gas from 5s. to 4s.

A MASONIC TOWER OF BABEL.—The Masonic brotherhood of Philadelphia are about to build a granite structure, it is said, 250 ft. long by 150 ft. wide, with a tower 300 ft. in height. It will cost nearly 1,000,000 dollars.

"THE DUST REALLY LAID AT LAST."—Under this title the *Parochial Critic*, speaking of Mr. Cooper's new patent, already described in the *Builder*, for watering the streets, with a simple and harmless deliquescent solution, which will keep the roads always moist, yet not wet,—thus ridding them both of dust and mud, at a saving of 20 per cent. to the ratepayers, exclusive of saving to the roads and comfort to shopkeepers, householders, and passengers,—says:—

"Mr. Cooper's proposals are being eagerly accepted by the vestries and other governing bodies. St. Pancras has given him a contract for the whole season for a portion of the parish, comprising the macadamized and the paved granite. The Marblebone vestry has allocated to Mr. Cooper one-fourth of their important parish. He is also in treaty with the City authorities, who are favourably impressed with the improved system. Clerkenwell has also requested Mr. Cooper to tender, while the aristocratic parish of Kensington has entered into a contract for some of their most important roads. The Government has also given permission to the patentee to experimentize in Hyde Park, and before the Horse Guards in Parliament-street.

We hope no prejudice or pressure on the part of interested parties will be the means of depriving the ratepayers of the boon, especially in those districts where the traffic is great and the rates oppressive. Let the vestries defer entering into any contracts for watering until they have received a tender from Mr. Cooper; for apart from the saving that will be effected, will be the future absence of those complaints which tradespeople and others are constantly making to the vestries during the dry season."

Dr. Odling, F.R.S., who has chemically examined the patented substance, certifies that it seems well calculated to effect the object in view, and that it is composed of perfectly harmless ingredients, which "do not exert any influence upon the atmosphere, and are altogether devoid of corrosive or otherwise injurious action upon carriages, wheel-tires, boots and shoes, horses' hoofs, or any substances likely to be brought into contact with the solution." There is a good prospect, therefore, now, of the dust being really laid at last.

FACT AND IMAGINATION.—An admirable lectures on this interesting and important subject was recently delivered in the Ipswich Mechanics' Institute, by Mr. T. S. Gowing:—

"What," said the lecturer, "do I mean by fact? What by imagination? A definition of fact appears to be one of the easiest of tasks. Everybody will tell you 'a fact is a fact'; and yet, when you inquire about the simplest circumstance, what different versions are commonly given! A fact should be an ascertained truth relative to a deed, a point of time, an event, &c. Strictly speaking, we are not justified in calling anything a fact which is not absolutely true and indisputable; but, popularly speaking, everything is fact which a man from his own point of view conceives to wear the appearance of reality. Imagination will, in this lecture, be regarded as that faculty of the mind by which physical or mental objects are vividly perceived, not merely in their simple relations, but in accordance with the laws of mental association and affinity, and therefore so arranged in the mind, that the objects themselves, when recalled, can be reproduced with life-like clearness and force, and represented either in their simple forms or in new yet appropriate combinations. Science is not merely a knowledge of facts, but of the principles which govern facts: for to know a fact is not necessarily to know that of which the fact is significant. It is not, therefore, by multiplied collections of facts made easy that science can hope to advance; but by a clear perception of what may be deduced from one or more unexplained facts. A well-understood principle is an absolute accession to our knowledge, and is commonly applicable to a wide range of phenomena; but a mere fact can never have more than a limited and relative value. . . . In what is called invention or discovery, contrary to the accumulative course of the mere factist, it is from a few carefully-observed facts, in some cases even from a single fact, that brooding genius has often leaped forward in the twilight, which we name invention or discovery. I have used the expression 'twilight,' because there are generally dawnings of light from various quarters, heralding the meridian glow of new truths. In this, the first or anticipatory stage of discovery, it is my belief that imagination is the chief agent; and that the logical faculty is never employed in discovery or invention till the imagination has first struck out the thought at a heat, which it is the subsequent province of the logical faculty to correct and verify."

Great discoverers and inventors have often urged similar views, in contradiction to the priggish, superficial, and shallow notions of mere fact-mongers; but no one has better defined the important office of imagination in scientific pursuits than Mr. Gowing has done; although, amongst our modern men of eminence, both Faraday and Tyndall have done so. Coleridge, in speaking of it, compares it to "an *à priori* light" which every successful interpreter of nature must have, otherwise he is a mere groping and grubber in the dark amongst the host of facts whose bearings and relationships are totally *unseen* and *intently unknown*, although the hard and stubborn facts themselves may here and there be *felt* and *handled*. We have often urged these views in the *Builder*.

BATH ABBEY RESTORATIONS.—This work continues to progress. The third bay of the groined ceiling of the nave and aisles is now completed. The fourth bay is to be immediately proceeded with. Had the funds been sufficiently promising, the fifth bay in the nave would have been ordered also. The stained-glass windows in the aisles are being gradually filled in, and it only needs increased liberality on the part of the public to insure the opening of the nave for divine service during the present year. Mr. J. Bell, of Bristol, has just completed a stained-glass window, intended to be placed in the north side of the choir in the Abbey Church. The window consists of five lights, and the subject of the whole is Christ reading in the Synagogue. The tracery above is illustrative of the verse "The spirit of the Lord is upon me," &c. (Luke iv. 18), which is quoted beneath the subject. There is a foliated haemost and canopy. The window measures about 16 ft. high, by 12 ft. wide, and contains a large number of figures.

NEWCASTLE MECHANICS' INSTITUTION BUILDING.—The new Mechanics' Institution in New Bridge-street, Newcastle, has been opened. The old building was in Blackett-street. The foundation-stone of the new building was laid by Sir George Grey nearly three years ago. Its erection was much interfered with by the protracted masons' strike. It is not quite finished yet, according to our authority, the *Gateshead Observer*, but the lecture-room and the library-room are completed, and the other parts of the building will ere long also be ready for use. The front is in the Palatial Italian style of architecture; and the whole of the ornamentation has been put into this part. It is adorned with three carved heads, representing Literature, Science, and Art. The stairs are 6 ft. in width. The lecture-room is 70 ft. by 40 ft., 23 ft. high, and capable of accommodating 600 persons. Over the lecture-room is the library and news-room, which is similar in size. Both these rooms are of a semi-circular form. The site is within the moat of the old town wall. The foundation was laid with concrete. The architect is Mr. Oliver. The cost of the building will be about 4,000l.

PECULIARITIES OF BRICKMAKING.—Few things would be more trying to the constitutions of those who had not properly graduated, than the tramping all day with naked feet on the cold wet clay, as do the brickmakers; there is no wonder that they are devoured with rheumatism—such, at least, as live to be old men, and these do not form a large proportion of the number. Continually handling the clay, too, is quite as trying to a stranger—indeed, the men themselves consider it the worse. Their feet get so hard from continually tramping the "stuff," as they call it, that they are horny all round, and when the season is over, and the men have to wear their hoots all day, they are sadly inconvenienced. Some of them are quite crippled, as the effect of the unaccustomed covering is to make the outer skin peel off, leaving a soft skin, which is very easily galled by the hoots, and the men can hardly limp along. To most persons the strong and somewhat pungent smell arising from a brickfield is very disagreeable, and when this is the case it is naturally supposed that the odour is unhealthy. I have never, however, been able to trace any practical effect on the health of the neighbourhood of a brickfield is often condemned as a nuisance. Like other nuisances, however, if it be one, those who come after it has been established have no right to complain, and some years ago advantage was taken of this fact in a manner which would do credit to American shrewdness. The lease of a piece of ground at the west of London was offered for sale by auction, and one of the conditions of sale imposed a penalty of 1,000l. on any attempt to turn it into a brickfield. The lease was sold to a gentleman for 1,200l., and on signing to complete the purchase, he handed the agent a cheque for 2,200l. "The sum is only 1,200l.," said the man of business; "here is a mistake of 1,000l." "No mistake at all," said the huyer, "I am going to turn it into a brickfield." And turn it into a brickfield he did, although threatened with innumerable actions by the residents around. The fact was, he had discovered that once a part of it had been used for that purpose, and so he could not be indicted by those who came to the nuisance. From this very field is built a great part of our noblest metropolitan suburbs.—*Cassell's Magazine*.

CRYSTAL PALACE.—The newly-built Tropics End, having been completed, will be thrown open to the public on Saturday. The erection has been undertaken by the Hamilton Windsor Iron-works Company, Liverpool, under the direction of Mr. Edwin Clark. The finishing of this portion of the Palace has afforded the opportunity of locating the show of British and foreign birds there.

EXPLOSION IN A CHURCH.—A serious gas explosion has occurred in the Parish Church at Ripley, near Alfreton. On a lucifer match being struck in the church, a violent explosion immediately ensued. Every window in the building was smashed to atoms; and the organ, which has recently been repaired at much cost, was very much shattered. Many of the pews and other parts of the church were also damaged. The explosion must have resulted from an escape of gas from one of the pipes. It is said that the damage done by this explosion is estimated at 450*l.*, which is covered by insurance. The explosion took place at the west end of the church.

FIRE AT ST. NICHOLAS'S PARISH CHURCH, LIVERPOOL.—A fire, resulting in very considerable damage, has occurred in the parish church of St. Nicholas, Chapel-street, Liverpool. The part attacked was the roof, which was completely burned through, while the falling debris and water did considerable damage to the walls, floors, pews, cushions, &c. The organ was also materially injured, more, however, by water than fire. We are informed that plumbers had been engaged at work on the roof; but whether the fire was caused by the falling of lighted cinders from fires used by them in their occupation; whether it arose from the overheating of the fire of the vestry; or to what other cause the occurrence is due, remains to be inquired into.

HEARTS OF OAK BENEFIT SOCIETY.—From the official auditor's report on the financial operations of this Society for the year 1867 it appears that the "Hearts of Oak" began the past year with 12,000 members, and finished it with 15,500. The income for the year was 26,801*l.* 5*s.* 7*d.*, or 2,238*l.* per month, while the income for 1866 only averaged 2,000*l.* per month. The amount thus received appears to have been disposed of as follows: out of every 100*l.* received 73*l.* 1*s.* were distributed in benefits to members; 2*l.* 2*s.* were spent in postage, reports, &c.; 5*l.* 12*s.* were spent in management expenses; and the remainder, viz., 18*l.* 12*s.*, was added to the reserve fund, which now amounts to only a few pounds short of 50,000*l.*

A YANKEE STEAM "MAN."—Every one has heard that in the progress of steam, as a locomotive power, and long before the "iron horse" was matured, attempts were made to work a predecessor of his upon four legs. This old English notion has become a new Yankee notion, only our cousin has the ambition of a Frankenstein, and has made a steam man, who walks upon his two legs, though he "works like a horse," or, rather, like three horses. Mr. L. Dedrick, a machinist, of Newark, U.S., is the inventor. The man walks or runs (in stabs) as he is bidden, in any direction, and at almost any rate of speed, drawing after him a load whose weight would tax the strength of three stout draught horses. He stands 7 ft. 9 in. high, the other dimensions of the body being correctly proportioned, and his name is Daniel Lambert. He weighs 500 lb. "Steam is generated in the body or trunk, which is nothing but a three-horse power engine, like those used in our steam fire-engines. The legs which support the automaton are complicated and wonderful. The steps are taken very naturally and quite easily. As the body is thrown forward upon the advanced foot, the other is lifted from the ground by a spring, and thrown forward. Each step or pace advances the body 2 ft., and every revolution of the engine produces four paces. It is proposed to run the engine at the rate of 500 revolutions per minute, which would walk the man at the modest speed of half a mile a minute. The fellow is attached to a common rockaway carriage, whose shafts serve to support him in a vertical position. The boiler and such parts as are necessarily heated are to be encased in felt or woollen undergarments. The cost of this 'first man' is 2,000 dollars, though the makers, Messrs. Dedrick & Grass, expect to manufacture succeeding ones, warranted to run a year without repairs, for 300 dollars." Our American friends, in losing the nigger, as a slave, are fortunate in obtaining the "steam man."

ROYAL SOCIETY CONVERSAZIONI.—The president has issued cards for two conversazioni at Burlington House, on March 7th, the other April 25th. Winter has slipped by and "the season" is again in view.

THE INSTITUTION OF CIVIL ENGINEERS.—On February 4th, Mr. C. H. Gregory, president, in the chair, the paper read was on "Floods in the Nerhudda Valley; with Remarks on Monsoon Floods in India generally," by Mr. A. C. Howden.

VOLUNTARY ARCHITECTURAL EXAMINATION.—With reference to the voluntary architectural examination appointed for the second and third weeks of May, we are able to say that it will be held if the application of even one candidate be approved by the council.

THE ASSEMBLY ROOMS, READING.—The Rooms in Friar-street, formerly known as "The Town Rooms," have been entirely re-arranged and re-decorated by Messrs. Green & King, of London. By the use of movable partitions, the new Assembly Rooms are made capable of accommodating either large or small audiences. The decorations are of a light Italian character, and are described by the local journals as tasteful.

HUNGARIAN JOURNAL OF CIVIL ENGINEERING.—The Hungarian Society of Civil Engineers issue a periodical six times a year, in parts, containing each from five to six sheets of letterpress and three or four plates. The publication is intended, in the first place, to acquaint the Hungarian reader with the progress realised abroad in the science and practice of civil engineering; and, in the second place, to afford the profession in foreign countries, as far as may be done by engravings, an account of important engineering works carried on in this country.

MR. HENRY LESLIE'S CONCERTS.—The concert on the 6th was very successful. The opening piece was Mendelssohn's music to Sophocles' tragedy of *Edipus Colonus*, composed in 1845. This fine work was capably performed by a first-rate orchestra, including a number of the best men in the profession. The dialogue, in this version of Mr. W. Bartholomew, was declaimed by Mr. Lin Rayne. The solo parts were entrusted to Mr. W. H. Cummings, Mr. Frederick Walker, Mr. Chaplin Henry, and Mr. Lewis Thomas. The concert on the 13th consisted mainly of madrigals. On the 20th Mr. Sims Reeves is to assist.

NATIONAL FREEHOLD LAND SOCIETY.—The eighteenth annual report states that there has been an increase during the past year in every department of the society's business. The deposits have exceeded those of the previous year by 178,888*l.*, whereas the withdrawals also only exceeded those for the same period by 32,369*l.* The "members' capital" has increased by 210,799*l.* The assets amount to 1,010,312*l.* The directors have added 5,000*l.* to the reserve fund, which now amounts to 10,000*l.* A further sum of 27,337*l.* has been added to "convertible securities," increasing that fund to 129,186*l.* The net profit this year (after deducting the 5,000*l.* carried to the reserve fund) is 21,829*l.*

LABOURERS' DWELLINGS FOR CROYDON.—New buildings have just been completed in a poor district of this town, and are now open to receive tenants. They have much less of the bar-rect style of architecture than usual. There are ninety-two rooms, divided into tenements of from one to three rooms, to meet the requirements of all, as far as can be ascertained at the outset. The single rooms are much in request by those who are unable to pay for more, or whose families do not require more. There is a good demand for rooms, and it appears that the benevolent projectors will receive a dividend as well as do great good to the working classes in the neighbourhood. Each living-room is provided with an oven and large cupboard, and every room has a fireplace; by this and other means the ventilating arrangements are admirable. Provision is made for all tenants to place flowers in the windows, by means of a water-tap; also they are provided with a dust-shaft. The whole of the stone staircases and landings are lighted with gas. A washhouse, with six boilers and large drying-ground, is provided. There is also a large or common room in the centre of the buildings, where the various agencies connected with the poor may be carried on. The buildings have been erected from the designs of Messrs. Beck & Lee, of Finchbury-circus, by Messrs. Colls & Son, the builders, of 28, Moorgate-street, and Camberwell.

DESIGNS FOR TILE-PAVING.—We go a little out of our way to point attention to an advertised set of designs for the arrangement in patterns of ordinary red, black, and buff tiles. They show cleverly what a varied tone may be played on three notes.

FIRE IN THE OXFORD MUSIC-HALL.—The well-known "Oxford" Music-hall, in Oxford-street, has been gutted and unroofed by fire, which broke out early on Tuesday morning, after Monday evening's performance. How the fire originated is yet to be discovered. Some say it broke out first in the roof, and at all events the burning of the roof first attracted attention from the outside. Others strangely say that it originated in the cocoa-nut fibre with which the seats were stuffed, and which was covered with canvas, and the canvas with damask. Even though a burning cigar-stump, as is supposed, had penetrated to the fibre, it is known that this fibre is scarcely combustible at all, and a red-hot coal has made its way to the centre of a mass without setting it in a blaze. Besides, in the seats it must have been well matted together.

PRINCESS'S THEATRE.—The revival of the "Octoroon" here, with a strong cast, is likely to prove very successful. Mr. Vining plays admirably the scoundrel *McClosky*, Mr. J. S. Clarke *Salem Soudair*, with much discretion, but less force than was originally given to it by Mr. Bouicault, who now presents picturesquely the Indian, *Wahnote*. The *Pets* of Mr. Dan Leeson is very effective, and Miss Sanger and Miss Simms add in producing an effective whole. Mrs. Bouicault sustains the part of *Zoe* with pathos and grace as of old. Mr. F. Lloyd has painted some exceedingly good scenery, especially a sun-rise over the *Atakapas*. "Arrah-na-Pogue," with an equally strong cast, is played with the "Octoroon," and makes a remarkable evening for visitors to the Princess's.

TENDERS.

For Independent Chapel at Ivy Bridge, South Devon. Messrs. Ambrose & Snell, architects:—

Bramblecombe & Triggs	2350 0 0
J. Bramblecombe	800 0 0
Marshall	757 0 0
Hurrell	742 0 0
Jenkins	736 0 0
Clarke	729 0 0

Beg to offer BLUE LIAS LIME, LATH, and FIRE GOODS of the highest quality, DIRECT from their Works, by RAIL or CANAL, to LONDON and all parts of the Kingdom. The above Lime is of the highest quality, and is used in the New Houses of Parliament, Trent Valley Railway, and many other large works. It is also used on the Thames Embankment, Millwall Docks, Ruckfords Bridge, undercroft railways, &c. It is an unusual CEMENTIOUS property, making the HYDRAULIC power equal to the best cement.

Please Address, L. M. TATHAM, RUGBY; or L. M. TATHAM, FADDINGTON, W.

A BERTHAW BLUE LIAS LIME, the most celebrated Lime in the world. Concrete, Brickwork, and Masonry generally. S. J. WOOD & CO. Albertham Lane Works, and Albion Works, are now prepared to execute orders for the above Lime to any extent, delivered either by rail or to every part of the United Kingdom.—London Agent, Mr. CHARLES WEEKES, C.E. 12a, Great George-street, Westminster, S.W.

BAL TIC WHARF, PUTNEY, S.W.—ROBERT AVIS & CO. Lime, Cement, Plaster, and Sand Merchants, Bricks, Tiles, Slates, Chimney-pots, Stone-ware, Drain-pipes, Laths, Hair, Fire Goods, and all kinds of Building Materials.

COLES, SHADBOLT & CO. CEMENT MANUFACTURERS, LIME BURNERS, SLATE, TILE, DRAIN-PIPE, LATH, and FIRE GOODS. ST. JAMES'S and THORNHILL WHARFS, CALDORIAN ROAD, LONDON.

TO ARCHITECTS, BUILDERS, and CONTRACTORS.—Messrs. EADON, of 11, DAY, of the old dock, Grey-street, Finsbury, London, are now prepared to supply BORING GREY LIME, of the purest and best quality, warranted pure, free from core or water, at the lowest possible price, delivered at any station on the South-Eastern Railway. Estimates on application as above.

PORTLAND, ROMAN, and PLASTER CEMENT MANUFACTURERS. STROOD DOCK, on the RIVER, KENT. LARK & WHITE.

Are prepared to supply their Cements, of the best quality, either for hydraulic, brickwork, or for final works, or otherwise, and for home or foreign use, direct from the Manufacture, or at our home WHITE LIME WHARF, BANESIDE, LONDON.

N.B.—Merchants for the foreign trade treated with on the most advantageous terms. Ships of any size loaded and stowed and disloaded. HYDRAULIC LIME MANUFACTURERS OF THE BEST QUALITY.

SAND.—BRICKMAKERS' and BUILDERS' SAND, of the finest quality delivered to any station between Charinghouse and London. Give Notice by Rail, or by particular apply to Mr. WEBB, 31, Jackson-road, Holloway, London.

The Builder.

VOL. XXVI.—No. 1307.

Memorials of
Westminster Abbey.

IN former times, sovereigns brought offerings to Westminster. The Dean of Westminster, the modern representative of the great abbots of old, reversing this precedent, has just laid at the feet of our Sovereign Lady the Queen a choice offering.* It is a comely volume, telling the history of the great centre, or core, of all Medieval expression of regal and ecclesiastical magnificence, — Westminster Abbey. The Dean sketches the thorny morass on the bosom of the Thames, once haunted only with the stampee of herds of wild oxen and red deer, that ultimately became the site of the abbey. Then he builds up the fabric, first in the old Saxon days when the island was a bright green spot upon the river. With silvery phase, with a mellow musical ring, he tells of the coronations that have fitfully filled the edifice with splendour and acclamations to leave it quiet, cool, and grey again; of the many other incidents in the lives of our successive kings associated with the abbey, such as the deposit of the Scone Stone in it, or the placing of Llewellyn's crown, the death of Henry IV. in the Jerusalem Chamber, or the sanctuary enjoyed by the wife and widow of Edward IV.; of the successive additions made to the fabric by royal piety and munificence; of the royal burials, now of a warrior king and anon of a queen consort, perhaps, like Philippa, asking as her last prayer that her lord would choose no other sepulchre but hers; then of tiny princes and princesses; and of the monuments of other celebrated persons. And this story of the aims and ends, the loves and lives, of so many of the great ones of our land he lays at her Majesty's feet, "with every sentiment of loyal and respectful gratitude."

Through this great theme the Dean skillfully draws two stout wefts. One of these, which he may deem incumbent upon him by reason of the traditions of his office, is an assertion of the thorough independence of the collegiate body. In old times this assertion was maintained by the account of supernatural appearances which no one could gainsay, and then by references to the legends thus received. On the eve of the day when all things were prepared for the consecration of the church, a fisherman deposed that as he was casting his net into the waters, he per-

ceived a bright light on the Lambeth shore. He crossed over to it in his boat, and found a venerable stranger in foreign attire, who requested to be ferried over to the new building. As soon as the stranger landed, the air became full of celestial splendor, in which angels could be discerned descending and ascending, carrying sweet odours and bright lights, with whose assistance he proceeded to consecrate the church with much solemnity. On returning to the boat, he revealed to the fisherman that he was St. Peter, and left with him a message for the Bishop of London, who was to have consecrated the building on the following day,—"When Mellitus arrives to-morrow, tell him what you have seen, and show him the token that I, St. Peter, have consecrated my own Church of St. Peter, Westminster, and have anticipated the Bishop of London." And to be independent of the Bishop of London, and of as many other authorities as possible, as well as to maintain the high claims of the abbey, has ever been the persistent aim of the whole line of abbots and their representatives. Never, with their consent should St. Peter be robbed to pay St. Paul. When the monks of St. Paul's boasted that their cathedral covered the site of a temple dedicated to Diana, those of St. Peter's were ready with a statement that their abbey covered the site of a Temple to Apollo; in like manner every vaunted superiority was met with a contrary attraction. In modern times, when Nelson was buried in St. Paul's, and crowds flocked thither to see his funeral car, to the comparative desertion of St. Peter's, the officials of the latter caused a waxwork figure of the hero to be made, and dressed in clothes that he had worn, as a counter-charm. The same irrepressible spirit may be traced in the protest made by the deans when convocation sits.

The other weft we see interwoven here and there throughout these memorials is the identification of the abbey with royalty. The abbey is the outward and visible sign of the union of Church and State. The Abbey Church and "our Palace of Westminster" are with the Dean synonymous terms, as they are literally in the present day in the gazettes proclaiming the coronations. "The head, crown, and diadem of the kingdom" is the olden description of the Church he most fully acknowledges: it is this character of the fabric that he delineates with most delight; this aspect that he presents most forcibly. With much the same feeling that induced William the Conqueror to stand upon the gravestone of his predecessor, Edward the Confessor, whilst the rite of Coronation was taking place, the dean looks round upon the Abbey Church, and its associations and contents, as the chief seat and expression of the continuity of royalty. "The English kings," he says, "as soon as they became truly English, were crowned and lived and died for many generations at Westminster." Unlike the French monarchs who were crowned at one place, lived in another, and were buried in a third, the mediæval kings of England stepped over the graves of their ancestors to receive their crowns, and lived and died in immediate proximity to these and their own final resting-places. It was the Abbot of Westminster who was charged with the duty of preparing the successive kings for the rite of coronation; and it was his hand that was authorized to administer the chalice to the king and queen in token of their conjugal unity. These offices are still the peculiar privilege of the Protestant deans of Westminster; as is that of the burial of great personages. On one occasion only could the Primate of Canterbury or the Bishop of London take his place as by right in the choir of the abbey: this was on the solemnization of a coronation, when the Archbishop of Canterbury was always the first ecclesiastic, and the Bishop of London usually preached the sermon. The Reformation, perhaps, by reason of this semblance of the abbey

to a large chapel-royal of the palace, did not make so decided a transformation here as elsewhere. The abbot became the dean; the monks were supplanted by twelve prebendaries; mass was still said three times a day; and on the anniversaries of Henry VII.'s death dirges were still sung and tapers burned in his chapel. Continuity rather than catastrophe asserted itself even at this crisis. Quietly and gradually the change came about. The brass lecterns and copper-gilt candlesticks and angels were sold in the reign of Edward VI., and the proceeds applied to the library and purchase of books; the word communion was silently substituted for mass; and "surplices and hoods" were written in place of the "ancient vestments." In due time, just as quietly, the old order of things was reinstated. The prebendaries conformed to the faith of Queen Mary; the chapter was dissolved, and the convent was restored. The Confessor's shrine was set up, and his holy replaced in its ancient sepulchre, whence it had been torn. The altar was enriched with jewels, sent by the queen; and a large paschal candle installed upon it, with a ceremony at which the masters and wardens of the Wax Chandlers' Company assisted. The retrograde movement was but of short duration. Fuller tells us how Queen Elizabeth's messenger found the abbot setting elms in the orchard of the abbey, where there are elms to this day. "Coming afterwards to the queen, what discourse passed between them they themselves know alone. Some have confidently guessed she proffered him the archbishopric of Canterbury, on condition he would conform to her laws, which he utterly refused." The first Elizabethan dean, William Bill, enjoyed the revived dignity only for a short time. It was his successor, the Welshman, Gabriel Goodman, of whom Fuller wrote, "Goodman was his name, and goodness was his nature," who perfected the rehabilitation of Protestant worship, and left us the order of the service as we now know it.

The researches of a lifetime, without assistance, could scarcely have compassed the number of minute facts grouped in the Dean's pleasant work; we are therefore not surprised to hear that Mr. Joseph Burt, Mr. Frank S. Haydon, and Mr. E. Rhodes, of the Public Record Office, have rendered valuable aid. The archives preserved in the muniment chamber of the abbey, beginning with the charters of the Saxon kings; the chapter books dating from 1542; the Consuetudines of Abbot Ware, long considered illegible, but restored to recognition within the last two years by a chemical process; the burial registers and preceptors' book all require the well-accustomed eye to master their contents. And when we come to the bewildering amount of printed authorities, assistance is again imperatively called for, though on other grounds. Although the memorials are not treated from an architectural point of view, the works of Camden, Keepe, Crull, Dart, Widmore, Akerman, Neale, Brayley, G. G. Scott, Cunningham, Ridgway, as well as of the topographers and historians of Mediæval times, have been all duly considered. The charming pages of the "Spectator," the "Citizen of the World," and Washington Irving's "Sketch-Book," too, have been also laid under tribute; and the letters of Horace Walpole, and those of the large circle of his brilliant contemporaries, examined for new lights. Gatherings from this immense reservoir of reading and reference flow in a sparkling stream of narrative from the Dean's pen, full of grand scenes, processions, vivid pageants, bright colours, cloth of gold, and all the pomp and circumstance of Mediæval life, save when the section of his subject requires more sombre tints. His references are indefatigably minute: his appreciation of the romance, poetry, magnificence of his theme is intense, and yet when any writer has been over the same ground before

* Historical Memorials of Westminster Abbey. By Arthur Penhryn-Stanley, D.D., Dean of Westminster. London: John Murray, Albemarle-street, 1868.

him, as in the word-spectacle of the coronation of Anne Boleyn, he reticently prefers that account to his own. In this way his work is studded with some of the best passages of our best authors.

It is suggestive to consider, with the confidence we may feel from the amount of care our author has taken, how much of the august ceremony of a coronation is a legacy of the earliest times. Tradition says King Arthur was crowned at Stonehenge. Standing in that grand sky-canopied temple scarcely "made with hands," this Celtic monarch left a precedent that we have not yet cast aside. Seven of the Saxon kings were crowned standing on the King's Stone, still to be seen in the highway of Kingston-on-Thames; and, although the sanctuary of the House of Cerdic, the Cathedral of Winchester, became the scene of the coronation of the rest of the Saxon kings, the impression implanted that a particular and holy stone must form part of the ceremony, showed itself again in the fact that the grave-stone of the Confessor was chosen as the spot upon which his "inheritor" William was crowned; and still more forcibly in the removal of the Stone-stone from Scotland by Edward I. Again, the ceremony of anointing kings is very ancient. Charlemagne was anointed from head to foot; and some of our own kings have sat stripped naked down to the waist before the congregation in order that the sacred oil might not be impeded in its course. Notably, Henry IV. and his queen sat, on a platform raised above the altar, stripped from the waist upwards, the king surrounded by dukes, the queen by bishops and ladies. The regalia are relics of Saxon times, and bear Saxon designations. The king's crown was that of Alfred or the Confessor; the queen's was that of Edith, wife of the Confessor; the sceptre with the dove was an emblem of the peace that prevailed after the defeat of the Danes; the gloves were a souvenir of the abolition of the Danegelt; the ring, according to Planche, was the ring of the pilgrim; the stone chalice holding the sacramental wine belonged to the Confessor's time; and the oath, which endured down to the reign of James II., was to observe "the laws of the glorious Confessor." We have a detailed account of the ceremony of the coronation of Richard I. The principal features in it have been preserved in the rite still in use. The difference of the times, however, is well marked in the alarm that the entrance of a host occasioned, especially when it flew round and round in circles over the king's throne, and in the consternation that ensued when the bells began to ring late in the day without any orders from the authorities; as well as in the still more momentous attack upon the Jews that took place as part of the rejoicings. Of the coronation of Henry III. we know still more. As Westminster was in the hands of the Dauphin of France on Henry's accession, he was crowned first at Gloucester, and again, four years afterwards, on the restoration of the place, in the Abbey. Impressed with the attributes of the ceremony and its scene, he is said to have asked of the greatest theologian of the day, Grossete, Bishop of Lincoln, "What was the precise grace wrought in a king by the motion?" When he was answered, with what Dean Stanley calls "truly episcopal discretion," "The same as in confirmation."

It was the enormous sums lavished by this prince upon the rebuilding of the abbey that called into existence the House of Commons. The first sittings of this body were held in the Chapter-house. Before the separation of the Lords and Commons, Westminster Hall was their meeting-place; but the Commons were called alone to the Chapter-house, and the Lords met ever afterwards in the Painted Chamber, known as St. Edward's chamber, from the fact of the Confessor having died in it. The meetings of the Commons were often stormy in those days. The Dean tells us—"On a few occasions they were assembled in the vast oblong hall of the refectory. There, in a chamber only inferior in beauty and size to Westminster Hall, was impeached Piers Gaveston. There, in an assembly partly of laity, partly of clergy (but apparently chiefly the latter), Edward I. insisted on a subsidy of half their possessions. The consternation had been so great, that the Dean of St. Paul's had, in his endeavour to remonstrate, dropped down dead at King Edward's feet; but 'the king passed over this event with indifferent eyes,' and persisted the more vehemently in his demands." In the reigns of Richard II., Henry IV., and Henry V., the Commons were occasionally convened in the refectory, but the

house of the Chapter was the usual place of meeting. In the reign of Edward III. this building was decorated with paintings that have not yet altogether faded away. We may picture the speaker taking the abbot's stall, which faced the entrance, whilst the members ranged themselves around on the seats intended for the monks. "To the central pillar were attached placards, libellous or otherwise, to attract the attention of the members." The Jerusalem Chamber has ever since been used by the abbots and their successors, the deans, for the transaction of the business of the convent or collegiate body. By virtue of this arrangement the Chapter-house, though long outgrown by the Commons, remains public property. The mention of Edward's demands reminds us of the conspicuous figure he makes in the history of the abbey. He and his good queen, Eleanor, were the first king and queen who were crowned together. Then, he left for our delight Queen Eleanor's monument and the tombs of his father and uncle. He extended the building westwards, and the Confessor's chapel, in which he kept his vigils before his knighthood, he filled with tokens of his conquests; the great stone on which the monarchs of Scotland were crowned, and the fragment of the cross from a Welsh shrine. Moreover, he caused his little son to hang up with his own hands upon the shrine of the Confessor the golden crown of the last Prince of Wales. Then we come to his own unfinished tomb, and the story of the grim promise he exacted from his son to boil the flesh off his bones, and carry them before his army into Scotland. The dean accounts for the plain tomb as a facility for the fulfilment of his wish should the opportunity have arisen to carry it into effect. Every two years, till the fall of Richard II., the tomb was opened and the wax of the regal warrior's cerecloth renewed. In 1771, in the presence of the Society of Antiquaries, the tomb was again opened, and the old Plantagenet belongings scrutinised.

"The king was found in his royal robes, wrapped in a large waxed linen cloth. Then for the first time we saw that figure, lean, tall, and erect as a palm-tree, whether running or riding. But the long shanks, which gave him his surname, were wrapped in the cloth of gold; the eyes, with the cast which he had inherited from his father, were no longer visible; nor the hair, which had been yellow or silver-bright in childhood, black in youth, and snow-white in age, on his high broad forehead. Pitch was poured in upon the stripes, and, as Walpole comically laments, in deploring the final disappearance of the crown, robes, and sceptre, 'They boast now of having enclosed him so effectually that his ashes cannot be violated again.'"

The name of Edward, says the Dean, loyally, is the one royal name that constantly re-appears to assert its unchanging hold on the affections of the English people. Mention of Richard II. fills the abbey, too, with Plantagenet memories. He was crowned, married, and buried in the abbey. He rebuilt the great northern entrance, and in many ways displayed great affection for the fabric. When his queen died he caused her to be buried there with the greatest pomp, and erected a monument to her memory, on which reposed his own effigy by the side of hers, with his hand clasping hers. As we gaze upon it we call to mind, with satisfaction, that Henry V. brought back Richard's body from Langley, whither Henry IV. had carried it, and placed it in this tomb. We have his portrait, too, that celebrated picture which is considered the oldest contemporary representation of any English sovereign, which hung for so many years in the abbey, and was so frequently painted over, to be skilfully cleansed of its superfluous coatings, by an accomplished artist of our own day. The funeral of Henry V., who performed so graceful a tribute to the memory of this beautiful but unfortunate prince, was the grandest that ever took place. He died at Vincennes, and the procession which accompanied his remains to Westminster, headed by James I. of Scotland, and Catharine, of Valois, started from Paris. All the clergy went out to meet it as it approached London:—

"His three layers were led up to the altar, behind the effigy, which lay on the splendid car, accompanied by torches and white-robed priests innumerable, and which was now for the first time seen in the royal funerals; previously the king himself had been exhibited in their royal attire. To give a worthy place to the mighty dead a severe strain was put upon the capacity of the abbey. Room for his grave was created by a summary process, on which no previous king or abbot had ventured. The extreme eastern end of the Confessor's chapel, hitherto devoted to the sacred relics, was cleared out, and in their place was deposited the body of the most splendid king that England had, down to that time, produced; second only as a warrior to the Black Prince, second only as a sovereign to Edward I."

A chantry was erected for the performance of masses for the repose of his soul, which mate-

rially altered the contour of the Confessor's chapel, and encroached in the most ruthless manner upon the tombs of Eleanor and Philippa. In this recess were hung his shield, saddle, and helmet, and the sculptures around the walls were made to depict his great achievements. His recumbent effigy, carved in oak, was plated with silver-gilt, except the head, which was of solid silver. The latter has long since disappeared. When the Spectator and his friend, Sir Roger de Coverley, were inspecting the monuments, this last theft especially moved the worthy Tory knight's ire. "Some Whig, I'll warrant you; you ought to look up your kings better; they'll carry off the body, too, if you don't take care." Referring to the want of consideration for the integrity of the Confessor's chapel, hitherto deemed sacred, displayed in this instance, we must note that modern clearances and barbarisms have not been more sweeping or scornful of the remains of past ages than were the many alterations and rebuildings made by successive monarchs in the days of old. Henry III. nearly obliterated the first building without scruple, and his successors made nearly as free with his improvements. The arrangements of an ancient temple, from their sacred passages, have been compared to those of a vast slaughter-house, and those of a Dominican church or Nonconforming chapel to a vast preaching-house, in contradistinction to those of Westminster Abbey, which have been likened to the arrangements of a vast tomb-house. A contemplation of the fabric in this aspect, apart from the royal tombs, brings the Dean to a comparatively modern period: to the companionship of the statesmen, warriors, men of letters, and men of science of the last century and our own. It is this aspect of a Pantheon, a Valhalla, and a Santa Croce, as he says, more than any other, which won for the venerable pile the visits of Addison, Steele, Goldsmith, Charles Lamb, and Washington Irving, described so delightfully in their respective works, which prompted Nelson to cry, "A peerage or Westminster Abbey?" and Macaulay to enshrine in it some of his most elegant passages, and which gives most promise of the endurance of the abbey in the hearts of the people. Here we have no isolated manœuvres of kings as at St. Denis, the Escurial, Vienna, Moscow, and St. Petersburg; but just as the kings gradually grouped round the Confessor's grave, so have the chiefs of the court and camp grouped around those of the kings, and, subsequently, other centres have been formed in like manner. The northern transept remained comparatively unoccupied till the death of William Pitt, Earl of Chatham, who being interred there after much entreaty that St. Paul's might have the honour of receiving his remains, formed the centre around which have grouped all subsequent statesmen, giving to this part of the edifice as distinctive a character as Poets' Corner enjoys. In the aisle of the same transept lie the great Indian statesmen. It was Geoffrey Chaucer who formed the centre around which the poets were subsequently grouped in the south transept. The first to follow was Spenser, whose epitaph originally stated that it was the vicinity of Chaucer that caused the selection of his burial-place. Then came Drayton. Writes Fuller, overflowing with appreciation of all that is good and great, "Chaucer lies buried in the south aisle of St. Peter's, Westminster, and now hath got the company of Spenser and Drayton, a pair royal of poets, enough almost to make passengers' feet to move metrically, who go over the place where so much poetical dust is interred." As our author turns from one monument to another he relates every detail of interest connected with them and their inscriptions, without, however, giving any technical or artistic particulars of them. We meet here Johnson, whom Ronhill called to his aid for the epitaphs of the monuments he put up; Pope, who wrote Row's epitaph; Swift, whose spirit pervades the atmosphere of the whole place; Sir Joshua Reynolds, who fixed the spot for Goldsmith's memorial; and many other of the intellectual athletes of the last age with full working powers, some of whom were not destined to swell the catalogue of the mighty dead deposited around. "I have been told of one Pope," says the Chinese philosopher, slyly deprecating the intrusion of small names and the omission of some great ones in Poets' Corner. "Is he there?" "It is time enough," replied his guide, "these hundred years. He is not long dead. People have not done hating him yet." Purcell

became the centre of the musicians; Casaubon of the scholars; and Newton of the men of science.

Of course the increasing scarcity of space receives consideration at the Dean's hands, for it must be a difficulty that is ever before him. The project for extending the space available for memorials of the great that he seems to favour most, is the erection of a cloister, communicating with the abbey by the Chapter-house, on the site of Abingdon-street, where it would face the palace on one side, and the College Garden on the other. It is, perhaps, too late to talk of extending the nave westwards, now that the prebendal houses have been built; but a grand narthex, or galilee, on account of the inferior height, would not be so inadmissible. And, again, it would be possible to throw out a large mortuary aisle, or series of chapels, between every buttress of the north side of the nave, after the manner of the chapels at Notre Dame. The objections to an extension by way of Abingdon-street are, that it is too far eastward; and in the interior of the building it would be quite out of sight in the *corp d'œil*. For one eye that would fall upon the Abingdon-street cloister, a thousand would see either the galilee or chapels. Few who look up at the western front, by the bye, and shrug their shoulders at Wren's towers, will give them credit for the interest they possess by force of association of idea. Dean Wilcocks, under whose auspices they were completed, was elected a Fellow of Magdalen College contemporaneously with Addison. After being chaplain at Lisbon, and preceptor to the princesses, he held the deanery for twenty-five years. The towers we condemn as a blemish, he considered the glory of his period of office; and "on his monument in the abbey, in his portrait in the deanery, in the picture of the abbey by Canaletto, which he caused to be painted evidently for their sake, the unfortunate towers of Wren appear. He was buried under the southern of the two, in a vault made for himself." When we think of this affectionate pride of the good old dean, whose motto was identical with his constant endeavour, "Let me do all the good I can," the offending features will not be without their interest.

More sombre, less picturesque, perhaps, and less "glorious within," with scarlet and gold, purple and ermine, precious marbles, jewels, and embroideries, is the history of the abbey under the deans, than when every head bowed as abbot after abbot passed on his way, but not less momentous. A refined taste can get as much effect from browns, greys, and neutral tints generally, as from those of the tulip. This our author brings to bear, and more. "Whilst the dignitaries of the ancient abbey, as we have seen, hardly left any moral or intellectual mark on their age, there have been those in the catalogue of former deans, prebendaries, and masters, not to speak of innumerable names among the scholars of Westminster," he writes, "who will probably never cease to awaken a recollection as long as the English Commonwealth lasts." In place of coronations, royal marriages, and burials, we may picture the venerable fabric, which the antiquary, John Carter, rejoiced to record, was *never white-washed*, with grave assemblies of divines. In 1643, the Westminster Assembly met in the choir, both House of Parliament assisting at the opening. Among the divines were bishops, Non-conformists, Presbyterians, and Independents, "dressed in their black cloaks, skull-caps, and Geneva bands." Not since the famous conference in the days of Elizabeth had there been so imposing an assembly. For five years and more this commission laboured, sometimes in Henry VII's chapel, and when it grew too cold there in the Jerusalem Chamber, discussing the thirty-nine articles, drawing up the catechisms, directory, and confession of faith. Here we have the fabric presenting a very different aspect to its former wont. It clashes with our notions of the transcendent earnestness, soberness, and piety of the divines of the Commonwealth, however, to read of their treatment of works of art. It is impossible to admire Sir Robert Harley for taking down the crosses of Queen Eleanor at Charing and Cheapside (and yet this might have been necessary), or for destroying the monument of Edward VI, by Torrignano, in the abbey; or Withere, the poet, trailing about the town with the royal robes and regalia, "with a thousand spish and ridiculous actions." The Dean records to their credit that the monuments and fabric received, in this case, but little injury, the ornaments of the church suffering most. In 1645, the dean and chapter were superseded

by commissioners entrusted with the care of the abbey; and seven Presbyterian ministers were appointed to perform a "morning exercise," instead of a "daily service."

Westminster school and the head-masters, being too closely associated with the fortunes of the abbey to be altogether overlooked, occupy some pages. "Dr. Busby was still there to carry the ampulla of the new regalia at Charles II's coronation, and to escort the king round Dean-yard, hat on head, lest the boys should else think there was any greater man in the world than himself." During the great Plague the school was removed to Obiswick, where, on the walls of the house occupied by Mr. Berry and his celebrated daughters, only the other day, were to be seen the names of some of Busby's pupils; Montagne and Dryden among the number. The elms in the field adjacent to this house are said to have been planted by Dean Goodman, of whom we have spoken before, in whose period of office this sanatorium was secured. At the Great Fire the scholars were marched to the conflagration, and assisted for hours in carrying water from the neighbourhood of St. Dunstan's-in-the-East.

The revolutions of taste, in their effect upon the abbey, afford a most curious study. We know how monumental effigies were at first recumbent, then partly raised, then kneeling, and finally erect. In the beginning of the last century the best judges agreed that nothing could be more stupid than laying statues on their backs. We have come back again whence our ancestors started in this particular. The Confessor's chapel, once looked upon as a sacred spot, became the play-ground of the Westminster scholars, who were allowed to skip from tomb to tomb. Where William the Conqueror trembled, and kings and queens wept over each other's last resting-places, these young "bloods" disported themselves. Then there was a time when the scenes of the Westminster play were kept in the triforium, and a thoroughfare was set up from the Poets' corner to the western door; when, in fine, nearly every sentiment that once prevailed with regard to the sanctity, beauty, and venerableness of the fabric was erased. In the care and solicitude which it now enjoys we have come round again; in a second instance, to the starting-place of our predecessors—who laboured, and into whose labours we have entered. Our author gives many more examples of this revolution as reflected in the history of the abbey. Into the reverence of the institution he does not enter. The many gifts and grants, and the circumstances under which they were made, would have made another pleasant section.

The Dean's melodious diction dwells on the ear after his hook is laid aside; just as we carry away from the majestic pile itself a sense of lingering echoes long after its portals have closed behind us.

PROFESSOR G. G. SCOTT ON EARLY ARCHITECTURE IN GREAT BRITAIN.*

ACCORDING to Mr. Petit and Mr. Fergusson, the Norman is rather an early stage of Gothic than strictly Romanesque; and, though this may be said to be rather a question of nomenclature than of distinctive principle, I am inclined to think there is much real truth in it. I would rather, however, put it thus: that, among the many branches of the great Romanesque tree, this was one,—as the Anglo-Saxon was not one,—of those which contained the intrinsic elements of the future Gothic style. I gave my reasons, in one of my earlier lectures (while not desiring a change of nomenclature), for holding the completed round-arch style to be, in a certain sense, one with the earlier-pointed, and for rather favouring Mr. Fergusson's custom of calling them respectively round-arched and pointed-arched Gothic. It is better, however, in an historical sketch, to view each phase on its own bearing, and not to judge of it by anticipation of its subsequent results.

Norman architecture, then, judging of it from its principles, and throwing aside imperfections resulting from its development occurring in comparatively rude times, may, in the first place, be said to be an almost perfect carrying out into a style of art the arcuated system of construction; using, also, the simplest and most obvious form of arch, the semicircle. Roman buildings, when divested,—as in the case of aqueducts,—of Grecian or traileated accompaniments, displayed

often a perfect system of arched construction; but, in such works, one cannot say that it had been developed into a style of art.

To effect this, both the arch and its supports and accompaniments must be moulded into artistic elements; their natural crumpledness softened; their mere normal character relieved; and each part subjected to a system of decoration suited to its proper character and conditions. The parts, too, which have been thus dealt with, must be studied as to their grouping. They must not be viewed as isolated objects, but as parts of an architectural work; each contributing to the beauty and consistency of the whole; and that also, by such combinations as are dictated by the varied suggestions arising from the purposes and demands of the buildings of which they form parts.

All this required time; and the length of time was, no doubt, increased by the rudeness of the ages during which the process had been going on.

Among the earliest approaches to so reasonable a result, the Lombard style had taken, perhaps, the lead in Western Europe; and, during the days when the three Othos governed Northern Italy as well as Germany, the good seed had spread from Lombardy into Germany, and it there grew into an almost perfect development.

Somewhat similarly, a well-considered development seems to have originated in central France, and spread towards the north. Probably these two varieties may have come in contact, and in some degree influenced each other; for the early Norman architects, though mainly developing upon French models, appear to have been acquainted with those of the Rhine. However this may be, it is certain that they developed for themselves a variety of Romanesque at once eminently reasonable and susceptible of highly artistic treatment and combinations.

The elements of such a style are often not, as taken singly, peculiar to itself, but may be found in other and in earlier works: it is the aggregation of many such elements, and their judicious and artistic utilization that constitutes the merits of a style.

Among the most important of these may be placed the subordination of arches, by means of which, instead of going square through the thickness of a wall, they recede in orders or arched ruins, each narrower than that above it, so as to give the entire arch or section of alternate salient and receding angles. This is the primary element; and it at once produces the second,—the breaking of the section of the bearing pier into a similar form to that of the arch. This, in the Anglo-Saxon style, was hardly known; while in the Norman it is the key-note.

At St. Alban's, where the unmanageable nature of the material,—the Roman brick,—rendering finished architecture unattainable, we find these two principles supplying all architectural requirements, and producing results certainly rude, but not unpleasing in their effect. This building is often said to partake of "Saxon" character. I think the very reverse of this; for the one thing to which it trusts for effect is that which scarcely exists in Anglo-Saxon buildings, while it is the leading principle in Norman ones. This error is the natural result of looking to rudeness of workmanship and homeliness of material, instead of the principles of design, as the evidences of early style.

The next principle is merely the resultant of those already named. It is the decoration by mouldings of the salient divisions of the arch and the substitution of decorative shafts for those of the pier.

These principles do not necessarily accompany one another. An arch-order may be moulded or otherwise decorated, while the corresponding pier-order may remain square, the two being parted by an impost; or the decorations of the arch may, without the intervening impost, be continued through the pier; or, again, a shaft may be substituted for the pier-order, while the arch-order remains plain. The above principles, thus variable in their application, supply the most marked features in the perfected Romanesque style, nor can any arched architecture be perfect without them. To illustrate their effects let us take a doorway of the older English period, and contrast it with a Norman doorway.

The Anglo-Saxon doorway would, in all probability, be an arched opening straight through the wall, the door hanging against the inner fence. It may or may not be relieved by a pilaster strip on either side, and an impost to

* See pp. 70, 80, and 108, ante.

rown the pier, leaving it still a very primitive and inartistic composition, with the door itself dealt with as if it had been forgotten and no provision made for it. We will suppose the Norman doorway to be of the same width and height with the Saxon one. Its reveal, to begin with, is reduced to perhaps one-fifth of the thickness of the wall, and the door itself placed at such a distance from the exterior as the architectural grade aimed at may dictate, and this distance is divided into so many orders or recesses (each some 8 or 10 inches in depth in a moderate doorway) as may be preferred. These arched ribs or orders may be either left plain or may be moulded, or otherwise decorated at pleasure. The jambs of such a doorway may be treated in several different ways. The simplest is to make the jambs continuous with the arch, with or without the interposition of an impost. A second mode is to substitute a shaft or decorative column, for one or all of the orders, excepting, generally, that with which the door itself comes in contact. Add to this an outer or drip moulding to sever the arch from the wall face, and you have the elements of a really well-considered and artistic doorway. Internally, the remaining thickness of the wall is arched in another order (either square or sloping), which has to spring at a higher level to avoid the catching against it of the door while opening.

A doorway thus constructed may be clothed with what decorations you think good; and, if you are working in the Pointed style, the principle applies just as well as in Norman; indeed, we have here the principles of nearly all good doorways, whether Romanesque or Gothic.

I have already described the application of the principle to an archway, which in its elementary form is merely the outer jamb of a doorway repeated on both sides of the wall. A shaft or demi-shaft may be substituted for the central order, or, if the wall be a little thicker, this shaft may be doubled; or, if thicker still, there may be three orders, or other obvious combinations may be made, rendering the archway, instead of a mere crude opening, an artistic composition, though trusting for its effect to a perfectly reasonable constructive system.

I will now suppose two such openings brought so closely together as to leave only a short space of wall between. We have then two systems of recesses brought into close contact, making a pier of comparatively slight form such as those at St. Alban's; or, if shafted, we at once obtain the great feature of Gothic architecture, the clustered pier.

In cases where it was preferred to support the adjoining springings of two arches upon a single column, though the arch was sometimes left undivided, the same system of sub-orders was more usual. If the abacus remained square, its angles, being unoccupied, would present a clumsy appearance. This led to the breaking of the capital into orders, though resting upon a single shaft, or the abacus was made round or octagonal.

Such a column as this often alternated between two clustered piers, making an extremely agreeable group.

The developments I have described, so logical in their motive that one fancies that one might have originated them all by a mere process of inductive reasoning, supply nine-tenths of all the elements of the perfected Romanesque style.

Extend, now, the same principles to a vaulted space which we have hitherto applied only to an arched wall, and we gain another great instalment of the elements of the style by a simple process of reasoning.

The normal form of groined or intersecting vaulting,—the simplest manner in which a large space may be arched over in moderate spans,—is, by the two or more intersecting vaults, springing directly from a square pier. Now, this is not only inartistic, but is bad in construction. The line of intersection is necessarily weak, and requires aid to make it perfect in construction; and this can only be given it in the form of increased thickness, which is at once obtained by altering the form of the pier from a square to a cross form, and applying to the vault the same principle of divided orders as we have done before to arches; only that, in this case the upper order is a vault, and the lower one only an arched rib coming in to aid the vault. The groined vault is thus divided into compartments, and beauty and strength at once provided for. This elementary form may be decorated in a multitude of ways.

The mere addition of an impost and a base to the pier does much to relieve its plainness. We may, however, as in the case of arches, substi-

tute shafts for the divisions of the pier, or double shafts where the ribs are wide; or we may, instead of amplifying the forms of the pier, concentrate it to a column, from whose capital the ribs spring, as we have already seen in case of the double arch.

When groining springs from a wall, nearly the same system applies, excepting only that one division only of the pier is needed instead of all four. Thus the simplest provision is a mere projecting pilaster, carrying the cross ribs, the wall itself taking the place of the lateral ones. This pilaster may be converted into a shaft or a double shaft, or the rib may be amplified by a central semi-roll moulding, and the whole carried by a triple shaft or other combinations, or a corbel substituted for the pilaster or group of shafts. Thus we have vaulting reduced to a principle which, however plain, is at once artistic and constructionally good, and is susceptible of all degrees of ornamentation.

What I have said of doors applies equally to windows, subject to some modifications arising from their practical requirements. The simplest form of an arched opening, going square through the wall, is eminently unsuited to a window; and this is so obvious that it has rarely been used at any period, for the square edges of a thick wall evidently prevent the light from diffusing itself in the interior.

The most favourable forms are those in which the jambs are sloped, either directly from the exterior inwards, or from some intermediate point, both inwards and outwards, so as to give the freest scope for the rays of light. In this respect I have nothing to say against the forms customary in the previous style.

The Norman windows are of great variety. The simplest, which are prevalent in very homely buildings (as may be seen in many extremely humble churches on the cliff between Dover and Deal), is an opening with no external recess, but splaying at some 45 degrees inward, the glass being flush with the exterior. From this we have every variety of architectural grade: first, a chamfer or moulding added to the exterior; then, two orders, plain or moulded; or a shaft may be substituted for the outer order in the jamb, or the same repeated, as in doorways. Internally, the thickness of the walls continues to be played so as to diffuse the light, though in buildings of a high architectural class, mouldings or divided orders (with or without shafts) may enrich the inner angle, or may even take the place of the splay altogether.

In domestic windows two or more openings are often used externally, divided by a little column, the whole being internally united into a single opening. These are sometimes comprised on the exterior under a single arch to increase the architectural effect. The same is also used for bellies and other positions where use dictates it.

I have now shown you that doors, windows, archways, arcades, and vaulting were generated, as to their architectural treatment, simply by the exercise of logical reasoning.

In the general treatment of the exterior of a building the same prevailed. The walls, being thick, needed little buttressing, and this little was supplied, and the flatness of the walls at the same time relieved, by a sort of pilaster or slightly projecting pier placed at reasonable intervals, which were united under the eaves, in many cases, by a row of corbels. The walls were further relieved by projecting base-courses, and string-courses under the window niches or elsewhere; and, in buildings of a higher class, by decorative arcading or other methods of raising its architectural character.

In all the foregoing particulars, it will be observed that I have stated nothing but what could be arrived at by simple and almost abstract reasoning, almost apart from anything which, strictly speaking, belongs to style of art. The results, indeed, apply equally to all the more perfect varieties of Romanesque, and follow from the mere thinking out of the subject; and if we desired to strike out some new variety of arcuated architecture, we could not do better than to start from a point thus logically arrived at. To say that these are the leading characteristics of the Norman style, is saying at once too much and too little; for none of these characteristics would distinguish it from the Romanesque of Central France or Germany, which possess them equally with the Norman, while the latter certainly does possess features which would so distinguish it. These consist, however, for the most part, in the decorative details, and in the general composition of the

buildings, but more particularly the latter; for, if the Rhensish, Central French, and Norman buildings were to exchange details, their composition would still distinguish them at a single glance, and each would be appropriated to its respective district in spite of any doubt about its details. The essential and logically derived elements are the same in all; the details, though united by a common bond of sentiment and feeling, differ in a certain degree,—while the customary forms of composition, though by no means contradictory, still differ so much as to leave no doubt about their being three, though evidently sister styles, or, rather, local varieties of the same great style.

Two very important features which Norman possesses, in common with other varieties of Romanesque, are, first, that, when a column is used for bearing weight, its diameter is made proportionate rather to its load than to its height; and, secondly, that columns are used also in a purely decorative capacity, and their diameter, in that case, is simply such as is best proportioned to their position; and most usually to the size of the arch order they have, apparently, or really, to carry.

We will now go into minor details. The first purely decorative feature which we may imagine to have been introduced,—if the logical scheme I have been supposing had been strictly followed out,—would be the base-course of a wall, the impost to sever the pier from the arch, and the drip, or label, to draw the line between the arch and the wall. These mouldings in their elementary forms are alike. In Anglo-Saxon they were usually square courses; in Norman their simple form is the same with the angle cut off.

This form for the impost and the label was adopted, also, very unusually, for string-courses; but, in all positions, it was soon relieved by additional forms, as the quirk, the quirk and hollow, and the round and hollow, or the cyma. The primary idea of a capital to a decorative shaft is that of a capital block over which the impost returns. It is, in fact, the upper course of the square portion of the pier for which the shaft has been substituted, or out of the substance of which it is cut.

The object, therefore, to be kept in view in designing the capital, is to devise the best method or methods of bringing about a transition from the cylindrical shaft to the square impost or abacus. The simplest form used in Early Norman work is little more than the mathematical solution of the problem, which would be the frustum of an inverted cone, intersected by the faces of the abacus.

The elliptical sections thus generated being unsightly, they would soon be converted into semicircles; and as these will not fit themselves to the true cone, a group of portions of conoids is generated, meeting in an indented angle, such as we always find in these capitals, excepting in the very earliest. At no period, however, were the reminiscences of the Corinthian capital wholly ignored; and we accordingly, even in the earliest examples (and perhaps as frequently in them as in later ones) find a rude imitation of its form. At other times we find the block covered with carved scroll-work; and at others, again, the extreme simplicity is obtained by a mere portion of a cone or a simple moulding intervening between the shaft and the abacus, as in the Confessor's buildings at Westminster, and in the crypt at Winchester. The bases consisted usually of a moulding following the curve of the shaft, and resting upon a square plinth, beneath which was a sub-base. The mouldings of the base were very various: they seem to have been suggested by the varieties of the Roman base; but they often take other forms, as in the Confessor's work at Westminster, where we have a mere splay and a double hollow. The orders of arches were sometimes relieved by being cut into large rolls; or the lower order in arcways had a massive demitroll attached to it. The roll was soon accompanied by a hollow, and these varieties almost exhaust the list of mouldings in the earlier examples, though we shall see that they subsequently increased into great multiplicity and beauty. Mouldings became, moreover, at an early date enriched. Thus we find the chamfers of a string or label relieved with the billet or short piece of roll left projecting from them at intervals. These chamfers are also enriched with chevrons of slight depth such as masons sometimes impress in mortar with the point of their trowel. These simple ornaments, as we shall presently see, soon increased into endless variety.

The figure-sculpture of the period was of extreme uncountness; often so much so as to be nearly unintelligible, though rapidly improving as the style advanced. The tympana of the doorways (which were sometimes filled in to the square, and sometimes to a low segmental arch line) were often filled with sculpture in slight relief. Heads were used as corbels (placed in a hollow moulding), and such rude art was introduced in other positions as might suggest it.

Soon it became frequent to relieve plain surfaces—whether to arch, orders, or elsewhere— with ornaments in very slight relief usually known as "surface ornaments," which had the advantage of imparting decoration without disturbing essential forms. Of this, however, we shall see abundance as we proceed.

Having now traced out, by a system of rational induction, the essential elements of the style, we will proceed to some of the varieties of combination.

Let us take, in the first instance, a portion of the nave or choir of a church.

If this be unvaulted and unvaulted, it is a very simple affair. Windows at a reasonable height, dealt with agreeably to the architectural grade of the building—probably a base-course, a string beneath the eills, and possibly pilaster buttresses between the windows, and a corbel-table uniting the same under the eaves.

If vaulted with a wagon-vault (as, for instance, St. Corneille's Chapel, at Cashel), the walls must be higher, and, it may be, the dead space which this occasions externally may be decorated by arcading. If, however, it is groined, the difficulty disappears.

Again, an aisled but unvaulted nave is of simple construction, but if the aisle be vaulted (unless, indeed, it be a mere demi-vault, which in this country is very rare), a greater complication is brought into existence. The groining requires that the aisle wall shall be fully as high as the crown of the arches between the aisles and the nave; and, as the aisle roof demands some reasonable height, it follows that there must be a considerable space of wall above the arches. This may be dealt with in several ways. If the nave be unvaulted, it is a blank space, or may be pierced by an arcade or other openings. If the nave is groined without a clearstory, the space is partly occupied by the springers of the vaulting, and the intervals may be pierced. If there is a clearstory, the space becomes what we call (though erroneously), a triforium; or (whether there be a clearstory or not), it may be made more of and utilized by raising the aisle walls sufficiently to convert it into a second story or gallery to the aisle.

We possess a most complete instance of such an arrangement (though without a clearstory), in the chapel of the Tower of London, where this space is made a gallery, covered with a wagon-vault, and opens by a second tier of arches into the nave, which is itself covered by a similar vault. Had clearstory windows been in this case denied, the only change requisite would have been to groin the central space and the gallery, instead of giving them plain vaults, and we should then, with a triple more height, have had a model, on a small scale, of the perfected arrangement of a vaulted and aisled church. Most, however, of our Norman churches in England are imperfect in two particulars as compared with this ideal. They have no groining to the central space, nor any vaulting to the gallery over the aisle. Several, as Durham and Lindisfarne, had the former, and Gloucester, and perhaps Tewkesbury, the latter; but I know of no existing church in England, nor of any perhaps of very early date, even in Normandy, which has both. The tower-chapel is the nearest approach; and, strange to say, the pre-conquest example at Westminster appears (if I read the description aright) to have had all these features complete, the central space being vaulted, and the aisle also vaulted in two stories. Such was often the case in central France, even at an early date, as we see in the Church of St. Stephen at Nevers, erected about 1063, where we find groined aisles, aisle-galleries with the demi-vault, a clearstory, and above it a wagon-vault to the nave.

The churches at Notre Dame du Port at Clermont, Issoire, and some others of about the same date in Auvergne, are one point less complete, having all the features I have enumerated, excepting only the clearstory: nor do I know that there is any specimen so complete and of early date in Normandy, so that King Edward's church seems to have gone ahead of its types in

Normandy, and its model not to have been reached by its successors in England.

Those principles of combination being attained, it was easy to carry them out into a complete building.

A nave, such as I have described, may be either continued, with the intervention of a chancel arch, into the choir, and terminated by an apse; or two such ranges of buildings may be made to intersect, the crossing space being surmounted by a central tower, supported on four lofty arches and by massive piers. The east end would usually be terminated by an apse; the cross building, or transept, by gables; and the nave, perhaps, by a gable flanked by two towers, which terminated its aisles, or projected beyond them. Transepts may have two aisles, as at Winchester and Ely; one, as at Durham and Peterborough; or none, as at Canterbury and Norwich. In the latter case, apsidal chapels would probably project from its eastern face; and, if the choir aisle runs round the apse, similar chapels may open out of it.

This gives us the complete mechanical ideal of a great Norman church, though numerous are the varieties which it is capable of assuming.

I have occupied your time so long in my elementary investigation of the style that I must defer till my next lecture any attempt to describe its actual productions.

I will only now say that the vast scale and the endless number of the architectural works undertaken, and, in most cases carried out to completion by the early Norman builders, is such as to fill the mind with astonishment, when we contemplate them. Nearly every cathedral and great abbey was rebuilt on a stupendous scale; new cathedrals and new abbeys founded; and churches of all grades from these vast temples down to the smallest village church erected throughout the length and breadth of the country; while castles of the most portentous magnitude and prodigious solidity rose in all directions: the one class of building appearing to propitiate the divine aid, and the other to defy human opposition, as if the kingdoms both of heaven and earth were to "suffer violence" and "the violent to take them by force."

Few periods, probably, in the world's history have been marked by the construction of buildings more multitudinous and more vast. Their architecture, as Mr. Freeman remarks, "majestic and awful rather than beautiful, no style is more truly religious or more inhaled with the spirit and position of the church" (and one may add of the state) "in its own day," nor has any age "produced structures whose number, size, splendour, and richness bear more honourable testimony to the zeal and bounty of their founders."

THE ARCHITECT OF THE HOUSES OF PARLIAMENT.

We claim the power of stating, of our own knowledge, that the late Sir Charles Barry was the architect of the Houses of Parliament,—an architect, distributions-architect, constructions-architect,—one and indivisible; and in compliance with the earnest personal request of the late Augustus Welby Pugin we feel ourselves bound again to state, that the latter did nothing whatever on his own responsibility at the Houses of Parliament; that his occupation was to assist in carrying out Barry's own designs and views in all respects, everything being submitted to be approved or altered by him; and that any assertions that exaggerated the nature of Pugin's employment under Barry caused Pugin the greatest pain and annoyance.

We mention the two pamphlets on the subject, recently published,* merely that such of our readers as are curious may know that all that has been said on both sides is now obtainable in a convenient form.

Dr. Barry has well brought together such facts of the case as he could command, and, as it seems to us, has made the truth clear.

The apparently strong points in Mr. E. Pugin's statement are certain extracts from a diary for 1835, wherein appear: "April 28. Begon Mr. Barry's drawings." "May 10th. Saw Mr. Barry;" and so on; and the assertion that Barry

* * * Who was the Art-Architect of the Houses of Parliament. A Statement of Facts, founded on the Letters of Sir Charles Barry and the Diaries of Augustus W. Pugin. By E. W. Pugin. London: Longman, Green, & Co. 1867. "The Architect of the New Palace of Westminster. A Reply to a Pamphlet, &c. By Alfred Barry, D.D." London: John Murray. 1868.

paid Pugin a sum of 400 guineas, which must have been for the original design.

This is what Dr. Barry says, in part, as to Mr. E. Pugin's references to the diary:—

"In his first letter he referred to the entries in that diary for 1836, apparently forgetting that the competition drawings were sent in on December 1st, 1835, and that these references were therefore simply absurd! He has since found out his error; he has corrected it without acknowledgment, and now gives a long series of extracts from the diary for 1835. But this leads him to a greater difficulty still; for he asserts that Mr. A. W. Pugin 'began working on the Parliament House drawings for Mr. Barry on the 15th of May,' when it is well known that the conditions of the competition were not announced till the end of July. . . .

What is the explanation of these extraordinary errors? When we examine the quotations from the diary given on p. 15 of his pamphlet, we find (it is true) many entries of 'drawings for Mr. Barry,' but no word about the Parliament House in connexion with them. The fact is that they were drawings of fittings and furniture for the Birmingham Grammar School. Thus Mr. E. W. Pugin might have known, had he compared dates; but it is proved to demonstration by a comparison of my father's diary with Mr. Pugin's.

Thus in the latter we read—April 28th, 'Began Mr. Barry's drawings,' May 8th, 'Left Sarum,' May 16th, 'Saw Mr. Barry.' In the former I find—May 9th, 'Birmingham School, Mr. Pugin here with drawings of furniture.'

Again, in Mr. Pugin's diary I find—May 15th, 'Began Mr. Barry's work,' May 20th, 'Saw Mr. Barry's drawings.' My father's diary says—May 21st, 'Birmingham School, received drawings from Pugin.'

But the most curious point, and one which Mr. E. W. Pugin ought to have understood, is this. In Mr. Pugin's diary I find—September 2nd, 'Saw Mr. Barry's drawings of dining-room to Mr. Barry.' Now, what could the 'dining-room' have been in a general design for the New Houses of Parliament? Turn to my father's diary, and we find—September 24th, 'Arrived at Salisbury from Bowood at half-past four. Mr. Pugin at the White Hart to receive my directions as to designs for the furnishing of Dr. Jeune's house' (at the Birmingham school)."

It appears by Mr. Pugin's diary that Mr. Talbot Bury was engaged from September 11th to October 3rd on Mr. Gillespie Graham's drawings, and Mr. Bury expressly testifies that Mr. Pugin was at work at that very time on drawings for the Birmingham School. "This evidence, coming from a perfectly independent source, proves still more clearly the truth, which might be inferred from the diaries."

As to the asserted payment to Pugin of the sum of 400 guineas, Dr. Barry writes:—

"In our first letters we allowed this to pass, because all my father's cheque-books of that date had been lost, and in consequence of the subsequent failure of his bankers, Messrs. Cockburn, we were unable to ascertain the truth by the banking records. But Mr. T. Bury, speaking from memory, doubted the fact of the payment, and a subsequent discovery of the counterfoils of the cheque-books (in the course of the rigorous search instituted in consequence of Mr. E. W. Pugin's demand of the letters said to have been lent to my father) has confirmed the doubt. In 1835, Mr. Pugin's name does not occur at all. In 1836, I find the following payments—Feb. 10th, 105l.; June 22nd, 60l.; Dec. 19th, 154l. 18s., amounting not to 400 guineas, but to 1834l. 18s., and of this I do not feel sure that some did not belong to the Birmingham Grammar School. In 1837, payments were made to the amount of 1100l., and in 1838 there is a payment of 1200l. 'in full.' It is clear that these subsequent payments were for the assistance given in working out the drawings for the estimate, and no one can think them excessive for a first-class draughtsman. At that time Mr. A. W. Pugin was a young man of twenty-three, known as a man of ability and great knowledge of Gothic detail, but not as the designer of any great building. His time (I have reason to believe) was reckoned and paid for by the day, and such payment was a matter of some consequence to him. The whole theory, which Mr. E. W. Pugin has built up, is coloured by a remembrance of the position which his father afterwards occupied, and is not in the slightest degree based on fact."

It would be difficult to maintain the assertion that Mr. A. W. Pugin "was the sole architect of the Houses of Parliament" (p. 55), even with those who know nothing of the matter themselves, in face of the often-quoted letter addressed to the conductor of this Journal by Pugin. Mr. Edward Pugin, therefore, devotes a portion of his pamphlet to show that the letter was forced from his father; that Pugin returned to Ramsgate after writing it in a frightful state of prostration; and that he told his son afterwards, "Barry said, I must write it, and, if I had it, the whole thing must have been given up—the Houses would have been ruined and Barry's reputation gone."

What were the facts, as shown by some further letters of Pugin's, recently found? Why, that the proposition came from Pugin himself two months before the letter was actually sent to the Builder. Here is what Pugin wrote some time before June 12th, 1845:—

"Morning Steamer, Saturday.
"My dear Mr. Barry,—Since I saw you last night, I have been informed that some most exaggerated statements respecting the nature of my employment at the Palace of Westminster have appeared in one of the papers. I need not tell you how distressed and annoyed I feel at it, for I have always been most careful to prevent any misconception on this head. I have most distinctly stated that I was engaged by you and for you to carry out into practical execution the minor details of the decorations

* * * The italics here are in the original."

according to your designs, that I did nothing *whatever* on my own responsibility, that everything was submitted to be approved or altered by you; that in fine, my occupation was simply to carry out your views in the practical execution of the internal detail. I can assure you, I wish to serve you in this work with the greatest fidelity; no one else can better appreciate your skill and judgment than myself, and no man has ever borne more sincerely and willingly testimony to them than myself. Now, if you think right, I will make a formal denial of these statements to put an end to all nonsense. I have no objection, but Mr. Crace told me that one of your clerks had mentioned it to him; it will therefore be easy to know when and where it appeared, and I really think it would be as well to state the real state of the case. I will send you my contradiction for your approval. I am sure you know me too well to imagine that such statements would give me any thing but great pain and annoyance; but I should like at once to disabuse the public, and let them know the true nature of my employment at the Palace. Pray let me hear from you about this."

Then comes the following, with the postmark of Ramsgate, June 12, 1845:—

"My dear Mr. Barry,—I enclose you what I think will be a sufficient contradiction, and being short and simply worded is more likely to succeed in your hands."

2. I have at last succeeded to my entire satisfaction in the enamel colouring of the armorial plates; the enamel is now sunk below the surface in hollows, and the effect is very rich and good. You will soon have a perfect panel up. I think we shall do this time.

Ever yours, most sincerely,
WALTER PUGIN.

"The *Builder* has now a rather extended circulation [1845], and amongst that class of people whom you would not wish to be wrongly informed on the subject. But I leave the matter entirely in your hands."

[Enclosure.]

"Sir,—My attention having been drawn to an erroneous paragraph which appeared in your journal, relative to the nature of my employment at the New Palace at Westminster, I take an early opportunity of stating that I am not engaged in any work connected with that building on my own responsibility, but am simply superintending the practical execution of the internal details and decorations of Mr. Barry's design. Nothing is done without his entire knowledge and approval, nor is anything put into execution that has not been previously arranged and designed by himself.

I remain, Sir, your obedient servant,
To the Editor of THE BUILDER.

It will be seen, by the first letter, that the notion of denial arose in Mr. Pugin's own mind, without any communication with Mr. Barry; that Pugin himself suggested taking some public steps, and offered to send for approval a formal contradiction. "It will be seen, by the second letter," says Dr. Barry, "that Mr. A. W. Pugin actually does (what Mr. E. W. Pugin suggests that he would have done, were our statements true) write himself a plain straightforward letter, absolutely denying the truth of the report." I presume that my father did not at this time accept the offer so unhesitatingly made. Subsequently, on the revival of the report, the letter of Sept. 6th, 1845, was written,—differing from Mr. A. W. Pugin's own proposed form only in stating more emphatically what Mr. Pugin did actually do, and being certainly less treacherous and emphatic. I do not know whether any impartial person ever has accepted Mr. E. W. Pugin's theory as to the letter; but, if so, his acceptance will hardly survive the comparison of the private and public documents."

Mr. Edward Pugin maintains, further, that in writing his letter to the *Builder* his father did not deny that he "was the author of the original designs for the Houses of Parliament." Of course he did not: because no one had said that he was. And read what Pugin wrote in a letter endorsed by Barry "16th June, 1844:—

"I got your letter at Nottingham. I am sure I can never do you real service except in absolute detail; you should fully make up your mind as to every arrangement and then turn the small work over to me. It is next to impossible for me to design any abstract portion of a great whole in the same spirit as you have conceived the rest, and I know it is only a waste of time in me to attempt it."

"I can do you far more service by adopting the best examples and getting them carried out in execution than by making a lot of drawings which could never be worked from. Remember, I never made a drawing which was of any real use to you, and it is a very useful way of time to me, necessarily occupied as I am with church work, to attempt it. As I said before, I can do you no good except in actual detail, and in that more by ferreting out the fine things that exist than composing new ones. I expect to be in town by Tuesday, and will come over to you immediately; that is, if I am strong enough to travel.

Ever yours most sincerely,
A. WILBY PUGIN."

A body of evidence is given by Dr. Barry to show how correctly Pugin had set forth his real position. Mr. J. L. Wolfe, the constant friend of Barry, his "familiar" as he was called, who knew not merely what he did, but what he thought, says distinctly:—

"Soon after our return home [from Belgium] Barry sent a copy of the instructions issued by the Commissioners of Works, &c. for my consideration; and then, after several preliminary discussions with me, and in my presence, he made the first sketches which comprehended the entire design and contained the germs of all that followed.

Long before Barry sought Pugin's assistance, the entire

design had been not only worked out in his own mind, but committed to paper in a series of plans, elevations, and sections, all drawn by his own hand, in his well-known and admired style of pencilling. These drawings, though on a small scale, were so minute, intelligible, and expressive, that any able assistant could, under Barry's eye, have worked out the details.

In general character the elevations differed little from less ornate; indeed, those of New Palace-yard were in harmony with the entrance front of Westminster Hall. I had thus ample means of observing the progress of Barry's design in the great work he had in hand, it will not be thought surprising that I can now, after the lapse of so many years, make the present statement with confidence."

Mr. B. Ferrey, Mr. Talbot Bury, and Mr. C. J. Richardson, testify, as we have done, to the indignation denied by Pugin of the report that he was the author of the building; and Messrs. R. R. Banks, C. Barry, E. M. Barry, E. C. Pressland, John Gibson, G. Somers Clarke, W. H. Brakspear, G. Penrose Kennedy, W. Wright, F. H. Groves, T. Grisell, Thos. Quarm, R. Layton, J. Birnie Philip, J. R. Clayton, and Sir S. M. Peto, all engaged upon the work in different capacities, assert emphatically the right of Barry to be considered the architect of the Houses of Parliament, and Barry alone. The public, we have no doubt, will think with them.

MUSEUMS OF INDUSTRY.

PERHAPS Englishmen have never been at any time more unanxious in acknowledging a defective system than at the present moment. Paris has taught us a needed lesson, and proved to us that with all our great natural advantages, wealth, enterprise, and boasted intelligence, we are going into the rear. There are, of course, men to be found who refuse to see the fact in this light, and, hugging the consolation that we are not actually retrograding, think there is not much to grumble about. But at the present epoch coming to a stand-still, or any thing approximating to a stand-still, is a retrogression, and a very serious one. We are all looking anxiously round for the cause of this defect, but the last fifteen years furnish us with no great calamity upon which we can lay the weight of blame. No costly and ambitious wars pulling us back, no plague, no famine; nature has performed her part of the task well, and leaves us with the unpleasant conviction that we have only ourselves to cavil with over our own shortcomings. It is somewhat remarkable that every thinking man who has written or spoken upon this subject unhesitatingly attributes the cause of failure to the unhappy relations existing between capital and labour; indeed, when we reflect upon the trade strikes which have convulsed and unsettled this country for years past we may wonder how the result could come otherwise.

If we are to go forward again with the same strong and robust strides as of yore, this open wound must be healed up, and the gulf between them safely bridged over; one must be made to feel and work with a just interest in the other, they must meet oftener upon neutral ground where these vexatious "questions" cannot enter, and by that means establish a better feeling between them. When this is done, we may safely venture to hope that things will wear another complexion five years hence. With this aim in view, I wish to make a few observations, which, if they bear any value at all, must be received as coming from one whose experience is entirely of a practical nature.

I have no doubt that many besides myself have observed, while mixing intimately with the working men of this country, a certain devil-may-care feeling among them respecting their employer and his property, as if they were conscious of being looked upon by him as no more implements of labour, and of no more consideration to him than his horses or engines, only that intellect had made them a little more dangerous to deal with. Whether there be a just foundation for their harbouring this thought I must leave others to decide; but no one can help lamenting that such a feeling should exist. We all know there is latent in every human heart a certain ambition—a yearning to be recognized—which gives a little honest praise a greater value than gold could ever buy. It is a purely healthy and honest thought, and one which, if properly cultivated, may be made of great good to the cultivator. Such ambitions may be humble, but they are none the less intense; and it would be

well, perhaps, to bear in mind, that the rustic stone on the grave of the cottager is reared by the selfsame feeling as that which in "the morning of the world" built up the mightiest pyramid,—a love and a longing for recognition and remembrance. Surely it would not be difficult, dangerous, or unprofitable to break up this coldness existing between the contending sides? Since it is nothing but natural that a man should wish for a state somewhat higher than a working automaton, it is worth while considering how such a desideratum could be brought about. We have seen lately a great deal of what is called working-men's exhibitions, and, with all their imperfections, they have doubtless done a great amount of good in this country. The inducements they held out have taught many men, for the first time, how much they could do with a little independent, earnest study, and proved to them what a wonderful and fruitful mine the brain is when properly worked. They were certainly a move in the right direction; but unfortunately there are many working men who, from the very nature of their work, are shut out from them altogether.

This is a hitch where the co-operation of the employer is wanted. Happily we have now in every industrial town of any importance a free industrial library, and the corporations of such towns have taken them into their hands, with power to weed them, or add to them as circumstances may require. Then why not in the same centres, and under the same keeping, establish a museum of industry? A hall where the workman, if necessary with the help of his employer, could show his handiwork. No one could be so unreasonable as to ask a machinist to lend an engine for such a purpose; but it would not be a very great sacrifice to lend for a few weeks, or in some cases a few months, some of the component parts of one. A crank fresh from the hammer of some excellent forgerman, a cunning joint from the fitter, a faultless casting, with the names of the workmen attached, together with that of the employer, would be everything desired; or gun implements, heavy steel toys and tools in their various stages of workmanship. Such an exhibition would be of the highest interest to all members of these various trades, though the articles may not be of a nature to charm the ordinary longer. Still there are others who could, under such a system, bring something for even this butterfly to dwell upon; chasers, jewellers, engravers, designers, painters of china, carvers, and countless others in such variety as each town or district could afford. Many such exhibits would of course have to be portions of orders then being executed by each firm; but they would take no more harm in being placed before the public for a few days than in lying aside in the warehouses, and still be giving the workman that justice which many think he is entitled to, a means of having his merit recognised. Such a system would give life and vitality to the museum, and by the constant change of articles prevent that stagnation of which so many things of the kind pine away and die. It would be of great advantage to labour; but would it not benefit capital much more, while it spread a sure and effectual incentive to emulation and improvement, and at the same time engendered a warmer and more reciprocal feeling between the two? Besides this it would form a much needed receptacle for the useful fruits of the intelligent workman's leisure hours, always taking care to exclude those useless and hideous cork models of existing buildings, toy ships in full sail, bank notes in pen and ink, and such like ruins of murdered hours and wasted intellect. Accepting only those contributions wrought in downright earnestness, and aiming at some practical end; allowing no exhibit to remain longer than three months. If a mixed committee of workmen and employers were formed to make a quarterly report upon the town exhibition, giving every meritorious work its meed of praise, it would be a means of placing in the hands of deserving men a recommendatory proof of their excellence, and I trust I am not too sanguine in hoping the time would come when a man would be held in little consideration who did not possess some such proof of his skill. There would also be afforded a means of giving distinction to the different grades of talent, and the formation of first, second, and third class certificates would form a sound basis for the better regulation of payment of wages, and be the means of striking a fatal blow at the present rule of equalised remuneration,—a system the

laid; that 17 new street-lamps have been fixed and lighted; that an increase of 343 public lamps has been supplied; and that 116,994,500 cubic feet of gas had been manufactured during the year 1867, being an increase of eight millions over the year 1866.

The gasworks at Ticebrist have been opened. Mr. Porter, of Lincoln and London, erected the works, at a cost of 1,680*l.*, on a portion of land near the tollgate. The shareholders calculate to receive at the end of the first year interest on their money at the rate of about 7 per cent. The newest and most useful gas apparatus are said to be employed in the erection.

MR. PEABODY'S GIFT TO THE POOR OF LONDON.

THE annual statement of the trustees for the year 1867 shows that the original fund has been increased by rents and interest on unexpended capital to the extent of 20,042*l.* 6*s.* 4*d.*, making the sum total at the end of December, 1867, 170,042*l.* 6*s.* 4*d.* The total population in all the buildings erected by the trustees is 1,583.

The cost of land and buildings at Spitalfields is 27,314*l.* 11*s.* 8*d.*; the gross rents from which for the year amounted to 1,050*l.* 11*s.* 8*d.*, and after deducting 359*l.* 10*s.* 10*d.* for working expenses, insurance, taxes, alterations and repairs, there remains a net return of 690*l.* 12*s.* 10*d.*

At Islington the amount invested in land and buildings is 40,897*l.* 2*s.* 1*d.*, and the gross rents for the year were 1,694*l.* 7*s.* 6*d.*, deducting 699*l.* 13*s.* for working expenses, taxes, insurance, alterations and repairs, there remains a net return of 995*l.* 14*s.* 5*d.*

The investment in land and buildings at Shadwell is 1,828*l.* 13*s.* 5*d.* (the dwellings being but partially occupied), and after deducting 540*l.* 17*s.* 9*d.* for working expenses, insurance, taxes, alterations, improvements, and repairs, there remains a net return of 447*l.* 15*s.* 8*d.*

According to the intention of Mr. Peabody, his second donation of 100,000*l.* will be available for objects of the trust in July, 1869.

Is the gift benefiting "the poor of London?" Well, that will be a very proper subject for inquiry.

THE CONDITION OF THE NEIGHBOURHOOD OF THE SHADWELL PEABODY BUILDINGS.

SIR,—I do not know upon whom lies the blame of the horrible state of the ways about the above four costly structures, whether on the parish of Shadwell, the Limehouse District Board of Works (which includes the parish of Shadwell), or on the Metropolitan Board of Works, but probably upon all three. There is filth of the most disgusting character; in one way, mountains of mud! There are other abominations (as pitched up cowhouses, &c.) by the dozen. It really seems a shame when so many millions are being spent by the Central Board, that this part of London should be left as it is. It would not take a very large sum to make a level road in continuation of Glamis-road, through that vile Sun Tavern gap, to come out exactly opposite the end of Hardings-street. Three very old poor houses, 161, 162, and 163, High-street, Shadwell, would require removing, and at the other end two houses, Nos. 4 and 5, St. James's-terrace. The few intermediate buildings are of no great value, but most of course come down. When a man like Mr. Peabody does such good work the parishes should strive to meet him in goodness. No attempt, however, seems to be made. If the site of the two houses I have named in St. James's-terrace were the line of road, there would be a clear way from Churnington's brewery, Mile-end, to Craneworth's Wapping; that is, if the small block at the top of Hamhall-road, Mile-end, were removed. The present opening from Sun Tavern Gap to St. Mary's Church should be built on, and a new opening made three houses further east. This is a local matter, but yet not local. The question is, shall the neighbourhoods of Mr. Peabody's princely gifts be left as disgraceful as they can be, or shall they not? Seeing a few days since a report for the year 1867 of Mr. Peabody's donations, I went down to see the Shadwell buildings, which cost 45,000*l.*, and I send you the above notes for publication if you think they will do good. A. WARDEN.

ST. MARY'S, ITCHENSTOKE.

THE recently consecrated Church of St. Mary the Virgin, at Ichenstoke, in the valley of the Itchen, about five miles east of Winchester, consists of a narthex, vaulted and roofed with Bath stone, a nave of four compartments, and an apsidal chancel vaulted in stone. The exterior view shows the western façade and the outside of the narthex, with the southern flank, the bell-turret, and a portion of the chancel. The shafts of the western doorway are of red Mansfield, and the capitals of grey Mansfield, as is also the statue of the Good Shepherd in the niche above. The narthex is entered through sliding oak doors, ornamented with iron scroll-work. In fine weather these are pushed back, and a sliding wrought-iron grille drawn out in

their stead, thus ventilating the church, and rendering its interior visible from the churchyard.

The interior of the narthex is divided into three compartments by two transverse arches of two orders. The mouldings of these archways are of the same character as those of the external doorway, and rest on foliated capitals which surmount sixteen polished shafts, alternately of green marble and red serpentine; the vaulting of the central compartment is quadripartite, and the two lateral compartments are tunnel vaulted; the ribs in all three compartments are deeply moulded; round the three sides of each of the lateral compartments runs a stone bench, and between these seats and the vaulting the walls are diapered, the pattern being taken from the spandrels of the nave arches of Westminster Abbey. At each end of the narthex is a cross-shaped opening (shown in the exterior view). These are glazed, with a cross of ruby glass, having a crown above, and with the legend underneath "Christi crux est mei lum."

The nave is entered from the narthex through swing-doors, covered with chocolate baize, and with large plate-glass panels. These doors open both ways, or are folded back and secured within the thickness of the western wall. The interior corresponds in richness with the porch. The western façade of the interior is framed, so to speak, in the arched roofing rib glowing with gold and colour of the half-principal against it, which arched roofing rib is supported, like all the others in the nave, by shafts extending from the roof to the pavement. This arch encloses the rose window, which is shown in the exterior view. This is filled with thirteenth-century stained glass,—a memorial to the late Lord Ashburton, and the gift of his widow. Below the window is an arcade, supported by shafts of polished Sicilian marble, intended to contain monumental inscriptions.

The two spandrels between the rose window and the string-course above the arcading is enriched by rosettes, each consisting of a large central boss of emerald glass cut into facets on the back, surrounded by eight pear-shaped bosses of ruby and emerald glass alternately, the whole set in a frame of stone carved and gilt. These carry down and balance the colour of the rose window. Beneath this arcade is a larger one of five openings, of which the central and largest encloses the doorway. All the plain portions of the western wall and of the side walls are diapered like the narthex.

The nave consists of four compartments; the greater portion of one of these is shown on the left-hand of the interior view. Each compartment contains three similar lancet lights. Beneath these, and above the seats, the wall surface of each compartment contains three panels of diaper, enclosed in glazed tile borders, designed for the purpose. The character of the roof is seen in the interior view. All the principals correspond with the half-principal shown above the chancel arch. The arched ribs of the roof rest on roofing shafts carried down to the pavement: the ribs are 8 in. thick.

From the portion of one of them as shown comparatively near to the eye, in the upper left-hand corner of the engraving, it will be seen that its profile consists of three filleted rolls, separated by deep hollows, the latter filled in with "pellets." The vaulting ribs are of the same profile and width, but with greater depth.

The ground of the panels is the natural tint of the material (yellow pine), varnished but unstained. The principals are similarly treated, but having been exposed to the weather for some time before the building was covered in, are of a darker tint.

The five-leaved flowers with which the panels are "sown," are purple, with white eyes and margin, the latter carried between the leaves, and all round them. The colouring of the rolls and hollows, of the moulded stiles, separating the panels, and also those of the ridges and cornices, and of the ribs, is from the old Cathedral of Carcassonne (St. Nazare), a good example of the thirteenth century coloured decoration.

The fillets of the rolls of the arched ribs and of the ridge are gilt. The pellets with which the hollow between them is decorated are formed of spheres of pale yellow glass (blown with cylindrical slanks for fastening into the ribs), with metallic silver precipitated in their interior. These pellets are, therefore, golden, and have a lustre very valuable in ornaments thus situated in a hollow, which lustre, however, does no more than bring them up to the tone of the

gilt fillets of the rolls, between which they are placed. The chancel arch fills up the whole width of the nave, and its springing is at the same level as that of the arch-rib ribs with which it is also concentric. All the windows, both of nave and chancel, spring from the same level: the more prominent fillets of the moulding of the chancel arch are also gilt.

The organ and choir are accommodated in the easternmost compartment of the nave, which thus serves as a chorus cantorum.

The sacristy is circular in plan: its pavement is a reproduction, with slight modifications, in glazed green and chocolate tiles, of one of the concentric labyrinths (called Heavenly Jerusalem) which so frequently occur in the pavements of the early French cathedrals.

The arrangement of the apse is fully shown in the engraving. It will be seen that the capitals of its vaulting-shafts are on the same level as those of its window mullions, as in the apsidal chapels of the cathedrals of Beauvais and Trèves. The fillets and pellets in the vaulting ribs are gilt, and the foliage of the bosses, &c., picked out with gilding, as also the most prominent fillets of the chancel-arch mouldings.

The five windows of the chancel are filled with stained glass copied from Mans and Auxerre. Beneath the windows is an arcade of three openings in each of the five bays. The three under the central window form the pinnacles, and are filled up with glass mosaic by Powell. The remaining twelve form sedilia, encircling the apse as in the early basilicas. These sedilia are backed by slabs of polished marble. The shafts are of Californian marble,—a new and beautiful material diaphanous, and resembling the so-called Algerian agate.

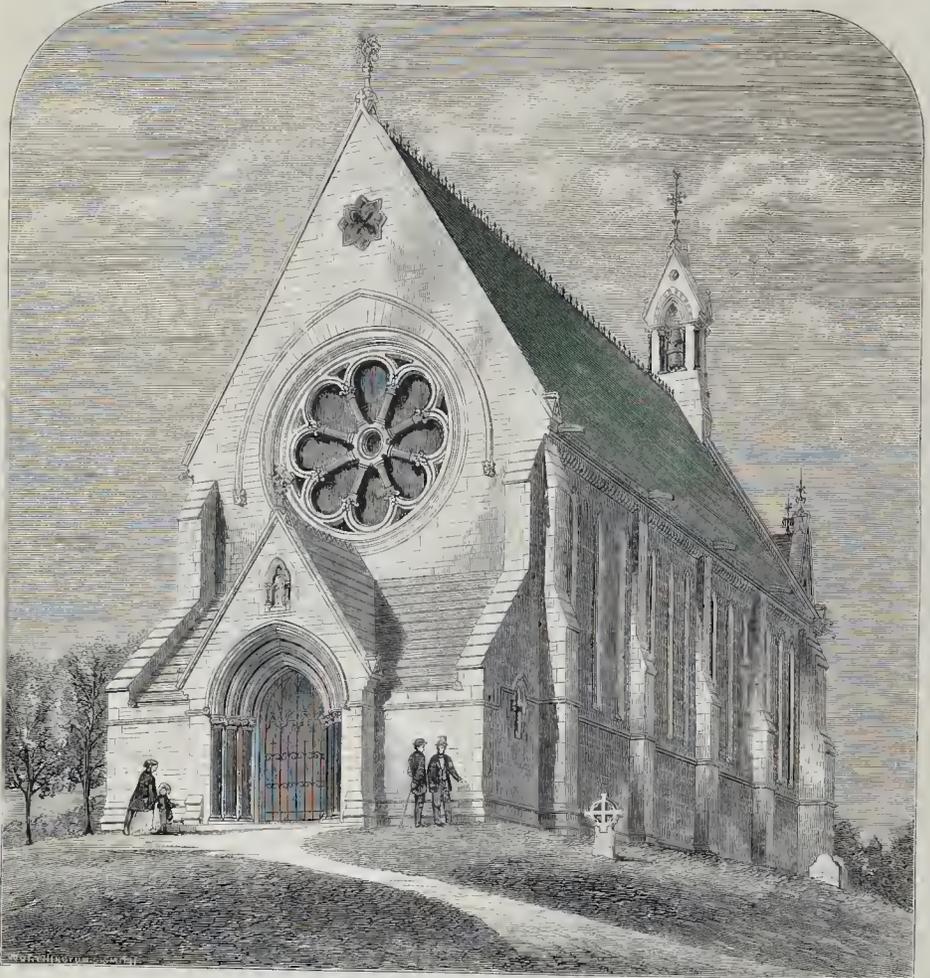

The pulpit, which is of wood, is shown in the engraving. It is entered from the vestry. Its sides are recessed into five sunk panels, each filled with scroll-work and foliage in gilt metal, designed and treated as metal. All the bench ends are similarly treated.

The eagle is of brass, with a jewelled crown and collar. The character of the font is rich. From a circular step of polished black marble, 4 ft. 6 in. wide and 7 in. high, rises a polished circular plinth of the same material, on which stands a black marble shaft, with eight smaller shafts of Californian marble clustered round it. The bases and foliated capitals of these eight shafts are gilt. On the capitals rests the bowl of the font—an octagonal block of polished black marble, each face of which is a perfect square. Into the centre of each square is sunk a jewelled rosette of gilt bronze, similar in character to those in the spandrel under the rose window; a border of smaller jewels, emerald and ruby alternately, each in a gilt cup-shaped setting, surrounds the four sides of each square. And there is a row of similar and similarly set jewels, but larger, disposed vertically down the centre shaft of black marble between each pair of the smaller shafts. The idea of thus combining coloured enamel gilt bronze, and black marble, is taken from the tomb of Mary of Burgundy, in the church of Our Lady at Bourges.

The church contains thirty-two windows, all of which are filled with stained glass; the capitals inside and outside are all different, and are carved from natural foliage, duly conventionalized to suit the material (Bath stone).

The bell turret contains two bells, which are swung and rung by levers. The eight shafts at its angles are of polished red Serpentine, and the arch above inlaid with glazed tiles, green and chocolate alternately; the cross which surmounts it is topped with gilt intercup-leaves, and the cock is from La Sainte Chapelle. The cresting of the nave roof is of intercup-leaves; that of the chancel has also its upper tier of leaves of the same character, the two lower tiers being from exotic types of foliage; the roofing is of purple and green grey slates disposed in patterns.

The principles on which the architect claims to have designed this church are as follows:—
1. That in designing a church the paramount object to be kept constantly in view should be to obtain the highest possible interior effect, treating the exterior composition as altogether subservient to that of the interior, and not to sacrifice one jot of the dignity or unity of the interior effect in order to break the exterior into picturesquely disposed masses, or to spend money on any merely external features, such as spires or pinnacles, until a splendid interior has been fully provided for.
2. That the most effective position for the entrance to a church is the west end; and that in our inclement climate it is always

ST. MARY'S, ICHENSTOKE.—VIEW OF WEST END.

desirable that a western porch or narthex should be interposed between the auditorium and the outer door. A vestibule is invariably deemed indispensable in the case of public rooms intended for secular uses, and they are certainly not less requisite for places of public worship, where attendance in all weathers is deemed not so much a matter of choice as of duty. The earliest Christian churches were almost invariably provided with a narthex.

Thirdly, that there are, as regards the interior effect, certain definite principles of composition and certain definite proportions of height to width and length to height, which cannot be ignored without most grievously falling short of the maximum of aesthetic effect of which the style is capable, some of the principles of which are as follow:—

That the only form of roof, whether of stone or timber, compatible with perfect Gothic, is one apparently supported by a series of Gothic arched ribs; and that the height from the top of the bench-ends to the springing of these arched ribs should (in interiors without a clearstory) be at least equal to the span of such arches; and that, in accordance with the principle of decorative construction (which consists in providing an apparent as well as an actual support to

every visible weight or thrust), and to that of "vertical or pointed composition" (which requires that all horizontal lines should be stopped by preponderating vertical lines), that these arched ribs should be supported by shafts extending without interruption from the ribs to the pavement, and stopping all horizontal lines they meet; also that the length of the nave should be at least twice its height, the latter being measured from the pavement to the vertices of the arched roof ribs.

That the chancel should possess every grace of which the style is capable; that one of the noblest and most distinctive of these is loftiness of proportion, and therefore that the modern practice of making the chancel so much lower than the nave should in all cases be avoided. That such practice is also objectionable on other grounds; for one of the chief aims in interior effect should be to create an impression of length, and this requires that the eye in ranging eastward should not be arrested by a dead wall-space over the chancel arch, which space has, moreover, in general a most eccentric contour: thus the chancel arch should be carried to the full height of the nave, and should fill up its entire width: that it should have its springing line at the same height, and should also be con-

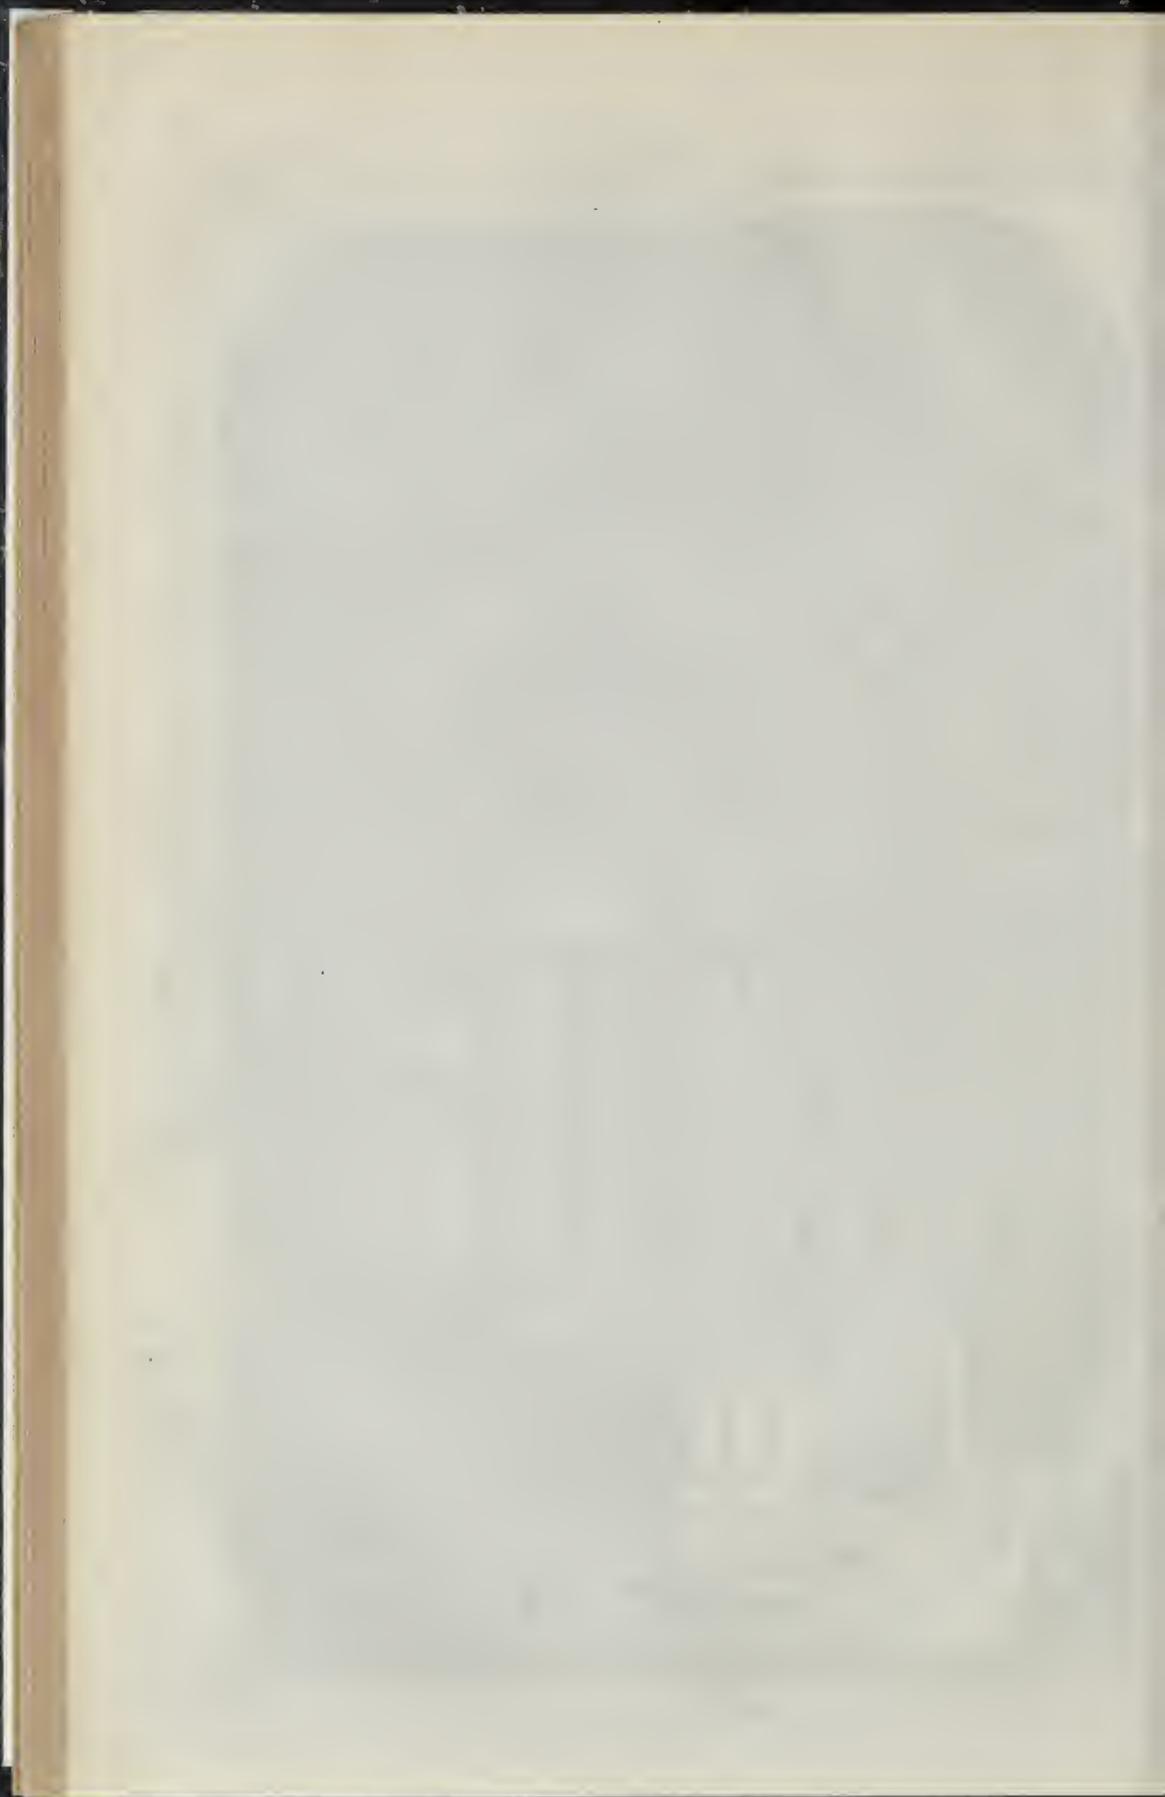

centric with the arched ribs of the roof; that the projection of the chancel arch beyond the side-walls of the chancel should be small as compared with its projection beyond the walls of the nave, whereby the eastern windows and altar are rendered more visible from the body of the church.

Also that the apse, when loftily proportioned and vaulted in stone, is the most effective eastern termination for a church; but when of low proportion, or ceiled otherwise than by stone vaulting, is merely a waste of force, and very inferior to the ordinary rectangular termination. Also that it is most conducive to an effect of harmony and repose in the interior, to keep the capitals or springing of the roofing shafts, vaulting shafts, chancel arch, and of the nave and chancel windows at the same level. And, in conclusion, that all these principles admit of being as fully carried out in a small parish church (like the present example), as in a cathedral.

The church has been built almost entirely at the expense of the incumbent, the Rev. Charles Conybeare. Mr. Henry Conybeare was the architect. The chancel is intended as a memorial of the late Mr. Markland, well known as an ecclesiologist.

ST. MARY'S, ICHENSTOKE, NEAR WINCHESTER.—VIEW LOOKING EAST.—MR. HENRY CONYBEARE, ARCHITECT.

INSTITUTE OF BRITISH ARCHITECTS.

On Monday evening last Mr. George Grove, Honorary Secretary to the Palestine Exploration Committee, read a paper on the "Exploration of Jerusalem and the Holy Land," and in the course of it described what had been lately done, with which our readers are acquainted. It was proposed, he said, to investigate the whole system of sewerage and water supply in ancient Jerusalem, and also that remarkable live rock, some 60 ft. by 40 ft., which contained a cave in which Constantine believed that our Lord was buried. These explorations would doubtless be most interesting to the members of the Institute of Architects, for they would inevitably throw a much-needed light on the history of a great era of their art. Herod was a building Prince, and Jerusalem was the great centre of his enterprise. Among the questions which would arise to them would be the following:—Did he employ Roman workmen? and if so, what influence did the climate and customs of the country exercise on the works of the builders? The Palestine Exploration Fund was extending its work, and he asked the assistance of the Institute to promote it.

TERRA COTTA.

THE ARCHITECTURAL ASSOCIATION.

At the ordinary meeting of the Architectural Association held at the House, in Conduit-street, on Friday evening (the 31st ult.), the president (Mr. R. Phéne Spiers) in the chair, a paper was read by Mr. Gilbert R. Redgrave "on Terra Cotta, and its Employment as a London Building Material." Having referred to the use of terra-cotta by the Egyptians 4,000 years ago, and by the Greeks and Romans at later periods, Mr. Redgrave proceeded to give a brief account of the revival of its manufacture and employment in London. About the commencement of the present century, Messrs. Croggan had an establishment in Lambeth Marsh for the manufacture and sale of artificial stone ornaments; and a writer of the period described the process as very similar to that which he had observed in Mr. Chantrey's workshops in modelling designs in clay, remarking that the durability of the material was fully equal to the ordinary kinds of stone; and that, in his opinion, when the power of the composition to resist the influence of the weather was fully ascertained by a longer experience, it would encourage a more general use of it, and give employment to a higher class of workmen. The manufactory known as Croggan's subsequently came into the hands of Mr. Coade, but the terra-cotta used in the decoration of New St. Pancras Church, in Euston-square, was executed by Messrs. C. & H. Rossi at a cost of 4,300l. The capitals of the columns and around all the external ornamental enriched mouldings, &c., were of terra-cotta. Imitations of Greek tiles in terra-cotta were arranged along the coping of the side walls, as well as round the circular part of the east end. The colossal statues, females guarding the entrance to the catacombs, were of terra-cotta formed in pieces, and connected together round pillars of cast-iron, which in reality supported the entablature. The whole of the exterior of St. Pancras Church was faced with Portland stone ashlar work, and the sharpness and freshness of the terra-cotta enrichments contrasted advantageously, with the worn, bleached, and disintegrated appearance of the generality of building stones used in London. Another building, in which terra-cotta had been employed, was All Souls' Church, Langham-place. The capitals of the columns here were supplied by Messrs. Coade, in 1822. The quaint basso-relievo inserted in the Haymarket front of the recently destroyed Opera House, was modelled by Mr. Bubb, the sculptor, in a substance called "Lithargolite," or artificial stone. This material was added to the old Opera House, by Mr. Nash, in 1820, and the lithargolite was dated 1821. There were, no doubt, many buildings in London of this date, the enrichments of which were executed in terra-cotta. In the struggle with the various cements which were introduced at the commencement of the present century, and the object of which was to convert brick walls into sham cement, terra-cotta was favoured, probably owing to the fact that, as the early manufacturers aimed at assimilating their productions to stone, a much more perfect resemblance could be obtained with stucco than with burnt clay; and, in fact, the quality

which was now so much admired in terra-cotta, namely, its colour was that which in the earlier stages of its London career proved its ruin, and hastened its downfall. That terra-cotta could effectually resist exposure to the atmosphere in our climate, was proved at Sutton-place, near Guildford, a Tudor building, of the most elaborate kind, the ornamental parts of which were of red and white terra-cotta. This house was built in 1559, by Richard Weston, brewer to King Henry VIII. A still older example, and within easy access of London, was to be found in the walls of Hampton Court Palace. This terra-cotta, which was very hard, and of a light red colour, had been fairly exposed to our climate for 350 years, and was certainly of a date coeval with the building. It had been attributed to Master Georgione, who was in this country at that time. Having said thus much, how eminently terra-cotta was worthy of extensive use in London! Mr. Redgrave next proceeded to point out the methods which he had found most desirable in preparing and arranging the material for the manufacturer. These observations he divided into three heads,—1. Terra-cotta considered with reference to the architect; 2. With reference to the manufacturer; and 3. With reference to the builder. The quality which caused the architect most trouble with regard to terra-cotta was its shrinkage, which varied from $\frac{1}{4}$ in. to $1\frac{1}{2}$ in. in the foot. In order to arrive at a fair conclusion as to the scale of shrinkage, and at the same time to obtain a genuine sample of the material, he had found it advisable to prepare a plaster cast of some simple ornament, and to deliver copies of the same to the manufacturers invited to supply the terra-cotta, requesting them to make a model from the cast, and impressing upon them the necessity of using an exact sample of the clay which would be used for the whole of the work, and to burn the clay blocks in various parts of the kiln with the customary heat. These trial pieces, together with the plaster cast, ought then to be returned to the architect. Having before him these samples, the architect could make his choice and select the one which in colour, hardness, and squareness of form seemed to be the best: he could then proceed, by a simple rule-of-three sum, to ascertain the scale of shrinkage. Assuming that the detail drawings of the terra-cotta work for a large building had to be prepared, he might add that, until the decimal system was introduced into England, there was no scale more intelligible and satisfactory for details than $\frac{1}{2}$ in. to 1 in., or $1\frac{1}{2}$ in. to the foot, and to this scale the small-sized terra-cotta drawings, showing the relative position of the block, should be prepared. With regard to the size of the blocks, it was impossible to produce them beyond a certain limit of dimension on account of the difficulty of manipulation in the manufacture and of the danger of imperfection in the firing, but he thought the limit should be placed at a contents of 4 cubic feet, or thereabouts. This size would show the nature of the material used, and avoid, on the one hand, the massiveness of stone and on the other the pettiness of brick-work. If these dimensions were exceeded the blocks would twist and sag in drying, and the mouldings would lie uneven and defective. It was also very desirable that great accuracy should be observed in the drawings for terra-cotta, as otherwise the blocks might become absolutely useless. With regard to designing ornaments for terra-cotta work, the material in which the design was wrought was so perfectly adapted to the skill of the modeller that the highest effort of the sculptor's art might be obtained; and in cases where only a few copies of the work were needed, they might be actually modelled in the clay which was to be burnt, and thus the artist's own handiwork might be preserved. When many copies were wanted, with good moulds, and workmen who knew how to let the clay alone after it had left the mould, a very near approach to the sculptor's own work might be expected. Indeed, the approach was nearer than in stone carving, where a weak resemblance to the model was obtained in a material whose qualities and methods of making were so essentially different from the sculptor's clay, that a sort of education in the art of interpreting modelling into stonework was all important to the stone-carver. The motto for the terra-cotta modeller should be, "Work in low relief and avoid under-cutting." Having considered terra-cotta in reference to the manufacturer, Mr. Redgrave explained the steps taken at the Horticultural Gardens, South Kensington, to test the strength

of the material. A weight of 20½ tons had been sustained by a column, under somewhat adverse conditions, and he had no doubt that a column 15 ft. high, and 1 ft. 6 in. in diameter would carry a weight of 25 tons with greater and more permanent safety than a cast-iron column or core 8 in. in diameter and 1 in. thick. Advertising next to the special advantages of the use of terra-cotta in London, Mr. Redgrave contended that it was eminently adapted to receive a glaze, and expressed a hope that enamelled terra-cotta,—the Della Robbia ware of the old Italian times,—would be the material destined to beautify and decorate the London of the future. In glazed terra-cotta was to be found the *panacea* for all the evils which caused the failure or the ill-success of our modern London architecture. Victorian architecture relied to a very great extent upon colour for its enrichment and for its effect. At present the costly city banks, public buildings, and warehouses had, after a few months of splendour, fallen a prey to soot. Indeed, it was humiliating to think that, with the exception of polished granite, every material used in our metropolitan architecture succumbed after a brief struggle to fogs, smoke, and London atmosphere. If, however, good terra-cotta were used, it would defy our climate, and, at the same time, preserve that good rich colour which our architecture so much wanted. Glancing, in conclusion, at the price of terra-cotta, Mr. Redgrave remarked upon the discrepancy which existed between the prices of the same article from producers in different portions of the country. A variation of 200 per cent. was by no means uncommon, and furnished a convincing proof of the ignorance and uncertainty which prevailed with reference to the subject. The average price of terra-cotta in the neighbourhood of London was from 4s. to 8s. per foot cube, and in the coal districts of Staffordshire and the north it varied from 2s. to 5s. per cube foot. He felt certain, however, that in a few years terra-cotta of excellent quality, made where coal and clay abounded, would be sold in London at from 1s. 6d. to 2s. 6d. per foot in cases where a considerable number of the blocks of each pattern were required. This last proviso, however, was a very important one, as regulating the price of terra-cotta; for one of the principal expenses of the manufacture consisted in the preparation of the models and the moulds, and where only a small number of blocks was required from any given pattern the preliminary expenditure formed, when divided, a heavy item in the ultimate cost of each block. Terra-cotta ornamented work contrasted very favourably with stone carving in point of price,—the modelling being set down as the same in each case. In using stone it was necessary to allow a large sum for the labour of carving, while in the case of terra-cotta the only labour consisted in forcing the clay into the mould and placing it in the kiln. In the South Kensington Museum there were exhibited two ornamented mullions, one carved in stone and the other executed in terra-cotta. The relative prices were ascertained with accuracy, and the result was that the stone cost 5l. 8s. and the terra-cotta but 2l. 3s.

Mr. Watson inquired whether it was not the practice to provide in shafts for columns a chipping piece to meet the case of shrinkage. In his opinion it would not be desirable to place a great weight upon terra-cotta pillars, but to reserve it for light arcades, subdivision of arches, and the like.

A member thought terra-cotta might be advantageously employed in decorating London exteriors, but not for constructive purposes. In Northern Italy it was extensively used for ornamental purposes by letting it into the walls. This subject, introduced by Mr. Redgrave, was most interesting and important at a moment when public taste was setting in favour of colour, and when it was becoming more and more necessary to devise something that would defy the London atmosphere.

Mr. Perry saw no reason why burnt clay, highly glazed, which was, in fact, majolica ware, should not be extensively used, when bedded in cement, for decorative purposes in street architecture.

Mr. Blashill said he would be sorry to advocate the use of terra-cotta in a decorative sense only, and not as a material for construction. In his opinion, terra-cotta was very suitable for the decoration of brick buildings. He could see no objection to the use of bright red bricks with terra-cotta dressings, which could be washed occasionally with a steam jet and hot water and

soap, as was done in Paris. With regard to the use of the material in pillars, he saw no objection to it, as he believed that if properly made and fixed, a terra-cotta pillar would bear a considerable weight with perfect safety.

Mr. J. D. Matthews observed, that few persons were aware that terra-cotta had been used so largely in the decoration of St. Pancras Church as Mr. Redgrave had described it to be, and that the architectural student would henceforward examine the building with greater interest. It seemed to him that the great objection to using terra-cotta constructively, was to be found in the difficulty of getting truly horizontal lines in small blocks. This difficulty would, he apprehended, be a drawback to its general adoption. With regard to shrinkage, however, he did not attach much weight to it, as if proper drawings making due allowance for shrinkage were prepared, the difficulty could be got over. Great care would, however, have to be exercised in this respect, and also as regarded the firing of the blocks, otherwise the architect would be dissatisfied, and the builder could not get on with his work.

Mr. J. S. Quilter called attention to the importance of insuring a uniform colour, as otherwise the terra-cotta would look patchy. He thought the architect ought not to be expected to deal with the question of shrinkage; but that it should be left to the potter, who was naturally better acquainted with the matter.

A member said that the deeper the clay was got the less would be the shrinkage.

Mr. Canning (Messrs. Gibbs & Canning, of Tamworth), stated, that as a maker of terra-cotta, who could bear practical testimony to its great strength, the white sorts were made from fine clay of the purest description and texture, and free from iron, and admitted of the hardest burning, while at the same time it exhibited the minimum of shrinkage.

The Chairman.—Could not the figures at St. Pancras Church be made able to support the weight of the entablature without the iron columns inserted in the interior?

Mr. Canning.—I think they could.

The Chairman, commenting upon the value of the paper read, as emanating from a person who had had much experience in the use of terra-cotta at South Kensington, observed that in the buildings in Northern Italy which had been referred to, iron supports were unnecessary, as the pillars were used only for light arcades, and had no great weight upon them. There were, he thought, two great advantages in the use of terra-cotta. The first was that its lasting and durable properties exceeded those of stone, and the second was, that its highest artistic skill might be obtained at a moderate price. He confessed he should have liked to have heard more about the application of it to London buildings, and a discussion of the question as to whether it should be used merely in an ornamental and not in a constructive sense. He hoped, however, that should it be generally introduced it would not be in the shape of a glazed covering for buildings, for which our climate was wholly unfitted. In the few cases in which polished stone was used in London buildings reflection, and not light, was the result.

Mr. Redgrave said that so far as crushing weight was concerned terra-cotta would compare favourably with any building stone now in use. It was, however, to a certain extent a treacherous material, as if a piece were imperfectly fixed it might endanger the safety of the portion of the building in which it was used. At the same time, in discussing its advantages and disadvantages as a building material, it would be necessary to bear in mind that the manufacture was still in a crude and unsatisfactory state, and that eventually it would probably be brought to such a state of perfection, that iron supports might be entirely done away with. With regard to the Italian buildings in which he had seen it employed, it was used in small pieces on flat surfaces, and had not any weight to support. If, however, the material were to be so perfected in the manufacture as to come into general use, the architecture might be tempered to it. With respect to the question raised by Mr. Quilter as to whether the architect should prepare the drawings for the terra-cotta, he made them so as to provide for shrinkage, he saw no reason why he should not do so when the amount of shrinkage could be ascertained to a nicety.

A member observed that, whatever difference of opinion might exist as to the merits of terra-cotta as a decorative or as a constructive mate-

rial, there could not, he fancied, be any with reference to its applicability to the interior decoration of buildings,—as, for instance, in halls, corridors, staircases, and public rooms. The room in which the members were then assembled and which always struck him with amazement as a type of what British architects were able to do under severe pressure, might be greatly improved if a band or string-course of terra-cotta enrichments were carried under the cornices, or if the windows (which were now nothing better than glazed holes) were ornamented by its agency. He found, however, that in this case, as in all other innovations, no matter how simple or obvious, the client and the architect would be met by the old cry of expense, which was always cropping up whenever we went a quarter of an inch out of the beaten track.

The Chairman remarked that the new town-hall of Berlin was built of terra-cotta and brick. It was a building of enormous size, and the Prussian Government had resolved that it should be composed exclusively of those two materials.

MONUMENTAL.

At a recent meeting of the Doncaster Town Council, designs were received from Messrs. J. Athron, W. Potter, and T. & C. Anelay for a monument to be placed over the grave of the late Mayor (Mr. H. Woodmansey). The committee recommended the design, No. 2 upon the sheet, furnished by T. & C. Anelay. It was stated that the height of the monument would be 10 ft., and its cost £81, which came just within the limit of the sum specified. The recommendation of the committee was, therefore, adopted.

A monument to the late Mr. Jackson, of Bradford, has been erected in Undercliffe Cemetery, under the ash tree where the remains were buried. From a pedestal of Bolton stone rises a shaft of the same material, clear and close in the grain, presenting four faces, pointed and carved in the common Gothic style. These faces are separated from each other by four small columns of polished red or Peterhead granite; and the whole culminates in a short pyramidal spire, closely covered with inverted leaves. The inscription states that the deceased was "composer of the oratorios 'Deliverance from Babylon,' 'Isaiah,' and other musical works;" and that the "monument is erected by the Bradford Festival Choral Society in affectionate memory of him, their first conductor." Messrs. Staké & Co., of Bradford, executed the monument.

MANCHESTER TOWN HALL COMPETITION.

The designs for the new town-hall submitted by the selected architects are now being hung in the present town-hall. All the available wall-space in the hall, as well as two additional screens placed across it, will be required to arrange them in a satisfactory manner. It is matter for regret that a better-lighted room has not been chosen. Messrs. Donaldson and Street will assist the committee in making the selection.

ACCIDENTS.

In the vestry of the Priory Church, at Malvern, an explosion of gas has taken place; the clerk having inconsiderately taken a lighted candle to discover the spot where an obvious escape of gas was occurring. The vicar, clerk, and vergers were all injured by the explosion, and damage done to the floor, the organ, and other property to the extent of more than 100l. A similar explosion, it will be recollected, took place at Ripley Church a week or two ago.

St. David's Church, Merthyr, took fire the other day in the roof from the old grievance, an over-heated stove flue. There was some difficulty in putting out the fire by means of fire- hose. The church was flooded, and the molten lead fell amongst the people as they rushed out wildly, and were arrested by the difficulty of getting through the doors, which opened inwards.

A fire has occurred at Wynyard Hall, near Stockton, the seat of Earl Vane, from a beam, it is believed, getting ignited in a chimney of the servants' apartments. The roof fell into the

kitchen, but the fire was kept from the main building by the use of the Hall fire-engine, supplied from a pond, and other means.

By the fall of the wall of a warehouse at Brighton, a child has been killed. The recent gale, it is said, had previously brought down a portion of the walls of the same building.

At Scarborough recently a man was killed by the fall of a chimney belonging to a new building. At the coroner's inquest the jury, after examining several witnesses, including the borough surveyor, the architect of the buildings, one of the workmen employed with the deceased man, and a surgeon, returned a verdict of "Manslaughter against John Land, the builder of the house in which the accident occurred." This verdict was repudiated by the coroner; and the jury, after being locked up for some time, embodied their conclusions in the following form:—

"That the death of Henry Moore was caused by the fall of a chimney of the house in which he was working on Saturday, February 19th, 1868. From the evidence that has been brought before the jury, they are of opinion that the fall of the said chimney was owing to the culpable negligence and disregard of John Land, the builder of the house, to certain conditions required by the Scarborough Local Board in consideration of the safety of life and property. The jury attached to this their verdict their earnest opinion and conviction that the conditions required by the Local Board are not sufficiently exacting and particular, especially with regard to the inspection of buildings during their erection; and the jury strongly recommend that increased powers be granted by the Board to their surveyor or some other officer for the purpose. And, with regard to the building in question, the jury further express their opinion, that it is not only desirable, but absolutely necessary, for the future safety of the public, that that building be further and fully inspected on the authority of the Board by one or more efficient surveyors; and that Mr. Land shall be directed to complete the building (if at all) either according to the plans as originally approved by the Board, or such modifications thereof as the Board may approve."

STYLES NOT INVENTED.

SR.—It is extraordinary that a man so well acquainted with the history of architecture as Mr. Fergusson, should have fallen into the error of supposing it possible to "invent" a new style. No style of architecture has ever been "invented," but has always developed, and, what is more remarkable still, is the fact that new styles have always arisen from copying the works of a former age, exactly what Mr. Fergusson finds fault with architects doing at the present time. Whence came the Grecian architecture?—from copying the works of the Egyptians. The Roman?—from copying the Grecian. The Byzantine and Romanesque?—from the Roman. And what is Gothic architecture but a development of the Romanesque?

Now, in each of these cases the style was for many years only "copywork." By degrees, after centuries of toil, the new style became gradually "developed," and this development generally took from three to four hundred years. In the case of the Gothic style, it took over six hundred years. The earliest Romanesque buildings were erected about the sixth century, and Pointed architecture did not develop itself into a new style till the thirteenth century.

Now, if Mr. Fergusson could live for five or six hundred years he might create a new style. I have the greatest possible respect for Mr. Fergusson, and I think he has done much for architecture, but I can hardly wish him to live long enough to "invent a new style."

H. W. BREWER.

THE DISPOSAL OF SEWAGE QUESTION.

SR.—In the very neat summary you gave in the *Builder* last week of several ways of dealing with town sewage, you mentioned a pamphlet by Mr. Slagg, "On the Principles of Town Drainage," in which he says that towns ought, for the purpose of disposing of their sewage, to be individualized and not combined, as has been often put forward as being the best way of getting out of the difficulty that has been recently thrown upon the towns in the Thames Valley, and will be repeated, probably, all over the country where rivers are polluted by town sewage. In addition to the reasons therein set forth for this individual mode of dealing with the subject, I think another may be stated. Surely, sir, we, the town surveyors of England, if authorised to carry out our own ideas of how to get our towns out of this difficulty, could and would quickly do it. We have not all had sufficient experience to undertake this work with confidence, but I am sure those who have not

ould readily acknowledge it, and make way for
assist those who have.

If it be thought better to have our plans sub-
mitted to a standard authority before being put
practice, by all means let it be so. The Presi-
dent of the Institution of Civil Engineers, Mr.
Lawson, or some other gentleman of eminence,
could quickly detect anything wrong in principle
in detail in the plans submitted to him. On the
other hand, we should have the advantage of any
new idea of any value that might be broached
put into train for a practical trial, and
timely the country would gain by such a
course.

It will hardly be contended by any disinterested
that we ought to rest satisfied with the present
practice of town drainage as a final measure
sanitary science. And I think we ought, at
onset, before we are further committed to
principles which may not prove to be the best,
to establish what ought to be done, both in principle
and practice.

I acknowledge the value of the information
furnished by the Royal Commissioners lately, but
do not think their "conclusions" ought to be
conclusive. By leaving the work of disposing of
the sewage to the town surveyors, with the ad-
vantage of a reference to, and consultation with,
our eminent engineer, we shall more quickly
arrive at the best thing to be done than by any
other means. A TOWN SURVEYOR.

ARCHITECTS' FEES IN COMPETITION.

Sir,—I beg to hand you the following advertisement
which has this morning appeared in one of the local
papers, thinking that, as a specimen of the sublime
genius of the Sculptors guardians, it may be somewhat
interesting to your professional readers:
"Sculptors Union.—To Architects.—The guardians of
the above union, being desirous of making certain alterations
and additions in the workhouse, will, on Tuesday
next, be prepared to receive tenders, stating for what sum
architectural plans of such proposed alterations and addi-
tions will be prepared. The premises may be viewed, and
instructions for plans received from the committee, who
will be in attendance at the workhouse, from ten to
one o'clock on Thursday next. The tenders must be
delivered," &c.

Among the number of those who profess and call them-
selves architects, how many will be found with virtues
enough to hold to this remarkably tempting invita-
tion to self-sacrifice is yet to be seen.

KINGSTON HULL.

GREENOCK HARBOUR AND DOCK.

Sir,—Many of your readers have doubtless applied for
the "particulars" respecting the proposed dock and
harbour at Greenock, and have done so, and the particulars
are so inconsistent that I find it impossible to define
it is really required. The instructions require two
harbours or wet docks (but do not say which); also
a wet dock, sea wall, and embankment, together with
a railway communication; whereas the sections of the Har-
bour Act to which competitors are referred only authorize
the construction of one small dock (according to the
provisions therein delineated) and the graving dock
at a given position; the instructions also authorizing its
being placed in another position, if the competitor can
show "valid reasons" for doing so.

The instructions and the clauses of the Act appear con-
sistent with each other, and other discrepancies being
identical between the former and the plan furnished, I ap-
plied to the clerk for further particulars, but can get no
reply. I should feel obliged by these facts being made
public, because they lead me to believe that the competi-
tion may not be a bona fide one, or worst wasting time
and money. C. E.

GREAT BELLS: WOBURN NEW
CHURCH, &c.

Sir,—Mr. Walsely, to whose general campanological
knowledge I would pay all due respect, thinks that a new
bell of 55 cwt. at Woburn, Beds, will be the heaviest
cast in this country. I venture to doubt this, by fancying that
there may be several latent heavy bells of little more than
usual cognizance and fame; as even that of Sherborne ap-
pears to have been but little publicly known till lately. There,
at least, near forty years ago, a statement of all at
one parish church in Gloucestershire, weighing 8,000 lbs.
was in a village tenor of six in Oxfordshire, I am pretty
certain near Witney (else Banbury), undoubtedly weigh-
ing fifty-six cwt.; also in a village church of East-
Hampton, Beds, being on good authority to weigh 50 cwt.
Some correspondents might, doubtless, elucidate these or
other examples, to Mr. Walsely's satisfaction also.

The "Bells" of the little town, under
1,000 inhabitants, is of course a lawful one, which none
are entitled to evil at. This same new church at Woburn
possesses, however, so strange a tale—perhaps utterly
unprecedented, and unexampled, at least, in such a
parish, that it may invite notice from the mere singu-
larity of the case, little as may be the likelihood of
occurrence of a similar astonishing "blunder."
The "Bells" of the little town, under the
Woburn, was a pretty one, and a great favourite of the
present duke's esteemed grandfather, who liberally and
generously ornamented it. It was pulled down, against the
wishes of the "regular" old church, and some "mono-
theists" (his present Grace being, unhappily, an absentee)
little inhabitants—Churchmen and Dissenters; and, after
being sacrificed (with a handsome neighbouring parson-

age), it was discovered that there was *not* room where they
had calculated on rebuilding!—too justly styled by the
old inhabitants a "cruel blunder." This necessitated
building at some distance, leaving, instead of a time-
honoured existing church, a heavy "waste," leaving the
old tower, and a new "sepulchral chapel," rendered also
necessary through their "management," in the centre of
the little old town, at which any "Kip van Winkle" of the
old "coaching" days might almost discredit the evidence
of his senses.

A few years ago, it was stated in the *Builder*,
that the "poorest almshouses in England" were supposed
to be, now, those at Woburn, founded by the Bedford
family, though in "exchange" for some charity lands
bequeathed by others long before, in which twelve poor
inmates receive one shilling a week each, not augmented
in about a century, and without other perquisites. The
case seemed more regrettable, as there are several well if
not excellently endowed almshouses in neighbouring
towns. These poor folks at Woburn will now have the
common privilege of hearing the "great bell," but might
they not be more grateful for a few additional shillings a
week each, than even living under its sound, however
otherwise imposing? VERUS.

CROSSINGS.

Sir,—Much having been lately said about the applica-
tion of bridges and tunnels for the convenience of foot-
passengers at the crowded thoroughfares, it struck me
that lifts might be advantageously employed for the pur-
pose. It is not worth while for me to enter into details;
but I hope an engineer will take up the idea, for I am
satisfied that there are no objections which might be
surmounted by ingenuity and perseverance. A bridge,
with lifts in the form of the letter H, would occupy less
space, and the fatigue of climbing stairs be avoided. The
police-station already situated at such crossings could regu-
late the machinery, so as to secure the preponderance of
the descending party. Pedestrians would then walk into
the box containing any six, be raised to the level of the
bridge, walk across, and in turn by their weight, assist in
raising the ascending followers. CICEROUS.

COMPARATIVE ALTITUDES.

Sir,—It is very satisfactory to see the question of
"comparative altitudes" treated practically by your corre-
spondents "A. J." and "B. E.," who have done good
service by their communications.

I hope, and believe, I am giving utterance to the feel-
ings of many, when I express my own sense of gratitude
for these contributions, and give an assurance that it
would be a matter for regret if the subject were allowed to
rest there. May I be excused if I also express my own
opinion that the observations would be really valuable for
scientific purposes, as well as for certain practical opera-
tions, if some common datum were agreed upon and
adopted throughout the country. It must be evident to
all persons directly and indirectly concerned that this
should be the mean level of the sea.

Anxious not to trespass too much on your space, I will
restrict myself to one or two suggestions of the advantage
of such a course. To many geological students who have
not time and opportunities to do much field-work, such
tables of comparative altitudes as those commenced by
"A. J." would be very valuable, having the end-level
datum. In the promotion of great sanitary improvements
such general levels would probably prevent many blunders;
and the same remark would apply in all cases where
land drainage on a large scale is contemplated.

With most of the remarks of "B. E." in your last
number I entirely agree; but would proclaim the impor-
tance of uniformity in taking the altitudes, and the adop-
tion of a common datum. "B. E." rather objects to the
term "mean level of the sea," as being ambiguous; and I
beg, therefore, to suggest, that the uniform datum should
be the average low-water level, which is adopted as the
zero in all Admiralty as well as land and estuary surveys on
the eastern coast. JAMES WYATT.

METROPOLITAN BOARD OF WORKS.

A SPECIAL meeting of this Board has been held for
the purpose of receiving a report from the Works and General
Purposes Committee on the subject of a draft bill with
reference to the loans and funds for carrying on the works
under the existing Thames Embankment and Mansion
House-street Acts, also the works for the Thames Em-
bankment approaches, the Chelsea Embankment, and the
Park-lane improvement, and to enable the Board to
charge in aid the rates of the metropolis and the general
properties of the Board under those Acts. Mr. Freeman,
in moving the adoption of the report, said that their
object was to get the necessary capital for the works,
and that at the lowest possible per-centage. They had
sufficient capital to pay for the net cost. If they could
get the guarantee of the Government, they would be able
to raise the money at a lower per-centage. A short dis-
cussion followed, in the course of which it was stated that
the amount was 2,100,000*l.* Upon the resolution being
put, twenty members voted for it and three against,—the
latter being Messrs. Healey, Roche, and S. Taylor.

ST. PANCRAS INFIRMARY COMPETITION.

THE Guardians of the poor of St. Pancras have pur-
chased, for 4,200*l.*, four acres of land, situated at Highgate,
near the Small Fox Hospital and the Cemetery, for
the purpose of building an infirmary for the poor of the
parish distinct from the workhouse, in accordance with
the provisions of the Metropolitan Poor Act, 1867. The
competition for designs for the building, we are told, is
limited to a number of architects who have been accu-
tomed to design buildings of a similar class. For the
three best designs the Guardians offer premiums of 150*l.*,
100*l.*, and 50*l.* The successful competitor, if required, is
to carry out the works for the payment of 300*l.* less the
amount of premium; and this is to include all travelling
expenses and attendances, and the supply of all plans,
drawings, &c., that may be required, but he is not to be

entitled to any premium or payment unless a substantial
contractor will undertake the work at a price not being
more than ten per cent. above the estimate accompanying
the design. Every part of the building is to be of the
plainest design consistent with the same being thoroughly
substantial and suitable for the purpose required, and no
money is to be expended in ornamental work of any kind.
Accommodation is to be provided for 500 patients, and the
buildings are to be so arranged as to be easily capable of
extension at a future period. The Guardians proposed
that from 1,000 to 1,200 cubic feet of space should be
allowed to each patient, but the Poor Law Board con-
sidered 800 "quite sufficient." The building is to be
rendered fireproof as far as possible, and facilities for
the escape of inmates in the event of fire considered.

FLOATING BASIN AT BREST.

FOR several years past the floating basin of the port
of Brest, constructed in the sixteenth centu-
ry, has been wholly inadequate to the require-
ments of a station of such strategic and military
importance. On the proposition of M. Duprey
de Lôme, director of the *matériel* of the Imperial
Marine, the minister of marine ordered, in 1863,
studies to be made, and the works of enlarge-
ment were subsequently undertaken. But, the
contractor not having been able, even after six-
teen months of persevering efforts, to render the
dam water-tight,—the fundamental basis of the
constructions,—was obliged to abandon the en-
terprise.

After new studies, M. Collignon, inspector-
general of maritime works, suggested the use of
compressed air, as at Kehl Bridge and else-
where, and that course was decided upon. The
project adopted was that of M. Castor, who had
already a practical acquaintance with the system.
He proposed to form a dam by means of an im-
mense iron caisson, and to make it descend
5*l.* 6 in. below the highest tide-level. The
author of this project was entrusted with the
execution of the works, which were commenced
in February, 1867.

The caisson has a capacity of 3,174 cubic
yards. Forty workmen, relieving each other
every four hours, work day and night in the
compressed air extracting the enormous quantity
of stuff to be excavated (rock, wood, and stones),
of which more than 392 cubic yards have been
taken out. The total number of men employed
is 150.

The weight of the caisson, of its materials,
plant, machinery, &c., amounts to 3,000 tons. A
thirty-horse power engine sets in motion a
blowing-engine, which maintains the air at a
constant pressure, and continually renews the
air vitiated by forty men at work. At present
the caisson has arrived without accident at a
depth of 20 ft. 4 in. below the zero of the mareo-
metric gauge; and there is every reason to
expect that this difficult undertaking will be
brought to a successful close before the end of
the present February.

PROVINCIAL NEWS.

Doncaster.—The Doncaster Market Committee
have opened the tenders sent in for the exten-
sion and improvement of the markets. They
were in two sets, viz., for builders' and con-
tractors' work, and for smiths' and ironfounders'
work. The first were required for constructing,
erecting, and completely finishing three new
slaughter-houses, pens, and boundary-walls in
connexion therewith; and for laying out a new
cattle-market adjoining the slaughter-houses,
constructing the roads, laying pen-floors for
about 5,000 sheep with asphalt, and for 750 pigs,
with paving bricks; for making and pitching
the pen-floors for about 120 fat beasts with ran-
dom Mount Sorrel pavours, for forming the
various drains, erecting sheds and boundary
walls, and for providing the stone kerbs and
plinths, and letting in the ironwork of the pens,
&c." The second set of tenders were required
"for the cast and wrought iron work necessary
for constructing and erecting pens for about
5,000 sheep, 750 pigs, and 120 fat beasts." Be-
tween the highest and lowest tenders for the
builders' and contractors' work there was a
difference of 1,068*l.*, that sent in by Mr. W.
Huddleston, of Lincoln, being the lowest,—
4,298*l.*; while Messrs. Pattisons, of Ruskington,
was the highest,—5,366*l.* The tender of Messrs.
Kirk & Parry, of Steaford, was 4,872*l.* For the
ironwork the lowest and highest tenders were,
York Railway Plant Company, 1,020*l.*; and
Messrs. J. Clift & Co., Bradford, 2,050*l.*—a
difference of 1,030*l.* Messrs. Robey & Co., and
Messrs. Kirk & Parry sent in tenders,—the for-

mer offering to do the work for 1,625*l.*, and the latter for 1,542*l.* The committee have recommended that the tenders of Mr. Huddleston and the York Railway Plant Company be accepted.

Salisbury.—The committee appointed to take the preliminary steps for the enlargement of the Salisbury Infirmary report that subscriptions to the amount of nearly 5,000*l.* have already been received. The total amount required is estimated at about 10,000*l.*

Keyham.—The new north basin at Keyham yard has been opened, the operation of floating the caisson into its position on the western boundary having been successfully performed in the presence of the admiral superintendent and officers of the Devonport and Keyham yards. The basin is 900 ft. long, 400 ft. broad, and at the opening the water was 32 ft. deep in it.

Yarmouth (Isle of Wight).—We are informed that another new town, similar to that of Bouldnor, is proposed to be carried out in the watering-place known as Totland Bay. A number of workmen are already engaged for the erection of brick-kilns, in order to commence operations.

North.—The subject of widening Neath Bridge over the river has been discussed in the Town Council. The Mayor explained the original plan, which was accompanied by sections and specifications, showing how a footpath 5 ft. wide on each side of the bridge could be thrown out upon brackets. The plan received the unanimous consent of the Council. The county magistrates have agreed to give 350*l.* towards the expense, and other contributions are expected.

THE CO-OPERATIVE MOVEMENT.

The attempt of shopkeepers of different classes, such as butchers, grocers, &c., to combine in trades unions, for the purpose of plundering the public to an unconscionable extent, is recoiling with a vengeance on their own heads, by the spread of the co-operative principle on the part of consumers. The shopkeepers now threaten to combine against wholesale dealers who shall continue to supply the co-operative stores, but they will only thus hasten their own downfall; because it is evident that co-operation can support a wholesale trade no less than a retail; and, indeed, as their customers are not credit but cash ones, they are in a much better position to do so than the usual wholesale houses themselves. There are far too many shopkeepers in London. They are destined to be greatly thinned in number, and all but a remainder will find it necessary to turn to industrial pursuits of a more productive kind than merely standing behind counters, and handing over goods from the producer to the consumer, after appropriating a lion's share to themselves for doing so. A movement which necessitates a return from credit to cash cannot but be a wholesome one, whatever may become of the credit givers.

The London lawyers are in for the movement. They have started "The Legal Co-operative Supply Association," whose stores are in the Euston-road. The London clerks have not only started their own restaurant, but a "Clerks' Supply Association," under the management of clerks connected with some of the most respectable firms, but not restricted to clerks; and they have made a contract with the London Parcels Delivery Company for the delivery of goods at reduced rates. The Civil Service Co-operative Society have found their premises in Alban-place, a little back street near her Majesty's Theatre, already too small, and have just taken larger premises in the Haymarket, and opened a store there. All day long the place is crowded with purchasers, and outside there is quite a string of carriages, whence it will be inferred that even the upper classes are not insensible to the advantages of household economy, and peevishness have been seen there making out their own invoices, and taking away their own parcels. Another similar association opens its doors wider, and admits any one who is introduced by a civil servant. The society has its store—a very large one—in Monkwell-street, but it is not necessary to deal at the store; arrangements have been made with tradesmen in various parts of London to supply members of the association at reduced prices. This contract answers the tradesmen's purpose, because they are thereby secured a large number of additional customers who pay cash, and with whom, therefore, there is no risk.

The *Globe* newspaper has some remarks on

this movement, from which we may quote a passage—

"The high prices of London tradesmen have caused the co-operative system to prosper immensely, and we are informed that a single store is doing a business exceeding 400*l.* a-day, which is rapidly increasing. At these stores the customer has not the numerous conveniences offered by the private tradesman; there is no calling for orders; he must make up his own bill and take away his own parcel. Yet, with all this, the advantages offered are so great that they draw away sufficient custom from the retail tradesmen to give them serious alarm. There are too many retail tradesmen. The number of shopkeepers, as Mr. Mill has shown, is everywhere in too high a ratio to the number of producers. And the general collapse in credit begins to make this felt. The eddy that began in the City, the centre of commerce, is extending throughout the nation. There has been too much credit; there is now too little for the public convenience. Cash is wanted everywhere: when men have to pay cash, they begin to think seriously about prices. Hence, retail trade, like the great speculative enterprises, is in a state of transition. Co-operation is its most formidable rival. It is easy to anticipate the time when co-operative stores and a much smaller number of first-class tradesmen will occupy the whole field. The disappearance of a great number of petty shopkeepers will be no great loss, except to themselves. And they will have no more right to complain than had the wigmakers when people took to wearing their own hair. The first-class tradesmen will maintain their stand. An opulent aristocracy will always pay for easy service; and the *jeunesse dorée* will always require credit, and will always be willing to pay for it. All these things are inevitable. Still, the present movement, by which cash payment is likely to supersede credit, in the vast majority of cases, is undoubtedly a healthy one for society. Those shopkeepers are most likely to retain their position who adapt themselves to it in time, and are content with moderate profits when customers pay ready money."

We observe shops with large bills in the windows offering goods at co-operative prices. The public should of course be on their guard against imposition in such cases; but still there are instances in which shopkeepers do give goods to members of co-operative associations at reduced prices, on a previous understanding with them; and some shopkeepers may desire to give the general and cash-paying public also, as well as themselves, the benefit of such an arrangement, by competing against other shopkeepers, instead of combining with them against the public.

The check to adulteration of all sorts is not the least of the benefits likely to be conferred on the public by the co-operative movement.

CHURCH-BUILDING NEWS.

Frampton (near Dorchester).—A new reredos has lately been placed in Frampton Church. The design comprises the feature of three rich gables, carved in Caen stone, over the altar, the central one being a little the highest, flanked by an ornamental arcade on each side. Under the latter is an inlaid diaper, formed of bands of white alabaster, incised with black lines and green marble eyes, the ground being a brown mottled alabaster. The portion of the reredos over the altar is lined with Maltese alabaster from Gozo, the central panel having a fioriated cross, composed principally of a rich creamy yellow marble, also from Malta, closely resembling gold in colour. The shafts and spandrels of the arcade on each side of the altar are composed of marbles of various tints. The greater part of the inlaid marble and alabaster work was selected by Mr. R. B. Sheridan, M.P., of Frampton Court, when on a recent visit to Malta, and was prepared there. Mr. Earp, of London, carved the ornamental Caen stone-work, and also the arcade and marble diaper-work underneath it, and fixed the reredos in its position. The design was prepared by Mr. Ferrey, architect. The reredos is intended as a memorial of a relative of Mr. Sheridan, who has borne the entire expense.

Tawstock (Devon).—The Church of St. Peter's, Tawstock, has been restored under the direction of Prof. G. G. Scott, architect, at a total cost of 1,800*l.* The expense of the chancel has been defrayed by the rector, the Rev. H. B. Wrey, who has placed stained glass in all the windows, in memory of deceased members of his family. The ancient fourteenth-century roofs have been repaired and freed from the plaster by which they were hidden. The nave and aisles have been re-seated with open benches of wainscot, and a vaulted oak ceiling fixed in the tower. Many curious mural paintings have been discovered, representing Scriptural subjects and ecclesiastics. One, supposed to represent Baalam and the Ass, was overlaid with an inscription recording the names of seven persons who died 1573. The church is noted for its monuments erected by the Bouchiers, Earls of Bath. The holy of the ancient oak pulpit was discovered, and has been refixed. The transept roofs yet remain unfinished. The contractors were Messrs. Dendle

& Pulsford, of Barnstaple; Mrs. Beer, of Exeter supplied the stained glass, and Messrs. Peard Jackson the artistic metal-work. Mr. The Leigh, of London, was the clerk of the works.

Wells.—The effects of high wind on the 18th of January are plainly apparent in the west front of the cathedral. The two niches in the upper part of the north-west tower are almost entirely deprived of their sculptured canopies. This was not wholly the work of the tempest. Several large fragments having fallen, and other portions appearing to have been loosened, the dean and canon in residence deemed it necessary to order a considerable space of ground to be enclosed, whilst a man descended from the top of the tower, by means of a rope, to examine the state of the stonework, and to remove any particles to be dislodged. The statue of Bishop Bulwih is in a sad state of decay.

Lynn.—The new spire of St. Nicholas Church, Lynn, has recently been completed. Some year back, it was considered desirable to take down the old spire on account of its dangerous state, and for many years the old tower was without a spire. A committee was formed, and a subscription obtained, to erect a new spire. Mr. C. G. Scott, designed the spire, to be erected similar to the new lantern tower of Ely Cathedral, with oak framing covered with stout lead. The builders of the Ely lantern tower, Messrs. Freeman, were also employed to erect this spire in height 200 ft. from the ground-line.

Acot.—The late Mr. William Rogers, of Shorliff Court, had for a considerable time been labouring to obtain the erection of a new parish church, on land which he had purchased, and intended to present for the purpose. The preparation of the plans and designs were entrusted to Mr. W. L. Sear, of Margate. His design consisted of a building, a portion of which only it is proposed to erect at present, which will be sufficient to accommodate 300 persons, but to which when funds will allow, it is proposed to add a second portion, entirely in keeping with the original design, in which other 300 persons can be seated. There will be a bell-tower at the north-west angle, and a spire rising to the height of 100 ft. The design of the building is in the Perpendicular style, and it is proposed to be built of bricks (to be made on the spot), faced with Kentish rag, and covered with slating in ornamental courses. The structure will be extremely plain.

Nidd.—The church of Nidd, built at the expense of Miss Rawson, of Nidd Hall, has been consecrated and opened by the Bishop of Ripon. The present building is on the site of an old church, which had fallen to decay, and the foundation-stone was laid in August, 1866. The architects were Messrs. T. H. & F. Healey, of Bradford, and the contractors Messrs. Favcett of Harrogate. It is built in the Early Decorated Gothic style, with plain simple nave and chancel. The pulpit, lectern, and chancel-fittings are of a less plain character. Open moveable benches of oak form the sittings. The floors are laid with Maw's Staffordshire tiles. The east and west windows are of stained glass. The tower at the west end contains a peal of five bells, by Messrs. Mears & Stainbank, of London. The walls internally are of Burton Leonard limestone. The roof is hoarded, and a tower with a groined ceiling is used as a baptistery, the ancient font being retained. A hot-air heating apparatus by Messrs. Haden, of Trowbridge, is laid down.

Wansford, near Driffield.—A new church has been consecrated here. Sir Tatton Sykes, bart. laid the foundation-stone on the 29th of September, 1866. The site, with the surrounding burial-ground, was presented by Sir Tatton, who also defrays the whole cost of the new church, which was designed by Mr. G. E. Street, of London, and occupies the site of a demolished chantry-chapel, founded by Elias de Wansford early in the fourteenth century, and of which only the font remains. The old chapel was dedicated to the Virgin, as is the new church. By the liberality of Sir Tatton large schools have been built in the village likewise.

Eastbourne.—The chancel-stone of St. John's Meads, has been laid. The want of a church at Meads (which is a district entirely separate from the Old and New Towns, and situated at the foot of the breezy downs, commanding view of the town, the sea, the hill, and the neighbouring country), has long been felt by all classes; the nearest place of worship being more than a mile off. A subscription was consequently set on foot, headed by members of the Brodie family, and it was contemplated that the sum required to build a church, a residence for the minister

d to establish a small endowment, would be about 6,700l. Of that sum 5,370l. have been allocated, and the erection of the church and organ commenced on a piece of land given by the Duke of Devonshire, the patron of Eastbourne. The architect is Mr. H. E. Rumlh, and the builder, Mr. James Peeres; both residents of Eastbourne. The church is intended to afford accommodation for 450, and the style is Decorated. The edifice will consist of a chancel, nave, tower, spire, and aisles.

Bishop Stortford.—Mr. J. Clarke writes that he is preparing the plans and reporting on the proposed works here for the restoration of the parish church.

Hull.—An influential meeting has been held here for the purpose of considering the best means of completing the restoration of the Holy Trinity Church. The meeting was attended by the Archbishop of York, Lord Wenlock, Mr. C. Kes, M.P., Mr. W. H. H. Broadley, high sheriff of Yorkshire, &c. Resolutions were agreed to regarding the meeting to form a fund of 20,000l., for the purpose of restoring this, one of the largest parish churches in the kingdom, and which is now in a very dilapidated condition.

Books Received.

Wholesome Fare; or, The Doctor and the Cook: a Manual of the Laws of Food and the Practice of Cookery. By EDMUND S. and ELLEN J. DELAFORE. London: Lockwood & Co. 1868.

NOTWITHSTANDING the abundance of cookery books, the waste of food from bad cookery does not seem to diminish. This is a subject of great importance to the poor, but, unfortunately for them, the cookery books are generally prepared for another class of persons. It is not amongst the poorer classes alone, however, that there is bad cooking; and were the middle classes better instructed, good cookery might soon descend to the lower orders. The work under notice is intended for the middle classes, and it is not a mere collection of receipts for dishes, but an enlightened treatise on hygiene as well as cookery. The more immediate object of the work, according to the authors,—

"is to show that the real essentials of a good dinner,—a few good dishes,—may be had by those who have means to will it. . . . Other points which we have been anxious to insist on are the hygienic effects of cookery, and the relative value of the different kinds of food. . . . The class whom we address are above the prejudices entertained by the labouring population of England and Scotland, if not of Scotland, who will only cut what they eat and what they are used to. . . . Our readers will not be offended at being reminded why some articles do not eat good, others indifferent, and others bad,—that popular belief may be sometimes mistaken in the nutritive and it attributes to certain articles,—that jellies and root-rot pap are not nourishing, while prase soup and stinging, head-four, out-of-the-way, and dried harricots, made into a stew decidedly are. Besides the passages relating to what may be fairly called the philosophy of cookery, it is hoped that useful suggestions will be found in the pages devoted to the sick, the sedentary, and the invalid."

As a specimen of the style of the work, we may transfer two or three of the passages marked by us for use in this notice. In treating of the two essential principles of food, aliments and combustion and aliments of nutrition, the authors remind us that,—

"The fat of living animals is a stock of combustibles, stored away by the blood against a rainy day. Fat in the circulation's savings bank. There it puts aside its little perquisites, knowing well where to find them in case of need. Witness the fat pig mentioned by Lucretius, which, covered by a heap of fallen ruins, was found alive and well three days afterwards. As a matter of course, he was fat longer; but, even had the length of the feast been less, the blood is able to find in the fat. For the pig had not certainly continued to breathe from the first to the end of those 180 days. His fire of hydrogen and carbon never went out for a minute, and a lucky thing it was that the pig that he had put something by in his time of plenty. The principal sufferer was the owner of the pig, who reckoned on the luxury of rasher and ham. On this occasion pigs literally ate his own bacon. . . . But all that we eat is not burnt to keep us warm; it would the continual wear and tear of our organs? Our food, therefore, may be divided into two distinct kinds: the kind intended to be burnt within us, which may be called *aliments of combustion*; the other destined to nourish the body, which may be called *aliments of nutrition*. The flour of wheat, of which bread is made, contains both these elements."

There is no need to be over-anxious about the bodily health of the man who has plenty of good bread to eat, who has sufficient starch to keep himself warm, and salt to enable him to sustain his strength. It is only his palate that will be inclined to grumble.

When the distinction which has been thus fully explained between aliments of combustion and aliments of nutrition is never to be forgotten by the home-physician, the nurse, the doctor, and the house-keeper. It should guide

every individual's bill of fare. For what can he clearer need of additional material to build up their frame than the adult or the aged, to whom the same supply of growth-making material is not only superfluous, but positively adverse? That amongst adults the hard working man, the sportsman, the traveller, have greater need of repairs than the gentleman who leisurely sits at home at ease? That even sedentary persons make different expenditures of exertion, which require to be replaced accordingly? The statesman who composes a novel, or the customer who writes a book, the business man who manages a concern, draw more freely on their strength and nervous energy than the lounging who skims the daily papers, the reader who whiles away an hour with a novel, or the customer who purchases an article at a shop.

The distinction is likewise of great importance both to persons who are Too Fat, and to those who are Too Lean. The former have had their ailments attended to by medical writers, both in England and France. The latter, if enjoying tolerable health in spite of their leanness, will be wise to let well alone, consulting themselves with the sportsing proverb, "A lean dog for a long heat." If they feel unwell and weak, let them consult some respectable, properly-educated physician, and beware of the arts of unscrupulous advertising practitioners.

For some time past it has been a well known fact that dry bread and pure spring water constitute a diet whose fattening effects had either been ignored or remained unknown. The grog fed, who are advised to drink water and fermented beverages, and to eat abundance of farinaceous and starchy food. To grow thin, drink very little, confining that little to unwatered wine, coffee, and tea, and abstain from all aliments containing starch.

Literary and other sedentary persons cannot too often be reminded of some wholesome truths as regards regimen and other subjects relating to their special habits.

"Animal fibre becomes hardened by exercise. The whole bodily man, as he grows older, harder, and old age is a general conversion into horn. With workmen, the cooking members are incriminated; with literary persons, it is the brain that works; and often do they become incapable of connecting their ideas, and grow old before their time. In children the brain is still too soft; in old people, it has grown too hard; and either excess is an equal hindrance to the complete exercise of its proper functions. The memory, the first to give the signs of failing, presages the weakness of the other faculties."

Over-activity of mind and inaction of body are the principal causes of disorder with literary persons; but they are not the only ones. The student's very attitude cannot be otherwise than injurious to health. The folding and compression which the vessels suffer, in a sitting posture, at the upper part of the thigh and beneath the knee, impede the circulation in the lower members, one of the consequences of which is cold feet and legs. The action of the body affects the abdominal viscera, and is an additional cause of indigestion; the stomach is doubly a sufferer. Hence, not a few literary men have wisely performed their work in an erect position, by means of a desk which they can stand and write. A standing-desk is useful to have in one's study, if only for the purpose of varying the disposition of the limbs during a spell of work.

Night-work may be regarded as a fourth exciting cause of madness in learned folk. A man who has been working during the day, toils much too hard if he continues to work during a part of the night. The time allowed for sleep is unduly shortened, and an instrument to repair the previous wear and tear. Moreover, the sleep which follows long-continued exertion is never calm and tranquil. It does not produce the effect it ought, because the brain continues in a state of excitement. It is found impossible to break the thread of thought; the over-early labourer cannot sleep, or if he do, it is a state of half-sleep and half-awake, during the course of which restless ideas increase fatigue without rendering any service. The ancients were well aware of the danger. Aminus Pollio, consul and orator, who was the first in Rome to collect a library, was so conscious of the risk of evening studies, that he would never read his letters after the tenth hour; that is, two hours before sunset.

Of all the functions, when once disordered, sleep is the most difficult to re-establish. We lose it gaily, we lament it bitterly, and almost always uselessly."

"Literary persons should pay attention both to the selection of their food, and to its quantity. Errors in either respect produce bad consequences; but, of the two, it is better to make an injudicious choice than to exceed a due allowance as to quantity."

Improper aliments are,—all fat and greasy things, which further relax the fibres of the stomach, deaden the action of the saliva and the gastric juice, and occasion heaviness in the stomach, in consequence of the slowness with which they are digested.

All viscous, pasty, glutinous things act nearly in the same way as greasy things. Amongst these are included fried things, pancakes, fritters, creams, the feet of animals, &c., certain fish,—as eels, skate, cuttle-fish, &c.

All meats which are either hard naturally, or are hardened by salting and smoking, on which a weak digestion acts too slowly,—rest a long time in the stomach, and irritate it by their weight and their acrid qualities. Pork, sucking-pig, ducks and geese, are not usually aliments adapted to the digestive powers of sedentary, convalescent, or literary persons.

Their most proper aliment consists of,—the young and tender meats of the animals which are usually sent to table; scaly fish, whose flesh is firm and delicate, whether from the sea, the river, or the lake; the cereal grains, such as the different varieties of wheat, rye, barley, oats, and rice; those vegetables which are neither too saline nor too acid; most of the common garden-roots, which, besides their farinaceous elements, contain a proportion of sugar and flavoured matters, whose effects are very beneficial; bread, with its common basis of the food of every civilized nation; eggs, milk, well-ripened fruits.

Meat should be eaten either roasted or cooked in a very small quantity of water, when boiled in a large quantity of fluid, many of its nutritious particles go into the broth. Tender beef, good veal, mutton fed in dry pastures, chicken, capons (when not too fat), the guinea-fowl, young partridges, and leverets, are the proper meats for delicate persons, and which, perhaps, they would do right in confining themselves. Fish is never more wholesome than when it is boiled.

In the choice of food, precautions have to be taken which cannot be laid down in general rules, but which everybody ought to discover for himself, by observing what things

suit and what disagree with him. Some people digest meat more easily than vegetables, which cause a disagreeable sensation at the pit of their stomach; whilst others find them lighter than meat, being less liable to cause sleepiness and feverish symptoms. Some literary persons feel easily after eating bread, so that they are obliged to restrict themselves to a very small quantity. Milk does not suit everybody, and eggs disagree with many people, without its being possible to assign a reason. In short, in respect to food, it is absolutely necessary to consult each individual stomach.

Men of letters (which includes women of letters), like Augustus Cesar and all other delicate persons, cannot bear severe cold, nor great heats, which try them sorely, because it is more difficult to protect one's self against them than against cold. Milton, in summer used to fall into a state of prostration which bordered on intellectual dulness. Less illustrious instances are far from rare."

On the whole this is a much superior "cook-book," as the authors have it, than the general run of what one is wont to see, whether new or old.

Practical Plane and Solid Geometry, especially adapted for Science Classes. By WASHINGTON HUDSON, Government Science Teacher. London: Whittaker & Co. 1868.

SEVERAL works on geometry have been published lately (some of them noticed in our pages), and we are very glad of it; it is a good sign. Mr. Hudson's intention, in issuing the quarto of thirty-five pages of letter-press, and sixteen pages of plates, now before us, was to supply what, as a Government science teacher, he has always felt, the want of a cheap book upon geometrical drawing, which would combine all branches of geometry, and be couched in the simplest phraseology. This want he seems to have supplied. The book unites plane and solid geometry, with perspective projections, and may be bought for its workmen in many branches of trade would find the study of it of great assistance to them.

VARIORUM.

"TELEGRAPHIC Communication with India." By Francis Gishmore. Stanford, Charing-cross. In this pamphlet a short account is given of lines at present available for Indian messages, and an explanation of the arrangements lately entered into with the Governments of Prussia, Russia, and Persia, for carrying out a new line through these countries, to be exclusively devoted to the transmission of Anglo-Indian and other Indo-European messages. The working of this line has been entrusted to Messrs. Siemens & Halske, of London, Berlin, and St. Petersburg, electrical engineers and contractors, who propose to delegate the office to an English company. The proposal is to construct a two-wire line from London to Teheran in Persia, where the lines of the Indian Government to India commence. The line will run from London, via Hamburg, Warsaw, Odessa, and the Black Sea, to Tiflis and Teheran.—"The Transference of the Telegraphs to the State." By John Stephen, electrician. London: Longmans & Co. In this pamphlet a sort of gossipy advocacy of the proposed transfer of the telegraph lines to Government is given.—"Hints to Certifying Surgeons under the Factory Acts." By George Greaves, consulting surgeon, Chorlton Union Hospital, &c. Knight & Co., Fleet-street. The chief object of this tractate is to aid certifying surgeons in respect to the physical signs of age in the young, and especially on the dental tokens, so as to meet the requirements of the law. It also treats of indications of contagious disease, delicacy or deficiency of health, accidents, &c.

Miscellaneous.

THE ANCIENT CHURCHES OF THEFTORD.—An archaeological fact has just come to light in the identification of the architectural remains of the crypt of a church, forming the wine-vaults of a dwelling-house situated near the Market-place, Theftord, as the ruins of St. Laurence church, one of the many that formerly ornamented this ancient town. The roof of the portion which remains is scarcely above the level of the present street of Theftord, but the freestone columns, &c., are still in a good state of preservation. This completes the local knowledge of the sites of the churches of St. Mary the Great, St. John's, St. Nicholas, St. Ethelred or St. Audry's, St. Giles's, St. Andrew's, Trinity Church, St. Mary Magdalen, St. Helen's, St. John's, and St. Augustine's. Those remaining to be traced are the sites of St. George's, St. Benet's, St. Edmund's, St. John's, and St. Margaret's.

DURHAM UNION WORKHOUSE.—"Fairplay" has sent us a reply to the letter in our issue of February 8th, signed "William Fox," but no public advantage would result from its publication.

THE THREE S'S.—Every one knows of the three R's in the educational question, Reading, 'Riting, and 'Rithmetic. We are now to have three S's in the railway question,—“ Signals, Safety, and Sivilty,” at least, so said a learned director at a dinner t'other day.

VALUE OF SEWAGE MATTER.—The sewage of Mansfield has been for years applied to upwards of 900 acres of pastures belonging to the Duke of Portland. Since the irrigation was commenced the duke has saved 1,400*l.* per annum, formerly expended on bone manure, and the water flowing from the meadows is returned clear and pellucid into the river Maun.—*Nottingham Journal.*

CHESTER TOWN HALL.—At a meeting of the Corporation, held on Wednesday, a resolution was passed that the tower, which forms the most ornamental part of the design for the new town-hall at Chester, should be built. The Corporation had it in their contract with the present builder to have it built for the sum of 1,980*l.*, and the building will be at once commenced.

BOILER EXPLOSIONS.—The report of the chief engineer to the National Boiler Insurance Company has been issued. There was only one case of explosion in boilers insured by the company, but the reporter records the occurrence of 49 explosions during 1867, against 74 in 1866. The cases, however, have been of a more fatal character in 1867 than in 1866. No less than 58 persons were killed and 81 seriously injured. The explosion of the insured boiler is said to be the only occurrence of the kind in the experience of the company. We observe just now from the newspapers that a locomotive boiler has exploded near Bolton, severely injuring the driver; and a dyework boiler or pan has exploded at dyeworks near Bacup, killing one man and injuring another, besides damaging the dyeworks to the extent of 400*l.*

FALL OF A RAILWAY TUNNEL.—An accident of a serious character, but fortunately unattended by loss of life, has happened on the Knighton and Central Wales branch of the London and North-Western railway. This line extends from Craven Arms to Llenydyd, and in a distance of a little over 48 miles passes through three tunnels. For the last two months a gang of men have been engaged at every favorable opportunity in casing with brick the tunnel near Llanynllo station, a costly work undertaken by the company as a means of giving additional strength to the arch. The precaution has been justified by the sudden collapse of a portion of the tunnel at the Knighton end, which had not yet been reached by the workmen. The tunnel is nearly three-quarters of a mile in length, and was constructed about four years ago.

POSITION OF GATESHEAD.—The local *Observer* says,—“We would that it could be our duty to defend our borough from the attacks of contemporaries; but when truth shines upon truth contradiction is not advisable. The *Builder* of Saturday contains an article in reference to our borough. The allusions are, we say it with respect, painfully true. Perhaps if there is one slight error, it is concerning the townhall. Our contemporaries will be pleased to note, as well as ourselves, that that question is now settled; designs have been approved of, and a tender for erection accepted. This of course was not known until the 6th inst., and in all probability the *Builder's* article would be written previously. Unpleasant and uncheerful as the picture may be, we feel it is our duty to give it *in extenso*,” and thers it is given. Elsewhere we find, in comments on the same article,—“However gloomy the writer of the article in the *Builder* may have pictured our borough, we can at least hope for better things. New, young, and vigorous men are now pushing their way in the council chamber, men who do not adhere to the old ways of transacting business, and do not approve of the see-saw committee to committees work; but men who will, I hope, act as stimulants to the older members, and stir them to do all they can to amend their ways. The poet remarks that ‘discretion is the better part of valour,’ but the discretion of our town councillors has been so unsatisfactory for some time, that a little valour at the present moment would not be an improper proceeding.”

TRADE UNIONS AND MR. GLADSTONE.—The conference, of which much has been said, took place at Mr. Gladstone's residence, Carlton-gardens, on Tuesday morning last, according to arrangement.

SANITARY MATTERS AT OSSETT.—Some ill-considered and unwise opposition to the introduction of the Local Government Act at Ossett is being made, but it is to be hoped will not be successful. The *Ossett Observer* combats their statements with much spirit and intelligence.

THE BALCONIES OF THE TRAVELLERS' CLUBHOUSE.—We are glad to hear that in consequence of the representations that have been made to them, the committee of the Travellers' Club have determined to restore the balconies of the south front of their club-house to their original condition, as designed by the late Sir Charles Barry. The work of reconstruction will be deferred till the autumn to avoid inconvenience to members of the club.

STRIKE AGAINST FOREIGN OPERATIVES.—A large proportion of the workmen engaged at the extensive spliter works Messrs. Vivian, Swansea, have struck, owing to various alleged grievances that the native workmen complain of in several respects. It appears that Mr. Disme, a German gentleman, is at the head of one department, and, owing to certain reasons of his own, he has recently engaged some twenty or thirty of his countrymen, who have been introduced to the works. This gave great umbrage to the English, Welsh, and Irish operatives, who aver that the foreigners, although paid a higher rate of wages than the natives, are inferior to them in physical and other respects.

THE HERTFORD BUILDING COMPANY.—The annual meeting of the shareholders of this association for the improvement of the dwellings of the poorer classes has been held. The mayor presided. Among those present were Mr. R. Dimsdale, M.P., Baron Dimsdale, and various other influential gentlemen. The report, which was adopted, showed that the past year's proceedings were satisfactory, and that a dividend of 4 per cent. was available. The paid-up capital of the company was all exhausted, and they possess at the present time twenty-six tenements and a lodging-house. They propose to dispose of them on a benefit building society scheme to working-class tenants, payable in rent for a given number of years. The financial affairs are said to be in a healthy condition.

LONDON AND MIDDLESEX ARCHEOLOGICAL SOCIETY.—An evening meeting of this society was held last week at its rooms, 22, Hart-street, Bloomsbury, Mr. Henry Campkin, F.S.A., in the chair. Mr. T. Milbourn, Hon. Secretary, read a paper “On the Church of St. Mary, Somerset, Upper Thames-street” (about to be pulled down). He said it was dedicated to the Virgin with the additional epithet of Somerset from its proximity to a port or haven in olden time called Sumer's Hot or Hibe, resembling that of Queenhithe. It is of early foundation. After the Great Fire the church was rebuilt and finished in 1695 on the designs of Sir Christopher Wren. Mr. W. H. Hart, F.S.A., exhibited and described four MS. Books of Hours of the Virgin in good preservation. Mr. T. Gunstan exhibited Roman antiquities from Tokenhouse-yard, and Mr. J. E. Price examples of ancient pottery from Old Ford. Fragments of Samian ware, lately discovered in Fenchurch-street, were contributed by Mr. Ivatts.

YORKSHIRE ARCHITECTURAL SOCIETY.—The annual meeting took place in the York School of Art, when the Rev. Canon Hey occupied the chair. The Rev. G. Rowe (secretary) read the annual report, and the Rev. T. Bayly stated that the balance last year in favour of the society was 98*l.* 5*s.* 1*d.*, whilst this year, with 160 members, who brought in an annual income of 80*l.*, the balance in their favour had increased to 128*l.* 2*s.* 1*d.* If they ever became a society having the object of making grants, he said they should possess at least five times as many members as at present, whilst its income should be at least 300*l.* a year. The Rev. G. Rowe moved that local secretaries be appointed for the districts of Leeds, Doncaster, and Sheffield, and that the secretaries of these places respectively should be the Rev. Mr. Gott, of Bramley, the Rev. G. H. Phillips, and Mr. Joseph Fawcett. The resolution was carried. It was explained that the general meetings would be held alternately at each of the above places.

THE LATE SIR DAVID BREWSTER.—The name of this eminent philosopher have been laid Melrose Ahey. He was born in the Canonry of Jedburgh, on the 11th December, 1781. His father was teacher of the local Grammar School which at that time was held in the Lady Chapel of Jedburgh Ahey. It was in this place that James Thomson, the author of “The Seasons” received part of his education.

FIRE AT THE CHARING-CROSS RAILWAY STATION.—The roof extending over the entire length of the station has sustained considerable damage from fire, originating about the clearing-ho. Strangely enough, a second accident has occurred at the station, an explosion of gas having taken place in the eastern lodge of entrance-gates of the terminus. It seems that a lad went down into the basement of the lodge to turn on the gas. It is presumed that he had a light, and, as the gas had been escaping, explosion resulted, and the lad is seriously injured. An examination of the lodge disclosed that the interior was completely torn up.

DINNER AT THE CITY TERMINUS HOTEL, CROWN-STREET.—On Wednesday evening about 100 surveyors, including a few barristers, dined together in the great hall of this hotel. Mr. J. Lloyd presided; and the vice-chairs were occupied by Mr. Clark, Mr. Horsey, Mr. Ryde, Mr. Buckland, Mr. P. Vigers, Mr. Watney, and Mr. Lee. Among the general company were Mr. Garth, Q.C., M.P., Mr. Keane, Q.C., Serjeant Parry and Robinson, Mr. J. A. Russell, Q.C., Mr. John Clutton, Mr. H. A. Hunt, and the majority of the leading London surveyors. Among the principal toasts were “The Surveyors of England coupled with the name of Mr. Clutton,” and “Our Committee and Mr. Ryde.” A glee party was attended.

SINGULAR SUBSIDENCE OF AN HOTEL.—An extraordinary casualty is taking place at Desenzano, in the province of Brescia, in Italy. The Hotel de Porta-Vecchia, built upon piles on the shore of the Lake of Garda, is gradually sinking at the rate of about 6 in. a day; the ground floor has already disappeared. This immersion is taking place imperceptibly, and without a shock. Every means of preventing it have been employed, but without avail. The proprietor of the hotel, who was at first in despair at the misfortune, at length determined to charge a fee for admission to the house, and has already received a sum of money which will go far to compensate him for his loss. A scientific commission is about to visit the spot to open an inquiry.

TENDERS.

For alterations and additions at the parish school Lower Norwood, Surrey, for the Board of Guardians of the parish of St. Mary, Lambeth, built upon piles on the chert. The quantities were taken out by Mr. Gould-wardle & Baker

TO PLUMBERS, BUILDERS, &c. WANTED, by a respectable Young Man, aged 26 (married), a SITUATION, as thorough good PLUMBER, in all its branches, Gasfitter and plain Zinc-work. No objection to late painting, to fill up his short distance from London not objected to.—Address, G. T. P. 12, Pealand-street, Oxford-street.

WANTED, a permanent SITUATION, as PLUMBER. No objection to fill up time with painting and glazing. Can do plain zinc-work.—Address, P. J. 10, Paradise-terrace, Liverpool-road.

The Builder.

VOL. XXVI.—No. 1308.

Cottage Hospitals.

THE first attempt to establish a cottage hospital was made at Cranley (by some spell Cranleigh) in 1859, and we lost no time in bringing it under the favourable notice of our readers. Since then many others have been established, and in seven years, or in 1866, there were sixteen in full work and no less than sixty-seven in course of establishment. Nevertheless, a great many more are needed throughout the country. It has been calculated, on satisfactory data, that to supply the proper amount of hospital accommodation in rural districts,—setting aside London and the six principal cities,—one bed to every thousand inhabitants is the requisite proportion. Taking Mr. Swete's statistics

as the basis of the calculation, it appears that there are (or were a year or two ago) no less than nine millions of people in Great Britain unprovided with hospital accommodation. To meet this state of things 9,000 more beds are required; and allowing six beds, on an average, to each hospital, there is scope and necessity for 1,500 cottage hospitals, scattered throughout the country, to meet the demand.

The advantages of cottage hospitals in villages and even towns are many. Besides those which affect the patients themselves, of which we will hereafter speak, there are other benefits which ought not to be lost sight of. Country surgeons and physicians are too often obliged to send off their poorer patients to some county hospital where they and their cases are lost sight of either partially or entirely, and valuable experience is thus lost to country surgeons and physicians which they might bring to bear upon any class. It is thus decidedly for the interest of the well-to-do classes in villages and small towns to support any movement for the establishment of a cottage hospital where it may be requisite in their own immediate district. The bringing of patients near the local surgeons and physicians where cottage hospitals are conveniently situated, is an important point too. As regards the patients themselves the advantages are various. It cannot be promotive of cure in many cases where patients are not saddened by isolation from every relative or friend in a town or county hospital, even were their position equally favourable otherwise to their restoration to health; but of this there is good reason to doubt. We find it stated by some authorities that the proportion of deaths in cottage hospitals is no

greater than in the London hospitals, where the most eminent and experienced surgeons of the day are engaged. This itself is much to say, but we are not inclined to accept it as anything like all that can be said in favour of cottage hospitals. Even were no larger proportion of cures effected in them than in London hospitals, a most important question to the poor man remains to be investigated, namely, how long time on an average it will take to cure any given case in a London hospital by comparison with the time requisite for just such a case in a cottage hospital. Of course much depends on stamina, and on other conditions; but something like reliable statistics, we think, might be ascertained on so material and important a point to the poor head of a family. The assertion that as many deaths in proportion occur in cottage hospitals, with some half-dozen patients in each, as in the London hospitals,—for that is what the ostensible recommendation, to which we have alluded, of cottage hospitals by comparison with London hospitals comes to,—we are by no means inclined to rest satisfied with in the face of the following declaration—not as to cases in cottage hospitals certainly, but as to those in cottage and other homes, to which the nearest thing is a cottage hospital. The cases referred to are not such as are casually treated in cottage hospitals neither, nor indeed in London hospitals with certain exceptions: they are cases of child-birth in cottage and other homes on the one hand, and in town maternity hospitals on the other. The difference of mortality in these respectively is enormous, and we cannot think that as between cottage hospitals and town or county hospitals in other cases such a difference can be all at once reduced to *nil*. Sir James Y. Simpson, one of the highest authorities in the kingdom on such a subject as that of which he writes, says, in a letter to the *Times* on "Hospital Reform":—

"In my address to the Public Health Section of the late Social Science Congress at Belfast I stated, as the result of Dr. Leon Le Fort's semi-official investigations, that, out of 934,781 parturient women delivered at their own poor and often very wretched homes, 4,409 died, or 1 in every 212; while out of 888,513 delivered in maternity hospitals, where every kind of professional care and comfort was bestowed upon them, 36,394 died, or 1 in every 24. These statistics apply to hospital practice as compared with dispensary or home practice among the same class of women in the leading cities and medical schools of Europe. To the general law of the excessive mortality of hospital as compared with home practice, London is no exception. I find from the statistics published by Dr. Barnes that out of 4,000 women confined in the four chief maternity hospitals of London, 142 died, or 1 in every 28; while out of 18,383 confined at their own homes as dispensary or out-patients in connexion with the hospitals of St. Thomas and Guy, 83 died, or 1 in every 246."

That something similar must occur in any extensive enough statistical comparison of the general mortality in London hospitals on the one hand, and cottage hospitals on the other, we have no doubt.

Considering the good they do, cottage hospitals are most economical and easily supported establishments. In an account of them by Dr. Andrew Wynter, in *Good Words*, for May, 1866, he gives the following statement of the receipts and expenditure at the Cranley Cottage Hospital during four years, from 1859 to 1863, for 100 patients:—

Receipts.	
Donations and subscriptions	£342 5 5
From patients	131 4 6
	£473 9 11
Expenditure.	
For patients, salaries, wine, beer, &c. ..	£411 5 5
Insurance, printing, &c.	34 17 5
Repairs and improvements	73 11 4
Furniture	82 11 4
	£612 12 6

If we divide the total expenditure by four, we find that the annual cost, including furniture and repairs, was but little more than 150*l.* per annum; and, indeed, that the cost of the patients but little exceeded 100*l.* for the treatment of twenty-five patients, or 5*l.* as the total cost of each case. This cost is not all paid by subscription or donation: on the contrary, the hospitals

are made as far as possible self-supporting, after they are once established, by weekly payments from the patients or their friends, who, under careful supervision, are also allowed to provide food, &c. In this case the sum contributed on the part of the patients themselves was 131*l.*,—an example of independence to our London artisans and others of the poorer classes.

There should be a cottage hospital in every village, ten miles distant from a town or county hospital.

With regard to the expense of fitting up an hospital for six beds, Mr. Napper, whose experience in the matter, at Cranley, gives great weight to his opinion, places the cost at 70*l.* The cost of fitting up each bed he places at 9*l.* 7*s.* 5*d.* = 56*l.* 7*s.*, leaving about 13*l.* for a kitchen-range, dresser, bath, clock, an easy-chair, table, &c.; but in the estimate no mention is made of crockery, cooking utensils, and some other minor articles. Dr. Waring estimates the cost of furnishing at 80*l.* This sum, added to 20*l.* for repairs, will give a total of 100*l.* With this amount in hand (raised by private donations, sermons, bazaars, or otherwise), any one would be fully justified in at once establishing a cottage hospital of six beds (inclusive of one for the nurse), in any district with 5,000 inhabitants placed beyond ready access to another hospital.

Cottages, of course, can often or generally be had for the purpose ready built, at rents of 12*l.*, as at East Grinstead, where Dr. Rogers presides, to 16*l.*, as at Tewkesbury; but it is not considered advisable to exceed the latter sum except under special circumstances. One great fear which those experienced in the working of cottage hospitals have is, that the system may be elaborated into some costly or ponderous arrangements which would diminish the chances both of the multiplication of such hospitals, and of effecting all the good of which the more primitive and economical system is capable. The subject of fever cases has been considered, but it has been thought better to exclude these, and to rent temporarily a separate cottage for any special occasion of the kind. Memorial cottage hospitals are not a bad idea if the limits be not extended, and the purposes be confined simply to the cure of such cases as those undertaken at present in cottage hospitals.

When the erection of a cottage hospital is contemplated, the best plan is to place the matter in the hands of a respectable local architect, with instructions to conform as nearly as possible to the character of the neighbouring cottages, striving, however, for as much air and light as practicable. The rooms required, according to Dr. Waring,* are,—

"Upstairs: 1, men's ward for three beds; 2, a women's ward for two beds; 3, a small ward, with one bed, for a case requiring separation; 4, a nurse's bed-room; 5, an operating room (lighted from above), to contain the medical and surgical stores; and 6, a bath-room. On the ground-floor: 7, kitchen; 8, scullery; 9, sitting-room; 10, store-room and larder; and 11, water-closet. In addition to these, there should be a small mortuary chamber with a skylight, and sheds or cellars for coal and wood. Such a building, he adds, I am informed by those capable of judging, should cost about 400*l.*; but this would differ according to the price of materials, which varies much in different localities."

The surroundings of cottage hospitals, drainage, &c., ought to be carefully looked to.

A proposal was made last year by Mr. Horace Swete to establish a National Cottage Hospital Association. He considered that such an association would be of value—1, in starting new cottage hospitals; 2, in framing a general scheme of rules for their more effectual operation; 3, in diffusing through their means a sound knowledge of sick nursing and sick cookery; 4, in helping, by a central fund, poorer districts to commence cottage hospitals; 5, in arranging meetings of cottage hospital medical officers annually, for the discussion of matters

* Cottage Hospitals. By E. J. Waring, M.D. Churchill & Sons, 1867.

connected with this class of institutions; 6, in undertaking the arrangement of questions affecting poor law unions, &c.; 7, in publishing a quarterly paper with information as to the progress and working of the system; and 8, in furnishing plans for building, and other such information as might be required.¹

ON THE UTILIZATION OF SEWAGE BY IRRIGATION.

Introductory.

THE records of all countries which, in the history of the world, have arrived at any prominent degree of civilization, bear witness to the important consideration which has ever been bestowed upon the subject of the drainage of cities. A comprehensive digest of these ancient records, such as has yet to be written, would, indeed, form a most valuable addition to what is already known on a subject so full of interest, and concerning which there is such a diversity of opinion. As populations increased, and a certain degree of refinement became a necessity, the rude and primitive habits incident to savage life were cast aside for the systematic purging of great communities of the accumulations of residue and filth which mark the gregarious condition of man. Hence originated that important branch of modern science,—hydraulic engineering.

Much as we are apt to pride ourselves on the development of the infinite resources of our modern civilization, it cannot be doubted that even our most advanced hydraulic works must yield in solid grandeur of design and execution, if not in scientific perfection, to many whose ancient splendour may still be traced through all the ravages of time. When we compare the precarious water-supply of modern London, estimated by Mr. Bazalgette at 5 cubic feet, or 31-25 gallons per head per diem, and by Messrs. Hoffman & Witt at 7 cubic feet, or 43-75 gallons per diem,² with the supply of ancient Rome under the Emperor Nerva, which is recorded in a treatise by his inspector of aqueducts, at 50 cubic feet, or 312 gallons per head per diem, it is difficult to overrate the advantages of the Roman in this respect.

Where, also, the supply of the pure element was so prodigious, there was equal provision for its drainage after being rendered subservient to the uses of man; so that it is not too much to say that in spacious magnificence the *cloaca* or sewers of imperial Rome have never been surpassed. In other countries of antiquity—Greece, Egypt, India, and Assyria, as well as throughout the whole of those nations of Southern Europe assembled under the imperial domination—we have similar instances of the high estimation in which water supply and drainage were held. That which, in a sparse and scattered population, and under the rudest periods of the human intellect, was not deemed, nor was in reality, a nuisance, became, by the concentration of people in cities, with their multiplied wants, a matter which thrusting itself upon the public attention, could no longer remain in harmless obscurity, but loudly called for proper treatment. It is true we have no authentic instance of the application of sewage to the soil on a scale approaching to that upon which it is now proposed to deal with this commodity; nor, perhaps, would there be the need of such a measure under the ancient condition of things; for, when we consider the almost unbounded dilution of sewage, where a daily bath was indulged in by every member of the community, gentle or simple; where the very highest had at his service bathes of such extraordinary magnificence that modern Europe can, by comparison, form no adequate conception of them; when we recollect that water-closets were unknown, and that the more solid and offensive parts of sewage were conveyed and distributed over the land,—it may readily be conceived that the blending of riverine

and drainage waters would not be attended by any such disastrous results as occur in the present age. What was passed into the broad streams upon whose banks all large cities of antiquity were built, mingled with their strong currents, and was swept so rapidly down to the sea that time was not allowed for decomposition.

Moreover, it must not be forgotten that, although the ancients were by no means, as is often erroneously stated, ignorant of the principles of hydraulics and hydrostatics, yet a knowledge of the natural laws of fluids, unaccompanied by the resources of modern invention in mechanical appliances, would in many cases form an insuperable drawback. Had the engineers of ancient Rome commanded the agency of so powerful an auxiliary as the steam-engine, or could they have obtained cast-iron pipes capable of resisting the pressure of a column of water of indefinite height, doubtless they might have solved many a problem which has puzzled later ages, and have dispensed with those stupendous arched aqueducts which are at once the envy and the theme of criticism of their modern successors.

But although the drainage waters of towns may not have been turned to account for agricultural purposes, yet from time immemorial water-irrigation,—its kindred science,—has been practised in all warm countries which have attained any degree of advancement in the tillage of the soil, and it may reasonably be asked why, if pure water alone be beneficial to the land, water containing the undoubted elements essential to the growth of vegetation should not be more so. Before, however, we enter into an inquiry as to the effect of sewage applied to soils, it will not be irrelevant to take a brief view of those causes which in this country have led, we may say so suddenly, to the eminent importance of this subject; from which we may perhaps see that, despite our ingenuity in striving after cleanliness, we have as yet merely succeeded in shifting the locality of the disease, without in any degree eradicating it from the constitution; or as some hold, that in efforts to rid our habitations of their necessary refuse with as little delay as possible, we have converted a transitory sore into a fixed and dangerous ulcer of the gravest kind.

Town Drainage with reference to Water Supply.

That "cleanliness is next to godliness" is a saying for which we have very high and ancient authority, and if we consult the records of religious ordinances from the earliest ages we find that in the performance of sacred rites frequent ablutions form a never-failing ingredient. In Holy Writ we are told that such ablutions were strictly enjoined under grave penalties, and the washing of feet was an invariable act of hospitality towards the wearied traveller. It is true that the climate in some degree necessitated a certain standard of cleanliness, more especially as touching the curse of leprosy; and that the Hebrew of colder countries has not always been distinguished for his impartial observance of this duty; but, nevertheless, the very existence of such ordinances appears to point out the fact that uncleanness of the body was deemed unholy and incompatible with devoutness of the soul. In all Mahometan and Oriental countries these rites are held in the highest respect, and the neglect of them, which travellers occasionally notice, arises chiefly from the scarcity of the precious liquid under a burning sun. In our own country, as in all modern nations, it is only of late years that a frequent use of water has become at all tolerated, and even yet the great masses of the population of Christendom are far behind the followers of the Prophet in this regard, and are not untruthfully described as the "great unwashed." So advanced, indeed, is the Oriental of higher rank, even beyond the fastidious cleanliness of the English gentleman, that in his ablutions running water alone will serve his purpose.

Until nearly two centuries ago and a half ago there was no regular supply of water to the metropolis, and the construction of the New River works, by Sir Hugh Myddelton, was considered a prodigy of human skill. Since then there have been sundry additions made from time to time by way of auxiliary supply; but until a period within the recollection of the present generation there was no marked alteration in the water supplies of our towns. The use of the bath was a luxury, and as such, unknown to nineteen-twentieths of the population; water-closets were still in futurity; manufactures by steam-power had not arisen from their infancy;

and what was sent through the miserably incomplete systems of drainage then extant was in fact little else than the household drainage and a portion of the rainfall. So slight an admixture of sewage in the large volumes of our rivers was therefore comparatively harmless; and up to a very recent period their waters, with a few exceptions, such as in the clothing districts of the West Riding of Yorkshire, were clear and pure, and abounded in fish.

But when the requirements of modern civilization caused the erection of water-closets, and were supplemented by an increased water-supply to the towns; when new and complete systems of main drainage were adopted, by means of which masses of filth, which before had been allowed to stagnate and rot under the noses of the inhabitants, until hoisted into the farmer's wagon, were swept down into the nearest water-course, then the attention of the public became drawn to the baneful results of river pollution.

The defiling of the great source of our water-supply is indeed the price we pay for the abolition of the pestilent dung-heaps, reeking gutters, and other unclean and unsavoury practices of our ancestors, such as in Smollett's time were to be found in Edinburgh, and which would shock the nice manners of the present day. Cesspools were at first instituted, and in many towns it was made a punishable offence to allow water-closets to drain into the sewers. It was not long, however, before the authorities discovered that, in avoiding Scylla, they had lighted upon Charybdis; and with improved sewerage it was found better to suffer fecal matter to pass into the drains and so into the rivers, than to harbour in the vicinity of each dwelling the ever-accumulating abominations of the cesspool, which were enough to poison the water of every well in their neighbourhood, and breed a pestilence in the land. Speaking on this subject, Mr. Rawlinson, principal inspector in the Local Government Act Office, says:—"The most dangerous condition for a cesspool is for it to be covered; if you are to have cesspools, the safest plan is to take the top off, and let the gas be constantly diluting. In Paris, cesspools are constructed under the superintendence of the authorities, who profess to make them water-tight by hermetically sealing them. This is a fallacy, as the gas escapes at the joints."³

The failure of cesspools to meet the sanitary requirements of a town, has mitigated the prohibition clauses in Corporation Acts, and the discharge of water-closet refuse into the sewers has become wellnigh universal. The influx of so enormous a volume of organic matter, rendered doubly pernicious by the immense increase of manufactures, and the numberless river-weirs, which in dry weather divide them into long, stagnant reaches, has had its due effect on our rivers; so that in all our populous districts their one-time pure waters have been converted into so many masses of unsightly sewage, whose sight and smell are offensive, and whose effect is to breed subtle and dangerous epidemics.

Let, however, there should be any misunderstanding in the minds of the reader as to the just proportion of the effect of manufactures upon river waters, it must not be omitted to state, that although positively the effect of all foreign and discolouring matter is to deduct from their wholesomeness, yet relatively it may be otherwise; as when a certain kind of pollution may be neutralised by the introduction of polluting matter of a certain other kind, which is undoubtedly the case in regard to the infusion of the acid refuse of dye-works amongst currents polluted by town sewage and other animal refuse. The statement of the Rivers Pollution Commissioners, in their report on the Aire and Calder rivers, vol. 1, page 14, sets this matter in a clear light:—

"The dark and foul appearance of the West Riding rivers is mainly due to insoluble dye-matter discharged from the works; but dye refuse in general, though in this sense highly objectionable, really tends, to a considerable extent, by the disinfecting action of the mineral ingredients and acid it contains, to neutralise the corruption of town sewage. Where, on the other hand, this dye refuse is not discharged in sufficient quantity, that offensive matter deposited on the beds and banks of the streams, becomes, in dry weather, putrid and stinking."

In many parts of the West Riding clothing districts, where large and increasing towns are situated on the banks of comparatively small streams, recourse is had to reservoirs. Periodically, once a week, or once a month, these are flushed out, generally on a Saturday afternoon, and the whole of the deposit of "sludge" and refuse is sent down the stream. During these

¹ The experiment made by the Marchioness of Ailesbury in establishing a cottage hospital at Bevernake, near Marlborough, appears to have succeeded admirably. At the annual meeting held under the presidency of the Marquis of Ailesbury, K.G., the report was read by the Rev. J. O. Stephens, honorary secretary to the institution, and the document showed that during the past year an addition of 154, had been made to the endowment fund. It was also reported that seventy-nine cases had been received into the hospital (making up nine beds only), forty of which were discharged cured, twenty-eight were relieved, two pronounced incurable, and two fatal.

² Report on Metropolis Sewage, 1864. Mr. Ellis's evidence: 174.

³ Rep. Metropolis Sewage, 1864: 4219, 4220.

flushings the water of the stream is defiled to such an extent as can hardly be realised by those who are non-resident. The neighbourhood of Bradford, Dewsbury, Batley, and Heckmondwike, is especially distinguished by this characteristic.

How, then, to deal with an evil so gigantic and so rapidly increasing, is a matter which has naturally attracted the attention of the scientific men of the time, and innumerable remedial schemes have been proposed. In order to form a correct estimate of the most prominent of these, it will be proper to ascertain, as far as possible, what its sewage is; what are its constituents, what its capacities, and what is its commercial worth.

Sewage: its Constituents and commercial Value.

In the earliest stages of the inquiry into the best means of restoring our rivers to their pristine purity, the chief source of encouragement was the fact that the liquid hitherto wasted to the detriment of the public, contained all the most valuable elements of manure, which but required to be applied in a proper manner to become a permanent source of revenue. In spite of the example of the Edinburgh meadows, where for nearly two centuries sewage has been profitably utilized, many schemes for merely purifying the liquid, without any view to turning the residue to account, have been entertained, adopted, and in almost every case abandoned, to the neglect of the sounder principle of utilisation.

Perhaps the best definition of sewage in its present application is, the condition of water after it has served all the purposes of mankind, and contains the impurities disgorged by water-closets, kitchens, washhouses, hospitals, tanneries, slaughterhouses, knackers' yards, dye-works, and manufactories of every description, the washings of streets, housetops, &c. That this refuse holds in solution the most essential ingredients of fertility in the form most adopted to their beneficial application, is a fact now established in the opinions of those who, as chemists, agriculturists, or engineers, have especially devoted their studies to the development of this branch of political economy; the chief exceptions being on the part of those who advocate the dry-earth system of closets, and those who are interested in the production of artificial manures. But the history of sanitary reform for the past quarter of a century shows how slow this truth has been in gaining upon those whom it most concerns.

During that period time, money, and careful research have been abundantly bestowed upon experimental dealings with sewage, chiefly in pursuit of precipitates, mediums of filtration, and similar remedies. But it can be no error to state, that notwithstanding the manifold inventions, which from time to time have been set forth, a practical and undoubted remedy of this nature has yet to be produced; on the other hand, the practical results of sewage irrigation would appear to have placed the theory of utilization upon a solid basis of fact—an eminence which no other remedy has reached.

Careful analyses by some of our most eminent chemists have shown that town sewage contains ammonia, phosphoric acid, potash, and other fertilizing ingredients, which, having been abstracted from the land in the process of agriculture should logically be restored in their transmitted form.

Professor Way, consulting chemist to the Royal Agricultural Society, says that the average of ninety-three analyses of Rugby sewage showed 7½ grains of ammonia to the gallon. He made similar experiments with London sewage at different points, and found it to vary from 7½ to 18 grains per gallon; but the results appear inconsistent, as the same gentleman states that the value of London sewage, as compared to that of Rugby, is as 60 to 100, or six-tenths.¹

Mr. J. B. Lawes, manufacturer of artificial manures, appointed by Government to conduct experiments in sewage at Rugby, found, in 1861, that the proportion of ammonia in a gallon of Rugby sewage was 6.39 grains; 1862, 6 grains; in 1863, 6.75 grains, besides potash, phosphoric acid, and a variety of valuable salts. The quantity of ammonia given would amount to three or four ounces to the ton, and he valued it at 8d. per pound.²

Boussingault says, that supposing the excreta of man to amount only to 1½ lb. per day, and that they contain 3 per cent. of nitrogen, in one

year they will amount to 547 lb., containing 16½ lb. of nitrogen,—a quantity sufficient to yield the nitrogen of 800 lb. of wheat, rye, or oats, or of 900 lb. of barley.³

The agricultural value of these manorial ingredients has been variously estimated by a host of authorities, some of whom base their calculations on analytical results, some on actual experience, and some on a well-digested combination of the two. These estimates are given below; and, in order that a definite conclusion may be found as to the gross value to the nation of this important commodity, we prefix the annual quantity of London sewage, as estimated by Mr. Bazalgette, Captain Galton, and Mr. Ellis:—

Mr. Bazalgette	155,544,000 tons.
Captain Galton	215,762,000 "
Mr. Ellis	266,000,000 ⁴ "

Baron Liebig is of opinion that the value of sewage is 1½d. per ton.⁵

Sir Charles Fox places it at the same figure, but says that 1d. per ton is more than can be obtained.⁶

Mr. B. Latham stated, at the sewage congress at Leamington, 1866, that 6s. per head of the population contributing to contributing to the sewers had been realized at Croydon and South Norwood.⁷

Messrs. Hoffman & Witt state that 1,250 tons of sewage contain as much fertilising matter as one ton of guano, the value of guano being from 11s. to 14s. 10s. They also estimate the money value of the excreta of each person, based on the analyses of Liebig, Way, Wesarg, and others at 10s. 10d. annually.⁸

Mr. Ellis, taking Messrs. Hoffman & Witt's estimate, calculates the gross value of the London sewage at 2,793,000l., guano being taken at 11l. per ton.⁹

Mr. Lawes's estimate of the London sewage is 1d. per ton; its value as compared with guano as 1 to 3,000.¹⁰

Professor Way considers the value of the ingredients of Rugby sewage to be from 1d. to 1½d. per ton, but does not consider the ingredients of London sewage to be worth so much. He also affirms that the chemical value of the ingredients cannot be taken as a test of the commercial value of the sewage itself.¹¹

Mr. Hope says that the theoretical value of the manorial ingredients of sewage, based upon the opinions and analyses of the chief scientific authorities, is on the average 6s. per annum per head of the population.¹²

Dr. Thudichum finds, by careful analysis, that the annual solid and liquid voidings of an adult male are worth 10s.¹³

Mr. George Shepherd estimates sewage to be worth, in wet weather, 1d. per ton, and in dry weather 2d.; and on the average, 1½d. per ton.¹⁴

Mr. Lawes, before the Royal Commission, stated in evidence that the application of 1,000 tons of sewage to the soil would result in the increase of milk to the value of 5l. 19s. 10d.; from which it would appear that one ton of sewage represents a value of 13d.¹⁵

Mr. C. W. Johnson, chairman of the Croydon Board, considers that, according to analysis, the sewage of Croydon and that of London are of the same strength.¹⁶

The evidence laid before the Commission on Metropolitan Sewage, 1864, led it to the conclusion that the manure which sewage contains can be applied in the cheapest manner when conveyed in water.¹⁷

From the statements collected above it will be seen that, although there appears to be a diversity of opinion as to the precise monetary value of town sewage, yet the one least favourable,—that of Mr. Lawes, an extensive manufacturer of artificial manures,—tends to show that in fouling our water-supply by the discharge from sewers, we are, in a pecuniary sense, as well as in a sanitary sense, carrying out a suicidal policy. It is no new discovery that our present supply of manure is but from hand to mouth; that guano is yearly increasing in price

as it is decreasing in quantity, and will be exhausted in another generation; that our bone-manure manufacturers are so hard put to it that even the pits of Sebastopol have been stealthily disgorged to recruit the impoverished soil of this country;¹⁸ and if it be an axiom in political economy that in all the bare necessities of life a nation should be self-supporting so far as within it lies, it is certain that we can strike no heavier blow at the foundations of our national welfare than by undervaluing a matter of so great importance; a policy which, if persisted in, cannot fail to throw this country, year by year, into deeper dependence upon foreign nations, which are thus empowered, in any period of strife, to deprive us of the very elements of existence. The sewage of a nation upon whose soil the progress of agriculture is yearly making heavy draughts, may be said to represent its food in another shape, and in casting it away to reclaimable loss the natural reproductive powers of the land are rendered impotent, and, without foreign importation of fertilizing matters, exhaustion ensues.¹⁹

That country in which this policy is pursued may be likened to one of those vast inland seas of North-western America, which, having at some bygone period been severed from the ocean by the upheaval of the bed or channel of communication, and being without other sufficient source of supply, is gradually diminished by evaporation, until at last a dry stratum of salt alone indicates its ancient condition. It cannot be supposed that even should the wealthy pre-eminence of this country be sustained in future ages, we shall always be enabled to import the materials of fertility at will; and when once the balance of giving and taking between the soil and its inhabitants is overcome to the prejudice of the former, a national atrophy must set in,—a result which a timely wisdom in the matter of the utilization will avert. It is a truism in agriculture, that if all the refuse of the products of the soil be restored to it, land is self-supporting. Belgium, a more thickly-populated country than our own, where sewage is generally utilized, is stated to import none of the chief staples of food, whilst already in this country the sum of 30,000,000l. in hard cash is annually paid for foreign supplies.

The agriculture of the empire of Japan, which, perhaps, affords the only complete system of the utilization of sewage in existence, may also be fairly pitted against our own. That remote country, of similar extent to Great Britain and Ireland, and one-half of which is unfit for cultivation, not only maintains a larger population than the United Kingdom, but maintains it without the introduction of any foreign supply of food, and we are even told²⁰ that it actually exports considerable quantities.⁴ M. P.

THE CAPABILITIES OF ARCHITECTURE AS A DISTINCT BRANCH OF INTELLECTUAL RESEARCH.

THE relation of architecture to history is no recent discovery. It is true that, with every fresh contribution afforded by the enterprising and the patience of modern explorers to our increasing knowledge of the past, the value of this relation becomes more apparent. Every ancient building that is distinctly and satisfactorily investigated adds a new chapter, not indeed to history itself, but to what our clear thinking neighbours call "*Mémoires pour servir à l'histoire*." The exact date of the foundation of the structure, the obvious purpose of its erection, the mode by which the architects of that date dealt with problems that, under any phase of civilisation, recur within certain limits, are matters requiring a careful study, the chief disturbing element in the course of which arises from doubtful questions as to restorations and alterations. The

¹⁸ "Of all the elements of the field which, in their products, in the shape of corn and meat, are carried into the cities and there consumed, nothing, or as good as nothing, returns to the fields. It is clear that if these elements were collected without loss, and every year restored to the fields, these would retain the power to furnish every year to the cities the same quantity of corn and meat; and it is equally clear that if the fields do not receive back these elements, agriculture must gradually cease."—Baron Liebig's letter to the Times, Dec. 23, 1850.
¹⁹ "Report on Japanese Husbandry." By Dr. H. Maron, Member of the Prussian East Asiatic Expedition. *Vide* Liebig, in the "Natural Laws of Husbandry," app. pp. 368-398. Dr. Maron's report contains a graphic and interesting account of the Japanese method of dealing with fecal matter.

distinct and minute examination of a single building of architectural magnitude and of known antiquity, when the dates of the several portions of the structure can be ascertained, and when the efforts of the restorer or the adaptor are absent, or are to be distinctly traced and accounted for, may be more valuable, as providing an exhaustive monograph, than many a wider and more ambitious description of a collection or of a series of buildings.

It may be said that we are speaking not of architecture, but of archeology. We will not pause to quarrel about terms, but it must be admitted that unless the word architecture be held, in its highest and most comprehensive sense, to include the whole doctrine of human structural abode, we are in want of a term that shall comprehend all the branches of that study. The decorative and the structural portions of the building art are in themselves separate branches of the subject, and, although the highest excellence must be thought to be attained when structure is decorative, and when decoration is structural, this happy result can only be arrived at by a full mastery at once of the science, and of the art, of architectural design. Historic architecture is, no doubt, properly neither a science nor an art, but a method of investigation. It is, however, a necessary portion of the full knowledge of the subject of building, and a broad and marked line may be drawn between this portion of antiquarian research, and that which inquires into the weapons, the food (and therefore the habits of hunting, of pasture, or of agriculture, indicated by the relics of consumption), or even into the sepulture, of ancient races. It is, therefore, rather to maintain distinctness of expression than with the view of attempting any redistribution of terms, that we speak of the study of architecture, in the highest sense, as including the archeology of building.

Thus far we shall, no doubt, have the assent and the sympathy of all those who like to think on the subject. But we wish to carry the antiquarian portion of the subject a step further, and to refer to the value of architecture as a distinct method of intellectual research, one capable, if properly pursued, of obtaining results not dissimilar to those with which the study of philology is now extending the limits of our knowledge of the past. We cannot admit the claim of Professor Müller to call his favourite pursuit an independent natural science; but the difference, after all, is rather in expression than in idea, and as a distinct and in some sort independent portion of the natural history of mankind, philology is no doubt assuming new and most unexpected proportions. But if speech, so far as its gradual transformation can be now recalled, and as it were, disinterred, by the labours of the philologist, be an external sign of the intellectual, moral, and social state of those whose utterance it formed, no less importance must attach to the similar indication of what has been committed to architectural record. The mind of the architect is, to some extent, reflected in his building; it is the outward expression of a set of the habits and requirements of the age, of its intellectual progress, as marked by the mode of dealing with the known difficulties of the structure, and, more than all, of that advance either in general professional culture, or in the culture of the individual architect, that gives the impress of character to his works.

Again, in the study of spoken language, difficulty arises from many casual and incidental causes which may altogether escape the researches of the inquirer, although their results may so materially influence the state of the subject of his investigation that ignorance of them will altogether mislead him. Thus the habit of certain tribes of occasionally dropping words altogether from their language, and of replacing not only these words, but their component sounds or syllables when they form part of another word, by something of corresponding meaning, but of altogether different vocal formation, if undetected as a fact, would never have been imagined as a possibility. The name of a king, for example, on his accession or on his death, is thus "tabooed." Early and simple names are invariably significant, and the forbidden sound is thus replaced by one which has no vocal relation with its character, but more or less corresponds with its meaning. It is as if, on the accession of the Norman Conqueror, not only the sound "will," and all its compounds, but the sound itself as a syllable had been suppressed in this country, excepting for the sole duty of indicating the sacred name of the sovereign; and not only should we speak exclusively of a last

"testament," in referring to the devise of property, but we should call a willful man a "testament-fal" man, or a willing horse a "devising" horse.

Against the result of vagaries of this sort, the investigator of the historic teaching of architecture is entirely protected. Casual disturbance, so to speak, is generally of local origin in individual buildings; and thus, from the permanence of the cause, tends to explain itself. Brick may be substituted for stone. The reason will be evident from examination of the site. Material of an unusual description may offer itself to the hand of the builder. The result is to be traced in a richness of ornament, or in a severity of design, that is unusual for the date, but that is at once understood by one familiar with the locality. Thus the stone palaces of Lecce, and some neighbouring cities and towns on the Adriatic sea-board, burst on the eye with a bold luxuriance of ornament which is peculiar to the locality. You trace on the door-jambes of the humblest houses foliage and arabesques fit to adorn a highly-finished mansion. The gargoyles of the ancient monastery which now forms the palace of the prefect of Lecce start from the wall as life-size, half-length, human figures. The ornamentation of the entire facade is of corresponding boldness, and of admirable finish. You look for the cause, and you find it in the character of the stone quarried on the spot, soft as ebk beneath the knife or chisel when freshly brought to the air, and gradually and permanently hardening into a most excellent and durable stone. Material such as this irresistibly tempts the mason to become a statuary. Thus a difference between a church or palace of a given date in the city of Lecce, and a specimen of similar and contemporary buildings some forty or fifty miles distant, which would perplex the student who learned the details from the pencil of others, ceases to require any explanation on a visit to the spot. While, therefore, the casualities that beset the subject of the research of the philologist are such as often to mock his utmost skill, those which render the work of the architect *hazardous* or abnormal may generally be traced to their actual source, and thus cease, instead of interfering with, the amount of knowledge obtained by the inquiries.

When positive historic date can be assigned to an ancient building of importance, when questions of restoration and alteration can be eliminated, and when to the local circumstances tending to impress a special and peculiar character on the work due importance has been assigned, we see, in the form and details of the building, evidence of two distinct elements. The first is the social indication which it affords. In size, in position, in arrangement we see the marks of the state of society for which it was designed. Is it a lonely and carefully strengthened tower, erected on an inaccessible hill?—we see marks of a state of civil discord, of the rule of the strong hand, and of the habits of the "robber chivalry," who ensconced themselves in stone for their dwellings as they did in iron for their garments. A spacious church tells of a people whose time, and whose devotion, would allow and would impel them to worship beneath its roof, and to swell the processions of the clergy. Such a simple matter as the direction in azimuth of the plan, or the exact orientation of the building, may tell of the religion of those who built sepulchres, or of the astronomical knowledge of those who raised pyramids or obelisks. At Cumæ three stories of sepulchres are superposed. Each series differs as much in its orientation as in its structure. The lowest, the rudest in construction, and the rudest also in the relics which they contain, follow no fixed rule, but appear to have been dug as caprice or convenience dictated. Then came a race who laid their dead with their feet to the south; then one who turned their *fast* couches towards the east. It is clear that a large amount of indication of the social state of mankind is to be drawn from a knowledge of what, at any period of their history, they expected from the art of the builder.

Intellectual progress and status, on the other hand, is shown by the manner in which the architect met the requirements of the day. This, indeed, depends on two conditions,—the general and the special state of his knowledge. To a certain extent the architect is always conventional; he arrives at given results by a customary mode. His individual genius may improve this mode, his poverty of spirit may fall short of its best expression; but, on the whole, his work will prove an intellectual gauge of the professional

merit of his period. Thus he has a space to cover, with superincumbent weight to support. He begins by the use of ponderous and misshapen lintels, after abandoning the simple inclination of two jambs towards a vertical line. Then he dresses his lintels and stepped them so as to throw their weight in part on a second course of masonry. Then he hollowed them from below, and produced a pseudo arch. Then he vaulted from pier to pier, with small and timid span, indeed, but with a firm grasp of that master-principle of masonry which later, in its bolder applications, produced structures that so far excited the wonder of those not initiated in masonic science as to be pretty generally attributed to the agency of Satan. You may not be able to detect how far each step in the steady and long progress is due to each worker in the series; how much of the advance is due to the pupil, and how far to the master. You may hesitate, for instance, whether to admire or to blame Brunel for the first arch he threw over the Thames at Maidenhead; but if you compare the freedom of the present structure, over which such heavy loads are whirled with such immense velocity, with the steep ascent and the numerous and picturesque arches of a old road bridge over the same river close by, it is impossible to disguise the fact of the immense difference of intellectual level at which the successor of Brunel must start as compared to the successor of the architect of the earlier bridge.

With the change in the requirements of social life, and the advance in the scientific and practical power of the architect, we can at times also trace the history of the development of principle, and of the gradual transformation of idea,—a class of observations of extreme interest in dealing with the intellectual history of mankind. Thus, at a time when the column in Roman architecture had been most thoroughly conventionalized, and when proportions had been fixed within distinct dogmatic limits, we find the simple columnar pier of the Saxon or Early Norman architect constructed on a no less definite rule, but one which he had not borrowed from the Roman masters. It was a structural not a conventional rule. The Italian architect, if he had only to support a trellis-work of wood for the training of his vines, and thought fit to do so by columns of marble or of stone, proportioned their diameter to their height in exactly the same manner as if they had been intended to support a solid and ponderous pediment. The Gothic workman proportioned the diameter of his column to the weight it had to sustain. As the heavy and solid arch of the earlier builders became lightened by recessing, and gradually became architecturally divided into separate members, the sustaining pier split into clustered columns. The same structural idea seemed to be present, the law that each superincumbent piece of work must have its own support. If the low heavy arch require the squat pier, each of the many moulded groins and ribs must be supported by its own graceful but appropriate shaft. With the advance of practice, and with some increase of knowledge of the transformed Oriental style of the Sarsenic builders, the arches and vaults of our cathedrals became lighter and bolder. The indispensable shaft would interfere with some other feature or requisite of the building if it sprang from the ground. It was made to rise, in such a case, from a light corbel instead. The principle was preserved, though modified in its application. A step further, and the original idea has become so entirely conventionalised that the object for which it was introduced as a canon has entirely disappeared. The shaft clings to the rib, but it is as a weight and not as a support. In the form of a penile shaft, or a pendant or of a boss, entirely unsupported, it has become at the same time a quaint and effective architectural ornament, and a structural defect. It weakens the arch which it professes to strengthen. Thus, while the rule has been unsustained, the reason of the rule has been abandoned, and an architecture founded on the idea of a just and exact proportion of support to superincumbent weight has been gradually transformed into a style that aims at destroying the sense of weight altogether, and suspends over the heads of astonished admirers a rich canopy of stone, soaring high, as if upheld by celestial supporters, and actually weighted and pulled down by bosses and pendants, where it would, in simpler times, have been supported by shafts.

The instances in which we can thus distinctly trace the rise, development, conventionalisation,

and final obliteration of a great idea or leading principle, are extremely rare. Hardly any, if any, branch of human study affords so ready a means of investigating a case of the kind as that which we have pointed out as falling within the province of architectural study. Some of the most curious problems in human history arise from the conventionalized form in which a new idea is first to be detected by the light of the present state of our erudition. The form of the square Hebrew letters is a case in point. They are called Chaldean. They differ from the Phœnician, while there is a close family resemblance between the Samaritan or general character of Palestine, the ancient Greek—the Phœnician of the Jewish coins of the date of the Maccabees,—and very possibly the rudimentary forms of the Sanscrit. From all these the Hebrew letters differ—not only in finish and detail, but in being written the reverse way. But almost every ancient Greek letter presents a distinct resemblance to an impression of an incised Hebrew letter of corresponding value. The literal hieroglyphics throw no light on the subject. The most learned and approved theory is, that the square Hebrew letters were those used by the Chaldean men of learning, and that they were brought back from Babylon by Ezra, who is generally made to stand godfather for the whole Jewish literature of a date preceding his own. Unfortunately we have, since this theory became orthodox, found out what letters the Chaldean scribes *did* use, what letters were in use in Mesopotamia from the days of Abraham to those of Nahonadius. And these letters present no resemblance whatever to the square Hebrew character, which thus remains an instance of a set of signs first known to human history in a full-grown state of maturity, as to the origin of which we have no light whatever.

Heraldry is another case in point. According to all the theoretic explanations of the origin of heraldry, charges, as the heralds call them, lions, eagles, representations of natural objects, should have been the earliest bearings. Those familiar with genealogical study know that the contrary is the case. In Continental heraldry charges seem mostly to have been originally borne as differences. Where they are known to have been augmentations, they are known to be the original bearings. The sixteen eaglets of Montmorency were four at an earlier period. The ancestors of the "premier Châtelain," who assumed the four birds at a date heraldically determined, bore the plain red cross. Again, in the arms of Lorraine, the first bearing of the House of Austria, the three alerions are attributed to the time of the Crusades. The bend claims a higher antiquity. The honorable ordinaries are older than the charges; or, in other words, heraldry, when first known to history, was as thoroughly conventionalised as it is at the present day. The pale may denote the lance, the bend the scarf, the fess the belt, the chevron the saddle; but we have not the smallest certain knowledge of the manner in which a broad line across a certain part of the escutcheon came to have such an import. Heraldry comes into history full grown, as Minerva sprang into the midst of the gods.

This view of a great capability of historic architecture should stimulate the exertion of those of the professors of that noble art who have time as well as knowledge at their command. It is only necessary for such men to bring to bear on this novel branch of their study the patient and untiring energy by which the philologists have lately won such brilliant triumphs, to take place by the side of the latter discoveries with no secondary lustre.

SOUTH KENSINGTON MUSEUM.

SOME eleven or twelve thousand persons are visiting the museum weekly just now, instead of the ordinary average of about ten thousand, chiefly on account, we suppose, of the loans and purchases from the recent Paris Exhibition. These are exceedingly interesting, and will give pleasure and advantage to all who rightly examine them. The inlaid and carved cabinet of various woods, manufactured by M. Fourniois, of Paris, was purchased, and rightly, as the piece of furniture of highest class exhibited. This cabinet extorted the admiration of the English artisans who have reported to the Society of Arts. The carving, says one of them, is "not planned on, but inlaid, the wood being quite cut through, and, when all glued to-

ther, it forms one solid mass. This piece of work I consider to be the perfection of cabinet work." If we understand it rightly, the carving is cut in as marquetrie, allowed to project as required, and afterwards carefully modelled and worked down to the ground, the inside being afterwards veneered. Where the carving is put upon thick pieces, it is let in with chisel and gouge about 3-8ths of an inch. Another of the reporters, while expressing great praise of this cabinet, gives the palm to Messrs. Jackson & Graham's exquisitely made ebony and ivory cabinet, of which we spoke with great admiration, even before it was sent to Paris. The French cabinet, however, involves art of a much higher order, in the shape of sculpture, and must be placed first. The majority of the figures and all the heads are admirable and beautiful in the highest degree; the general tone of colour, too, is exceedingly agreeable, and the whole is a delight. The authorities have wisely inclosed it in a glass case, to protect it from soot and dust, not to be avoided, especially in a glass-covered building.

We should like to see the same care immediately bestowed on the truly lovely ebony and ivory pavilion-cabinet from Italy, which has been lent by its makers, the Signori Alessandri. Unless this be covered, our terrible dust and smut will ruin its pure fresh beauty. Being entrusted to us, it would be discreditably if we allowed any damage that could be guarded against to befall it. Some of the groups are exquisitely carved.

The spinet of pear-tree wood, carved, and encrusted with ebony, ivory, lapis lazuli, and other rare materials, should not be overlooked by those who are technically interested in cabinet-work and its connexions. The centre-piece for a table and large ewer, in Rock Crystal, from the Imperial treasury, Vienna, are more remarkable than beautiful. These were executed in the seventeenth century for the emperor Rndolph II., and are lent by the present Emperor of Austria. The term "crystal" has been so bandied about, from cups and chandeliers to palaces, that it was not surprising to us to hear a man of position and education describing these articles as "of a peculiar kind of glass"—glass, certainly, but having Nature for its maker. Rock crystal is a transparent variety of quartz.

The collection of cheap gold-work and jewelry as worn now by the Italian peasantry, is suggestive, but should scarcely be laid out "as examples for art-workmen," without cautionary remark. The great curiosity of the new acquisitions, however, is what is termed the "Treasure of Petrossa," a collection of ornamental objects in solid gold, found by peasants near Petrossa, in Roumanis, in the year 1837. The inscription upon them says they were probably manufactured by the Gothic tribes of Dacia, from 400 to 500 years after Christ. In one of the pieces (if not in others), a circular dish, with a sitting statuette rising from the centre, Byzantine influence is visible. Without assenting wholly to the date ascribed, these works are very early and very remarkable; and what a story they suggest! Dacia, the land of the Gætas, was the last of the Roman conquests in Europe. This was effected by Trajan, A.D. 104, and the chief events of the campaign are shown on Trajan's Column in Rome. A lump of masonry on each side of the Danube, near the village of Scala Gladova, shows where stood the enormous bridge built by Trajan. The Romans ceased to be masters in the year 275, and left Dacia to the Goths. After the death of Attila came varied rulers, and then it fell to Charlemagne. The Dacian tribes supplied the Roman circus. Every one will remember Byron's reference when describing the fall of a gladiator in the Colosseum:—

"He reek'd not of the life he lost, nor prize—
But where his rude hut by the Danube lay,
There were his young barbarians all at play,
There was their Dacian mother,—he, their sire,
Butcher'd to make a Roman holiday—
All this rush'd with his blood,—Shall he expire,
And unavenged? Arise! ye Goths, and glut your ire!"
Childe Harold, stanza cxi.

A good account of this Treasure of Petrossa, and the circumstances attending the find, would be interesting.

IMPROVEMENT OF DWELLINGS IN BELGIUM.—A joint-stock company for the erection of working men's dwellings has just been founded in Brussels, under the patronage of the Belgian Immobilière. The King has taken a hundred shares of 500 f. each, and the Count de Flandre fifty. The capital is to be 5,000,000 f.

PROFESSOR G. G. SCOTT ON EARLY ARCHITECTURE IN GREAT BRITAIN.*

HAVING now given a general outline of the intrinsic principles of Norman architecture, I will proceed to offer a few brief descriptions of some of its earlier creations, or rather of a selection of such of them as have come down to our own day, or of which we have sufficient information to make the consideration of them profitable.

I have already spoken at some length of Lanfranc's Cathedral, at Canterbury, and of its identity, in general design, with the Conqueror's Ahhey Church of St. Etienne, at Caen. I shall have to revert to this cathedral more than once in describing additions and alterations of later date; but there are no remains of Lanfranc's original work of sufficient importance to warrant me in occupying your time upon it.

I have also alluded to the chapel in the Tower of London: of this most perfect and typical example of the very early Norman, I exhibit some illustrations. Severely plain, as befitting the chapel of a fortress, it is, nevertheless, as complete and as well designed a building as could well be produced. Apical with continuous aisles, in two stories, and vaulted throughout the central space and the upper aisle by unriched wagon vaults, becoming in the former case semi-domical on reaching the apse, and the lower aisle groined, it is more perfect in ideal than the choir of any English or Norman church that I am acquainted with of its period, and is parallel in this respect with the great churches of Auvergne, only needing the clearstory to render it a complete type; a model of a perfect choir, with an entire absence (excepting in the capitals of the columns) of ornamental detail. Several of these capitals are like those which prevail in St. Etienne at Caen, and which appear in Remigius's work at Lincoln: they are a dim reminiscence of the Corinthian capital, with a cross-formed block representing the rosette in the abacus; for, he it always remembered, that the abacus of a Corinthian capital was not the prototype of that of a Romanesque one, in which a substantial impost is superimposed upon the delicate abacus of the classic column. I give drawings from Caen, from the Tower, and from Lincoln, to explain the identity and peculiar characteristics of these capitals. The common cushion capital is also freely used.

I will next go to St. Alban's: not that I can distinctly assert it to be the next in date; but because it stood first in rank among ahheys, as Canterbury among cathedrals; because it was built by the friend and companion of Lanfranc; and because the crudeness of its material, by divesting it of all decorative features, renders it a more purely typical and elementary example than any other we possess.

Founded only ten years after the Dioclesian persecution, when St. Alban became the protomartyr of Britain,—destroyed during the invasions of Pagan Saxons, and refounded as an ahhey during the last years of the eighth century by Oifa, king of Mercia,—the church of St. Alban had become famous throughout Christendom.

The two last Anglo-Saxon abbots having determined on its reconstruction, had incurred great labour in excavating among the ruins of the adjacent Roman city of Verulam to procure materials for the work; but a dreadful famine, followed by the Norman invasion, had prevented the realization of their intentions.

In the year 1077, Paul, a monk of St. Stephen's, at Caen, and a relative of Lanfranc, was appointed to the ahhey; and, during the first eleven years of his tenure of office, he had "constructed the entire church" "of the stones and tiles from the ancient city of Verulam." I presume, however, that this statement of Matthew Paris must be taken with some abatement, as we do not find the dedication to have taken place till 1115.

The church thus erected, though homely in material and of simple workmanship, was stupendous in its scale and prodigiously massive in its construction.

It is curious that, while the Ahbot of St. Stephen's, when made Metropolitan of all England, was content to copy his ahhey church for his metropolitan cathedral, a plain monk of the same monastery, when made head of the first

* Lecture III. at Royal Academy, February See pp. 70, 80, 108, and 127, *ante*.

English abbey, should go so far beyond his former church in the scale of his new one.

A glance at the two plans will show the extent of the difference. While at St. Stephen's the nave (including the façade) has nine bays, that of St. Alban's has thirteen; while each transept of the former church had two bays and one apsidal chapel, those of the latter had each three bays and two chapels; and, while the choir at Caen had only two bays besides the apse, that at St. Alban's had four.

The western façade, too, differed in that while that at Caen had towers which closed in the ends of the aisles, those at St. Alban's projected wholly beyond their side walls; thus increasing the width of the front by double that of the aisles. The effect of all these changes upon the dimensions of the buildings was that, while St. Stephen's was only 300 ft. long, St. Alban's was 465; that, while the transept of the former measured 140 ft. in length, that at St. Alban's was 210 ft.; and that the widths of the two western façades were respectively 88 ft. and 155 ft.

The design, though of the most rigid and almost granite simplicity, was admirably proportioned; and, when compared with Norman churches of more kindly or more finished structure, the case of this was the use, almost to the entire exclusion of finer material, of the Roman tiles from Verulam. With these, not only a great part of the mass of the walls, but the pillars, arches, windows, string-course, and other parts normally formed of stone, are almost exclusively constructed.

One might fancy that a vast structure erected of such materials, might have a very picturesque appearance, and that the rich and deep red of the brick, alternating with an equal quantity of coarse mortar in the joints, and interspersed with rough flint work, might give to the general colouring of the edifice a warmth of tone, and a richness of texture which, on a general view, might more than make up for its æsthetic plainness. But, oh! tell it not in the streets of our Tyburnian Asclon! These Norman builders, like too many of their descendants in our own day, had no such artistic notions, but resorted to encrusting the whole,—within and without,—with one uniform coating of the smoothest and whitest plaster! St. Alban's, when viewed from the ruins of Old Verulam, must have looked like a sort of "Moel Wynn,"—*a white mountain*; or, like the creation of a spell of Merlin,—born out of a single block of marble! Our romantic old Mediaevals were not proof against such fascinations, for we found St. Wilfred glorying in having washed the York Minister of his day, "whiter than snow;" and at Peterborough, it was the boast of one of the abbots, that he had so skilfully whitewashed his cathedral, that it appeared as if cut out of a single stone! But let us take comfort. Abbot Paul had not sunk to so low a depth! He had an eye to the sister arte; and we find him recorded as having enriched with painting the vaulting of the apse behind the high altar. Nor did he stand alone in his taste for such decorations; for we find now that every part of the plain old plastered walls, pillars, arches, and vaulting has been so enriched at different periods, the western side of the great piers of the nave being richly painted with figures and subjects as the retables of the altars placed against them.

With such artistic relief as this, added to the stern and massive grandeur of its parts and the stupendous scale of the whole, and adding also the gorgeousness of the shrine of the Protomartyr, and of the numerous altars and other objects which imparted beauty and solemnity, one may well imagine that the internal effect, notwithstanding the absence of architectural detail, was as noble as it must have been unique.

The roofs, internally, may be proved to have been masked by level ceilings, no doubt gorgeously painted like that which still remains over the contemporary church at Hildesheim in North Germany, or that but recently executed by Mr. Burgess, aided by the charming art of Mr. Poynter, over the nave of Waltham Abbey. The present painted ceilings are, no doubt, the lineal ancestors of the Norman ones.

In the midst rose the stupendous piers and arches which sustained the tower, between which the open lantern soared high above the church, while beneath this lofty centre of the stupendous cross were ranged the stalls of the monastic choir.

I illustrate this wonderfully dignified and impressive structure by several drawings of the whole and of parts. It will be seen from this how simply and almost exclusively it trusts to the most elementary principles for its architectural effect. First, to its general grouping and proportions, which are a perfect model of a typical Norman church, bereft of its usual details; and, secondly, to the simple principle of divided orders, which I have before explained, but used in nearly all instances without the aid of decorative shafts of mouldings.

The proportions of the internal elevation are such that, if the entire height of the wall be divided into nine parts, four go to the main arcade, two to the triforium or gallery, and three to the clearstory.

The arches of each are of three orders, and are, for the most part, without shafts; the section of the jamb and arch being the same, severed only by a simple impost. A broad pilaster buttress runs up the face of each pier from floor to ceiling.

In the transept, however, the triforium is differently designed, being sub-divided into coupled arches, and supported by stone shafts. Many of these shafts are balusters (most likely of Offa's church) made use of again, with the addition of a Norman capital and base, and sometimes eked out in length by the interposition of Roman tiles. Like the balusters I have had at Jarrow, they bear evident marks of having been turned in a lathe.

The outer wall of the gallery story has been removed, but of its former existence there is distinct evidence; the mark of the roof, as seen against the transepts, showing that the walls have been lowered by some 8 ft. or 9 ft. Only three bays of the aisles remain their vaulting, which is of the most typical form of groining. It is capable of almost certain proof that the roofs were throughout devoid of parapets. The transept fronts were divided up the middle by a wide pilaster buttress, and flanked by similar ones. Their windows, as nearly all others, are of the greatest simplicity; three recessed orders in jambs and arches alike, with impost to the two outer ones: above the springing line, however, of the gables, were ranges of double windows divided by stone shafts. Each transept has a staircase in its western angle which runs up into an ornamental round turret, with four double windows in its upper stage, and was most likely crowned with a cone. These staircases led into the triforium passages and into the roof.

The tower has three stages above the ridges of the roofs. The lower one has plain windows lighting the lantern; the second has, on each side, two pairs of double windows; and the upper story has two such windows of large scale. The tower is flanked with pilaster buttresses merging in the upper story into round turrets.

I will next take Winchester Cathedral. York would have claimed precedence as a metropolitan church, but its Norman remains are so small in extent as to neutralize its claims. I may mention, however, that Professor Willis (whose marvellous perception of antiquarian evidence enables him to describe, almost with precision, buildings of which the common observer would conclude that no relic or evidence exists) has shown us that the Norman cathedral at York (begun soon after 1070) was a structure of prodigious magnitude, and exceeded in the width of its nave any church in England; measuring 60 ft. from centre to centre of its piers.

Winchester may be said, in these early days, to have rivalled London as the capital of England; for it had been the capital of that Saxon kingdom which brought all the others into subjection, and whose kings became kings of England; while London—the capital only of Essex, a kingdom subordinate to Kent—owed its greatness simply to its river.

We have already seen that the cathedral, founded by Birinus in the seventh century, had been rebuilt by Athelwold and Elphege in the tenth century.

Bishop Walkelyn, a chaplain and relation of the Conqueror, about 1079, began to rebuild it, and finished his work about 1093.

Walkelyn's Cathedral exceeded in vastness even Abbot Paul's stupendous work at St. Alban's. Its nave was of eleven bays, besides two vast western towers. Its transepts each had four bays; its eastern arm four bays, besides the apse, which had a surrounding aisle, and was flanked with two small towers.

Its length, independently of an eastern chapel,

was 485 ft.; or, including this chapel, 530 ft. The length of its transept was 225 ft. (it was double aisled, that at St. Alban's being unaisled), dimensions which exceed those of St. Alban's, and leave those of Lanfranc's metropolitan church far in the background. The width, too, of the nave and its aisles was greater than that of St. Alban's.

The architecture of this vast temple was of stern simplicity, though, being carried out in stone, it was much more fully developed than that of St. Alban's. It was, in fact, a full and typical development of the Early Norman, with every feature complete, though all in their plainest garb.

All which now remains of this date is the transepts and the crypt of the eastern arm, and they may be described as the text-book of Norman in its earlier form. The transepts, as before-stated, were doubly aisled, and (as at Canterbury and at Caen) a gallery crossed the outer bay of each, supported on a massive round pillar, so as to render the upper aisle continuous.

The plan of the piers of the transept, which probably gives us also that of the rest of the church, is very perfect and typical.

Their figure may be generated by the process I have described in my last lecture. Take a block of wall about half as long again as its thickness; cut out from each of its angles the recess of an order; substitute half or three-quarter shafts for the part which supports each order; and the pier proper is complete. It still needs, however, supports for the vaulting of the aisle on the one side, and for the central roof on the other. The former is given by adding to that side a pilaster of equal size with the transverse rib of the vaulting, and substituting for its front portion a demi-shaft; the latter (as a similar projection with the addition of two smaller shafts on its flanks. Nothing could be more perfect or more typical than this arrangement. The capitals are everywhere of the cushion type, in its simpler form. The arch-orders square, and without labels. The entire height of the wall being divided into three, the upper, or clearstory, may be said to occupy one-third; the remainder being divided between the great arcade and that of the gallery or upper aisle in the proportions of about four and three.

The gallery, or triforium pier, is similar in plan to that above, but the arch is divided into two widths, in the sub-order, by a central shaft bearing two smaller arches. The clearstory, in its more typical hay, is divided into three widths by small shafts, the side spaces being low arches, and the central one being considerably elevated, and containing the window.

Through this story passes the passage through the thickness of the wall, which ought more properly to be called the triforium.

The transept elevation is divided vertically into two compartments by a large pilaster buttress, both without and within, and is externally flanked by similar buttresses. In height it is divided into three stories, ranging with those of the interior, already described, the aisles naturally containing two of these stories; the upper of which has small windows in the sides, and large ones in the gables. The windows are (as a rule) shafted singly, without and within, with a deep layered jamb filling the interval. Those of the upper story of transepts fronts are arranged internally to correspond with the clearstory. The gable of the south transept is enriched with intersecting arcades.

Unfortunately, the central tower, of the Early period, fell shortly after its erection, rebelling, as it was thought, against the ungrateful task of overshadowing the body of the detested Rufus.

This untoward behaviour has had the effect of rendering the work imperfect; for, had the crossing remained, one could supply the choir and nave with a fair amount of certainty. As it is, we cannot make any imaginary restoration, for the whole of the centre, with the adjoining bays, has been rebuilt in a Later Norman style, influenced by a morbid fear of a second catastrophe, which led to an undue bulkiness in the piers, where better foundations and harder material would have supplied sufficient security. Let us hope that no second Rufus may be buried beneath the shadow of our precious monuments of art-history! The tower, however, as rebuilt, is a noble work, though of small height. That such sturdiness of proportion was not viewed as essential to the style, we have practical proofs at St. Alban's, Tewkesbury, and Norwich; so we may safely conclude that, like the needless bulk of the renewed piers, it was the result of the

feared that their tower would again refuse to canopy the red-haired king, who still lay in the midst of the church, though removed a few feet from being under the tower.

The crypt, which gives us the form of the original sanctuary and eastern chapel, is a fine example of the Early Norman where used for simple purposes. The columns bear some resemblance to those of King Edward's work at Westminster, though much lighter. Their proportions, however, cannot be seen, owing to their being buried deep in earth, which is, I am sorry to say, not the only barbarism for which the chapter there are responsible.

The nave, as is so well known, was converted into another style by Wykham and his predecessor, Eddington; the last-named of whom must, I suppose, have destroyed the two western towers, if ever they had been carried up. We know them only by their foundations.

In the same county are the two noble ministers of Christchurch and Romsey, the former of which I will mention presently; meanwhile I will carry you in thought to Ely, where Wallydn's brother, Abbot Symeon, undertook, a little later and in his extreme old age, the reconstruction of his abbey church on a vast scale. The parts built or commenced building by Symeon were the eastern arm, the transepts, the central tower, and probably a bay of the nave; for, he remembered, the eastern arm was, not in those days, as afterwards became customary, the choir, but rather the sanctuary, or, more correctly, the sanctuary and presbytery conjoined. The choir,—that is to say, the stalls for the monks or canons who sat in choir,—was under the central tower, and often ran a little into what we call the nave. It resulted from this that, in cases where funds did not permit the completion at first of the entire building, it was customary to build from the east end up to the second or third pillar of the nave, so as to provide for the actual requirements, and also to give an abutment to the central tower.

Abbot Symeon's plan was formed on the largest scale. His transepts had each four bays in length, and, like those of his brother's church at Winchester, were aisled on both sides. He also built the gallery across the transept, as at Canterbury and at Winchester. His eastern arm was of four full bays, added to which was a smaller bay and an unaisled apse. The aisles of the eastern arm were square-ended. The pillars of the transept were generally round, though in some cases clustered, and their capitals were totally different from those used by his brother, being a quaint reminiscence of the Corinthian.

The proportions of the interior, in point of height, differ from those of Winchester; and it would seem, that the height being divided into three, one was here given to the gallery or triforium, the remainder being divided between the great arcade and the clearstory, with proportions of 4 to 3; so that the main arcade retaining the same proportion as at Winchester, there is more triforium and less clearstory, differences which were increased in building the nave.

The galleries originally built across the ends of the transept were removed during later, though still Norman, times; and an arcade of slight projection substituted. The clearstory differs from Winchester in the arches of the three openings springing at equal height, and the plans of the piers differ considerably. Those in the transepts (as before said) are round and clustered, the latter consisting of the customary group of three shafts on its lateral faces, with a single shaft at hack and front, for the vaulting and the roof, making together a perfectly uniform group of four larger and four smaller shafts. The round columns have a shafted pilaster attached to them on the side facing the aisle.

The nave piers are of alternating forms. The one is founded on the circular column, but has, not only the shafted pilaster at the back, as those in the transepts, but two shafts, to carry an extra arch order, in front, and a group of three running up to the roof. The other form of pier is like that at Winchester, with the addition of an extra order, and has the triple shaft running up to the roof, as that last described.

The triforium piers are very similar, though lighter, excepting that the round pillar has lateral shafts to carry the subarcuation. All the orders are moulded.

How far the general plan was laid down from the first by Symeon is not known, but it differs from other cathedral and abbey churches in having a magnificent transept at the west end. Whether what we call the foundations of towers

at Winchester may have been a foreshadowing of the arrangement I cannot judge; but from its extraordinary scale (far exceeding that of western towers in general), I think it not unlikely. There was also some distant resemblance to this in the façade at Bury. Though, judging from the number of its bays, one would think the size of Ely and Winchester not very different, there is a disparity in the essential scale, which causes it to fall far short of the dimensions of Walkely's church. The widths of naves from centre to centre of piers are respectively, 42 ft. 6 in. and 37 ft. 6 in.; and that of the bays, similarly measured, are, about 22 ft. and 19 ft. 9 in.

The nave is of thirteen bays, besides the western transept. These parts were added in the course of the twelfth century, making the whole length (not measuring the west porch added in another style), about 420 ft., the transept measuring about 190 ft. in length.

There was, of course, a central tower as usual, but there was a second tower of great size, and probably of greater height in the middle of the western transept, which transept was flanked at its angles, with vast polygonal stair turrets, and had large and noble apsidal chapels projecting from its eastern sides. These parts are in the transitional style, which I do not touch upon during this session; but I may here say that, whether projected from the first or not, a more magnificent addition to the usual features of a great cathedral or abbey church, can hardly be imagined, though what its effect was when the central tower existed, and the western one was crowned by a vast leaded spire, one can hardly now appreciate.

Abbot Symeon's tower had the same radical weakness with that built by his brother, and though it lasted longer (having no Rufus heathen it) it at length gave way, and was succeeded by the remarkable structure now forming the unique centre of the glorious temple. The transept and elevations are not unlike those at Winchester in general distribution of parts.

Of doorways, windows, &c., I will not now treat, though some of the latter are of great beauty. Were it not that I limit myself during the present lecture to buildings begun during the eleventh century, I should here have noticed Peterborough, whose eastern end was a manifest imitation of that of Abbot Symeon. I exhibit some excellent illustrations of the architecture of that magnificent church, but must reserve my description of it for another lecture.

Abbot Symeon died at a hundred years of age in 1093. Of what a long course of events had he been a contemporary or an eye-witness! He might have remembered the congratulations called forth by the failure of the prognostications of the world's ending in the year 1000. A relative of the dual family of Normandy, he might have witnessed, when in early manhood, the arrival of Ethelred and Emma with the destined king, confessor, and saint, when they fled from the ravages of King Swayn; and he might have even directed the education of the Confessor-King. In architecture, he might have watched almost from its rise the development of the Norman style, and have assisted, when at early middle age, at the consecration of Duchess Judith's Abbey Church at Bernay, which is now our earliest specimen of what was then the rising art of Normandy, and long subsequently became that of England, and of which he and his brother,—now in their old age,—had become respectively the founders of two of the noblest examples.*

COMPARATIVE ALTITUDES.

I beg leave to supplement the article on comparative altitudes, by drawing attention to some places that have escaped the notice of "A. J.," and which, with some additions, I will endeavour to make by running up the levels along the different lines of railways and canals, we may arrive at the comparative altitudes of the principal places in the country; and if, perhaps, from untoward circumstances, I am unable to complete the series, perhaps some of your scientific readers will render us aid, so that your journal may possess a complete record of the altitudes of the cities, towns, &c., throughout the country.

Should we succeed in obtaining this information, on correct and trustworthy data, it is to be hoped that the surveyors of the different towns

* To be continued.

will make the addition to the sections of the towns by adding the sea level as a common datum, where sections exist, as in several cases that have come under notice it has been found that the inclination is only marked on the plans, and sections are altogether dispensed with. This is one of the serious innovations introduced by the staff of the late General Board of Health.

I have carefully looked through the reports of the general Board of Health for the year 1849 and subsequent years, and find no allusion made, except in one instance in the report on Penrith, to the subject of the altitudes of towns, although that must be matter worthy of consideration, and must exercise a marked effect on the public health, as it seems to regulate the state of the atmosphere, the hygrometric condition of the air, the rainfall, and other meteoric causes; and it would be a subject of curious and interesting inquiry to make a careful analysis of the death-rate in our towns, looking more particularly at their physical site and their comparative altitudes. On the subject of altitude and climate, an eminent medical authority observes, there are three degrees of altitude in eminences to be considered, namely, the moderate mound, the high hill, and the lofty mountain: the mound is a small eminence, while the hills in England rise to varied heights. According to their heights so the air differs in degree of temperature, which is readily ascertained by a barometer.

But we have no instrument to ascertain in what degree one air differs from another in medical quality, since the composition of the atmosphere appears to be merely the same on all parts of the earth and ocean; but we know from observation that there are great differences in the air as well as climate, as far as the effects on the human frame are concerned. When the hill is of moderate height, lying open to the south, and backed by others in the form of a crescent, such a spot would be pronounced salubrious and bracing; when it is lofty, open, and exposed, such a situation would be severely felt, and on the tops of the mountains it would be insupportable, arising from the lightness of the atmosphere.

The objections to climates in valleys are,—they produce many complaints when shut in with high ridges of barren sides, the cold draughts and the reflected heat of the sun produce a variety of diseases, the high ridges prevent free circulation, and the hot sun beats down and creates a complete focus of heat, and extracts from vegetation and humidity a prodigious amount of malaria.

The place is not open to those objections where the ground gradually slopes to the south, with a gravelly substratum. There the climate is thoroughly beautiful; but when it is low and flat, and on a clayey soil, it is then objectionable and unhealthy.

But this is subject matter, I fear, that has not been sufficiently considered by us, nor dreamt of in our philosophy in the consideration of, and in the selection of the sites for, our cities and towns; and we are now many of us paying the penalties this ignorance and want of foresight has entailed, as just now in the middle of the nineteenth century we are endeavouring to remedy gross sanitary abuses, that are rendered difficult, if not almost impossible, by the injudicious sites and physical climates selected for our towns.

"To build, to plant, whatever you intend,
To rear the column, or the arch to bend,
To swell the terrace, or to sink the grot,
In all let Nature never be forgot."

I beg to add a few additional altitudes I have obtained, and hope shortly to send you others procured from the ordinates and levels of our railways and canals:—

Boston	30 ft. above sea level.
Gosp. rt.	30 "
Plymouth	30 "
Chiswick	25 "
Tottenham	50 "
Penzance	40 "

Rockdale	500 "
Marple	531 "
Lanark (Scotland)	600 "
Chapel-en-le-Frith	1121 "

ACKNOWLEDGING with thanks your aid in launching this subject, and gratified by the remarks educed, I wish to explain the "some-what ambiguous term" alluded to. "The mean level of the sea at Liverpool," to which my figures all refer as a common datum level, is a plane as nearly as possible 10 ft. below high water-mark, and 10 ft. above low water-mark. If, therefore, "B. B." will add 10 ft., he will find that his figures and mine very nearly agree. For comparative altitudes it matters not what datum level is adopted, if that one be adhered to. The figures I have given before, and now append, will probably incite some in *stati pupillari* to level across to other points, and thus information may be extended beneficially. It has always seemed to me that several considerations are involved in this question of altitudes, and I hope to treat the subject comprehensively very soon. Meanwhile I shall be glad to see facts, figures, and opinions from correspondents. The statistics which accompany this letter, grouped as before, show at a glance the undulating features of this island, which is called flat. Certainly it is unlike Abyssinia, where our troops have had to mount 9,000 ft. before they really entered the country; but probably very few who have read Her Majesty's book know that Balmoral Castle stands 900 ft. above Buckingham Palace.

EXCAVATIONS ON THE PALATINE.

BEFORE the commencement of the works on the Palatine Hill, 4th November, 1861, in that Farnese estate purchased from the ex-King of Naples by the Emperor of the French, at the price of 18,000l. sterling, little of systematic or persistent effort had been dedicated to the search after antiquities on that classic site. It appears that the buildings here served for the last time as a royal residence A.D. 500, during the brief stay of the Ostrogoth Theodoric in Rome; but it is supposed that, till so late as the twelfth century, the newly-crowned German emperors used, in some instances at least, to hold their state banquet, after the coronation ceremony at St. Peter's, in these decaying halls. The general conclusion is that, from some period within the eighth century, the aggregate of these imperial edifices was abandoned to the natural process of decay, already, no doubt, despoiled of its portable treasures in the invasions of northern barbarians; but, as we may affirm with like certainty, exposed to much greater injury, affecting all that remained in ancient architecture, at all serviceable, from the deliberate and cold-blooded spoiliations by Roman citizens, the turbulent baronial families, and perhaps, also, some of the Popes, alike unscrupulous, within Mediaeval periods. It was about the year 1536 that Paul III. founded the villa, with extensive gardens and a summer residence called, after his family, "Orti Farnesiani," for which Vignola, Sangallo, and Brambrotti were engaged to make designs, and in which that pontiff accumulated great store of artistic wealth, sculptures from the Antonine thermae, and from other classic ruins; a museum, all whose contents were finally transported to Naples after the Farnese line had become extinct, and its property then inherited by the Bourbon dynasty of the Two Sicilies. The only noticeable works for antiquarian objects carried out on the Palatine by the Farnese owners were those ordered by the Duke of Parma, 1720-28, and described in the "Palazzo de' Cesari," by a learned prelate, Mgr. Bianchini (Verona, 1738), subsequently to which nothing of the kind was attempted on this part of the Imperial Mount, till it had passed into other hands. Adjoining this Farnese estate is the villa, with large gardens, formerly of the Dukes Mattei, but later purchased by an Englishman, Mr. Mills, who built the ugly and conspicuous mansion called after him, and now owned by a consequence of which proprietorship neither honors nor grounds can now be visited by the public. According to some learned writers, and inferable also from the character of the ruins here brought to light, that same Villa Mills occupies the site of the palace of Augustus, built for him by public subscription after the modest mansion of his forefathers had been destroyed. Curious is the story of explorations on that now conventual estate, exemplifying the unsystematic senseless manner, though with some fits of transient zeal, in which such undertakings used to be carried on in Rome. Among other eye-witnesses, Flaminio Vacca tells (in his "Memorie," written 1594), of a gateway with marble jambs, 40 ft. high, a niche lined with African marble, and a colossal head of Jupiter in basalt, found here in his time; that bust having been purchased by himself, and therefore lost to the Roman public. Santi Bartoli tells of diggings made about the middle of the seventeenth century, that led to the discovery of a spacious hall, subterranean, entirely hung with tapestry of woven gold, but which discovery was soon reduced to dust on the admission of the outer air; also another chamber, with walls encrusted with finely-beaten laminae of silver, that seemed to have been ornamented with designs or reliefs, but all which precious material passed into the hands of traders, or into those of a certain cardinal's servant, the first purchaser to present himself! And the same antiquarian writer mentions also the mutilated statues, the fluted columns of *giallo antico*, seen by him among this treasure-trove—all eventually swept away!

The first published plan of the Palatine ruins was drawn up, but far from completely, by Buffalmi, about 1550; the next, with more exactness, later in the same century; another, satisfactory in regard to what had hitherto been discovered, by Bianchini, in his above-named "Palazzo de' Cesari"; and lately, we have seen the map of the buildings, with the entire ground, now the area of the works ordered by Napoleon III., prepared with skilful execution by Sigismondo Rosa, director of those works.

To conclude our survey of discoveries on the Palatine in past time. Most important were those due to the undertakings of a French abbe, Rancoreil, 1777, in the Mattei (afterwards Mill's) Villa, reported in the "Monumenti Inediti," v. ii. Behind this mansion were opened, at some depth below the actual level, buildings of such extent and character as to give the idea of a residence truly imperial, in two stories; among the numerous chambers being found four circular, one octagonal, also two circular edifices with fountains in the midst, two atria with colonnades, three spacious interiors with hemicycles or exedrae, on opposite sides, and with tiers of niches along their lateral walls; three quadrilateral halls, also provided with rows of niches (no doubt for sculpture), a small but richly-ornamented bath-room, six chambers entered from a ovoidium, a peristyle communicating with other interiors,—in fact, such a labyrinth of buried and magnificent as the explorers might have fancied themselves in an enchanted palace. Beautiful also were the remnants of art in these underground retreats, the fragments of statuary in the circular halls, the stucco ornamentation of vaults, and the paintings, Tritons, Sirens, and flowery patterns on wall-surfaces, besides numerous capitals, friezes, and remains of pavements in precious coloured marbles. Two statues of Leda (the finest of which found its way to England) and the Apollo Saurochthonos were the most precious and best preserved of artistic treasures thus disinterred. The illumination of the lower story by skylights with marble gratings seemed to confirm the notion that that part had from the first been subterranean, and used for refuge from the summer heats. Will it be believed that, though an intelligent ecclesiastic was directing these works, almost the whole aggregate of moveable objects,—capitals, friezes, cornices, pavements in rich materials,—was carted off to be sold to marble-cutters on the Forum? And the French abbe, strange to say, caused the entire upper story of those ruins to be demolished, the greater part of the lower to be again filled with soil (as when first opened), and only three among the principal halls left disencumbered,—these being now accessible to the Visitandine nuns alone. The estate on the north-western slopes of this hill was purchased by the Russian Government; but some years since given back to the Roman, by whose order works were soon afterwards undertaken, and slowly carried on in ensuing years on that ground. Here was laid open, 1847, a considerable extent of walls in enormous square-hewn blocks of lioid tufa without cement, supporting the declivity like a buttress, and evidently the remnant of fortifications, which, whether or not actually referable to the city of Romulus, are assuredly the most ancient ruins of this character in Rome; and later we have seen the soil several small chambers, supposed to have been the lodgings of soldiers, with curious graffiti, proper names, and sentences in Latin or Greek, scratched on their walls; among these, that extraordinary representation so much noticed at the time, referred by archaeologists to the time of Septimius Severus, and since transferred to the Museum of the Collegio Romano, a caricature of the Crucifixion, with a figure standing below in act of saluting, the victim on the cross having an ass's head, and the words rudely traced below, in defective Greek, "Alexamenos worships his God!" With the recent works on this side of the hill should be classed those under the neighbouring church of St. Anastasia, where a large extent of chambers and passages, referable to different dates, have been opened; most noticeable of all things here found being other portions of fortifying walls in stonework masonry,—the best preserved, and in every sense most important remnant of the ancient civic defences, no doubt among those of highest antiquity, yet known to explorers. Along the southern and much of the western slopes of the hill extend several gardens and vineyards held by different proprietors, in great part by the English College, till purchased; a few years ago, by the Roman Government, in order to the carrying on of works here also, and in the result of which much that is interesting may now be reported. Within the estate formerly owned by that college rise the noblest and most conspicuous ruins, that so imposingly crown the western hill-side above the road towards the Porta Appia, and are probably the latest among additions to the imperial buildings, due to Septimius Severus, and the last inhabited in Mediaeval periods.

Encouraging proofs of awakened interest and enterprise have, at all events, been supplied, with promise of ample reward both to French and Roman undertakings on this classic mount, beyond what could be foreseen in the days when Goethe roamed at large over solitary kitchen-gardens planted with artichokes, helping himself *ad libitum* to the precious marbles strewn at his feet on the Palatine in the year 1786.

Rome.

BRITISH ARCHAEOLOGICAL ASSOCIATION.

At the meeting of the British Archaeological Association, on Wednesday evening last, Mr. G. Godwin, V.P., in the chair, Mr. Vanderpent exhibited a bronze urn, said to have been exhumed in the Etrurian Necropolis at Perugia. It consists of a small oblong tomb, containing an urn, and surmounted by a seated female figure. Only one other similar urn is said to be known, and this was in the museum of the Hermitage at St. Petersburg. The urn exhibited was supposed to commemorate Tanagulla, wife of Tarquin, the fifth king of Rome. Some doubts were expressed as to the genuineness of this object. Mr. E. Roberts said some of the letters of the inscription were not Etruscan, and some of the ornamentation did not seem of the time supposed. Doubts as to the composition of the bronze were also expressed; and the discussion was adjourned to the next meeting. Mr. Holt exhibited two fine wood carvings, which had been presented by the carver, Hans Springenkle, to Albert Durer on his fifty-third birthday, 1523, and read a paper upon them. Mr. Cuming exhibited the wedding-ring of Martin Luther, which was adorned with Christian symbols, and engraved within with the names of Martin Luther and Catharine Boven. This ring belongs to Mr. Frederick Gause, banker, of Vienna, and has been in his family for 250 years. Mr. Irving read a paper on seals of the borough of Lanark, on one of which was a falcon, which he supposed to refer to forest-rights. Mr. Planché thought the bird to be no falcon, but a spread-eagle,—a two-headed eagle, in fact,—which it was now well known had had its origin in the division of arms; being, in truth, the putting together of two similar halves of an eagle. Mr. Greville read an interesting account of the remains of a Roman villa at Chedworth, where he seemed to think there were strong traces of early Christianity. The chairman announced that the Annual Congress would be held at Cirencester, from the 3rd to the 8th of August, and that Lord Bathurst had undertaken to preside.

GLASGOW ARCHITECTURAL SOCIETY.

The usual monthly meeting of this Society was held on the 17th inst., Mr. Honeyman, president, in the chair. A paper was read by Mr. W. Forest Salmon, architect, "On Roofs and Chimney-heads." He thought it a mistake to regard the cornice as the finish of a building, above which any kind of ugliness might be placed; it would be much more conducive to pleasing picturesqueness and variety if no attempt were made to make street buildings harmonize with those adjoining them. Each building should be treated independently, and the parts above the cornice should bear an important part in the expression of its individuality, and were therefore worthy of most careful study. He alluded more particularly,—1, to the junction of roof and walls; 2, to the roof itself; 3, to chimney-heads; and 4, to the junction of buildings of different heights.

Mr. A. Thomson thought that where it was practicable one design should embrace a number of houses, and that breaking up the sky-line by irregularities was not desirable where it could be avoided. He thought that practically the design was crowned by the cornice, and that any building which was much indebted to its roof for effect could not be of a high style of art.

Mr. Douglas did not agree with Mr. Thomson in this last remark; at the same time, he admitted that in the grandest architectural remains the roof is utterly ignored. In regard to towns in general, and Glasgow in particular, he might say that practically we had no choice, we were so tied down to uniformity by feu charters and dean of guild court regulations. If a man proposed adding a story to his house he was

at once interdicted; and perhaps it was as well, because such varieties could not be indulged in without great risk of making a blow down in our neighbours' vents, and then the chief variety of sky-lines would be produced by very picturesque arrangements of chimney-cans!

Mr. Bromhead thought that the cost would be found to be the great difficulty; and in this Mr. Howatt agreed, pointing out that the chief ranges of buildings were got up by speculating builders, without the assistance of any architect; and that the cost was slaved down to the last farthing.

Mr. Kennedy thought that the erection of a blocking or parapet along streets should be made compulsory.

The Chairman remarked that he could not understand Mr. Salmon's remarks as applicable to the streets of a city generally. Obviously there were localities where a picturesque style and treatment was not only admissible but most appropriate; and others where anything of the kind would be quite out of place. We should study the requirements of each, recognising the propriety of a difference. He thought a striking instance of a total disregard of this, and the result, was to be seen in the business part of the city of London, which has in so great a measure been reconstructed of late years. He could not understand how any man in his senses could design a magnificent Italian palace, with elaborate frieze and hold overhanging cornice, for an insignificant strip of frontage of 25 ft. or 30 ft. in a narrow street.

NORTHERN ARCHITECTURAL ASSOCIATION.

The annual meeting of the Northern Architectural Association was held on Tuesday, the 18th, in the Old Castle, Newcastle-on-Tyne, Mr. Green, the president, in the chair. The report, read by the secretary (Mr. Thos. Oliver), stated that the number of members amounted to 51. The income of the year had been 13l. 10s. 11d., and the expenditure, 9l. 8s. 5d., leaving a balance of 4l. 2s. 6d. in the hands of the treasurer. The arrears in subscriptions amounted to 25l. 15s. 6d.

The secretary said that between 2,000 and 3,000 persons were, through their respective associations, in connexion with the Architectural Alliance, and all of them adopted one uniform scale of charges. Prior to the Alliance adopting that scale every town had its own scale; but now they had uniformity of practice, and did not undersell each other. The Alliance had also taken up the question of having a uniform mode of measuring artificers' work throughout the United Kingdom, but the matter was in abeyance. Another subject which had been considered was the insertion of an arbitration clause into contracts, and of quantities forming part of contracts; but this matter was also in abeyance.

A subscription of 5l. 5s. was voted to the Architectural Museum, London.

The president delivered an annual address, and concluded by suggesting the formation of an architectural library, a school for drawing, modelling, and carving—say in connexion with the School of Arts,—the formation of classes for obtaining a complete mastery of the natural sciences and of languages, in order that they might be able to keep ahead of the time.

Mr. F. R. Wilson, of Alnwick, read a paper on "Dangerous Methods of Construction in the North." He said he would not have taken upon himself to point out some important errors in the present modes of construction in use in the building trades, if he had been, as it were, to the manner born; but having had considerable experience in construction in the South, the imperfections in question, more especially the want of extra care to meet climatic conditions, struck him more forcibly than they might otherwise have done. They were bound to protest against the use of any mode of construction that did not fulfil every condition likely to insure stability and prevent casualties. He first referred to a common method of building stone walls, which was fraught with much evil. Leave a builder alone, he would build up the wall hollow within, throwing into the interstices loose rubble as he went on, which should never be done in this climate. Every course should be well grouted together. He found that some North-country builders, in building brick walling, after a few courses, laid their

bricks only at the edges of the wall for a height of a foot or more, and filled up the hollow space with loose rubbish; and then, after another course of solid brick-work, would repeat the hollow one. It had been more than once called to an alarm of fire in consequence of this mode of forming boxing for hearths with wood. A crack in the hearthstone, or a widening of the division in it when formed of two stones, admitted of hot ashes falling through on to the timber, till at last it smouldered. Hearthstones should be of one piece, and should always be laid upon brick or stone arches. Chimney-stacks should be made more substantial, and slates should be fastened more securely on roofs. In this humid climate, and with the porosity of all the stones of the North, no external walls, or walls communicating with external walls, should be plastered on the inner side without being stoothed, in order to do away with damp walls. He also advised more attention being paid to gutters and drains. These, he said, were some of the items of construction in every-day use among builders, which militate against the interests of the architect, and which were fraught with danger to the public; and the unfortunate system which had grown up of reducing the cost of everything to its uttermost limit was the moving cause of the defects he had noticed.

FROM SCOTLAND.

Edinburgh.—Mr. Dobie, painter and decorator, offered, some months since, to the journeymen house-painters and decorators of Britain a number of prizes for the best designs for wall-decoration. A large number of competitors entered, and their productions have been on view for several weeks, and have attracted much attention in the trade. The drawings were submitted to the following gentlemen, who acted as judges: Messrs. J. Dick Peddie, James Ballantine, John Nisbet, Edinburgh; R. Dow, Perth; and J. B. Bennett, Glasgow. Their decisions were as follows:—

Drawing Room.—1st prize (20 guineas), William Lucifjens, Glasgow; 2nd (10 guineas), Alexander Girldwood, Edinburgh; 3rd (5 guineas), Matthew Hislop, Langholm.

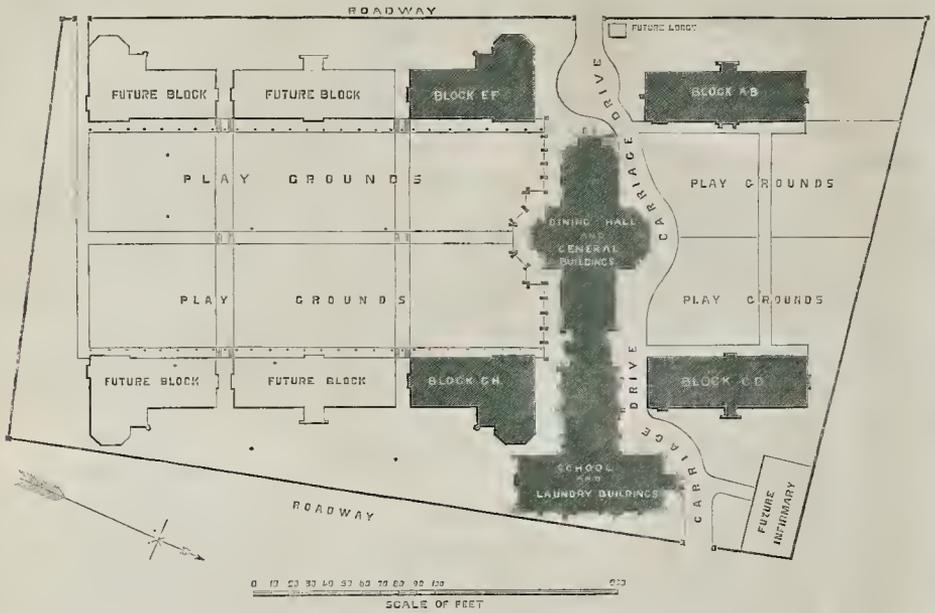

Dining Room.—1st prize (10 guineas), Alexander Girldwood, Edinburgh; 2nd (5 guineas), William Lucifjens, Glasgow; 3rd (2½ guineas), Andrew Wells, Glasgow.

—The committee of the Scottish Society of Arts or Technical Education have arranged that a conference shall be held in Edinburgh, on Friday, the 20th of March, and an invitation will be issued to those gentlemen who take an interest in technical education.

Glasgow.—The proposal, which originated in the town council some months ago, to open two new galleries in the Corporation Buildings with an exhibition of portraits of worthy citizens and distinguished countrymen, now deceased, has been successfully carried out. The walls of the five new rooms and galleries are nearly all occupied by the paintings. There are 392 pictures in oil, 26 in water-colours, 15 in crayons, and 26 busts or medallions, executed principally by the best Scottish artists of this and preceding generations. The works of several eminent English artists are also represented. The Exhibition has been formally opened to the public.

SCHOOLS OF ART.

The Wolverhampton School.—A few gentlemen interested in this institution have met at the school, in Darlington-street, to distribute the prizes and certificates of merit among the more successful students during the past year. The distribution was made by Captain Loveridge, the president, Mr. Vincent Jackson, the hon. secretary, and Mr. Gunn, the head master. Captain Loveridge made a few appropriate remarks in reference to the importance of such an institution in a manufacturing town like Wolverhampton, and recommended the pupils to continue to attend the classes regularly, and to endeavour, by setting forth the utility of the institution to their friends, to induce them to become students. The local *Chronicle* says,—“The fact that this school is so little appreciated is almost unaccountable. It reflects no credit on many of the parents and young men, showing, on the part of the latter, a disinclination to improve themselves, and either unwillingness or inability to recognise the importance of endeavouring to maintain that superiority which English manufacturers have attained in

ALEXANDRA ORPHANAGE FOR INFANTS.—Block Plan.

foreign countries. One would think that as the subject of technical education is earnestly engaging public attention greater interest would be taken in the School of Art, and that there would be an increasing attendance of students."

The Sheffield School.—The annual conversation of this school was attended by a large company. The council, with the efficient help of Mr. Soules, the head-master, had gathered together a considerable number of first-class paintings and drawings for exhibition. The distribution of prizes took place in the large room on the ground floor. Mr. F. T. Mappin, the president of the council, occupied the chair. Mr. Bowler (of the Department of Science and Art) having been introduced by the president, referred to the action of Government. He reminded the audience that when the Sheffield School was founded it was one of a very few, but since then other schools had sprung up, so that where there were formerly some eighteen or nineteen receiving Government assistance, there were now about one hundred. The Government could not continue giving to individual schools of this increased number grants so large as the Sheffield School formerly received, although it was giving a larger aggregate amount. This had been the real reason for the change. The people of Sheffield had only to say the debt of their school should be removed, and the Government would help them. He believed the Government would pay 500l. towards it. As to the deficient annual income, the Lords of the Council had come to the conclusion that it was desirable to give further aid, and new minutes had been published within the last few weeks. This he hoped would increase the grant to the Sheffield school by about one-third. Possibly, if the debt were paid off, the council might, with this help, make both ends just meet, but the wealthy town of Sheffield ought to feel it a duty to increase its support to that institution.

ARCHITECTURAL EXHIBITION SOCIETY.—The annual general meeting of this Society is to be held at the House in Conduit-street on the 4th day of March next. A report and balance-sheet for the session 1867 have been issued.

THE ALEXANDRA ORPHANAGE FOR INFANTS.

The Alexandra Orphanage was founded in October, 1864, under the patronage of Her Royal Highness the Princess of Wales, who gives it its name. The charity originated in the thoughtfulness of a few friends for a long period interested in the welfare of the orphan poor. It was seen, in carrying out the designs of the Orphan Working School, that there was great need of a charity for the infant orphans of respectable but poor persons, whose incomes were insufficient to permit of their making future provision for their families; and this consideration determined those who first met in conference to convene a meeting of friends, which resulted in the formation of a committee, half of whom should be members of the parent society. In the space of two years and a half ninety infant orphans have been presented for admission, of whom sixty have been elected. The purpose of the charity is to receive orphan children from earliest infancy to the age of five years, and to board, clothe, nurse, and educate them until they are eight years of age. The object and design of the founders of the Alexandra Orphanage being that its benefits shall be extended to all necessitous infants, it is to be distinctly regarded as of the very essence of the charity that at the present time and in all future times no religious distinction of any sort shall be introduced, either as a qualification for admission or after admission; and that while it is fully intended that the children shall have a Scriptural education, no denominational rules or catechisms whatever shall be adopted.

The institution is situated on the rising ground of Hornsey, occupying an area of about 500 ft. by 300 ft., with a rapid descent of 60 ft. from the high-level to the base of the hill.

The desire being to provide for separate sectional supervision, closely allied with a centralization of the whole, as the first requirement, the ground is allotted for separate detached buildings of cottage blocks, arranged symmetrically in the form of a double quadrangle, of which the main buildings, for dining-hall, schools, and offices, form the central point and feature of the design.

The cottages are arranged in couples, providing separate homes for twenty-five infants each, having its own accommodation separate and distinct, and arranged with playground or garden, terraced, to meet the accommodation level in the face of the ground. Each cottage provides a day-room, two dormitories, with nurses' rooms, lavatories, and bath-rooms: provision is therefore made for a total accommodation of 400 infants, when the whole scheme is carried out in the sixteen proposed cottages.

The quadrangle provides to each block a separate recreation ground, and access to a covered corridor communicates with the school-rooms and dining-hall in the centre.

The central buildings include the principal centre of dining-hall, matron's house, and domestic offices, on a terraced level with a cloister, communicating immediately with the cottage corridors. The schools on the east are approached in the same way, and will shut on the Sunny-side-road.

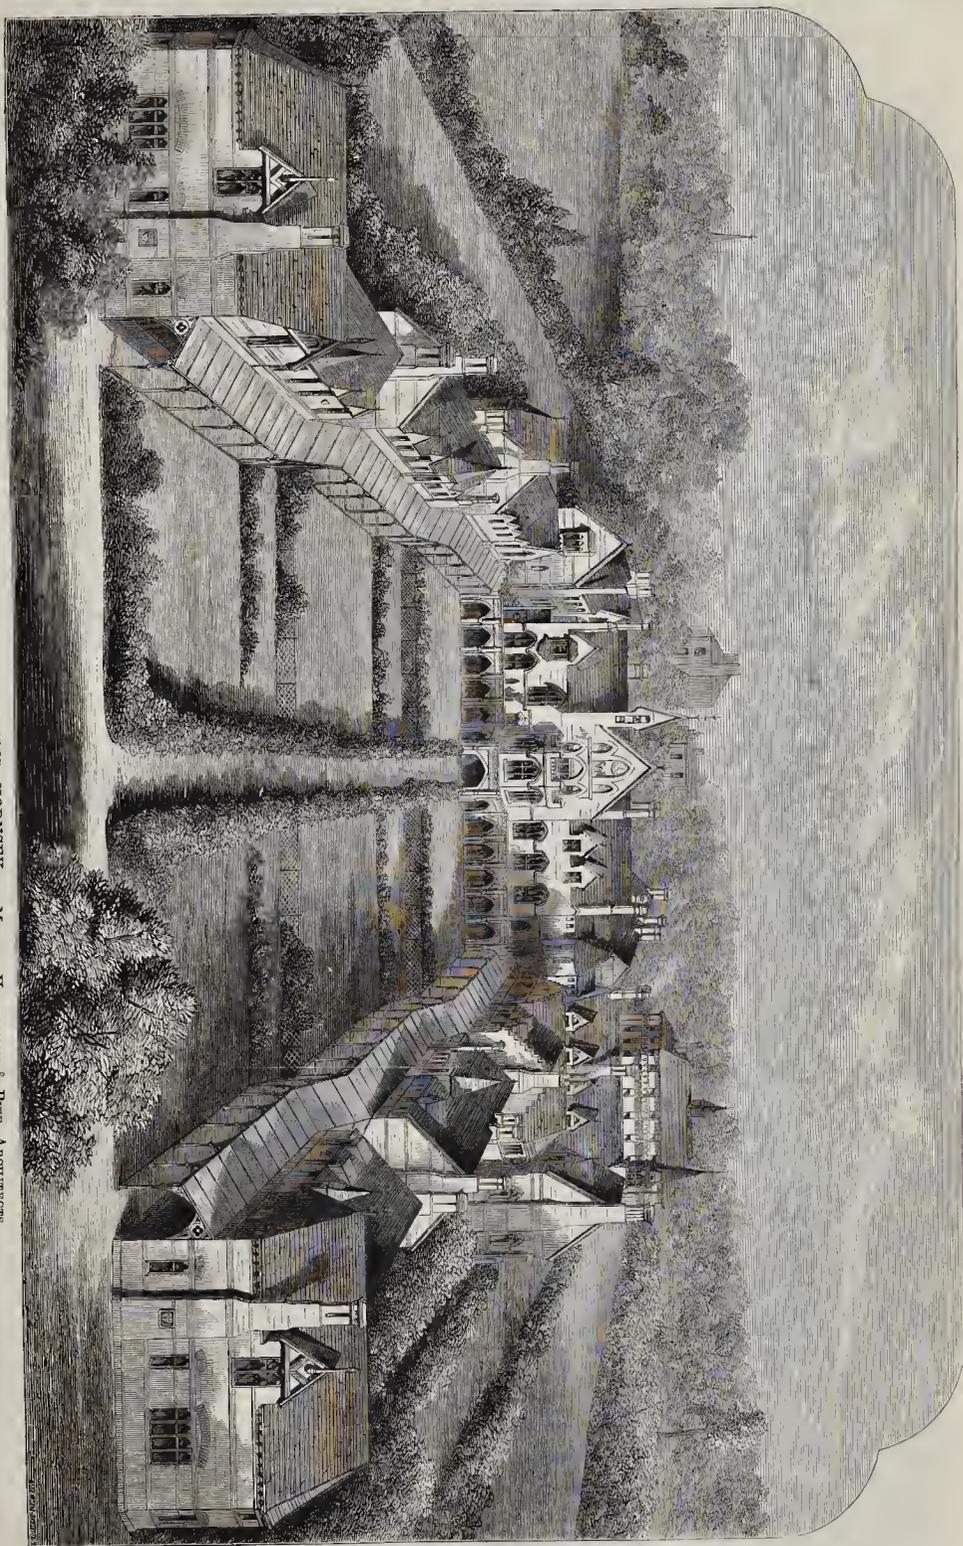

The infirmary is placed at the extreme boundary of the freehold property, and is to be erected on the principle of adapting a Swiss cottage exterior and plan to the requirements of the institution. This building will have a verandah, carried up to the eaves of the roof, and giving to three separate floors independent access, by external staircases, to the three wards, so that in all contagious and epidemic diseases the separation may be perfect, and consistent with the requirements of such an institution.

The general style of the buildings is Domestic English Gothic, of varied character to each block, the whole being proposed for execution in ordinary brickwork, with freestone dressings.

The estimated cost of the present undertaking is 15,000l.; while eight cottages will yet remain for future addition, at an estimated cost of 500l. each. Messrs. W. G. Habershon & Pite are the architects.

The first stone of the eight cottages now erected was laid by the Duchess of Sutherland, on the 6th of July last, when Earl Granville took a considerable part in the proceedings.

We have pleasure in mentioning Miss Elizabeth S. Soul as the indefatigable hon. secretary of the ladies' committee.

ALEXANDRA ORPHANAGE FOR INFANTS, HORNSEY.—MESSRS. HADENSON & PITT, ARCHITECTS.

ACCIDENTS.

The Fire at Charing Cross Railway Station.—In the half-yearly report of the South-Eastern Railway Company, the directors state that the cost of restoration and improvements (by the use of unflammable materials and otherwise) rendered necessary by the fire at the custom-house building at Charing Cross Station on Tuesday last, as estimated by the engineer, will not exceed 4,000l.

Fall of a large Chimney at Halifax.—A mill chimney, in course of erection, and which had attained an altitude of 40 yards, has fallen at Lee Bank, Halifax, doing much damage to two adjacent mills. The accident happened on the premises of Messrs. W. H. Rawson, who have just completed a seven-story mill, which, with an adjoining mill, are about to be occupied in cotton spinning. Until within a few minutes of its fall, the chimney was considered quite safe. It, however, was observed to oscillate several times, and two masons were in consequence called from the top. They had been down only about ten minutes when the chimney fell at its full length. A slip at the foundations, it is thought, must have led to the fall of the structure, which was of stone, having a 6-ft. flue.

Accident at the New Exchange Works, Manchester.—The site of the intended building is one immense sand-pit, and workmen are now engaged in excavating the sand and carting it away, for the purpose of allowing the foundations to be put in. Adjoining Market-street the foundations are carried to a depth of about 20 ft. below the level of the street. Three excavators were engaged in one of the sandpits when a huge mass of sand slipped, causing the wooden supports to give way, and the three men were buried up to their waists in the sand. Fortunately, the wooden supports fell in such a manner as to serve as a protection to the heads of the men. Mr. Marshall, the clerk of the works, and Mr. J. Alcock, the gang foreman, with a number of men, set to work and rescued the three men from their perilous position.

Fire at the Limerick Gas Works.—During the prevalence of a most violent squall from the south-west, with vivid and constant flashes of lightning and a deluge of rain, the immense gasometer of the United General Gas Company, which contained 200,000 ft. of gas, was ascertained to be in flames, which burnt for an hour. The accident was occasioned by a strong gust of the wind having caused the gasometer to cant over against the gable of the wall where it was set; the wall gave way, and then the gasometer was blown entirely upon its side, the hasement stonework making a large breach of several feet near the lower water-rim, from which the gas rushed out, and, coming in contact with a lamp, caught the flame and lighted up. Nearly all the gas was burned out.

THE CONSTRUCTION OF VITRIFIED PORTS.

At a recent meeting of the Glasgow Architectural Society, Mr. Galloway in the chair, Mr. Honeyman read a paper "On the Construction of Vitrified Ports." After referring to the various theories of construction which have been propounded, he remarked that these entirely failed to account for the phenomena presented in the remains. He then proceeded to describe the vitrified fort on Dunskeig Hill, at the entrance of West Loch Tarbert, and certain peculiarities of construction there, which, with other examples, led him to the conclusion that the walls—some of which are fully 10 ft. in thickness and vitrified throughout—were constructed by a series of furnaces on the walls, not by the application of heat to the external surfaces. The paper was illustrated by numerous specimens of vitrified work, many of which were from the collection of Mr. W. Keddie. It is evident, he said, from the condition to which the most intractable rocks have been reduced—mica slate being frequently found converted into a material resembling pumice stone, light and porous; while green stone has been completely liquified, so as to glaze over and agglutinate the looser materials over which it has been melted—that the holders of these curious structures must by some means have applied an artificial blast to their furnaces. Mr. Honeyman suggested that the natives may have pressed into their service the gales of such a season as this. He thought some light might be thrown on the mode of construction if geo-

men who had an opportunity of visiting the remains would observe:—1. If the stones composing the walls had been broken down, or if they were smooth and round like boulders or stones worn by the action of water. 2. If they adhered in consequence of fusion, or because agglutinated by a fused material of a totally different character. 3. If the vitrification were more complete towards the outside, or otherwise. 4. If the walls showed any evidence of horizontal courses. 5. If there were any indications of transverse or longitudinal portions more completely calcined than the rest of the work; and 6. If the walls were more completely vitrified towards the north and east than towards the south and west.

A discussion followed, conducted by Messrs. Hart, Galloway, Mackinlay, A. D. Robertson, Michael Connal, and other gentlemen. It was considered desirable that the subject should be further investigated in the light of Mr. Honeyman's theory.

COMPETITIONS.

Darlington Union Workhouse.—On the 24th instant the Board of Guardians met, and decided the above competition. Mr. Wm. Lee, architect, London, was called in to assist in the selection, and the designs bearing the motto "Nota Bene" were selected as the best. The first premium of 40l. was awarded to these plans, and the author of them, Mr. Charles J. Adams, of Stockton-on-Tees, was appointed to carry out the works, which are to cost about 10,000l. The second premium of 30l. was awarded to designs under motto "Economist;" the third premium to motto "(A)" A in a circle.

St. Mary's Church, Lichfield.—The design selected for this church is by Mr. James Fowler, of Louth, and we understand it will be carried out at once under his direction.

THE ARCHITECTURAL ASSOCIATION.

The ordinary meeting of members was held at the Hoare in Conduit-street on Friday evening, the 14th instant, Mr. Lacy W. Ridge in the chair.

The following gentlemen were elected members of the Association:—Messrs. T. E. Cole, Alfred Bovill, and B. A. Mayhew.

Mr. J. D. Mathews (hon. secretary) explained, with the assistance of the black board, a plan which he had under consideration for improvements in the warming and ventilating of private houses by the introduction and circulation of waste heat from ordinary stoves. He also described (in connection with the same subject) certain improvements in the construction of gas-chandeliers, by which the light could be concentrated without shadow, while the noxious properties of the gas would be carried off without discolouring ceiling or spoiling furniture, pictures, &c.

The Chairman observed that the subject was one of such great importance, both in a sanitary and economical point of view, that he hoped the Association would be able to devote an evening to the discussion of it.

Mr. Tarver read a paper on "Symmetry from a Gothic Point of View," in which his object was to prove that the study of Gothic architecture relied as much on an observance of symmetry as Classic architecture, which he considered out of place in England, but to which the term is generally thought exclusively applicable; and he believed it was the too easy acceptance of this inference that had led to the astonishing vagaries in much modern Gothic work. By analyzing the terms "balance," "proportion," and "symmetry," he pointed out that the first referred to an instrument for testing the relative weights of two bodies, as, for example, to a centre flanked by twin masses in episcopio, and so to the design of most Classic buildings (Mr. Lovesdale supplemented this remark by the instance of a steel-yard, in which two bodies of different weights counterbalanced each other by being placed at different distances from the centre, as was the case in some Gothic examples); that "proportion" dealt with single features as much as could be comprehended in one glance; but that the term "symmetry" meant literally "measuring together," and might be taken in a more comprehensive sense than the others. He thought that balance was right when there was no reason to the contrary;

but that we should recognise the principle that symmetry should not be confined to the subdivision of a façade into two equal halves, or even to façades at all; but that it should guide the distributive form and size of every limb and feature of a building.

Mr. Potter, observing upon the new public Offices in Downing-street, designed by Mr. Gilbert Scott, said that in the upper rooms there was not that abundance of light which Lord Palmerston had declared to be so essential in all public buildings in this country.

Mr. Quiller contended that symmetry in Gothic architecture was not the balancing of the parts, but the proportioning of all the parts, so that the entire building might be harmonious.

Mr. Redgrave, while declaring himself unprejudiced as regards the rival claims of Gothic and Classic art, could not agree with Mr. Tarver in condemning the design of St. Pancras New Church, built by Mr. Imman. The spire was not, he held, so incongruous as it had been represented to be; although he was prepared to admit that the jumble of spires in the metropolis was anything but agreeable to the educated eye. Sir Christopher Wren's city spires were no doubt the most successful; but those who condemned St. Pancras spire on the ground that it represented one temple upon another, ought to know that there was a precedent in ancient art for such an arrangement. In his opinion the description of Classic architecture which ought to be encouraged was the Renaissance. There were many fine buildings in Italy in that style which would suit our climate very well, and which would be more appropriate than designs borrowed from the rigid antique of Greece. On the whole, however, he thought that Gothic architecture was that best suited to our climate. It had, no doubt, faults, but these might be avoided; and he held that it would be better for architects to study so as to avoid those hominies rather than to adopt a manner which might be described as a jumble of many styles.

THE INSTITUTION OF CIVIL ENGINEERS.

At the meeting on February 18th, the paper read was "On the Supporting Power of Piles; and on the Pneumatic Process for Driving Iron Columns, as practised in America," by Mr. W. J. McAlpine. The first part of this communication related principally to the experience gained in driving 6,539 piles, an average depth of 32 ft., for the foundation of the Government graving dock at Brooklyn, N. Y., when the support was mainly derived from the adhesion of the material into which the piles were driven, and slightly from their sectional area. The piles were in rows 2½ ft. apart, and at transverse distances of 3 ft., all from centre to centre; intermediate piles of tough second-growth oak being frequently employed. The main piles were chiefly round spruce spars, very straight, from 25 ft. to 45 ft. long, and not less than 7 in. in diameter at the smaller end, and on an average 14 in. in diameter at the larger end. From a record kept during the progress of the work, it was ascertained that it took two and one-third blows to drive each foot of pile, and that the distance moved uniformly diminished from the first to the last blow, ranging from 8 in. at the beginning to no movement at the end, the average distance moved by the last five blows being 1 in. A considerable number of the piles were driven by a Nasmyth steam-piling machine, with a ram of 3 tons, and a stroke, or fall, of 3 ft., and making from sixty to eighty strokes per minute. The other machines were generally operated by steam-power, giving an average of a blow per minute; but occasionally the hammers were hoisted by manual and horse power. The rams in the latter machines were of cast-iron, swelled out at the bottom to concentrate the weight at that point, and weighed about 2,200 lb. each, though some were used of 1,500 lb.; the fall being 30 ft. It was observed that the heaviest ram, when striking blows of the same effect as lighter ones, did the least injury either to the head of the pile or to the protecting iron ring, and this injury was still less with the Nasmyth hammer. It was also found that no advantage was gained by the fall of the ram being more than 40 ft., as the friction on the ways then prevented any increased velocity to the ram when falling from a greater height. With the Nasmyth hammer, piles were driven 35 ft. in seven minutes, while with the other machines similar piles required one hour, or more, to drive them the same distance.

Experiments were made at different times to ascertain the weight which the piles would sustain. For this purpose a long lever of oak timber was employed, with a number of the foundation and coffer-dam piles of nearly the same size, and driven under exactly similar conditions, were withdrawn. It was thus ascertained that a weight of 125 tons was required to move a pile, driven 33 ft. into the earth, to the point of ultimate resistance, with a ram weighing 1 ton, and falling 30 ft. at the last blow. These

trial piles averaged 12 in. in diameter in the middle. From a number of other experiments, it was believed that the extreme supporting power of the pile, due to its frictional surface, was 100 tons, or 1 ton per superficial foot of the area of its circumference. From an analysis of the experiments, the following general laws seemed to have prevailed in these cases:—1st. That the effect of lengthening the fall of the ram was to increase the sustaining power of the pile in the ratio of the square root of the fall. 2nd. That by adding to the weight of the ram, the sustaining power of the pile was increased by 0.7 to 0.9 of the amount due to the ratio of the augmented weight of the ram. 3rd. That a pile driven by a ram weighing 1 ton, and falling 30 ft., would sustain an extreme weight of 100 tons. The formula based upon these data, as applicable to rams weighing from 1,000 lb. to 3,000 lb., falling from 20 ft. to 30 ft., was $X=80(W+0.228\sqrt{F}-1)$, in which X was the supporting power of a pile driven by the ram W, falling a distance F; X and W being in tons, and F in feet. The author was of opinion that, under the most favourable circumstances, the pile should not be loaded with more than one-third of the result given by this formula; and when there was any danger of a future disturbance of the material around the pile, or when there was any vibration in the structure which might be communicated to the piles, the load imposed should not exceed one-tenth.

The bearing support due to the sectional area of the pile had not been considered in the preceding inquiry; but numerous experiments had been made, which gave results of from 5 tons to 10 tons per square foot.

THE FITTINGS OF COTTAGES.

A LADY, dating from Quebec, favours us with some observations on the planning and fittings of economical dwellings for working men. We print the portion relating more particularly to the second part of the subject.—It has been proposed by some architects, who carried their ideas of economising space to an extreme, to make the drawers under bedsteads available by having drawers to slide under the bed. This is by no means advisable. The space beneath the bedstead, for the sake of health as well as of cleanliness, should be open, and daily subjected to the supervision of the broom.

In domestic architecture it has been much the fashion of late to have no closets. This omission entails much expense on the occupants of houses, and is eventually injurious to the landlords, as bringing in and out large articles of furniture, such as presses and wardrobes, can seldom be done without damage to the walls. The open dressers, so ornamental with their rows of plates and dishes, have generally given way before the swarms of flies which seem ever to increase and multiply; and although it has been stated that the presence of these insects is so beneficial in some respects that Europeans in New Zealand carry them in boxes to localities where they were formerly unknown; yet, whatever their qualities may be, it is desirable to keep things as much as possible from their touch, and to this end closets in kitchens are indispensable. Closets are more easily cleansed than drawers; and it was no improvement in finishing to expel the old-fashioned linings, which formed a defence against the entrance of vermin. Closets are convenient even in the dining-rooms of the opulent; they are *requisites* in the apartments of the working-classes. In sleeping-rooms, the closet should, if possible, be large enough to stand in, have rows of shelves transversely from the floor to the ceiling, at the sides, with a long shelf lengthways, under which should be rows of pegs. If recesses by the fire-places do not admit of closets in the kitchen, they should be put up as fixtures.

The problem how to dispose of what may be termed the refuse of human life is a disagreeable but most important one. The waste in cookery and preparing food may be reduced by good management; rags may be kept for the rag-gatherer; bones, and fragments of metal and crockery, which so frequently disfigure the roadsides, may be given to collectors of such things; but still there must be refuse, there must be a dunghill, and this, with other nuisances, should be removed at short intervals to serve for manure.

Doubtless, those houses should be most healthy that have no drains passing under them, as the

vapours and had air fall not to penetrate above, and the most costly appliances of luxury do not always obviate such inconveniences; but round the habitations of the poor, without care, damp and dirt gather fast, and the question still remains how to dispose of the waste water without a sink or waste-pipe. Can it be safely enfolded to be thrown out into the yard or the field, and suffered like the rain to permeate the soil? Perhaps a small tiled drain to carry off soaped and greasy water is as good a way as can be devised to keep the surroundings of the houses of the working-classes dry.

A labouring man who has to leave home early, and at a regular hour, requires a meal speedily and comfortably prepared; when he returns, he wants refreshment and repose in comfort. Now, very few articles are required for actual comfort, and every article not necessary for personal convenience and enjoyment gives trouble, and is in the way, when there is only one pair of hands to keep all in order. In selecting furniture what is strong and durable should be chosen. Cleanliness is the grand element of comfort; and unpainted wood being most easy to keep clean, is the nicest for the living-room. Wooden-seated chairs wear best, and are the healthiest. The little round claw-table is pretty, and suitable for the mother's afternoon work; but it must not be spersed the deal-table, 4 ft. long, indispensable for meals, for the preparation of food, and for ironing. Bedsteads, with laths that can occasionally be taken out and washed, are preferable to those with ticks or close boards. Curtains are quite unnecessary. In the climate of England hair mattresses are more to be recommended than wool mattresses, or any mixtures of *lock*, but ticks filled with straw, and pillows stuffed with chaff, are very good. Fine shavings make excellent beds. Where the father or the boys have the valuable knack of carpentering, a few boards and two or three harrels can be made very serviceable.

A bedstead can soon be knocked together; one harrel can serve as a washhand stand, another as a side table; a harrel can be cut into two seats for children, and a barrel can be made into a commodious arm-chair, and with a little ingenuity made to look well. For the floor, cleanliness is the best ornament; and to insure this it is not requisite that a woman should go down on her knees to scrub. The process of cleaning the floor may be rapidly and effectually performed with an iron mop. The only coverings requisite are large mats at the doors, and rugs before the fireplace and by the side of beds. Tin kettles and saucepans are less durable than iron, but far more expeditions in cooking, especially in boiling water. Dwellings thus arranged, with as much space as is possible for the living-rooms, and as few articles of furniture as will suffice for convenience, have a better appearance, and will be found more healthy, cleanly, and comfortable than the confined and encumbered rooms in which the working classes usually live.

A. E.

MR. CLADSTONE AND TRADE UNIONS.

SIR.—If any one expected the deputa-tion to Mr. Gladstone would effect the promised object of their visit, he must have been greatly disappointed. The public had been led to expect that a selected number of working men, thoroughly acquainted with the subject, and speaking with authority as representing the whole body, would (as was somewhat boastfully predicted) expose popular fallacies, make clear the benign principles of restriction, elucidate political economy generally, and so enlighten the mind of the statesman that he should humbly acknowledge himself to have been entirely mistaken. The further effect proposed was to provide a solid groundwork for legislation, and to gain the sanction of law for what has by some been considered a selfish and odious tyranny. I confess to having looked forward with much interest to this discussion, and have carefully read the report, hoping to find some grains of sound argument amongst the crude mass of mere assertions. In the first place, the deputa-tion evidently were not all of one mind; several individual members stoutly upholding practices which Mr. Potter stated were confined to a small minority of the trades; such as the restriction of apprentices, and the prohibition of piecework. But surely, before undertaking to enlighten an obtuse and supposed hostile public, the members ought to have agreed amongst themselves. Moreover, at a later meeting, it was announced that several large and influential trades altogether repudiated

the self-constituted championship of the deputa-tion. If they really wish to enlighten the public, and to meet the case—as the leader of the deputa-tion said their intention was—"fairly, openly, and without equivocation or reserve," let some one on their behalf publish a collection of trade-union rules, supplemented by a narra-tion of trade-union practices, the materials for which would not be difficult to obtain. Then let him state their case, adduce their arguments, say which of the practices they uphold and approve of, and which they disown and will discourage, and they may rely upon it the public to whom they appeal will give them a fair hearing and pass a just verdict; but the work must be done fairly, honestly, dispassionately, and with a sincere desire to arrive at the simple truth. Anything like an attempt to deny well-known and proved facts, or to throw dust in the eyes of the readers by rhetorical special pleading, will only deepen the feeling they complain of, which, rightly or wrongly, certainly exists, that they practise things which would look very ugly in print. Mr. Gladstone evidently perceived the heterogeneous nature of the body he had to deal with, and that they were so fully persuaded of their power to teach that they had nothing to learn.

AN ENGINEER.

CONSTRUCTION OF FIRE-PROOF DWELLING-HOUSES.

AMIDST all the modern improvements and appliances for home building it appears remarkable that so few attempts have been made to render our dwellings, if not entirely fire-proof, yet not wholly destructible by this insatiable element. Whosoever has been roused out of midnight slumbers by the fearful cry of "Fire! fire!" will need but little advocacy to induce him to adopt any feasible mode in his power to construct a dwelling so far fire-proof that the destruction may be reduced to a minimum, or at most confined to only one apartment, and the loss of life all but impossible.

The common mode of house building is so fraught with danger from fire that the wonder is how any portion of the building or its contents is ever saved from the devouring flame. Indeed I would ask the most superficial observer is it possible to lay timbers for ignition in a more scientific manner than they are usually placed in our common dwelling-house? Is there any kitchen fire-grate laid for the express purpose by our servants so skilfully disposed for the ostensible purpose? First, there are the joists for the floors, then the quarter partitions, then the rafters and battens of the roof, and afterwards the lathing and lathening for papering the walls; also the flimsy staircases, all nicely spaced, and just adapted for burning at a minute's notice. Let any person look through or upward at a house that is what is termed carcassed in, and say whether he could devise anything better calculated for combustion?

And this insecurity exists for the sake of a little more expense in the first place,—say 25 per cent. addition for a first-class house.

In the first place, I propose to arch over the basements, either in the way I shall recommend for the next floor, or in the old-fashioned way of groins. The other stories I should arch over in the same way as a coach-head trimmer, taking a bearing upon all the walls, with a semi-elliptical curve.

The materials I prefer are the common vertically perforated brick laid flat ways, and jointed with Portland cement; it is almost needless to say that these should be laid well and carefully, so as to break joint as much as possible, especially at the groins, or angles.

Over large rooms, or openings, a course of plain tiles may be bedded upon the bricks, but in small spans a rendering over in cement would be sufficient. The reason I prefer the perforated bricks is on account of their being lighter, and they also afford a good key for the plastering underneath.

The joist can be laid into the walls in the ordinary manner, or 4½ in. brickwork may be carried up from the springing of the arches in the spandrels, or, if more desirable, by using a few iron ties the wood joist can be laid independent of the walls altogether.

On coming to the roof, the arch may be varied to any shape, and the rafters bear upon it; indeed, by using ornamental iron ties across the rooms, the roof may be formed without any other covering than the arch, cement, and tiles.

The staircases may be turned upon segment centres, and by working in the arch occasionally course of heading bricks, or laid lengthwise, the corse for the steps may be formed, and may afterwards be lined or cased with wood. At the springing of the arch for the stairs the floor-arch could be strengthened as much as may be deemed necessary.

This scheme would necessitate each story to be carried a little higher, and the walls made about half a brick stouter; but it would save all the lathing to ceilings.

It is obvious that in the event of fire breaking out it would be confined to the room where it broke out, and, indeed, would die of inanition. The advantages for carrying water-pipes, gas, bell-wires, and such like, along the spandrels is too plain to require pointing out.

This is no new idea, although I do not know of any building where it has been carried out in its entirety; and having but a small country business, I have never been able to persuade any proprietor to incur the additional expense required. The objection usually made is the outward thrust upon the walls from the arch; but from the lightness of the materials employed, I think this will be very small, and there are many modes of tying in and counteracting this which will suggest itself in practice.

GEORGE BURCHETT.

hint either to manufacturers, merchants, or workmen, whereby they may profit.

In consequence of the difference in the price of foreign and English-made sheet glass and glass shades, I can venture to affirm that two-thirds of the former are used to one of the latter, thus depriving hundreds of English workmen of labour which naturally and reasonably belongs to them. It is true the English make is superior to foreign make; but what does that signify if the latter is preferred on account of its price, to the former? I think, if the English glass manufacturers would make quantity their first aim, instead of quality, they would drive the foreign glass trade out of the English market, would find work for many of our unemployed, and in the end would supply an equal, if not an increased, quantity of the superior article which they now send into the market.

A WINDOW-GLASS CUTTER IN A CITY HOUSE.

FORTIFYING POLICE STATIONS.

SIR,—Absence from town prevented my noticing the paragraph headed "Fortifying Police Stations," in your issue of the 15th inst., which, from the high position occupied by the *Builder*, is calculated to give an erroneous impression better avoided.

There is no foundation whatever for this assertion that Messrs. Clark are manufacturing shutters for the station at Scotland-yard. The simple facts are these. A shutter was required for a particular room that had no shutter before. I applied to Messrs. Clark for a price, and they handed me also a sample of their manufacture, which they asserted was bullet-proof. This question was disposed of by sending two shots from a revolver through it. Mr. Peard happened to be with me at the time, and proposed to me a much simpler contrivance to meet the same end. A series of experiments were arranged, and as the question of making this shutter bullet-proof had turned up, a section for a shutter that could not be pierced was decided upon. Whilst these experiments were going on, Messrs. Clark produced a second sample, which on being fired at perfectly resisted the shot.

Under these circumstances, I directed Messrs. Clark to fit up one shutter, and Messrs. Peard & Jackson to fit up two other shutters, the latter being less expensive, less liable to derangement, and closed in one-fourth the time.

THOMAS C. SORBY,
Surveyor to the Metropolitan Police.

WITH reference to the paragraph in a recent number of this *Builder*, headed as above, Messrs. Peard & Jackson say,—“That having, somewhat accidentally, been shown the result of an experiment, we suggested shutters of a totally different construction to what had at first been recommended as best adapted to the purpose. Our idea was entertained; and, after some severe tests, approved by the police authorities. We have made and fixed two of these shutters, which are the only ones so constructed that they can be closed almost instantaneously, while they are of themselves ‘proof against any fusilade of small arms;’ and are also adapting the principle to two pairs of ordinary existing box-shutters.”

STYLES NOT INVENTED.

WHEN an architect, such as, for example, the architect of the Temple of Theseus, makes an original design so full of beauty, and so perfect in its proportions, and with such appropriate ornamentation, that hundreds of other architects endeavour to imitate his work, he may be said to invent a style, or, as I should call it, found a school of architecture.

A new school may be founded; but first we must learn how to copy what has been done before. There are two ways of copying, both professing to be the right way.

One is to imitate mouldings and ornaments exactly, without regard to general proportions; and thus is produced in this present century a bawling in the style of another long-past century; and every judge and critic says its mouldings are correct, its ornaments are correct, its tracery is correct; all, all of the same period, all true Gothic, all true Greek, as the case may be.

But some one who is not acquainted with these supposed elements of correctness will say, “That may be; but there is something about the building that I do not like, and cannot say exactly what it is.” In this manner was the Parthenon copied from the Temple of Theseus; the latter of which has the general repute of being by far the best proportioned. And this brings me to the other way of copying, which, and which alone, will lead to the foundation of as many new schools of architecture as the greatest admirer of originality can desire. If I wanted to get an idea from, for example, this said Temple without copying it exactly, I should begin thus:—

The *schobli* is Greek. That I shall copy.

The *mode* is Doric. That also I shall adhere to.

The *order* is —? Well, I must measure its proportion, and fix upon a scale of orders. The lowest order is when the height of the columns is $\frac{1}{2}$ of their distance between centre and centre, as is almost always the case in old English examples of *monostyle columns*. You cannot have a lower order than this, and you cannot have a column of less than one shaft.

Again, in the tetrastyle columns of the English school the height is $\frac{1}{2}$; in the next, the octostyle, the height is generally $\frac{2}{3}$; this is the third order, then. Now, the requirements of my building make it almost imperative to have the height of my columns $\frac{3}{4}$ of their intercentral distance. So my building will be of the fourth order. And you will see, by an extension of this scale of orders that the XX style column would be $\frac{4}{5}$ high. Now count the vertical lines in the columns of the Temple of Theseus; and now measure the height and *mean* distance apart. Now you see why this good old Greek design and these good old English designs are equally pleasing.

To return to my own design. As we have seen, it will have to be duodecastyle to *look well*: too many shafts to have separate capitals, or to arrange in a diagonal square; so we will arrange them in a circle under one capital. There is a reeded column. No, we must not have an entasis or diminution, because we are too far apart for an architrave, but too near to render pointed arches necessary. We must have half-circular arches, as a medium between the two.

Mouldings.—In that temple they are parabolic curves; in our low English orders circular, two extreme conic sections. Then ours must be near conic sections,—that is, ellipses. This system of moulding is carried out in many examples of many schools.

This is the right way to copy, and at the same time the right way to *originate*; for, look at our new design! Where is its resemblance to the Greek temple?—not a feature left to show whence we started! WALTER SCARGILL.

SIR,—Your correspondent, Mr. H. W. Brewer, is surprised Mr. Ferguson should suppose it possible to “invent” a new style, such being always “developed.” Mr. Ferguson, however, says distinctly, “No man or set of men can at once invent a new style. It must be developed out of some previous form, and by a slow and gradual progress of growth.” But is the distinction, after all, of real utility? In his incomparable “System of Logic,” Mr. Stuart Mill forcibly points out, that different words do not necessarily indicate the existence of corresponding different qualities in things; so, I suspect, invention and development are, in actual effect, and so far as practical usefulness is concerned, virtually convertible and synonymous terms, as applied to mental processes touching new styles of architecture; for these—the simple statement of the fact coercing conviction—are both invented and developed. Classic orders and Gothic windows, with round and pointed arches, could scarcely have been at all developed if they had never actually been invented; and, to my mind, development has no precisely distinct meaning beyond aggregating, maturing, and adding to inventions composing styles.

Mr. Brewer’s startling assertions, that “new styles have always arisen from copying the works of a former age,” is more paradoxical than instructive. Whether or not some of the ancients began by copying is perfectly immaterial to the point at issue; for it is manifest that so long as there was “only copy-work,” there could not be any original work at all; and “copying the works of a former age” was thus too antecedent to the new style to be considered in connexion with it, and related, in fact, not to

AIR-OR-NOT COMPANY (LIMITED).

Has the promulgated scheme for laying on country air into London houses (in the same manner as gas and water) *blown up*? Oh, how delightful it would be to repose in a pure atmosphere here within the sound of Bow bells; to be able to dress, toilet, breakfast, and take the country air simultaneously and expeditiously. It would be a boon to mammas, for the winds (from bleak Highgate or sunny Sydenham) could be tempered to the shorn lambs in this nursery; the children could revel in refreshing draughts of half-and-half, and no bother of mud, rain, ditches, &c. Night air is not so beneficial; so someone but daylight-gathered ought to be supplied from odiferous roses and mignonette plantations, and from warm conservatories in winter. I presume the only plant required would be a windmill to work gigantic bellows.

Our commercial atmosphere requires purifying, for it has long been stagnant and in bad odour.

Directors of bubbles, awake to aerology! No company formed to bring it into operation yet? Where are the limited-liability mongers? *Dum Spiro spero*. It is a project that requires ventilating. It is ill wind that blows nobody good; it may to *them*, if it do not to the shareholders for public.

R. T.

FRENCH AND ENGLISH WINDOW GLASS.

SIR,—The Society of Arts, as you have stated, raised a fund purposely to send a select number of workmen to visit and report upon the progress and improvement made in the different branches of industry as shown at the Paris Exhibition. Every workman in the branches of the industry thus represented ought to become acquainted with the reports sent in to and published by the Society of Arts, so that he may learn something new, correct something wrong, or profit by them in some way or other.

The window-glass trade was represented by Mr. Richard Pearsall, glass-maker, near Birmingham. He is a workman of Messrs. Chance, Brothers, glass manufacturers, and no doubt, was recommended by them as a suitable person to be sent to Paris, for the purpose above stated. No report published can be more unsatisfactory than the one sent in by Mr. Pearsall. It is so brief, it covers but little more than one page, and so empty as to be absolutely useless to any one engaged in the trade. The Messrs. Chance, Brothers, have many workmen in their employ who, without going to Paris, could, in their dinner-hour, have drawn up a much better report concerning the manufacture of glass in England, France, and Belgium.

Sheet and rolled plate glass and glass shades are imported into England from France and Belgium, at from 30 to 50 per cent. cheaper than the same kind of articles can be bought from English manufacturers; yet Mr. Pearsall goes to Paris and sees these things exhibited, and to the various manufactories in France where they are made, and in his report there is not a single

the new, but to the old style. As only copies could "arise" from copyism, the invention and development of novel features were consequent, not on copying, but on departing from the old style, and in this way forming a new one.

Finally, Mr. Brewer intimates that as the development of a new style "generally took from three to four hundred years" in ancient days, one "might" now be created in "five or six hundred years." Mr. Brewer evidently thinks we have sadly deteriorated (to about half the value of the old folks), and are in a very bad way indeed. But, setting aside analogies where there are no analogies, perhaps a more hopeful view may be taken. Of course there is no sign of a "new style arising from copying the works of former ages," which we have already done for between three and four (the ancients' allowance) of the (moderns' allowance) five or six hundred years. What is really wanted is a *true* style, reflecting neither Classicism nor Mediævalism, but Modernism, and thus subsidiarily a *new* one. As all archaic styles first arose in comparatively barbarous times, and the true and new style of the future will start from the most civilized of all times, its development will surely be proportionately more rapid. But to attain this consummation we must depart from copyism, and cast aside that undue reverence for antiquity and that singular depreciation of our own powers in this calling, which have rendered modern architecture the reproach and shame, as the one retrograde art, of the age. "For in reality," says Lord Bacon, "as we look for a more mature judgment from an old than from a young man, just so it is fit that much greater things be expected from our age, if it knew its strength and would endeavour and apply, than from the old times, as being a more advanced age of the world, and enlarged and accumulated with numberless experience and observations."

EDWARD L. TARRUCK.

THE GREAT INDIAN PENINSULAR RAILWAY.

SIR,—The state of the bridges and viaducts on this line is far from satisfactory, and unless the company take prompt action, I have no hesitation in stating that the traffic on many sections will be suspended. In several cases the passengers have to leave the trains "and walk across" a distance of upwards of a mile! For an old Indian with something of the Salamannderabout him this is had enough, but for English ladies and their families to walk such a distance in a temperature of 138°, many of them suffering from intermittent fever and ague, without a *tattea*, a *palauquin*, or a *tonjon*, the journey is really perilous and desperate.

The cause of this ruinous condition of the works is obvious, as every European who has travelled over the line can testify. The enterprisers employ too many native inspectors, instead of sending out skilled European foremen to guide and direct the works. Now, as these native inspectors are generally high caste, and consequently devote much time to the worship of the "big God of the Hindoos," therefore the native workmen, many of whom are low caste, scamp the work in their absence. Need a word more be said?

Besides, the native mechanics are, in matters of science, far behind Europeans, as, indeed, Asiatics generally are. Let the company send to India qualified engineers and inspectors, and let the public thoroughly understand that the Great Indian Peninsular Railway is not a huge quantity of mis-spent labour, or the works of Sisyphus rolling up stones to come down again.

Is it not a matter of surprise, when it is considered the numerous accidents through defective workmanship which have occurred on this line between Lamoly (top of the Chants) and the "Snake City" of Nagpore, that the enterprisers should remain like flies in winter—in a state of suspended animation. F. H. ARTHUR.

ST. JOHN'S CHURCH, WEYMOUTH.

SIR,—I regret that Mr. Bury should have made statements in your paper in connexion with the above church which are not correct. I can only say that he is labouring under a mistake, and that your announcement of the 25th of January was quite right. I beg to refer him to the Rev. J. Stephenson, and hope that you will do me justice by the insertion in your paper of this communication.

ROBERT C. BENNETT, Architect.

THE CHANNEL RAILWAY.

SIR,—I beg to forward you a plan for a railway between England and France, the bridges being the mode of communication proposed, this letter relates principally to the piers or supports of such bridge. It is proposed that such piers be built of iron; that they be hollow, and somewhat of the shape of a mushroom turned upside down. The essential characteristic of this plan is that such railway, or rather, the piers supporting the bridge constituting such railway, can be hauled on land, and afterwards floated to their several positions, and then sunk and placed in position, by filling them with water. When so sunk they would remain firm and immovable, by the weight of the water inside them, and the attraction of gravitation. The bottom portion of each pier would somewhat resemble a large gasometer, or a round engine-shaft 300 ft. in diameter; and the top portion the Eddystone Light-house, or an iron column 160 ft. high and 90 ft. in diameter at the top. After such piers had been so placed in position, they would resemble and constitute so many iron islands. Wherefore, a suitable number, say a few scores, of such iron islands being made and existing between Dover and Calais, it is presumed that a road, or a highway, or a railway would simply forthwith follow, as a matter of course. For a comparatively trifling sum, say 50,000,000,—it is believed that the feasibility of this plan could be tried, and tested and verified at once. One of the largest of such piers might be thus constructed (in sections) at Birmingham, sent by its several sections to a harbor, there put together and completed, afterwards floated to its allotted position, half-way between England and France, and then and there sunk and placed in position by filling it with water. When so sunk, the bottom portion of each pier would be in effect something like 100,000 tons of iron, of the shape of a penny-piece, lying flat at the bottom of the sea; but it is believed it would so remain for generations. The top portion being an integral part of and firmly affixed to such bottom portion, would of course necessarily sink with the same, and would so remain being perfectly smooth and round, would consequently offer the least resistance of anything to wind and waves.

J. K. H.

CAN A BUILDER CHARGE FOR MAKING AN ESTIMATE?

SIR,—Some time since I was invited in a limited competition to tender for a church. The committee did not reserve to themselves the right to reject the lowest or any tender. My tender was the lowest, but the amount was more than the committee expected. The architect was instructed by his clients to request me to meet him at his office (at a distance of 100 miles from my place of business), to go through the estimate, and see where it could be reduced. This was done, but after some further correspondence, the committee decided to do the work themselves, under the superintendence of a clerk of works. The foundations were put in, but they found this too expensive; and (through their architect) asked me to go over my estimate again,—this time with a view of adding to the tender in consequence of the rise of wages. I was put to much trouble, but at the last moment, and without any explanation, the committee broke off the negotiations, and gave the work to another contractor, who was in the first competition some 250l. above me. Am I not entitled to be paid for my trouble? and can any of your readers name any legal decision bearing upon the point? If they can, they will oblige.

A BUILDER.

* * Under the circumstances stated above, our correspondent would seem unquestionably to have a legal claim. Much would depend on what was said or written during the transaction.

STAINS ON STONE.

I SHOULD be obliged if any of your readers would inform me of any solution with which a light freestone chimney-sock might be coated, so as to preserve it from injury by higer marks or greasy stains.

S. B.

LETTERS ON MARBLE.

CAN any of your readers inform me, through your journal, of the best, quickest, and most durable method of preparing engraved letters in marble, or any other hard stone, so as to receive gold leaf?

F. M.

DESTRUCTION OF PORTMAN MARKET BY FIRE.

AN extensive fire took place on Sunday morning last in Portman Market, Marylebone, whereby twenty-three shops have been destroyed. The fire commenced in a boot and shoe warehouse, No. 2, in the market, and then laid hold of the adjoining premises, No. 1, belonging to an ironmonger. From these two buildings the flames were forced by the violence of the wind in sundry directions, igniting buildings some distance off, whilst for a time several of the intermediate shops escaped. At one time it was feared that the Marylebone Theatre would also have been destroyed, but several land steam-engines having arrived, they were set to work, and stopped the further progress of the conflagration.

The fire was remotely due, probably, to Saturday night's gale. Just at closing-time the wind blew a shop-blind against a jet of gas. The blind caught fire, was hastily rolled up and put away under a counter, and the shop was closed. An hour after the house was in a blaze, from a few sparks, it is suspected, which may have been left

in the blind when it was put away. Only one of the twenty-three tradespeople burned out was insured; and these represent a total of something like a hundred persons who are now on the brink of destitution. A meeting on their behalf is to be held on this Friday night.

THE ELECTRIC ORGAN.

MR. BARBER, organ-builder, of Paris (inventor of the pneumatic lever), has just patented, in England and France, a system for applying electricity, to supersede the ordinary moving drawstop and key-action in large organs. The patentee has already built an electric organ of forty-two sounding stops and eight couplers for the church of St. Angustin, Paris; also another for Salon, near Marseilles: both are spoken of as successful. As the largest organs may now be played through a cable of insulated wires, positions hitherto impracticable can be turned to a good account. The organist, with his various clavers, can be placed in any direction and at any distance away from the organ, the touch being equally delicate and rapid on every manual, whether used separately or coupled. Messrs. Bryceson, Brothers, & Co., have the concession for working this patent in Great Britain.

Miscellaneous.

UTILISATION OF THE METROPOLITAN SEWAGE.—The report of the Metropolitan Board of Works for 1866-7, just issued, states that the Essex Reclamation Company have commenced the formation of the culvert for taking the sewage down to the Maplin Sands, and for the distribution of so much of it as may be required by the neighbouring farmers in Essex. The Board have had some difficulty in deciding between six tenders received for the utilisation of sewage on the south side of the river, but up to the date of the report they had not come to any definite arrangement.

THE RESTORATION OF ST. NICHOLAS STEEPLE, NEWCASTLE-UPON-TYNE.—At a recent meeting of the Committee of Management of the St. Nicholas' Church Restoration Fund, the following statement as to the financial position of the Restoration Fund was submitted:—The total amount of subscriptions promised was 2,742l. 5s. 6d.; of that 1,020l. 9s. were still unpaid; leaving actual cash received, 1,721l. 16s. 6d. The disbursements had been 1,394l. 4s. 5d.; leaving a balance in the bank of 327l. 12s. 1d. A letter was read from the contractor, Mr. Walter Scott, giving notice that the works comprised in the first division would be completed in six weeks, and requiring to know the decision of the committee as to commencing with those in the second division: the cost of the two combined will amount to above 4,000l. Seeing that only about 2,800l. have been promised, it was resolved that the committee would not be justified in giving requisite authority until supported further by the public. The secretary was therefore instructed to issue an urgent appeal for additional contributions.

VENTILATION OF PUBLIC BUILDINGS.—The Institution of Mechanical Engineers have published a report of their annual meeting, held last summer in the lecture theatre of the Conservatoire des Arts et Métiers at Paris, when a paper was read by General Morin "On the Ventilation of Public Buildings." General Morin, like some others, holds that outlets for the escape of bad air should be at or near the floor of a room, and the inlets for fresh air near the ceiling, or at such a height as to prevent the sensation of a draught. The discharge is best effected by "suction," and to maintain this suction nothing more is required than an ordinary fireplace. This being the case, the same system is applicable to ordinary dwelling-houses as well as to public buildings. The displacement of foul air by the mechanical forcing in of fresh air is, General Morin maintains, far less effectual, and requires more attention than the suction system, which is in use in the lecture theatre where the paper was read, as well as at the Théâtre Lyrique, and in certain public schools, where its operation is said to be satisfactory. By passing under the seats of the lecture theatre the General stated, "he had felt completely stifled by the poisonous atmosphere drawn off from the room."

SOCIETY OF ENGINEERS.—At the next meeting, 2nd March, a paper "On the Surveys of proposed Lines for a Ship Canal between the Atlantic and Pacific, on the Panama Railroad, and on the Darian Ship Canal," will be discussed.

FIGURED GLASS.—Messrs. Wenden & Fussell have devised a mode of producing ornamental patterns on ground glass, to serve as a hind Though produced without burning, it is stated to be perfectly durable, and to stand the test of sulphuric acid and other chattering agents. The method is applicable to the largest sized plate, and is very cheap.

THE PUBLIC WORKS OF HUNGARY.—Some English gentlemen (amongst whom are a duke and two lords) are expected in Paris, according to the *Morning Post's* correspondent there, in order to examine and take into consideration a concession offered to them by the Hungarian Government for carrying out all the public works of Hungary. Count Karolyi and two other Hungarian gentlemen represent Hungarian interests.

NORFOLK AND NORWICH ARCHAEOLOGICAL SOCIETY.—The annual meeting of the members of this Society has been held at the Guildhall, Norwich, under the presidency of the mayor (Mr. J. J. Colman). The Rev. C. R. Manning, hon. secretary, read the report, after which the sheriff, Mr. R. Fitch, read a paper on the discovery of flint implements at Santon Downham, and the Rev. G. W. Minns one on some panel paintings on the rood-screen in Thornham Church.

SICILY.—In Sicily, on one of the plateaux of the Cassaro mountain, ruins have been discovered which indicate the existence of a great city, whose origin dates from the period when a colony of Syracusans established themselves in this spot. According to the historians, this city can be no other than the ancient Castro. The walls have a development of 2,154 yards, and are 9 ft. 10 in. thick; the materials are stratified marly limestone, well chiselled. The entire circumference of the town is about 6,400 yards. It was divided into many quarters, and in the eastern portion the ruins of a temple are visible. Not far from this city there exists another locality called Castro-Novo, of very ancient origin.

THE BARNSELY NEW WATERWORKS.—These works have been completed. The supply is obtained about nine miles from Barnsley. The water-shed is about 1,700 acres. A storage reservoir, which covers about 70 acres, is 60 ft. deep, and at the present time contains about 40 millions of cubic feet of water. The entire length of pipes is about 3½ miles. The pressure at the town end has been 25 lb. to the square inch. The hardness of the water is about 3 degrees. The contract for the construction of the reservoir was let, in May, 1864, to Messrs. Skelton & Pratt, of Halifax, for the sum of 22,918l., and that of pipe-laying to Mr. Joseph Taylor, of Flockton Hall, for 2,352l. The total amount of money borrowed on account of the water-works is 75,000l.

NEWSPAPER PRESS FUND.—A general meeting of the members of the Newspaper Press Fund took place on the 22nd. Mr. C. Codwin, senior vice-president present, presided. The report congratulated the members on the gradual increase of the Society. The number of members now on the roll-book is 210. In London there are 147, of whom 47 are life, and the remaining 100 ordinary, members. In the country there are 63 members, of whom 9 are life, 17 subscribing 1 guinea, and the remaining 37 half a guinea to the fund. The invested capital of the society now amounts to 3,822l. 11s. 7d., consisting of 3,122l. 11s. 6d. in the New 3 per Cents., and 700l. in the Great Indian Peninsular Railway debentures. Whilst earnestly entreating the members generally to co-operate with them in inducing others of their professional brethren to join the institution, the committee anticipated very successful results (already becoming apparent) from the efforts they had recently been making to acquire a large accession of members from the provinces. The balance-sheet, in addition to the amount specified as being invested in the Funds, &c., showed a balance at the bankers' and in the hands of the secretary, of 425l. 18s. 7d. The report was unanimously adopted. Some alterations were then made in one of the rules, Mr. Mould, Mr. Hyde Clark, Mr. Grunisen, and others taking part.

THE LATE PROFESSOR M'GAULEY.—Her Majesty has, on the recommendation of the Earl of Derby, granted 60l. from the royal bounty fund to the widow and family of the late Professor M'Gauley, formerly editor of the *Scientific Review*, and for some time lecturer on natural philosophy to the Board of Education in Ireland. As the subscription list will shortly close, it is earnestly requested that additional subscriptions may be sent without delay to the treasurer of the fund, Mr. Robert Richardson, C.E., 26, Great George-street, Westminster.

SANITARY REFORM AT DORRING.—Mr. Baldwin Latham, C.E., president of the Society of Engineers, has delivered a lecture on "Sanitary Reform," at the Red Lion Assembly Rooms, Dorking. The Rev. W. H. Joyce presided, and there was a large attendance of the chief ratepayers of the parish. The chairman, in introducing the lecturer, said, from his own personal experience he could speak of the necessity of something being done in Dorking to remedy the defective drainage of the place. Mr. Latham said, on opening his lecture, that he did not intend to speak particularly of Dorking, or to needlessly frighten them with the state of things in existence there, but rather to give them matter for careful thought and consideration, and to lead them to adopt such measures as the light of science had provided to contend with these difficulties.

BOARDS OF ARBITRATION BETWEEN EMPLOYERS AND WORKMEN.—A public meeting has been held in the Guildhall, Derby, at the instigation of the members of the Derby Chamber of Commerce, to hear an address from Mr. A. J. Mundella, of Nottingham, on the growing importance of Boards of Arbitration to adjust differences between employers and workmen, and to consider the expediency of establishing such a board for this town and neighborhood. The hall was crowded with working men, hundreds being unable to obtain admittance, and the proceedings throughout were of the most orderly and enthusiastic character. A resolution was unanimously passed that a Board of Arbitration should be established in Derby similar to that at Nottingham; and arrangements were made for obtaining a committee of workmen. It was stated by a workman that there were no builders members of the Derby Chamber of Commerce.

SODA WATER ON A LARGE SCALE.—A curious geological phenomenon lately took place at the thermal establishment of Saint-Aihon, while a slight repair was being made to the Cesar Well. The water had to be lowered some centimetres, when, all of a sudden, a loud subterranean noise was heard, and the springs, which usually gave off a great quantity of gas, but in a calm bubbling way, were really put in ebullition. The gasometers of the establishment, which ordinarily take half a day to be filled, were all raised to full height in a few minutes. Since this occurrence effervescent lemonades and soda water have been increasingly produced. It is also a remarkable fact, the mineral water has become stronger of the salt, which consists of a mixed bicarbonate of iron and other substances. The village is in the commune of Saint-André d'Apchon, on the left bank of the Loire (Department of the Loire), and contains only 150 inhabitants. It is about 1,300 ft. above the level of the sea.

THE NEW AGRICULTURAL HALL AT WALSALL.—The plans for this building show that the arrangement of the ground-floor comprises a hall 80 ft. by 50 ft., with two ante-rooms and a stage, which, including the orchestra platform, is equal to 36 ft. by 30 ft. The roof is constructed partly of wood and partly of iron, and is in the form of a hexadecagon, or half of a sixteen-sided polygon, and ornamental cast-iron columns are introduced to support the roof in lieu of masonry. Under about one-half of the span of the hall a series of vaults are arranged. The upper floor comprises a secretary's room and retiring-rooms. The side walls of the hall are shown to be of red brick, with bands and panels of white bricks, and the main cornice is to be constructed of ornamental, moulded, and perforated brickwork. The end walls are to be of white bricks, relieved with bands of red bricks. The white brickwork is to be executed with the Hednesford Colliery Company's bricks. The principal entrance has double pilasters, supporting a frieze and cornice, over which is a large semi-circular window. On either side are triple windows, with semi-circular heads. The stonework is to be executed with Hellington, Bath, and Gadsall stone. Mr. Nicholas is the architect.

HYDE PARK DRINKING FOUNTAIN.—H.E.H. the Duke of Cambridge is to open the Hyde Park Drinking Fountain, of which we recently gave a view, on (his) Saturday, the 29th inst.

MASONIC HALL FOR GATESHEAD.—Masonic halls are rising in many directions. The craft is largely supported in Gateshead and neighbourhood, and it is the intention of the freemasons to erect a hall in Gateshead. We learn from "Oberon's" communication in the *Gateshead Observer* that the building will be almost immediately started with; that Messrs. Charles Bass and J. Stokoe are the secretaries; and that the style of the structure will be Gothic. The building will be erected on an open space in West-street.

A NEW CHURCH FOR ST. OSWALD'S PARISH, CHESTER.—The Dean of Chester, in a letter, invites attention to the desirability of building a new church for this parish, and restoring the south transept of the Cathedral. The screen in the Cathedral, he states, which was intended to make it possible that both services should be carried on simultaneously, has fallen in its object; and thus the Cathedral and St. Oswald's Church are inevitably hinderances and annoyances to one another; and every day makes it more evident that the general restoration of the Cathedral, which has long been contemplated, ought to be begun without much delay. Under these circumstances the scheme which recommends is not the building of a chapel of ease on the new site, but the building a large parish church on the new site, where ample space is secured both for vicarage and for schools.

GAS.—The Redhill Gas Company have declared a dividend of 8 per cent. at their eighth annual meeting. The chairman said they had reduced the price of gas to 5s. 6d. per thousand, and he hoped they might soon bring it down to 5s. The increased consumption, he added, justified the remark he made last year, when many of the shareholders asked the directors to wait a little longer before making any reduction. He then stated and estimated that their loss would not be great, if any, and the revenue of last year had more than realised what he thought it would be.—The directors of the Gloucester Gas Company recommend dividends of 10l. per cent. per annum on Class A Shares, and an additional 5l. per cent. per annum in reduction of the arrears of dividends due to this class of shareholders; 7l. 10s. per cent. per annum on Class B Shares, and 2l. 10s. per cent. per annum, being the balance of arrears of dividend due to them. There will besides be left a balance to be carried over to the next half-year of 212l. 5s. 5d. They say the result of the last year's working must be highly satisfactory to the shareholders.—At the annual meeting of the Bodmin Gas Consumers' Company a dividend of 6 per cent. per annum was declared, leaving 51l. to be applied towards plant. The consumption of gas has steadily increased.

ST. JAMES'S TOWER, TAUNTON.—The present position of affairs relative to the destruction of this tower has given archeologists another opportunity to advocate its preservation. The Rev. Thomas Hugo thus writes on the subject: "I have long felt that, until the gentlemen who wished to destroy this ornament of Taunton were beaten by a large majority in a parish meeting, it would be waste of time and words to plead for its conservation. Of that *desideratum* we are now in the enjoyment, and the field is open to one who desires, as a townsman, to urge upon the majority the preservation and not the destruction of a building which possesses for many of us a most sacred interest. Of its beauty I presume it is needless to speak. There is nothing equal to it for many a long mile round. Of its soundness and the consequent absence of any necessity for its removal, I gladly accept the deliberate judgment of my friends, Messrs. Ferrey & Metford, the opinion of either of whom would for me be sufficient, while their united voices are irresistible. . . . What I would very respectfully propose is, that Mr. Ferrey should be commissioned to examine and report on the structure, and that tenders should then be obtained for carrying his suggestions into action. If I mistake not, the result would be very acceptable, even on the score of expense, to the great majority of the parishioners, while not a few outsiders would, like myself, give their ten guineas towards such conservation, and thus lighten the burden, if so it should be called, of those to whom the duty more especially belongs."

EXHIBITION OF FINE ARTS AND INDUSTRY AT LEWES.—The Lewes and East Sussex Exhibition at the County Hall promises to be a success. On the opening day the number of visitors was considered large for a half-crown day, there being 500 present.

THE METROPOLIS SUBWAYS BILL.—Mr. Ayrton has obtained leave in the Commons to introduce a Bill,—similar to the Bill of last session,—to make provision respecting the use of subways constructed by the Metropolitan Board of Works in the Metropolis. The Bill has been read a first time.

WORKMEN'S INTERNATIONAL EXHIBITION, 1869. An executive committee has been appointed to undertake the necessary arrangements for this exhibition by the honorary council chosen at the public meeting in St. Pancras Vestry-hall, under the presidency of the Hon. Anthon Herbert, M.A., on the 14th of October.

NOTTINGHAM LITERARY AND PHILOSOPHICAL SOCIETY.—The annual *conversations* was held on the 19th inst., when the president and others delivered short addresses. There was an interesting collection of antiquities, photos, and so on, including an extensive series of specimens, illustrating the manufacture of Venetian glass, mosaics, &c., from Messrs. Salvati.

GEOLOGICAL STRATA-CUTTER.—A machine, for boring for coal, made by Mather & Platt, of the Salford Ironworks, is being used on the Walton estate, near Wakefield. The coal and other strata come up in solid discs nearly 4 in. in diameter, much as cheese does when cut out by the taster, so that, when put together, these discs show complete sections of the various strata from the top downwards.

CLEANSING STONE BUILDINGS.—Mr. Harwitz is cleansing the back part of St. Paul's Church, Covent Garden, as an experiment, by means of a process patented by M. Nivert, namely, by a jet of warm water from an engine instead of cold. The water is drawn up into the engine and warmed by a jet of steam by means of the "Injector," an English invention. The French patent would seem to be merely for the application of the Injector to this particular purpose. The end of the hose is held in the left hand by a man in water-proof dress, who follows up the application with a scrubbing-brush.

BUSTING OF A CANAL EMBANKMENT AT DUDLEY. The embankment of the canal, near the old workhouse, has given way, at the branch point belonging to Messrs. Dixon, of Horsley. For nearly a mile the canal was drained, and many of the boats were thrown helter-skelter by the rush, and several were broken in half, while all were more or less injured. By the stoppage of the New Horsley furnaces a great number of hands are thrown out of employ. It is supposed that it will be at least three weeks before the damage caused by the outburst can be repaired. The accident, it is conjectured, was caused by the mining operations underneath the embankment.

THE MAGNET AS A STOVE.—An experiment made by M. Louis de Henry is cited to illustrate the correlation of physical forces. If a glass flask, it is said, be placed on a small copper plate, and a magnet with its poles pointed upwards be made to revolve rapidly in a vertical axis below this plate, an increased temperature in the air of the flask will be observed, which may be made sensible by any particular arrangement. It is supposed that, by substituting for the plate and glass a copper vessel containing water, sufficient heat may be generated by the rapid action of the magnet to cause the water to boil. But would not heat be generated in such a case whether the apparatus had magnetic power or not?

LOOK TO YOUR DEPOSITS IN FOUNDATION STONES. A bottle, containing important documents and curiosities, inserted at the ceremonial of laying the chief stone of the Bolton parish church, has been abstracted. It is believed that the robbery must have been committed by some of the workmen on the premises. The few current coins which the bottle contained were only of the value of 1l. 8s. 10½d. Mr. Ormrod, who gave 30,000l. to re-build the church, and who laid the stone, visited the spot; and another bottle, with contents *fac simile* as far as possible, will be prepared. The thieves will thus be prevented, no doubt, from proving to future generations how much churches must have been needed in the nineteenth century.

ARTISANS' ESSAYS.—A second collection of Artisans' Essays on the comparative merits of British and Continental Industry and Manufactures, will shortly be published. These essays will receive the prizes offered in connexion with the Paris Excursion Committee.

THE LATE MR. JOHN HERAPATH.—Mr. John Herapath, proprietor of *Herapath's Railway Journal*, and the cousin of Mr. William Herapath, the chemist of Bristol, whose death was announced a few days since, died on the 24th, at his residence, Catford Bridge, Kent. Mr. Herapath was engaged in completing his concluding volume of "Mathematical Physics" for publication, when he caught a cold which, though it at first appeared to be slight, terminated in his death.

MUSEUMS.—A conference of persons of various classes interested in the provision of museums and libraries for the people, together with supporters of sundry social, educational, philanthropic, and religious organizations, will take place under the auspices of the Public Museums and Free Libraries Association, on the 9th of March, at Stion College, the use of which has been kindly granted for the purpose. The president of the college, the Rev. William Rogers, M.A., canon of St. Paul's, will occupy the chair.

VALUE OF PROPERTY IN NEW-STREET, BIRMINGHAM.—The two shops and houses, Nos. 8 and 9, New-street, were lately offered for sale by auction by Mr. R. Clarke, of Clarke & Barrows. The property consists of two shops with houses, and back premises, comprising in the whole about 400 square yards of land. It is practically freehold, being held on a lease of 750 years, at a peppercorn rent, and produces 470l. a year. The biddings reached 10,200l., but this offer was declined, and the property was bought in at 11,000l.

BLACKHEATH.—In reply to an application to Government for its co-operation in the preservation of Blackheath for recreative purposes, the Office of Woods has stated that the Metropolitan Commissioners Act, 1866, provides a course of procedure in such cases which the metropolitanities must comply with; and that her Majesty is expressly empowered, for the purposes of a scheme under that Act, to let the land to any person, or otherwise make use of it. The popularity of Blackheath as a place of recreation for the working classes may be inferred from the fact that it is frequently visited on a single day by 80,000 persons.

TENDERS.

For sewerage, paving, curbing, channels, and other works, in Victoria-road. Quantities supplied by Mr. W. Rowley:—
 Wainright 21,860 16 6
 Jellies 1,400 9 8
 Beachall 1,331 12 8
 Martin 73 4 2
 Beevons 1,338 6 4
 Booth 1,315 7 5
 Knight (accepted) 1,375 9 7

For tower and spire to Christ's Church, Wanstead.
 Mr. John T. Bressy, architect:—
 F. & P. J. Wood £2,240 0 0
 Reeve 2,174 0 0
 Perry & Co. 2,123 0 0
 Ennor 1,988 0 0
 Hedge 1,956 0 0
 Bians 1,395 0 0
 Mundy & Hutchinson 1,370 0 0

For alterations of shop front and house, 70, East-almost, Brighton, for Mr. Booth. Messrs. Goulty & Gibbons, architects:—
 Chappell £250 0 0
 Cheesman & Co. (accepted) 425 0 0

For St. Peter's Free School, Albion-road, West-end, Hammer-smith. Mr. G. A. Burn, architect:—
 Simpson 3,693 0 0
 Braithwaite 4,817 0 0
 Dove, Brothers 4,119 0 0
 Adamson 3,988 0 0
 Myers 3,888 0 0
 Mansell 3,795 0 0
 J. & E. Bird 3,785 0 0
 Chamberlain 3,657 0 0
 Scrivenar & White 3,677 0 0

For erecting a detached residence and stables at Stamford-hill. Mr. Thomas J. Hill, architect:—
 Mills & Sons £3,470 0 0
 Coreland & Burton 3,300 0 0
 Ashby & Sons 3,125 0 0
 Henshaw 2,958 0 0
 Pritchard 2,991 0 0
 Corder 2,848 0 0
 Webb & Sons 2,929 0 0

For new shop-front and alterations to shop in Exmouth-street, Chelsea. Mr. Dose, Builders:—
 Dose, Builders £369 0 0

For villa residence at Belvedere Park, Mr. Thomas Dowdilly, architect. Quantities supplied:—
 Villa, Fencing, &c.
 Allen £1,000 0 0 2,100 0 0
 Knight 819 10 0 112 10 0
 Cowland 704 0 0 135 0 0
 Nowlan 795 0 0 83 0 0

For new premises, Counter-street, Borough Market. Messrs. Jarvis & Son, architects:—
 Henshaw £1,085 0 0
 Ronald 1,075 0 0
 Rider & Son 1,080 0 0
 Carter 1,037 0 0
 Baguley 1,020 0 0

For new shop-front, No. 85, Borough-road. Mr. William Smith, architect:—
 Crabb & Vaughan £140 0 0
 Saby 129 0 0
 William 125 0 0
 Patterson 88 18 6

For the erection of a pair of semi-detached villas, at Wood-green, Tottenham, for Mr. Robert Bomanis. Messrs. Strudwick & Meenie, architects:—
 Ronald £1,450 0 0
 Eustace 1,339 0 0
 Wardle & Baker 1,308 0 0
 Feard 1,297 0 0
 Shurmer 1,295 0 0
 Bogers & Richards 1,233 0 0
 Perkins 1,270 0 0
 Bidley 1,250 0 0
 Snowdon 1,225 0 0
 Hunt & Elkington 1,200 0 0
 Spurr 1,198 0 0
 Abbott 1,172 0 0
 Aitchison & Walker 1,164 0 0
 Adams 1,155 0 0
 Brett 1,145 0 0
 Keys 1,097 0 0
 Linnell (accepted) 695 0 0

TO CORRESPONDENTS.

L. J.—R. T.—An old brick. T. W.—S. M.—S. D. W.—S. A. M.—P. A.—B. Brookes—J. F.—J. R.—C. J. A.—P. O.—W. C. T.—Mr. F.—R. S.—P. R.—T. J. H.—T. D.—H. N. H.—R. H.—G. B.—E. W. J.—G. & G.—A. S.—G. H. J.—D. G. H.—R. R.—W. & P.—S. & W.—J. F.—J. T. D.—F. M.—R. B. (perfectly suited to this climate. Size and form must be guided by circumstances.) J. O. (the form should be mailed on the owner's side)—W. R. (a list of charges is published by Institute of Architects)—T. W. (in type).

NOTE.—Architects who are unwilling (as we are) that their names should not accompany lists of tenders with which they are concerned may prevent the omission by sending lists themselves. We cannot repeat lists on the ground of such omission.

We are compelled to decline pointing out books and giving addresses.
 All statements of facts, lists of Tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.
 NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

TO SUBSCRIBERS.

NOW READY, THE TWENTY-FIFTH VOLUME OF "THE BUILDER" (bound), for the year 1867, price One Guinea.

CLOTH CASES for binding the Numbers, price Two Shillings and Ninepence.

COLOURED TITLE-PAGE, gratis.

SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of Three Shillings and Sixpence each.

Advertisements cannot be received for the current week's issue later than THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and not to the "Publisher."

[ADVERTISEMENTS.]

CHURCH, TURRET, and STABLE CLOCKS. J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the Manufactory, Ludgate-hill, will be glad to furnish to clergymen, architects, and committees, Estimates and Specifications of every description of Horological Machines, especially cathedral and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Makers by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862, 25, Old Bond-street, and 33 & 34, Ludgate-hill, E.C. Established 1749.

The Builder.

VOL. XXVI.—No. 1309.

On the Superficial Remains of Ancient Jerusalem.

THE work commenced at Jerusalem opens up a field of archaeological discovery hitherto entirely untouched, and can only be compared to the exhumation of Pompeii, the extent of the ruins, if fully explored, being probably much greater, though their state of preservation may not be so perfect.

The actual work done is not, perhaps, great as yet, and an obstacle almost insuperable exists in the fact that a modern city stands above the most interesting part of the ancient town, so that in this quarter nothing can be done, at least at present; but still a considerable portion lies without the walls on the north and south, and it is here that Lieutenant Warren has commenced his work, and already made some progress in it. It is not, however, the amount, but the nature of the work which is important. It has been known for some time past that the whole of the present level of the site of Jerusalem is artificial. Drs. Barclay and Robinson have pointed out those mounds of rubbish varying in depth, and sometimes attaining to 60 ft. or 70 ft., which cover the entire surface of the two hills on which the modern city stands, as well as those belonging to the same plateau on which, as is admitted by all, however different their ideas of its extent and boundaries, the ancient city was situated. It has also been found that the soil consisted principally of a fine limestone *débris*, and resembled in character the *débris* formed by the disintegration of limestone masonry, and that the outline of each of the hills resembles rather that of a gigantic rubbish-mound than the natural outline of a limestone range, as exemplified in the Mount of Olives and the chain of Neby Samwil, in the immediate vicinity of the city.

And yet, although whenever, either by design or during the execution of some independent undertaking, this artificial surface has been removed, in every case some relic of the ancient city has been found, the top of an arch or wall, or the upper part of a tower, still it never seems, until quite lately, to have struck any of the writers on the subject, or of the more practical explorers who, during the last fifteen years, have done good service by describing minutely those few remains which still appear above the surface of the ground, that beneath it lay an extent of ruins equal in interest and preservation to those of Pompeii, and sufficient, when coupled with the minute descriptions of the Old Testament and Josephus, to lay at rest at once the controversies which have so long been carried on concerning the extent of the city, and the position and character of its principal buildings.

The first blows of the sapper's pickaxe have demolished one stoutly-contested theory, that of

the course of the southern wall of the city, which nearly all the writers on the subject have agreed in bringing so far north as to reduce the city to an extent about two-thirds of that positively given by Josephus, and have established two important facts,—first, that the extent of the ancient town on the south was much greater than it is at present, and covered the whole of the hill of Zion, the modern wall running nearly over the crest, a course which cost the Arabic architect his life; and secondly, that, instead of the modern level of the Haram, both within and without, being that of the temple inclosure of Herod or Solomon, while the rest of the city has mysteriously disappeared, the whole does in fact exist, but at such a level that it is only the temple inclosure that, owing to its enormous height, can, like the sphynx before its exhumation, keep its gigantic head above the ground.

At such a time, when a new Jerusalem is on the point of being disinterred, when we may say without exaggeration that a long-lost city has been recovered, it will be interesting to describe the few remains which were discovered before the time of Lieutenant Warren, at different periods and by different explorers; and the more so as these remains show a mixture of styles and workmanship which, independently of their special interest, are most interesting and instructive to the architect and the archaeologist. The greater part of these exist in the present Haram inclosure, and have been principally described by Dr. Barclay, Robinson, Catherwood, and most especially by the French architect, M. De Vogüé, whose work on the subject is the most important and perfect hitherto published. Much information is also to be obtained from the Ordnance survey and the photographs which accompany it, as well as from those taken during the visit of H.R.H. the Prince of Wales.

So much attention has recently been turned to this subject that it is almost unnecessary to give a general description of the city and Haram inclosure; although there are the means of obtaining the most accurate measurements of all these remains, moreover the space occupied would be too great for such a review. A few words of introduction will suffice roughly to fix on the mind of the reader the localities of these relics.

The sketch given* shows the general features of the ground occupied by the city.

It will be seen, then, that Jerusalem stands on a plateau divided from the surrounding country by two valleys, originally of some depth, but now much filled up.

This plateau rises into four principal hills—one to the south, nearly circular, though described by the ancient writers as heart-shaped. Hence the origin of many traditions. This is, at present, the most elevated of the four, though probably the *débris* is thickest upon it. Immediately north of it lies a second, which is considerably lower, and answers, as all writers agree, to the Acra, or lower city, of Josephus. East of this is Moriah, the natural shape of which is entirely lost owing partly to its having been altered by Herod and Solomon, to suit their buildings, and partly to the accumulation of rubbish upon it and in the valley below. Its present shape is roughly that of a parallelogram, with a tongue known as that of Ophel, on the south. This, as well as the other hills, has been accurately contoured.

North of these three hills is a fourth, surrounded originally by the third wall of Josephus, though the exact extent of this wall has not been well determined by any writers. This hill is the Bezetha of Josephus, and, as it is of greater extent, it is also much less elevated than either of the other three.

Such being the general features of the site, two points will be sufficient, together with the

outline of the modern city wall marked on the plan, to fix with sufficient accuracy the position of all the remains about to be described. These are the modern church of the Holy Sepulchre on Acra, though no eminence exists there which may be known as Mount Calvary, and the Haram enclosure on Moriah.

The remains in the city are few and imperfect, but those in the Haram are almost intact, and present a jumble of architecturæ which, commencing with the work of Solomon, go down with the additions and improvements of Herod to the patchings and ornamentation of Julian and Justinian, the restorations of the caliph Omar and his successors, and the execrable workmanship of the more modern Turkish and Arabic masons. The preservation and wonderful interest of these are points concerning which very little seems generally to be known, and are confined to those who have made Jerusalem a special object of study.

The ruins of the city itself,—that is, of that part hitherto brought to light,—may be treated of in a few words.

The most important of these is a gateway, discovered originally by Robinson, on the site of the present Damascus gate, the position of which is marked on the map. It consists of the foundations of two towers of an irregular shape, built of huge stones of the rebated style, characteristic of the oldest masonry of the city. These towers are built into the city wall, and but little can be seen of them, as modern masonry covers some part of them.

In one, however, Dr. Barclay found the remains of a winding staircase of remarkable construction, consisting of flights of steps at right angles to each other, the size of the stone being proportional to that of those in the walls.

This ruin, more accurately examined by Lieutenant Warren, concerning whose work it is not our intention to speak here, belongs exclusively to the first or rebated style.

Another of almost equal interest is found in the immediate vicinity of the Church of the Holy Sepulchre, at the east entrance. It consists of a wall of large rebated stones, the foundation being broader than the upper part of the wall, and a pier or buttress projecting from this, flush with the face of the foundation. The recess is not made with a horizontal step, but is sloped off with a course of stones, the face of each block of which recedes at an angle of about 45 degrees.

A precisely similar construction is visible in the wall of the Haram at Bethlehem, in which the whole wall consists of large rebated masonry, like that of Jerusalem.

A third ruin stands a little south of this, consisting of a plain wall of large cut stones, like those of the second style of the Haram enclosure. In this an archway is cut, with a semi-circular arch, and two pilasters of different styles. The arch consists of stones of much smaller size than those of the wall, and is evidently much more modern; each capital of the pilasters is cut out of the blocks of the old wall, one being of Romanesque character, with a bird introduced into the tracery, the other having the peculiar basket-work tracery of the Byzantine capitals; as shown, for instance, in the Mosque of St. Sophia, and elsewhere.

It is also worthy of notice that the courses of stones forming the shafts of the pilasters are not continuations of those of the wall, although of equal size, the horizontal joints not being flush, and several smaller stones being patched in between the pilasters and the wall, as well as round the keystones of the arch, in a clumsy and most inartistic manner.

These two remains were first described by M. de Vogüé, who gives plan and elevations of both to scale. They are most interesting as bearing on the disputed point whether the present Calvary was or was not within the walls

* See p. 174.

of the ancient city, and seem to show from their position east of the present church that both the walls of Nehemiah and of Herod excluded the traditional site of Calvary. The first of these ruins forms part of the entrance to the basilica of Constantine, as restored, apparently with certainty, by M. de Vogüé. From this fact Dr. Robinson thought that he traced the marks of a wall running north, but there seems to be some doubt as to the true character of these indications.

On the southern slope of Zion another ruin exists, consisting of a small square tower with a wall of the second or unrebated megalithic style, and with a fosse. This, with a cistern containing an arched reservoir, completes the list of the few remains of the city itself found before the commencement of Lieutenant Warren's excavations. No account has, however, been taken of the square tower situated at the Jaffa gate on the east wall just above the northern side of Zion, as, although the stones of its walls are rebated, still their very small size as compared with the immense blocks of 40 ft. found in the Temple, together with a want of finish and difference in material, is opposed to the assumption of many authors that this work is the Hippicus of Josephus.

Besides these remains there exists a second class, namely, the tombs around the city. Of these there are two groups, and the date of them is a matter of considerable interest.

The first of these is the so-called Tombs of the Kings, which exhibits the true Jewish character as shown all over Palestine. The principal feature of these is a square rock-cut chamber, communicating by narrow passages with other similar chambers, which have niches or cubical places lengthwise at right angles to the walls, three cubical being the most in one side, and two or three being placed directly above one another: thus the total number of cubical in one chamber, allowing for the passage occupying part of one wall, would be at the most about thirty, and at the least about half that number.

The chambers in this set of tombs are numerous, and arranged in two stories; but they are all of the same character, and this is entirely different from that of any Roman sepulchre, and also from that of the traditional Holy Sepulchre. The entrance to the hall from which the passages radiate is through a small door, communicating with an excavated outer hall, which has an open entrance from the large sunken court, which surrounds the opening. Part of this outer hall has its floor level with that of the court without, but the other part is level with the floors of the first story of the excavated apartments. A narrow channel is cut in between the face of the wall, in which the door leading to the inner hall is cut, and the higher part of the floor of the outer entrance. The bottom of this channel is not horizontal, but has a sensible incline, so arranged that a large cylindrical block of stone might roll along it, and when in its lowest position cover the entrance not closed by any other means. When this block was rolled to its highest position the door was open. This construction beautifully illustrates the passage in the Gospel, in which the rolling away of the stone from the door of the sepulchre is mentioned.

Above the broad entrance of the outer hall is an entablature, which has been a puzzle to many archaeologists. Its general character is similar to that of the Tombs of the Judges, not far distant, but it is more ornamental. In the latter instance, not only is the internal arrangement of the true Jewish character, but the outer face of the rock is channelled in imitation of being megalithic, and from the appearance of the entablature it would seem to be of the same date,—that, namely, of the Jewish kings; but in the tombs in question no such imitation exists, and therefore there is nothing particular to fix the date.

The entablature represents wreaths of laurel, bunches of grapes, and various figures resembling a Y formed of small round globes, perhaps representing grapes, the whole divided by triglyphs, with guttae of Ionic character, and bordered above and below with a band of leaves. Three plasters cut in rock appear to have supported this ornate entablature; but they have entirely disappeared, and the whole is considerably damaged and broken.

The entablature has been accurately photographed, and the tombs explored and planned.

The second group of tombs is in the Kedron

valley, south of the Haram, and on the opposite side on the slope of Olivet. Of these the principal are the so-called tombs of Absalom and St. James, traditional names to which monkish legends are attached. The tomb of Absalom is a square monolith, with an excavated chamber at the top, and surrounded with Ionic pilasters supporting an entablature from which springs a dome almost Saracenic in character, the whole partially ruined, and resembling the curious rock-cut tombs of Petra, in Arabia Petraea.

The tomb of St. James or of Jacob is a rock-cut sepulchre, more resembling the sepulchres of the kings, with an entrance supported on apparently Doric columns, with an inscription in square Hebrew, very imperfect, attributing it to three Jewish brothers, priests, and to two of their nephews. The style resembles that of the Palace of Hycranus, and is supposed by De Vogüé to be of the time of Herod.

Such are the remains in the city itself; but those of the temple are far more numerous and interesting.

The Haram enclosure has of late been often described; and, having been repeatedly measured, though with different results, it will be sufficient to say that it is an enclosure of which the south wall measures about 900 ft.; that on the east, which is at right angles to the first, is about 1,800 ft.; and the northern about 1,000 ft.; while the western wall, as shown by Catherwood and the Ordnance survey, was at right angles to the south wall for some way, but, when past a certain place, about two-thirds of its length from the north, known as the Jews' Walling-place, it bends towards the west and joins the north wall at an acute angle. This latter part seems to be modern.

The interior of this enclosure is considerably elevated above the present exterior level, and covered partly with soil and trees,—partly with flags of limestone.

In the centre, on an irregular trapezoidal raised platform, stands an octagonal mosque of large size, known as Kuehet es Sacra, or the Mosque of Omar. In the centre of this stands the curious hollowed stone which Mr. Ferguson, supposing that the whole of this enclosure is not really ancient, has considered to be the traditional Holy Sepulchre of the time of Constantine.

On the south wall, about a third of its length from the west end, is another large building, now a mosque, but originally a Christian church, built by Justinian and augmented by the Crusaders, the three styles being mixed together, but easily separable. This is the Mosque of El Aksah.

The height of the interior walls, as measured before Lieut. Warren's excavations, was about 60 ft., and 70 ft. at the south-east corner, where the rock was lowest; but he has now excavated to a depth of about 130 ft. below the top of the wall.

Of the masonry, of which these wonderful fortifications are composed, something has been said in the pages of this Journal, and a more minute description given than is here possible. It is sufficient to say that below the more modern Arabic patchwork two dissimilar styles are to be remarked all round the enclosure.

The first consists of gigantic stones hewn vertically from the limestone, which is of a kind hardening with exposure to the atmosphere, without regard to the character of the bed, soft and hard veins being used indiscriminately, and thus the wall presents an irregular appearance, owing to the different amount of weathering of the different blocks.

The upper courses are sometimes deeper than those below, and the joints and the lengths of the stones are very irregular. Those discovered before the investigations now commenced, were all marked with the peculiar ornamentation of a deep rehauting, improperly described as bevelling, which runs round the four edges of the face of the stone, and gives a kind of ornamentation to the face of the wall. The stones since discovered are said to be more roughly worked, the face being uncut, while the former were even polished.

The size of these stones is very great, many being as much as 40 ft. in length and 10 ft. in height. The largest were at the south-east corner, and some in a very good state of preservation. This style is found running round the entire length of the wall on the south-east and that part of the west on which no new buildings have been raised against the Haram walls. The position is always below the stones of the second style. On many of the stones there are small

square blocks placed irregularly on the face, which are supposed to have been used by the builders to attach ropes by which each stone, when finished, was slung, and being moved on rollers up the floor of the cavern (still found with a gentle slope), to have been transported by means of a great number of crossbars, which allowed the distribution of the weight over a large space, and facilitated the transport by a large number of men or beasts. The quarries themselves afford much interesting information, and give many valuable indications of the mode of workmanship and means of transportation used by the builders of this first period. They have been fully explored and described by Dr. Barclay.

The second style shows considerable advance in masonic skill. The stones are nearly as large and more regular in jointing and length; they are not marked by any rebating or other ornamentation, being plain and rather square, resembling the Roman megalithic masonry of Herodion.

The large stones ascribed to Justinian do not equal any of these stones in proportions; and although of a fair size, are decidedly not megalithic. The principal points of interest on the walls of this extraordinary enclosure (for of the interior we know hardly anything as yet) are the Jews' Walling-place, Robinson's Arch, and the Single, Double, Triple, and Golden Gateways. Above ground not a single relic remains of the ancient Temple, and the whole of the present surface is covered exclusively with work the most ancient of which only dates back to Justinian. Beneath, a few vaults remain; but it is worthy of notice that every one of these is built up at the end; so that if it were not for the inflexible opposition of the Mahometan possessors, it is most probable that many interesting relics might yet be found in the heart of the mountains.

A disconnected work of great importance has also been visited by Dr. Barclay, namely, a very large reservoir, with a roof supported by rock-hewn pillars, bearing marks of having been originally covered with metal. This reservoir is placed centrally with regard to the east and west walls, and about three times as far from the north as it is from the southern wall. It communicates with the Brook of Kedron, and with seven other reservoirs or wells. It can at present be only reached from the interior of the Haram.

The Jews' Walling-place, a well-known spot to all who have read any works on this subject, is a portion of the western wall, forming one side of a narrow street. It is here that some of the largest stones are found, both of the first and also of the second style. It receives its name from the practice of the Jews of assembling here once a year to lament the dispersion of their race and the ruin of their city, as they sit on the ground, tearing their clothes, casting dust on their heads, and often placing them in large weathered hollows between some of the lower stones, in which position they often remain lying for some considerable time. The stones here are much weathered, and some almost destroyed.

The arch, which is known at the present time by the name of its discoverer, Dr. Robinson, appears to have formed the communication between the Temple and the city on the south-west; and it is interesting to observe that, taking the longer cubit, as generally determined in English feet, both the breadth of the arch and its distance from the south-east corner, as determined by the Ordnance survey, are such as to mark the continuation of the central cluster of Herod's Temple, the dimensions of which are given by Josephus; this cluster being of different dimensions to those on the north, east, and west, and known as the Stoa Basilica. In this view Mr. Ferguson and many of the best writers on the subject agree.

Of this arch but a trace remains at present. It appears to have been semicircular, and sufficient is left to make the restoration of the span possible, following which indication Lieut. Warren has been able to find a pier of the bridge on the opposite side of the valley, which, even above the present surface of the ground, shows indications of the springing of another arch. The stones of which it is composed are of larger size than those in the wall, and one only forms the thickness. They are not rebated, and are said to be held by tenons into the wall, so as to stand still, though unsupported by the piers. The arch springs directly from the wall, a little above the present level of the ground.

The four gateways mentioned above are by far the most important and extensive remains as yet discovered, and present a jumble of styles from a time before that of Solomon down to the present day.

The Golden Gateway is on the east wall, at a distance from the north-east corner rather less than a third of the length of the wall. It consists of a gate-chamber, whose floor is on a level with the outer ground beneath the Haram wall, some 20 ft. from north to south by 80 ft. from east to west. It is double, and has a double-arched entrance, now filled up. The roof, which reaches a height of about 30 ft., is supported on two pillars and two piers with half pillars, while four pilasters on the north and south walls support four cross arches. Above these transverse arches are six domes with pendentives, of which the two nearest the east are raised to a greater height on drums, and furnished with windows for lighting the chamber, otherwise closed. Above the thickness of the entrance is a tower, which is about 60 ft. in total height.

Here, then, we have a most curious mixture of styles. The domes, drums, and arches are all of modern workmanship, and may be of any date later than Crusading times. The two central pillars are undeniably Byzantine, with the usual heavy capitals and bases. The pilasters on the walls, and the richly-carved entablature which they support surrounding the room on three sides, are of fine Romanesque work, beautifully cut and ornamented to an extent which marks the latest and more degraded Roman style. They are merely ornamental, and do not enter into the construction of the room. The same style of work is observable without, but here the entablature is bent into arches above the entrance, these arches starting from pilasters on each side and in the centre of the gateway. The same ornamentation is found on the outside of the north and south walls, and another double entrance leading to the Haram enclosure. This transitional style, occurring also in the Golden Gate of Spalatro, has been pointed out by Mr. Fergusson as belonging to the fourth century, about the time of Constantine,—a fact which he seems to prove by architectural evidence,—thus making it probable that there are remains of the work of Julian the Apostate, who commenced the rebuilding of the Temple.

It will be worth while to remark some of the details as they recur in another doubtful relic. Among the principal are small deeply-cut dentils, scroll-work with square projecting blocks as the centre of each flower, a larger kind of dentil often found in immediate succession to the smaller kind, and many other nameless ornaments sufficiently characteristic of the style.

But the confusion does not stop here. The piers and walls of the apartment are of enormous stones, of the second style, in a good state of preservation; and, although no masonry of the first style occurs, yet the projection of the lintel internally at the east entrance is formed on each side of two enormous blocks of solid stone, some 20 ft. in height, which have been channelled horizontally so as to represent two or three courses of this masonry. These are unquestionably of greater age than the first style, and must be of enormous antiquity, if we suppose the related masonry to be of the time of Solomon. But a fuller comment on this ruin has appeared at some distance back in the numbers of this paper.

The Single gateway is on the western wall. (This name is that by which it was known before Lieut. Warren in his investigations had discovered another vaulted entrance on the south, to which he gave the same name.) It consists of a single passage, about 20 ft. wide, the sides lined with small stones, and walled up at one end, its total length being about 300 ft., and the height to the centre of the vaulted roof about 20 ft.

The entrance is most remarkable, and externally it is made of an enormous lintel, resembling that at the Gate of Lions at Mycenæ, supported on the wall on either side without any kind of pier. All the stones up to the level of the top of the lintel are rebated, as is also the lintel itself. Its height is double that of the course of stones, and the joint is broken by the prolongation of the lower half of the lintel on either side as at Mycenæ. Above the lintel stones of the second style occur, though of comparatively small size. Internally a very flat relieving arch, or, more properly, a second lintel, slightly curved, is built of five stones of enormous size, and of the second style, a method of taking

the weight of the old stone observed in other parts of the Haram.

The Double and Triple gateways are at an equal distance from each other, and form the south-west and south-east corners of the wall. The Double gateway is the double in all its dimensions of the Single gate, and was first discovered by Mr. Tipping, who, observing part of an entablature and a rebated window, heheld within a large vault, hitherto unexplored; the entrance being covered by modern Arab houses, into which he managed to effect an entrance.

In order to make out any order from the confused mass of ruins and patchwork now existing, it is necessary to begin with the oldest work and proceed to the latest. Of the rebated masonry the remains are perfect. The entrance at that time consisted of a double doorway, 40 ft. wide, with a central heavy pier, on which and on the ends of the two walls the lintel, similar to that of the single gate in form and size, rested. The remains of the second style consist of two low relieving arches in the wall above, taking the weight of the lintels, one of which is cracked across. The walls of the chamber within are also of the second style, with plain Doric pilasters; though there are marks, according to Mr. Tipping, of these stones having been cut down to afford relief to the shafts of the pilasters, traces of rebating being still visible.

Before speaking of the more modern alterations of this simple plan, it will be necessary to give some description of the interior passage. This consists of a room of equal width with the doorway, and about twice the length; being divided by arches, resting on pilasters and three pillars, into four compartments, capped by flat domes with pendentives.

These domes are, however, of very different character to those of the Golden Gate, being composed of large stones and ornamented in a manner foreign to any known style of architecture. The principal feature, besides numerous wreaths of corn sheaves, being a large and irregularly-traced vine, with bunches of grapes, which runs in low relief over the whole dome, and over this are four squares, surrounded with a raised frame, placed on their corners, and filled with various kinds of ornamentation, one being of rose and coffee work, another of intersecting arcs, in high relief. The pendentives are also of a similar character.

The central pillars on which these curious domes are supported are themselves of a unique description. They are both of monolithic shafts and without bases. The more southern has a capital, the outline of which is of an unmistakably Egyptian character, consisting of a bell covered with acanthus-leaves traced in the very lowest relief, with lotus-leaves appearing between the divisions, the whole capped with a thick abacus. The only capital of similar description is found in the Tower of the Winds at Athens, and even this is of a much more decided character; yet it is from this that Mr. Fergusson has deduced the Egyptian origin of the Corinthian style. The second pillar has a plain bell-shaped capital with abacus, resembling the former in profile, but unornamented. The second pillar is placed at the foot of a flight of four steps, apparently ancient, which occupy the half of the passage to the west, while to the east of the pillar a wall of related masonry forms the end of the hall.

Mounting by these steps, a vaulted gallery raised somewhat above the hall is reached, being divided centrally by a row of piers supporting arches,—the whole of smaller masonry, though still of a size larger than usual. The walls are megalithic, and therefore of a different age to the piers, being of the second style. The passage is blocked at the end, but communicates by steps with the interior surface of the Haram.

The present appearance of the gate, as seen from without (the houses built over part of it being removed), is further complicated by the addition, for ornamentation, and in a manner not at all connected with the construction, of an archway resembling a T in shape; the lower side of the entablature being arched out into a double arc, and the line running horizontally above. The whole ornamentation running round this peculiar form is similar to that of the Golden Gate, the same details being observable as spoken of above, and the same order retained. Above this double arch, and at some height on the wall, disconnected from the lower work, and immediately surmounting the relieving arch, is a narrow cornice consisting of two rows of dentils and a moulding which stands out as a string-course from the wall. There can be little doubt

that these added ornaments are of the same date as those on the Golden Gate.

Close to the last-named detail is a curious stone, in size equal to those surrounding it which are of the second style, but bearing an inscription and built reverte into the wall. The time of the inscription is Hadrian's, and it runs as follows:—

“ Tito Zē[ho]i Hadriano
Anonino Aug[usto] Pio
P[at]ri[ci] P[at]rici[us] Pontif[ic]i Augur[um]
D[ecreto] D[ic]cunium.”

The Triple gate is built on exactly the same plan, and finished in the same method by Herod, with the exception that it is triple, and leads to a rock-hewn passage, and that no ornamentation exists on its pillars, face, or roof. To the east of it are a series of vaulted passages, irregular both in width, length, and height,—a series of arches, supporting a vaulted roof, the piers being formed of large stones, apparently taken from the walls, and rebated on one side, while on the other three they are roughly rusticated. Thus they appear to have been made use of after having been taken from the wall, and the whole system is considered to be modern.

It is under these that Lieutenant Warren has just discovered his Single gate, which appears to be undoubtedly ancient.

Although this system of vaults, which has been accurately planned and measured, is apparently modern, there exists at the extreme south-east corner a chamber investigated by M. de Vogüé, which is of similar character with those remains already described. It consists of a roughly-squared room, with a window having a triple opening to the east. The plan of the piers of the window are similar to those of the gateways already described, and in one corner is a winding staircase similar to that in the tower of the Damascus gate. The roof of the apartment is vaulted, and is supposed by M. de Vogüé to be ancient, resembling that at the Double gate.

To the north of the first window, one bay of which is without the wall of the chamber, is another, double, and of the same character. Both of these are at a much higher level than any preceding remains, as is also the floor of the chamber, and seem to have been situated near the top of the ancient wall. On the south side of the chamber is another window, filled up.

Such is a brief description of the few remains which at different times and by separate individuals, have been discovered above the surface of the ground before the work was commenced by Lieutenant Warren. Though few and scattered, they are yet of great value, as showing by their exact coincidence with the description of Josephus, how unexaggerated and truthful his statements are, and how magnificent were those works the immovable foundations of which we must surely find, if we only seek in the proper place. It would be truly a disgrace if such a scheme were allowed to fall through.

It is probable, that if fully carried out, these investigations will lay at rest for ever the controverted points in the topography of Jerusalem. It would be out of place to draw any conclusions from the facts hitherto collected; still, it is well to have an idea of the tendency of all the evidence, and thus to have some notion of where to work and what to expect. It will, therefore, be well to point out the indications of these remains, with regard to the three temples of Solomon, Herod, and Julian. The similarity of the second style to that of Herodium, together with the semicircular arches and square stones, must seem to all who look without prejudice on these relics to point out the origin, as belonging to the time of Herod, while the inferior position, the Egyptian character of the pillars, and the unusual rebating, together with the absence of the arch, will seem to date the first style at the time of Solomon.

The fact that the transition style limits the Romanesque architecture of the Golden and Double gates to a time between that of Julian and Diocletian, when coupled with the known fact that Julian built on Moriah, would seem to be sufficient to fix the authorship of this work.

Of the more modern works of Justinian and various builders, down to modern times, nothing need here be said, as they admit of no dispute, and are only important when considering another branch of this interesting subject—the Mediæval relics of Jerusalem, a subject which has been most fully investigated, and is of great, though separate, interest.

Such, then, are these relics briefly described,

as is necessary from the nature of such a sketch, but of which plans, photographs, and accurate detailed drawings exist. We must await that fuller and more complete investigation which, with proper men and sufficient money, Lieutenant Warren will be able to carry out.

ON THE UTILIZATION OF SEWAGE BY IRRIGATION.*

On the Methods by which it has been proposed to treat Sewage.

EVER since the arrival of Asiatic cholera and other devastating epidemics on our shores a multitude of schemes for the deodorisation, disinfection, filtration, precipitation, and utilization of the offensive matters held in the sewage have been from time to time in vogue. Few of them, however, have been successful, and by far the greater number may be pronounced to be the nostrums of visionary enthusiasts, with no real save that of needless expenditure of time and money.

The following may be considered the principal of these methods of treating sewage:—

1. Filtration through artificial beds.
2. Deodorisation and precipitation of the organic and inorganic matter.
3. Utilisation by earth closets.
4. Utilisation by irrigation.

1. *Filtration through Artificial Beds.*—The experience of the past twenty years has shown with what favour the theory of the filtration of sewage has been adopted by engineers and public boards. There is hardly a single district of any importance under the jurisdiction of the General Board of Health which has not at some time or other been more or less engaged in attempts to bring this theory into practice. Had a tithe of the energy thus bestowed upon a vain and hopeless pursuit been devoted to the solution of the question of utilization, there can be little doubt that it would have long since been settled to the permanent and solid benefit of this heavily-taxed nation. Amid all these efforts, no satisfactory case can be pointed out in which valuable results have been obtained from the adoption of artificial filter-beds; and it is now generally acknowledged that organic matter held in solution cannot be extracted by filtration. What is extracted is simply the solid matter suspended, that which is in chemical combination being practically untouched.

Sand, gravel, lime, charcoal, animal and vegetable, alum, shale, magnesia, and an indefinite number of other purifiers, have each had their turn; have undergone every variety of combination and permutation; and have invariably met with the same fate. Many of these, indeed, have given good promise when dealt with experimentally in the laboratory, or upon a very limited scale, but, from obvious reasons they have entirely failed when brought to extensive application. It may, perhaps, tend to lessen our professional pride, when we reflect that after the lapse of a generation distinguished for the spread of engineering science, we find ourselves compelled to submit to the sagacious conclusions of our eminent predecessors, after a fruitless attempt to better them.

It is but recently that at Aldershot, the eminent civil engineers who carried out the drainage of the permanent camps, erected near their outfall costly and elaborate beds of prepared lime, &c., through which it was proposed to filter the sewage on its way to the Blackwater. These works may now be seen (1867), a square, solid fabric of masonry, with all the signs of recent erection, silent, and utterly abandoned. It was found, as might have been expected, that the fluid, although by no means freed from its offensive sewage matter, became so charged with lime during its passage through the beds, that in a very short time all the fish for miles down the river were killed, and an injunction from the Court of Chancery was obtained, commanding the Government to stop the works.

At the oft-quoted Croydon, amongst the many schemes forced upon the Local Board by the proprietors of the river Wandle, filtration in every form was tried,† with such results as are recorded in the extensive works which are now rapidly falling into ruin near the site of the present irrigation tanks at the outfall. Mr. Alder-

man Mechi, in referring to these works, which consisted of vertical perforated iron plates, with layers of gravel or charcoal, said before the Select Committee on Sewage, in reply to Mr. Ferrand, that the filtered sewage "looked like dirty water, and was slightly disagreeable to the smell."²

At Wakefield, the adoption of Mr. Spencer's magnetic carhide filter for the water supply does not appear to have been devoid of success, as there is undoubtedly a material improvement in the water obtained from the river Calder after filtration; yet in the gross and polluted state of that river the removal of an immense amount of organic and inorganic matter in suspension, does not by any means destroy the dangerous condition of the liquid. Even yet, the filtered water placed in a newly-washed decanter throws down a precipitate which presently turns putrid, indicating the noxious presence of nitrogenous matter or ammonia.†

At Rugby, the failure of the filtering process was complete. Mr. G. H. Walker, the lessee of the Rugby sewage, says that the filter-bed did more harm than good, inasmuch as it was always full of putrefying matter, and the sewage flowing through it passed into the river in a fouler state than before.‡

Coventry, Leamington, Leeds, Leicester, Nottingham, Carlisle, Tottenham, Bury St. Edmund's, and other towns have witnessed the failure of artificial filtration to meet its required purpose; and it may now be considered that, with the exception of a few enthusiasts, who now and again intimate to the world that they have at last solved the problem, and discovered the true filtering medium applicable to this purpose, this means of purifying our sewage has been condemned as futile. Concerning artificial filtration, the following clause is extracted from the report of the Committee on Metropolitan Sewage 1864:—"No efficient artificial method has been discovered to purify, for drinking and culinary purposes, water which has been once infected by town sewage. By no known mechanical means can such water be more than partially cleansed; it is always liable to putrefy again. Processes of filtration and deodorisation cannot, therefore, be relied upon to do more than mitigate the evil. Water which appears perfectly pure to the eye, is sufficient, under certain conditions, to breed serious epidemics in the population which drinks it." "Soils, however, and the roots of growing plants, have a great and rapid power of abstracting impurities from sewage-water, and rendering it again innocuous and free from contamination."⁴

The Rivers Commissioners⁵ say, that "no arrangements for treating sewage are satisfactory, except its direct application to land for agricultural purposes."⁶

2. *Deodorisation and Precipitation of the Organic and Inorganic Matter.*—As the alchemist of olden time passed his life in the vain pursuit of the philosopher's stone or the elixir vitae, so in the present age the resources of chemistry have been wasted in the endeavor to extract wealth by the precipitation into a portable and concentrated manure, of the valuable parts of sewage. Enterprises conducted upon a grand scale have been projected with this object, under every eminent auspices, and have brought their promoters nothing but ruinous failure.

The history of the Patent Solid Sewage Manure Company's works, at Leicester, with such names as those of Robert Stephenson and Professors Aikin and Taylor as the chief proprietors, and that of Mr. Wicksteed as projector and engineer, forcibly illustrates the errors into which a too keen enthusiasm may lead men of acknowledged reputation. Mr. Stephenson, although, perhaps, second to none as a constructive engineer in the highest branches of the profession, could scarcely in justice be considered

* Rep. Met. Sewage, 1864: 3365-60.

† Third Report of Rivers Commission. Aire and Calder, 478 and 2301. The Calder at Wakefield is in a state of extreme pollution, draining in its course 1100 acres containing 400,000 inhabitants, the whole of whose sewage passes into the river, which, moreover, is polluted in every imaginable form by the refuse of no less than 1,200 manufactories of various kinds. To this pollution, Wakefield, a manufacturing town of 20,000 inhabitants, adds the contents of its own sewers, and the discharge from its own manufactories; and having done so, draws from the stream three-fourths of its own supply (vol. i., p. 46).

In an analysis of the water of the Calder, 1864, Mr. Fowler, surgeon, found five varieties of animalcules, decaying muscular fibre, constituents of feces, several varieties of vegetable life, and other noxious matters. This water was at that time drunk by the people of Wakefield without filtration (vol. i., p. 15).

§ Rep. Met. Sewage, 1864, p. vi.

|| Third Report, vol. i., p. 55.

to possess that nice and accurate knowledge of the chemical relations of sewage which unvaried study and practice can alone give; and his engineering colleague, although practised in hydraulic questions, was far too sanguine in pursuit of this theory, as will be seen on reference to his report to the Commissioners of Sewers. In 1854, after a series of satisfactory experiments, works were erected at Leicester by this company for the purpose of precipitating the solid manure in sewage, by quicklime administered in the proportion of 1 in 3,000. The capital is reported to have been 40,000*l.*, and seventeen steam-engines were required for pumping the sewage. Two reservoirs, 200 ft. by 44 ft., were constructed, and over these were erected warehouses, engine-houses, &c. Very hopeful reports were issued by Mr. Wicksteed, and the attention of very high dignitaries was directed to the enterprise, which after an enormous expenditure, collapsed into utter ruin as a commercial speculation, and now is ranked as one of the most signal failures on record.*

At Tottenham, the process of deodorisation and precipitation was tried with the same want of success, the works being now abandoned. The like result has occurred at Bury St. Edmund's, Croydon, Leamington, Coventry, and many other places.

In Paris, some years ago, gigantic reservoirs were excavated at Montfaucon, into which all the filth of that city was conveyed in covered carts, for the purpose of being converted by the action of sun and wind into a solid and useful manure or *pois-d'été*. The stench from these pools was intolerable, and bred putrid fever in the hospital in their neighbourhood. Since then the Montfaucon nuisance has yielded to a vast system of main drainage, which, as yet incomplete, promises to maintain the eminent reputation which has been gained by the internal government of Paris. The nuisance at Montfaucon, however, did not arise from what is now understood as sewage, *i.e.*, the contents of our sewers in their diluted condition, but from the night-soil, consisting chiefly of urine and excrementitious matter.

We have seen from the foregoing examples, that the verdict pronounced against the sufficiency of all known methods of dealing with the contents of our sewers by filtration or precipitation, is in every sense just and warrantable. Before we approach the discussion of the principles of sewage irrigation, there still remains another important expedient, which, although of all methods the most ancient in use, and one that has never been discontinued, has but recently received the attention it deserves, namely, deodorisation and utilisation by the use of dry earth.

The Dry Earth System of Sewage Utilisation.

The remarkable deodorant action of common black soil in a dry and pulverulent state, upon the ammoniacal steams given forth from the liquid and solid feces of animals, is a truth which, however it may be casually lost sight of, can be deemed of little less antiquity than the human race itself. Neither has this knowledge been confined to human reason, since the commonest observation tells us that it is shared by the instinct of many animals. There are few country houses of any importance where the domestics have not been instructed to carry out periodically this natural process of deodorisation by the timely aid of a shovel of ashes. When we hear, therefore, of high church dignitaries declaring the dry-earth system to be the greatest of sanitary discoveries, and of associations of learned men meeting to enlarge upon the singular revolution which is about to regenerate the mind, body, and estate of the whole human kind, we may be permitted to wonder at the want of so ordinary a kind of knowledge. Nevertheless, there can be no dispute that this useful property of earth has, to some extent, fallen into disuse, more especially amongst the humbler classes, who give themselves very little trouble on this score. That this proceeds more from indolence than from ignorance, does not detract from the merit of those who, viewing this matter with due regard to its practicality, would urge its general adoption where, from comparative isolation, or from other natural causes, the ordinary privy cannot be dispensed with.

The amount of popularity, then, which has been acquired by the earth-closet recently patented by the Rev. H. Moule, vicar of Fordington, is by

* Rep. Met. Sewage, 1864: 4732 and 4002-3. See also Mr. Wicksteed's Report to the Commissioners of Sewers, February 13, 1854.

† Amongst other processes tried, were, — filtration through charcoal; Higgs's patent lime process; treatment with carbonic acid and pre-chloride of iron. Mr. Latham, Leamington Congress Papers, p. 139.

no means altogether undeserved, although far too much scope in its operation has been claimed by those inflexible enthusiasts who cannot comprehend the impossibility of arriving at a single system which shall equally serve in every case. The details of the scheme contain nothing very striking or original, and it may be better and not unjustly defined as a new and systematic rendering of a very ancient practice, rude and primitive enough. There is no need, consequently, to enlarge materially upon it. The following is a brief description of the process:—The earth, which is to be of the common black description, dried and pulverized, is thrown down into the closet after use, either by means of a self-acting mechanical contrivance, or with the hand. The receptacle, a portable vessel of commodious size, is to be removed each day or each week, as the case may be, into collecting-carts, which in towns make their rounds at certain convenient hours, whence it is returned after disposal of its contents, which in the interval are consigned to the land or to some fixed depot. The amount of earth required in each case amounts to 12 or 16 ounces, and must be perfectly dry.

From the foregoing description it will be at once seen that the whole operation and mechanism of the earth-closet are of a very simple kind; but that great care is necessary in the use, and in the preparation of the requisite material, which must be of the loosest and driest nature. Its advantages in the country and in all places where water-closets are inexpedient are very evident; for not only is its application in strict accordance with the rules of health, but there is a perfect economy or saving of the agricultural ingredients contained in human voidings. Whether these are manipulated in the most profitable manner is another matter. In all isolated dwellings, prisons, asylums, schools, barracks, in rural villages, and even in straggling and thinly-populated towns, unfitted for economical drainage from scarcity of water or other causes, the dry-earth system will be attended by good results, care in its detail management being enforced by inspection. The readiness with which an ample supply of the deodorising material can be procured is, of course, an item in the condition of success; but, in the instances mentioned, this condition may be taken for granted. It is very doubtful, however, whether, without prejudice to the agricultural neighbourhoods of large towns, a sufficient quantity of dry black earth could be made available; for although it has been so supposed, it is by no means certain that it would be consistent with sanitary rules to use it again within a reasonable period. In the use of Mr. Moule's closets, about 2 cwt. of dry earth is required per week for a family of six persons.* This, at the rate of 38 lb. per head per week, would give in the case of the metropolis, with a population of 3,000,000, a quantity of dry earth amounting to 2,600,000 tons; † or allowing, in round figures, 25 cwt. to the cube yard, a total quantity of 2,400,000 yards per annum. To put it another way, this would be equal to 100 acres of land excavated to a depth of 13 ft.; but, as it would be no easy matter to get the proper kind of soil at so great a depth, the quantity may be more fairly estimated at 1,300 acres excavated to the depth of 1 ft.

It is plain, therefore, that an attempt to carry out a complete system of dry-earth closets throughout the populous towns of this country, would be attended in the first instance by a failure of the necessary deodorising material.

Secondly, it is absolutely indispensable that material shall be perfectly dry, inasmuch as, in the words of the projectors of the Earth Closet Company, "The earth-commode will no more act properly without dry earth, than will a water-closet without water." It is equally plain, therefore, that artificial means must be employed to bring the earth to this condition of dryness as well as of pulverisation, whereby another expense is added to the cost of soil.

Thirdly, an enormous addition to street traffic would follow the introduction of this method, which would amount in the metropolis to upwards of 40,000 one-horse loads weekly, and which must not be understood to take place during the hours of sleep, but must therefore necessitate the intrusion of labourers into every dwelling.

Fourthly, the displacement of existing water-closets in order to make room for earth-closets,

would simply be doubling the expense of the internal arrangements of each household.

Fifthly, it is justly surmised by those whose experience has taught them the habits of the poor that if the material has to be bought and paid for by its weight or measure, and insists upon a certain standard of care and precaution, however slight, inevitable neglect must ensue, which no amount of costly inspection can altogether prevent. Even with water-closets, the use of which adds nothing to the immediate outlay of the householder, there is too often great difficulty in keeping the humbler classes to the simple duty of uplifting the handle.

A final, and perhaps a fatal, objection to the introduction of this system in towns of great magnitude is, that it no more affects the evils of river pollution and ill-ventilated sewers than anything most foreign to the matter. The refuse of water-closets forms but a minor portion of what we term sewage: the household refuse, the scourings of market-places, stables, slaughter-houses, knackers' yards, the refuse matter of tanneries, hospitals, and innumerable sources of pollution still remain to be dealt with. The same main sewers and house drains are required, of the same depth and of the same sectional area; the same need of sewer ventilation exists, and the same fouling of streams goes on,—in short, the whole question which it has been alleged this method has entirely solved, confronts us in all its original force.

A close and impartial examination of the objections above enumerated will hardly fail to convince the professional inquirer that something very different from what has hitherto been placed before the public in the shape of earth-closets will be needed to solve the question of sewage utilization. Dr. Hawkesley,* in a paper read at the Leamington Congress on sewage, 1866, in the course of which he stated that his acquaintance with the earth-closet contrivance extended over a period of two months, gave a series of calculations affecting the financial results of the system. In one of these he took the annual value of the liquid and solid human voidings at 10s. per head, which, perhaps, is their received value; this, in a population of 3,000,000, would give a gross value of 1,500,000l. sterling. Against this sum he places the cost of collecting and carting to the depot, namely, 793,000l., and claims, as clear profit, the balance of 707,000l. But Dr. Hawkesley's figures are based upon an unaccounted assumption. He appears to be ignorant of the vast difference between the value of the condensed constituents of manure, which may be transported to great distances at a tariff which bears but a trifling proportion to the value of the commodity, and the value of the same constituents hurried in a huge mass of comparatively valueless matter, the carriage of which fairly tends to equal its marketable value. He, therefore, falls into the error of supposing that agriculturalists would send portions of their poor lands to London. They would pay the railway charges, and the only other payment they would have to make would be for the amount of refuse organic matter put into the soil.† This supposition, which is altogether foreign to the experience of those who are especially acquainted with marketable value of night-soil, has perhaps tended to form the views of many of the exponents of the dry-earth system. But let us suppose, on the other hand, that agriculturalists will not pay the carriage of their poor land either way; but that it is paid by the seller of the manure. From London outward, the average distance to which it would be sent may be taken at fifty miles; the carriage then, of one ton, at the rate stated by Dr. Hawkesley, namely, 1d. per mile, would be 4s. 2d. either way, or altogether, 8s. 4d.; let us add this 8s. 4d. to the supposed expenses of London management, and we find the following results:—

Working expenses in London.....	2733,000
Carriage of 2,993,000 tons of manure (Dr. H.'s calculation) at 8s. 4d. per ton.....	1,247,000
.....	2,010,000
Credit by sale of manure.....	1,500,000
.....	2510,000
Balance against.....	2510,000

So that, instead of a favourable balance of 707,000l., we have an adverse balance of 540,000l. For convenience sake, no account has been made of the cost of the dry earth, but it is very evident that the cost of "scraping" so great a bulk of earth, and its subsequent preparation for proper

application, must swell the cost of this system to a far greater total. It should not be omitted that the cost of spreading so bulky an article of manure is a consideration which has its due weight with farmers generally, and is a very different thing from that of applying a similar value in guano, *poudrette*, or other consolidated manure.

It is possible, and, indeed, highly probable, that Dr. Hawkesley's calculations, above quoted, are of a very crude sort, and may not do entire justice to the merits of the system he expounds; but it is precisely our intention to show what a slight value is to be placed upon a series of calculations based entirely upon supposition, warranted by no former experience, and in many respects opposed to existing facts.

Mr. Menzies, remarking upon Dr. Hawkesley's paper before the congress at Leamington, gave a very pointed illustration of the difficulties attending the disposal of night-soil. He said that at Aldershot, surrounded by some of the poorest soils in England, the whole refuse was in the first instance received into iron troughs, and carried away every morning, or thrice a week. The disposal of this was advertised for the highest bidder; but instead of the authorities receiving anything for the concession, they were compelled to pay 500l. or 600l. per annum,* although the manure was placed upon soil within a mile of the camp.†

ON THE ARCHITECTURESQUE.‡

WHEN I speak to you of "The Architecturesque," I am perfectly well aware that I am using a term which will be entirely new to you. I have this advantage, however, that its very structure will enable you to divine the tendency of the argument with which I have to submit it for adoption. The word "picturesque" will at once occur to you as that upon which this is based; and it will no doubt occur to you also that my argument need go no further than to persuade the architect that it is necessary, or at least desirable, that he should possess some word in connexion with the fine art architecture, which will be equally useful with this word "picturesque" in connexion with the fine art painting. It is scarcely possible, I think, to say that we already possess phraseology which sufficiently conveys the idea. It would be impossible, for instance, to suppose that the word "architectural" serves the same purpose in connexion with architecture that the word "picturesque" does in connexion with painting. This word "architectural" goes little if any further than the artistic elements of architectural forms, whether as ordinarily received or otherwise. Again, the word "architectonic," which we sometimes use, goes no further, I think, than the idea that architectural forms shall be subjected to structural propriety. Neither of those words, I may safely venture to say, carries anything with it of the peculiar idea which the word "picturesque" conveys in common parlance in respect of painting.

Now, let me remind you that the adoption of the term "picturesque"—comparatively a recent act in this country,—was in reality something more than the mere adoption of a phrase. It was the foundation of an idea. The Italian word *pittoresco* had been in use for centuries, signifying "picture-like,"—"painter-like." This word had been adopted by the French in the form of *pittoresque*, signifying the same idea; but it was only, I may say, within the limits of the present century that the word "picturesque," the English form of these terms, came to be publicly used and universally accepted. Still, it is plain that the idea which the word "picturesque" conveys needed expression only, not discovery. No doubt it was well understood, both by painters and by critics, before our adoption of this term. Nevertheless, it is equally plain, I think, that our adoption of the term formulated that idea which was not capable of being expressed previously except by periphrasis, and was therefore to a considerable extent hidden or unperceived, for want of a definite phrase which would carry from one instructed mind to another the precise notion here suggested. And I may go further in saying that it was purposely to define and fix this idea, which is now so commonly known amongst us as to seem axiomatic,

* Leam. Cong. Papers, p. 70.
 † To be continued.
 ‡ Lecture to the Architectural Association, February 25th, by Professor Kerr.

* See Prospectus of the Earth Closet Company, p. 8.
 † Dr. Hawkesley estimates it at 2,930,000 tons. Leamington Congress Papers, p. 56.

* Leamington Congress Papers, p. 56.
 † Leamington Congress Papers, p. 56.

that the term *picturesque* was introduced. This is what I mean, therefore, when I say that the introduction of this word into England formulated a most valuable and essential idea; and my opinion is that the term "*architecturesque*" would be similarly useful in formulating an equally valuable idea, which, although it may be said to exist in the mind sufficiently clearly perhaps in many instances, I think I may venture to suggest does not receive that degree of public recognition which it might do if it were formulated by a definite phrase such as I have proposed.

Let me discuss for a moment the meaning of the word *picturesque*. It signifies *worthy of being painted*. It is a certain piquancy in objects capable of being painted by which they are made worthy of the application of the painter's art. Examples may be very easily offered; but indeed it is scarcely necessary, for the precise application and significance of the term *picturesque* are so thoroughly understood that examples can only serve as common-place illustrations. But take a landscape. Suppose the spectator is stationed upon a hill-top. His attention is directed to the valley beneath, parcelled out into square, trim, ploughed fields, with neat hedge-rows, and perhaps a well-kept brook. All the evidences of material prosperity are there; the farm-house, the farm-buildings, the engine-chimney, everything of the very best; and the spectator is called upon to say whether it is not a pleasing and suggestive landscape. Certainly, he says; suggestive of material wealth and comfort; hope looks forward to a long succession of abundant crops and a well-provided and happy population. But, if the painter is asked whether that landscape is picturesque, he says, "No: for my purpose it is utterly worthless. I care nothing for trim fields, for the suggestion of large crops, for the comfortable farm-house, for the substantial farm buildings. It is something altogether different that I want." And he turns about to another view, where he sees mountain scenery, barren crag, confronting barren crag, profless light and comfortless shade playing about at random amongst mere shapes and outlines, on a very desolate, dreary, barren condition of things altogether, but a condition of things which lights up the artist's eye, and makes his fingers tingle to paint it. It is what we call picturesque: inhospitable, and worthless even in the mere considerations of material benefit, but to the painter, looking upon not material good, but pictorial effect, as his peculiar province, all that can be desired. This is an illustration of course common-place enough, but still it enables us distinctly to understand what it is with which we are dealing. Take the case, again, of the features of a man. Look at the portrait of a gentleman" banging yearly on the Academy walls. A very agreeable face, no doubt; a pleasant, comfortable, smiling countenance; an eminently respectable person; an intellectual man, perhaps, or a great man, worthy of painting certainly, or it would not be where it is, but worthy only for the sake of its owner, and certainly not for the sake of its features. But take another face: it is seamed with the furrows of care and thought; perhaps the eye is lighted up with wild enthusiasm, the hair dishevelled, the whole aspect distracted. Says the painter, "This is the subject for me: an odd man, no doubt, but a picturesque countenance; a disagreeable man very likely, but that makes no difference to me; those features are the features I desire to paint." And so on. I might take any number of such illustrations; but let me take the subject of a building, because then we are all at home. What, then, is a picturesque building? It is, in its primary sense, a building which is worthy of painting. The painter looks upon the placid face of some serene classic edifice, and he says, "This is very fine, no doubt—exquisitely proportioned, gracefully beautiful in every feature, but all that I do not care to understand; show me something which is piquant, put together no matter how, in pitch-fork fashion if you like, but something which has its outline broken and its placidity disturbed, and, if you like, its mouldings worn and its face weather-stained, as the face of a man scarred and furrowed with agonies,—and its turrets cast into the clouds like wild arms tossed about: give me a building of that character, and this is what I will paint, and let the symmetries and the graces go elsewhere."

We have next to reflect upon how the painter is able to impart this picturesque principle into that which, perhaps, nature supplies to him in an

essentially non-picturesque form. The landscape, which is dull and uninteresting enough as presented by nature, he can nevertheless make picturesque at his will. He has at command certain effects of light and shade; there are certain common objects, perhaps only hrambles and stones, which he flings about the foreground; there are certain atmospheric effects in the sky, in the aerial perspective, in the accidental shades and shadows; all of which are his well known contrivances, the "tricks" if you will, of his art; and by such means he can throw any amount of the picturesque into his landscape with perfect ease. The same, of course, with the human features. If a painter has a photograph or a "portrait of a gentleman," and desires to make it a picturesque object, he has merely to study the attitude, to dispose the drapery, to throw expression into the face, and soon, according to corresponding principles, and he makes of that which is essentially unpicturesque something as essentially picturesque as need be for his purpose. This picturesque-essence, therefore, which we call the picturesque, is obviously not a name merely, but an entity independent of mere associations, and certainly independent of pre-association; and what I have to say to you to night is little more than this,—why cannot we suppose and maintain that a similar entity exists in connexion with, or in relation to, other arts; and, if this appears to be so, more particularly why should not such an entity be discerned in connexion with our own good art of architecture?

If this be so, let me next try to define what I call the *Architecturesque*. It is an essence of form and disposition, which (speaking vaguely at first) may be said to make architecture what it is. Now, what is architecture? Our old definition in this very Society twenty years ago was this—"Architecture is the art of the beautiful in building;" and I do not know that we have hit upon a better definition yet. We do not ignore building; we do not hesitate to accept it in all the fulness of the idea; but building is not architecture; architecture is not building. Architecture is the fine art of the beautiful in building; and, as all architecture must therefore be based upon building, I think it plainly follows that there is something which is to be superadded to building in order to convert building, if the expression be allowable, into architecture. This element it is that I am endeavouring to suggest to your minds; and if there be an essence, if the application of which to bricks and mortar fine art is to appear, then I go on to say that in other matters besides those which are directly architectural,—in matters which, not being themselves architectural, are still adaptable to, or commensurable with, architecture,—this same spirit or essence may be applied to produce conformity and harmony of idea; and if this principle is as I describe it, I think it may be sufficiently designated by the term I venture to propose, the *Architecturesque*.

Let me next illustrate my notion by considering what is the picturesque in architecture? We understand the idea of the picturesque in painting; and what I want to do now is to dwell for a moment upon the corresponding principle in architecture. The picturesque in painting, as I have said, is piquancy,—the picturesque in architecture is piquancy still. There are various modes of the picturesque in architecture,—various mannerisms; there have been various fashions, and there will be various others; but the same principle or idea is present in all—not in a uniform degree, or in any uniform manner of development, but still as the picturesque, and the picturesque definitely. When Classic architecture was more generally, or rather universally, in vogue, some may remember that the picturesque presumed to go no further than those villas of the rural Italian style which frequently form conspicuous objects in the works of Italian painters, and which were then considered to be all that could be wished for in respect of piquancy or architectural effect. Again, when we looked to our architectural works at home, I remember very well, for it is no longer ago than within my own remembrance, that the Elizabethan was considered to be the acme of the picturesque; indeed, when it was of more than usually ornate character, it was considered to be more than picturesque—fantastic. And it was upon this very ground, as matter of fact, that the present fashion of revived Gothic architecture arose. It was the study of the picturesque, the desire for the picturesque, which led to the study of Gothic architecture; and it has proceeded on picturesque ground step by step from

the days of Carter and Britton till now, when the desire for the picturesque in Gothic architecture has become almost unlimited. In other words, as the revival of Gothic architecture sprang out of the love of piquancy, if I say that the more piquant our designers in that style have occasionally overstepped the picturesque and passed into the fantastic, I am certainly using language which should be considered modest and moderate. So much for the forms and modes of picturesque which have successively prevailed in architecture; but observe, that the idea underlying all these developments alike has been the same idea, namely, the idea of picture-worthiness, of painter-piquancy,—of architecture, in short, worthy of painting. I need only refer you in a single word to such works as the Châteaux of the Continent, many of them so eminently picturesque as compared with our own most piquant works. The Scottish castles, again, are not, perhaps, always very convenient abodes, any more than the English castles of very early date, but they are picturesque—they are objects worthy of painting. How they came to be thus worthy of painting it is not for us at present to inquire; but still there is a rudeness, a piquancy, and ruggedness about them which render them picturesque as almost every example. Then there are the Gothic churches; and every one would say, whether adherents of Gothicism or not, that they are, beyond all others, certainly most picturesque. And all this brings me to the great fact, Medieval architecture is all picturesque. Radically and primarily, the picturesque element is that which gives spirit to Medieval architecture; and perhaps, when we trace back Medievalism to its source, the principle comes to be that it is Northern architecture which is picturesque—Northern and Western, possibly, as distinguished, however vaguely, from Oriental and more southern architecture.

It is, perhaps, by a sort of contrast with all this, that we may best endeavour to show what is the architecturesque in architecture. I should describe it to be something which is architectural, and nothing but architectural. The picturesque is picture-worthy, but the architecturesque is something not pictorial nor picture-worthy, but architectural and architecture-worthy, and nothing else. Take the Parthenon. There is a building in which there is not one gleam of picturesque design, situated upon a picturesque rock,—occupying such a position that in the hands of any Northern or Western people, it would have been made something certainly very different from what it is. The very suggestiveness of the site, we might suppose, would have induced any people but the Greeks to make a picturesque building. But to show how the Greeks were architecturesque and non-picturesque, there is that building standing upon such a site, with not one element that we can recognise for a moment as even tolerant of the picturesque. I call it purely architecturesque. Looking again at the interiors of the Egyptian temple, you find there everything excluded that architecture and other art architecturally treated. That is to say, the whole prospect is architecturesque. When I say the sculptures and paintings are treated in this manner, I refer to what is called their stiffness—their peculiar rigidity, the absence of natural development, the peculiar conventionalism which always makes Egyptian work so eminently adapted to Egyptian architecture. Then, again, we have another instance in the Pantheon at Rome. There is a building both externally and internally architectural, and nothing else. Not only is there no attempt to produce pictorial effect, but it is impossible to discover anything else but architectural sentiment. Again, take the Pompeian House: even the paintings upon the walls have a peculiarly conventional form, which I think is eminently capable of being described under the phrase I use. And all this leads us to conceive that Classic work generally is architecturesque; and not merely Classic, but Oriental work generally.

The inquiry now naturally arises in one's mind, whether the essential difference between Classic and Medieval architecture does not lie here—that the Medieval is primarily picturesque, and the Classic primarily architecturesque. I have been for years persisting in this proposition, that all Classic architecture forms one school of art, and all Medieval architecture another school of art,—the latter picturesque, and the former something not picturesque. I have called it Classical for want of a better term. But if I am now right, I should call it Architecturesque.

turesque, and say that the distinction between Medieval and Classical is thus rendered plainer than before, if the one is to be looked at as based on picturesque endeavours, the pictorial, the picture-worthy, while the other is based only on architectesque endeavours, the architectural, the architectesque-worthy, pure and simple.*

PROFESSOR G. G. SCOTT
ON EARLY ARCHITECTURE IN GREAT
BRITAIN.†

BEFORE describing any other of the remaining works of the period, I will carry you in imagination to one which has long ceased to exist. St. Paul's Cathedral in London,—founded, as we have seen, early in the seventh century, by Mellitus, the missionary bishop, and by Sebert, king of Essex,—having been destroyed by fire, its rebuilding was commenced in 1053 by Bishop Manric. The structure then commenced was of the most ample dimensions. The elementary scale was larger even than that of Winchester, for the width of the nave from centre to centre of the pillars was 46 ft. 6 in., while that of Winchester was 42 ft. 6 in. The nave was twelve bays in length, and each transept had five bays, exceeding in this respect (so far as I know) any other Norman church, excepting the Abbey at Bury St. Edmund's. The transepts were doubly aisled. The choir had, probably, four bays, but of its eastern termination I know nothing.

The central tower must have been nearly 60 ft. square, and the length of the transept 300 ft. The choir was raised high on an extensive crypt (the successor, in all probability, of that which I have conjectured that Bishop Mellitus had constructed on the model of that of St. Peter's at Rome). Whether the two western towers, placed beyond the outer walls of the aisles, like those of Abbot Paul at St. Alban's, were of the original date I am uncertain.

The architecture of the interior seems to have somewhat resembled that of Winchester, but was more lofty and more ornate. The plan of the pillars seems precisely the same; but the arches both of the main arcade and of the gallery were moulded, and circumscribed apparently by an enriched label. The triforium arches are not shown as subdivided, but I think that this was owing to an alteration of the original work. The clearstory had in each bay three openings. The aisle walls were, internally, arcaded beneath the windows. Whether the circular windows, which in Hollar's view light the triforium story, represent original ones, such as those at Waltham, we cannot judge.

Of this stupendous edifice, William of Malmesbury, who saw it in its unaltered state, remarks that "such is the magnificence of its decorations that it is reckoned worthy to be numbered among the most illustrious edifices; such the extent of the crypt, such the capacity of the temple above, that it seems capable of sufficing to hold any multitude of people."

Our old London cathedral, through the whole period of its existence, appears to have been the largest in England, and one of the largest in Europe,—its dimensions at a later date being 600 ft. east to west, 300 ft. north to south, and 520 ft. in the height of its spire.

One of the great builders of the first race of Anglo-Normans was Gundulph, a monk of the famous Abbey of Beck, and the friend of Lanfranc, who in 1077 consecrated him as Bishop of Rochester.

He rebuilt his cathedral, originally founded by the missionary Bishop Justus; but it is very doubtful whether any part of his cathedral now exists. He founded, also, the Castle at Rochester, though he did not build the magnificent keep usually attributed to him. He did, however, build the still more stupendous keep of the Tower of London, including the chapel already described, having been regularly employed by the king as the surveyor of the work. The existing remains of Norman style at Rochester differ so entirely from this in character that I am convinced that the parts of the cathedral which he built were just the eastern portion,—raised high on its crypt,—which were rebuilt again in the thirteenth century.

I shall return at another time to the existing Norman works at Rochester, of which I exhibit some beautiful illustrations.

Though not precisely in order of date, I will take next the great cathedral of East Anglia, which was erected, not on any ancient site, but wholly anew, at Norwich; and of which nearly the entire shell of the original fabric has come down to our own day.

It was commenced in 1096 by Bishop Herbert de Losinga, who (*O tempora! O mores!*) had, among other acts of simony, purchased the see of the scrologious Rufus for 1,900*l.*!—a sum equal in our money to nearly 40,000*l.* His apologist excuses this on the ground that it is lawful for the clergy to purchase the rights of the church if they cannot obtain them otherwise, adding the apostolic words, "Redeeming the time because the days are evil." The Pope, however, did not take this view, and sentenced him, for his simoniacal practices, to build a number of churches at his own cost, of which this stupendous edifice would appear to have been one, for it is distinctly stated that he built it at his own charges,—a most amazing fact, though he held the see for twenty-eight years; and our surprise is increased when we recollect that the stone of which it is constructed was transported from Northamptonshire.

The plan of the church differs from that of St. Alban's mainly in there being only one apsidal chapel to each transept, the aisle being continuous round the great apse, and in the projection therefrom of three chapels; also in the absence of western towers. Two of the chapels last named remain, and are of remarkable plan, a circle from the eastern part of which projects an apse. The nave attains the vast number of fourteen bays; each transept has four; and the eastern arm a like number to the commencement of the apse. The length is 420 ft. without the eastern chapel, now lost; that of the transept is 195 ft. Like St. Alban's, we have here the original central tower rising to its full height of 135 ft. It is richly decorated, both without and within, with ranges of arcading and other ornamental features. Within it rises a lofty lantern, round which are triforium passages on two levels. The angle buttresses without consist of a group of numerous shafts forming an octagon, and ending in turrets now terminated in another style. The upper part of the walls is curiously filled up with two ranges of large circles. The tower is a very noble work, though somewhat eccentric in its design.

We find here the aisle and its gallery, or triforium, of about equal height, and occupying about three-fourths of the height of the wall; the remainder being given to the clearstory. The triforium arches are undivided, and very much resemble those of the main arcade; differing chiefly in being generally uniform, with a slight alternate variety, while those below are subjected to frequent changes.

The usual pier on the triforium level has three shafts in a row in its reveal, carrying a wide and plain soffit, while the angles have alternately one and two recessed shafts, and the piers have alternately single and couple shafts running up their front.

The piers below are in some cases like those above, in others a portion of a vast round pillar is substituted for the row of three-shafts, the rest remaining as before described; and in one instance, on each side is a simple round column, with spiral flutings, as at Durham, Waltham, &c.

The zigzag and billet appear in the arches, and mouldings are, though sparingly, introduced. The capitals are mostly either of the cushion type, or varieties of the form I have shown you from the Tower of London, Caen, and Lincoln.

The whole internal effect is magnificent and noble in a very high degree.

The transept-fronts are divided here into three bays instead of two, as in the churches hitherto described. The arcades of the eastern arm differ considerably from those of the nave, while those of the apse unite in a very pleasing manner into a continuous range. Beneath the central arch are still remaining the shattered vestiges of the original episcopal throne.

I may mention in passing the remarkable plan of the great East Anglian abbey church at Bury St. Edmund's. I exhibit a ground-plan, from which its remarkable features and extraordinary magnitude may be judged. The length was 500 ft., and that of its western façade 250 ft. The latter is of a unique type, being flanked by two vast octagonal towers.

A very different type of the same age is found at Gloucester, the erection of which commenced in 1089. Here, as was so usual where the foundation

was of the Anglo-Saxon period, the sanctuary has a vast crypt beneath it.

The peculiarities of this church are two,—first, that the triforium or gallery of the eastern arm is vaulted with a demi-vault, and from it opened repetitions of the apsidal chapels, which are placed somewhat as at Norwich; and second, that no such gallery exists to the nave, but that the height is there thrown into the aisle; so that we have a very lofty aisle of one story to the nave, and two ranges of aisle of very low proportions to the eastern arm, the two arrangements coming face to face in the transepts. The piers throughout were vast cylindrical columns, with very plain and uncut round capitals.

This remarkable type was followed, with minor variations, in the two neighbouring monastic churches of Tewkesbury and Pershore. In all it has been greatly altered; but, by comparing one with another, the same scheme is shown to have prevailed in all three. In none were there aisles to the transepts.

The church at Tewkesbury was built just at the same time with Gloucester, and retains a feature which Gloucester has lost, a magnificent Norman central tower. It possesses also a unique feature which it is possible it may have shared with Gloucester. I refer to the enormous arch that occupies its west end, no parallel to which I know elsewhere.

This church is of peculiar value from its retaining, like those of St. Alban's and Norwich, so much of the original Norman outline, and few there are which exceed it in the solemn dignity of its external aspect.

Of the neighbouring cathedral of Worcester, as rebuilt about this time or a little earlier by St. Wolstan,—one of the few English bishops who retained their sees under the Normans,—we have only the crypt, which is wonderfully perfect in its design and preservation, and the arches which led into the eastern chapels of the transepts. We have also the unique and beautiful circular chapter-house of about the same period. Against the south transept, in an arched passage, we find either a reminiscence of the Saxon baluster or some from the old cathedral used again. St. Wolstan would, no doubt, have been glad of any such memento of good old times; remembering which, while watching the progress of his Norman church, he could not restrain his feelings, and exclaimed, "We wretched people destroy the works of the saints, that we may get praise for ourselves. That age of happy men knew not how to construct pompous edifices, but they knew well how, under such roofs as they had, to sacrifice themselves to God, and to set a good example. We, alas! strive that we may pile up stones, neglecting the while, the care of souls."

I will not detain you by describing Hereford, built by the more pious relative and namesake of Losinga, of Norwich; nor Chichester, commenced about 1089, a few years after the removal of the ancient see from Selsey, and which was a very perfect Norman cathedral on a minor scale, with its eastern end arranged much as that of Norwich, but with two western towers. Its original features are excellent specimens of the early period.

Let us now travel far northwards, and visit St. Cuthbert's glorious shrine; but, after entering upon the great Northern road, let us step aside and pay a passing tribute to the memory of England's last Saxon king, Harold Godwinson, in the church of his own founding, at Waltham.

When the nave, now standing, was erected, let us not too curiously inquire. It is a question on which some of our keenest antiquaries have differed, and let us not dispute over a site so sacred in England's history. Right goodly is the remaining fragment, by whomsoever erected. I confess to a belief that it was the work of some who still loved the memory of Harold, after living long under Norman sway; and if, in after years, the chieftains of Norman lineage delighted to trace their names in the roll of Battle Abbey, that proud memento,—

"Of Hastings' fatal field,
Where shiver'd was fair England's spear
And broken was her shield,"

he it rather for Englishmen to take a mournful pleasure in the spot whither were borne from that fatal field the mangled remains of England's native but unhappy king.

The two are alike mementos of national humiliation; but let us rejoice that, though the triumphal thank-offering of the Conqueror was a desolate ruin, the remnant of Harold's foundation, however reduced, is still a church, and has been in our day rescued from much of

* To be continued.

† Lecture III. at Royal Academy, February, concluded, See pp. 70, 90, 108, 127, and 149, ante.

its humiliation and been made the subject of thoughtful and artistic care.

In its architecture you will perceive some resemblance to the glorious work which we have next to consider; for, like Durham, its bays are arranged in complets. In one instance, on either side, the intermediate pier is a round column, pure and simple, with spiral flutings; in the others, the same form but with attached shafts towards the aisles, so that the two buildings which I have thus accidentally taken—the one on our pilgrimage to the other—are so much alike in internal design that one might fairly attribute them to the same architect. One pair of piers (which carried the western towers) are of the typical form, the others consist of two half columns flanking a shafted pilaster.

At Durham we have a glorious temple erected by Norman bishops, over the shrine of a British saint. The body of St. Cuthbert, after many journeyings and sojournings, had eventually become domiciled at Durham; for,—

"After many wanderings past,
He chose his lordly seat at last,
Where his cathedral, huge and vast,
Looks down upon the Wear;
There, deep in Durham's Gothic shade,
His reliques are in secret laid."

The existing cathedral was commenced in 1093, by the Norman Bishop de St. Carleph. Malcomb, king of Scotland, and his true-hearted English queen, Margaret, assisted in laying the first stones.

Sir Francis Palgrave tells us that Bishop de St. Carleph obtained the design abroad during three years' exile from his see. I know not of any church like it abroad, but this is no refutation of the statement, which seems by no means an unlikely one, and is, I think, founded on ancient authority. However this may be, a design more noble can scarcely be conceived, and I think it must be admitted that, among all the churches erected by the Normans in England, this is the noblest though far from being the first in size.

Its great beauty is internal, and arises from the carrying throughout the principle of alternating clustered piers and vast round columns, the latter having their shafts decorated with spiral, zigzag, intersecting, and vertical flutes.

This principle, in an isolated form, we find elsewhere: as in two bays at Norwich, and a similar number at Solby, and more perfectly at Waltham, and at Lindisfarne; but Durham seems to have taken the lead in carrying it throughout the church; but still more remarkable is the stupendous scale and noble proportions in which it is produced.

Though the church was begun by Carleph, he only survived its commencement for three years, and a like interval of vacancy followed his decease. During this time the monks, under their zealous prior, Turgot, carried on the work, which, on the succession of Ralph Flambard to the see, in 1099, is said to have been completed as the nave, which was carried on to completion by Flambard.

It is clear that the general design had been laid down under Carleph, as the choir, transepts, and nave agree in their leading idea; so that, whatever influence the previous building experience of Flambard obtained during his holding the deanery of St. Paul's or elsewhere may have had upon the details of his nave at Durham, we must award the honor of the scheme, as a whole, to Carleph's architect, who had supplied him the design during his exile in Normandy. Both bishops were as far as may be from the *beau ideal* of an unworlly ecclesiastic, but one would regret to attribute a work so noble to the unscrupulous and wicked agent of the oppressions of Rufus.

In the plan the church, being arranged in coupled bays, has two such complets to its choir and two to either transept (the latter much narrower than the former). The nave consists of three complets, after which comes a single bay, and then the bay which represents the western facade; or, in other words, it consists of four complets, the westernmost of which is disturbed by the substitution of a complex pier on either side to carry the towers, in the place of what would have been its round column. This seems an imperfection; for four complets, clear of the tower bay, would appear a more perfect arrangement.

The transept has only an eastern aisle. The eastern termination of the church is lost. It was apsidal, and probably with a circumscribing aisle. The dimensions of the entire building are not quite equal to some of those which we

have reviewed, being probably at first about 430 ft. in length by 200 ft. from north to south of the transept. The width from centre to centre of columns is 40 ft. The bays of nave and choir, similarly measured, vary from 23 ft. to 26 ft.

The piers are of prodigious size, the clusters and round pillars being respectively about 11 ft. and 7 ft. in diameter. The magnificent grandeur of the interior arises as well from the extreme nobleness of the design of these complets of bays, as from their continuous use throughout the church. Nothing can exceed the noble simplicity and grandeur with which they are treated, nor the happiness of their proportion.

The main arcade assumes a much more commanding altitude than in most of the churches already described, occupying, what became in after-times its received proportion, of one-half of the height of the wall, the other half being pretty equally divided between the triforium and clearstory.

The great columns are precisely like those at Winchester, excepting that the three-fold group of shafts, which there occupies the lateral portion, is precisely repeated on the front and back faces, making a perfectly uniform group in all directions. This arrangement produces great grandeur, owing to the noble group of shafts it carries up to the vaulting of the central space. The arches are boldly moulded, with rolls and hollows, and enriched with the chevron. The triforium, piers, and arches are of three orders; the lower one of dividing into two arches on a centre shaft. The clearstory is usually of three unequal arches.

The capitals are all of the cushion type; those to the great cylindrical columns being octagonal. The chevron is here freely used, and the doorways are magnificently rich. One most marked feature in this cathedral is, that its central space is everywhere vaulted.

It is known that this was a subsequent work; but, in the nave at least it appears equally clearly to have been contemplated from the first, a portion of the transverse ribs having been built with the walls. In the transept, however, the evidence seems to be the other way, though I think the question has been hardly sufficiently investigated. The sister church at Lindisfarne, built almost on the same design, seems from the views one sees of it to have been vaulted from the first, or, at least, to have been so designed.

Externally, a peculiarity occurs in the gabled roofing originally covering the aisles. This does not now exist, but the evidences of it are indisputable.

The awful grandeur of the interior of this cathedral, and its noble effect from without,—standing, as it does, on a rocky promontory nearly surrounded by the deep ravine of the river, and, as a quaint old writer says,—“So envyrond with hills, that he that hath seen the situation of this city hath seen the map of Zion, and may save himself a journey to the Holy Land,”—must ever cause it to rank among the grandest of our Mediaeval remains; and its influence seems to have been proportioned to its merits; for, as Sir Francis Palgrave tells us, it “became the normal model of ecclesiastical architecture throughout the ancient diocese of Aidan and Finan, far beyond the Tweed.”

I will only notice one more building in the present lecture, and that in the farthest south; and I make this long stride,—from the Wear to the New Forest,—for the sake of noticing the other great work of the notorious prime minister of Rufus. Mr. Ferrey, who has every right to judge of all that relates to Christchurch, has traced out certain resemblances between Christchurch and Durham. The difficulty in connecting such resemblances with the influence on each of Bishop Flambard, is (as I have before said) that Durham was commenced, and had made great progress before his accession to the see. I am, however, disposed to think that it was Durham that influenced Christchurch,—as it was not while dean, but subsequently when patron of Christchurch, that Flambard rebuilt that church; and this was contemporaneous with his holding the see of Durham.
